Canada is the world's second-largest country by land area, occupying most of the northern part of North America between the Atlantic and Pacific Oceans, and extending north to the Arctic Ocean. Originally founded as a union of British and former French colonies, Canada became a dominion in 1867 and gained independence from the United Kingdom in 1982. It is a federal constitutional monarchy with a parliamentary democracy comprised of ten provinces and three territories. An officially bilingual nation, nearly 60 per cent of the population have English as a mother tongue, while 23 percent have French. Canada adopted an official policy of multiculturalism in 1988, and its population of nearly 33 million people is composed of no fewer than 34 ethnic groups that number at least 100,000 people. Canada is a technologically advanced and industrialized nation whose diversified economy is heavily reliant on trade with the United States, with which it shares land borders to the south and northwest.

Canada's communications sector has been particularized by three factors: the country's close and often ambivalent relationship to the United States, its policy of official bilingualism, and its avowed dedication to the principle of multiculturalism. Of these differences, it is Canada's bilingual status that most clearly separates it from the American model (→ United States of America: Media System). With seven million French-speaking Canadians, the vast majority of whom are located in the province of Quebec, nationalist and nation-building projects have long had to contend with the issue of "two solitudes" existing side by side. Although some French-language → radio and → television services are available across the nation, they have limited audience outside of Quebec, and French-language daily newspapers have almost no circulation outside of that province. Concerns over the linguistic divisions among Canadians, as well as the perceived threat of American culture to English-Canadian identity formation, have characterized many governmental interventions into the media system.

## PRINTED PRESS

Canadian newspapers derive their origins from the influence of the New England colonies. John Bushnell, a printer from Boston, started Canada's first → newspaper, the *Halifax Gazette*, on March 23, 1752. Early newsweeklies were dependent on governmental patronage and, consequently, were rarely critical. The first significant expansion of the press occurred in the first half of the nineteenth century, as settlers arrived in Upper and Lower Canada. During this period, newspaper editors were often politicians, and their newspapers, including Stephen Miles' *Kingston Gazette* (1810) and George Brown's *Toronto Globe* (1844), reflected their political orientations. The westward expansion of the late nineteenth century spread the press across the nation, and events such as the Confederation (1867) and the Riel Rebellion (1885) created an interest in domestic news. Canada's population exploded at the turn of the twentieth century, when it was the fastest growing country in the world. Newspaper circulation doubled between 1901 and 1911, and by 1938 there were 138 daily newspapers in the country. In 1917, Canadian newspapers formed the Canadian Press, a cooperative → news agency, which allowed for a greater level of integration of news reporting across the geographically vast nation.

Since the 1960s, Canada's newspaper industry has been dominated by a shrinking number of increasingly large chains, including CanWest Global, Hollinger International, Quebecor, Torstar, Osprey Media Group, and Power Corp. While most major Canadian cities have competing daily newspapers, and while the country is served by two English-language nationally distributed dailies (the *Globe and Mail* and the *National Post*), diversity is limited considerably by the trend toward conglomeration. Specifically, by 1999 chains controlled 95 per cent of Canadian daily newspapers, accounting for 99 per cent of total circulation. Currently, only four daily newspapers are classified as independent by the Canadian Newspaper Association, and only one of those (*Le Devoir*) is considered to be a major newspaper.

In the area of press freedom, a significant body of law covers matters ranging from libel, to contempt of court, and copyright (→ Freedom of the Press, Concept of). As well, the Charter of Rights and Freedoms, passed as part of the Canadian constitution in 1982, guarantees "freedom of thought, belief, opinion and expression, including freedom of the press and other media of communication."

Canada's → *magazine industry* differs significantly from the newspaper industry insofar as it is largely dominated by American publications. In 1961 the Royal Commission on Publications, the O'Leary Commission, reported that 80 per cent of Canada's magazine industry was foreign-controlled, and recommended the imposition of a tariff on "split-run" editions, or foreign-owned magazines that print a second edition in Canada in order to benefit from Canadian advertising revenues. This recommendation became law in 1965, and has been a source of controversy between Canada and the United States for decades. In 1997, the United States successfully challenged Canada's laws on split-run magazines through the World Trade Organization, and two years later, after negotiations with the US, the Foreign Publishers Advertising Services Act was passed as a compromise position.

## BROADCASTING AND DIGITAL MEDIA

Canada's national broadcasting system was initiated as a response to the Royal Commission on Radio Broadcasting (1928–1929), also known as the *Aird Commission*. The Aird

Commission reported a widespread concern about the Americanization of Canadian airwaves, recommended that broadcasting be publicly owned, and advocated for the establishment of a national public radio network. In 1932, this network, known as the Canadian Radio Broadcasting Commission (CRBC), was established by the government of R. B. Bennett, when it took over a number of stations operated by the Canadian National Railway (CNR). Four years later the passage of the Canadian Broadcasting Act changed the CRBC into a full-fledged crown corporation and altered its name to the Canadian Broadcasting Corporation (CBC; → Public Broadcasting Systems).

In 1955, spurred by the arrival of television in Canada (1952), a second broadcasting commission, the *Royal Commission on Broadcasting* (1955–1957), otherwise known as the Fowler Commission, was convened. The recommendations of this commission resulted in the Broadcasting Act (1958), which stripped the CBC of its regulatory powers by establishing the Board of Broadcast Governors (BBG) as an oversight body, opened the door for the creation of national private broadcasting networks, and established the first Canadian content regulations, requiring a threshold of 45 percent Canadian content as a condition for receiving a broadcasting license. In 1968 the Broadcasting Act was amended, expanding Canadian content quotas to 60 percent, requiring Canadian ownership of the broadcasting system, and establishing the Canadian Radio-television and Telecommunications Commission (CRTC) as a replacement for the BBG. The CRTC was charged with granting and renewing broadcasting licenses, maintaining programming quotas, and ensuring the ongoing Canadian ownership of the broadcasting system. In 1971, the CRTC introduced a point system for Canadian content intended to clarify Section 3 of the Broadcasting Act. This checklist awards points for the number of Canadians involved in the production of a film, song, or television program, and became the basis for calculating Canadian content from that point forward.

Since the beginning of the 1990s, CBC Television's role as a public forum has been challenged by a series of funding cuts. In 1990, CBC closed eleven regional stations as a result of cuts to its budget, and in 1995 the resignation of CBC president Anthony Manera over the issue of funding highlighted the crisis situation for the public broadcaster. By 1999, the CBC's budget had been reduced to \$820 million, far below the 1990 budget of \$1.2 billion. Critics of the CBC point to the fact that Canada has one of the most diverse television spectrums in the world as evidence that there is no longer an important role for a public broadcaster in the system. Cable television was introduced to Canada in 1952 and was an important feature of the television landscape in urban centers by the 1970s. Subscriber specialty channels were introduced in 1983 and significantly expanded in 1996, and again in 2000 when the CRTC approved the licenses of 283 new digital television channels.

Canada's *current television landscape* is comprised of six types of channels: (1) basic service analogue stations comprising local over-the-air affiliates; (2) analogue specialty channels such as TSN, CBC Newsworld, and the Weather Network; (3) digital specialty channels such as OutTV and the Documentary Channel; foreign channels from (4) the United States (A&E; → CNN) and (5) other nations (Alpha Punjabi, → Deutsche Welle); and (6) premium movie services. Generally, satellite and cable providers offer packages ranging from approximately three dozen (basic service) to more than two hundred (digital) channel options. Despite the broad range of viewer options, television viewing in Canada is dominated by dramas, situation comedies, reality television programming, and

sports broadcasting (particularly professional hockey). Consistently, the most popular programs in English Canada mirror the most popular programs in the United States, with the notable exception of CBC's *Hockey night in Canada*. By contrast, almost all of the most popular programs in French-speaking Canada are produced in Quebec and feature local celebrities.

Despite the creation of two Canadian digital networks in 2005 (Sirius Canada and XM Radio Canada), *radio* remains a predominantly local phenomenon in Canada. While the CBC has two national radio networks that attract approximately 11 percent of all listeners, the bulk of the radio audience tunes in to one of the 515 commercial AM and FM radio stations offering a range of options from adult contemporary and contemporary hit music, to news, sports, and talk radio. One of the defining features of Canadian radio is the Canadian content regulatory framework that governs it. The CRTC requires that 35 per cent of popular music played between 6 a.m. and 6 p.m. be of Canadian origin, as defined by the MAPL criteria that assign points based on a song's music, artist, production, and lyrics. French-language radio stations, which comprise 20 percent of the total, are further required to broadcast 65 per cent of their musical selections in French, and must also meet the minimum Canadian content requirements.

Unlike television and radio, the CRTC has largely left the → Internet unregulated, allowing it to be developed by the private sector and academic communities. Canada is a world leader in broadband access, a nation in which 17 million adult Canadians (68 per cent of the population) reported using the Internet for personal or nonbusiness purposes in 2005. Increasingly, the Internet has become an important domestic communications technology, with almost two-thirds of users who access it from home doing so daily. Nonetheless, a notable gap has arisen between cities and rural areas, with urban Canadians significantly more likely to access the Internet (→ Communication Law and Policy: North America; Internet Law and Regulation).

## **CONGLOMERATION IN THE CANADIAN COMMUNICATIONS INDUSTRIES**

The conglomeration that has defined the Canadian newspaper industry is increasingly a reality for the entire media system. As convergence becomes the norm, a small number of corporations have seized control of much of the media. The largest players in the media field include CanWest Global, CTVglobemedia (formerly Bell Globemedia), Rogers Media, Quebecor Media, Corus Entertainment, and Alliance-Atlantis (→ Concentration in Media Systems; Convergence of Media Systems; Media Conglomerates).

CanWest Global owns the Global television network, the smaller CH television network, and a number of digital specialty channels; a small number of radio stations; and the former Southam newspaper chain, which includes a number of major dailies as well as the *National Post*. CTVglobemedia is the owner of the CTV television network, and a large number of specialty television channels, as well as the *Globe and Mail* newspaper. In 2007 it acquired the CHUM television network, a large number of specialty television channels, and a radio network from CHUM Limited. Rogers Media controls a large portion of the cable industry, more than 70 consumer magazines (including the newsweekly *Macleans*), 46 radio stations, and numerous specialty television stations. In 2007, Rogers agreed to purchase from CTVglobemedia the Citytv stations formerly owned by CHUM. Quebecor Media owns Vidéotron, the largest cable provider in Quebec, as well as the 18

newspapers in the Sun Media chain, the TVA French-language broadcasting network and its affiliated French-language specialty channels, and the group of publishing houses Éditions Quebecor.

## **Candidate Image**

*Kenneth L. Hacker*

*New Mexico State University*

The candidate image construct is used in the study of political communication to explain how campaign messages affect voter perceptions of candidates. It is assumed that changes in the images of candidates lead to changes in candidate evaluations and choices in elections. This assumption is consistent with the vast voting behavior literature which indicates that there are numerous long-term and short-term determinants of voting choices. Candidate image is one type of short-term voting determinant.

While there are competing definitions of candidate image, most uses of the construct assume that candidate images are cognitive representations of candidates (→ Political Cognitions). In their seminal work, Nimmo and Savage (1976) initiated a rigorous focus on candidate image as a construct that can help to explain how communication affects candidate evaluation. They argued that an image of a candidate consists of voter → perceptions. These perceptions are the result of an interaction of voters' subjective knowledge and messages sent by candidates. Some scholars assume that voters compare candidates on a similar set of criteria, such as attributes for an ideal office holder. Others, however, argue that voters appear to incorporate dissimilar standards in their images of competing candidates (Hellweg 2004).

The general theoretical perspective for contemporary candidate image research is an information-processing view of voters and citizens (→ Information Processing). Some scholars argue that voters follow a rational choice model and select candidates with ideal image comparisons or with their own self-interests. Other scholars believe that voters reduce the plethora of campaign messages and claims they encounter into simplified models of the candidates. In the latter view, voters form images of candidates in order to judge how the candidates are positioned in relation to the concerns that are most important to themselves (Kendall & Paine 1995; Lodge et al. 1995).

### THE FUNCTION OF CANDIDATE IMAGES IN CAMPAIGNS

Campaigns provide voters with information about parties, candidates, and voting decisions (→ Election Campaign Communication). Campaign events like conventions and debates have significant effects on the public images of candidates (Holbrook 1996). Candidates attempt to shape candidate images in the minds of voters and reporters by projecting qualities that they believe will appeal to voters. Campaign public opinion analysts identify the desired traits and candidates then attempt to project those traits (→ Election Surveys). A common image-building technique used by candidates without international political experience is to film them abroad talking with foreign leaders. This might show that they are endorsed by a group of experts who do have the international background.

One of the most important characteristics of candidate images is that they are *changeable*. If they were not, there would be little need for political consultants, participation in debates, and expenditure on advertising. Candidates can present their views on issues in various ways to increase the level of support for their position on these issues. They may not be able to change their job experience or religion, but they can alter perceptions of such aspects of their personal history.

Unless a voter votes by party line, he or she makes decisions about differences between candidates in an election. Candidate images provide voters with a means of evaluating candidates in relation to what they are most concerned about in an election. They also provide a means of tallying positive and negative reactions. This is useful in contrasting one candidate with another, as voters are most likely to vote for the candidate with the best positive to negative impressions ratio. Voters reason about their choice of political candidates as they do about other important choices in their lives. Most voters engage in economical means of integrating information they receive about candidates. According to Popkin (1991) voter reasoning draws on information shortcuts and rules of thumb (“low-information rationality”).

### COMPONENTS AND PROCESSES

Early views of candidate images treated them as summary representations of candidate source credibility. An alternative view regards candidate images as representations of the personality traits of candidates including source credibility, competence as a leader, communication style, etc. A third view treats images as representations of both candidate personal impressions and candidate issue-position impressions. A more expansive view

allows any impressions about candidates (personality, issues, party, ideology, etc.) to be included in the images. This fourth view holds the promise of describing how affective responses can be part of images. To date, most approaches to images have conceptualize their content only as cognitions with inadequate accounting of affective responses to candidate and how those reponses might also constitute content in the images.

Kilburn (2005) argues that overall evaluations of candidates are formed by input from perceptions about candidates, issue attitudes held by voters, and partisanship. He also argues that trait perceptions and overall evaluations are mutually influential. For candidate images, this might suggest that the images of candidates have feedback influence on certain components such as impressions of candidate attributes. Voters tend to prefer candidates who have attributes they like, partisanship that matches their own, and views close to their own issue preferences.

Much of the *content* of candidate images concerns the personal traits of the candidates such as personality, mannerisms, communication behaviors, credibility, leadership potential, etc. Along with character input, however, candidate images appear also to be affected by reactions to candidates' issues positions. Candidate issues positions can include policy statements, actions on issues, record in office regarding issues, and arguments made about political changes. Studies show that voter perceptions of the candidate issue positions (issue perceptions) and candidate personality traits (persona perceptions) are highly and significantly correlated (Hacker et al. 2000).

Image formation is subject to dynamic changes throughout a campaign. Components may change in candidate images as new messages are received, but the relative importance of component types like issue positions and personal impression may also shift (Flanigan & Zingale 2006). One example is the 1952 election, when Dwight Eisenhower ran as the victorious general of World War II, whereas in 1956, he ran as an incumbent president with a good record on issues. Another example is Bill Clinton downplaying personality perceptions in favor of strong issue stands to focus images on policies rather than personal issues.

Cognitive processing of candidates in election campaigns involves the ways in which incoming messages and information are evaluated and related to previously stored knowledge, attitudes, and images. A candidate image may be linked to a candidate → schema with the latter being more long-term memory-based. This line of reasoning follows the “online tally” model of political cognition which holds that evaluations are continuously updated by voters (Lodge et al. 1995). Voters respond to campaign messages without necessarily being able to memorize or recall the content of those messages later. Conclusions may remain after the basis of concluding is forgotten. This may occur because facts presented through the news media can be forgotten while reactions to them are accumulated.

## COMMUNICATION EFFECTS ON IMAGES

When voters speak to one another about candidates, they describe the images they have of the candidates. These candidate images include cognitive and affective elements. What others tell them about the candidates interacts with what they already believe and feel. The candidate image can be easily articulated because it is a summary structure of the

candidate. However, it can be added to as more information from candidate schemas is activated to facilitate communication. Thus, candidate images can be seen as a mediating structure between schemas and the representations of candidates discussed in communication. The images may be reinforced, added to, or changed in personal communication as well as in mass and new media communication.

Candidate images are shaped in many forms of political communication. Political advertising, for example, directly targets image-shaping and image repair while sometimes attempting to generate negative images of competing candidates. News media provide information about candidates that makes it easy to observe their behaviors and make inferences about them (→ Political News). Film biographies are used as convention documentaries to provide extended video and audio narratives of a candidate and to highlight accomplishments and good traits. Debates provide candidates with opportunities to change certain impressions that voters have of them. Certain “defining moments” of debates can backfire and harm the candidates, however. A classic example of this from the USA was Gerald Ford’s claim, in his debate with Jimmy Carter in 1976, that the USSR did not dominate eastern Europe. Reactions by voters to what candidates say about issues and how they perform in the debates change their images of the candidates.

The nature of the content of candidate images is likely to be affected by the agenda-setting that occurs in news media coverage of campaigns, by priming done in news stories, and various processes of framing done by candidates, journalists, and others who use old and new media to characterize candidacies and campaigns (→ Agenda-Setting Effects). Priming refers to the tendency of audience members to evaluate political candidates on the basis of the events and issues that are particularly salient in the news (→ Priming Theory). Framing, also known as second-level agenda-setting, refers to the ability of the news media to affect the construction of candidate images by selecting and emphasizing candidate attributes for attention (→ Framing of News). In the same way as journalists focus on certain events or issues more than others, they also focus on certain candidate traits or attributes more than others. This suggests that news media play a key role in helping to shape candidate images.

News media agenda-setting effects have been found in numerous nations. For example, in the Spanish election of 1996, voters’ images of the three candidates for prime minister were positively correlated with candidate descriptions in the news media. A study of a mayoral election in Taipei, Taiwan in 1994 found that salient features of voters’ candidate images were correlated with candidate attributes emphasized by Taipei newspapers (McCombs 2004).

## CONCEPTUAL AND METHODOLOGICAL ISSUES

In voting research, cognitive constructs help to study how people evaluate candidates and make their voting choices. A focus on any cognitive structure in the cognitive system is part of an effort to ascertain how people represent the political world to themselves.

Candidate schemas are knowledge networks and dense long-term memory structures regarding candidates. Candidate images are evaluative and online cognitive representations of candidates. Candidate → attitudes are summations of beliefs about candidates

which include affect attached to those beliefs to the point attitudes are essentially affective structures constructed of beliefs. While these three structures may overlap, their respective literatures indicate substantive differences. Moreover, studies of voting behavior suggest that political cognition involves multiple structures that affect voting choices. On the other hand, it can be argued that the three constructs simply describe three different angles of view on the same evaluative process.

There are various ways of measuring candidate images that are somewhat related to the various conceptual definitions of images. This should not be alarming, because many, if not most, constructs in social and behavioral science research have different conceptual and operational definitions. As with attitude and schema, an image is not directly observable. Cognitive constructs are hypothetical constructs that serve as devices to understand human behavior and communication. Constructs like images are believed to exist because we can see how they mediate between input and output in relation to the mental processing of messages.

As long as communication is conceptually related to cognitive changes in voter perceptions and evaluations of a candidate, a candidate image provides a useful construct for linking messages to stabilized cognitive representations of the candidate.

# Caribbean States: Media Systems

*Canute James*

*University of the West Indies, Jamaica*

The Caribbean archipelago curves from Cuba in the northwest to Trinidad in the southeast. The islands have all been at some stage colonies, departments, or possessions of European or North American countries. This history has given the region a varied culture that has created divisions among groups of islands. The English-speaking group, for example, traditionally has been apart from the others. These differences of language and other aspects of culture have created barriers in communication among the 38 million people of the islands.

## HISTORICAL BACKGROUND

The Caribbean's history has left it with differing political and administrative systems that, to a significant degree have determined the structure and operations of the media in the many countries. The culture of the media is also a consequence of the economic history of the islands. The media are more diverse in the larger and more populous islands such as Cuba, Hispaniola, Jamaica, Puerto Rico, and Trinidad and Tobago. With the exception of Cuba, the political systems in the region are based on periodic elections that have produced administrations ranging from social democratic through centrist to center right (→ Cuba: Media System). They are generally pro-business.

Fundamental *political changes* in recent years in the English-speaking islands have seen them become politically independent of the UK over the past 45 years. These countries inherited the British approach to press freedom (Surlin and Soderlund 1990; → Freedom of the Press, Concept of). There were also political changes in other countries with the overthrow of right wing dictatorships in Cuba (Batista), Dominican Republic (Trujillo), and Haiti (Duvalier). The change in Cuba was to a socialist administration with a centrally controlled economy, while the Dominican Republic and Haiti moved to elected administrations. Other islands have remained colonies, possessions, and overseas departments of the UK, France, the Netherlands, and the United States.

In most of the countries in the region, the past 25 years have seen fundamental changes in *economic policy* that have affected the structure and operations of the media. Most countries had one or two major newspapers that were owned by the state, economically influential individuals, families, or businesses. Radio and television stations were owned, in the main, by governments, well-established economic entities, or rich individuals.

Progressive deregulation of many economies has led to increased private business involvement in the media. Barriers to foreign ownership of media have also been removed in some countries. Many governments have divested state-owned media. This has led to a rapid expansion in the number and type of media operating in commercial competition (→ Commercialization of the Media).

## LEGAL FRAMEWORK

While the constitutional and legal environments in most of the countries allow for free media, many media houses and professional associations complain intermittently about

elements that limit this freedom. These range from the murder and physical intimidation of journalists to the application of laws concerning slander and defamation (→ Violence against Journalists).

The Association of Caribbean Media Workers, a federation of media professional organizations (Cuba is not represented), found an “ambivalence of respect” for the practice of journalism in an environment “in which commercial and political agendas exist” (Association of Caribbean Media Workers 2006). It reports: “Self-censorship becomes a foil against the practice of good journalism and citizens are denied a view of reality necessary to move themselves and their societies forward” (→ Journalists: Professional Associations).

## PRESS

The leading daily newspaper in the *Dominican Republic* is *Listín Diario* (circulation 160,000). It was part of the Grupo Intercontinental, a financial services and media conglomerate, one of whose banks – Baninter – collapsed in 2003 under what the government claimed was fraud of \$2 billion. The government took over the group, including *Listín Diario*. Other daily newspapers include *Hoy* (80,000), *El Caribe* (42,000), *El Nacional* (42,000), and *Ultima Hora* (circulation unavailable).

The main dailies in *Haiti* are *Le Matin* (circulation 8,000) and *Le Nouvelliste* (circulation 9,000). Both provide coverage of national events. Both operate in a turbulent political environment that has overtaken the country since the overthrow in 1986 of the dictatorship of Jean-Claude Duvalier.

The main newspapers in the *English-speaking Caribbean* are privately owned and operate in an environment that allows freedom of expression. The main newspapers in Barbados are dailies – the *Nation* (circulation 35,000) and the *Advocate* (16,000). The main dailies in Jamaica are the *Gleaner* (circulation 45,000) and the *Observer* (40,000). Both report higher circulation for the Sunday editions. The *Gleaner* also publishes the *Star*, an afternoon weekly. There is also a national weekly, the *Herald* (circulation unavailable), and several weekly community and regional newspapers. The main dailies in *Trinidad and Tobago* are the *Express* (circulation 85,000), the *Guardian* (60,000), and *Newsday* (48,000). There are several weeklies.

The newspapers in these countries cover broadly national issues relating to politics, business, and crime. They give significant coverage also to regional and international developments, particular where these have an obvious impact on their readers.

Newspapers in the *Leeward Islands* (Antigua-Barbuda, St Kitts-Nevis, and Montserrat) and *Windward Islands* (Dominica, Grenada, St Lucia, and St Vincent) concentrate more on domestic political and social issues. There are a few dailies, although most are weekly. While most are privately owned, several are published by political parties. The financial viability of many of these newspapers tends to be uncertain because of the small markets in which they compete.

## RADIO

There are 104 licensed → radio broadcasters in the Dominican Republic that operate on AM and FM frequencies. Most of these are provincial, while some provide national coverage. These are located mainly in Santo Domingo, Santiago, San Francisco de Macoris, La

Romana, Azua, and Barahona. The stations are privately owned, mainly by major business enterprises and media conglomerates.

*Haiti* has 121 listed stations broadcasting on AM and FM frequencies. Most are located in Port-au-Prince, Cap-Haïtien, Jacmel, Les Cayes, and the Central Plateau. The stations are privately owned and are generally small operations.

Most radio stations in English-speaking countries are privately owned. There is, however, state ownership in some of the smaller countries. The number of private stations has expanded over the past 10 years following the deregulation of the media market in several countries.

There are 32 radio stations operating in *Trinidad and Tobago* with commercial and community licenses. There are 17 in Jamaica. State-owned radio broadcasters are in the minority in the Leeward and Windward Islands, where they compete with a growing number of private stations.

## TELEVISION

The major → television broadcasters in the *Dominican Republic*, which provide national coverage, are RadioTelevisión Dominicana, ColorVision Canal 9, Teleantillas, and Telesistema. There are 54 television community and local commercial television broadcasters. *Television Nationale d'Haiti* is a state-owned broadcaster that provides national coverage. Six privately owned television broadcasters provide provincial coverage.

The leading television stations in *Trinidad and Tobago* are state-owned CNMG TV operated by Caribbean New Media Group, and privately owned TV6, which is part of the Caribbean Communications Network group. In Jamaica the main stations are operated by privately owned RJR Communications Group and CVM Communications.

State-owned television broadcasters in the *Windward and Leeward Islands* increasingly are competing with privately owned stations. Most television stations are part of converged broadcasters that also operate radio stations.

The content of most stations mainly is imported, with locally produced programming limited to newscasts, discussions/talk shows, and coverage of live sports and culture.

## NEW MEDIA AND THE INTERNET

There has been rapid expansion of privately owned cable television providers across the region. The content generally is sports, culture, and news, with limited local content being supported by foreign programming. Government regulators and the media industry in several jurisdictions are discussing the extent to which cable providers are allowed to carry → advertising. The pace of the expansion of new media ventures in the Caribbean is constrained by relatively low levels of Internet access in the region (→ Digital Divide). Figures from Internet World Stats (2005) indicate that these range from 1.7 per cent in Cuba to 60 per cent in Barbados.

While the average level of Internet penetration in the Caribbean of 8.1 per cent is higher than in most emerging economies, the region lags behind North America and Europe. Increases in the level of Internet penetration in the region will be determined by the efficiency of new players, which are challenging long-dominant providers, and the extent to which these will be able to offer broadband access at rates that can be afforded

in countries that are poor. Caribbean media houses increasingly provide web-based versions of their output. This is generally limited to repurposed content by newspapers, and radio and television broadcasters. However, in some instances the content is continuously updated (→ Online Journalism). There is also an increasing number of web-only media – mainly newspapers – produced mostly by and for the Caribbean diaspora in North America and Europe (→ Online Media).

## MEDIA TRENDS

Newspapers, which have been the traditional media in the Caribbean, have been forced to change their business and editorial operations to deal with increasing competition from broadcast media. The rapid changes in technology, combined with liberalized state policies, have put newspapers in direct competition with other – mainly electronic – media (→ Information and Communication Technology, Development of). Except in Cuba, the changes in the region's media industry have significantly removed governments as major players in the industry. Media are being managed not as a public good being delivered by the state, but as private business. The financial framework has changed from state subsidies to accountable profits.

Caribbean newspapers were at the vanguard of these changes, and were influenced by what Grant-Wisdom (1995) saw as a consequence of a shift in the use of capital for activities, and the search for “strategic partnerships” in business. Consequently, the region's newspapers were followed by electronic media houses in moving from being unique business ventures to becoming wider media enterprises that benefited from an economic scale of production that enhanced their chances of survival in an increasingly competitive environment (→ Media Conglomerates).

This tendency for newspapers – and subsequently electronic media – in the Caribbean to seek linkages that could widen their markets was evident more than two decades ago. Brown and Sanatan (1987) observed that in the late 1980s the ownership of newspapers in the region was primarily private, and that this was a consequence of traditional links between advertisers and early newspaper development in the region. They said that the tendency toward concentration in the print sector was “observable,” and noted: “There is a cluster effect in newspaper management and plant operations. In Trinidad and Tobago, the *Express* is linked with the *Nation* in Barbados. These newspapers have been helping the weeklies in St Vincent, Dominica and formerly in Grenada” (→ Concentration in Media Systems).

The *trend toward linkages* has gathered pace across the region, leading to significant convergence in media businesses. This has been driven by increasing competition, which has brought about mergers and acquisitions as media businesses tried to survive by being more efficient. This has reflected developments in media in other parts of the world. However, the driving forces behind these changes, and the need to create entities that can benefit from economies of scale, as suggested by McChesney (2001), have been particularly important to Caribbean media because of the small markets in which they operate, and the increasing commercial competition that has accompanied the liberalization of the industry.

There is, for example, the case of *Listín Diario* of the Dominican Republic, which began at the end of the nineteenth century as a daily listing of the arrival and departure of merchant ships. It became a national daily and, after being closed because of political turmoil in the

country, re-emerged in 1967 as the centerpiece of the Grupo Listín de Communications, publishers of other newspapers, including *El Expreso*, *Ultima Hora*, and *El Financiero*. It soon after was acquired by Grupo Intercontinental, a major financial services conglomerate, and was expanded to include 4 television stations and 70 radio stations (James 2003).

The Caribbean Communications Network of Trinidad and Tobago, owner of the *Express* newspaper and the TV6 television network, holds a majority interest in the Grenada Broadcasting Network along with minority interests in other Caribbean media companies. The Nation Corporation, a privately held company, is the owner of the *Nation* newspaper and Starcom Network radio stations. Caribbean Communications Network Limited and the Nation Corporation agreed in 2005 to merge their operations to create a publicly owned regional media company called One Caribbean Media.

## **Caricature**

*Thomas Knieper*

*Technical University at Brunswick*

A caricature is an exaggerated and distorted image of a person or thing, which is characterized by visual likeness, immediate recognizability, and pictorial wit, irony, or satire (→ Visual Representation). This visual burlesque can be insulting or complimentary. It is not uncommon that a caricature offends the sensibilities of a depicted person.

Caricatures can serve editorial, illustrative, entertainment, or commercial purposes, as part of political cartoons, illustrations for books and articles, standalone artwork, or use in publicity and advertisements (→ Advertisement, Visual Characteristics of; Book; Cartoons; Political Communication). Caricatures can be standalone drawings or well-integrated depictions in a broader context. For example, caricatures of politicians can be one part of an editorial cartoon that comments on a political issue (→ Political Media Use).

## HISTORY OF CARICATURE IN EUROPE

Etymologically the word “caricature” originates from the Italian verb *caricare*, which means “loaded” or “overloaded,” and the Italian noun *caricatura*. The word *caricare* first appears in Italy around 1600, at the time of the rise of the artistic genre *ritrattini carichi* (exaggerated pictures). In a preface to the 1646 published collection of etchings of the drawings of Annibale Carracci (before November 3 1560–1609), it was pointed out that Carracci had employed *caricare* for sketchy, satirical, and exaggerated portrait drawings. Carracci’s fundamental idea was that in nature there is nothing like perfect beauty or total ugliness. From his point of view, perfect objects could only be created artificially by artists. For absolute ugliness the existing features must be exaggerated. In the sense used by Carracci, caricatures are simply drawings where quirks or imperfections of nature are highlighted and accentuated rather than corrected or idealized.

The art of *caricatura* was further developed by Gianlorenzo Bernini (1598–1680). Aside from the external appearance of a depicted person, it was important for him to expose internal characteristics of personality or temperament. The intention behind this approach was not only to exaggerate unusual or unattractive features but to make the depicted person seem ridiculous. During his occupation at the court of Louis XIV in 1665, Bernini introduced the term *caricature* to France. At the time, there was no conceptual equivalent for this term, which was translated into the French as *portrait chargé*. In the middle of the eighteenth century, the term *caricature* became popular in French.

In England the first definition of *caricature* appears in the *Bibliotheca abscondita* in 1686. Here, caricature was described as portraits of human faces using animal heads. In the middle of the eighteenth century there was a dispute over whether or not caricature satisfies artistic demands and quality criteria (→ Art as Communication). William Hogarth (1697–1764) described caricature as “scrawniness.” In 1743 Hogarth published his famous print “3 Characters – 4 Caricaturas” to illustrate the difference between proper portraits and “scribbling.” This dispute seemed to fade with the publication in 1813 of J. P. Malcom’s *An historical sketch of the art of caricaturing*, a compilation of caricatures that defined the nature of the art. From this point caricature is a term used widely for all depictions of persons employing exaggeration or deformation. In the second half of the eighteenth century caricature became the generic term for political, curious, emblematic, and comic → prints.

The evolution of the term *caricature* has followed a circuitous route. For Carracci, caricature was an exaggerated depiction of individual physiognomic characteristics. For Hogarth caricature was a flawed rendering of a grotesque illusion. For both, caricature was the selective depiction of isolated individual physiognomic guises and features, normally limited to the face and head. They were drawings that exaggerated the unique mental, physical, and other discernible characteristics or features of a person (Unverfehrt 1984).

Caricatures gained popularity among the upper class with broadsheets circulated for distraction and enjoyment among aristocratic circles in France and Italy (→ Printing, History of). It was a kind of honor to be depicted. And it was considered a pleasant pastime to view the exaggerated drawings. In Britain this kind of amusement also became popular around the middle of the eighteenth century. The rise of caricature as a genre is closely connected to some noteworthy artists. English artists Thomas Rowlandson (1756/7–1827), James Gillray (1757–1815), and George Cruikshank (1792–1878) played important roles. Rowlandson's early portrait drawings were strongly influenced by John Hamilton Mortimer (1740–1779). Around 1780 his watercolors became more socially conscious and humorous. After the publication of his etchings in 1784, Rowlandson turned increasingly to illustration and caricature. With Dr Syntax, a fictitious figure he invented at the beginning of the nineteenth century for the publisher Ackermann, he drew the first English “cartoon” character (Bryant & Heneage 1994, 185–187).

Like Rowlandson, James Gillray was influenced in technique and style by Mortimer. From 1786 he devoted himself to caricature exclusively. Gillray is renowned for his depictions of William Pitt the Younger (1759–1806), British prime minister from 1783 to 1806. Gillray's most famous etching and best-known political print is “The Plumb-pudding in danger,” which shows Pitt and Napoleon Bonaparte carving up a globe to divide the world between them (Bryant & Heneage 1994, 90–92). George Cruikshank was the son of the caricaturist, illustrator, and painter Isaac Cruikshank (1764–1811), who taught him to draw and etch. Cruikshank published his first caricature in 1806. He was especially famous for ridiculing George IV. However, in 1821 he abandoned caricature for straight illustration (Bryant & Heneage 1994, 50–51).

In France, painter, sculptor, and lithographer Honoré Daumier (1808–1879), perhaps the greatest social satirist of the nineteenth century, produced over 4,000 lithographs designed to comment upon and satirize social and political conditions in France and Europe. Appreciated as cartoons by his contemporaries, these prints are now considered masterpieces by many. A good deal of Daumier's work was published in the magazines *La Caricature* and *Le Charivari* between 1830 and 1835 (→ Magazine, History of; Picture Magazines). In 1832 his caricature of King Louis Philippe (1773–1850) as Gargantua led to six months imprisonment. After *La Caricature* was suppressed, his work appeared in *Le Charivari*, where he used a realistic graphic style to satirize and ridicule the bourgeois society of his day. In the later years, after 1848, he painted watercolors on the subject of jurisprudence. His visual skits about the Courts of Justice are well known. In old age, he went blind and died impoverished.

### POLITICAL CARTOONING IN THE US

The German emigrant Thomas Nast (1840–1902) carried the tradition of caricature and political commentary to the United States (see Figs 1 and 2). At the age of 15, Nast was discovered by the publisher Frank Leslie. Subsequently, his work appeared in the weekly magazine *Frank Leslie's Illustrated Weekly Newspaper*. He joined Leslie's struggle against the so-called “swill milk scandal” and experienced the power of the press for the first time. After three years Nast became a freelance for magazines such as *Harper's Weekly*, the *Sunday Courier*, and the *New York Illustrated News* (→ Illustrated Newspapers; Newspaper;

**Figure 1** A caricature of Thomas Nast, one of the greatest caricaturists ever, by Milt Priggee. If you look closely at the figure, you will see a penguin on Nast's lap. This is a homage to Pat Oliphant (1935–), an outstanding contemporary American editorial cartoonist, who invented the penguin character called Punk

Newspaper, History of). As a sketch artist/correspondent for the *New York Illustrated News*, he accompanied Giuseppe Garibaldi's troops in Sicily for four months in 1860, contributing sketches to newspapers in Britain, France, and the US. In 1861 he returned to the US, having improved his drawing technique. After the outbreak of the Civil War, Nast was employed as a sketch artist/reporter by *Harper's Weekly*. In 1864 he supported Abraham Lincoln's presidential campaign with his drawings. His cartoons attacking President Andrew Johnson in 1866 established his reputation as an exceptionally talented caricaturist and editorial cartoonist. During his artistic career Nast invented some of the familiar encodings still in use in the US today: for example, the Democratic Donkey, the Republican Elephant, and Santa Claus. He was also famous for his aggressive and sometimes offensive cartoon series about William Marcy "Boss" Tweed (1823–1878) and

Figure 2 Another Milt Priggee caricature of Thomas Nast

the New York City political machine, as well as his anti-immigrant and racist depictions of Irish famine refugees. In the end Nast's drawings were responsible for the cessation of the political career of Tweed.

### MODERN CARICATURES

In the twentieth century the number of caricaturists working for newspapers and magazines, as well as creating books, comics, and animated cartoons, multiplied with the scale and reach of mass produced media (→ Animation; Comics; Media History). Milt Priggee (1953–) was encouraged to become a caricaturist and editorial cartoonist by his mentor and Pulitzer Prize-winning cartoonist John Fischetti (1916–1980). In his career Priggee has worked for the *Chicago Tribune*, the *Chicago Sun-Times*, the *Chicago Daily News*, and the *Spokesman-Review*, among other media. Americans such as Al Hirschfeld

**Figure 3** A Milt Priggee caricature of Al Hirschfeld, who was famous for his caricatures of Hollywood and Broadway stars, as well as other celebrities

(1903–2003; see Fig. 3), David Levine (1926–), Taylor Jones (1952–), and Christopher Fox Payne, alias C. F. Payne (1954–), as well as Austrian Erich Sokol (1933–2003), the British Gerald Scarfe (1936–), the French Jean Mulatier (1947–), the Italian Tullio Pericoli (1936–), Swedes Ewert Karlsson, alias EWK (1918–2004), and Riber Hansson (1939–), and Germans Dieter Hanitzsch (1933–) and Bernhard Prinz (1975–) enjoyed long and distinguished careers and contributed to the establishment of caricature as a routine practice in western culture.

Some of them, such as EWK, Hanitzsch, Hansson, Priggee, and Sokol, are not only famous for their caricatures but for their editorial cartoons. Dieter Hanitzsch pioneered animated editorial cartooning. Hanitzsch began his career as head of advertising at the Paulaner Brewery. As an editor for the economics section at a public broadcast station, he regularly produced cartoons and caricatures. In 1985 Hanitzsch became a full-time cartoonist for the German quality paper *Süddeutsche Zeitung* and other print media (Fig. 4). Together

Stellvertreter-Krieg

**Figure 4** Dieter Hanitzsch. This cartoon appeared with the caption “War of the substitutes.” After eight years of war, on August 20, 1988, there was an agreement to a ceasefire between Iran and Iraq. Before this armistice the US supported Saddam Hussein’s Iraq (including the approval of attacks with toxic gas). The former USSR supported Iran. In the cartoon, President Ronald Wilson Reagan (1911–2004) of the US and Soviet President Mikhail Sergejevich Gorbachev (1931–) ask each other which substitutes they should use next

with the renowned journalist Herbert Riehl-Heyse (1940–2003), Hanitzsch invented the virtual conservative Bavarian politician “Max G. Froschhammer.” This cartoon character comments on weekly political events in Germany and Bavaria. First run as a weekly comic strip in the *Süddeutsche Zeitung*, this political satire is now broadcast as an animated cartoon by *Bavarian television* (→ Television; Television as Popular Culture).

**Figure 5** Riber Hansson. This editorial cartoon showing “Bush almighty” shows that caricature often is a supporting element of a political cartoon. In his term of office as 43rd president of the United States, George Walker Bush (1946–) sees himself as Superman. With pleasure and in love with himself, he is watching the mightiest man on earth – himself – in the mirror. Using the American flag as a bath towel indicates that he will most likely leverage the legacy of presidency. He is neither indebted to the American people nor to his voters but to himself only. At least, he seems to feel this way. Bush knows that he has the power and he will use it for his own agenda

Drawings by Riber Hansson were published in Swedish papers like the *Svenska Dagbladet* and the *Sydsvenskan*. Furthermore, his cartoons were reprinted in *Courier International*, *NRC Handelsblatt*, and many other papers around the world. His work is represented in the National Museum of Art in Stockholm, the Swedish Library of Parliament, and many cartoon museums (Fig. 5).

By the twentieth century, caricature had come to be associated most often with political or editorial cartoons, visual frames, or opinion columns using unique tools like caricature, exaggeration, transformation, symbolism, narration, composition, design, and visual juxtaposition to construct ironic and satiric commentary (→ Design; Graphic Design; Symbolism). Editorial cartoons are filtered through the prism of the creator's perspective, imagination, and artistic preferences. Therefore, any editorial cartoon will show an issue from a particular point of view, which may shift the balance of debate and provoke thoughts that range from anger to whims. Editorial cartoons not only have the right but also the liability to be painful, cynical, and provocative. In some respects, an editorial cartoon is nothing but a graphic sledgehammer.

However, *caricature* and *cartoon* are not the same. A caricature is an exaggerated depiction of a particular person, characteristic, or thing and so can be a component of any cartoon. As such, caricature is a potential but not essential part of any cartoon.

# Cartography

Jacqueline Naismith

Massey University

Cartography is the visual representation and communication of data, geospatial information, and relationships in the form of printed and digital maps. The form of the map and the visual systems of map-making are determined by technologies of production and reproduction. The mass reproduction of maps has encouraged the dissemination of geospatial information, statistical data, and shared cultural and scientific understandings throughout history (→ Statistics, Descriptive).

Maps as historical documents provide evidence of worldviews, cultural values, relationships, and representational practices at specific moments in time. Cartographic history encompasses the changing forms of the map as artifact. Ptolemy's *Geographia* (2nd century AD), for example, records ancient Greek geographical concepts, and established conventions for representing geographic concepts including latitude, longitude, and north orientation. Mercator's (1569) projection became a well-understood way to translate the globe to a two-dimensional chart (Harley & Woodward 1987).

Design processes for mapping data include reduction/simplification, scaling, projection (converting three-dimensional data into two-dimensional representations), symbolization (→ Symbolism), assemblage, and execution. These require systems of graphic and geographic conventions, including design elements and symbols (points, lines, areas, text, and color), hierarchies, and layers of information (MacEachren 1995; Wood & Keller 1996; → Sign Systems; Perspective, Pictorial).

In the twentieth century cartography has been positioned as a science and an art of communication (→ Art as Communication). The lineal model of communication placed an early emphasis on scientific efficiency. A shift of research attention by the 1970s to the map user and the nonlinearity of visual information processing saw both visual cognition and → semiotic theory playing an important role in cartographic research and practice (Salitchev 1983). The rise of geographic information science (GIS) and geospatial computing in the 1980s concentrated attention on cartographic visualization processes and products in new technological environments. Early twenty-first-century research agenda have included map user experience and design issues in interactive, multimedia, web-based, mobile telecommunication devices and virtual cartographic environments (→ Graphic Design).

A wider interdisciplinary concern with cartography and mapping in the later twentieth century has examined the cultural and constructed nature of the map as representational text (→ Visual Representation). The concept and process of mapping is a mode of visual language and thinking equivalent to writing that enables a visual and spatial representation of abstract ideas, relationships, and understanding. Maps are thus understood as constructed texts, which interpret and present data in accordance with defined communication objectives and audiences (Crampton 2001; Harley 2001).

The cartography literature groups maps into *two broad categories*: topographical maps and thematic maps. Salitchev (1983) identifies three main uses of topographical and thematic maps: communicative use (i.e., storage, display, and dissemination of data);

operative use (i.e., geographical management or navigational uses); and cognitive use (i.e., space–time investigations and visual display of phenomena).

*Topographical maps* and charts aim to construct an accurate symbolic representation of what exists in physical geographical worlds. Sometimes also described as general or reference maps (Robinson 1982), topographical maps rely on the quality of survey and other geographic data for accuracy of positions and relationships. Graphic symbols used in topographic maps include points, lines, areas, and text. The growth in production of topographic maps is associated with exploration and global discoveries in the sixteenth and seventeenth centuries; the invention and expansion of technologies of visual reproduction; the progressive advance of data capture and survey technologies; the worldwide military demand for geospatial information; and the subsequent expansion of empires and shifting national boundaries.

*Thematic maps*, also called data maps (Tufte 1983), visually represent all kinds of geographic, political, social, cultural, and economic data and relationships. Graphic symbols and conventions are used to represent the characteristics, patterns, distributions, differences, and changes over time of these phenomena, which include for example populations, routes, territories, and resources. The thematic map in the twentieth century has developed following the growth of quantitative geography and the production of geospatial data; the need for the visual presentation of scientific information; the development of statistics; the growth of information design; applied semiotics; and the centrality of the visual as the late twentieth-century mode of communication (→ Visual Communication).

Since the advent of printing technologies enabling visual reproduction, maps have been produced for dissemination as a reference authority (→ Printing, History of). Cartographic design and production bear a close historical relationship to both the technologies of visual reproduction and those of data capture. Reproduction technologies have included hand drawing; intaglio printing methods; photographic, photolithographic, and digital printing processes; and now screen-based media.

GIS (geographic information systems/science) have precipitated significant shifts in the production, function, dissemination, and uses of maps. These technologies have enabled network distribution, database linkages, interactivity, and new modes of visualization. The term *cybercartography* describes the intersection of geospatial visualization with digital and remote sensing technologies (Taylor 2005). Accompanying the rise in the technological expansion of cartography through GIS has been an interest by critical social theorists in the social and political implications of these technologies.

## Cartoons

John A. Lent

*International Journal of Comic Art*

Cartoons can be simply described as humorous drawings, separated into political or editorial, which use → caricature, humor, and satire to comment on current affairs and influence → public opinion, and social or gag, which poke fun at daily life and its problems or merely illustrate jokes. Although political cartoons normally are found in daily → newspapers, where they often support editorial views, they have also appeared in → magazines, on → television, and as broadsheets and → posters. Gag cartoons typically are in general interest magazines, some of which (e.g., *Saturday Evening Post*, *Collier's*, *Esquire*, and *New Yorker* in the US) were famous for them, and in cartoon/humor periodicals (most notably, the long-lived *Punch* of the UK and *Mad* in the US).

The lineage of cartoons is long. Some early examples include Bishop Toba's humorous scrolls kidding Japanese religious and government leaders a millennium ago; the satirical prints of England's William Hogarth, James Gillray, George Cruikshank, and Thomas Rowlandson; France's Honoré Daumier and others who published in *Caricature* and *Charivari* in the eighteenth and nineteenth centuries; and the colonial unity drawings of Benjamin Franklin in the 1740s–1750s. Because of its often loose definition, the cartoon can include some of Pablo Picasso's abstract works, Francisco Goya's drawings entitled "Disasters of War," or Käthe Kollwitz's war and poverty paintings.

Besides amusing, cartoons serve multiple purposes worldwide, including social consciousness raising (notable examples being AIDS awareness cartoons, existing especially in Africa), education, instruction, and → propaganda, the latter particularly evident during wartime (→ Propaganda in World War II). In late 1930s China, a roving band of 10 or 11 cartoonists drew anti-Japanese cartoons on banners, posters, and elsewhere, warning the Chinese of the invaders. During World War II, the Japanese military dropped cartoon leaflets on Allied soldiers in an effort to demoralize them. During the same period, the US had a cartoon bureau within the War Department for similar propaganda purposes.

*Politically*, the cartoon has been universally effective and, at the same time, vilified. In the US, the drawings of Thomas Nast in the 1870s were credited with helping to bring down the corrupt New York City government, while more recently, Herb Block's caricatures of Richard Nixon were so devastating that Nixon felt he had to "erase" them before proceeding with his political ambitions. Elsewhere, officialdom, extremely wary of the potential impact of cartoons, have killed cartoonists (as in Vietnam, Argentina, Algeria, and other parts of Africa), threatened them with death (Ríos in Mexico, Alberto Breccia in Argentina), arrested them (Kim Song Hwan in South Korea, Zapiro in South Africa, Gado in Kenya), forced them into exile (as in Burma and parts of Africa), and imprisoned or otherwise stopped them from drawing for decades (Ding Cong, Liao Bingxiong, Wang Fuyang in China, Sibarani in Indonesia). In authoritarian states, such as Nazi Germany, the former Soviet Union, formerly Kuomintang-controlled Taiwan, and Lee Kuan Yew's Singapore, cartoonists were pigeonholed to serve the state. In the USSR, for example, two types of cartoons were permitted – *druzherskii sharzh* (celebratory of the state) and *karikature* (negative toward the west; → Violence against Journalists).

Home to both political and gag cartoons, the humor and cartoon magazines have also been around for a long time and have flourished under all types of regimes. In the Soviet Union, *Krokodil* was one of the highest-circulated periodicals, and *Dedeté* and *Palante* in Cuba were also favorites until economic woes destroyed them. China still has *Humor and Satire*. While the US has had venerable humor/cartoon magazines in the past (*Puck*, *Judge*, and *Life* in the latter nineteenth century; *National Lampoon* and *Mad* in more recent times), this is not the situation today. The UK's long-lived *Punch*, itself an institution, is also deceased. On the other hand, Malaysia, Turkey, and Tanzania each nurtures between 6 and 15 such periodicals at any given time, and other successful humor/cartoon magazines publish in France (*Le Canard Enchaîné*), Francophone Africa, Iran, Mexico, and elsewhere in Latin America.

Cartoons, especially political, face a number of challenges, even in the US, where they have had a fruitful stay. At the beginning of the twentieth century, US newspapers and magazines employed 2,000 fulltime cartoonists; the number is under 140 now. Fewer than 90 dailies have their own cartoonists, and papers such as the *Los Angeles Times*, *Chicago Tribune*, and *Baltimore Sun* have either dropped or not replaced their cartoonists. Increasingly, US dailies, and newspapers elsewhere, depend upon syndicated cartoons, thus depriving readers of visual commentary on local issues. Also, publishers worried about possible litigation have steered their cartoonists to draw gag rather than serious cartoons. Other problems plaguing cartooning are competition from other media for the readers and the demise or merging of dailies, which deprive artists of outlets. Furthermore, cartoonists are confronted by heightened levels of self-censorship on the parts of editors, who are fearful of stepping on the corporate interests of publishers or alienating minorities in an age when political correctness has run rampant. Widespread use of the → Internet is another problem cartoonists face because it necessitates the rethinking of how cartoons are created and distributed.

Like comics, the cartoon has reinvented itself in recent years, adapting to new technology and new norms. Many aspiring cartoonists have entered the field through Internet websites. Alternative cartoon periodicals, either printed or online, have appeared at an unprecedented pace and in unexpected places, and more explicit content has

become usual where hitherto it was highly frowned upon. These are all indications that the cartoon will endure and continue to amuse, inform, and persuade.

## **Case Studies**

*Andreas Hepp*

*University of Bremen*

While the term “case study” (or “case method”) is widespread in social methodology and media research, it is nevertheless a complex concept. McCartney (1970, 30) defines a case study as “a descriptive report analyzing a social unit as a whole (e.g. individual, family, organization, etc.) in qualitative terms.” With a different focus but in a comparable manner, Robert K. Yin defines a case study as “an empirical inquiry that investigates a contemporary phenomenon within its real life context, especially when the boundaries between phenomenon and context are not clearly evident” (Yin 1994, 13).

In the case of working definitions like these, three main aspects become evident. The first is realizing that a case study is not a methodological choice of data collection and analyses but a choice of what is studied. A case study can combine completely different methods (qualitative and quantitative ones; → Research Methods) and analytical approaches, but is defined by the circumstance of focusing on a case (or a number of cases) and is especially established in qualitative media research (being also the main focus of this entry). Second, the term “case study” is rather vague as it can name either the process of doing research or the presented result. And, third, a main problem when doing case studies is the construction of the case borders.

## NATURE AND TYPES OF CASE STUDIES

All in all, case studies can be located in the tradition of quantitative as well as qualitative (media) research (Baur & Lamnek 2005, 241f.). Within *quantitative (media) research* case studies are considered as “exploratory research” (→ Quantitative Methodology). Based on this, further standardized research should be undertaken. The argument is that a higher number of cases allows more general conclusions than focusing on only one case (→ Generalizability). A more sophisticated understanding of case studies – which is outlined in this entry – is established in *qualitative (media) research* (→ Qualitative Methodology). One can argue that each qualitative study is based on “cases” in the sense that an engagement with contextualized social phenomena is the foundation of qualitative research per se. Beside that, a more concrete understanding of the case study grasps research investigating specific cases separated from one another. The aim of these studies is either the “thick description” (Geertz) of a case or case research with the aim of making general (theoretical) conclusions.

Systematizing case studies, Robert E. Stake (1994, 437) has proposed to distinguish *three types of case studies*: (1) intrinsic, (2) instrumental, and (3) collective case studies. An *intrinsic case study* is undertaken because the researcher wants a better understanding of this particular case; the purpose is not theory building. An *instrumental case study* analyzes a particular case to provide insight into a more general issue or to redraw a generalization. The *collective case study* focuses on different cases to investigate a general phenomenon; in this sense, it is an instrumental study extended to several cases.

## THE CASE STUDY IN QUALITATIVE METHODOLOGY

Focusing on case studies within the tradition of qualitative methodology, at least four aspects appear to be striking: (1) the history of case studies, (2) the problem of case definition, (3) the way case studies are undertaken, and (4) the question of generalization and theorization. While the considerations in this section address case study research in general, the examples are taken from media research or related to it.

First, focusing on the *history of case studies*, it becomes obvious that the case study approach has its foundations in the beginning of (modern) social and cultural research. Between the 1920s and 1950s it was already usual to contrast the “case study method” (the qualitative approach) with the “statistical method” (the quantitative one) (Platt 1992, 19, 41). Especially in the early days of American sociology, the case study approach was linked with the Chicago School, focusing on the personal meanings of people “involved” in a case. Locating media research in the wider context of social and cultural science, different classical work was undertaken as case studies; for example, the work of Elihu Katz and Paul Lazarsfeld or that within the Frankfurt School tradition. After a certain lack of interest in the late 1950s and 1960s – caused by a number of reasons, among them a fragmentation of the case study approach into different “qualitative research methods” – there is again increasing interest in case studies, especially in the context of theory formation (Glaser & Strauss 1967; → Grounded Theory) and of policy/consultancy work (Yin 1994).

Second, each case study is confronted with the *problem of defining a case*. “Cases” can either be “single persons” (for example, the case of an interview partner) or – more usually – “social

aggregates” or “cultural phenomena” like (media) organizations, (media) products, media events, interpretative communities, socio-cultural processes, etc. Especially when focusing on more complex cultural phenomena, each case study is confronted with the problem of demarcating “case” and “context.” As a case interacts with its context, it is not possible to make a clear distinction (Baur & Lamnek 2005, 244). Rather the “case” builds a kind of center for describing further contextualizing forces, which themselves take part in articulating the case. This aspect has a deep relation to methodological discussions in audience studies (→ Audience Research), where an ongoing contextualizing of media reception was criticized for loosening “the case” of specific reception practices or interpretative communities in a more general view on the everyday and its contexts (→ Cultural Studies).

Third, current methodological publishing focuses particularly on *organizing case studies*. Undertaking case studies in a more focused sense is at least in two points different from other procedures in qualitative (media) research. Concerning case selection, two approaches can be distinguished (Stake 1994, 446). While “intrinsic case studies” begin with an already identified case (based on a striking feature or – in commercial media research – on a research mission), in “instrumental” and “collective” case studies, normally the cases are selected by the researcher. This can either be done in a theory forming/inductive frame (Glaser & Strauss 1967) or in deductive relation to a theory that defines specific cases and needs to be tested/differentiated (Platt 1992, 45; Yin 1994). In all of these approaches, case studies are oriented on a research question, anchoring the case study research in the perspective of a specific academic discipline (Stake 1994, 440). Further, arranging case studies is based on the → triangulation of different methods. As case studies are not defined by a specific procedure of research but by a specific focus on a case, very different methods of “data collection” and “data analysis” are combined in current case studies. Nevertheless, these different methods are used in a qualitative frame as far as the aim of the case study is a (more) differentiated understanding of the specific case(s) and theory formation (Krotz 2005). This is typical for case studies in media research, too, where it is common to triangulate very different methods either for a more “thick description” of the case or for a more sophisticated theoretical conclusion.

A final point that is important for a general understanding of case studies in the tradition of qualitative methodology is the discussion about *generalization and theorization*. As already discussed, case studies are both descriptively and theoretically oriented. The argument is either to focus on something particular – an approach whose relevance is justified by the widespread neglect of the particular in (media) research – or to undertake research for a “grounded” way of theory formation/testing, which cannot be undertaken in another manner. Irrespective of in which approach case studies are oriented, in current qualitative methodological discourse they are understood as a procedure of their own: not functioning as a kind of “exploratory research,” whose “range” and “generalizability” has to be proofed by quantitative/standardized studies with a wider main unit, but as a kind of research to produce also generalizable and theoretical knowledge that cannot be achieved in any other way.

### **“CASE STUDIES” IN CURRENT MEDIA RESEARCH**

As the discussed examples show, case studies are common in current qualitative media research. Especially when focusing on audience studies and appropriation research, it

becomes obvious that a lot of far-reaching research focuses on specific cases in detail (→ Cultural Appropriation). For example, Herman Bausinger's classical considerations on the relation between media, technology, and everyday life are based on the research of one case, the family Meier (→ Domestication of Technology). Studies on the cases of different social groups are also the reference point of other early research on media appropriation, especially in the tradition of gender studies (→ Audience; Audiences, Female). But also, current efforts to argue for a more comprehensive cultural studies orientation in media research are especially oriented on cases along the "circuit of culture." Most of these studies are not "intrinsic case studies" but focus on specific cases as a starting point for (theoretically oriented) research. In doing so, they show the outstanding significance cases have for qualitative media research: research in that tradition takes up with (a number of) single cases and has the aim of investigating these cases as exhaustively as possible to make their meaning structures and patterns accessible for further, critical theorizing. For this, the data sample of research is not defined in advance but in the process of researching these cases (→ Sampling, Nonrandom; Sampling, Random), and qualitative data can be combined with quantitative.

Three tendencies in the use of case studies in current qualitative media research can be observed. First, the *potential of case studies* was underlined during the past decade, especially by research on media events integrating qualitative and quantitative data (→ Historic Key Events and the Media; Media Events and Pseudo-Events). Media events show exemplarily how far our present media cultures are marked by outstanding incidents (9/11, Live 8, public funerals, etc.), which demand detailed analyses. Research like this is not just a description of something exceptional but an important foundation to understand our increasingly mediated presence.

Second, in all, one can ascertain a *theoretical orientation* in current case studies within qualitative media research. While there may be "intrinsic" motivations for researching specific cases – like outstanding media events – such research is especially undertaken to make more general conclusions or for theory formation (Krotz 2005). One can understand this as an indicator of an increasing theoretical discourse in media research, which lies beyond the deductive/hypothesis-testing paradigm of much standardized media research and is more aimed at material-based enhancements of theoretical discourse (→ Hypothesis). This is the point where media and cultural theory meet each other.

Third, while case studies are a general moment of qualitative media research, a remarkable number of them understand research on specific cases – and not along predefined categories and samples – as a way of *critical reflection* (→ Critical Theory). The underlying idea of this argument is that case studies make it possible to bring into academic discourse "voices" and "particularities" that are normally excluded in media research. The critical potential of case studies, then, lies in the trajectory of taking specificities seriously while still contextualizing them in wider connections like power relations. These three points show that case studies are an inherent part of current media research. In this, an "intrinsic" orientation on specific cases is increasingly combined with a critical focus on theory development.

## **Catharsis Theory**

*Sonja Glaab*

*Brown University*

Catharsis theory has played an important role in the discussion about the effects of violence in the mass media for many years (→ Violence as Media Content, Effects of). The term “catharsis” is derived from the Greek *katharsis* which means cleansing, purging, or purification. In the form the theory is used in communication research, it implies that the execution of an aggressive action under certain conditions diminishes the aggressive drive and therefore reduces the likelihood of further aggressive actions. The crucial point in catharsis theory is that the observed aggressive action does not necessarily need to be executed in reality – it can instead take place in the actor’s fantasy or in the media (symbolic catharsis).

Seymour Feshbach, key proponent of the catharsis theory in communication research, distinguishes between three conceptions of catharsis: the Dramatic, the Clinical, and the Experimental models. The Dramatic model goes back to Aristotle who used the term “catharsis” in his *Poetics* to describe an effect of the Greek tragedy on its spectator: by viewing tragic plays the spectator’s own anxieties are put outward and purged in a socially harmless way. The spectator is released from negative feelings such as fear or anger. Aristotle’s definition of catharsis is not precise and therefore was interpreted in various ways.

The Clinical model is based on the work of psychoanalytical researchers, e.g., Josef Breuer and Sigmund Freud, who assumed the existence of an inherent aggressive drive as well as a correlation between repressed negative emotions and psychological symptoms. To treat these symptoms, they used a new therapeutic method, the catharsis method, whereby patients were encouraged to relive the situations that had given rise to their repressed feelings. By talking about them under hypnosis patients' tension was reduced and they were cured of their psychological symptoms. The term "catharsis" was used to describe the effect of the abreaction of repressed emotions.

The Experimental model can be traced back to the work of John Dollard and his colleagues, who defined catharsis in the context of the → frustration aggression theory as the reduction of aggression caused by the expression of any act of aggression. Here the catharsis was restricted to aggression catharsis.

Since the 1950s various experiments have been performed on the reduction of aggression by phantasm or by vicarious aggression in witnessing violence on → television (→ Violence and the Media, History of; Violence as Media Content). One of the researchers was Seymour Feshbach, who introduced the concept of catharsis to media effects research (initially as a combination of the Experimental and Clinical models). As the findings of most of the studies did not support the catharsis theory, but rather showed contrary effects (→ Bandura, Albert), the theory was modified. It was argued that a catharsis could occur only if the recipient was emotionally aroused or aggressive, otherwise stimulating effects were expected. Other variations of the catharsis theory consider the content of the perceived aggressive action, perception of the consequences of the aggressive action, the participation of the viewers in the plot, or identification with the actors. The empirical evidence for all variations is weak.

Research results on catharsis were often called into question. First, methodological aspects were criticized, e.g., the suitability of the stimulus material used, particularly in the early studies where whether the stimulus shown was perceived as aggressive by the viewers was not controlled. The stimulus material often consisted of a film lasting a few minutes, which might have been too short for evoking a catharsis. The measurement of aggression of the test subjects before the experiments was often disregarded as well as the measurement of the subjects' involvement in the films shown. Another central point of discussion was the measurement of aggression itself, especially the question of how to measure the motivation to aggression and the strength of the aggression drive. In the context of laboratory experiments a problem was how to annoy the test subjects and to provoke their aggression.

Second, research on catharsis theory was criticized on the level of content, e.g., the interpretation of a measured decrease of aggression after the watching of vicarious aggression as a symbolic catharsis. Several researchers interpreted these findings as a result of the inhibition of aggression due to aggression anxiety caused by watching violent actions. Feshbach's later reference to Aristotle was often seen as inadequate because his conception of an aggression catharsis differs immensely from Aristotle's conception of catharsis.

Third, on a theoretical level it was questioned why a reduction of aggression drive should have reductive rather than reinforcing effects on the likelihood of further aggressive actions.

After the discussion about the validity of the catharsis theory and the lack of empirical evidence (which went on for several years), most researchers conclude today that the

catharsis theory is obsolete. Others, like Berkowitz, one of the main critics of the catharsis theory, state the existence of “results which definitely suggest that a catharsis process has occurred – under limited circumstances” (Berkowitz 1993, 348). Today, there is still ongoing research on the catharsis theory, for example, in the context of violent computer games or song lyrics (Anderson et al. 2003), and the idea of aggression catharsis is still popular among nonscientists (Bushman et al. 1999).

## **Celebrity Culture**

*Jill Caravelli*

*University of Illinois at Chicago*

Perhaps the most rapidly expanding facet of today’s media landscape is celebrity culture; entertainers’ work in the film, television, music, and fashion industries accompanies gossip about their personal lives in → magazines and → newspapers, on → television, and online (→ Internet). The major players in celebrity culture are known worldwide – today, there are few who do not know of American actors Angelina Jolie and Brad Pitt, English power couple Victoria and David Beckham, Australian singer Kylie Minogue, or Brazilian supermodel Gisele Bündchen (→ Stars). The ability of celebrity culture to cross national and cultural boundaries as well as media outlets has made it an important issue in communication studies.

The analysis of celebrity culture began in the 1940s with Lowenthal's (1944) content analysis of magazine biographies (→ Content Analysis, Qualitative), which traced a shift in focus from "idols of production" (politicians and businessmen) to "idols of consumption" (entertainers). Though the idols of consumption have remained the center of celebrity culture, communications researchers have broadened their studies to explore the types and purposes of celebrity, celebrity media, and audiences' relationships with celebrity culture.

### CELEBRITY TYPOLOGY

Attempting to categorize and describe the various types of celebrity has been a part of studying celebrity culture since Lowenthal (1944) initially distinguished between the idols of production and consumption. Researchers have often studied a celebrity's line of work – whether film, television, music, or fashion – as the determining factor in the type of fame a celebrity experiences. Gledhill (1991) and other researchers have argued the type of fame that dogs film stars is different from that of television personalities because of the distance each maintains from the audience. On one hand, film stars appear on the big screens at movie theaters, and on the other hand, television personalities enter viewers' homes on a daily or weekly basis making them seem more familiar. It is the air of mystery and unpredictability surrounding film stars that seems to lend itself to "true stardom."

Researchers maintain it is the audience's search for the authenticity of celebrities that creates the fascination of stardom. Gledhill (1991) observes that the "persona" of a celebrity is the coming together of the performance (role) and the private life to form a public self available to the audience (→ Image). And while the creation of a persona has been traditionally reserved for film stars, Jermyn (2006) points out the number of A-list celebrities that now appear both on television and in films, as well as the widespread stardom of American television actors, in particular, resulting from the international distribution of American programs (e.g., *Sex and the City* and *Friends*).

### USES OF CELEBRITY

Communications researchers recognize the connection between celebrity culture and → consumer culture. The function of celebrity overwhelmingly seems to be promotion: of self, of lifestyle, and of products. Celebrities themselves are an important part of the → culture industries because they can advertise themselves – on talk shows, at red carpet events, in interviews – and at the same time promote their latest projects.

The excessive media exposure that comes naturally from this type of self-promotion lends itself to *advertising specific products*, whether intentionally or not. McCracken (1989) points out in his study of celebrity endorsements the insufficiency of traditional "sources of credibility" and "sources of attractiveness" models (→ Interpersonal Attraction). Celebrities cannot increase sales simply because they are well known or have had successful endorsement deals in the past: he notes Bill Cosby's popular American campaigns with Kodak and Coca Cola and subsequent failure with E. F. Hutton. Instead, he argues, a celebrity must "connect" with a product, and the transfer of meaning from role to celebrity to product to consumer must flow seamlessly (→ Advertising Strategies).

Researchers have also looked at the inadvertent celebrity endorsements emerging from tabloid magazines and television shows. Jermyn (2006) and Feasey (2006) both point out the red-carpet-turned-fashion-ad photographs in tabloid magazines such as *heat*, *OK!* and the *Daily Mirror*. Jermyn notes the detail with which a photograph of Sarah Jessica Parker becomes a “how-to” guide for readers of the latest trends in → fashion, hair, and makeup (→ Commodity Feminism; Girl Culture). Similar features discussing the exercise regimes, diets, and leisure activities of celebrities also serve to promote the celebrity lifestyle.

## CELEBRITY MEDIA

Celebrity culture media outlets combine the audience’s need for authentic celebrities and celebrities’ ability to encourage consumerism. Schely-Newman’s (2004) analysis of Israeli gossip columns explains how tabloid magazines use intimate language to draw readers into the circle of celebrity gossip. She applies Bergmann’s (1993) *triad of gossip interaction* to the participants in celebrity culture: the columnist, the audience, and the celebrity. Schely-Newman points out how Israeli gossip columnist Zippora refers to herself and her opinions, personally addresses the audience, and divulges celebrity “scoops” in order to create an intimate exchange of information between columnist and audience about celebrities (→ Celebrity Journalists).

Celebrity media also create this sought-after sense of intimacy through photographs. Over the last decade, paparazzi have become an increasingly integral part of celebrity culture. The *paparazzi* are photographers who work for larger media organizations or freelance; they patrol the streets of major cities in search of celebrities in candid moments that will yield photographs or videos to be sold to magazines and other celebrity media outlets for thousands of dollars, or simply posted online for the world to see. Paparazzi provide constant access to celebrities around the world during moments not quite worthy of the red carpet (→ Tabloid Press). Feasey (2006) notes the barrage of cellulite, wrinkles, pimples, and other defects discussed in tabloid magazines. She says while these photographs appear to mock celebrities on the surface, the captions work to underline the ordinariness of celebrities, relieving the audience of the pressure to be celebrity-perfect (→ Body Images in the Media).

The pervasiveness of *reality television* has also increased the intimacy and authenticity of celebrity media. Programs such as *The Osbournes*, *Katie and Peter*, and *Newlyweds* offer paparazzi-style looks at the lives of celebrities “being themselves.” Tolson’s (2001) content analysis of Geri Haliwell’s documentary *Geri*, intended to rehabilitate her career after leaving the Spice Girls, highlights Haliwell’s goal of being herself as a way to redeem her public persona (→ Image Restoration Theory). Although reality television and documentary films are meant to capture what is “real,” Tolson highlights the conscious performance of self in celebrity media.

## AUDIENCE PARTICIPATION

Whether positive or negative, audience participation is vital to celebrity culture. While some researchers have looked at the effects of celebrity culture (increased body consciousness, participation in consumer culture), others have studied the ways in which

audiences interact with celebrity culture. Johansson's (2006) interviews with tabloid magazine subscribers in Britain focus on the way readers incorporate celebrity media into their own lives (→ Fandom; Audiences, Female). She says the gossipy nature of celebrity magazines not only works to increase the level of intimacy readers feel toward celebrities, it also encourages readers to incorporate the gossip into their own social circles.

## **Celebrity Journalists**

*David Marshall*

*Northeastern University*

Celebrity journalists are news workers who become prominent or famous in their own right and thus objects of media attention. Journalists are a means of chronicling fame and

infamy, and stars and leaders depend on journalism to maintain a public profile. Under economic pressures, media industries have tended to associate public personalities with their chroniclers. Repeated contact with the renowned has led journalists to become closely identified with those whose stories they report, resulting in their being elevated to celebrity status themselves and joining the A-list of popular culture celebrities from film, television, and music (→ Popular Culture and the News Media).

Celebrity, which emerged from historical patterns of fame, is a modern phenomenon that arose along with democracy and capitalism. Unlike other forms of influence and power, it is a populist phenomenon. Celebrities come from the people, and their power depends on an affective connection with an audience. Over the past two centuries, the reach of personal reputation has expanded through the expansion of media forms (→ Communication Technology and Democracy). As media and entertainment industries emerge, they manufacture celebrity as a branded commodity (→ Branding; Brands), and the commodification of personality gives expression to individuality as part of consumer and democratic ideologies. In these economic and political cultures, celebrities exemplify hyper-individuality (→ Celebrity Culture).

Journalism and celebrity have parallel and intertwined histories (→ Journalism, History of). Journalistic practice developed a populist strain particularly in the late nineteenth century, when journalists championed popular causes and challenged the powerful (→ Yellow Journalism). Journalists emerged as personalities slowly. Although some editors became prominent, early reporters remained either anonymous scavengers supplying news items or pseudonymous correspondents supplying commentary. In the twentieth century, the coverage of celebrities became one route to journalism celebrity. For example, Walter Winchell became known in the US after inventing the *celebrity gossip column*.

Newspaper journalism generally maintained the tradition of reporter anonymity well into the twentieth century. Bylines emerged in the 1920s, but mostly for columns and commentary on the inside pages. Front-page stories generally did not include reporter names, but hierarchies did exist within newsrooms. Senior reporters became the first to win bylines and then their own columns. The column was the greatest encouragement to the development of celebrated journalists. Columnists adopted a distinctive voice that the paper itself could not produce in → editorials, and gained a license to express opinions and, like celebrities, to proclaim their individuality.

Different journalistic traditions and different media affected how celebrity emerged. Radio, television, and film with their distinctive systems of reportage often turned journalists into celebrities. It was a US tradition that then spread internationally. By the 1930s, film → newsreels in many countries made audiences familiar with reporters' voices. Edward R. Murrow in the 1940s quickly established an iconic voice with US audiences through his CBS radio reports during the London Blitz.

From the 1970s US newspapers attached a byline to almost any story, while European cultures continued to maintain anonymous reportage for most daily coverage, a tradition that persists in some newspapers today. Bylines allow reporters to develop reputations earlier in their careers by linking their names to significant stories.

Television, perhaps more than any other medium, has promoted celebrity journalism. In some cultures, news anchors became the public face of a broadcast network. A US

model for star journalists had developed by the 1960s, which Latin America and Canada in particular emulated. Network anchors represented the pinnacle of celebrity journalism, rising to that status generally by covering major news events: Walter Cronkite's coverage of the John F. Kennedy assassination in 1963, and later Dan Rather's coverage of Vietnam and the → Watergate scandal, made them stars. Polls identified Cronkite as the most trusted US man, in contrast to the low public opinion surrounding journalists.

Elsewhere, television employed the British tradition of simple and interchangeable newsreaders, but other routes to journalism stardom did emerge via genres such as the television newsmagazine or interview programs: Ray Martin in Australia, David Frost in the United Kingdom, and others. Access to the famous makes journalists appear to be equal with their subjects. Barbara Walters established the celebrity interview as a genre in American television journalism by profiling cinema and sports stars as much as political leaders (→ Interview as Journalistic Form).

Morning television programs provided another avenue to fame. In the United States, the *Today Show* and *Good Morning America* have led to celebrity status for their presenters. Katie Couric rose to the position of news anchor after gaining visibility for her morning work. Television generally seems to produce more than its share of celebrity journalists, and local television news represents a training ground for would-be news stars. Exposure and familiarity are key elements of celebrity that are provided by television and radio, with their intimacy, but not by some forms of print.

The pattern of celebrity journalism currently seems in decline. Television anchors no longer operate at the center of American politics and culture. In an era of person-to-person networks, celebrity status may emerge through news blogs or websites that circulate at the margins of the mainstream media (→ Blogger). The "Drudge Report" made Matt Drudge perhaps the first new media celebrity to emerge in the era of the Internet (→ Online Journalism).

Elements of the work routines and news values of journalists may contribute to their eventual quest for celebrity. Journalists learn to pursue the scoop and the exclusive, for example, both of which tend to focus attention on the journalist as journalist. Celebrity journalism may be an inescapable element of modern democracies which reward individuals and commodify culture.

# Censorship

*Sameer Ahmed*

*Yale Law School*

Generally speaking, censorship is the control of speech and other forms of human expression. For the most part, bodies that partake in censorship attempt to provide stability for and strengthen their control over certain individuals and groups under their authority. Censorship commonly takes place in the following areas: morally questionable material like pornography (→ Pornography, Media Law on), military intelligence, corporate secrets (→ Corporate Communication), government actions, and religiously objectionable material. Legally speaking, censorship involves the attempts of government agencies to restrict public forms of communication. These forms of communication include holding public meetings and protests, publishing books and other written materials, and providing viewpoints and information in → newspapers and → magazines, or on the → radio, → television, and → Internet.

## **PRIOR RESTRAINT VERSUS SUBSEQUENT PUNISHMENT**

The two primary ways a government can censor material are either through prior restraint or subsequent punishment. Prior restraint refers to a government's attempts to prevent material from being released to the public. Prior restraints include legislation requiring a person to seek government permission before publishing or broadcasting information as well as government injunctions and orders barring the public release of specific material. Subsequent punishment, on the other hand, attempts to censor material through punishment after the offending material has already been published. Types of subsequent punishment include lawsuits for defamation, slander, and libel as well as criminal statutes for publishing certain material, such as pornography.

In US jurisprudence and, to some extent, in European legal codes like the German Basic Law, the law has been strikingly more hostile toward prior restraint than subsequent punishment. For example, in *Nebraska Press Assn. v. Stuart*, Chief Justice Warren Burger of US Supreme Court writes, “[P]rior restraints on speech and publication are the most serious and the least tolerable infringement on First Amendment rights” (427 US 560; → Freedom of the Press, Concept of). Some authors have questioned the distinction between prior restraint and subsequent punishment. Eric Barendt (2005) argues that sometimes the effects of subsequent punishment may be greater than prior restraint because a publisher's fear of facing prosecution and an unpredictable prison sentence may be particularly high. Furthermore, he states that criminal statutes against a wide range of material – such as those against pornography – affect many more publications than a prior restraint – a court or administrative order, for example – against a single publication. However, Barendt does acknowledge the main reason why the courts in western Europe and North America have been more hostile toward prior restraints. Prior restraints prevent the censored material from ever being distributed in the public. On the other hand, material facing subsequent punishment still enters the marketplace of ideas,

allowing public criticism and review (→ Political Discourse; Public Opinion). According to US constitutional scholar Alexander Bickel (1975, 61), “A criminal statute chills, prior restraint freezes.”

### **HISTORICAL BACKGROUND OF PRIOR RESTRAINT**

Historically, the roots of censorship in Anglo American law can be traced to King Henry VIII’s use of prior restraints in sixteenth-century England (→ Censorship, History of). In part to develop a favorable relationship with the Catholic church in Rome, Henry tried to assist the church by controlling the heretics’ freedom of expression. In 1529, he executed booksellers and anyone else who owned copies of → books he had prohibited. One year later, Henry created the first licensing system outside of the church. All religious materials had to be scrutinized and approved by the clergy before publication. Anyone who disobeyed this order faced fines, imprisonment, and execution. Although soon after this, Henry had a rift with the Catholic church and began executing Catholics, he recognized that through censorship he could strengthen his authority by controlling public opinion. Thus, in the Proclamation of 1538, he expanded the licensing system to include all printing. In particular, no criticism of the government was allowed. This, according to Steven Helle (2007), was the first time political expression was censored using a licensing system. The system existed in England long after Henry’s reign and was not abolished until 1694 when the House of Commons allowed the act to expire. The licensing system endured in the American colonies until the 1720s, when a Massachusetts grand jury declined to indict a Boston newspaper publisher for refusing to abide by the legislature’s licensing system (→ Printing, History of).

To a certain extent responding to the licensing systems and other acts of prior restraint in England and the United States, Sir William Blackstone (1836, *Four commentaries*, 151–152, 1st pub. 1769), in *Commentaries on the laws of England*, wrote the following in what has been considered the foundation of the doctrine against prior restraint: “The liberty of the press is indeed essential to the nature of a free state; but this consists in laying no previous restraints upon publications, and not in freedom from censure for criminal matter when published. Every freeman has an undoubted right to lay what sentiments he pleases before the public: to forbid this is to destroy the freedom of the press: but if he published what is improper, mischievous, or illegal, he must take the consequences of his own temerity.”

Blackstone clearly supported the notion that a “free state” can make a distinction between prior restraint and subsequent punishment. While he emphatically states that prior restraints are inconsistent with freedom of the press, he suggests that subsequent punishments for “improper, mischievous, or illegal” materials are not.

### **RATIONALE FOR DOCTRINE AGAINST PRIOR RESTRAINT**

According to Vincent Blasi (1981), prior restraint is antithetical to the following three premises inherent in the limited government and libertarian theories that produced the First Amendment of the US Constitution and other codes against prior restraint: (1) distrust of government, (2) acceptance of risk, and (3) respect for individual autonomy (→ Communication Theory and Philosophy). First, Blasi argues that by rejecting prior

restraint, governments acknowledge that societies should base their trust in individuals and the public rather than in the state. Conversely, by regulating the public space, prior restraints can prevent open government criticism.

Second, freedom of speech includes accepting risks. Governments that impose prior restraints try to deter worst-case scenarios and provide stability and security. However, the doctrine against prior restraint argues that a government's worst-case scenarios usually do not come true, and a greater risk to society is not allowing the speech to be published. And finally, prior restraint restricts the autonomy that individuals in a constitutional system of limited government should have in relation to the state. Although public forums scrutinizing government action may create certain burdens on the state, supporters of the doctrine against prior restraint argue that this is a suitable price to pay for individual autonomy.

## TYPES OF PRIOR RESTRAINT

### Administrative Censorship versus Judicial Restraints

A major question regarding the doctrine against prior restraint, as practiced by western democratic governments, is whether judicial injunctions should face the same hostility in the courts as administrative censorship. Most forms of administrative censorship – when an administrative official or committee rejects certain material prior to publication – are condemned almost universally by western democratic governments. However, many countries differ as to whether judicial injunctions and orders to stop the issue of certain publications should be more tolerable than administrative restraints.

In *England*, for example, the courts will grant injunctions in certain cases but not others. English courts usually will refuse to grant an injunction to stop defamatory allegations before a full trial if the defendant will argue that the accusations are true or if the comments can be perceived as a suitable comment on public interest matters. On the other hand, the courts are willing to grant injunctions after a successful libel lawsuit, as well as temporary injunctions in breach of confidence and copyright cases.

Similarly, *German and French courts* are willing to grant temporary injunctions in certain cases regarding defamation and privacy. Although the third sentence of Article 5(1) of the German Basic Law states, "There shall be no censorship," the German courts have never argued that this statement should disallow granting temporary judicial orders to stop publication of certain material. In the US, on the other hand, the courts have argued that the doctrine against prior restraint applies to judicial restraints as well. For example, in the 1971 *Pentagon Papers* case, the US Supreme Court argued that temporary orders granted against newspapers for revealing confidential government secrets are unconstitutional. Only very rarely have American courts argued that injunctions are consistent with the First Amendment of the US Constitution (→ Communication Law and Policy: Europe).

### Confidential Government Information

Regarding confidential government information, European courts have generally given greater consideration to accepting prior restraints than their American counterparts. The

primary justification in accepting prior restraints in these circumstances is that if the law does not prevent the publication of government secrets, then the harm will have already taken place, and subsequent punishments would be useless. The *Spycatcher* litigation in England is one example in which the courts stopped the publication of government confidential information. In this case, the English Attorney General in 1986 obtained interlocutory injunctions to prevent the *Observer* and *Guardian* newspapers from printing allegations from former MI5 agent Peter Wright about the English security services. Although the newspapers applied to discharge the injunctions, the injunctions were upheld initially by the Court of Appeal and subsequently by the House of Lords. The case then went to the → European Court of Human Rights, which sided with the newspapers and ruled that maintaining the injunctions after July 1978 was incompatible with freedom of expression. The court continued to say that although all prior restraints are not incompatible with the European Convention on Human Rights, “the dangers inherent in prior restraints are such that they call for the most careful scrutiny on the part of the Court” (14 EHRR 153, para. 60). The court argued that delaying a story can remove its interest and value.

The position of US courts regarding the issue of prior restraints on confidential information is significantly different from that of the English courts. In the 1931 case *Near v. Minnesota*, the US Supreme Court left open the possibility of prior restraints on government secrets. Chief Justice Charles Evans Hughes’s opinion states, “[T]he protection even as to previous restraint is not absolutely unlimited. But the limitation has been recognized only in exceptional cases.” He suggests that confidential government and military secrets could be examples of “exceptional cases” (238 US 717). In the *Pentagon Papers* case, however, the Supreme Court denied a government request to prevent the *Washington Post* and *New York Times* newspapers from publishing secret State Department records on US involvement in the Vietnam War. The justices disagreed over when injunctions should be issued regarding government confidential information. While Justices Hugo Black and William Douglas stated that the First Amendment does not allow any prior restraints, the majority of the Supreme Court supported the position that an injunction can be issued if publication of confidential government information will cause irreparable damage to vital national interests (→ Journalism: Legal Situation; Communication Law and Policy: North America).

### **Internet Censorship**

While courts in western democratic states continue to debate to what extent prior restraints in defamation, privacy, and confidential information cases are acceptable, authoritarian regimes in China and Saudi Arabia have practiced some of the most stringent forms of administrative prior restraint. Within the last decade, both countries have expanded their use of prior restraint over one of the most up-to-date methods of publicly disseminating information: the Internet (→ Internet Law and Regulation). In December 2000, the *Chinese government* passed a series of regulations explaining why and how the Internet would be censored. The Chinese government has established a prior restraint on certain Internet content by creating a nationwide firewall, which blocks thousands of websites that it deems inappropriate. Using domestic software, China filters not only sexually

explicit material, but also websites it considers politically sensitive, such as those of overseas human rights organizations, certain news organizations, and sites related to Taiwan, Tibet, the Falun Gong movement, and dissident and pro-democracy groups (→ China: Media System; Communication Law and Policy: Asia).

Similarly, the *Saudi government* has established the most widespread and technologically advanced filtering system in the world to block all online material that the ruling family argues is contrary to Saudi Muslim customs and values. A government body called the Internet Services Unit maintains specialized proxy equipment, which processes all website requests from within the country and compares them to a blacklist of banned sites. If the requested site is included in the blacklist, then it is blocked. The blacklists are purchased from commercial companies and renewed on a continuous basis. In addition to the commercial blacklists, Saudi censors contribute other websites they deem inappropriate (→ Communication Law and Policy: Middle East). Despite political opposition groups and others who have used increasingly sophisticated techniques to circumvent government censorship and disseminate information online in China and Saudi Arabia, prior restraint has allowed these governments to continue to maintain a stranglehold on power in the same way that King Henry VIII did with his licensing system hundreds of years earlier.

# Censorship, History of

*Sue Curry Jansen*

*Muhlenberg College*

The English word “censorship” is derived from the root *cense* from the Latin *censure*: to estimate, rate, assess, judge. Censor was a title given to two magistrates in ancient Rome who were responsible for administering the census, and supervising public morals. When the Roman Empire became the Holy Roman Empire, the church assumed primary responsibility for → censorship.

## **ECCLESIASTICAL CENSORSHIP**

The early church used its censorial authority to establish orthodoxy and condemn heresy. Written scripture codified the tenets of the Christian faith and secured the church’s earthly authority, but the clergy possessed a monopoly over interpretation of the sacred text. Instruction of the laity was almost exclusively oral: with few exceptions, only those entering the priesthood had advanced levels of education and access to reading materials, which were stored in monasteries during the manuscript period. The church began cataloguing forbidden texts as early as the second century; however the development of the Gutenberg press in the fifteenth century posed a profound challenge to church authority. Print facilitated the spread of heterodox ideas, especially Protestant reform. The church responded by establishing an elaborate administrative system of prior censorship, requiring a license to publish (an imprimatur), and certification that a book had been inspected by a local Ordinary, usually the bishop. The church published its first index of forbidden books, known as the Pauline index, in 1559. The *Index Librorum Prohibitorum* went through 42 editions before it ceased publication in 1966.

The Index provides the most comprehensive record of censorship ever compiled. State censorship bureaucracies adapted the administrative model pioneered by the church, with its central authority and local enforcement. Where the church publicly condemned objectionable ideas, however, state censorships routinely operate covertly as well as overtly. National security, often a contentious construct with expansive boundaries, provides the justification for covert state censorship (secrecy), especially in wartime, when all nation-states practice censorship.

## **RECORDED HISTORY OF CENSORSHIP**

The etymology, administrative model, and much of the recorded history of censorship are of European origin, but the practice is universal. It predates the word, and continues in other forms even where religious or state censorships have been formally abolished. The written history is largely a history of western censorships because opposition to church and state censorships and advocacy for freedom of expression developed widespread support and achieved legitimacy first in Europe and America (→ Freedom of Communication; Freedom of the Press, Concept of). Enfranchisement of freedom of expression in the west is not, however, a story of European superiority or linear progress, but rather a

narrative of conflict and struggle. Several factors converged to produce this outcome. A synthesis of Asian, Middle Eastern, and European communication technologies took place in Europe at a propitious moment when the dominant social institution, the church, was experiencing a crisis of legitimacy in reaction to pervasive repression and corruption (→ Information and Communication Technology, Development of).

Movable clay type had been invented in China four centuries before Gutenberg refined the technology in his workshop in Mainz. A difference that made a difference in the rapid development of book publishing and distribution in the west was the Roman alphabet. Based upon the writing system developed by the ancient Phoenicians in the Middle East and adapted by the Greeks, the simple 26-character Roman alphabet could be transferred to print quicker and less expensively than the open-ended system of Chinese characters, which can require thousands of different characters to print a single text. Once books were widely available in Europe, the simplicity of the alphabet also facilitated widespread development of literacy. As literacy spread beyond clerics and aristocrats, censorship became an important administrative tool of both church and state.

The suppression of books magnified the powers of print, enhancing demand for prohibited books and the skills to read them. It galvanized opposition to censorship among those most directly affected by its enforcement: printers, book dealers, authors, intellectuals, freethinkers, artists, performers, rebels, and revolutionaries. For fifteen centuries monotheistic orthodoxy and Roman administrative practices effectively imposed a monopoly over the minds and morals of Europeans: when opposition finally gained momentum, the targets were clearly legible, visible, and as accessible as the nearest church, as Martin Luther demonstrated when he nailed his 95 theses to the church door in Wittenberg in 1517.

Censorship in the west frequently involved church and state collaborations. In France, under the Ancien Régime, the Faculty of Theology at the University of Paris was responsible for censorship; later the king played a more prominent role; and then in the period prior to the revolution, the police served as censors. England followed the ecclesiastical model, publishing its first list of forbidden books in 1529. After 1557, the Stationers' Company, made up of printers and manuscript merchants, was granted a monopoly over the production and distribution of print by the crown; the Stationers' Company had the responsibility of suppressing all work that posed a danger to authority. With the proliferation of print, administration of prior censorship became increasingly difficult in England, and the Censorship Act was allowed to expire in 1604; but offensive expression remained subject to prosecution under criminal law.

## LANGUAGE, CULTURE, AND KNOWLEDGE

Censorship is a universal phenomenon: it casts shadows over all consequential forms of communication. It is the interdiction that empowers the dicta: sense is made by censoring nonsense. Social order is created by proscribing disorder and inclusion is defined by exclusion. Fundamental distinctions are reified and naturalized to form the categorical structures of language, culture, and knowledge. The resulting cosmology may be internalized, resisted, elaborated, or imploded, but it cannot be ignored because it defines the terrain upon which responses to censorship can be intelligibly enacted and communicated. Whether articulated in relatively benign or deeply oppressive forms, this *constitutive or sociological censorship* is

what makes society possible. Because it is largely unrecognized, its influence is insidious. It casts a pall over human consciousness, and compromises the most rigorous professions of objectivity.

Constitutive censorship escaped critical scrutiny until quite recently because censorship scholarship has been narrowly conceived. Sharing the Enlightenment's conceit that liberal democracies had abolished censorship, it viewed surviving forms of *regulative censorships* as the work of unenlightened or regressive institutions: churches and repressive states. Critique of regulative censorship is essential to preservation and expansion of free expression. Reasonable levels of transparency are possible in assessing regulative censorships: indices can be identified, calibrated, and evaluated based upon legal or human rights standards such as levels of violence used to secure and enforce control, degrees of tolerance for heterodox ideas, or the frequency and intensity of ritual purgation. Regulative censorships are amenable to reform or revolution in ways that can lower body counts, books banned, or citizens gulaged; but no revolution in human history – not even the scientific revolutions of the seventeenth and eighteenth centuries – has ever abolished constitutive censorship.

Constitutive censorships are elastic. Limits of permission can be expanded (or contracted), but constituent censorships can never be fully eliminated because complete escape would require fugitives to step outside of language and beyond the limits of human knowledge: the penalty would be silence or unintelligibility. Yet constitutive censorships share porous borders with regulative censorships. They provide precedents, and linguistic, conceptual, and epistemological anchors for regulative censorships. This is the fundamental conundrum of constitutive censorship: to step outside of one form involves stepping into another.

### CONTEMPORARY FORMS OF THEOCRATIC CENSORSHIP

Throughout most of human history, censorship has been considered a legitimate prerogative of power: a means that authorities use to authorize normative systems. In condemning the evil and erroneous, censorship also defines and clarifies the meaning of the good, true, just, or at least the harmless. Until the democratic revolutions of the eighteenth century, the power of communities to excommunicate, to silence, and to exile was nearly absolute. Freedom of expression, where it existed, was community bound and hierarchically distributed. Within these closed circles, censorship was considered a positive act: a way of ensuring morality and homogeneity.

In fundamentalist theocracies, the power is absolute, and sometimes extends beyond excommunication, even beyond communicants. This was the case when Iran's Ayatollah Khomeini issued a *fatwa* condemning to death the Indian-born author Salman Rushdie, who is not a practicing Muslim, for satirizing Islam in his 1989 book, *The Satanic Verses*: a sentence that the Iranian Government News Service reaffirmed in 2006. The *fatwa* obligated all faithful Muslims to carry out the sentence, forcing Rushdie into years of hiding; his Japanese translator, Hitoshi Igarashi, was murdered, and his Italian translator and Norwegian publisher suffered serious injuries when they were stabbed by assailants carrying out the orders of the *fatwa*. Others, including the Egyptian-born Nobel Prize-winning author of the *Children of Gebelawi*, Najib Mahfuz, also received death threats for defending Rushdie's right to free expression.

Resurgence and politicization of fundamentalist forms of Islam following the 1979 Iranian revolution has been accompanied by stricter enforcement of moral codes and

reinstating or strengthening of censorship in Muslim majority nations. Islam is, however, a world religion composed of diverse nationalities and branches, so all generalizations have numerous exceptions. Moreover, individual imams, as divinely ordained descendents of Muhammad, can issue moral orders as well as *fatwas*. In Iran, for example, censorship moderated under a reform government in the early years of the twenty-first century, but has tightened dramatically since 2005, with new restrictions on book publishing, film, and theatrical performances, suppression of some newspapers, and crackdowns on rooftop satellite dishes. The Islamic Guidance Minister has long blocked access to many Internet news sites; and in 2006 instituted new measures to attempt to control bloggers. The government also brought charges against journalists for postings on Internet sites.

As → satellite television and the → Internet have made it increasingly possible to circumvent national censorships, transnational responses are becoming more common. Repression of offensive forms of expression has also taken on new, extra-legal forms through international protests, including violent protest as, for example, when a Danish newspaper, *Jyllands-Posten*, published a series of cartoons ridiculing the Prophet Muhammad in late 2005, some of which were reprinted and denounced as racist in an Egyptian newspaper, *al-Fagr*. This set off worldwide protests and counter-protests over the next several months, including violent conflicts in Libya, Pakistan, Afghanistan, Nigeria, and Somalia that killed at least 139 people and injured 823. The editor of the Danish paper apologized for publishing the cartoons. Pope Benedict XVI triggered another wave of global protests by Muslims in 2006 when he quoted a medieval text that condemned Muslim innovations. A nun in Somalia was murdered in retaliation. The Pope also apologized for offending Muslims.

### BUREAUCRATIZED STATE CENSORSHIP

State censorship, by contrast, uses law and administrative procedures to enact and enforce censorship. The most comprehensive and longest lasting form of state censorship in recent history was put into place as an emergency measure by Lenin immediately following the victory of his forces in the Russian Revolution in 1917. State censorship remained formally in force until 1989, when the Supreme Soviet eliminated newspaper censorship. *Russia* had a long tradition of censorship under the tsars, with only a brief period of liberalization (1855–1865) under Alexander II. Lenin was acutely aware of the power of the press and arts as “collective organizers” of propaganda, and mobilized them for socialist re-education. There was some openness to ideological divergence in the immediate post-revolutionary era; however, after 1928 ideological conformity to socialist realism, which entailed viewing life as it was to become rather than as it actually was, became mandatory. Religion was suppressed, and tight controls over art and literature were imposed.

Multiple agencies had responsibilities for supervising literary affairs and the performing arts. The most visible was the Chief Administration for Literary Affairs, known as Glavit; enfranchised in 1922, its powers were expanded considerably under Stalin to include all printed materials, visual arts, broadcasts, lectures, and exhibits. According to the procedural fiction, submission of materials to Glavit for editorial and ideological criticism prior to being publicly disseminated was “voluntary.” Glavit actually exercised absolute authority over publication and the performing arts, and possessed the power to shut

down any newspaper for ideological deviations. The campaign to rid Soviet culture of neo-bourgeois elements resulted in purges of well-known writers, including Isaac Babel, Osip Mandelstam, and Mikhail Kolcov; in all, it has been estimated that as many as 6,000 writers perished in Stalin's gulags. Tight controls were also imposed over foreign literature entering the Soviet Union, and over artistic and scientific contacts with the west. Stalin personally intervened in supervision of the arts in highly unpredictable ways; this made already cautious bureaucrats even more vigilant, and accelerated self-censorship in literature, the arts, and science to the point of cultural stagnation. The Soviet administration of mind was so successful that in 1952 Stalin had to moderate it because it constrained scientific discovery and produced dull, formulaic literature.

During a brief thaw in Soviet censorship in 1956, Khrushchev personally approved publication of Alexandr Solzhenitsyn's *One day in the life of Ivan Denisovich*, a story about life in a Stalinist labor camp. The same year Khrushchev denounced the Stalinist cult of personality at the 20th Party Congress. Although strict controls remained in effect, these two interrelated developments contributed immeasurably to the emergence of a visible dissident movement in the Soviet Union. After 1956, travel became possible for scientists and intellectuals, and Soviet participation in international conferences and performances increased substantially. Travel not only brought more exposure to western ideas, but also to Russian literature published abroad, *tamizdat*, such as Boris Pasternak's *Dr Zhivago*.

Technology posed special challenges to Soviet censors. Under Stalin, the typeface of every typewriter had to be registered so that illicit manuscripts, *samizdat*, could be traced; when photocopying machines became available, access was strictly regulated and every copy had to be registered. Administering these controls proved onerous; and in order to function at all, work routines were developed that gave higher level employees access to the "not allowed but possible." A fundamental contradiction was built into the Soviet system: the government emphasized universal literacy and provided its citizens with good educational opportunities that fostered intellectual curiosity. At the same time, however, Glavit's censorship was designed to stifle curiosity. Technology was also a factor in the demise of the Soviet system; suspicion of communication technologies along with restrictions imposed by the United States on export of high-performance computers to the Soviet Union and China left the Soviet Union lagging far behind the west in the telecommunications revolution of the 1980s. After the demise of the Soviet Union in 1991, Russian media and the arts experienced a decade of unprecedented openness. However, under Vladimir Putin's leadership, the Russian Federation has reasserted centralized control, including control of media, especially television.

### **CENSORSHIP IN THE TWENTY-FIRST CENTURY**

In the twenty-first century, *China* is expected to be the primary site of struggles for intellectual freedom (→ China: Media System). Its imposition of controls on the Internet, with the compliance of US-based software companies Google, Microsoft, and Yahoo! has become a *cause celebre* among Internet freedom advocacy groups (→ Advocacy Journalism; Search Engines). However, the Committee to Protect Journalists ([www.cpj.org](http://www.cpj.org)) listed North Korea, Burma, Turkmenistan, Equatorial Guinea, Libya, Eritrea, Cuba, Uzbekistan, Syria, and Belarus as the ten most censored countries in the world in 2006. In an era of

instantaneous international communication, journalists, media workers, and communication facilities have increasingly become targets in both regional and international conflicts. Since 1991, when the Committee to Protect Journalists began monitoring violent deaths of journalists, 580 deaths had been recorded by early 2006 – more than three per month, 71 percent of whom were directly targeted in retaliation for their reporting. Even in war zones, murder is the leading cause of death for journalists. By October 2006, 118 journalists and media workers had been killed in Iraq since the US-led invasion in 2003, making it the deadliest war for journalists in modern history, far exceeding the number of journalists who died in World War II (69) and Vietnam (63).

## **Central America: Media Systems**

*Frank Priess*

*Konrad Adenauer Foundation*

Geographically, Central America includes parts of Mexico (→ Mexico: Media System), i.e., the southern part of the Tehuantepec Isthmus, but traditionally it is composed of the

countries of Belize, Guatemala, Honduras, El Salvador, Nicaragua, Costa Rica, and Panama. With the exception of Belize, which is a small country with about 300,000 inhabitants that did not gain its independence from Great Britain until 1981, all were Spanish colonies. The current Panamanian territory was part of Colombia until 1913. All of these countries gained their independence between 1821 and 1859. Of 43 million Central Americans, 13 million live in Guatemala. The geographic position of Panama and the political stability of Costa Rica have allowed both of these countries to develop economically, but the rest of the countries in the region display extreme poverty, particularly evident in areas inhabited by indigenous groups. After several decades of internal turmoil, civil war, and dictatorships, Central America has recovered its essence. Since the 1980s, it has recovered its peace. Even though democracy and competitive elections are now a fact within the isthmus, the influence of remote times still prevails.

### REGIONAL MEDIA DEVELOPMENT

The influence of the media was important during the democratization of Central America. It was the result of multiple experiences from the past, both those of journalists and those of several media owners. Many of these individuals faced → censorship, military repression, and the closure of their offices. The participation of the army was a common feature in these events. State financing, which plays an important role in private investments and represents a key survival factor, enables many governments to exert their influence over media content in the press, → radio, and → television. Tax collection and audits contribute to keeping state influence marginal. External influence also plays a key role, mainly that from Mexican investors.

Nowadays, many media function as *political instruments* and, in nearly every Central American country, they are concentrated in the hands of a few families (→ Ownership in the Media; Concentration in Media Systems). Their interests are primarily centered on the economic impact of the media network. Only Costa Rica, El Salvador, and Panama have laws that guarantee equal → access to the media by the political parties. Deviation or reduction in campaign funds and parties has led to greater distortions in competition.

The *lack of scientific research on the region* makes it difficult to provide quantitative data (→ Communication as an Academic Field: Latin America). That said, radio is the most-used medium, and television constitutes the most-marketed medium, followed by the press. The proportion of the latter is 40 newspapers for every 1,000 inhabitants. Costa Rica has the highest proportion with 79, while Nicaragua has the lowest with 16.

Journalistic work faces the multiple challenges of a narrow labor market, complicated structural conditions, bad planning, corruption, and the limitations imposed by restrictive laws. A more active civil society is needed to support and encourage independent and capable journalists. Furthermore, both professionalism and journalistic ethics are nearly unknown, as is the case in the rest of Latin America (→ Professionalization of Journalism; Ethics in Journalism). Despite attempts made by some international training programs to change the situation, the tradition of research and → investigative reporting is unknown in many places. Finally, the lack of interest in regional and international issues is evident in the different media offerings.

The regional results obtained from the annual study of the US organization Freedom House are highly critical. Its 2007 report shows Costa Rica as the only country belonging to the group considered to be free countries (20th place of 195). The rest of the Central American countries are considered “partly free”: El Salvador and Nicaragua are placed 42nd, Panama 43rd, Honduras 51st, and Guatemala 59th.

There is a climate of aggression directed toward journalists in Central America, and *Guatemala* is perhaps the most notable example of this. This country suffers the consequences of a long and bloody civil war as well as the influence of violent regimes, which have lacerated social consensus. In this respect, it is the indigenous groups, representing 40 percent of the country’s population, that are the most deprived. Crime, international traffic of drugs, corruption, and a flourishing kidnapping industry make research in information and critical journalism a highly perilous occupation. According to the corruption index of *Transparency International*, Guatemala holds 117th position (of 159); attempts to clarify are overshadowed and contributions are regarded as threatening.

The Guatemalan radio and television industries are mainly concentrated in the hands of Mexican investors. A sole consortium controls the four open channels and 90 percent of the frequencies held by radio broadcasters are the property of three groups. Concentration also exists within the press. Newspapers (*Prensa Libre*, *La Hora*, *Siglo Veintiuno*, *El Periodico*, *Diario de Centro America*, *La República*, *Nuestro Diario*, *Al Dia*, *El Quetzalteco*, and *El Metropolitano*) are not the exception, and only two are published outside the capital. The general trend is mainly conservative, and economic forces dominate the scene, making it impossible for a spectrum of plural opinion to exist. As is the case in all of Central America, community radios are isolated (→ Community Media).

The amount of violence is also critical in *El Salvador*, with the issue of the *Maras*, gangs of juveniles active in the capital, terrorizing the population. The influence of a long civil war is ever-present, and the division of the nation keenly felt. El Salvador’s business elite dominates the five national newspapers with its conservative posture (*El Diario de Hoy*, *La Prensa Grafica*, *El Mundo*, *Clatino*, and *Diario Mas*, printing 250,000 issues in a population of 6.9 million people), as well as the audiovisual media. Three of the five private television networks are the property of *Telecorporación Salvadoreña (TCS)*, which openly supports the ARENA party, currently in power. Channel 12 is Mexican-owned.

El Salvador also has its official channel. The one-dimensional stance of its owners, reflected in its taboos and preferences, leads the path to self-censorship. If it does not follow this trend, a forceful silence is imposed. Finally, several Salvadorian laws point out the benefit of national security in contrast with critical journalism.

*Honduras* enjoys free elections – though they are often accompanied by expressions of violence – and this is reflected in a free media system, which is also concentrated in the hands of highly influential families. The country’s newspapers are *La Tribuna*, *El Heraldo*, *Diez*, *La Prensa*, and *Tiempo*. Journalistic work always encounters difficulties in the use of official sources, and corruption in exchange for positive reports is very common. A positive point is that slander was ruled unconstitutional (→ Libel and Slander).

In the case of *Nicaragua*, the influence of civil war and dictatorship continues. The change of power in 2007 – Sandinista commander Daniel Ortega, working in a coalition with a liberal former president, won the presidency – showed the existence of competitive democratic rules and processes. The country’s history and past changes of power made it

possible for leftists to gain presence and voice. Little before the conclusion of their term, the Sandinistas privatized the main radio networks and guaranteed the permanence of individuals and groups loyal to them in these entities. The main newspapers offer a space for different political voices – though demanding a positive political orientation in exchange. *La Prensa*'s liberal voice has represented public criticism since Sandinism times. *El Nuevo Diario* has a clear tendency toward Sandinism, and *La Noticia*, *La Jornada*, *Trinchera*, *Bolsa de Noticias*, and *Hoy* are also worth mentioning. In addition to six private television stations, Nicaragua has one official channel.

As a result of American influence and having direct management of its Canal in recent years, Panama's position is special in Central America, for it is also a bridge to South America. The history of the media in this country is also affected by past dictatorships. The country has four private television stations and a wide range of radio stations, along with one state television channel and a network, both of which are under the Catholic church's guardianship. Panama has eight national newspapers (*La Prensa*, *El Panama America*, *Critica Libre*, *El Siglo*, *La Estrella de Panama*, *Mi Diario*, *Dia a Dia*, and *Capital Financiero*). It also suffers from concentration of media and difficult working conditions for journalists: they are constantly threatened by the state, and by the end of the former president's term, 80 journalists had received official warnings. Media laws are highly restrictive; many date from dictatorial times and have not been reformulated.

Given its small size, Belize's open and free media system is seldom discussed. Although it is true that it lacks daily journals, its weekly press is varied and pluralistic. Belize's 300,000 inhabitants can choose from ten radio stations and two television channels. Cable television is a widely spread medium. However, the laws on media give the state intervention rights in journalism, mainly when public officials and ministries are within the focus of reports and if they are criticized. Finally, attacks on radio broadcasting freedom are commonly interpreted as protection of national security.

Costa Rica continues to be the Central American democratic model. This fact is reflected in its media system and the current situation: the → freedom of the press dates from 1835, and ever since, radio, television, and press have been able to work freely. More than 100 stations make up the private broadcasting system, along with the private sector newspapers *La Nación*, *La República*, *Diario Extra*, *El Herald*, *La Prensa Libre*, *Al Dia*, and *La Teja*, and public sector broadcasting such as *Canal 13*, which operates under the guardianship of the *Sistema de Radio y Televisión Cultural de Costa Rica* (SINART) and has been in existence since 1977. However, a financial crisis brought about restriction in investments and infrastructure. The open sector has a UHF channel from the University of Costa Rica, Channel 15, receiving income from university funds. 40 percent of its content comes from → *Deutsche Welle* and from *Asociación de Televisoras Iberoamericanas* (ATEI). One of the most controversial issues is whether or not stations should pay taxes on frequencies – this was not provided for in the obsolete 1954 act that regulates broadcasting in the country.

In recent years, press freedom in Costa Rica played an important role in uncovering massive corruption scandals. In the lead were *La Nación* newspaper and the editorial department of *Canal 7*. Meanwhile, the interest that the population shows in the media continues to increase. Costa Ricans invest a significant part of their incomes in the use of the media. There is increasing demand for cable television systems, which now accounts

for 20 percent of Costa Rican households. The use of telephones and computers with → Internet access is far above the Latin American average.

## **Chaffee, Steven H.**

*Jack M. McLeod*

*University of Wisconsin-Madison*

Steven H. Chaffee (1935–2001) was an internationally recognized mass communication scholar who had a crucial role in developing and shaping the field of communication during the last third of the twentieth century. He was born in Los Angeles on August 21, 1935. He received a BA in history (with distinction) from the University of Redlands in 1957, and an MA in journalism from UCLA in 1962. In 1965 he completed a PhD in communication at Stanford where he studied with → Wilbur Schramm and Richard Carter, who supervised his dissertation. He served in the US Navy as a public information

officer (1958–1961) and worked as news editor and reporter for various Los Angeles newspapers (1961–1962).

Chaffee began his *teaching career* in the School of Journalism and Mass Communication at the University of Wisconsin-Madison in 1965. He established during his 16 years there a prolific research record: eight books and monographs, and 50 journal articles and book chapters. Much of his research was conducted in collaboration with Jack McLeod and graduate students in the Mass Communications Research Center where the innovative ideas for co-orientation and family communication pattern concepts were developed (McLeod & Chaffee 1972; Chaffee et al. 1973; → Family Communication Patterns).

His summary of the scientific evidence for a connection between televised violence and adolescent aggressiveness for the US Surgeon General's Committee on Television and Social Behavior in 1972 gave impetus to subsequent research on effects of media violence (→ Violence as Media Content, Effects of). His editing of *Political communication: Issues and strategies for research* (1975) can be given primary credit for founding the field of political communication (→ Political Communication; Political Cognitions). Chaffee served on a dozen key AEJMC and ICA committees during this early period and was elected president of ICA for 1980–1981 (→ International Communication Association [ICA]). He was awarded a prestigious Vilas Professorship in 1974 and served as director of the School of Journalism and Mass Communication in 1980–1981.

In 1981, Chaffee returned to Stanford's communication department as professor and director of the Institute for Communication Research founded by Wilbur Schramm. He was named Janet Peck Professor of International Communication in 1987. His research productivity continued unabated with seven books and 42 journal articles and book chapters over the last 19 years. Most notable are three very different works: empirical research on measuring *attention* to media content (Chaffee & Schleuder 1986; → Attention; Attention to Media Content across the Life-Span), the co-edited *Handbook of communication science* (1987), and the helpful monograph on concept explication (1991). During the Stanford years he received many awards: ICA Fellow, 1983; the Nelson Award for career contributions to education for journalism and mass communication from Wisconsin, 1990; the Fisher Mentorship Award for service to his students and communication research from ICA, 1992; and the AEJMC Presidential Award for his dedication and service, 1996. He was editor of *Communication Research* (1983–1986) and served on the editorial boards of several other journals.

Chaffee left Stanford to accept the Arthur N. Rupe Endowed Chair in the department of communication at the University of California, Santa Barbara in 1999. He died unexpectedly from a heart problem at the age of 65 on May 15, 2001.

An essential *key to understanding Chaffee's career* was his unusually strong commitment to the development of communication as a recognized autonomous scholarly field. From Wilbur Schramm, who stitched together a framework of the field, he learned that much more theorizing and empirical research needed to be done before claims of legitimacy could be made (→ Communication as a Field and Discipline). He was able to see the weaknesses of the mid-twentieth-century models borrowed from other social sciences. The “*minimal effects*” Columbia model focused narrowly on → persuasion in terms of conversion of candidate vote preferences (→ Media Effects, History of). *Selective exposure*

was almost an iron law leading directly to the flawed concept of “reinforcement” (→ Selective Exposure). Instead, Chaffee focused his early research on knowledge and other cognitive news media effects that were more likely than attitude conversion (→ Media Effects; Cognition; Information Processing).

He later challenged → Lazarsfeld’s “synthetic competition” between media and personal influences through research showing that the two forms of communication could be mutually facilitating (1982; → Media Effects: Direct and Indirect Effects). He was also ahead of his time in questioning the then popular diffusion of information models that assumed knowledge and technology to be of unquestioned value and treated them as fixed quantities “transported” to the “underdeveloped” world (→ Diffusion of Information and Innovation; Development Communication). He also attempted to revise political socialization models that envisioned “transmission” of knowledge and values “functional to the ongoing system” from parent to child through simple modeling. A much more valid and sophisticated learning model can be found in Chaffee’s late work evaluating the “Kids Voting” school civic intervention program (McDevitt & Chaffee 2000; → Political Socialization through the Media).

Chaffee understood that progress in developing an autonomous field would depend on constructing a set of well-explicated communication concepts. Concept explication became a distinctive feature of the methods courses and group projects at Wisconsin. He insisted that the seemingly simple concept of “media use” was multidimensional and demanding of careful concept explication. Time spent with TV, the sole measure used by many social scientists, he showed, was totally inadequate. Exposure and attention to types of content within a medium were more important (→ Political Media Use).

His devotion to hands-on teaching of graduate students beyond classroom hours was testimony to his strong commitment to the communication field. He mentored his junior colleagues toward tenure by providing encouragement and extensive feedback on their research. He believed in the benefits of the expression of diverse viewpoints, an idea empirically supported by his early political socialization work where families with pluralistic communication patterns facilitated adolescent learning.

Steven Chaffee was a leader among a handful of second generation “young Turks” who reinvigorated the mass communication field in the 1960–1980. Chaffee was justifiably proud of the achievement of his cohort, but in historical essays on Schramm, Bleyer, Nafziger, and others he acknowledged their debt to the “founding fathers.” He was unsatisfied with past achievements and in a final essay on the future of political communication research (2001), he stressed the need to refocus research: “While questions of political content and direction will always be important, the direction in which the most inventive efforts are needed have to do more with the politics of communication than with the communication of politics.”

## **Change Management and Communication**

*Theodore E. Zorn*

*University of Waikato*

Change management in the context of organizations is the process of planning, directing, and controlling a transition from one set of organizational conditions to another. Change management has been studied for many years in the management and organization studies disciplines. It has not traditionally been considered a communication process, although models of change management typically have included communication as a component of effective change management (→ Organizational Communication; Strategic Communication).

However, several related trends have led to change management and communication becoming much more closely interrelated. First, the rate of organizational change has increased, as has the perceived importance of changing organizations to managers, executives, and other stakeholders (Zorn et al. 1999). The result of this is that organizational reputation is greatly influenced by the appearance of keeping up with the latest

trends, as captured in organizational buzzwords such as benchmarking, continuous improvement, and best practice. Second, as a result of the massive failure rate of major organizational change initiatives (a 50–80 percent failure rate is typically reported in the literature), practitioners and scholars have given significant attention to rethinking the process of change management and the reasons underlying failure. In particular, there is a recognition that resistance by stakeholders – particularly, but not limited to, staff – impedes many organizational changes, and a concurrent belief that communication is the key to managing such resistance. Third, some prominent scholars have argued that organizational change is constructed in communication. That is, communication is not simply a tool to use in the process of managing change; rather, what we consider to be change is an intersubjective phenomenon co-constructed in discourse among organizational members and stakeholders (→ Organizational Discourse; Business Discourse). Ford and Ford's work is exemplary here; they describe change as a series of conversations in which people bring change into existence (or resist it) through their conversations (e.g., Ford & Ford 1995). Finally, as strategic communication has become more central to organizational strategy, communication with both internal and external stakeholders is seen as more central to change initiatives (→ Stakeholder Theory).

Much of the research on this topic is, not surprisingly, quite applied or “managerialist” in orientation, although the body of interpretive and critical literature has been increasing rapidly in the past decade. Of course, some research has both applied and interpretive (or critical) dimensions, but this distinction is still useful for differentiating the aims of most studies of communication and change management.

### APPLICATION-ORIENTED RESEARCH

Application-oriented research has focused particularly on strategic means of announcing or initiating change, principles for communicating effectively with stakeholders, methods of stakeholder involvement, and means for managing employee stress and resistance. Several scholars have focused their efforts on identifying the elements of communication that introduce change to stakeholders. This work stresses the importance of adapting change announcements to the situation, taking into account the organizational dynamics and the particulars of the change initiative and crafting messages that influence stakeholders' buy-in or readiness for change (e.g., Smeltzer 1991). Armenakis and Harris (2002) argue that such messages will be effective to the degree that they clearly identify the discrepancy between the present and desired state, and that they convincingly argue that: (1) members have the efficacy to be successful; (2) the particular change initiative is appropriate; (3) adequate support and resources will be provided; and (4) members will benefit from the change.

Perhaps the most extensive research on the topic of communication and change management has focused on principles and practices of communicating with employees in the process of implementation. As Elving (2005) argued, management attempts through communication processes to inform and direct employees, while at the same time creating a sense of coherence and community. Klein (1996) summarized the applied literature on *effective implementation communication* in the following seven principles: (1) message redundancy enhances message retention; (2) using multiple media is typically

more effective than the use of just one medium; (3) face-to-face communication is often more effective than alternatives; (4) the line hierarchy is the most effective organizationally sanctioned communication channel; (5) direct supervisors are the expected and most effective source of organizationally sanctioned information to employees; (6) opinion leaders are important conduits to changing attitudes and opinions; and (7) personally relevant information is better retained than abstract, unfamiliar, or general information (1996, 34).

Of course, change agents are interested in communicating with stakeholders other than employees, too, and often adapt the approach taken depending on the particular group of stakeholders targeted, as well as other factors. For example, Lewis et al. (2001) studied the strategies that nonprofit organizations used to communicate with external stakeholders, as well as the influences on their choices. They identified six separate approaches that vary from simple one-way message dissemination to highly interactive and/or adapted communication. They found that many factors might explain the choice of change communication strategies, for example, the scope, novelty, and complexity of the planned change, as well as the nature of the → organizational culture and the management style of the implementers. However, many of these influences are indirect in that they influence two factors that more directly predict the implementation strategy chosen: the perceived need for efficiency in communication and the perceived need for consensus building. Implementers are more likely to see a need for communicative efficiency when (1) the organization has limited channels for communicating; (2) there is perceived to be little time for interaction about the change; and (3) when resources are scarce. A high need for consensus building is likely to be perceived when (1) changes are perceived to be highly controversial or novel; (2) there is a history of resistance to similar changes; (3) critical resources are controlled by stakeholders; and (4) ongoing cooperation is needed for implementation.

A number of studies have examined *employee participation practices* as a key element of strategic communication in the change process. The importance of participation methods stems from the consistent finding that participation is associated with positive outcomes, including increased commitment and decreased resistance to change as well as more positive adjustments for employees who feel included in change-related decisions (e.g., Bordia et al. 2004). Thus, scholars have investigated alternative means of participation. For example, varieties of collaborative “dialogue” as a method or practice of communication have been explored for their potential to enhance the quality of organizational change initiatives (e.g., Kellett 1999). Dialogue is particularly valued for its emphasis on increasing understanding and learning, both of which may be valuable in enhancing relationships and creative action (→ Learning Organizations). Similarly, methods such as appreciative inquiry that focus on involving employees in identifying and building on existing, positive aspects of organizational practices have received increasing attention. Proponents of these methods theorize that such practices are energizing and motivating because they reframe change from a problem orientation that puts a spotlight on negative deviations from desired standards to an “appreciation” orientation that focuses on positive deviations and methods for enhancing them. Finally, given the documented value of participation in creating positive outcomes, various large-group participation methods have been devised and explored for their potential to include a higher proportion of an organization’s members in the participation process.

Since employees' responses to change initiatives can be a critical factor in the success of change initiatives, substantial attention has been directed at identifying factors that influence their responses and ways to manage them. In fact, much of the research on communication principles and participation studies reviewed above has been motivated by concern for generating positive responses from employees. Involving employees, in particular, tends to create a greater sense of control and commitment. In addition to research on participation and communication principles, other research suggests that early, regular, and relatively complete communication, along with various forms of social support, tends to relieve the stress associated with change as well as to decrease resistance to change.

### **INTERPRETIVE AND CRITICAL RESEARCH**

Beyond application-oriented research, interpretive and critical studies of communication in change management have focused on how change initiatives and practices are symbolically enacted and socially constructed, the tensions and contradictions underlying change processes, and the political processes through which participants employ power in their struggle for material and symbolic resources. An example that encompasses many of these themes is an in-depth, longitudinal investigation of change processes in the context of the post-merger developments at Nordea, a multinational financial services company (Søderberg & Vaara 2003). The study illustrates sense-making and political processes employed by managers and other stakeholders in the process of attempting to merge companies representing different organizational and national cultures into a coherent entity. The findings demonstrate that the process is fraught with tensions and struggle (→ Organizational Communication: Critical Approaches).

Another theme within interpretive and critical studies is characterizing the role of discourse at multiple levels (e.g., macro, meso, and micro). Both change agents and stakeholders draw on prominent socio-cultural (or macro-level) discourses in framing their meso- and micro-level discourse in the context of organizational change. For example, managers are influenced by discursive hype surrounding new management trends such as e-commerce, sustainable business, and enterprise resource planning. They subsequently draw on the same discourses in selling these initiatives to stakeholders both internally and externally. Through resonance with these discourses – often framed in terms such as “best practice,” “leading edge,” and “world class” practices – organizational persuasion (meso-level) campaigns as well as manager–employee (micro-level) interactions take on legitimacy. Stakeholders, often immersed in the same discourses, draw on them to interpret as well as resist change initiatives. Critically oriented scholars often seek to demonstrate how discourse is used strategically to mask efforts to serve the interests of some groups – both within and external to organizations – at the expense of others.

Future research on change management and communication will need to pay more attention to theory development. At present, much of the applied research on change communication is atheoretical, although there have been attempts to draw on speech act theory, stakeholder theory, social identity theory, and others. Critically oriented research, for its part, will need to move beyond critique to offering alternative visions of more positive change communication processes.

## **Channel/Program Loyalty**

*Horst Stipp*

*NBC Universal*

The issue of viewer loyalty has received some attention from academics, but it is of vital interest to broadcasters. Since the beginning of → television, stations and networks have tried to promote viewer loyalty in order to increase ratings, advertising revenue, and profits (→ Advertising, Economics of; Markets of the Media). In fact, the way US broadcasters devise programming schedules – with most programs being shown daily or weekly at the same time – is designed to maximize loyalty. Branding strategies and campaigns have the same goal (→ Branding). However, looking at the history of television, it is clear that technological developments have changed television behavior and have strongly affected viewer loyalty. The following describes in more detail the changes in the US but the pattern would apply to most industrialized countries with multichannel television systems.

Until the mid-1970s most people in the US had about five channels and the three networks had audience shares over 90 percent. One might say, loyalty was high by default. Audience research indicates that most viewers expressed preferences and loyalties to local stations – the stations’ local news programs and also their prime-time programs (→ Audience Research; Exposure to News; News Audience). But many viewers were not able to correctly connect prime-time programs and the networks that carried those programs.

The increase in the *number of channels* through cable and satellite and, of course, the *remote control* changed viewer behavior (→ Cable Television; Satellite Television). First, the change was small: cable networks did not offer very attractive programming and in 1985, barely 30 percent of all households had remotes. However, as cable and remote control penetration grew, a third factor came into play: cable networks – like MTV – started to brand themselves in ways that eluded the major broadcasters. The big networks all showed a variety of programs that were not thematically connected and, therefore, could not as easily be branded (→ Television Networks). Only the Fox network followed a strategy that was similar to that of the cable networks – a more narrowly defined range of programs and target groups. The increase in choice, combined with new technology that made it simple to exercise choice, started an erosion in viewer loyalty.

These changes prompted a reaction by the broadcast networks. To prevent a further decrease in channel/network loyalty, they persuaded their affiliates to de-emphasize the station brand and *focus on network branding*. In addition, they started “seamless” programming; that is, they shifted commercial pods away from ends of programs to reduce channel switching at the end of programs. We do not know what would have happened without those measures, but indications are, these steps help slow down the erosion of audience loyalty (McGrath 1998).

In today’s multichannel environment, branded cable channels, branded broadcast networks, and many other media compete for loyalty. As Figure 1 shows, there has been a steady increase in the number of channels available to viewers during the past 20 years. Today, the average viewer in the US has close to 100 channels to choose from – a substantial increase even compared to just 5 years ago. The most recent increase is largely driven by digital cable subscriptions, which provide over 200 choices.

Most viewers use, as shown in Figure 1, only a fraction of the available options. Still, the more channels they have, the more they use and the less loyalty they have, especially compared with 20 or 30 years ago. However, there is little support for this statement by News Corp. chair and CEO Rupert Murdoch: “There’s no loyalty to TV channels. That went with the remote control” (Online Reporter 2005). It is true that the remote and the proliferation of choices for the viewers had a major negative impact on viewer loyalty. On the other hand, branding, programming, and scheduling strategies have counteracted those trends.

Research indicates that most viewers’ focus is indeed on the programs they like, but many networks have established a strong brand that attracts loyal fans (HBO, ESPN, Discovery, MTV, and SciFi are examples of networks with well-defined identities; → Brands) and the broadcast networks are still seen by most as “leaders” and receive the highest audience shares. The broadcast networks’ branding has led to a *stronger link between shows and network* than 20 years ago, and the role of local channels has decreased. Further, despite the remote control and the many viewing choices, lead-ins can still create hit programs (as an example, the hit show *American Idol* almost doubled the audience

Figure 1 Trend in channels received and channels used, 1985–2005  
 Source: Nielsen Media Research, NBCU Research

for *House* when that show was scheduled to follow it; → Nielsen Ratings.) Even *channel position* can help a network increase loyalty, and viewing habits seem to have a positive impact on many viewers' loyalty to networks and stations. In short, loyalty and appointment viewing have not disappeared; loyalty is primarily driven by programs, but the network brand and also the image of local stations can be significant factors.

The number of channels available to most viewers is likely to increase further and we see already today a significant increase in the use of broadband for video entertainment. New Internet brands are emerging that compete with established media brands (Yahoo!, YouTube). This presents new challenges for established media brands that want to maintain audience loyalty. Those brands are already active on the web, trying to use their brand to move consumers between their TV and web products. It appears that both content and brand will be important to maintain audience loyalty (→ Online Media).

Technology continues to impact viewer behavior. In May 2007, the digital video recorder (DVR) was in about 17 percent of US homes. Interestingly, new research suggests that the DVR promotes loyalty to programs: it is used primarily to time-shift favorite shows, which are now seen more regularly by DVR owners than by non-owners. HDTV will also play a role in this context because it uses different channel numbers and is, therefore, likely to further diminish the role of channels as a driver of loyalty. At the same time, the increased complexity of media technology and content is confusing many consumers and is making search and navigation more important. This could give a boost to loyalty based on branding.

## **Child Art**

*David Pariser*

*Concordia University*

The generic term *child art* often refers to graphic and even three-dimensional work done by children. The term was first made popular by a leading art educator of the last century, Victor Lowenfeld (1947). It is occasionally used to refer to “real” artworks produced by “wunderkinder” such as Alexandra Nechita (Plagens 1996) who paints only in Picasso’s Cubist style or Wang Yani (Winner 1993) who produced traditional Chinese brush paintings to global acclaim. Two aspects of child art have been studied: the aesthetic, i.e., how good, or expressive, or authentic the image created by the child is; and the developmental, i.e., how best to describe a child’s acquisition of graphic fluency (Golomb 1993; Kindler & Darras 1997; Kindler et al. 2002; → Art as Communication; Media Use and Child Development; Media Use by Children; Visual Representation).

Aesthetic judgments about children’s art are always the result of applying adult norms (Pariser 1997; 2006). Thus, judgments about the aesthetic worth of children’s art are highly contentious, and are best resolved with the antique quip *De gustibus non est disputandum* (There’s no accounting for taste; → Taste Culture). Wilson (2004) noted that the art that children make for themselves borrows heavily from → popular culture (→ Comics), while the look of “school art” reflects the aesthetic choices and preferences of art teachers (Kindler et al. 2002). The move to use popular culture as a source for motivating children’s school art has been much criticized by some modernist educators who define visual art as an exercise in craft and tradition, which gives form to humanistic insight, and comforts the afflicted (Smith 1998). Postmodernist educators see “art” as an open game whose sole purpose is to articulate a social agenda and to provoke the complacent. For the postmodern defenders of transgressive art, the notion of the art object as the occasion for aesthetic experience is a defense of outdated privilege (→ Postmodernism and Communication).

This clash of views has implications for the *identification of authentic child art*. The romantics and their modernist successors celebrated certain features of children’s artwork, its supposedly atavistic spontaneity and formal boldness (Fineberg 1997). Postmodernists, however, expect “real” child art to reveal the uncertainties and difficulties

of postmodern existence. Thus, pop-star cameos and photos of the latest human or natural catastrophe constitute the genuine visual language to use for teaching children art. We note here that there is no empirical basis for postmodernist claims that popular culture is an effective resource for teaching art.

When it comes to describing the trajectory of children's development in the visual arts the classic, stage-bound, linear description is enshrined in the work of Lowenfeld (1947), but it is being displaced by other models. Wolf & Perry (1988) conceived of individual artistic development as the simultaneous exploration of multiple repertoires of representation. Thus, teachers should consider that a child might be trying to master naturalistic drawing at the same time as she is acquiring skills in map drawing, schematic rendering, and cartooning.

The insight that informed Wolf & Perry's model was formalized in Kindler & Darras's (1997) elaboration. Theirs is a multiple-terminus model that describes graphic development as movement along a diverse network of pathways that any given child might travel as she attempts to communicate various ideas. The media explored by children go beyond the two-dimensional and include gesture, language, and the use of still and moving photographic images (→ Visual Communication). In many cases children integrate media, combining image with sound or gesture. Citing Vygotsky (1978), the authors emphasize the ways in which children rely for support on all aspects of their cultural environment (→ Socialization by the Media). This model expands the category of what constitutes child art. Where the term used to refer to material that could be displayed on the refrigerator, we are now dealing with child artwork that may require a DVD player or a computer screen in order to realize the child's communicative intentions (→ Digital Imagery).

## Child Protection, Media Regulations for

*Kathryn C. Montgomery*

*American University*

In democratic societies, the fundamental, core principle of freedom of speech must often be balanced with the need to protect children from harm. This issue has dominated the public debate over children and the media throughout the twentieth century, often moving to the forefront during the entry of a new medium, when parental anxieties are particularly high (→ Media Use and Child Development). Since the earliest days of television and continuing into the digital age, parents' groups, health professionals, and educators have organized numerous campaigns to protect young people from various kinds of harmful media content, often calling on the government to enact safeguards (→ Violence as Media Content, Effects on Children of).

These efforts reached a high level of intensity in the 1990s, as the growth and expansion of the → Internet and a host of accompanying digital technologies transformed the media system (→ Information and Communication Technology, Development of). Several governments have responded with regulations designed to shield children from violent and sexually explicit material in the media. Presented below is an overview of some of these regulations as they have been proposed and carried out in a number of countries (→ Internet Law and Regulation; Sex and Pornography Online).

Concerns over TV violence began as early as the 1950s in the US, when Congress first took up the issue in hearings on juvenile delinquency. Over the years, dozens of bills aimed at reducing television violence were introduced, but none became law. However, when the US Congress passed the Telecommunications Act of 1996, it contained a provision requiring, for the first time, that all new television sets be equipped with an electronic chip that would enable parents to block certain programs (Federman 1998). The *V-chip* is designed to work with the TV Parental Guidelines, a system for labeling program content that was developed by the Motion Picture Association of America (MPAA). During the first few years after the V-chip mandate took effect, neither the television industry nor the manufacturers did very much to educate the public about it. Surveys of parents showed considerable confusion about how the V-chip functioned or what the ratings meant. In 2004, when the government began cracking down on broadcasters over indecent content, the television industry launched several high-profile campaigns to promote the V-chip, but these moves have not thwarted further efforts by advocacy groups and law-makers to push for additional regulations (→ Television Broadcasting, Regulation of).

In Canada (where the V-chip was invented and where it is also largely ignored by the viewing public), the emphasis has been on voluntary measures on the part of industry, including the Canadian Association of Broadcasters' Action Group on Violence on Television and the Canadian Broadcast Standards Council (→ Communication Law and Policy: North America). The European Union, in contrast, as part of its longstanding "Television without Frontiers" initiative, has rejected the V-chip in favor of purely rhetorical devices: "Programs which might seriously impair the development of minors are prohibited," according to a June 1997 Directive of the European Commission (without, however, specifying any means of enforcement). "Those which might simply be harmful to minors must, where they are not encrypted, be preceded by an acoustic warning or made clearly identifiable throughout their duration by means of a visual symbol" (→ European Union: Communication Law). As with the concern over racist and misogynist lyrics in popular music and depictions of violence in → video games, the debate over television programming unsuitable for children continues.

While the Canadian Radio-Television and Telecommunications Commission, in its 1999 *Report on new media*, announced that it would not attempt to regulate the Internet and video games under the Canadian Broadcasting Act, other governments have been much more aggressive in these areas. Concerns over "cyberporn" and its impact on the safety of children and youth began during the mid-1990s, as the Internet began to make its way into more and more homes. The EU-funded COPINE (Combating Paedophile Information Networks in Europe) project, for example, is part of a larger effort to combat child pornography on the Internet. More generally, the EU's Safer Internet initiative (launched in 1999 and expanded in 2004 as Safer Internet Plus) promotes the use of hotlines, rating and filtering technology, public awareness campaigns, and other cooperative ventures to protect children online.

In the US, the Communications Decency Act (CDA), passed as part of the omnibus Telecommunications Act of 1996, imposed fines and possible jail sentences on anyone found guilty of transmitting obscene or indecent material with the knowledge that minors under 18 could receive it. Civil liberty groups challenged the CDA in the courts, and the Supreme Court struck it down within a year of its passage. Over the next two years, new laws were passed to replace the defunct CDA (→ Pornography, Media Law on). The Child Online Protection Act (COPA), enacted in the US in 1998, for example, would make it a crime for commercial organizations to allow access by those under 17 to sexual material deemed "harmful to minors." An official commission was set up through the National Academies of Science to work through some of the complicated challenges posed by the Internet indecency legislation, but because of challenges by civil liberty groups, the law has been blocked in a series of court decisions.

In contrast to COPA, the Child Internet Protection Act (CIPA), passed in the US in 2000, has been successfully implemented. That law requires libraries and schools receiving federal discounts and funding for computers and Internet access to install filters on computers used by minors, in order to restrict their access to harmful material on the Internet (American Library Association 2006). A survey by the Pew Internet and American Life Project found that more than half of Internet-connected families with teens are using some kind of filter, although the overall effectiveness of this technology remains unclear. The US government passed a law in 2003 creating a "dot-kids" domain,

an official subsection of the .us domain, described as a “child-friendly” safe zone for children under 13. The following year in Europe, such concerns were extended to mobile networks (as an emerging major carrier of online content), with the formation by the European Internet Coregulation Network (a consortium of nine private organizations) of a working group on child protection and mobile phones.

The public policy debates over violent and indecent content during the 1990s left a legacy of “parental empowerment tools,” including an array of rating systems, filtering software products, and labeling schemes, as well as dozens of private, self-regulatory initiatives that are now institutionalized into the expanding media landscape. But the persistent public focus on media harm to children and teenagers has also created a climate within government, the educational community, and industry that positions young people primarily as potential victims in need of protection, rather than as productive participants in digital media culture. Such concerns have diverted attention away from developing a broader understanding of the role of media as a positive force in the lives of children and youth.

## **Chile: Media System**

*John Sinclair*

*University of Melbourne*

Chile is a country of over 16 million people, lying along the southwest coast of South America. Becoming independent from Spain after 1810, Chile evolved as a republic with

strong democratic traditions, until a major coup in 1973. The development of media in Chile has been unique in its region, principally because of the following interregnum of dictatorship from 1973 until 1988, which accelerated the adoption of neo-liberal policies. By the mid-2000s, although it still had a local press duopoly like its neighbors, Chile's degree of commercialization and of foreign ownership in radio, in free as well as pay television, and in related telecommunication services, notably the Internet, set it apart from the conventional model in the region of local family oligopolies.

Clearly, the *dictatorship* was a crucial turning point in Chile's history, including that of the media. Prior to September 11, 1973, when a military coup led by General Augusto Pinochet overthrew the legally elected Unidad Popular government of Salvador Allende, there was a highly politicized press, with five pro-government dailies and the government's own publishing house, Quimantú, lined up against the three dailies and regional papers of the conservative Edwards family's El Mercurio group. Centered in the capital and most populous city, Santiago, their papers dated back to the beginning of the twentieth century. As well, the Copesa company had one daily, and there was one other, *Clarín*.

As for broadcasting, radio had developed as a wholly commercial medium ever since the 1920s, when Chile was the first country in the region to adopt it, but in the 1960s, in order to keep television independent of both commercial and state control, the first licenses were given to universities, and funded jointly by state subsidies and advertising. This system was quite distinct in the region. The General Law of 1970 also set up a national state network and regulatory body (→ Radio Networks).

With the coup, all left-wing newspapers were closed down, and even those of the center-right and right squeezed out of existence. The state → television network was seized, and put under direct control of the new regime, and laws were passed in the name of state security to obstruct journalistic investigation and otherwise impose censorship of media content. Scores of journalists were killed or made to disappear, and hundreds sent into exile (→ Violence against Journalists). As the dictatorship consolidated itself, the press settled into a duopoly of El Mercurio and Copesa, while state subsidies were withdrawn from television, obliging networks to conform to an exclusively advertising-supported system. Before the end of the Pinochet years, the basis was laid for the subsequent development of privately owned broadcast and cable television networks (→ Communication Law and Policy: South America).

Under the constitution with which the dictatorship sought to legitimize itself in 1980, a plebiscite on the junta's rule was set down for 1988, and as that time approached, some opposition *daily newspapers* emerged, joining a flourishing alternative media scene. Pinochet was rejected in the plebiscite, ushering in an era of democratic transition under the Concertación, a coalition of pro-democratic parties. However, because the Concertación continued to pursue much the same kind of neo-liberal policies as were introduced by Pinochet, reform-minded Chileans were disillusioned by a failure to achieve the level of democracy and diversity they had expected. For example, the new government gave no support to the progressive dailies, and even online newspapers failed in a market still dominated by the El Mercurio–Copesa duopoly. Media reform was not a priority: it took until 2001 before the former dictatorship's media controls were superseded by a new press law.

Similarly with *television*, the Concertación government favored a neo-liberal approach, facilitating a privatized, commercial system, which has come to eclipse the university-based public service model. University channels and the national state network still form part of the Chilean system, however, regulated under the National Council for Television, but all are advertising-based. Even before the end of the dictatorship, broadcast television was in 95 percent of homes, and after 1990 the new government intensified the commercialization of the industry by carrying through the junta's initiative in permitting two private channels to open up, at the same time allowing cross-media and foreign ownership (→ Commercialization of the Media). These provisions initially enabled Copesa to acquire a network, while Mexican and Venezuelan media conglomerates were able to obtain significant interests in the industry later during the 1990s (→ Media Conglomerates). In terms of → advertising, television overtook print as the premium advertising medium early in the decade, and by 2004 was reaping almost half of total advertising media expenditure. Though radio lags behind even print in its attraction for advertisers, its reach extends into more remote areas than television, and it has undergone a similar internationalization of ownership.

However, the greatest extent of foreign ownership is found in the convergent media of *cable and satellite television*. Originally there were two cable providers, but the US companies involved in each of them, Liberty Media and UnitedGlobalCom, later merged within the US. In Chile, this created VTR GlobalCom, which in 2006 was claiming 80 percent of Chile's cable subscribers, as well as being the major → Internet service provider. Similarly, at the global level, the once-competing satellite services Sky and DirecTV merged with the Murdoch News Corporation takeover of DirecTV in 2004. The cases of both cable and satellite illustrate how foreign ownership can diminish media diversity, beyond the reach of national control (→ Satellite Communication, Regulation of). Both kinds of service tend to cater mainly for upper socio-economic groups, while broadcast television remains more of a mass medium. Nonetheless, pay services achieved over 20 percent market penetration by 2006, the highest in the region, stimulated by the availability of the "triple play" of fixed telephony, broadband internet access, and pay television in the one package. Consequently, there is also a high rate of computer ownership and Internet access.

## China Central Television Channel 9 (CCTV-9)

*John Jirik*

*University of Texas at Austin*

CCTV-9 is the global 24-hour English-language channel run by China Central Television (CCTV), the state-owned broadcaster of the People's Republic of China (PRC; → China: Media System; Newscast, 24-Hour). CCTV-9 has a dual function: (1) to provide → news and information about China, Taiwan, Hong Kong, and Macao in line with government policy, and (2) to provide news and information about world affairs from a PRC perspective. CCTV-9 is available globally via satellite, cable, and the Internet (→ Satellite Television; Cable Television; Internet). Its target audience is foreigners, both inside and outside the PRC. It plays a key role in *wai xuan* or “external publicity,” projecting for the PRC what Joseph Nye (2004) calls “soft power.”

CCTV-9 was *launched* on September 25, 2000, when the English-language programming was split off from CCTV's overseas-oriented channel, CCTV-4, which then became a global 24-hour Mandarin-language service. CCTV-9 and CCTV-4 are part of the Overseas Service Center at CCTV, which also operates a 24-hour global Spanish and French channel, CCTV E&F.

On May 3, 2004, CCTV-9 was *relaunched* as CCTV International, although it retains the channel identification CCTV-9. The relaunch was ordered by the Communist Party of China (CPC) Politburo member in charge of publicity, Li Changchun, who in 2003 had called for the creation of “China's CNN.” The idea of emulating → CNN, understood as an instrument of state power, had been circulating since at least 2001, when it was used to describe CCTV-9's role in the “going out” project.

The “going out” project was part of a long-term strategy to make the PRC's external publicity internationally competitive (Xu 2002). In April 2003, media involved in *wai xuan* were told to check whether reports helped create an international environment conducive to the PRC, whether they improved the PRC's image abroad, and whether they were conducive to safeguarding national security and stability. Media were charged with providing accurate information about the PRC's opening up, reform, and development, and promoting reunification with Taiwan as well as promoting the PRC's stated desire for world peace, development, and common prosperity.

In September 2003, Li Changchun further announced that CCTV-9 had to take issues such as the economy and travel, which Li delineated as of interest to foreigners, as the starting point for reporting, and at the same time to report the world's news, including news about the PRC, in a timely fashion. The goal was to make CCTV-9 an “international news channel in the genuine sense” (CCTV 2003; → International News Reporting).

The relaunch of CCTV-9 as CCTV International was aimed at creating a rolling news service that would eventually compete with channels like CNN International, the → BBC World Service and Al Jazeera International (→ Arab Satellite TV News). The ambiguity of a channel that is both an instrument of state power and committed to becoming an international news channel was glossed in the realization of Li's directive. The editorial

policy at CCTV-9 was to report foreign news according to international norms, and foreign policy and domestic news in line with official policy (→ Journalism; News Values; Standards of News; Journalism: Normative Theories). As a result, sensitive topics were variously reported from the government's point of view, toned down, or ignored. CCTV-9 was best understood as a hybrid channel that served both as a rolling news channel and as a government publicity organ, an amalgam of public service broadcaster like the → BBC, commercial news channel like CNN, and → propaganda channel like → Voice of America (→ Public Broadcasting Systems; Hybridity Theories).

CCTV-9 had a budget of 100 million renminbi (US\$12 million in 2005 figures) and about 300 staff, of whom some 30 were foreign nationals. Foreigners were employed primarily to copyedit stories and programs written or translated by domestic staff. Foreigners also worked as program hosts and news anchors. As part of its relationship with CCTV, → News Corporation provided CCTV-9 with consultants who periodically visited Beijing to advise management on strategies for targeting foreign audiences and to train program-makers and reporters. CCTV subscribed to the news wire and video services provided by Associated Press and Reuters, which provided the raw video and scripts for over 80 percent of the foreign news (→ News Agencies). Most of CCTV-9's domestic and foreign policy news programming was translated and rewritten from CCTV-1 (CCTV's flagship channel), and CCTV-4. CCTV-9 produced some of its own feature and entertainment programming and the reporting team generated about 10 percent of the news. CCTV-9 had video exchange agreements with several foreign broadcasters, but rarely used them.

CCTV-9 had two major departments, news and current affairs, and features. In 2007, the news and current affairs department had about 200 personnel and was providing 94 hours (56 percent) of programming weekly. The features department had 100 personnel and provided 74 hours (44 percent) of programming. Most news and current affairs were broadcast live. All feature programming was taped, and usually repeated once or twice daily.

The → audience for CCTV-9 was difficult to measure (→ Audience Research; Nielsen Ratings). CCTV did not include figures for CCTV-9 in its weekly ratings survey. Although the channel had become an indispensable instrument for foreigners living in the PRC with no access to other English-language programming, the bulk of CCTV-9's audience was thought to be local Chinese, most of them using it to help them learn English. In 2005, CCTV publicity materials claimed that the channel had 2.3 million subscribers outside the PRC.

## **China: Media System**

*Shuhua Zhou*

*University of Alabama*

For centuries, China stood as a leading civilization, outpacing the rest of the world in the arts and sciences. But in the nineteenth and early twentieth centuries, China was beset by civil unrest, major famines, military defeats, and foreign occupation. After World War II, the Communists, under chairman Mao Zedong, founded the People's Republic of China (PRC) in 1949, which centralized control over almost every facet of Chinese life. After 1978, his successor, Deng Xiaoping, gradually introduced market-oriented reforms and decentralized economic decision-making. Political controls remain tight even while economic controls have continued to be relaxed under President Jiang Zemin (1993–2003) and President Hu Jintao (2003–).

China occupies a total of 9,360,000 square kilometers of land. The total population is approximately 1.3 billion. The Communist Party of China (CPC) is the key decision-making group in Chinese politics, economics, and security affairs, but the influence of non-party consultants, business leaders, and organizations has increased since the reform launched in early 1980s.

### **MEDIA REGULATION AND CONTROL**

The General Administration of Press and Publication (GAPP) is the government's administrative agency responsible for drafting and enforcing China's press regulations as well as screening books for content. The GAPP has the legal authority to screen, censor, and ban any print, electronic, or Internet publication in China (→ Censorship). Because all publishers, including those using the Internet, are required to be licensed by the GAPP, the agency also has the power to deny people the right to publish and to completely shut down any publisher that fails to follow its dictates.

China's State Administration of Radio, Film, and Television (SARFT) controls the content of all radio, television, satellite, and Internet broadcasts in China. The Ministry for Information Industry is responsible for regulating China's telecommunications and software industries. It also controls the licensing and registration of all Internet information services.

The Central Propaganda Department (CPD) is the Communist Party's counterpart to the government's GAPP and SARFT. Whereas the GAPP and SARFT exercise their powers through their authority to license publishers, the CPD is the organization primarily responsible for promoting and monitoring content to ensure that China's publishers, in particular its news publishers, disseminate information consistent with the Communist Party's policies and agendas. The CPD is a special organization that is highly involved in almost every aspect of China's media issues.

### PRINTED PRESS

China was among the first nations to have *printed newspapers*. The country's earliest newspaper, *Di Bao* (Court Gazette), debuted in the Tang Dynasty, during the first half of the eighth century (→ Newspaper, History of). The Chinese press, however, remained undeveloped until the late nineteenth century, when nearly 300 newspapers began mass circulation. In the early twentieth century, many progressive newspapers appeared to support bourgeois learning as part of the New Culture Movement. Between the two world wars, journalism under the Nationalists and the Communists saw steady growth (Chang 1989).

The number of Chinese newspapers increased approximately tenfold from 1950 to 2000. According to the GAPP (China Knowledge 2005), there were 100 million copies of daily newspapers printed every day in 2004, surpassing circulation figures for all other countries in the world, and making up 14.5 percent of the world's total number of daily newspapers in 2004. China had a total of 1,926 newspaper titles as of July 2005. The country has 218 party-affiliated newspaper titles, accounting for 11.3 percent of its total newspapers. Provincial newspaper titles reached 806, accounting for 41.8 percent, while city newspaper titles totaled 848, accounting for 46.9 percent.

There were only a limited number of *magazine and periodical titles* until the 1970s in China. While the exact number was unknown, it was reported that one-fourth of total circulation of all magazines was attributed in 1955 to two youth publications, *Chinese Youth* and the *High School Student* (Chang 1989). However, 9,500 magazine and periodical titles were published in 2006, among which more than 4,000 emphasize the natural science areas. This number also fairly represents the vast number of state-related institutions that are active in the publishing business (McCullagh 2006).

The total annual circulation of Chinese → magazines has been wavering between 2 and 3 billion copies for nearly 20 years. The average magazine purchase per capita per year has never reached more than three copies. Magazine advertising revenues are estimated to be \$500 million (McCullagh 2006).

Chinese magazines largely focus on general interest and leisure, which allow for simple and easy reading. The Chinese periodical industry, compared to other media, is slow in adapting to the information age and changing its business model accordingly.

## **RADIO AND TELEVISION**

The nation's official radio station is the Central People's Broadcasting Station (CPBS), which has eight channels, and broadcasts for a total of 156 hours per day through satellite (Huang 2006; → Radio). Every province and autonomous region has local broadcasting stations. China Radio International (CRI), the only national overseas broadcasting station, is aired to all parts of the world in 38 foreign languages, standard Chinese Mandarin, and four Chinese dialects, and its broadcasts total 290 hours every day. It offers a variety of programs consisting of news, current affairs, commentary, entertainment, politics, economy, culture, technology, and so on. Currently, CRI ranks third in overseas broadcasting time and languages in the world. There are approximately 1,000 radio broadcasting stations in China (Huang 2006).

The → television era did not begin in China until 1958, when the Beijing TV Station began servicing the capital city with one channel. Chinese radio was a step ahead, with the CPC establishing its first radio station in 1940 (Chang 1989).

In 1965, there were 12 television and 93 radio stations in China. In 1978, China had less than one television receiver per 100 people, and fewer than 10 million Chinese had access to a television set. However, at the time of writing there are about 25 TV sets per 100 people and approximately a billion Chinese have access to television (G. Xu 2003). By the end of 2005, there were approximately 2,450 television broadcast stations in China. Of these, 20 are administrated by China Central Television (CCTV), 31 are provincial TV stations, and nearly 2,400 are local city stations (Huang 2006).

CCTV is the largest and most powerful national television station in China. It has established business relations with more than 250 television organizations in over 130 countries and regions around the world. CCTV and some 3,000 television channels across the country constitute the largest television network in the world.

## **THE INTERNET**

The first computer network in China was the China Academic Network (CANET), set up in 1987. It provided email exchange services with the global → Internet via a gateway at Karlsruhe University in Germany. In spite of political and social concerns, the Internet has seen rapid growth in the last decade. Today, there are 123 million Internet users and the number is expected to hit 180 million by 2010 (CINIC 2006), making China the second largest Internet-using nation after the United States. According to China's Ministry of Information Industry (MII), three major Chinese metropolises, Beijing, Shanghai, and Tianjin, have the highest concentration of Internet users, with 28 percent of Beijing's population having access to the Internet.

China's broadband users have reached 77 million, about two-thirds of the total Chinese online population. This represents roughly 11 percent of Internet users in the world. Although mainland China has the second-largest Internet population, its penetration of 9.9 percent lags far behind nations like the United States and Japan. However, the price of broadband connections is fairly reasonable, financially within reach for the Chinese middle class. A wide gap exists between Internet use in cities and rural areas.

The number of websites has risen by more than 110,000 to a total of 788,400 (CINIC 2006). Blogging has also become a new way of communication for scholars, researchers, novelists, and social activists.

### NEWS AGENCY AND MULTIMEDIA GROUP

*Xinhua* is the nation's official → news agency, headquartered in Beijing. It was established in 1931 and is known as one of the major international news agencies in the world, with over 100 branch offices internationally. It has more than 7,000 staff engaging in news coverage, management and operations, and technical work. Its news gathering and processing system consists of three parts, namely the head office, domestic branches, and overseas branches. In many ways, *Xinhua* is the fuel propelling China's print media. Perhaps unique in the world because of its role, size, and reach, *Xinhua* reports directly to the CPC's Department of Propaganda. Because most newspapers in China cannot afford to station correspondents abroad, or even in every Chinese province, they rely on *Xinhua* feeds to fill their pages. The *People's Daily*, for example, uses *Xinhua* material for approximately a quarter of its stories. *Xinhua* is more than just a news agency, however; it is a publisher as well, with more than 20 newspapers and a dozen magazines in Chinese, English, Spanish, French, Russian, and Arabic.

China's membership of the World Trade Organization began on December 11, 2001. In response to competition and challenges from overseas media groups, the Chinese government organized state conglomerates by establishing transregional multimedia news groups in 2001 in order to compete on the transnational media giants' terms. The *China Radio, Film and Television Group*, founded by the end of 2001, combined the resources and power of the central-level radio, television, and film industry with the radio and television Internet companies, through the varied avenues of television, Internet, publishing, and advertisement. It is the biggest and most powerful multimedia group in China. At the same time, Chinese media began to cooperate with overseas media groups.

Prominent newspaper groups in China include the Guangzhou Daily Newspaper Group, the Beijing Daily Newspaper Group, the Wenhui Xinmin Associated Newspaper Group, the Liberation Daily Newspaper Group, and the Zhejiang Daily Newspaper Group. Among electronic conglomerates are the Hunan Radio, TV, and Film Group, the Shanghai Radio, TV, and Film Group, and the China Radio, Film and Television Group.

### CHANGING MEDIA ENVIRONMENT

Within the PRC, there has been heavy government involvement in the media for some decades. A number of the largest media organizations are seen as mouthpieces of the government. There are certain taboos and red lines within the media in mainland China, such as questioning the legitimacy of the CPC. Yet within those restrictions, there is vibrancy and diversity of the media as well as fairly open discussion of social issues and policy options within the parameters set by the party (Paradise 2004).

Much of the surprising diversity in the media in mainland China can be attributed to the fact that most state media outlets no longer receive large government subsidies and

have to largely depend on commercial advertising (Zhao 1998). Therefore, they can no longer fulfill the sole function of mouthpieces for the government; instead they must produce programming that attracts and interests people so that they can survive and develop through advertising revenue. In addition, while the government does issue directives defining what can and cannot be published, it does not prevent state media outlets from competing with each other for viewers and commercial advertising.

Government control of information can also be ineffective in other ways. Despite government restrictions, much information is gathered either at the local level or from foreign sources and passed on through personal conversations, text messaging, and the Internet. The withdrawal of government media subsidies has caused many newspapers, including some owned by the CPC, to take editorial stands which are bold and critical of the government. This has come about as the necessity of attracting readers and avoiding bankruptcy has become a more pressing fear than that of government repression (Zhu 1997).

Chinese newspapers have been particularly affected by the loss of government subsidies, and have used investigative reporting and muckraking tactics in order to gain readership. As a result, even papers that are nominally owned by the CPC are sometimes very bold in reporting social issues. However, both commercial pressures and government restrictions have recently caused newspapers to focus on lurid scandals often involving local officials who have relatively little political power. Chinese newspapers tend to lack in-depth analysis of political events that are seen as politically sensitive.

This separation between ideological dependence and financial independence has led to two interesting phenomena. First, most newspapers have begun to increase the number of pages printed in order to include light reading material. Publishers hope this method will help to increase readership and maximize advertising income. Second, some have become media conglomerates by acquiring or founding other businesses (W. Xu 2002). The *Guangzhou Daily Newspaper Group*, for example, owns 13 newspapers, four magazines, one publishing house, and one web station, in addition to advertising, printing, chain supermarkets, hotels, restaurants, and clubs (C. Lee 2003).

The deepening of market reforms has typically resulted in two types of outcome. One is the change of the media ownership structure. Although by law Chinese mass media could not be owned or operated by private sectors or individuals, the development of the stock market has begun to erode the state-owned basis deeply. The other typical outcome is the introduction of world professional standards, direct investment, and advanced management, which is a positive sign of China's integration into broader world standards. Although there is no concrete evidence that the greater participation in political affairs and relative autonomy will eventually lead to freedom of the press, an elite-journalist group, eager to shoulder more social responsibility for the mass public rather than ideological gospels, is steadily taking shape in China (Pan & Lu 2003).

Although the trend in mainland China clearly is toward greater media autonomy and diversity and away from government control and intimidation, cross-currents of resistance persist. Powerful domestic institutions still constrain efforts by the media to become more autonomous and politically diverse.

With the economic development that started in the 1980s, and the arrival of the Internet in the 1990s, Chinese media have become more diverse as they extend their reach throughout China and accommodate their content to mass audience for the sake of

advertising revenue. China's media reform started in the early 1990s, and while the pace was slow, the process of change is inevitable (P. Lee 1994).

Institutional change allows governmental authority and media practitioners to work together to explore some new paths, even though a clear destination is still uncertain. The basic principles of the party-state system remain heavily rooted and powerful (Pan 2005). Journalists have to effectively manage the tensions between market forces and the party-press system in order to reduce political and financial risks in media change. This juggling act often limits them to pursuing professional ideals in a highly restricted manner. Devising and establishing new methods constitutes a mode of media change in this transitional society where the central authority, through its control of political resources and ideological ownership over all media, initiates reforms and sets their speed, depth, and parameters. Viewed in this context, the trajectory of China's media reforms may be hard to predict; much is dependent on the political climate in the forecast (Pan 2005). While the ongoing media change is expanding the presence of and voices from people of different social milieus in the media, such representation enhances the welfare of the public without jeopardizing the authority of the regime.

## Cinema

*Dana Polan*

*New York University*

Provisionally, we can define cinema as on-screen (and even large-screen) presentation of moving images that have been pre-recorded photo-chemically on some support (most often, strips of celluloid).

Among the practices of modern, mass-disseminated visual culture, the cinema was perhaps the pre-eminent form for at least the first half of the twentieth century (after which it confronted challenges for audiences' attention from television) and it certainly continues to exert great impact on both leisure activities and the visual education of publics worldwide into the twenty-first century (→ Popular Culture). As film theorists of the 1970s were fond of declaring, the cinema combines a technical apparatus – that is, technology for capturing images; technology for presenting those images to viewers – and a mental apparatus – that is, the psychological dispositions that encourage spectators to invest cinematic images with great affective power (→ Film Theory). That so many ordinary citizens report that their first response to the media images of 9/11 was to be reminded of → Hollywood big-explosion disaster films (and even perhaps wonder if they weren't seeing “just a movie”) is a sobering reminder of the cinema's ongoing emotional power, its ability to insinuate its imaginary visions into our very mental make-up.

### **HISTORICAL CHALLENGES TO ABSOLUTE DEFINITIONS OF CINEMA**

The cinema emerged out of the rich visual culture of nineteenth-century western society as an art that gave motion to the still images of photography (→ Cinematography, History of; Visual Culture). While the earliest films were single-shot renditions of everyday reality and delighted spectators simply by projecting their ordinary world to them, very quickly creative filmmakers used editing and staged scenes to construct narrative fictions that grew in complexity. The art of film came in the public imagination to be identified with entertainment stories geared for mass consumption around the globe (→ Global Media, History of).

Paradoxically, though, while its very popularity makes it seem easy to say what the cinema is, most definitions of the form capture only some part of the cinematic experience as it has evolved over time and been disseminated across the globe. But to return to the

provisional definition of cinema offered above, the actual history of cinema suggests that virtually every term in such a “definition” is at best a generalization from specific practices particular to just some phases of cinema’s complex history. For instance, although it is easy to associate film with movement and thereby distinguish it from, say, more seemingly static visual culture such as → photography (and here the etymological derivation of “cinema” from “kinetic” can encourage such association), some filmmakers play with stasis in ways that seek directly to challenge cinema’s ostensible kinesis. The motion of the film strip through the projector does not necessarily imply motion in the images that are then presented on the screen. Here, an extreme example might be Andy Warhol’s 1964 film *Empire*, which lasts close to 8 hours and offers a fixed shot of New York’s Empire State Building. While there is some “action” in the film (for example, a blinking light comes on the building as night falls), it is minimal, and Warhol slowed down the experience even more by shooting the film at fast speed (which generates more film stock and therefore extends projection time).

Warhol has been termed an experimental or avant-garde filmmaker, and it has been one of the goals of experimenters in the arts to challenge any attempt to fix artistic forms within rigid definitions. Where narrative diversion has been a, if not the, primary historical form of cinema, avant-garde artists seek other functions for the art form. Additional challenges to an encompassing definition come from the evolution of technologies for the capture and display of images and from changes in the roles those images take on for their various publics.

For example, it might be tempting to *distinguish cinema from, say, → television* by the supposed intimacy of the latter within the privatized realm of domesticity (television as a medium of the home). But it is clear that from the second half of the twentieth century on, there were various forms of convergence between screen practices, both large and small, public and private, that blurred the boundaries of cinema and other forms of moving-image culture. Is the ritual holiday presentation of *The wizard of Oz* (1939) on television part of cinema history (the holiday viewings are in fact where the popular veneration of the film really took off) or part of television history, or both? Is the viewing of a feature film on a computer screen or even, as is becoming more possible, on a mobile phone still part of a cinematic experience we so traditionally assume involves public movie-going? Conversely, is the viewing of a loud, explosion-filled Hollywood blockbuster on a television screen at home not to be called movie viewing, especially if the television is a large-screen “home theater” (which may be hooked up to a domestic version of multi-track Dolby and THX sound; → Digitization and Media Convergence)?

In today’s movie business, the public projection of a film in theaters is often only a first stage in a process in which the individual film moves across *multiple media platforms* – from theater to DVD, to subscription → cable television and cable video-on-demand, to computer screen, to large-screen home projection to hand-held device, and on and on. If we are tempted to think stereotypically of cinema as an independent cultural form centered on the experience of seeing films in a theater, then it seems increasingly likely that such singular imagining of cinema is partial and inadequate. It is the prediction, moreover, of most media experts that digital filmmaking and digital projection will eventually supplant most production and exhibition through the physical format of film stock, and this rendering virtual of film images will no doubt further the convergence of

cinema with other forms of digital culture such as television shows and video games (→ Digital Imagery).

### **FROM THE HISTORICAL VARIABILITY OF THE CINEMATIC EXPERIENCE TO HOLLYWOOD HEGEMONY**

It is likely, then, that an understanding of cinema requires less an ontology (that is, a definition of the very being, the very nature, of the cultural form) than a history or a sociology of the various forms of cinema that have been and will be. Indeed, if we associate “cinema” with the experience of public, theatrical projection of moving images, that is because historically such experience became the socially dominant form for the art. Revealingly, many of the very first films were viewed not in public, theatrical contexts but on a person-by-person basis: in particular, the Edison Kinetoscope of the late nineteenth century involved the film strip running inside a large box that single spectators peered into one at a time. It was not inevitable that screen images would cease to be viewed in such privatized, individualized fashion, and it was in large part the impact of market conditions – the financial need to bring in more revenue by bringing more people into contact with the cultural form – that led to larger screen projection viewable by collective audiences rather than just individuals alone.

Clearly, the historically hegemonic form of cinema through the twentieth century was the narrative, fiction film, with the *US film industry* in particular assuming domination of the world market (→ Film Production). In the earliest decades, Europe had been in the forefront of production and distribution, but World War I left many European film companies in a shambles and US firms quickly gained a comparative advantage in the world market for film entertainment. For many audiences, cinema means “the movies,” by which the intention is to describe an entertaining, diverting, and kinetically moving form of leisure culture based on identification with on-screen characters who are involved in stories often of romance and action. That identification is fostered by film techniques that render the image seductive (for example, in Hollywood’s so-called Golden Age, soft focus might be used in close-ups of stereotypically beautiful women stars to give them an additionally attractive ethereal quality) and by the → star system itself, which implied that certain people stood out from the crowd and deserved special adulation for their grace and glamour (→ Cinematography).

The seductiveness of Hollywood fictions centered on vibrant protagonists could be so strong as to cast its spell over cinematic forms that set out precisely to move away from fiction and offer an imputed direct engagement with everyday reality. Thus, many works from documentary cinema adopt compelling narrative form and center on figures who fight the odds to insist on their place in the world: from Robert Flaherty’s portrayal of the resilient Eskimo who keeps at his battle with savage nature in *Nanook of the North* (1922) to Michael Moore’s documentary box office hits like *Fahrenheit 9/11* (2004), the history of the nonfiction film is to a large degree the tale of its complicated encounter with fiction, narrative engagement, and entertainment (→ Documentary Film).

Throughout its history, indeed, the documentary film has had to bear the charge that its seemingly direct presentation of reality is in fact mediated in ways that blur the boundaries of truth and fiction. The infamous manner by which Leni Riefenstahl’s 1935

documentary *Triumph of the will* set out to propagandize for Adolf Hitler as a seemingly god-like figure of incomparable charisma is only the most explicit example of a constant temptation in documentary to turn instruction into preplanned and prepackaged emotional persuasion (→ Propaganda in World War II). The documentary may set out to educate but it also frequently intends to seduce, and here the rhetorical devices of Hollywood storytelling are frequently an evident resource: not for nothing was the celebrated wartime propaganda series, *Why we fight* (1943), which set out in rousing fashion to mold ordinary citizens' support of the war efforts of the Allies, put together by Frank Capra, a Hollywood director well known for films of intense emotionalism and sentimental appeal.

Hollywood's hegemony over publicly shared image culture throughout the globe has raised concerns by → censorship organizations, moral custodians, and even governments over the power of this visual medium. For instance, in the domestic market of the US itself, worry over the potentially *deleterious effect of audience identification* with glamorously portrayed but morally dubious characters led to the imposition of a code of permissible content in films that achieved refinement at the beginning of the period of the sound film (the late 1920s and early 1930s) and then lasted for decades.

At the same historical moment, a group of conservative religious figures who worried over the *movies' impact on morals* decided to give their condemnation scientific standing by turning to social scientists for experiments that would “prove” the cinema's negative effects on behavior, conduct, and even health and personal well-being: with funding from a private foundation concerned with reform morals, the Payne Fund, the scientists produced over 10 volumes through the first half of the 1930s (→ Media Effects, History of; Morality and Taste in Media Content). The results of their investigations were somewhat mixed but it is clear that there was pressure on these social scientists to come up with conclusions that at least imagined popular cinema to likely have deleterious effects on public morals. However compromised in their research objectivity, the Payne Fund studies on the influence of movies are still cited in the literature of communication studies as one of the first concerted efforts – albeit highly biased in intent and highly questionable in control of method, collection of data, and interpretation of experimental results – by social science to conduct communications research on media effects for a specific form of modern popular culture.

### ALTERNATIVES TO HOLLYWOOD

Globally, there has historically been concern about the hegemony of Hollywood over other national cinemas, and resistance to the perceived power of the American feature film has manifested itself most immediately in such forms as quotas (percentages of indigenous production versus American film allowed into diverse national or regional markets), incentives (such as tax breaks) to local filmmakers, subventions of filmmaking when it concerns indigenous subject matter, and so on. The history of cinema is simultaneously the *history of a dominant industry* centered in Hollywood and the diversity of alternatives that have arisen elsewhere over time. This “elsewhere” can include American sites in which there is an attempt to articulate non-Hollywood modes of production: for example, the avant-garde film scenes of New York and San Francisco in the 1960s or the rough urban filmmaking of blaxploitation in the 1970s (which ironically was itself eventually largely co-opted and commercialized by Hollywood itself).

In some cases, the intent of filmmakers outside of the Hollywood system is to rival Hollywood at its own game by intensifying the entertainment propensities of various genres of playful diversion (→ Film Genres). For instance, *Italian “spaghetti westerns”* of the 1960s or *Hong Kong “kung fu” action films* from more recent years take inspiration from Hollywood genres of violence (for example, the western or the gangster story) as well as from Hollywood investment in the glamorous star (for example, in the Hong Kong case, the male star, whose characters exhibit extreme prowess in scenes of combat; → Hong Kong Cinema). Thereby, these non-Hollywood genres set out to articulate their own particularly seductive form of action through choreographed set pieces in which violent men move virtually balletically as they go about their work of mayhem.

In the 1980s, to take a very different example, a *French film industry* that was decidedly commercial in intent revitalized itself by focusing on the screwball genre of popular, fast-talking comedies of amorous and personal misunderstanding (as in the big indigenous hit, *Trois hommes et un couffin* [1985], about three carefree bachelors who suddenly “inherit” a baby from a single mom and must learn familial responsibility). Perhaps predictably, the success of such genre cinema has caught Hollywood’s attention and led to such phenomena as the hiring of global talent into the American system (for example, the revered Hong Kong action director John Woo was brought to Hollywood, as were seductive actors like Chow-Yung Fat) and to Hollywood remakes of successful genre films from the foreign scene (thus, *Trois hommes* became *Three men and a baby* [1987]).

Other global filmmakers and film industries find their own specificity less by extension or emulation of Hollywood genre entertainment than by the production of films that they assume offer audiences experiences that fall outside the purview of Hollywood escapism. For instance, in the 1960s and 1970s, a number of filmmakers in so-called “third world” countries set out, often with government support through production subvention, to challenge what they saw as their media industries’ risk of dependency on US hegemony in the cultural realm. Against the glossy visual perfection of the Hollywood film, some filmmakers (for example, in Latin and South America) thus militated for an activist cinema that would be rough or deliberately imperfect in look and politically confrontational in subject matter. This cinema was sometimes termed “third cinema” or “imperfect cinema.”

Yet other filmmakers have been driven by the assumption that there needs to be an encouragement of cinematic forms other than that Hollywood one geared ostensibly to passively absorbed entertainment. The alternative for these filmmakers is to create works that they assume lead to the audience’s intellectual engagement with what it is seeing and to reflection on both artistic and existential issues as well as political ones. Thus, in the period after the Russian Revolution of 1917, a number of *Soviet filmmakers* such as Dziga Vertov and Sergei Eisenstein set out to construct a dialectical cinema that would refuse easy entertainment and dramatically compel spectators toward new social attitudes.

Likewise, in the late 1950s and early 1960s especially, what was termed “*European art cinema*” was rich with films that offered thematic complexity, moral dilemma, intellectual puzzle, dis-identification with character, and philosophical reflection, along with an anti-narrative refusal of closure and the tying up of all enigmas with a happy ending. One strategy was to end with a freeze frame in which characters were caught in the midst of making a decision about life options – see, for instance, the famous last shot of François Truffaut’s *The 400 blows* (1959) with its truant boy stuck at the ocean’s edge not sure

where to go – and in which it was assumed the audience itself had to puzzle out intellectually what could or even should happen next.

Significantly, this emphasis in the 1950s and 1960s on an “art cinema” that ostensibly encourages the audience both to think and to appreciate concerted experimentation with cinematic language was complemented in the 1960s by criticism and scholarship that themselves emphasized a cinema of aesthetic distinction from Hollywood light diversion (→ Aesthetics; Art as Communication). Central to this new critical discourse was an emphasis on the film director as “auteur” – that is, a veritable author who, even with a screenplay written by someone else, imposed his or her own thematic vision on the finished work of film art. By the 1970s, the Hollywood film industry itself – which had seen its own efficacy of production and its own grasp of the world filmmaking scene challenged with the coming of television, the break-up of the old studios, and the influx of new subject matter in the area of sex and violence in ways that showed up Hollywood’s censorious fastidiousness as old-fashioned and out of step with the times – came to invigorate itself precisely by a turn to auteur-driven filmmaking.

For a while, Hollywood filmmaking ceased to seem conformist in order to give witness to films that appeared to have “something to say.” For instance, Robert Altman’s *McCabe and Mrs Miller* (1971) is essentially a “European” type art film but made from within the Hollywood system: this work employs ambiguity of character (is McCabe [Warren Beatty] a hero or not?), distinctiveness of visual style, critique of dominant power structures, thought-provoking thematic resonance, relative explicitness of violence and sexual reference, lack of full narrative closure, deconstruction of genre (in this case, the western) and its pleasures, and so on. However, as much as the “auteur” was intended to serve a directly critical function – reminding one that escapist cinema was precisely a site in which personal voice was rare – it was clearly also a sort of branding by which artful films could be promoted and sold to their target audiences. In this way, a cinema of supposed distinction rejoins the commercial impulses of dominant movie entertainment.

# Cinematography

*Patrick Keating*

*Trinity University*

Cinematography is the technique of photographing motion pictures. The art of cinematography involves working with three distinct sets of tools: the camera, the film, and the lighting. We can make useful distinctions among cinematography, *mise en scène*, and editing. Whereas *mise en scène* involves the arrangement of details in front of the camera, cinematography involves the act of capturing this arrangement on film (→ Film Production). The result of this process is a set of shots that can be cut together in the process of editing. Although these distinctions are not always clear-cut, cinematography is one of the major components of a film's visual style, playing a powerful role in shaping the spectator's experience of cinematic time and space.

## THE BASIC TOOLS OF CINEMATOGRAPHY

In the area of camerawork, the cinematographer can shape the appearance of an image in several ways. For instance, a lens with a short focal length captures a wide angle of view, while a lens with a long focal length (also known as a telephoto lens) captures a narrower angle of view. The resulting images have distinctive characteristics. It is often said that a telephoto lens “flattens” the image, while a wide-angle lens will produce more apparent depth. In Michelangelo Antonioni's *Red Desert* (1964), cinematographer Carlo Di Palma alternates between wide-angle and telephoto lenses to produce a disorienting sense of space, shifting back and forth between flatness and depth.

Each lens is also equipped with an iris, or aperture. By opening the aperture, a cinematographer can allow more light to hit the film. The size of the aperture is one of the most important factors in manipulating depth of field, the range of distance in which objects are in acceptable focus. Opening the aperture decreases depth of field; closing the aperture increases it. In Orson Welles's *Citizen Kane* (1941), cinematographer Gregg Toland uses an array of techniques, including a narrow aperture, to produce deep-focus images, allowing the spectator to see both the foreground and the background in sharp focus.

Cinematographic composition is often dynamic, incorporating both figure movement and camera movement. The camera movement options include pans, tilts, dollies, and cranes. A zoom looks similar to a dolly, but it is actually a manipulation of the lens, moving from wide-angle to telephoto, or vice versa. While many films use editing to direct the spectator's attention, some filmmakers rely more heavily on camerawork, using dollies and zooms to move from long shot to close-up and back again. The Hungarian filmmaker Miklós Jancsó is a master of this approach (see Bordwell 1985).

In composing the image, the camera crew must consider the aspect ratio of the film. This ratio measures the width to height of the image. During the silent period, the most common ratio was 1.33 to 1; in other words, the image had 1.33 times more width than height. During the 1950s, several new widescreen ratios were introduced, such as CinemaScope, with a typical ratio of about 2.35 to 1.

Since the introduction of sound, the film normally runs through the camera at 24 frames per second, but a filmmaker can produce special effects by altering the camera speed. A fast-running camera produces a slow-motion image, and a slow-running camera produces a fast-motion image. In Dziga Vertov's *Man with a Movie Camera* (1929), cinematographer Mikhail Kaufman uses fast motion to convey the pace of the modern city.

The choice of film stock can produce variations in contrast, color, and grain. In Oliver Stone's *JFK* (1991), cinematographer Robert Richardson creates a collage of visual styles by mixing several different types of film stock. The cinematographer can also work with the laboratory to manipulate the image in developing and printing. The lab can correct routine cinematographic errors, such as underexposure, but it can also refine the film's visuals, by adjusting details like color and contrast. Recently, digital post-production tools have increased the filmmaker's ability to manipulate the image.

Although lighting is an aspect of *mise en scène*, it is usually considered a part of cinematography as well, because the cinematographer plays a leading role in coordinating a film's lighting schemes. This is particularly true in → Hollywood, though some industries divide the cinematographer's chores between a camera operator and a lighting cameraperson. Lighting has several variables, including direction, intensity, and contrast ratio. The most common arrangement in Hollywood is three-point lighting. In this system, a key light provides the primary illumination on the subject, a fill light brightens up the shadows created by the key, and a back light separates the subject from the background. With subtle variations, this arrangement can produce the glamorous images of the romantic drama, or the somber tonalities of the *film noir* (Place and Peterson 1976).

### THE BAZINIAN AESTHETIC

Perhaps the most celebrated analysis of cinematographic style is to be found in the work of André Bazin (1967), the French critic of the 1940s and 1950s. Building his analysis on his theory of the photographic image, Bazin argues that photography is distinctly valuable because of its ability to capture reality in all its ambiguity. The important point is not simply that the photograph looks like reality; it is that the photograph, with its causal connection to the object in front of the camera, preserves reality (→ Photography). Bazin is well aware that intentions play a role in the production of most photographs; still, even the most heavily designed photographic image preserves something of the original reality in front of the camera. When it comes to enhancing the cinema's capacity to capture the real world, Bazin argues that certain strategies are better than others. He criticizes editing-based styles because they fragment space and time in the interest of imposing a certain meaning on the spectator. By contrast, deep-focus photography encourages spectators to scan the frame for meaning; the result is closer to the relationship that the spectator has with the real world, where meanings are inherently ambiguous, never in packaged form. Relying on shots of long duration enhances this effect of realism by preserving the integrity of time. Similarly, relying on camera movements rather than editing can preserve the integrity of space. In short, the Bazinian aesthetic, favoring deep-focus compositions, long takes, and camera moves, emphasizes the cinema's capacity to capture the real world (→ Realism in Film and Photography).

In the 1960s and 1970s, film theorists drew on various methodologies, such as semiotics and psychoanalysis, to launch a sharp critique of the realist style. One of Bazin's successors

at the journal *Cahiers du cinéma*, Jean-Louis Comolli (1990) directs his critique at the level of film technology. According to Comolli, a deep-focus film is likely to sustain the dominant bourgeois ideology by reproducing the techniques of Renaissance perspective, thereby relying on dubious assumptions about a universally valid individual observer (→ Film Theory; Perspective, Pictorial). The argument is designed to apply to almost any deep-focus film, regardless of story.

More recently, Fabrice Revault d'Allonnes (1991) has produced a surprising mixture of semiotics and Bazinian realism. D'Allonnes distinguishes between classic and modern lighting. In classic lighting, all the devices work together to produce a single meaning, as when sunlight expresses the mood of a happy scene, or when shadows set the tone for a crime scene. However, d'Allonnes insists that the light of the world does not have any meaning: the sun may shine even when we feel somber. Modern lighting, as in the films of Jean-Luc Godard, respects the meaninglessness of light. Like Comolli, d'Allonnes studies the ways that images produce meaning. Like Bazin, he admires films that honor the ambiguity of reality.

### **QUESTIONS OF METHODOLOGY IN THE STUDY OF CINEMATOGRAPHY**

Some scholars build their arguments on the statistical analysis of a large group of films; others prefer the close analysis of individual cases. Barry Salt (1992) is the most prominent champion of the statistical approach. Examining thousands of films, Salt looks for patterns in variables of cinematography, such as shot scale, as well as in variables of editing, such as cutting rates. One of Salt's achievements is the tracking of changes in shot scale over a century of cinematic style (→ Cinematography, History of). This statistical method provides a background for more evaluative claims about the achievements of individual filmmakers. Salt evaluates filmmakers according to various criteria, including originality and influence. These criteria make sense only against a background of norms. Techniques are original when they depart from prevailing norms; they are influential when they cause a change in norms. Because the statistical method is the best way to track stylistic norms, Salt suggests that it is an essential tool of evaluation (→ Quantitative Methodology).

Some scholars have criticized Salt's approach, on the grounds that he pays too little attention to questions of ideology. In his study of Hollywood cinematography in the 1930s, Mike Cormack (1994) argues that changes in the Hollywood style cannot be explained sufficiently by pointing to the intentions of individual filmmakers; nor can they be explained by developments in technology. Instead, they were most likely caused by changes in American ideology as the United States weathered the Depression. In brief, Cormack proposes that an unpredictable, somber style expressed the sense of crisis in the early 1930s; later, a restrained, high-key style appeared, expressing the reassertion of American ideals that took place after the trauma of the early years. Such an argument combines statistical analysis with interpretation, pointing out systematic correlations of style and theme.

Taking another approach, Richard Dyer (1997) argues that Hollywood's three-point lighting system produced a particular standard of beauty – a standard that cannot be understood without considering the ideologically charged concept of “whiteness.” This is particularly true for female stars, who often appear to be aglow with soft, bright keys and powerful backlights (→ Woman as Sign). Because cinematography shapes meaning,

Dyer relies on interpretation more than statistics. In other words, he builds his argument on the analysis of several individual examples, such as the lighting of Lillian Gish and Mary Pickford, or the writings of major cinematographers (→ Qualitative Methodology).

## CINEMATOGRAPHY IN THE DIGITAL AGE

As digital tools become more and more important to filmmaking, the techniques of cinematography continue to change (→ Digital Imagery). The changes are obvious for cameras and film stock, but digital technology has even changed the way filmmakers approach lighting. It is now relatively easy to modify the lighting in post-production, adding shadows and highlights that previously would have been created on set. Some filmmakers lament the changes; others hope to use the new tools to reproduce the established styles more efficiently; still others predict that the new tools will produce distinctive new cinematographic styles. In any case, cinematography will continue to play a powerful role in shaping the spectator's experience of time and space, even if the borders between cinematography and *mise en scène* continue to blur.

# Cinematography, History of

Luke McKernan

*British Universities Film and Video Council*

Cinematography is the art of photographing motion pictures. All photographing of motion pictures is, in its broadest sense, → cinematography, but it is the special

combination of aesthetics and technology that distinguishes the term. It is the art of the cinematographer that makes cinema compelling, the skillful blending of → photography, lighting, composition, and the capture of motion that creates the essence of what is memorable in cinema. The cinematographer, also known as the director of photography (DP or DoP) or sometimes lighting cameraman, makes real a director's creative vision, establishing a sense of place, character, emotion, and drama, through the essential visualizing of the moment (→ Visual Communication).

## **THE EARLY DAYS OF FILM UNTIL THE ADVENT OF TELEVISION**

### **Technical Development**

Stephen Herbert says of the original efforts to produce motion pictures on film, "To succeed, cinematography required the availability of a sufficiently sensitive photographic emulsion to enable at least sixteen pictures to be taken in one second; a suitable medium on which to fix the photographic emulsion; and the development of suitable camera and projection mechanisms" (Herbert & McKernan 1996, 3). The history of photographing motion pictures precedes the history of their exhibition. The first motion picture as we would now recognize it was a fleeting scene of people walking across Leeds Bridge, filmed in October 1888 by the French-born Louis Augustin Aimé Le Prince, using sensitized paper rather than celluloid. Le Prince achieved a sufficient frequency of images (12 frames per second) to achieve the illusion of movement, but was unable to solve the problems of projection. The French scientist Etienne-Jules Marey, keen to use sequence photography for the analysis of motion, began to use transparent celluloid film in 1890 as a more suitable medium for the taking of motion pictures, and others soon followed, notably William Kennedy-Laurie Dickson, an engineer working for Thomas Edison who was charged with developing devices for the taking and exhibiting of motion pictures.

Dickson had developed a camera using 35-mm-wide celluloid film strips with a double row of perforations by October 1892, thereby establishing the format on which cinema continues to be based to this day. In 1894 he produced a device for the exhibiting of motion pictures, the peepshow Kinetoscope. Various teams now worked on the practicalities of projecting motion pictures onto a screen, a race won by the brothers Auguste and Louis Lumière, whose *Cinématographe* was first demonstrated in March 1895, and famously first shown to a paying public at the Grand Café, Paris, on December 28, 1895. The machine gave its name to the cinema and to the art of motion pictures.

### **The Art of Cinematography in the Silent Days**

There was distinctive art to the Lumières' actualities, and the term "animated photography," which was commonly used to describe the new phenomenon, emphasized the studied quality of the first films, with their careful compositions and capturing of essential motion and form. The dramatic film gradually emerged as films started to get longer, and with its growing popularity with audiences came the distinctive art of the cinematographer. Billy Bitzer, cameraman with the American director D. W. Griffith, is generally considered to be the first such camera artist. Bitzer began working with Griffith

in 1908, finding technical expression for the director's creative impulses by developing such features as the close-up, the iris in, fade-outs, and backlighting. None of these effects were unique to Bitzer and Griffith, rather it was the combined effectiveness and consistency of their execution that proved so influential. Bitzer continued with Griffith, photographing such classics as *The Birth of a Nation* (1914), *Intolerance* (1916), and *Broken Blossoms* (1919) and establishing a lexicon of cinematographic techniques. Generally, as cinema moved out of its initial phase, film stock became more light-sensitive (faster), artificial lighting was employed, lenses improved (wide angle, telephoto), and special effects techniques grew in sophistication. Technology marched forward hand in hand with the screen's hold upon the audience's imagination.

Billy Bitzer was followed by many other great cinematographers who worked in the US in the silent era: Charles Rosher (particularly associated with the films of Mary Pickford), Rollie Thorough (Charlie Chaplin's cinematographer), James Wong Howe (*Peter Pan*), Hal Rosson (*Manhandled*), Arthur Miller (*The Volga Boatman*), John Seitz (*The Four Horsemen of the Apocalypse*), William Daniels (*The Kiss*), and Lee Garmes (*A Social Celebrity*). Several of these would enjoy long careers well into the sound era (Howe won an → Academy Award for *Hud* in 1963). The artistry and technical mastery demonstrated by the finest → Hollywood cameramen of the 1920s was driven by technical innovations in camera design, box office demand, and the rise of the star system, whereby the cinematographer became essential in the creation and sustaining of the illusion of dream-like glamour. European cinema of the 1920s also saw the emergence of several great cinematographers, German expressionist cinema producing such masters of light and shadow as Karl Freund (*Metropolis*, *The Last Laugh*) and Gunter Krampf (*The Student of Prague*, *Pandora's Box*). German and American talents combined to produce perhaps the pinnacle of not only silent film but the art of cinematography itself, F. W. Murnau's *Sunrise: A Song of Two Humans* (1927), made for Fox Studios and photographed by Karl Struss and Charles Rosher, who jointly won the first Academy Award for cinematography.

### Arrival of Sound

The arrival of sound was initially an impediment to the cinematographer's art, as camera movement was restricted to accommodate cumbersome audio technology, and the purely visual means of expression brought to such aesthetic heights by the masters of silent cinema was replaced by a leaden subservience to the spoken word. Sound also saw the running speed of films move from the variable 16 to 22 frames per second of the silent era to a standardized 24 frames per second. Gradually the camera was freed once more, though the dictates of the Hollywood studio system produced a glamorous but formulaic style of cinematography. Gregg Toland's deep-focus photography (where both foreground and background would be in sharp focus) for Orson Welles's *Citizen Kane* (1941) reinvigorated the art of cinematography, providing depth as well as sheen. Stanley Cortez in Welles's *The Magnificent Ambersons* (1942) and Desmond Dickinson for Laurence Olivier's *Hamlet* (1948) further demonstrated the striking effects of deep focus. The technique could not be used too frequently, gaining as it did from its strong dramatic qualities and a certain element of surprise, but its execution brought camerawork to the fore once more, and in its wake came the expressionist photography of postwar *film noir*,

with such skillful engineers of suspense and somber mood as Rudolph Maté (*Gilda*), Nicholas Musuraca (*Out of the Past*), and John Alton (*T-Men*), whose book *Painting with light* (1950) is an eloquent manual of the cinematographer's art.

## THE CHALLENGE OF TELEVISION

### Screen Size and Aspect Ratio

The commercial threat caused by rise of → television in the postwar era saw the cinema respond in two particular ways. The first was the size of the screen. A key consideration for the cinematographer is aspect ratio: the shape of the film frame within which the image is composed. This was effectively established by W. K.-L. Dickson's decision to produce 35-mm-wide film strips for his Edison experiments, with the rough proportions of four by three (horizontal and vertical), or more precisely 1.33 : 1. The addition of a soundtrack meant that a small portion of the picture area was lost, but this essential size remained the standard, and pre-determined the shape of television screens and subsequent monitor designs. Other formats have nevertheless proliferated, for both professional and amateur use: 35 mm and larger formats became the preserve of the cinema and the professional cinematographer; narrow gauge formats such as 17.5 mm (introduced 1899), 22 mm (1912), 28 mm (1912), and 16 mm (1923) were designed for the nontheatrical business; 9.5 mm (1922), 8 mm (1932) and Super 8 (1965) catered to the amateur market; and 16 mm and later Super 16 mm became prevalent in television, alongside new video technologies.

In the 1950s, television's increasing appeal for audiences, and the success of Cinerama (three synchronous films photographed and then projected in parallel) as a special attraction in select theaters, led the cinema to experiment with a variety of different aspect ratios, each giving a wider image than that which television could offer. Some systems achieved this by squeezing the image through an anamorphic lens and then unsqueezing it for projection. First and best known of these "scope" systems was Fox's Cinemascope, with a 2.55 : 1 ratio (subsequently 2.35 : 1), originally employed in *The Robe* (1953, cinematographer Leon Shamroy). Paramount's VistaVision process (first used in 1953 for *White Christmas*, cinematographer Loyal Griggs) used 35 mm film run horizontally through the camera, leading to a negative double the standard size, with reduction prints that could be run on standard projectors. Todd-AO employed a 65 mm negative, a special wide-angle lens, a running speed of 30 frames per second, and printing onto 70 mm film to incorporate six magnetic soundtracks. The result was then projected onto a curved screen, first demonstrated in 1954 with *Oklahoma!* (cinematographer Robert Surtees). Widescreen formats were exasperating for many directors and cinematographers ("It is a formula for a funeral, or for snakes, but not for human beings," said the director Fritz Lang), and in their way they were as restrictive of cinematic techniques as had been the case with the conversion to sound. Eventually 70 mm films were produced for particular film spectacles (although the Biograph company had innovated with this approximate frame width in 1896), and then IMAX. This uses 65 mm film run horizontally in the camera and requires not only special theaters for its exhibition (with a curved screen rising above the audience to achieve its immersive effect) but special films designed for a

format that is strong on natural spectacle but alarming when it comes to viewing faces in close-up. Different aspect ratios continue to be employed to this day, but the industry standard for cinema exhibition has become 1.85 : 1.

### Color

The other strategy to counter television was color. Films were originally monochrome, but the search for color began as soon as cinema was “invented.” In the earliest years, color effects were achieved by hand-painting, then in semi-mechanized form by the application of artificial color through stencils. The first successful natural color system was Kinemacolor (first exhibited 1908), which used red and green filters to achieve an approximation of a full color effect. Similar color systems in the silent era likewise employed two primary colors, including early Technicolor, used for example in *The Black Pirate* (1926, cinematographer Henry Sharp), while the majority of silents were richly colored through the tinting and toning of prints in colors that matched particular settings or moods. Three-strip Technicolor (red–green–blue) was introduced in the 1930s. Initially garish in its effects, Technicolor came to be used with expressive skill in Britain, in particular in the films of Michael Powell and Emeric Pressburger, such as *Black Narcissus* (1947) and *The Red Shoes* (1948) (both photographed by Jack Cardiff), and in Laurence Olivier’s *Henry V* (1944) (cinematographers Jack Hildyard and Robert Krasker), with its bright look inspired by the medieval Book of Hours. The arrival of cheaper Eastman Color in 1950, with improved color rendering, made color cinematography progressively the norm. It was soon followed by similar systems such as Warnercolor, Metrocolor, and Pathecolor. However, color’s prevalence in the cinema was soon followed by ubiquitous color television.

Such has been the move toward progressively naturalistic color that the emphatic or emblematic use of color seems to have, until recently, become a lost art. Directors such as Martin Scorsese, who were notable for their color sense, often looked back to the Technicolor era (Scorsese is a great admirer of Michael Powell, while his 2004 film *The Aviator*, photographed by Robert Richardson, showed the passage of time through the imitation of historical color cinematography techniques). The emergence of digital cinematography and sophisticated post-production manipulation, however, has led to some startlingly creative use of color, such as Christopher Doyle’s visually ravishing work for Zhang Yimou’s *Hero* (2002). Color coding, and the heightening of color for particular effects, is now far more common.

### **NOUVELLE VAGUE AND LATER REVOLUTIONS**

For all of the creative skill so often displayed through to the 1950s, cinematography had always been slave to the studio, employed to conjure up a hermetic illusion. The French new wave of the late 1950s/1960s encouraged a revolution in cinematographic techniques. A wish to capture life on the wing led to the use of light, hand-held cameras and faster film stocks more responsive to natural light. Jean-Luc Godard, François Truffaut (both working in particular with cinematographer Raoul Coutard) and Eric Rohmer (teamed for many years with Nestor Almendros) spearheaded a cinema freed from the shackles of

the studio, emblematic of a freer notion of society. Such films made the process of filmmaking more apparent, increasing audiences' awareness of the camera, of the choices to be made in visualizing a scene.

The new wave was immensely influential, but its innovations pointed up cinema's contradictory needs to portray the realistic (→ Realism; Realism in Film and Photography) and the fantastic. These twin needs have helped determine the trajectory of modern cinema. On the one hand cinema offers a vision of the grittily real, aided by plain or rawly authentic camerawork, for example, *Kes* (1969, cinematographer Chris Menges), *Five Easy Pieces* (1970, Laszlo Kovacs), and *Taxi Driver* (1976, Michael Chapman). On the other, there has been a great impulse toward fantasy, driven by ever more sophisticated special effects, so that cinematography shifts ever more from making the ordinary seem impossibly glamorous to making the impossible seem thrillingly plausible, as in *Star Wars* (1977, cinematographer Gilbert Taylor), *Close Encounters of the Third Kind* (1977, Vilmos Zsigmond), and *Terminator 2: Judgement Day* (1991, Adam Greenberg).

Other great cinematographers not yet mentioned include Guy Green (*Great Expectations*), Winton Hoch (*The Searchers*), Oswald Morris (*Moulin Rouge*), Sacha Vierny (*Last Year in Marienbad*), Freddie Young (*Lawrence of Arabia*), Haskell Wexler (*The Thomas Crown Affair*), Geoffrey Unsworth (*Cabaret*), Conrad L. Hall (*The Road to Perdition*) Gu Changwei (*Farewell My Concubine*), and Dick Pope (*The Illusionist*). There have been some notable director and cinematographer teams, demonstrating how close the creative partnership between the two roles can be, including Woody Allen and cinematographer Gordon Willis (*Annie Hall*, *Manhattan*), Ingmar Bergman and Sven Nykvist (*Persona*, *Fanny and Alexander*), Akira Kurosawa and Asakazu Nakai (*Seven Samurai*, *Ran*), Wim Wenders and Robby Müller (*Alice in the Cities*, *Paris Texas*), Stanley Kubrick and John Alcott (*2001: A Space Odyssey*, *Barry Lyndon*), the Coen brothers and Roger Deakins (*Barton Fink*, *O Brother Where Art Thou?*), and Bernardo Bertolucci and Vittorio Storaro (*The Conformist*, *Last Tango in Paris*). It is rare, however, for a cinematographer to succeed as a director. Among the handful of notable exceptions are Freddie Francis, Jack Cardiff, and Nicholas Roeg. Organizations representing the art and craft of cinematography include the American Society of Cinematographers (founded 1919), the British Society of Cinematographers (1949), and the Society of Motion Picture and Television Engineers (1916).

## THE FUTURE

Cinematography is constantly being reinvented, both by advances in technology and by shifting cultural tastes. The emergence of high-definition digital cinematography is changing what appears on our screens and its mode of delivery. Introduced in the late 1990s – the first high-profile Hollywood feature shot with a 24-frame High-Definition Progressive Scan camera was *Star Wars: Episode II – Attack of the Clones* (2002, cinematographer David Tattersall) – digital cinematography means that the motion picture is captured electronically as a series of digital images composed of pixels. The image resolution needs to be extremely high to emulate the quality of film (a precise correlative between digital and photo-chemical image is hard to determine, since ultimately they achieve their effects in different ways), but the advantages in the manipulation, transfer,

and ultimately projection of the images mean that the film industry will be moving increasingly away from film. Film is still the predominant medium for production and distribution, but the proliferation of broadcast outputs beyond the traditional cinema screen is making the digital image the norm. The cinema screen is but one stage in the complex life of a modern film production, which will be sold and resold through multiple platforms in ever-changing sizes – DVD, terrestrial television, cable, satellite, on computers, and now hand-held devices. Digital technologies have considerable implications for the art of cinematography and the relationship of image to audience. They have made the fantastical in cinema easier to achieve, but they have also encouraged the cheaply produced, rawly realistic production, as demonstrated by *The Blair Witch Project* (1999, cinematographer Neal Fredericks). With a mini DV camera and FinalCut Pro software, anyone can become a filmmaker. The technology is blurring the distinctions between cinema and monitor, between professional and amateur. The meaning of cinematography seems to be undergoing change even while its status as an art is still valued.

These contradictory impulses can be seen in the move toward high definition and a hyper-naturalistic image, and at the same time the low resolution of videos using Flash software available through YouTube and other social networking sites. Audiences both demand higher image quality, yet are paradoxically comfortable viewing the degraded or indistinct image. Just as audiences were made more aware of the filmmaking process through the free style of the new wave of the 1960s, so the rise of the digital image and multiple viewing platforms has made modern audiences aware of the manipulability and subjectivity of the image. The future of cinematography would appear to lie not with the artist, but with the consumer.

# Circulation

*Dan Shaver*

*University of Central Florida*

Circulation is the fundamental audience measure for print publications such as → newspapers and → magazines. Its importance lies in the fundamental relationship between circulation and advertising rates in the business models of most print publications.

Taking the US as an example, prior to 1830 US newspapers depended primarily on subscription revenues. Content was focused mainly on either politics or commerce, and subscriptions were expensive. Single copies of individual issues were generally only available to nonsubscribers at the publisher's office. In 1830, the US had only 65 daily newspapers with an average circulation of 1,200 copies, and total daily newspaper circulation was estimated to be 78,000 copies (→ Newspaper, History of).

In New York, the center of US newspaper publishing at that time, two publishers reinvented the newspaper business model. Benjamin Day, who founded the *New York Sun* in 1833, and James Gordon Bennett, who established the *New York Herald* in 1835, decided that by reducing the price of newspapers from the then prevalent six to eight cents per copy to a penny per copy, they could significantly increase the size of their audience (→ Penny Press). With increased sales (or circulation), they would provide a more effective vehicle for advertisers and could, therefore, charge more for → advertising (→ Advertising, History of).

Growing audience, however, required more than simply reducing the price. Publishers had to explore *alternative distribution strategies* that would increase sales while reducing their dependence on subscriptions. Newsboys, who hawked single-copy sales on the street, were introduced as a way to expand sales of single issues. By 1840, the number of daily newspapers in the US had grown to 138 and average circulation had nearly doubled to 2,200. Total daily circulation nearly quadrupled to 300,000. The model of decreased dependence on subscriber revenues and increased reliance on advertising revenues that were tied to audience size was firmly established and ultimately was nearly universally adopted by print media.

Circulation also impacts newspaper and magazine publishers' *cost structure*. "First copy" costs are the expenses incurred for the resources and activities required to produce the first copy of a publication. For newspapers, these average 40–45 percent of total costs. Once the "first copy" has been produced, the marginal costs of producing additional copies rapidly declines due to manufacturing economies of scale. Therefore, a publication with a circulation of 100,000 is significantly less expensive to produce than two newspapers of 50,000 circulation (→ Cost and Revenue Structures in the Media).

For magazine publishers, the problem is complicated by the general use of third-party vendors to print their product. Newspapers, which generally control their manufacturing process in-house, can readily add pages or increase the press run if major stories break – thus increasing their circulation average. Changing press runs for magazines, however, is much more difficult and expensive, limiting the publisher's ability to leverage circulation by taking advantage of content that is likely to increase sales.

## CIRCULATION MEASUREMENT

If the prices that publishers charged advertisers were to be based on the size and value of the audience they could deliver, measurements were needed. The latter half of the nineteenth century was marked by circulation wars – sometimes literally involving physical confrontations between groups of newsboys affiliated with competing publications – and unverified publisher circulation claims.

In 1914, a group of advertisers, advertising agencies, and publishers created a voluntary program to ensure reliable circulation data. The Audit Bureau of Circulation was charged with direct verification of publishers' claims of paid circulation. That movement expanded in 1963 with the formation of the *International Federation of Audit Bureaux of Circulations*, which now represents organizations conducting publication audits in 50 countries. Today, ABC ([www.accessabc.com](http://www.accessabc.com)) provides audit information on both newspapers and magazines to advertisers making purchase decisions.

Traditionally, audit functions have focused on *paid circulation* – copies for which the reader/subscriber paid a stated price to the publisher. Advertisers generally considered this to be a more reliable measure by which to gauge audiences than figures including free or heavily discounted promotional copies. The logic was that if someone paid for an issue of a publication, they were more likely to read it than if they were simply handed a copy as they walked down the street.

This assumption, however, may be changing. First introduced in Sweden in 1995, by 2002 there were more than 60 free daily newspapers published in 26 countries with a combined daily circulation of more than 10 million copies. The growth of online advertising has also increased the desire of advertisers for audited information regarding newspaper websites. ABC has expanded its services to include electronic newspapers and circulation of free distribution newspapers if they are owned by an ABC member that derives more than 50 percent of its circulation from home delivery. Other organizations, such as Verified ([www.verifiedaudit.com/history.htm](http://www.verifiedaudit.com/history.htm)), cater to the free distribution audit market.

An ABC audit involves *several steps*. First, a publisher submits unaudited circulation figures with supporting documents to the Audit Bureau. Then, once a year, an auditor visits the publisher's workplace to examine production reports, inventory records, circulation records by category and geographic zones, prices charged, discounts offered, returns records, and other factors bearing on the circulation claims. Finally, a random sample of subscribers is interviewed to ensure that the person who received a publication is the one who paid for it (→ Interview, Standardized; Sampling, Random; Survey). If all data are congruent, the ABC issues a formal audit report showing the publication's average audited paid circulation for a 12-month period.

Circulation measurements may be expressed in several ways. The most basic measure is *audited paid circulation*. That reflects the number of copies printed and delivered to readers who paid for them. Another measure frequently considered by advertisers making purchase decisions is circulation penetration. That is calculated by dividing the paid circulation in a geographic market by the total number of households in that area. This is often viewed as a more accurate measure of the effectiveness with which a publication delivers information within its market because it is assumed that everyone in the household has an opportunity to be exposed to the same content. Household penetration

is most effective as a measure for newspapers, which generally have a geographically limited distribution area, and is less meaningful for magazines, which have less geographically definable distribution zones (→ Audience Research; Copy Test and Starch Test).

## REVENUE ISSUES

The degree to which publishers rely on circulation revenues varies between magazines and newspapers. Circulation revenue for newspapers generally represents 15–20 percent of total revenues. Traditionally, newspapers have looked to circulation revenues to recoup a substantial portion of the material costs of the product – paper, ink, and supplements. The percentage varies over time depending on the publisher’s willingness to increase prices and often wildly varying costs for newsprint. The rapidly growing free newspaper segment, however, is entirely advertising dependent.

Magazines have traditionally relied more heavily on consumer subsidies. Some publishers of specialized magazines, such as *Consumer reports*, rely entirely on circulation sales revenues to avoid any potential of real or apparent conflicts of interest with advertisers. Others, particularly controlled circulation magazines in technology and similar areas, may rely virtually entirely on advertising revenues. The overall trend in consumer magazines has been to increase dependence on advertising revenues. Between 1980 and 1998, consumer subsidies fell from 57.8 percent of total revenue to 41.8 percent based on a study of 96 major continuously published magazines.

While circulation represents a major factor in advertising prices, other factors affect rates as well. Overall cost structure, competition for advertiser dollars, which may result in discounts or incentives, and audience demographics all affect the ability of publishers to establish and maintain advertising rates.

## CIRCULATION COMPETITION

Relatively little industry or scholarly research into circulation issues was conducted prior to the 1970s, when publishers began to notice a flattening in circulation growth. Early research focused on the substitutability of news products and the development of the *theory of umbrella competition* (Rosse & Dertouzos 1978). This model argued that newspapers compete across geographic boundaries for circulation and advertising by segmenting audiences and differentiating their product and content (→ Audience Segmentation). As news consumers become dissatisfied with their existing media mix, they reorder their media consumption to better satisfy their needs. Rosse’s model postulated four layers of competition – large metropolitan dailies, newspapers in satellite cities, suburban dailies, and weekly newspapers, shoppers, and other specialized media.

Subsequent research exploring the Rosse model tested it by looking at circulation and advertising behaviors independently as well as in combination. This research revealed that circulation and advertising competition are different but are closely associated. To address this issue, Bridges et al. (2002) proposed a *concentric circle or ring model*, which preserved Rosse’s layer model but suggested that the relationships between the levels of competition were more complex. They also suggested the need to include consideration of national-level competition.

Little theoretical economic research has been conducted on magazine circulation. The general view is that magazines compete for readers based on content quality and differentiation in increasingly segmented markets, although differences in pricing, marketing investment, and distribution capabilities may affect sales.

## CIRCULATION TRENDS

In the US the frequency with which people read newspapers began to decline in the late 1940s, but increases in overall population allowed total newspaper circulation to increase until 1970. Real circulation numbers remained stable for the next 20 years, though circulation penetration declined. In 1990, circulation began to decline in real numbers and continues to do so at approximately 1 percent per year.

Total daily US newspaper circulation declined from 62.2 million copies in 1980 to 56.2 million copies in 1998. A portion of this decline can be attributed to a reduction in the number of newspapers published (1,754 in 1980 compared to 1,489 in 1998). This decline primarily reflects a shift in reader preference from afternoon to morning publications and the closing of many evening newspapers.

Total circulation of general and farm magazine publications audited by ABC increased from 275 million in 1980 to 366.3 million in 1997. This was accompanied, however, by a significant increase in the number of published titles (from 406 to 590). Average circulation per magazine actually decreased from 677,431 to 620,850. During the same period, single-copy sales of magazines declined from 34.2 percent of total sales to 18.1 percent. Similar developments can be found in many industrialized countries (→ Exposure to News; Exposure to Print Media).

Several factors affect these trends. For newspapers, a number of studies have found that younger readers simply have not developed the newspaper reading habit. Although for many years, industry executives argued that younger readers would turn to newspapers as they aged and became settled into adulthood, cohort analysis indicates otherwise.

Churn, the number of cancelled subscriptions that must be replaced in order to maintain the existing level of circulation, is also increasing for newspapers. Although the percentage of churn increases with circulation size, data from the Newspaper Association of America shows that the average churn factor for all dailies increased from nearly 50 percent in 1996 to nearly 58 percent in 2003.

The *economic constraints of public ownership* may also be contributing to circulation declines. The newspaper industry is a mature business with increasing competition for advertising revenue and rising costs. Between 1960 and 1996, the percentage of total daily circulation in the US by group-owned dailies climbed from 46.1 percent to 81.5 percent. Many of these groups are publicly owned, and institutional investors are primarily concerned with increasing profit margins and stock prices. If investor expectations are not met, the firm may be forced into a sale, as occurred with Knight-Ridder in 2006 and the Tribune Company in 2007. Management response to these pressures has frequently been to reduce costs and resources devoted to the editorial product despite a substantial body of research indicating a strong correlation between editorial investment and circulation growth.

*Audience fragmentation*, driven by the proliferation of media alternatives, is affecting all of the traditional mass media, not just print. Cable TV news audiences were flat

between 2002 and 2004, despite the impact of a presidential election cycle in 2004 (→ Cable Television). Broadcast network prime-time audiences have declined 26 percent since the mid-1990s (→ Television Networks). Audiences for all-news radio stations have remained relatively stable, while audiences for National Public Radio (NPR) programming have actually grown, but radio as a source of news has diminished since the Telecommunication Act of 1996 made it possible for hundreds of stations to drop news coverage altogether.

Magazine circulation is particularly affected by declines in single-copy sales – attributable to a proliferation of titles – and a decline in the effectiveness of traditional marketing techniques such as sweepstakes and direct mail.

# Citizen Journalism

Chris Atton

Napier University

Citizen journalism refers to journalism produced not by professionals but by those outside mainstream media organizations. Citizen journalists typically have little or no training or professional qualifications, but write and report as citizens, members of communities, activists, and fans (→ Activist Media). They are amateur media producers. The two broad types of citizen journalism are political and cultural.

The term *citizen journalism* dates from the 2000s, but its practice is not new. The radical reformist newspapers that flourished in England from the late eighteenth to the mid-nineteenth centuries had characteristics similar to recent citizen journalism: the so-called *pauper management*; the stance as activists; and a close relationship with the audience, who themselves wrote reports (Curran & Seaton 2003). Similarities also appear in the anarchist presses at the turn of the twentieth century. Socialist organizations and political parties encouraged worker correspondents in English newspapers. Workers' contributions arguably made the papers' political philosophies relevant to readers' experiences (→ Citizen Journalism, History of).

The space available distinguishes current citizen journalists. The Internet enables publication of reports outside of the industrial arrangements typical of media corporations. The Internet may also offer social movements a global reach.

## PRACTICES

Citizen journalists practice across a range of media, from homeless-produced newspapers to community-based local radio and television stations (Howley 2005). Print media offer scope for full participation. Broadcast media require technical competence and training. Dependence on experts leaves fewer opportunities for citizens to participate in production, reducing them to advisors. Home camcorders and computer video-editing packages, used not for conventional broadcasting but for producing videos, DVDs and web streaming, minimize the reliance on experts. The → Internet has permitted citizen journalism to expand. Despite barriers to access in many places, software allows users to set up websites and discussion groups with minimal expertise.

Participatory media production contests media power and challenges the monopoly on producing symbolic forms (→ Participatory Communication). Pierre Bourdieu (1991) argues that symbolic power is the power to construct reality. Citizen journalism constructs a reality that opposes the conventions and representations of mainstream media. Citizen journalists engage in self-representation, community empowerment, and self-education through dialogue (Rodriguez 2000). Citizen media production aims not at state-promoted citizenship but at media practice to construct political identity along with everyday life (→ Citizens' Media). The media help define the boundaries of political life and alternative media spaces become important to the development of critical citizens.

In political practice, citizen journalism adopts social responsibility but replaces an ideology of objectivity with oppositional practices (→ Objectivity in Reporting; Advocacy Journalism; Alternative Journalism). The practices emphasize first-person, eyewitness accounts by participants. They rework the populism of tabloid newspapers to recover a *radical popular* style of reporting. Their collective and anti-hierarchical forms of organization eschew demarcation and specialization.

Academic studies of citizen journalism focus on political projects in the United States and western Europe. The radical community press that flourished there in the 1970s and 1980s sought to be free from commercial considerations and to provide information that was directly useful in daily life (→ Community Media). Instead of the perspective of authority, the radical local press adopted the perspective of those low in status, who became not only sources in stories but also news gatherers. Reporters built up networks of local activists, residents' groups, parents, workers, unemployed, and homeless who could supply leads for stories (Dickinson 1997; Whitaker 1981).

The network of independent media called *Indymedia* is an Internet-based, globalized form of citizen journalism (Downing 2002; Platon & Deuze 2003). Indymedia came to prominence during the demonstrations against the World Trade Organization summit in Seattle, in November 1999. Since then an → independent media centers network has reported and commented on issues such as third-world debt, human rights, internationalization of capital, and the political and economic power of transnational corporations. The reports counter the enduring frames of mainstream media coverage, which demonize and marginalize protesters. Indymedia reporters present the perspective of activists and emphasize the personal. The network is global, and studies need to examine specific regional and national practices.

Studies have explored other citizen journalism projects in Latin America and Asia. Bolivian miners' radio stations, for example, flourished from 1963 to 1983, but first appeared in 1952, the year of national revolution. Their participatory media production highlighted the rights of workers in a politically marginalized region (O'Connor 2004). In revolutionary Nicaragua of the 1980s and 1990s, the Movement of Popular Correspondents allowed nonprofessional, voluntary reporters from poor rural areas to produce and publish reports in regional and national newspapers alongside the work of professional journalists (Rodriguez 2000).

Men appear to dominate the history of citizen journalism in Latin America, but not necessarily elsewhere (→ Feminist Media; Gender and Journalism). For instance, the Revolutionary Association of the Women of Afghanistan reported on the abuse and execution of women under Taliban rule, producing audio cassettes, videos, a website, and a magazine (Waltz 2005). Afghan women distributed these clandestinely, using secretly filmed camcorder footage of abuse, for example. The South Korean OhmyNEWS has adopted a hybrid approach to its website (Kim & Hamilton 2006). Founded in 2000, the site relies on hundreds of citizen reporters, although a small professional staff runs its editorial office.

Researchers have not covered other regions as well. One study documents the diversity of citizen journalism projects in Africa and the Indian subcontinent (Gumucio Dagon 2001), presenting 50 brief examples of participatory communication used for social change. The cases represent all types of alternative media institutions that somewhat reproduce existing forms: newspapers, radio stations, and websites.

By contrast, → bloggers present their narratives, news, and commentary from the perspective of the individual. Citizen journalism is also a form of popular cultural commentary (Rau 1994). The world of fanzines, or *ezines* online, allows fans to create, maintain, and develop taste communities across geographic boundaries (→ Fandom; Zines). Considered an expert by readers, the fanzine writer accrues cultural capital, typically displayed directly, not through the mediation of other sources or primary definers (→ News Sources).

## CHALLENGES AND LIMITS

Citizen journalism is a radical challenge to the professional and institutional practices of the mainstream media. The citizen journalist engages in native reporting, which in a postcolonial sense is a subaltern media practice that contests the power of professional journalists, resists their othering and struggles within the politics of representation. Native reporting occurs within communities to present news relevant to their own interests, gathered with their collaboration and support and presented in a manner meaningful to them. Citizen journalism focuses less on the report as a commodity or on journalists as experts, not because of the novelty of knowledge they produce (a focus on uncovering hidden stories) but because of their new ways of thinking about and producing journalism (a focus on what kinds of knowledge they produce and how readers and writers may come together to make sense of the result).

The relationship between the citizen journalist's roles as writer and as activist (or enthusiast or fan) matters. For them, journalism is a secondary activity in the service of a greater goal. In the case of social movement journalism, for instance, the goal might be political reform or revolution (→ Social Movements and Communication). Such journalists are autodidacts, who practice not only different ways of writing but different approaches to sourcing and ethics.

Citizen journalism practices are not entirely separate from the mainstream. Commercial media organizations make use of amateur reporters; breaking television news increasingly relies on camcorder footage. Numerous examples appeared in 2005, for instance, including Hurricane Katrina in New Orleans, the fire at the Buncefield Fuel Depot in England and the terrorist bombings in Madrid (Sampedro 2005). Newspapers and broadcasters routinely incorporate blogs into their websites; some solicit advice and recommendations for stories and programs from audiences.

The nonprofessional status of citizen journalists tends to restrict the range of their reporting. The form appears most appropriate when used to report on local community issues or to present personal narratives from within a major event (such as a conflict). In reporting hard news, citizen journalists have less access to elite sources and institutions. The reliance on comment and opinion has left citizen journalists open to charges of bias and subjectivity, but subjectivity can inspire trust. A survey found that blog readers placed great store by the honesty and authenticity of subjective accounts (Matheson & Allan 2003).

Problems also arise from organizational methods. Some citizen journalism projects fail for want of long-term commitment or for lack of capital. Some projects have developed hybrid models of organizing their reporting. OhmyNews from South Korea sustains itself

through commercial advertising, and established a hierarchy so that professional journalists report hard news and citizen journalists report on their immediate communities, with the professional staff retaining overall control. In this case, limiting citizen journalists to what they do best addresses the doubts about their subjectivity, bias, and expertise.

# Citizen Journalism, History of

Donald Matheson

University of Canterbury

The history of the term → *citizen journalism* is closely associated with the rise of the → Internet as a medium of → news and public information. Citizens have certainly participated in news-making from the start of modern news, but journalism's industrialization in the mid-nineteenth century and later its professionalization marginalized that involvement (→ Journalism, History of). It was with the rapid growth of the Internet in the 1990s that attempts to conflate the categories of journalist and citizen gathered force. This article discusses three versions of that young history: (1) a cybercultural history; (2) the perspective most common in news organizations; and (3) a socio-cultural account.

The *first history* is one written on the Internet, largely in the US. Commentators looking back from the early 2000s explain the rise of citizen participation in journalism online by pointing to an *ethos of open collaboration* espoused by early Internet users – largely US-based academic and military researchers – which led to an open, nonhierarchical Internet structure. UseNet newsgroups' experiments in online community, such as The Well, offered up “a new cultural narrative based in collective self-determination” (Rushkoff 2003, 27). Strongly libertarian and anti-authoritarian ideologies have shaped this account of a free and open Internet. Key texts here include Dyson et al. (1994), which proclaimed the end of conformist mass society, and Barlow (1996), which told industrial society's institutions, “You have no sovereignty among us.” The utopian desire for citizen participation in public life has thus been closely connected with the rise of cyberculture.

The rise of weblogs, from 1997, was strongly shaped by such a history of citizen sovereignty, with talk of wresting control of public debate back from the “mainstream” or “old media” common, or recreating the liberal pamphleteering culture of eighteenth-century Britain and America (→ Blogger). The diary-like genre, often characterized by sharp-tongued and fast-moving public debate, soon produced the term “fisking” to describe right-wing bloggers' attacks on what they saw as “liberal” media, symbolized by British journalist Robert Fisk. By 2002 US bloggers celebrated the first instances where they had led the “mainstream media” in their job of monitoring power. The Indymedia network has drawn, in part, on similar anti-authoritarian ideas. Since its dramatic birth at the 1999 World Trade Organization in Seattle, the alternative news network, staffed by “volunteer journalists,” quickly gained in web traffic and reputation on the political left, and by 2004 had grown to an international network of 142 sites in 54 countries.

To many journalists and academic commentators, this first history has a little too much of the fable to it. The *second history* which they construct, then, points out that bloggers and other citizen journalists depend largely on the mainstream they critique for their agendas and information (Haas 2005). Indeed many bloggers themselves feel uncomfortable with the label “journalist.” It is also true that much citizen participation in journalism is facilitated by news organizations and is a story of collaboration or co-option, tension or accommodation. *San Jose Mercury News* technology journalist Dan Gillmor's experiments with using readers of his weblog as expert sources for his

newspaper column provides the model for one influential school of thought, which argues that citizen participation in digital media is leading to instances of journalism as “conversation” between journalists and citizens (Gillmor 2004). From 2004 on, in France (*Le Monde*), South Africa (*Mail and Guardian*), the UK (*Guardian*), and elsewhere members of the public were invited to write weblogs within the news website. Many journalists expressed concern at these moves, citing in particular dilution of the newsroom’s control over its sources and the absence of editing as lowering news quality. Indeed, the dominant practice has remained consistent since the early news websites of tucking away citizen contributions deep inside the site, firmly subordinated to the professionally produced news content, and usually unread by those journalists. Yet, from 2003, with each major news event and with each crisis where existing journalism practices seemed unable to sate the public appetite, the use of citizens’ eyewitness accounts, photographs, and video has increased, opening the way for further blurring of the lines between news producer and consumer.

The *third*, largely academic, *history* places citizen participation in the news within a much longer time frame, tracing the weakening of institutional society, with its homogeneous nation-state, its specialization of work, and its hierarchical structures. Industrial Anglo-American journalism took on a role on behalf of the public, holding government to account on behalf of citizens, recording civic life on their behalf, upholding society’s values. Sociologists and cultural geographers (e.g., Castells 1996; Harvey 2001) argue that contemporary social power resides more in networks of power and in global cultural forms. Wellman (2001) talks of the rise of a networked individualism, in which individuals in western culture move relatively freely among social networks and reflexively make their own identities as they do so. Jenkins (2004), building on fan theory, theorizes a “cultural convergence” to describe a growing expectation from media consumers that they can change and add to media content. In this view, the mass audience for twentieth-century journalism appears part of a departing historical moment. In its stead has emerged what Deuze (2005) calls “a perhaps over-zealous faith in ourselves” and a loss of trust in and dependence on professional storytellers such as journalists. For these reasons, some former enthusiasts for citizen journalism were beginning in 2006 to adopt the term “networked journalism” instead.

## Citizens' Media

*Clemencia Rodríguez*

*University of Oklahoma*

Citizens' media is a term used by communication and media scholars to refer to electronic media (i.e., → radio, → television, → video) and information and communication technologies (i.e., text messaging, cellular telephony, → Internet) that are controlled and used by citizens and collectives to meet their own information and communication needs. As an academic term, citizens' media belongs to a large family of concepts that, among others, include community media, alternative media, autonomous media, participatory media, and radical media (→ Activist Media; Communication Technology and Democracy; Community Media; Participatory Communication).

Although all these terms express more or less the same reality of media controlled by citizens and collectives, each of them emerges from a different conceptual framework. For example, "*alternative media*" accentuates the potential of these media to alter the social world in which they operate, and differentiates between these participatory, inclusive media and commercial media, driven by the need to produce a profit, produced by professionals, and limited to certain formats and genres (→ Commercialization: Impact on Media Content). "*Autonomous media*" underscores the absence of political and financial interests in these media ventures (→ Commercialization of the Media). "*Community media*" highlights their collective nature and connects to theories of community building (→ Community Integration). "*Participatory media*" puts emphasis on the fact that these media are commonly open to anyone in the community to produce their own radio, television, or any other media product. Finally, → "*radical media*" stresses their potential to express and embolden discourses, practices, and politics of resistance.

The term "citizens' media" was first coined by Clemencia Rodríguez in *Fissures in the mediascape: An international study of citizens' media* (2001). It emerges from the need to overcome oppositional frameworks and binary categories traditionally used to analyze

alternative media. As a concept, citizens' media moves away from binary definitions in two different directions. First, instead of defining alternative media as that-which-is-not-mainstream-media, citizens' media defines media in terms of the *transformative processes* they bring about for participants and their communities. In other words, while "alternative media" define community media by what they are not – not commercial, not professional, not institutionalized, "citizens' media" define them by what they are – the processes of change triggered with media participants (→ Social Movements and Communication).

Second, citizens' media breaks away from a binary and essentializing definition of power, whereby the mediascape is inhabited by the powerful (mainstream media) and the powerless (→ Alternative Journalism). Instead of limiting the potential of alternative media to their ability to resist commercial media owned by large → media conglomerates – and restricting our understanding of all other instances of social change facilitated by community media – the focus of citizens' media is on the metamorphic transformation experienced by their producers and participants. That is, citizens' media is a concept that accounts for the *processes of empowerment, "conscientization," and fragmentation of power* that result when men, women, and children gain access to and reclaim their own media (→ Communication Strategies for Empowerment). As they disrupt established power relationships and cultural codes, citizens' media producers and participants exercise their own agency in reshaping their own lives, futures, and cultures.

Citizens' media is a concept anchored in the *theory of radical democracy and citizenship* of political science scholar Chantal Mouffe. Mouffe takes distance from liberal democracy's definition of citizenship and proposes a move toward re-appropriating the term. Liberal democracy defines citizenship and citizen in terms of a legal status granted (or denied) to an individual by a state. Gaining citizenship is one of the foundational principles of representative democracies, because only citizens have access to full democratic rights. In this light, Mouffe proposes a reinterpretation and redefinition of the term "citizen" and "citizenship"; according to Mouffe, "citizenship" should be defined in terms of political action and access to power, and not as a legal status controlled by the state.

Mouffe defines citizens as political subjects not in terms of legal status that secures individuals' rights and responsibilities, but as localized subjects whose daily lives are traversed by a series of social and cultural interactions. Citizens exist in a mesh of interactions also localized in a specific context – family interactions, relationships with neighbors, friends, colleagues, peers, etc. It is precisely from these interactions that each citizen gains access to power – symbolic power, psychological power, material power, and political power. According to Mouffe, when citizens use their power to redirect and shape their communities, they enact political actions as political subject – and these actions are the building blocks of a democracy. It is this power that allows citizens to shape their communities (or not) according to their own needs and visions for the future (→ Media Democracy Movement). Thus Mouffe defines citizens as those individuals who generate power from their quotidian interactions and relationships and use this power to transform their community step by step.

Adopting Mouffe's definition of citizenship, Rodríguez coins the term "citizens' media" to refer to those alternative, community, or radical media that facilitate, trigger, and maintain processes of citizenship building, in Mouffe's sense of the term. Rodríguez's

“citizens’ media” are those media that promote symbolic processes allowing people to name the world and speak the world in their own terms, formats, and aesthetic values.

Rodríguez uses the term more as a qualifier than as a category that defines the legal status of the medium. In this sense, a medium can have a “community” license and still not qualify as “citizens’ medium.” A community medium will qualify as a “citizens’ medium” only as long as it triggers processes in which local producers can recodify their own identities and reformulate their own visions for their communities’ futures. Rodríguez has carried out case studies of citizens’ media in Nicaragua, Cataluña, Colombia, Chile, and among Latino communities in the US.

In other less academic contexts – such as Colombia, for example – media activists have adopted the concept of citizens’ media, although they are not necessarily referring to Rodríguez’s definition. In Colombia, the term is used to emphasize the role that community radio and television stations play in diversifying the public sphere and strengthening “a culture of citizenship.” Citizens’ media facilitate access to the public sphere for different political, social, and cultural views, thus encouraging public debate (→ Citizen Journalism). Colombian citizens’ media are becoming important elements of the public sphere where counter-publics express their views, disseminate information not accessible through the mainstream media, and demand transparency and accountability from local and national government authorities (→ Colombia: Media System).

# Civil Rights Movement and the Media

*Aldon Morris*

*Northwestern University*

Racism was an enduring part of American life before the modern civil rights movement of the 1950s and 1960s. This was especially true for the southern United States, where racism was rooted in all aspects of society. Southern blacks were severely exploited economically, where they were forced to toil at the bottom of the occupational structure. Blacks had no political power because they were excluded from the formal political process (→ Power and Discourse). Because blacks were believed to be racially inferior, they were segregated physically and made to live in the confines of resource-starved communities (Morris 1984). Southern racial oppression was designed to humiliate blacks daily so that both races understood their respective places in the racial hierarchy.

This all-encompassing racism was backed by state power, terrorist violence, customs, and a plethora of Jim Crow laws. These laws restricted the scope of interactions between the races, requiring that blacks attend separate schools and parks, ride at the back of buses, drink from different water fountains, and the like (Kluger 1976). Blacks who disobeyed Jim Crow laws faced the possibility of jail, beatings, and even death. Although racism was prevalent throughout America, the magnitude of its southern version was rarely known outside the south. This virulent racism usually operated beneath the radar of the larger society and was shielded from the world by democratic rhetoric proclaiming America as the land of liberty (→ Rhetoric and Social Protest).

The relative obscurity of southern racism prevented it from direct attack by non-southerners and other nations. A major task confronting blacks was to discover avenues to expose southern racism so that it could be scrutinized and contrasted with democratic principles. The media, especially → television and → newspapers, proved to be the avenue through which the civil rights movement exposed the ugliness of southern racism. Indeed, this movement used the media to help achieve its victories against Jim Crow (Garrow 1986; Branch 1988; Roberts & Klibanoff 2006). It did so by generating media coverage that conveyed the brutality that blacks received from segregationists. Such coverage triggered outrage over such anti-democratic behavior, thus cultivating sympathetic attitudes toward African-Americans among audiences both domestically and internationally. The social disorder initiated by the civil rights movement, coupled with media coverage, eventually forced decision-makers to debate racial injustice and enact laws to overthrow the Jim Crow order. The movement achieved victories by staging public confrontations with segregationists that were so packed with human drama they could not be denied media coverage (→ Social Movements and Communication).

## RISE OF MODERN MEDIA

The modern civil rights movement developed at the same time as television was emerging as a major institution. By the late 1950s the mass of American households had become television viewers. As early as 1958 over 83 percent of households owned television sets, in contrast to only about 45 percent in 1953 (→ Television: Social History). This rapid

expansion was made possible because new technologies reduced cost, making television sets affordable for most households. Because the rapid spread of television coincided with the rise of the civil rights movement, it would provide a window through which millions could be jolted by the clashes between the oppressed and the segregationists in the comfort of their living rooms. This development changed black invisibility dramatically and permitted the whole world to witness the blatant racism practiced by whites.

Another crucial technological advance occurred in 1960, when → television news and documentaries shifted from 35 mm equipment to the 16 mm camera (→ Television Technology). Erik Barnouw described the change: “In 1960 the umbilical cord between camera and recorder became obsolete with the invention of methods for synchronizing them without wire connection. The wire between microphone and recording equipment could likewise be abolished by use of the wireless microphone, which communicated its signals to the recording equipment via miniature transmitters . . . Now the performer with his microphone, the cameraman with his camera, the sound engineer with his recording equipment, could all be free agents” (Barnouw 1975).

These advances made it tremendously easier for photojournalists and camera men to capture volatile protest demonstrations quickly and up close, thereby providing startling images for both television and newspapers (→ Photojournalism). Before these advances, camera men had to carry heavy equipment and mount cameras on tripods, which limited the speed and clarity of coverage. Prior to the smaller, more sophisticated equipment, the old cameras only allowed one picture at a time, but the new cameras enabled journalists to shoot in rapid succession. The difference was as great as that between a one-shot rifle and a machine gun.

Additional innovations made it easier for more in-depth coverage of racial issues. Television introduced the *genre of documentaries* in the early 1960s through which racial inequality received unprecedented attention (Roberts & Klibanoff 2006; → Documentary Film; Documentary Film, History of). The expansion of nightly network news from a 15- to a 30-minute format in 1963 was even more far reaching because this made it possible for the civil rights movement to be covered extensively. Additionally, in 1962 the Telstar 1 communication satellite was launched, enabling television pictures to be relayed across the Atlantic and from continent to continent. These advances created the “whole world is watching phenomenon,” whereby civil rights struggles could be broadcast globally, thus insuring that people of color in third world countries were exposed to the movement (Morris 1990).

## **MEDIA AND THE COLD WAR**

The Cold War provided crucial leverage for the civil rights movement (Layton 2000; Dudziak 2002). Following World War II, America became involved in an intense struggle with the Soviet Union to determine which would emerge as the great superpower. America faced daunting challenges because communism was on the march. Over a billion people of color, and their newly independent nations, were deciding whether to align themselves with either combatant, thus determining which nation would achieve the balance of world power.

The Soviet Union courted the third world by providing its liberation struggles with resources to overthrow European colonialism. The United States countered by offering democracy, which it promised to all newcomers. But America had an undemocratic fly in its ointment: the oppressive treatment of African-Americans, who were being hung, denied enfranchisement, and relegated to economic servitude, did not fit its democratic rhetoric. Soviet leaders

knew this nasty secret and its potential nightmare for American international aspirations. African leaders, many of whom had attended American universities and bonded with African-American leaders, knew the secret as well. And that generation of World War II black leaders, including W. E. B. DuBois, Paul Robeson, and A. Philip Randolph, were keenly aware of Cold War politics and took advantage of them by championing civil rights for blacks in the international arena. Through exposure to these leaders and their own knowledge of the international scene, the emerging leaders of the modern civil rights movement understood Cold War politics and the advantages they afforded the black struggle.

But nothing could dramatize the contradiction between racism and democracy like explosive *public demonstrations* targeting racial oppression in the glare of worldwide media. Martin Luther King, Jr, and other leaders, learned to skillfully use demonstrations and media coverage to interject black freedom aspirations into Cold War politics. The United States government, including the President, Senate, Congress, State Department, and the Supreme Court, were all vulnerable to charges of racism if they failed to act to overthrow racial segregation in the wake of civil rights demonstrations. Thus, these sectors of government had a profound interest in addressing racial inequality as it was exposed worldwide because they were the key actors seeking to realize America's global aspiration to become the world's superpower.

### **CIVIL RIGHTS VICTORIES AND THE MEDIA**

During the civil rights era, advances in media technology made it possible for a powerful social movement to expose southern racism to the nation and the world. Leaders of the civil rights movement came to increasingly understand how to generate coverage that dramatized racial inequality and to demonstrate why change was required if America was to continue promoting itself as the world's greatest democracy that reached out globally, declaring "give me your tired, your poor, your huddled masses yearning to breathe free."

The civil rights movement framed the confrontations between itself and the segregationists as a battle between good and evil. Its nonviolent strategy lent itself to this framing because demonstrators dressed appropriately, often carried Bibles, and moved into the teeth of violence with a poised dignity – refusing to strike back, even when viciously attacked by white mobs. These actions made clear that black people were committed to obtaining freedom no matter the cost, even if it meant sacrificing limb and life.

The segregationists were equally committed to maintaining Jim Crow. The massive marches, jailings, boycotts, and other disruptive tactics rocked the foundations of Jim Crow because for decades its well-being depended on the acceptance of its inevitability. When the black masses responded with bold resistance, segregationists countered with state resources and the mob to crush the rebellions that mushroomed throughout the south. Attack dogs, fire hoses, billy clubs, mace, bombings, firings, jailings, and assassinations were used to crush the uprisings. When movement forces and segregationists met in dramatic confrontations, the media recorded the drama that exploded when "good" and "evil" clashed directly. Television reporters with their immensely improved equipment and photojournalists with their rapid-fire cameras relayed the confrontations through televisions and major newspapers. As television cameras recorded white troopers bashing the heads of dignified, peaceful demonstrators, many of whom were children marching

for their democratic rights, a nation was shamed. As satellites and newspapers relayed the images globally, America was scrutinized by world opinion as the Cold War raged.

The relationship between movements and media coverage is always problematic. Tensions arise because media usually represent the interests of the status quo while movements represent marginalized groups (Molotch 1979; Gitlin 1980). Thus, southern media often refused to cover the movement. Even national coverage was often truncated because of the bias toward covering the movement only when violence occurred (Jackson 2007; → Bias in the News). Nevertheless, national media interested in drama, violence, and a struggle reshaping America provided extensive coverage. The charisma of Dr King enhanced coverage. As King's lieutenant James Lawson put it, "any time King went to a movement, immediately the focus of the nation was on that community . . . He had the eyes of the world on where he went. It gave the black community an advantage it has never had" (Morris 1984).

As the world watched in horror while peaceful demonstrators were attacked, the American public began demanding racial change, as did leaders across the world. The President, Senate, Congress, State Department, and Supreme Court came under intense pressure to address Jim Crow or lose the battle to become the world's superpower (Layton 2000; Dudziak 2002). The movement and the media coverage of its struggle ripped the curtains off southern racism and allowed the whole world to scrutinize its undemocratic nature. As a result, national legislation that overthrew formal Jim Crow became a reality. The powerful civil rights movement that utilized mass resistance and clever use of the media changed a nation and continues to inspire liberation struggles globally.

# Classroom Instructional Technology

*Derek R. Lane*

*University of Kentucky*

Classroom instructional technology (CIT) includes the pedagogical tools and methods that allow educators to communicate instructional messages that achieve instructional goals and facilitate learning outcomes at all educational levels in classrooms around the world (→ Learning and Communication; Pedagogy, Communication in). Over the past three decades, researchers have studied both the challenges and the opportunities associated with the potential of CIT to enhance effective delivery of instruction in the classroom. Researchers have also aimed to understand how pedagogical tools are used to enhance student learning. When integrated appropriately into the teaching and learning process, CIT functions to enhance knowledge sharing, student engagement and collaboration, and classroom interaction, and ultimately to support learning (→ Classroom Student–Teacher Interaction). Studies also demonstrate, however, that CIT is least effective and can be detrimental to student learning when it is not intentionally integrated into a meaningful instructional strategy, and when it does not further a specific educational goal (Kadiyala & Crynes 2000).

## DEFINITIONS AND CONCEPTS

There is no single or universally accepted definition for CIT but the term can be broadly understood from a combined teacher–student perspective as “the *way* teaching is done and *how* learning is accomplished.” Technology is often used incorrectly as a synonym for computers. While computer hardware and software provide powerful tools for creating, recording, analyzing, and transmitting a wide variety of instructional messages, they are certainly not the only CIT that should be considered. Any tool that can potentially support student learning, including chalk, pencils, whiteboards, textbooks, overhead projectors, and → televisions, is an example of CIT (→ Computers and Display Programs in Education; Instructional Television). Communicating instructional messages that achieve instructional goals can be performed using message creation and manipulation tools, organization and presentation tools, information search, and resource management tools. CIT also includes iPods for podcasting, presentation graphic programs, discipline-specific software programs and tutorials, and the incorporation of the → Internet as an integral part of the course curriculum (→ Internet, Technology of).

Technology is used to distribute materials, handle logistics, and provide students with access to other students and the instructor. It can be used to foster open communication and active learning, clarify course expectations, provide individualized attention to students, and facilitate the collection of assignments and document sharing. Furthermore, when implemented appropriately, technology has been used to increase student contact with course materials, peers, and with the professor outside of the classroom (→ Course Organization Programs in Education).

The Association for Educational Communications and Technology (AECT) defines instructional technology as “the theory and practice of design, development, utilization,

management, and evaluation of processes and resources for learning” (Seels & Richey 1994). From that vantage, instructional technology and the teaching process are synonymous and difficult to distinguish. Communication researchers instead claim that the difference between knowing and teaching *is* communication, and that CIT is best conceptualized as the tools, media, and conduit (medium) through which clear and relevant instructional messages are communicated. The impact of CIT use on classroom communication, therefore, may vary in part as a function of course type and the ways in which instructors use technology to achieve different instructional objectives (→ Communication Education, Goals of).

### **PRACTICAL CONSIDERATIONS ON THE USE OF CLASSROOM INSTRUCTIONAL TECHNOLOGY**

Lane and Shelton (2001) have argued that throughout higher education, and particularly within the communication discipline, too many educators are latching onto the most recent wave of technological advances without fully considering fundamental CIT dimensions, practical issues, and evaluative pedagogical criteria that should be used to determine whether pedagogical tools can be used for effective delivery of instruction. Before CIT is integrated into any classroom, several strategic decisions about course objectives, curriculum, and the features of the technology must be considered.

Among these decisions are the determination of precise learning objectives – what students are expected to be able to do when they have completed the course or unit of instruction, and what the students need to know in order to meet behavioral expectations. It is also critical to ascertain what students already know and what knowledge they bring to the classroom, as well as to assess whether students can use their knowledge effectively. Effective integration of technology into the teaching and learning process must include consideration of key CIT features that would help educators make an informed decision about whether technology supports teaching and learning objectives, as well as how and when to use CIT, which squarely puts pedagogy before technology. It is necessary for educators to have a clear understanding of the available CIT features (e.g., text, audio, multimedia, storage, etc.) and how each could function to achieve instructional objectives, as well as a strong rationale for why the new CIT would improve the dimensions currently available in the status quo. One of the most important issues related to CIT integration is an accurate assessment of whether the teachers and students possess the requisite competencies and experiences to ensure an appropriate fit between the CIT, the instructional messages, and the course objectives. It is also necessary to have confidence in the flexibility of the CIT to allow for individual differences in teaching styles, student abilities, and learning styles. Finally, educators must consider whether the CIT will be reliable and available with consistent quality.

The practical considerations that can be potential barriers when implementing CIT include an analysis of whether the CIT is cost effective while providing access for all students, whether the integration of technology supplements and enhances the curriculum without becoming the focus of the curriculum, and an assessment of the intended and unintended consequences of CIT use. Educators have learned that purchasing computer technology (i.e., hardware and software) without budgeting for installation and training is a costly mistake.

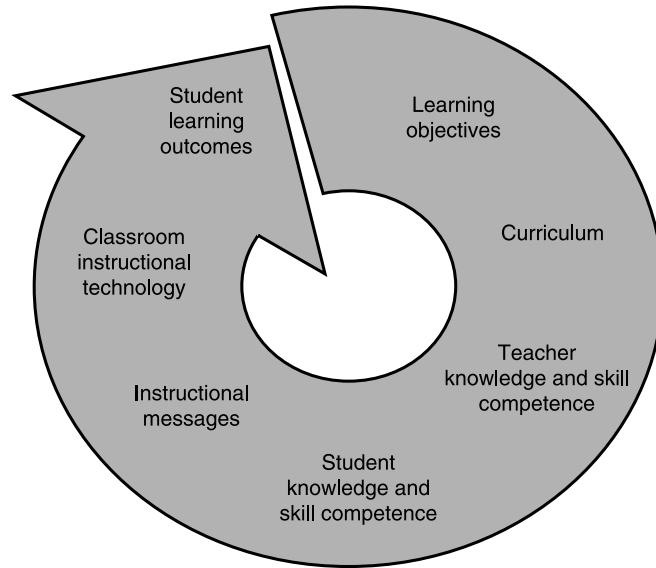

Figure 1 Teaching and learning with classroom instructional technology

A useful conceptual model to illustrate how technology can be successfully integrated into the classroom environment begins with a focus on learning objectives and the related curriculum, moves to a consideration of teacher and student knowledge and skill competencies, followed by the creation of tailored instructional messages that are communicated through appropriate CIT, and results in intentional student learning outcomes that accomplish the initial learning objectives (Fig. 1).

Evaluative pedagogical criteria should be employed based upon cost–benefit and assessment standards to determine whether the CIT succeeded in reaching its potential to enhance effective delivery of instruction in the classroom, and to understand how the pedagogical tools were used to enhance student learning. For example, the quality, appropriateness, and effectiveness of program tools, techniques, and materials that are presented as part of the curriculum should be assessed.

## RESEARCH ON CLASSROOM INSTRUCTIONAL TECHNOLOGY

Several theories have been applied to investigations of CIT. *Media richness* analysis demonstrated that different technological channels (e.g., multimedia, audio only) may lead to different performance outcomes (Timmerman & Kruepke 2006). *Attribution theory* has been tested to demonstrate how instructor credibility and caring are enhanced when instructional technology is incorporated into the classroom (Schrodt & Witt 2006; → Attribution Processes; Credibility Effects; Teacher Socio-Communicative Style). *Gender theory* has been used to explain why females are more likely than males to equate technology use with instructor competence (Schrodt & Turman 2005). *Distributed learning theory* allows educators to compare traditional curriculum presentation without technology with the same curriculum incorporating technology (Walker 2003). More applied research

has investigated the benefits of textbook technology supplements (Sellnow et al. 2005) and the incorporation of podcasts to increase student engagement and interest, while allowing for more time for classroom discussions and lectures (Huntsberger & Stavitsky 2007).

Although anecdotal and descriptive research has been plentiful, empirical evidence regarding the effects of technology on student learning is largely absent. Oppenheimer (1997, 45) has argued, “there is no good evidence that most uses of computers significantly improve teaching and learning.” The studies that have been completed are largely anecdotal and lack the necessary scientific controls to be conclusive.

National, state, and local standards require teachers around the world to integrate technology into an already crowded curriculum. In New Zealand, a model of teacher development in technology education was integrated into several primary and secondary classrooms to demonstrate best practices for how teachers develop advanced competencies in technological knowledge and an understanding of technological practice (Jones & Compton 1998). In 2005, the Minister of Education in Japan approved a national curriculum of technology education that was similar to the curricular standards established by the International Society for Technology in Education ([www.iste.org](http://www.iste.org)). The competencies are generally related to “what students should know and be able to do to learn effectively and live productively in an increasingly digital world” (ISTE 2007). The International Technology Education Association ([iteconnect.org](http://iteconnect.org)) is based in the United States but has international centers in Australia, Chile, Cyprus, Denmark, Finland, Germany, Greece, Japan, Korea, New Zealand, the Netherlands, Scotland, Spain, and Taiwan. Kimbell (1997) provides an overview and comparison of the international trends in technological curriculum and assessment in the UK, Germany, the United States, Taiwan, and Australia.

CIT has the potential to enhance a solid curriculum developed by a trained professional. Research that focuses on establishing the primacy of one instructional strategy over another should include considerations of the intended educational goal and corresponding instructional messages, and the extent to which a specific technology is best used to convey the intended message. The communication discipline can neither turn away from any mode of communication, nor can it practice an educational philosophy that is not grounded in practical use and access issues as well as critical evaluative issues. CIT enhances learning when pedagogy is sound and when there is a clear integration of technology.

Assessing the effects of technology on student learning is a complex process and requires that the strategies used to measure the effects of technology on student learning outcomes be appropriate to the learning outcomes promoted by those technologies. Instructional communication researchers will continue to document the effects of CIT on student learning outcomes. Of particular import will be whether CIT is related to course goals and objectives, and to what extent the implementation of the CIT supplements and enhances traditional teaching methods to increase student learning outcomes.

## **Classroom Management Techniques**

*Timothy G. Plax*

*California State University, Long Beach*

Classroom management refers to teacher behaviors which “produce high levels of student involvement in classroom activities, minimal amounts of student behaviors that interfere with the teacher’s or students’ work, and efficient use of instructional time” (Emmer & Evertson 1981, 342). Studies continually reveal a significant relationship between time spent on the subject content and student learning (Berliner 1988). Making time for learning, also called “allocated time,” is an important goal of classroom managers.

Further, effective classroom managers find ways to ensure that students spend sufficient time on specific learning tasks, also known as “engaged time” or “time on task.” Finally, in order to maximize learning outcomes, classroom managers must set up the conditions in such a way that students’ time on task is success oriented (Woolfolk 2001).

### EFFECTIVELY MANAGED CLASSROOMS

A number of teacher behaviors contribute to effectively managed classrooms, ranging from classroom structure, learning format, and learning activities, to teacher leadership skills and behavior alteration techniques. Classroom structure involves the use of specific and clearly defined rules and procedures, generated by both teachers and students, with sufficient time spent socializing students to those rules and procedures early in the term. Important to lesson format and learning activities, the research indicates that teacher-led group activities work better than individual seatwork assignments.

Effective teacher leadership skills include the use of prompts, positive questioning techniques, motivational and conformational statements, and structured transitions (→ Teacher Socialization; Teacher Training in Communication). Taken together, all of these teacher behaviors serve to minimize classroom disruptions by maintaining student involvement in on-task learning. An important addition to this literature is the consideration of how teachers employ persuasive or influence strategies in order to engage students in ways that increase their time spent learning (→ Classroom Student–Teacher Interaction).

### POWER IN THE CLASSROOM

Over the past 25 years, researchers have been examining how teachers employ strategies in the classroom to manage students’ on- and off-task behaviors, and, thus, students’ affective and cognitive learning. Most notable in the instructional communication literature is the early, systematic, and heuristic program of research referred to as “power in the classroom.” The origins of this research program began with preliminary investigations of teachers’ use of French and Raven’s (1959) *five bases of social power* (McCroskey & Richmond 1983; Richmond & McCroskey 1984). However, those original power bases referred to the teacher’s capacity or potential to effect students’ behavioral change. A major shift in thinking about teacher power was launched with the research that examined how teachers implemented that potential or, stated differently, how teachers communicated their power resources relationally with their students (Kearney et al. 1984, 1985). Inductively deriving teacher influence messages from college students, college teachers, and elementary and secondary teachers, a typology of 22 *behavior alteration techniques* (BATs) and sample *behavior alteration messages* (BAMs) resulted. Even though other operationalizations of teacher power are available, this typology continues to serve as the primary form of relational power measurement in the classroom context (Waldeck et al. 2001; → Classroom Power).

Subsequent research on BATs and BAMs revealed that teachers and students perceive the use of teacher power differently, with teachers reporting that they use pro-social or “nicer” strategies to influence students’ compliance, but students perceiving that their teachers use more antisocial or “meaner” strategies (Kearney et al. 1984). When teachers

are perceived to use pro-social strategies, students believe they learn more and like what they are learning. In reverse, with teachers who use antisocial strategies, students believe they learn less and dislike the learning process (Plax et al. 1986; Plax & Kearney 1992).

Continuing that line of research, others report a positive relationship between teachers' use of BATs and classroom outcomes, including cognitive and affective learning, student resistance and aggression, classroom interactional justice, motivation to learn, student interest, and their own reciprocal sense of power (Plax & Kearney 1992; Roach et al. 2006; → Learning and Communication). Similarly, teachers' selection of BATs is associated with nonverbal immediacy, credibility, satisfaction with their profession, teacher training and experience, culture, use of humor, and time during the semester (Plax & Kearney 1992; Roach et al. 2006; → Teacher Use of Humor).

Roach's parallel program of research illustrates how graduate teaching assistants (GTAs) use power or power-based BATs to manage their classrooms (Roach et al. 2006). He found, for instance, that the more inexperienced GTAs were perceived to use significantly more antisocial influence messages. Highly argumentative GTAs were prone to use more overall power than those low in argumentativeness, and those who were highly apprehensive about communicating as a TA in the classroom tended to use less power than those who were more moderate or low in their anxieties (→ Communication Apprehension; Teacher Assertiveness). Finally, Golish (1999) found that students reported using more power with GTAs than with their higher-status professors.

Finally, others have examined students' active role in the influence process by investigating students' resistance to teacher compliance-gaining attempts (Burroughs et al. 1989; Kearney et al. 1991; → Compliance Gaining).

Effective classroom management is often synonymous with teachers' ability to influence students in ways that optimize academic engagement time (→ Teacher Influence and Persuasion). Typically, teachers are rewarded or dismissed based on their management skills. And yet, not all management techniques are equally effective. Keeping in mind the relationship between selective use of particular BATs and student outcomes, teachers may facilitate student learning outcomes more effectively. In this way, teaching is more than content dissemination; effective teaching requires teachers to persuade and influence students (→ Persuasion; Persuasion and Resistance).

## Classroom Power

David Roach

Texas Tech University

Social influence is inherent in the process of classroom instruction. Interpersonal power, as social influence, is a relational phenomenon and is defined “as an individual’s potential to have an effect on another person’s or group of persons’ behavior” (Richmond et al. 1980, 38). It is a teacher’s job to communicate and to have an effect on students’ behavior and learning. Typically, teachers use power to help students learn, to keep students on task, to foster appropriate interactions between teacher and student and between student and student, to encourage students to stop antisocial or anti-productive behaviors, to encourage students to engage in pro-social and productive behaviors, etc. Notably, students exert interpersonal power in the classroom as well. Student communication, actions, and reactions have an influence on teachers and on other students.

It is important, as well, to realize that power is a perception. No one has power unless others perceive them to have it. Teacher power is granted or perceived by students, and

student power is granted or perceived by teachers and other students (→ Teacher Influence and Persuasion). Conceptualization and use of power must be receiver-based.

French & Raven (1959) outlined five basic bases of interpersonal power: coercive, legitimate, reward, referent, and expert. These power bases are anchored in the eye of the beholder – the perception of the person on the receiving end of the power use (i.e., the “target”). *Coercive power* is the perception of the target that the “source” (i.e., the person who has the power) can punish them if they do not do what the source wants. *Legitimate power* is the perception by the target that the source has the official right to tell them what to do simply by merit of position or authority. Society grants this power to certain individuals in certain roles or functions (e.g., teachers). *Reward power* is based on the target’s perception that the source has the ability to provide something desirable in exchange for cooperation. Like coercive power, this perception is influenced by whether or not the source can or will provide the reward. *Referent power* is based on the target’s desire to be like the source. This power base is rooted in the concept of identification. If a student likes and “identifies” with a teacher, he/she is more likely to do what the teacher suggests. Referent power is one of the strongest power bases available and tends to have more positive and long-term outcomes than other power bases. *Expert power* is the perception by the target that the source has great knowledge, training, background, and/or experience in a given area. “Knowledge is power” is a common and well-understood phrase. For this power base to be effective it must be relevant and seen as necessary by the target. There is a significant body of research literature dealing with classroom power.

In the early 1980s, a series of “Power in the Classroom” studies was launched to examine the operation and influence of power and compliance-gaining in instructional settings (→ Classroom Management Techniques). Instructor power use was found to be significantly correlated with student affective and cognitive learning (e.g., Richmond & McCroskey 1984). Other studies have extended findings from this research series. Richmond (1990) discovered a significant relationship between instructor power use and student exiting motivation to study course content.

Culture plays a significant role in classroom power. Roach and Byrne (2001) found that American instructors are perceived to use significantly more power in all five power bases than German instructors. In a comparison with French instructors, American instructors are perceived to use significantly more reward and referent power, and French instructors are perceived to use significantly more legitimate power (Roach et al. 2005).

Students also have and exercise power in the classroom. Golish (1999) found that students feel they have more power with graduate teaching assistants (GTAs) than they do with professors. Golish and Olson (2000) found that although teachers were perceived to use more power, students also used power and this power use was positively correlated with teacher power use. These studies indicate that supervisors and subordinates have power in an interaction context; power does not just come from the top down.

It is important that teachers use classroom power effectively. The overall goal in the classroom is learning and teacher power use is intended to promote this. Research indicates that though coercive and legitimate power can be used to accomplish desired short-term ends, the negative interpersonal aspects of these techniques are usually counter-productive in the long term. Even reward power, generally perceived as positive, can be ineffective in the long term. Research indicates that teachers should concentrate

instead on using referent and expert power. These two are the most pro-social power bases that produce the most positive outcomes. Use of referent power requires that teachers establish positive and trusting interpersonal relationships with students. Students are usually eager to respond to guidance from teachers they like and with whom they identify. Additionally, if teachers can convey their competence and character to the students (→ Teacher Self-Disclosure), the resulting level of credibility will allow the teacher to use expert power approaches toward the desired end.

## **Classroom Questioning**

*Barbara Mae Gayle*

*Saint Martin's University*

*Raymond W. Preiss*

*University of Puget Sound*

One important aspect of student–teacher classroom interaction involves the process of asking and answering questions. The proficient use of questioning in the classroom is

often recognized as a significant tool for managing classroom discourse and motivating student participation in the learning process. Many of the published studies in this area pragmatically advise teachers about the process of designing and executing questioning strategies that enhance student comprehension and recall of course materials. Other studies investigate the efficacy of teacher and student questioning practices. Although there is considerable disagreement regarding the outcomes of, and explanations for, effective classroom questioning, all researchers concur that educational questions are one of the fundamental tools teachers use to promote learning (→ Pedagogy, Communication in; Classroom Student–Teacher Interaction; Learning and Communication).

### RESEARCH QUESTIONS AND THEORIES

Research on oral questions asked during instruction emphasize the teacher's role in skillfully posing questions to stimulate student learning and the effect of questions on students' cognitive processing and understanding. Another studied area explores the effects of student question-asking/answering practices. At issue in these investigations is whether deliberately planned and implemented questioning can be associated with the integration and synthesis of the conceptual material being presented. Discussions about the efficacy of asking and answering questions most frequently conceptualize questions as inquiries that seek specific information or elicit cognitive elaboration (Graesser et al. 1992).

Although the notion of classroom questions is straightforward, researchers have yet to articulate a clear *theoretical perspective* to explain the way in which questions function to enhance student learning outcomes. Early research advanced a generative explanation that questions help students produce a myriad of thoughts related to the subject. Unconvinced by the simplicity of this explanation, some researchers embraced a more cognitive process suggesting that student learning was a function of elaborating upon the connections between material learned and questions asked. Not entirely satisfied that thoughts are stimulated by mere question-asking, other investigators suggest that teachers have so successfully modeled question-asking and answering behavior that their operant conditioning made questioning an integral part of the learning process. Finally, some investigators support a social interaction perspective, reasoning that the interpersonal interactions that occur in the classroom make question-asking and answering a normal part of a good teacher–student relationship.

Besides theorizing about the underpinnings of question-asking, there is also controversy about the best categorization schema to describe the *types of questions* employed and the descriptions used to classify the level of questioning occurring in the classroom. Many researchers use some form of Bloom's taxonomy (knowledge, comprehension, application, analysis, synthesis, or evaluation) to assess the types of questions asked. Others have developed schemas that emerged from direct observations, but these typologies have few commonalities. The most pragmatic way to handle question types and/or distinguish between categories of questions is to differentiate between questions that require the retrieval of factual information (lower-level cognitive questions) and questions that require students to cognitively locate relevant information, sift through that information for material most closely linked to the question posed, and evaluate or extrapolate the application of the information to the question being asked (higher-level cognitive questions).

Much of the question-asking literature focuses upon the scope of possible questions that the instructor could ask, phrasing questions carefully, selecting appropriate content-based questions, implementing both high-level and low-level cognitive questions, and allowing sufficient time for student responses to maximize learning (see Gayle et al. 2006). Such *pragmatic advice* posits that effective teachers need to: allow both volunteering and nonvolunteering students an opportunity to answer questions posed, retain the possibility of spontaneously called-out answers, provide support for incorrect responses, prod for deeper-level responses, and favorably acknowledge accurate responses. Teachers are urged to side-step the threatening, power-laden nature of question-asking and to avoid asking vague, trick, or abstract questions which may inhibit responses and evoke negative feelings toward learning.

### CONCEPTUALIZING THE RELATIONSHIP BETWEEN QUESTIONS AND STUDENT LEARNING

Not only does the research on classroom questioning behavior involve best practices, it also investigates the relationship between teacher questioning practices and student learning outcomes. This line of research addresses the efficacy of asking questions and the types of questions asked. Several studies indicate that student comprehension and recall can be enhanced by strategic question-asking (see Martin & Pressley 1991).

Not all studies affirm the educational benefits of asking questions, and some researchers found that more questions resulted in lower student recall of lecture material. Van den Broek et al. (2001) concluded that a host of factors such as student age, question timing, and question placement mediated student comprehension following teacher questioning. These authors caution instructors to investigate the efficacy of their particular question-asking strategies and to be mindful of the questions selected to motivate student learning.

Some writers make bold claims regarding the effects of questioning. Teachers are advised to increase the number of higher-level questions in order to enhance students' thinking capacity and overall level of academic achievement (Dornisch & Sperling 2004). Pressley & Forrest-Pressley (1985) reasoned that higher cognitive level questions require the integration of material and moving beyond the information presented. Research has not always supported these contentions. The discussion centers on how the cognitive level of the question actually functions to enhance recall or comprehension. Some research findings discount the educational benefits of higher-order questions (see Samson et al. 1987). On the other hand, researchers like Redfield & Rousseau (1981) in their meta-analysis claim that "gains in achievement can be expected when higher cognitive questions assume a predominate role during classroom instruction" (p. 237). This assertion is consistent with Gayle et al.'s (2006) meta-analytic findings that indicate achievement scores tended to increase following exposure to high-order questioning. The problem in documenting the impact of higher cognitive questions on student learning may lie in the actual employment of higher-order questions in the classroom. Wimer et al. (2001) observed that higher cognitive level questioning was surprisingly absent in American classrooms.

Researchers have also focused on teachers paying equal attention to the *type of question asked by instructors* and the *type of response received from students*. For example, Dantonio & Paradise (1988) observed that high-level questions, which require students to process

readily available information at a higher level than rote recall, elicited high-level responses. These authors believe that lower cognitive level questions requiring the recall of factual information elicit lower-level cognitive responses. Similarly, Fagan et al. (1981) concluded that asking higher-level questions produce higher-level responses. Their conclusions are supported by Gayle et al.'s (2006) meta-analysis. However, some researchers observe that half the time students' responses to questions fail to correspond to the cognitive level of teachers' questions (Dillon 1982). The issue appears to be that students may or may not have the mental ability or agility to answer a question at the level of abstraction sought by the teacher.

### **EXTENDED WAIT TIME**

One theoretical issue contributing to the efficacy of questioning behavior involves the amount of time necessary to deepen the level of student response. This construct is normally conceptualized as the time teachers allow students to think about, and answer, the question posed. Normally, wait time or lapse time is operationalized using a stop watch to measure the amount of time between the moment a question is asked and the time a response is initiated. Research into wait time suggests that the most frequent time allowed for students to begin answering the question asked is three seconds, which may not be the optimal interval for motivating student participation and/or learning.

Research on question wait time fails to produce conclusive evidence that extending wait time maximizes student learning. The majority of the findings have centered on question complexity and required processing-time. Several researchers report that students responding to higher cognitive level questions do not require more wait time than students responding to lower cognitive level questions (Duell 1994). It appears that pausing after higher-level questions does not necessarily produce higher-level responses and that extending the lapse time could actually lower the cognitive processing for higher-order questions.

There is some controversy surrounding the issue of wait time. Several researchers observed that using higher-level questions and increased thinking or wait time produced a higher-level cognitive response (Gambrell 1983). These authors also found that lower-level, text-based questions required more think time before eliciting a response. A mitigating factor may be the teachers' inability to capitalize on the use of higher-order questions which may improve educational outcomes. Another factor may be how a particular instructor encourages students to think before answering questions.

### **STUDENT AS QUESTIONER IN CLASSROOM INTERACTION**

An additional area of student-teacher interaction in the classroom involves asking and answering student-generated questions. Although this issue has received less attention, the pragmatic advice to teachers concentrates on modeling skillful questioning behavior for students. It appears that teacher questions generate the most opportunity for student question-asking. West and Pearson (1994) found that students ask about three questions per hour, and those questions most frequently pertained to classroom procedures, information inquiries, and clarifications of teacher statements. Student questions were most often answered by teachers' clarifying statements.

While considering student question-asking, investigations have focused upon the relationship between student question-asking ability and student comprehension and recall. King's (1990) studies provided students with a set of questions to guide them in asking and answering additional self-generated or peer-generated questions related to course materials. It appears that students capable of asking and answering questions when engaged in peer interactions produced more in-depth synthesis of the subject matter. Interestingly, the level of student questioning was significantly related to the level of the knowledge statement produced (King 1994). Students who asked questions about their experiences as well as questions that integrated course material demonstrated a deeper understanding of the subject matter and more sophisticated knowledge construction.

Finally, researchers have focused upon other mitigating factors in exploring student-generated question-asking. Graesser et al. (1992) reported that tutors generate more questions than students being tutored, but both tutors and students use more questions requiring yes or no answers. This made it difficult to determine the efficacy of questions in enhancing student learning. Good et al. (1987) discovered that lower-achieving students begin by asking more questions than other students in the early grades but ended up asking the least questions as they progress through school. The authors speculate that these students most likely learn not to ask questions because of teacher and/or peer feedback.

## **Classroom Student–Teacher Interaction**

*Scott A. Myers*

*West Virginia University*

Student–teacher interaction, both in and out of the classroom, is influenced strongly by the teaching perspective embraced by the teacher. Within the instructional communication discipline, teaching can be viewed from two perspectives: the rhetorical perspective and the relational perspective (Mottet & Beebe 2006). Teachers whose student–teacher interaction is governed by the rhetorical perspective communicate with their students as a means to influence or persuade them. Communication is teacher-centered, which means that teachers send a message to students who play a passive role as the recipient of the message. To communicate effectively with their students, teachers focus on teaching clearly, making course content relevant, and acting in an assertive manner (→ Teacher Clarity; Teacher Assertiveness). In essence, their in-class communication behaviors center on performing their classroom functions as lecturer and discussion leader and managing the classroom.

### **TEACHER–STUDENT IN-CLASS COMMUNICATION**

Teacher–student in-class communication revolves around the primary communicative roles played by the teacher. Two of these roles are teacher as lecturer and teacher as discussion

leader. The lecture enables teachers to communicate large amounts of information organized in a way to appeal to many students at the same time. For the lecture to be effective, it must have the appropriate breadth and depth of content, be organized in a logical pattern, and contain the appropriate amount and type of examples. Teachers must also strive to engage in effective communicative behaviors when lecturing. These communicative behaviors include being clear, making the content relevant, and using humor. When engaged in teaching with clarity, teachers communicate their expectations clearly, stress key points, provide preview and review statements, and describe assignments (Book 1999).

*Clear* teachers are concerned with not only the clarity of course content, but the clarity of course procedures, course policies, and course expectations. When making content relevant, teachers communicate content relevance through the use of examples, explanations, current events, and experiences. Teachers who are *relevant* are concerned with making the connection between course material and students' career goals, personal goals, and personal needs. When using *humor*, teachers communicate through relaying humorous stories, anecdotes, and jokes, and by exaggeration (→ Teacher Use of Humor). Humorous teachers make sure their humor is related to the course content and is used to clarify key points made in the lecture. Thus, by incorporating clarity, relevance, and humor in their lectures, teachers are able to enhance student learning. Additionally, when teachers are clear, relevant, and humorous, students report that they liked their teacher, liked the course, and were motivated to study (→ Pedagogy, Communication in).

When leading discussion, teachers rely on asking questions as their primary communicative tool (→ Classroom Questioning). By asking questions, teachers can assess whether students are learning, are interested in the course content, or are simply paying attention. Many teachers rely on asking recall and clarification questions to determine whether students are learning or paying attention, but other forms of teacher questions exist. These teacher questions are exploratory, diagnostic, action, cause-and-effect, and summary (Davis 1993). Exploratory questions ask students to probe known facts; diagnostic questions ask students to probe motives or causes; action questions ask students to develop a course of action; cause-and-effect questions ask students to derive a causal explanation; and summary questions ask students to synthesize content. Whatever the type of questions teachers ask, these questions are designed to challenge and involve students in classroom interaction.

Teacher communication is also central in classroom management. Classroom management refers to the communicative behaviors used by teachers to regulate and control student classroom behavior (→ Classroom Management Techniques). Some of the communicative behaviors used by teachers are messages rooted in teacher power and influence and behavioral alteration techniques. Messages rooted in teacher power and influence enable teachers to persuade students to behave in ways that are appropriate for the classroom. Two of these messages include teacher expert power and teacher referent power (→ Classroom Power). Teacher expert power refers to student recognition of the teacher as a content specialist and teacher referent power refers to student recognition of the teacher as a likeable person. When teachers use expert power and referent power messages, students report that they liked the course, learned something from it, are satisfied with how their teachers communicated in the course, and consider their teachers to be competent and trustworthy. Moreover, students are more likely to behave and

respond to their teachers' requests to behave, which emerge in the form of behavioral alteration techniques. *Behavioral alteration techniques* are 22 strategies used by teachers to gain student compliance using either a positive or a negative tone. When teachers use pro-social techniques, students are more likely to respond positively to teacher influence attempts; when teachers use negative techniques, students are more likely to resist teacher influence attempts (→ Teacher Influence and Persuasion).

Conversely, teachers whose student–teacher interaction is governed by the relational perspective communicate with their students as a means of developing a relationship. Communication is mutually created and shared between students and teachers, with an emphasis on the role of shared emotions and feelings used by students and teachers to respond both affectively and effectively to each other. To communicate effectively with their students, teachers use affinity-seeking strategies and immediacy behaviors, are supportive and confirming, and use humor (→ Teacher Affinity Seeking; Teacher Comforting and Social Support; Teacher Confirmation; Teacher Immediacy).

Through the relational perspective, student–teacher interaction is viewed as collaborative in that student–teacher interaction is interpersonally driven and relationally oriented. Implicit in this argument is the notion that students and instructors engage in communication in order to develop professional working relationships with each other. The relational perspective can account for student–teacher interaction, which impacts whether and how students are motivated to communicate with their teachers, whether students participate in the classroom, and whether students engage in out-of-class communication with their teachers.

### **STUDENT COMMUNICATION MOTIVES**

Whether student–teacher interaction occurs may be dependent on whether or not students are motivated to communicate with their teachers. Student communication motives refer to the primary reasons for students to communicate with their teachers. Researchers have identified five communication motives. These motives, or reasons, are relational, functional, participatory, excuse-making, and sycophancy (Martin et al. 1999).

When students communicate with teachers for *relational reasons*, they are doing so to learn more about the teacher on a personal level. Students may perceive their teachers as having similar interests, sharing the same background, or having the potential to become a potential friend. When students communicate with teachers for *functional reasons*, they are doing so to acquire needed information about the course. Students may ask questions or use information-seeking strategies to learn about course expectations, to understand the material, or to clarify the requirements for assignments, exams, and projects. When students communicate with teachers for *participatory reasons*, they are doing so to demonstrate their involvement in the course. Students may answer questions, offer examples, or challenge teachers' comments to demonstrate that they are genuinely interested in participating in class discussion or class activity. When students communicate with teachers for *excuse-making*, they are doing so to provide a reason as to why their academic performance is suffering. Students may offer excuses for why they are tardy, why they are absent from class, or why their assignments are incomplete or not finished at all. When students communicate with teachers for *sycophantic reasons*, they are doing so in order to

make a favorable impression on teachers. Students may engage in conversation, answer questions, or appear interested in the course content because they want to be viewed positively by their teachers.

When students communicate with their teachers for relational, functional, and participatory reasons, they report that they liked the course, learned something from it, are satisfied with how their teachers communicated in the course, and are motivated to study. Students who communicate with their teachers for relational and functional reasons also report that they liked the teacher. Conversely, students who communicate for excuse-making and sycophancy reasons do not indicate any positive links between their communication with their teachers and their liking, learning, or satisfaction and this motivation. These findings suggest that when students communicate with their teachers for relational, functional, and participatory reasons, their educational experience is affected positively, whereas when they communicate with their teachers for excuse-making and sycophantic reasons their educational experience is not affected at all, whether positively or negatively.

At the same time, whether students are motivated to communicate with their teachers is dependent on the interpersonal communication behaviors used by teachers. Generally, when students are motivated to communicate with their teachers, they perceive their teachers as being approachable, as friendly yet challenging, as responsive yet assertive, and as possessing the communication skills necessary for functional relationships. They are also motivated to communicate when their teachers use verbal and nonverbal immediacy behaviors and use pro-social classroom management techniques. Moreover, students are motivated to communicate with their teachers when they consider their relationships to be of high quality and unlike the relationships the same teachers have with other students.

### STUDENT IN-CLASS PARTICIPATION

One way in which students' reasons for communicating with their teachers may surface is through their in-class participation. In-class participation, which is defined broadly as the comments offered and questions asked by students during class time (Fassinger 2000), encapsulates the questions students ask, the clarification tactics and the information-seeking strategies they use, and the challenge behaviors in which they engage.

Asking questions is perhaps the most fundamental process through which students participate in class. By asking questions, students can request help, signal a lack of comprehension, request additional information, and check a point of view. College students generally ask five types of questions: classroom procedures, general inquiry content, clarification, confirmation, and general inquiry teacher (West & Pearson 1994). *Classroom procedures* questions center on course assignments and exams, the syllabus, and general classroom management; *general inquiry content* questions are factual and revolve around the subject matter; *clarification* questions focus on further elaboration of the subject matter; *confirmation* questions center on student requests for affirmation; and *general inquiry teacher* questions seek personal information about the instructor. Although it is estimated that 95 percent of students have questions, college students typically only ask three to four questions per hour of class, and these questions are asked primarily to request clarification and inquire about classroom procedures.

*Clarification tactics* refer to the questions asked or statements made by students through which students indicate they need additional information in order to enhance their understanding of the subject matter. College students use a variety of clarification tactics (Kendrick & Darling 1990). These tactics include: ignoring the problem; asking the teacher to elaborate, provide an example, rephrase the content, or repeat the material; asking the teacher a specific question; indicating confusion via a quizzical look or brief phrase; and checking to determine if the content was interpreted accurately. Other clarification tactics include asking classmates, asking the teacher to speak more slowly, and asking the teacher for written material. Of these clarification tactics, asking the teacher to elaborate, to provide an example, and to repeat the material are the most commonly used tactics, although the use of each tactic can depend on class size and instructional format.

*Information-seeking* is defined as the process by which students acquire feedback through the use of information-seeking strategies, and is used when they are unsure of how their performance is being evaluated. Five information-seeking strategies used by college students are the overt, indirect, third-party, testing, and observing strategies (Myers & Knox 2001). The *overt* strategy is the only strategy that involves direct interaction between two individuals; an *indirect* strategy entails either hinting at the information or getting the target to provide the information without explicitly being asked; a *third-party* strategy requires an individual to solicit the information from someone other than the target; a *testing* strategy involves an individual deviating from the organizational or institutional norms in the hopes of being noticed; and an *observing* strategy requires little or no interaction between the information seeker and the target. Among college students, the overt information-seeking strategy is used the most frequently and the testing strategy the least frequently, although the use of each strategy may depend on students' perceptions of whether the classroom climate is supportive or defensive and whether teachers use communication behaviors that invite students' use of each strategy.

*Challenge behaviors* are strategies used by students specifically in an attempt to reduce their uncertainty about classroom rules, expectations, power, and explanations. Four challenge behaviors used by students are procedural challenges, evaluation challenges, practicality challenges, and power challenges (Simonds 1997). *Procedural* challenges focus on students testing the classroom "rules," which may be stated by teachers or included in the course syllabus; *evaluation* challenges arise when students question teachers' grading methods, grading scales, or measurement tools; *practicality* challenges occur when students question the relevance or salience of course assignments or tasks; and *power* challenges arise when students attempt to exert influence over teachers or other students. All four challenge behaviors are used steadily by students throughout the course of a semester and across all academic disciplines.

### **OUT-OF-CLASS COMMUNICATION (OCC)**

*Out-of-class communication* (OCC) between student and teacher is defined broadly as "structured and unstructured activities or conditions that are not directly part of an institution's formal, course-related instructional purposes" (Terenzini et al. 1996, 150).

These activities or conditions include students' use of scheduled or impromptu office visits; e-mail messages and telephone calls; running into faculty on campus, at campus events, or off campus; stopping to speak with faculty in the corridor or during class breaks; speaking with their instructors before and after class; and scheduled advising sessions. OCC is initiated primarily by students and occurs most frequently in the form of office visits.

Although the number of students who participate in OCC varies, its content is restricted to several topics. Some of these topics include students inquiring about course-related information, engaging in self-disclosure, seeking advice, engaging in small talk, sharing intellectual ideas, asking instructors for favors, discussing future career plans, and discussing campus issues, although inquiries about course-related information are the most frequently reported OCC topic (Jaasma & Koper 2001; Theophilides & Terenzini 1981).

Students who engage in OCC report a better educational experience than students who do not engage in it. Similarly with the research findings on students' motives to communicate with their teachers, student learning outcomes are linked positively to OCC. When students engage in OCC, they report that they like their teacher, liked the course, learned something from it, are motivated to study, and are satisfied with how their teachers communicated in the course. Students also are more likely to discuss what they have learned in the course with their family and friends, and report that they consider their teachers to be trustworthy, empathic, and as possessing the ability to mentor.

At the same time, whether students are motivated to engage in OCC with their teachers is dependent on the interpersonal communication behaviors used by teachers. These interpersonal communication behaviors include whether teachers are assertive and responsive, engage in verbal and nonverbal immediacy behaviors, use humor, utilize affinity-seeking strategies, and use functional communication skills (→ Teacher Socio-Communicative Style).

## Climate of Opinion

Leo W. Jeffres

Cleveland State University

Like many concepts in the social sciences, the “climate of opinion” is a metaphor borrowed from the physical world to describe a phenomenon that is not only important to the general public and policymakers but also to major mass communication theories. The *climate of opinion* refers to the “perceived popularity” of opinions (Sutherland & Galloway 1981). Political communication scholars often differentiate between → public opinion and popular opinion, between organized community on the one hand and mass or crowd on the other, between opinions based on consensus and unifying tradition and aggregated views of the moment. Policymakers generally respond to the former referents in each of these pairs, to public opinion, rather than to the latter, popular opinions, expressed in polls reported by the media (→ Polls and the Media; Public Opinion Polling; Survey). Scholars have examined how the climate of opinion affects → political discourse and the perceived freedom to talk (Wyatt et al. 2000).

The importance of the media lies in their ability to not only affect public opinion but also report popular opinion, and it is the latter that often is the content of messages conveyed to the general public as they consider what represents the climate of opinion at any given moment. When the topic or issue is clear, as in the case of elections – Who do voters support? Do people favor an issue? (→ Election Polls and Forecasts; Election Surveys) – the public is generally quite accurate in gauging the climate of public opinion, but the same cannot be said of other contexts, when coverage of what is on the minds of citizens is more fragmented and fleeting, and when the referent opinion is unambiguous (→ Perceived Reality; Meta-Analyses; Pluralistic Ignorance).

The significance of the climate of opinion as a concept increased with the introduction of the → *spiral of silence*, first articulated by → Elisabeth Noelle-Neumann (1993). In this theory, what people learn from the media affects their perceptions of the climate of opinion and how they express themselves in interpersonal discussions. People are seen as using the media and personal experience to perceive those opinions that are gaining and those that are losing ground. When people believe that their opinions are in the majority or becoming more popular, they express their convictions openly, outside of their family and circle of friends. If they think their opinions are in the minority, or losing favor, they feel less certain of their position and are less likely to discuss their opinion except with friends. Thus, the climate of opinion visible in interpersonal discussions and reported in the media is distorted in some way (→ Public Opinion, Media Effects on).

The research generated to test the spiral of silence shows support in numerous countries with diverse publics but also raises questions about its applicability based on how people process media messages conveying the climate of opinion (e.g., congruency between one's own opinion and that climate reported), whether the media present a consonant portrayal of the *climate of opinion* (→ Consonance of Media Content), a prevailing attitude (challenged when applied to the US), whether perceptions of a climate of opinion dissonant from one's own can sometimes stimulate people to “buck the spiral” to express opinions, and whether people's socio-demographic characteristics, the nature of the issue, the issue's salience to individuals, and the positive attraction to social groups are more important determinants of willingness to express an opinion than fear of social isolation.

Another issue surrounding the concept asks whether there is one climate of opinion or *multiple climates*. People live in various circumstances, so a national climate of opinion may be important for some topics, but individuals may respond to local climates for other issues. These distinctions may vary not only by geography but also by social groups, e.g., people living in communities with different levels of racial diversity when the opinion concerns racial issues.

The climate of opinion also is pertinent to discussions of → *third-person effects*. Documented across various publics, third-person perception represents the tendency for people to estimate negative media effects on other people to be greater than they are on themselves, with a reverse discrepancy when the effects are positive. This line of research links third-person perceptions to personal opinions and media perceptions through notions of a hostile or persuasive media and projection processes. The projection effect posits a positive relationship between personal opinion and the perceived climate of opinion, with support found in some studies (→ False Consensus; False Uniqueness; Hostile Media Phenomenon; Social Perception).

## **Cluster Analysis**

*Martin Emmer*

*Ilmenau University of Technology*

Cluster analysis is a collective term for a broad variety of statistical methods and procedures which share the purpose of reducing the complexity of large collections of elements by arranging these objects into groups. Clustering procedures try to identify homogeneous groups (clusters) of entities within an empirical data set by comparing their attributes. The elements being clustered are predominantly the objects (cases, arranged in rows of a common data matrix) of an observation, but nothing stands against clustering the variables (columns in a data matrix) likewise. Thus cluster analysis is closely related to methods of → factor analysis.

The groups to be identified consist of elements that are similar to one another, while the resulting groups ought to be as different as possible. Thus the main goal of all measures and algorithms employed in cluster analysis is to optimize this equilibrium of homogeneity (of the elements within groups) and heterogeneity (of all identified groups).

## APPLICATIONS OF CLUSTER ANALYSIS

Early developments of methods for classification or cluster analysis can be found from the late 1930s on. The techniques and algorithms used today (and included in popular statistical software packages like SAS and SPSS) were developed mainly in the 1960s and 1970s, with the growing power of electronic data processing, which is essential for cluster analysis. The output of literature on classification and clustering is still much higher than in other fields of quantitative data analysis.

The main fields of application for clustering techniques early on, and still today, have been biology, psychology, marketing, and medical science (Mirkin 1996, 4–17; Mirkin 2005, xi–xxii). In media and communication studies the number of publications referring to this method is relatively moderate (if the much more frequently used factor analysis is not regarded as a variation of a clustering technique). Nevertheless, cluster analysis can be very helpful in exploratory studies as in hypothesis-testing in the field of communication studies: it can contribute substantially to the identification and description of types of media users, print publications, and patterns of media use (→ Exposure to Communication Content; Research Methods).

## ELEMENTS OF A CLUSTER ANALYSIS

A cluster analysis usually comprises several steps (Milligan 1996): (1) the entities to be clustered and the variables by which the clusters will be defined have to be selected; (2) the similarity of the objects of interest according to the selected variables has to be determined by measures of proximity; (3) the objects have to be sorted into groups on the basis of these measures and by using specific clustering methods; and (4) a decision has to be made as to the appropriate number of clusters, followed by description and interpretation of the final cluster solution.

The first step is usually predetermined by the available data set. The *entities for clustering* in the field of communication research might be primarily persons (survey data), media products, statements, images (content analysis), or even complex aggregates like states or communities. There are no special requirements for the entities, but some clustering methods achieve a better response with the problem of outliers than others. One solution is to eliminate outliers from the data set; furthermore, literature has provided specific methods of clustering that are less affected by extreme cases.

Much more crucial, though seldom discussed in applied research, is the *selection of the variables* for clustering. There is no upper limit for the number of variables that can be included in a cluster analysis. There are measurements and methods for binary data as well as for metric scaling; there is no normal distribution required and only a maximum number of variables is allowed. Nevertheless, the outcome of a cluster analysis may be severely affected by mistakes in choosing variables. The selection of the variables should

be made on the basis of theoretical assumptions, for the incorporation of just one or two “noise variables” might have a severe influence on the resulting solution (Milligan 1996, 361–365). It should also be recognized that large numbers of particular variables have a weighting effect on the cluster formation (if, for example, TV use is measured by 10 variables and newspaper use by only two, the resulting clusters will be strongly determined by TV use), as well as the use of different scale ranges or possible correlations of the variables used. This problem can be solved by the employment of standardization or weighting procedures; however, an imbalance of variables of different kinds might be deliberately imposed by a researcher as a way of weighting.

The second step concerns the selection of an appropriate *measure of proximity*. Proximity measures determine the distance between two objects on one or more variables, and many different statistical procedures are available that can deal with all sorts of scale types. For example, with binary data, there are four possible relations of two objects: both carry the same attribute (a), e.g., persons are newspaper readers or not, have online access or not, etc.; only either the first object (b) or the second object (c) carries it, or finally neither of them (d). In order to compute the *simple matching coefficient* (SMC) the matching values (a + d) are related to the sum of all measurements:

$$SMC = \frac{a + d}{a + b + c + d} \quad (1.1)$$

Distances between metric scales can be determined by the Minkowsky metrics, among which the Euclidian distance is the most common. All these measures have specific effects on the results which might be unwanted in the light of the data or of the research question. The decision as to what measure to use should be made on the basis of a careful examination of the requirements of the study (Arabie & Hubert 1996, 13).

The third step and the core procedure of a cluster analysis is the *clustering method*, which puts the objects into groups. The main distinction in the field of clustering algorithms is that between hierarchical and nonhierarchical methods. Hierarchical methods generally try to separate the whole portion of cases stepwise into groups, while nonhierarchical procedures start with a specific partition and try to optimize the cluster representation by moving single objects between the given clusters. As the latter group of methods require an idea of the possible resulting groups, very solid and theoretically based assumptions about the pre-formulated groups are essential. Thus nonhierarchical methods are usually employed in a second step to evaluate or optimize a cluster solution that has previously been produced by the use of hierarchical methods.

In order to identify groups of objects in a data set without any preconceptions, *hierarchical methods* are appropriate and common (Gordon 1996, 65). Here too a large variety of methods is available, of which agglomerative (bottom-up) and divisive (top-down) methods are the most common. *Agglomerative algorithms* begin by regarding every case as one cluster, and continue by merging the two most similar clusters step by step, until all cases are integrated in one final cluster. Some examples are single link, complete link, centroid, and the Ward algorithm. *Divisive methods* work the other way around: they start with all the objects in one cluster and then separate them step by step. Within these groups of methods there are many algorithms to identify distinct groups of objects that have, as the underlying proximity measures, certain consequences which may be positive or negative

depending on the type of data and research objective. Hence some of the algorithms tend to form long chains of cases, while others tend to produce more bold clusters; some tend to build clusters of a comparable size, while others produce different-sized clusters. Generally speaking, the results of agglomerative methods are strongly dependent on the starting point: a second run through the same data set, beginning with a different object, might easily lead to more or less different group sizes or even different optimal cluster solutions.

In the fourth step the last problem is to be assessed: the decision about the final cluster solution, which is mainly a decision about the *number of clusters* that best represents the structure of the population. As a result, hierarchical algorithms provide the whole scale of steps, from all cases in a single cluster to each case forming its own cluster, leaving the researcher to decide the result. Additionally, in a prototypical social sciences data set of about 1,000 or 2,000 cases and several dozens of variables it is – despite technological progress in software and hardware development – impossible to calculate all the potential distances, combinations, and clustering orders in order to identify the one solution that represents the optimum in similarities and dissimilarities of cases and clusters according to a specific measurement. Last but not least, there may be theoretical implications that lead a researcher to prefer, for example, a two-cluster solution to a six- or seven-cluster landscape. Statistics provide several “stopping rules,” which help to determine the optimal point at which to stop the cluster integration before the end (either all cases in one cluster or every case a cluster) is reached (Bock 1994, 9–10). Following the Ward algorithm, for example, a significant increase of the error sum of squares from one step to another would be a criterion for stopping the process and accepting the previous solution as final.

In all four steps of cluster analysis, there is not the *one* standard method (as the limited possibilities of standard software packages may sometimes suggest). In addition to careful selection of the appropriate variables, proximity measures, and clustering algorithms, the choice of procedure depends to a great extent on the individual research question.

# CNN

*Ingrid Volkmer*

*University of Melbourne*

Cable News Network (CNN) has become an icon of the globalized news world (→ News; Television News). CNN's rise as one of the most prominent global news organizations is based on a successful strategic integration of three key spheres of → journalism: (1) an innovative approach to internationalization (→ International News Reporting); (2) the invention of unique presentation styles, such as “breaking news”; and (3) a continuous implementation of state-of-the-art technologies in order to reach clearly defined target audience segments (→ News Production and Technology).

## FOUNDATION AND EARLY HISTORY

CNN was launched on June 1, 1980 in Atlanta, Georgia (USA) as a dedicated 24/7 news and information channel (→ Newscast, 24-Hour). CNN was the fourth specific channel of the first phase of → cable television in the US: the movie channel HBO was launched in 1972 and the children's channel Nickelodeon and sports channel ESPN were both started in 1979 (→ United States of America: Media System). News as well as political information programs had been reduced on prime-time network television throughout the 1970s in the US. However, CNN's founder, Ted Turner, saw on one hand a potentially lucrative market niche and on the other a severe need for solid political information within the US television culture of the late 1980s.

Turner, owner of Atlanta-based superstation WTBS, envisioned a 24-hour program that would cover political, economic, and cultural issues in 30-minute components, framed as magazine-style journalism that would then be rebroadcast in continuous program loops. Given the need for low budget production as well as the experimental status of the channel in its early days, this program loop model helped to fill 24/7 airtime.

In 1980, CNN's audience consisted of only one million out of the 13 million households who subscribed to cable television in the US. Although the established networks had cut back on news programs, they still had exclusive access to the international news gathering infrastructure and to a number of international correspondents, as well as exclusive satellite access. CNN as a newcomer was not yet able to hire foreign correspondents and was instead forced to establish new forms of one-to-one national and international cooperation: CNN would receive footage of events happening internationally from a particular broadcaster, and that broadcaster would exclusively receive CNN material on events in the US. This innovative news gathering structure created what was later called “breaking news” coverage, meaning covering events as the story unfolded – a journalism style that is today the norm among 24/7 news channels.

In these early days, the established US → television networks and other news organizations did not take CNN seriously, which – in retrospect – allowed CNN to successfully expand into new and innovative territories. So successfully that ABC Westinghouse planned to launch a satellite news channel (SNC), airing headline-type news clips. In response, Turner formed CNN 2 Headline News on January 1, 1982, which clearly took

the lead, given that CNN was already a popular news channel. Furthermore, Turner promised to pay cable operators \$1 per subscriber to CNN 2, which quickly forced ABC's SNC to close down. In 1985, NBC plans to launch an all-news channel also failed, given Turner's successful negotiation with cable operators in the US.

## INTERNATIONALIZATION

Already in its early phase in the 1980s, CNN sent its signal abroad in order to establish a news exchange system with international broadcasters. In 1984, CNN was available in 22 nations of Central America and the Caribbean. In this first internationalization phase, the international channel consisted of CNN's and CNN Headline News's segments. In the early 1990s, CNN International (CNNI) began to produce news programs for an international market, such as *The International Hour* (co-anchored from London and Washington, DC), aired live from London, as well as *World News*.

Given the fact that cable and → satellite television emerged in various worldwide media markets such as Europe and Japan, particularly due to deregulation of media ownership policies, CNNI rapidly expanded internationally by utilizing an increasingly competitive second-generation "direct-to-home" satellite infrastructure. In addition, selected CNN programs were delivered by regional channels, for example in Southern Russia, on Bahrain TV, and on Australian networks.

From the outset, CNN was forced to innovate in news journalism in order to compete with established news outlets nationally and internationally. One key aspect of CNN's success throughout the 1990s was the "diversification" of news. Once gathered, news stories were repackaged and distributed through a system of outlets. Among these were *Noticiero Telemundo CNN* (for Hispanic audiences in the US), CNNI as well as so-called "out-of-home" channels, such as *CNN Inflight* (for inflight television), *Airport Channel*, and *CNN Reel News* in movie theaters as well as through a radio network (→ Radio; Radio Networks).

However, it is often overlooked that CNN additionally served as a news agency by selling breaking news to news outlets worldwide. This service, called *CNN Newsource*, was established in 1985 with 22 participating stations and helped to sell a CNN flagship product, breaking news, to outlets worldwide. It constituted a major component of CNN's revenue stream.

Covering breaking news in various parts of the world was possible through CNN's cooperation systems with international leading broadcasters. One of these quite unique systems was the program *World Report*, which allowed international broadcasters to contribute news stories. A great number of international broadcasters from developing and developed countries have participated since the 1990s in this program and use this unique global platform to deliver their viewpoints to an international audience. As Don Flournoy argued: "The emergence of a political climate for freer use of the media and the easing of restrictions on the flow of electronic information across borders played a role for establishing such an egalitarian news arrangement" (Flournoy 1992, 49).

## CNN AND THE 1990–1991 GULF WAR

CNN International gained further prominence in the 1990–1991 Gulf War through a unique set of four factors. These were the use of the latest satellite technology (mobile

uplink devices), which allowed “live” coverage from remote locations; access to a system of globally operating satellites to deliver images instantaneously; a powerful role in the controlled information flow of the “pool system” of journalists; and exclusive access to otherwise restricted war zones. These four factors enabled CNN to deliver a unique and unprecedented “live” war coverage to a worldwide audience.

The Gulf War of 1991 was the first “televised” war that “commenced and ended during US prime time” (Ammon 2001). The visual images of the war conveyed live by CNN and picked up by news networks in various world regions had an influence on the war strategy of the US administration and created a new journalistic terrain of real-time → media diplomacy. These new effects of live news coverage, not only of wars and military conflicts but also humanitarian crises, have been described as the “CNN effect” (Robinson 2002), and as “headline diplomacy” (Seib 1997), highlighting the power of continuous coverage of conflicts as a new force in shaping foreign policy (→ Conflict as Media Content).

### THE RISE OF COMPETITION

It was the role of CNN as the journalistic gatekeeper of the global crisis agenda that led to the launch of other international 24/7 news channels (→ Gatekeeping). *Euronews*, part of the European Broadcasting Union, was established in 1993, the television service of the BBC, *BBC World*, in 1995 (→ BBC World Service), the Arab news channel *Al Jazeera* (in Arabic) in 1996 (→ Arab Satellite TV News), *Channel News Asia* (English and Chinese) in 1999, *Al Arabiya*, in 2003, *Al Jazeera English* in November, 2006 and *France 24*, a transnational French news channel (in French and English, and from June, 2007, in Arabic), in December 2006, all attempting to challenge not only CNN but the “Anglo-Saxon” view of the world.

Within the US, CNN’s dominance faded due to other 24/7 news channels, such as Fox Cable News, a channel owned by Rupert Murdoch’s → News Corporation that competed with CNN for majority share of the US news audience, and MSNBC, as well as specialized news services such as *Bloomberg TV*, focusing on financial news. Turner sold CNN (along with the Turner Broadcasting System) to Time Warner, even as the → Internet began to gain a new role in news journalism.

As more satellites became available, more television channels with news components were delivered worldwide to enable national broadcasters to reach an international audience, among them the Italian broadcaster RAI (→ Italy: Media System), Jordan TV (→ West Asia: Media Systems), and CCTV-9, the English-language program of → China Central Television (→ China: Media System). Latest developments enabled by broadband technologies included entire program platforms, such as Cyfra+, targeting a particular sub-national audience in various world regions.

CNN’s influence on transnational audiences and policymakers peaked in the early satellite age when the former UN Secretary-General Boutros-Ghali famously remarked in an interview in 1995 that CNN was the 16th member of the UN Security Council. This influence, however, began to fade due to the network character of digital technologies, such as satellite (→ Satellite Communication, Global) and Internet, in which news constituted only one layer of a personalized information network. CNN found itself competing not only with other transnational channels but with local news and → citizen

journalism being delivered instantaneously through websites, blogs (→ Blogger), and mobile devices. Although the network had lost its dominant role in the global news sphere, it still constituted a powerful model for 24/7 news journalism.

## **Code**

*Robert L. Craig*

*University of St. Thomas*

A code is a term in → semiotics that designates a set of related signs or signifying practices that correspond to a system of → meaning. While each → sign has a unique signifier, what is signified is generally understood as a marker of difference within a larger group of signs. For instance, the number sign “2” has no meaning without the number system as a whole; when listeners hear the word “2,” they inherently understand that it represents a specific quantity different from 3, 4, and 5, etc., which were not uttered by the speaker (→ Sign Systems). Likewise, together color names comprise a code that corresponds to the color spectrum; “red” is meaningful as a sign because it is not green or blue. Morse code is a set system of dots and dashes that correspond to the alphabet. Knowing the whole code allows an encoder and decoder to communicate by selecting configurations from the code.

In media, codes operate at technical/production, formal/aesthetic, social, professional, and ideological levels. A significant aspect of being a professional photographer is

knowing how selections from these codes result in a photograph that communicates the desired message for a specific media context and audience. Thus, codes are also rules or norms that guide professional practice. The degree to which communication takes place between an encoder and a decoder is based on their shared understanding of codes.

### CODES IN PHOTOGRAPHY

Consider how codes operate in → photography. Taking a photograph involves dozens of technical decisions that affect its look and meaning (→ Visual Communication). Each decision is derived from a *technical code* or set of related technical choices the photographer makes, among different format sizes, film speeds, shutter speeds, lens types, aperture settings, lighting setups, and whether to use a film or a digital camera. For instance, to create a grainy photograph and its associated meanings, a photographer must make the appropriate selection from each code: a high ASA film, dim lighting with a large aperture opening, a slow shutter speed, etc. Other choices could have been taken, but they would result in a photograph with a different style and meaning.

*Formal codes* refer to sets of choices photographers make when composing photographs. These formal elements are too numerous to catalogue but include choices like camera placement, distance, angle, how the subject is framed and balanced, and whether it is posed or treated candidly, how the background depth and perspective are constructed, where horizon lines are composed, the use of leading lines to direct attention, and how light, shadow, and color are treated to create depth, pattern, and texture. Formal codes underlie photography's representational qualities because the visual range between realism and abstractionism derives largely from formal choices (→ Visual Representation; Structuralism in Visual Communication). So too, different genres of photography, such as landscape, portrait, news, fine art, postmodernism, advertising, and wedding photography employ different formal codes (→ Genre).

*Social codes* refer to broader sets of signs that appear in a photograph's content. Thus, in decoding a commercial photograph, readers employ their existing social and cultural knowledge and experience to make inferences about the meaning of content – say, about the model, her dress, make-up, jewelry, and other props in the picture (→ Advertisement, Visual Characteristics of; Celebrity Culture; Popular Culture). Kate Moss playing pool and sipping a can of beer signifies something different than Cindy Crawford dressed like a businesswoman and drinking from a champagne flute. The photographer depends on the reader's shared knowledge of the codes of fashion models, modes of dress, appropriate vs edgy behavior, and kinds of drinking vessels to communicate meaning (→ Cultural Studies).

### THE PROFESSIONALS' USE OF CODES

Photographers rely on *professional codes* to anticipate the kinds of pictures they should take and the kinds of production practices and values they should follow to fulfill their professional obligations. Professional wedding photographers know the kinds of pictures the bride and groom expect to see in their wedding album, just as news photographers know how to photograph public officials in meetings. Both come prepared with the right

technology and expertise to position themselves to photograph the appropriate people at the appropriate moment so the results fit the visual code for their profession.

News photographers understand what editors expect relative to the assignment's → news value and context, whether they be close-ups, long shots, portraits, action shots, sentimental pictures, and so on (→ News Factors; Photojournalism). Working knowledge of other journalistic codes, such as → graphic design, helps photographers anticipate whether vertical and/or horizontal photos might be needed for a news package, and how their photos' meanings and significance might be combined in layout with headlines, stories, illustrations, and graphics (→ Newspaper, Visual Design of).

Photographic *production values* are codified as well, and news photographers must understand how certain practices correspond with specific contexts but not others. In investigative news coverage, photographers know the content of their pictures is more significant than their aesthetic value (→ Aesthetics; Investigative Reporting). If a presidential candidate is caught in a compromising situation, a grainy photo would be of little concern. But a blurry food photograph for the cover of a feature section would never even be shown to the editor for consideration.

Professionalism includes knowledge of different *ethical codes* that prescribe different behavior for different picture-making contexts. In hard news photography, ethical guidelines prohibit photographers from staging their pictures and limit manipulation and retouching (→ Image Ethics). News photographers violating these norms may be fired (→ Professionalization of Journalism). On the other hand, commercial photographers win awards for staging, manipulating, and even manufacturing photos through montage and illustration (→ Art as Communication).

## IDEOLOGICAL CODES

Ideological codes result from the fact that adhering to technical, formal, social, and professional codes leads to patterns of photography that repeat narratives, which shape and reify people's expectations and social norms (→ Narrative News Story). Pictures tell us who is powerful, beautiful, and heroic, and who is not. They situate, enculturate, and politicize our gaze toward men, women, and children and their race, class, and ethnicity. Some groups are left out of the frame altogether.

For instance, in reading → fashion advertisements, ordinary readers quickly infer that buying the product will make them sexy and rich like the pictured model. Ideological codes frame the readers' inferences because the assumptions that the ideal woman is sexy and wealthy, that "flaunting it" is desirable, that we want to be like her, and that buying products make us and our lives better are taken for granted and go unquestioned (→ Framing Effects). Thus, particular ideological understandings of how gender, wealth, and desire operate are codified in highly redundant forms and narratives found in everyday communication practice (→ Popular Communication).

The power of ideological codes is that they can operate at an unconscious level in both encoding and decoding. Fashion photographers must apply technical, formal, professional, and social codes to make their pictures fit the fashion industry clients' expectations. Professional models also know the code of poses they must strike to make acceptable pictures. Neither may recognize that in applying these codes they are ritualistically

reproducing an ideology that subordinates women to men (→ Rituals in Popular Communication; Gender: Representation in the Media). Fashion magazine readers generally flip through these magazines decoding them very quickly. Their familiarity with advertising codes generally does not extend deeply into the realm of technical, formal, or professional codes. But readers have been socialized to take for granted that the signs in the ad are relevant to the product (which often they are not; → Socialization by the Media). Knowing these social codes quite well allows readers to make quick inferences that idealize the product.

Such naïve, uncritical encoding and decoding are what Stuart Hall has called the *preferred meanings*, which situates photographers and readers within the dominant, hegemonic view of the social order. Without a critical attitude toward the way businesses and advertisers codify and thus present the world to us, photographers would seem to be just taking pictures of the natural world. Hall also pointed out two forms of critical decoding. A *negotiated reading* questions some aspects of the message while an *oppositional reading* questions all of its assumptions. So, a woman might negotiate the meaning of an ad, criticizing its portrayal of women without criticizing the consumer culture. A devout Muslim's oppositional reading might see the ad as a sign of the west's materialist over-indulgence and a loss of its spiritual direction, and reject not only the ad but the society that created it.

Signs and the codes in which they are embedded are socially constructed and thus are always politically and ideologically accented (→ Constructivism). Reproducing messages from within these codes reproduces the ideologies they frame, while oppositional readings are counter-hegemonic and challenge the existing order of things. Hall has written, "One of the most significant political moments . . . is the point when events which are normally signified and decoded in a negotiated way begin to be given an opposition reading. Here the 'politics of signification' – the struggle in discourse – is joined" (Hall 1980).

# Code as Law

Andrew D. Murray

*London School of Economics and Political Science*

In 1999 Professor Lawrence Lessig, then Berkman Professor for Entrepreneurial Legal Studies at Harvard Law School, later professor of law at Stanford Law School, opened his new book, *Code and other laws of cyberspace*, with a chapter entitled “Code is law.” This short but complex phrase has, since then, found itself at the heart of a thorough interdisciplinary debate on how new media technologies and, in particular, the Internet have altered the configuration of centers of regulatory power and the application of regulatory control mechanisms. “Code is law” is, as a result, one of the most deceptively complex and debated phrases in contemporary regulatory theory.

Lessig’s thesis is predicated upon his belief that “cyberspace presents something new for those who think about regulation and freedom” (Lessig 1999a, 6). This belief reflects views developed in the 1990s by a group of theorists classified as the *cyberlibertarian school* who viewed cyberspace as inherently unregulable because of the borderless nature of its environment (Johnson & Post 1996) and the lack of effective control mechanisms (Barlow 1996). Lessig’s *Code is law* thesis, although founded upon some of this school’s values, does not represent an addition to the cyberlibertarian literature. Instead, it forms part of the opposing *cyberpaternalist school* that grew in opposition to the cyberlibertarians (Goldsmith 1998; Reidenberg 1998; Benkler 2000). Drawing from these cyberpaternalist works, Lessig states that in cyberspace we are compelled “to look beyond the traditional lawyer’s scope – beyond laws, regulations and norms. It requires an account of a newly salient regulator: code” (Lessig 1999a, 6).

The “code” regulator referred to by Lessig reflects the regulatory contribution of the design element of cyberspace encoded in the systems software that both supports and controls the cyber-environment. Lessig believes that code in cyberspace represents control through architecture, one of four modalities of regulation that he identifies along with law, markets, and norms. Each modality is described in terms of constraints on action (Lessig 1999a, 235–239). Thus law, the traditional hierarchical modality, constrains through the threat of punishment; norms, or social controls, constrain through the application of societal sanctions such as criticism or ostracism; the market constrains through price and price-related signals; and architecture physically constrains (think of a locked door). The concept of architectural or design controls is not new. They are apparent in the works of Bentham (1995, 1st pub. 1787) and Foucault (1977) and are utilized today by the designers of theme parks and stadia to manage crowds (Shearing & Stenning 1984). The key contribution of Lessig’s work is to reassert the importance and value of architectural or design controls, in particular, with reference to cyberspace. Lessig’s application of these principles to the environment within cyberspace provides the foundation for a new and enhanced application of design controls: design in an environment that is completely plastic and that is under the management of a relatively few environmental designers.

Lessig believes design-based regulatory modalities, or, to use his term, architecture, are particularly effective in cyberspace because of the nature of the environment. As he notes: “we can build, or architect, or code cyberspace to protect values that we believe are fundamental,

or we can build, or architect, or code cyberspace to allow those values to disappear” (Lessig 1999a, 6). This is an application of *environmental plasticity* (Murray 2006), that attribute of cyberspace encountered when one ventures into the higher network layers (Benkler 2000) beyond the physical infrastructure layer. In its higher layers, cyberspace is an entirely virtual environment. As a result, designers of the environment, or code-writers as Lessig calls them, have complete control over the environment, something not available to architects in the physical world because of the constraints of physical laws (Murray 2006, 42). This creates both a challenge and an opportunity for regulators. The *opportunity* is that, as environmental controls are self-executing (Murray & Scott 2002), the designer/implementer of an architectural or code-based regulatory system need not invest in costly ex-post monitoring or enforcement agencies: once implemented, environmental controls mechanically regulate all who come in contact with them. The *challenge* is that, for traditional regulatory theory, this represents a shift in regulatory power from hierarchical, usually state or state-sanctioned regulators to private regulators such as the software companies and network providers. This shift is stylized by Lessig as a move from East Coast Code (the code of Washington, DC) to West Coast Code (the code of Silicon Valley and Redmond, VA.).

Thus far the story of the two codes may suggest that Lessig’s concern should be with the lack of democratic accountability of West Coast code-makers. However, his take on this is more subtle and much more complex. His concern is not about opposing camps and who wins the battle to design the environment of cyberspace. His concern is that East Coast code-makers are interfering in the business of West Coast code makers to the potential detriment of both Internet users and West Coast code. Lessig notes that “the power of East Coast Code over West Coast Code has increased” (Lessig 1999a, 53).

This increase is one of the results of the ever-growing commercialization of cyberspace and the increasing prominence of a select group of West Coast code-makers such as SAP, IBM, Oracle, and Microsoft. These large commercial organizations seek good relations with government, making it easier for East Coast code-makers to influence the design of their software products, even though in many cases these code-makers do not fully understand the product or how it regulates individuals. The result is, as predicted by Lessig, a migration of the regulatory center wherein East Coast code-makers increasingly will seek to develop controls in cyberspace, not through the application of laws, but through mandating changes in the environmental code of the place (cyberspace): code is thereby used as a substitute for law; or, to put it another way, with East Coast code-makers employing software code to bring about regulatory outcomes, “Code is Law.”

## Coding

*Patrick Rössler*

*University of Erfurt*

The term “coding” has different meanings in empirical research. Generally speaking, coding becomes relevant whenever data at hand are unstructured, and coding then provides a structure for a systematic analysis of these data. In quantitative research using standardized instruments, coding is the process of tagging data about a given unit of analysis, in order to assign these units to a category (→ Quantitative Methodology). Usually, these categories correspond to numbers that allow the information to be processed by statistical software.

Coding gains particular importance in quantitative content analysis, where it represents the main task of researchers. Likewise, the term is used in qualitative research to describe how data gathered with nonstandardized methods is broken down into components relevant to the research question under study (Bryman 2004, 537; → Qualitative Methodology). Within statistical data analysis, the term “recoding” is technically used for the procedure of regrouping the categories of a variable; this meaning of the term is not elaborated on in greater detail here.

### CODING IN QUANTITATIVE RESEARCH

#### Data Tagging

For the purposes of computerized data analysis, researchers need empirical information to be tagged with numeric codes. This is true whenever processing is based on structured

data collection commonly labeled as “quantitative.” The coding of items can be carried out either by the data source (usually the interviewee; → Interview; Interview, Standardized) or by the researcher (Sullivan 2001; Babbie 2002).

In the first case, *coding by the data source*, the researcher prepares a precoded instrument, e.g., a questionnaire with closed-ended questions. This means that the interviewee is exposed to a fixed selection of categories from which he or she can choose as appropriate with regard to the stimulus (for the most part, a question or an object to be rated). Accordingly, this is a two-step process that first requires the researcher to generate relevant and meaningful categories. These categories should be distinct, exhaustive, and adequate with respect to the related construct. In the second step, the interviewee gives the required assessment based on the given alternatives.

The advantages of this procedure are obvious: with the completion of the data entry, descriptive results of the research are quickly available. But this procedure also raises at least two problems in terms of → validity. On the one hand, the results of the data analysis depend heavily on the thoroughness of category construction exercised by the researcher. Second, the difficult task of transforming empirical reality into numeric codes is handed over to the interviewee (→ Measurement Theory). Thus, data quality reflects the way the interviewee understands the different answering options and the mental effort he or she puts into the responses. Variability in this respect is a substantial source of error, which is why careful category construction focused on minimal ambiguity is important.

The second case mentioned above, *coding by the researcher*, refers primarily to the use of so-called open-ended questions in a questionnaire. Here the steps are performed in reverse order. First, the interviewees are given a question without precoded categories and are encouraged to express their thoughts in their own individual style. In a self-administered questionnaire, respondents are required to write down all relevant aspects. During an interview, their answer is either recorded literally or in note form, or the interviewer translates the answer immediately into precoded categories usually not available to the interviewee. When data collection includes nonstandardized entries, the process of coding is postponed until the data editing phase, when categories are defined in a coding frame and codes are assigned to the answers.

*Pros and cons* are distributed exactly the other way around in this case. After collecting the data, further coding efforts are necessary, which postpones the results. Furthermore, people’s answers to open-ended questions may vary substantially across a sample – a phenomenon that becomes increasingly important when the reference point for answers is not clear. As no categories are administered, the researcher does not obtain comparable results from all units of analysis. This might impose severe restrictions on data analysis. Still, open-ended questions are an important tool since they produce “unbiased” data in the sense that interviewees can reproduce their thoughts without needing to perform any kind of mental transfer beforehand. Furthermore, if the subject matter lacks evidence to establish precoded categories in the run-up to the survey, open-ended questions provide an opportunity to collect a broad range of relevant aspects. To this effect, it resembles coding in qualitative research (see below).

While coding by the researcher has so far been applied to the example of → survey research, it is relevant to other methods of empirical data collection as well. For instance, in the case of structured or systematic → observation research, the schedule

for the recording of observations such as → interpersonal communication or → group communication may include precoded categories as well as space for individual notes to be coded afterwards (for a classic example of coding communication behavior in small groups, see Bales 1950).

### Content Analysis

One major methodological approach in communication research is the standardized content analysis of messages in general and of media coverage in particular (→ Content Analysis, Quantitative). For this purpose, particular features of these messages need to be identified and assigned according to a set of relevant categories previously defined by the researcher. Thus, coding is the main procedure when applying this method, which explains why the term is prominent in almost every stage of a content analysis research process (Krippendorff 2004, 125–149). It is used to address the primary preoccupation of the research assistants we call coders, and, moreover, it serves as a general label for the fieldwork in content analysis as a whole.

Procedures in standardized content analysis are quite similar to data tagging in survey research, as mentioned above. Researchers will determine the concepts to be measured and operationalize these concepts by defining categories accordingly (→ Operationalization). These categories are summarized in a coding manual, together with further instructions and examples. Coders are provided with a coding scheme that is prepared to hold the codes attributed to each category by the coder. Data entry is based on these coding schemes or, if computer-aided coding applies, the coder enters each code into a preformatted data file (Neuendorf 2002).

With regard to the *mental processes involved in coding*, the term refers to the capability of each coder to identify the relevant characteristics of each unit of analysis, and to assign these coding units correctly to the categories and their respective codes. Thus, the difficult task of translating the content of messages to numerical data is left to the coder. Therefore, his or her performance is considered the main source of error in standardized content analysis. Different techniques are applied to ensure correspondence of coding acts, beginning with intense coder training and ending with checks of coding agreement between and within coders (Riffe et al. 1998, 104–134; → Reliability).

Besides this standardized type of content analysis, there is a longstanding tradition of so-called qualitative content analysis (→ Content Analysis, Qualitative). This method basically refers to techniques of → document analysis. Messages are extracted from these documents by using a more holistic approach since texts (or pictures, films, or voice recordings) are considered complex structures of → meaning. Condensation of issues and arguments often follows a more implicit process. Quotes from the materials are presented in the text report, and are important to illustrate the reconstructions of the researcher.

### CODING IN QUALITATIVE RESEARCH

Although qualitative research depends on standardization to a substantially lesser degree, coding still remains an issue. It applies, for example, to → grounded theory as a general

strategy of qualitative data analysis where coding is considered to be a key process. “It entails reviewing transcripts and/or field notes and giving labels (names) to component parts that seem to be of potential theoretical significance and/or that appear to be particularly salient within the social worlds of those being studied” (Bryman 2004, 402).

The meaning of “coding” in qualitative research (which some authors also refer to as “indexing”) differs from the meaning prevalent in quantitative research, where coding is a technique for transferring information to numeric data, classification, and data handling. In this case, important decisions about what a single code actually means are made in advance, during the procedure of operationalization. In contrast to this rather instrumental sense, coding in qualitative research is a *first step toward creating a theory*. It represents an ongoing state of potential revision and fluidity, as the resulting codes are not treated as fixed “data.” In contrast, qualitative research merely treats codes as potential indicators of concepts, with these indicators being permanently under revision. This is because, while research proceeds, they are compared with previous codes and modified with regard to the best fit of concepts.

Following Strauss and Corbin (1998), three types of coding practice can be distinguished, which are often not exclusive but used sequentially in the elaboration of categories. First, *open coding* implies the least regulated step, when data are examined, compared, and broken down into codes (or “concepts”), which are later grouped and turned into categories. Second, *axial coding* usually follows open coding and aims at connecting the categories obtained by relinking the codes to contexts such as causes, consequences, or patterns of interaction. Finally, *selective coding* identifies the core category, which is the one central aspect that serves as the main concept for interpretation. All other categories are organized around the core category and thus integrated into a larger frame that is called the “storyline.”

These steps are not undisputed in research practice. Researchers who fear terminating the exploratory step too early in the process suggest refraining from axial coding and performing only an initial and a focused coding. There are several different approaches to conceptualizing the coding process in qualitative research, but most of them share the general distinction between one phase that stays closer to the original data, and a second phase where codes are transferred to a more abstract level in order to construct meaning about the phenomena under study.

Research practice has developed *indications and guidelines for developing codes*. Considerations that may lead to relevant codes include the topic of an item of data, its underlying type of event, the persons involved, statements and intentions of these persons, causal attributions, and descriptions of opinions, emotions, and behaviors. In the process of coding it is suggested to code promptly after data collection, to keep in mind that each item of data can be coded in more than one way, and, above all, to constantly move forward and backward between the different steps of coding. Only from this permanent rereading and reviewing may the relevant connections between concepts and categories emerge. Finally, coding should not be equated to analysis in general: although coding represents an important step within the analysis (particularly because it reduces the amount of data available), interpretation is still the step in which codes are assigned to meaning, the significance of the coded material is assessed, and the findings are reflected in the light of theoretical considerations and earlier research.

## **Coffee Houses as Public Sphere**

*Stuart Allan*

*Bournemouth University*

The notion of a → “public sphere” is useful when thinking about the spaces available for public discussion and debate – and thus the formation of → public opinion – in different societies). The writings of → Jürgen Habermas (1989; 1992) have proven to be especially valuable in this regard. It is Habermas’ contention that under ideal conditions the public sphere serves as a discursive realm situated between the purview of the state on the one hand, and the economic dictates of the marketplace on the other, for public deliberations over social issues (→ Discourse; Argumentative Discourse). In his words, the public sphere represents a space for “rational-critical debate” among citizens, where “a time consuming process of mutual enlightenment” may take place “for the ‘general interest’ on the basis of which alone a rational agreement between publicly competing opinions could freely be reached” (Habermas 1989, 195). This normative conception of open and free relations of communication, where people can engage in reasoned dialogue about the conduct of social life as equals, highlights a range of intriguing questions for communication scholarship.

The importance of coffee houses for the emergence of what may be described as an embryonic public sphere in various European countries has been the subject of much scholarly attention. For Habermas, the coffee house – with its idealized projection of “a

kind of social intercourse that, far from presupposing equality of status, disregarded status altogether” (1989, 36) – evolved into the central institution of the *English public sphere*. Its ascendant popularity corresponded to the celebrated ambience it enjoyed as an establishment open, in principle at least, to any ordinary citizen inclined to “learn the news and discuss it.” Individual premises served as meeting places, usually for a specific type of clientele sharing an interest in a particular kind of news or information: newspapers, along with broadsides, pamphlets, journals, and similar tracts, were distributed via coffee houses, where they were passed about from one patron to the next (→ Public Meetings).

The purchase of a single “dish” of coffee entitled the customer to a seat around a communal table, to be occupied for several hours if so desired. Virtually every type of interest, trade, or profession was catered for by one coffee house or another, with particular establishments associated with politics, law, medicine, religion, science, arts, literature, or wit, among other topics. The term *penny university*, derived from a well-known rhyme of the day, highlighted their educational qualities. A further use revolved around the *conduct of business* (including insurance, shipping, stock and commodity dealing), where regular hours were kept at certain rooms for negotiations and transactions. Similarly pertinent here was the way coffee houses supported the fledgling postal system via the collection and delivery of letters and newspapers, while others facilitated alternative – even at times surreptitious – purposes, such as auctioneering, matrimonial services, masonic meetings, gambling, and prostitution.

Apparent from the outset was the formative role coffee house sociability of private individuals wielding considerable influence. The remarkable appetite of participants for → news – as well as for political discussion of its significance – recurrently attracted the attention of authorities concerned with controlling the flow of information. Habermas (1989) observes that coffee houses were sometimes castigated as seedbeds of *political unrest*. On these grounds, Charles II’s government responded to the “great complaints” that were being “daily made” of the “license that was taken in coffee houses to utter most indecent, scandalous and seditious discourses” (Pincus 1995, 828) by seeking to suppress them by proclamation on 29 December 1675. This attempt was abandoned shortly thereafter, however, when it became apparent that the order was being ignored. In addition to government proclamations, other efforts mobilized against coffee houses over the years included Christian authorities convinced that free speech was helping to cultivate atheism, purveyors of rival beverages (including critics fearful that the demand for English grain used in ale would be undercut), and also women alarmed by the amount of time their idle spouses spent newsmongering (→ Censorship, History of).

This last point underlines a significant issue. Although they were egalitarian in theory, actual participation in the typically boisterous, uninhibited discussions of the coffee house was largely confined to middle- and upper-class men able to afford the price – and conspicuous leisure time – to indulge their coffee-drinking habit on a regular (frequently daily) basis. In contrast with the *salons* of France, women were seldom welcomed to partake in conversation in this milieu, their custom tending to be discouraged for entirely sexist reasons characteristic of the period. Records indicate that some women were present in the role of proprietor (a “coffee woman,” who was often a widow) or, more typically, in a service capacity, but in any case women were ordinarily excluded from

taking part in “rational-critical debate” (Habermas 1989) because of the gendered culture of what was a predominantly masculinized domain.

The importance of coffee houses for public life had begun gradually to decline by the 1780s, in the main as a consequence of changing social patterns. Pertinent factors contributing to their demise included the growing prevalence of private clubs (where membership rules could be upheld) and public houses, as well as the increasingly popular consumption of tea in the private household. Many of the services provided by coffee houses – such as the relaying of post or for business purposes – were being transferred to other social institutions. By the 1830s, their status had diminished to the point where their association with public opinion formation had been effectively displaced.

Historians continue to rehearse contrary views on the extent to which coffee houses actually embodied the normative ideals of a public sphere. Nevertheless, there is general agreement that a consideration of their relative freedoms throws into sharp relief many of the factors that constrain public discussion and debate today.

## **Cognition**

*Lenny Shedletsky*

*University of Southern Maine*

*Cognition* refers to (1) the wide variety of mental entities we locate within the mind, including thoughts, → meanings, ideas, → attitudes, knowledge, beliefs, perceptions, intentions, memories, images, dreams, states of mind, consciousness and subconsciousness, and (2) the operations of the mind, such as association, search, comparison, → attention, and inference. Cognition is thinking.

Ancient philosophers speculated on the nature of thought, and modern day researchers continue to explore cognition. What has changed over the years is just how we describe cognition, how we study it, and how we think it relates to our experiences in the world.

Plato tried to explain how it is that we can think of an abstraction rather than merely an instance of the abstraction, such as the abstract idea of “triangle” as opposed to a specific triangle. Modern day theorists propose models to describe how symbols and meaning work (Osgood et al. 1957).

Cognition plays a significant role in theories ranging over intrapersonal communication, → interpersonal communication, small → group communication, persuasive communication, attitude change, mass communication, and computer-mediated communication (→ Human–Computer Interaction; Persuasion). In each instance, the notion of meaning is at the center of the cognitive perspective. Cognition/meaning may in fact be one of the few defining features of communication in its broadest sense. This close tie between cognition/meaning and communication links all types of communication and links the field of communication to psychology, → linguistics, and philosophy (→ Communication Theory and Philosophy). As meaning has been increasingly seen as located in the mind, the role of cognition has gained a place in communication theory. Many theories of communication share a central concern for meaning assigned to experience in context.

In the late nineteenth and the early part of the twentieth century, psychologists attempted to understand the mind through the *method of introspection*. When introspection fell into disfavor as unworkable, behaviorism – a movement toward eliminating cognition from psychological accounts of human behavior – grew up in philosophy and psychology. The mind was banished from accounts of behavior. Stimuli entered a person and responses came out, both of which are directly observable. According to behaviorism, meaning would need to be located in the observable world, not in the mind. Meaning was synonymous with what could be verified as true, a correspondence between words and the things around us.

Early models of communication adopted a stimulus and response psychology (Weiner 1950; Shannon 1948; Shannon & Weaver 1949) that placed meaning *in* gestures and words. Not surprisingly, this notion of communication was compatible with the stimulus–response (S–R) view of language also popular at the time (Skinner 1959). In short, cognition was not a prominent component of early communication research and theory (→ Models of Communication).

By 1983, Gerald Miller could write: “Among communication researchers, a respect for the role of human volition has replaced the law-governed, deterministic paradigm of communication behavior” (Miller 1983, 31). Miller maintained, “An actor’s perceptions of or meanings for a given situation constitute the primary data for communication researchers” (p. 32). Researchers began to look at → discourse over time and in natural settings (Nofsinger 1991). Communication offered a place to study cognition in real-life contexts. Ironically, that is exactly what the psychologist Ulric Neisser called for in his assessment of cognitive psychology when he wrote: “cognitive psychologists must make a greater effort to understand cognition as it occurs in the ordinary environment and in the context of natural purposeful activity” (Neisser 1976, 7). One could look back to Bartlett (1932), famous for his work on memory within psychology, for early signs of just such a view of people as active, constructivist processors. In a similar vein, it is significant that Broadbent’s model of attention, often cited as introducing the cognitive revolution, appeared in his book entitled *Perception and communication* (1958). Social cognition (Roloff & Berger 1982) and intrapersonal communication are good examples of cognitive

and communication studies converging (Roberts & Watson 1989; → Social Cognitive Theory).

Researchers in both cognitive psychology and communication have called for a return to the situated act, the larger unit of analysis found in ongoing discourse and human purpose. During the same time period, scholars from fields outside of communication have also proposed a communication perspective on cognition (e.g., Lave 1988; Levinson 1983; Seifert 1999; Smith 1999; Sternberg & Wagner 1994).

# Cognitive Dissonance Theory

Wolfgang Donsbach

Dresden University of Technology

Cognitive dissonance is a theory developed in the late 1950s by US psychologist → Leon Festinger, which claims that people tend to avoid information and situations that are likely to increase a dissonance with their existing cognitions, such as beliefs, attitudes, or other value judgments. The author proposed the following basic hypotheses: “(1) The existence of dissonance, being psychologically uncomfortable, will motivate the person to try to reduce the dissonance and achieve consonance. (2) When dissonance is present, in addition to trying to reduce it, the person will actively avoid situations and information which would likely increase the dissonance” (Festinger 1957, 3). For him, “two elements are in a dissonant relationship if, considering these two alone, the obverse of one element would follow from the other” (Festinger 1957, 13).

The theory has become by far the most influential of all theories based on the consistency paradigm. At the same time, it was one of the most controversial ones. In 1968 Aronson wrote, “Over the past three years, dissonance theory continued to generate more research and more hostility than any other one approach” (Aronson 1968, 5). And other authors noted with irony that the scientific career of the theory proved it to be right because its proponents did not take note of successful falsifications, or its opponents of confirming results. Nevertheless, it became widely adopted in communication research, where researchers linked it to findings about selective exposure to media content as, for instance, in the pioneer study *The people’s choice* by → Paul Lazarsfeld et al. (1944), and treated it as a basic psychological “law” behind these findings of de facto selectivity (→ Exposure to Communication Content; Selective Exposure; Selective Perception and Selective Retention).

## DEVELOPMENT OF THE THEORY IN PSYCHOLOGY

Like several other → *consistency theories*, Festinger’s theory of cognitive dissonance was based on the “law of good gestalt.” Accordingly, the protagonists of consistency theories suggested that individuals will try to avoid dissonance and pursue consonance between their many cognitions or even social relations. For instance, if a person, for whatever reason, perceived an argument against a political leader whom he or she otherwise admired, this person would try to resolve the tension between the two conflicting cognitions. As mentioned above, Festinger’s theory takes an already existing dissonance as the starting point for predictions about subsequent behavior. In his famous card game experiment, he created either consonance or dissonance with a decision taken by his subjects by means of manipulated results in the game, and had them then look at information supporting or contradicting their prior decision. The results confirmed the author’s assumption about a U-shaped curve between dissonance and selective exposure: selectivity was highest among subjects who had experienced a mean degree of dissonance. In cases of no or very little dissonance and in cases of very high dissonance, individuals had no reason to avoid further dissonant information.

Because of its compliance with day-to-day experience on the one hand and its contradiction to the normative image of a tolerant individual on the other, the theory immediately triggered numerous studies. Their results, however, remained all in all unclear. A first meta-analysis of 18 studies on selective exposure by Sears and Freedman (1967) found as many confirming as disconfirming results of the theory. A radical cooling down ensued, which was evidenced by a sharp decrease in the number of consistency theory studies in the 1970s.

The theory had *two main theoretical problems*. First, from the state of dissonance, only search can logically follow, but not the avoidance of information, because only active search can reduce the state of tension. In a state of consonance, however, only avoidance is reasonable, because every search could create dissonance. Second, the theory did not distinguish between simple cognitions (or “protocols”) and hypotheses-cognitions (more general cognitions, norms, laws, etc.).

The early dissonance research also showed several *methodological problems*. Often the question arose whether other variables besides dissonance – for instance, a person’s degree of dogmatism or the utility of the information offered – might have generated the behavior interpreted as the consequence of cognitive dissonance. Others criticized the theory and the experiments derived from it for radically simplifying the cognitive system of an individual by reducing it to the relationship between just two cognitions. However, in subsequent psychological research, some methodical problems could be overcome. For example, by using a skin galvanometer it was possible to prove that being exposed to dissonant information indeed creates a state of tension, and by using an EEG that dissonance is a motivational condition.

The history of the dissonance theory can be described as an ongoing limitation of the original hypothesis through intervening variables. Certainly, Festinger’s personal hope to establish the theory of cognitive dissonance as a general psychological–biological law that applies to all living creatures (as his dissonance-theoretical experiments with rats show) has clearly failed. Nevertheless, today we observe again an increasing interest in Festinger’s assumptions – such as in Beauvois and Joule’s (1996) “radical dissonance theory,” which aims at a return to the original theory but with an alternative understanding of Festinger’s basic assumptions. Over 30 years after Sears and Freedman (1967), D’Alessio and Allen (2002) conducted another meta-analysis with 16 experimental studies on cognitive dissonance fulfilling several requirements. The correlation between attitude and selection of consonant or dissonant information was highly significant – albeit with a relatively low correlation coefficient of 0.22.

## DEVELOPMENT OF THE THEORY IN COMMUNICATIONS

“By and large about two-thirds of the constant partisans – the people who were either Republican or Democratic from May right through to Election Day – managed to see and hear more of their own side’s propaganda than the opposition’s” (Lazarsfeld et al. 1944, 89). With this statement the paradigm of weak media effects was born. Its basic presumption was that people selectively expose themselves to media contents according to their predispositions. It is worth mentioning that Lazarsfeld and his co-authors had already noted the basic assumption of dissonance theory in a footnote of their book: “The fact that

people select their exposure along the line of their political predispositions is only a special case of a more general law which pervades the whole field of communication research. Exposure is always selective; in other words, a positive relationship exists between people's opinions and what they choose to listen or to read" (Lazarsfeld et al. 1944, 164).

Together with Festinger's theory, published 13 years later, the findings in *The people's choice* paved the way for the concept of selective exposure and the *paradigm of weak media effects*: when people selectively expose themselves to media content according to their already existing predispositions, persuasion through media content is almost impossible. This paradigm dominated the notions about media effects for three decades. There are several reasons why cognitive dissonance theory became such a widely recognized theory in communications, and persisted there for much longer and almost unchallenged as compared to psychology. Two of these reasons were rather administrative than academic. First, the paradigm of weak media effects made rising questions about the legitimacy of the media's social power less prevalent. Second, cognitive dissonance theory offered the opportunity to the still young field of communications to link its findings to another, much more established, discipline (→ Media Effects; Media Effects, History of).

However, while psychologists tried to prove the causal relationship between dissonance and exposure to information mainly through experimental research, communication researchers most of the time supplied only evidence for *de facto selectivity*, i.e., a correlation between qualities of a particular media content and the predispositions of the audience. Cognitive theory was mostly used as an interpretation for the correlation obtained. Typical examples were and still are the relation between political preferences of readers and the editorial biases of newspapers used by them. However, there were also a few early quasi-experimental and experimental studies in communications. Atkin (1971), for instance, produced eight different front pages for a university newspaper that were different only in terms of layout and headline of an article (partisan bias). The results showed that supporters of both parties picked the articles that endorsed their opinions, even when the articles were not prominently positioned.

A field study by Donsbach (1991), combining content analysis, a reader → survey, and a copy test with readers of real newspapers, found across the board only a small influence of readers' predispositions on their exposure to political news (→ Content Analysis, Quantitative; Copy Test and Starch Test). However, when distinguishing by valence of the news, the data showed a very clear selectivity for consonant news when it is positive. The avoidance of selective exposure also to negative news complies with findings in psychology about a generally higher attention for negative, i.e., potentially "dangerous," information as in the theory of *automatic vigilance* (→ Negativity).

The adaptation of cognitive dissonance in communication research actually contains a serious misunderstanding. As cited in the beginning, Festinger only made assertions about an individual's state of dissonance but not about a state of consonance. Communications all but completely ignored this limitation and simply took the transferability of the basic hypothesis for granted. There is an easy explanation for this: for communication researchers, media content is not conceptualized as a potential instrument to reduce dissonance, but selectivity is seen as an instrument to channel media content according to one's own cognitive needs. Thus, it is relevant to communications whether selectivity in order to

avoid dissonance can also occur in a state of consonance or is only used – as Festinger asserted – to reduce already existing dissonance.

### **SIGNIFICANCE OF THE THEORY FOR COMMUNICATION RESEARCH TODAY**

Over the years the theory of cognitive dissonance has been linked to several other theories in communication research. One example is → mood management. As Festinger himself pointed out that dissonance, “*being psychologically uncomfortable*” (see above), is a mood state, Zillmann considered the theory as being just another case of his own mood management approach, viewing it as a “bad mood that is produced by exposure to counter-attitudinal persuasive messages” (Zillmann 1988, 329). Further research is needed to answer the question of how the emotional attractiveness of media content (as conceptualized, for instance, in the mood management theory) and its consonance or dissonance for the recipient’s cognitive system interact. A magazine story about a politician’s private affair might serve affective needs for personality stories but at the same time, if read, create cognitive dissonance because the reader likes this particular politician, whose career might be endangered by the story. Another example for the integration of cognitive dissonance theory with other theories of exposure is the information utility approach. Here, the avoidance of dissonance is one among many considerations of utility that can motivate people to expose themselves to information from the media (Atkin 1973).

The theory today still offers a lot to communication research because it applies to all phases of the communication process. While the theory so far has been predominantly applied to audience behavior, it is also relevant to journalists’ news decisions. Journalists are under a considerable constraint to make selections. The possibility of deciding unconsciously in favor of their own predispositions occurs for them in various phases, for example in the selection of issues to investigate, in their attention toward arguments in political speeches, or in the evaluation of the newsworthiness of stories in wire reports. As the effects of dissonance on the selection of information seem to be even more prevalent in group than in individual behavior, and as journalists show a high degree of ingroup orientation, cognitive dissonance might explain findings on the influence of subjective beliefs on news decisions.

## Cognitive Science

*Jeremy N. Bailenson*

*Stanford University*

*Jesse Fox*

*Stanford University*

Cognitive science is the study of mind, and is an interdisciplinary field that encompasses psychology (→ Psychology in Communication Processes), philosophy, computer science, education (→ Learning and Communication), neuroscience, anthropology, and linguistics. The intellectual origins of the field can be traced back to the 1950s, when researchers first began to use formal mathematical representations and computational structures to model theories of mind (→ Cognition). Cognitive science became an “official” field in the late 1970s; in 1976, the first issue of the journal *Cognitive Science* was printed, and the first meeting of the Cognitive Science Society took place in 1979.

According to Thagard (1996, 5), “Cognitive science proposes that people have mental procedures that operate on mental representations to produce thought and action.” What binds researchers across the various contributing disciplines is the notion that the processes that occur during cognition can be represented abstractly by some type of predictive representation. The nature of that specific representation depends on the discipline; for example, philosophers rely on formal logic, artificial intelligence researchers employ computer code, neuroscientists are guided by biological structure, and cognitive psychologists often use statistical analyses to fit data resulting from experimentation. By building theoretically driven, empirically tested structures of cognitive processes, cognitive scientists seek to increase understanding of the mind, as well as to build systems that are able to understand, predict, and generate human thought and action (→ Information Processing).

The *methods* employed by cognitive scientists vary greatly. Linguists (→ Linguistics) are most concerned with developing formal systems of syntax, semantics, phonetics, and pragmatics (→ Discourse, Cognitive Approaches to), and their work typically consists of comparing sentences and utterances. Often, this is done by examining databases of existing language, whereas some linguists perform laboratory experiments and implement computer models to test their theories. Psychologists rely primarily on laboratory experiments, aiming to understand how people form categories, reason, perceive stimuli, and encode, store, and retrieve memories. To accomplish these goals, psychologists examine the outcome of various experimental manipulations, the amount of time it takes an experimental subject to perform a task, and the various strategies people implement to complete the task. Computer scientists, in comparison, most often build algorithms to simulate artificial intelligence, creating programs that can comprehend or generate language, exhibit creativity, or solve problems. Cognitive anthropologists compare multiple cultures to assess the universality of mental structures, often using ethnographies, field observations, and some direct manipulation of experimental variables.

In sum, cognitive science spans many disciplines and methodologies, but researchers across this field seek to answer the same fundamental question: how are information processes represented in the mind?

## COGNITIVE SCIENCE AND COMMUNICATION

In terms of their history and organization, the fields of communication and cognitive science share many characteristics. One of the main professional bodies of the communication field, the International Communication Association (→ Communication as a Field and Discipline), was officially formed around the time (1950) that much of the work in cognitive science began. Like cognitive science, communication is a new field with its roots in a number of related disciplines such as psychology, sociology, political science, linguistics, journalism, anthropology, and economics. Thus, not only are both fields extremely interdisciplinary; they share many of the same sub-fields. Throughout the world, departments of cognitive science and communication are becoming more common.

The similarities between the two fields are quite manifest. A number of scholars who teach and research in communication departments were trained in cognitive science and vice versa. Furthermore, while it is rarely listed in textbooks as a component sub-field, many would agree that communication is one of the related sub-fields within cognitive science. For example, when comparing a popular textbook in communication (Griffin 2003) to a widely used textbook in cognition (Medin et al. 2001), one notes that both feature very prominently, in the opening pages of the book, the classic work by Claude Shannon on information processing. Of course, there are international and cultural variations in the use of textbooks and the crossover between the two fields, but overall the relationship is robust.

Craig (1978) was among the first communication scholars to explicitly point out the practical and theoretical overlap between the two fields. Later, Craig (1999) recognized → cybernetics, an approach informed by cognitive science, as one of seven “traditions” of the communication field. According to Craig, cybernetics “points out surprising

analogies between living and nonliving systems, challenges commonplace beliefs about the significance of consciousness and emotion, and questions our usual distinctions between mind and matter, form and content, the real and the artificial” (1999, 141). He argued that modern communication theory evolved from the works of Shannon, von Neumann, and Turing; cognitive scientists cite these same scholars as the foundation for the development of their field. From the cybernetic perspective, communication is defined as information processing or an evaluation of input in order to produce output.

One of the most fruitful ways of comparing the two fields may be to think of communication as a macro-version of cognitive science. Cognitive scientists create models of human behavior to gain insight into the underlying structure of the mind. In order to do so, they often study how a person interacts with some set of information or stimuli. Similarly, communication scholars examine the exchange of information among people to provide an understanding of the structure of human interaction. In communication, scholars study how people interact with others face to face as well as through media technologies and cultural artifacts. From the perspective of cognitive science, communication research might be said to take the model that cognitive scientists apply to one person interacting with information, and transfer that model to interaction among multiple individuals and society. This micro/macro-relationship between the two fields can be illustrated by comparing case examples of the Stroop Effect from cognitive science with the notion of interactional synchrony from communication.

*The Stroop Effect* (Stroop 1935) is considered a classic paradigm in psychology, and basically addresses how people attend to and process stimuli by examining patterns of interference when these stimuli contain a cue conflict (e.g., an experimental subject attempts to quickly state the meaning of the word “green” although it has been written in a red font). This theoretical model continues to drive a large amount of work in cognitive science, including linguistics, psychology, neuroscience, and artificial intelligence (see MacLeod 1991 for a review of this work). By studying how people process various types of information with an explicit conflict in cues, one learns more general lessons of how the brain and the mind are structured.

*Interactional synchrony* (Kendon 1970) refers to the idea that successful communication among multiple parties depends on their simultaneous and coordinated use of multiple channels. A key finding is that interaction succeeds only when the many verbal and nonverbal cues are correctly in synch, both within a speaker (i.e., the speaker’s verbal cues should not conflict with his or her nonverbal cues) and across speakers (i.e., the verbal and nonverbal cues between two speakers should be coordinated). By taking the general “cue-conflict” paradigm arising from the Stroop Effect, communication scholars have been learning more about how people interact with one another (→ Social Cognitive Theory). The paradigm of cue conflict has been applied to studies of processes of social interaction, both face-to-face interaction (Burgoon et al. 1995) and mediated forms of interaction (Capella & Pelachaud 2002; Lee & Nass 2004; Bailenson et al. 2005).

To sum up, cognitive science attempts to formulate models of how the mind processes information, while communication research attempts to formulate models of how information flows between people, culture, and society. The paradigm of cue conflict serves to illustrate this micro/macro-distinction within two related interdisciplinary fields.

## IMPLICATIONS FOR COMMUNICATION RESEARCH

Cognitive science can enrich our general understanding of the psychological processes that inform the production and interpretation of messages (→ Message Production). Several specific phenomena that are commonly addressed by communication researchers lend themselves to cognitive approaches, including interpersonal scripts (→ Schemas and Media Effects; Schemas; Schemas, Knowledge Structures, and Social Interaction; Scripts), priming (→ Priming Theory), attitude accessibility, patterns of discourse, → human–computer interaction, and responses to media stimuli such as those originally hypothesized by → Albert Bandura’s (1986) social cognitive theory. Each of these areas of inquiry can benefit from the exchange of methodological approaches and theoretical perspectives. A combination of micro- and macro-levels of analysis will provide a greater, more holistic understanding of communication and of the wider relationship between human cognition and behavior.

# Collective Action and Communication

Scott A. Reid

*University of California, Santa Barbara*

Collective action may be defined as any behavior that is directed at fulfilling a goal shared by two or more people. Examples of collective action include the chants and audience waves of sports crowds, race riots, language revival movements, political election campaigns, military action, and political protests. In essence, communication scholars have been concerned with the ways in which communication can serve to enable, or in fact stifle, collective action.

Social psychological theories have provided useful models for explaining the circumstances under which collective action will occur (→ Social Identity Theory). According to social identity theory, people who are in subordinate groups are most likely to engage in collective action when they believe that access to a dominant group and its advantages is blocked, and when the basis for their subordinate status is perceived to be illegitimate and or subject to change. On the other hand, members of elites are often more concerned with maintaining their advantages, or in other words, stifling collective action that might undermine their position. One strategy of elites is to communicate an ideology of social mobility, such as promoting tokenism. What this means is that members of dominant groups can control the degree to which members of subordinate groups can enter their group, and even when the rate of entry is very low, this can be enough to prevent the subordinate group members from organizing collectively to address shared inequalities or legitimate grievances (Wright et al. 1990).

Communicatively, then, we can expect that protests will increase in size when there is much media coverage because this will give others a sense of the possibility that the group might be able to effectively challenge the dominant group. Similarly, elites will be particularly interested in communicating the ideology of social mobility in their efforts to maintain ascendancy. Particular attention can be expected to be directed toward the success of individual subordinate group members, or more simply avoidance of discussion of subordinate group grievances. In all of this, there is a *dynamic interplay* between intergroup forces and their mass communications that are designed to enable their side to prevail (Reid et al. 2004).

Because of this, the ways in which leaders communicate to followers is critical to understanding collective action (Reid & Ng 2003). *Leaders* who are most likely to influence followers are those whose language carefully and strategically frames people as sharing an ingroup identity. By using language to create or manipulate such frames, a successful leader will be able to spur collective action because a critical ingredient in predicting whether people will engage in collective action is whether or not they identify with a cause (→ Power in Intergroup Settings). One way in which leaders do this is to demonize or attack members of a relatively defenseless outgroup. This has been seen on repeated occasions historically, and continues to this day in democracies where leaders flagging in the polls attempt to gain a boost in votes (→ Election Polls and Forecasts).

Similarly, we can understand the success of collective action by *self-determination groups* with respect to the degree to which the leadership of those groups have effectively

communicated an ingroup (often shared multicultural) relationship with the colonizing group. By doing so, self-determination groups can increase the perceived legitimacy of their grievances in the minds of majority group members, and at the same time lead those members to feel a sense of collective guilt or anger over past injustices. The collective guilt and anger are aversive motivational states, which can be satiated through bringing attitudes into line with reconciliation, affirmative action, and land redistribution policies. This has proven to be the case in popular support for reconciliation movements in Australia (Reid et al. 2005) and may well prove to be the case in dozens of other similar situations involving colonization around the world.

The mass media continue to occupy an important position in both the promotion and stifling of collective action. Herman and Chomsky (1988) in their propaganda model outline a number of filters on the media which serve to promote elite interests, and thereby stifle collective action that might challenge ascendancy. These filters include the concentration of corporate interests in media ownership, the government sourcing of information, and ideological constraints on the expression of dissident opinion. What this means is that the deck is stacked against those who lack the power to disseminate information. In this connection, an important new thread of work aims at understanding how the changing face of the mass media is making these traditional control relationships change, if not decay (→ Bias in the News; Construction of Reality through the News). The advent of the → Internet, mobile telephony, and texting has made it possible for people to organize without relying on elite-owned media (→ Mobility, Technology for). We can expect the future of the collective action enterprise to be affected by these new technologies, but the way in which this happens will continue to depend upon the nature of intergroup relations and the associated processes of communication, leadership, and control of information.

# Collective Memory and the Media

*Andrew Hoskins*

*University of Warwick*

Memory, according to the Greeks, is the precondition of human thought (Samuel 1994). For psychologists, memory is also seen as a fundamental condition of consciousness. Not surprisingly, psychologists have constructed a variety of complex models of individual → memory. However, memories also require distinct social and communicative frameworks, patterned ways of framing the flow of remembered actions, images, sounds, smells, sensations, and impressions. Without social frameworks to anchor and sustain memories, they would soon falter and fade. This idea is central to the contribution of the sociologist Maurice Halbwachs (1877–1945) who advanced the study of memory beyond the individual and the interests of psychology at the time through his notion of “collective memory.” He believed that for individual memory to thrive it was reliant upon continuous support from “frameworks of social memory” (1992, 182).

## INCREASING RELEVANCE OF THE FIELD OF RESEARCH

Memory is almost by definition part of the past, of course, yet in significant ways it is a central resource for making sense of the present and thus for extending the continuous present out to edges of the personal and collective horizons of time/space. An increasingly “presentist” perspective on memory is evident over the past thirty years with a growing premium placed on, and contestation of, memory in modern societies. Susan Sontag (2003, 86), for example, argues that the concept of collective memory is misleading, for it “is not a remembering but a stipulating: that *this* is important, and this is the story about how it happened, with the picture that lock the story in our minds.” Public discourses on our past have intensified in response to the renaissance of the heritage/museum industry, the technological, political, and cultural shifts affecting how, what, and why societies remember, and the near-globalization of discourses on the Holocaust (Huysen 2003). In this context, the concept of collective memory seems an inadequate expression of how individuals and societies remember in the contemporary age.

We now inhabit a new mediatized sphere of memory, in which individual and social memories increasingly intermingle or collide, partly as a result of the technological shifts in the modes of recording, archiving, and representing events. In response, new taxonomies of memory have emerged, particularly in the field of media, communication, and → cultural studies, and there is now a critical intellectual mass so that an emergent field of *Memory Studies* is evident – and a journal of the same name being launched in 2008. These transformations transcend and transform “living memory,” i.e., afford an “experiential” engagement with a past reaching beyond generational memory (this is the case especially with Holocaust and war memory: see Hirsch 1997, Landsberg 2004, and Weissman 2004, on “post,” “prosthetic,” and “fantasy” memories, respectively). And Barbie Zelizer (1998, 6) convincingly demonstrates how the “texture” of visual memory “becomes a facilitator for memory’s endurance” in her study of how images have transformed the remembering of the Holocaust.

The most far reaching, and perhaps least understood, of the new contestations of memory have been ushered in by and through the *mass media*. The electronic and now digital media have become the ultimate conveyors of the contradictions of contemporary memory: ephemeral, fleeting, and artificial in one sense (e.g., the rapid and continuous circulation of news and images) but also explicit, enduring, and authentic in another (e.g., the potentially depthless storage capacity of archives from which footage can be retrieved and “relived” by new generations for the first time). Thus a key function of the mass media today is the *renewal* of memory (Hoskins 2007). However, any process of renewal inevitably involves obsolescence, displacement, and discarding; thus the amnesiac effects of the process of renewal of memory are crucial in any understanding of how modern societies in particular come to live with and transform their pasts in and for the present. This importantly involves an understanding of the production processes of the media itself.

### MEDIA PRODUCTION

Increasingly central to contemporary debates on collective memory are critiques of the mass media overpowering or condemning human memory, or even negating the need for memory through potentially unlimited and increasingly complex documentation, storage, and instant retrieval and re-assemblage of our past(s). The neurobiologist, Steven Rose (1993), for example, contrasts the memory-keeping of early human societies with the memorial processes of today. In the oral cultures of the former, memories needed to be constantly trained and renewed, with select individuals afforded the considerable responsibility of “retelling” the stories which preserved the common culture. Rose argues that the media of “artificial memory” are said to diminish our capacity to remember in unique and imaginative ways (1993, 61). And, for the influential critic Pierre Nora (1989, 14), the accumulations of mass archives produce a “terrorism of historicized memory.”

These debates concern the nature and possibilities for memory exteriorized through and shaped by a seemingly rampant and particularly visual media. Are the prolific mediated symbols and signs of the past, for instance, sufficient to deliver our continuing relationship with what has gone before, or are these merely a product (and exploitation) of society’s anxiety with a present irretrievably loosened from the bonds of a past? Yet, today’s media-processing of events effect, if not always-fixed “artificial memory” in Rose’s terms, but a constant renewal of the past through the widespread usage of “media templates” (Hoskins 2004; 2007). Templates are the frames, images, and discourses (presumed by news editors and producers to be familiar to their audiences) that are routinely employed as often instantaneous prisms through which current and unfolding events are described, presented, and contextualized. For example, the Blitz (the 1940–1941 German bombing of London and other major UK cities) was widely employed as a template to frame the immediate coverage of the 2005 London bombings, invoking memory of the “Blitz spirit,” the capacity to carry on with daily life in the face of daily bombing attacks. This included the use of still images and footage, and the living memory of survivors from World War II, in renewed narratives interwoven into news coverage and analysis of the breaking story of London “under attack” in July 2005. The growing media archive thus constitutes a readily available local, national, and global resource of memory

which through its highly selective appropriation is self-consciously employed to shape interpretations of the present, as it in turn renews the past.

The media renewal of memory thus affords growing status to the historical functioning of the media and those who come to author and shape its content. So, particularly journalists, photojournalists, and even news anchors, who are increasingly co-present, contemporaneous and connected with the “production” of original events, are to some extent inevitably involved in the production and reproduction of the memory of those events. Thus, the core features of strong individual (and collective) memory: witnessing or experiencing the original event, its retelling and reshaping through repetition, and particularly its visualizing, are all increasingly powerfully constituted by and through the mass media and its personnel in our digital age.

These processes, however, also extend to anyone who is equipped with widely available and highly portable audio/visual recording devices to capture the unfolding of events as they witness them. Recent technological developments have enabled a much greater integration between the role of co-present witnesses and their subsequent testimony – and the emergent digital media. For example, mobile-phone video recordings and photographs taken by public onlookers (who are somehow compelled to stop and record even the most disturbing of scenes) led the global news coverage of the July 2005 London bombings, affording immediacy and proximity to scenes of fear and death that would until relatively recently have remained obscured or unseen. Thus so-called “citizen journalists” enter into the constitution of the media memory of events that they witness and record (→ Photography; Photojournalism).

In some instances, the accumulation of audio/visual records of some media events are so intensively and extensively mediated that it becomes difficult to imagine a history of them that is not already-inscribed, archived, and visually imprinted on social memory. For example, there seems little point in being a historian of the attacks on the US of 9/11 when there has already occurred such an explicit media rendering of oral testimony, combined with a seemingly endless archive of audiovisual material. In this way particular frames and images accumulate a granular quality in contemporary memory as they become over-familiar through their repeated exposure and analysis. Images of conflict and catastrophe are particularly vulnerable to this granularity as they enter into the public, political, and media obsession with the cyclical commemorative marking of these events.

### **FLASHBULB MEMORIES**

A significant contribution to the study of the relationship between memory and media is made by cognitive psychologists, although, unsurprisingly, they focus on the former at the expense of the latter. This is particularly so in relation to research into how media events are remembered, notably the study of so-called “flashbulb memory” (Brown and Kulik 1977). Some of the earliest photographs of publicly mediated life are associated with the introduction of burning flashbulbs of the 1920s. Flash photographs from this period, as well as carrying the age of the paper on which they are printed, possess a certain frozen quality. The subject was literally flooded indiscriminately with very powerful light, momentarily illuminating the detail of everything within range in the frame. The term

*flashbulb memory* thus describes human memory that can apparently be recalled very vividly and in great detail, as though reproduced directly from the original experience.

In this way, such memories are said to possess a *photographic* quality, owing to the apparent clarity of the reproduction of the image in the mind's eye. A pioneering example of work on flashbulb memory is the Emory Cognition Project which examined the relation between memory and affect in recollections of the US Space Shuttle *Challenger* explosion in 1986 (see Winograd and Neisser 1992). Neisser and Harsch (2000) found a shift to "TV priority" in some of their student-respondent recollections of this event two years after its widespread media coverage. In other words, even for the individuals who had not first learnt of this catastrophe via television, some later misremembered the medium as being their original source, suggesting an *accumulative* influence of the ubiquitous and repetitive televisual image and analysis (and public and private discourses thereon) on human memory.

Although it never exists within a vacuum of personal or collective history, it is the still visual image that is central to the idea of flashbulb memory in its apparent capacity to rest memory in a single moment and in a single form that is frozen, fixed, and stopped in time. And thus, it is precisely because we inhabit an image-saturated environment, with its much greater explicit rendering and contestation of established past, emerging past, and newly captured images, that has raised the stakes of flashbulb memory significantly, beyond explanations of the accuracy or otherwise of this phenomenon.

## Colombia: Media System

*Dagmar Kusche*

*Independent Scholar*

With an area of 1.14 million square kilometers, Colombia is the fourth largest country in Latin America. The population is 45 million. Geographical conditions impede the infrastructural development as well as the opening up of an efficient system of communication. For several decades, a violent conflict has been going on in Colombia. As a consequence of the peaceful disarming of more than 30,000 paramilitaries before April 2006, the situation became relatively quiet.

To replace the previous 1886 constitution, the foundation of all *media law* for over a century, a new constitution was ratified in 1991. The basis of Colombian press law is now Art. 20, which grants every human being the right to "express and spread freely his opinion, inform himself, and get true and unbiased information, as well as to found mass media." All means of mass communication are free according to Art. 20, under a social responsibility concept of the media (→ Freedom of the Press, Concept of). There is no → censorship (→ Communication Law and Policy: South America).

Colombia can look back to more than 200 years of press history. The first → *newspaper* was published in 1791. In the nineteenth century alone there were more than 1,000 newspapers that accompanied Colombia's difficult path to the formation of a republic. Today about 35 daily papers are published in Colombia. Colombia's most important daily paper is the one with the highest circulation: *El Tiempo*. It is liberal and read across the nation; the oldest and most famous liberal newspaper *El Espectador* from Bogotá (founded in 1887) has been published as a weekly only since 1997. The daily paper *El Colombiano* reports from Medellín, *El País* from Cali and *El Heraldo* from Barranquilla. All other newspapers have only a small regional or even local area of circulation.

The official introduction of broadcasting in Colombia was in 1929. Since the late 1950s, → *radio* has become the most important mass medium with the largest spread and range. Law no. 72 dating from 1966 is still applicable, according to which the aim of broadcasting is "to spread and to support culture, to offer intelligent entertainment, and to strengthen the values of Colombian nationality" (Art. 22). According to Art. 75 of the Colombian constitution of 1991, ownership of all channels and administration of broadcast is a "public good." The state is allowed to interfere in cases of monopolistic activities. In 1995, with decree no. 1456, broadcasting stations were classified into commercial stations (*emisoras comerciales*), stations run by communities (*comunitarias*), and broadcasting

stations of public interest (*de interés público*). Altogether there are 1,292 broadcasting stations in 603 communities. 656 stations are said to be commercial (= 51 percent), 469 are community-run (= 36 percent), and 167 (= 13 percent) are run by public institutions. Commercial stations use FM as well as powerful AM transmitters (→ Radio Technology); → advertising, music, and short news dominate their program. The community stations, mostly run by associations and local, agricultural, and political organizations, have only existed since 1997; they are exclusively of local importance (→ Community Media). Stations of public interest, which are run by universities, schools, army, remote communities, native groups, and the government, also work only with FM transmitters. Of the 656 commercial stations, 341 (= 52 percent) are organized in six big station radio chains (→ Radio Networks). 182 of these stations (= 54 percent) belong to the *Caracol* Radio group; *Radio Cadena Nacional* assembles 75 (= 22 percent) and the chain *Todelar* 32 (= 9 percent) under their names.

Television in Colombia aired its first program in 1954 (→ Television). Founding the national Institute for Radio and Television *Inravisión* in 1963, Colombia chose to install a “mixed system” in the television sector. Unique in Latin America, government was on the one hand to participate in the television sector by owning, along with *Inravisión*, the channels and the technical means for broadcasting, while on the other hand it was to give licenses every four years to the private commercial TV companies by public invitation of tenders (*licitaciones*). Moreover, *Inravisión* was responsible for the state-controlled radio station *Radio Nacional* and the channel for education *Canal 3*. Until 1991 only two commercially run television channels and one state channel existed. In the 1980s additional regional channels started in different parts of the country. The constitution of 1991 finally laid down fundamental changes for television by decisively turning its back on the “mixed system” in television policies. Art. 76 laid down the foundation of an independent commission, the *Comisión Nacional de Televisión* (CNTV), whose five members (two of which were chosen by the government) from then on were in charge of technical issues, the distribution of channels and television policies in general. This was the first step toward privatization of television in Colombia.

In 1998 CNTV gave direct concessions to private commercial television channels for the first time. The radio and television companies *Caracol* and *Radio Cadena Nacional*, being market leaders, each acquired their own television channel with national range. A third channel (*Canal 1*) was immediately opened for smaller private commercial companies. At present, six companies share program time on *Canal 1*. Apart from commercial channels, the state channel (*Canal institucional*, *Canal 9*) and the education channel (*Señal Colombia Educativo y Cultural*, *Canal 3*) are still on air. In different administrative regions of Colombia, six regional channels are broadcasting. In Bogotá, the private, strongly commercial *Citi-TV* with information on the capital has gained a name, working together with *El Tiempo*. Its local rival is the *Canal Capital* in Bogotá.

In 2004 *Inravisión* ran dramatically into debt and was dissolved and replaced by *Radio Televisión Nacional de Colombia* (RTVC), which has been in charge of all technical matters for broadcasting channels since 2004. CNTV controls the distribution of broadcasting time.

Six companies supply predominantly wealthy urban households with *cable television*. Television for subscribers, a kind of Pay-TV (*televisión por suscripción*), is available too. The channels *Galaxy* and *Sky* dominate the market for *satellite television*. The Internet

was introduced in Colombia in the 1990s primarily by the universities. Meanwhile several providers offer their services and traditional media are using the new technology.

## **Comforting Communication**

*Brant R. Burleson*

*Purdue University*

*Amanda J. Holmstrom*

*Michigan State University*

Comforting communication encompasses the verbal and nonverbal messages that people use when trying to reduce others' emotional anguish. Thus, comforting represents a strategic communication activity that has the primary goal of alleviating another's emotional distress; it may also aim to enhance the other's self-esteem, facilitate the other's coping, and assist the other's problem-solving in a troublesome situation. Comforting is a form of behavioral empathy (→ Empathy Theory) or social support (→ Social Support in Interpersonal Communication) and is usually studied as a communicative activity carried out by laypersons in everyday situations; however, professionals (teachers, pastors, nurses, counselors, therapists) and para-professionals (bartenders, hairdressers) also engage in comforting communication.

### **FUNCTIONS AND STRATEGIES OF COMFORTING**

Typically, people seek and receive comfort from intimates in their social networks, especially friends, family members, and romantic partners; neighbors and co-workers may also be important sources of emotional support. Research indicates that comfort (or

emotional support) is an important provision of close personal relationships and helps to maintain these relationships (→ Relational Maintenance), with people evaluating their partners for the quality of the emotional support given. When provided effectively, emotional support can assist with the processing of negative emotions, reduce affective distress, foster functional coping, maintain self-esteem, improve performance, and enhance the quality of social relationships. Moreover, by reducing potentially harmful physiological processes that often accompany emotional distress, effective comforting may protect mental and physical health, reduce susceptibility to disease, and decrease morbidity and mortality rates (→ Social Support in Health Communication).

Unfortunately, many comforting efforts intended to provide emotional support are *not* effective. Indeed, research has documented a fairly high incidence of support attempts that fail, “cold comfort,” or “miscarried helping” these messages, however well intended, are ineffective and may actually make the recipient feel worse rather than better. These findings motivated research focused on identifying the features of more and less effective comforting strategies.

This research indicated that highly *person-centered* verbal comforting strategies, in contrast to their low person-centered counterparts, generally are perceived as most sensitive and effective and do the best job of reducing emotional distress. These verbal strategies acknowledge, contextualize, and legitimize the feelings and perspective of the distressed other and encourage the other to express, explore, and elaborate his or her feelings. Low person-centered verbal strategies typically minimize or ignore the distressed other’s feelings, tell the other what to feel or do, and may even criticize the other’s feelings and perspective.

In addition, comforting efforts that provide *face support* are experienced as more helpful than those that ignore the face wants of recipients. Facework uses politeness forms (→ Politeness Theory) that support the recipient’s desires to be viewed positively and autonomously. Facework supporting the desire to be viewed positively expresses affirming feelings toward, or evaluations of, the recipient and his or her actions. These devices include statements of positive regard, admiration for the courage or effort shown by the target, esteem, understanding of task difficulty, and confidence that the other will prevail. Facework supporting autonomy includes indirect verbal forms such as seeking permission prior to suggesting or advising, expressing deference, offering suggestions indirectly, hedging and qualifying, hinting, describing hypothetical options, and otherwise indicating respect for the target’s autonomy. Nonverbal behaviors may also provide comfort and emotional support (→ Nonverbal Signals, Effects of).

*High immediacy* nonverbal behaviors (including forward body lean, touches and pats, hugs, hand-holding, focused looks, and soothing sounds) are experienced as comforting whereas low immediacy nonverbal behaviors (including backward body lean, folded arms, little eye contact, mumbled responses) are experienced as insensitive.

Comforting messages that exhibit high levels of these three features (person-centeredness, face support, and immediacy) typically receive favorable responses from both sexes, members of different cultures, and people with diverse personality traits; these messages also receive favorable responses across an array of support situations. In contrast, comforting messages that exhibit low levels of these features are generally viewed as insensitive, ineffective, and unhelpful, although there are somewhat larger cultural and gender differences in the evaluation of these messages. Recent research suggests that differential responses to comforting messages may be due to variations in recipient ability and

motivation to process comforting messages; high ability and motivation to process these messages leads to the sharpest discrimination among them. Numerous demographic, personality, and situational factors appear to influence the recipient's ability and motivation to process comforting messages (Bodie & Burleson, in press).

Recent scholarship has focused on explaining comforting outcomes by examining the cognitive and affective mechanisms these messages influence. Comforting messages can promote changes in feelings and coping behaviors through multiple mechanisms; these mechanisms differ in the verbal strategies that activate them, their information-processing demands, the magnitude and stability of the changes they can produce, and the speed with which they generate changes in feelings and behaviors. For example, *distraction* produces changes in affect by redirecting the attention of distressed recipient; this mechanism (1) may be activated by drawing the recipient's attention to some positive feature of the environment, (2) makes minimal information processing demands, (3) is capable of generating large, but typically temporary, changes in affect, and (4) acts relatively quickly. In contrast, *cognitive reappraisal* produces changes in affect by altering the cognitions (appraisals) that lead to particular emotional states; this mechanism (1) may be activated by inviting the recipient to reflect upon and talk about his or her feelings and the reasons for those feelings, (2) makes large information-processing demands, (3) is capable of generating large, stable changes in affect, and (4) often requires a relatively long time to produce affective changes (→ Appraisal Theory). Jones and Wirtz (2006) found that highly person-centered comforting messages bring about changes in another's emotions by encouraging the other to talk about those emotions which, in turn, results in cognitive reappraisals of the problematic situation.

### COMFORTING SKILLS

The ability to provide sensitive, effective comfort to the distressed is a fundamental form of communicative competence that requires appropriate knowledge and motivation (→ Interpersonal Communication Competence and Social Skills). Models of comforting communication competence (Burleson 2003; Eisenberg 1998) indicate that skilled comforting requires several abilities, including (1) social perception skills such as cognitive complexity and social perspective taking, through which the helper can acquire knowledge of the distressed person and his or her feelings, goals, and perspective, (2) an understanding of human emotional dynamics (i.e., the circumstances that typically cause and relieve particular emotional states), (3) self-regulation of one's own emotional response to a distressed other and upsetting circumstances (since strong emotional reactions may interfere with the ability to generate sophisticated messages), and (4) the capacity to generate message plans that efficiently and effectively implement the helper's goals while adapting to situational contingencies.

In addition, because providing sensitive comfort to distressed others often requires considerable effort, the production of skilled comforting messages mostly occurs when helpers have appropriate motivations (Burleson et al. 2005; Feeney & Collins 2003), including high levels of *goal motivation* (the helper's desire to aid the recipient in feeling better), *effectance motivation* (the helper's belief that he or she is capable of improving the recipient's affective state), and *normative motivation* (the helper's belief that it is socially

appropriate to use particular messages with the recipient). These motivations are influenced by a variety of personality traits (e.g., attachment style, emotional empathy, gender-role orientation, pro-social orientation) and aspects of the comforting situation (e.g., presence of others, sex of the helper and recipient, recipient responsibility for the problematic situation). Women typically have higher levels than men of the abilities and motivations that contribute to skilled comforting, which may be why women are more likely than men to engage in such comforting. In addition, the abilities and motivations that contribute to skilled comforting develop with age, which helps explain why the use of sophisticated comforting efforts increases over the course of childhood and adolescence.

The abilities and motivations that underlie the competence to engage in skilled comforting are cultivated by several aspects of the social environment, especially during childhood and adolescence. In particular, caregiver and peer use of highly person-centered comforting messages is associated with children's use of such messages. Using these messages models the form and content of skilled comforting to the child and facilitates the child's development of social perception skills by explicitly mentioning feelings, intentions, and motivations. Caregiver talk in other contexts (such as discipline) about feelings and internal states also facilitates development of the skills and orientations that underlie skilled comforting. The reliable provision of emotional support by caregivers, along with their use of positive forms of discipline, also promotes the development of secure attachment, pro-social orientations, and an expressive personality, all of which contribute to the use of skilled comforting messages. Frequent social interaction with peers facilitates the child's development of good comforting skills; peer interaction creates opportunities for children to exercise their social perception and communication skills and provides feedback to children about the effectiveness of their skills.

### **FUTURE DIRECTIONS OF RESEARCH**

Given the numerous positive consequences that can result from skilled comforting, and the unfortunate fact that many people do not naturally possess the abilities and motivations that underlie the competence to engage in such comforting behavior, it is reasonable to inquire whether the comforting skills of ordinary people can be enhanced through educational or training efforts. Currently, this question cannot be answered directly because few (if any) studies have been conducted that assess the efficacy of efforts to train comforting skills. There is evidence, however, that certain abilities (e.g., social perception skills) and motivations (e.g., concern for others) can be fostered by clinical and educational interventions. Moreover, there is abundant evidence that instruction and coaching can improve a broad range of communication skills (e.g., conversational skills, presentational skills, persuasive skills). Thus, there is ample reason to hypothesize that comforting skills can be improved; one goal for future research lies in developing and evaluating curricula aimed at enhancing these important skills.

## **Comics**

*John A. Lent*

*International Journal of Comic Art*

Comics, either in the form of newspaper strips (funnies) or comic books, combine text and images to carry a narrative or a joke. Although semblances of comics can be found in Egyptian Pharaonic art, thousand-year-old Indian, Japanese, and Chinese scrolls, eighteenth-century Japanese *kibyoshi* (yellow books), and thirteenth-century European book illustrations, the nineteenth century is normally credited as their birth date. Strips by Rodolphe Töpffer appeared in Switzerland in 1827, and by Wilhelm Busch a few decades later in Germany, but it was in the US that newspaper comics flourished, especially after New York newspaper publishers William Randolph Hearst and Joseph Pulitzer used

them to lure readers in the 1890s. After *The yellow kid*, usually considered the first US strip, was created in 1895, several hundred new funnies were started during the next five years.

These early comics left their imprints on American society, inspiring other literary and art forms, adding to the English lexicon, and even affecting women's → fashion. They also became favorite reading fare abroad, where they were reprinted or cloned, and later replaced by indigenous comics. Some early comic strip adopters were Canada (1901), Japan (1902), Australia (1907), Korea (1914), the UK (1915), and Argentina (1916). By the 1920s, local comic strips appeared in newspapers in China, Sweden, the Netherlands, the Philippines, Mexico, Denmark, and Finland.

The 1920s represented for the US an *era of specialization*, with new genres featuring women, average American children, adventure, and family. Playing a key role in the development of some of these comics was Joseph Patterson, publisher of the *Chicago Tribune*, who nurtured new talent and helped conceptualize a number of memorable characters. In other parts of the world, the publication of funnies grew quickly before World War II, although the domestic genre lagged because comics were still a children's medium in many places, and because female-centered stories did not fit patriarchal norms in Europe and Asia. Although local adventure strips existed, they faced stiff competition from American classics provided through syndication. Countries such as Italy, Australia, and Canada banned or imposed import licensing regulations on foreign comics during the 1940s, giving local strips a chance. During World War II, comic strips thrived as escapist reading material and an effective propaganda vehicle in at least the US, the UK, Italy, and Japan.

Also popular during the war were American *comic books*, which began as collections of newspaper strips, but by the mid-1930s developed their own stories and characters. Although semblances of comic books had existed earlier in Switzerland, the UK, Germany, Australia, Japan, and Mexico, it was the American version that became popular, partly because of its superhero stories. Already in the 1940s, American comic books had left their mark: banned in France, Canada, and Australia because they thwarted local comic books; imitated in Japan, the Philippines, Taiwan, and Mexico, which developed their own markets. Mexican comic books were so popular in the 1940s that some published daily (e.g., *Pepín*, published eight times per week).

When the war ended, some sectors of US and UK society blamed comic books for corrupting children's morals and education, leading in the US to Senate investigations in 1954 and the passing of a very stringent self-censorship code that nearly destroyed US comic books (→ Morality and Taste in Media Content). Similar actions were taken in about 20 other countries, although overall, comic books fared well in France, the Netherlands, the UK, Italy, Belgium, Argentina, Mexico, Brazil, and elsewhere (→ Censorship; Censorship, History of). In post-war Asian comics, some giants emerged, such as Osamu Tezuka in Japan, with *Jungle Taitei* and *Tetsuwan Atom*; Antonio Velasquez, who with publisher Ramon Roces established Ace Publications in the Philippines; and important strip artists Machiko Hasegawa (Japan), Lee Fei-meng (Taiwan), and Kim Song Hwan (Korea).

Significant changes occurred in the US comic book industry in the latter quarter of the century as sales dropped, many companies folded, and surviving firms DC and Marvel shifted to socially relevant superheroes, direct sales approaches, and adult-oriented themes. Actually, *underground comix*, which grew out of the 1960s counterculture, first showed

there was an adult market; rather quickly, local underground comix spread to Australia, the UK, Canada, the Netherlands, and Latin America. As the millennium ended, comic books in the US, and gradually elsewhere, reinvented themselves with different styles (more literary-like; better artistic execution), formats (varied panel shapes/sizes, graphic novels), contents (autobiographical, journalistic), companies (independent, alternate publishers), and venues (comic shops and cafes, Internet, movie/TV adaptations). Comic book publication also penetrated Africa (especially Francophone countries and South Africa), the Middle East, and new parts of Asia. During this time, Japan became the leader in comic book sales (more than a billion copies yearly in the 1980s) and overseas influence.

US *newspaper comic strips* during the latter twentieth century changed drastically, with reduced panel sizes, fewer genres (mostly gag-a-day), and lowered quality. Because of political correctness, bottom-line economics, and inept cartoonists, the strips suffered a lack of spoken dialect, clever puns, rich parody, and skilled artwork (→ Cartoons). Strips did not face the same dilemma in Belgium, the UK, France, Italy, Spain, Australia, and Japan, where genres such as science fiction, adventure, soap opera, western, police, fantasy, and humor have been kept alive. In the Philippines, Indonesia, Malaysia, Zimbabwe, Zambia, Tanzania, Kenya, India, Bangladesh, and Sri Lanka, to name a few countries, strips with native characters and in indigenous languages found places in daily newspapers and humor magazines.

Comics, though imperiled at times and often reshaped, have endured as key storytellers and cultural identifiers.

## **Commentary**

*Monika Djerf-Pierre*

*Göteborg University*

A commentary is a genre of journalism that provides interpretations and opinions on current events, rather than factual reporting (→ News). Interpretations may include

evaluating the motives behind actors' behaviors, interpreting the wider scope and meaning of events, and assessing the ramifications and significance of facts. It also includes speculation, such as forecasting future events and foreseeing the behaviors of actors in the news. Opinions, on the other hand, mean promoting or advocating specific standpoints, ideals, or policies.

Commentary has a principal function in the → public sphere. As the free expression and exchange of ideas is necessary for the formation of public opinion, commentary is crucial for the democratic function of the media. Historically, commentary became an integral part of the press long before journalism as an institutional practice and profession was invented (Chalaby 1996). In fact, partisan reporting outdates the ideal of objective journalism by more than a century (→ Partisan Press; Advocacy Journalism). The evolution of objectivity as a journalistic ideal, and the neutral, descriptive style of journalistic expression are closely connected to the growth of professionalism and of journalism as an independent social force in the 1900s (Schudson 1996; → Professionalization of Journalism).

In the US this modernization process gradually took place from the mid-1800s to the mid-1900s. The early US newspapers in the 1700s were governed by the printer of news, speaking in a universal voice that was impartial and neutral (Barnhurst & Nerone 2002; → Printer-Editors). Later, in the 1800s reporting often had a partisan tendency or bias, as the press became affiliated with political parties (→ Bias in the News). The early commentaries in the US press were mainly found in editorial columns, where politicians' statements were praised or criticized from an engaged, partisan stance (Schudson 1996). The news reports expressed a simple notion of objectivity; reporting or "mirroring" events in a manner that meant describing what the observers on the scene could see for themselves.

This approach changed gradually during the first half of the twentieth century. To an increasing extent the news started to assess the larger political meaning of the messages. The journalist was becoming an independent interpreter of news rather than a reporter of immediate events. This was a manifestation of a shift in power and focus from editors to journalists. Journalistic professionalization eroded political parallelism, and the ideal of objectivity was established in the 1920s. One of the basic premises in the objective style of reporting was that news should be separated from views and facts from opinions (→ Objectivity in Reporting).

In a *comparative perspective* the trajectory toward modern journalism is not as straightforward as appears in this short description of the US development. Forms and styles of journalism vary across cultures and contexts, and although the development of the European press, both northern and southern, shows many parallels to that in the US, there are also many differences (Hallin & Mancini 2004; Høyer & Pöttker 2005). The notion of objectivity is more pronounced in North American journalism than in other western democracies. US news tends to be more information- and fact-oriented, particularly in comparison to journalism in southern Europe. The informational approach is connected to a neutral style of reporting. In southern Europe, the advocacy tradition of the press persists more strongly. Commentary is mixed more freely with factual reporting, and the southern style of writing is also more interpretive and evaluative. In northern Europe, and particularly in the Scandinavian countries, journalism has a long tradition of a strong party-political affiliation. Here a depoliticization of the press gradually came about in the

second half of the twentieth century. A legacy of commentary-oriented journalism is coupled with an equally strong public service tradition in broadcasting, where public service from the outset was supposed to vouch for balance, fairness, and neutrality in reporting. Comparative studies of journalists' ideals and norms also suggest that the ideal of objectivity isn't prevalent everywhere in the world. Obviously, in countries that lack freedom of speech and where the media is closely monitored or even controlled by the government, commentaries on current affairs often tend to represent the power-holders' point of view (→ Journalists' Role Perception).

In the 2000s, commentary is an integral part of journalism worldwide. National journalistic cultures still exist in the 2000s, although research suggests an increasing *homogenization of journalism*, particularly due to market pressure and globalization (Hallin & Mancini 2004; → Commercialization: Impact on Media Content). Commentary today exists in various forms and formats, from the long-lived editorials and traditional commentaries in current affairs magazines, to journalistic talk shows, Internet blogs, and online magazines in the 2000s (→ Broadcast Talk). Internet blogs represent a further blurring of the boundaries between facts and views, as journalists here may have more far-reaching opportunities to express opinions than in the traditional news media (→ Blogger). Commentary does not pertain only to political reporting. It permeates other journalistic topics and beats, such as business news, and sports news. Where commentary was historically rooted in specific social and cultural contexts and categories (class, religion, gender, race, and geography), in the 2000s it is supposedly free from such biases. Publicists in the 1800s and early 1900s often advocated the interest of particular social groups and analyzed the world from the viewpoint of the group they represented. Commentaries persist today but now rest on the purportedly disinterested critical expertise of professional journalists. However, journalists are increasingly speaking in their own voice, delivering interpretations and speculations more often than opinions, advocating nothing but the legitimacy of the profession.

# Commercialization: Impact on Media Content

*John A. Fortunato*

*Fordham Graduate School of Business*

No industry exists without a product or service to offer to customers. For mass media organizations the product they offer is their content. The primary business of the mass media is to produce content – fill the broadcast hours, the print pages, the Internet site. Because of limits of time and space, selection of content is a necessary function. Mass media organizations have to make difficult decisions in evaluating their story options and determining which content to provide to an audience. Some stories never become “content” and are not exposed to a mass audience.

Many internal and external factors influence the mass media content decision-making process (e.g., Shoemaker & Reese 1996; Croteau & Hoynes 2001; Fortunato 2005; → Media Production and Content). Primary among those factors is the economics of the industry. Advertisers are an essential external factor in any evaluation of the business aspects of the mass media because they generate all of the revenue for privately owned broadcast media and most of the revenue for the print and Internet media. The size and demographics of the audience help determine the amount of money that mass media organizations can charge advertisers. Because it is the audience determining the advertising rate, Wenner (1989, 22) points out “the content per se is not what is being sold; rather it is the audience for that content that is being sold to advertisers.”

## CONCERNS ABOUT COMMERCIAL INFLUENCE

Because of this economic role, there is concern about the extent of advertisers’ influence dominating the content decision-making process (e.g., Shoemaker & Reese 1996; Croteau & Hoynes 2001; Jamieson & Campbell 2001). Jacobson and Mazur (1995, 206) contend “many producers, editors, and publishers alter or pull stories that might offend advertisers, write pieces expressly to appease or attract advertisers, avoid topics that create controversial ‘environments’ for advertising, and gear articles and programs to attract an audience that advertisers crave. In short, they often trade editorial integrity for the almighty ad dollar.” Picard (2004, 54) argues that “economic pressures are becoming the primary forces shaping the behavior of American newspaper companies” and this development is leading the “attention of newspaper personnel from journalism to activities primarily related to the business interests of the press.” He claims, “the result is that stories that may offend are ignored in favor of those more acceptable and entertaining to larger numbers of readers, that stories that are costly to cover are downplayed or ignored and that stories creating financial risks are ignored” (2004, 61).

Scholars argue that as a result of trying to deliver a mass audience to advertisers and not emphasize content that might lead to a reduction in audiences or advertisers, journalistic quality suffers (e.g., McQuail 2000; Jamieson & Campbell 2001). Croteau and

Hoynes (2001, 27) claim “the consumers that media companies are responding to are the advertisers, not the people who read, watch, or listen to the media.”

Scholars emphasize that because the mass media play a prominent role in providing information in a democratic society, their operating in only the advertisers’ economic interests has negative consequences. Another chief concern is the continuing trend toward commercialization. As the media environment changes, so too will the advertising environment. Advertisers are always reacting to the audience’s media use and are developing their media placement strategies on the basis of audience behavior. With the technology of the DVR, Internet, cable television, and pay-per-view having made the audience more splintered, it is harder for advertisers to reach the large masses they were once easily able to, leading to more sponsorship and product placement initiatives. McAllister and Giglio (2005) claim there is a blurring of the distinction between program content and advertising.

Jacobson and Mazur (1995, 25) speak to the cultural concern of increased commercialization, claiming, “taken as a whole, the collective body of advertising sells a vision of the world, a way of life. Each ad is a parable that illuminates the same theme: All of life’s problems can be solved and happiness attained by *buying things*.” Schiller (1989) also spoke of the cultural impact of commercialization where advertising influence goes beyond simple economic support of culture industries (i.e., the mass media), and translates into the domain of support for ideas and images, and importantly who controls these ideas and images. According to Schiller, economic support through advertising becomes tantamount to support and validation for that entity and its existence within the culture. He contends that corporate speech is the “loudest in the land” (1989, 4).

Other scholars do not contend that the advertiser influence on media content is significant. For example, regarding advertising’s negative impact on democracy, Baron (2003, 67) comments, “it is a strange but powerful testament to the American democratic and market system to have one of its most important democratic institutions to be a resounding market success.”

## EVIDENCE ON ADVERTISERS’ INFLUENCE ON MEDIA CONTENT

In evaluating the impact of commercialization, the question of what advertisers desire emerges. Advertisers pay large amounts of money because their investment guarantees them placement in the media outlet at the time and location desired, giving them access to the audience that participates in that mass media organization’s content. For that investment advertisers hope to achieve the following communication goals: (1) exposure to the desired target audience, (2) increase in product brand recall, and (3) increase in sales (e.g., Fortunato 2005).

The pivotal question thus becomes whether the achievement of these advertising goals necessitates control of the media content. It seems what the advertiser most desires is not necessarily to influence content, but simply to reach the largest possible numbers of its desired target audience as often as possible. In this philosophy, control or influence of media content is not a necessary condition for achievement of advertisement goals. Brants (1998) argues the evidence for the decline in journalistic quality and standard of media performance because of increased commercialization is not strong. To also support this idea, in a survey of network news correspondents from ABC, CBS, CNN, NBC, and PBS Price (2003) asked if they felt any story influence from advertisers. She found that

only 7 percent reported some advertiser pressure and 93.1 percent had never felt pressure from advertisers to report or not to report a story. No correspondents responded they were frequently pressured by advertisers to report or not to report a story, and only one respondent reported an occasional pressure of this sort from advertisers. With the purchase of advertising time well in advance, it is impossible for the advertisers who have bought time to know the exact topical content of that particular program or periodical. This also makes it difficult for the reporters, editors, or producers to tailor a story to fit the needs of an advertiser who they probably do not know has advertisements planned surrounding the content segments they are producing.

As evidence of advertiser influence on content, it has been pointed out that advertisers might pull out of certain media locations because they do not approve of the content (e.g., Jacobson & Mazur 1995; Richards & Murphy 1996). It is important to note that often such a pull-out is not a cancellation of the advertising contract with a mass media organization. Often the result of a conflict regarding content is a shifting of the location of the advertisement. If there is a conflict, an arrangement is made whereby there is a location or time shift and the advertiser will merely move its commercial to another segment of the television program or magazine, or possibly even to the next week's issue or program. The fact that the financial commitment does not change, only the placement location of the advertisement, is an important point when evaluating the influence that advertisers have or even desire on the content decision-making process.

This time shifting of the advertisement within a magazine or even the shifting of a story to the following week's broadcast is a minor adjustment and the editorial content of the mass media organization is not impacted at all. The tactic of time shifting, rather than completely pulling out of a program, is evidence that advertisers are not necessarily trying to intrude on the editorial process, but merely trying to use that media content vehicle to reach the audience. Time shifting does not conflict with the advertisers' need for exposure to the audience or with the mass media organization's editorial decision-making or their need for revenue.

The role of advertisers in the mass media industry is clear from an economic standpoint, as they provide the revenue to the mass media organization. For many scholars this arrangement allows for a clear connection to these advertisers strictly influencing and dictating media content decisions. To others what advertisers most desire is exposure of their brand to the audience, not necessarily control of the content. Therefore, the relationship between mass media organizations and advertisers does not appear to necessitate interference into the editorial aspects of content decision-making, as that level of influence is not a prerequisite for advertisers achieving their communication goals.

The arguments of many theorists that the mass media organizations are only trying to please advertisers is a little misleading in that advertisers most want an audience, particularly a desired target audience that might buy their product. Advertisers pay the mass media organizations and invest in locations only if that content delivers an audience. It is a large audience that generates advertising revenue and a profit for the mass media organization. If the mass media organizations are all about profits, they have to attract an audience – no audience, no advertisers, no profits. McQuail (2000, 105) points out that “the critique of commercialism is particularly difficult to reconcile with the redemption of the popular, since popularity is usually a condition of commercial success.” As Richards and Murphy (1996, 29) summarize, advertising “space or time is worthless

without readers, listeners, or viewers.” They add, “a medium is only beneficial to advertisers if consumers use it, and consumers will not use a medium if they are unhappy with its content” (1996, 30).

## **Commercialization of the Media**

*Graham Murdock*

*Loughborough University*

“Commerce” is a longstanding synonym for business as it is conducted in capitalist societies. It refers both to the institutions and practices of market economies and to the imaginative landscapes they produce. Commercial systems have two defining characteristics.

Organizationally, they rest on the assumptions that competition between privately owned companies is the most effective way to maximize the diversity and choice of products on offer, and that markets should be allowed to operate with the minimum of interference and regulation from government. Imaginatively, they present consumption as a unique sphere of personal freedom in which individuals can realize their aspirations and confirm their sense of self through the goods and services they choose to purchase and possess.

This identification of “being” with “having” lies at the core of the ideology of consumerism that provides advanced capitalism with its major meta-ideology. It presents itself as a system that can “deliver the goods.” The media play a unique role in sustaining this system. Not only do they offer a wide variety of purchasable communications goods and services, ranging from cinema seats to iPods, they are also the major conduit for the advertising promoting the consumer goods produced by every other sector of the economy (→ Political Economy of the Media).

The expansion of the modern commercial media however, coincided with the rise of the nation-state as the central political formation of → modernity and with an ethos of citizenship that required mass participation in the election of governments. It was also accompanied by the development of a new kind of civil society made up of the multiple organizations through which people championed their interests and expressed their shared identities. Both of these other nodes of mobilization and power supported cultural and communicative activities that operated outside the market. States subsidized interventions they saw as helpful in cultivating national solidarity and a culture of responsible citizenship. Civil society organizations supported a range of initiatives that relied on voluntary labor. Some were devoted to sustaining momentum within the group. Others were aimed at attracting new recruits or raising money from sympathetic supporters. The history of modern commercialization is a history of the shifting relations between capital, state, and civil society, and of the persistent efforts by private corporations to enlarge their sphere of operations, both institutionally and imaginatively, and commandeer the material resources and social allegiances developed by the other two nodes of power.

### FROM INDIVIDUAL PRESS FREEDOM TO MEDIA BUSINESSES

Most observers of the communications landscape in Europe in the early decades of the nineteenth century saw markets as guarantors of greater freedom of expression (→ Freedom of Communication; Freedom of the Press, Concept of). Everywhere, the dominant medium of the time, the press, was restricted by government censorship and licensing. In Cologne, the *Rheinische Zeitung*, edited by the young Karl Marx in his first job after graduation, was closed down by the censors for attacking the Russian Tsar. In London, every sheet of paper used in printing a newspaper was required to bear an official government stamp. By throwing ideas and argument open to the play of demand, commercialization promised to transfer power from governments to publics. A free market promised to produce a press that reflected the full range of political positions and social interests. After a series of long and bruising battles, this market-led definition of a “free press” prevailed and newspapers began to develop as modern businesses staffed by professionals. As this transition gathered momentum, however, it became increasingly clear that, far from disappearing, restrictions on expression had simply assumed another form. Control by

government had been replaced by the censorship of money (→ Censorship, History of; Newspaper, History of).

By the later decades of the century, newspaper publishing had become an increasingly expensive proposition. It required substantial investment in new printing and production machinery and subscriptions to the new telegraphic “wire” services that transmitted breaking → news (→ Telegraph, History of). Free market ideology presupposed that anyone who spotted a gap in prevailing provision could enter the market and submit their ideas to the judgment of readers. In the ensuing Darwinian struggle, good ideas would survive and develop. Bad ideas, like ill-adapted species, would die out. In reality, launching a major title was becoming a privilege reserved for the rich and well supported.

By the turn of the century, the press business was increasingly dominated by a *new kind of proprietor*, who owned chains of titles in a number of markets. The British entrepreneur Alfred Harmsworth (later ennobled as Lord Northcliffe) typified the imaginative estates of these new “press barons,” owning both the country’s leading popular “tabloid” titles, the *Daily Mail* and the *Daily Mirror*, and the primary newspaper of record, *The Times* (→ Tabloid Press). The front page of *The Times* had long been filled with small classified ads, a practice that continued well into the second half of the twentieth century, but the *Daily Mail* and its rival tabloids were becoming important vehicles for the display advertising promoting the new branded goods – Lipton’s tea, Pear’s soap, and Colman’s mustard – that were rapidly replacing unlabeled generic commodities (→ Branding). In the process, the economic foundation of the press was shifting from sales to readers to revenues from advertising (→ Consolidation of Media Markets; Media Conglomerates).

### **EARLY CONCERNS ABOUT THE COMMERCIALIZATION OF THE MEDIA**

Chain ownership and advertising finance prompted increasing concern. Observers worried that the new proprietors would mobilize the titles they owned behind the political positions and causes they particularly favored (as Northcliffe often did) and exclude or unfairly denigrate alternative opinions. The greater the reach and centrality of their publications, the greater the potential damage to open debate and diversity of expression (→ Plurality; Political Discourse). There were concerns, too, that the drive to maximize advertising revenues by assembling the largest possible readership was pushing popular titles toward entertainment and sensation rather than objective information and rational debate on public issues (→ Objectivity in Reporting; Sensationalism).

These developments coincided with extensions to the franchise and the move toward mass participation in the political process based on the universal vote. To commentators committed to advancing this ideal by fostering a democratic culture rooted in informed deliberation, these trends appeared as “*market failures*.” Given the entrenched identification of a free press with a free market, there was little they could do to change the newspaper business other than impose limits on the number of titles any one owner could command and offer modest subsidies to support minority publications. When broadcasting emerged as a popular mass medium after the end of World War I, however, they saw another opportunity to counter the censorship of commercialism.

Governments in Europe had long seen the provision of public cultural facilities as an important aid in efforts to construct the nation as an imagined community with a

common heritage, and to promote rational recreation and self-improvement. The resulting array of public libraries, museums, and galleries differed from the novels, theatre seats, and → magazines produced by the commercial cultural industries in two key respects: they were free at the point of use and they were designed for shared use rather than personal possession (→ Culture Industries). They came to be seen as → public goods, not simply in the technical sense that a number of people could enjoy them simultaneously without pre-empting each other, but also in the more general sense that they contributed to the quality of collective life as well as to the pleasure and education of individual users.

Where commercial media were rooted in the private interests of producers and consumers, publicly funded cultural facilities were seen by their defenders as pivotal contributions to the common good. It was this view that prevailed in European debates on broadcasting and led to the establishment of radio as a *public service*, funded out of the public purse and oriented to providing the cultural resources deemed essential for a culture of citizenship and national solidarity (→ Public Service Broadcasting: Law and Policy). The fact that it delivered the same programs across the nation simultaneously and could be enjoyed by everyone equally – without the resource limits imposed by the limited space of a gallery or the competition for loans from public libraries – made it the ideal typical public good. In contrast, in the United States, despite a vigorous campaign for public service waged by universities and community groups, broadcasting followed the dominant pattern of the pre-existing cultural industries and became a commercial business, operated by privately owned companies and financed by assembling and selling audiences to advertisers (→ United States of America: Media System).

The *nature of* → advertising was changing, however. As real wages rose and a larger section of the audience began to move from maintaining basic living standards to making consumer choices that expressed lifestyle aspirations, so advertising set out to secure the links between tastes and → brands (→ Taste Culture). Hollywood began to embrace product placement, with manufactures paying to have their products featured and used in feature films and engineering tie-in promotions in local stores (→ Hollywood). Alongside spot advertising, broadcasters embraced program sponsorship, allowing manufacturers to include the name of the company or brand in the program title. Consumerism was no longer confined to the spaces between media artifacts; it was increasingly integrated into them. Faced with this *consolidation of commercialism*, at the level of both institutions and imagination, advocates of broadcasting as an essential medium of democratic life responded by subjecting the business of radio to regulations limiting the number of stations any one owner could command and insisting on a minimal diversity of output and opinion.

## COMMERCIALIZATION OF TELEVISION

When television emerged as the dominant popular medium after World War II, the same basic division of operating philosophies was reproduced. The major European nations extended the principles of public service to the new medium and were mostly joined by their former colonies, which mobilized broadcasting behind the twin drives towards → modernization and nation-building. Within Europe, the *United Kingdom* was unique in introducing advertising-funded television services in the mid-1950s, although the new

commercial (ITV) companies were bound by extensive public interest requirements. As a consequence, competition was confined to audiences and talent, with the → BBC continuing to receive the whole of the public subsidy provided by the license fee while the ITV operators enjoyed monopoly rights to advertising in their franchise regions. By guaranteeing relative security of income to both sectors, this convenient division of the spoils enabled both to fulfill their public service remits, an arrangement that supporters of greater competition dismissed as a “comfortable duopoly” (→ United Kingdom: Media System).

Elsewhere in Europe, broadcasting remained a public service monopoly. Against this, the *United States* pursued the basic business model already established for radio and constituted television as a commercially operated medium, subject to minimal public interest regulations, a pattern widely followed in the key countries in Latin America that lay within the US’s longstanding sphere of influence. This dual system lasted more or less intact until the mid-1970s, when a combination of technological innovations and shifting political ideologies progressively undermined both public cultural institutions and the ethos of public service. As a result, over the next two decades, commercialism was to gain unprecedented geographical and cultural reach.

In a number of countries, from Norway to India, the arrival of commercial cable and satellite services, often beamed from “offshore,” broke the historic monopoly of public service broadcasting and opened the way for increased competition and commercialism (→ Cable Television; Satellite Television). New advertising-supported terrestrial channels emerged alongside proliferating pay-TV services. Cultures habituated to the worthy fare served up by public stations were suddenly exposed to the full force of consumerism. The brashness and glamour offered by imported shows like *Dynasty* offered a window on a world where clothes and furnishing spoke louder than words about who one was and wanted to be. This way of looking played across an imaginative landscape already prepared by a fundamental shift in political and popular attitudes.

### **NEW DRIVE TOWARD MARKETIZATION**

The elections of Margaret Thatcher in the UK and Ronald Reagan in the US marked the beginning of a rapid movement toward a renewed reliance on entrepreneurship, markets, and competition as the key drivers of economic growth, and a corresponding rejection of public enterprise, public subsidy, and state management. It was a worldwide movement. Not only was there growing disillusion with welfare capitalism across Europe and an evaporation of trust in state-managed development in emerging economies, but the three major economies that for most of the postwar period had been partly or wholly uncoupled from the global capitalist system all embraced market-led solutions: the Soviet Union collapsed, China introduced a market form of economic organization, and India moved away from self-sufficiency.

The communications industries were central to this shift in three ways. The telecommunications and data-processing sectors provided the essential infrastructure that allowed business to operate across dispersed arenas of action in real time. The popular commercial media constituted the central spaces for product promotion and marketing. And, as core elements in the wider array of high-technology sectors, the creative and

information industries were assigned a central role in developing the next phase of advanced capitalism, based on trade in ideas and expressive forms rather than manufactured goods. This pivotal position made them prime targets for policies designed to enlarge the market sector and give companies maximum freedom of operations.

This drive towards marketization was pursued through a range of interventions deployed in varying combinations. Public communications assets were sold to private investors (→ Privatization of the Media). Markets that had previously been dominated by one or two suppliers were opened up to competition (liberalization). In Europe, the old state-run post, telegraph, and telephone monopolies were broken up and obliged to compete for customers with new entrants. Institutionally, regulatory regimes relaxed the previous rules governing acquisitions and ownership, permitting larger, more diversified media to emerge and allowing broadcasters to take more advertising in more flexible forms (such as product placement).

Ideologically, they moved from the defense of the public interest to the application of competition law and purchasers' rights, privileging audience entitlements as consumers rather than citizens (→ Audience Commodity). At the same time, media organizations that remained in the public sector were increasingly cajoled or pressured into behaving as though they were commercial corporations, a process known as corporatization. In China, the major state-owned broadcaster CCTV was required to support itself from advertising sales rather than state subsidy (→ China Central Television Channel 9 [CCTV-9]; China: Media System). In New Zealand, the public broadcaster was recreated as a state-owned enterprise, whose first duty was to generate profits that could be returned to the Treasury to top up the general pool of taxation. In the UK, the BBC was required to sell off its transmission network, commission a proportion of its programming from independent producers, urged to seek co-productions with commercial players in the US and other major markets, and encouraged to maximize the value of its assets by aggressively pursuing the merchandising opportunities offered by programs and selling program formats across as many markets as possible.

At the same time as established media sectors were being reconstructed around the principles of commercialization, however, new forms of communicative activity were developing on the → Internet. With the rapid expansion in computing power, the increasing speed and capacity of broadband networks, and the mobility offered by WiFi connectivity and the migration of the net to mobile phones, the struggle for the future of Internet services has become a major arena of contest between competing principles.

*Self-organized communities* played a central role in the Internet's development from the outset. Where commerce relies on prices or advertising subsidy and public goods are funded out of taxation, these grassroots initiatives are grounded in an ethos of reciprocity and collaborative creation. The first, and still in many ways the most impressive, example of this new gift economy in action is the *free software movement* that, though pooling expertise, has created a range of robust alternatives to the commercial software produced by Microsoft. This same basic principle has been successively applied to an ever-expanding range of uses. These include the wiki movement, which allows postings, such as the entries to Wikipedia, to be modified and added to by other participants, and the multiple recommendation sites, where users of hotels, airlines, and other facilities post their experiences and tips.

These developments are a double-edged sword for commercial enterprise. On the one hand, piracy and unauthorized postings are reducing revenues. On the other hand, users' loyalty and enthusiasm for peer-to-peer sites opens up new markets and promotional opportunities. The major media have been quick to capitalize on this, buying up sites, establishing a corporate presence in sites like Second Life, and pioneering novel forms of viral marketing. Public cultural institutions are also moving onto the Internet, using websites to extend their reach, make their resources and archives more readily available, and develop new participatory relations with audiences.

At present, then, we are witnessing both an intensification of commercialization and the extension of public goods and gift economies. The future of public communication will depend on eventual balance between these possibilities.

# Commodification of the Media

Graham Murdock

Loughborough University

All the goods and services used in everyday life possess intrinsic qualities that meet human wants, and even those that cater to basic needs, like hunger, may also satisfy a desire for beauty or a wish to communicate. Food is more enjoyable if made with love or artistically presented and served with style. These material and aesthetic qualities, as defined by social convention, constitute a good's value to its users: its use value. At the same time, in modern capitalist economies, goods also have a value in the marketplace: an exchange value. When a good is produced with the express aim of selling it at a price, it becomes a "commodity." In order to expand, capitalism required all goods to be converted into commodities. Analyzing this process of commodification and its impact on the diversity and availability of cultural goods is central to the account of media systems in industrialized, market-economy countries from the perspective of political economy (→ Political Economy of the Media).

## POLITICAL ECONOMY AND THE MEDIA

The professionally produced popular media that emerged in the nineteenth century had a *double relation to the commodity system*. All were commodities in their own right, sold for a price, but some, most notably the popular press and, later, commercial broadcasting, also provided the major spaces where other kinds of commodities were advertised and promoted. As a consequence, in the view of political economists, audiences themselves became a commodity to be traded between media organizations and advertisers, with the price being determined by the size and social composition of the readers and viewers (→ Audience Commodity). For Marxist analysts, commercial entrepreneurs were buying the work audiences devoted to paying attention to advertising in the same way as they bought their labor in the workplace.

Apart from firms making specialized or luxury items, companies paying for → advertising demanded the largest possible audience containing the highest proportion of consumers with command over spending. This requirement for *access to audience attention* had consequences for the range of diversity of media production. In a striking metaphor, the Canadian economist Dallas Smythe compares commercial broadcast programming to the "free" snacks put out by barmen in pubs and clubs. They needed to be tasty enough to be enjoyable in their own right but their main purpose was to encourage the clientele to stay and continue drinking. As numerous earlier commentators had pointed out, a system comprehensively geared to maximizing either direct sales or advertising revenues was likely to offer little scope for genuine creative originality. The contrast between "art" as an authentic expression of individual insight and inner conviction and industrialized creativity tailored to recycling already popular themes and formats was central to the critique of mass culture developed by many intellectual commentators, most notably the → critical theory developed by the Frankfurt Group.

Cultural commodification first happened in writing and book publishing. It was cross-cut by political considerations. In the nineteenth century public libraries opened in many countries. Where cultural commodities were only available at a price, these services were free. They were → public goods in three senses: they were paid for out of taxation; they were designed for collective use rather than personal possession; and they were seen to contribute to the quality of social life as well as to individual pleasure and self-development. What exactly constituted “common culture” and the “common good,” however, was fiercely contested (→ Culture: Definitions and Concepts). Against a background of rising popular militancy and the extension of the franchise, many within the Establishment had two main ambitions for these initiatives: to encourage a sense of national unity based on a shared culture, and to provide the intellectual and imaginative resources that would support rational participation in the political process (→ Political Discourse; Public Sphere). The tensions between commodification and public intervention intensified with the arrival of broadcasting as a technology of mass distribution.

## BROADCASTING

There were some early experiments with providing subscription radio services over telephone connections, most notably in Budapest, but the broadcasting industry soon became centered around the air transmissions. Because signals were universally and freely available to anyone with suitable receiving equipment, broadcasting offered unrivalled opportunities both to extend commodification and to create a new kind of public cultural good.

The first option was pursued with vigor in the United States (→ United States of America: Media System); the second option was developed in its fullest form in the UK, where the → BBC was constituted as a public service and charged with defending national culture and providing resources for citizenship (→ Public Service Broadcasting: Law and Policy; United Kingdom: Media System). Variations on these basic templates were adopted around the world and were later carried over into the television era.

The legacy of the various political decisions taken on the financing and organization of cultural and communications services lasted until the 1970s, with most countries outside the communist bloc operating a *dual system*, with commercial enterprise dominating the publishing, music, and film industries (→ Film Production) and various public institutions, museums, galleries, libraries, and in many cases public broadcasters, offering an alternative network of production, distribution, and availability. Over the past two decades, however, this system has been progressively dismantled as governments around the world have pursued policies geared to expanding markets and promoting their operating values. This shift toward “marketization” has enabled a major extension of commodification (→ Commercialization of the Media).

Corporations have long wanted to extend their relation with programming beyond the confines of the 15- or 30-second spot advertisement. One early, and well used, device developed in the United States system was sponsorship. In return for a contribution to production costs, firms were allowed to integrate their company or brand name into the title of the program in the hope that the positive attitudes and feelings generated by the performers and content would transfer themselves to the company and its products. At

the same time, the film industry was experimenting with product placement deals inviting manufacturers to pay to have their brands featured in popular movies, and, where possible, used by the stars.

In many broadcasting systems, these forms of *integrated advertising* have been ruled inadmissible on the grounds that programming and promotion should be clearly demarcated and separated. As spot advertising has come to be seen as increasingly ineffectual, however, and the competition between brands has come to center on sign value, a commodity's ability to communicate the personality and lifestyle of its owner, so this separation has come under increasing pressure. As a consequence, even where formal rules forbidding product placement remain in place, they are persistently circumvented. The consequence is a contemporary broadcasting system in which product promotion has moved from the margins to the center, locking commercial services ever more securely into the commodity system.

### **IMPACT OF COMMERCIALIZATION ON PUBLIC INSTITUTIONS**

Nor have public cultural institutions been immune from this process. Persistent squeezes on tax funding have forced them to seek alternative sources of income. Some have had to introduce entry charges or to charge for services that were once provided free. Commercial sponsorship has become a necessity for → museums and galleries wishing to mount major exhibitions, and literary prizes increasingly feature corporate names.

But arguably the greatest impact has been on public broadcasters. The result has been an increasing reliance on co-production arrangements with commercial enterprises, a more aggressive stance toward selling finished programs and program formats overseas, and concerted efforts to maximize returns on program investment by marketing an expanding range of tie-in merchandise, from books and CDs to games and toys (→ Commercialization: Impact on Media Content). In the process, the logic of commodification has come to influence not only creative decision-making but also the language through which the organization's goals are described and justified. Maximizing value has increasingly come to mean maximizing monetary returns rather than maximizing the intrinsic use value of programs.

### **OPPORTUNITIES OFFERED BY THE NEW MEDIA**

The → Internet offers public media and cultural institutions an unrivalled opportunity to revivify their public service remit, expand their reach, and forge new relations with their users and audiences. Digitization enables them to release themselves from the limitations of physical geography and make their archives and expertise universally available. The faculty of MIT have voted to make their lecture notes freely available on the Internet. The BBC is experimenting with a plan to open up its program archive, employing a creative commons rights arrangement that allows users to download material at no cost and to employ and adapt it for educational or creative activity, providing that they do not then sell the results of their reconstructions. These extensions of the principle of public goods provision are only one aspect of the Internet's potential to counter the onward march of

commodification. The other is the explosion of vernacular and amateur cultural production.

This had always co-existed with commercialized provision. The period 1860 to 1919 saw a boom in amateur singing and playing around the piano but the growth of the record industry and radio in the 1920s tipped the balance away from performance. Amateur playing revived with the guitar's emergence as the key rock, blues, and folk instrument, but unless they caught the eye of record company entrepreneurs, most performers achieved only local circulation. The Internet provides enlarged and potentially globalized spaces for the exchange of music and other areas of creativity, expertise, and experience outside of the price system (→ P2P Networking). Contributors to the online encyclopedia Wikipedia, or to the myriad popular recommendation and rating and video and photo posting sites, offer their material free of charge in the expectation that other users will contribute in turn.

These collaborative creations rooted in the *principle of reciprocity* offer a powerful alternative to the logic of commodification. In response, commercial companies are making strenuous efforts to co-opt the commitment underpinning peer-to-peer initiatives, buying up sites and mobilizing social online networks as sales forces. These extensions of commodification into new modes of communication have been accompanied by their entry into geographical areas from which they were previously excluded. The collapse of the Soviet Union and China's turn toward markets have opened up huge new arenas of operation.

For the first time, capitalism approximates to the global system foreseen by Marx. Whether the logic of commodification that underpins it will continue to determine the overall organization of the communications and media system will depend not only on the ambitions of the major corporations that currently dominate the cultural industries, but also on the strength of the countervailing principles of public goods, reciprocity, sharing, and collaborative production.

# Commodity Feminism

Rosalind Gill

*London School of Economics and Political Science*

Commodity feminism refers to the way feminist ideas and icons are appropriated for commercial purposes, emptied of their political significance and offered back to the public in a commodified form – usually in advertising. The term pays homage to Marx’s notion of “commodity fetishism” and is often framed within contemporary Marxist and feminist terms.

The concept of commodity feminism is most commonly associated with the work of Robert Goldman, who elaborated it in detail in his 1992 book *Reading ads socially*. Writing in a US context, Goldman argued that advertising underwent a radical transformation in the late 1980s when it was forced to address three closely related challenges: sign fatigue – a condition in which viewers of advertisements were quite literally suffering from exhaustion and ennui on account of their daily bombardment by images in postmodern consumer culture; increasing viewer skepticism, particularly among a younger, media-savvy generation who had grown up with fast-paced MTV (and, after the mid-1990s, the Internet) and who were suspicious of any attempt to sell them anything; and finally women’s anger at being addressed constantly in terms of idealized images of feminine desirability (→ Advertising; Sex Role Stereotypes in the Media; Women in the Media, Images of).

From the beginning of the second wave, feminists had identified *advertising* as one of the key sites for the production of sexist imagery. Throughout the subsequent decades women voiced their anger about being treated like objects to be visually consumed. By the end of the 1980s advertisers were beginning to recognize the significance of women’s hostility to being objectified and fed with unattainable, perfect images of femininity, and they started to rethink their advertising strategies. This was also prompted by women’s increasing financial independence, which meant that advertisers needed to address them in new ways: it is no good showing a woman lying on or draped over a car, for example, if the aim is to sell that car to women.

Goldman argued that advertisers’ response was to develop commodity feminism – an attempt to incorporate the cultural power and energy of feminism while simultaneously domesticating its critique of advertising and the media. An example of → postfeminism, it represents an aesthetically depoliticized version of a potentially oppositional feminism. It turns social goals into individual lifestyles, and has fetishized feminism into an iconography of things: a product, a look, a style. Just as femininity is portrayed through a narrow range of signifiers, so now is feminism conjured up through an increasingly predictable lexicon – shoulder pads, briefcase, location in an up-market work environment, etc. Advertisers assemble signs which connote independence, freedom, and bodily autonomy and link them to the purchase of commodities. In this way, feminist goals like independence and control over one’s body are emptied of their political significance and sold back to women as choices about what to consume. Far from being straightforwardly positive images, these newer representations invite women to become liberated and take control of their own lives by acts of individual consumption – rather than collective

struggle for social and political change. Feminism, signified in this manner, becomes just another style decision.

Commodity feminism can take many *different forms*. Pantene's (L'Oreal) advertising slogan "Don't hate me because I'm beautiful" is an example of a campaign that tries to appease women's anger at being addressed in terms of unattainable images of glamour (while still nevertheless using an image of an extraordinarily attractive woman). The global campaign for Dove products, organized around the company's apparent anger at the "narrow stifling stereotypes" of women's appearance, is a similar example – in this case backed up by the language of campaigning, and the establishment of a charity designed to promote "real beauty" and to tackle body image disorders among young women. The iconography of the Dove campaign and its use of "ordinary" women also link to the trend toward *photographic hyperrealism* and *neo-feminism* within contemporary advertising, which targets women's skepticism about the claims made in some adverts for their products, and promotes an unpretentious, authentic, "real" look.

A different strategy can be seen in the attempt to create a *détente between feminism and femininity*. Frequently this is achieved by presenting visual signifiers of female success, such as a business suit, a car, own home, with signifiers of conventional femininity, such as long hair, makeup, conventional attractiveness, so as to imply that there is no tension between being a successful and powerful woman who is taken seriously in the workplace, and being sexually attractive to men. The struggling subject of some feminist perspectives, then, is recast as a kind of superwoman – powerful, respected, successful, as well as effortlessly beautiful and desirable (and in some cases also a perfect mother). Other examples of commodity feminism include the shift from presenting women as passive sexual objects to presenting them as active, desiring sexual subjects; the use of gender "reversals" within adverts; and the increasing evidence of revenge themes in advertising (Gill 2006).

The notion of commodity feminism is an important corrective to views which see advertising as "becoming feminist" or simply "reflecting" feminist ideas. Advertising is involved in what Fredric Jameson in *Postmodernism, or the cultural logic of late capitalism* described as the "cannibalization" of ideas: it may wear a feminist mark today if that will help it to sell, but it may well wear a different mask tomorrow. Commodity feminism has clear links with "commodity racism," and with the packaging of alternative sexualities in a hypersexualized, ultra-glamorous, depoliticized "queer chic".

The notion also has strong resonances with the much older ideas of "incorporation" and "recuperation," which speak to the ability of mainstream political or commercial cultures to "take on" and absorb radical dissent – neutralizing its revolutionary or transformative potential, while appearing to be open to its significance and challenge. Such processes are well documented in political movements; commodity feminism might be understood as a specific example that relates particularly to advertising, marketing, and "promotional culture."

# **Communiology**

*Michael J. Beatty*

*University of Miami*

An important and enduring question for communication science concerns why people interact in the ways they do. This issue has been simplistically framed as a “nature–nurture” question although the process is substantially more complex than can be captured by a dichotomous metric. Until the early 1970s, genetic inheritance played a central role in accounts of psychological development. Critics, however, argued that the correlations in the 0.50 region between identical twins’ personality scores indicated that no more than 25 percent of the variance in personality was attributable to genetic inheritance (→ Correlation Analysis; Regression Analysis).

This observation prompted a host of behavioral theories positing features of the social environment as the primary shapers of behavioral patterns and personality. Of these models, Bandura’s (1971) social learning theory emerged as most prominent (→ Observational Learning). According to → Bandura, people imitate (model) another’s behavior, depending on patterns of reinforcement and punishment vicariously witnessed in response to the model’s action. Whether an action pattern is repeated by the observer also depends on the reinforcement contingencies associated with the observer’s enactment of the model’s behavior. Beatty and associates have proposed that individual differences in communication behavior and responses to messages are manifestations of individual differences in inborn thresholds for activation of the neurobiological systems responsible for the particular response.

## **BACKGROUND**

In the late 1990s, Beatty and McCroskey began re-examining the relative roles of inheritance and social environment on the etiology of emotion-based communication traits such as → verbal aggressiveness (Beatty & McCroskey 1997) and → communication apprehension (Beatty et al. 1998). Beatty and McCroskey’s work was informed by the massive research literature that had accumulated under the rubrics of psychobiology, temperament, and cognitive-neuroscience (for references see Beatty et al. 1998, 2001b).

In spite of the general dominance of learning theory accounts of behavior and personality evolution, the role of genetic inheritance re-emerged in these literatures (→ Developmental Communication). Beatty and McCroskey took note of *two insights about the earlier criticisms of twins studies*. First, while it was true that the correlations were in the moderate range, it was also true that the reliability coefficients for the measures employed rarely exceeded the observed correlations by much. Given that the correlation between two variables cannot exceed the square root of the products of their reliabilities, it was possible that much of the unexplained variance in twins studies was due to measurement error rather than a substantive factor (→ Measurement Theory; Statistics, Explanatory). Second, when correlations between variables are spurious in nature (i.e., the variables are correlated because of a common latent factor), which is the case with correlations between twins' scores (i.e., personality scores are assumed to represent underlying genetic profiles, which are common to both twins), the correlation, not its square, represents the best estimate of shared variance (for explications, see Jensen 1971; Ozer 1985; D'Andrade & Dart 1990; Beatty 2002). Like many other researchers, Beatty and McCroskey viewed these psychometric oversights by critics as reason to question whether genetic explanations were prematurely abandoned. In addition, Beatty and McCroskey were heavily influenced by the temperament- and psychobiology-oriented theorists who posited several intervening variables between genetic inheritance and behavior. In such models, contemporary approaches depict genetic inheritance as having indirect rather than direct effects on behavior.

### TRAIT FOCUS

With respect to communicator traits, Beatty and McCroskey hypothesized that traits represented thresholds of activation of specific neurobiological systems. Because their initial work was limited to traits, which at the conceptual level contained a strong emotional component, Beatty and McCroskey anchored their work in Gray's (1991) neurobiological model of emotion. According to Gray, one set of neurological circuits – termed the *fight or flight system* (FFS) – consists of the basolateral and centromedial nuclei of the amygdala, the ventromedial nucleus of the hypothalamus, the central gray region of the midbrain, and the somatic and motor nuclei of the lower brainstem. Painful or frustrating input stimulates the system components, which combine to coordinate the brainstem effectors in producing defensive and aggressive behavior. Cessation of behavior results from stimulation of the *behavioral inhibition system* (BIS), which consists of the hippocampus, the subiculum, the septum, and the limbic system. The BIS is activated by novel stimuli and those associated with potential punishment or cessation of reward. The *behavioral activation system* (BAS) describes the neurobiological system that energizes goal-directed behavior. Anatomically, the BAS consists of the basal nuclei, the neocortical regions connected to it, the dopaminergic fibers that extend from the midbrain, and the thalamic nuclei. Although the anatomical regions and interconnections described by Gray are common across humans, there is considerable variance in the population regarding thresholds for triggering the systems and the intensity of response once activated. Gray referred to these individual differences as “parameter values” and argued, “the major dimensions of personality . . . are created by individual differences in such parameter

values” (Gray 1991, 23). By major dimensions of personality, Gray meant psychoticism, extraversion, and neuroticism. Strelau (1994) explicated the nature of the parameter values by pointing out that they may represent “sensitivity to neurons’ postsynaptic receptors or sensitivity in their synaptic transmission, the amount of neurotransmitter being released, or the reactivity of the neural structures (including receptors) to the different kinds of stimuli” (Strelau 1994, 135).

Zuckerman (1994) reviewed a huge body of research that demonstrated that biochemical signatures detected in the analysis of body fluids were accurate post-reaction indicators of particular neurobiological activity and that biochemical markers differentiated individuals along the dimensions of personality. Because the biochemical analyses supported Gray’s contention that the BIS, BAS, and FFS were the neurobiological underpinnings of neuroticism (N), extraversion (E), and psychoticism (P), Beatty and McCroskey viewed measures of N, E, and P as efficient proxy indices for the three emotional systems described by Gray. In their initial work, Beatty et al. (1998) reviewed literature that indicated that the neurobiological conditions for trait communication apprehension were a low threshold for BIS activation and a high threshold for BAS activation. Accordingly, they hypothesized that communication apprehension scores would be positively correlated with neuroticism but negatively correlated with extraversion. Both hypotheses were confirmed. Similarly, Valencic et al. (1998) found general support for a model of trait-like verbal aggressiveness using measures of E, N, and P.

### HERITABILITY OF COMMUNICATOR TRAITS

The scholarly dialogue concerning the origin and development of communicator traits centers around two predictor variables: social environment and genetic inheritance. With respect to environment, Beatty and McCroskey differentiate *physical influences* (e.g., chemicals) from *social features* (e.g., situations). Theoretical statements regarding “environment” are limited to *social features* in their work. Observation that malnutrition during childhood affects brain development, for example, is not inconsistent with Beatty and McCroskey’s position on trait development.

Although the substance of the etiological literature would seem to imply that traits are either due to genetic inheritance, social environment, or some combination of the two, such a view assumes only possible direct effects models. Beatty and McCroskey proposed an indirect effects model in which genetic inheritance is the principal (but not only) contributor to neurobiological operational parameters, which in turn are the primary (but not only) influences of traits. The variance in traits due to genetic inheritance, therefore, should be equal to the product of the coefficient between genetic inheritance and neurobiological set points and the coefficient between neurobiological set points and traits. Even if the strength of association were set at 0.80 for each path, the hypothesized percent of variation in traits attributable to genetic inheritance would be 0.64. Beatty et al. (1998) suggested that inherited components of emotion-based traits such as communication apprehension could be much higher, perhaps in the 0.80 vicinity. Other traits, however, could be far less influenced by genetic inheritance.

Support for the proposition that traits are strongly influenced by the indirect effects of genetic inheritance can be gleaned from studies of infants, biochemical studies, and twins

research (for references, see Beatty et al. 1998). Inheritance can be estimated from twins studies because identical twins (monozygotic) are genetically identical whereas fraternal twins (dizygotic) are no more genetically similar than non-twin siblings. Therefore, comparing correlations on variables for identical twin pairs to those of fraternal twin pairs provides a means for calculating genetic inheritance. Furthermore, partitioning twin pairs into raised-together and raised-apart cells allows analysis of common social environment effects. A massive number of studies, however, shows that the correlations are nearly identical for twin pairs raised together and those raised apart, a finding that generally holds for both identical and fraternal twins (for a review, see Zuckerman 1995).

In the communication literature, twins studies have provided interesting evidence that the biological underpinnings of many communicator traits are at least partially inherited (Horvath 1995; Beatty et al. 2001a). Beatty and colleagues (2002) meta-analyzed 40 twins studies that contained trait variables that had been cited in journal articles in communication and/or mainstream communication reference texts. This dataset provided a total sample size (i.e., *n* of twin pairs) of over 51,000. Conservative data analytic procedures were applied. Specifically, unless evidence of additive gene effects was absolute, non-additive effects were assumed; unless reliability coefficients were reported in a study, the highest reliability estimate reported in the literature for a measure was employed to correct for measurement error (this decision minimized corrections); and observer ratings, although imperfect, were not corrected for attenuation. The application of these analytic procedures addressed criticisms that allege that heritability factors have been inflated in twins studies. Although the conservative procedures employed by Beatty et al. (2002) would, if anything, yield underestimates of heritability, the results indicated that 70 percent of the variation in traits related to interpersonal affiliation (e.g., extraversion, friendliness, verbal expressiveness, gregariousness, empathy, perspective-taking) was due to inheritance, 65 percent of the variance in social anxiety traits was heritable, and 58 percent of the variance in aggressiveness was heritable. Furthermore, Beatty et al. applied Plomin's (1986) formulae for calculating variance attributable to shared and nonshared environment when analyzing twins data. The near-zero coefficients in the Beatty et al. data resulting from the application of Plomin's formulae were consistent with Zuckerman's (1994) observation about small effects of environment observed in the general twins literature.

### **PREDICTION OF BEHAVIOR**

Although the centerpiece of Beatty and McCroskey's work has been communicator traits, one of the major theoretical payoffs of a scientific model of communication is the accurate prediction of behavior. Theorists interested in human interaction became disenchanted with trait approaches, in part because syntheses of research appeared to indicate that correlations between traits and behaviors were quite low. Mischel (1968), for example, observed that the average correlation between traits and behavior was a meager 0.30. Beatty et al. (2001b), however, suggested that many of the problems that plagued twins research were also present in trait-behavior studies. Specifically, correcting the correlations for attenuation due to measurement error in trait measures, utilizing multiple traits to

predict behavior because particular behaviors are complex and represent influences from multiple dimensions of personality, and improving the measurement of behavioral variables would all produce larger trait–behavior correlations. Beatty (2002) added that the correlation coefficient, not its square, represents shared variation if behavior is conceptualized as a manifestation of traits.

Although considerable work is still needed, two studies conducted by Beatty and his colleagues are informative regarding the speculation of Beatty et al. (2001b) about trait–behavior relationships. Heisel et al. (2003) accounted for 55 percent of the variation in observer ratings of another’s affinity-seeking competence and 58 percent of the variation in another’s verbal aggressiveness using path analysis in which multiple indicators of personality (extraversion, neuroticism, and psychoticism) were purified through confirmatory factor analysis (CFA) and employed as predictors, and observer ratings were also refined through CFA. La France et al. (2004) meta-analyzed the nonverbal behavioral correlates of extraversion studies and found negative relationships between effect size and both number of nonverbal behaviors coded and sample size, such that the largest correlations were observed in studies of a moderate number of participants and in which no more than three nonverbal behaviors were coded. La France et al. speculated that the near zero size effects for large sample, multiple variable studies were due to “coder fatigue.” Taken together, the results of these studies suggest that the prospects for accurate prediction of behavior are enhanced when complex rather than simple models are tested, and when fundamental psychometric practices are followed.

### **ROLE OF SOCIAL ENVIRONMENT**

The role ascribed to social environment in the communibiological paradigm is complex and perhaps the most often misinterpreted aspect of Beatty and McCroskey’s work. According to Beatty and McCroskey, social environment functions differently in shaping traits than in shaping specific behavioral reactions. As already discussed, social environment is portrayed as having very little, if any, impact on the development of traits and predispositions. With respect to behavioral action, Beatty and McCroskey have proposed that situations have a negligible direct effect. Attentiveness to the statistical meaning of “direct” is essential to understanding Beatty and McCroskey’s position. Drawing from a rather large body of research indicating that (1) individuals position themselves in circumstances that are compatible with their personalities, (2) manifestations of individuals’ temperaments contribute to situations, and (3) interpretations of situations are driven by personality (for references, see Beatty et al. 2001b, 39), Beatty and his colleagues treat situational variables as endogenous rather than exogenous variables in causal models. Thus, various selectivity processes combined with individuals contributing to the fabric of situations through their own behavior are critical aspects of immediate social environments. Beatty et al. (2001b) argue that inattentiveness to individual differences in temperament is responsible for the small effect sizes observed for situational factors in experimental research. In summary, Beatty and associates hold that the objective qualities of social environment have little impact on any dimension of communicative functioning. Rather, the communicator’s subjective reaction – which is driven by temperamental traits – is associated with behavior.

## CORTICAL FUNCTION AND COGNITIVE PROCESSES

Although Beatty and McCroskey have modified the basic propositions of communiology, a consistent tenet has been that theory regarding cognitive and affective processes involved in communicative functioning must be consistent with knowledge regarding brain functioning. One strategy evident in the most recent work of Beatty and associates has been to test hypotheses that are informed by cognitive neuroscience research. For example, brain wave recordings are consistent with cognitivist positions on social interactions (e.g., Beatty & Heisel, 2007).

## Communication as an Academic Field: Africa

*Arnold S. de Beer*  
*Stellenbosch University*

Present-day communication education in Africa has not been able to build on a rich tradition of a longstanding university system. Widespread university education in Africa is a postcolonial phenomenon, with North Africa and South Africa being the main exceptions. Like other academic disciplines, communication studies suffers much of this postcolonial legacy, be it the effect of the general education system, the role of universities in general, or the media and other communication systems, which have to struggle against oppressive state regimes and survive in a globalizing world (Bourgault 1995; Barratt & Berger 2007; → Globalization of the Media; Globalization Theories).

### ACADEMIC COMMUNICATION PROGRAMS

The general standard of communication as an academic field in Africa is disappointingly low when measured against western standards, but also when compared to peer-group

university departments in Latin America (e.g., Brazil) and in the east (e.g., Singapore). The rapid growth of the communication media industry in some African countries did not necessarily lead to an improvement in the teaching of communication and its applied fields. However, efforts in the 2000s were under way to radically structure and restructure African communication departments (→ Africa: Media Systems).

Communication education in Africa, like the modern mass communication system on the continent, is an import from western Europe and North America (Boafo & Wete 2002; → Journalism Education). The source of inspiration and supply of university staff, curricula, and textbooks is mostly western. Teachers are often western educated, curricula are drawn from western models, and most textbooks are authored and published in the west, especially in the USA. Consequently, communication education and training curricula in Africa are not geared to be culturally relevant, although cultural inculcation was usually the main justification for their introduction and sustainability.

Subjects offered in communication programs in Africa vary from one region to another. In eastern and southern Africa, the emphasis tends to be mainly on print and broadcast journalism, with marketing communication and public relations becoming more and more dominant. The curricula combine theoretical and practical courses – but only to a certain extent. Programs range from certificate level through BA degrees to doctoral programs, but the focus remains on the first few years of tertiary education.

A major shortcoming in communication is the shortage of available competent and experienced faculty. Poor working conditions, especially low salaries, often result in the loss of qualified faculty to the private sector or international organizations. Due to financial constraints, textbooks and library sources are insufficient in quantity and variety, partly because of prohibitive costs, exacerbated by low state subsidies to universities and extreme differences in exchange rates. Modern infrastructure in communication departments is the exception, rather than the rule.

## MAIN UNIVERSITY ACADEMIC PROGRAMS

*South Africa* presents arguably the best and strongest group of university communication programs in Africa. It has, in terms of the general African standard, a highly developed journalism communication system, with the Rhodes University school able to hold its own not only on the continent, but also further afield. Graduate programs at the University of the Witwatersrand and Stellenbosch University are complemented by communication and media/journalism programs at other universities (those of Johannesburg, Cape Town, Northwest, Free State, and South Africa) and universities of technology, such as Tshwane. The University of KwaZulu-Natal is internationally known for its M- and D-level programs and research in media studies. Communication programs are growing throughout the rest of southern Africa, with notable developments in Namibia and Zambia.

Journalism education and training in *eastern Africa* have commonly been a result of fragmented initiatives by western donor organizations, but there is a growing tendency to formalize programs in established colleges and universities. The merger of existing journalism programs, as has happened in Ethiopia and Tanzania, is a notable trend. While a major challenge for journalism in East Africa is fighting institutional and government corruption, as well as the regulation of journalism training, an acute challenge to both

schools and the media industry in the Horn of Africa is the insecure situation for media workers due to state actions against the media, and in some countries also against journalism schools – albeit in more subtle ways. The strongest programs in the region are found in Kenya (Nairobi), Uganda (Makerere), and Ethiopia (Addis Ababa).

The rapid growth of the media sector in *West Africa* since the late 1990s has fueled a major demand for trained media practitioners. This demand–supply pull has meant a remarkable expansion in the number of training institutions and programs in the region. However, questions remain unresolved with respect to the quality, as well as the rigor, of journalism and communication education and training in the region. Although there is sensitivity to improving the quality of journalism training in the region, little information is available publicly about how the training programs are organized, what they offer, the sequencing of curriculum and practical internships, graduation requirements, the numbers and profile of faculty, and information about accreditation standards or requirements. Some of the best departments are found in Nigeria (Ibadan) and Ghana (University of Ghana).

### SCHOLARSHIP AND RESEARCH

There are a limited number of *research books* on African communication studies (including works in the field of journalism, mass communication, and media studies). Most of these publications are concerned with the relationship between media development and political democratization, such as those of Nyamnjoh (2005), and more recently also those dealing with the role of communication in national development (→ Development Communication: Africa). One of the very few textbooks explicitly aimed at communication research in Africa is that of Boafa and George (1995).

A major disadvantage in communication research is the *lack of a paradigm* that could be called “home-grown” within the African context. Western theoretical perspectives, such as functionalism and → critical theory, have found a foothold in communication schools, where they often have a foreign ring to local theoretical expectations and aspirations (→ Functional Analysis). A glaring example is the *four theories of the press approach*, which sits uneasily in political systems where freedom of speech and the role of the media as a watchdog are not to be taken for granted (→ Communication Law and Policy: Africa). On the other hand, efforts to introduce indigenous theoretical dimensions, especially in the fields of development and → health communication, have yet to come to fruition as these approaches have often been dismissed as “inconsequential” (Ansu-Kyeremeh 2005; → Development Communication). Recently efforts have been made to introduce the traditional concept of *ubuntu* (an African form of communitarianism) into the curricula and research (→ Communication Modes, African).

It is thus a peculiar characteristic of African communication scholarship that an important section of the main body of communication research and publications has not been produced by Africans on the continent, but by either expatriates or researchers with African roots or research interests living and working elsewhere, especially in the USA, but also in Europe, and writing in English or in French. A case in point would be US-based African-American researchers such as Cecil Blake, Lyombe Eko, Festus Eribo, Sean Jacobs, Polly McLean, Andrew Moemeka, Charles Okigbo, Folu Ogundimo, Cornelius

Pratt, and Francis Wete. Non-African-American US authors, such as Louise Bourgault and William Hachten, have written groundbreaking monographs on the media in Africa. Even when African scholars do produce “indigenous” work, it is common to find many or the majority of co-authors in edited volumes and in journals not to be from Africa at all.

### COMMUNICATION AND MEDIA INSTITUTES

The Centre for Media and Cultural Studies at the University of KwaZulu-Natal in South Africa (director: Keyan G. Tomaselli) is perhaps the only communication and media research center in Africa with a widely accepted international research reputation. The School for Journalism and Media Studies at Rhodes University, South Africa (director: Guy Berger) is known throughout Africa as the foremost journalism training institute on the continent, especially in terms of its Highway Africa Program. In terms of infrastructure, facilities, and teaching staff, this school would be able to hold its own compared to typical journalism schools in, say, the US midwest.

The major center for social research (including communication studies) in Africa is the Council for the Development of Social Science Research in Africa (Codesria) based in Dakar, Senegal, with its head of publications, Francis B. Nyamnjoh, perhaps the foremost African communications scholar based in Africa. The Media Institute of Southern Africa in Namibia, and the Media Foundation for West Africa in Ghana are important research organizations tracing the role of the media in their regions, as well as doing training.

### RESEARCH JOURNALS AND PROFESSIONAL SOCIETIES

The continent does not boast an extended range of top-flight peer research journals. Three South African peer reviewed communication research journals that have been accepted into the international fold are *Ecquid Novi: African Journalism Studies* (University of Wisconsin Press), *Critical Arts*, and *Communicatio* (both Routledge/Taylor & Francis). All three journals moved to international publishers in 2007, after having been published in South Africa since their inception in the 1980s. The only pan-African academic research journal of note is *Africa Media Review*, also founded in the 1980s. It is presently published by Codesria for the founding body, the *African Council for Communication Education* (ACCE).

Strongly supported by UNESCO and European NGOs, ACCE played a pivotal role in the 1980s and early 1990s to foster communication education, research, and publication under the leadership of Boafo and then Okigbo. Internal and regional strife, however, left the organization limping into the 2000s. In 2006 a new association, the Trans-African Council for Communication Education (Tracce), was founded on the basis of solidifying the discipline both in Africa and abroad. It strives to empower its members by encouraging and fostering good journalism and effective communication. The *African Forum of Editors* (Taef) is a pan-African association working toward the improvement of journalism.

According to Sawyerr (2000), important African university role players tend to agree that the present African situation is untenable, inasmuch as the conditions, policies, and practices of yesteryear cannot be replicated or restored. This is also applicable to the field of communication studies.

## **Communication as an Academic Field: Australia, New Zealand, Pacific Rim**

*Bernard McKenna*

*University of Queensland*

The communication discipline in Australia, New Zealand, Singapore, and Hong Kong is strong and diverse. Although regional research clearly emerged from a strong US and British tradition, it has matured. This maturity is evident not only in the region's contribution to evolving communication research, but also in identifying and analyzing significant trends as the region's rapidly developing economies and changing political circumstances impact on technology use and cultural mores.

### **HISTORY AND INSTITUTIONS**

In *Hong Kong*, communication studies began in 1965, when the Chinese University of Hong Kong developed a course in journalism. Since then, most universities have offered communication degrees, predominantly in → journalism, → public relations (PR) and → advertising, and film and → television, with most enrollments being in journalism, PR, and advertising (→ Communication as an Academic Field: East Asia). In *Australia*,

communication courses emerged in the 1960s when speech training was developed into oral communication. In 1975, 12 journalism educators formed a journalism education association. Now, about three-quarters of Australia's 40 universities offer degrees in communication (some specializing in specialist areas such as → organizational and → health communication), PR, journalism, and → media.

In *New Zealand*, the first communication courses began in the late 1980s at what is now Auckland University of Technology, and Victoria University offered an MA. The first undergraduate degrees began at the University of Waikato in the 1990s. The Australian and New Zealand Communication Association, begun in 1980 as an Australian association, included New Zealand in 1994. Communication studies as a degree program began in *Singapore* in 1991 when the National University of Singapore established a Department of Mass Communication. In 1993, this department was transferred to Nanyang Technical University within the new School of Communication Studies. Nonetheless, NUS continues to offer courses in new media and public relations. Both NUS and NTU have strong research profiles. Singapore Management University and various other polytechnics now also offer corporate communication and PR programs (Kuo & Lee 2005).

The strongest sources of regional communication research are the Center for Communication Research at the City University of Hong Kong and the Asian Media Information and Communication Centre in Singapore. While Australia and New Zealand do not have centers of this significance, apart from the Institute of Creative Industries and Innovation at Queensland University of Technology, a considerable number of researchers have an international profile. Communication research in these two countries tends to be highly interdisciplinary with diverse theoretical sources. The US influence, although strong, is leavened by a strong British and European influence, so that critical, post-structuralist, and neo-Foucauldian research is relatively strong. Communication research in Hong Kong and Singapore has contributed significantly to a decentering of the Anglo-American bias, particularly with its comparative intra-Asian studies and analyses of the impact of media and ICTs within the momentously changing political and economic Asian landscape.

### ACADEMIC JOURNALS

Although Australasian and Pacific Rim researchers appear in the major international journals, there are also local journals. This analysis considers 11 local, refereed journals for the period 2004–2006. *Australian Journalism Review* and the *Australian Journal of Communication* contain most articles. The content of the 195 articles for all journals was then categorized according to the → International Communication Association's 21 divisions and interest groups; as each article could incorporate multiple divisions, there was a total of 301 division occurrences. Apart from these divisions, six other emerging issues became evident: media ownership/control (11 instances); globalization (9); rural and regional issues (3); creative industries (7); corporate social responsibility (6); and capitalist and economic discourses (2).

In the discipline-specific public relations journals, the *Asia-Pacific Public Relations Journal Prism* and *Asia Pacific Media Educator*, the emerging issue was corporate social

responsibility, media ownership/control, and creative industries. The articles in the other eight journals are spread across at least 9 divisions (i.e., interest groups and new emerging issues) up to a maximum of 17 in one journal, the *Australian Journal of Communication*. Other journals with a broad range of coverage across divisions are the *Journal of International Communication* which contains 28 articles spread across 16 divisions, *Media International Australia* with 26 articles across 13 divisions, and the *Asian Journal of Communication* which covered 9 divisions in 21 articles.

Of the eight journals with predominantly Australian and Asian-based editorial boards, the dominant issues are mass communication, → political communication, and → technology and communication. For example, mass communication and political communication dominated the *Asian Journal of Communication*. The *Australian Journal of Communication* published a large number of articles in the area of organizational communication in addition to articles relating to communication and technology, and *Continuum* displays an interest in the emerging issues of globalization and of mass communication. The content of the three journals with a stronger international focus is more eclectic. Most articles in *Media International Australia* (Australian and NZ board) are concerned with communications law and policy, while the *Journal of Asia Pacific Communication* (US and international board) is dominated by articles that deal with ethnicity and race in communication and language and social interaction. The *Journal of International Communication* (Australian and international board) has a relatively even spread of articles across divisions, with slightly greater numbers published in intercultural and → development communication and philosophy of communication. Future research trends may well be indicated by the emerging issues listed above.

## RESEARCH TRENDS

The nexus in the region between research and teaching as well as the academy and industry varies too much to simply categorize. Regional research in the eight areas below does reveal active and diverse research communities.

### Psychology-Oriented Research

Dominant in psychology-oriented communication research are → communication accommodation and → social identity theories. This is evident in the work of leading researcher Cindy Gallois in intergroup and health communication. Leading work in social identity theory has been provided by Deborah Terry and Michael Hogg, which has influenced organizational communication studies. Victor Callan's considerable research in corporate change communication has influenced, through collaborative research, more recent researchers (e.g., Paulsen et al. 2005).

A noteworthy trend is critical discursive psychology. Social psychologists Martha Augoustinos and Amanda Le Couteur, combining → discursive psychology, social constructionism, and feminist social theory, have analysed racist discourse in Australia. This critical perspective is also evident in the work of Iain Walker and Mark Rapley. Much discursive psychological research in gender and sexuality is conducted from a feminist social constructionist perspective. Ann Weatherall, who incorporates a social constructionist

approach, researches in communication technologies and sexuality education (Potts et al. 2004). Critical feminist scholars Virginia Braun and Nicola Gavey examine the relationship of bodies, sexuality and health, and their impact on public health policy and practice, as well as discourses of sexuality, including rape narratives (→ Language and Social Psychology; Psychology in Communication Processes).

### **Linguistic-Oriented Research**

Linguistic-oriented research output is considerable. Perhaps the strongest influence has been M. A. K. Halliday's systemic functional linguistics. Following in this tradition has been the substantial work of Jim Martin and Christian Matthiessen (Halliday & Matthiessen 1999). Although applied largely to literacy education, SFL has impacted on other communication research, including Gunther Kress, now based in the UK, and Theo van Leeuwen, who analyze visual text and multimodality. The work of linguist Michael Clyne has also been prominent, particularly in cross-cultural studies and bilingualism. Leading applied linguist Chris Candlin has contributed significantly in research on languages for specific purposes, and in intercultural, health, and legal communication (Candlin & Gotti 2004), using discourse, sociolinguistic, and pragmatic analysis. His editorial board membership on major journals, including the new *Journal of Applied Linguistics* ensures his continued influence. Anna Wierzbicka has been influential with her analysis of the relationship between language and culture (→ Linguistics; Language and Social Interaction).

### **Critical Discourse Analysis**

The impetus for critical discourse analysis in Australia and New Zealand has been driven by critical educational theorists such as Allan Luke in the 1980s and 1990s. However, its application is now very diverse, particularly in organizational and management research. Cynthia Hardy, perhaps the most prolific critical discourse researcher (Grant et al. 2004), looks at organizational power and politics in organizations, identity, and strategic change. Phil Graham has an eclectic reach including the political economy of new media, discourse analysis, and the social changes wrought by the knowledge economy. His board membership of *New Media and Society* and *Discourse and Society* and co-founding of *Critical Discourse Studies* is indicative of the emerging international presence of antipodean critical theorists. Bronwyn Davies has provided leadership in narrative discourse and interdisciplinary research assessing the impact of neo-liberal management processes on intellectual work, youth, and labor market subjectivity, especially from a feminist perspective (Gannon & Davies 2006). Although not essentially a critical methodology, → ethnomethodology and → conversation analysis are now lifting their profiles, particularly in race, gender, and disability issues. For example, Alec McHoul and Mark Rapley's work has examined the interactional and rhetorical production of intellectually disabled people and of indigenous Australians. Richard Fitzgerald has applied conversation analysis to radio talkback and news (→ Critical Theory; Organizational Communication: Critical Approaches; Discourse Analysis; Language and Social Interaction; Political Economy of the Media; Rhetorical Studies).

## Organization Communication

Research in *organizational communication* is particularly strong in Australia and New Zealand. Indeed, Jones et al. (2004) provide a comprehensive set of challenges for future OC studies. Ted Zorn has influenced a wide range of communication areas including communication management, change, and PR. Much of his work is co-written with such people as Mary Simpson, Judy Motion, and Juliet Roper, extending his influence in multiple areas (→ Corporate and Organizational Identity). David Grant's discourse research has been primarily related to change (Putnam et al. 2005). Like Cynthia Hardy, he has significant international links, is published in journals such as *Academy of Management Review* and *Human Relations*, and recently co-edited the *Sage handbook of organizational discourse* (2004). Other researchers have taken OC into new directions. Rick Iedema conducts discourse analytical and ethnographic investigations into organizations and healthcare provision. In *Discourses of post-bureaucratic organization*, Iedema analyzes how people position themselves in changing organizational environments (→ Organizational Discourse). Prashant Bordia researches issues of organizational rumor and the impact of uncertainty in organizations. Colleen Mills applies Gioia and Weick's sense-making theories to discourse theory in studying change and intercultural issues. Feminist analyses have been provided by Deborah Jones and Janet Holmes, who are involved in the Language in the Workplace Project at Victoria University of Wellington. Jones draws on feminist and postcolonial theory to consider issues of communication and representation. Holmes adopts a critical sociolinguistic perspective to analyze the gendered role of language in the workplace (Holmes & Stubbe 2003). Little research is conducted on professional communication (e.g., English for specific purposes (ESP), or English for academic purposes (EAP)), apart from the work of Vijay Bhatia, who is also part of a larger project on legal discourse in multilingual and multicultural contexts directed from the City University of Hong Kong (→ Organizational Communication: Postmodern Approaches).

## The Asian Context and Cross-Cultural Research

China's massive industrialization process and Asia's growing economic strength have provided an impetus to cross-cultural research, the impact of new media technologies, and Western cultural influences. For example, John Flowerdew analyzes the impact of globalization on Hong Kong by looking at how the city discursively constructs itself. Jian Hua Zhu considers the effect of the → Internet, in particular the implications of China becoming the second largest Internet-user market in the world. Chin-Chuan Lee, Director of the Center for Communication Research at City University of Hong Kong, is particularly interested in the social and political effects of a globalized media in China (C.-C. Lee 2003; → Globalization of the Media). Similarly, Joseph Man Chan of Chinese University of Hong Kong has extensively researched the impact of the Internet and globalized media on national identity (Chan & McIntyre 2002). John Erni's (Erni & Chua 2005) extensive work over 20 years has focused on queer and gendered subjects in Asia. The work of Lee Chun Wah on the cultural effects of advertising and Katherine Frith on depictions of Asian women in advertising provide useful leadership in more critical analysis of advertising in a local context.

Given the ethnic diversity of the region, cross-cultural research is a prominent research area. It has tended to be a distinctly critical, emancipatory, and democratic orientation as suggested by Simpson and Zorn (2004). James Liu has researched the impact of regional ethnic identities. Yoshi Kashima uses narrative in social psychology to consider cultural cognitions. Yunxia Zhu, extensively published in such journals as *Text* and *Discourse Studies*, and Bertha Du-Babcock consider the effect of different cultures in business contexts. This area of research importantly moves intercultural studies to consider intra-Asian relations.

### **Knowledge Economy, New Media, and Creative Industries**

Communication is now intricately linked to knowledge economy and knowledge management theory. David Rooney and Greg Hearn have contributed strongly in this area, particularly raising questions about the nature of knowledge. The related area of creative industries is strongly influenced by Queensland University of Technology's Creative Industries Faculty led by John Hartley and Stuart Cunningham. Its emerging researchers such as Terry Flew focus on multimodalities of communication and the impact of such industries on postindustrial economies. In other domains, researchers such as Virginia Nightingale research the impact of new media technologies.

Much Singaporean communication scholarship has been concerned with media effects, the social and legal impact of the Internet, news reporting, and cultural aspects of advertising and PR. Vivian Chen discusses the impact of popular culture on national cultures and how technology changes communication behaviors, while Stella Chia considers media effects particularly on adolescents' risky behaviors. Internet research includes the effect of globalization on cultural identity. Brenda Chan, Alfred Choi, and Lee Chun Wah study youth use of the Internet. Marko Skoric's research analyzes the social and political impact of new communication technologies. Outside Singapore, there is considerable analysis by such researchers as John Sinclair and A. O. Thomas on the cultural impact of globalized media.

### **Journalism and Media Studies**

Characterizing regional journalism and media research is difficult because no single area dominates and because some research tends towards → cultural studies, which is outside the scope of this entry. Australian and New Zealand research, while looking at general issues such as the nature of contemporary journalism, or investigative journalism and ethics, covers a wide range of other issues. Local and regional politics catalyzed research into reporting of asylum seekers, terrorism, and the Iraq war. The legal aspects of journalism such as FOI and defamation is another active area. Cross-disciplinary research, such as media portrayals of mental illness conducted by Warwick Blood and others, is strong.

Singaporean and Hong Kong research tends to show more interest in the democratic function of the media in the changing political landscape and also in Internet journalism. Peng Hwa Ang researches copyright, self-regulation, and free speech issues of media law and policy related to the Internet. Typical of the extensive research on news reporting in an Asian context is Cherian George, who looks at how Internet journalism opposes state influence on media in the region. Xiaoge Xu identifies the idea of Asian values in journalism,

demystifies its movement, and makes recommendations on how to further journalism theory development in Asia. Politically oriented research, primarily from Hong Kong, is diverse. It ranges from analyses of South Korean and Taiwanese presidential debates to the Chinese and Vietnamese governments' response to SARS, China's political (in)tolerance, and Hong Kong's incorporation. However, Lee and Chan (2004) point out that Western research can tend to categorize Hong Kong research as "regional studies" thereby diminishing their theoretical contributions, whereas they have contributed not only to such hypotheses as spiral of silence, but also to analysis of phenomena such as Internet and politics.

### Public Relations

Public relations research, although often criticized for being underresearched, is well covered regionally. In fact, Botan and Hazleton's *Public relations theory II* (2006) identifies Australia and New Zealand as leading PR research centres. Outside Singapore, David McKie and Debashish Munshi's (2004) article and their forthcoming book, *Reconfiguring public relations: Ecology, equity, and enterprise*, are contributing strongly to the theory debate. Methodological issues have been raised by cross-cultural theorist Niranjala Weerakkody.

Another prominent research center is Singapore, where Krishnamurthy Sriramesh, in particular, is influential. He is widely published and, through his editorial board membership of such journals as the *Journal of Public Relations Research*, has contributed to studies of public relations in an Asian context. His 2002 critique asserts that the PR body of knowledge is extremely ethnocentric and that PR practice and pedagogy must incorporate more diversity. His two books, *The global public relations handbook: Theory, research, and practice* and *Public relations in Asia: An anthology*, have attempted to remedy this ethnocentricity.

## **Communication as an Academic Field: East Asia**

*Min-Sun Kim*

*University of Hawaii at Manoa*

*Guo-Ming Chen*

*University of Rhode Island*

*Akira Miyahara*

*Seinan Gakuin University*

The community of East Asian communication researchers has been growing rapidly in recent years, which shows that communication studies in East Asia has reached a certain

level of maturity (Miike & Chen 2006). In the United States the academic study of communication began after World War I. In East Asian culture, however, the academic study of communication has been a relatively recent phenomenon. Focusing on three East Asian countries (Greater China, South Korea, and Japan), we shall review major research and educational trends in the field of communication.

## OVERVIEW

Any attempt to generalize about conditions and patterns in the region immediately comes up against vast differences and anomalies that arise from the diverse cultures, languages, religions, and traditions. While differences exist between nations in East Asia, their similarities, due to the influence of Confucianism, Buddhism, and Taoism, are not surprising. According to Chen and Starosta (2003), similarities between the nations of East Asia can be viewed from different *paradigmatic perspectives*: (1) ontologically, a holistic view of communication or the universe is evident; (2) epistemologically, the holistic view of communication or the universe is conceived of in the relational connection of all things. There are some other similarities in these East Asian countries. Communications curricula in Asian universities have been greatly influenced by western, notably American, communication theories. One consequence of this is the uncritical acceptance of western models and theories.

We shall review trends in communication research and education in East Asia, describing some of the major developments. In examining the culture-specific development of communication studies in East Asia (focusing on Greater China, South Korea, and Japan), we shall focus our analysis on four aspects: (1) the development of communication research and education trends, (2) communication associations and scholarly journals, (3) academic programs in communication, and (4) communication-related professions.

## CHINA

Although the study of communication in Chinese societies started in the early 1950s, it was confined to Hong Kong and Taiwan. In the People's Republic of China (PRC), political ideology hindered the development of the discipline for almost 30 years. It was not until the coming of an open policy in the early 1980s that the PRC began to join the outside world through academic exchanges. Since then communication studies as a discipline has developed rapidly, following the enormous growth of the economy in the PRC.

Before 1990, the study of communication in Greater China was dominated by *mass communication*, which reflects the overemphasis on practical skills and job orientation. In addition, most theories and methods of communication studies were transplanted from the west without critical questioning. In the discipline of communication, most instructors in Chinese societies are trained in the west, curricula are designed following the western model, textbooks are either written by western scholars or translated from their work, and communication theories lack Chinese cultural components (Chen 2002).

Only recently have different areas of communication studies, such as interpersonal, intercultural, and → organizational communication (→ Interpersonal Communication; Intercultural and Intergroup Communication), received more attention from Chinese

scholars. At the same time, the localization of communication studies, i.e., examining the concept of communication from the perspective of Chinese culture, or studying so-called “Chinese communication,” is also increasingly pursued by Chinese scholars facing the impact of globalization (Chen 2002; Leung et al. 2006).

Four influential *communication associations* are leading communication research and education in Greater China: the Chinese Association of Communication (CAC) in the PRC, the Chinese Communication Society (CCS) in Taiwan, and the Association for Chinese Communication Studies (ACCS) and Chinese Communication Association (CCA) overseas. In addition to the *Chinese Journal of Communication Research* sponsored by the CCS, two well-established journals are *Mass Communication Research* in Taiwan, and *China Media Report* in Hong Kong and the PRC. *China Media Research* from the US, and the *Chinese Journal of Communication and Society* in Hong Kong, are two recent scholarly communication journals that are having an impact on communication research in Greater China.

Although → journalism dominated in the early stages, communication education has developed a stable base in Hong Kong and Taiwan since the early 1980s. Mass communication remains the main focus, but courses on other branches of communication, including interpersonal, organizational, rhetorical, and intercultural communication, are also offered. The Chinese University of Hong Kong, City University of Hong Kong, and Hong Kong Baptist University are the three key players in communication education in Hong Kong (Leung et al. 2006). In Taiwan, most universities have communication education programs.

A more systematic introduction of the discipline of communication took place in the mid-1990s in the PRC. However, due to its vast geographic area and the differing needs of each college, it is very difficult to draw a complete picture of academic programs in communication. More and more universities have begun to establish communication programs, but a problem of imbalance in terms of the content of communication teaching continues to exist. In addition to this, the problems of westernization, overemphasis on skill training, and lack of collaboration among universities are challenging contemporary communication education in the three areas of Greater China (Chen 2002). The tradition of freedom of expression in Hong Kong, the lifting of martial law in the late 1980s in Taiwan, and the open door policy in the PRC have led to a rapid development of the communication-related job market in Greater China, especially in the areas of → advertising, graphic and → visual communication, media production, and → public relations (→ Media Production and Content). It appears that the communication-related professions will continue to flourish due to the impact of globalization.

## SOUTH KOREA

It was not until the mid-1970s that the academic community in South Korea developed an interest in the study and teaching of communication. By the late 1970s, the field had grown from being a subject of topical interest to a recognized “independent” field of study (Kang 1991). The first development was the rapid establishment of regular four-year courses in journalism/mass communication in no fewer than 20 universities (Kang 1991). The rush was sustained through the 1980s and 1990s, and now there are no fewer than 60 universities or colleges with departments in journalism, mass communication, and/or

advertising and PR. From the late 1970s, professorships were taken up by those with doctorates from North American universities, and most research conducted in the field has followed in the footsteps of North American and European countries.

South Korea has one of the most developed *journalism and communication education systems* of any Asian country. Very rapid progress was made in communication and → journalism education at the universities and colleges, almost all of which now have journalism/communication departments (Heuvel & Dennis 1994). One reason for the rapid development may have been simply to keep up with the rapid development of the mass media. Since the beginning of journalism education in South Korea in 1954, this academic discipline has become increasingly popular.

Because of the long tradition and prestigious past of the South Korean press, education in the field of communication has been by and large identified with newspaper journalism (Kang 1991). Most of the mass communication departments at universities were called departments of journalism. The emphasis on newspaper journalism was reflected in curricula. Most communication courses used to be mainly about print media, with a literary tradition (Kang 1991). In recent years, however, US-educated returnees specializing in interpersonal communication and public relations have streamed into the universities and research institutes, thus counterbalancing the dominance of journalism and mass media-centered education. Many universities no longer consider “journalism” to be an adequate description, and have extended their department names to include communication, public relations, telecommunications, or newspaper and broadcasting.

Communication research and education in South Korea is led by several influential *communication associations*, including the Korean Society for Journalism and Communication (KSJC), Korea Communication Association (KCA), Korean Speech Communication Association (KSCA), and the Korean Association for Broadcasting and Telecommunication Studies (KABS), as well as the Korean American Communication Association (KACA) overseas. In recent years, several more professional communication associations have been established, including the Cybercommunication Academic Society (CAS) and the Korean Association for Advertising and Public Relations (KAAP).

The number of departments, schools, faculties, and students interested in communication has grown rapidly. So have the journals devoted exclusively to communication-related subjects, such as the *Journal of Journalism Studies* published by Un-Ron-Hak-Bo (Korean Society for Journalism and Communication Studies), the *Journal of Broadcasting Research* (*Bang-song-hak-bo*) published by the KABS (Korean Association for Broadcasting and Telecommunications Studies), and the *Journal of Advertising Research* (*Kwang-Go-Yeon-Ku*) published by the Korea Broadcasting Advertising Corporation. The Journalists' Association of Korea launched the *East Asia Journalists Forum* in October 2003 to strengthen the links between journalists in the Asia-Pacific region.

## JAPAN

Communication as an academic field in Japan has faced many challenges. The foundation of modern communication research and education can be traced to the Meiji restoration period in the 1860s. After 265 years of the Tokugawa shogunate's policy of seclusion during the Edo period, Japan was flooded with innovative technology and new ideas

imported from the western world. Among them was western rhetoric, which prominent scholars such as Fukuzawa Yukichi attempted to adopt and spread in order to educate the Japanese public to become competent as both speakers and audience in the coming democratic society. Such attempts, however, were not readily accepted in Japan, as western rhetoric was vastly different from traditional values and the Japanese ontological and epistemological orientation towards communication. While the absence of western rhetoric in Japan has been cited as evidence of the Japanese people's lack of persuasive skills, such criticism has stimulated contemporary scholars to initiate studies to identify the characteristics of Japanese communication (→ Rhetoric in East Asia: China and Japan). They argue that the Japanese have acquired and effectively utilized communication skills based upon their own traditions (Ishii 1993); they stress that the Japanese had their own rhetoric, though it was not called "rhetoric." The relatively new field of communication, however, has yet to establish its own identity and territory distinct from, although collaborating with, related subjects such as psychology and sociology.

Although Japanese journalism education at university level started in the 1930s, it did not play any significant role in the actual practices of Japanese journalists before World War II. After the war, Japanese *journalism education* imitated the US system. Many academic programs in communication studies in Japan focus on the practical aspects, i.e., acquisition of communication skills, particularly in English. While these programs have presented, and most likely will continue to offer, popular communication curriculums, the field of communication as a discipline has been slowly but firmly established in recent years. These communication programs possess interdisciplinary features, drawing upon and collaborating with other social sciences and liberal arts such as journalism, linguistics, literature, psychology, and sociology. Their main emphases can be roughly categorized into four areas: international relations, human relations, journalism, and → information processing (Ito 2006). The overemphasis on the practical aspects of communication has been criticized as a reason for the weakness of communication as a scholarly field, evidenced by the paucity of profound and sophisticated discussion of the philosophical issues, the absence of established methodologies, and the consequent lack of clear identity of the field (see, e.g., Ikeda 2006).

Despite its different culture and history, Japan's communication research is also under strong influence from the United States and Europe. Ishii (1998) has commented: "For decades, Japanese communication scholars have been willing to import and apply Euro-America-centered research paradigms not only in the natural sciences but also in the social sciences and humanities. They have been doing so without trying to develop their own non-Western frames of research" (p. 109). Today, Japanese researchers are expected to develop new research paradigms and perspectives based on their own Japanese cultural background, and to contribute these to the international academic arena.

Several professional communication associations have played active roles in generating and incorporating research interests and identifying specific needs and methods in communication education. The Communication Association of Japan (CAJ), originally founded as the Communication Association of the Pacific in the early 1970s, has helped develop ties between communication researchers and educators in Japan. *Human Communication Studies* and *Speech Communication Education* are the professional journals published by the CAJ.

The Japan Communication Researchers' Conference has held annual meetings since 1988. Other small-scale university-led communication research groups include the Intercultural Communication Group at Kanda Foreign Language Institute, publisher of *Intercultural Communication Studies*; the Institute for Communication Research at Keio University, publisher of the *Keio Communication Review*; the Rikkyo Intercultural Communication Society at Rikkyo University; and the Society of Language, Communication, and Culture at Kansei Gakuin University. A few other organizations have also helped establish and maintain the academic discipline of communication: the Japanese Association for Studies in English Communication; the Japan Association for Communication, Information, and Society; and SIETAR (Society of Intercultural Education, Training and Research) Japan.

### GENERAL TRENDS AND FUTURE DIRECTIONS

To summarize, these East Asian countries tended to follow the American communication training and research model. They began by setting up journalism departments at universities, later expanding them to include broadcasting, public relations, interpersonal communication, and advertising. With the growing importance of information and communication technologies (ICTs), training in new media has also been developed in communication curricula since the 1990s. In research, the American positivist-quantitative model dominated until the 1980s. In the late 1980s, the influence of critical and interpretive paradigms, prominent in the UK and continental Europe, began to spread around the world. Communication programs in East Asian countries have all followed similar paths of development (Leung et al. 2006).

As more scholars from Asia have entered the field of communication, there has been increasing dissatisfaction with the use of North American models of communication to explain communication processes in Asia, and even some aspects of communication processes in North America. Recently, questions have been raised about the use of communication theories based on western models to generalize about other countries, including East Asian countries (Kim 2002; Kincaid 1987). According to Chen (2002), this issue relates to the balance between globalization and localization. That is, communication study, both education and research, needs to be grounded in the soil of its own culture, while being projected to the global context. Globalization and multiculturalism will alter the communication landscape of the future.

Although it is true that communication research in East Asian countries has been largely based on the American model, several distinctive approaches can be identified. As a critical mass of researchers has formed in most Asian countries, collaboration among regional researchers is growing. The Asian Media Information and Communication Centre (AMIC), and its journal, the *Asian Journal of Communication*, are exemplars of such collective efforts.

Furthermore, the search for communication theories and concepts unique to each of these societies and cultures has begun. In 1987, a book edited by Kincaid, *Communication theory: Eastern and western perspectives*, led the way toward theoretical approaches to communication that are compatible with the political and cultural realities of Asia. Dissanayake's book (1988) represented another collective effort to introduce Asian philosophies into the building of Asian communication theories. Since then, there have been

new and exciting approaches which differentiate clearly between communication as it is practiced in the “east” and in the “west,” especially in the United States.

Since the 1980s, a few cross-national studies have been published on communication within East Asia, comparing, for example, China and South Korea, or Japan and South Korea (Miyahara & Kim 1994). This is an important research trend, because it provides a close examination of cultural variability within East Asia – a region that, in the 1980s, was often treated in the literature as homogeneous.

Instead of attempting to construct theories that are distinctly Asian, today there is a call for efforts to *broaden the existing western theoretical framework*. Wang and Shen (2000) claimed that for an Asian researcher to fail to recognize, and take advantage of, their rich cultural heritage was to throw away their most valuable asset in making a significant contribution to the study of communication. However, at a time when one’s counterparts in the western world are making an effort to broaden their perspectives, limiting oneself to just Asia is not only counterproductive, but also draws away further from the goal of formulating a universal theory. If communication theory-building is to be successful, the relevant aspects of all human histories, experiences, philosophies, cultural traditions, and values should be given due consideration. Further exploration into East Asian traditions will provide rich insights for theory development, and may contribute to theoretical and methodological breakthroughs.

## **Communication as an Academic Field: Eastern Europe and Russia**

*Jan Jiráček*

*Charles University*

*Barbara Köpplová*

*Charles University*

Media communication, mass communication, political communication, and other aspects of social communication represent a dynamic academic field in contemporary central and eastern Europe and Russia. In particular, communication on the societal level, which was the subject of the most visible and remarkable changes during the 1990s (reintroduction of “free” media and deep structural change of the media system, establishment of media and advertising markets, consequences of the commercialization of media), as well as some traces of older tradition and huge inspiration from western Europe and the USA, led to the establishment of communication and media studies as a new field of academic interest in many universities in the region. Some development can be found in studies of interpersonal and organizational communication, too, but those areas are traditionally covered by established fields, in which they have largely remained.

Various processes of social communication, including media and related issues (especially → journalism), have attracted the attention of various disciplines, but communication did not become a self-sustaining field of academic research and university education in most of the central and eastern European countries (including the former Soviet Union)

before the beginning of the 1990s. This does not mean that some topics understood as part of communication research and education nowadays did not appear in the region before, but no synthesizing theoretical approach looking for links between communication, media, society, and individuals was developed. The only exception was the “theory of journalism,” which developed in the post-war period as a theoretical and methodological framework for the role of media and journalism in “Soviet-type” societies.

The development of communication as an academic field in eastern Europe and Russia can be characterized by a set of distinctive features, among which the following are the most important: inspiration coming from western Europe and the USA, the fragmentation of “communication as a topic” into a variety of fields, the development of “theory of journalism,” and the focus on media and media communication after 1989 (→ Communication as a Field and Discipline).

### WESTERN AND OVERSEAS INSPIRATIONS

Before World War II, the development of the field was – at least in some countries of the region (for example, in former Czechoslovakia) – closely connected with developments in the rest of Europe. Some evidence of the influence of German “press science” (*Zeitungswissenschaft*) can be found before World War II (→ Communication as an Academic Field: Western Europe). There was an attempt to establish a new field of applied media sociology called *novinověda* (a literal translation of the German expression *Zeitungswissenschaft*) organized by a circle of sociologists, political and economic scientists, and journalists in the late 1920s and early 1930s. The work of Jan Amos Comenius (Komenský), a protestant Moravian educator and churchman of the early seventeenth century, was claimed to be the root of the tradition of modern thinking about media. In the inter-war period, there was a clear distinction between developments in central Europe and those in the Soviet Union, with its focus upon the role of journalism as a fundamental tool of → propaganda. Many “institutes of journalism” were founded and some university departments of journalism were established during the 1920s and 1930s, with the university in former Leningrad as one of the most important ones. The journal *Žurnalist* (“The journalist”), became representative of the whole field.

For many years after World War II, central and eastern Europe was under a strong and enforced influence of the Soviet Union, and links with the rest of Europe were weakened remarkably. Because of officially negative attitudes toward sociology and, to some extent, psychology, the field of communication was underdeveloped. Only in the late 1960s did some attempts to follow the changes taking place in western Europe appear, but these were weakened in the 1970s and 1990s. The situation has changed since the fall of the bipolar world in the early 1990s.

### COMMUNICATION AS A TOPIC IN VARIOUS ACADEMIC FIELDS

Within many academic fields, various communication processes and activities were studied before and after World War II but were never linked into one coherent academic field. There was a clear divide between interpersonal communication as an academic field on one hand and mass (media) communication as an academic field on the other. Both spheres

of communication were studied by a variety of disciplines; however, the focus upon media communication and its role in society is quite clear. Among others, the following academic fields seem to be the most important sources for developing the communication field in the region.

*Historiography*, and its tradition of studying media and journalism history, was predominantly inspired by inter-war German and French traditions (e.g., N. Lenin and G. Zinovjev from the USSR, S. Jarkowski from Poland, N. B. Andreeff from Bulgaria, K. Hoch from Czechoslovakia). Journalism history developed after World War II as a part of the theory of journalism (→ Journalism, History of). Thanks to that, the history of journalism grew continuously and became one of the strongest disciplines of the restructured and newly established media and communication field of study in the 1990s (J. I. Gerasimova, USSR; M. Beránková, Czechoslovakia; M. Ivanov, Bulgaria).

*Sociology*, which was developing especially in the inter-war period (including Weberian sociology and the *Zeitungswissenschaft* tradition), and then during the 1960s, particularly in Poland, offered a possibility to analyze the relations between media, culture, and society even in the context of Soviet-type regimes (Kłoskowska 1964).

*Linguistics* and the tradition of analyzing the role of language in communication processes were vivid, especially in the Prague Linguistic Circle (with Jakobson as one of the leading figures), with their “functionalistic” approach to language (the idea of a specific “journalistic language” was published in the late 1920s; → Linguistics). The linguistic approach to media and communication continued in the post-war period, since the “Marxist linguistics” followed the main ideas of the functionalistic tradition. Most of the research on interpersonal, as well as institutional, communication took place within linguistics.

*Literary theory* and → *semiotics* contributed to understanding the processes of communication, starting with the tradition of Russian formalism and Šklovskij’s study of narrativity down to Soviet semiotics. Especially Soviet semiotics, with Jurij Lotman as a leading figure and two centers – Moscow (Russia) and Tartu (Estonia, former USSR) – developed communication studies as a part of a more general interest in film, music, and painting.

## THEORY OF JOURNALISM AND THE SOVIET ERA

The role of media and the relations between media, political power, and society were in a sense central themes of Soviet-type societies. The highly centralized political and economic powers were dependent upon “manufacturing consent” within society by means of an effectively working propaganda system with mass media as the principal tool. The theoretical approach to media and their (desirable) role in society was under the strong influence of a Soviet “Marxist–Leninist theory of journalism,” which was focused upon measuring and improving the effectiveness and ideological control of media influence. The use of the word “journalism” refers both to the importance of journalistic work as a part of propaganda as well as to the fact that the officials were trying to avoid the terms “mass media” and “media” because of their connotations of a “western” sociology of media (→ Medium Theory).

The “theory of journalism” was developed not only in the Soviet Union (S. M. Gurevič, E. P. Prochorov, N. G. Černyševskij, among other) but also in other countries of the Soviet bloc (S. B. Stančev in Bulgaria, V. Hudec in Czechoslovakia, and others). The theory of journalism was sometimes understood as one of two parts of a more general “press

science” (*gazetoznaniye* in Russian; *prasoznawstwo* in Polish; German and Czech expressions mentioned above), with “history of journalism” as the other one. Being the fundamental theoretical framework for studying not only journalism itself but mass media (the “means of mass information and propaganda”) as a whole, theory of journalism was developed on two levels – the “general theory of journalism” and the “specific theory of journalism.” The former was focused upon the main common features that can be identified in any type of journalism and structured according to the main aspects of journalistic production (creativity, editorial work, analyses of final journalistic outputs, etc.); the latter studied specific features of journalism in different types of media (press journalism, radio journalism, television journalism, even film journalism). The dialectic and historical materialism, as defined by Marxism–Leninism, was understood as a general methodological frame of the theory, explicitly mentioning the ideas of V. I. Lenin on the role of the press.

“Press science,” covering history of journalism and theory of journalism, became a main subject and methodological and theoretical background for curricula of schools of journalism and for research institutes, which were founded in all countries of the former Soviet bloc. In each country, at least one academic journal focused upon journalism and media was published (e.g., Polish *Zeszyty Prasoznawcze* [Journal of Press Science], with the remarkable personality of Walery Pisarek, professor of Jagellonian University in Krakow; Soviet *Věstník MGU – Žurnalistika* [Review of Moscow State University – Journalism]; *Otázky žurnalistiky* [Questions of Journalism] in Czechoslovakia). The Soviet-type nondemocratic regimes were focused upon ways of improving the dissemination of ideology within the whole society and on effectiveness and control of the media as the main tool of this task. Therefore, surveys of public opinion were organized, too, and can be understood as a part of the pre-1989 milieu of media and communication research (e.g., the Mass Communication Research Centre in Budapest in the 1970s and 1980s).

However strong was the tendency toward unifying the field in the whole Soviet bloc, some differences can be found when comparing country to country. In Poland, as well as in some parts of former Yugoslavia (Slovenia), the strong tradition of Polish sociological thinking led to the development of a more sociological approach (e.g., Goban-Klas 1978). In former Czechoslovakia, the tradition of historiography led to the development of journalism history and the linguistic tradition in the study of “journalistic language.”

Part of the theoretical and historical approach to journalism was also a study of media and journalism in western Europe and the USA. This study, generally labeled as “criticism of bourgeois media and journalism,” represented the strongest link with media and communication in the west, and some of the academics established in this field became leading figures in restructuring the whole discipline in the 1990s (e.g., Y. N. Zassoursky, professor of Moscow State University, in the Soviet Union and later in Russia).

### **MEDIA AND COMMUNICATION STUDIES AFTER 1989**

After the Cold War period and collapse of the bipolar world, the concept of the free press was (re)introduced in the countries of central and eastern Europe (and with some limitation in the former Soviet Union and then in Russia), and the media system in each country was transformed. The fundamental changes and quick and massive development of mass communication, as well as the inspiration coming from western countries, led to

increasing interest in studying media and communication. The pre-1989 theoretical and methodological framework of Marxist–Leninist theory and history of journalism was abandoned and journalistic education was transformed. New schools and departments of media studies, media and communication, mass communication, etc. have been established.

There is a *plurality of normative and theoretical approaches*, mostly based upon the interests and training of people who established media and communication studies as an academic field. In some countries (Hungary, Poland, former Czechoslovakia, and contemporary Czech Republic), a clear distinction has been created between journalism on one hand and (mass) media communication studies and research on the other. Journalism as a part of higher education was transformed into a vocational (skill oriented) training field in many schools, with media and communication study as its academic background. Departments of media studies were established, and not only do research but also develop their own curricula of media studies and produce their own graduates as media and communication experts. New media journals have appeared in many countries.

In other countries (some schools in Slovakia, Russia, etc.), journalism remains an academic field but its content and theoretical framework have changed fundamentally and shifted toward media and mass communication studies, also introducing the concepts of media literacy and media education for the general public as topics of general education.

The interest in → interpersonal communication and → speech communication has remained nonintegrated and is still mostly connected either with linguistics (especially with studying national languages of nations and states in the region) or with psychology (mostly as an applied or practical set of skills).

## Communication as an Academic Field: Latin America

*Jesús Martín-Barbero*

*Javerian University, Bogota*

In Latin America communication studies started during the late 1960s, and were characterized by two very different conceptions. On the one hand, there was the *functional paradigm*, from the United States (where many Latin American professors had been trained), which related the study of communication to the *diffusion of innovations*, and which was part of a development policy primarily for the rural sector (→ Functional Analysis; Diffusion of Information and Innovation). On the other hand, there was the *theory of dependence*, developed by Latin American economists and sociologists, which asserted that mass communication was part of the process that included the domination Latin American countries had to put up with (→ Cultural Imperialism Theories; Dependency Theories).

Even though the functional-diffusionist perspective silenced social and cultural problems by linking communication directly to the development of the mass media, the number of newspapers sold, or the number of radio and television sets per consumer, the theory of dependence provided a conceptual approach within which it was impossible to separate the action of the mass media from the social context and the political processes of the Latin American region. This is why both research and academic training on communication were initially characterized by a double function: development of the media and the training of its professionals, as well as trying to understand the role played by communication processes and the mass media in the changes that were taking place in Latin America.

From the beginning, the field of communication studies in Latin America has faced two issues: the *technological* one, characterized by the modernizing and developmental argument of the “technological fact,” and the *socio-cultural* one, which relates to cultural memory and identity in a struggle for both social survival and cultural reconstitution based on movements of resistance and re-appropriation.

### THE BEGINNINGS: COMMUNICATION AND CULTURAL IMPERIALISM

During the late 1960s, the Latin American reflection on communication was first synthesized by the works of Paulo Freire (1967) and Antonio Pasquali (1968). Freire

discovered and discussed the communicative dimensions of a liberating pedagogy: education as a dialogue and activity of appropriation of the cultural universe that constitutes the tissue of language. Pasquali researched the relationship between communication and the cultural/political structure of society, and introduced a groundbreaking distinction between information, which is characterized by unidirectionality, and communication, which implies some form of reciprocity (→ Information; Models of Communication).

During the 1970s, advances in the theoretical analysis of communication depended on the strength of the theory of dependence and structuralist → semiotics (→ Structuralism). The focus of theoretical work was *mass* communication as a strategic instance of *ideological struggle*. The rise of the concept of “form of merchandise” permitted Armand Mattelart (1973) to analyze the process of fetishization undergone by media messages: the process of message production is concealed, providing the medium with an almost magical strength/influence, and ignoring the structural relation between communicative products and the trade system that marks messages and consumption with the “factory brand” of the dominant ideology in society. L. R. Beltran (1973) devoted himself to analyzing the “deep regions” where ideology ritualizes social impotence, but also where the imaginary mythical-utopian dimensions of the hope for social liberation come from.

The theoretical and methodological development of those times was greatly concerned with the *ideological dimension* of mass discourses. Eliseo Veron (1971 and 1975) had a prominent role in this. His main contribution was the study of the processes of production and consumption of significations, which overcame the quantitative reductionism of content analysis (→ Content Analysis, Quantitative) and reoriented research toward the latent and connotative levels of operation of the *signifying structure*: a structure from which the signification of messages refers to the central conflicts experienced by a society.

The ideological and commercial fabric of communication takes its real shape in the *transnational space*, which is conformed by the imposition of an economic model to the internationalization of a political model where the mass media play a crucial role. In the field of communication, the “transnational issue” will clarify the need to develop new political ways of facing *information imbalance* (CIESPAL 1973), as well as the implementation of new modalities of intervention and participation on the part of civil society (CIID 1976).

## THE 1980S: RELATION BETWEEN COMMUNICATION AND CULTURES

Communication studies in Latin America experienced deep changes during the early 1980s, due mainly to a general shift in the social sciences. The greatest change had to do with the questioning of *instrumental reason*, which was present not only in the functional model but also in Marxist ideology. Conceptual and methodological shifts seeking to renew the field of communication studies came not only from the academic arena, but also from new social movements and cultural dynamics.

First, the relationship between the media and national cultures became historically important. It is impossible to separate politics and culture in the twentieth century from the shaping influence of communication processes and the media. The notion of modernity, which had been the basis for the national development projects since the 1930s, had already articulated an economic movement – the entry of national economies into the international market – into a political project which consisted of making them

nations through the creation of a national culture, identity, and *feeling*. But that project was possible only through communication between urban masses and the state. The media, especially radio, became the spokesperson of the process which, as part of a state initiative, transformed the masses into peoples and peoples into nations. In radio, populist leaders found a medium that facilitated a new way of communication, as well as a new political discourse that broke away from the rhetoric of both church and parliament. In radio, this new discourse found a fundamental mediation with “popular” language, as well as with a capacity to orally re-elaborate the passing from the expressive-symbolic rationality of the rural world to the informative-instrumental rationality of the urban world (Martin-Barbero 1987, 170; → Mediatization of Society).

In social terms, the cultural mediation offered by the mass media in Latin American countries refers to a new sense of the *popular*, which emerged with *urban culture*. The word “popular,” whose meaning implied both the primitive and the uneducated, became the culture of tango, movies, and football: an early hybrid of the national and the foreign (Sunkel 1985, 27). The → *radio* facilitated the passing from rural cultures, which were still a majority, to the new urban culture, without completely abandoning a number of traits of oral tradition. *Movies* helped develop a sense of nationhood through the theatricalization of rural culture, disrupting customs to the point of transforming what for long had been thought of as vulgar and cheap into an element that helped define a sense of “national identity” (Monsivais 1976, 112; 1981, 42). Both media decisively contributed to the development of a powerful *Latin American imaginary*, which included musical genres and rhythms such as tango, bolero, and ranchera, as well as movie stars like Maria Felix, Libertad Lamarque, and Cantinflas.

During the 1980s and 1990s, Latin American research on communication processes focused on the contradictory trend of cultural globalization and fragmentation, as well as on the worldwide diffusion and revitalization of the local through communication (→ Globalization Theories). The press, as well as radio and, increasingly, television, became most interested in *differentiating* cultures on the basis of region or age as it tried to connect them to the rhythms and images of the global. On the other hand, the presence of companies like Mexican Televisa or Brazilian Redeglobo in the audiovisual space of this world has been established at the price of molding these peoples according to the image of audiences that were gradually becoming more neutral and undifferentiated. These changes have been oriented by the demands of the model imposed by globalization (→ Globalization of the Media). Such demands have become evident in the privatization of national television systems all over the world (Portales 1988). Nevertheless, the increase in the number of channels, the diversification and the growth of → cable television, and the expansion of satellite connections (→ Satellite Television) have increased programming time and led to a growing demand for shows that has opened up the market to Latin American productions, especially soap operas. This has affected US television hegemony, as well as the image of a world traditionally divided into the producing countries of the north and the consuming countries of the south. Notwithstanding this, *market experience* is an evident victor in the field, as the media industry has managed to make a profit out of cultural differences by renewing worn-out narrative forms and by connecting them to other sensitivities whose vitality is re-signified in favor of a *culture of indifference* (Getino 1993).

## **THE LATIN AMERICAN AGENDA IN THE TWENTY-FIRST CENTURY**

### **Globalization and its Effects on Cultures**

In the current map of Latin American communication research it is possible to have a look at the landscape of the new century. Research on the political and cultural disorganization introduced by globalization has redefined the identification of the periphery with the foreign. It is within our countries, both nationally and locally, where culture is diffused worldwide (Ortiz 1995), because globalization is not simply a wider distribution of products, but a re-articulation of international relations due to a decentralization that concentrates power, and a loss of roots that hybridizes cultures. But what is really at stake in this hybridization (Garcia Canclini 1990) is not only the rise of new cases of cross-breeding; it is the reorganization of culture by a logic that detaches cultural experiences from the niche repertoires of each ethnic group and social class, as well as from the opposition between modernity and tradition, and modernity and modernization (Ianni 1996; → Modernity; Modernization; Ethnicity and Exposure to Communication).

Such logic thickens the technological mediation that blurs the boundaries between art and science, between work and game, and between the oral, the written, and the electronic; it radically challenges theoretical inertias, the barriers between different kinds of social knowledge; and it proposes, not only “new research objects,” but new ways to think about the struggles between the market and symbolic production, between culture and power, and between modernization and democratization. A particular reconfiguration of culture is carried out by the audiovisual universe, particularly by television, which, as a device that radicalizes the detachment generated by modernity, redefines the hierarchies that used to rule culture, its modalities, levels, and languages.

### **The Mass Mediation of Politics**

Second, we can see the study of the processes of mass mediation of politics (Landi 1992; → Mediatization of Politics), as well as the assimilation of → political discourse into the model of communication proposed particularly by television, which establishes a sense of identity between the public and the scene of the media, and influences the new forms of political representation and citizenship. Once the transformation of politics into a show is analyzed as a whole, future studies will be geared toward the analysis of the specific devices that link television and the emergence of a new political culture.

This is a research path that opens up analysis of the ways in which the media act, not as a substitute, but as a constituent part of the fabric of political discourse and action, because they densify the symbolic, ritual, and dramatic dimensions politics has always had, and are part of the new forms of recognition and questioning of social subjects and actors (→ Symbolic Politics). According to Mata, this displaces research on the mechanisms that confront “the square to the stalls,” i.e., the scene of the media, and focuses instead on the tensions between them; on the uses of the media in politics – the ways it looks at the camera – and on the re-signification procedures through which the scene of the media transforms the sense of political action into a representation that reduces publicity – the act of making something public – to mere visibility (Mata 1992, 61–77). Additionally,

there is another research path which displaces the viewpoint of formal politics in order to inquire into the role of consumption in the other forms that *create identities and citizenships*: the socio-cultural practices that establish forms of self-identification and need-satisfaction, as well as rituals of distinction and forms of communication which make consumption not only a means of squandering, showing-off, alienation and submission, but a means by which we re-elaborate the sense of the social, redefine the signification of the public through the publication of what we believe is socially valuable, and remake what we perceive as our own, as well as the ways in which we unite and establish differences (Lechner 1995; → Social Identity Theory).

### **The City as Communication Space**

The city as a space for communication presents itself as another watchtower from which to glimpse fundamental changes. The close relationship between the expansion and spread of cities and the growth and densification of electronic media and networks demands analysis of the anthropological scope of changes in ways of coming together, and of the new socialities that match the newly emerging urban scenarios of communication (Garcia Canclini 1998). Located at multiple levels, and composed of greatly diverse constituents, these scenarios correspond to the imbalance generated by an irrational and speculative urbanization which is evidenced by an impoverishment in the sense of solidarity and interaction among neighbors, the reduction of usable city space by citizens, and compensation for such constraints through a culture of delivery service, as well as through the reinvention of social bonds where the information running through international networks is mixed with a need of local membership and attachment.

These scenarios define the imaginaries from which people establish their feelings and representations of their city: events, characters, founding myths, places, aromas and colors, stories, legends and rumors that describe and identify cities in ways that greatly differ from the conception of city planners. These come together with the process of modernization, as well as with tensions between ethnic-local and transnational memories, which generates a mosaic whose set-up differs from the regularities defined by experts and tends to correspond to the disorganization and chaos experienced by citizens in their act of living together (Silva 1992). There are also the scenarios of the event-city, which, every time the inert daily life is altered, reveal how fragile the modern urban order is and uncover the corruption that connects the explosive inefficiency of public utilities – damaged sewage systems that cause floods and leave thousands homeless, or gas leaks that blow up entire neighborhoods – to the underground devices of power, while also revealing the communicational thickness of the survival strategies and the means of establishing citizen identity among the powerless (Reguillo 1995).

### **Media Use and Cultural Consumption**

Finally, another research field lies in the reception and use of the media and cultural consumption (→ Exposure to Media Content). An especially controversial and, even for some, worn-out field, the study of reception processes is characterized by an ambiguous duplicity, as well as being strongly revealing, in relation to some of the deepest changes in

communication research (Orozco 1994). This is because of the loss of the viewpoint that was sought in Latin America – reception/consumption as an epistemological and methodological starting place to rethink the process of communication – which was confused with the stage when, according to the American perspective, it had to do with the paradigm of “effects” (→ Media Effects) and then with that of → uses and gratifications. Nevertheless, when research on reception/consumption is identified, in a good number of research works, with a sort of hypostasis of reception, the value of such studies ends up confused with the “consumer power” fallacy.

The goal is to discover the extent to which communication works as an interchange and interaction between subjects (Wilton de Sousa 1994) who are socially established and located in produced and productive conditions and scenarios that present asymmetrical differences and are, therefore, areas of power where disputes, shifts, and struggles for hegemony take place (Garcia Canclini 1995). On the other hand, it is necessary to understand the forms of sociality that are generated along the paths of consumption, the level of cultural competence in such paths, which is possible from the perspective of an ethnography of usage (Sunkel 1999) that inquires into the trends of rupture and continuity, of attachment and placelessness, as well as into the long- and short-term memories that go through and support them. The resulting perspective is especially future-oriented if applied to the cultural paths of younger generations, strongly characterized by their connection with or disconnection from technologies, and by their ability to insert themselves into the rapidly changing society (Cubides et al. 1998; → Culture and Communication, Ethnographic Perspectives on).

## **INSTITUTIONAL DEVELOPMENT OF COMMUNICATION STUDIES**

The field of communication studies in Latin America is going through a period of strong growth with the teaching of new academic programs, but not in terms of research in the field. Among the institutions engaged in research are the Departments of Communication at the Universidad de Sao Paulo and the Universidad Javeriana in Bogotá; the Department of Socio-cultural Studies of the ITESO in Guadalajara, Mexico; and the Faculties of Communication at the Universities of Buenos Aires and Lima.

In these departments and faculties the two leading indicators of research are the increasing number of publications, particularly of journals in which the different types of research are published, and the launching of international research programs such as OBITEL, which is devoted to the study of the production and international circulation of soap operas.

## **Communication as an Academic Field: Middle East, Arab World**

*Muhammad I. Ayish*

*American University of Sharjah*

The history of communication as an academic field of study in the Arab world goes back to 1939 when the Higher Journalism Institute (HJI) was established within the College of

Arts at Cairo University (Cairo University 2004). By the early 1970s, Egypt and Iraq (Baghdad University) were the only countries in the Arab region to have full-fledged academic communication programs. In the early 1980s, however, mass communication programs mushroomed in many Arab universities, and as the third millennium dawned on the Arab world, almost all institutions of higher education offered some form of academic program in media studies.

From a historical perspective, communication studies in the Arab world have evolved in three distinctive post-World War II contexts: the modernization paradigm context, the dependency paradigm context, and the globalization paradigm context (→ Dependency Theories; Globalization of the Media; Modernization). In the three contexts, communication has developed in line with western-oriented perspectives about politics, culture, and social change. Daniel Lerner's classic about the "passing of traditional Society" (Lerner 1954) seemed to have focused research on a presumed media role in socio-economic modernization (→ Lerner, Daniel). To a large extent, academic programs share some common features: they cater largely to undergraduate students, focus more on professional preparation, and shape themselves more according to western theories of media and society (Ayish 2003a).

## **ACADEMIC COMMUNICATION PROGRAMS**

In early 2006, there were 70 communication programs offered at different government and private Arab universities, which seek primarily to provide students with technical professional skills in print, broadcast, and electronic media as well as in public relations and promotional activities. The programs, structured along similar lines as western academic programs, address the mass communication phenomenon along technological lines as marked by print media, broadcasting, public relations, advertising, and online communications. Available data show that Egypt is leading the Arab world in terms of number of programs (19), followed by Sudan (9), the United Arab Emirates (8), and Libya and Algeria (5 each; → Egypt: Media System). It has been noted that communication programs offered at Algerian, Moroccan, and Tunisian universities are more aligned with French media training traditions while those in the rest of the Arab world are styled more along American lines.

As such the programs seek to prepare students in specialized areas of communication with little emphasis on the interdisciplinary nature of the field. But as convergence continues to bear on the media market in the Arab world, the programs find themselves, more than ever before, under pressure to adapt to evolving realities (→ Convergence of Media Systems; Digitization and Media Convergence). The changing face of Arab media suggests that new media jobs are surfacing, and that there is therefore a need for new academic and professional training orientations. Unfortunately, most academic programs in the Arab world seem very slow in responding to the changes, while the programs being offered continue to focus on traditional rather than new digital and interactive mass communication.

## **RESEARCH OUTPUT**

Although the Arab world has witnessed an impressive proliferation of academic communication programs, the production of scholarly research has been limited. Ayish

(1998) noted that Arabs' earliest encounter with communication scholarship took place mainly during the post-independence era, when mass media infrastructures were being established as part of national development projects. Communication theorization was viewed as a luxury Arab researchers could not afford at a time when Arab societies were preoccupied with nation-building. In his review of communication research produced in the Arab world until the mid 1990s, Ayish (1998) noted that the works reflected clearly western influence not only in the framing of communication problems, but also in determining how they are methodologically approached.

A survey of research carried out over the past four decades reveals a range of areas and themes: propaganda, national development, cultural identity, Arab stereotypes, media hegemony, development of new conceptual views of communication from an Islamic perspective, representation of women, new technology, and globalization. To some extent, studies on psychological warfare were carried out in the spirit of Cold War politics when media were entrusted with huge mobilization functions (Nasr 1966; Tuhami 1974). The *development communication* research tradition arose out of growing interest in the role of media in social change in newly independent states (→ Development Communication: Middle East).

While this tradition has spawned a wide range of works (Hatem 1982; Khateeb 1983; Abu Bakr et al. 1985; Tal'at 1987; Kazan 1996), the perpetuation of *economic and social inequalities* in Arab societies in the 1970s and 1980s gave rise to more critical research work drawing on anti-western perspectives. Arab countries were central parties to global debates over a → New World Information and Communication Order (NWICO) in the 1970s and 1980s. *Imbalances and biases in news flows* from and into the Arab world were important topics of research which sought to shed light on the nature, direction, as well as orientation of news transmitted by major international news agencies and carried by Arab print and broadcast media. Most of the studies found notable discrepancies in news flow patterns, with western agencies dominating the news scene in the Arab world (Masmoudi 1985; Abdul Rahman 1995).

A tradition of research known as *Islamic communication* was in vogue in the mid-1980s (→ Communication Modes, Muslim). Basically, it was no more than an exposition of how mass media could be used to propagate Islamic ideas and concepts around the world (Imam 1985; Khateeb 1985; Shanqiti, n.d.). Such efforts fell short of meeting the minimum requirements of model-building in theoretical and methodological terms. With the advent of globalization in the early 1990s, communication research in the Arab world shifted more to scrutinizing the potential negative effects of satellite television and the world wide web (Ayish 2003a; 2003b; ECSSR 2005). The conceptual tools used to address this issue have been more descriptive than analytical.

In the age of globalization, communication research in the Arab world has also witnessed contributions of non-Arab scholars, mainly from the United States and the United Kingdom (→ Globalization Theories). Boyd's work on Arab world broadcasting remains the most comprehensive account on *radio and television systems* in the region. Rugh's classification of Arab press systems has also been an outstanding intellectual effort to describe and understand media landscape in the region. New contributions by Alterman (1998), Hafez (2001), Miles (2005), and Lynch (2006) have added new outside perspectives to mass communication literature.

## ACADEMIC AND PROFESSIONAL ASSOCIATIONS

Though all Arab countries have had some form of a professional press bodies to serve as an umbrella for journalists, these association have developed mostly within government-controlled mechanisms. The Arab Journalists Union is the central pan-Arab professional body serving as an umbrella for Arab journalists. National journalists associations, most of them with politicized orientations, are also operational in all Arab countries. There are also pan-Arab associations for broadcasting like the Tunis-based Arab States Broadcasting Union (ASBU), the Arab Broadcast Forum, the Arab Electronic Journalism Union, the Middle East Advertising Association, and the Middle East Public Relations Association (→ Journalists: Professional Associations). As for academic associations, the Arab world seems to be lagging behind in this respect with only one national association (Saudi Communication Association) and one international Arab–US Association of Communication Educators. These associations have annual conferences attended by media scholars and practitioners. The Arab world also suffers serious shortages in publications. There are only eight of them across the Arab World: the *Egyptian Communication Journal*, the *Public Opinion Journal*, the *Media Research Journal*, the *Algerian Journal of Communication*; the *Tunisian Journal of Communication*; the *Saudi Journal of Communication*, *Transnational Broadcast Studies* and the *Global Media Journal*.

## GENERAL TRENDS AND FUTURE DIRECTIONS

It seems that communication has come a long way in the Arab world in terms of academic preparation and professional development. There are over 70 communication programs across the region extending from the Atlantic Ocean in the West to the Arabian Gulf in the East. Yet, despite these diverse offerings, one sees limited significant contributions of Arab researchers to communication scholarship beyond the institutions of Western-style conceptual and methodological procedures. There has been an impressive abundance of academic programs across the region mainly to meet the growing needs of an expanding media sector marked by the rise of satellite television and the World Wide Web.

Yet, communication as a theoretical discipline with significant cultural peculiarities remains largely unaddressed in the Arab World. One reason for this feature might be related to the sweeping effects of Western, especially American communication traditions that sought to insulate the study of communication from political and ideological structural variables impinging on its form and content. Many research analyses in the Arab world have viewed communication in mass media forms with little concern for its relevant inter-disciplinary nature. In order to understand communication in its mass media manifestations, researchers need to shed light on its cultural peculiarities, the very features that make it a distinctive social phenomenon in the Arab World. In this sense, the employment of cultural studies discipline would be of great help (→ Cultural Studies).

## Communication as an Academic Field: Middle East, Israel

Hanna Adoni

Hebrew University of Jerusalem and Max Stern Academic College of Yezreel Valley

Anat First

Netanya Academic College

The *institutionalization* of communication as an academic field in Israel began with the establishment of the Communication Institute of the Hebrew University of Jerusalem. From 1966 when founded by → Elihu Katz, and through the 1990s, the Communication Institute acted as a sole academic authority, a conceptual model, and a source of faculty recruitment for communication departments in the other Israeli institutions of higher education. Today, 18 academic programs in communication operate in Israel, offering various academic degrees. The basic orientation of these programs is theoretical; yet, the professional practicum, taught by senior Israeli journalists, forms an integral part of the curriculum. About 200 practicing communication scholars are members of the Israel Communication Association (ISCA) founded in the mid-1990s. Most of them are also members of the ICA, IAMCR, and other professional organizations.

The concept of communication as an academic field, as developed in Israel in the 1960s, was rooted in → Paul Lazarsfeld's school, comprising the *administrative research model*, which sought to integrate academic and applied studies of communication that were relevant to journalists, cultural policymakers, and academic researchers. This concept was further enhanced by the Communication Institute's close, enduring cooperation with the Institute for Applied Social Research (IASR) headed by Israeli-American social psychologist Louis Guttman. The IASR generated crucial studies connected to policymaking, public opinion, and patterns of media consumption (Gratch 1973).

During the 1960s and 1970s, the *functional theory* was dominant in Israel as well as in the American social sciences (→ Functional Analysis). At the beginning of the 1980s, the hegemony of administrative research was weakened when several *sociolinguistics* researchers joined the Communication Institute at the Hebrew University. The immediate change was that new research topics and methods were included in the curriculum, such as → discourse studies, → linguistics and → cultural studies. The more profound changes were the legitimization of subjects that were traditionally part of the humanities and the diminishing influence of communication studies on communication policies.

In the late 1980s and early 1990s, Israel's electronic media system rapidly developed from one television channel and two government-controlled radio channels to a semi-private, commercial, competitive, multichannel system (→ Israel: Media System). Growing demand for media studies on both the academic and professional levels at least partly resulted from these radical changes in the communication scene. In parallel, the process of privatization of higher education enhanced the competition among existing universities as well as private entrepreneurs who established private academic colleges. Thus, in the 1990s, communication studies began to be offered in all the Israeli universities and several regional academic colleges.

At the time of writing (2007), 18 communication *academic programs* were offered by different governmental and private institutions, including six universities (Hebrew, Haifa, Tel Aviv, Ben Gurion, Bar Ilan, and Open Universities), three private academic colleges (Netanya University College, Herzlia Interdisciplinary Center, College of Management), and three publicly financed academic colleges (Yezreel Valley, Sapir, Ariel). Six colleges offer a BEd in communication (David Yelin, Oranim, Lifshitz, Gordon, Levinsky, College of Teaching Technology). (For full details, see [www.isracom.org](http://www.isracom.org).)

In most cases, the academic programs reproduce the Hebrew University model in which the research orientation remained dominant. However, they are also trying to develop their own unique academic features and specific subjects, and in general they are all investing more effort than the universities in the development of professional journalistic training for various media.

All the departments and schools of communication are equipped with state-of-the-art technologies and a practicum organized along specializations in different media – print, radio, television, online journalism – as well as general subjects of public relations and advertising. Notwithstanding the growing attention given to professional journalistic training, a diploma in communication studies has not yet become a condition for applying for a position in media organizations.

The *research output* of Israeli communication scholars has been most prolific and has produced a voluminous body of theoretical and applied social studies over the years. Historical studies demonstrated that the establishment of the Hebrew University was part of nation-building projects before the establishment of the state of Israel in 1948 (Adoni & First 2006; Katz & Hed 1997), and the scientists viewed themselves as active participants in the Zionist project. Consequently, in the earlier periods of the country's history, most studies conducted by communication scholars focused on issues relevant to Israeli society, for example, studies of media contributions to social integration.

The hegemony of the functional paradigm ended in the early 1990s, and the rapid development of various branches of European cultural research opened up critical vistas of Israeli communication research, which nowadays includes critical approaches, cultural studies, and ethnographic and historical research. Although contemporary communication research is more interdisciplinary, it continues to focus on Israeli society's central issues. There is, however, a continuing effort to anchor these idiosyncratic problems in the wider theoretical context of various approaches in communication research.

At present, a wide *spectrum of topics* is investigated by Israeli communication scholars, comprising all the main issues of international communication research including research on discourse and on → popular culture. Among the dominant areas is a

well-developed and still growing research trend in → political communication, comprising analysis of news, public opinion, patterns of interaction between media and the political system, Palestinian media, and media and terror. There is also strong interest in multiculturalism and research on ethnic minorities, with a particular emphasis on Arab and Russian communities in Israel, their representation in Israeli mainstream media, the development of their own media systems, and their consumption of communication. Recent years have witnessed rapid developments in feminist communication research (→ Feminist and Gender Studies) which was previously rather scarce. Additional strongholds of Israeli research are → discourse analysis, → media effects on children and youth and cultural studies on various aspects of Israeli culture and media contents, using quantitative, ethnographic, and semiotic methods.

The privatization of applied social research significantly diminished the influence of academic, noncommercial, policy-oriented communication research on social and cultural policies.

## **Communication as an Academic Field: South Asia**

*Pradip Ninan Thomas*

*University of Queensland*

The South Asian region comprises Pakistan, India, Nepal, Bangladesh, Bhutan, the Maldives, and Sri Lanka. Given the relatively undeveloped nature of communication as an academic discipline in most of South Asia with the exception of India, the major focus of this article will be on the scenario in India.

**PHASE 1: 1940–1989**

Communication as an academic field in South Asia has until very recently been closely tied to → *journalism education*. This is not altogether surprising given that the first communication programs on the subcontinent were tied to promoting journalism education. The first was a short-lived course in journalism education in Aligarh in 1938, followed by the establishment of the Department of Journalism at Punjab University, Lahore, in 1940. The University of Dhaka, in what was then East Pakistan, started a journalism program in 1962, and a Department of Mass Communication was established at the University of Kelaniya, Sri Lanka, in 1973. These programs were promoted by newly independent governments who were keen on training journalists in the art of public communication and for careers in the news services, broadcasting, and publicity.

A free press was promoted as an essential foundation for democracy, and US-based foundations and agencies were involved in establishing the first *media programs* on the subcontinent (→ Freedom of the Press, Concept of). The New Delhi-based Indian Institute of Mass Communication (IIMC), envisaged by the pioneer US communicator → Wilbur Schramm, and established by the Indian government under its Ministry of Information and Broadcasting, exemplifies an approach in which the state was vested with overwhelming authority to control the scope and character of communication education. In turn, this embrace of communication education by governments in the region affected its character, shape, and scope (→ India: Media System; Communication Law and Policy: Asia).

The Indian broadcaster Mehra Masani (1976, 1–2) has observed that the inability of the state broadcaster, All India Radio, to fashion an *Indian identity* in post-independent India could be explained in three ways: “the first would credit our former rulers with extraordinary foresight and understanding of broadcasting; and the second would reveal our lack of initiative and capacity to create appropriate organizations to our needs; and the third would expose the Government’s decision to retain, for reasons of expediency, vestiges of our colonial heritage which were neither democratic nor progressive.”

This may also account for the lack of an identity for communication and journalism education in South Asia, at least in the first phase of its growth up to the 1970s. Given the focus on a narrow, instrumental education, the advancement of knowledge based on research was assigned a low priority. There was very little original research output and the early books on communication in India were descriptive accounts of classical and traditional media and comparative studies of rural and urban communication. The diffusion of innovation was a popular subject for any number of doctoral students and for many years the only substantive “research” in communication was closely related to communication in agricultural extension. The only research of note was policy studies on broadcasting produced by interdisciplinary government committees: the Chanda Committee, the Verghese Committee, and the Joshi Commission.

In terms of research, the period 1975–1977, which coincided with the launch of India’s Satellite Instructional Television Experiment (SITE), saw some innovative research in communication strongly influenced by sociology and social anthropology (→ Satellite Television). SITE arguably spawned the most comprehensive studies on communication research in India to date on media structures, processes and audiences, distance

education, and methods. Studies by Agrawal and Sinha (1981) and by others explored the role of satellite television in distance education. The Kheda project, an offshoot of SITE, led to innovative, critical, advocacy communication research, although, in hindsight, its findings did not affect the constancy of mainstream research. Ironically, this was also the period of the Emergency in India, a two-year dictatorial interregnum, the cessation of which led to a number of mainly descriptive studies on the freedom of the press. The Kothmale Community Radio project in Sri Lanka, which was begun with substantial funding from → UNESCO, led to significant research on community radio, the first of its kind in South Asia.

Overt *government control* has indirectly been responsible for the lack of a single nationally or internationally recognized center of excellence in communication research in South Asia. This rather doleful state of affairs can be contrasted with other areas in the social sciences and the humanities – economics, politics, sociology, literature – that were allowed to develop without overt government control and which, as a consequence, can boast of several centers of excellence. There is no equivalent communication school in India that has the reputation of the Center for Developing Studies, the Madras Institute of Development Studies, the Delhi School of Economics, the Central Institute of English and Foreign Languages, and the Indian Institutes of Technology and Institutes of Management.

Communication as an academic field did survive in some *private colleges* – for instance the Xavier Institutes in Mumbai and Kolkata, and the Unit for Media and Communications at the Tata Institute of Social Sciences, although the most fertile academic studies in communication and culture emerged from interdisciplinary, often individual, research initiatives carried out in social science and humanities departments at a number of universities in India, including the University of Delhi, Jawaharlal National University, the University of Hyderabad, and research centres such as the Centre for the Study of Developing Societies, the Centre for the Study of Social Sciences, and the Madras Institute of Development Studies. The subject of film in India received some academic attention along with academic writings on the history of the press and development communication. The IIMC did produce a journal called the *Communicator*, although it was discontinued in the early 1980s. The journals *Vidura*, *Communicatio Socialis*, and the ICCTR were in circulation for a short period. The *India International Centre Quarterly* and in particular *Seminar* (vols. 292, 300, 327, 342, 390, 458, 561) were devoted to issues related to the media. Critical research-based articles on the media were infrequently featured in the *Economic and Political Weekly*. The bestseller on the media in India was *Mass Communication* by Keval Kumar, which was widely available throughout India – from bookshops to book kiosks at railway stations and airports. This book was primarily a descriptive account of the media in India, although later editions did include research-based chapters on broadcasting and media education.

## PHASE 2: 1990 TO THE PRESENT

The second phase of communication as an academic field in South Asia coincides with the liberalization of the South Asian economy, the privatization of education, and industry backing for the establishment of mainly media skills-training institutes for the burgeoning media industry primarily in India but also in other countries on the

subcontinent. This development was a reflection of the demand for skilled media professionals in the advertising, cable and satellite, print and online journalism, and film and animation industries (→ Media Economics). There has been a professionalization of media in the region. There are, for instance, a number of journalist organizations in Sri Lanka today – the Free Media Movement, the Editors Guild of Sri Lanka, the Newspaper (Publishers) Society, the Federation of Media Employees Trade Union, the Sri Lanka Working Journalists Association.

There is also a supportive environment for *academic media research* at institutions such as the Sri Lanka College of Journalism which was set up in 2003, the University of Kelaniya, and Jaffna University, which have encouraged research, mainly on aspects of the press in Sri Lanka – the Tamil and Sinhala press, democracy, regulation, and the role of the media in peace and reconciliation. Additionally, a variety of NGOs are involved in the provision of media-training and capacity-building in Sri Lanka – the Centre of Policy Alternatives, the National Peace Council, the Women and Media Collective, and the Centre of Peace Building and Reconciliation.

The Centre for Policy Alternatives is involved in media research, for example, the study on “Post-Tsunami Media Coverage,” and publishes the *Media Monitor*. Likewise, in Pakistan, there are currently more than nine universities that offer journalism or mass communication courses and a number of professional media associations. In Nepal, both Tribhuvan University and Kathmandu University offer courses in journalism or media studies and local and international NGOs, such as the Nepal Environmental Journalists Forum and Panos South Asia, are involved in media research and capacity-building. The Royal University of Bhutan, which was established in 2003, offers a program on language and cultural studies.

The most far-reaching and comprehensive change with respect to communication as an academic discipline has occurred in India. There are at present 60 universities, 25 agricultural universities, and 100 private institutions that offer media/journalism studies, along with a number of privately funded media research centers. To a large extent the incentive for change has come from the Indian media and entertainment industry which is worth US\$7.6 billion. Given demand, student intake has increased in journalism and media schools. The veteran journalist and founder of the Chennai-based Asian College of Journalism, Sashi Menon, is convinced that this demand ought to be met by offering students ethically grounded programs that are strong on theory and practice. The setting up of private media schools such as the Manipal Institute of Communication in Manipal, and the Mudra Institute of Communication in Ahmedabad, has led to a renewed emphasis on journalism/media research. Two media journals have been launched in India during 2005–2006, the *Journal of Creative Communication* and the Indian edition of the Internet-based *Global Media Journal*. Furthermore, institutions such as the Centre for Media and Cultural Studies at the Tata Institute of Social Sciences, Mumbai, the Centre for the Study of Culture and Society, Bangalore, and the New Media Initiative at the Sarai Institute, Centre for the Study of Developing Societies, have contributed to research on cinema, gender and the media, new media, intellectual property rights – from postcolonial, cultural studies, and political economy perspectives.

There is also demand for short- and long-term market forecasts, audience research, and administrative research carried out by the Centre for Media Research and similar

institutions in India. A number of NGOs, notably the Bangalore-based Voices, the Gujarat-based SEWA, along with other NGOs, have carried out grounded research on a number of media-related issues, e.g., ethno-religious conflict, gender, ICTs in development, community radio, and copyright. While research on issues related to the media and culture in India had long been a preserve of diaspora Indian academics, there are a number of internationally recognized researchers based in India today who are involved in interdisciplinary research on issues related to the media, culture, and communication, including Anjali Montiero, K. P. Jayasankar, Vivek Dhareshwar, Tejaswini Niranjana, Ravi Sundaram, Lawrence Liang, Ammu Joseph, Biswajit Das, among others. There is also a large market for applied research in areas such as health communication, development communication, ICTs in rural development, community media, and participatory communication. However, despite this apparent turn toward media research, the vast majority of government and privately funded academic institutions in media and journalism studies remain research-deficient.

While the future of communication as an academic discipline certainly looks bright for the region, it faces a number of challenges. The primary challenge is from the market, which is keen to shape communication as an academic discipline in its own image. There are other challenges as well – the need for indigenous theory, financial support for research, commitment to curricula development, emphasis on quality of teaching, and learning and research environments conducive to sustaining communication as an academic discipline.

# Communication as an Academic Field: USA and Canada

*William F. Eadie*

*San Diego State University*

There is general agreement that the communication discipline, as we know it today, began in the US. There is, however, a degree of disagreement as to how to trace the origins of the discipline. Arguably, the organizational roots of the communication discipline could be divided into *two traditions*: the “speech” tradition and the “journalism” tradition. Both traditions can be linked to the development of academic departments in US universities as they began to turn away from a single approach to higher education and to diversify and specialize. The development of land-grant public institutions after 1862 opened up higher education to students from a much wider range of economic backgrounds than before. This, along with a commitment to serve agricultural and technological interests, created a demand for specialized areas of study and thus spurred the creation of academic departments.

## THE ACADEMIC FIELD IN THE USA

### Development of Speech and Journalism

The University of Maryland, College Park claims to have established the first department to teach *speech*, in 1900, while the University of Missouri, Columbia, claims to have created the first School of Journalism, in 1908. Classes in speech and journalism had been taught prior to the establishment of departments, however.

Speech had been a part of the US university curriculum since Harvard University was founded in 1636 (Friedrich 1985). Speech could trace its lineage back to ancient writings on the subject of rhetoric, and had a claim as a branch of philosophy (→ Rhetorical Studies; Rhetoric in North America: United States). In practice, however, speech and debate skills were often developed as an integral part of the university experience, though not always through formal coursework. Debating societies were the norm in US universities, and both students and faculty took part in arguing the pressing policy issues of the day. In fact, Harvard’s first president also served as its debate coach. Principles of rhetoric, defined variously as the study of how humans influence one another or the style that speakers and writers use to move audiences, were taught under the rubrics of philosophy and literature.

In the latter part of the nineteenth century, *journalism* was considered a trade and taught through apprenticeship to a printer, who typically published newspapers and magazines as a means of supporting the printing business. With the beginning of land-grant universities, however, trades that had been taught through apprenticeship (e.g., engineering) began to be professionalized and taught at universities. There were somewhat different approaches to how journalism was taught. One early course was offered in 1891 at the University of Kansas by a professor in the history and sociology department. Other coursework was offered as part of writing programs in English departments. The development of journalism programs was assisted immeasurably by newspaper publisher Joseph Pulitzer, who donated money to Columbia University to establish a journalism school and prizes for excellence in journalism and the arts which came to be known as the Pulitzer Prize. Debate continued among working journalists, however, as to whether a formal journalism education was superior to intelligence, a well-rounded education, and skill in writing regardless of how it had been acquired, as the best qualification for the work of a journalist.

The early years of the twentieth century also saw the formation of a number of *scholarly societies* serving the needs of faculty and students of the new academic departments. The American Association of Teachers of Journalism, the forerunner of today's Association for Education in Journalism and Mass Communication (AEJMC), was founded in 1912. In 1913, the National Council of Teachers of English (NCTE) was formed, which included an interest group for speech teachers. Almost immediately, the speech members of NCTE began to debate whether they, too, should form a separate organization. A large majority of speech teachers polled between the 1913 and 1914 annual meetings of NCTE favored having some sort of organizational identity, but the teachers were about evenly split on the question of forming a separate organization or working within the structure of NCTE. After the poll results were announced at the 1914 NCTE meeting, a group of 17 individuals held a rump meeting and decided unilaterally to form a separate organization. The name given to the new organization was the National Association of Academic Teachers of Public Speaking. This title was probably chosen to distinguish the group from professional teachers of elocution, who suffered from an unsavory public image (George Bernard Shaw had satirized the societal role of private elocution teachers in his 1912 play, *Pygmalion*). Four name changes later, this organization became known as the National Communication Association (NCA) in 1997.

### Communication Research in Sociology

Journalism and speech faculty focused on improving instruction and establishing curricula in their early disciplinary efforts. Scholarship was seen more as a necessity for status in the academy than as serious investigation of new ideas about one's area of study (e.g., Winans 1915). The memberships of the new organizations were much more interested in teaching and curricular issues than they were in generating new knowledge.

Meanwhile, scholarship on communication was developing in other fields of study (Delia 1987; Rogers 1994; → Communication and Media Studies, History to 1968). Principal among these was *sociology*, where the program at the University of Chicago predominated. The University of Chicago had been established in 1892, in the middle of

a massive era of immigration from Europe. New immigrants had settled in Chicago in large numbers, drawn by the massive industrial and agricultural processing plants located there. The immigrants settled in slums on the city's south side, and numerous social problems emerged from such a concentration of poverty. The first president of the university decided to use the campus location as an impetus for focusing scholarship on the study of social problems in the immediate vicinity of the campus and proceeded to recruit faculty for such a purpose. One of the faculty members recruited, Albion Small, founded the sociology department and hired a particularly talented group of faculty members. Four of this faculty group stood out: Robert E. Park, Charles Horton Cooley, John Dewey, and George Herbert Mead. Park, a one-time newspaper man, was a prolific doctoral adviser, who worked with his students to develop early theories of mass communication. Cooley was interested in how individual self-concepts arose from their interactions with the groups to which they belonged, as well as how media could work to create community among individuals. Both Park and Cooley studied with Dewey at the University of Michigan before they all became a part of the University of Chicago faculty. Dewey and Mead were philosophers and close friends. Both were pragmatists – the philosophy that was dominant in US higher education at that time – and wrote extensively about the education process (→ Pragmatism). Dewey's work fitted well with the tone of the leading public-speaking textbooks, and he became popular with speech teachers, particularly for his writing on the process of critical thinking and how groups make decisions. Mead was a brilliant intellectual whose lectures were prized by his students for their many original ideas. Mead's ideas about how language use shapes both individuals and societies eventually became known as symbolic interactionism and exercised considerable influence over the development of communication theory (→ Symbolic Interaction).

Ideas about communication were often advanced by *practical concerns*. The rise of Hitler and Nazi Germany brought about interest in the US in propaganda and its uses. It also brought to the US eminent Jewish scholars, such as → Paul Lazarsfeld and Kurt Lewin, who pioneered work on media effects and group dynamics, respectively. Political scientist → Harold Lasswell developed the first communication model (Who? Says What? To Whom? With What Effect?). These individuals, along with → Wilbur Schramm, an English professor who had directed the famed University of Iowa Writers' Workshop, worked on communication problems for the federal government during World War II.

Following World War II, interest in communication burgeoned. Claude Shannon developed a mathematical theory for understanding the transmission of information electronically from one point to another (Shannon & Weaver 1948). Speech and journalism professors, whose scholarship had been focused largely on the development of messages and the content of media, saw an opportunity to model communication in scientific terms. So they took Shannon's model and began to study the information transmission process in humans, using → Carl Hovland's very successful attitude change experiments which he called the Yale Program in Communication and Attitude Change. The opportunity to do "scientific" research that was conflated with "experimental" research energized many speech and journalism professors, and they began to denigrate the atheoretical content analysis work that had been going on in journalism and the

atheoretical rhetorical analysis work that had been going on in speech. A new professional organization, the National Society for the Study of Communication (NSSC), was founded in 1950 to provide a means of pursuing communication research as a social science. By 1968, the NSSC had changed its name to the International Communication Association (ICA).

### **Communication becomes the Dominant Term**

This interest in communication eventually led to the renaming of the principal journalism and speech scholarly societies. In 1970, the Speech Association of America became the Speech Communication Association. In 1982, the Association for Education in Journalism added “and Mass Communication” to its title.

The 1960s and 1970s were a time of ferment, particularly in the speech field. As social scientists pushed for recognition of “communication” as the dominant term, rhetorical and performance scholars began to reconsider and redefine their theories and methodologies. Given the social justice concerns of the 1960s, it was not surprising that communication scholars wanted to engage in research that addressed social problems and not simply theoretical issues. Eventually, there was what might be called a counter-revolt against a social science paradigm that valorized laboratory experiments over other forms of scholarship. Several previously unused methodologies, such as ethnography (→ Ethnography of Communication), → discourse and → conversation analysis, and critical/cultural analysis, emerged as significant alternatives to experimental research, and eventually experimentalism waned in popularity (→ Experimental Design). By the early 1980s, a *détente* of sorts had been reached, and communication study from any viable theoretical and methodological viewpoint became acceptable.

By the 1980s, many academic departments had renamed themselves to include the word “communication” in their title. Common department names were “speech communication” or “journalism and mass communication.” Students who might have hesitated to major in either “speech” or “journalism” found the addition of “communication” to their liking, and enrollments in these programs soared. University faculties found themselves with far more student interest than they could accommodate, and higher standards for entering communication majors were imposed.

The *détente* led to some confusion as to where communication programs should be placed within the university’s organizational structure. Unless a university was organized around a large college of arts and sciences, neither speech communication nor journalism and mass communication fitted comfortably into units such as colleges of humanities or social sciences. Sometimes, a program would stay with the unit where it had begun its life (e.g., what had been a speech and drama department might continue to reside in a college of fine arts even though the department now included social-scientific communication research). Some journalism programs became freestanding schools, and some universities formed a school or college of communication to house former speech and journalism departments, perhaps including other programs as well. Universities also tried combining former speech and journalism programs into one large department or school. Sometimes, this approach proved successful, but on a number of occasions differences in the cultures of the faculties led to infighting, and the combined units might separate again.

### THE ACADEMIC FIELD IN CANADA

The intellectual impetus for the communication discipline in Canada seems to have come from the scholarship of → Harold Innis and → Marshall McLuhan. These University of Toronto colleagues both focused on the development of technology and the nature and uses of media from a historical and critical perspective. McLuhan, in particular, became widely known in the 1960s and 1970s and was, perhaps, the communication scholar with the greatest degree of popular recognition, to the point of appearing in a cameo role as himself in Woody Allen's film *Annie Hall*, in 1977.

The Canadian higher education system is organized differently from the US system, and communication programs were slow to take hold as majors leading to a degree. Most of the 51 communication programs leading to bachelor's degrees in Canadian universities focus on some aspect of media, and many of them have a focus on new media and technology. There are very few programs at Canadian universities that focus on topics under the "speech" tradition in the US. The very small number of Canadian universities that grant a doctoral degree in communication may have hindered the development of communication programs in Canada, as many Canadian communication faculty members probably needed to obtain doctoral degrees from US universities.

### PROBLEMS OF THE FIELD

The US communication discipline has struggled for legitimacy. The Speech Communication Association's application for membership of the American Council of Learned Societies was rejected more than once before it was finally accepted in 1995. John D. Rockefeller and the Rockefeller Foundation funded early communication research, initially as part of general support for the University of Chicago. Rockefeller money dried up around the time that the communication research of the 1930s and 1940s became associated with the better-known term "social and behavioral sciences." As the US government began to fund research, through the National Science Foundation (NSF) and the National Endowment for the Humanities (NEH), communication research was left out unless it could be associated with a discipline such as psychology, history, or philosophy. The National Institutes of Health (NIH) and several private foundations have provided some support for communication research, but the level of support pales by comparison to other disciplines. In 1980, the US Department of Education classified "communication" as a practical discipline which was associated primarily with learning journalism and media production; the National Science Foundation followed suit, leaving communication ineligible for NSF funding. The same classification system considered "speech and rhetorical studies" as a subcategory of English, which meant that data collected on the speech communication field by the National Center for Educational Statistics (NCES) could reside in a "communications, general" category or in "speech and rhetorical studies."

Scholars from the speech tradition have been unhappy with the "communications" designator, claiming that the added *s* makes the word refer only to media. The *s* was removed with some difficulty when the Department of Education's classification system was revised in 2000, and the communication category was revised to include

“communication studies, speech communication, and rhetoric,” as well as “media studies,” which were designated “scholarly” areas of study rather than practical ones. The NSF, however, did not designate communication a scholarly discipline until 2005, in conjunction with the discipline’s first inclusion in the National Research Council’s ranking of scholarly doctoral programs in the US. Unfortunately, despite efforts to the contrary, the “speech and rhetorical studies” category remained under English in the revised classification system.

Still, the continuing popularity of communication programs for US undergraduate students cannot be denied. NCES (2006) data available at the time of writing indicated that there were 955 programs in US universities offering bachelor’s degrees in classifications that fit into its “communication” category. Of those, 690 programs offered degrees in “communication studies, speech communication, and rhetoric,” and 420 programs offered degrees in journalism. These programs produced approximately 71,000 of the 1,400,000 degrees granted in the last year for which data were available. In addition, NCES listed 237 programs offering bachelor’s degrees in “speech and rhetorical studies.” NCES also listed 261 programs offering graduate degrees in some aspect of communication, plus another 63 programs offering graduate degrees in speech and rhetorical studies. The National Communication Association (2006) estimated that approximately 132 doctoral programs in some aspect of communication were found in US universities. More US students seem to be studying in programs that had evolved from the “speech” tradition than in programs that had evolved from the “journalism” tradition.

Similar ratios existed for membership and participation in the scholarly societies serving the communication discipline. The National Communication Association (NCA), the primary society evolving from the “speech” tradition, had approximately 7,500 members and attracted over 5,000 of its members to its annual meeting at the time of writing. The Association for Education in Journalism and Mass Communication (AEJMC), the primary society evolving from the “journalism” tradition, had approximately 3,500 members and attracted over 2,000 of them to its annual meeting. The → International Communication Association (ICA), whose membership overlaps with both NCA and AEJMC as well as attracting a significant number of members from outside the US, had a membership of approximately 3,500 and attracted over 2,000 to its annual meeting. There were also four regional communication associations whose members looked primarily to the NCA as their national organization, as well as a number of specialized societies serving various smaller constituencies within the discipline.

## **Communication as an Academic Field: Western Europe**

*Denis McQuail*

*University of Amsterdam*

Communications and media as a field of research in Europe scarcely predates World War II and, with minor exceptions, did not develop as a full program of study until the last quarter of the twentieth century. The main exception was Germany, where a press science (*Zeitungswissenschaft*) was quite well established in some German universities before the war and was later restored under the name of *Publizistik* (→ Communication and Media Studies, History to 1968).

Much of the early work was historical or practical, but theory about the links between the press and society had also been developed by German sociologists (Hardt 2003). Early French sociologists, notably Gabriel Tarde, had also paid attention to the press and other means of publicity as influences on collective behavior, the formation of opinion, and the transition to modernity. Early British sociology was focused primarily on social problems, and the “media” attracted little academic attention until after the arrival of television in the 1950s.

### **INFLUENCES ON THE FIELD AND AREAS OF RESEARCH**

In general, the large task of postwar reconstruction and regeneration in Europe overshadowed issues relating to the media. All in all, at the middle of the twentieth century the field seemed very open to an influx of American ideas about mass media and methods of inquiry, not least because American media, especially film and music, were already ubiquitous in Europe. As Tunstall (1977) observed, not only were the media

American, so was media science (→ Communication as an Academic Field: USA and Canada).

The social sciences were still underdeveloped and the field of media and communication was largely left either to informed speculation and elite commentary or to investigations carried out by the media themselves for internal purposes, with only limited publication. *Postwar American influence* showed up especially in a predilection for sample survey inquiries into “media use” and studies of → media effects carried out by statistical methods (→ Research Methods). It took the arrival of the new mass medium of → television to really stimulate media research. In the 1950s and 1960s, the study of mass communication in Europe was largely framed according to topics that lent themselves to inquiry within the frames of *leisure time use*, effectiveness in political persuasion, protecting the interests of children and youth, and assessing the merits or demerits of “mass culture” (→ Persuasion; Exposure to Communication Content). Apart from this, a central and growing concern of the media industry and others was the measurement of audiences, as media increasingly competed for → advertising revenue (→ Media Economics). In several countries, public broadcasting organizations played a key part in initiating research, as part of their public service mission (→ Public Broadcasting Systems).

From the later 1960s onwards, a new wind was blowing in European social science, perhaps especially from Britain. The dominant paradigm of study of media uses and effects was challenged by → *critical theory* that interpreted the tendencies of media content, especially in news, as a form of hidden ideology designed to maintain hegemonic control on behalf of state bureaucracies or big business. Attention also turned from messages, audiences, and effects to include the political economic supports for the media system (→ Political Economy of the Media). Another strand in the new movement was the development, more or less simultaneous in North America and Europe, of sociological inquiries into the *media production process*, especially of news, usually with a critical purpose (→ Media Production and Content). The results shed light on the dominant tendencies of content and supported the view that media tend to maintain rather than challenge the status quo. A major change also occurred in the study of *popular and mass culture*, involving a reevaluation of the significance of popular forms (in music and fiction especially) and a rejection of what were perceived as elitist and hierarchical perspectives (→ Cultural Studies; Popular Communication).

Although it has sometimes been claimed that European media research is distinctively more “critical” than American research, in line with Merton’s (1957) contrast between American empiricism and European *Wissensoziologie*, by the time of the general post-1968 upheaval, there is not much to choose between America and Europe in this respect. The distinctiveness of the European field of media inquiry was not clear at the end of the 1970s, except perhaps in the area of → popular culture (in the UK at least) and also in a preference for *qualitative methodological alternatives* to surveys, experiments, and statistical analysis (→ Qualitative Methodology). One of the forms this took was the greater use of ethnographic methods, especially for studying audiences, or “interpretative communities” (→ Ethnography of Communication). Another was the attraction exerted by semiological theory and other linguistic methods in the study of media content, largely following the guidance of French theorists, especially → Barthes, Grémas, and Lacan (→ Semiotics).

The development of critical theory in Europe was affected at some point by a growing gap between those who emphasized the determination of media ownership on media structures and therefore eventually content, and those who focused more directly on the ideological tendencies in content that favored the status quo or the potential for popular resistance. In the end, the “culturalist” branch of critical inquiry largely parted company from the political economic school, leading to separate publications and a cessation of dialogue across the divide. It also moved to a position where popularity (variously defined) became a criterion of merit and a guide to understanding media culture. The political economic school was to some extent vindicated by the huge changes to media systems that were driven by technology, economics, and politics, more or less in that order. For the cultural school, there was at least the relative novelty in Europe of a popularly driven abundance of media culture.

### THE INSTITUTIONALIZATION OF TEACHING PROGRAMS

Until about 1970, there were very few programs of study at any level or for any purpose, whether academic or professional. The study of media was mainly an individual research pursuit or organized in a handful of underfunded research centers. Occasionally there were courses within the framework of the study of politics, sociology, psychology, or education. In some countries there were separate institutions for the professional training of journalists, but the courses were practical in orientation and made little contribution to research and theory.

The main exception, again, was *Germany* where several universities had established programs in communication science, and much the same was true of *Belgium* and the *Netherlands*. However, from the early 1980s onwards more or less the whole of Europe saw a rapid institution and expansion of undergraduate and also graduate programs in media and communication, under various names, in response to demand from growing student numbers and the expansionary policies of educational authorities.

The precise reasons for growth at this time are hard to pin down, but a general explanation can be found in the belief that an → “information society” was being born, in which skills relating to communication of all kinds would be in demand. There was a practical correlate in the expansion of media industries, leading to new work opportunities in the field of communications, media, and information services. The enthusiasm for opening courses was not much restrained by the fact that the background of most existing communication research institutions (focusing on media effects on society) was not very well adapted or practical for meeting the expected new needs.

Nevertheless, the study of mass media provided the available core that could be expanded to deal with more relevant matters such as organizational communication, legal and policy issues, media management, understanding new technologies, and developing practical skills of communication in advertising, → public relations, public information, and → journalism (→ Organizational Communication; Media Policy; Technology and Communication). Particularly important and difficult was the need to bridge the gap between the public communication functions of mass media and the private (person-to-person) communication networks carried largely by telecommunications and subsequently the → Internet. Despite the difficulties, a new and expanding field of media and communication teaching and research has been forged in Europe.

## EUROPEAN “EXCEPTIONALISM”?

### Reasons for Differences

Despite the debt owed to the United States for the founding principles of “communication science” and the continuing influence wielded through literature and the dominance of international scientific publication, a distinctively European approach to media and communication developed. This is not, as is sometimes caricatured, simply more qualitative or more critical (or more amateur), but different in its agenda of issues and in the relative salience of different themes.

The distinctiveness stems ultimately from the fact that European media systems and circumstances differ between countries and from other countries around the world in many respects, despite widely shared legal, normative, and professional principles. Even habits of media use by the public vary a good deal from country to country (→ Media Use, International Comparison of). Virtually every communication “problem” takes on a somewhat different definition. This opens the way for fruitful and even necessary cross-national comparative analysis which is not really possible in North America.

European media systems tend to have a significant *relationship to the state and the political system* which seems unusual, even sometimes undesirable, to American eyes. There is no standard model for arranging these relationships, but it means that politics does tend to have some acknowledged interest in media performance and some means of influence (Hallin & Mancini 2004). At the same time there are mechanisms in place for managing this relationship to insure a degree either of independence or of transparency in the arrangements for linking politics with media.

The conditions described have resulted in persistent concerns about political diversity and → balance in the media (→ Plurality). This has been a legitimate object of *policymaking* in many European countries. Various forms of economic intervention have been adopted, especially in relation to the newspaper press (broadcasting being separately regulated in this respect), and in some countries limits have been set to the degree of concentration of ownership (→ Concentration in Media Systems). With varying degrees of effectiveness, many countries have also adopted self-regulatory mechanisms such as press councils and ombudsmen (see Bertrand 2003). There have also been safeguards in some cases for the rights of journalists within their employing organization.

In most European media systems, the most distinctive feature, as seen from outside, is the existence of a large *publicly financed broadcasting service* alongside now numerous commercial channels (with the ratio of public to private now long reversed). Public broadcasting was and remains an important means of linking the political system with the media system. However, powers of control have mainly been used to insure that broadcasting does not upset the balance of advantage between established political interests (→ Public Service Broadcasting: Law and Policy). Whatever the pros and cons, the presence, which is taken for granted, of a public media sector has left its mark on the agenda of European communication research. In general, the degree of “commercialism” of media in Europe certainly has to be considered as a variable rather than a fundamental and universal principle. It is also at times an object of disdain.

The particular *geography of Europe* has consequences other than those mentioned. The boundaries set by nation-states, and often by language, create divisions and also provide some natural protection against international media competition and incursion, except where small countries are overshadowed by a large same-language neighbor, as with Ireland, Switzerland, Austria, and French-speaking Belgium. Within a number of countries, differences of languages and historic regions have persisted and are either reflected in the media structure or give rise to pressure for recognition (e.g., in Spain and France). For many countries, it is hard or even impossible to maintain a viable audio-visual sector without heavy reliance on imports. The winds of globalization seem to have blown rather coldly across Europe for at least 20 years in the age of satellite, cable, and Internet, and this has provided a focus for research relating to national and cultural identity (→ Globalization of the Media).

### **Research as Response to Reality**

Communication research everywhere tends to respond to the circumstances and events in the “real world” as they affect the media and their audiences. News media in particular frequently become implicated in the events they report. In the period of development of communication science in Europe there have been *major themes* that are particular to the region.

These include the Cold War and the “Iron Curtain” actually dividing Europe; the tensions in relations with America over foreign policy and in the cultural sphere (globalization); the gradual move toward a more united Europe by way of the EC and later the EU; the marked turn toward deregulation and stimulation of communication markets that has followed the “communications revolution,” with new challenges to policy and governance especially as these affect the future of public broadcasting; ideological conflicts between left and right in the political arena that have diminished but not disappeared; various internal insurgencies and terrorist movements that have afflicted several major European countries, including the UK, Spain, Germany, and Italy; varied responses to the Balkan wars of the 1990s and the “War on Terror”; the response to immigration into Europe, especially in the later phase of large-scale asylum-seeking and economic migration. These and other matters have often provided the stimulus to research and shaped much of its agenda.

Against this background, we can better understand the evolution of the main themes of European communication research and their particular focus. Most of the issues mentioned are matters of public concern and have a political dimension. There are also some very large and growing areas of research in Europe, especially in relation to issues of culture and its many new forms and expressions and also the large expansion of attention to what might be called “commercial” or applied communication. Not far behind in growth is research into the use and content of Internet-based media.

### **European Specializations in Communication Research**

The preceding remarks about European “exceptionalism” mainly relate to the traditional core of research attention to news and related genres. An essential feature of development

during the last 20 years has been the growth of different specializations in research and in educational programs, with different institutions adopting different profiles.

In one important respect there is still a large difference from the United States and that is in the *lack of development of study of interpersonal communication* or of what typically falls in the United States under “speech communication” (→ Speech Communication, History of). However, even here, developments in the field of psychology have led to more work and teaching in these subject areas, even if still somewhat cut off from the mainstream of media and communication study. In summary, it could be said that much of the field of communication in western Europe is accounted for by the following main agenda items: news research (→ News); television fiction genres and audiences (→ Genre); journalistic roles and ethics (→ Journalists’ Role Perception; Ethics in Journalism); popular culture; audience and reception research; content and text research (→ Content Analysis, Qualitative; Content Analysis, Quantitative; Text and Intertextuality); the → public sphere; cultural identity, Europeanization, and globalization; political campaigning (→ Election Campaign Communication); political economy issues; policy issues, especially relating to public broadcasting.

### VARIATIONS WITHIN EUROPE

Although it is possible to generalize about “Europe,” as in the above observations, there are and have always been considerable differences within this space. The most obvious differences are linguistic, but below the surface are less visible distinctions of academic culture and schools of thought. From this perspective, it is possible to sketch the outline of certain national or regional “schools,” each with its distinctive character and path of development.

A *francophone* school began with quite strong influences from postwar American empiricism and an emphasis on media institutions. It became marked subsequently by linguistic and semiotic theory and then by a strong focus on new technologies and “telematics” generally. The latter phase reflected an interaction between government policies and intellectual elites. A *Scandinavian* school, with Sweden initially in the lead position, also originated from American empiricism, with a strong focus on political communication, press institutions and policy issues, international news research, and applied communications.

A *British* school has also embraced empiricism with respect to media audiences and effects. It has also given rise to founding theories concerning popular culture, and remained attached to critical political economy perspectives. The sharing of a language with the USA did not make it more likely that it would follow the American language, and in some respects it has remained somewhat insular.

A *German-centred* school has typically been very empirical in orientation (studies of content, audiences, and effects), with a strong focus on politics and the newspaper press and on media institutions. High standards of scholarship and methodological correctness are typical. Issues to do with the clash between public private television and the division of Germany, as well press history, have been prominent.

A “*Mediterranean*” school, especially in Italy and Spain was initially dominated by linguistic theory, but has diversified with development. In Italy, the state broadcaster RAI

played an important role in stimulating research from an early date, while Spain was held back until the demise General Franco in the 1970s. Smaller countries were not necessarily backward in developing the field of communication and some, such as Holland, Belgium, Switzerland, and Finland, took leading positions. Nor were they lacking in distinctiveness, but even so they were more likely to be eclectic borrowers from surrounding cultures.

Since the 1970s, along with the growth of educational programs (→ Educational Media), there have been strong *signs of convergence*. These have been stimulated by several factors, including a common focus on new technologies and new media plus the impulses stemming from the European Union, with its educational, cultural, and technological policies (→ European Union: Communication Law). There have been numerous teaching and research programs promoted and financed by bodies such as the EU, the Council of Europe, and the European Science Foundation. The result has been extensive cooperation, networking, and sharing of paradigms and ideas. The wide use of English as a lingua franca has, somewhat paradoxically, been itself a vehicle for convergence and for the emergence of something like a European identity for the field. After an uncertain and troubled start, a new Europe-wide association of communication scholars, the European Communication Research and Education Association (ECEA), was founded in 2005 as a merger of two previously established associations, although to some extent the → International Association for Media and Communication Research (IAMCR) association had earlier fulfilled the role.

This tendency has been supported by a great expansion of publications in the field, in all languages and in the form of periodicals as well as books, even if the main periodicals that count as “international” are likely to be in English. These include *European Journal of Communication*, *International Communication Gazette*, *Journalism*, *Communications*, *New Media and Society*, *Media Culture and Society*, *European Journal of Cultural Studies*, *Global Media and Communication*, *Discourse and Society*, and *Intermedia*. There are many other specialist journals in related fields.

# **Communication Accommodation Theory**

*Howard Giles*

*University of California, Santa Barbara*

*Susan C. Baker*

*Saint Francis Xavier University*

In interpersonal situations, language can be used to convey information about one's personality, temperament, social status, group belonging, and so forth. Although many of us like to think that we interact essentially the same way to virtually every person we encounter, thanks to fairness and our integrity, this simply is not true. In most instances, it is desirable, and even necessary, to adjust our language patterns to our conversational partners, be they close friends or loathed felons. Sometimes we encode this deliberately and consciously, other times it emerges automatically and may not even be decoded overtly.

Communication accommodation theory (CAT), initially known as speech accommodation theory, was first developed by Giles in 1971 so as to explain how we manage certain facets of interpersonal communication, particularly, our choice of accents and dialects. Indeed, it was originally conceptualized to mine more complex socio-psychological understanding of language choices than a mere recourse to people's socially normative dispositions (Giles & Powesland 1975). Over the years, and with various colleagues, Giles has elaborated and revised the theory in varying directions (e.g., Giles et al. 1991) and it has, according to many commentators, assumed the status of a major socio-psychological theory of language and social interaction (e.g., Tracy & Haspel 2004). It has embraced a wide range of communicative behaviors (linguistic, paralinguistic, discursive, and nonverbal) as well as being applied to a rich array of contexts (e.g., the workplace,

intergroup and intercultural relations, the mass media, and health clinics; see Gallois et al. 2005 for a history of CAT; Giles et al. 2007 for the most recent refinements).

### THE CONCEPT OF CONVERGENCE

Accommodation – as a process – refers to the way interactants adjust their communication behaviors so as to either diminish or enhance social and communicative differences between them; such shifts can be complete switches (as in bilinguality) or partial ones (as in a word choice). Put another way, the theory has devoted a significant proportion of its attention to examining how and why we converge or diverge from each other. *Convergence* – the empirical heartland of CAT – occurs when interactants' communication styles become more similar to another by choice of slang, obscenities, grammatical structures, volume, pitch, gait, hand movements, dress style, and so on. When the features involved connote social value (e.g., a fast speech rate is often associated with competence, a slow one with incompetence), convergence can be termed upward or downward. The former occurs when an individual approximates another's more formal, prestigious communicative style, while the latter refers to matching another's more colloquial, informal, and/or nonstandard product.

Convergence is a means of signaling attraction to, and/or seeking the approval of, the other person. As social power is an important component of CAT (→ Power in Intergroup Settings), interviewees, salespersons, and those in socially inferior roles will converge more respectively to interviewers, clients, and those in socially dominant roles than vice versa. People can also converge to underscore common social identities, to convey empathy, and to develop bonds with others. Relatedly, and giving a motive for convergent propensities, studies have shown that people in general evaluate those who converge toward them more favorably (e.g., considering them more socially attractive and respected) than those who do not – albeit up to an optimal point and perhaps also at an optimal rate. By assembling linguistic communalities, speakers reduce interpersonal uncertainties and interactional anxieties, and increase communication satisfaction. Moreover, not only are we more compliant and cooperative with those who identify with us by sharing our own language features (in the cases of, e.g., physicians and police officers), but it can also bolster our self-esteem. Indeed, data show that having a social network that is accommodating later in life can facilitate life satisfaction.

### ACCOMMODATION STRATEGIES

An important feature of CAT is that people converge not so much toward where others are located in any physical sense as to where they *believe* them to be. An illustration might be using an ethnic dialect with a known immigrant who, in actuality (and in ways you do not discern), has linguistically assimilated. In such cases, subjective convergence is translated into, and can be measured by, objective divergence. In addition, people can accommodate to where others expect (or would wish) them to be. This might occur in romantic situations where males take on more macho stances (e.g., speaking with deeper pitch) while females might incline toward sounding more feminine (e.g., softer tones) – tactics called “speech complementarity.”

Such subjective moves are often based on social → stereotypes and therefore can be problematic when people “over-accommodate” to certain others. In this vein, much work on intergenerational talk has shown how, because of unfavorable stereotypes that people hold of those who are older, young people can patronize elderly people by slowing down for them and using overly simple language. For those elders who are socially and cognitively active, such messages (even if constructed from positive and nurturing motives) risk being construed by recipients as condescending and demeaning (see Coupland et al. 1988).

Other accommodative strategies have been articulated (Giles & Coupland 1991), one of which is a so-called “interpretability strategy” (Jones et al. 1999). Here, interactants attend to their interlocutor’s knowledge of, or sophistication about, a particular topic being talked about. Supposedly communicatively competent speakers should, for example, attenuate the complexity of their speech and reduce jargon, thereby promoting comprehension, coherence, and clarity. The goal of this strategy is to establish mutual ground with an interlocutor, yet it is quite easy not to appreciate another’s lack of understanding and “under-accommodate” them – a stance that is often interpreted as insensitive and egotistic (Williams & Nussbaum 2001).

## APPLICATIONS OF COMMUNICATION ACCOMMODATION THEORY

As mentioned above, accommodation is not limited to converging behaviors, since CAT has, in contrast, shed light on why interactants may sometimes choose to accentuate communicative differences between themselves and others. This may occur through so-called “speech maintenance,” where people deliberately avoid using another’s communicative style and, instead, retain their own idiosyncratic stance or that of their social group’s; for instance, by not switching languages when they have the capability of easily so doing. Moving along the social differentiation continuum, people can *diverge* from others by adopting a contrasting language, dialect, jargon, speech rate, gestures, and dress style.

Drawing upon → social identity theory (e.g., Tajfel & Turner 1979; Intercultural Conflict Styles and Facework; Intercultural Norms; Intergroup Accommodative Processes), CAT has argued that the more a person psychologically invests in or affiliates with a valued ingroup (be it occupational, religious, political, or whatever), the more they will want to accentuate that positive identity by communicatively divergent means. This will be evident where the dimensions diverged are salient components of their social identity (e.g., a switch to Greek where that language is a source of pride for, say, Greek-Australians) or when the relevant outgroup has threatened some aspect of their social livelihood, and particularly by illegitimate means (Giles & Johnson 1981).

In general, recipients who perceive divergence directed at them will tend to see the speaker in a negative light, other extenuating circumstances notwithstanding. The speaker will appear unfriendly, incompetent, impolite, and perhaps even belligerent or hostile (as in a situation where an African-American child adopts Black English with a Caucasian teacher). This need not actually be the intent behind the act, which is simply performed, again sometimes intuitively, to emphasize one’s loyalty toward a group. Sufficient numbers of a group frequently engaging in language divergence in an array of

public contexts (such as in the resurrection of an ethnic minority language or even the widespread creation of a youth code) can change the whole tenor of the communication landscape through street signs, newspapers, TV channels, or the Internet. Indeed such individual actions can mobilize social movements whereby whole languages and codes are institutionalized and or revitalized (see Marlow & Giles 2006).

CAT, therefore, appeals to and captures the evolving histories, politics, and changing demographics of the cultures in which interactions that draw on accommodative moves are embedded (→ Ethnolinguistic Vitality and Communication). Like all theoretical positions, it has its limitations (e.g., it cannot precisely predict what linguistic dimensions particular people will accommodate). Nonetheless, it is supported by empirical research from diverse cultures and languages, is invoked across disciplines and different methodologies, and has spawned an array of satellite models in diverse areas (e.g., intergenerational relations and bilingualism).

# Communication Apprehension

*Joohan Kim*

*Yonsei University*

Communication apprehension refers to one's anxious feelings about communication. McCroskey defines communication apprehension as "an individual's level of fear or anxiety associated with real or anticipated communication with another person or persons" (1977, 78). Communication apprehension has been one of the most studied individual differences in the field of interpersonal communication, under a variety of labels such as social anxiety, reticence, shyness, unwillingness to communicate, and social-communicative anxiety (Daly & McCroskey 1984). The scope of subjects includes dating anxiety, receiver apprehension or informational reception apprehension, singing apprehension, writing apprehension, and intercultural communication apprehension (Knapp & Daly 2002).

Richmond & McCroskey (1998) suggest that there are at least four types of communication apprehension: (1) trait-like communication apprehension, which cuts across time, receiver, and situation; (2) context-based communication apprehension, which is associated with a single type of communication context cutting across receiver and time; (3) audience-based communication apprehension, which is associated with a single receiver or group of receivers cutting across context and time; and (4) situational communication apprehension, which is specific to a given context with a given receiver at a given time.

Scholars have reported that communication apprehension tends to produce helplessness, social isolation, and disintegration; more than 30 percent of Americans consider themselves communicatively apprehensive (→ Communication Apprehension and Social Anxiety; Speech Anxiety). Communication apprehension also has a direct relation with cognitive performance and various academic achievements such as overall grade point average, standardized achievement scores, and grades earned in small classes in junior high and college. Compared with nonapprehensive people, apprehensive people engage in less eye contact, are more self-protective and less disclosive, and are seen less positively by others (→ Interpersonal Communication Competence and Social Skills).

Communication apprehension has been thought of as a relatively stable construct. Traditionally, scholars have assumed that communication apprehension is a personality-based predisposition, which is believed to be a more or less consistent trait across time, places, and situations. The notion that communication apprehension is a trait-like predisposition, however, does not necessarily mean that it is always rigidly invariant. Communication apprehension can be context or situation specific. For example, a person who is quite normal in everyday life may suddenly become fearful of communication in a certain context, such as job interviews and public speaking. In fact, some early researchers proposed that communication apprehension is a state rather than a trait-like predisposition (Behnke & Beatty 1981).

Many studies have examined causes and effects of communication apprehension, but relatively few studies have closely investigated changes in it. Some researchers, however,

have found that communication apprehension levels can be changed within a rather short period of time, even in a week, and posit that communication apprehension can be controlled or reduced with the right treatments. For example, Berger et al. (1984) reviewed studies examining various methods for reducing communication apprehension and concluded that systematic desensitization was the most effective method (→ *Communication Apprehension: Intervention Techniques*).

One interesting finding in this line of research is that communication skill training programs such as public speaking classes were found to be disappointingly ineffective in reducing communication apprehension. The reason may be the involuntarily enforced nature of such classes in schools. As an alternative, Richmond & McCroskey (1998) recommend interpersonal or small group communication classes that are less coercive. Perhaps nontrait-like communication apprehension that is context based can be more easily treated through regularly and externally imposed small group discussion sessions such as cooperative learning in class.

Many studies have compared cultural differences in levels of communication apprehension and reported that people of western cultures tended to have lower levels of communication apprehension than people of Asian cultures. But some studies have reported that two geographically close countries may have quite different levels of communication apprehension. For example, Klopff & Cambra (1979) compared communication apprehension levels among college students in America, Australia, Japan, and South Korea and found that the Americans had significantly lower apprehension than the Japanese but significantly higher than the Australians and Koreans. Interestingly enough, the Koreans and the Japanese, usually considered as neighbor countries that are very close culturally as well as geographically, showed quite different communication styles: while the Koreans had the lowest percentage of apprehensives, the Japanese had the highest.

Researchers have found communication apprehension affects a wide range of behavior, ranging from seating positions at a conference table to housing choices. It is not surprising that many types and versions of communication apprehension measures have been developed, including the Personal Report of Communication Apprehension (PRCA), Writing Apprehension Test (WAT), and Test of Singing Apprehension (TOSA). Most communication apprehension measures are self-report scales. For future studies, communication scholars should consider using more objective measures based on biofeedback systems or hormones such as cortisol.

## Communication Apprehension: Intervention Techniques

*Michael Hazel*

*Gonzaga University*

*Chia-Fang Hsu*

*University of Wyoming*

*Joe Ayres*

*Gonzaga University*

Communication apprehension (CA) intervention techniques are systematic, empirically grounded methods employed in a variety of settings to reduce communication-related anxiety, most commonly in public speaking contexts, where many speakers experience → stage fright. Communication scholars have developed, adapted, and tested a variety of effective methods to treat → speech anxiety due to its pervasive nature and deleterious effects. Although most contemporary CA theories view → communication apprehension as being a multidimensional construct comprised of interrelated cognitive, affective/physiological, and behavioral components, different interventions emphasize one component over the others. That is, some theorists viewed speech anxiety as stemming primarily from thoughts, internal dialogue, and/or images associated with public speaking (e.g., Ellis 2001). Others emphasized the physiological consequences of autonomic nervous system activation. And still others underscored the lack of public speaking skills as the primary reason people experience speech anxiety (e.g., Kelly 1997). Thus, treatments are typically categorized as cognitive, affective, or behavioral in nature, and instructors and counselors employ either one or a combination of the treatments outlined below.

### VISUALIZATION AND PERFORMANCE VISUALIZATION

*Visualization* (VIS), a cognitive approach, was developed by Ayres et al. (1997). In the procedure, speakers listen to an approximately seven-minute script read by a trainer, played on a cassette tape, or shown on a video. This guided image task requires participants to follow the script, vividly imagining positive, upbeat images of a successful speech. The

VIS procedure provides a plausible scenario of public speaking success by creating a general picture of anticipation and reactive behavior regarding the communication performance throughout the day a speaker is to deliver his or her speech. The script consists of specific, detailed content, starting with the person waking up, dressing, walking to class, greeting people, and then successfully delivering the speech (Ayres & Hopf 1993).

VIS has been tested extensively, and has been shown repeatedly to reduce self-reported CA in public speaking situations better than placebo and control conditions. It is also adaptable to other contexts, like initial encounters and writing, and its effects hold over time (→ Communication Apprehension and Social Anxiety). VIS can be self-administered on a CD or video tape, providing an effective intervention for individuals reluctant to seek treatment in a workshop setting.

*Performance visualization*, a variation of VIS, includes a behavioral practice component. The treatment involves viewing a video of an outstanding professional speaker, repeatedly imprinting the linked mental images of the video-taped speaker, and eventually replacing the vivid images with oneself as the speaker. The speaker also prepares by alternatively imagining the speech, practicing the actual speech, imagining again, etc. until the speaker is satisfied that the speech matches the image. A full description of the complete procedure is available in Daly et al. (1997, 401).

There are several positive effects of performance visualization. First, it enhances behavior as well as reducing CA, and does so more effectively than other interventions or no treatment, although its impact is moderated by whether speakers can produce vivid images, or are able to control the nature of the images effectively. Second, exposure to performance visualization itself alters the way high apprehensives envision themselves as public speakers. That is, after exposure to the treatment, high-CA speakers see themselves in a more detailed, confident, and positive fashion. In addition, outcome studies indicate that speakers derive even more benefit if the video-taped model speaker more closely resembles the speaker in question (e.g., the same gender, excellent student model vs a famous orator). Finally, performance visualization also effectively reduces CA and improves performance in job interviews.

In general, available evidence suggests that both VIS and performance visualization are effective, but performance visualization is the preferred procedure because it enhances communication behaviors. However, VIS is still of considerable value because of its simplicity, ease of use, and time requirements.

## **RATIONAL EMOTIVE BEHAVIOR THERAPY AND COGNITIVE RESTRUCTURING**

*Rational emotive behavior therapy* (REBT), formerly rational emotive therapy (RET), focuses on thoughts/beliefs that lead to negative emotional and behavioral consequences (Ellis 2001). An REBT practitioner views fear/anxiety as a consequence of an irrational or dysfunctional thought/belief about an “activating” event/stimulus, such as riding in an elevator or giving a speech. Consequently, REBT seeks to identify and address the dysfunctional thought processes and/or belief systems that lead to anxiety. Accordingly, the primary therapeutic thrust of REBT is the identification and disputing of irrational

thoughts. REBT uses direct, confrontational, Socratic dialogue and other interpersonal exchanges with an individual in order to identify and challenge irrational beliefs.

REBT has been adapted as an effective intervention for reducing speech anxiety in a group workshop setting (Ayres & Hopf 1993), although it is more time consuming and requires more training than the administration of other interventions. In this context, an upcoming public speaking situation is the activating stimulus, and a speaker's belief, or worry about giving the speech would evoke anxiety or fear. For example, if a public speaker thought that the consequences of getting up in front of an audience would be catastrophic or unbearable, a trained instructor/counselor would identify and challenge that belief in order to ameliorate the consequences of the dysfunctional thoughts, thus putting the feared event in a more realistic, rational perspective.

*Cognitive restructuring* (CR) is similar to REBT in that it views cognitions as antecedents to emotion/anxiety (Meichenbaum 1985). Consequently, it also focuses primarily on modifying cognitive processes. There are differences, however. REBT actively challenges irrational thinking, whereas CR teaches people to identify maladaptive thoughts and develop coping statements to counteract them. Ayres and Hopf (1993) have tailored CR to treat CA by emphasizing education, speech skills acquisition, and rehearsal.

### **COMMUNICATION ORIENTATION MOTIVATION**

Communication orientation motivation (COM) was developed and refined by Motley (1997), who posited that a communicator's orientation toward an anticipated communication event is the key to understanding the potential for CA. One orientation is a "performance orientation," in which the speaker views a public speech similar to the way a professional performer would view his or her performance in front of an audience. If a speaker has a performance orientation similar to an ice skater's or gymnast's view of performance, she or he is more likely to experience CA. That is, a communicator may view a future speaking requirement as a similar expression of some great artistic ability, or skillful demonstration. With such self-imposed performance demands, it follows that such individuals, fearing themselves to be lacking the requisite abilities, experience high CA. The other orientation is a "communication orientation," which views a speech as a normal, everyday communication encounter, which serves to recontextualize speeches as less threatening.

COM emphasizes teaching people to focus on the message of a speech and how it is understood by the audience, rather than the speech as an anxiety provoking performance. This is accomplished by either reading Motley's book of about 20,000 words, or in interpersonal counseling sessions. Motley and Molloy (1994) reported that COM significantly reduces CA better than systematic desensitization (SD), placebo, and control groups. Ayres et al. (2000) compared COM to SD, placebo, and control conditions, and found that COM, while not significantly different from SD, effectively reduced trait CA compared to placebo or control conditions.

### **SYSTEMATIC DESENSITIZATION**

Systematic desensitization (SD) was developed and refined by Wolpe (1958). In his initial experiments with cats, the sound of a buzzer was paired with electric shocks, and the cats

subsequently developed a conditioned fear of the buzzer. After the conditioned fear was well entrenched (i.e., the buzzer alone elicited a strong anxiety response), the buzzer was paired with food, leading to a gradual extinction of the conditioned anxiety response. The observation of this counter-conditioning led to the development of SD as a treatment for anxiety in humans. The underlying principle of SD is that a person cannot be relaxed and anxious at the same time. In SD, people are trained in relaxation techniques and instructed to create a relevant, personally tailored “anxiety hierarchy,” comprised of a set of imagined “fear” situations arranged to be increasingly anxiety provoking (e.g. “lying in bed thinking about an upcoming speech,” to “preparing a speech alone in my room,” eventually leading to “delivering the speech”). People visualize these images until they can remain relaxed through the entire hierarchy. Full, updated, and detailed training procedures as well as a relevant standardized speech anxiety hierarchy are available in Friedrich et al. (1997, 305). Friedrich et al. (1997) report that SD as an affective treatment for CA has been significantly modified from its original procedure (e.g., group settings vs single sessions), yet is still effective.

### **RHETORITHERAPY/SKILLS TRAINING**

Rhetoritherapy, a form of skills training (ST), is a behavioral approach designed to build relevant micro-skills related to the speech act (Kelly 1997). This approach is grounded in the assumption that speakers are anxious primarily due to skills deficits. Consequently, rhetoritherapy focuses primarily on behavioral skills related to composing and delivering a speech. The method includes instruction, goal setting, practice, in vivo assignments, and instructor feedback. Empirical evidence for skills training as an effective standalone intervention is mixed, although ST can take so many forms that generalizing across studies is difficult. This approach, as well as any other intervention, can be combined with others to address the multifaceted aspects of speech anxiety more comprehensively.

In general, data reported here and elsewhere suggest that the aforementioned interventions, used either alone or in combination, are an important ingredient in the remediation of speech anxiety. Research in this area is ongoing and will likely continue to refine the effectiveness of interventions for the pervasive problem of speech anxiety.

## Communication Apprehension and Social Anxiety

*Melanie Booth-Butterfield*

*West Virginia University*

Communication anxiety/avoidance is one of the most studied phenomena in the field of communication. Communication apprehension (CA) is defined as “the fear or anxiety associated with real or anticipated communication with others” (McCroskey 1984; → Communication Apprehension). CA is problematic when anxiety reaches levels that interfere with goal attainment (→ Goals, Social Aspects of).

Inherently social, communication apprehension is emotionally based, although CA does involve attitudinal and behavioral components (→ Emotion; Attitudes). Other anxiety-related constructs (e.g., reticence, willingness, shyness) are more belief-based and attitudinal, and all incorporate elements of avoidant behavior. Because responding can be via thinking, feeling, and behaving, these anxiety/avoidance constructs are related, but

not isomorphic. Fear of negative evaluation permeates self-perceptions, external orientations, and behaviors.

Such emotional responses are not necessarily aversive. Low levels of anxiety may be perceived as anticipatory arousal or excitement, and not negatively experienced (→ Excitation and Arousal). But as anxiety increases it becomes more aversive and debilitating, interfering with social interaction demands. In societies that place priority on active communication and talk, social anxiety can be painful and inhibiting.

Communication-based anxiety/apprehension occurs due to individual characteristics, situational factors, or their interaction. These factors give rise to “trait,” “state,” and “interactional” approaches to the study of CA. An enduring, cross-situational fear of communication is labeled *trait apprehension*. Transient responses, occurring in selected moments are considered *state anxiety*. Most explanations include a combination of both.

### TYPES OF COMMUNICATION APPREHENSION

*Trait communication apprehension* is an enduring orientation toward communication. The trait predisposes someone to respond to many kinds of communication demands with anxiety and trepidation. A person who is trait apprehensive will be fearful across time, and respond anxiously to many different circumstances. Trait CA is resistant, although not impossible, to change.

*Audience-based communication apprehension* is anxiety toward communication with a specific person or group. It tends to be consistent across time with those specific receivers. For example, some work has reflected students’ fear of communicating in classroom settings with other students and teachers. Some people report an enduring anxious response toward communication with their spouse, and not surprisingly, this is linked to lower relational satisfaction.

*State, also called situational, communication apprehension* is a transitory response to a communication situation. One experiences the state of anxiety in a given circumstance, but as soon as that interaction or situation terminates, the arousal dissipates. State CA fluctuates widely across contexts, but due to accumulated effects, is reliably more intense and consistent among high trait-apprehensive individuals.

The premise underlying *context-based communication apprehension* is that certain settings have similar interactional demands that may create anxiety (i.e., as soon as people find themselves in that setting with those performance demands, anxiety occurs.) People may experience heightened anxiety in one context or multiple settings. Four primary contexts are associated with CA: public speaking, meetings, group discussion, and dyadic interactions. Although researchers have also investigated more specific contexts such as classroom, writing, or health-related interactions.

*Public speaking* remains the most widely recognized, studied, and feared communicative context. This typically involves prepared presentations in a one-to-many setting, where one primary sender has multiple receivers who do not interact in a balanced, reciprocal manner. While gender differences overall are negligible for CA, an exception is public speaking where females tend to be more anxious.

*Meeting and group* contexts may be less anxiety-provoking because participants share communicative responsibility in the more interactive settings. However, status differentials

may exacerbate anxiety. The *dyadic* or *interpersonal* context tends to be the least anxiety-provoking (although not for everyone). The dyadic pattern is typically one-to-one with both conversationalists sharing approximately equal responsibility for the interaction. Interpersonal communication is generally less structured and more social than other contexts. One reason dyads tend to be less anxiety-provoking is that interactive rules may be fewer, looser, and subject to negotiation and adaptation. Nevertheless, because of their innately more personal interaction demands, interpersonal communication contexts still evoke anxiety in many people.

### Measurement

Assessment of CA is primarily through self-reported feelings, attitudes, and behaviors, but there are also some studies measuring physiological responses (e.g., S. Booth-Butterfield 1987) and assessments of overt behaviors, especially in the public speaking context. The most widely used measure of trait CA is the personal report of communication apprehension (PRCA-24). This 24-item self-report scale measures four separate contexts of CA, which are either summed to identify levels of trait CA, or used individually to measure anxiety in specific contexts (→ Research Methods).

### CAUSES OF TRAIT ANXIETY

Development of trait CA may be due to genetics, modeling, and/or reinforcement patterns. There is good evidence that some types of apprehension/inhibition are biologically based or heritable (e.g., studies of twins, adoptees, and physiology). Modeling may also impact avoidance, when individuals act in ways they see others act. However, modeling tends to be more applicable to behavioral than emotional outcomes.

Reinforcement is based on the premise that consequences or outcomes of what we do cause us to either repeat or avoid certain behaviors. When people are consistently punished for communication, they learn to fear it. But a particularly dysfunctional pattern of reinforcement occurs when responses or reinforcement contingencies are random or unpredictable. Under these circumstances, productive expectations for avoiding punishment or garnering rewards cannot be formed and thus anxiety develops.

Recent attention among some communication scholars has refocused on the extent to which CAA is inborn or acquired. Most conclude that high CA is a combination of biological predispositions and long-term reinforcement patterns creating ambiguous or negative expectations for communicative outcomes.

### EFFECTS OF HIGH COMMUNICATION APPREHENSION

Numerous communication scholars have conducted anxiety-related research, but the leader and most prolific researcher in these efforts has been James C. McCroskey. Most research on outcomes of CA has been correlational in design, with a few experimental and observational studies (Greene & Sparks 1983; M. Booth-Butterfield & Booth-Butterfield 1986; Behnke & Sawyer 2000). The effects of high CA for the individual include (1) avoidance of communication encounters, (2) withdrawal or minimization of communication

within interactions when they cannot be avoided, (3) cognitive interference which distorts information processing, and (4) behavioral disruption. These negative effects have been studied in a variety of contexts including educational settings, interpersonal situations, organizational contexts, health-related environments, and across cultures. For example, high anxiety is related to preferences for jobs with low interaction demands, self-selected seating arrangements, and task choice. High CAs often exhibit avoidance and disruption in performance/participation classes, whether this involves making speeches, playing music, or explaining science projects. Not surprisingly, they tend to avoid, withdraw from, or perform poorly in presentational circumstances.

Highly anxious people have been shown to differ on both *self-perceptions and perceptions elicited from others*. High CAs report a preponderance of self-focused negative thoughts. They have lower self-esteem, less creativity, and a greater need for structure. In addition they tend to be less assertive, more self-conscious, and higher in receiver apprehension and touch avoidance. They believe that others view them as less competent and may respond with verbal aggression when forced to interact. Higher trait anxiety is related to lower satisfaction with many types of communicative interactions; e.g., health-care providers, social interactions, work settings.

Studies find that others tend to view apprehensive individuals as more withdrawn, lonely, less socially attractive, having few leadership skills, low on immediacy and lacking interaction involvement. They are generally perceived as more difficult to interact with and as possessing poor social skills. Teachers' and supervisors' perceptions are similarly negative, contributing to lower evaluations and levels of achievement among highly anxious individuals.

*Physiologically*, anxious individuals experience greater levels of arousal, especially measured by heart rate, and such anxiety may occur a week or more before a presentation. Importantly, among high CAs, arousal does not quickly dissipate when completing communicative tasks such as public speaking, making it even more aversive.

Overt behaviors are generally congruent with the need to avoid or minimize communication in order to control aversive arousal. The most consistent observable effect is *low verbal output*. Whether in public speaking, groups, or dyads, high CAs talk less than others. Studies reliably report that they engage in less eye contact, maintain neutral facial affect, pause more, exhibit either excessive "fidgety" movement or gestural rigidity, and are more disfluent. Additional actions have also been noted in some studies, but they are more idiosyncratic and less widely verified. When assessing CA via behavioral output, it is best to observe clusters of behaviors rather than one indicant.

Due to fear and expectation of negative evaluation for their communicative efforts, high CAs avoid drawing attention to themselves. They may be overlooked by teachers, acquaintances, or supervisors. Thus, while they perform equally well in large lecture classes and there is no indication of substantive intellectual differences, due to communication expectations, high CAs tend to have lower GPAs and job attainment compared to lower CAs.

### **TREATING COMMUNICATION APPREHENSION'S EFFECTS**

The debilitating effects of high levels of CA have focused attention on alleviating the negative impact. This has taken two primary directions: therapeutic programs and

contextual adjustments. Therapeutic approaches seek to lower anxiety by reducing levels of activation and cognitive disruption, hence altering the individual's cognitive, emotional, and/or behavioral responses. Primary forms of treatment are cognitive therapies, systematic desensitization, and communication skills training, with visualization offering a combined approach.

Reducing anxiety via *cognitive therapies* involves changing the way people think and feel about communication interactions, often altering their belief systems. This will likely take substantial in-depth, focused effort. *Systematic desensitization* (SD) incorporates training in muscle relaxation while visualizing a hierarchy of threat situations to reinforce a calm approach to communication challenges. Repetition of images successively approximating the fear-provoking situation, while in a relaxed state, *desensitizes* the apprehensive individual to the communication threat.

*Skills training* focuses on developing more competent behaviors and eliminating dysfunctional actions. Skills training involves planning, rehearsal, and practice of the communication challenge. Each form of treatment can be effective for specific types of anxiety-based avoidance, although meta-analysis indicates additive effects for multiple therapies, and performance visualization incorporates elements of all three to reduce high CA.

Reducing anxiety through *context adjustments*, compared to changing the individual, is most often applied to instructional practices. Numerous studies have examined pedagogical approaches supporting anxious learners. Providing sufficient assignment structure, arranging the room in conversational and nonthreatening patterns, facilitating introductions, supportive teacher behaviors, and avoiding excessive evaluation especially via oral communication, are all strategies that have been found to create a more sympathetic environment for people with high CA, at all levels of learning.

## **Communication: Definitions and Concepts**

*Paul Cobley*

*London Metropolitan University*

The Latin root of “communication” – *communicare* – means “to share” or “to be in relation with.” Through Indo-European etymological roots, it further relates to the words “common,” “commune,” and “community,” suggesting an act of “bringing together” (→ Communication: History of the Idea).

The notion of communication has been present and debated in the west from pre-Socratic times. The Hippocratic Corpus, for example, is a list of symptoms and diseases; it discusses ways of “bringing together” the signs of a disease or ailment with the disease itself for the purposes of diagnosis and prognosis.

### **COMMUNICATION AS PROCESS AND COMMUNICATION AS PRODUCT**

In the west, classic works of Greek philosophy set much of the agenda for understanding communication (Peters 1999, 36–50). Emerging from a society in the transition from oral to literate modes, these works figured communication as a process bringing together humans to consider a shared reality through the word. Like many societies, early Greece was characterized by orality: communication by means of the voice, without the technology of writing. Oral communication, because it could not store information in the same ways and amounts as writing, evolved mnemonic, often poetic, devices to pass on traditions and cultural practices. Narrative, for example, developed as a form of communication in which facts were figured as stories of human action to be retold in relatively small public gatherings of people. Communication, in this formulation, was necessarily a locally situated process.

The development of literate societies involved communication resulting in a “product” to be stored, distributed, and used as a reference for scientific analysis, critique, and political organization. Written communication is originally thought to have developed as a means of keeping a record of economic transactions. In other spheres, it allowed the storage of large amounts of information and the recording of abstract, scientific principles. Furthermore, written communication was also to be used for the reification of cultural and religious traditions. Writing wrought a transformation in the experience of

space and time: in contrast to oral messages, a communication in writing could be accessed at a later date than its composition; it could also be consumed in private. In tandem with these transformations, written communication facilitated scientific thought and the growth of technology, providing a means of knowledge storage that far surpassed, in its capacity for detail and complexity, that of oral memory.

### SOCIAL USES OF COMMUNICATION

Communication could be understood originally as a *repository of tradition*. In pre-print Europe, the protection of religious tradition was partnered by the preservation of writing, enshrining the “Original Word” for the purposes of instruction. Before Gutenberg’s invention of the printing press, writing was the preserve of monasteries, the locations in which scriptures were copied out longhand. Latin writers from Augustine to Aquinas, through exegesis of such manuscripts, also meditated on the relation between signs and referents.

Following the introduction of print, communication became a key *symbolic resource* for social change. In the centuries after 1450, Europe experienced major transformations of social life in which communication played a central role. Print facilitated widespread communication of messages that might be deemed educational or seditious, ultimately enabling confrontation (as in the Reformation) as well as specialization (sciences building on the Renaissance). As a result of a series of legal and constitutional changes across Europe in the late seventeenth and early eighteenth centuries, print experienced a boom. Booksellers grew in number; the growth of magazines, periodicals, newspapers, and other printed materials also aided literacy, whether in schools or when taken up privately by the self-taught citizen. Print promoted a more private, individual communication centered on the self. Yet, through its reach to a large audience, it also allowed public life in Europe to prosper.

In the modern era, communication served as a *common denominator of public life*. The activities of public life in Europe developed into what → Habermas (1989) calls the (bourgeois) → *public sphere*. This sphere, derived from the meetings of the mercantile class – burghers and others – for talk and debate, was attendant on the eighteenth-century growth of coffee houses in Britain and the German-speaking lands and, in France, of the salons. As Habermas shows, coffee-house talk was driven by the content of printed periodicals and mainly oriented toward questions of literature and culture, even above politics. It was divorced from the family and the intimate sphere, and simultaneously extraneous to the relations of production, commerce, and business. The discourse of the public sphere could be considered political in quite a “pure” sense, a “rational” communication, enabling self-governance and self-reflection, not simply dictated by, or the epiphenomenon of, the accumulation of capital.

Among the educated classes in eighteenth-century Europe, oral communication assumed an importance that arguably surpasses that of the present-day western world of mobile telephony and wireless connection. Just as periodical content fueled oral communication, the content of conversation was frequently, in turn, reproduced and disseminated in periodicals. The “public sphere thesis” is important for understanding communication as a socio-historical phenomenon in that it exemplifies, first, the ways in

which social entities are brought together (in this case, members of a particular literate class) and, second, the way communication has long been simultaneously interpersonal in the flesh and technologically mediated.

### TWENTIETH-CENTURY CONCEPTS OF COMMUNICATION IN THE WEST

A full-fledged “communication theory” emerged in the twentieth century (→ Communication and Media Studies, History to 1968) and was, not coincidentally, intimately linked to investigations of “togetherness” in a number of different fields. Among these investigations were those of American sociology (the Chicago School) and the written accounts of Anglophone anthropology (especially, Malinowski, Boas, and Sapir), which, along with assessments of the idea of “community” (for example, Tönnies), attempted to present a comprehensive vision of how communication is constituted. After these early milestones in the development of the human and social sciences, progress was accelerated in the 1920s by a series of studies into specific aspects of modern communication and communication as a general phenomenon (Peters 1999). New technologies of communication during the period stimulated the broadening of the understanding of communication. *Photography*, in various forms, had proliferated since 1839; film, from the mid-1890s, had become an important new medium of information and entertainment (→ Photography; Film as Popular Culture); and → *radio*, above all, became the defining medium in which communication by one to many – broadcasting, or mass communication – could take place without listeners having to even leave their homes.

Radio was an intensely public medium of communication and stimulated worries about its potential uses in bringing people together through propaganda. The period from the 1920s to the late 1940s, a period dominated by the use of radio for propagandizing purposes by the Nazis and the fascists in Europe, featured a renewal and expansion of the understanding of communication by intellectuals. Political scientists and theorists of the “public” (for example, → Lippmann, Bernays, Schmitt, → Lasswell) were aligned with “administrative researchers” (for example, → Lazarsfeld, Berelson) who carried out industry-funded studies of (usually) media audiences, who were being redefined as key players in public communication.

The understanding of communication in this period generally proceeded from the flow of

Sender == > Message == > Receiver

The message requires encoding and decoding, indicating that it is not a perfect, transparent vehicle for → “*meaning*”: it *mediates* meaning as a result of being in a channel, even if the concept of mediation is given a variety of definitions across the human, social, and technical sciences (→ Media). Lasswell (1948) presupposed that communication has “effects” on the receiver in the formula “Who, says what, in which channel, to whom, with what effect,” an assumption shared by the early Payne Fund studies of movies in 1930s America. The work of Lasswell and others represented a “scientific,” de-personalized understanding of communication, which was taken further in an “objective” account of communication by researchers in cybernetics from the late

1940s. Producing → *models of communication*, their work exemplifies the concept of communication as both product and process.

For Shannon and Weaver (1949), on the one hand, an information source in the model, with a message, uses a transmitter to produce a signal, which is received, by a receiver, which delivers a concomitant message to a destination. At the interface of the sent signal and the received signal is likely to be “noise.” Such “noise” might corrupt the implicit integrity of the message as a product during the process of transmission, the prime example being several conflicting signals in the same channel at once. On the other hand, → Gerbner’s 1956 model and the 1957 model of Westley and MacLean attempted to unravel the process of communication to determine how elements and their combination might be susceptible to misunderstanding.

In the second half of the twentieth century, further advances in the technology of communication invited a specific focus on media to explicate what communication is. All communication is mediated by virtue of the fact that telepathy for humans and direct messages for other organisms have not been achieved. Radio was supplemented, especially after the 1950s, by television, a powerful medium of mass communication, allowing the flow not only of aural messages, but of images, as well, into the domestic environment. “Medium theorists,” observing such developments, stressed that media are, in the phrase made famous by the Canadian communication theorist → Marshall McLuhan, “extensions” of humans. Like tools, media extend the capabilities of humans to reach out into a broader world of communication and interaction. However, as a corollary of this, the media transform humans’ apprehension of the world and produce a consciousness that is tied to particular modes of communication, for example, orality and literacy. For medium theorists → Innis, McLuhan, Havelock, Ong, Meyrowitz, Postman, Levinson, et al., all the major media of communication have entailed “paradigm shift[s] in cultural evolution” (Danesi 2002, 15).

*Medium theory* assumed a much different “effect” of communication in audiences than Lasswell and other early social-scientific communication theorists (→ Medium Theory). Also, later social-scientific theories of communication that have been skeptical about direct effects, such as → *uses-and-gratifications* approaches since the 1940s, have found that audiences utilize communications media in ways that do not result in linear effects. In a parallel development, Lazarsfeld and colleagues put forward the idea of a → *two-step flow of communication*. This replaced the image of the audience as a set of unconnected individuals with, instead, a theory of → *opinion leaders* who, having been exposed to media, will circulate messages from the media and, hence, disseminate influence on a local basis (Katz 1957). This idea replayed the concept of communication as a symbolic resource. In a summary assessment of contemporary audience research, sociologist Joseph Klapper (1960) stressed the minimal effects of mass communication, conceptualizing communication instead, in a weak sense, as a common denominator of public life. Klapper’s review suggested that exposure to the large amounts of mass communication that have been characteristic of modernity was more likely to reinforce existing attitudes than to make receivers adopt new ones.

By the early 1980s, televisual communication, having established itself in western homes, was supplemented by video cassette recorders, which potentially offered greater autonomy to viewers through the capacity to “timeshift.” Research demonstrated that

television viewers were not necessarily behaving as expected; indeed, television sets that had been turned on in homes were sometimes found to be totally ignored. Timeshift allowed viewers to receive more televisual communication, repeatedly if chosen, and at times different to those of the original broadcast, by being active media users. Research during this period (→ Communication and Media Studies, History since 1968) emphasized other aspects of “the active audience” as well, recapitulating lessons from the uses-and-gratifications approaches, although often in a more critical perspective (for example, Morley 1980; Hobson 1982) (→ Critical Theory; Cultural Studies). The audience was found to be the locus of attitudes, values, experiences – ideological baggage that is brought to the act of decoding. As a result, audience members could be seen to actively and immediately reshape the communications they received, thoroughly transforming them in a manner that tended to invalidate the idea of an encoded message that is decoded by a receiver. Audiences do not simply decode, but “make” or, at least, “remake” communication. In this perspective, communication as “bringing together” implies not just that communities are built through communication, but also that communication is accomplished in and through the “interpretive communities” of communicators.

Twentieth-century technologies re-fashioned the way in which communication was carried out and, accordingly, prompted revisions of the way in which it was to be theorized. Computers entailed a “digitizing” of communication (→ Digitization and Media Convergence), despite the persistence of naturalized, analog graphic user interfaces remediating previous media forms (→ Remediation). The use of computers for Internet access, along with the implementation of hypertext links, created the potential for non-linear as well as many-to-many communication, summed up as *interactivity* (→ Interactivity, Concept of). Some traditional aspects of face-to-face communication were revamped through the “time-space compression,” which allowed global communication to take place instantaneously (email, video conferencing, mobile telephony, and so forth). The proliferation of digital and converged communication technologies seems to suggest that there is more opportunity for humans to communicate with growing numbers of humans than ever before. Yet the profusion of technologies that enables global communication evinces a fundamental imbalance between those who can afford converged technologies and those who cannot. This presents political issues of who may not be “brought together” in communication; it also raises theoretical issues of how communication may be conceptualized with due consideration to the cultural specificity of the concepts of communication and cognition.

### COMMUNICATION BEYOND INDIVIDUAL COGNITION

As Kim (2002) argued, much western communication theory is underpinned by notions of an individualistic self, despite the fact that 70 percent of the world’s population is characterized by cultures of “collectivism” or “interdependence.” Not only have western concepts of communication been grounded in the self rather than “selves”; they have also assumed that communication is the preserve of sapient, cognizing participants.

A non-individualistic conceptualization of communication has been offered by → *semiotics*. Based on pre-Socratic principles, semiotics has been taken up in the study of animal communication as well as in media studies. Semiotics sheds light on communication

because of its focus on signs *as* signs, whether they are part of communication in films or novels, the expressions of animals, or the messages that pass between organisms or cells. The nonverbal signs that are exchanged between animals can be said to actually *communicate*, as do the verbal and nonverbal signs passed between humans. The nonverbal signs that occur in components of organisms or plants also communicate. The concept of intrahuman and interspecies – as well as interhuman – message transfer amounts to a major reorientation of the understanding of communication, one in which human affairs constitute only a small part of communication in general.

## COMMUNICATION AND NONCOMMUNICATION

Definitions of communication often assume successful contact and interaction. Yet the importance of noncommunication (or miscommunication) in understanding what communication is should not be underestimated. This includes ambiguity, misunderstanding, lying, cheating, deception, and unconscious and willful self-deception.

The famous case of “Clever Hans,” involving a horse whose abilities “proved” that animals could think and speak, but which in fact was responding to a number of nonverbal cues emitted by its “interlocutor,” illustrates well the vicissitudes of communication (Sebeok and Rosenthal 1981). Similarly, the overvaluing of verbal communication has tended to encourage neglect of nonverbal communication, a fact well understood by magicians and others practiced in deception. Lying is also central to communication, particularly as lies are often necessary to the project of human interaction (Ekman 2001). Nor is this exclusively a matter of human communication. In the animal world, too, lying is widespread (Sebeok 1986). Indeed, the reliance of communication on signs to substitute for something else that “does not necessarily have to exist or to actually be somewhere at the moment that a sign stands in for it” (Eco 1976, 7) suggests the fraternity of communication with lying.

## Communication Education, Goals of

Jo Sprague

San Jose State University

Because the ability to communicate is considered a major – perhaps even the primary – defining characteristic of humanity, people assume that, throughout human history, elders have taught the young this essential survival skill. Despite agreement on the importance of learning to communicate, there is no consensus about the particular goals of communication education or even about how people learn. People in many parts of the world and for long stretches of history have assumed that communicative competence emerges almost naturally through innate predispositions and imitation. In other cultural and historical settings, communication abilities have been fostered through informal forms of coaching or apprenticeships that were specific to the context of use. Yet others have believed that communication skills and knowledge were subjects that could and should be taught formally or at least explicitly in educational institutions.

The term “communication education” generally applies to these structured curricula. Discussions of the goals for teaching communication in schools center on the philosophical and ideological underpinnings of the enterprise. From whatever goals are established, educators derive their specific instructional objectives, standards, and implicit or explicit pedagogies. Although multiple goals are present in most educational settings, the four following categories of goals represent distinct rationales for teaching communication.

## GOALS OF INDIVIDUAL COMPETENCE

The most evident goal of communication education is to equip individual learners with the skills and knowledge they will require for success (→ Student Communication Competence). Countless studies confirm the popular wisdom that, other things being even approximately equal, the person who is skilled in communication will have greater academic and career success, more satisfying interpersonal relationships, and a greater sense of individual agency and empowerment. In the popular mind, communication education probably evokes an image of Demosthenes shouting over the sounds of the surf with pebbles in his mouth, a speech coach working with a politician to polish an important speech, or members of a Toastmasters Club meeting to overcome fears of speaking. In every case, the assumption is that individuals can meet their personal goals by becoming more articulate. The primacy of this goal can be traced from the emergence of the sophists in ancient Greece, through the rigid scholastic exercises of the Middle Ages, the stylized posturing of the elocutionary movement in the nineteenth and early twentieth centuries, to the extensive modern curricula in public speaking, argumentation, organizational, interpersonal and group communication, journalism, broadcasting, advertising and public relations (→ Rhetorical Studies).

Communicative competence has been widely theorized, providing alternative frameworks for scholars to classify the educational goals for individuals. For example, Dell Hymes' influential 1972 model implies a *hierarchical and developmental process* of acquiring communicative competence. At least a minimal mastery of grammatical and syntactical goals would be prerequisite to the achievement of more advanced strategic goals such as making situationally and culturally appropriate communication choices. Spitzberg and Cupach's 1984 model identifies *three components of competence*: (1) knowledge, (2) skill, and (3) motivation. This perspective invites educators to take a more functional perspective on classifying the goals of communication education. Recent documents such as the National Communication Association's *Speaking, listening and media literacy standards* (1998) and the *Expected outcomes for speaking and listening* (Morreale et al. 1998) illustrate comprehensive listings of specific individual goals, combining the type of learning outcome sought and the increasing level of complexity of learning.

## GOALS OF ENABLING ADVANCED LEARNING

A second set of communication goals, though still centered on the development of individuals, places less emphasis on communication skills as outcomes and more on the essential *role communication plays in all learning*. This perspective goes beyond the obvious point that learners must be able to receive and process information. Instead, learning itself is understood as a profoundly social process in which students co-construct knowledge through the acts of discussion and writing. This way of justifying the study of communication springs in part from the work of Soviet psychologist Lev Vygotsky, who in the 1920s argued that development occurs first interpsychically through scaffolded communication before becoming internalized. The move in rhetorical theory toward understanding rhetoric as epistemic further reinforces the concept of communication as a way of knowing rather than just a way of transmitting knowledge (→ Rhetoric and Social Thought).

This distinction can be traced back to the medieval universities, where the liberal arts curriculum was divided into the trivium and quadrivium. The *trivium* consisted of logic, dialectic, and rhetoric, skills that were prerequisite to learning the subjects of the *quadrivium*. In many contemporary universities, especially in the United States, communication is categorized as a basic intellectual skill, along with writing, critical thinking, and computation, which is required of all students. The justification for the requirement is that speaking and listening are prerequisite to gaining an advanced understanding of all other subjects (→ Communication: Definitions and Concepts).

### **GOALS OF CIVIC, ECONOMIC, AND SOCIAL PARTICIPATION**

A third major way to think about the goals of communication education shifts the emphasis from the individual to the *needs of the larger society*. Advocates of formal instruction in speech and communication often base their rationale on the need for certain kinds of citizens, consumers, or workers in order to meet national goals. Ever since the newly enfranchised citizens of the Greek city states recognized the need for coaching to defend their interests in public forums, the survival of democratic societies has been premised on the existence of a well-educated populace able to listen critically, argue effectively, collaborate, and compromise. When social critics and reformers set forth a vision of the good society, they are in effect specifying the kinds of citizenry that will be needed to create that society. Whether or not democratic values are at the heart of a political system, every collectivity has economic, religious, and cultural goals that can only be realized by developing appropriate communication skills. In a patriarchal society, communication education might have the goal of teaching women how to communicate submissively. Where economic productivity reigns as supreme, workers would need to learn to be complacent and to follow directions without question. In a highly collectivist culture, skills of teamwork and cooperative communication are essential; in a more individualistic culture, educational goals would involve fostering critical thinking, assertive communication, and effective self-presentation. In short, it can be argued that we can discern much about the vision of a society by the goals it sets for education of the youth, and more specifically, by the communication goals that are adopted (→ Discourse; Political Discourse).

### **GOALS OF TRANSFORMATION AND EMPOWERMENT THROUGH COMMUNICATION**

A final set of goals for communication education seeks to instill certain *habits of mind and heart in learners*. Advocates of this perspective look at education as more than technical skill building, and communication as more than transmission of information. Instead, they see all communication, including acts of education, as profoundly constitutive. The ways people speak and listen and relate are deeply tied to their cultural and personal identities and are enmeshed with relations of power and privilege. Within such assumptions, both individual competence and social indoctrination are illusory. It is not possible or justifiable for communication education to incrementally improve either individuals or societies, so the goal becomes to transform both. In effect, the more traditional goals of communication are replaced by a *set of meta-goals*. Students are taught that although it is impossible to

step outside of communication to study it objectively, they can glimpse its complexity through critical reflection. These perspectives have emerged from postmodern and post-foundational philosophy, social construction theories, critical pedagogy, critical theory, feminism, postcolonialism, and new media studies (→ Communication Theory and Philosophy).

The rapid acceleration of change has challenged all educational theories that assume elders know what youth will need to thrive in the future (→ Communication Skills across the Life-Span). But specifically within communication, the new communication technologies have radically changed not only social life but also social reality. Students will continue to need to know how to communicate effectively through oral face-to-face modalities and traditional written media, but they also need to master the infinite combinations of time, space, sight, sound, music, pictures, and words that are available to them as communicators. More significantly, they will not only need to know the etiquette of mobile phones, the design of PowerPoint presentations, the dynamics of teleconferencing, and the strategies of Internet searches, but they will need to become aware of how these communicative forms themselves, and others their teachers have not dreamed of, will shape them and their world. This level of self-reflexiveness and cultural observation goes well beyond the foundations laid in critical media literacy or the study of computer-mediated communication, though it builds on both (→ Media Literacy). To reach these goals, students will need a sophisticated arsenal of analytical and critical frameworks. They will need to be intensely aware of the impact of the choices they make, not just about what to communicate but also how to communicate, rigorously critical of the kinds of social arrangements that are instantiated and perpetuated. At the same time, advocates of this sort of critical perspective do not want students to become overwhelmed or cynical, but to be empowered to use communication toward some desirable ends such as social justice or inclusiveness.

### RELATIONSHIPS AMONG THE GOALS

Those who actually build communication curricula, write textbooks, and/or prepare communication teachers will usually have a conscious awareness of these goals and can justify setting one in a primary position. Politicians, parents, students, and even teachers may not be fully aware of the assumptions they are making when they speak about why communication should be taught. Unstated assumptions about the *priorities of these goals* underlie some of the dramatic clashes in the political and educational spheres.

When one group of educational stakeholders believes that students need to have the skills employers want and another believes that students should become discerning and eloquent citizens, radically different notions of the goals for communication education emerge. At the same time, if educators are able to articulate multiple goals and develop creative curricula and pedagogies, it is often possible for two or even all four goals of education to reinforce one another. Even when multiple goals coexist at a philosophical level, the move to more specific goals for a particular communication course or workshop typically creates tensions. In any area of communication, educators must set relative priorities for teaching theory and teaching skills, and also must decide whether to emphasize goals for senders of communication or goals for receivers. Those who deal with the performative aspects of communication will also need to set priorities between

content goals and presentation goals. Educators find that they differ on the importance of helping students develop effective communication products (such as speeches, press releases, effective interviewing protocols) as compared to helping them master the more general processes (audience analysis, persuasive strategies, empathic listening), which can be applied to a variety of settings (Sprague 1999).

# **Communication Evaluation Research**

*Jane T. Bertrand*

*Johns Hopkins Bloomberg School of Public Health*

This entry addresses research that evaluates communication programs designed to bring about change in individual behavior and social norms. These programs or campaigns may focus on health, agriculture, environment, water and sanitation, democracy and governance, gender equity, human rights, and related areas. They can be referred to by different labels: → strategic communication, behavior change communication, information-education

communication, communication for social change, and → development communication, among others (→ Health Campaigns for Development). Communication evaluation research serves both to guide the design of such programs and to determine their effectiveness in achieving their objectives (→ Communication and Social Change: Research Methods). The myriad of communication forms used in such programs generally fall into three categories: mass media, community mobilization, and interpersonal communication/counseling (IPC/C).

## **TYPES OF EVALUATION**

A comprehensive evaluation of a communication program includes three primary types of evaluation: formative, process, and summative. Large-scale, well-funded programs will use all three types of evaluation, whereas those with limited budgets or evaluation know-how often stop at formative or process evaluation.

### **Formative Evaluation**

Formative evaluation refers to activities undertaken to furnish information that will guide program design. This information helps program planners to determine who is most affected by the problem; identify the needs of specific sub-groups; ascertain existing knowledge, beliefs and → attitudes; determine access to levels of services, information, social support and other resources; understand barriers to action; and determine audience media habits and preferences (Bertrand 2005; → Audience Research; Exposure to Communication Content). Some relevant information may be available from existing data sources such as epidemiologic or demographic reports, situation assessments, → surveys, secondary analyses of existing data, media ratings data, service delivery statistics, and other program records (→ Nielsen Ratings). However, the researcher often needs to collect new information regarding the opinions, aspirations, fears, beliefs, and other key psychological factors that influence a given behavior (→ Attitudes, Values, and Beliefs, Media Effects on). Primary data collection may include quantitative or qualitative research methods (→ Qualitative Methodology; Quantitative Methodology). Surveys are by far the most commonly used quantitative method. Frequently used qualitative research techniques include focus groups, in-depth interviews, direct → observation, and a range of different participatory methods. This information serves to guide the design of a communication strategy for a given setting. It captures existing levels of knowledge, attitudes, beliefs, and behaviors relevant to the topic. It also focuses on characteristics of the intended audience, the potentially most effective channels, the sources of motivation and barriers to change among the intended audience, and other elements (→ Audience Segmentation).

Communication pre-testing before final production is one type of formative research specific to communication programs. This technique involves testing a communication product (e.g., radio spot, poster, TV storyboard) among a convenience sample of members of the intended audience to measure comprehension, attractiveness of the message, identification with the message, cultural acceptability, and related factors. Programs often conduct multiple pre-tests in an effort to “get the message right” before investing in expensive print runs or broadcast time.

### Process Evaluation

Process evaluation involves tracking program implementation once the program is launched. One common form of process evaluation is to compare actual implementation to the proposed scope of work, to answer the question: to what extent is the project implemented according to plan? (Rossi et al. 2004). This information serves *two useful purposes*. First, it can alert program managers to delays or shortfalls in implementation that need to be addressed midcourse in program implementation. Second, it provides valuable information in later assessing the effectiveness of the program to achieve its objectives. If the program falls short in delivering the projected elements (e.g., training, print materials, community mobilization activities, counseling sessions, media broadcasts) it will likely not achieve the desired objective. Rossi et al. (2004) distinguish between *implementation failure* (the program not implemented as designed) and *theory failure* (the hypothesized effects not being realized despite complete and appropriate program implementation). The results of process evaluation also help managers to understand the program dynamics such that one can replicate successful components and eliminate ineffective elements in future efforts (Bertrand 2005).

Process evaluation may take several forms, one of which is *monitoring outputs*. At a minimum, programs can and should track the activities conducted, such as number of materials used, number of radio spots, number and frequency of broadcasts for radio or TV spots, number of community educational activities conducted, and so forth. The measure reflects program activity and program managers' compliance with a work plan, but it should not be confused with achieving desired results or outcomes (measured in terms of actual change).

Measuring the *reach of a communication program* is another important type of process evaluation, especially for large-scale interventions. Such studies – conducted among a random sample (→ Sampling, Random) or a convenience sample (→ Sampling, Nonrandom) of the intended audience – indicate the percentage of the audience exposed to the campaign through different channels. They may also measure recall of specific elements such as the content of a radio spot or the logo of a campaign. The data indicate overall coverage by the program as well as the relative reach of different channels used. Data on reach via different channels also provide the basis for evaluating “dose–response” (i.e., the greater the exposure, the greater the effects) as part of summative evaluation, discussed below.

Special studies that examine the *functioning of different elements* of the program constitute another form of process evaluation. For example, a mystery client study to measure the quality of counseling in a given program captures one aspect of program implementation. Reviewing broadcast logs can indicate whether stations are delivering the number of broadcasts purchased or promised. Participants in community meetings or health fairs may give feedback on what they liked and disliked about the event.

In short, process evaluation tracks whether a communication program is implemented according to plan. Alternatively, it may capture *how much* the program has done and *how well* it has done it, measured by audience reaction and reach. However, process evaluation stops short of answering the question: did the desired behavior change occur among members of the intended audience?

## Summative Evaluation

Summative evaluation measures the extent to which change occurs, consistent with objectives of the program. It addresses the issue: did the program make a difference? Did it have an impact?

The answer to the question of impact relates directly to the objectives of the program and the types of change anticipated. In some cases, especially where funds for evaluation are limited, program planners may rely primarily on measuring service utilization or sales (also labeled “service outputs”), which serve as proxies to behavior change. For example, in the United States a smoking cessation campaign might track calls to a hotline or sales of nicotine patches. In an international public health context, programs might monitor the volume of contraception sold, the number of bed nets distributed, the number of prenatal visits made, or the number of doses of polio vaccine administered.

*Measuring outputs* has several advantages. First, the necessary data are often collected for programmatic purposes and become available to evaluators at little or no cost. Second, the results are easy to grasp, especially when presented in graphic form. And third, such measures reflect a behavioral response on the part of the intended audience. However, they fall short in answering the question of whether the program changed behavior, for several reasons. First, it is difficult to conclude with certainty that the program – and not other activities or factors – prompted the actions reflected in these measures of service utilization or sales (→ Validity). Second, the supplies or devices might be purchased but never used. And third, these measures of output yield “numerator data” but no indication of the denominator (50,000 prenatal visits might be impressive in a small country, whereas it would be insignificant in China).

For this reason many evaluators prefer to assess behavior change from a given program by conducting a population-based survey among members of the intended audience to measure outcomes consistent with the objectives of the program. Three categories of outcomes are initial, intermediate, and long-term. *Initial outcomes* relate to cognitive and psychosocial factors that are hypothesized to precede actual behavior change: knowledge, → risk perception, attitudes, beliefs, and self-efficacy (→ Political Efficacy), among others. Even if a program does not achieve its behavioral objectives, program staff may want to know if the audience demonstrates any progress toward the behavior, as outlined by Piotrow et al. (1997).

*Intermediate outcomes* refer to actual behaviors that will lead to the desired end state (e.g., stopping smoking to reduce morbidity or mortality, conserving water to improve the environment, voting in an election to promote democracy). Most summative evaluations that measure outcomes focus most directly on this type of intermediate outcome, because it captures the behavior(s) promoted by the program and is measurable within the life-span of the project.

By contrast, *long-term outcomes* measure the desired end state or ultimate objective of the program, such as increased life-span or decreased morbidity, increased agricultural yields, improved environmental conditions, more democratic societies, and higher quality of life. Yet communication research evaluation rarely measures these long-term outcomes because (1) they often happen long after the program itself ends, and (2) factors other than the communication program contribute to them (→ Media Effects Duration).

## MEASURING EFFECTIVENESS

With respect to measuring impact, the strength of the evidence varies depending on the study design and/or statistical techniques used (→ Statistics, Descriptive; Statistics, Explanatory). Not surprisingly, the methods needed to produce the strongest evidence are often the most costly and/or require knowledge of advanced analytic techniques, making it difficult for small projects with limited budgets to use the most rigorous evaluation methods (Bertrand 2005). The levels of evidence from strongest to weakest are described below.

### *Change occurred that can be attributed to the intervention/program*

Most donor agencies and program directors would ideally like to be able to make this claim. Purists would argue that the only means to definitively establish cause and effect is to conduct a randomized trial (experimental design). Specifically, the evaluator would randomly assign subjects to two groups, apply the communication intervention to one (the experimental or treatment group) and withhold it from the other (the control group), then compare the behavioral outcomes for the two to determine whether the program had any effect (→ Experiment, Field; Experimental Design). However, this type of randomized trial or controlled field test is only possible where the program can feasibly manipulate (control) exposure to the communication (e.g., in the case of home visits, mass mailings, clinic counseling sessions). By contrast, a large-scale program with a mass media component such as radio or TV potentially reaches all segments of the population; those not reached are generally “atypical” and thus unsuitable for purposes of comparison. This situation requires evaluators to seek alternative methods to determine the impact or effectiveness of communication programs, often requiring advanced statistical analyses.

### *Change occurred, which is associated with exposure to the intervention*

Because randomized trials are not feasible for the evaluation of communication programs using broadcast media, evaluators must seek alternative methods that yield plausible evidence of impact (Victora et al. 2004). For example, they may use quasi-experimental designs (Fisher & Foreit 2002). The most frequently used are time series, pre-test/post-test nonequivalent control group designs, and separate sample pre-test/post-test designs (→ Longitudinal Analysis; Time-Series Analysis). An alternative approach that is increasingly in use to measure communication effectiveness involves post-test only data, analyzed using a series of econometric techniques, such as simultaneous equations models, propensity score matching, or longitudinal/panel data methods (→ Test Theory). However, the latter require advanced statistical techniques and are used primarily in well-funded large-scale evaluations. Although still relatively rare, some evaluators have analyzed program costs in relation to effectiveness in an effort to measure “bang for the buck” (Bertrand & Hutchinson 2006).

### *Change occurred in the desired outcomes following the intervention*

In the real world, many program managers, donor agencies and policymakers are happy if change in the desired outcome(s) occurs at all, and they are less concerned about the technical aspects of study designs (for example, that factors other than the communication

program might have triggered the change). This type of trend data constitutes “adequate evidence” of change, to use the language of Victora et al. (2004). Programs with limited budgets or access to evaluation specialists can track changes in data from program statistics or surveys to demonstrate the extent of change in behavior(s), consistent with program objectives.

## **Communication as a Field and Discipline**

*Robert T. Craig*

*University of Colorado at Boulder*

The editorial structure of the *International encyclopedia of communication* offers one view on the present state of communication as an academic field. The 29 editorial areas range

in scope from micro-analysis of individual behavior (e.g., → Information Processing) to macro-analysis of communication institutions on societal and international scales (e.g., → International Communication). Editorial areas also range across modes of inquiry, including those of quantitative social science (e.g., → Media Effects), interpretive social science (e.g., → Language and Social Interaction), critical and cultural studies (e.g., → Feminist and Gender Studies), humanities (e.g., → Rhetorical Studies), applied professions (e.g., → Journalism), and such varied other interdisciplines as → media history, → media economics, and communication and media law and policy.

As these examples suggest, the field of communication is highly diverse in methods, theories, and objects of study. What, if anything, unites the field as a coherent entity? What warrants bringing together such an apparently eclectic group of topics and approaches in a single reference work? Presumably, as the encyclopedia's title indicates, the common focus is on "communication." But what is the nature of that common focus? Is communication merely a nominal theme that loosely connects a series of otherwise unrelated disciplines and professions? Is communication truly an interdisciplinary field in which progress in knowledge is only possible through close cooperation and synergy among several distinct disciplines composing the field? Is communication actually (despite its apparent fragmentation), or at least potentially, the object of a distinct intellectual discipline in its own right? Might each of these interpretations of the field be true in some respects?

Three editorial areas overview the field as a whole and are, therefore, potentially helpful for illuminating its disciplinary identity and coherence: → Communication Theory and Philosophy, → Research Methods, and the subject of the present entry, Communication as a Field and Discipline. Whereas the first two editorial areas examine, respectively, theories and methods, Communication as a Field and Discipline is concerned with the historical development and academic–professional institutionalization of communication studies. It includes entries covering the history of the field, professional organizations and issues, and the current state of communication research and education in geographical regions around the globe. Where the question of communication's disciplinary coherence is concerned, these institutional and professional aspects of the communication field also touch on matters of theory and methodology.

## HISTORY OF THE COMMUNICATION FIELD

The English word *communication* derives from Latin and originally referred to acts of sharing or making common but without the distinctively modern emphasis on communication as a process of sharing symbols, information, and meaning. Those modern senses of the word can be traced back through a long "spiritualist" tradition (Peters 1999) to ancient and early Christian eras in the west, but emerged toward their current prominence in ordinary English discourse only from the late nineteenth century. Around the same time, academic studies of communication began to appear on scattered topics such as transportation systems, crowd behavior, community, and newspapers, with important work being done in Germany, France, and the USA. By the post-World War II period, in which communication research began to be recognized as a distinct academic field, the ordinary concept of communication had evolved rich connotations related to semantics,

therapy and human relations, interaction and social influence, mass communication, and information technology, and derivatives of the Latinate term, *communication*, or native words that had acquired similar connotations, were spreading globally in various languages (→ Communication: Definitions and Concepts; Communication: History of the Idea; Communication and Media Studies, History to 1968).

Communication research and education underwent *rapid growth and institutional consolidation as an academic discipline* in the second half of the twentieth century (Craig & Carlone 1998; → Communication and Media Studies, History since 1968). Unlike, for example, the field of molecular biology, which emerged around the same time as the result of a unique scientific breakthrough (the 1953 publication of DNA's double helix molecular structure), communication and media studies sprang more or less independently from many different sources. Formation of the communication field has resulted from a partial convergence of various disciplines and lines of research that intersect in complex ways, all somehow related to the phenomenon of "communication," but have never been tightly integrated as a coherent body of thought. Hence, the manifest diversity of communication research and education is not a recent development but has characterized the field throughout its history.

The *intellectual traditions* that have informed the modern field of communication have come primarily from two streams: the humanities and the social sciences. Antecedents of the *humanities* most relevant to communication go back to the ancient Greek arts of rhetoric, dialectic, and poetics (→ Rhetoric and Dialectic; Rhetoric and Poetics). In early-nineteenth-century Europe, the humanities formed as research disciplines concerned with historically oriented studies of texts and artifacts. The disciplines of → aesthetics, → hermeneutics, → historiography, and → linguistics were among the intellectual traditions important to communication that developed with the humanities in this period.

The second main stream that informs the modern field of communication emerged a century later with *experimental psychology and the social sciences*. The system of social science disciplines that crystallized in that period included anthropology, economics, political science, and sociology but not communication (Abbott 2001). However, communication became a topic of interest across disciplines and a stimulus to interdisciplinary work that eventually gave rise to the institutionalization of the communication field.

As it was institutionalized, the field constructed an eclectic theoretical core by collecting ideas relevant to communication from across the social sciences, humanities, and even engineering and the natural sciences. Craig (1999) presented a model of the field based on the idea that distinct theoretical concepts of communication in the diverse intellectual traditions of the field interact with ordinary → meta-discourse about communication to address practical social problems. Craig identified *seven main traditions of communication theory* distinguished by different practical concepts of communication that underlie them: rhetoric, → semiotics, → cybernetics, → phenomenology, social psychology, socio-cultural theory, and → critical theory.

The vast range of topics in this encyclopedia reflects, again, the range of sub-fields and special research topics that now make up the field of communication. This body of knowledge has no universally accepted overall structure. Sub-fields and topics can be grouped and organized in various more or less systematic ways for different purposes. The field can be *divided up by disciplines*, beginning with "humanities," "social sciences,"

and “applied professions” at the top level. Or again, the field is sometimes bifurcated into “communication studies” and “media studies,” with sub-fields arrayed under those main headings. The *editorial areas and content taxonomy* developed for this encyclopedia provide a pragmatic organizing scheme that loosely follows some of the divisions and special interest groups of the → International Communication Association (ICA). Berger and Chaffee (1987) created a different scheme that organized the field in *three dimensions* according to “levels of analysis” (individual, interpersonal, network, and macro-social), “functions” (socialization, persuasion, conflict, etc.), and “contexts” (family, health-care, professional mass communication, etc.).

## COMMUNICATION RESEARCH AND EDUCATION AROUND THE GLOBE

### Common Themes

The state of communication research and education varies considerably within and among countries but can nevertheless be summarized with regard to some *common themes*. One theme certainly is *growth*: the field is flourishing in many parts of the world, wherever political and economic conditions and academic institutions have allowed it to take root at all. Where growth has been stimulated to a great extent by demand for trained employees in burgeoning media and communication-related industries, which is often the case, growth is also associated with certain problems: strain on resources, an over-emphasis on practical training of undergraduates that can stifle the development of a strong research discipline, and the threat of co-optation by commercial interests that are not necessarily aligned with academic and intellectual priorities.

Although always with much borrowing from Europe, the field matured first in the USA and spread from there. Overdependence on American and European concepts and practices and the need to develop locally based, culturally relevant knowledge of communication are common themes in other regions. Yet, as that very emphasis on local development suggests, the field is *increasingly internationalized*, with global influences now flowing from many places. As the field has spread globally, its assimilation to different academic systems and national cultures has created distinct local characteristics.

Finally, an international consensus may be emerging that the *name and underlying concept* of the broad field to which all contribute, as indicated by the title of this encyclopedia, is *communication*. Insofar as the concept of communication is understood to include forms of human interaction not encompassed by media studies and related professions, this trend may have implications for the future development of sub-fields of communication that now may seem to be “missing” from programs in many places. These themes are further developed as we survey the communication field region by region around the globe.

### The Americas

Academic communication and media studies programs in the USA are numerous, well established, and often include a broader range of sub-fields than programs in other countries. Unlike the rest of the world, in which communication research and education

tend to be identified with media studies and related professional fields, in the USA communication typically includes, in addition to media-related areas, substantial components of speech and rhetorical studies, → interpersonal communication, → organizational communication, and other areas of study not primarily concerned with media. Those subjects are studied, of course, at universities elsewhere but are less likely to be institutionally affiliated with communication; instead, they may be housed with disciplines such as linguistics, psychology, or management. Similar academic configurations are also common among some of the traditional elite universities in the USA, such as those of the Ivy League, many of which do not yet have communication schools or departments.

*Canada* (with important exceptions, such as rhetorical and organizational communication studies at the University of Montreal) generally follows the international pattern. A distinct Canadian contribution to the field has been the tradition of → medium theory growing from the work of → Innis and → McLuhan.

In the history of US higher education, “practical” subjects like speech and journalism were established in the early twentieth century primarily in the growing public-land-grant universities (→ Journalism Education; Speech Communication, History of). Under the influence of the interdisciplinary communication research movement that coalesced after World War II and related cultural trends, speech and journalism, along with other communication-related fields, gradually shifted their academic identities toward communication and began including that word in the names of courses and academic programs, professional associations, books, and journals. Student enrollments soared as communication programs in various arrangements (some in comprehensive schools or departments under various names, others divided between journalism/media studies and communication studies) became the designated institutional homes for communication research and education across the range of topics and approaches included in this encyclopedia, and more (e.g., writing, speech pathology, performance studies, or theater, in some institutions; see Craig & Carlone 1998; → Communication as an Academic Field: USA and Canada).

Major academic associations serving the communication discipline in North America include the National Communication Association (NCA; [www.natcom.org](http://www.natcom.org)), the Canadian Communication Association (CCA; [www.acc-cca.ca](http://www.acc-cca.ca)), the Association for Education in Journalism and Mass Communication (AEJMC; [www.aejmc.org](http://www.aejmc.org)), and the Broadcast Education Association (BEA; [www.beaweb.org](http://www.beaweb.org)).

Journalism schools were founded in *Latin America* beginning in the 1930s and 1940s. Communication research, including both US-influenced empirical studies of mass communication and diffusion of innovations as well as critical studies on topics such as cultural imperialism and globalization, developed slowly beginning in the 1960s but more quickly in recent years (→ Communication as an Academic Field: Latin America). Associations of communication scholars currently active in the Latin American region include the Asociación Latinoamericana de Investigadores de la Comunicación (ALAIIC; [www.alaic.net](http://www.alaic.net)), the Federación Latinoamericana de Facultades de Comunicación Social (Felafacs; [www.felafacs.org](http://www.felafacs.org)), and nationally based associations such as the Sociedade Brasileira de Estudos Interdisciplinares da Comunicação (Intercom; [www.intercom.org.br](http://www.intercom.org.br)) in Brazil and the Asociación Mexicana de Investigadores Comunicadores (AMIC; [www.amicmexico.org](http://www.amicmexico.org)) in Mexico.

### Europe and Russia

The oldest intellectual traditions from which modern communication theory derives originated in Europe, as did certain fields of modern communication research (e.g., journalism studies growing out of the late-nineteenth-century German *Zeitungswissenschaft*). However, communication research did not really take off as an organized academic field in western Europe until the 1970s and in eastern Europe and Russia until the post-Soviet period in the 1990s.

Communication research in *western Europe* through the 1960s was influenced primarily by US empirical social scientific studies of mass communication content and effects. From the late 1960s, reverse flows of influence from Europe to America in the fields of critical theory, political economy of the media, and critical studies of popular culture also became important. Despite these significant cross-influences between Europe and the US, differences both among European countries and between Europe generally and the US due to different media and political systems, policy concerns, languages, and academic traditions have also shaped the field of communication in western Europe.

For example, the state tends to be more directly involved with the mass media in Europe than in the US, including a much larger publicly owned media sector, as a result of which European research tends to be more concerned with questions of media independence, political diversity, and cultural policy. Fields such as journalism studies, → political communication, → technology and communication, and → popular culture are highly developed in western Europe, while fields such as interpersonal communication and rhetorical studies continue to be less developed or institutionally disconnected from communication and media studies. Research on personal forms of communication occurs, however, in areas such as computer-mediated interaction (→ Personal Communication by CMC), → intercultural and intergroup communication, and organizational communication, all growing fields in Europe. The recently established European Communication Research and Education Association (ECREA, created in 2005 in a merger of two older associations) presently includes 13 thematic sections covering both established and emerging topical areas ([www.ecrea.eu](http://www.ecrea.eu)) (→ Communication as an Academic Field: Western Europe).

The field of communication, primarily focused on media and related issues, developed rapidly in *central and eastern Europe and Russia* from the 1990s. Prior to World War II the beginnings of communication research across several disciplines followed trends in the west except in the former Soviet Union, where journalism studies were organized to support the functions of state → propaganda. The Soviet pattern prevailed as well to varying degrees in countries of eastern and parts of central Europe from the postwar period through the breakup of the Soviet Union in the late 1980s. Media and journalism historiography, media sociology, linguistics, literary theory and semiotics, and “press science” in the former Soviet bloc are among the disciplines that have principally contributed to the formation of communication research and education in eastern Europe and Russia (→ Communication as an Academic Field: Eastern Europe and Russia). Although nonmedia areas of study are not usually affiliated with the communication discipline in this region, topical areas represented in the recently organized Russian Communication Association (RCA; [www.russcomm.ru](http://www.russcomm.ru)) currently include interpersonal

communication, → group communication, and → discourse pragmatics (→ Linguistic Pragmatics), along with media-related fields.

### Africa and the Middle East

Communication education and media studies are beginning to develop in *sub-Saharan Africa* despite the postcolonial legacy of economic and political problems that continues to affect academic and media institutions across much of the continent. The expansion of media industries in some countries has created a rising demand for journalism and communication training programs, which are generally based on western models. Research goes on in universities and research institutes in fields such as → development communication, → health communication, and → cultural studies (→ Communication as an Academic Field: Africa; Development Communication: Africa). Aside from the recently organized Trans-African Council for Communication Education (Tracce), the most currently visible academic association is the nationally based South African Communications Association (SACOM; [www.ukzn.ac.za/sacomm](http://www.ukzn.ac.za/sacomm)), which includes sections representing corporate and business communication, cultural and social theory, film studies, and journalism and media studies.

Having grown rapidly since the 1980s, the communication field is more densely developed in the *Arab world*, where at least 70 academic programs currently exist in universities across the region, most primarily engaged in technical training of undergraduates for occupations in media or public relations. The production of research, limited to date and usually based on western models, has focused on development communication, cultural identity, Arab → stereotypes, Islamic communication, new technology, and globalization, among other topics. Issues concerning imbalances in international news flows and policy debates on the → New World Information and Communication Order (NWICO) were prominent in the 1970s and 1980s. Academic associations currently active in the region include the Arab–US Association of Communication Educators (AUSACE; [www2.gsu.edu/~wwwaus](http://www2.gsu.edu/~wwwaus)) and the Saudi Association for Media and Communication (SAMC; [www.samc.org.sa](http://www.samc.org.sa)) (→ Communication as an Academic Field: Middle East, Arab World).

The field in *Israel* has developed differently from other countries of the region since the founding in 1966 of the Communication Institute of the Hebrew University of Jerusalem as the first Israeli institution for communication studies. Communication programs in Israel, which currently number 18, have traditionally emphasized theory and research, although practical training in journalism and media fields has increased since the 1990s, partly in response to privatization and consequent growth of the media sector. In addition to media research, both administrative and critical, Israeli scholars have been prominent in cultural studies, discourse studies, and → ethnography of communication, among other fields. The Israel Communication Association (IsCA; [www.isracom.org](http://www.isracom.org)) has about 200 members (→ Communication as an Academic Field: Middle East, Israel).

### Asia and the Pacific

In *South Asia* (India, Pakistan, and nearby countries) the field of communication grew from university-based journalism education, which developed slowly from the 1940s

through the 1980s, and from research projects sponsored by international foundations and agencies primarily concerned with the functions of media and communication in national development. Economic liberalization and privatization of education and media institutions in the 1990s led to a second phase in which the rapid growth of media industries and professions has driven the related growth of career-oriented media education and training programs at a large number of academic institutions. Communication research has also been expanding in areas such as development communication, community media, new media, cinema, and postcolonial studies, and new academic journals are appearing (→ *Communication as an Academic Field: South Asia*). South Asian media and communication scholars participate in local and international academic associations, among the latter especially the → *International Association for Media and Communication Research (IAMCR)* and the *Asian Media Information and Communication Centre (AMIC; www.amic.org.sg)*.

The communication field is burgeoning in *East Asia* and shows promise of important theoretical contributions spurred by efforts to adapt the discipline to Asian cultural traditions. Communication research and education, mainly in journalism and media studies, are well established in *Taiwan* and *Hong Kong* and have been developing rapidly in mainland *China* since the 1990s as economic liberalization has expanded the job market for communication professionals. The field is also highly developed in *South Korea*, where most universities have instituted journalism and communication programs since the 1970s, and where interpersonal communication and public relations studies are now growing along with the earlier established and still dominant media fields. Journalism education based on US models began to develop in *Japan* after World War II and the field of communication has gradually emerged in recent decades. As in some other parts of the world (e.g., *China* and *Russia*), practical instruction in speech communication skills and intercultural communication sometimes occurs in English programs, which forms a basis for developing studies of interpersonal forms of communication within the broader communication discipline. Communication and media studies are represented in the East Asian region by a growing number of academic journals and by international associations as well as nationally based associations such as the *Korean Society for Journalism and Communication Studies (KSJCS; www.ksjcs.or.kr)*, the *Communication Association of Japan (CAJ; www.caj1971.com)*, the *Chinese Communication Society (CCS; http://ccs.nccu.edu.tw)* in *Taiwan*, and the recently formed *Chinese Association of Communication (CAC)* in mainland *China* (→ *Communication as an Academic Field: East Asia*).

Communication, journalism, and media studies programs are developing in the *southeast Asian and Pacific* region, most prominently in *Hong Kong* (which can be included in this region for some purposes), *Singapore*, *Australia*, and *New Zealand*, but also in other countries such as the *Philippines*, *Indonesia*, *Malaysia*, and *Thailand*. Aside from the common themes of growth with a typical emphasis on journalism, public relations, and media studies, the diversity of the field across this vast region inhibits generalization. In *Australia*, for example, research and instruction cover a wide range of communication sub-fields, although not always institutionally located in communication/media departments or schools. Australian scholars have done important interdisciplinary work in intergroup communication, → *discursive psychology*, → *organizational discourse*, and *cultural studies*, among other fields. *Organizational communication* has a strong presence in *New*

Zealand. Comparative Asian studies are an important contribution from Singapore and Hong Kong. The Pacific and Asian Communication Association (PACA; [www.paca4u.com](http://www.paca4u.com)) and the Australia and New Zealand Communication Association (ANZCA; [www.anzca.net](http://www.anzca.net)) are among several academic associations that serve media and communication scholars in this region, and at least 11 local journals are published (→ Communication as an Academic Field: Australia, New Zealand, Pacific Rim).

## INTERNATIONAL ASSOCIATIONS

The field of communication as a whole is served by two international academic associations of worldwide scope: the ICA and the IAMCR. Several other international societies, such as the World Association of Public Opinion Research (WAPOR), the International Association of Language and Social Psychology (IALSP), and the International Association for Relationship Research (IARR), represent particular specialty areas.

ICA was founded in the USA in 1950 as the National Society for the Study of Communication (NSSC), an offshoot of what was then the Speech Association of America (now the National Communication Association), and launched the *Journal of Communication* in 1951. With its reorganization and adoption of its new name in 1969, ICA began a slow, uneven process of growth and internationalization that accelerated in the 2000s as a result of structural changes that markedly increased international membership and participation in the association's governance, conferences, and publication programs. As of 2007, ICA is a USA-based international organization of more than 4000 members from 76 countries. Its 21 divisions and special interest groups span most fields of communication and media studies. It holds conferences in the USA and around the world, and sponsors several highly ranked journals and a review yearbook, among other publications ([www.icahdq.org](http://www.icahdq.org)).

IAMCR from the beginning has differed from ICA in significant ways. Founded in 1957 by a Constituent Assembly meeting in Paris under the auspices of → UNESCO, the International Association for Mass Communication Research (as it was then called) was from the start a diverse international organization that, despite the global Cold War polarization of the time, brought together media researchers from the Soviet bloc, the developing world, and the west. IAMCR has further differed from ICA in being somewhat smaller and differently structured in membership, more focused on international media policy and development issues, and more actively involved in international policy debates on those issues. In response to the changing media environment of the early 1990s, IAMCR changed its name (while keeping the same acronym) to become the International Association for Media and Communication Research. IAMCR sponsors publications, including a book series, and holds major biennial conferences around the world, with smaller conferences held in alternate years ([www.iamcr.org](http://www.iamcr.org)).

## COMMUNICATION AS A DISCIPLINE

The word “discipline” in one of its standard senses refers to any distinct branch of knowledge or learning. Philosophers over many centuries in the western tradition have proposed category schemes for classifying knowledge (Machlup 1982). With the development of modern research universities since the nineteenth century, the notion

of a discipline has evolved in relation to specific institutional and professional structures (university faculties, scholarly societies, peer reviewed journals, funding agencies, etc.) that interact in complex ways with conceptually defined categories of knowledge.

Becher (1989), in a study of academic disciplinary cultures, wrote:

Disciplines are thus in part identified by the existence of relevant departments; but it does not follow that every department represents a discipline. International currency is an important criterion, as is a general though not sharply-defined set of notions of academic credibility, intellectual substance, and appropriateness of subject matter. Despite such apparent complications, however, people with any interest and involvement in academic affairs seem to have little difficulty in understanding what a discipline is, or in taking a confident part in discussions about borderline or dubious cases. (Becher 1989, 19)

Sociology, political science and economics are well-established social science disciplines in this academic system. While communication in the past few decades has acquired many of the trappings of a discipline, not even scholars in the communication field universally regard it as such.

By one relatively straightforward definition, an academic field becomes a discipline when it forms a faculty job market in which PhD-granting departments at different universities regularly hire each other's graduates (Abbott 2001). Communication does appear to meet this structural criterion. For example, a survey of ICA members conducted in 2005 found that two-thirds (rising to three-quarters of younger members) had received academic degrees in communication (Donsbach 2006).

Skeptics, however, still may debate whether communication is sufficiently coherent and distinct from other disciplines in its methods, theories, and objects of study to warrant admitting it to that exclusive club.

### **History of the Debate**

Communication's status as a discipline and/or an interdisciplinary field has been debated internationally at least since the 1980s. The "ferment in the field" addressed by a special issue of the *Journal of Communication* in 1983 mainly concerned the insurgency of critical cultural studies and political economy against the established tradition of functionalist mass communication research (Gerbner 1983). Because the insurgent approaches had gained earlier acceptance in Europe and elsewhere than in the USA, the "ferment" also involved tensions between different national traditions within an increasingly internationalized field. The primary theme implied by the title and contents of the special issue, although not endorsed with equal enthusiasm by all contributors, was unity in diversity. The dissidents were now "in" the field. The field would be redefined to include them.

This spirit of inclusiveness was somewhat in tension with a second theme of the 1983 special issue: that the sought-for unity-in-diversity of communication studies was that of a distinct academic discipline rather than an interdisciplinary area. Discussions of this theme foreshadowed the elements of the *communication science model* of communication as a social science discipline that was articulated in a series of prestigious publications over

the following decade (see especially Berger and Chaffee 1987). While the communication science model acknowledged a broader field of communication extending across a diverse array of academic disciplines and methodological approaches, it asserted the existence of, or at least the potential for, a focal *discipline of communication* marked by characteristic methods, lines of research, and scientific theories.

More specifically, the communication science model described the discipline in terms of *five salient features*: (1) its historical origins in the mid-twentieth-century interdisciplinary communication research movement; (2) its rapid institutional growth and consolidation in the last decades of that century; (3) its core identity as an empirical social science; (4) its proper place as a “variable” discipline spanning different “levels of analysis” in the scheme of academic disciplines (Paisley 1984); and (5) its urgent need to rejoin the “split” between interpersonal and mass communication that constituted the most serious barrier to the development of a cross-level theoretical core in the discipline (Hawkins et al. 1988; Craig 1994). Communication science admittedly did not yet have a well-developed theoretical core; however, its distinct focus on *messages* was said to provide a framework for constructing new theories to explain how messages perform specific *functions* across a micro- to macro-range of *levels of analysis* of communication. Whereas “level” disciplines like psychology and sociology focus on certain levels of human interaction, “variable” disciplines like communication and economics focus on variables that perform related functions on all levels.

The communication science model asserted grounds for inclusiveness and closer integration between interpersonal and mass communication studies, yet its core identity as an empirical social science tended to marginalize the critical and humanistic studies whose massive entrée into the field had produced the earlier-noted “ferment.” Aside from that structural problem, not even all empirical social scientists agreed that communication could or should become an independent discipline. Beniger (1988, 1990), for example, argued based on journal citation analyses that the academic field of communication had unfortunately isolated itself from interdisciplinary trends that offered the most fruitful approaches to communication theory. None of the most important communication theorists were associated with the communication discipline itself, he maintained; hence, communication research could thrive intellectually only if studied as an *interdisciplinary field*, not as an isolated discipline. Institutionalization of communication as a discipline has only produced intellectual poverty, according to this view (Peters 1986). Yet, as Donsbach (2006) noted, powerful institutional imperatives still drive communication to define itself as a discipline.

The ferment in the field was taken up in a different way in ICA’s 1985 annual conference on the theme “Beyond polemics: Paradigm dialogues” and a subsequent two-volume edited collection of essays (Dervin et al. 1989). Included among an international group of authors representing a wide range of areas and approaches to communication research were two major interdisciplinary theorists, Stuart Hall and Anthony Giddens. Although the communication science model was reflected in several chapters and commentaries, the framing vision of “paradigm dialogues” emphasized epistemological pluralism, interdisciplinary openness, and critical reflexivity in communication studies. One essay proposed that communication should be regarded as a “practical discipline” that uses both scientific and humanistic methods to pursue a common, essential purpose,

“to cultivate communicative *praxis*, or practical art, through critical study” (Craig 1989, 98).

In 1993, the *Journal of Communication* revisited the question of disciplinary status in two successive special issues on “The future of the field” (Levy & Gurevitch 1993). A cross-section of the 48 articles reveals *no emerging consensus*. Many writers referred casually to “the discipline” as if there were no longer any question of disciplinary status or identity. Many others claimed, some quite emphatically, that the field of communication was *not* a discipline, but they differed greatly in their attitudes toward this fact and their prescriptions for what, if anything, to do about it. Some were optimistic that the field was emerging toward disciplinary status; others seemed equally certain that no such thing was happening. Some saw the continuing fragmentation of the field as a problem; others celebrated fragmentation as an invaluable source of adaptive strength. Some called urgently for efforts to define the intellectual focus of the discipline; others just as urgently insisted that any such effort to define a theoretical core would be not only useless but counter-productive. Still others were unclear about the possibility or desirability of becoming a discipline but nevertheless proposed various conceptual definitions of the communication field.

None of these views clearly dominated the field by the mid-2000s. The disconnection between interpersonal and mass communication research was still regarded by some as a problem (McMahan 2004), as was the continued institutional growth of the field without any consensus on a theoretical core and a rigorous scientific epistemology (Donsbach 2006). The pluralistic vision of “paradigm dialogues” also continued (Putnam 2001; Dervin 2006), as did efforts to define a disciplinary theoretical core that could still accommodate the field’s pluralism (Craig 1999, 2007, forthcoming).

### PROSPECT FOR THE FUTURE

If communication is a discipline, it is one that will continue to have distinctly *applied* emphasis. As Donsbach (2006) noted, growth of the communication field has been stimulated by the *high demand for communication expertise* in modern societies. Applied communication research is both a quality that characterizes much of the field’s work globally as well as an organized sub-field that has developed, so far, principally in the USA (→ Applied Communication Research). The field’s practical relevance to important policy concerns, ranging from media concentration to public health campaigns to new forms of conflict resolution, both attracts research funding and draws communication scholars into policy debates (→ Communication Research and Politics). Also driving the field toward an applied emphasis is its incorporation of, or close *association with*, a *series of professional/occupational areas*, including, among others, journalism and other media fields, → public relations, → advertising, intercultural training, and organizational training and consulting. Creative efforts to resolve the inevitable tensions that arise between the different needs or value priorities of professional training versus academic research may, in an optimistic view, transform both types of work constructively (→ Communication Professions and Academic Research). Research scholars who may differ in their epistemological commitments still agree that communication research should be applicable to key normative questions and social problems (Deetz 1994; Donsbach 2006).

No matter how intellectually or institutionally well established the discipline of communication may become, many areas of the field will continue to be highly *interdisciplinary*. Contextually focused areas like health communication and political communication inherently straddle disciplinary boundaries. Study of the media as social institutions is unavoidably a multidisciplinary endeavor involving psychology, sociology, economics, legal and policy studies, technology studies, etc. The question is not whether communication will continue to be an interdisciplinary field, as it certainly will do. The open question is whether communication may also have a theoretical core that enables communication scholars to approach interdisciplinary topics from a distinct disciplinary viewpoint that adds real value to the interdisciplinary enterprise. The growing centrality of *communication as a theme in global culture* involves the discipline of communication in a “double hermeneutic,” a process in which the academic field derives much of its identity and coherence from its profound engagement with communication as a category of social practice while also contributing to the ongoing evolution of that very cultural category that constitutes the discipline’s centrally defining object of study.

# Communication: History of the Idea

John Durham Peters

University of Iowa

The word “communication” is descended from the Latin noun *communicatio*, which meant a sharing or imparting. From the root *communis* (common, public), it has no relation to terms such as *union* or *unity*, but rather is linked to the Latin *munus* (duty, gift), and thus has relatives in such terms as *common*, *immune*, *mad*, *mean*, *meaning*, *municipal*, *mutual*, and German terms such as *Gemeinschaft* (community) and *Meinung* (opinion). Its root senses have to do with change, exchange, and goods possessed by more than one person; the Latin verb *communicare* means to make common (→ Communication: Definitions and Concepts).

## ANTIQUE ANTICIPATIONS AND MODERN MEANINGS

Three lasting strands of meaning are already visible in the Latin root. The first is communication as a mutual exchange in language. The Roman philosopher-statesman Cicero used *communicatio* as a technical term in his treatise on rhetoric, *De Oratore*, to explain what occurs when an orator overtly includes the audience in the discussion by means of rhetorical questions or staged dialogue (thus “sharing” the floor with listeners). (→ Rhetorical Studies). The notion that communication involves some kind of mutual exchange between speaker and hearer(s) will be one of the defining features of the idea from Cicero onward. Here Cicero is extending *communicatio*’s basic sense of imparting to the realm of speech.

A second strand is visible in the Vulgate, Saint Jerome’s fourth-century Latin translation of the Bible. Here *communicatio* means the imparting of things both tangible (bread) and intangible (spirit). Christianity expanded the idea of communication from material to metaphysical senses: *communicatio* could mean both a physical sharing of food or drink and a spiritual sharing of mind or soul. The Vulgate reinforced the notion of communication as a spiritual sharing.

A third sense is communication as pollution or contamination. As the common can be profane (vulgar or inferior), making common can be taken as defilement or degradation, a sense found in both the Greek New Testament and the Vulgate.

All three senses – rhetorical, spiritualist, and purist, respectively – persist into the modern world. *Communicatio* left descendants in the Romance languages (French *communication*, Spanish *comunicación*, Italian *comunicazione*), and French bequeathed the term to English in the fourteenth and fifteenth centuries. Though most languages have rich semantic clusters around “the common,” English launched the concept of communication into the modern world, and is thus the focus here. The King James Bible (1609), a foundational source for modern English, uses “communication” both to refer to speech (e.g., Matthew 5:37) and to sharing material goods with other people (1 Timothy 6:18). In Shakespeare as well, the verb “to communicate” could involve diverse substances (parts, strength, words), not exclusively symbolic matters. As late as the eighteenth century, the term had the predominant sense of sharing physical rather than metaphysical entities. Philosopher David Hume, for instance, used “communication” to refer both to

billiard balls (communicating motion) and to feelings (communicating emotion). It could even be used to refer to sexual intercourse, just as the term *intercourse* once meant more or less what we mean by “communication” today (human relations).

Communication’s modern sense as a reciprocal sharing of minds through speech was perhaps born in John Locke’s enormously influential *Essay concerning human understanding* (1690). In Locke, “communication” was the practice by which two or more minds shared “ideas” via words. He saw language as a “conduit” (Reddy 1979) between private meaning and shared understanding; signs publish the private wealth locked inside inner experience. He wanted to cure people of the tyranny of meaningless words, but he also loosed the specter of communication breakdown. He left the door open for later thinkers to the labyrinth of solipsism and the doldrums of empty convention – two options quite remote from his own ideal of civil, empirically grounded language use. In Locke, the spiritualist edges out the rhetorical sense: communication meant ways of creating shared mental space, not practices of coordinating public actions. Locke interiorized, privatized, and de-rhetorized communication.

### THE CONUNDRUMS OF COMMUNICATION

The next step was the twinned revolution of transportation and distant signaling that occurred in the long nineteenth century (Mattelart 1996; → Technology and Communication). What Adam Smith had casually called “free commerce and communication” in *The wealth of nations* (1776) soon took on special freight in the wake of political and industrial revolutions, the steamship and railroad, imperialism and the growth of a world market. By the time of Alfred Marshall’s epoch-making *Principles of economics* (1890), “communication” had become a regular term in economics, and an earlier economist with a very different outlook also gave “communication” (*Verkehr*) a central spot in his theory: Karl Marx. “Communication” retained a strong transportational sense into the early twentieth century and the term “lines of communication” still describes military networks for moving messages, troops, and supplies. By the early twentieth century, “communication” could refer to all the ways in which people interact symbolically.

The American sociologist Charles Horton Cooley announced the key rupture in 1894: “transportation is physical, communication is psychical.” This dematerialization of communication took its immediate inspiration from electricity – a potent medium and metaphor for human connection since the eighteenth century. By putting distant terminuses into instantaneous contact, the electrical telegraph revived the older spiritualist sense of “communication.” Indeed, the spiritualist movement was inspired by electrical telegraphy and later radio. “Wireless” intelligence was considered magical or uncanny. When *telepathy* was first named in 1882, it was defined as “the communication of impressions of any kind from one mind to another, independently of the recognized channels of sense.” Visions of channel-free communication were endemic in pre-Einsteinian physics and early radio practices in the late nineteenth century (Hagen 2001). The sense that communication was uniquely “psychical” spoke for a sea change in human economic and symbolic relations over the long nineteenth century.

The long revolution also precipitated a first wave of critics. Conservative individualists such as Carlyle and Kierkegaard, self-critical liberals such as Tocqueville and Mill, and

Transcendentalists such as Emerson and Thoreau all lamented the ways in which communication made prized things common (ordinary, vulgar). These complaints would only grow stronger in the twentieth century, especially in postwar criticisms of “mass culture” and “mass society.” Some saw real communication as a form of protest against a false world; others saw communication itself as the problem. Kierkegaard was one of the first to make communication (*Meddelelse*) a philosophical problem, specifically of how to disclose truth amid a din of inauthenticity. This theme was taken up influentially in the twentieth century by philosophers such as Karl Jaspers, Martin Heidegger, Martin Buber, Jean-Paul Sartre, Hannah Arendt, and Emmanuel Levinas (Pinchevski 2005). For these more or less existentialist thinkers, communication was both cure and disease, an ambiguity that goes back to *communicatio* as sharing and as pollution. A somewhat related sense of the impossibility of communication was manifested in the fractured dialogue that started to appear in several influential late-nineteenth-century playwrights such as Chekhov, Ibsen, and Strindberg, and which was to become a hallmark throughout twentieth-century drama and cinema.

A similarly double-sided analysis of communication took place in American social thought around the turn of the twentieth century. Pragmatist thinkers such as Jane Addams, Charles Cooley, John Dewey, George Herbert Mead, Charles Sanders Peirce, and Josiah Royce both feared the flattening effects of modern social life and celebrated the ethical and political potentials of communication (→ Pragmatism). Communication they saw as ethical because it taught us to assume the position of the other; they saw it as political because it helped to build democratic community. These thinkers created a rich treasury of communitarian communication theory. One heir is the German philosopher → Jürgen Habermas, perhaps the most important thinker about communication in the later twentieth century.

In the wake of World War I's horrific destruction and fearsome propaganda, many pondered communication and the power of symbols. Literary theorist → Mikhail Bakhtin, poet T. S. Eliot, linguist Roman Jakobson, political scientist → Harold Lasswell, political commentator → Walter Lippmann, critics C. K. Ogden and I. A. Richards, anthropologist Edward Sapir, philosopher Ludwig Wittgenstein, and novelist Virginia Woolf were some of the figures who grappled with the failure of communication, its all too successful influence on people's minds, or its centrality to the human condition. By the late 1920s the term “mass communication” came into use for the new reality of persuasion industries organized by the market and state (Peters & Simonson 2004). By the 1940s, the field of “communications research” was being organized by figures such as → Paul Lazarsfeld, and its academic institutionalization continued in later decades, eventually yielding a prolific variety of theories of communication (Craig 1999; → Communication as a Field and Discipline). By the end of the twentieth century, almost every serious intellectual had something to say about communication (Beniger 1990). It was an index of the age.

## THERAPEUTIC AND TECHNICAL TRENDS

Two more strands round out the twentieth century. The therapeutic strand owes something to both the pragmatists and the existentialists, and sees communication as a

criterion of mental health and a requirement for self-realization. That the notion was embraced by psychiatrists is evident in the book title, *Communication: The social matrix of psychiatry* (1952) by Jurgen Ruesch and Gregory Bateson (→ Communicology). Here they coined the pregnant term “metacommunication,” one that would prove fertile for Paul Watzlawick and “the Palo Alto School” in the 1960s, which viewed schizophrenia as essentially a problem of communication in families. Harry Stack Sullivan, Carl Rogers, and other psychological thinkers saw communication as a therapeutic norm useful not only for treating individual psychopathologies, but also for resolving global conflicts as well. By the 1970s, the notion that “communication” was a means of self-affirmation as well as a deep existential need had become an established and sometimes parodied part of American culture (Katriel & Philipsen 1981). Despite obvious contraindications, the notion that communication makes people better or happier does not seem to have lost its hold.

Finally, “communication” implies progress in techniques and technologies. A utopian and dystopian tradition stretching from the telegraph to the Internet, the technical strand hit one pinnacle in mid-century. *The mathematical theory of communication* (1948) by engineer Claude Shannon, and popularized by physicist Warren Weaver, not only institutionalized the telecommunications model of “sender, message, channel, and receiver,” but conceived information in terms of the old thermodynamic favorite, entropy (→ Information). This intellectual tour de force quickly spread to a wildly diverse set of fields in the 1950s, including psychology, music theory, philosophy, political science, linguistics, and genetics. Norbert Wiener’s *Cybernetics* (1948), in contrast, warned of the imminent displacement of the human brain in the second industrial revolution (→ Cybernetics). These two texts, which emerged from commercial and military research, had international resonance. In the Soviet sphere, translations of Wiener in the 1950s led to a new term *kommunikatsiya*, which entered Russian to join older terms such as *obshchestvo* (society) and *obshcheniye* (communication). Indeed, derivatives of the Latinate term “communication” have flourished in many languages since World War II alongside native equivalents. In postwar France, philosopher Jean Hyppolite and psychoanalyst Jacques Lacan wrote on information theory, and since then communication has been a lasting concern in French thought for such diverse thinkers as Michel Serres, Jacques Derrida, Régis Debray, Luce Irigaray, and Jean Baudrillard. Thanks to → Harold Adams Innis and → Marshall McLuhan, Canada was another center for communication theory from mid-century, as was Germany from the 1970s, thanks to thinkers such as Niklas Luhmann and Friedrich Kittler.

The history of the idea of communication reveals diverse semantic strands: rhetorical, spiritualist, purist, transportational, communitarian, therapeutic, and technical. These lines of meaning give the term power and resonance. Some might consider it ironic that “communication” as a term fails to live up to the ideal of communication that it is often expected to fulfill – indisputable transmission of meaning. Rather, we might learn something profound about communication itself from the fact that even its name is full of competing meanings and visions. Plurality and difference seem to be our lot in both the theory and the practice of communication.

## **Communication Inequality**

*Shoba Ramanadhan*

*Harvard University*

*K. Viswanath*

*Harvard University*

Communication inequality refers to differences in the generation, manipulation, and distribution of → information among social groups, as well as differences in: (1) access to and use of information channels, (2) attention to media content, (3) recall, knowledge, and comprehension, and (4) capacity to act on relevant information among individuals (Viswanath 2006). The intellectual origins of the communication inequality theory can be traced to the knowledge gap hypothesis by Tichenor et al. (1970), an early formalization of inequalities in communication research (→ Knowledge Gap Effects). According to this hypothesis, benefits from information flows on a given topic are more likely to be accrued by people of higher socio-economic status compared to people of lower socio-economic status, thus widening the existing gaps rather than narrowing them, drawing attention to

the unequal media effects. Subsequently, the term → “digital divide” made its way through both scholarly and popular literatures, drawing attention to the unequal access to the → Internet among different social groups. Viswanath expanded on these formulations of access to one medium (the Internet) and → media effects on knowledge to incorporate the thesis of inequalities across the communication continuum as well as across information delivery systems (Viswanath 2005, 2006). In its current formulation, the communication inequality thesis draws attention to disparities across the communication continuum, starting with access to learning, and the consequences of the disparities. Moreover, it argues that the inequalities may manifest at both individual and group levels.

### **DIMENSIONS OF COMMUNICATION INEQUALITY**

The first dimension of communication inequality relates to differences among individuals and social groups in their access to and use of a variety of information channels (→ Access to the Media; Exposure to Communication Content). These patterns exist in both developing and developed nations. For example, an assessment of mass media use among a range of African countries suggests that despite recent increases in mass media use overall, the ability to access a broad range of mass media resources is constrained for most individuals, and illiteracy and poverty often impede supply and demand of these resources. Lack of electricity or remoteness may limit the forms of media available (World Bank 2002). Alternatively, illiteracy may restrict access to certain types of media. For example, a recent survey found that in Mozambique, 62 percent of men are literate, compared to 31 percent of women, greatly impacting the types of media they can consume. Similarly, across the continent, most rural populations had higher rates of illiteracy than their urban counterparts (→ Media Use by Social Variable).

In developed nations, such as the United States, access to and use of information channels also varies between groups. For example, higher socio-economic groups are more likely to use the Internet for health information (Viswanath 2005; → Exposure to the Internet; Health Communication and the Internet). Similar patterns have been found in Germany based on gender, age, level of education, and other socio-demographic characteristics (Kubicek 2004; → Internet Use across the Life-Span). These inequalities appear to particularly manifest in the access to and use of media that demand recurring expenditures, as well as in complications in use. Often, issues of class, race, and ethnicity may conflate, generating inequalities, particularly in multiracial and multilingual societies.

Attention to media is a significant predictor of knowledge about a given health topic. Inequalities in → attention may lead to inequalities across the communication continuum from processing to communication effects. For example, recent data from the Health Information and National Trends Survey (HINTS) conducted by the National Cancer Institute in the United States show that greater attention to health information in → newspapers, → magazines, and the Internet was linked to higher education levels, though these differences did not present for → radio and → television.

The growing advances in medicine, science, and technology, despite their immense benefit to humankind, also place greater demands on individuals and institutions that are attempting to understand and use this information. These developments trigger information flows, yet the benefits from the flows accrue unequally among different social classes,

as predicted by the knowledge gap hypothesis (Tichenor et al. 1980). Conditions that may deter gaps from opening or widening include inducing or increasing relevance for that information, wide diffusion of information leading to saturation on that topic, the controversial nature of the topic, extensive social ties, participation and involvement in community groups, and use of appropriate information channels (Gaziano 1983; Viswanath & Finnegan 1996; → Diffusion of Information and Innovation).

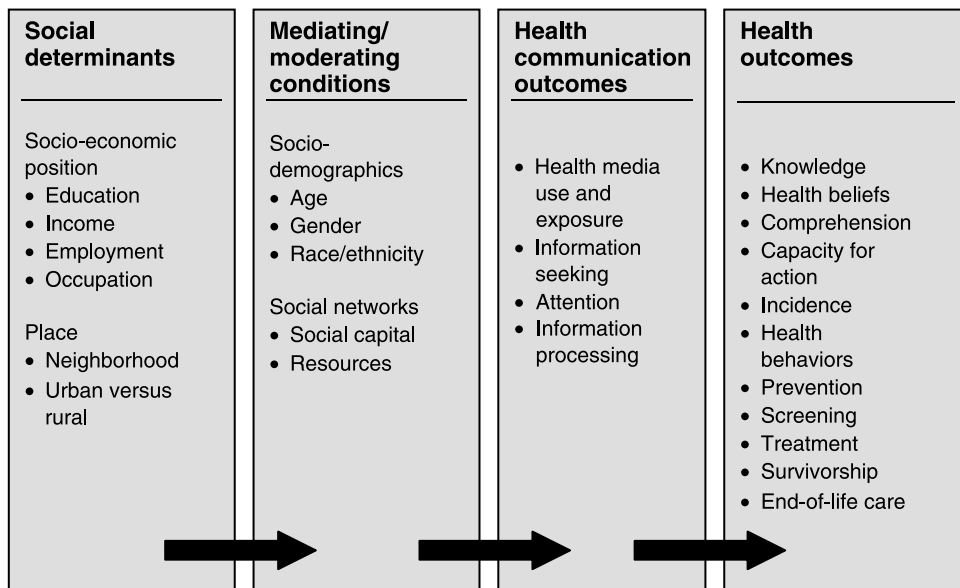

Inequalities in communication may also manifest in individuals' and groups' capacity in using the information. For example, in health, individuals vary a great deal in their ability to use health information to direct their medical and health needs. Part of this problem stems from limited → health literacy, an ability to find and use relevant health information to make decisions about one's health that are consistent with one's values. The capacity to act on information requires not just individual motivations and skills, but support from the environment and resources to act on the information. For example, mere provision of information about engaging in physical activity is unhelpful if the audience lack access to green space or live in unsafe neighborhoods, conditions that are more likely to be experienced by the poor.

### **APPLICATION OF COMMUNICATION INEQUALITIES: HEALTH DISPARITIES AS AN EXEMPLAR**

The thesis of communication inequality may offer one potent explanation for inequalities that exist in other aspects of our society. For example, communication inequalities may offer one explanation for widespread disparities in health, an inequity that has been attracting increasing attention from different groups (Institute of Medicine (IOM) 2002b; World Health Organization 2007; → Health Disparities, Communication in). Health disparities are disproportionate disease burdens faced by certain social groups, leading to increasing morbidity and mortality. For example, in the US, there is a clear socio-economic gradient in diabetes, where those in the lowest income group had a prevalence rate of 9.7 percent compared to 3.5 percent among those in the highest income group (Kanjilal et al. 2006). In Bangladesh, the neonatal mortality rate is 1.63 to 2.0 times higher among poor versus rich families (Razzaque et al. 2007).

Social epidemiology, the study of social determinants of population distributions of health, offers several explanations for such disparities, including social cohesion, social class or socio-economic status, social networks, work environment and life transition, neighborhood and residential conditions, and social policies, among others (Berkman & Kawachi 2000). Yet, while a number of explanations have been offered to suggest why these "social determinants" may contribute to health disparities, the precise mechanisms linking social determinants with individual and population health are yet to be delineated.

Viswanath et al. (2007) offered the structural influence model (SIM) of communication to connect social determinants to final health outcomes through communication (Fig. 1). The model posits that health outcomes and health disparities can be explained by understanding how (1) structural determinants such as socio-economic status and geography, and (2) mediating mechanisms such as gender, age, and → social networks, lead to (3) differential communication outcomes, such as access to and use of information

**Figure 1** Structural influence model (SIM) and health communication  
*Source:* Viswanath et al. (2007)

channels, attention to health content, recall of information, knowledge and comprehension, and a capacity to act on relevant information among individuals. Structural antecedents such as socio-economic status and geography influence both the information environment and resources for consumption, leading to differential communication behaviors, which in turn may affect actions along the public health continuum, including knowledge, prevention, detection and treatment, survivorship, and quality of life. Health disparities, therefore, may be explained partly by inequalities along the communication continuum resulting in a cumulative effect on ultimate health outcomes.

## FUTURE DIRECTIONS

Despite innovations in information delivery systems and their speedy diffusion, inequalities are unlikely to ease or disappear. Constant innovations demand continuous and recurrent investment in information delivery services, placing demands on one's discretionary incomes. Moreover, people make conscious choices as to how they allocate money to different communication services, including entertainment and telecommunication services. Yet communication is a social function. Individuals' tastes, interests, and needs are shaped and influenced by their immediate orbit, including their social networks, significant peers, class interests, group norms, and perceptions about their leadership roles. Moreover, choices are made within certain constraints of availability of degree of discretion and calculations about relative costs. Thus, choices in both subscriptions to media services and exposure to content are still influenced by socio-economic status and social networks.

Further work in this area will have to elucidate such issues as:

- 1 How can information be targeted to underserved groups while accounting for structural barriers to access?
- 2 What are the obligations of institutions such as government and public and private sectors to ensure that current and future policies and innovations do not widen communication inequalities?
- 3 The constant change and improvement in technologies of information delivery systems assume – or, in fact, may even demand – frequent investment in new technologies (→ Information and Communication Technology, Development of). Is this likely to be a deterrent for those who cannot afford to update their technologies as is warranted by the development of new systems?
- 4 Is the increasing sophistication in using and operating the new technologies likely to leave certain groups at a disadvantage? What are the downsides, if any, in not using new information delivery systems?
- 5 What are the implications of interactive effects of technologies and formats on attention and learning among different populations groups, and specifically, on their impact on communication inequalities?
- 6 What are the implications of social and communication policies on communication inequalities (→ Media Policy)?

These questions have acquired a sense of urgency given the characteristics of our epoch, which is sometimes called the “information age.” In the so-called “information age,” inequalities in communication are as invidious as inequities that exist in wealth, health, and power.

## Communication Infrastructure

*Alison Gillwald*

*University of the Witwatersrand*

Communication infrastructure refers to the backbone of the communications system upon which various broadcasting and telecommunication services are operated. This can be built from copper cable, fiber, or wireless technologies utilizing the radio frequency spectrum, such as microwave and satellite. The infrastructure is the core component that connects upstream production, such as voice, data and audiovisual services, with downstream consumers.

Albert Hirschman's (1958) now widely used definition of infrastructure as capital goods offering public services, often associated with public utilities such as electricity, water, and communications, remains pertinent to communication infrastructure today because it does not link public services to public capital goods. The definition accommodates public services being offered by public entities as they have been traditionally in most jurisdictions, but does not exclude public services from being offered by privately

owned and operated capital firms. Despite ownership and investment of communication infrastructure predominantly having been transferred from the public to the private sector through privatization and the introduction of competition to traditional monopoly networks, private communication operators continue to offer public services in addition to certain private services and, for this reason, continue to be regulated to different degrees in different jurisdictions.

### ECONOMIC AND SOCIAL SIGNIFICANCE

The economic and social significance of communication infrastructures lies in the nature of such networks. They have the potential to produce value much greater than the direct investment made in them. Unlike other goods, the addition of new subscribers to a telecommunication network, rather than diminishing the availability of service, indirectly benefits those already on the network and enhances the value of the network by creating more calling opportunities. This side effect of a transaction is referred to as a “network effect” and can be positive or negative (Bergman et al. 1998). Additional subscribers on the network only enhance its value up to the point of congestion, after which the effect is negative. Hence the need for networks to constantly extend their capacity to meet demand (→ Telecommunications: Law and Policy).

Such side effects or “externalities” can further extend outside the network. Access to broadcasting services, for example, could indirectly (positively) improve social cohesion or (negatively) erode cultural values as a result of foreign content. The extension of telecommunication infrastructure is associated with greater business activity, which it has the potential to enable and make more efficient (→ Information and Communication Technology, Economics of).

It is the positive *economic and social “multipliers” or “spillovers”* that motivate the state to seek investment in and to coordinate infrastructure development even if it is not provided directly by the state. Investment in communication infrastructure contributes directly to economic activity in that it creates demand for the high-cost products used in the expansion of the network. It has also an indirect impact in that telecommunications is an input for other services. If efficiently provided, it has the potential to reduce the transaction costs between businesses and with customers. Infrastructure expansion produces positive economic multipliers as productivity within the economy is increased through more efficient information gathering and the substitution of communication for higher-transactional-cost activities (Röller & Waverman 2000). Social multipliers associated with safety and survival, and social cohesion more generally, are also well documented, though they have not been costed or quantified (see Grace et al. 2001; Mansell & Wehn 1998).

Despite research in OECD country studies indicating a positive correlation between fixed *communication infrastructure and economic growth*, demonstrating causality has proved problematic (Waverman & Röller 1997). In 2000, after an extensive study of 21 OECD countries over 20 years, Röller and Waverman (2000) concluded that investments in the telecommunication infrastructure had strong growth effects and that causality is two-way in that communication infrastructure development and economic growth catalyze each other. Perhaps more significantly for developing countries, they also found

that in order for the positive growth effects of infrastructure investment and expansion to be realized, a critical mass or a threshold of a significant size would be necessary for the network effects to kick in (→ *Communication Technology and Development*). This critical threshold is close to universal access – around 40 percent of the population, assuming around 2.5 people per household. This would explain the absence of the often anticipated positive growth associated with infrastructure investment in many developing countries where, despite improvements, teledensity remains on average under 4 percent in non-OECD countries (Röller & Waverman 2000). The exponential extension of networks to meet this critical threshold would require unprecedented investment in national communication infrastructures, probably possible only through the creation of private investment opportunities and sufficient institutional capacity to regulate it in the public interest.

Credé and Mansell highlight the significance of this as knowledge-based development becomes a more important aspect of the global economic and social order: “advanced communication networks will become more central to the acquisition of information . . . Without the appropriate communication infrastructure, ICTs might accentuate, rather than ameliorate, existing parities in income, wealth and opportunity” (Credé & Mansell 1998, 19).

## **PUBLIC GOODS**

Communication infrastructure, like other national infrastructure such as electricity and water, has long been understood as a “public good” (→ *Public Goods*). These goods are regarded as so beneficial to society and the economy that access to them needs to be insured by the state, historically often through the creation of public utilities. Even where communication infrastructure has not been provided by the state, it is regarded from a policy perspective as an economic and social good, public access to which should be insured as far as possible through regulation (see Melody 1997; Laffont & Tirole 2000). While access to communication is not a pure public good in the classical sense in that, unlike defense of a country or clean air, it is technically possible to exclude someone from the service, the attainment of universal access to this public good is a core principle from a policy perspective.

In addition, communication networks are nonrival – a distinguishing characteristic of public goods – that is, the consumption of the services offered by an adequately proportioned network does not diminish the availability of the services or goods for others. An additional listener to a radio station does not affect other listeners on the station. Indeed, additional listeners or viewers of broadcasting services enhance the value of the audience for advertisers or better justify the public cost of delivering the service (→ *Consumers in Media Markets*).

## **NATURAL MONOPOLY AND PUBLIC UTILITIES**

Historically, the economic rationale for state provisioning of communication infrastructure was that these essential facilities and services could not be economically duplicated due to high fixed costs in several parts of the network. It therefore constituted a natural

monopoly (Laffont & Tirole 2000). It was operated as a public utility on the grounds that the only way to bring essential services affordably to citizens was through the economies of scale and scope made possible by a monopoly.

However, the potential offered by economies of scale and scope tends to be under-exploited when companies have no incentive for efficiency, as they would have in a competitive environment. On the contrary, the inefficiencies in many, particularly developing, countries, of state-run infrastructures have led to their paying a capital cost per line three or four times above international averages and little of the service revenues being reinvested in network extension and development. The widespread practice of subsidizing calls of those with access, and often greater resources, at the expense of those who could not own telephones meant insufficient internal revenue was generated to invest in network expansion (Stiglitz 1999).

As the necessity of developing a national information infrastructure as the backbone for a modern economy became evident, modernization and extension of communication infrastructures became the key drivers of a wave of telecommunication reform from the 1980s onwards. The poor outcomes of public provisioning in many countries, especially developing countries due to the lack of investment in network development, led to the privatization of national communication infrastructures and liberalization of markets. With new cost-effective technologies making possible the economic duplication of certain infrastructure components and services, and a growing acknowledgment of the inefficiency of telecommunication monopolies, the rationale for monopolies was increasingly eroded and difficult to enforce without resorting to repressive measures. The market was increasingly perceived as a more efficient operator of communication infrastructures and deliverer of services (Laffont & Tirole 2000).

## REGULATION AND COMPETITION

However, the imperfect nature of the telecommunication market, with its infrastructure bottlenecks and *high barriers to entry*, were acknowledged as requiring regulation to insure fair competition and to deal with market failures associated with the delivery of services to uneconomic areas (→ Digital Divide). The most critical aspect of creating a fair competitive environment is insuring access to infrastructures by competitors through interconnection and facilities leasing arrangements. The necessity of regulation relates to the special nature of infrastructure industries. For seamless communication by customers on different networks, rival firms need to cooperate in order to deliver services. Interconnection appears to be a logical and mutually beneficial action between competing customers: the more subscribers there are the greater the network effect and benefit to the entire network system. However, this is so if the networks that are interconnecting are of a similar size; but, if an incumbent's network is significantly larger than the new entrant network desiring interconnection, the benefits of interconnection are not symmetrical. Incumbents are likely either to delay interconnection or to restrict the conditions of interconnection or price it so that it is difficult for the new entrant to compete effectively (See Laffont & Tirole 2000; Melody 1997; → Competition in Media Systems).

Regulating access to facilities raises particular issues in a case where, as in many developing country jurisdictions, despite some liberalization of the services market, the

privatized entity has retained its monopoly on certain network elements and services and downstream competitors are required to acquire their facilities from it. Even if competition based on full facilities and service exists, it is likely that certain elements of the network are not economic to duplicate and open access is therefore essential.

### ESSENTIAL FACILITIES

A case in point is undersea cable *infrastructure in Africa* (→ Africa: Media Systems; Communication Law and Policy: Africa). Even with the opening up of international gateways in many countries there is only one economically feasible source of high-quality bandwidth which today is the SAT-3 undersea cable. It was built by, and is operated through, a closed consortium of African incumbents and international operators who have exclusive rights on the landing stations in their countries. Their practices have come under fire by a multi-stakeholder continental initiative to demonstrate the access and cost benefits of nonexclusive open access regimes for African countries which have the most expensive international bandwidth in the world. There have been calls to regulate these landing rights as “bottleneck” or “essential” facilities. This attention has also highlighted the arbitrariness of the costing of this essential facility for African countries at the national level and discrepancies in the charges across different portions of the network. A price survey of African countries that use SAT-3 for their international bandwidth showed that Telkom SA is charging up to 800 percent more than other countries for a megabit per second per month. While the Senegalese incumbent Sonatel charges only US\$1,316, Telkom SA, which also holds the management contract for the cable, charges US\$11,000 (Southwood 2006).

For some eastern and southern Africa countries the longer-term solution lies in the *Eastern Africa Submarine Cable System* (EASSy), which is to be completed by 2008. Through the intervention of nongovernmental and academic organizations and the e-Africa Commission, the consortium established to build the cable has been far more open and the approach to landing rights nonexclusive. Bandwidth will be sold on an open access model where everybody can purchase it at the same price whether they are an investor or not. Of course, while EASSy will provide relief for the eastern and southern African countries, including many landlocked countries that have bought into the consortium, the likelihood that west Africa will have any alternative to SAT-3 in the foreseeable future is poor, rendering the landing station a natural monopoly which requires regulation.

### INVESTMENT, CREDIBILITY, AND ECONOMIC GROWTH

Intervention of this kind by regulators, however, has to be clear and reflect a fair rate of return on operator investment, otherwise it could impact negatively on future investments. This is one of the major challenges for regulators in insuring that the benefits of competition are achieved by guaranteeing access to all competitors to scarce resources such as spectrum, numbers, rights of way, incumbent infrastructure, and facilities. From an investor’s perspective all are regarded as “regulatory risk.” If, however, the government is regarded as credible as a result of clear policies and contracts on which there is no history of renegeing, and regulation is transparent and independent of political and

commercial interference, there is evidence that this can induce investment in new operations (See Gillwald 2005; Mahan & Melody 2005).

Because infrastructure investment is capital-intensive and involves long-term, “sunk” or nonrecoverable costs, governments have often induced infrastructure investment by offering periods of exclusivity (monopoly) at the time of privatization or reserving particular activities for new licensees before introducing competition. After several decades of reform there is evidence that the sequencing of these activities is important. Where privatization has occurred prior to competition, without effective regulation prices generally increase. There is little innovation of new services and even network extension, unless compelled, may not increase significantly (Wallsten 2001, 2002).

### CONVERGENCE

Broadcasting and telecommunication infrastructure looked much the same for the first 100 years of their existence. However, in the last few decades infrastructure has required constant reinvestment in network upgrades in response to the constant waves of new generation technologies and associated services. Historically, these services have been operated on distinct platforms but with digitization and the reduction of all communication information into bits, telecommunication services such as voice services and data services such as the → Internet can be offered on cable and satellite infrastructure proportioned for television (→ Cable Television; Satellite Television). Television can be offered on new broadband networks of fiber, upgraded cable, and wireless infrastructure originally used for telecommunications. This has allowed not only for the convergence of broadcasting and telecommunications but for convergence within telecommunications, for example, between fixed and mobile voice services that were previously operated on separate networks (→ Digitization and Media Convergence).

This has compelled policymakers to create a regulatory framework and licensing regime better suited to the *convergence of broadcasting and telecommunication infrastructures*. Primarily this entails shifting the licensing of the silo-like vertically integrated operators that have characterized the market structure in the industrial era to horizontal service layers – infrastructure, services, and content (ITU 2005). Increasingly, it is only the “infrastructure” or “network” layer that requires a license, with the other service layers automatically receiving class licenses on compliance with basic threshold requirements, which might be only registration. This framework is more suited to the IP-based networks that are likely to dominate communication rollout in future and the seamlessly integrated information infrastructure necessary for a modern economy.

### NEXT GENERATION NETWORKS

Whilst digitization allowed for the convergence of broadcasting and telecommunications services through reduction of all services into bits that could be carried across any platform, it is through new IP-based networks that seamless communication across integrated networks can be realized. Such networks are generally referred to as *next generation networks* (NGN) and are evidenced in the increasing number of lower-cost, IP-based services such as Voice over IP (VoIP) and IP Television (IPTV).

The shift from circuit switched to packet switched protocols allows traditionally distinct PSTN, wireless, DSL, 3G, CATV, and potentially new power line communication networks to be integrated through common standards. The layered nature of these NGNs' architecture allows for the separation of the service from the transmission layers and permits new services to be offered independently of the underlying infrastructure on which they run. A significant characteristic of IP-based networks is the ability to distribute intelligence across the networks from the core to the periphery, unlike traditional public switched telephone networks (PSTNs), enabling the connection of different types of access networks at their intelligent edge (Wey et al. 2006). This is critical for the growth of potentially cheaper, decentralized services and the seamless connection of networks that enhances the network effects or positive multipliers (→ Television Technology).

Combining IP-based services with lower-cost, rapidly deployable wireless technologies has enabled rapid and easy entry into the market by new service providers, some of which have been able to circumvent technical and regulatory restrictions, often undermining the rationale for regulation and potentially the revenues of traditional PSTNs.

Despite prohibitions on many of these IP-based services in many developing countries, the significance of this type of network for countries with limited infrastructure is that considerably more efficient IP-based networks could be rapidly and flexibly deployed. Unencumbered by the financial and technical concerns of countries with extensive legacy networks, such countries would be able to benefit from open standards and global economies of scale and scope. Countries without these obstacles or those that rapidly reach a decision on how to enable IP-based networks will have quicker times to market and are more likely to achieve more widespread ICT diffusion.

## Communication and Law

*Amy Reynolds*

*Indiana University*

The phrase “communication and law” is used in this entry to refer broadly to the general field of speech and press law. It is also used to denote multidisciplinary research done at the intersection of two distinctly separate disciplines of study (communication *and* law).

The study of communication and law has traditionally been nation-specific, with a few exceptions, i.e., “those areas where particular technologies or common goals mandated a degree of international cooperation” (Huffman & Trauth 2002, 73). This is still true today, although less so than in the past. Perhaps the best examples of contemporary areas where technology and a common goal has allowed for substantially greater global cooperation are in the areas of intellectual property and Internet regulation (→ Intellectual Property Law; Internet Law and Regulation). The explosive use of the Internet as a “borderless technology with no international boundaries” has called into question the traditional, nation-specific approaches to communication law (Huffman & Trauth 2002, 91), although clearly nation-specific approaches still prevail.

## FREEDOM OF EXPRESSION

There is no such thing as absolute freedom of speech and the press, for freedom of expression is subject to various social, political, economic, or legal controls of its society. This is also true more broadly about freedom of expression, a term which many people use to refer to both free speech and free press (→ Freedom of the Press, Concept of). Fenwick and Phillipson put it another way: “Almost all free expression jurisprudence is, today, media jurisprudence” (2006, 2). Legal scholar Thomas David Jones has observed that free speech is a “general norm of customary international law” (1998, 37). The Universal Declaration of Human Rights, the European Convention on Human Rights, the International Convention on the Elimination of All Forms of Racial Discrimination, the International Covenant on Civil and Political Rights, the → American Convention on Human Rights, and the African Charter on Human and Peoples’ Rights all consider freedom of expression a fundamental human right. As Article 19 of the Universal Declaration of Human Rights states, “Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive, and impart information and ideas through any media and regardless of frontiers” (Universal Declaration of Human Rights 1948).

In his influential essay “Toward a general theory of the First Amendment,” Yale law professor Thomas I. Emerson writes of the importance of free speech to a democracy, but takes the need for protection of expression a step further. Emerson suggests “the right to freedom of expression is justified first of all as the right of an individual purely in his capacity as an individual” (1963, 877). He argues that four broad categories encompass the societal values that free expression serves – assuring individual self-fulfillment, attaining truth, securing citizen participation in political decision-making processes, and maintaining social stability and societal change. “Every man . . . has the right to form his own belief and opinions. And, it also follows, that he has the right to express those beliefs and opinions” (1963, 877).

In a democratic society, free press is considered equally important as *free speech*. The First Amendment to the US Constitution offers separate guarantees for speech and press, but in the US the two concepts are intertwined by well-established case law. They are also intertwined in American legal theory. First Amendment philosopher Alexander Meiklejohn is often credited with articulating the self-governance theory as applied in the US, which holds that the primary purpose of free speech in a democracy is to allow citizens to effectively govern themselves. The focus is on advancing democracy and the collective public good, rather than on the rights of individuals. Meiklejohn writes, “The First Amendment . . . is not the guardian of unregulated talkativeness. It does not require that, on every occasion, every citizen shall take part in public debate. Nor can it even give assurance that everyone shall have opportunity to do so . . . What is essential is not that everyone shall speak, but that everything worth saying shall be said” (1948, 25). Put simply by the noted constitutional scholar Lee Bollinger, currently the president of Columbia University in New York, “the primary function of speech and the press is to advance the process of self-governance” (1983, 438).

To advance the process of self-governance, press and speech must be *free from governmental interference*. In the US, England, France, and Sweden, it took several centuries

to move from an authoritarian model of free press to one that embraced libertarianism. The two main struggles in the move toward libertarianism in England and the US in the eighteenth century were with seditious libel (a libel against the government as a crime) and with the right of the press to publish governmental proceedings (more so in England than in America). The establishment of truth as a defense to libel in the US and England in the nineteenth century is what ultimately allowed libertarianism to triumph in those two nations. In some countries today, criminal or seditious libel continues as a major impediment to a free press (→ Libel and Slander).

The basic idea behind libertarianism is credited to English poet and philosopher John Milton. He had put forward the “marketplace of ideas” metaphor as early as 1644 in *Areopagitica*, Milton’s appeal to the English Parliament to rescind a licensing order that allowed the government to use official censors to approve publications. Legal historian Frederick Siebert writes that the libertarian system spread throughout the world in the nineteenth century: “Practically all democratic countries in the world adopted the libertarian theories and embodied them in their constitutions or fundamental laws” (1956, 51). Generally speaking, press and speech freedoms under the libertarian model are negative freedoms. That is, they are freedom *from* governmental restraint. Another model of press freedom exists in the positive form, which would focus on “the capacity to do or achieve certain ends” (Youm 2001, 5775).

An example of an international positive model of press freedom came in 1978, when the United Nations Educational, Scientific, and Cultural Organization (→ UNESCO), which includes nearly all independent nations in the world, adopted the “Declaration on Fundamental Principles concerning the Contribution of the Mass Media to Strengthening Peace and International Understanding, to the Promotion of Human Rights, and to Countering Radicalism, Apartheid, and Incitement to War.” The declaration was called a landmark, albeit controversial, in the history of journalism and mass communication, because it was able to create a body of principles and ideals on which north, south, east and west agreed “at a time when ideological confrontations, rather than harmony, became characteristic of the international community” (Nordenstreng 1984, xi). The declaration, though, soon sparked heated debate about free press and the intention of the document.

In 1981, the US and Israel broke the consensus that had prevailed in the adoption of the UNESCO mass media declaration, claiming that the Soviet Union and some third world nations were using the declaration to legitimize governmental press controls. In his first speech on communication to the UN Committee on Information in 1982, UN Secretary-General Javier Perez de Cuellar responded: “Critics of the Declaration, who express concern that national public authorities have been given an instrument to limit freedom of the press, are mistaken. Such a concept was not and could never be the intention of any United Nations deliberative body, in which free and open debate always prevails” (Nordenstreng 1984, xiii; see also Mowlana 1989). The UNESCO declaration was not legally binding. But the international, often cantankerous, debate about the declaration highlighted some political, social, and cultural differences in opinion about what constitutes a free press across the globe.

As communication law scholar Kyu Ho Youm writes, “Most discussions of freedom of the press center on the relationship of government and the press, and here the basic question is not whether government controls the press, but how and to what extent” (2001, 5775).

In the eighteenth century, Sir William Blackstone, the English Chief Justice whose commentaries on English law profoundly impacted American law, defined the limits of a free press thus: “The liberty of the press is indeed essential to the nature of a free state, but this consists in laying no previous restraints upon publication” (*Near v. Minnesota* 1931, 713). The licensing of the press is considered by many as the most troubling form of prior restraint and is incompatible with freedom of the press as a fundamental human right (→ Licensing of Journalists). The → *Inter-American Court of Human Rights* (IACHR) ruled in 1985 that licensing the press would violate not only individual rights to free expression, but also “the right of the public to receive information without any interference” (*Compulsory Membership in an Association Prescribed by Law for the Practice of Journalism* 1985).

In 1992, the → *European Court of Human Rights*, emphasizing the pre-eminent role of the press in ensuring the rule of law in a state, said: “Freedom of the press affords the public one of the best means of discovering and forming an opinion of the ideas and attitudes of their political leaders. In particular, it gives politicians the opportunity to reflect and comment on the preoccupations of public opinion; it thus enables everyone to participate in the free political debate, which is at the very core of the concept of a democratic society.”

While the *United Nations Human Rights Committee* has not issued an express condemnation of licensing requirements for printing presses, “it has on several occasions asked critical questions concerning the issue and has been satisfied only when country representatives confirmed that such requirements were no longer in place” (Article 19, 2007, 7). Specifically, this was the case with Azerbaijan and Uruguay in 2001. Article 19, a nonprofit group promoting global free expression, wrote a memorandum in January 2007 on the draft law of the Republic of Kazakhstan, condemning that draft law, which would include some provisions for licensing the press (→ United Nations, Communication Policies of).

Meanwhile, since the end of the Cold War in the late 1980s, the positive concept of press freedom, more often than not, has defined the standard for quality journalism around the world. This is especially the case with the expanding press freedom in many newly independent countries and emerging democracies in Asia, former Eastern Europe, Latin America, and Africa.

## CONTEMPORARY ISSUES

The degree to which a country guarantees freedom of expression is still an important area to study and monitor (→ Censorship). But scholars should also consider less nation-specific ways to explore important communication law topics across the globe. Boston University law professor Pnina Lahav, whose book, *Press law in modern democracies*, is a seminal work on comparative press freedom, notes that the US often believes it has “a monopoly” over press freedom because it has a constitutional guarantee. “The United Kingdom and Israel have neither a constitution nor an explicit commitment to press freedom engraved on a basic charter. Sweden, France, and the Federal Republic of Germany have special press statutes . . . Yet all of these countries are generally recognized as democracies and their press is considered free. It is this [similarity] that triggers the need to compare the way by which different democratic legal systems treat their press” (1985, 1; for an example of another comparative study, see Couprie & Olsson 1987).

Future research in communication law should also account for *changing trends in press ownership* that could have implications for a free press around the world. Mass communication scholar Flew notes that while “the claim that the nation-state has been rendered increasingly irrelevant by media globalization is strongly questioned, it is at the same time noted that media globalization presents significant challenges for media and cultural policy as it has been traditionally understood” (2007, 28).

One other typical way that communication law issues are explored is by legal topic. This is often done in a nation-specific way (for example, you might look at libel law in the US or obscenity law in Canada), but it can also have a comparative aspect. Several freedom of expression issues have received a good amount of international and comparative law attention in recent years. Among them are defamation, → privacy, and hate speech (→ Hate Speech and Ethnophaulisms), which is not surprising, given that these three areas showcase important contemporary legal issues that have international dimensions worthy of comparative study.

### Defamation

Communication law is more global than ever. A good illustration is defamation law because transnational media, along with the Internet, defy the traditional state-nation sovereignty of geography-bound communication. Where does the “publication” of defamation as a civil wrong take place when any statement is increasingly accessible via the Internet around the world? This question relates to which laws should govern in libel lawsuits involving transnational mass media, whether online or offline. In a 2002 libel case that pitted an Australian businessman against a US newspaper publisher, the High Court of Australia ruled that when defamatory statements are accessible to and read by ISP subscribers in an Australian state, a court of that state has jurisdiction to hear an action for defamation relating to the statements (*Dow Jones & Co. v. Gutnick* 2003).

From a First Amendment perspective, the foreign libel judgment like the one from the Australian High Court does not directly impact US media unless the judgment is brought to the US and enforced against the American media. American courts have invariably refused to enforce foreign libel judgments if the judgments were based on libel law incompatible with the First Amendment standards. In the early 1990s, for example, a New York state court rejected a libel plaintiff’s request for enforcement of his English libel verdict against a newspaper publisher in New York. The court found England’s lack of an equivalent to the First Amendment to be crucial and ruled that enforcing a foreign libel judgment would seriously jeopardize the First Amendment protection of speech and the press (*Bachchan v. India Abroad Publications, Inc.* 1992).

It is still largely true that American libel law is more speech-friendly than the rest of the world. Nonetheless, an increasing number of countries are more willing to protect political expression – such as criticism of the government and government officials – than ever before. So, the actual or perceived gap between the US and other nations has narrowed. Since the mid-1970s, for example, the European Court of Human Rights (ECHR) has embraced the Meiklejohnian free speech theory. The ECHR’s cartographical principle of application is fundamentally shaped by the self-governance theory. Thus, the European Convention on Human Rights’ preference for political speech is clear-cut. The ECHR’s

rejection of criticism of the government as a crime reflects the functional value of freedom of expression as crucial to an effective political democracy.

### **Privacy**

In 1890, American lawyers Samuel Warren and Louis Brandeis (a future US Supreme Court Justice) wrote a law review article that served as the starting point for discussions about privacy law in the US. In “The right to privacy,” they argued that the Anglo American common law implicitly recognized a right to privacy. But, in the US, it was not until *Griswold v. Connecticut* (1965) that the US Supreme Court offered constitutional protection for privacy rights (→ Privacy).

Privacy as a basic human right is acknowledged in most international human rights declarations. For example, Article 12 of the Universal Declaration of Human Rights and Article 17 of the International Covenant on Civil and Political Rights (ICCPR) both say that “no one shall be subjected to arbitrary or unlawful interference with his privacy . . . everyone has the right to the protection of the law against such interference or attacks.” Privacy is a constitutional right in a number of countries, including Brazil, China, South Korea, Belgium, Germany, Spain, Italy, and Russia. Also, several common law nations such as Australia, Canada, Iceland, England, the US, and New Zealand recognize privacy in case law. Hong Kong also has privacy case law, some emerging when it was under British rule, some coming after it was returned to the People’s Republic of China.

One of the issues in contemporary privacy law that has garnered a great deal of contemporary attention has to do with the balance of the privacy right against the rights of the media to pursue information. A recent case in Germany, centered on a series of photographs of Princess Caroline of Monaco that were published in a German → magazine, used ad hoc balancing to determine whether privacy or press rights prevailed. English judge Lord Wilberforce has suggested that Germany’s approach might help England as it strives to develop its privacy laws under the impetus of the Human Rights Act of 1999. Wilberforce notes that Germany’s ad hoc balancing approach and lack of code or statutory provision “has not led to a flood of litigation nor to any real or perceived restriction of speech rights. . . . The German approach shows us the way, avoiding the brutal simplicity of the [US] First Amendment, to work out a balance between the right of free speech and the right of privacy” (Markesinis 2001; → Celebrity Culture; Yellow Journalism).

With the increased use of the Internet, and increasing access to still and video cameras and technologies (for example, cameras in cell phones), privacy will become an increasingly important international communication law issue.

### **Hate Speech**

International law allows regulations on hate speech, and there are two human rights instruments – the International Covenant on Civil and Political Rights and the International Convention on the Elimination of All Forms of Racial Discrimination – that require governments to prohibit hate speech. Many countries proscribe it as well. In this regard, the First Amendment protection of hate speech in the US signifies American exceptionalism as a speech-protective nation. (see *R. A. V. v. St Paul* 1992).

Germany and France are perhaps best known for their hate speech prohibitions, based on the theory that “no one may engage in an activity aimed at destroying the rights of others” (Farrior 1996, 4). International law of hate speech generally requires a contextual analysis. For example, the European Commission of Human Rights held that the European Convention on Human Rights allows punishment of someone for hate speech aimed at destroying the rights of others (*Glimmerveen v. Netherlands* 1980). Article 19 wrote in 2007 that it had recorded increasing instances of violations of freedom of expression in regard to hate speech, “occurring alongside a growing number of racist attacks, and the acceptability of traditional forms of racism” (2007, 11). The organization called hate speech a “crucial topic on the contemporary freedom of expression and anti-racist agenda.” The organization cited, as an example of a free speech violation, recent actions by Germany and France (despite their status as models for developing hate speech codes that promote a contextual analysis and respect for others). In 2006, Germany drafted a proposal and France’s parliament drafted a bill aimed at prohibiting speech that denied or trivialized the Holocaust and the 1915 Armenian genocide respectively. Critics have said this ignores the contextual analysis approach needed to insure that hate speech prohibitions do not infringe upon protected expression.

The contrast between the US and France on hate speech was highlighted in 2001, when Yahoo!, an Internet service provider in the US, was ordered by a French court to ban the display of Nazi insignia on its sites. The *Yahoo!* decision of the French court was challenged in the US. Yahoo! argued that the French court’s order should not be recognized and enforced in the US. A federal district court in California held that the French court order violated the First Amendment and was unenforceable in the US. The US court stressed the “fundamental judgment” embedded in the First Amendment that “it is preferable to permit the nonviolent expression of offensive viewpoints rather than to impose viewpoint-based governmental regulation upon speech. The government and people of France have made a different judgment based upon their own experience” (*Yahoo v. La Ligue Contre le Racisme et l’Antisemitisme* 2001).

In addition to considering issues of race, some more recent laws have begun to address religious hatred. Blasphemy law is linked to the area of incitement of religious hatred, and it is of ancient origin. Blasphemy, by definition, is the defamation of one or more Gods. In some ways, blasphemy is more connected to ideas about the separation (or lack of separation) of religion and government. For example, the Basic Law of Saudi Arabia denies any right to free expression that might counter Islamic tenets. Incitement of religious hatred is different from this, albeit connected, and these laws typically resemble hate speech prohibitions. For example, in 2006 England passed the Racial and Religious Hatred Act, which makes it illegal to incite hatred against a person on the grounds of their religion.

### **MULTIDISCIPLINARY APPROACHES TO COMMUNICATION LAW RESEARCH**

As noted earlier, one way the term “communication and law” is used is to denote multidisciplinary research done at the intersection of two distinctly separate disciplines of study (communication *and* law). The two major questions that scholars debate when considering how useful an interdisciplinary approach to the study of communication and law

are: “Which framework should prevail – law or communication?” and “Are the disciplines of legal studies and communication, as a field grounded in social science, compatible?”

Most scholarly approaches to legal research are grounded in traditional legal studies. Broadly speaking, this takes into account ideas of legal formalism or positivism, legal realism, critical legal studies, and law and society views, as well as some other, related schools of thought (Cate 2006). *Legal formalism/positivism* sees law and legal rules as important in their own right, requiring compliance without much regard for the effect or impact of laws. *Legal realism*, on the other hand, largely rejects positivism. It rejects the notion that law is objective or neutral and can be applied to achieve consistent, reliable results. Its focus is on evaluating factors such as judicial experience, bias, desirable public policy goals, and even some social science research as a way to better explain outcomes. Legal realism helped lay the groundwork for other legal schools of thought that followed in the twentieth century, including the *economic analysis of law* with its focus on the goal of wealth maximization. Legal realism also inspired *critical legal studies*, which builds on the more radical components of realism to assert that the study of law should include analyses of bias, ideology, power, status, and politics, and that social justice and measuring impacts on disenfranchised populations are most important. And it influences the *law and society* approach, which focuses broadly on how law and legal institutions operate in society.

In terms of communication studies today, most approaches are focused on evaluating communication processes and media effects (→ Media Effects; Communication Theory and Philosophy). As mass communication scholars Guido Stempel III and Bruce Westley note, “When we speak of ‘the systematic study of mass communications,’ we mean any research discipline that can shed new light on mass communication processes, effects, institutions, and institutional change, its legal constraints, its constitutional imperatives, its technology, its changing response to new challenges” (2003, 3). As a field of its own, communication is not disconnected from a wide range of other disciplines (→ Communication as a Field and Discipline).

Both law and communication as autonomous disciplines have their own set of assumptions, theories, and methodologies. Specific discussion about and promotion of greater interdisciplinary work between the two fields took off in the US in the early 1980s. By 1986, three strains of legal scholarship in mass communication had emerged – traditional documentary research, socio-behavioral research, and critical-qualitative research. These three strains reflect disciplinary overlap, particularly with respect to socio-behavioral research. Communication law scholars Jeremy Cohen and Tim Gleason wrote in their ground-breaking book, *Social research in communication and law*, that a new approach to communication and law research was needed. “A communication and law approach must distinguish itself from research generally recognized as within the traditional purview of law or legal studies. . . . It should be generated from the perspective of the communication scholar, not in competition with the legal scholar, but in recognition of the objectives of communication research” (1990, 8).

What is the difference between traditional legal research and communication research? *Communication research* grew from a social science foundation (→ Communication and Media Studies, History since 1968; Communication and Media Studies, History to 1968). But today communication research is eclectic: “Mass communication researchers have drawn on the methodological insights of scholars in such fields as sociology, political

science, and psychology. Another linkage has grown up between journalism scholars interested broadly in communication processes and like-minded persons in departments of speech, communications, speech-communication, and the like. At the same time, those interested in historical and legal research in mass communication have found appropriate models in the base disciplines” (Cohen & Gleason 1990, 3). Generally speaking, the purpose of communication research is to build and test theory, and offer insight into a wide variety of communication processes, both at the macro- and micro-level. Social science research intends to be neutral and objective (→ Objectivity in Science).

*Legal research*, on the other hand, has its own methodology – one quite different from that which grows out of social science, even though the two fields may overlap. As media law scholars Eric Ugland, Everett Dennis, and Donald Gillmor observe, legal research will often “unabashedly advocate” a position based on “normative assumptions.” But the purpose of legal research is often quite different from that of the social scientist. The function of legal research is to clarify “the law through analysis of procedure, precedent, and doctrine” and to provide “a better understanding of how law operates in society” as well as to “furnish materials for legal education” (2003, 388).

Traditional legal research, like historical research, focuses on making a distinction between primary and secondary sources on which to base an analysis. Cases, statutes, and administrative codes are considered the primary sources (the actual source of law) at the disposal of the legal researcher. Secondary sources include someone else’s interpretation of the law, and these come in the forms of books, law review and journal articles, treatises, digests, encyclopedias, and annotated volumes.

The *differences in methodology* between communication and law as broad disciplines are vast. The same is true when you consider questions of theory. Within law, you first have to navigate through the broader ideas brought forth by legal formalism/positivism, legal realism, and other schools of thought, such as the economic analysis of law, the law and society approach, and the various critical legal theory approaches (including feminist legal studies and critical race theory). If you then consider questions of interest to scholars in communication, typically the focus is on free speech theory, other free expression models, or on human rights declarations.

While most scholars emphasize the importance of theory to all scholarship, within the field of law some debate about how to use theory exists. Communication theoretician Matthew Bunker refers to the two most common theoretical approaches as top-down and bottom-up theory. Top-down legal theory begins with a premise, value, or insight. A researcher would then explore the implications of the theory, and ultimately will bring these implications “down to earth to be operationalized in legal doctrine.” The bottom-up theory is also called doctrinal scholarship, or, legal formalism. This approach historically fits the roots of traditional legal research and involves the aggregation of case law and other textual evidence “to provide a theory about what courts are doing in practice” (2001, 185).

Bunker suggests that both models are problematic, arguing that “top-down theory is often disconnected from the concrete reality of constitutional law, and . . . so far removed from . . . history, text, and doctrine as to be of questionable legitimacy. . . . Bottom-up theory, on the other hand, can be little more than descriptive of existing practice” (2001, 185).

In the field of communication, a wide variety of theories exist, including agenda setting, knowledge gap, → cultivation theory, → spiral of silence, hierarchy of influences and framing (→ Framing Effects; Agenda-Setting Effects; Knowledge Gap Effects). All of these theories tend to be top-down, mostly because they come from social science models for conducting research.

It is within these vastly different theoretical and methodological approaches that research in communication and law occurs, sometimes connected and sometimes distinctly separate. A 2006 study of the US media law literature found that “mass communication scholars tend to cite theoretical, historical and philosophical works frequently” while “law school scholars tend to cite doctrinal works more often” (Pasadeos et al. 2006, 179). Its findings support the historical evolution of the two fields, and further highlight the challenges that scholars who work at the intersection of communication and law face.

In 2006, Amy Reynolds and Brooke Barnett, authors of *Communication and law: Multidisciplinary approaches to research*, argued for more interdisciplinary work and a better integration of theory and methods that come from communication and law, despite law’s heavily doctrinal approach. They note that, “Within the past two decades, these kinds of multidisciplinary approaches have become more creative and a little bit more common – traditional legal research combined with surveys, content analysis, experiments, or participant-observations, for example, as methodologies that answer questions and hypotheses that try to connect the law and mass communication rather than separate them” (2006, xv; → Quantitative Methodology; Survey; Content Analysis, Quantitative).

Not everyone embraces or sees value in a multidisciplinary approach. Matthew Bunker and David Perry (2004) have suggested that in American communication law research, First Amendment law is still considered by some legal scholars as the “last bastion” of legal formalism and that free speech theory, as well as jurisprudence, have resisted interdisciplinary efforts more than other areas of the law. Bunker further notes in his book, *Critiquing free speech*, that while there are “obvious advantages to legal disciplinarity,” interdisciplinarity is not “an unalloyed good. Much of the recent wave of interdisciplinarity seems to have been deployed to argue for greater limits on free speech rights” (2001, xiii).

Three of the major academic journalism and communication organizations in the US and abroad allow a variety of theoretical and methodological approaches to the study of communication and law. The → International Association for Media and Communication Research (IAMCR), the → International Communication Association (ICA), and the Association for Education in Journalism and Mass Communication (AEJMC) all have communication law and policy divisions, and all embrace methodologies that evolve from both disciplines, which aids in the promotion of multidisciplinary work.

The challenges ahead for scholars who work at the intersection of communication and law are many, given that law is not science and science has never really fit the courts. However, as Cohen and Gleason wrote: “Interest in communication and law has increased. Research scholars are regularly working beyond the limits of the single discipline approaches of law, history, psychology, and communication to develop richly textured portraits of the environment – legal, social, and cognitive, among others – that influence and are influenced by the regulation, practices, and philosophies of expression” (1990, 6).

For scholars who want to understand communication and law, and freedom of expression, the contemporary trends that include multidisciplinary study as well as global

comparative analyses provide a number of challenges sufficient to attract attention for many years to come.

## Communication Law and Policy: Africa

Lyombe Eko

University of Iowa

The media law regimes in Africa are the result of a confluence of historical and political factors: first, the authoritarian colonial systems inherited at independence; second, international communication policy transfers from the UN and its specialized agencies;

and third, the post-Cold War liberalization of the 1990s. The 53 countries on the African continent can be classified into *four major media law traditions*: (1) the English-speaking tradition, an eclectic mix of British colonial traditions and indigenous African communication values, (2) the highly centralized regimes of the French-speaking countries, (3) the ideologically laden systems of the Portuguese-speaking countries, and (4) the authoritarian media law regimes of North Africa. There is considerable diversity between and within these broad classifications. Each country's media law regime is a reflection of its specific political, economic, social, and cultural context.

## HISTORICAL ORIGINS OF AFRICAN MEDIA LAW REGIMES

The modern press was introduced in Freetown, Sierra Leone, in 1801 by former slaves from the US. The returnees brought with them some of the printing technology and press traditions of the American Republic (→ Printing, History of). Pockets of returning Africans also started → newspapers in Liberia, Ghana, and Nigeria. Under British colonial rule, the press was modeled on British newspapers. The colonial administrations allowed the press freedom as long as it did not threaten colonial rule. The first press laws were “sedition” laws passed to counter the scathing attacks of the African press against slavery and European colonialism. Offending reporters and editors were punished, and newspapers were censored (→ Freedom of the Press, Concept of).

Things were similar in Southern Africa where the first newspaper, the government-owned *Cape Town Gazette and African Advertiser*, had been started in 1800. Conflicts between the governor and the press led the British government to issue a press ordinance in 1829. This law extended the freedom enjoyed by the British press to South African newspapers. In 1948, the National Party won the national elections and introduced the policy of apartheid, or strict racial segregation. The government instituted draconian press → censorship laws that banned publication of government information and made it illegal to quote “banned” persons, as well as material that was thought to incite hostility between white and non-white. Additionally, the law banned newspapers from publishing any information about prisons, universities, banned organizations, and so on. In addition, there was thorough censorship of → books, music, → magazines, and motion pictures coming into South Africa.

In broadcasting, British colonial administrations introduced public broadcasting corporations modeled on the British Broadcasting Corporation in all British colonies in the 1920s and 1930s (→ BBC). These localized versions of the BBC were aimed at serving British settlers in Africa. Since adequate revenue for these stations could not be raised from license fees alone due to the limited number of radio sets in the colonies, funding came from a combination of government grants and advertising. These statutory shadows of the BBC survived the colonial era in many African countries (→ Africa: Media Systems).

## FRENCH COLONIAL MEDIA POLICY

French colonial policy was aimed at assimilating, “civilizing,” and transforming Africans in French colonies into black Frenchmen and women. All French-speaking African

colonies operated under the press law of 1881 (→ Media Policy; Francophonie). Though this law granted French colonies the right to publish newspapers, this right was highly circumscribed. All publications had to be under the control of a European French citizen. All publications were systematically censored and anything that appeared in print did so at the discretion of the colonial authorities. All African journalists who did not follow the dictates of the French colonial administration were jailed or exiled to other French colonies (→ Violence against Journalists).

Broadcast regulation in the French colonies was different from broadcasting in other parts of the continent. Radio was introduced in the French African colonies in the 1930s by a French government agency, *La Société de Radiophonie de la France d'Outremer* (SORAFOM), the Radio Corporation of Overseas France. These highly centralized colonial broadcasters were managed from Paris. After World War II, management and development of colonial radio came under the auspices of *l'Office de Coopération Radiophonique* (Corporation for Radio Cooperation). Broadcasting in the French colonies was directed mainly at European settlers and the small group of French-educated African elite.

### POST-INDEPENDENCE MEDIA LAW REGIMES

From 1960 to 1990, media law regimes in Africa were a function of communication policies advanced by the United Nations Educational, Scientific, and Cultural Organization (→ UNESCO), the International Telecommunications Union (ITU), and the press laws inherited from the colonial era. Communication policy transfers from the international community to Africa started in 1958, when the General Assembly of the United Nations passed a resolution calling for the building of mass media facilities in the “Non-Self-Governing Territories” in Africa and elsewhere. This was the origin of the concept of → development communication, a policy that dominated the mass media in Africa for more than 40 years.

As formulated by western experts, the *development communication perspective* postulated that developing countries do not have the resources to indulge in the luxury of the liberal, watchdog journalistic model of the western countries (→ Communication Technology and Development). As such, all media were to concentrate on the task of disseminating information that would improve agricultural production, health, education, and other vital sectors. The development communication model embraced in Africa was premised on the assumption that African countries were fledgling societies where national unity was more important than freedom of the press. Many African politicians argued that in situations of dire poverty, having mass media that concentrated on checking government action was a misuse of scarce resources. The result is that most African countries dusted off the old colonial press laws and imposed them on their media with little modification.

Two countries, Tanzania, a former British colony, and Cameroon, a country with mixed French and British colonial heritage, are cases in point. In *Tanzania*, President Julius Nyerere nationalized the press in 1970. The *Tanganyika Standard*, the largest English-language newspaper, which was owned by a British company, was merged with the *Nationalist*, the paper of the ruling party, Chama Cha Mapinduzi. A newspaper, the *Daily News*, emerged from this merger. President Nyerere himself became the editor-in-chief of the

newspapers. He appointed the managing editor and issued the newspaper's working charter. The *Daily News* became the mouthpiece of the ruling party and government.

In *Cameroon*, the government of President Ahmadou Ahidjo enacted the Cameroon press law of 1966, four years after independence. This law was a slightly modified version of the content-based, highly restrictive colonial press law, which itself was modeled on the French law of 1881 on freedom of the press. The Cameroon press law of 1966 made publication of newspapers and periodicals contingent on pre-approval from the government. Additionally, all newspapers were subject to strict pre-publication censorship. Some licensed newspapers often appeared on the newsstand with whole sections blackened out by censors. In addition, under the press law, libel was both a criminal and a civil offense (→ Libel and Slander). News photography was also strictly regulated. The Regulation of Public Photography Act of 1974 made it illegal to take pictures of national public ceremonies without prior governmental authorization (→ Photojournalism). The law on advertising of 1988 required that all advertising agencies be licensed. Additionally, pharmaceutical and health products could not be advertised without prior approval from the Ministry of Health.

These kinds of repressive media laws existed throughout the continent. The most egregious examples included the *Ghanian* Rumors Decree of 1966, an order that classified all newspaper criticism of the military regime in power as illegal rumor-mongering. In *Nigeria*, successive military regimes passed a plethora of anti-press decrees that eliminated criticism of corruption and human rights abuses. In *Kenya*, repressive statutes included seditious libel, the colonial era "misprison of treason," (an offense that is committed when a journalist is alleged to have knowledge of the actual or intended commission of a treasonous act, or the utterance or publication of a treasonous expression, and does not immediately inform the authorities about it), and inciting disaffection with the government through public utterances or through the press.

In virtually all French-speaking countries, Napoleonic-era laws against insulting the head of state and his family were passed. The media were subject to pre-publication censorship, seizure of published material from newsstands, and denial of the right to purchase newsprint or hire government printing presses. Journalists practiced self-censorship for fear of falling foul of the "forces of law and disorder" that enforced repressive laws. Ironically, during the same period, all African countries ratified the Universal Declaration of Human Rights, which was translated into the 70 major languages spoken on the continent. Additionally, the majority of African countries ratified the African Charter of Human and People's Rights of 1981, which also guarantees freedom of speech and of the press.

### **MEDIA LAW IN AFRICA (1990 TO PRESENT)**

The fall of the Berlin Wall in 1989, and the collapse of the Soviet Union in 1991 significantly affected media law in Africa. These historic events triggered popular uprisings and demands for political freedom across the continent (→ Freedom of Communication). In response, authoritarian regimes legalized opposition parties, and at least 50 of Africa's 53 countries implicitly or explicitly granted constitutional protection to freedom of speech and freedom of the press. National conferences were held to exorcise the ghosts of the

political past and chart the constitutional paths for the future. These *new freedoms* were circumscribed by local realities. For example, in *South Africa*, the Bill of Rights (Chapter 2) of the 1994 Constitution of South Africa states: “Everyone has a right to freedom of expression, which includes freedom of the press and other media; freedom to receive or impart information or ideas.” However, freedom of expression does not cover “propaganda for war; incitement of imminent violence; or advocacy of hatred that is based on race, ethnicity, gender, or religion and that constitutes incitement to cause harm.”

Additionally, freedom of the press in South Africa is balanced away by a limitation clause that states *inter alia*: “The rights in the Bill of Rights may be limited only in terms of laws of general application to the extent that the limitation is reasonable and justified in an open and democratic society based on human rights, dignity, equality, and freedom.” On the whole, media law in South Africa is a complex affair. South African lawyer Jacques Louw (2005) has noted that more than 100 statutes, many of which date back to the apartheid era, regulate the publication or disclosure of information in South Africa. Information that may not be disclosed or published includes the identity of children under the age of 18 who are involved in cases or legal proceedings, publication of private facts involving divorces, photographs of criminal suspects, certain matters involving terrorism and national security, as well as tax returns.

Having constitutional provisions protecting freedom of speech and of the press is not enough. A few cases from Gabon, Cameroon, and Zimbabwe illustrate the point. In February 2002, Michel Ongoundou Loundah, editor of *La Griffé* (The Claw), an irreverent, satirical newspaper based in Libreville, *Gabon*, fled to neighboring Cameroon, and sought political refuge there after *La Griffé* was banned indefinitely and its whole editorial staff barred from practicing journalism in Gabon. The newspaper was accused of publishing articles and cartoons “bordering on provocation against the head of state.” Loundah was ultimately granted political asylum in France.

Despite its hostility towards the independent press, the government of Gabon has a novel method of controlling the nongovernmental media. In 2005, the government enacted a law creating the National Fund for the Development of the Press and the Audiovisual Media (FONAPRESSE). Under the provisions of this law, the media – including the private media – are to be funded by a combination of government grants, fines levied on violators of the press law, and a 5 percent tax on advertising. This law essentially compromised the independence of the private press.

Journalists in *Cameroon* fared no better than those in Gabon. On November 29, 1998, Nyemb Ntoogue (Popoli), cartoonist of *Le Messager Popoli*, a satirical newspaper in Cameroon, fled the country when armed intruders broke into his home one night – he was not home because he had been tipped off – and left him a message to the effect that he must stop drawing caricatures of President Biya or face death by machete. These incidents continue to take place despite the fact that the law on social communication of 1990 had eliminated official pre-publication censorship. Nevertheless, this law criminalized material the government believed would lead to a breach of the peace, affect public morality, or insult the president. One of the most severe penal sanctions against the press was meted out on Pius Njawé, publisher and editor-in-chief of *Le Messager* (The Messenger). Njawé was sentenced to two years’ imprisonment and fined \$1,000 for “propagation of false news” after his newspaper published an article about the health of the President.

Pressure from international human rights groups led to the editor's release four months into his sentence.

In 1999, a law on legal registration of published material changed pre-publication censorship to post-publication seizure. The law requires all publishers of newspapers, books, periodicals, brochures, → posters, and other material destined for public dissemination to deposit four copies of their publications at the National Archives of Cameroon, no more than four hours after publication. This law was ostensibly intended to safeguard copies of all published material. However, in reality, the law was used to screen the content of all material published. Publications found to be objectionable are seized as soon as they arrive on the newsstands.

The *Zimbabwean government* of President Robert Mugabe has been a thorn in the side of the independent press. In 2004, the *Daily News* was banned for publishing material critical of the president. Police promptly sealed the premises of the newspaper. On four separate occasions, courts invalidated the ban, but the government defied the courts. After a four-month standoff, a high court judge ordered the police to vacate the premises of the newspaper. To the amazement of everyone, the police complied with the order. As these examples show, the media law environment in contemporary Africa is characterized by a system of law and disorder, a model of governance based on the triumph of arbitrary legalism over individual rights.

## ELECTRONIC MEDIA REGULATORY AGENCIES

One of the novelties of the post-Cold War era was the creation of regulatory agencies to manage the airwaves (→ Telecommunications: Law and Policy). The degree of independence of these agencies depends on the political context in which they operate. Many of these agencies are neither insulated from political pressure nor adequately funded. The result is that transformation of broadcasting from state monopolies to competitive, market-oriented, or public service systems has not always been transparent.

*Uganda* was the first East African country to liberalize its airwaves. Parliament passed the Electronic Media Statute of 1996 and the Uganda Communications Commission (UCC) Act of 1997 to regulate the electronic media sector. The UCC was given the power to issue broadcast licenses as well as establish, manage, and operate Information and Communication Technology (ICT) training centers. Other African regulatory agencies include the National Broadcasting Corporation of Nigeria (NBC) and the Communications Commission of Kenya. The Independent Broadcasting Authority (IBA) of South Africa is one of the most independent communications regulators on the continent. It manages the frequency spectrum and promotes diversity and equal political access to radio and television broadcasting.

## INTERNET LAW AND POLICY

Most information and telecommunications policies in force in Africa are the result of policy or legal transfers from the UN and other international organizations. With the spread of the → Internet around the world in the 1990s, international organizations and aid agencies conceptualized the Internet as a catalyst for rapid economic, social, and

political development in the third world. The International Monetary Fund and the World Bank have, through structural adjustment programs, provided Africans with templates of Internet regulations ranging from data protection to electronic commerce. Most countries now have governmental agencies responsible for managing the Information and Communication Technology (ICT) sector, registering Internet Service Providers (ISPs) and monitoring the Internet for harmful or objectionable political content (→ Internet Law and Regulation).

One of the first African countries to recognize the potential of the Internet as a tool for development was *Burkina Faso*. In 1995, Burkina Faso had one of the first Internet nodes in Africa. By 1997, it had set up a regulatory framework to coordinate the management of the domain name server (DNS) for its zone, as well as for a number of neighboring countries. Burkina Faso subsequently created a policy framework, which included information technology regulatory and advisory bodies, and laws regulating training and licensing of information technology workers.

*South Africa* has the most extensive Internet law regime on the continent. In 1999, the country outlawed child pornography, which was increasingly being hosted on servers within its territory, under the Film and Publications Act no. 65 of 1996 and the Film Publications Amendment Act no. 34 of 1999 (→ South Africa: Media System).

In *North Africa* (Algeria, Morocco, Libya, Tunisia, and Egypt) governmental agencies are the de facto or *de jure* gateways to the Internet. In most cases, government ministries or agencies control telecommunications infrastructure, are the principal telecommunications operators and regulators, the domain name registries for their respective countries, the sole Internet service providers (ISPs), the Internet content providers (ICPs), and the Internet hosts. This type of arrangement ensures that transmission of politically and culturally objectionable material to and from the regulating country is blocked by proxy servers (→ North Africa: Media Systems).

## Communication Law and Policy: Asia

*Doreen Weisenhaus*

*University of Hong Kong*

Communication law and policy in Asia covers a spectrum of issues involving widely varying political, cultural, and legal contexts across dozens of countries in the world's largest and most populous continent. While it can be difficult to generalize legal trends in the region because of a lack of conformity of interests and laws, or of what even constitutes Asia, several observations about the more significant developments at both the public level of media–government conflict and at the private level involving civil litigation can be made.

The rise in emerging democracies, burgeoning media markets, anti-terrorism efforts, and new media technologies have been among the major factors affecting communication law and policy in Asia in the latter part of the twentieth and early twenty-first centuries. The manner in which individual countries have responded to these changes has resulted in part from the unique historical traditions in the region.

### HISTORICAL BACKGROUND

For many of the more than thirty jurisdictions in Southeast, East, and South Asia and Oceania, the region's long history of European colonization continues to have a major impact on media law and policy and the type of legal system they inherited. The common law system, imposed in territories under British rule, dating back to the nineteenth century, remains in such former colonies as India, Malaysia, Singapore, Brunei, Australia, New Zealand, Fiji, and Hong Kong.

The French, Dutch, and Portuguese introduced civil law systems in their Asian colonies, including Vietnam, Cambodia, Laos, Indonesia, and Macau. Even without colonization, several jurisdictions – Japan, South Korea, China, Taiwan, and Thailand – adopted European-style civil codes. The significance of these systems extends to media law. For example, British sovereignty bequeathed many harsh laws regarding defamation, official secrets, sedition, and contempt of court to its common law progenies.

Control by Spain and the United States over the Philippines left a legal system based on Spanish and Anglo-American law, a combination of civil and common law. In fact, this blending of influences, including customary and religious law, in a common law or

civil system is a distinctive characteristic of many Asian nations. Islamic law or laws protecting Islamic interests are featured in Afghanistan, Bangladesh, Brunei, Indonesia, Malaysia, Pakistan, and East Timor, which have sizable Muslim communities. Nepal's legal system is based on Hindu legal concepts and English common law.

As religion plays a larger role politically throughout the world, *nonsecular restrictions* figure prominently in press freedom issues in Asia (→ Freedom of the Press, Concept of). Indonesia, home to the world's largest Muslim population, prohibits conduct or comment that is hostile or abusive to a religion practiced in that country (Criminal Code, Article 156[a]). In 2006, a newspaper editor in Jakarta was charged with blaspheming Islam by publishing a cartoon of the Prophet Mohammed that first appeared in a Danish newspaper. Afghanistan has decreed that no law can be "contrary to Islam." A Kabul television station was fined for airing Indian films considered insulting to Islam; an editor was sentenced to two years in prison for articles criticizing stoning and other Islamic punishments. In 1990, Pakistan's Federal Shariat Court, which examines legal matters to ensure they do not contravene Islamic principles, held that "the penalty for contempt of the Holy Prophet . . . is death and nothing else."

Concern over morals also affects the media in more conservative Asian cultures. In 2007, an article about a sex survey with questions about incest and bestiality published in a student university magazine in Hong Kong was ruled to be indecent. In Indonesia, religious groups protested the acquittal of the editor of *Playboy Indonesia* on indecency charges for publishing photographs of scantily clad women (→ Morality and Taste in Media Content).

As one of several remaining communist countries in Asia, the *People's Republic of China* continues to loom large with its unusual form of media regulation. Its law combines elements of Germany's civil code, Soviet socialist law, and traditional Chinese culture, emphasizing detailed administrative control over all aspects of media practice. But because of the rapid expansion of its economy, industrialization, and its admission to the World Trade Organization in 2001, rule of law in China and its impact on journalists are evolving. A draft law that would have fined Chinese media each time they reported on "sudden events" without prior government authorization was withdrawn after media protests. In late 2006, authorities announced a relaxation of reporting rules for foreign press (but not applicable to mainland journalists) in the run-up to the Beijing 2008 Olympics. China, however, is not expected to relinquish most of its tight controls over its media in the near future.

### **DEMOCRACIES, POLITICAL INSTABILITY, AND THE PRESS**

A dramatic increase in the number of democracies in Asia, particularly since the 1980s, has generally resulted in more legal protections for press freedoms and, for some nations, the repeal of harsh laws from earlier, more restrictive eras. Countries such as Taiwan, South Korea, and the Philippines best typify this phenomenon as they have made the transition from extended periods of martial law to robust democracies. The establishment of democracies, however, has also brought concurrent concerns by governments that public criticisms foster political instability, and thus in a number of Asian countries, a legal backlash against the media has occurred. Military coups such as in Pakistan (1999)

and Thailand (2006), and states of emergencies such as in the Philippines (2006) and Bangladesh (2007) have dealt further setbacks to a free press.

Most of the Asian nations guarantee freedom of expression and speech in their constitutions, but their political and legal environments often create quite different realities, notably in China, where Article 35 of the constitution (1982) states: "Citizens of the People's Republic of China enjoy freedom of speech, of the press, of assembly, of association, of procession and of demonstration."

Governments also frequently use press laws that regulate print media to censor them, typically by withdrawing or withholding licensing and permits. Malaysia's Printing Presses and Publication Act can revoke licenses any time without judicial review. Singapore's Newspaper and Printing Press Act gives it control over content for both foreign and local publications. A much rarer situation is Mongolia's 1998 Media Law, which bans government censorship.

Despite the political and legal restrictions they face, the region's media have enjoyed expansion during a period of economic growth after recovery from the Asian economic crisis of the late 1990s. That growth has fostered competition, which in time led to concerns about press responsibility, especially in the areas of defamation and privacy.

Asia has seen an explosion in the number of *defamation cases*, both criminal and civil, filed by government officials, politicians, and others against the media. Most Asian jurisdictions have longstanding criminal defamation laws, although they have been long dormant in some places, such as Hong Kong and Singapore. Nonetheless, criminal prosecutions continue to be brought. The husband of Philippines President Gloria Macapagal-Arroyo brought more than 40 criminal actions against journalists critical of him. He dropped the actions only after the journalists filed a counterclaim for violation of their constitutional rights. East Timor, as one of the youngest democracies in Asia, installed a penal code in 2005 with harsh penalties for criminal defamation, with specific protection for public officials. Under Article 173, harming an official's reputation can yield a three-year prison sentence and unlimited fines.

At the same time, though, there has been a *move toward more freedom of expression* in these cases. Courts in Taiwan, Thailand, Indonesia, Japan, South Korea, and India have ruled in favor of the media, establishing new principles of press protection in criminal defamation. In a 1997 landmark case, a Taiwanese court dismissed criminal charges against two journalists for an article reporting that the business manager of the then-ruling party had offered a \$15 million contribution to US president Bill Clinton's re-election campaign fund; the ruling endorsed a good-faith defense on matters of public interest. In Japan, the courts have upheld a journalist's reasonable belief that statements made concerning matters of public interest were true, even if that belief later turned out to be wrong. Indonesia's Supreme Court in 2006 overturned a defamation conviction against a magazine editor, ruling that a civil press law was the more appropriate mechanism to better protect press freedom. Cambodia and Sri Lanka have repealed their criminal defamation offences altogether.

## ANTI-TERRORISM LAWS AND THE REVIVAL OF SEDITION

Following the September 11, 2001 terrorist attacks in the United States and the Bali bombing in Indonesia in 2002, Southeast Asian countries have been identified by some as

the “second front” in the global war against terrorism. A number of Asian countries (e.g., Indonesia, Thailand, and the Philippines) have passed or were considering anti-terrorism laws that would have a major impact on press freedom and other civil liberties. Nations in the region have also been reviving the use of existing sedition laws, which criminalize speech or conduct that incites resistance to or insurrection against authority.

In its 2005 anti-terrorism legislation, Australia, long a beacon of press freedom, strengthened its *sedition laws*, the first modern democracy to do so in decades. Like many former British colonies, Australia still retained the sedition laws it inherited but rarely invoked. In 2006, New Zealand prosecuted its first sedition case in more than 80 years. Malaysia, which had not used its 1948 Sedition Act in years, began using it to curb political dissent, with “seditious tendency” as its vague criteria. In a three-year period, Indonesia brought more than a dozen sedition prosecutions. In 2005, Singapore sentenced two ethnic Chinese bloggers under its Sedition Act for posting remarks offensive to the minority Muslim-Malay community on their websites. In 2007, Philippine authorities charged a publisher and two columnists with incitement to sedition for articles that alleged corruption in the military. Australia also enacted a covert surveillance law that allows phone tapping against journalists and others. Hong Kong passed a similar surveillance law in 2006. The threat of terrorism in Southeast Asia predates the attacks of the twenty-first century. The rise in militant Islamic groups that push for separate Islamic states has been ongoing for decades.

### **ACCESS TO INFORMATION**

Laws ensuring access to government records have gained acceptance worldwide, with more than 60 countries having adopted → freedom of information laws as of 2007. The trend, however, has been slower to take hold in Asia, with only half a dozen countries having enacted national laws. They are Australia (1982), New Zealand (1982), Thailand (1997), South Korea (1998), Japan (2001), and India (2005).

Even without national freedom of information legislation, several Asian countries had acknowledged constitutional status for the right to government information. The Philippines explicitly referred to the right to information in its 1973 and 1987 Constitutions (“The right of the people to information of matters of public concern shall be recognized. Access to official records and documents, and papers pertaining to official acts, transactions, or decisions as well as to government research data used as basis for policy development, shall be afforded the citizen, subject to such limitations as may be provided by law”). Before Thailand adopted its freedom of information law, its 1991 constitution expressly recognized the right to information, which was retained in its 1997 constitution.

India’s courts in the 1970s recognized a constitutional right as implicit in freedom of speech and expression. In 1989, South Korea’s Constitutional Court held that there was a constitutional right to information “as an aspect of the right of freedom of expression and specific implementing legislation to define the contours of the right was not a prerequisite to its enforcement.” In the mid-1990s, the National Assembly of South Korea enacted a freedom of information act, and it revised the statute in its entirety in 2004. The Korean freedom of information law guarantees Koreans’ “right to know” and aims to ensure the citizens’ participation in governance and the transparency of their government.

Despite constitutional recognition or the existence of federal or local laws, citizens and media often face excessive *court costs and improper denials of requests*. Increasingly, they are also finding denials for national security reasons or as contrary to official secrets laws. In 2007, Philippines President Arroyo issued an executive order to restrict public and media access to official information through the creation of a “National Security Clearance System” that would “protect and ensure the integrity and sanctity” of classified information against “enemies of the state.” While freedom of information laws have usually exempted various categories of information, including national security, the latest government efforts around the region citing this category indicate heightened concern over the issue.

Some restraints, however, do exist. South Korea, pursuant to its Military Secrets Protection Act, requires that secrets marked as classified must follow legal procedure and create a clear danger to national security. New Zealand, one of the first jurisdictions in Asia to pass a freedom of information law, also simultaneously dismantled its Official Secrets Act.

The right-of-access trend is likely to continue, albeit slowly, with other countries, such as Indonesia and Nepal, also considering enactment of a freedom of information law. Even China has experimented with a lesser form, an administrative access-to-information scheme, in several large provinces, and in 2007 authorities issued draft national legislation and a regulation mandating more government transparency. (China, however, also has stepped up its prosecutions of journalists and writers for violating state secret laws.) Right-of-access advocates hope further developments will help establish an affirmative right of the public to access the governing process in Asia’s developing democracies.

## INTERNET AND COPYRIGHT REGULATION

The rapid escalation in the use of the → *Internet* and other technologies to communicate and publish has spawned particular concern among Asian governments because of their potential for contributing to political opposition. The technical know-how and determination of Internet users in some Asian countries have created a fast-changing game of regulatory chess between the newly technically empowered and governments struggling to contain what they view as harmful content. This has led to varied attempts to monitor and control the Internet, including shutting down sites, filtering, enacting new regulatory regimes, and applying more traditional criminal and civil laws (→ Internet Law and Regulation).

China has been especially innovative and aggressive in *Internet filtering*, imposing regulations, and prosecuting online writers for violation of laws on state secrets, subversion, and sedition. Malaysia arrested a blogger in 2007 under its Official Secrets Act for posting comments about the country’s internal security system; this was despite Malaysia’s 1998 Communications and Multimedia Act and its guarantees against Internet censorship. Other countries with strong Internet controls include Vietnam, Burma, Pakistan, and Thailand.

Newer regulatory schemes include Thailand’s 2007 *cyber crime law*, which addressed computer-related offences such as hacking and data theft, but critics feared it would be used to regulate online content. The law gave the government broad authority to shut down or block websites, seize computers, and penalize individuals who use proxy servers to access banned sites. Also, under the law, damaging someone’s reputation by altering a

picture online can result in up to three years in prison and large fines. In Japan, the government was considering legislation that would regulate online video programming to the same extent as television broadcasting. A number of Asian jurisdictions, including Australia, Hong Kong, Japan, New Zealand, and South Korea, however, maintain few specific controls over the Internet.

Because of international treaties and agreements such as the Berne Convention and with the World Intellectual Property Organization and the World Trade Organization, there are not as many differences among Asia's → *copyright laws* as there might be in other areas of law. Different legal systems can have similar laws, with some differences, of course. For example, the fair dealing defense is more common in the countries deriving from common law systems. There can also be unique national characteristics such as Japan's protection of *dojinshi*, which are self-published works, usually *manga* or novels.

# Communication Law and Policy: Europe

Ana Azurmendi

University of Navarra

The first newspapers were published in Europe in 1605: *Nieuwe Tijdinghen* in Antwerp and *Relation* in Strasbourg, both published as weeklies (→ Newspaper, Antecedents of; Newspaper, History of). Soon afterwards, more newspapers appeared in several European cities, until in 1650 the first daily newspaper was printed in Leipzig, Germany. Censorship and license were the key legal restraints on newspapers under the absolute monarchies of Europe (→ Censorship). The 1662 Licensing of the Press Act in England was the first media regulation. In the nineteenth century, dynamic movements of ideas, the consequent political changes, and technological improvements contributed to the emergence of the European press as we know it today (Chapman 2005), with precedents such as the *Daily Telegraph* in Britain (1855), *Le Petit Journal* in France (1863), and the news agencies Havas in France (1835), Wolff in Germany (1849), and Reuters in Britain (1851).

## MEDIA LAW: THE LIBERAL AND THE COMMUNIST SYSTEMS

The present media law of Europe has been shaped by two historical events: the French Revolution and the Russian Revolution.

In the eighteenth century, *the French Revolution* gave rise to liberal ideas about freedom that questioned the state's intervention in freedom of expression. The *Declaration of the Rights of Man and of the Citizen* was proclaimed in August 1789. Article 11 states: "The free communication of thoughts and of opinions is one of the most precious rights of man: any citizen thus may speak, write, print freely, save [if it is necessary] to respond to the abuse of this liberty, in the cases determined by the law." It exerted a strong influence on every liberal constitution and their provision of freedom of expression in Europe – Spain in 1812, Sicily in 1812, Belgium in 1831, Switzerland in 1848, and Piedmont in 1848 – and even in the new independent countries of Latin America, former colonies of Spain – Venezuela in 1819, Chile in 1833, and Mexico in 1857 (→ Freedom of Communication; Right to Communicate).

The English philosophers John Stuart Mill and John Locke prepared the basis for a liberal conception of the press (→ Freedom of the Press, Concept of). In *Law of libel and liberty of the press*, Mill (1985, 1st pub. 1825) spoke about the essential role of freedom of expression in a democracy: "The importance of free discussion . . . concerns equally every member of the Community. It is equal in value to good government, because without it good government cannot exist. Once remove it, and not only are all existing abuses perpetuated, but all which, in the course of successive ages it has overthrown, revive in a moment, along with that ignorance and imbecility, against which it is the only safeguard."

The *Russian Communist Revolution* created a system of censorship and control over the media, which rejected personal freedom of speech. The Decree on the Press of October 1917 included "temporary and extraordinary measures to stop the flow of dirt and slander." In the 1950s, the eastern and central European countries under Soviet domination adopted the Soviet system of media censorship and control. The Soviet Communist

Party's *Pravda* (1912–1991) and *Izvestia* (1917–) of the Supreme Soviet (the central government) were the main organs for propaganda. This state-controlled media system was repeated in every Soviet state (Richter 2002a).

### **THE UNIVERSAL DECLARATION OF HUMAN RIGHTS AND THE EUROPEAN UNION**

A third crucial event in Europe was World War II (1939–1945). The Universal Declaration of Human Rights was adopted by the United Nations in 1948 in response to World War II (→ United Nations, Communication Policies of). Article 19 states: “Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media and regardless of frontiers.”

The right to information and freedom of expression, as expressly enumerated by the UN human rights declaration, has been recognized by all the national constitutions, such as the Basic Law of Germany (1949), the Constitution of Portugal (1977), the Spanish Constitution, (1978), and the democratic constitutions of the ex-soviet and ex-Yugoslavian European countries, such as Poland (1997), Lithuania (1992), the Czech Republic (1992), Slovakia (1992), Croatia (1991), and Slovenia (1991). In every European media law system, the right to information and freedom of expression is weighed against an individual's right of → privacy and reputation. Illustrative are the French Law of Privacy (1970), the Spanish Law of Protection of the Right to Reputation, Privacy and Own Image (1982), and the UK Human Rights Act (1998).

At the end of World War II came the entity now known as the European Union, as a European plan of cooperation, which aimed at producing economic links among European countries. The definitive objective of the European Union has been to build strong cultural and political links among the member states. So, the European Convention on Human Rights provides for freedom of expression as a right.

### **NEW MEDIA LAW IN EASTERN AND CENTRAL EUROPE**

After the fall of the Berlin Wall in 1989, the perestroika movement, which Mikhail Gorbachev had introduced to the Soviet Union, took the Soviet economy to bankruptcy. Although perestroika was for social and economic renewal, it became the last step toward the collapse of the Soviet Union in the early 1990s.

The majority of the postcommunist countries in eastern and central Europe have begun on their own paths to democracy. Their new constitutions guarantee freedom of expression, the right to information, and the right of privacy, as do those of many western European countries. Given that the democratic tradition in the post-Soviet nations is still weak, the constitutional guarantees of freedom of expression in many former Soviet countries are more aspirational than operational (Richter 2002b).

### **PROMOTION OF FREEDOM OF EXPRESSION AND RIGHT TO INFORMATION BY THE COUNCIL OF EUROPE**

The Council of Europe has been a watchdog on human rights around the continent since 1950. The European Court of Human Rights has promoted freedom of expression over

the years, especially since the mid-1970s. Its jurisdiction affects European countries that have signed the European Convention on Human Rights. As of June 2007, the Court has ruled in more than 150 cases on freedom of expression. Its case law tackles a number of free speech issues: (1) special protection for children; (2) commercial speech; (3) hate speech (→ Hate Speech and Ethnophaulisms); (4) the balance between reputation and criticism of politicians and institutions; (5) the balance between privacy of public individuals and freedom of expression; (6) the secrecy of journalistic sources (→ News Sources); (7) separatist propaganda; (8) television licenses and transborder broadcasting; (9) independence of justice and journalistic reports on courts; and (10) access to public information. Both freedom of expression and the right to information are considered as fundamental pillars of a democratic society, as the Court reiterated in its case law on Article 10.

The European Union adopted its own *Charter of Fundamental Rights of the European Union* in January 2001. Article 11 of the EU Charter is similar to Article 10 of the European Convention on Human Rights: “Everyone has the right to freedom of expression. This right shall include freedom to hold opinions and to receive and impart information and ideas without interference by public authority and regardless of frontiers. . . . The freedom and pluralism of the media shall be respected.”

## EUROPEAN UNION MEDIA LAW AND POLICY

### General Patterns

Media law and policy in Europe revolves around the EU’s measures concerning the media and their policies in each individual European country (→ European Union: Communication Law). The EU took note of the media as a subject for regulation in the late 1980s, when the idea of Europe as a political union was one of its possible goals. In this light, the media would play a fundamental role in configuring European identity. As in other sectors of society, the media have a big impact, and hence are valuable both in the market and in the cultural-political context. The media’s influence on the EU centers on the audiovisual area. Meanwhile, there are other regulatory areas in European media and communication policies, such as competition, advertising, and the protection of minors.

The diversity of European countries is a crucial component of media law and policies in Europe. Indeed, the different backgrounds of each EU member nation in their history and socio-political heritage determine the particular implementation and formulation of EU media policies. Although EU nations share with each other the challenges of reforming public broadcasting and creating audiovisual authorities (Carey & Sanders 2004), diversity still remains. Examples of successful regulations include the UK’s → BBC with a special regulatory frame, the Royal Charter, Poland’s broadcast regulation (1992), Belgium’s public broadcasting institutions in three different languages – *Belgische Radio en Televisie* (BRT), *Radio Television Belge Francophone* (RTBF), and *Belgischer Rundfunk und Fernsehen* (BRF) – and Italy, where the Constitutional Court plays an important role in media law (Caretti 2001).

### Focus on Audiovisual Media

The EU views audiovisual media as essential to building a European identity among Europe’s multi-citizenship. The promotion of inter-European delivery of audiovisual

contents throughout the “European Audiovisual Space” is the best support to the European multicultural identity. This started with the “Television without Frontiers” Directive of 1989. The main issues from the Directive are still relevant. Among them are → advertising limits, the protection of minors and human dignity, cultural diversity, and access to information.

The EU audiovisual policy is related to public broadcasting in particular (→ Public Broadcasting Systems). The EU pays close attention to various controversies arising from public broadcasting services. In the early 1990s, for example, commercial broadcasters complained to the European Commission that privileging public broadcasters violates fair competition. The EU Protocol “The Public Broadcasting System,” together with the Amsterdam Treaty (1998), supported European public broadcasting. It asserts that public broadcasting services are indispensable to meeting the democratic, social, and cultural demands of each society. Insofar as its public funding does not violate fair competition among broadcasters, public broadcasting may be maintained. After the EU public broadcasting protocol was adopted, the European Commission urged Italy, France, Portugal, and Spain to reform their public broadcasting systems in compliance with the protocol (→ Radio Broadcasting, Regulation of; Television Broadcasting, Regulation of).

Thus, broadcasting laws in France, Italy, Portugal, and Spain have been revised (France, Public Broadcasting Laws [2000]; Italy, Law on Regulation and Principles Governing the Set-Up of the Broadcasting System and the RAI – Radiotelevisione Italiana [2004]; Portugal, Public Broadcasting Law [2003]; Spain, Public Broadcasting Law [2006]). The interest in public broadcasting has been heightened throughout Europe by digitization and EU demands for fair competition in the audiovisual market. The BBC adopted a new Royal Charter in 2007, Germany amended its Law of Interstate Treaty on Broadcasting in 2005, and Ireland passed a new Broadcasting Act in 2001.

### **Fair Competition Measures**

EU concern about media concentration issues has been addressed by the EU Parliament and Commission Resolutions, which are aware of decreased pluralism and the Commission’s executive actions (→ Concentration in Media Systems; Plurality). The EU’s focus is to preclude one particular communication enterprise from dominating the European market (→ Media Conglomerates; Mergers). But the necessity of being competitive in the global market has pressured the European Commission to compromise on its media concentration policy.

Regardless, the European Commission has devoted considerable efforts to fighting unfair competition through the European Registry of Mergers or by the Directorate-General for Competition. The EU does not have specific rules on media ownership; the legal ground of any activity on this field is based on general competition regulation, mainly on the Council Regulation of January 2004 “on the control of concentrations between undertakings” (→ Ownership in the Media). Its article 21 empowers member states to apply additional controls to protect media pluralism.

The latest significant actions by the European Commission include the merger procedure against the joint ventures of → Time Warner Inc., worldwide provider of online services, film entertainment, operator of cable systems and television networks, and publisher, and CBS, the US mass media company engaged in the delivery of television,

radio, and print publishing content; and the Commission's investigation in May 2002 of contracts among European pay-TV companies and various content providers, including the Hollywood film studios NBC Universal, Paramount Pictures Corporation, Inc., Buena Vista International, Inc.; Warner Brothers Entertainment, Inc.; 20th Century Fox Film Corporation; Sony Pictures Entertainment, Inc.; MGM Studios, Inc., and Dreamworks LLC (→ Sony Corporation).

In the first case, in March 2006, after the examination in light of Council Regulation (EC) no. 139/2004 of the newly created company, the CW, and the control operated by TimeWarner and CBS, the Commission decided not to oppose the operation and to declare it compatible with the common market. Concerning the broadcasting rights' contracts, the Commission's investigation pressured in some way the withdrawal of the "most favoured nation" (MFN) clauses from the majority of the Hollywood film studios' contracts, in October 2004. The only exemptions were Paramount and Universal. The Commission's preliminary assessment considered these MFN clauses to produce "an alignment of the prices," because they give the studios the right to implement the most favorable terms agreed between the TV companies and any of the Hollywood studios.

## Communication Law and Policy: Middle East

*Orayb Aref Najjar*

*Northern Illinois University*

22 countries belong to the Arab League, established in 1945. Most of those countries were ruled by the Ottomans, British, French, or Italians. Thus, Arab countries have largely adopted legislation based mostly on the legal systems of their former colonial rulers. Egypt, however, has a longer and more established legal tradition that dates back to the Egyptian constitution of 1923, while some Gulf nations that were British “protectorates” until 1971 have a less tested or developed legal tradition. The normative sources regulating speech rights in Israel consist of a number of British mandatory statutes incorporated into Israeli law in 1948 from the Law and Administration Ordinance, as well as Israeli legislation enacted by the Knesset after the establishment of the state.

### LICENSING AND MINIMUM CAPITAL REQUIREMENTS

All Arab countries with the exception of Iraq still require licensing before publication. In almost all countries, minimum capitalization is required. Sometimes, licensing involves obtaining a certificate of good conduct from the ministry of interior or the intelligence services.

In *Israel*, the 1933 ordinance based on British law, which mandates licensing of publications, the approval of the credentials of journalists, and the closure of publications, is still in force (→ Licensing of Journalists). Although Israel kept the British Defense (Emergency) 1945 Regulations on the statute books, the government undertook not to impose them on the Hebrew press, signing an agreement on military censorship with Israeli editors in 1949 and renewing it several times. A “censorship tribunal” resolves disputes between the chief censor and the Israeli press, which receives general guidelines on the topics the

government considers sensitive. Ever since a 1989 Israeli High Court of Justice ruling that the censor can cancel an article only if there is “a near certainty of tangible harm to the state’s security,” censorship of materials for political expediency has been reduced (→ Censorship).

The latest (1996) agreement with the editors was amended to allow all media, not just publications that belong to the editors committee, to file petitions against the censor in the High Court of Justice. The censor cannot appeal decisions by the committee. The agreement also established a censorship appeals committee, headed by a retired Supreme Court Justice. Schmidt (2006) notes that although Jews and Palestinian Arabs who are Israeli citizens “are formally equal before the law, the basic approach of using different normative and interpretative standards on both groups underlies Israel’s legal, judicial, and socio-political system as a whole and may be described as systematic.” (→ Israel: Media System).

### ACCESS TO INFORMATION

*Israel* enacted a freedom of information law in 1998. The law allows any citizen or resident to access records held by government offices, local councils, and government-owned corporations. Requests for information must be processed within 30 days. A court can review decisions to withhold information. *Jordan* has approved an access to information law in 2007, but the law was criticized for not having an independent body responsible for overseeing compliance.

Journalists who publish information on corruption are often punished for obtaining documents on which they based their investigations. *Algerian* journalist Bahir Arrabi was imprisoned in 2006 after publishing his investigative report on a charitable institution whose boss registered a piece of land in his own name instead of the name of the organization he was heading. The court ruled against him for obtaining documents that did not belong to him. On the other hand, the Yemeni parliament formed an 11-member anti-corruption authority to apply the Yemeni Anti-Corruption Law no. 39 (2006). Such legislation will make it easier for journalists to cover corruption. The *Iraqi* interior ministry on May 13, 2007, limited journalists’ access to scenes of bomb attacks, thus restricting their ability to report independently (→ Freedom of Information).

### DEFAMATION AND INSULT LAWS

Insult laws have their origin in the concept of “lèse-majesté” in the 1881 French law. Henderson (2005) arrived at a typology to determine the categories of critical statements prohibited under defamation and insult laws in the five countries he examined (Egypt, Jordan, Lebanon, Morocco, and Yemen). He found that the law prohibited statements (1) because of a person, such as the head of state (king, president) and his family, public officials, foreign heads of state, etc.; (2) because of an institution, such as the parliament, the courts, public agencies, religious authorities, etc.; and (3) because of a topic, such as public morality, nation’s reputation, or relations with a foreign state or territory. Additionally, many laws include vaguely defined offenses such as inflammatory propaganda or malicious information.

The → *right of reply* is found in the press laws of Bahrain, Egypt, Jordan, Lebanon, Libya, Morocco, Palestine, Syria, Tunisia, and Yemen among others. Israeli defamation law does not distinguish between defamation of private individuals and public officials or figures. It provides for imprisonment for six months for insulting “a public servant or a judge or officer of a religious court or a member of a commission of inquiry under the Commissions of Inquiry Law while engaged in the discharge of his duties.” No journalists were prosecuted under the criminal libel law. However, Amos Keinan, a columnist for Israel’s *Yediot Ahronot*, was convicted of contempt of court in 1995, and fined US\$670 for criticizing Israeli courts for imposing allegedly lenient sentences on Israelis convicted of attacking Palestinians in 1988 and 1989 (→ Journalism: Legal Situation).

### LEGISLATION AFTER THE SEPTEMBER 11 TERRORIST ATTACKS

September 11 has led Jordan, Egypt, Tunisia, and Bahrain to promulgate new press laws to fight “terrorism.” The Jordanian government on October 8, 2001, amended the penal code and enacted a new anti-terrorist law.

The new anti-terrorist law defines terrorism in vague terms and increases the scope of the death penalty. It stipulates that “anyone who commits an act which undermines the political regime in Jordan or incites others to do so, and anyone who acts individually or collectively to change the economic, social, or fundamental situation of the society” can be sentenced to hard labor. Because of the way some of these laws have been applied, some observers criticized the laws as attempts not to combat terrorism but to muzzle internal dissent.

### THE EFFECT OF RELIGION ON MEDIA LEGISLATION

As a result of the level of secularism versus Islamic observance, Arab countries use Sharia law sparingly or extensively. The *Syrian* constitution is the most secular because the founder of the Baath party in the 1940s, Michel Aflak, was a secular Christian. In contrast, *Saudi Arabia’s* Basic Rules for Governance serve as its constitution: Article 1 states that Islam is its religion; God’s Book and the Sunnah of His Prophet are its constitution.

*Israel* has no constitution and no bill of rights: the religious parties objected to any constitution other than the Torah, and the military establishment realized that much of the Israeli and British mandatory emergency legislation would never stand the test of judicial review. Israel hopes, however, that the basic laws it has enacted will eventually serve as its constitution.

After the publication of the Danish cartoons on September 30, 2005, and the republication of some of them in *Jordanian* weeklies, *al-Mehwar* and *Shihan*, two editors-in-chief were first charged with blasphemy in violation of the Jordanian penal code. After being released on bail, they were rearrested and detained for a week on charges of violating the Press and Publication Law, which prohibits “publishing anything that conflicts with the . . . values of the Arab and Islamic nation” and “publishing anything that might instigate violence, prejudice, bigotry or . . . which invites racism, sectarianism, or provincialism.”

The editors of the *Algerian* weeklies *Ar-risala* and *As-safir* were imprisoned for a month for reprinting the cartoons, their imprisonment based on the criminal code allowing for

between three- and five-year imprisonment for “anyone offending the Prophet or emissaries of God or belittling the doctrine and principles of Islam” (→ Violence against Journalists).

## INTERNET IN THE MIDDLE EAST

In the mid-1990s, when → Internet use was reserved for the well-to-do, most Arab governments did not attempt to censor it. As Internet use became common, some governments set up surveillance units. Only Saudi Arabia and Tunisia, however, have Internet-specific legislation.

In 2007, 53 percent of the citizens of the United Arab Emirates (UAE) were reported to use the Internet regularly, according to the *World Fact Book* of the Central Intelligence Agency. Israel comes second at 50 percent, followed by Kuwait (25 percent), Bahrain, (22), and Qatar (20). The rest of the Arab countries range between 10 and 15 percent. Iraq is in the last position at 0.1 percent (→ Exposure to the Internet).

Local Internet service providers (ISPs) enable governments to block certain websites. Gulf nations are most concerned about pornography, while Algeria, Egypt, Jordan, Libya, Morocco, Syria, and Tunisia concentrate mostly on human rights, political, and religious websites. Countries that have no Internet-specific legislation define communication in their press laws to include *any* means of dissemination, including digital. Thus, the most recent attempt to try a Bahraini → blogger for defamation of a government official was to be conducted under both the penal code and the Press and Publications Law 47/2002 before the official dropped the suit after mediation.

*Tunisia* has the region’s most detailed Internet legislation issued in a decree in March 1997, which explicitly extended the press law to cover the Internet. Each ISP must submit, on a monthly basis, a list of its Internet subscribers to the “public operator” (the state-run ATI); if the ISP stops providing services, it must turn over to the public operator a complete set of its archives as well as the means to read them. Furthermore, the “director” is to maintain “constant oversight” of the content on the ISP’s servers. The Internet decree also bars encryption without prior approval from the authorities. The contract presented to institutional clients by the ATI restricts their right to seek and access information online only to “scientific, technological, or commercial purposes under penalty of cancellation of the contract.”

*Saudi Arabia’s* 2001 Rules for Regulating the Internet forbid the publication of “anything contravening a fundamental principle or legislation, or infringing the sanctity of Islam and its benevolent Shari’ah, or breaching public decency,” and “anything contrary to the state or its system.” Censorship is undertaken by service providers, who, “record the time spent, addresses accessed or to which or through which access was attempted, and the size and type of files copied, whenever possible or necessary.” Saudis require the approval of the Ministry of Information “for setting up of media-type websites.” The Jordanian government has submitted a draft law in 2007 that regulates Internet broadcasting.

Although the *Egyptian* constitution stipulates that “no crime and no penalty may be awarded out of law, and no penalty may be awarded to the violations committed before affecting the respective law,” Egypt criminalizes some online activities, although there are no legal stipulations that criminalize them. Egypt jailed three bloggers in 2006.

Censorship of Internet content in *Israel* starts in 2008 after a law, unanimously approved by the ministerial committee on legislation, is brought to the Knesset for final approval. The proposed law requires Internet ISP and cellular phone providers to only allow access to Internet sites featuring pornography, gambling, and violence to users over 18 who specifically sign up for them and identify themselves as adults (→ Internet Law and Regulation; Pornography, Media Law on).

### POSITIVE DEVELOPMENTS IN THE ARAB PRESS

*Kuwait* is emerging as the freest country because of recent court rulings favoring freedom of the press. The Press and Publications Law of 2006 permits *any* Kuwaiti to engage in publishing after receiving a permit and allows for court review of rejected applications. It forbids the publication of material that criticizes the constitution or the prince, or calls for the overthrow of the regime. Insulting the prince, however, is no longer punishable by a jail term but by a steep fine.

Arab journalists are becoming increasingly assertive. The *Yemeni* journalists syndicate rejected a draft press law prepared by the government without consultation in 2005, leading to its suspension in 2007 and the initiation of consultations with civil society and the press syndicate on a new draft press law. Protests by journalists in Egypt and Jordan in 2007 also got press laws renegotiated. The Arab Journalists Union has crafted a progressive media law as a model; one that Arab governments have not yet adopted. The law ensures that the broad promises of freedom written into various constitutions are not contradicted in press laws or penal codes, forbids referring journalists to the State Security Court or imprisoning them, and insists that Arab countries adhere to the international conventions they had ratified.

*Bahrain's* most famous blogger cited on his website the Bahraini constitutional protections of free speech under Article 19 of the Universal Declaration of Human Rights “which the Bahraini Government is a signatory,” as he put it. The blogger, who writes in English, has published a photograph of the order to block his website, “Mahmoud’s Den,” signed by what he called “the minister of disInformation.” He also published a list of other blocked Bahraini sites coupled with instructions for unblocking them.

The Internet used to be the refuge for strict Islamists who issue fatwas (religious rulings) against Muslims with a different interpretation of Islam, and it still is. Today, however, the Internet is also the home of Muslims who take religious zealots to task by making fun of them, as happened in 2007 when sexually explicit cartoons ridiculed a fatwa on the separation of the sexes. The strange fatwa decreed that males and females may work together alone in offices if the female nurses the male five times, thus making him qualify as a brother. As a result of the uproar in the press and on the Internet, Al Azhar University of Egypt has since suspended an Al Azhar professor who issued the ruling, but the comic pornographic cartoons depicting what would happen in the workplace if the fatwa was applied were making the rounds on the Internet throughout the summer of 2007.

# Communication Law and Policy: North America

*Karla K. Gower*

*University of Alabama*

North America consists of 23 countries, including the United States, Canada, Mexico, the Caribbean Island nations, and Central America. The continent also encompasses several territories and possessions such as Greenland. The United States dominates the region, especially in the area of communication law and policy, with Canada next in line. Except for Cuba, all of the countries in the region are democracies, with most of the legal systems based on the American system, English common law, or French civil law. All of the countries have constitutions that protect the right of freedom of expression. The extent of the right in practice, however, varies. In the 2006 Freedom House classification regarding freedom of the press, 14 of the countries are free (61 percent), 7 are partly free (30 percent), and 2, Cuba and Haiti, are not free.

## CONSTITUTIONAL PROTECTIONS

The *United States* has the oldest constitution on the continent. Protection for freedom of expression falls under the First Amendment, which states that: “Congress shall make no law . . . abridging the freedom of speech, or of the press” (→ Freedom of the Press, Concept of). Although the provision originally applied only to Congress, it has been extended to governments at the state and local levels as well. The First Amendment is written in absolute language, but the protection it provides has never been absolute. The level of protection tends to vary depending on societal conditions. As a general rule, however, political speech (speech critical of the government) receives the greatest protection. Commercial speech (speech motivated by profit) receives less protection, and obscene speech receives no protection (→ United States of America: Media System).

The other North American countries have chosen not to adopt the absolute language of the First Amendment in their constitutions, and build in a method for balancing freedom of expression with other societal interests, rather than leaving the courts to create limits on the substantive definition of freedoms themselves. Freedom of expression, for example, is protected in *Canada* by Section 2(b) of the Canadian Charter of Rights and Freedoms (the Charter). The section provides that “everyone has the following fundamental freedoms: . . . (b) freedom of thought, belief, opinion and expression, including freedom of the press and other media of communication.” The Charter also provides in Section 1 that the freedom is subject to “such reasonable limits prescribed by law as can be demonstrably justified in a free and democratic society.” Section 1 allows the courts to reach a just result in a particular case without unnecessarily restricting the scope of freedom of expression (→ Canada: Media System).

The *Mexican Constitution* as of 2002 provides in Article 7 that “The freedom to write and publish on any matter is inviolable.” While “no law or authority may establish prior censorship, or require bond from authors or printers, or abridge the freedom of printing,” freedom of the press can be limited by “the respect of private life, of morals, and of public

peace" (→ Mexico: Media System). Similarly, *Guatemala's* constitution protects freedom of expression from governmental interference, but also allows for that freedom to be curtailed when its use is disrespectful of another's → privacy or morality (Greene 2007).

Nicaragua's constitution provides for freedom of the press, but allows for some → censorship (Freedom House 2006). Costa Rica, the oldest democracy in Latin America, has what is considered one of the freest press environments in the area (Freedom House 2005). Freedom of communication is guaranteed under Article 24 of the constitution (Freedom House 2006).

Guatemala's constitution guarantees freedom of expression but restricts press freedom to accredited members of the press (Freedom House 2005). *Cuba* has the most restrictive constitutional provisions regarding freedom of expression. The constitution prohibits private ownership of media but does allow free speech and press provided they "conform to the aims of a Socialist society" (→ Caribbean States: Media Systems; Central America: Media Systems; Cuba: Media System; Ownership in the Media).

## AMERICAN CONVENTION ON HUMAN RIGHTS

In addition to individual country constitutions, several of the states in North America are signatories to the → American Convention on Human Rights. Under the convention, "Everyone has the right to freedom of thought and expression. This right includes freedom to seek, receive, and impart information and ideas of all kinds, regardless of frontiers, either orally, in writing, in print, in the form of art, or through any other medium of one's choice." The convention specifically provides that "the rights of each person are limited by the rights of others, by the security of all, and by the just demands of the general welfare in a democratic society" (American Convention, Article 32[2]).

The convention is applied and interpreted by the → *Inter-American Court of Human Rights*, which was created in July 1978 with the ratification of the convention (Statute). The court is an autonomous judicial institution seated in San Jose, Costa Rica. It has the power to decide cases involving those states that have formally recognized its jurisdiction. Barbados, Costa Rica, Dominica, the Dominican Republic, El Salvador, Grenada, Guatemala, Haiti, Honduras, Jamaica, Mexico, Nicaragua, and Panama have all declared themselves subject to its jurisdiction (Pasqualucci 2006). In addition, any member state of the Organization of American States (OAS) may ask the court for an advisory opinion regarding the interpretation of the convention.

The court has interpreted the right of freedom of expression as having two interdependent dimensions: an individual dimension, which is the right to express oneself, and a social dimension, which is the right to communicate and to receive information (Ivcher Brontein Case 2001; Pasqualucci 2006).

## ACCESS TO INFORMATION

Although constitutional protections for freedom of expression are important, they can be meaningless for journalists without access to information (→ Freedom of Information). In the *United States*, where freedom of the press has long been vigorously protected, the Freedom of Information Act (FOIA) permits any person access to the records of federal

executive branch agencies. Under FOIA, government records are presumed open and exemptions to that openness are to be construed narrowly. After the September 11, 2001 terrorist attacks, however, the federal government changed its policy, making the range of the nine exemption categories broader and reducing access. The Homeland Security Act of 2002 further restricted the presumption of openness by expanding the nature of the information that fell under the national security exemption.

*Canada* also has a federal act regarding access to information. The Access to Information Act allows any individual to apply for access to a government document, and, like its US counterpart, has exemptions to the presumption of openness. Unlike in the United States, however, individuals who believe they have been improperly denied access to a record under the Act can appeal to the Office of the Information Commissioner of Canada. The Information Commissioner is an independent ombudsman appointed by Parliament to investigate complaints under the Act and mediate disputes. The Commissioner has strong investigative powers and annually ranks government agencies on their compliance with the Act.

As with the United States government, the Canadian government has restricted access to information since 2001. The Security of Information Act forbids unauthorized possession or communication of sensitive government information. In 2005, the government extended the Act's coverage to include a broader number of agencies. The result has been a severe curtailment of information flow to journalists (Freedom House 2006).

In *Mexico*, the concept of the public's → right to know is relatively new. Until the early 1980s, Mexico was under single-party rule. Criticism of the government was tolerated but only within certain limits and only by those who played by the rules (Sarmiento 2005). As a result, the majority of the country's press tended to promote the official agenda of the Institutional Revolutionary Party (PRI) rather than serve as watchdogs of the government (Lawson 2002). PRI was framed as being "the only valid representative of the Mexican population as a whole" (Lawson 2002, 126). Thus, there was no need for a right of access to government information. But in the late 1980s and early 1990s, Mexicans began to think more broadly about government and democracy, and journalists began covering the emergence of this new civil society and paying less attention to the PRI. The result was a more democratic election and the passage in 2002 of the Federal Law for Transparency and Access to Information.

Like the Canadian Act, Mexico's open records law created the Federal Institute for Access to Public Information to ensure that federal executive agencies were following the law in spirit and letter. Agencies in the judicial and legislative branches of government, however, were not subject to the Institute's oversight. Originally hailed as one of the best open records laws in North America, the law has failed to live up to its promise because of procedural hurdles that hamper its use (Freedom House 2005).

Several of the *Caribbean nation states* are also new to the concept of freedom of information. Jamaica's 2002 Access to Information Act provides for freedom of information (Freedom House 2005), as does the Dominican Republic's 2005 Free Access to Public Information Act. The government of the twin-island state of Antigua and Barbuda fulfilled an election promise to pass freedom of information legislation in 2006. The legislation provides for an information commissioner (Freedom House 2006). While El Salvador is considered a relatively safe place for journalists to comment on their

government, the country has no freedom of information legislation (Freedom House 2006). Nor is there such legislation in Barbados (Freedom House 2006). That situation may change, however, since the Inter-American Court has ruled that the right to freedom of expression protected by Article 13 of the American Convention includes the right to request and receive state-held information (*Claude Reyes v. Chile* 2006).

### **BROADCAST REGULATION**

Broadcasting in all of the countries is a mixture of private and public ownership with varying levels of regulation, except for Cuba, where the government owns all the electronic media outlets. The United States has a system of private ownership of television and radio stations, but those stations operate on an electromagnetic band that is owned by the public. Broadcasters are licensed by the → Federal Communications Commission and are obliged to operate in the → public interest. Because they use a public resource, broadcasters are subject to greater regulation over their content than are the print media. For example, broadcasters must limit programming considered “indecent” to particular hours of the day (Middleton & Lee 2007).

Canada has a similar private-ownership broadcasting system, but it also has the public, government-funded Canadian Broadcasting Corporation. The Canadian Radio-Television and Telecommunications Commission (CRTC) grants licenses to and regulates broadcasters (→ Public Service Broadcasting: Law and Policy; Radio Broadcasting, Regulation of; Television Broadcasting, Regulation of).

### **INTERNET REGULATION**

For the majority of the North American countries the percentage of their population with → Internet access is extremely small (→ Digital Divide). For that reason, most of the countries have no government restrictions or regulations on Internet access and content. The United States government, on the other hand, has tried to pass laws censoring Internet content, but the courts have ruled those attempts unconstitutional. Consumer protection legislation has been successful, with commercial websites being restricted in the amount of information they can collect from minors (Freedom House 2006).

In Canada, the CRTC has indicated that it will not regulate content on the Internet, although several provinces have enacted consumer protection legislation that affects e-commerce, and the criminal code gives judges wide latitude in deciding what constitutes hate speech on the Internet (Freedom House 2005). Cuba is the only country in the continent that strictly regulates Internet content and access (Freedom House 2006).

### **OTHER RESTRICTIONS ON FREEDOM OF EXPRESSION**

As indicated, although the constitutions of every North American country protect freedom of expression, that protection is never absolute. Some countries have built restrictions into the constitutional documents themselves; others have laws that make the constitutional provisions meaningless, such as criminal defamation laws and desacato laws, also known as “insult” laws. Desacato laws criminalize “expression which offends,

insults, or threatens a public functionary in the performance of his or her official duties” (Inter-American Commission on Human Rights 2002). Such laws are used to intimidate citizens and the media from criticizing the government and can result in self-censorship, effectively eliminating the public’s right to know (Pasqualucci 2006).

The *United States* has the strongest protections for journalists and others who speak out against the government (→ Journalism: Legal Situation). Defamation is still a criminal offense in some states, but the laws are rarely used (Middleton & Lee 2007). The US Supreme Court has made it difficult for public officials to bring libel suits civilly, requiring them to prove that the defendant knew the defamatory information was false or recklessly disregarded the truth. And hate speech is generally protected. In recent years, however, there has been an increase in the use of subpoenas to compel journalists to reveal confidential sources. Efforts to enact a federal law that would shield journalists from being compelled to reveal sources stalled, as they had on previous occasions. The District of Columbia and 34 states, however, have some form of “shield” law that protects journalists to some extent in such matters (→ Source Protection).

The Inter-American Court has not yet addressed the use of contempt laws to jail journalists who refuse to reveal sources although the Inter-American Declaration of Principles on Freedom of Expression specifies that “every social communicator has the right to keep his/her source of information, notes, personal and professional archives confidential” (Pasqualucci 2006; Inter-American Commission on Human Rights, n.d., Principle 8).

In *Canada*, journalists can be held in contempt for failing to reveal a source in a court case. And, unlike in the United States, defamatory libel and blasphemous libel are still criminal offenses under the Canadian Criminal Code (Freedom House 2006). Although the Canadian Supreme Court often looks to its US counterpart for guidance on freedom of expression issues, it has refused to adopt the American libel standard in civil cases brought by public officials, retaining the existing strict liability standard. Plaintiffs in libel actions need only show that the statement negatively affected their reputation and that the statement was made to a third party (Tingley 1999; *Hill v. Church of Scientology* 1995).

In April 2006, *Mexico City’s* Legislative Assembly passed a bill directing libel and slander complaints to be dealt with in civil courts, effectively eliminating criminal defamation. The law applies to the Federal District of Mexico City but has yet to be adopted by the other states (Greene 2007).

In Belize, the government may fine and imprison those who question the financial disclosures of public officials. And journalists are subject to libel laws for criticizing politicians (Freedom House 2006). Defamation is a criminal offense in El Salvador, and journalists are frequently prosecuted under the law (Freedom House 2006).

In May 2006, the Supreme Court of *Honduras* banned the criminal defamation laws that carried a mandatory two- to four-year jail term for defamation of a public official, but subpoenas are still used against journalists who reveal public information (Freedom House 2006). A year earlier, the country abolished its insult laws, which provided for the punishment of anyone who offended the president or other high-ranking government official (Pasqualucci 2006; Greene 2007).

Similarly, *Guatemala’s* highest court ruled in 2005 that the country’s insult laws were unconstitutional (Pasqualucci 2006; Greene 2007). Costa Rica’s Legislative Assembly also

has removed desacato laws from the criminal code, but the country continues to have strict libel laws that include penalties of up to three years imprisonment for insulting a public official (Pasqualucci 2006; Freedom House 2006). In 2004, however, the Inter-American Court of Human Rights held that the libel conviction of a *Costa Rican* journalist violated the American Convention on Human Rights (Pasqualucci 2006). In throwing out the conviction, the court concluded that those who “have an influence on matters of public interest have laid themselves open voluntarily to a more intense public scrutiny and, consequently, in this domain, they are subject to a higher risk of being criticized, because their activities go beyond the private sphere and belong to the realm of public debate” (Herrera Ulloa 2004, 129).

*St Lucia* usually enjoys a high level of freedom of expression. In 2003, however, the government amended the criminal code to include a jail term for anyone publishing false news that harms the public good. Section 361 of the Code states: “Every person who willfully publishes a statement, tale, or news that he or she knows is false, that causes or is likely to cause injury or mischief to a public interest, is guilty of an indictable offense and liable to imprisonment for a term not exceeding two years” (Freedom House 2005).

In *Cuba*, laws criminalizing “enemy propaganda” and the dissemination of “unauthorized news” effectively restrict freedom of speech. Violation of the country’s insult laws can result in jail terms of between three months and one year and in some situations up to three years. The Law of National Dignity proscribes jail time for “anyone who, in a direct or indirect form, collaborates with the enemy’s media.” The law is aimed at those who send material abroad for publication (Freedom House 2006).

## Communication Law and Policy: South America

*Susana N. Vittadini Andrés*

*Tamkang University*

South America comprises 13 countries with a vast array of cultural backgrounds. Its cultural diversity stems from Spanish, French, Dutch, Portuguese, and a myriad of indigenous languages (→ Cultural Patterns and Communication), which is reflected in South American communication law and policy. Néstor García Canclini (2005) has called South American culture a hybrid variety of influence and patterns (→ Culture: Definitions and Concepts).

Citizens' liberty was a key idea in many South American countries during their pre-independence struggles. It can be traced to liberal traditions in South America (Habermas 2006). In South American political culture, *caudillos*, or charismatic leaders, were a vital element in the “delegative democracies” (O'Donnell 1994), as they considered themselves the voice of the people. They often monopolized political decision-making processes.

## THE STRUGGLE FOR POWER AND THE QUESTION OF FREEDOM OF EXPRESSION

During the nineteenth century, the *caudillos* occupied the vacuum of power left by the European colonial powers. As their predecessors did, they restricted freedom of expression and enforced censorship. But liberal principles impacted freedom of expression in most South American countries, and they evolved according to local customs and norms, which *caudillos* invoked in imposing their authoritarian rule. Two opposing free speech ideas coexisted: to obey *caudillos* vs. to achieve freedom while rejecting government → censorship. The *caudillos* modus of operation prevailed, which was similar to the military command system. Freedom of expression was allowed insofar as it did not diverge from the leaders' views and agenda.

In the late 1960s and early 1970s, several South American dictators as well as constitutionally elected presidents signed the → American Convention on Human Rights, also known as the “Pact of San Jose of Costa Rica,” to protect freedom of expression and other human rights. However, the American human rights convention did not have a practical impact on freedom of expression in many nations of South America. Censorship was often imposed by non-elected governments. Besides, freedom of speech was subject to various penal limitations such as the crime of contempt or *desacato*. The late 1970s were a time of challenge to freedom of speech and the press in some South American countries (→ Freedom of the Press: Concept of). Non-elected government leaders suppressed freedom of expression through laws and regulations, and self-censorship was widely accepted as a fact of life. This was showcased by the military rule in Argentina, Uruguay, and Chile.

Significantly, however, the government restrictions on human rights made people increasingly conscious of the value of democracy and human rights. In the late twentieth century, the American Convention on Human Rights emerged as an important tool to stop these human rights violations. The Inter-American Commission on Human Rights (IACHR) and the → Inter-American Court of Human Rights have protected, promoted, and defended human rights since the 1980s. Thus, many South American countries had to amend their constitutions to expand freedom of expression, freedom of information, and other related rights.

## CONSTITUTIONAL EVOLUTION

*Argentina* has the oldest constitution in South America. It does not explicitly mention freedom of the press as a right, but the Supreme Court of Argentina held that protection of press freedom falls under freedom of expression. Most constitutions of South American nations do not consider freedom of expression an absolute right. Colombia is an exception in that its constitution provides for the “immediate application of the consecrated rights” such as “the freedom to express and to diffuse . . . thought and opinions,” and prohibits censorship of expression (→ Argentina: Media System).

The constitution of *Peru* guarantees freedom of expression, opinion, and diffusion of thought without prior censorship. Similar free speech principles are included in the constitution of Paraguay. But freedom of speech varies from country to country,

depending on their social, cultural, and political conditions. Some countries consider the honor and reputation of individuals, including public officials, more important than the right to free expression.

The constitution of *Brazil* is similar to other constitutions in South America, but it is more detailed. It provides for the right of free expression of intellectual, artistic, scientific, and communications activities with no censorship or license. The constitution of Uruguay does not mention freedom of expression textually, but it stipulates protection of communication of thoughts through words, private writings, or published in the press, or in any other form. It forbids censorship of expression, but at the same time it disallows the abuse of freedom of expression. Similarly, the constitution of Suriname includes an individual's right to express his or her feelings to the public (→ Brazil: Media System).

*Guyana* became a democratic republic in 1970, and it adopted the Constitution of the Co-operative Republic of Guyana Act in 1980. The constitutional protection of freedom of expression in Guyana is a fundamental right, and it is limited only by "respect for the rights and freedoms of others and for the public interest."

Some South American constitutions include treaties, pacts, and conventions relating to human rights that have a constitutional rank and prevail over conflicting internal legislation. Among them are the Argentine Constitution Reform and the Chilean Constitution Reform.

## **RIGHT OF ACCESS TO INFORMATION AND PUBLIC DOCUMENTS**

The General Assembly of the Organization of American States (OAS) reaffirmed its previous resolutions in 2005 to allow civil societies' participation in drafting access to information laws that would contain clear and transparent criteria. Several South American countries, including Peru, Argentina, and Bolivia, adopted freedom of information laws. In Bolivia, the Supreme Decree about Transparency and Access to Information exempts disclosure of information that affects territorial integrity and the existence of the democratic system, such as military strategic plans, financial information, and foreign relations.

In *Argentina*, access to public information is expressly guaranteed by the constitution, and the Personal Data Protection Act governs access to personal data. Similar freedom of information laws have been enacted in Chile, Paraguay, and Brazil. More recently, the Argentina government proclaimed an executive decree for public information access. The executive decree limits access to public information regarding national executive power activities and specific meetings of government agencies in charge of public services. Other access to public information laws in Argentina are the Establishing Access to Environmental Information Act and the Fiscal Transparency Act. But to implement the underlying principles of the freedom of information laws in Argentina is no easy task, for various administrative and political reasons.

*Brazil* has constitutional provisions for access to personal data, and also a 1997 law regulates habeas data, a judicial proceeding to "ensure the knowledge of information related to the person of the petitioner, contained in records or databanks of government agencies or of agencies of a public character;" and also "for the correction of data, when the petitioner does not prefer to do so through a confidential process, either judicial or

administrative.” Brazil is considering legislating access to government records. Suriname, French Guiana, and Venezuela have yet to put freedom of information laws in place.

*Chile* has laws limiting the public’s right to access government information, such as “state-held environmental information concerning the scope and terms of state deforestation project.” Such freedom of information limitation in Chile was submitted to the IACHR for review. The Commission determined that the “Chilean State’s interest in improving access to state-held information is insufficient.” It reasoned that the exemptions of the information access law “are overly broad, vague, and confer excessive degree of discretion on the official determining whether or not to disclose information” (*Miguel Fredes González and Andrea Tuzek Frides v. Chile*). In a case of 2006, *Claude Reyes v. Chile*, the Inter-American Court of Human Rights ordered Chile to train public officials on the rules and standards governing public access to information, and declared that access to information is part of freedom of expression under the American Human Rights Declaration. The 2006 case was the first time in its 27-year history that the Court had ruled on the right to access government information (→ Chile: Media System).

*Colombia* was among the first South American countries to recognize access to public acts and documents as a statutory right. The Colombian freedom of information law excepts from public release classified documents according to the constitution and laws, or those related to national defense and security. The constitution of Colombia provides that the professional secrets of journalists are inviolable. Colombia’s Anticorruption Act guarantees journalists access to “knowledge of the documents, acts administrative and other illustrative elements of the motivations of the behavior of the public authorities,” with some legal restrictions (→ Colombia: Media System).

In *Guyana*, access to information for the public is limited when the informational access requested “would interfere unreasonably with the operations of the public authority,” or when it is “detrimental to the preservation of the document.” In *Ecuador*, the Law of Transparency and Access to the Public Information requires all information that is generated or controlled by public institutions and entities, public or private, connected with the state, be subject to the principle of publicity, unless otherwise stipulated by law.

The constitution of *Venezuela* provides “the right of access to the information and data concerning him or her or his or her goods which are contained in official or private records,” with exceptions established by law. The information access right includes the right to “access documents of any nature containing information of interest to communities or group of persons.” But the Venezuela government prevented *Transparencia Venezuela* from participating in an OAS meeting. *Transparencia Venezuela* intended to have presented a report “based on official governmental information” showing “that no steps have been taken to fulfill” the Inter-American Convention against Corruption.

## INTERNET REGULATION

In South America, *Brazil* is the country with the most Internet users, while Chile and Argentina have the highest penetration rates. ADSL is the leading broadband technology, although cable modems have a strong presence. Most countries have regulations about Internet service providers (ISPs), domains, and spam. Not everyone has access to the Internet due to economic constraints. Argentina, Brazil, Chile, and Peru, among others,

have adopted the Rules of Heredia (2003) to disseminate judgments and judicial decisions on the Internet to promote “transparency in the administration of justice” and to protect personal data.

The *Argentine* constitution makes no mention of the Internet. A 1997 Executive Decree considers the Internet similar to the traditional news media in its freedom of expression under the constitution. The Argentine Supreme Court ruled that the constitutional freedom of expression principle includes disseminating and receiving information (F. Gutheim *c/J. Alemann*, April 15, 1993). The European Commission recognized in 2003 that Argentina provides an appropriate protection level for personal data, and thus Argentina can engage in the free traffic of personal data with EU member states without further requirements.

The constitution of *Chile* is identical to that of Argentina in that it contains no reference to the Internet. But some regulations determined procedures and terms to accept connections among ISPs and for the national dissemination of information via the Internet. Others stipulated the minimum quality indicators of the connections for the national Internet. At present, the Chilean government is deliberating on two draft laws for broadband and net neutrality, i.e., free Internet access without any obstacle or discrimination.

In 2002, the *Ecuador* government enacted a law that regulates, among other topics, messages of data, electronic signature, and electronic services, through nets of information, including electronic trade and protection for users. In *Peru*, young people are denied access to pornographic web pages that violate their moral integrity or affect their personal and family intimacy. In 2005, Peru enacted another law aimed at the use of unsolicited electronic mail and spam, while the penal code has applied to cyber-crimes since 2001. MERCOSUR, a regional South America organization, adopted a resolution in 2004 to facilitate Internet access for consumers in gathering information about products, services, and commercial transactions (→ Internet Law and Regulation).

## FREEDOM OF EXPRESSION RESTRICTIONS

At present, freedom of speech in many South American countries is often limited extrajudicially, although it is constitutionally and statutorily guaranteed. Freedom of the press is brutally suppressed by some ruling authorities and those connected with drug trafficking. They kill, kidnap, or threaten journalists (→ Violence against Journalists). For example, Colombian guerrilla organizations and paramilitary groups threaten journalists whenever their activities are reported. In other countries, such as Peru, journalists are attacked and threatened so often that Reporters without Borders has officially denounced those governments (2007). Why does this physical suppression of journalists continue in South America? To begin with, certain restrictive laws and political decisions stand in the way of free speech principles. Second, the absence of internal security and widespread corruption make it impossible to put into effect those constitutional and regional human rights principles and norms.

The American Convention on Human Rights forbids freedom of expression to be restricted through “indirect methods or means.” It also bars the “abuse of government or private controls over newsprint, radio broadcasting frequencies, or equipment used in the

dissemination of information, or by any other means tending to impede the communication and circulation of ideas and opinions.” One or more of such speech-constraining methods are used by many South American governments, including Venezuela and Argentina. In Argentina, Joaquin Morales Solá, a highly respected political analyst, stated that at present there is an anti-free-expression “climate” similar to the one that existed prior to the restoration of democracy in 1984 (Inter American Press Association 2007). Importantly, however, the crime of contempt or *desacato* was abolished in Argentina in the 1990s due to people’s pressure for democratic ways.

In *Uruguay*, where a long period of military rule (1973–1985) was replaced with democratic politics, access to information about military and police violations of human rights is extremely difficult. The right to know is limited by the right of honor, as the Supreme Court of Justice in Uruguay stated in the Carlos Dogliani case in 2006. Uruguayan journalist Carlos Dogliani was sued for publishing information of public interest relating to the Department of Paysandú municipal government. He was charged with criminal libel and insults through communication. The Supreme Court, ignoring its own precedents, stated that it does not matter whether the facts are true because what really matters is “the possibility to offend other people’s reputation.” It also affirmed the journalist’s “criminal behavior” even though “the offended person had been condemned by that fact” (Inter American Press Association 2006).

Although the crime of contempt or *desacato* has been abolished in some South American countries, it remains on the books in Brazil, Peru, and Venezuela. In Venezuela, for example, *desacato* serves as an easy tool of censorship for the vice-president, the Supreme Court justices, cabinet ministers, and congressional representatives, as well as the military high command, in punishing insults to the authorities. To define insulting as a criminal offense is perilously more political than judicial because no exact definition of the expression has been given by the judges. The Venezuelan penal code mentions various possible offenses against the reputation, the dignity, and the honor of those who share in the political, judicial, or administrative power. In Venezuela, one of the most significant *desacato* cases was against General Francisco Usón for his comment on television about an incident in which many soldiers died. Such *desacato* crime was prohibited by the Law of Social Responsibility in Radio and Television, which imposes numerous obligations on broadcasters.

Because South Americans have limited access to → television sets or the → Internet, → radio is an important means of communication (→ Digital Divide). Politicians often use radio and television to connect with people. Ecuador, Bolivia, and Venezuela are cases in point. Bolivia has different ethnic groups and languages, and President Evo Morales, a member of the Aymara, speaks the language of the largest group of Bolivians.

In *Venezuela* today, freedom of expression is increasingly in jeopardy because of its government’s repressive policies. Courts tend to view freedom of expression constrictively. The Supreme Tribunal of Justice refused to accept the IACHR’s decision as mandatory. This judicial rebuff of the IACHR rulings denies that the constitutional principles of the international conventions on human rights that Venezuela has ratified have a constitutional rank. The Constitutional Chamber of Venezuela also held that authorities can establish prior censorship. Further, journalists are intimidated and their contract clauses are altered in such a way as to restrict the news media. A good illustration is President Chavez’s much criticized decision not to renew the broadcast license of Radio

Caracas Television (RCTV) and his arbitrary distribution of government advertising. Direct and indirect methods to restrict information also tend to weaken people's right to be informed and to inform (→ Freedom of Information). Article 19 (2007), an independent free speech organization in London, presented a submission to the IACHR detailing international standards relevant to the regulation of broadcasting in the case of RCTV.

# Communication Management

*Peggy Simcic Brønn*

*Norwegian School of Management*

For some, communication management is a special way of managing; for others it is the steering of all communications in the context of the organization; for yet others it is the same as → public relations (PR), i.e. managing communication itself. This entry features the second approach, i.e., communication management as the steering of all communications in the context of the organization (→ Organizational Communication; Corporate Communication).

In order to understand communication management, it is important to first discuss the different communications functions within an organization. A prevailing view today is of corporate communication as defined by van Riel (1995). His definition includes organizational communication, marketing communication, and management communication (→ Marketing: Communication Tools). Organizational communication in this context is seen as PR activities, or communications between (and to) all other stakeholders than consumers and the organization. Marketing communication is typically communication directed at customers (B2B or B2C), and management communication is defined as that between managers and stakeholders. Others view van Riel's umbrella definition not as corporate communication but rather as organizational communication. Corporate communication is thus the typical PR function. In this view, organizational communication is seen as encompassing all of the communication activities of the organization. This has caused some confusion, but regardless of how an organization's communications roles are defined, a prevailing issue common to any definition is how the functions are structured within organizations.

## INTEGRATION OF COMMUNICATION

The two primary communication functions are marketing and PR. Kotler and Mindak's seminal article in 1978 discussed the organizational possibilities of the marketing and PR functions. Depending on what they call the "class of an organization," the two functions might be two separate but equal functions, equal but overlapping functions, marketing or

PR as the dominant function, and marketing and PR as the same function. An integrated approach to communication management, calling for increased cooperation and interaction between communication functions, has gained popularity in recent years but even this approach has caused confusion (Schultz et al. 1993; Gronstedt 1996; → Integrated Marketing Communication).

Cornelissen and Lock (2001) recognized the appeal of integration but believed that it deserves closer scrutiny. They cite the polarization within academia itself, describing those supporting it as pragmatists and those opposing it as purists. The pragmatists accept the concept enthusiastically, almost without question, as they see the need for communication consistency as even greater today. The “purists,” on the other hand, see integration as superficial and lacking theoretical grounding (Grunig & Grunig 1998). They challenge the idea of marketing as the dominant function in the excellence studies, which have become for some the standard for how PR should be organized. They believe that the marketing function, because of its budgets, perception in the organization, etc., would subsume PR if allowed too close proximity. Furthermore, they adhere to the oft-repeated argument that anything developing out of marketing cannot be strategic communication, as it can never understand the concept of dealing with multiple stakeholders.

Duncan and Caywood (1996) deal with this by viewing integrated marketing communication as occurring in seven stages, starting with awareness of the need for integrating communication by firms in dynamic markets. Their sixth stage encompasses stakeholder-based integration, and it can be said that the organization has achieved integrated communications due to all recognizing that customers are not the sole stakeholders of the organization (→ Stakeholder Theory). Finally, in stage seven, the relationship management integration results in a fully integrated communication strategy with contact by all management functions, thus achieving integrated communication.

Regardless of whether one takes a purist or pragmatist view, however, the need for integration exists. A primary reason for this is the need for consistency in communication. The marketing department that creates ad slogans that are inconsistent with an organization’s stated identity of ethics, trust, etc., can damage an organization’s reputation. Common sense dictates that organizations have oversight of who is saying what to whom. This, along with other influences, such as a tendency to consolidate communication disciplines within organizations, greater influence of communications in decision-making, and the rise of the corporate communication manager, all impact how communication is managed (Cornelissen 2004). As noted by Cornelissen, the integrated approach does not mean that there is no longer a need for separate PR and marketing functions.

Van Riel (2005) calls integration of communication a “magic word.” He proposes that “orchestration of communication” might be a more appropriate term, and, according to him, in essence it is more or less solving coordination issues. He suggests that the literature on “organizational behavior” (March & Simon 1958; Lawrence & Lorsch 1967; Ouchi 1979; Grant 1996) is also applicable to the field of communication management. Grant (1996) addresses the most important issues in the area of coordination. His approach can relatively easily be “translated” to the coordination of all forms of communication. He argues that there are four mechanisms within an organization that integrate specialist knowledge (such as communication knowledge). These are: (1) rules and instructions consisting of procedures, standardized information, and communication

systems; (2) the organization of the primary process in a sequential manner, such that the input of every specialist seems independent because it is granted its own “time slot”; (3) application of professional action in a relatively automatic manner, with the use of implicit protocols; and (4) group problem solving to be implemented when the complexity increases, a more personal and communication-intensive form of integration.

## ORGANIZATIONAL ISSUES FOR COMMUNICATION MANAGEMENT

The ability to orchestrate (manage) communication is also dependent on, among other things, organizational structure. Brønn et al. (2005) provide a review of organization theory and communication following the typology developed by McPhee and Poole (2001). Broadly speaking, organizational research has attempted to describe and to understand the influence of organizational structure on communication. For example, in the *traditional perspective*, which is based on the container metaphor and takes a reductionist approach to the subject, organizations are reduced to sets of dimensions or factors that are seen to be relevant for understanding organizational behavior. These include horizontal differentiation, size, and vertical hierarchy. This research has yielded much detailed information and propositions that are used by practitioners.

A second perspective is called the *configurational view*, which takes a more holistic view of the organization. The configuration approach in organizational theory and communication looks at the organization in its entirety, rather than decomposing it into distinct parts. Each configuration is composed of unique and specific combinations of structural features. One objective of this research is to understand the implications of the configuration on communications, as well as to investigate new configurations that arise from the competitive environment. Communication is key in configurational theories, and their communication structure and processes define some configurational types. For example, new configuration types such as networks are dependent on communication.

A more extreme and thought-provoking group of theories that have emerged in recent years are those that see *organizational structure as a communicative phenomenon* (McPhee & Poole 2001, 529). An example of this form is the “formal structural communication” (FSC) model (McPhee 1985) and various textual models of the organization. The FSC model is intended to highlight the “distinctive features of organizational communication that help to explain the proliferation of the complex organization as a social form” (McPhee & Poole 2001, 529). Some examples of communication types that have a direct relationship to organizational structure include the organizational charter, a company newsletter article about a structural change, and a co-worker’s explanation of what a manager “really meant” in a presentation. These examples largely rely on individuals’ interpretations of the communication as the basis for action and change. This approach has natural links to some of the main themes associated with the organizational learning literature (Senge 1990). The structure–communication approach appears to provide a platform for promoting a higher degree of interdisciplinary thinking, including a stronger focus on communication.

Farace et al. (1977) offer an approach to communication management. These authors state that communication managers’ roles are emerging because organizations are putting more emphasis on the processes of organizational communication. They maintain that three actions are necessary in order for a systematic approach to communication occur.

First, it is necessary to know how things are in the organization's communication system, who is saying what to whom and how, including measures of timeliness, believability, and relevance. Second is a decision on how a system should operate, and third is knowing how to change the communication system. In this phase, the key to success is institutionalization of the communication system.

However, institutionalization does not imply that communication management is static. As the internal and external environment changes, organizations must also change and adapt. But institutionalization of communication management implies that communication is recognized for its key role in an organization's performance. Furthermore, an institutionalized system can deal with communication management viewed as the orchestration of communication functions, as well as managing communication, the communication performance of individual organizational members.

The discussion of communication management has not changed much since Kotler and Mindak's 1978 article. Organizations are still trying to find some optimal way to organize their communication functions so that communications are more effective and consistent. A popular approach has been the development of integrated communication but there is still not much empirical evidence that integration of PR and marketing is more effective than nonintegration, even though there is a large body of anecdotal evidence that integration might be a good idea. Resistance to integration is not solely a characteristic of the practitioner community, but also of the academic community. Marketing faculty in business schools and PR academics in schools of communication or journalism (at least in the US) do not help. Organizational structure is also a key element in communication management, with recent research indicating that communication may even be a driver of how organizations are structured.

## **Communication and Media Studies, History since 1968**

*Lisa Mullikin Parcell*

*Wichita State University*

Communication and media studies matured into an integrated discipline in the years following 1968. Research and education became centralized in independent schools of communication, while at the same time drawing from related disciplines to improve methodology and explore new paradigms.

By the early 1960s, communication studies began to move out of departments of sociology, psychology, political science, and research institutes and to build independent departments. Before that, the leaders in communication research came out of other departments in social science and the humanities, who simply explored communication processes as one approach to answering questions in their own discipline. Having such an academically diverse group of scholars contributed to a richness of early scholarship in the field; however, as many of these scholars then moved away from communication research, the field was left with a wide array of theories and methods that couldn't independently answer many communication problems.

This “disjointedness” in the field was reflected in Bernard Berelson's (1959) stinging criticism of communication scholarship in the late 1950s. In what is often referred to as Berelson's obituary for communication research, he argued that the field was essentially

dying, with no new ideas or directions. In 1983, → George Gerbner responded to this criticism with a special issue of the *Journal of Communication* entitled “Ferment in the field.” A series of solicited articles from scholars around the world discussed the new directions, challenges, and opportunities of communication scholarship. Communication research, it appeared, was very much alive.

In the 1980s, traditional departments of speech and schools of journalism in the USA added “Communication” or “Mass Communication” to their names, or simply created independent communication departments. Often these new schools merged the professional fields of print, broadcast, public relations, advertising, information science, and speech with growing research programs in more broadly defined communication research (→ Communication as an Academic Field: USA and Canada). Growing recognition of the importance of the media by both industry and the public, as well as increasing respect for the field at the university level led to increased support for new scholarship. By the late 1960s scholars regularly met at national and international conferences and published in a growing number of communication journals. National as well as international communication associations like the → International Communication Association (ICA) and the → International Association for Media and Communication Research (IAMCR) all support scholarly research and its dissemination through conventions and journals. In 1970, *Ulrich’s international periodicals directory* listed fewer than 100 general communication academic and trade journals for the year. By 2004, that number had increased to over 800, with almost 100 of those being refereed. This combination of integrated research and scholarly outlets for sharing findings gave communication scholars the opportunity to merge their diverse ideas and approaches.

However, as communication departments formed separately from the other social science disciplines, their research lost the close connections it had earlier had to other social science fields. In recent years, however, the pendulum has swung back again, and many communication scholars now actively employ a multidisciplinary approach in their work, often in collaboration with colleagues in other social science fields. This combined effort allows scholars from different areas to bring fresh insight and methodology to the work.

## EDUCATION

As the discipline of communication grew around the world, so too did communication programs. The number of undergraduate and graduate students has grown exponentially in the past 30 years. Undergraduates, often attracted by the growing marketability of a communication degree, have dramatically increased in number. The boom in enrollment calls for bigger faculties, which, in turn, support more graduate students. Many communication programs increasingly demand that incoming faculty hold a PhD in communication as well as have professional experience. Communication departments try to offer both “professional” courses in print, broadcast, public relations, advertising, etc. and theoretical and methodological courses in communication research. This dual role can cause some friction, often referred to as a disagreement between “green-eyeshades” and “chi-squares,” as departments and schools of communication try to offer their students the best of both (→ Communication Professions and Academic Research; Communication Education, Goals of).

While American and northern European nations have a much longer tradition of communication programs, communication study became more popular in Latin American nations from the late 1960s, and Asian, Middle Eastern, and African countries soon followed. American and European programs continue to offer the majority of graduate programs, but many foreign students complete these programs and then return to teach in their home countries.

## RESEARCH

Historically, European and Latin American scholars have grounded their work in the critical school, focusing on critical analysis using qualitative data (→ *Communication as an Academic Field: Western Europe; Communication as an Academic Field: Latin America*). European scholarship often emphasizes society as a whole, rather than the individual, as the basis of study. This work is often rooted in political or social issues, and the results of research adapted to promote social change, while American scholars have traditionally based their scholarship on empirical studies, using survey analysis and other quantitative data analysis techniques. While these descriptions are generally accurate, there are many well-known scholars from both sides of the Atlantic who break this mold.

Until the 1980s American and European scholarship essentially operated independently. Working from different schools of thought and paradigms, researchers rarely drew from or even read each other's work. By the 1980s easier travel and more international conferences, journals, and other publications also contributed to increased understanding of international scholarship and blurred the traditional lines between European and American scholarship.

By the 1980s, communication scholars had pretty much abandoned the linear model of communication in favor of more complex models (→ *Linear and Nonlinear Models of Causal Analysis; Models of Communication*). As a result, the individual or society became the focus of study rather than the source or channel. This shift in focus, which had actually begun in the 1960s, led to a more sociological perspective, which included using a contextual approach, considering the individual rather than the media as the active agent, applying a convergent model of communication, and looking at communication as a process over time.

In the 1960s, researchers began including social context in their theories and empirical analyses. For example, traditional studies of how news organizations operate and the texts they produce shifted to examine how these structures and messages preserved the status quo of power and prevented social change. This contextual approach allowed researchers to look beyond using the media or channel as the variable for their work, and instead to explore the complex impact of communication messages.

As researchers moved away from the linear model of communication, they also turned their attention to what conditions determine when an individual will select information from a source. Individuals do not simply digest every message that crosses their path. Instead, people actively select information that they believe is relevant to them and can be incorporated into their construction of meaning. In addition, this line of research led to the notion of how communication can create shared meaning among groups. In these studies, the person or society is regarded as the activating agent, and researchers began to

approach communication as a process rather than as a single event or action that results from the media acting as a delivering agent for the message (→ Selective Attention; Selective Perception and Selective Retention).

The boom in diversity of communication technologies beginning as early as the 1970s forced scholars to adopt a more convergent model of communication (→ Technology and Communication). Not only could researchers no longer realistically determine a single source for a message, but the increasingly interactive nature of new media made it almost absurd to try to find a direct path from sender to receiver. Today's audience has much more control over which messages they are exposed to, and, through the interactive nature of the Internet, for example, one person can almost simultaneously be both the sender and receiver.

What became increasingly clear through all this research was that communication is a process, not a simple direct effect. The process of communication is often very complex, with many independent variables all affecting its outcome. In addition, this process of communication rarely happens quickly, but more often develops gradually over time. Scholars now regularly explore the communication process over time, in addition to trying to discover how sequences of events affects the process.

## **METHODOLOGY**

Although more American scholars now take a critical approach to communication studies, much of communication scholarship today remains empirical, quantitative, and focused on the effects of communication (→ Research Methods). Methodological advances in quantitative data analysis through the use of computers have further supported and enhanced this research. By 1970, most major academic institutions had computers and by the 1980s most had moved to desktop computing. The microprocessor gave researchers the statistical packages to complete complex analyses in minutes rather than months or years. Because of this, researchers can now use multivariate statistical techniques to quantitatively analyze complex communication processes with numerous independent and dependent variables all in interaction (→ Statistics, Explanatory).

Developing hand in hand with more complex statistical analysis were advances in both quantitative and qualitative methodology. Content analyses now make use of more complex coding schemes, which often allow researchers to put the content in context. For example, researchers using content analyses now often study genres such as television news, sitcoms, popular music, etc. instead of simply counting headlines, instances of terminology in texts, or acts of violence. These genres are then analyzed in context (→ Content Analysis, Qualitative; Content Analysis, Quantitative). In addition, many scholars have adopted a longitudinal approach to their work and moved away from the quicker, lab-based experiments (→ Longitudinal Analysis).

As scholars began studying communication processes in context, they expanded their methods beyond statistical analysis of quantitative data and found new ways of producing and analyzing qualitative data. Particularly since the 1990s, communication researchers have also improved the methodologies associated with case studies, interviews, focus groups, and various observational methods. Combining the traditional American empirical approach with the predominately European qualitative analytical approach in the 1990s,

researchers developed an empirical qualitative approach (→ Qualitative Methodology). This → triangulation in approach gave a more complete picture of the area being studied and has led to substantial theory-building.

## **FIELDS OF INTEREST**

The range of communication research is as rich, diverse, and complex as the communication processes under study. Rarely does an area of study remain in isolation; but instead researchers pull from other areas of communication and other disciplines. For example, it would be difficult, if not impossible, to draw a dividing line between the studies of new media, public policy, and media effects. However, since the 1970s communication scholars have by and large turned their attention to critical analysis, media effects, cultural studies, semiotics and meaning, agenda setting, new media, history, and law and public policy.

Critical research has gradually expanded in the United States over the past few decades to meet the growing desires of researchers to use their scholarship to promote change. European scholars with a long tradition of critical analysis continued to apply critical scholarship to politics and a growing number of other areas. American scholars applied critical research to the areas of politics, minorities, women, children, and new technology (→ Critical Theory; Feminist and Gender Studies; Political Economy of the Media; Postcolonial Theory).

Critical research will continue to be important as the world uses and develops new technologies. These technologies place communication and information in positions of ever growing influence in a nation's economic vitality. The same technologies also affect a country's ability to control and maintain power. Communication scholars across the world recognize the potential importance of critical communication research in balancing world power (→ International Communication).

As the expansion and development of new media and deregulation of existing media allowed increased global communication and made it possible to circumvent governmental barriers designed to keep outside messages out, many developing countries feared the influence of western messages bombarding their citizens through the media. They argue that western images, ways of life, and values subvert their traditional cultures which would therefore suffer from being opened up to new media. The result has been much research that is both critical in nature and concerned with global public policy (→ Cultural Imperialism Theories). This body of research expanded after a United Nations resolution called for a "New World Order in Communication" in the mid 1970s, which was followed through with → UNESCO's appointment of an International Commission for the Study of Communication Problems, known as the MacBride Commission. The Commission argued that before nations could enter into a truly global dialog, there must be equality in the distribution of global information resources and expertise.

Media effects scholars look beyond the individual level to try to understand how an audience as a whole is affected by a media message. Early media effects research focused on the effects of media violence, particularly in television and film, on children. Through decades of research using diverse methodology, samples, and media genres, scholars found that exposure to violent television and films, video games, and music increases the

likelihood of aggressive and violent behavior in both immediate and long-term contexts. Continued exposure to violent content desensitizes the viewer and undermines feelings of sympathy, empathy, or concern for victims. Scholars later applied similar methodology to the areas of pornography and women, children and advertising, and targeted audiences and health campaigns. Other studies of media content and their effects have explored issues such as sensationalism, stereotyping, and antisocial behavior. Communication scholars often classify media effects as either limited effects or powerful effects based on the impact on audiences' attitudes and behaviors. These effects are mediated in complex ways and depend on audiences' demographics, social context, values, beliefs, and emotional states.

Another area of media effects scholarship, uses and gratifications theory, posits that audiences actively consume certain media to meet specific needs. Many scholars have explored the relationship between mass media messages and their effect on popular culture. Some argue that mass communication simply reflects the status quo and doesn't directly affect attitudes and behavior, while others maintain that the messages serve as informal education and persuasion. Much recent research has explored various aspects of media effects using new media. Media effects remains the most popular area of communication research in the United States (→ Media Effects, History of).

Closely related to critical analysis and media effects is the area of → cultural studies. As a result of the political turmoil in the 1960s, communication scholars began to explore the power of the expanding mass media and its influence on culture and societies. Cultural studies scholars often study issues of empowerment of disadvantaged people in a society (based on race, gender, or social class). To do this, they moved away from the simple study of reproduction of media messages in the individual to a contextual analysis of cultural practice as a struggle for power and identity. They argued that the media were not simply benign, but that the prevailing structure of media organizations and their messages helped secure social control by elites. Researchers in developing countries, in particular, were concerned with the increasing disparity between people in these countries and people in the richer nations that was a result of unequal access to new technology and information (→ Digital Divide).

George Gerbner and his colleagues at the Annenberg School of Communication in the early 1970s introduced the term "cultivation analysis." They created a model of television's influence on behavior based on the theory of → symbolic interaction. Television, they argued, creates an environment of symbols which "cultivates" an individual perception of reality. These shared symbols, in turn, influence culture at a societal level. Later scholars approached cultural studies with critical research perspectives and explored the process in which a society together creates, modifies, and transforms a shared culture (→ Cultivation Theory).

Some critical scholars, who focus on the individual as opposed to the media as the acting agent, support an interpretive school where they look at how audience members individually interpret media messages. These scholars began to address questions about how and why people select media messages, how individuals and society create shared meaning, how individuals place new information into their realm of meaning, and how messages spread through channels and over time. Much of this research is based in theories of → semiotics and cultural studies.

Early research into why people select media messages began with agenda-setting theory (→ Agenda-Setting Effects). In this body of research, scholars attempted to describe and define how the media selects what information and issues are important and, through this selection, controls what information the audience receives. McCombs' and Shaw's early work with presidential campaigns in 1968, 1972, and 1976 formed the foundation for later work that developed the ideas of priming and framing (→ Framing Effects; Priming Theory). Other attempts to understand media usage developed the ideas of uses and gratifications and dependency theory, which argued that people actively select media based on their own needs (→ Dependency Theories; Uses and Gratifications).

The study of new media began with what is often called the communication revolution, when audiences could control the flow of information through new interactive technology. The growing interactive nature of most media was the final blow to the linear model of communication and forced scholars to consider more convergent models of communication (→ Computer–User Interaction; Digitization and Media Convergence; Interactivity, Concept of). Recent research has explored how individuals utilize new media, how they interpret and create meaning out of the messages they send and receive, how new media can limit or expand the information gap and knowledge gap, and how new media can play a role in government power.

Historians are now looking at long-run effects of media technology, control of the media, and the social effects of news, advertising, public relations, entertainment, and minority-controlled media. Media historians have expanded their focus from basic biographies and documentaries of particular media forms to more analytical discussions of how particular forms of media, groups of people, or social environments supported or forced change. In particular, media historians since the 1990s have compiled a great deal of work on the contributions of women and minorities in the media.

Legal scholarship in communication, traditionally related to First Amendment issues, has greatly expanded in scope in recent years (→ Communication and Law). New communication technologies, together with the continuing deregulation of the media industry, have raised a plethora of new concerns and issues related to public policy. Media conglomerates can now legally own and operate cable, Internet, and telephone services as well as hold publishing interests. In fact, the industry is in such flux with the development of new technology that many would argue public policy often lags years behind.

# **Communication and Media Studies, History to 1968**

*Peter Simonson*

*University of Colorado at Boulder*

*John Durham Peters*

*University of Iowa*

The international history of communication and media studies has yet to be written. To this point, most histories have been national, with the bulk of attention devoted to North America and western Europe. These emphases are not unwarranted, for the field established itself first on either side of the North Atlantic, was disseminated outward from there, and with a few notable exceptions remains best established in those regions today.

By necessity, this entry follows some of the traditional lines of analysis, but also aims to offer an overview of the interdisciplinary and transnational origins of the field, from its prehistory in the late nineteenth century through its institutionalization in the post-World War II era – when departments, doctorates, journals, and professional organizations were established in sufficient numbers to birth a separate field of communication from its several parent disciplines.

### **THE PREHISTORY OF A FIELD, 1870–1939**

In the last quarter of the nineteenth century, newspapers and “communication” became objects of sustained scholarly inquiry. To be sure, there had been influential analyses of

both earlier (and doctoral theses as early as 1690 [Atwood & de Beer 2001]), but not before the 1880s did there begin a coordinated scholarly effort to interpret the press and related phenomena which were increasingly collected under the sign “communication.” The home discipline was political economy and its then sub-field, sociology. The most important work was done in Germany, France, and the US. One important thread developed from consideration of transportation systems and another from concern with publics, masses, and community. The German political economist Albert Schäffle’s *Structure and life of the social body* (1875–1878) portrayed society as an organism whose transportation/communication systems functioned as nerves. Schäffle influenced the University of Michigan’s Charles Horton Cooley, whose research on railroads led to a grander social theory of communication, the first of its kind in the US (c. 1895–1909). By then Karl Bücher, another German political economist, had conceived of a *Zeitungswissenschaft*, or science of newspapers, and offered a course on the history, statistics, and organization of the press system (Hardt 2001). In *fin de siècle* Paris, the sociologist Gabriel Tarde, whose theory of social imitation was implicitly about communication, published articles on conversation, public opinion, and the press, continuing a longer French preoccupation with newspapers most influentially pursued by Alexis de Tocqueville. In Berlin, the American Robert Park was hearing lectures about social interaction given by Georg Simmel, and readying himself for a 1904 dissertation on crowds and publics.

Others devoted attention to newspaper study in the first two decades of the twentieth century. Max Weber proposed an ambitious but unrealized study of the press in 1910, while Columbia University’s A. A. Tenney developed basic methods of content analysis (→ Content Analysis, Quantitative; Content Analysis, Qualitative) that catalyzed newspaper studies by graduate students there into the 1920s, just as Park was overseeing better-known sociological research on the press at the University of Chicago. In 1916, Bücher founded the Institut für Zeitungswissenschaft at the University of Leipzig, the first such institute devoted to the science of the press, combining political economy, sociology, and history. The first American journalism schools had opened by then, but were devoted to the training of journalists and would not conduct serious academic research for another generation.

World War I and the Russian Revolution focused international attention on propaganda, widely used by all the major combatants (→ Propaganda; War Propaganda). In the US, political scientists like Harold Lasswell did some of the most important scholarly work, while the public intellectual → Walter Lippmann and the philosopher John Dewey weighed in with widely read books on the subject. In Germany Karl Jaeger coined the term *Publizistik* in 1926 to name a field concerned with publicity, media, and the formation of publics, while the philosopher Martin Heidegger explored communication (*Mitteilung*) in his hugely important *Being and time* (1927). The Agitprop Department of the Soviet Central Committee organized newspaper readership studies in the 1920s, enlisting linguists and literary critics to examine the content and style of the official mass press (Lenoe 2004).

Journalism programs were established in China, Japan, and Finland in the 1920s, drawing variously upon American and German models. In 1935, Brazil’s new Federal University in Rio established a professorship devoted to the study of journalism as a literary and social phenomenon. Following a more professional model, Argentina’s National University formed the first school of journalism in South America (1935), and

half a dozen other Latin American countries would follow suit before 1950 (Cuba in 1942, Mexico 1943, Peru and Ecuador both in 1945, Venezuela and Brazil in 1947). US journalism schools began producing scholarly research in the 1930s, initially of a historical sort, and led by Willard Bleyer and Frank Luther Mott, both of whom had doctorates in English. As director of Wisconsin's School of Journalism (est. 1927), Bleyer linked journalism with the social sciences and trained a cadre of academics who disseminated the model to other American universities.

Scholars also explored other media in the interwar years. Film study had begun before World War I (the Italian Futurist Ricciotto Canudo, the German sociologist Emilie Altenloh, and the Harvard psychologist Hugo Munsterberg had all written monographs). In the 1920s and 1930s, the League of Nations sponsored an encyclopedia of film, and the Payne Fund sponsored studies on the impact of movies in the US. Rudolf Arnheim went from studying Gestalt psychology with Kurt Lewin at the Psychological Institute of the University of Berlin to publishing books on film and radio. Lewin emigrated to the US in 1933, and over the next decade laid foundations for → group communications research at the University of Iowa and MIT. Tarde, Simmel, and Cooley had all written about face-to-face interaction, but published notes from George Herbert Mead's 1927 lectures probably had a greater impact on the study of communication.

Hundreds of thousands of Jews fled central Europe after the Nazis came to power in 1933, among them intellectuals who would play key roles in the institutional formation of communication study. Some emigrated to other European countries (Kurt Baschwitz settled in Holland), but many more went to America, where they cross-pollinated domestic institutions and ideas and helped bring mass communication research into existence. From Austria came → Paul Lazarsfeld, who had studied and worked at the University of Vienna, where he conducted perhaps the earliest scientific survey of radio listeners and advised the first Austrian dissertation on radio, written by his future wife, Herta Herzog (→ Audience Research). From Germany came Theodor Adorno and other members of the Frankfurt Institut für Sozialforschung. Lazarsfeld was instrumental in developing methodologically sophisticated objectivist approaches to mass communication, while the Frankfurt scholars formulated brilliant critical theoretical alternatives (→ Critical Theory). Their paths crossed briefly through Lazarsfeld's Office of Radio Research (ORR), begun at the University of Newark but moved to Columbia in 1941, and soon renamed the Bureau of Applied Social Research (BASR). Initially funded by Rockefeller money, Lazarsfeld's institutes survived and grew through commercial and government sponsorship of audience, marketing, and propaganda research (→ Propaganda in World War II). In conversation with Lasswell, whom the Rockefeller Foundation brought in for its important Communications Group seminar (Gary 1999), Hadley Cantril, and later with Robert K. Merton, hired by Columbia in 1941, Lazarsfeld oversaw development of a social scientific field that by the mid-1940s was being called "communications research."

Scholars in literature departments also turned their attention to media and communication in the interwar years. In the US, speech teachers had broken from English and created their own association in 1915. Over the next several decades they differentiated themselves into two camps, one devoted to traditional humanist inquiry of rhetoric and oratory, another advocating instead "speech science" (→ Speech Communication, History of). In England, F. R. Leavis wrote an English dissertation on the relation of

journalism and literature in the eighteenth century (1924). At Cambridge in the 1930s, he teamed with his wife Queenie to analyze mass culture and its media with the tools of literary criticism (as Robert Silvey was conducting survey-based audience research for the BBC). Among those influenced by Leavis's work were a Canadian, → Marshall McLuhan, and a Welshman, Raymond Williams, both of whom took Leavisite criticism as points of departure for their own influential analyses of media and culture two decades later.

### **COMMUNICATION AND MEDIA RESEARCH INSTITUTIONALIZED, 1940–1968**

World War II played an important role in establishing international frameworks for communications research. In the US, many of the leading students of propaganda and mass communications joined the war effort, working for the Office of War Information (OWI) and other government agencies, where they solidified social networks and refined methods of content analysis, focused interviews, survey research, and laboratory-based experimentation. Allied victory reshaped the global balance of power, prompted formation of the United Nations, and ushered in a new era of international hope counterbalanced by Cold War hostilities. Communication became a relevant concept across many fields of study. American government money flowed into universities and went overseas, funding communications research in the name of democratic institution building, development, and American influence. Europe re-established traditions of media inquiry interrupted by the war, and the new United Nations Educational, Scientific, and Cultural Organization (→ UNESCO, est. 1947) extended mass communication research around the globe.

Communication established itself institutionally through institutes, programs, and departments. Wilbur Schramm was a key figure, who drew upon Lazarsfeld's model to establish the Institute of Communications Research at the University of Illinois in 1948, and another at Stanford in 1956 (the latter partly backed by the Ford Foundation, which supplanted Rockefeller as chief private funder of communications research after the war). Schramm edited communications readers, trained graduate students, and through wide-ranging international contacts exerted great influence on the field (→ Schramm, Wilbur). Other universities established programs as well, including the University of Chicago, whose Committee on Communication (est. 1947) remained active through the 1950s, led by David Riesman, Morris Janowitz, and Elihu Katz among others (Wahl-Jorgensen 2004). Magazine and newspaper magnate Walter Annenberg endowed a School for Communication at the University of Pennsylvania (est. 1959), which would eventually become a leading center in the field. Louis Guttman took Lazarsfeld's model overseas when he emigrated from the US and established the Israel Institute of Applied Social Research (1947), an early site of public opinion research in that country. Katz began spending half his year at Jerusalem's Hebrew University in 1956, at which point he became the key figure in building Israeli communications research.

In the US the geographical center of gravity lay in midwestern public universities, which brought scholars of speech and mass media together, sometimes uneasily, under the covering term of "communication." After the war, speech faculty had established the National Society for the Study of Communication (an early version of the → International Communication Association), which in 1950 launched the *Journal of Communication*.

Though there were a handful of critical, cultural, and historical scholars working in the US, “The coalescence of American communication research was founded on the hegemony of quantitative social science,” as one observer notes (Delia 1987, 71).

Some drew upon American models in postwar Europe; others re-established native traditions of *Zeitungswissenschaft* and *Publizistik*; Finland’s University of Tampere established a chair of newspaper science in 1947. In Amsterdam, Kurt Baschwitz formed the Dutch Institute for the Science of the Press (1948) and organized a series of conferences that led to the founding of the *Gazette* (1955) as a central journal in the field. In Germany, *Publizistik* was institutionalized under Emil Dovifat at the Free University of Berlin, and by others at the Universities of Munich and Munster (Vroons 2005). At the University of Hamburg, the Hans Bredow Institute for Radio and Television was established in 1950, and began publishing a journal, *Rundfunk und Fernsehen*, the following year. Diverse spirits advocated the use of empirical methods, ranging from Theodor Adorno, working at the repatriated Frankfurt Institut, to → Elisabeth Noelle-Neumann, who founded the Allensbach Institut für Demoskopie (1947) and utilized survey methods in a long career as a conservative pollster and theorist. Adorno’s assistant, → Jürgen Habermas, conducted a public opinion study of student attitudes in 1961, a year before publishing his hugely influential critical-historical work, *The structural transformation of the public sphere* (→ Public Sphere).

In France, where public opinion research and press institutes (est. 1937–1938) had been closed down by the war, the study of the press resumed in 1947 at the University of Paris, under the guidance of legal scholar and historian Fernand Terrou. An international leader in the field known as *information* in France, Terrou founded the journal *Les Études de Presse* (1946) and served as the first director of the French Institute of the Press (est. 1951) and first president of the International Association of Mass Communication Research (founded with UNESCO backing in 1957) (→ International Association for Media and Communication Research [IAMCR]). UNESCO played important roles after 1947 by publishing bibliographies, sponsoring studies of mass communication systems around the world, and funding research centers, most notably the International Center for Advanced Study of Journalism in Latin America (CIESPAL, est. 1959 in Quito, Ecuador).

American foreign policy played a significant role in the spread of communications research. In US-occupied postwar Japan, the press was considered an important building block of democracy, and new journalism programs were established at four universities. In 1949, the Institute for Journalism and Communication Studies was founded at Tokyo University, and two years later the Japan Society for Studies in Journalism and Mass Communication (*ma su ko my ni ke shyo n*) was formed, headed by Hideo Ono, who had begun Tokyo University’s journalism program in the 1920s. Everett Rogers and other US development researchers conducted studies and trained students from around the world, spreading a paradigm of communication as diffusion from a centralized source, which served multiple purposes (→ Rogers, Everett; Development Communication). The Ford Foundation funded some of the work (sometimes in coordination with the CIA), and in the 1960s helped establish communication institutes in South and East Asia, including the Indian Institute of Mass Communication at the University of New Delhi (1965).

Operating from a very different vantage point, University of Toronto political economist → Harold Innis considered the relations between communications and empire in the last

years before his untimely death in 1952. He was the catalyst for an interdisciplinary group there which coalesced around the study of media and communications, led by English professor Marshall McLuhan and cultural anthropologist Edmund Carpenter, who used a Ford Foundation grant to publish the journal *Explorations* from 1953 to 1959. Canada had no graduate programs in communication before the 1970s, but the *Explorations* group pioneered a distinctive blend of cultural, literary, and historical analysis that distinguished it from the mainstream of American research (→ Medium Theory).

Two other influential alternative approaches emerged from Europe in the early 1960s. In Paris, the Centre d'Études des Communications de Masse (CECMAS) was founded in 1960 by the sociologist Georges Friedmann and his allies Edgar Morin and Roland Barthes (whose brilliant *Mythologies* [1957] probed the contours of modern mass culture). CECMAS began publishing the journal *Communications* in 1962, which like *Explorations* served as an ecumenical forum on communication and culture before it became the leading outlet for semiology late in the decade (→ Semiotics). Meanwhile in Britain the English professor Richard Hoggart established the Centre for Contemporary Cultural Studies (CCCS) in 1964 at Birmingham University (→ Cultural Studies). It was a postgraduate research institute which supplemented methods of literary criticism with sociology and history, taking its early bearings from Hoggart's *Uses of literacy* and Raymond Williams's *Culture and Society* (both 1958). London School of Economics social psychologist Hilde Himmelweit had conducted an important study of the effects of television on children (1954–1958, funded by the Nuffield Foundation), but sociology was slow in developing in the UK, and media studies emerged from the ranks of literature – a tradition initiated by the Leavises and updated with new left sensibilities at the CCCS. Indeed, literature served as one of the key parent disciplines for media research in many countries, including Denmark and Norway.

With varying degrees of acceptance, communications gained institutional footholds around much of the world by 1968. It was centered in the US, but had a presence across much of western Europe, though Spain and Portugal, still governed by dictatorships, were slower in establishing programs. The Baltic countries provided intellectual leadership in the Soviet Union, with Estonia's University of Tartu becoming a key center for media research in the 1960s (when television first gained a mass audience there), under the leadership of Ülo Vooglaid, who led the Laboratory for Sociology (est. 1967) and hosted a series of USSR-wide congresses on mass communication research over the next three years (Vihalemm 2001). Though one study estimated that there were no more than 20 scholars in Latin America with graduate training in the "communication sciences" (Nixon 1970), the 1959 founding of CIESPAL represented a beachhead of sorts, and a critical strand of research was beginning to emerge in Venezuela and Chile (where the Belgian Armand Mattelart taught from 1962 until the coup of 1973). Institutes of mass communication had been established in a number of Asian countries. Africa still lagged in developing indigenous research traditions, but in the 1960s it too witnessed a handful of studies conducted by native researchers.

## Communication Modes, African

Michael L. Hecht

Pennsylvania State University

Khadidiatou Ndiaye

Pennsylvania State University

Defining communication in Africa as well as the African diaspora is a complex task involving both cultural commonalities and differences. African communication itself reflects a complex mix of cultural values from the cultures and traditions spread across the vast continent (→ Communication as an Academic Field: Africa; Africa: Media Systems; Communication Law and Policy: Africa). While some traditional values have been fervently preserved throughout the continent, the myriad of outside influences, including European colonizers and religious crusaders, cannot be ignored. Similarly, Hecht et al. (2003, 9) explain that African-American communication builds from a “cultural amalgam of the cultural traditions, values, and norms of the indigenous African slaves as well as the European settlers who laid claim to what we know now as the United States.” Understanding African and African-American communication involves a thorough analysis of this cultural amalgam, understanding the worldviews through cultural codes (e.g., values and norms), processes (e.g., communication patterns and practices), and sense of community. We begin with a discussion of African-American communication.

### AFRICAN-AMERICAN COMMUNICATION

Pioneers in research on African-American communication such as Asante, Blake, Cummings, and DuBois worked to establish it as a salient area of inquiry (Jackson & Givens 2006). Western thought had long neglected African influences and these scholars advocated the need to include African-Americans in communication research and

theorizing. For example, Asante (1993, 2) explained that Afrocentricity is “a perspective which allows Africans to be subjects of historical experiences rather than objects on the fringes of Europe. This means that the Afrocentrist is concerned with discovering in every case the centered place of the African” as a fundamental concept derived from African values rather than merely in comparison or contrast to European styles.

One of the key issues is identifying these common cultural codes of meaning. Hecht et al. (2003) identify *five core symbols* in African-American communication systems: (1) sharing or endorsing the group (including rituals and communication styles), (2) uniqueness of or homage to the individual, (3) positivity and emotionality (based on spirituality and expressed through art and everyday life), (4) realism (both a style that is genuine and a practicality about the world), and (5) assertiveness (standing up for self).

Building on these common themes, the research on African-American communication is also concerned with exploring *communication styles*. For example, Hecht et al. (2003) noted the centrality of oral tradition and performance. This is illustrated in the preaching styles of the traditional black church. The preacher’s sermon goes beyond a mere speech, becoming a performance complete with “tonal semantics” (long pauses, rhythm, etc.). Call-and-response is an important aspect of the sermon as audience members are encouraged to participate by speaking up (e.g., yelling “preach on” or “yes”). These styles transcend the church, permeating both public and private discourse in the community (→ Religion and Popular Communication).

This research is also concerned with the impact of various *identity factors* on African-American communication including issues of gender (masculinity, women’s experiences, etc.), context (i.e., communication environment of first-generation African-American students), and pedagogy (i.e., experiences of African-American in academia), etc. For example, Jackson (2006) describes how the media “scripts” black masculinity in essentializing and stereotypic ways (i.e., exotic/strange, sexual, violent, and incompetent/uneducated). At the same time, Jackson (2006) holds out the hope that artists can embrace multiple black masculinities, describing them in healthy, nonhegemonic terms.

Building on the efforts of its pioneers, African-American communication is a thriving discipline which addresses a complexity of standpoints and the diverse experiences of people of African descent in the United States.

## COMMUNICATION IN AFRICA

Unfortunately, communication research on the African continent lacks such breadth. African communication research has been, for the most part, development-oriented, emphasizing the move toward modernization (→ Planned Social Change through Communication). While definitions of development communication differ, they share the underlying concern about change for the social, economic benefit of populations (Okigbo 1996). During the African nations’ independence era (1950s to 1960s), communication research was mainly limited to *mass communication*, and in particular radio, which was used to diffuse messages about modernization. Mirroring earlier studies of African-American communication which had imposed mainstream models of communication, the ideas disseminated were “pre-packaged” (Rogers 1976; → Rogers, Everett), and since, in the main, they had been designed by experts in the west, there was hardly any attempt to conceptualize or adapt communication to the African context. The use of mass media may

have led to better family planning or higher health awareness, in some cases and for some people, but ultimately it did not insure that the poorest, those who needed assistance the most, benefited. More importantly, this change was not embedded in emic or indigenous cultural systems. Mass media dissemination could not insure that the needs of those who required assistance were met; all it could do was to share a standardized message.

In response to the use of western models of development communication, some African scholars propose a *culturalist approach*. West & Fair (1993) noted the work of Bofo and Ugboajah who proposed the term *Oramedia* to account for oral forms of media including dance, drumming, storytelling, etc. They pointed out, appropriately, that culturalists proposed different channels of communication, but did not challenge the basic top-down communicative approach. Additionally, the basic assumption of communication as being solely the mass media was not contested.

The prominence of mass media can also be explained by the postindependence political contexts of the 1960s. New African leaders considered mass media as a central mean of promulgating a nationalist ideology. Ngwainmbi (1995) quoted former Kenyan president Kenyatta (in 1968): “the press in Africa can have a tremendous influence in nation building . . . It may constantly inspire the spirit of Harambee or National Unity which every young country needs as the fundament of its progress.”

The dominance of mass media is still apparent in more contemporary efforts to conceptualize communication in Africa. Obijiofor (1998) identified two forms of communication in Africa which he labeled “urban” and “rural” based on the location and culture of the audience. He explains that the *urban form of communication* included western communication media (i.e., radio, television, magazines, telephones, and limited electronic mail, etc.). On the other hand, *rural forms of communication* include traditional channels (i.e., “Gongman,” community leaders, marketplace, friends/neighbors). Obijiofor (1998, 165) notes: “Simply defined, the gongman is a man appointed by community leaders to disseminate information to members of a community. In many parts of rural Africa and Nigeria in particular, the gongman uses a wooden or metal gong to disseminate official information.”

Some scholars, however, have promoted a more *elaborate study of communication* in Africa. Advocating a philosophy of African communication (analogous to the Afrocentricity movement in the US), Okigbo (1987) observed the need to establish a communication philosophy based on African thought. Such a philosophy would demonstrate the limitations of western-based communication for exploring African thought. Okigbo (1987, 21) explained that without theorizing about communication phenomena in Africa, communication research throughout the continent would continue to be “shots in the dark.” Today, in-depth discussion of communication in Africa remains rare. Efforts to study and research what communication (especially mass media) *can* do for Africa have surpassed and even eclipsed the fundamental discussion of what communication in Africa *is*. However, there do exist promising efforts to advance the latter.

For example, Opubor (2004) builds on conversations with his grandmother to advance an African conceptualization of terms such as “truth.” He (2004, 56) argues for an *ethnographic approach* (→ Ethnography of Communication) to studying communication in Africa and poses crucial questions: “Are there African theories of communication? Are there African theories of behaviour and social change? What would these theories consist of? What would they focus on? Would they stress: individuals or social groups or the

individual-in-the-group? What communication strategies would be applicable for creating change from an Afrocentric perspective? What are the meta-languages of African communication? Should we study them language by language and culture by culture, or their generalised communication framework related to 'Africanity'?"

### QUESTIONS TO ANSWER

For the reasons outlined above, the discussion of communication in Africa ends with questions rather than answers. Themes or fundamental principles of African communication can be adequately advanced only once these questions have been answered. This discussion illustrates the complexity of African and African-American communication. It is irrelevant to discuss similarities between African and African-American communication. After all, the two groups share strong ancestral experiences. For example, oral tradition is an important unifying feature in both African and African-American communication and the research traditions for both are centered on describing an endogenous rather than a Eurocentric perspective. However, social and political contexts have led to different communication research agendas. The African-American research tradition is, perhaps, further developed, with recognition of diversity within the group (e.g., identities), and has moved from description of communication patterns to attempts to address health and economic disparities. In the African setting broader communication research (beyond mass media) is necessary to understand the range of cultures and identities, address language diversity, and apply findings to health, relationships, and civic life as well as economic development. Of course, the pressure of economic development will continue to attract primary attention and communication that recognizes endogenous voices is likely to be more powerful than that which is externally imposed, particularly given the history of colonialism. From what we know about the commonalities, these cultures share an oral tradition that values expressiveness and community. This would suggest the importance of interpersonal channels, which are particularly understudied in the African context, as well as of a narrative style of message construction.

## Communication Modes, Asian

Yan Bing Zhang

University of Kansas

Communication in its simplest form refers to the ongoing process of sharing and understanding meaning (→ Communication: Definitions and Concepts; Communication: History of the Idea). Many intercultural communication problems stem from the different ways that messages are composed, transmitted, and interpreted. Human beings depend on a variety of philosophical, social, psychological, and institutional standards or criteria of conduct to arrive at reasonable, appropriate, and meaningful modes of communication. Asia is very heterogeneous. Each Asian culture has its unique philosophical traditions, ethics, and morals for appropriate social behaviors and conduct. Confucianism, however, is one of the most prevalent practices in Asian cultures. Although communication is unique within each Asian culture, systematic similarities in communication (e.g., indirect, implicit, polite, and formal communication) have been observed across the Asian cultures (Gao et al. 1996).

Human communication modes (→ Communicator Style) can be understood from multiple perspectives. The purpose of this article is to explore the phenomenon by examining the current literature from Asian perspectives (→ Communication as an Academic Field: East Asia). Specifically, this entry discusses certain Asian communication modes, their fundamental core concepts, and the overarching philosophical frameworks of Asian cultures.

### CORE PRINCIPLES IN CONFUCIANISM: HARMONY AND HIERARCHY

Asian society has been strongly influenced by an ancient Chinese sage, Confucius, who lived approximately 2,500 years ago, before the Greek philosopher Socrates. Confucianism encompasses sets of principles and rules regulating social behaviors and

relationships, among them *ren* (humanism), *yi* (righteousness), *li* (courtesy), and *shu* (forgiveness), which are emphasized in dealing with the five cardinal relationships (father and son, emperor and minister, husband and wife, between brothers, and between friends) (Gabrenya & Hwang 1996).

Confucius proposed that things and persons be regarded as belonging to prescribed power hierarchies with responsibilities so that individuals could relate to one another in a supportive and harmonious manner. Confucianism was developed in a time of chaos in China. In the development of human civilization, its influence spread to neighboring countries and elsewhere in Asia. The effort to promote Confucian values in Asian societies is evident in media representations, school teaching, and government policies. In particular, some of the main Confucian values, such as interpersonal harmony, relational hierarchy, and traditional conservatism, are considered as essentially Asian, because they are generally emphasized more in the east than in other parts of the world. Hence, many scholars have identified Asian societies as collectivistic, rooted in Confucianism (e.g., Hofstede 2001).

### INDIRECT AND IMPLICIT COMMUNICATION

As one of the classical writers on communication and culture, Hall (1976) differentiated cultures on a continuum based on how much information is communicated and/or implied by the communication context per se, regardless of the specific words that are spoken. In Hall's view, on the high end of the continuum are *high-context cultures* where contextual messages other than the explicit verbal codes are emphasized. Not surprisingly, high-context messages can be implicit, ambiguous, and indirect. On the lower end of the continuum he locates *low-context cultures* where explicit and direct verbal codes are emphasized. High-context communication might involve managing strategic ambiguity, and sometimes "beating around the bush," thus seemingly little intended meaning is provided in the explicit verbal form. Grice's (1975) conversation maxims illustrate the ideal conversation styles preferred in low-context cultures, calling on communicators to give sufficient and relevant information and evidence in conversations and to avoid ambiguity, excessive verbosity, disorganization, and obscure expressions (→ Communication Modes, Western).

In line with the broader descriptions of Hall's high-context cultural traits where the *contextual cues and nonverbal communication* (→ Nonverbal Communication and Culture) are emphasized more than the sheer verbal codes, indirect/implicit communication illustrates how communication is carried out in Asian cultures. By its discursive expression, indirect communication refers to a communicative practice that is shared in many Asian cultures where communicators express meaning (especially the intended meaning) by using implicit, sometimes ambiguous, and unassertive messages. For example, in the *Chinese cultural context*, indirect/implicit communication is most exercised in the expression of feelings and emotions, in initial encounters, in public settings, when imposing on others, in situations where the other person's face or image needs to be protected, in self-enhancing situations, and when dealing with sensitive people and topics (Gao 2006). Assertive verbal skills in public speaking and debate are promoted and evaluated positively in western societies, such as the United States; but in Asian societies those who are perceived to have a "sharp tongue" are viewed more

negatively and considered to cause trouble, be disruptive and self-centered, and to have less knowledge than those who are relatively reticent. In other words, taciturnity is encouraged. When verbal messages are necessary, they are usually strategically managed and unassertively presented, especially in expressing discontentment, in order to avoid the escalation of conflict (→ Strategic Communication).

Confucian tradition encourages individuals to conduct “*mind to mind*” communication (Tsujimura 1987), involving the communication of meanings through physical setting, context, the relational and psychological temperaments of the communicators, shared beliefs, values, and norms. Phrases like *ishin-denshinin* in the Japanese culture, *i-shim jun-sim* in the Korean culture, and *hanxu* in the Chinese culture all demonstrate the importance of nonverbal communication and strategic ambiguity (Gao et al. 1996; Tsujimura 1987; Yum 1987). Consistent with this perspective, previous cross-cultural studies examining assertiveness and argumentativeness have revealed that Asians are less assertive than westerners (Kim 2002). To a large degree, indirect communication aims to promote and cultivate modesty, humility, and harmonious relations with others. In addition, certain external variables have contributed to the practice of indirect communication. Tsujimura (1987) argues that linguistic and ethnic homogeneity enables people in Asian cultures to understand the unspoken subtleties and understatements of a message, presumed to be part of the normative repertoire of social knowledge. On the other hand, cultural and linguistic diversity in the United States would make indirect communication inefficient and problematic.

A recent discussion in an American college classroom about a dialogue between an American student and a Malaysian student who was indirectly asking for a favor revealed several critical points. Some American students read the dialogue several times and still did not know exactly what the Malaysian student was asking for. Those who understood the request perceived the Malaysian student to be sneaky and manipulative. Some thought that the Malaysian student had a problem with language proficiency. Two Asian students in the classroom were frustrated with the American students’ lack of sensitivity in reading between the lines. This example demonstrates how frustrating the use of an indirect communication style in intercultural communication between those from Asia and those from western societies can be for both parties.

## **POLITE AND FORMAL COMMUNICATION**

Cultural systems mold individuals’ communication behaviors by influencing individuals’ self-construal (Kim 2002). Asian communication is very affectively based, other-centered, and ingroup-oriented. Unlike western societies where the independent self (i.e., where individuals are viewed as autonomous beings with unique personalities, emotions, and motivations) is most valued, in Asian societies the *interdependent self* (i.e., where individuals are regarded as connected by multiple relationships with others) is most emphasized (→ Cultural Patterns and Communication). Self in Asian cultures is defined by a person’s surrounding relations, derived from kinship networks. An Asian person’s self-concept and self-esteem are dependent on how he or she is considered or perceived by others. To have a positive sense of self is to be able to relate to others in ways that are sensitive to cultural values (e.g., filial piety), norms, and role expectations. Western

self-esteem also depends on how one is considered by others, but the emotional attachment of Asians to the concept of others is far stronger than that of westerners.

In Asian societies, maintaining good relations with others, being able to work in a team, and having a supportive social network project a positive self-image of a person as amicable, likeable, and capable. The cultivation of such social relationships involves behaving with *politeness and formality to others*, including supporting their “face” by abiding by the spoken and unspoken social rules and norms. Using formal and appropriate forms of address; praising others; being friendly, patient, and respectful; knowing one’s limit; expressing concern; showing care, warmth, and gratitude; and displaying modesty and humility are all specific examples of politeness. In general, an Asian communicator uses a great deal of sensitivity to protect the other party’s positive image or “face” in the communication process. Hence, from early childhood, individuals in Asian societies are educated to respect established relational and social hierarchies and to show an abundance of consideration to others.

As hierarchy permeates every corner of Asian societies, Asian communication is characterized by its politeness and formality. Coming from an Asian cultural background and teaching in the United States, the present author finds that the different levels of politeness and formality extended by students in their emails illustrate these cultural disparities. A typical email from an Asian international student who is interested in enrolling in a class that is full will start with a very formal address (e.g., Dear Professor/Dr.), followed by a well-structured self-introduction and reasons for the request. Such requests are always signed off “Sincerely” or “Yours truly.” A typical email from an American student will be very informal, frequently without any form of address and often with no name at the end of the message.

In explanations of the motivational forces of Asian communication styles, using Hall’s theoretical framework of high-context and low-context communication, Confucianism has always been observed to be the overarching philosophical frame while collectivism and high power distance are cited as the shared Asian cultural traits (Hofstede 2001). Cultural level analysis (e.g., accounts of Asian communication styles tend to paint all Asians with the same broad brush as collectivistic and thus reserved, indirect) has enhanced our understanding of Asian communication styles and their motivational forces. However, recent research using individual level analysis calls attention to the complexity and *increasing heterogeneity of Asian communication styles* and takes into account the impacts of cultural change, especially within younger, more educated, and urban segments of Asian societies (e.g., Zhang et al. 2005).

## Communication Modes, Hispanic

*Carlos Galvan Alemán*

*James Madison University*

It is widely accepted that communication, whether presented as a manner of acting, a style of conversing, or a fashioning of language, functions in many *modes* to bring individuals to some awareness of each other as members of a collective. This conceptualization of modes as *signifying forms of social activity* is in contrast to the more general notion of *channels* or means of communication (→ Communication: Definitions and Concepts; Communication: History of the Idea; Communicator Style).

That researchers would seek to characterize Hispanic modes of communication is not surprising given the reported growth in the number and economic power of people ascribed to that demographic in the world. For some researchers, identifying modes of communication unique to Hispanics presents an opportunity to understand cultural biases that inform interactions and relations between Hispanics and non-Hispanics. Others find implicit assumptions about such modes as the source of strained relations between groups offensive. Still others find the notion of modes generalized to bodies of people classified as “Hispanic” to be politically suspect. These thoughts underlie and inform the inquiry as it pertains to cultural communication and intercultural contact.

### CONCEPTS AND CONTEST

Research identifying Hispanic modes of communication can be framed by its contests. At one level, some observed communication practices and preferences have been challenged as overly generalizing and nonrepresentative. For instance, Mirandé & Tanno (1993)

criticized research reporting Mexican-American themes of interethnic communication because survey data submitted by respondents who self-identified as Chicano, Latino, or Mexican were excluded from the study. One issue here is the extent to which communication preferences associated with one grouping (i.e., Mexican-Americans) can be generalized to other named but unexamined Hispanic groups. But an altogether different issue raised is the extent to which such groups can be represented on a continuum of Hispanic cultural identity at all.

Most researchers now seriously consider ideological differences between the terms “Hispanic” and “Latino.” For many people, the term *Hispanic* symbolizes an ascribed identity, a designator created by the United States government in the 1970s to define a disparate population by national origin, use of Spanish language, and Spanish ancestry as a common denominator. Consequently, an understanding of groups or individuals as *more or less* Hispanic becomes a summation of citizenship, language, and lineage. In contrast, *Latino* has come to symbolize an avowed pan-ethnic cultural identity for groups and individuals as connected to the heterogeneous origins, histories, and cultures of people indigenous to Latin America and the Caribbean. The hybridity and paradoxes presented by *Latinidad* enable an identity that is fluid, relationally defined, and dynamically responsive to changing social and political contexts. The concept is not without its own criticism, especially when scholars overstate Latino unity under a “Latinist” framing, leading many indigenous and non-Hispanic people (e.g., Portuguese) of Mexico and Central and South America to resist the term or its sense of collective consciousness (Mayer 2004).

At another level then, several modes of communication characterized as Hispanic, as well as the very idea of a Hispanic culture, have been contested as poorly represented in the research literature. For instance, *machismo* is often represented as a mode of communicating monolithic masculinity and honor in Latin America, but rarely described so as to present how masculine ideals of dignity and respectability within the particular communities and circumstances are activated. Similarly, the word *macho* (manly) can signify a host of meanings by Spanish interlocutors who speak in jest or with seriousness of what it means to be a man (*ser hombre*). Taken outside of these spoken contexts, the word becomes a signifier of the exaggerated male behavior and aggressiveness that typifies definitions of *machismo* as a generalizing image of Hispanic men and Latin American culture (→ Latina Feminist Media Studies).

Delgado (1994) and other critical theorists question the construct of Hispanic itself as presented in both research and criticism. The concern is not simply with regard to non-Spanish speaking or non-Latinos engaging the inquiry, but to any person unaware of the histories and politics of ethnic identity. For instance, scholars who privilege US–Mexican or Spanish–Mexican relations for constructs of cultural identity often do so without regard to how the practices and customs of Mexico might be viewed with skepticism by nations and indigenous groups of Central and South America. Taken together, inattention to how modes of communication are often taken out of social, linguistic, and political contexts underlies some of the strongest objections to the inquiry as being complicit in strategies of *essentialism* and the construction of an *ethnic other* to justify social policy.

Within these contested terrains, a body of research nevertheless exists that presents complex and contradicting modes of communication notable among Hispanics and

Latinas/Latinos, and to a lesser extent among indigenous peoples that share in historical, social, and political situation (e.g., Maya).

## MODES

Among the more favorably received bodies of research are *local knowledge theories* of communication (→ Culture and Communication, Ethnographic Perspectives on) in a variety of *speech communities* and regions in South, Central, and North America. Local knowledge theories inform researchers of the varied ways in which people identify forms of social activity as signifying their collectivity. The significance of these modes is not always apparent to naïve observers as they are embedded in larger cultural schemes or *codes* internalized by participants. This embeddedness affords multiple layers of meaning for the social activity, only some of which is ever explicitly conveyed verbally. Researchers of cultural variability refer to such embedded modes of communication as *high-context*, and tend to regard Latin American countries as high-context cultures. Relationships between connectedness, familia, and the Spanish language illustrate this communication dynamic.

Modes of communication embedded in codes of *connectedness* have been noted in many Hispanic and Latino speech communities. Codes of connectedness in communities influenced by traditions of Roman Catholicism and Spanish colonialism tend to emphasize relationships between persons (*personas*), who can expect to be treated with a dignity (*dignidad*) and deference (*respeto*) that is not extended to animals or material objects. Such codes have conflicted and have been combined with indigenous codes that extend connectedness in mind, body, and spirit with earth and cosmos. Codes of connectedness presented in Latina/Latino speech tend to move between these and other discourses, placing emphasis on a sense of self that is defined by personal, spiritual, community, and socio-political ties. For instance, Fitch (1998) highlights the importance of connectedness by middle-class Colombians who summarize *vinculos* (bonds to others) that are derived in part by nature (e.g., ties to homeland) and in part by nurtured shared experiences (e.g., friendship) as a fundamental unit of one's existence. The primacy of connectedness as a code is one reason Latin American countries are noted as *highly collectivist* by researchers examining cross-cultural communication (→ Cultural Patterns and Communication).

The extent to which individuals are defined by and place value on family and community relations has been a central feature for assessing societies as collectivist. For many Hispanics and Latinos, modes of communication that revere *la familia* are constitutive of the connectedness that defines their communities. Mexican parents who insist their children affirm age, sex, and even birth order as statuses worthy of honor, for instance, may do so not simply to sustain the orderliness of *respeto* in *la familia*, but to publicly signify the family's connectedness to local customs of *culto* (well-manneredness).

Modes of communicating *respeto* and *confianza* (relational closeness, trust and reliability) in *la familia* may be extended to close friends and in some degree to social relations. For instance, Fitch (1998) observes how acts of *confianza* must be balanced with acts of *distancia* (interpersonal distance) in professional relations between Colombians so as to communicate a familiarity that is appropriate in deference and personal respect. In other communities the importance of conducting daily interactions with *personalismo*

(interpersonal warmth) is necessary so as to construct one's person as *simpática/simpática* while affirming the *dignidad* of another. Milburn's (2001) analyses of "Puerto Rican time" in social and work settings illustrates how calling up that mode is not only meant to break the constraint of "American time," but to relax the "respect" rules among Puerto Ricans as well. These concerns for status, familiarity, and self-image help inform research which characterizes Hispanics and Latinos as preferring interpersonal conflict styles that are indirect, accommodating, and showing concern for another's positive face (→ Intercultural Conflict Styles and Facework).

Finally, numerous studies have reported the ability to speak Spanish as important for perceived ethnic and cultural identity (→ Ethnolinguistic Vitality and Communication). While much writing exists that examines relationships between language and culture and between linguistic and social structures, descriptions of talk regarding what it means to "speak Spanish" are informative of disconnectedness within and connectedness between communities. For instance, a failure to speak Spanish (*habla*) might be explained as an inability to demonstrate a knowledge or fluency of the Spanish language proper (e.g., Castilian). To "speak Spanish" then is to signify connectedness to a worldview or culture through a language proper, with greater fluency often serving as an indicator of class status. In contrast, a person lacking in knowledge and fluency may be evaluated as disconnected from the history and culture afforded by the Spanish language.

A failure to speak Spanish (*hacen*) might also be explained as incompetence in a social activity signifying of connectedness to others (e.g., familial, community, regional, political). To "speak Spanish" then is to assist in the "doing" of some activity, such as making conversation, where the expected amount and quality of Spanish spoken varies with the coded significance of the activity. For instance, in a bilingual household a child may only be expected to greet visiting elders in Spanish. Failure to carry out such activities as expected might thus be experienced as some disconnectedness between persons and their communities.

Both frames inform how "speaking Spanish" functions as a mode of communication. While the Spanish language is generically structured to differentiate relations by gender and formality (i.e., status and familiarity), studies of language use illustrate how forms of personal address (e.g., *tú, usted*) and directives are fashioned so as to indicate how relations are being assessed in particular communities. A phrase fashioned so as to tease the sexed status of a hearer may be taken as play in one community but as serious transgression in another. It makes sense then that plays on words, use of irony, joking, and teasing are frequently listed as misunderstood social activities between people who can "speak Spanish" but do not know how to "speak Spanish." It also makes sense how growing up in a "Spanish-speaking" household in one community may mean something altogether different in another.

Calafell (2004) notes that, as townships, cities, and nations continue to grow more diverse in ethnic populations and social practices categorized as Hispanic, modes of communication notable in Hispanic and Latino speech communities will continue to be tested and contested as signifying of their collectivity. The paradoxes and dialectic between ideas and ideology, research and practice, as well as the connectedness/disconnectedness between individuals and community should not be seen as problematic, but as conflict worth having.

## **Communication Modes, Muslim**

*Fathali M. Moghaddam*

*Georgetown University*

Traditional Islamic modes of communication have evolved to become very effective at enhancing conformity and obedience, and in strengthening ingroup cohesion (→ Communication and Social Change: Research Methods). Three illustrative examples are discussed here: the *azan* (call to prayer), the daily prayer, and the month of *Ramadan*.

It is particularly important to attend to Islamic modes of communication, because Islam is the fastest-growing major religion in the world, soon to constitute about a quarter of the world population. Although the rise of Islamic fundamentalism and terrorism (Moghaddam 2006; → Mediated Terrorism) has focused attention on Middle Eastern countries, particularly Saudi Arabia which is the home of Wahhabism, the most populous Islamic countries are outside the Middle East. Indonesia alone has about 220 million Muslims. Approximately 90 percent of Muslims in the world belong to the Sunni sect; Shi'a is the second largest sect, Shi'a Muslims make up the vast majority of the populations of Iran, southern Iraq, and southern Lebanon. The historic conflict between Sunni and Shi'a Muslims has intensified since the US-led invasion of Iraq in 2003; on the borders of India and Pakistan, Islamic fundamentalists are fighting for control over Kashmir.

Anyone traveling in Muslim societies immediately experiences the *azan*, the call to prayer, which is heard from every mosque, in every neighborhood of a city and every village in the countryside. Radio and television stations also broadcast the *azan* (Bowen & Early 2002). The migration of millions of Muslims to western European societies means that the *azan* is now also heard in some western cities (→ Intercultural and Intergroup Communication). The *moazen*, the person singing the *azan*, is specially trained, and the most successful *moazens* have a wide following and appeal. In traditional societies, each mosque has a *moazen* who climbs up the minaret and sings the *azan* five times a day, but in many places now tapes of the most famous and successful *moazen* are played through loudspeakers, and are available on the → Internet. An important consequence of the *azan* is that five times a day, the entire Muslim community is immersed in the call to prayer: everyone – people shopping, walking in parks, driving through the city, lingering in tea houses – undergoes the same experience. Even secular parts of society are forced to hear the *azan*.

Prayer may not be considered by some to be a mode of communication for study, but the social influence exerted by the practices associated with Islamic prayer play a unique and highly important role. All Muslims are obliged to pray five times a day at specific times. The prayers are to be said in Arabic, and are preceded by ritual cleansing. Children start learning the prayers by heart from an early age, and in Muslim families girls over 9 and boys over 13 are expected to follow the routine of daily prayer.

Muslims are encouraged to pray as part of a group, led by an *imam* or a community leader. The spiritual value of prayer is said to be higher when it is undertaken as part of a collective, rather than as an individual act, separate from others. Thus, the *azan* calls the faithful to prayers five times a day, and the expectation is that individuals will try to join others in saying their prayers. This arrangement creates opportunities for the collective to exert continuous influence on the individual, maximizing possibilities for achieving *conformity to group norms* and obedience to Islamic authorities. In particular, the gathering of Muslims for prayer presents Islamic preachers with daily opportunities to communicate with the faithful, passing on messages that come from local, regional, or national authorities (Parshall 1994).

The tradition of *Ramadan*, a month during which, from sunrise to sunset, practicing Muslims abstain from eating, drinking non-alcoholic beverages (alcohol is forbidden to Muslims at all times of the year), and smoking, represents another unique and effective mode of communication in Islamic societies (Bakhtiar 1995). Again, the emphasis during *Ramadan* is participation in collective life and conformity to group norms. First, the practice of fasting disrupts the normal routine of daily life and sharpens the difference between ingroup and outgroup. Muslims find it very difficult to interact with non-Muslims during the month of *Ramadan*, because they must fast between sunrise and sunset. A consequence is that during this month social and business meetings with Christians, Jews, and other non-Muslims becomes difficult. This is in part because during *Ramadan* fasting becomes a national preoccupation and there is far less attention on getting work done. Also, lengthier meetings typically involve sharing food and drink (e.g., a “business lunch”), which is not possible when Muslims have to fast. The result is that during *Ramadan* business slows down and even grinds to a halt in many parts of the Muslim world. Second, Muslims are encouraged to break their fast at sunrise each day as part of

a group, as well as to attend various sermons and gatherings special to this time of the year.

The power of traditional communication modes is weakened by some *alternative sects* and reformist Muslim groups, which have challenged the priority given to the interpretation of Islamic rules by authority figures. For example, Sufi groups tend to highlight personal inspiration rather than dictates from authority figures.

## **Communication Modes, Western**

*John R. Baldwin*

*Illinois State University*

An understanding of values and worldviews can greatly inform our understanding of the modes of both face-to-face and mediated communication in the so-called western world. The terms “eastern” and “western” are problematic. Stevenson (1994, 178), for example, classifies Japanese media systems under his rubric of Western mass media. However, for want of alternatives, these terms will be used in this essay.

In terms of face-to-face communication, there is great diversity in communication among western cultures, yet we find some similarities in terms of values and thought structures – that is, similarities that characterize Europe and European-descended cultures, as opposed to non-European cultures such as Middle Eastern, Sub-Saharan African, Oceanic, South Asian, or Far Eastern cultures.

### **FACE-TO-FACE MODES OF COMMUNICATION: VALUES, WORLDVIEW, AND COMMUNICATION STYLES**

Hofstede (1997) created a set of value dimensions that many researchers apply to different cultures. The dimensions include the notion of self as a culture’s preference for individual autonomy versus connectedness of individuals to their group (individualism/collectivism:

I/C), a culture's acceptance of status difference or social inequality (power distance: PD), gender role rigidity and communicative directness versus role fluidity and face-saving communication (masculinity/femininity: M/F), and the culture's relation to ambiguous situations (uncertainty avoidance: UA). Within these dimensions few distinctly western patterns are observable.

In general, individualism increases with gross national product and with industrialization, because in collectives one's status role becomes more important; and as individualism increases in a culture, status importance tends to decrease. On some dimensions (M/F, UA), one cannot make predictions about eastern or western cultures. Greece, Portugal, and Belgium, for example, prefer to avoid ambiguous situations (high UA), while Scandinavian cultures and British-descended cultures are more accepting of such situations. Some central European cultures (Swiss, Germany, Austria) and British-descended cultures are more "masculine" (which, with a double-barreled definition is, in fact, uncertain in meaning), but Scandinavian countries are more "feminine."

The *power distance* and *individualism/collectivism* spectra are clearer: Mediterranean cultures tend to be at the midpoint of both ranges (PD and I/C), followed (in the direction toward lower power distance and increased individualism) by central European cultures, Scandinavian cultures, and finally by British-descended cultures, which are the most individualistic. Australia and the United States are among the most individualistic cultures in the world, with other sources suggesting that the US, with its "hyper-individualism," has only seen individualism increase in the last several years, to the point where some feel that there is an increasing breakdown in civility and social involvement, except where the latter meets personal goals (Bellah et al. 1996). These categorizations have limitations, such as the placement of many Latin American cultures (also considered to be "western" by most) among higher power distance and more collective nations.

Where value specifics may not be generalizable to western cultures, some writers make claims about western ethics and worldview, often by way of comparison with other world philosophical systems. In brief, the western philosophical system, strongly influenced by ancient Greek and Roman philosophy, tends to center on "reason, logic, evidence, and truthfulness," which Shuter (2003, 450–451) calls the "hallmarks of Western civilization." Kim (2006) notes that eastern and western cultures differ in terms of views of the person, of knowledge, and of time (→ *Communication Modes, Asian*). Western epistemology is bound up with reason, with an ethical system that privileges openness and honesty, where eastern epistemology focuses on reflection, propriety, intuition, and respect of others. These values extend to the very notion of communication: in western models, communication is often seen as a linear "transfer of meaning" from a sender to a receiver (Jandt 2004) – a "representative" view of communication (i.e., with communication actually representing reality, a notion challenged by social constructivism and postmodernism). Communication is "regarded as a tool for transferring and reflecting truth" (Chen 1998, 357). In other cultural views, to express something with words may be seen to obscure its beauty or even reality (e.g., some Asian cultures), while other cultures see reality as cyclical and interrelated (e.g., Afrocentrism; → *Communication Modes, African*).

Regarding religious worldview, western cultures are predominantly monotheistic, influenced strongly by a Judeo-Christian heritage, while most nonwestern cultures (with

the exception of Muslims and Farsis) tend to have ethics-based religious or polytheistic systems. Beyond that, the western world seems divided between those that are based on Judeo-Christian systems but with everyday thought and communication following a secularist (and often pragmatic) model, and those where the element of the spiritual still pervades thought and talk, such as the *si Dios quiere . . .* (if God wills . . .) of some Latin-based western cultures (→ Communication Modes, Hispanic).

As values and purposes of communication vary widely among so-called western cultures, so do communicative practices (→ Intercultural Norms; Cultural Patterns and Communication). Some western cultures – as low-context cultures – look for meaning in the explicit code, i.e., words (Hall 1976). These include cultures that use a more succinct style of communication, using understatement and few words, but with the meaning still supposed to be in the words themselves (e.g., Great Britain); and also cultures that prefer an elaborated style, giving much detail in the words, “spelling everything out,” so to say. Such cultures (e.g., the United States) may be *more* likely to favor direct modes of communication, for example, in conflict situations (→ Intercultural Conflict Styles and Facework). However, other western cultures favor the preservation of harmony and face-saving (e.g., the Latin American concept of *personalismo* or personal respect in communication). Some of these, while more collectivistic, do not look for meanings in silence, as happens in some Asian cultures (→ Nonverbal Communication and Culture), but may use exaggeration, formality, and harmonizing behaviors, where communication is used not so much to *transfer meaning*, but to maintain harmony and build trust, as in some Muslim cultures (→ Communication Modes, Muslim).

Even these generalizations do not acknowledge the changing or diverse nature of the individual “national” cultures mentioned, within each of which there are co-cultures with different cultural norms and preferences. Within these cultures, communication takes on a different function even beyond meaning transfer: the building and maintaining of identity and the resistance of dominant (western) culture(s) (→ Power in Intergroup Settings). There is much criticism of attempts to define national cultures, even more attempts to generalize any notion of “western” culture. Some have opted instead for descriptions of specific western cultures or co-cultures. For example, Carbaugh (2005) compares western nations, such as Russia, the United States, and Finland, in terms of specific communication aspects (→ Culture and Communication, Ethnographic Perspectives on), while others provide contradictory views of communication reality from within single cultures (e.g., *Our voices*, on US culture; González et al. 2000).

### MEDIATED MODES OF WESTERN COMMUNICATION

If it is problematic to describe so-called western modes of verbal and nonverbal communication because of the diversity among nations, it is also difficult to discuss western modes of mediated communication because of similarities in modes between western and nonwestern nations. Nations such as Japan and South Korea are emerging as creators of new global media (→ International Radio; International Television; Internet: International Regulation). Eastern and western nations alternate among the top users of land telephone lines, cellular phones, and computers (*CIA Factbook 2006*; → Technology and Communication). Some argue that though global in origin and diffusion, media

technologies perpetuate the underlying values and epistemologies of (some) western nations (principally, those in the center rather than on the periphery of global media power, as noted above) (→ Globalization of the Media; Globalization Theories). The rise first of video recorders, and increasingly the use of digital forms of television and individual musical digital (e.g., MP3) players, allow listeners to select and create their own play list, and then to watch or listen to the recording individualistically. In addition to possible effects of hyperindividualization, Postman (1985) suggests that the onslaught of televised media and its version of reality have turned public knowledge in the United States (such as the news and education) into show business. This, in turn, has transformed public discourse into “dangerous nonsense” (p. 16), education into entertainment, and culture into “burlesque” (p. 155) (→ Media Ecology).

Some have striven to define the characteristics of western media systems writ more broadly. For example, Stevenson (1994) characterizes the *English-speaking media* in terms of their imperialistic or colonizing influence on the rest of the world and the increased privatization of media, especially in Australia and the United States. Others note the potential for such media forms to support systems of global media colonialism and dependence. This perspective has led some organizations, such as → UNESCO and the → New World Information and Communication Order (NWICO), to seek to limit the outward flow of media content from nations with more powerful media systems (core nations) to those on the periphery, a move which in turn has strained the relations between some core nations, such as the USA, and those organizations (McPhail 2002). The strength of western media systems – in hosting most of the top news agencies and networks, music industries, and advertisers, as well as all of the top ten global advertisers help support western media’s place in the global media system.

Even with these summary statements, generalizations about western media systems become as difficult as those about face-to-face communication. While *some* western nations have large, dominant media systems, other nations rely upon these systems (either merely as recipients of diffusion of media form and content or of media colonization, depending on one’s perspective). Authors often group media systems not in terms of region, but in terms of degree of control over the media by the state (e.g., authoritarianism), or by macro-geographic regions (e.g., Latin America, Europe). And some simply note differences between the various western media approaches. For example, Canadian media, while still quite independent, works more overtly in the formation of national identity. British broadcasting has traditionally been geared more toward public service, with more financial involvement from the government, and concomitant restrictions on what is reported regarding government affairs (Stevenson 1994, 157; → Canada: Media System; United Kingdom: Media System). Stevenson states that continental European media systems are smaller and more homogeneous than those of the English-speaking nations, and that they focus on community (like Canadian media) and on public service (like British media). Press freedom on the European continent is often more restrictive (→ Freedom of the Press, Concept of). Despite trends in eastern European nations, differences in newspaper readership, concentration of media ownership, advertising revenue, government subsidies (e.g., through value-added taxes), and Internet and film industries lead Fridriksson (2004) to conclude that “diversity remains a hallmark for the media of western Europe” (p. 181).

# Communication Networks

*Peter Monge*

*University of Southern California*

*Drew Margolin*

*University of Southern California*

Communication and other → social networks have been the subject of considerable scholarship since the eighteenth century (Mattelart 2000), but the past two decades have produced unprecedented growth in network theorizing and research. Further, this interest in communication and information networks now spans the social sciences, including sociology, psychology, history, political science, organization science, and economics, as well as the physical and life sciences. As Castells (2000) has so comprehensively elucidated, we are now living in the age of the network society.

Networks, in general, are structural configurations that emerge when sets of relations are applied to sets of entities. Entities are typically called “nodes,” points, or elements, and relations are called “links” or ties. “Communication networks” reflect patterns based on message and information flow relations among the elements of the network, thereby creating the information infrastructure on which all organizations and societies depend. Network configurations that occur across a large number of organizations are called “network forms,” and organizations that share a common network form are viewed as “populations.” Historically, → organizational communication focused almost exclusively on nodes defined as people who were members of specific organizations. Today, a much broader view of networks envisions both human and nonhuman nodes, the latter including elements like computer avatars, web-bots, and knowledge repositories (→ Avatars and Agents).

The study of networks tends to pursue one of two general research questions: (1) why are particular networks configured as they are? and (2) what are the effects of different network configurations on the people who comprise them, the performance of the institutions which contain them, and the fitness and survival of the larger organizational communities in which they operate? These questions will be addressed after a brief presentation of basic network concepts. We conclude with a brief discussion of recent trends in the field.

## NETWORK CONCEPTS AND MEASURES

Nodes and ties can be studied in a variety of ways. Many relations can be applied to create organizational communication networks. “Shares information with,” “innovates with,” “is friends with,” are all different relations. Network research has indicated that when different relations are applied to the same organizational members, they produce very different networks. Networks can be created by applying one relation to the nodes, forming a “uniplex network,” or by applying two or more relations to the nodes, forming a “multiplex network.”

Typically, *relations are defined* on one set of entities, such as people in organizations, called “one-mode networks.” However, relations can also be defined between two or more different sets of entities, such as organizations and people. These are called “*n*-mode networks.” Two-mode networks that relate people through common participation in

organizations (such as professional associations) or events (such as meetings) are often called “affiliation networks.”

*Ties* typically have a number of *properties* that impact the nature of the network. Many organizational communication relations link people directly with each other. Links that tie people together through intermediaries are called “indirect links.” Relations also have properties such as “sign” (positive or negative), “frequency” (how often the link is used), strength (weak to strong), direction (from one member to another), and “stability” (existence over time).

A number of important *measures* can be applied to the people or elements of a network. “Degree” is the total number of links with others in the network. “In-degree” is the number of directional links pointing to a person and “out-degree” is the number pointing away from a person. Centrality measures (in several different ways) how close each person is to all other members.

Metrics also exist for *networks as a whole*. “Size” simply indicates the number of people in the network. A “component” is the largest subset of connected people. “Connectivity” is the extent to which people are linked to one another. “Density” is the ratio of the number of actual links to the possible number of links. “Centralization” measures the variation in average nodal centrality of the entire network.

One important aspect of networks is their suitability for *multilevel analysis*, which compares different parts and wholes. For example, analysis can be at the level of nodes, dyads (a pair of nodes), triads (three nodes), cliques, or the entire network. *Dyadic network properties* include the degree to which directional ties are mutual or reciprocated, i.e., the degree to which a link from A to B is mirrored by a link from B to A. For triads, properties of transitivity and cyclicity apply. Transitivity implies that if A communicates to B and B communicates to C, then A also communicates to C. Cyclicity represents a closed loop:  $A \rightarrow B$  and  $B \rightarrow C$  implies  $C \rightarrow A$ . The next higher level in the network is the *clique or group*, which is composed of members who relate more to each other than to others in the network. Cliques have properties such as cohesion, the degree to which the members of the clique are tightly connected to one another.

Given the various properties mentioned above, it is easy to see that networks are inherently multilevel. Scores at one level, such as a large number of isolates, do not necessarily affect the network’s dyadic reciprocity or triadic transitivity. Further, these measures do not necessarily indicate the properties of the overall network, such as density (see Brass 1995 for additional details).

The analysis of network properties requires a special set of *statistical methods*. Because networks describe relationships between entities that are inherently related rather than independent from one another, the assumptions required for the use of normal parametric statistical tests are violated. Thus, network researchers have developed a variety of tools for addressing networks in a statistically appropriate manner (Wasserman & Faust 1994). The key concept in most statistical analysis of networks is that an observed property of a network should be compared to the likelihood that such a property could have occurred by chance in a network of the same size (Robins et al. 2007; → Network Analysis; Statistics, Descriptive).

## THEORIES OF NETWORK STRUCTURE

One of the critical challenges in network research is to explain how specific communication network configurations evolve out of the extremely large set of possible

configurations that could evolve. The evolution of the observed configuration of a focal network can be explained by four major factors. These are (1) endogenous factors internal to the network, (2) attributes of the people or other nodes in the network, (3) other networks, including the same network at earlier points in time, and (4) network externalities.

*Endogenous factors* are those tendencies within networks toward particular kinds of configurations. These tendencies include factors such as reciprocity among dyads, cyclicity or transitivity among triads, etc. *Attributes* are those characteristics of the members of networks that make a difference in terms of how people relate to each other. Typical characteristics include physical and social variables like age, gender, religious and political affiliations, and physical proximity. Other networks reflect other sets of relations that might impact the focal network. For example, a work network might be highly influenced by a friendship network (defined on the same people). *Other networks* also include *autoregressive networks*, which are the same networks at earlier points in time. Thus, last week's "shares ideas with" network is likely to be highly predictive of this week's "shares ideas with" network. Finally, *network externalities* refers to those factors outside of the network itself that are likely to influence a focal network, including market forces, regulatory regimes, major environmental events, etc. (Fig. 1).

Though researchers have identified these fundamental factors influencing the creation, evolution, and maintenance of network structure, there is no unified theory of network structure. Nonetheless, several social science theories have extensive implications for organizational communication networks. Monge and Contractor (2003) review *seven families of social theories* and discuss in detail the network implications of each. These theories are summarized in Table 1.

Importantly, each theory has a unique structural signature, a particular configuration of relations that should exist if the logic of the theory is operating in any focal network. For example, exchange theories suggest that people will seek to maximize their connections to others with valuable resources. Thus, exchange theories predict networks will demonstrate redundancy. On the other hand, transactive memory theory suggests that individuals will seek to outsource cognitive tasks, such as the storing and updating of specialized knowledge, to other individuals, thus reducing redundancy. Thus, the degree of redundancy in a network can serve as a structural signature indicating which logic is

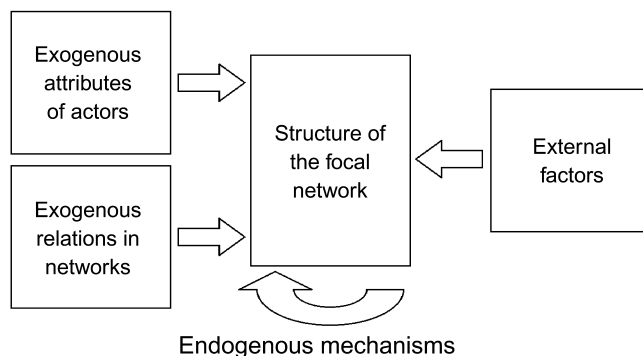

Figure 1 The multi-theoretical multilevel network structuring process

Table 1 Seven families of social science theories and their theoretical mechanisms

Theory families	Theoretical mechanisms
<i>Theories of self-interest</i>	<i>Maximization of individual benefits</i>
Social capital	Profit from investment opportunities
Structural holes	Control of information flow
Transaction costs	Cost minimization
<i>Collective action</i>	<i>Joint value maximization</i>
Public goods theory	Inducements to contribute
Critical mass theory	People with resources and interests
<i>Cognitive theories</i>	<i>Cognitive mechanisms leading to</i>
Semantic/knowledge networks	Shared interpretations
Cognitive social structures	Similarity in perceptual structures
Cognitive consistency	Maintain consistent cognitions
Balance theory	Drive to avoid imbalance and restore balance
Cognitive dissonance	Drive to reduce dissonance
<i>Contagion theories</i>	<i>Exposure to contact leads to infection</i>
Social information processing	Social influence
Social learning theory	Imitation and modeling
Institutional theory	Mimetic behavior
Structural theory of action	Similarity positions in structure and roles
<i>Exchange and dependency theories</i>	<i>Control over valued resources</i>
Social exchange	Equality of exchange
Resource dependency	Inequality of exchange
Network exchange	Complex calculi for exchange balance
<i>Homophily and proximity</i>	<i>Choices based on similarity</i>
Social comparison theory	Communicate with comparable others
Social identity theory	Choose others based on own group identity
Physical/electronic proximity	Influence of distance and accessibility
<i>Theories of network evolution</i>	<i>Variation, selection, retention</i>
Organizational ecology	Competition for scarce resources
Kauffman's NK(C) model	Network density and complexity

Note: See Monge and Contractor (2003) for references and citations.

operating in the network. Because several theoretical mechanisms might be operating on any specific focal network, Monge and Contractor (2003) recommend combining multiple theories to provide more comprehensive explanations.

## THE EFFECTS OF NETWORKS

Network scholars have always been curious about the effects that information and other content flows can have on various entities. These include (1) the people and other elements that comprise the networks, (2) the performance of the institution that contains the networks, and (3) the fitness and survival of the larger communities to which the organizational networks are connected. Advances in network methods are making it increasingly possible to pursue these issues.

Considerable network research has concentrated on the *network members* and considered how people and organizations make use of networks to meet their needs. For example, Wellman (2007) and his colleagues have documented the types of extended networks that exist in different local communities to understand how people rely on social organizations, such as family, friends, and institutions, to meet their needs. Burt (1992) demonstrated that nodes that fill or broker particular network positions called structural holes tend to thrive and outperform other nodes. Miner et al. (1990) found that organizations used linkages to other organizations to buffer threatening environments.

Another research focus has been the *institutional performance* of networks. Because networks are inherently relational, their effects cannot be examined only at the individual level. Positive effects at the node level can have negative effects at the network level and vice versa. Though brokering benefits individual nodes, the network as a whole performs poorly if all nodes attempt this strategy. If one organization dominates the network by becoming a central hub, this can lead to organizational stagnation for other organizations (Stark & Vedres 2006). The transformation of networks has had dramatic implications for the organizations and institutions in which they reside. Castells (2000) describes how companies, industries, and national economies have all been challenged by the changes in underlying social structure, with some thriving and others suffering. In particular, a new form of organization, the network organization, has emerged. Network organizations are flat organizational structures, as opposed to hierarchical, that are more flexible than hierarchies yet more stable than markets. Network organizations have performed exceedingly well in the environment of the network society though it remains to be seen if they can sustain this advantage as social structures continue to change.

A third area of research is the *fitness and survival of networks*. Often overlooked are the effects that networks have on communities. Most organizational networks are tied to multiple other organizations in their own populations and in their larger communities, including suppliers, regulators, retailers, professional standards organizations, and other community institutions. Organizations and their networks both cooperate and compete with each other. Often, competition for scarce resources leads to the demise of weaker organizations and networks. Further, research in a variety of fields indicates that networks may have a carrying capacity for links, i.e., a total number of links that the network can support. Thus, an organization could, in the course of optimizing its own network, overdraw this community capacity and begin an overall network decline. Individual organizational networks contribute to the fitness of the communities in which they reside, which often, in turn, impacts their own survival.

Research on the implications of network structure has recently begun to focus on the *new networks* that have emerged with the development of *new communication technologies*. For example, the online collaboration of social resistance organizers or of players in online role-playing games (MMORPGs) have both been studied (→ Social Movements and Communication). Researchers have also begun to consider the implications of the participation of nonhuman actors in these networks, particularly the mediating effects of cyber-infrastructure. For example, MySpace participants create enormous affiliation networks as they communicate with each other. Members of online communities may create both person-to-person and avatar-to-avatar networks as they communicate in different contexts (→ Network Organizations through Communication Technology).

## THE EVOLUTION OF ORGANIZATIONAL COMMUNICATION NETWORKS

Historically, organizational communication research focused on (1) relatively small networks, (2) of single relations, (3) in single organizations, (4) at one point in time, and (5) without a theoretical rationale. Early research was descriptive, reporting different network configurations or testing how different network roles related to organizational outcomes. Over the past decade, a *new science of networks* has emerged that focuses on a wide range of organizational network phenomena, including virtual work teams and organizations, online organizational communities, electronic commerce, massively multi-player online gaming worlds, the network society, community level alliances such as nongovernmental organizations, and the growth of the world wide web.

Instead of studying small organizational networks, contemporary network research now typically focuses on much larger networks, some of which contain thousands of members and hundreds of thousands (or millions) of links. Rather than static configurations, network theorists and researchers now focus on growth, stability, decay, and other forms of change over time. Several *growth and decay principles* have been identified. One is preferential attachment, which states that new entrants to a network will link to the nodes that have the greatest number of existing links. Another principle is a preference for diversity, whereby existing nodes attempt to “hedge their bets” by connecting with as many different types of nodes as possible. An important *decay principle* is called the liability of newness. Burt (2000) has shown that new links tend to disappear faster than older links, a form of the inertial principle in which it is hard to establish links because they die out quickly, but once they exist, they tend to last. Ironically, an opposing principle, the *liability of aging*, asserts that links and networks tend to decline with age.

Network scholars are now beginning to study *multiplex rather than single relations*. For example, Powell et al. (2005) examined four separate relations in their study of all the organizations involved in the evolution of the biotechnology industry: research and development, finance, sales and marketing, and licensing. Shumate et al. (2005) examined the alliances among all HIV/AIDS nongovernmental and intergovernmental organizations from the onset of AIDS in the mid-1980s to the early 2000s, thus incorporating all of the organizations that comprised the community. Similarly, there is a significant increase in the number of longitudinal network studies, many made possible by new data capture techniques (→ Longitudinal Analysis).

Finally, network researchers are increasingly using theory as the basis for forming and testing network hypotheses, particularly *evolutionary theory*. Evolutionary principles of variation, selection, and retention account for network change and stability. Conceiving of networks as having niches that provide resources necessary for their sustenance provides important explanatory power. Researchers are now seeking to understand the evolutionary factors that induce sequential linking patterns, imprinting, and changes in organizational forms. These principles have the advantage of integrating explanations of how networks form particular configurations with findings regarding the effects of those networks.

# Communication Professions and Academic Research

*Penny O'Donnell*

*University of Technology, Sydney*

Despite a common interest in communicative activity, mass communication professionals and communication scholars have long been at odds with each other. Scholars argue that media performance can only be enhanced by professionalization of the workforce and the self-knowledge generated from systematic, criteria-based analysis and assessment. They have also systematically criticized a great deal of mass media content since its origins. Conversely, communication professionals tend to disagree not by engaging in debate with scholars but rather by simply ignoring their work: the vast majority of academic literature from communication studies and cognate disciplines goes unread by media practitioners (Walker 2000). This is not to say that journalists and other media professionals are anti-intellectual. Rather, as sociologist Max Weber argued in 1918, problems arise in understanding a key media occupation like political journalism because the special talent, or what he called the “genius,” of journalists is rarely acknowledged, much less understood (Weber 2001). Consequently, wide discrepancies arise between practitioner and academic accounts of media practice, performance, and change.

There has been little research in the past on this relationship per se; rather, the topic typically arises in studies of specific media occupations or in discussion of developments in communication theory. Recently, however, fresh perspectives about the relationship between theory and practice in communication are emerging as scholars try to draw together the field's multiple and disparate intellectual traditions and, at the same time, as practitioners move to document and debate in their own terms the kinds of knowing found in media practice. Arguably, parallel lines of reasoning can be found both in these ground-breaking practitioner efforts to understand the art of journalism as “critical reflective practice” (Sheridan Burns 2002; see also Tumber 2000; Adam 2001; Tunstall 2001; Zelizer 2004) and in innovative research on communication as a “practical discipline” (Dervin et al. 1989; Craig 2007; → Applied Communication Research). Taken together, these efforts provide resources for thinking about new affinities in the relationship between communication professions and academic research rather than its traditional afflictions.

## THEORETICAL CONCEPTS

The professionalization of communication is historically linked to the emergence of national mass media systems, the most potent of which developed in the United States of America from the 1890s (Pye 1963; Carey 1997; → Professionalization of Journalism; Professionalization of Public Relations; United States of America: Media System). A new social role was created in that context; that is, the role of the “professional communicator” or broker of symbols who mediates in a vertical direction between information elites and general audiences, and in a horizontal direction between the diverse communities that make up general audiences (Carey 1997).

The generic term “professional mass communicators” includes a range of media occupations such as journalists, editors, public relations people, speechwriters, radio broadcasters, film and television producers, and actors (Ettema et al. 1987). However, the journalist occupation tends to absorb academic attention because, as journalism historian James W. Carey (1997, 133) indicates, the informational role of journalists is seen as crucial to mass media performance, and by extension, to the vitality of democratic public life (→ Journalists’ Role Perception; Media Performance).

Alongside the creation of this new occupational category, at the turn of the twentieth century, US universities created new tertiary education programs to train mass media recruits; professional associations and codes of practice also emerged at this time. This US model of concurrent media/professional development was later exported via postwar modernization programs to newly emerging nation-states in Asia, Africa, the Middle East, and Latin America. These programs typically included the creation of a new class of professional communicators via university-level journalism education courses (Pye 1963). The International Centre for Higher Education of Latin American Journalists (CIESPAL), set up in 1957 and based in Quito, Ecuador, is an exemplary initiative of this kind. While democracy today remains a vexed issue in many of the aforementioned regions, nonetheless, current research on their media highlights the ongoing influence of these imported mass communication concepts. Thus, for example, the “creative genius” of journalists is said to have enlivened the African press even during the period from 1970 to 1990, when it achieved particular notoriety for its sycophancy toward new national governments (Mytton 2001).

Discussion of *media responsibility* provides another focus for this topic. (William Rivers & Wilbur Schramm’s 1969) seminal study identifies government, media, and the public as the social institutions that guarantee responsible media performance. And, while a nation’s cultural standards are said to depend on a concert between mass education and mass media, the most influential of these three change agents is seen to be the media itself. It has a fundamental duty to improve its own performance through both self-regulation of the media (industry codes of practice), and professionalization of the workforce (codes of ethical practice, higher pay rates, mid-career education, and self-criticism; → Self-Regulation of the Media).

In this schema, which owes much to a western liberal democratic view of press–government relations, governments contribute most when media regulation is minimal (Rivers & Schramm 1969). The public’s duty, on the other hand, is to argue for better media and, more broadly, for mass education that will raise public expectations of the media and, hence, cultural standards (Rivers & Schramm 1969). Universities do not figure in this kind of analysis. Academic research is mentioned, but only as a source that journalists routinely mock. Thus, “anti-intellectualism” is identified as a key problem in journalism, evidenced in the lack of a self-critical spirit found in individual newsrooms as well as in the institutional hostility toward public scrutiny. Interestingly, to remedy this anti-intellectualism, journalists are advised to undertake advanced media study, along the lines of the Nieman Program at Harvard University (Rivers & Schramm 1969).

Elsewhere, *the professional education of journalists* is the habitual primary focus in discussions of the relationship between professional journalists and academic research (O’Donnell 2002; → Journalism Education). A common premise is that journalists should

be more appreciative of educational initiatives directed at improving their public standing as well as news standards. Further, professional education is assumed to enhance the capacity of journalists to shape news agendas (Schultz 1998, 64–67). So, for example, journalism graduates are expected to report news to higher editorial standards than amateur news cadets or occasional → bloggers because they know more about journalistic ethics, → news values, politics, laws that impinge on free speech (e.g., libel, defamation, privacy, sedition), and → media history (→ Ethics in Journalism; Journalism: Legal Situation). Debate then centers on the balance between practical and theoretical subjects in curriculum design; the research assumes higher professional standards are linked to more theoretical curricula programs, but recognizes that media employers prefer job-ready skills to abstract knowledge when recruiting graduates (O'Donnell 2002; → Communication Education, Goals of).

Moreover, professional skills and autonomy are said to permit public advocacy and vigorous pursuit of news in the “public interest” (Schultz 1998), buffering journalists from the worst excesses of the market, political interference, workplace change, and the increasingly sophisticated news management techniques of sources. In this view, professional journalists and editors are key social actors enabling the mass media to exercise its normative role in democracy; that is, the role of facilitating and enhancing public life by providing citizens with a wide range of opportunities to inform themselves and engage in debate about matters of public importance. Watchdog journalism has become a synonym for the fourth estate ideal (Schultz 1998). In this way, the research on this topic reproduces the well-established dichotomy in western culture between intellectual and manual work (theory and practice), including its premise that a well-educated person offers more to the workforce and society than a laborer. Academic study can be seen in this context as an important resource both for communication professionals and for society. However, journalists and other communication professionals do not typically see academic research this way.

### THE UNDERLYING QUANDARY

Doubts over the relevance of academic research to practice, and the expectation of anti-intellectualism among media professionals can be seen as two sides of a quandary that repeatedly surfaces in the literature on this topic.

The quandary is summed up in the question: does communication practice really need communication scholarship? In other words, what is the nature of the relationship between communication *research* and communication *practices*, especially where these practices are seen as innate and intuitive, and are habitually performed in effective ways without the benefits of higher education or recourse to scholarship? This is, of course, a somewhat false dilemma because all communicative practice involves intelligent action, whether or not media practitioners want to call their work that or interpret it in explicitly theoretical terms. Nonetheless, it is also a real dilemma when it comes to identifying the specialized intellectual training that is indispensable for professional mass communicators: in curricular terms, decisions have to be made about which communication theory best serves practice. A related concern is whether independent, critical, scholarly review enhances excellence or deters malpractice in mass communication practice in ways that are significantly better than on-the-job self-appraisal. The quandary also has a

political dimension: should democratic societies that hold free speech, equality, and pluralism as axiomatic principles rely on elite corps of highly trained mass communication experts, or are they better off with communicators who represent and understand their public?

### CHANGING PERCEPTIONS OF THE RELATIONSHIP

From the practitioners' perspective, ongoing doubts about the relevance of communication research to media practice arguably have their origins in the foundational experience of higher education mentioned above. Professional education in this area historically sought to enhance occupational status rather than transform the occupation into a learned profession (McGuire 1992), and was not grounded in abstract knowledge, much less a general theory of journalism. Indeed, mass communicator studies began some four decades after the first journalism education courses, with Rosten's (1937) inaugural survey of Washington correspondents (see Berger & Chaffee 1987), and the research field of journalism studies is a much more recent development, as evidenced by two international scholarly journals, *Journalism Studies* (Routledge) and *Journalism: Theory, Practice and Criticism* (Sage), both of which began publication in 2000. From the start, then, journalism curricula were "theory-free" and instead institutionalized free press principles, objective reporting techniques, and an ethic of social responsibility (Carey 1997; → Objectivity in Reporting). Today, irrespective of research developments, these practical "fundamentals" continue to be taught. Thus in simple, chronological terms, communication scholarship has been an optional rather than optimal resource in professional media practice and industry-based discussions of media performance and change.

Yet, on the other hand, as early as 1933, in their classic work on *The Professions*, British sociologists A. M. Carr-Saunders and P. A. Wilson attributed journalism's susceptibility to commercialism to the lack of specialized intellectual training and the occupation's failure to establish a "monopoly of technique indispensable to the proprietors" (Carr-Saunders & Wilson 2001, 40).

Journalists' preference for practical competence over theoretical rigor finds support in an unexpected quarter: US educationalist Donald Schön's (1983) proposal that all intelligent action presupposes a kind of knowing and, hence, that "reflection-in-action" be accepted as a legitimate form of *professional knowledge*. Schön's concept challenges the traditional positivist epistemology of practice or "technical rationality" found in Carr-Saunders and Wilson's sociology of the professions, claiming it encourages a limited view of professional practice as the application of research-based knowledge to real-world problems. In the alternative view, research is not only a scholarly endeavor but also an everyday activity of practitioners that informs good decision-making.

Australian journalism professor Lynette Sheridan Burns (2002) extends this new *epistemology of practice* to journalism, arguing news practices consist of ill-structured problems that are context-specific yet require consistent decisions that are mindful of ethical, professional, and commercial exigencies. Journalists typically find it hard to put their intellectual processes into words; Sheridan Burns therefore sees it as her task, as a former journalist, to research journalistic "reflection-in-action" and to teach systematic critical self-reflection as the mainstay of excellence in journalism.

Canadian journalism educator G. Stuart Adam's (2001) incisive study of *journalism's epistemology* centers on "the journalistic imagination" as both an individual property and the historical product of the culture of modernity. In this view, knowledge is understood as a creative design process; the "art" of journalism is a process of working imaginatively with and through scholarly and non-scholarly ideas. Thus, journalism students need to experiment with journalism's ambitious forms – investigative reporting, documentaries, and features – rather than rehearse daily news practices. Likewise, rather than master communication and media studies theory, journalism students need to understand those disciplinary discourses and research interests that enable good journalism, such as ideas of justice-making (law), the purposes and practices of democratic institutions (politics), and notions of progress (history) (Adam 2001). In this way, discussion of professional practice in journalism assumes a more conventional scholarly form.

It is important to note that the *reflective turn* in thinking about professional practice occurred at around the same time as what might be termed a corresponding "pragmatic" turn in the field of communication, particularly in the USA (Dervin et al. 1989; Craig 2007; → Pragmatism). The empirical social scientific orientation of US communication studies came under considerable scrutiny and challenge in the mid-1980s from critical and → cultural studies scholars, giving rise to "paradigm dialogues" that sought to rationalize the field's multiple theoretical and methodological positions and, thus, reinvigorate its framework (Dervin et al. 1989; → Communication Theory and Philosophy).

Robert T. Craig proposed that communication is best understood as a "practical discipline" whose central purpose is to cultivate communicative *praxis* through critical study (Craig 1989, 97–98). Despite some links to the Habermasian tradition of emancipatory → critical theory, this methodology owes more to the US philosophical tradition of pragmatism (e.g., John Dewey), with its preference for socially relevant ways of thinking over formal theoretical abstractions. Hence, in this view, practical theory aims to integrate rational, skeptical inquiry into the analysis, evaluation, and redesign of communicative activities at whatever level. Craig's primary exemplar is the 2000-year-old art of rhetoric (Craig 1989, 116) but arguably the art of journalism (Adam 2001) serves as a more illustrative case for media practitioners.

How, then, does this "pragmatic" turn in communication scholarship strengthen the possibility of new affinities between communication professions and academic research? Like the epistemology of journalism canvassed above, it brings theoretical inquiry into more familiar terrain for media professionals. In his history of the ideas shaping American journalism, the veteran journalist turned scholar J. Herbert Altschull (1990, 236) points to pragmatism as a "can-do" philosophy rooted in the search for "facts" that was "almost made for the American journalist." Not only does Altschull encourage journalists to improve their performance by studying more, but he also encourages and expects them to join the scholarly dialogue about communicative futures. Thus, the pragmatist tradition can be seen as one bridging point between communication professionals and scholars.

## NEW DIRECTIONS

Current studies of media professionals introduce a wider range of variables into the discussion of media responsibility, performance, and change (Tumber 2000; Tunstall 2001).

Thus, while Tumber (2000) points to ongoing concerns about news standards, media accountability, and the autonomy of journalists, these questions are no longer framed in terms of institutional self-regulation or workforce professionalization. Instead, there is broad discussion of global trends in media policymaking, the rise of corporate media power, the complexities of modern communication management, and the internationalization of both media and media studies. Media power is no longer understood solely in terms of the institutional independence of the press. Instead, the transnationalization of media corporations and operations has created new communicative spaces and practices, and new analytical concerns include corporate control, commodification, and competing media rights and responsibilities (→ Globalization of the Media). Professionalization of journalism is no longer, if it ever was, a panacea for improving media performance because news has lost its privileged ranking as media practices proliferate and variegate via the Internet and other digital platforms (→ Internet News). Indeed, the boundaries between news workers and the public are increasingly blurred by technological change that puts information tools in the hands of everyone with a desktop computer, giving rise to changing perceptions not only of journalism but also of terms like “media responsibility” and the “public interest.”

Tunstall’s (2001) study of media professions further departs from earlier work that foregrounds media’s responsibilities. It highlights three new categories of powerful, highly paid individuals who are central to media performance and change: the media mogul, the media baron or chief executive, and the media celebrity. Tunstall (2001) suggests these individuals exercise an unusual discretionary power to change media; a power that owes much more to their wealth, business acumen, and audience appeal than to educational qualifications or formal knowledge of communication. In this way, the business of media seems to overtake previous concerns to identify and investigate the intellectual work of journalism, and its role in strengthening the relationship between information, knowledge, and democracy.

Nonetheless, the search for more constructive dialogues between communication scholars and media professionals continues because, as a recent study indicates, we “are in the same boat and a hole at either end poses problems for all” (Izard & Morgan 2004)!

# Communication: Relationship Rules

Charles Pavitt

University of Delaware

A *communication rule* is a description of a communicative regularity relevant to social interaction. The communicative regularities contained within rules are normative, in the sense that they are what is expected to occur by participants in social engagements and their absence usually results in social disapproval or sanction on the part of those participants toward a transgressor.

## THE NATURE OF COMMUNICATION RULES

The most prevalent use of the concept within the communication discipline stems from its centrality within the natural language philosophical tradition begun by Ludwig Wittgenstein (1953) in *Philosophical investigations*. Within this tradition, all culturally defined social situations are governed by a set of rules consisting of two types: those that define the situation (*constitutive rules*) and those that instruct participants about what actions are permissible and impermissible (*regulative rules*). Regulative rules take the standard form “When in Situation X, Action Y is required/recommended/recommended against/forbidden” (e.g., in the context of basketball, “When a team has possession of the ball, an attempt at shooting the ball through the other team’s basket is permissible”), whereas constitutive rules take the standard form “When in Situation X, Action Y counts as/means Z” (e.g., in the same context, “A ball legally shot through the other team’s basket counts as, depending on its length, either two or three points”).

These rules are arbitrary in the sense that their content is only determined through agreement, whether explicit or tacit, on the part of participants. As a consequence, they can be said to have no truth value in an objective sense, although they are used as standards for judging the correctness of participants’ actions. Language is viewed within this context as rule-governed action, with the actual meaning of terms dependent on their standard usages within culturally defined social situations. We understand the meaning of an expression when we are aware of the relevant regulative and constitutive rules regarding its proper usage within a cultural/linguistic group. John Searle (1969) in *Speech acts* clarified this approach in a structure for delineating the constitutive rules defining *speech acts*, or actions that can be taken through the use of language (e.g., promising, thanking, apologizing; → Linguistic Pragmatics).

## THEORETICAL UNDERPINNINGS

A rules-based theoretical approach to interpersonal interaction was attractive to those communication scholars who accepted another Wittgensteinian (1953) idea, a distinction between *action* and *motion*. In short, action is behavior that is intentionally performed by a person, while motion is behavior that a person performs unintentionally. One can choose to raise one’s arm, or one can have one’s arm lifted by an outside agent. One

possible inference following from this distinction is that existing social scientific theory guided by a search for context-free, law-like generalizations is only relevant for nonvolitional behavior and is irrelevant for behavior resulting from choice. Although some communication scholars have taken this inference as evidence that all inquiry into human communicative behavior must eschew all of the standard trappings of scientific theory, others have proposed the possibility that theories based on rules can function in the context of action analogously to the way theories based on “laws” are intended; capable of describing, explaining, and predicting human behavior (→ Idiographic vs Nomothetic Science).

Among those accepting this latter position, two specific approaches to communication rules warrant detailed attention. In a series of co-authored essays (e.g., Cushman & Whiting 1972; Cushman & Craig 1976), Donald Cushman laid out a possible *meta-theoretical framework* for rules-based theories of communication. Although accepting the validity of constitutive rules, Cushman concentrated on regulative rules and their classification. Communication rules can be categorized according to their *range* (breadth of contexts within which they are relevant), *specificity* (number of different actions permitted in a given circumstance), and *homogeneity* (equivalence of understanding of the rule among participants in a given interaction). Communication rules also differ according to their relevance to either culture-wide, organization-specific, or interpersonal-relationship-specific interaction. More macro-levels generally result in less homogeneous rules; marital partners tend toward a shared understanding of the rules of their relationship, whereas there is marked disagreement within, say, western cultures concerning the behavioral rules insuring treasured ideals such as “freedom” and “justice.”

In contrast with Cushman’s meta-theoretical efforts and emphasis on rule sharing, W. Barnett Pearce and Vernon Cronen’s *coordinated management of meaning* (1980) deserves the title “theory” and stresses the idiosyncrasy among people’s understanding of rules and the misinterpretations of one another’s actions that can result. Each participant in an interpersonal interaction has certain understandings of the relevant regulative and constitutive rules, and if there is a significant mismatch among these understandings, then confusion and anger are a possible result. I might believe that within the context of our relationship “hey stupid” counts as a friendly greeting (constitutive rule) and that when I see you on the street a friendly greeting is desirable (regulative rule), but if you believe that “hey stupid” instead counts as a nasty insult (constitutive rule) and that nasty insults from friends deserve a cold shoulder in response (regulative rules), then you may be angry at the insult and I confused by the cold shoulder.

Pearce and Cronen extended the concept of constitutive rules beyond its Wittgensteinian sense by proposing a series of “levels of meaning” for interpretation beyond the speech act: *contracts* (the rights and responsibilities we see inherent in given established relationships), *episodes* (routines seen as distinct wholes), *life scripts* (the repertoire of episodes we expect to participate in, the theory’s version of the self-concept), and *archetypes* (experiences shared by all people). Thus, your anger about my utterance “hey stupid” reveals that you have interpreted it on the speech act level as an insult and that insults are forbidden in the contract associated with our friendship. Pearce and Cronen also described three levels of *communicative competence* in the ability to coordinate meanings: *minimal* (knowledge of regulative rules sufficient for day-to-day interactions,

but without understanding of what actions “mean”), *satisfactory* (knowledge of regulative and constitutive rules sufficient for day-to-day interactions, providing understanding of what actions “mean”), and *optimal* (ability to step outside rules and envision alternatives, allowing for social creativity; → Interpersonal Communication Competence and Social Skills).

Cushman and Pearce (1977) worked together in adopting the *practical syllogism* in a first attempt to describe how rules-based communication theories might be structured. This adoption makes sense in the context of the desire to develop rules theory in a structure parallel to that of the physical sciences. Philosophers had proposed practical syllogistic forms such as the following:

Person P intends to bring about goal G;  
 person P believes that performing action A will lead to goal G;  
 therefore, person P performs action A

as an explanatory form for intentional behavior. Given the assertion that rule-governed behavior is intentional, Cushman and Pearce proposed the following version:

Person P intends to bring about goal G;  
 person P believes that engaging in episode E will lead to goal G;  
 therefore, person P engages in episode E.

Note that there is no statement of a rule in this version; presumably we are to accept the notion that P’s engagement in E will feature intentional rule-governed action.

The absence of such a statement was central to Susan Shimanoff’s (1980) critique of the Cushman/Pearce model. In addition, Shimanoff noted that people often follow rules unintentionally and intentionally act in violation of rules. Shimanoff preferred an explanatory and predictive framework based on Toulmin’s model for argumentation (→ Rhetoric, Argument, and Persuasion). In the explanatory version of the model, the claim to be defended is that person P performed action A because of a given rule, the data used in the defense is the fact that person P performed action A, and the warrant linking the data and claim is the existence of a relevant rule qualified by person P’s knowledge of it. In the predictive version of the model, the claim is that person P will perform action A, the data is that a given context that makes a given rule relevant exists, and the warrant and qualifier are again the existence of the rule and person P’s knowledge of it. Shimanoff also wished to limit the range of the concept of rule to action, such that interpretive processes do not fall within its purview. If accepted, this limitation would invalidate the standard use of constitutive rules as interpretations, placing the Pearce/Cronen model in particular jeopardy.

### APPLICATIONS OF THE CONCEPT

At the time of publication of Shimanoff’s book, Cushman’s conception had been extended to persuasion and to both macro- and micro-approaches to mass communication, and Pearce/Cronen’s to organizational communication; both were soon applied to intercultural interaction. However, these efforts were limited to theoretical statements, very few relevant research studies appeared, and interest in rule-based approaches to

communication abated soon after. One likely reason for its demise is the failure to conceive of topics for research other than lists of rules applicable to different circumstances.

A second use of the concept, referred to in this case as *relationship rules*, is in the system-theoretic tradition stemming from the Palo Alto Mental Research Institute (Watzlawick et al. 1967; → Systems Theory). In this perspective, any message directed toward another person implies a possible definition for the relationship, and any response to that message implies an acceptance, rejection, or modification of that definition. Although relevant to other aspects of relationships, this school of thought has concentrated on relative relational power; in this context, any message is an attempt to either dominate or submit to the other, and any response is either an acceptance or rejection of that attempt (→ Relational Control). As relationships develop, interactional sequences of attempts and responses come to stabilize, such that particular patterns come to dominate. As a result, long-term relationships include regularities in the extent to which each person tends to dominate or submit in specific circumstances. These regularities are relationship rules. The Palo Alto group believed that dysfunctional families feature particularly inflexible relationship rules of which they are unaware, and that making their members cognizant of these rules and their pathological implications was a significant step in therapy.

Kurt Weick (1979) applied the concept of rule to organizational behavior in a manner similar to the Palo Alto group. Weick (1979, 89) conceived of organizing as a process in which, during the process of accomplishing some task, “an action by actor A evokes a given response in actor B which is then responded to by actor A.” Over time, these interlocking behavioral patterns stabilize, such that they tend to be adopted whenever the need to accomplish the given task reappears. A rule is a description of the behavioral patterns that are expected to occur in given task situations. Weick’s conception differs from that of the Palo Alto school in that organizational members are likely to have some awareness of the rules governing their coordinated activity (→ Decision-Making Processes in Organizations).

## Communication Research and Politics

*Kaarle Nordenstreng*

*University of Tampere*

Communication research is intimately related to politics, especially if politics is understood widely as the deliberate management of society. Research on media and other aspects of communication such as election campaigns has typically been inspired and financed by political motives (→ Election Campaign Communication). On the other hand, research has influenced politics by producing concepts and findings about how communication really works in society. Historically, the origins of communication research are deeply rooted in politics, beginning with the rhetoric of antiquity (→ Rhetoric and Politics; Rhetorical Studies) and ending with studies around each new medium – the press in the seventeenth century, film in the early twentieth century, → radio and → television in the mid-twentieth century, and the → Internet toward the new millennium (→ Media History). Histories of the field leave no doubt that each school of thought was founded as a consequence of a more or less direct political call of the day (Hardt 2001; Pietilä 2005; → Communication and Media Studies, History to 1968). It is less obvious what has been the opposite direction of influence – whether research has had a notable impact on politics.

The relationship between research and politics is an intriguing equation that has to be approached at different levels. The following three are most obvious: (1) *philosophy* – how communication-related concepts and paradigms of political thinking are generated and molded by research, and how research itself is shaped by prevailing political philosophy; (2) *policy* – how governance of communication is dependent on research and how research for its part is shaped by media regulation; and (3) *politics* – how political campaigns and specific political issues determine what research is being done and how research feeds back to politics.

### POLITICAL THINKING AND COMMUNICATION RESEARCH

Political philosophies everywhere and at all times include elements from the communication field – concepts such as transmission of → information from rulers to the people; → persuasion of people and the → public opinion prevailing among them; the influence of media on the public mind; and → interpersonal communication as an essential constituent of communities. The best-known element in this regard is freedom of expression and information, including media freedom, which is part and parcel of the idea of democracy (→ Freedom of Communication; Freedom of Information).

In democratic theory, the press is typically understood as an independent branch of government, next to the three powers suggested by Montesquieu: legislative, executive, and judiciary (Hamelink & Nordenstreng 2007, 227; → Fourth Estate). Freedom of expression and information is included in the Universal Declaration of Human Rights (Article 19), which was the basis for international law on human rights. The human right for freedom of expression and information is granted for individual citizens – not for media institutions, which, according to original liberalism, are supposed to serve as instruments of the people for an open and unhindered exchange rather than become a commercial marketplace by themselves (Nordenstreng 2007; → Freedom of the Press, Concept of).

Democratic theory with the concept of freedom is a central construct of contemporary political philosophy, which is based not only on political science but also on communication studies. A similar paradigmatic case was the so-called Frankfurt School, which emerged in the 1920s, with its notions of cultural industries and their repressing influence on people's authentic mental space (→ Critical Theory; Culture Industries). Contemporary followers of this critical line include scholars such as Douglas Kellner (2005) and Robert McChesney (1999). Thus, communication research feeds political thinking – both its grand theories and particular building blocks. An example of the latter is the concept of → media effects, both as such and as a later variant whereby media exercise influence by choosing the topics for public attention rather than by direct impact of individual messages (→ Agenda-Setting Effects).

Research is not just an autonomous source to feed political thinking but research itself is influenced by political philosophies. Accordingly, research in each country at each time reflects the prevailing political system – its basic philosophy and its particular needs. For example, European integration and globalization have introduced new research priorities in most EU countries, with more attention to multiculturalism and → international communication (→ Globalization Theories). And everywhere the paradigm of a world order in the media field, first introduced under Cold War conditions, has evolved into a paradigm of global challenge highlighted by the World Summit on the Information Society (Padovani & Nordenstreng 2005; → New World Information and Communication Order [NWICO]; UNESCO).

## **COMMUNICATION POLICY AS INTERFACE BETWEEN RESEARCH AND POLITICS**

At this level, communication research serves the legal and administrative regulation of communication and media, first and foremost by delivering data on the audiences, contents, as well as economics of media institutions (→ Audience Research; Media Economics; Media Production and Content). These data may not always be regarded as research proper but rather routine statistics. Yet communication research has a vital role in the process of media governance – not only by furnishing empirical data but also by elaborating concepts such as responsibility, accountability, and self-regulation (→ Communication and Law; Media Policy).

As above in political philosophies, policies are not only served by research, but research is determined by the system of regulation. Accordingly, the EU's audiovisual policies have

given rise to research, often commissioned by the regulatory agencies, concerning the TV and radio program structures, particularly the share of local/national productions and those originating from Europe against those imported from the rest of the world (→ European Union: Communication Law). General development of digitization and convergence has created research on structural changes and challenges of both print and electronic media (→ Digitization and Media Convergence). The institutions of self-regulation, for their part, have solicited research on news content and its various biases (→ Bias in the News).

### **ACTUAL POLITICS BEHIND COMMUNICATION RESEARCH**

This level includes, first of all, *election studies*, mostly around campaigns – the classic among them discovering that media influence proceeds in two stages: first indirectly by media and then through personal contacts (Katz & Lazarsfeld 1955; → Two-Step Flow of Communication). Today, → political communication research has expanded a lot, along with the → mediatization of politics, whereby politicians pay more and more attention to their images and resort to so-called → spin doctors, leading to a professionalization of political communication (Holtz-Bacha et al. 2007).

Second, this level includes the research projects and programs that have been launched as a *response to specific political issues*. The history of communication research is full of examples of these, including the Payne Fund Project in the 1920s, which was a response to moral and political concern about the new film industry. Later, in the 1960s and 1970s, there were similar research projects in the UK and the USA on the influence of television on children, focusing on the potentially detrimental effects of the medium in general and its violent content in particular (→ Violence as Media Content, Effects on Children of). The role of media in development belongs to the same category of research which was motivated by political concern about getting developing countries on the path of modernization and at the same time on the side of the Americans in the Cold War struggle with the Soviets (Lerner 1958; → Development Communication).

All this shows how politics has determined research by setting out the topics, defining the problems, and mostly also financing the exercise. Although the projects have been temporary, lasting for just a few years, the research tradition has been drastically shaped by this politically driven applied research. The basic research pursued in universities independent of political calls has always been more limited, but still vibrant enough to maintain tension between what is known as “administrative” and “critical” research.

While the other two levels were dominated by research influencing politics, here it is mainly politics that shapes research. But naturally there is also some influence in the other direction, from research to politics. All those politically determined projects do have an impact on political and other spheres – both empirical results and theoretical concepts have a bearing on society. Moreover, there are cases when even individual studies and scholars have stirred up political heat – an old classic being Max Weber in the 1910s (Hardt 2001, 140) and a new classic being → Elisabeth Noelle-Neumann in the 1990s (Koivisto & Thomas 2007, 64).

## **Communication Skills across the Life-Span**

*Wendy Samter*

*Bryant University*

This entry focuses on communication skills associated with success in same-sex friendship across the life-span. The ability to maintain a variety of relationships throughout life is

important to people's well-being, of which friendship is among the most significant. Individuals who lack friends experience myriad adjustment problems including drug and alcohol abuse, academic failure, antisocial conduct, depression, loneliness, anxiety, and fatigue. The relationship between friendship and communication has been studied in a variety of ways. One particularly promising approach involves analysis of individuals' conceptions and expectations of friendship, as well as the daily activities in which they engage (Zarbatany et al. 1990). Understanding what people think of and do with their friends tells us something about the duties and obligations of being a friend, the standards to which friends are held, and the kinds of skills through which such duties and standards are met (→ Developmental Communication).

### CHARACTERISTICS OF THE RESEARCH AREA

Three caveats are in order before going into detail. First, most work in this area has centered on communicative competencies predictive of *children's* friendship success. Perhaps this is so that negative, long-term consequences can be avoided through a concerted effort to understand and remediate skill deficiencies early in life, or because of the common assumption that romance should take precedence over friendship as one enters adolescence and adulthood. Whatever the reason, it is clear that more work is needed to grasp the relationship between communication skills and friendship across the *entire* life-span.

Second, much of what we know about children's friendship comes from sociometric studies in which youngsters' social standing is evaluated relative to their peer group. Social standing – or peer acceptance – is typically regarded as a *unilateral* construct because it captures a group's evaluation of the individual. Friendship, on the other hand, is seen as a *bilateral* construct which indexes a reciprocal relationship between two people (Parker & Asher 1993a,b). Hanna (1998, 311) argued that “although elements important to peer acceptance are likely to make an individual seem an attractive potential friend, additional elements may be necessary for developing high quality friendships.” Children cannot form friendships with those to whom they are not attracted; thus, findings from the sociometric literature are included here.

Third, space precludes discussion of *gender differences*. It is important to note, however, that such differences are most pronounced in childhood and attenuate with age. By adulthood, men and women are much more similar than they are different in their beliefs about friendship – and in performance of the skills that predict its success. The readings below examine sex and friendship.

### EARLY AND MIDDLE CHILDHOOD

The ability to take another's perspective drives children's thoughts about friendship. Very young children do not understand that others possess thoughts and feelings different from their own; thus, young children fail to recognize that they can choose friends on the basis of personal qualities. Friends are conceived of as “nonspecific” others who share activities, time, and/or materials. Many children equate play and friendship – but the relationship lasts only as long as interaction. Youngsters become friends because they play together; when this activity is absent, friendship ceases to exist.

*Play* remains an important feature of friendship throughout middle childhood, but is much more organized than earlier. As children gain more complex ways of viewing the social world, they begin to understand others have thoughts and feelings that differ from their own – and that some of these may center on evaluations of one another as “friend.” Thus, “fitting in” and gaining acceptance among peers is a primary task of middle childhood. Youngsters not only evaluate themselves in comparison with peers, but also develop rudimentary self-presentation skills so that they can project a desired image. In addition, children regard help as an indication of friendship and liking – however, at this stage, help centers largely on tangible acts that others can do for *them* (Selman 1981).

Several *interaction competencies* coincide with friendship during this time. Many skills reflect the idea that friendship revolves around play; when performed correctly, each skill allows play to proceed in a smooth fashion. For instance, youngsters must not only be able to recognize and respond appropriately to others’ emotional displays during play, but also be able to produce affect that is suitable for the situation. Researchers argue that children who can control their emotional expression and reactions are better able to reflect on the problematic aspects of social situations that arise during play.

Second, skills that foster coherent discourse are associated with *friendship success* throughout early childhood. Speech dysfluencies and articulation errors prohibit peer acceptance. Similarly, compared to children who are not well liked, those who are well liked exhibit mastery of basic conversational devices such as turn-taking, making appropriate requests, initiating dialogue, responding when spoken to, making intentions clear, and active listening. Scholars suggest that limited language and conversational abilities may prevent friendship development because youngsters cannot access significant peer activities such as play. A related competency is *peer entry*. Youngsters with friends attempt to enter games by integrating their behavior and comments with the ongoing activities of the group. In contrast, youngsters who lack friends try to access games and conversations through a variety of tactics that direct attention *away* from the activity and onto the child. Such tactics include disagreeing, asking questions, saying something about themselves, or stating opinions and feelings (see Haslett & Samter 1997 for a review).

As youngsters move into middle childhood – and “fitting in” becomes paramount – being perceived as fun is key to friendship success. Although not widely researched, there is some indication that possessing a sense of humor, engaging in playful teasing, and even having interesting gossip discriminate children who possess friends from those who do not. The *nature of conflict* and its role in friendship also change from early to mid-childhood. Among young children, fights typically involve issues of social control (e.g., following the rules of a game) or object control (e.g., not sharing toys). Here, the most common responses to conflict are to vent angry feelings and to resist the other in non-aggressive ways.

With development, however, children not only believe that conflict is common to all relationships, but they also distinguish between major skirmishes (that can threaten a friendship) and minor ones (that are part of everyday life). Conflicts in middle childhood often center on the rules associated with social groups and activities. Although negotiation becomes increasingly common as children age, *disengagement* may be even more important to friendship; the capacity to disengage minimizes prolonged problem discussions that

interrupt the coordinated and sustained activities of the group (Hartup et al. 1988). Children without friends tend to be particularly poor at disengagement and, in fact, escalate conflict via aggressive responses (→ Friendship and Communication).

## **ADOLESCENCE AND YOUNG ADULTHOOD**

In adolescence, children develop the capacity to take the perspectives of others. This enables them to think about themselves, others, and relationships with a sense of objectivity and insight they did not have before. Adolescents often apply this ability to their *search for self* which, in large part, is accomplished through interactions with friends. Adolescent friends are now defined as others who possess unique psychological dispositions. Friends are expected to share their innermost thoughts and feelings and through such sharing provide each other with opportunities for intimacy and growth. Friendship is perceived as the most important source of emotional support in the adolescent's life, and loyalty is highly prized. Given such expectations, it is not surprising that talk is a valued activity among adolescent friends (Damon 1977). Studies indicate a high degree of continuity in the friendship expectations of adolescents and adults. Across adulthood qualities such as loyalty, warmth, and the ability to discuss personal matters are most often mentioned as important characteristics for friends to possess.

As was the case in childhood, *pragmatic competencies* make it possible for adolescents and adults to initiate and sustain conversation with potential friends. Compared to individuals with friends, those without friends make fewer statements focusing on the partner, change the topic more frequently, ask fewer questions, and respond more slowly to the partner's previous statement (see Samter 2003 for a review). Nonverbal expressiveness in the form of gaze, positive affect displays, and back-channel utterances are also linked to one's attractiveness as a friend.

Once formed, friendships are dominated by conversations involving *self-disclosure*. In general, people who engage in intimate self-disclosures are better liked than those who do not. However, there does seem to be an art to knowing when and what to disclose. Revealing extremely personal information can damage relational development if done too early in the friendship. And, while friends report that they purposefully use self-disclosure to maintain their relationships, they also note that the majority of their disclosures are about mundane topics. In fact, *avoiding* certain topics – particularly those involving negative life experiences and relationship issues – is actually functional for friendship maintenance (Afifi & Guerrero 1998; Berg 1984).

*Emotional support* is a key aspect of friendship and a prominent activity in which adolescent and adult friends engage. Individuals perceive communication skills focused on the management of negative affect as the most important for same-sex friends to possess, and relationship quality is linked to the kind of support they receive. Strategies that acknowledge, elaborate, and legitimize another's feelings and perspective are regarded as the most sensitive and effective, and the most likely to alleviate emotional distress (Burlinson 1994).

Finally, although conflict seems contradictory to the essence of friendship, there is evidence that adolescent and adult friends have *disputes*. Such disputes appear to center on violation of friendship rules – for instance, betraying a confidence, not repaying debts or favors, ignoring one another's privacy, etc. Some work demonstrates that individuals

who are well liked avoid minor conflicts and employ integrative strategies to manage major ones (→ Conflict and Cooperation across the Life-Span).

### MIDDLE AND OLDER ADULTHOOD

Researchers distinguish between the middle-aged, the young-old, and the old-old. In terms of friendship conceptualizations, individuals in the first two categories are similar both to one another and to young adults. The old-old, however, alter the criteria they use to define friendship in three ways. First, face-to-face contact is not seen as essential for maintaining friendship; letters and phone calls are enough to sustain relationships. Second, ideas about who legitimately qualifies to be a friend are expanded. Unlike earlier periods, friends do not have to be equal in status; thus, acquaintances, hired help, and whole categories of people (e.g., people from church) count as viable relational partners. Third, friends are no longer identified as sources of support and esteem, but rather as companions with whom to have fun.

Given such conceptions, we might expect emotional support and self-disclosure to become less important to friendship as people get older. The few studies that have examined interaction competencies of the elderly bear out such assumptions. People aged 85 and older report it is “inappropriate to bother others with problems” (Johnson & Troll 1994, 85). When negative information is disclosed, it centers on *events*, not feelings associated with those events. In fact, expressing feelings to others is inversely associated with self-esteem and relationship quality among the oldest old. And, although conflict is mostly avoided during this time, pressuring another to be too close can be a source of conflict between elderly friends (→ Age Identity and Communication).

### FUTURE DIRECTIONS

We begin and end our lives by seeing friends as people with whom to have fun. Yet, because most studies focus on the serious pursuits of friends, little is known about what makes someone enjoyable to be around. Research on skills that enable others to be perceived as entertaining companions is needed. It is also important to note that most of what we know, and most of what is summarized here, concerns a small percentage of the world’s population. Studies examining the effect of culture on friendship conceptions and interaction competencies are also needed. Finally, although a great deal is known about the speech and linguistic patterns of older adults (Giles et al. 1994), little attention has been directed toward understanding the relationship between *specific communication skills* and friendship success among the oldest old.

## **Communication and Social Change: Research Methods**

*John C. Pollock*

*College of New Jersey*

Modern research methods for social/behavioral change reflect a tension between collecting data at the individual level while making inferences at macro-levels such as health-care systems, communities, and nations. This tension becomes more palpable

when measuring the concerns of historically underserved, difficult-to-reach populations, those suffering the greatest inequalities in access to information, civic participation, and, in particular, health-care. Research questions are explored by focusing on multiple levels of analysis, multidisciplinary approaches, targeted methods/measures, flexible measures of “community,” and converging methodologies for maximizing evaluation validity.

Communication studies often rely on national samples of self-reports on personal → attitudes and values, drawing conclusions at the individual level (→ Sampling, Random). Despite the risk of “ecological” or “atomistic” fallacies, creative *comparisons of different levels of analysis*, especially at the city level, can illuminate previously unconfirmed connections between communication and social change. For example, differences in community-level demographics or social structure have been linked to variations in major newspaper coverage, often called a “community structure” approach, sometimes revealing a “guard dog” relationship, in which media perpetuate existing social and political arrangements, as opposed to functioning as “watchdogs” on abuses of power (Tichenor et al. 1980; Donohue et al. 1995; Demers & Viswanath 1999; → Journalism: Normative Theories).

Combining article “prominence” and article “direction” into a single score, Pollock’s “media vector” measure used a → community structure model to link community/demographic characteristics or “stakeholders” at the metropolitan level – such as poverty level and educational or income privilege – to → newspaper coverage supporting social change or human rights claims, sometimes mirroring the concerns of more “vulnerable” groups (Pollock 2007). Other community analyses use hierarchical linear modeling to compare aggregate and individual levels of analysis regarding the positive contribution of local print media consumption directly (and indirectly, through increased social interaction) to community participation (Paek et al. 2005).

## **RATIONALE FOR MULTI-METHOD MULTIDISCIPLINARY APPROACHES**

Given the complexity of human communications and the consequences attendant with the flow of information, it is not surprising that communication both draws from and contributes to other disciplines. By extension, documenting and measuring communication processes and effects demand a variety of approaches.

For example, journalism → “gatekeeping” studies illuminate editorial decisions to omit some issues, “agenda-setting” studies enhance audience salience for selected issues, and “diffusion” studies underscore uneven flows of new information to different audiences (→ Agenda-Setting Effects; Diffusion of Information and Innovation; Journalists’ Role Perception). All draw attention to → audience or population inequalities in information (→ Communication Inequality). Dependent variables such as community participation, civic engagement, collective action, and social capital (→ Community Integration; Social Capital and Communication in Health) – community interaction and solidarity (Putnam 2000) – borrowed from political science and sociology illustrate the use of *multidisciplinary approaches* and concerns. “Framing” drawing from sociology and psychology, refers to the way journalists organize → news stories to provide → meaning to related events, indicating the advocacy of certain ideas (Reese 2001), and helping social movements

foster mobilization (Johnston & Noakes 2005; → Advocacy Journalism; Framing Effects; Framing of the News; Media Advocacy in Health Communication; Social Movements and Communication).

These diverse phenomena in a variety of media and multiple settings call for broadening the scope of research designs beyond traditional random samples of individuals to employing a variety of research designs and data collection tools, including surveys or quasi-experimental designs (→ Experimental Design); analysis of communication and media content (→ Content Analysis, Quantitative), including conversations, Internet postings, and exchanges; interpersonal exchanges (e.g., between physicians and patients); and exploring internal messages to improve self-monitoring of compliance with healthy behavior (Parrott 2004).

In addition, recent interest in the effects of health disparities, communication inequalities, and the role of “social contextual” factors like social class, social organizations, and social capital, on communication phenomena that affect health warrant measures at social level (Viswanath 2006; Viswanath & Emmons 2006).

Special attention is increasingly paid to *different types of “communities”* in reducing health knowledge gaps (→ Knowledge Gap Effects), whether communities with different levels of “community-boundedness” (relevance of a topic for a specific community) or “communities without propinquity” (Viswanath et al. 2000). “Community” as both a definition and unit of analysis is becoming elastic as researchers seek hard-to-reach and high-risk populations less through traditional telephone or residential interviews, more through intersecting respondents in the community contexts and venues they inhabit: in the workplace, meeting places, grocery stores, or recreational locations. Examining the role of “community norms” for college-age drinking, for example, requires exploring multiple norm sources: parents, social peers, close friends, etc. Modern research on breast cancer, for example, sometimes focuses on the roles that partners/spouses and workplaces can play in accelerating cancer recovery rates. In addition, some studies suggest training those in high-risk or difficult-to-reach communities themselves to promote risk reduction, suggesting that → identification can play a role in behavior change. In general, traditional onsite geographic research engagement is expanding to “onsite” measurement in a wide range of venues, from residence to workplace and → Internet sites of all kinds: blogs (→ Blogger), bulletin boards, chatrooms, or websites themselves (Sundar et al. 2007), including the use of online deliberation to discuss health policy and medical ethics (Price et al. 2006).

### **EVALUATING HEALTH COMMUNICATION EFFECTIVENESS: MAXIMIZING VALIDITY**

The experiences with major lifestyle campaigns such as the Stanford Heart Disease Prevention Program and the Minnesota Heart Health Program, among others, highlight the difficulty of measuring the impact of community-based health campaigns (Hornik 2002). These include (1) the problem of finding legitimate “control” groups or segments when long-term secular trends (such as changes in social norms regarding balanced diets and tobacco consumption) outpace the pristine designs of investigators; (2) the need to search for appropriate (especially longer) effect lag times and magnitudes of expected

effects (much smaller) that may differ from traditional research expectations (e.g., reduction in tobacco use has been gradual over several decades, but efforts to measure the effects of reduction campaigns within one- or two-year spans would have encountered few significant results); and (3) the importance of flexibility in accounting for effects across multiple (individual, institutional, and social) units of analysis. These dilemmas could be addressed by more creative approaches to research designs, including longitudinal designs with multiple time points, comparing different levels of exposure to campaigns rather than assuming no exposure, and measuring intermediate outcomes that are amenable to change through communications rather than limited to final health outcomes, among others (Hornik 2002; Glasgow et al. 2004).

These challenges are not unique to communication, and, in fact, are common in medicine, where randomized control trials (RCT) remain the gold standard. Given the practical difficulty in conducting RCTs, and the fact that evidence is accumulated through a variety of observational methods such as surveys, experiments and quasi-experiments, perusal of medical records, literature reviews, and meta-analyses, among others, some have argued that one must look at the total “weight of evidence” from the multiple methods to reach inferences rather than rely on one single method (Weed 2005). The latter is a reasonable and viable alternative, given the complexity in studying the impact of communication in social change.

Employing multiple methods is not unusual in health communication research. Researchers have used textual analyses to study physician–patient interactions, and narrative and discourse analyses to examine the impact of social movements on health policies (Sharf 2001). Further, ethnographic critical incident interviews were combined with online and paper questionnaires to examine relationships among social support, communication competence, and perceived stress in a study of well elders, seniors with cancer, and their lay caregivers (Query & Wright 2003; → *Ethnography of Communication*; Interview, Standardized). In addition, → *meta-analysis* pools and statistically analyzes data from similar studies with similar measures, combining findings to reach larger conclusions (see, e.g., Witte & Allen 2000).

To mitigate inequalities and health disparities, scholars use imaginative levels of analysis, measures and definitions of community, and converging methodologies to improve research validity and (for health communication) effectiveness, exploring how much communication exposure measures add to income, education, gender, and age in their collective power to improve prevention behavior and reduce differential risk behaviors among different social groups.

# Communication Strategies for Empowerment

Robert A. White

St. Augustine University of Tanzania

“Empowerment” generally refers to development approaches that “enable” the beneficiaries, especially the poor and marginal and excluded groups such as women, to take initiatives to solve their own problems of poverty, exclusion, and chronic dependency (Narayan 2005; → Dependency Theories; Development, Gender, and Communication). The role of government and nongovernmental agencies is to encourage and support local organization efforts, help local groups define their own needs, and respond to requests for training and other technical or capital assistance. Beneficiary groups are expected to initiate → participatory communication within their communities, establish communication networks with other beneficiary groups, and build cooperative linkages with government and nongovernmental agencies. Because personal and social isolation is so much a part of social passivity and exploitation, communication strategies of organization, networking, group communication, and community media are central to empowerment methods (→ Citizens’ Media).

Models of development emphasizing local control and initiative emerged because highly centralized decisions often imposed approaches that were not related to local needs and were not able to build on local cooperation, understanding, and voluntary contribution. Neo-colonial power elites and those in positions of privilege in systems of class and caste tend to define the rural and urban poor as “inherently inferior.” Critiques of modernization point to elites using their power in the economy, education, and media to instill in lower-status people attitudes of passive dependency, resignation, and incompetence, while disregarding indigenous knowledge, leadership, and organizational traditions (→ Modernization).

## A NEW PARADIGM OF DEVELOPMENT COMMUNICATION

The process of building a participatory communication structure for development often begins when groups recognize oppression and the lack of services from state bureaucracies, which require different solutions. The leaders in the movements often develop a communicative rhetoric and a new culture that rejects the myth of weakness and dependency and re-evaluates the identity of youth, peasants, or women as a positive value (Heward & Bunwaree 1999; → Rhetoric and Class). These *grassroots movements* have often been assisted by persons and organizations with a more urban-technical background, who wish to share their organizational, educational, and communication skills with these popular movements (Burra et al. 2005). Typical of this phenomenon is Paulo Freire, a Brazilian professor of education, who became involved with literacy training projects and applied his philosophical and educational background to develop the culture of popular confidence into a new method of education for the poor and excluded. The thought of Freire and others provides much of the theoretical foundation for methods of education

for dialogical communication aimed at creating a new culture of confidence and organizational capacity in these movements.

The relative success of the popular movements as a development strategy has gradually caught the attention of most of the major theorists of communication for development (→ Development Communication). Today, the theoretical paradigm based on participatory, grassroots communication and empowerment approaches has become dominant (Melkote & Steeves 2001; Servaes 1999; R. A. White 2004; Wilkins 2000). Theory and practice of development at the local level is today generally expressed in some form of empowerment, and this perspective has wide acceptance throughout the world including in some international development institutions such as the World Bank (Alsop et al. 2006; Bebbington et al. 2006).

### CONCEPTS OF EMPOWERMENT STRATEGIES

Empowerment communication strategies generally take into consideration different dimensions of power, not just the traditional meaning of power as “power over” (Rowlands 1997, 13–14). *Personal empowerment* (“power to” or “power within”) attempts to develop a sense of self-confidence in one’s identity as female, peasant, or young person. The consciousness of personal identity as full of value, competent, and able to contribute to national development becomes important (Freire 1972; 1973). *Relational empowerment* develops the ability not to passively accept power relations but to actively negotiate and influence relationships and decisions made in them (Rowlands 1997, 15). *Collective empowerment* (“power with”) trains people to work in organizations so as to have a greater impact. This develops the ability of groups to analyze problems, to discover solutions, and to carry out these solutions as an organization.

*Political empowerment* (“power for”) prepares people to participate in representative democracy in order to get the regional, national, and international political decision-making process to provide opportunities and resources for grassroots organizational efforts. Some conceptions of empowerment stress building freedom of choice (agency), gaining awareness of assets, and learning to take advantage of opportunities (Alsop et al. 2006). Another dimension is *social capital*, the degree to which one can call upon the social commitment, trust, and support of family, friends, community, and other social relations. Empowerment, as a de facto exercise of initiative, leads toward *entitlement*, when there is an awareness that the exercise of creativity is a human right inherent in personhood (Gready & Ensor 2005).

### STRATEGIES AT THE GROUP AND COMMUNITY LEVEL

Empowerment approaches place great emphasis on participatory forms of interpersonal, group, and organizational communication. Especially important is a nondirective leadership and administrative relationship with beneficiaries that encourages them to recognize and express their own ideas for solving the problems they face.

The first step in the process of educational and communication change is the formation of groups interested in more formal discussion led by locally elected, nondirective leadership. This leadership, which may have been accustomed to authoritarian power

structures, often benefits from training in participatory communication by those who have skills in empowerment. The best of the leaders have come out of the movements themselves.

Central to the communication process of empowerment is the *animation model of dialogical discussion* conducted by nondirective leadership, which includes the following components. First, there should be an open and free space in which all members of the group are able to say what they think and experience a supportive response of listening, appreciation, respect, and constructive building on the good ideas of others. Second, the animator should refrain from telling the group what their problem is or its best solution, but encourage group members to come up with their own ideas. He or she must have a deep respect for the capacity of the group to come up with its own solutions and patiently allow it to do so in its own way. Third, the members of the group are encouraged to get in contact with their own ideas, to establish their own sense of identity, and to bring this before the others with confidence. Many participants may have lived in a context of fear or repression and therefore find it difficult to raise their own perceptions to the level of conscious affirmation.

Fourth, members deliberate on the causes of the problem they face and the best course of action. For those accustomed to authoritarian communication, it may be difficult to create a solution together from all the ideas of those present so that everyone can see something of themselves in the final decision and in the group action. Fifth, those in the group who may never have participated in public decision-making are enabled to reach and enact a responsible decision. Sixth, the animator provides guidance for the group on how to build communication networks with other groups and how to negotiate with government and nongovernmental sources of assistance as a network. Group and community communication may use “small media” such as videos they produce themselves, theatre, traditional music, dance, and other forms of indigenous media. The purpose is not primarily to instruct but to present for analysis the everyday relations based on a power structure that they may initially take for granted as “natural.” In the production, witnessing, and discussion of this media, participants can deconstruct and rebuild social relations according to principles of democratic governance such as equal representation of women and men, open discussion, free elections, and rotating leadership (S. A. White 2003).

## **EMPOWERMENT AT THE DISTRICT AND REGIONAL LEVEL**

Although group communication is important for personal empowerment, these groups must be brought together to form community councils, cooperative associations, and voluntary associations to gain access to technical and economic support. At this level community media, which provide intergroup and district-level communication, are important. Particularly useful is community radio, which is “owned” by a cooperative of local organizations and manned largely by volunteers from all these organizations (Alumuku 2006). Community radio opens program areas for less powerful sectors – peasant farmers, women’s organizations, youth, artisans’ associations – and conducts a continual open forum of discussion of the problems and interests of these sectors (→ Community Media; Radio for Development). Community radio circulates local news, takes advantage of local entertainers, sponsors information and improvement campaigns, supports local language and cultural traditions, and defends local interests against the

economic and power elites. Community radio is open to all who wish to speak and provides training in radio broadcasting for all.

Typically, community radio runs a series of instructional programs and educational campaigns that use methods of empowerment: interpersonal mentoring and guidance, participation in educational broadcasts, consciousness-raising discussions, theatre and video produced locally, and community radio “open forum” programs in which issues of power relations are often debated. Community radio is also empowering in that it often links rural neighborhoods to national and international information sources through wireless forms of the Internet.

### **EMPOWERMENT AT THE NATIONAL AND INTERNATIONAL LEVEL**

The networks of local organizations are now increasingly being brought into regional associations directed by elected councils. These associations are able to make agreements with government and nongovernmental agencies to provide technical training, capital investment, marketing access, agro-industry processing, support for small “informal economy” industries, and special informational services of national newspaper, television, and radio networks. The networks of associations are themselves a communication infrastructure and are able to “translate” the highly technical languages and service approaches of banking systems, government development agencies, and international NGOs into the culture of the people-oriented “economy of affection” at the local level.

In many countries of the world there is now a major shift in the structure of governance and development from centrally directed “command models” to “response models,” which encourage grassroots organizations and provide services to these initiatives. The theory and practice of empowerment is currently playing a major role in this new model of democratic governance and administration.

# Communication Technology and Democracy

*Nico Carpentier*

*Free University of Brussels and Catholic University of Brussels*

Communication technologies have been seen both as instrumental and as destructive to democratic processes. The advent of the print media is intrinsically linked with the struggle for civil liberties and the construction of contemporary nations. At the same time their destructive capacities became equally clear when, for instance, at the end of the nineteenth century Hearst propagated war against Spain, and the French newspapers assisted in dividing the country during the Dreyfus affair, some of them relying heavily on anti-Semitic imagery. Similarly, the audiovisual media brought political voices and faces into the living room, but after Goebbels’s usage of the radio waves, their democratic capacity could no longer be taken for granted. Communication technologies are not necessary neutral instruments in the service of Enlightenment. They are always embedded in ideological constellations that may be democratic, but also may be totalitarian.

An equally tempting myth is the belief that communication technologies are the driving force of society, and that the development of new technologies will necessarily and fundamentally change our society. This *techno-deterministic myth* collapses the social into the technological, ignoring the complexity of the social. In this context Williams’s (1999, 133) remark should be borne in mind: “While we have to reject technological determinism, in all its forms, we must be careful not to substitute for it the notion of a determined technology.” While the realms of the social, political, democratic, and economic co-determine the technological, the technological simultaneously and dynamically co-determines the social, democratic, political, and economic.

## DEFINING DEMOCRACY

It is important to take a close look at democracy, as there is considerable variety in its significance due to the diversity of democratic theories (see Held 2006) and practices (Fig. 1). Some models restrict democracy to more centralized and elitist forms of societal

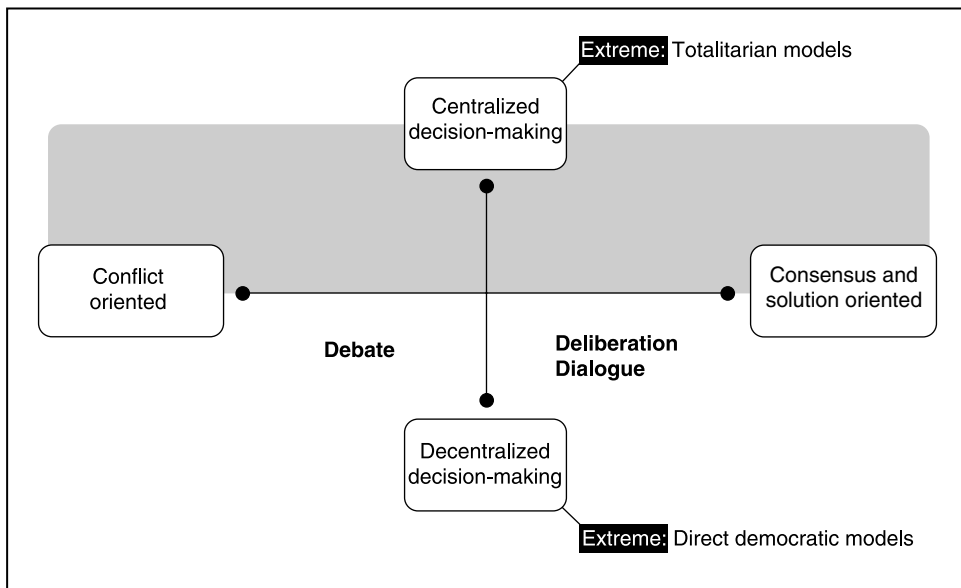

Figure 1 Dimensions of democratic theory

decision-making, protected by a legal-procedural articulation of democracy and a narrow definition of the political (as the political system). Other democratic models cherish a more decentralized version of societal decision-making, supported by a more substantial and/or culturalist interpretation of democracy and a broad definition of the political as a dimension of the societal.

A second dimension in democratic theory focuses on the main structuring concept that underlies the societal decision-making process and which ranges from conflict to consensus. In the first case, the socio-political is seen as being dominated by manifest and latent conflicts, possibly within the context of hegemonic projects. The confrontation between different societal groups leads to (heated) debates and claims of victory. In the second case, consensus is seen as the main societal organizing principle, focusing on the presence and achievement of societal harmony and unity. Here, processes of deliberation and dialogue support a harmonious polis and (if necessary) aim to stabilize the disruptions of this harmony.

### APPROACHES TO COMMUNICATION AND DEMOCRACY

The role of communication technologies in democratic processes cannot be separated from the political-ideological debates about the nature (and limits) of democracy itself. It is no coincidence that in the western media studies literature, theories of the (democratic) role of the media within society are designated as “normative theories.” The often-cited starting point here is *Four theories of the press* (Siebert et al. 1956), based on the work of the Hutchins Commission, which contains insights that remain surprisingly relevant in contemporary times.

The two models Siebert et al. describe that are relevant here are the liberal (or libertarian) and that of social responsibility. These focus strongly on information, but the function of the media is complemented by their role as a watchdog over the authorities (→ Fourth Estate) and by the need to create an independent forum for debate, a so-called marketplace of ideas. The importance of information for a political community in enabling citizens to make informed choices is rarely contested, although the “quality” of the information, its relevance and the degree of bias, are the subjects of ongoing debates within media studies (→ Bias in the News; Journalists’ Role Perception).

In the social responsibility model, the information and watchdog functions are complemented by stressing the importance of “accurate” representations of social groups and of providing a “truthful, comprehensive and intelligent account” of “the day’s events in a context which gives them meaning” (Siebert et al. 1956, 87). This early emphasis on representation has increased in importance over time, where the focus is not only on the representation of the social and its constitutive sub-groups (→ Gender: Representation in the Media), but also on the representation of the political. Moreover, the deepening of the theoretical frameworks that surround the concept of representation has also highlighted the unstable and ideological nature of media representations, incorporating these representations into the realm of the political.

As the treatment of these issues in *Four theories of the press* was considered too reductionist, McQuail (1994) added several models: the development model and the participatory-democratic model, which were replaced in the fifth edition of his *Mass communication theory* (2005) by the alternative media model. All of these models foreground the participatory role of the mass media. Here, it is important to distinguish between participation in the media and through the media (→ Media Democracy; Participatory Communication). Participation *through* the media deals with the opportunities for extensive participation in public debate and for self-representation in the public sphere. Starting from a broadly defined notion of the political, consensus-oriented models of democracy (and participation) emphasize the importance of dialogue and deliberation and focus on collective decision-making based on rational arguments in a → public sphere à la Habermas (→ Habermas, Jürgen). Other authors (Fraser 1990; Mouffe 1994) stress more conflict-oriented approaches. They point to the unavoidability of political differences and struggles and call attention to the articulation of the media as crucial sites of struggles for hegemony. Both consensus- and conflict-oriented models enable the need for citizens to participate in these processes of dialogue, debate, and deliberation to be emphasized.

Participation *in* the media deals with the participation of nonprofessionals in the production of media output (content-related participation) and in media decision-making (structural participation). These forms of media participation allow citizens to be active in one of the many (micro-)spheres relevant to daily life and to put their right to communicate into practice (→ New World Information and Communication Order [NWICO]; Right to Communicate). Although mainstream media have attempted to organize forms of audience participation, alternative media have proven to be more successful in organizing deeper forms of participation in the media (→ Activist Media; Citizens’ Media; Community Media; Grassroots Media; Radical Media).

## OLD AND NEW MEDIA TECHNOLOGIES

With the arrival of the new information and communication technologies (ICT), hopes for an increase in democratic communication were reinvigorated (→ E-Democracy). The arrival of a new generation of so-called “new” media had an effect on the nature of discussions about democracy, participation, and the media. The importance of access increased, as techno-utopians emphasized that we would all gain access to all information at all times. Interaction and interactivity became the new buzzwords of the world of ICT. One of the major differences from the media landscape before the introduction of the Internet (and more specifically before the world wide web) is the reduced role of mainstream media organizations in the new media environment. Not only ordinary users but also civil society organizations (van der Donk et al. 2004; Cammaerts 2005) are enabled or empowered to avoid the mediating role of the “old” media organizations, to publish their material (almost) directly on the web, and to establish communicative networks that (often) support more decentralized models of democracy.

These reflections partially build on the earlier work of participatory theorists such as Barber (1998). His analysis points to the potentially beneficial increase in information, which challenges the “existing political hierarchy’s monopoly on powerful communications media” (Rheingold 1993, 14), the strengthening of social capital and civil society (Friedland 1996), and the opening up of a new public sphere, or a “global electronic agora” (Castells 2001, 138). When this discussion is framed in terms of the quest for more direct and/or deliberative democracy, notions of power and decision-making are explicitly highlighted. Budge (1996, 1), for instance, defends the move toward more direct democracy, where “public policy can be discussed and voted upon by everyone linked in an interactive communications net.”

In reaction to these bold statements, there has been a critical backlash partly from a production perspective, pointing to the control by large media and communication corporations of the Internet despite its potential independence from large-scale media organizations. The “heaven on ICT user earth” perspective also has been questioned by focusing on problems of access and interaction/interactivity. The lack of access for some has foregrounded the notion of the → digital divide. Although the level of interaction may have increased, it is questionable whether societal and media participation have increased proportionally, or whether Penny’s (1995, 54) term “interpassivity,” referring to the “*Pavlovian interactivity of stimulus and response*,” is a better characterization of recent developments.

When attempts to deepen democracy are contrasted with representative democracy, the critique of “*technopopulism*” (Coleman & Götze 2001, 5) is relevant. It is important to keep Barber’s (1984, 289–290) words in mind: “Instant votes of the kind envisioned by certain mindless plebiscitary democrats are as insidious as interactive discussion questions are useful.” ICTs can be used to deepen the democratic process but their embeddedness in a democratic culture – at the societal level and at the level of media organizations – is necessary to overcome token democracy and pseudo-participation.

# **Communication Technology and Development**

*Heather E. Hudson*

*University of San Francisco*

Information is critical to the social and economic activities that comprise the development process. Communication technology as a means of sharing information is not

simply a connection between people, but a link in the chain of the development process itself (→ Development Communication; Technology and Communication). In general, the ability to access and share information can contribute to the development process by improving:

- efficiency, or the ratio of output to cost (for example, through use of just-in-time manufacturing and inventory systems; through use of information on weather and soil content to improve agricultural yields);
- effectiveness, or the quality of products and services (such as improving health-care through telemedicine);
- equity, or the distribution of development benefits throughout the society (such as to rural and remote areas, or to minorities and disabled populations);
- reach, or the ability to contact new customers or clients (for example, craftspeople reaching global markets on the Internet, or educators reaching students at work or at home).

Communication technologies may *improve efficiency and productivity* in several specific ways. First, communication technologies offer price information. Producers such as farmers and fishermen can compare prices in various markets, allowing them to get the highest prices for their produce, to eliminate dependency on local middlemen, and/or to modify their products (types of crops raised or fish caught, etc.) to respond to market demand. Communication technologies may also reduce downtime, when timely ordering of spare parts and immediate contact with technicians can reduce time lost due to broken machinery such as pumps, tractors, and generators. In addition, communication technologies foster efficiency and productivity through reducing inventory, improving timely delivery of products to the market, reducing travel costs, and saving energy through coordinating shipping and transportation logistics. In addition, communication technologies facilitate the decentralization of information networks and can help to attract industries to rural areas, and allow decentralization of economic activities away from major urban areas (Hudson 2006; → Social Networks).

### **TECHNOLOGICAL TRENDS AND IMPLICATIONS**

Key technological trends that are driving the proliferation of new information and telecommunications services include attention to capacity, digitization, ubiquity, and convergence (→ Digitization and Media Convergence). New technologies such as optical fiber have enormous capacity to carry information, and can be used for services ranging from entertainment and distance education to transmission of highly detailed images for remote medical diagnosis. Satellites and some terrestrial wireless technologies such as WiFi and WiMax also offer a tremendous increase in available bandwidth. Telecommunications networks are becoming totally digital, so that any type of information, including voice and video, may be sent as a stream of bits. Digital compression allows more efficient use of bandwidth so that customers may have more choices (such as compressed satellite television channels) and/or lower costs, such as use of compressed video for distance education and compressed voice for Internet telephony. Advances in wireless technology

such as mobile cellular networks and fixed wireless systems offer affordable means of reaching rural customers and urban areas without infrastructure in developing countries (→ Rural Development). The convergence of telecommunications, data processing, and imaging technologies is ushering in the era of multimedia, in which voice, data, and images may be combined according to the needs of users, and distinctions between the traditional sectors of telecommunications, information processing, and broadcasting are increasingly arbitrary and perhaps irrelevant.

There are several significant *implications of these technological trends*, particularly for rural and developing regions. Distance is no longer a barrier to accessing information. Technologies are available that can provide interactive voice, data, and multimedia services virtually anywhere. Costs of providing services are declining. Satellite transmission costs are independent of distance; transmission costs using other technologies have also declined dramatically. Thus, communications services can be priced not according to distance, which penalizes rural and remote users, but per unit of information (message, bit) or unit of time. The potential for competition is increasing. Lower costs make rural/remote areas more attractive. New competitors can offer multiple technological solutions, including wireless, satellite, optical fiber, copper, and cable. In addition, the sector is being restructured through privatization of formerly government-owned networks and liberalization to allow competition among services and across technologies (→ Privatization of the Media). The communications industry itself is also being transformed, with new entrants as well as mergers and acquisitions creating vertically and horizontally integrated providers of content and conduit, hardware and software. All of these changes are taking place within a context of globalization, as international trade in goods and services expands and national economies become increasingly interdependent.

### THE DIGITAL DIVIDE

Of course, these new technologies and services are not available everywhere, and in developing regions where they do exist, many people cannot afford to use them (→ Digital Divide). Telecommunications is a “missing link” in much of the developing world, as the International Telecommunication Union’s Maitland Commission (1984) noted two decades ago. A decade later, policymakers were calling for a “global information infrastructure” that would link everyone into a worldwide network, or more likely, network of networks. By the turn of the century, world leaders were committing themselves to bridge “digital divides” between the industrialized and developing worlds.

People in the least developed countries, many of whom are in Africa, still have very limited access to basic voice telecommunications. However, wireless technologies are beginning to bridge that gap. There are now more mobile phones than landlines throughout the developing world, as prices fall and users can buy services in small, prepaid increments. For most subscribers in the developing world, their mobile phone is their first and only phone.

Gaps also exist within the developing world. Not only do wealthier people have greater access to communication technologies, but the gaps are even greater between urban and rural areas. Typically, a high percentage of developing country residents live in rural areas (as much as 80 percent of the population in the least developed countries), where access to communication networks is extremely limited.

## RESEARCH ON THE IMPACT OF INTERACTIVE TECHNOLOGIES

During the 1970s, studies of telemedicine, teleconferencing, and interactive telecommunications (Hudson & Parker 1973) showed that telecommunications can facilitate many development activities (→ Telecenters). Several studies found a high correlation between economic growth and telecommunications investment, typically measured in GDP per capita and telephone sets or lines per 100 population. However, does telecommunications investment contribute to economic growth, and/or does economic growth result in increased telecommunications investment?

The first major study to address the causality issue was by Hardy (1980), who found that the causal relationship ran in both directions. Of course, telecommunications investment did increase as economies grew, but there was also a small but significant contribution of telecommunications to economic development. The implication was that early investment in telecommunications could contribute to economic growth. Cronin et al. (1991) used a similar methodology to show not only that increases in output or GNP level lead to increases in investment in telecommunications, but that the converse is also true: increases in telecommunications investment stimulate overall economic growth (→ Media Economics). Aside from the few macro-level reports, case studies provide much of the evidence on the benefits of telecommunications in rural development.

Many researchers note that there are *social benefits of telecommunications*, particularly in rural and isolated areas where other forms of interaction with distant family members, friends, and colleagues may be infrequent and time consuming. Field research from developing countries cites examples of rural residents keeping in touch with family members who have gone to the city or overseas to seek work (such as Egyptians and Indians to the Arab Peninsula, or South Pacific islanders to New Zealand); families contacting relatives scattered in many rural communities; and field staff such as nurses and teachers in rural posts using two-way radios or satellite links to keep in touch with colleagues and family members. Researchers have hypothesized that reducing isolation can help to reduce personnel turnover.

Communication technologies can contribute significantly to socio-economic development, but investments in them alone are not sufficient for development to occur. In addition to availability of communication technologies, other factors are necessary if they are to contribute to socio-economic development. First, context is important to understand the cultural, economic, and political context. For example, if women are “invisible” in public or in commerce, they are not likely to learn to use communication technologies without specific outreach activities. If there is no reliable transportation, producers may be forced to sell to a local middleman, even if they learn that prices are higher in the city. If there is no source of credit available, farmers may not be able to buy better seeds or pesticides, even if they learn from the Internet that these inputs would improve their crop yield.

Next, content matters. Telephones do not require literacy or knowledge of a major language. “Infomediaries” can help to find and interpret useful content, but communication technologies’ true potential will be realized only if content becomes available in more languages, and more content relevant for developing regions is produced. Finally, capacity must be taken into account. Use of communication technologies requires the skills to use the equipment and the ability to find useful information. Thus users require some training if they are to take advantage of access to communication technologies.

Alternatively, access sites must be staffed by “infomediaries” who can not only use the equipment but find relevant information. Thus, communication technologies may be seen as a complement to other infrastructure required for development, such as transportation, electrification, and a clean water supply.

## COMMUNICATION TECHNOLOGIES IN DEVELOPMENT PROJECTS

Communication technologies play an important role in health services in many developing countries (→ Health Campaigns for Development). Generically, these applications are referred to as “telemedicine,” although some use that term for consultative uses, and the term “telehealth” to refer to applications for medical education and administration. Initiatives using communication technologies to support health services include emergency care, consultation, remote diagnosis, patient monitoring, training and continuing education, public health education, administration, data collection, and research and information sharing.

The following are the most common *goals of applications* of communication technologies in education: improving the *quality* of instruction, for example by adding supplemental materials, research resources, opportunities to practice skills, interact with instructors, etc.; extending the *reach* of education to people who have been excluded because of distance from educational institutions or disadvantage, for example, to reach isolated students, illiterates, people in remote job sites or prisons, etc.; and providing *instruction* where no qualified teachers are available (for example, to teach foreign languages or advanced science or mathematics courses). Often these goals are combined with the need to save *time* and/or *money*, e.g., to enable employees to study at their workplace instead of traveling to classes or taking leaves of absence to attend distant courses; or to enable a specialized instructor to teach students in several locations.

A major problem may be that teachers do not have sufficient training to teach certain components of the curriculum. One approach is to use communication technologies to teach students directly, with the local teacher serving as an aide or tutor. Radio has been used to teach basic mathematics to school children, incorporating exercises using locally available materials such as sticks and bottle caps. Alternatively, communication technologies could be part of a strategy to improve the teachers’ knowledge and skills by offering courses for teachers using correspondence materials, radio, television, and possibly the Internet, often coupled with incentives for completing credentials and earning pay raises.

Another problem in developing regions is that there are not sufficient books for the students, or that the prescribed materials are dated. One solution is to provide access to up-to-date *materials from online sources*. For example, a teacher in Timbuktu (in central Mali) commented that the only African maps available in the school were from colonial times. That teacher could now use the telecenter’s facilities to download and print an up-to-date map of Africa. Worldspace, a satellite system that transmits radio programs directly to small receivers, plans to transmit educational radio programs via satellite for use in African classrooms (→ Radio for Development).

Another educational goal in developing regions is to *upgrade the skills of working adults*, such as extension agents, health workers, and employees of other government agencies. In the past, the main means of instruction were short courses that required participants to

travel to major cities or take time from work, or correspondence courses that workers were expected to complete in their own time. Today, such students may attend courses delivered to their workplaces or local training centers, or may supplement traditional correspondence courses with online materials and assignments, and email interaction with other students.

In many developing regions, women are using communication technologies to obtain and share information relevant to their work as teachers, community development workers, artisans, or entrepreneurs. *Women entrepreneurs* resell mobile phone services in countries such as Bangladesh, the Philippines, and Mozambique. Women entrepreneurs also manage phone shops in Ghana and teleboutiques in Senegal and Morocco, and many community telecenter staff in Africa and other developing regions are women (Hafkin & Taggart 2001). Women are indirect beneficiaries of communication technology use in a variety of contexts. Improvements in health-care can benefit women and their families; use of communication technologies in schools can improve education for girls; and availability of communication technologies in the community can provide opportunities for training as well as tools that can be used by community organizations that benefit women.

Several important *conclusions* can be derived from research on the benefits of information and communication technologies. Communication technologies may contribute to investment in telecommunications and thus to economic growth; improve the quality and accessibility of education, health-care and other social services; benefit rural and remote areas where distances are greater and telephone penetration is lower; and foster a sense of community and strengthening of cultural identity. Telecommunications can be considered a complement in the development process; i.e., other conditions must exist for maximum developmental benefits of telecommunications to be achieved.

All of these benefits are derived from the role of information in the development process. New technologies such as wireless and satellite communications and the Internet will provide more opportunities for people in developing regions to access and share information that can foster development, because, as a woman using a telecenter in Timbuktu noted, “Information is the key to all doors” (Hudson 2006).

## Communication Technology Standards

*Richard Hawkins*

*University of Calgary*

Communication technology standards are technical specifications that enable technological components from different suppliers to work together within a given communication system. Some standards refer to the physical interfaces between network and terminal equipment. Others refer to logical elements expressed in algorithms and embodied in software. In digital systems, many standards involve both physical and logical elements: a standardized physical interface is supported by standardized software elements. Standards are essential to telecommunication, broadcasting, and computer networks. More recently they have become crucial elements in the integration of digital networking and services environments.

Much standardization is limited to physical and/or logical interfaces between components and functions. However, it is often the case that systems or networks that adhere to common standards also may incorporate specific implementations that are not fully compatible. Indeed, an essential institutional dynamic in the standardization process involves determining the limits to standardization. Such factors add strong socio-economic and often political dimensions to the process of defining and adopting communication technology standards (Schmidt & Werle 1998).

### TYPES OF STANDARDS

Generally it is understood that standards have strong collective characteristics; that they are applied across entire product or service segments or otherwise on an industry-wide basis (Kindleberger 1983). Thus, standards are considered to reflect a *consensus* among stakeholders to adopt common solutions to shared problems. But consensus can be expressed in many forms, ranging from market preferences for proprietary solutions, to the outcomes of formal rule-based negotiations.

It has been common to make a distinction between *de facto* standards (often called “market” or sometimes “informal” standards) and *de jure* or “formal” standards as negotiated under the auspices of a standards development organization (SDO). It has been common also to refer to negotiated standards as “open,” reflecting the principle of admitting all stakeholders to the negotiation process. However, often the term “open” is confused with “open source,” which refers to software that is unencumbered by

proprietary intellectual property. This is unfortunate, as an  $\rightarrow$  open source environment is not necessarily synonymous with a standardized environment.

These simple distinctions have given rise to an enormous array of specialized definitions and taxonomies. However, there is disagreement among scholars as to whether such demarcations reflect practice. Broadly speaking, opinion splits according to whether standards should be defined and classified in terms of form or of function. Formal designations focus largely upon the institutional settings in which standards are developed and adopted. Functional designations focus more upon the practical consequences and impacts of coordinating technology and markets through common technical specifications.

In principle, standards are distinguished from *regulations* (as, for example, concerning safety or electromagnetic interference) in that compliance with standards nominally is voluntary. Nevertheless, standards and regulations often are linked – a regulation may reference a technical standard or vice versa. In practice, however, standards and regulations can yield many of the same effects. Moreover, even where there is no regulatory compulsion to adopt a standard, there may be commercial pressures that favor adoption to the extent that it becomes virtually mandatory to adopt a nominally voluntary standard because the costs or risks of deviance are too high.

### THEORY OF STANDARDS

Prior to the 1980s, most of the literature on standards was descriptive rather than analytical. Much of it focused either upon industrial efficiency from an applied production management point of view, or upon the regulatory role of standards, especially in the context of industrial procurement and trade. There was rather little explicit connection to the theoretical and empirical tools of the mainline social sciences, although some of the earliest analytical work on the role of standards in establishing modern forms of industrial organization remains conceptually relevant to many contemporary and emerging standardization issues (see Thompson 1954).

The variety and quantity of theoretical literature on standards has increased remarkably in recent years. Growing interest in the dynamics of communication networks has been a significant contributor to the diversification of scholarly interest in this subject. Significant new ideas have been forthcoming from economics, the management sciences, political and legal studies, organizational studies, and various branches of sociological studies concerned with the production and diffusion of technology ( $\rightarrow$  Information and Communication Technology, Development of; Diffusion of Information and Innovation).

Nevertheless, a common theoretical core runs through virtually all of the literature. The most basic concept is that *standards reduce variety*. Theory predicts that, by adopting a uniform solution to a problem that is common to many stakeholders, any loss in the value of discarded solutions will be regained and amplified for all stakeholders in the form of production efficiencies and overall reduction in the unit cost of standardized items. Even though the price may decline following standardization, theory predicts that producers of standardized items will benefit from access to a larger market overall. A closely related concept is that standards ensure *compatibility* rather than uniformity. This implies that conformance to a standard does not preclude variations in product qualities

and features. To some extent, the compatibility concept reconciles the reduction of variety with the continuance of innovation and competition.

Reduction in variety is reckoned also to lead to *information efficiencies* between producers and users of technology. Thus, if we find a standardized connector on a computer keyboard or printer, we know that it will operate with any computer equipped with the appropriate standardized receptor. We do not require any additional information about either device. All of this information is transferred transparently by the standard.

In the mid-1980s, led by the seminal work of David (1985), Arthur (1989), and others, social scientists became interested in the role of standards in generating *network effects* – commonly expressed in terms of “increasing returns to adoption” or “positive externalities” (→ Information and Communication Technology, Economics of). The public telecommunication network is often given as an example of this phenomenon because its value to all users increases with the number of users whereas the cost of connecting each new user is low. Standardized interfaces within and between telecommunication networks facilitate access, thus ensuring that the value of the network as a whole will increase for all users. Most communication networks, from radio broadcasting to the Internet, can be seen to display similar characteristics (→ Telecommunications: Law and Policy; Television Broadcasting, Regulation of).

However, the phenomenon of increasing returns means also that the circumstances and timing of standards selection can be crucial. Standards can set up path dependencies, locking users into technological environments that may not always have optimal characteristics. Lock-in has economic implications in that the standardization of suboptimal technologies may impede technological progress. But it has political and managerial implications also in that dominant firms may use lock-in effects from standards to control markets and prejudice further technological development.

Understanding the *relationship between standards and innovation* is one of the most challenging theoretical and empirical issues (Blind 2004). On the one hand, because of lock-in effects and their role in establishing dominant designs, standards might appear to impede innovation. On the other hand, information efficiencies may lower the costs and risks of experimentation, thus encouraging innovation. It can also be observed that standardized infrastructures and platforms, such as we see with the Internet or mobile telecommunication systems, have facilitated significant innovation in business models and value-added services.

## **INSTITUTIONAL DIMENSIONS OF COMMUNICATION TECHNOLOGY STANDARDS**

Prior to the present era in which virtually all communication technologies and networks are digital and oriented in some respect to the Internet, the institutional landscape for communication technology standards was oriented to three, largely discrete, networking environments – telecommunication, broadcasting, and data processing. Although there were always overlapping standards requirements, each environment had its own standards regime centered in its own set of institutions.

The → Internet has the potential to enable virtually complete convergence of these environments (→ Digitization and Media Convergence). Nevertheless, vestiges of the historical system persist. Many international standards for public switched telecommunication

networks remain in the orbit of the *International Telecommunication Union*, either under the auspices of the Telecom-standardization agency (ITU-T) or the Radio-communication agency (ITU-R). As the authority responsible for the international management of radio spectrum, ITU-R also plays a significant role in the broadcast and satellite sectors. On the other hand, international standards for data-processing systems have been historically the responsibility of the International Organization for Standardization (ISO) and the International Electrotechnical Commission (IEC) through a Joint Technical Committee (JTC1) on data processing and computer communication standards.

Spurred to a large extent by the liberalization of telecommunication markets and convergence between voice and data networking, the institutional structure of standardization has evolved considerably. Many telecommunication standards now are developed in regionally based organizations, e.g., the European Telecommunication Standards Institute (ETSI). Likewise, standardization activities for data networking are now distributed among an increasingly diverse group of organizations. Some, like the Internet Engineering Task Force (IETF) employ nominally informal methods, soliciting inputs from the community of Internet users at large. Others, like many of the standards committees of the Institute of Electrical and Electronics Engineers (IEEE) work to formal procedures.

In practice, the lines between national, regional, and international standards bodies are becoming as blurred as the lines between network and services environments. During the past 10 years, the most significant development has been the proliferation of industry “consortia”: stakeholder-sponsored organizations that develop technical specifications mostly for specialized product and service niches. W3C (the group that oversees standards development for the world wide web) is probably the most widely known consortium, but these organizations have grown in number from perhaps 60 in the mid-1990s to at least 350 today. Although some consortia collaborate actively with formal SDOs, many do not.

The rise of the consortium phenomenon has often been attributed to failure of the formal SDO system to develop standards quickly enough to meet the needs of ever shorter product cycles for information and communication technology products. But it now appears more likely that the selection of consortium or SDO environments is made for commercially strategic reasons. Many of the key technologies that now function as global standards are either wholly proprietary (like Microsoft Windows or Vista). Others may incorporate proprietary and nonproprietary elements (West 2003). Accordingly, intellectual property has become one of the most contentious standardization debates.

To sum up, over a period of 20 to 25 years, the scope and function of communication technology standards has broadened considerably. In addition to their historical role in ensuring the compatibility of network components, they have become associated more directly with the coordination of specific service environments. Also, the key issues and debates have moved largely out of the hardware segments and into the software segments. As all of these changes have occurred, the social and economic implications of standardization have intensified for a much wider variety of stakeholders.

## Communication Theory and Philosophy

*Klaus Bruhn Jensen*

*University of Copenhagen*

Communication theory is heir to classic issues in the history of ideas. If philosophy has traditionally asked how human knowledge of reality may be possible, communication theory addresses the media, modalities, and messages by which humans exchange, reflect on, and enact different perspectives on reality. Revisiting a number of key epistemological, ethical, and political issues, while responding to the increased importance of information and communication technologies throughout society and culture during the twentieth century, communication research emerged at the crossroads of social philosophy and scientific theory.

Communication became established as a distinctive category of human activity following the rise of new electronic communication media during the latter half of the nineteenth century (→ Communication: History of the Idea). These developments encouraged scholars and other commentators to think of diverse practices of social interaction – in the flesh, through wires, and over the air – in terms of their family resemblances. In Peters’ (1999, 6) felicitous formulation, “mass communication came first,” promoting explicit and sustained attention to the varieties of communication in research as well as in society

at large (→ Communication: Definitions and Concepts). Until the invention of the telegraph, “transportation and communication were inseparably linked” (Carey 1989, 15), because any communicative exchange depended on the physical presence of bards, manuscripts, books, newspapers, or other print media (→ Medium Theory). With telecommunications came decisively different means of interacting across space and time. With digital technologies, as increasingly embedded in everyday artifacts and living arrangements, have come additional resources of information and communication whose social implications may prove more radical than either the printing press or the telegraph, challenging communication research, once again, to reconsider its founding concepts.

This essay first outlines the profile of communication as a *scholarly field with a practical stake* in contemporary culture and society. The following sections trace the origins of key concepts of communication theory in *intellectual traditions* since classical Greece, and in modern sources within humanistic and social scientific *disciplines* as well as *interdisciplinary research*. These sources have been fed selectively into various models of the *process of communication*, which, in turn, have informed different approaches to the *process of research*.

### THE DOUBLE HERMENEUTICS OF COMMUNICATION RESEARCH

As perspectives on reality, all academic fields can be said to engage in hermeneutics, interpreting the world from particular positions of insight. Communication research belongs with those academic fields that engage in *double* hermeneutics, interpreting, not least, people’s own interpretations or understandings of how and why they communicate, and feeding such second-order interpretations back to the people in question and to society at large. Compared to natural and physical sciences, social sciences and humanities study already interpreted realities. In the words of anthropologist Clifford Geertz (1983, 58), much research on the communication and culture of humans seeks to determine “what the devil they think they are up to.”

The notion of double hermeneutics is familiar from early theories of culture and society; for example, Max Weber’s approach to understanding (*verstehen*) subjective meanings as a way of explaining (*erklären*) socially objective events (→ Verstehen vs Erklären). The specific terminology of double hermeneutics was advanced by Giddens (1979), who built on Winch’s (1963) challenge to predominant natural-scientific conceptions of post-1945 social science. On the one hand, social science encounters a preinterpreted world in the form of utterances, behaviors, and documents by social actors. On the other hand, the interventions and interpretations that are presented by social and cultural research cannot help but make a difference in the domain being studied – from respondents’ reconsideration, however slight, of their opinions in response to a political poll, to major reconceptions, for instance, of the nature of economic transactions or individual psychology, as prompted by the dissemination of the works of Marx and Freud.

Communication research may be considered emphatically double hermeneutic in three different respects. First, communication studies address the basic processes by which social reality is interpreted and reinterpreted on a daily basis, in everyday conversation and in dedicated institutions, from schools to news media. Second, as a field, communication research has been a response, following the nineteenth-century articulation of a category of “communication,” to the growth of an entire social sector of institutions devoted to

information and communication, what Beniger (1986) referred to as the control revolution, which was complete by the late 1930s, at the dawn of modern communication research. From government bureaucracies to market research and “mass media,” this sector produces information that enables society-wide planning, coordination, and control. Third, the rapidly shifting configurations of communicative practices in twentieth-century society, and the mixed success of single research traditions in accounting for them, has prompted the field to become increasingly interdisciplinary, observing communication through multiple lenses of human, social, and, to a degree, natural sciences. The double hermeneutics of communication research unfolds, simultaneously, within the academic field and in its nexus with the empirical field of study.

The notion of double hermeneutics can be concretized with reference to McQuail’s (2005) textbook formulation of *five types of “theory.”* *Scientific theory* is the most common understanding of the term, covering general explanatory concepts and models that apply across a range of empirical instances, as associated, not least, with (natural scientific and) social scientific quantitative research traditions. *Cultural theory* is one legacy of arts and humanities, drawing on textual and other qualitative approaches, which have contributed significantly to contemporary interdisciplinary research. *Normative theory* addresses the legitimate ends and means of organizing social resources of communication, not least mass media, from the printing press to the Internet. While communication research emerged at the interface of social philosophy and scientific theory, normative theories also developed as a separate area of research activity, particularly regarding the press, feeding into public planning and debate. *Operational theory* is the domain of media professionals and other communication practitioners, representing rules of thumb and tacit knowledge, as well as ingrained ethical and ideological positions regarding the purpose and status of their work. As such, operational theory constitutes both an object of empirical research, as in field studies of journalists or teachers, and a source of theoretical insight into communication processes. *Everyday theory*, finally, guides individuals’ interaction as citizens, consumers, and sources of information – with each other and with the media. Practically everybody has a notion of how communication operates, and in whose interests.

A common denominator for the five types of theory is that they enable people to act – as scholars, regulators, practitioners, and ordinary users of communication. What distinguishes scholarship is its potential for systematic and sustained self-reflexivity in grounding conclusions and actions. Communication research considers normative, operational, everyday, as well as previous scientific theories; it returns reconsidered theories. Like other academic fields, communication research thus amounts to a social institution-to-think-with (Douglas 1987), performing an ongoing double hermeneutics concerning contemporary institutions and practices of communication. In doing so, the field has been informed by a wide range of traditions in the history of ideas, and of disciplines in the modern research university.

## INTELLECTUAL TRADITIONS THROUGH THE CENTURIES

By far the oldest set of ideas with a recognizable influence on communication theory comes out of the rhetorical tradition (Kennedy 1980; → Rhetorical Studies). To Aristotle, *rhetoric* was the source of a particular kind of knowledge that is probable and reasonable,

while logic might generate “necessary” or certain knowledge (Clarke 1990, 13). One legacy of rhetoric, then, is a recognition of the intimate relationship between knowing that something is the case, and knowing how to communicate about it. What we know, as individuals and communities, depends crucially on the mental capacities and material resources that are available for articulating such knowledge. Like the production of knowledge in science, the production of meaning in communication may be conceived with a relative emphasis on either the entities carrying intellectual insight or the processes resulting in such insight. This distinction – between meaning as pre-defined *product* or participatory *process* – can be retraced in much later communication theory, summarized by James Carey (1989) as *transmission* and *ritual* models of communication (→ Media).

Rhetoric built on the resources and conventions of ancient oral traditions, even if “classical” rhetoric was codified and consolidated as part of a transition to literate culture (Havelock 1963). The point of departure for rhetoric, moreover, was speech, especially concerning matters of fact, and how to argue about them. In comparison, → *hermeneutics* developed out of the practice of reading and understanding written texts, not least narratives. Whereas the texts at issue originally belonged to religion and law, particularly from the early nineteenth century onwards, the principles and procedures of hermeneutics came to be applied to the arts as well as to other kinds of texts – indeed, to human experience as such. Not just the Bible and the classics, but modern societies and sub-cultures lend themselves to hermeneutic analysis. One contribution of twentieth-century hermeneutics was what Paul Ricoeur identified in the works of Marx, Nietzsche, and Freud, and developed further as a “hermeneutics of suspicion” (Ricoeur 1981, 46). Its purpose is to discover hidden principles behind what people as well as social institutions say and do, thus exposing interests and motivations that may equally be hidden to those people and institutions themselves. Such reading between the lines of society for reformatory as well as therapeutic purposes has been a central concern of critical communication studies.

All along, from classical poetics through traditional art history to modern → design, → *aesthetics* has remained a source of inspiration for the systematic examination of how meaningful expression and experience come about in human communication. Beyond separate domains of suspended disbelief and disinterested contemplation, aesthetics also serves to explicate how specific forms of representation relate to real-world functions of communication media. Recent aesthetic theory can be seen to re-emphasize an understanding of the arts as materially grounded phenomena and socially situated practices (e.g., Summers 2003). In the case of digital and interactive media forms, further, aesthetics has been coming back in style, being recruited by both scholars and practitioners to account for the reworking of familiar media and genres in new forms of representation and interaction (→ Digital Media, History of; Remediation).

The modern *humanities* took shape around the early nineteenth century as an inclusive configuration of scholarly traditions, incorporating rhetoric, hermeneutics, aesthetics, and other approaches to the study of history, culture, and communication (for overview, see Jensen 2002b) – even if the notion of communication was another century in the making (Peters 1999). The context was the reconception of universities as institutions producing knowledge through *research*, as initially associated with the Humboldt tradition in Germany (Fallon 1980; Rudy, 1984). This contrasted, in the domains of history and culture, with previous understandings of knowledge as either self-awareness or classical learning,

as sanctioned and administered by a class of learned people (Kjørup 2001, 20–22). Emphasizing analytical procedures and conceptual frameworks for research on human consciousness and culture, through detailed attention to historical and other empirical sources, the humanities helped to shape the foundations of modern communication research.

If the early 1800s marked the institutionalization of the humanities as one of the two mainstreams later feeding into communication research, the period around 1900 witnessed a further diversification of the academy into a second mainstream of *social sciences* (for overview, see Murdock 2002). Responding to a rapidly changing social reality, various social scientific disciplines came to perform a double hermeneutics of economy, politics, and culture. As imported into the field of communication research, diverse social scientific disciplines and their practitioners could be said to position themselves along an axis – simultaneously epistemological and political – from consensus to conflict. Communication is part and parcel of the ongoing social business of coordination and confrontation, from micro-social processes to macro-social structures. A gulf is still manifest in current conferences and publications between → *functional analysis*, from Spencer and Durkheim onward, and → *critical theory*, from Marx through the Frankfurt School to → *political economy of the media*, → *feminist and gender studies*, and → *postcolonial theory*.

This dual legacy of the social sciences for communication research has been complicated and enriched on several counts. Most important, perhaps, interpretivist and constructivist approaches have served as a constant reminder that the conduct of social life depends crucially on the available symbolic resources. Communication prefigures social agency, and configures social structure. *Symbolic interaction*, which emerged from the wider philosophical tradition of → *pragmatism*, has been widely influential in studies of how communication contributes to a sense of community and of self (→ Symbolic Interaction). Across the social sciences and humanities, moreover, → *phenomenology* reasserted the understanding of consciousness as a lived and interpreted whole. While phenomenology might be interpreted, in historical context, as a defensive reaction against reductionism in the shape of either positivism or psychologism, it became an active ingredient of twentieth-century social theory and of → *qualitative methodology*. A case in point, suggesting distinctive disciplinary and interdisciplinary perspectives on communication as an object of analysis, is → *psychology in communication processes*, which has been approached variously as a matter of interpretation or measurement, exegesis or experiment (→ Discursive Psychology; Rhetoric and Psychology).

### INTERDISCIPLINARY CONCEPTS THROUGH THE DECADES

The threshold to the twentieth century marked the onset of a two-tiered set of developments in the academic fields that were to feed into post-1945 scholarship on communication. On the one hand, specialized academic disciplines became the order of the day, operationalizing intellectual ideas into explanatory concepts for empirical research, while catering to the needs of professions and bureaucracies in modern society. Whereas both national and academic cultures differ (on the case of Germany, see Löblich 2007; → Communication as a Field and Discipline), the received, remembered history of US communication study (Dennis & Wartella 1996) is indicative of a widespread view that communication research stands on the shoulders of specific social scientific disciplines

(for a critique, see Hardt 1999). Although Schramm (1997) described its development with reference to “forefathers” (Lewin; → Lasswell, Harold D.; → Lazarsfeld, Paul F.; → Hovland, Carl I.), the conceptual and analytical substance derived from impersonal disciplines (political science, sociology, social and experimental psychology).

Importantly, a similarly partial history of communication studies might be told from the perspective of the humanities. In addition to the historical and intellectual traditions already noted, the candidates for disciplinary sources include art history, literary theory, → *linguistics*, and film studies. Interestingly, the second edition of Lowery and DeFleur’s widely circulated textbook on the (social scientific) “milestones” of mass communication research included reference to an ascending “meaning paradigm” (Lowery & DeFleur 1988, 455), which might admit some humanistic milestones. Only seven years later, however, in the third edition, this anticipation of a possible convergence had been replaced by a return to multiple parallel “focused theories,” each of which might explain “some set of events or phenomena that has clear boundaries” (Lowery & DeFleur 1995, 397). The crediting of relevant disciplines, and the definition of interdisciplinarity, remain contested.

On the other hand, communication research has always been at least tendentially interdisciplinary. This is evident, not just in Whiggish histories regarding the multi-disciplinary origins of the field, but also in some of the most influential contributions to its analytical concepts and techniques. At least two such sources can be identified. First, → *semiotics* and → *structuralism*, in multiple variants and in combination with other traditions of inquiry, for instance, rhetoric and hermeneutics, have provided detailed and rigorous frameworks for studying what Ferdinand de Saussure, a century ago, called “the life of signs in society.” Growing out of nineteenth-century studies of logic and language, these traditions inspired much linguistics and literary theory from the inter-war period, and were consolidated into a mainstream of humanistic media studies from the 1960s, while subsequently influencing also social scientific research on communication and culture.

The second family of interdisciplinary traditions is more closely associated with the social sciences and with technical and systemic conceptions of social life. *Cybernetics*, with a lineage in engineering and natural sciences, came into its own during the 1940s and 1950s as a generalized science of control and communication regarding machines and humans alike (→ *Cybernetics*). The related, but different, tradition of → *systems theory*, having lost its original dream of a theory of all systems, remains influential in the weaker sense of systems thinking. And theories of → *information* as a logical, statistical, and algorithmic category have been key to both the design and study of communication media throughout the post-1945 period.

Despite family resemblances between the analytical categories of, for example, semiotics and cybernetics, any committed convergence of these and other interdisciplinary sources into some consensual theory of communication is not in progress, may never occur, and might not be desirable. Instead, convergence between human, social, and, to a degree, engineering and natural sciences can be understood as the expression of a professional ethos and a research agenda, both of which may reflect a degree of disciplinary maturity that allows for intellectual tolerance and curiosity. At least since the symbolic “ferment in the field” issue of the *Journal of Communication* (1983), such a position has been advanced widely – even if tolerance can deteriorate into indifference between niches. Furthermore, the process can take the form of several local convergences, rather than a global

convergence across the field. To bring up two otherwise disparate strands of scholarship, → *cultural studies* and → *cognitive science*, each in their way has integrated elements from several disciplines across the humanities and social sciences. They constitute both interdisciplines in their own right and components of existing disciplines and fields, including communication research. Whereas cultural studies has brought classic hermeneutic and other discourse-analytical strategies to bear on modern society, reading for its cracks and fissures, cognitive science has revisited the notion of artificial intelligence with hindsight, as informed by neuroscience as well as anthropology.

The purpose of communication theory, thus, might not be to build one interdisciplinary building from disciplinary bricks, but to sketch a plan for how multiple buildings might be constructed and reconstructed. Craig's (1999) summary statement on communication theory as a meta-discursive practice suggested as much: communication theory is constituted in and through acts of communication that address practical problems and issues of communication in the real world, and which advance different and competing solutions and reflections. Craig's meta-perspective on the field yielded seven traditions of communication theory: rhetorical, semiotic, phenomenological, cybernetic, socio-psychological, socio-cultural, and critical. While their definition and delimitation remain debatable, this is precisely the point of a constitutive meta-model: communication theory is a communicative practice, and develops in relation to other practices and contexts of communication.

It is these practices that can be understood, more generally, as instances of the *double hermeneutic* of scholarship. Communication research is inter-, trans-, and multi-disciplinary and -traditional; it is all of these things in response to a reality that is endlessly communicating – or attempting to do so. The infrastructure of research institutions, journals, and conferences provides more glacial evidence of the dialectic. In addition to disciplinary and systematic distinctions such as → *communication and law*, → *media economy*, → *media production and content*, and → *media effects*, the field has been organized, further, according to domains of practical relevance, for example, → *educational communication* and → *strategic communication*, and with a view to historically contested notions such as → *popular communication*. New institutional configurations of a theoretical heritage arise (→ Communicology); revised disciplinary identities with a direct bearing on communication emerge, as in the case of → *information science*, which in some settings used to be known as library science, but whose research questions, with digitization, increasingly overlap those of → *human-computer interaction*. And, given the centrality of media and communication in contemporary society, communication researchers are regularly questioned in public to account for the role of communication in cultural change; for example, with reference to a possible epoch of → *postmodernism and communication*. The responses perform the double hermeneutic in live communication.

## THE PROCESS OF COMMUNICATION

Across disciplinary and intellectual differences, most forms of communication research share at least an ideal-typical understanding of the process of communication. *Models of communication* have been employed since the early days of the field as necessarily simplified, but heuristically helpful representations of the domain of study (→ Models of

Communication). A terminology of *sender* and *receiver*, *message*, and *channel* can be considered relatively uncontroversial, especially if reversible roles and feedback are considered. However, already regarding the *context* of this interaction, humanistic and social scientific approaches have tended to part company. Whereas the ideal-typical social scientist, as typified by Lasswell (1948), will think of contexts in terms of the natural and cultural environments embedding and being represented in communication; her or his humanistic counterpart, represented by Jakobson (1960), rather considers contexts literally as texts, as being always already discursive structures. And, while these two classic communication models have more than a surface resemblance, they imply alternative epistemologies. In Lasswell's paradigm, communicators are really existing individuals or institutions with intentions that say something in some physical channel to someone, eliciting behaviors; in Jakobson's model, communicators amount to immanent functions or traces in a text. This latter focus on the discursive vehicles of communication is re-emphasized by the category of a *code*, such as the English language or cinematography, complementing the physical channel (what Jakobson termed *contact*) – codes are not constitutive of Lasswell's paradigm. A third foundational model, originating from engineering, but widely applied to human communication, referred to whatever is being transmitted through some communication channel as a *signal*, which is subject to decay through *noise* (Shannon & Weaver 1949). In sum, the meaningful "content" of the communication process has been defined both positively, resulting from selections and combinations within a code of expression, and negatively, with reference to that portion of a signal which is not eliminated by noise arising from the material form of the channel of transmission – as well as indirectly in terms of the intentions and behaviors of senders and receivers.

The traditional divide between humanistic and social scientific approaches to the communication process can be traced to two distinctive conceptions of communication as either a mode of *representation* or a means of *action*. On the one hand, the humanities have emphasized the symbolic forms through which humans re-present different aspects of reality to each other as part of an intersubjective process of cognition and reflection. Theories have variously emphasized representation as a cognitive and aesthetic *expression*, as an externalized form of *exchange*, and as an internalizable source of *experience*. On the other hand, the social sciences have given priority to communication as a means of coordinating social interaction, as well as a type of interaction in its own right, feeding into all manner of social, cultural, and psychological practices.

Given their focus on forms of representation in communication, the humanities have generated a particularly rich legacy of concepts regarding the vehicles of communication. First, *texts* have been understood inclusively, since the 1960s, as carriers of culture, including print as well as audiovisual media, artworks, and everyday artifacts. The emphatically inclusive concepts of textuality and *intertextuality*, deriving from early twentieth-century literary theory, further suggest that no text is an island – texts enter into webs with historical ancestries and contemporary configurations (→ Text and Intertextuality). Long before hypertexts and the world wide web, humanistic scholarship had recognized the interconnectedness of texts as nodes of communication and culture.

Second, → *discourse* refers to the use of language and other signs in social contexts, sometimes as concrete instantiations of a particular text (e.g., a performance of *Hamlet*). Discourse, then, shifts attention from textual entities toward the situated processes in

which communication unfolds. In a wider sense, discourses refer to the cumulated usages of signs that articulate and bear witness to particular worldviews, ideologies, or cultural formations. Discourses accumulate as culture through communication. Also, beyond → *cultivation theory* as understood in media studies, communication cultivates humans, for better or worse, through the historically available media.

In typologies of the vehicles of communication, the humanities have often devoted special attention to → *genre* as an intermediate level of analysis in between specific texts or discourses and their institutional or media frameworks. While literary and aesthetic theory traditionally has examined epic, lyrical, and dramatic genres and their historical and cultural variants, media and communication studies have extended this perspective to apply to a wider range of (subvarieties of) genres, also beyond → *fiction* – genres include news and television serials, email and online computer games, lovers' quarrels and patient–therapist dialogues. Genres are textual equivalents of a wide variety of social practices, in public and in private, online and offline, as explored, for instance, in → *organizational communication* (e.g., Yates & Orlikowski 1992) and with added relevance in the context of *computer-mediated communication*.

Despite different conceptions of the “content” of communication, the social sciences and humanities may be said to converge on a performative concept of → *meaning* or a contextual concept of *information*. The humanities, increasingly, account for representational meaning in terms of its contribution to the ongoing structuration of culture and society (Giddens 1984); the social sciences, equally, attend to information as “a difference that makes a difference” in subsequent interpretations as well as actions within social and cultural contexts. Communication, accordingly, might be defined as those meaningful practices of human → *interaction* that depend on *interactivity*, not just with new digital media, but with the full range of “programmable” *media* and *modalities* (→ *Interactivity, Concept of; Modality and Multimodality*) – it is through an exceedingly complex set of selections and combinations within the available material and symbolic resources of communication that human representations of, and iterative interactions in and with, reality become possible. Communication enables doubt and delay – stopping, reflecting, and representing before acting.

The convergence of concepts regarding “media” and “communication,” as indicated, has been facilitated by new, interrelated media forms and contexts of communication, which call for interdisciplinary research. The contemporary media environment is being shaped by → *intermediality* in a technological, aesthetic, as well as institutional sense. In the process, new media rely on and reshape the repertoires of old media. One of the issues for further interdisciplinary research is how diverse everyday practices of communication relate to “the media” as specific institutions dedicated to communication about other institutions in society – political, economic, and cultural. What are the purposes and boundaries of different processes of communication? And what should be the purposes and institutional frameworks of different kinds of communication research?

## THE PROCESS OF RESEARCH

The process of research can be understood as a special case of the process of communication, even if it is certainly debatable, as noted by Craig (1999, 155, note 10), whether it could be argued that communication research is “the fundamental discipline

that explains all other disciplines, [all of which] are constituted symbolically through communication.” Communication research is a specific kind of communicative practice with particular social purposes or interests. The concept of  $\rightarrow$  *knowledge interests* – explanatory, interpretive, or emancipatory – suggests that purposes or interests are not external to, but constitutive aspects of, science and scholarship. The distinction between “administrative” and “critical” research (Lazarsfeld 1941) is founded in theoretical premises and research procedures, not political preferences.

Despite the diversity of research approaches that enter into communication research, it is possible to identify certain prototypical positions, as grounded in different forms of inference ( $\rightarrow$  Deduction vs Induction vs Abduction). In academic settings, two self-conceptions by researchers of what they think they are up to (Geertz 1983, 58) have frequently been pitted against each other – hypothetico-deductive reasoning supported by  $\rightarrow$  *quantitative methodology*, and abductive reasoning relying on *qualitative methodology*. (In fact, probably the most widespread kind of communication study, broadly speaking, relies on induction – research of the descriptive, commercial, and/or confidential kind that underpins business strategy and public planning.) These positions within academic communication research are aligned with wider traditions in epistemology and theory of science, which historically have amounted to separate cultures of research (Snow 1964), despite proposals for reintegration (Brockman 1995). On the one hand,  $\rightarrow$  *critical rationalism* informs a large proportion of empirical communication research, particularly quantitative studies. This is in spite of the fact that research practice may not always live up to the criteria stipulated by Popper, just as communication research as a whole, like other fields and disciplines, continues to struggle with definitions and implications of  $\rightarrow$  *objectivity in science*. On the other hand,  $\rightarrow$  *constructivism* has been influential, especially in qualitative, interpretive, and critical communication studies. In its more radical versions, constructivism may be said to abandon a modern notion of scholarship as intersubjectively validated representations of reality that social collectives may be willing to act on, putting narrative above argument.

In review, the two prototypical approaches to communication research can be summarized with reference to different aspects or levels of empirical studies (Fig. 1). Debates across the qualitative–quantitative divide have often focused on these individual levels, commonly with special reference to the levels of data collection and analysis. Importantly, however, it is research design or *methodology*, not theory, that distinguishes qualitative and quantitative research – although methodologies typically enter into families of theoretical frameworks and analytical techniques. The similarities and differences between the two mainstreams are perhaps best understood if one notes how they join – or separate – the several levels of analysis. Quantitative communication studies tend to assume that a separation of the moments of conceptualization, design, data collection, data analysis, and interpretation is both possible and desirable. Qualitative studies, in turn, hold that at least certain communicative phenomena require a research process that moves liberally among all the analytical levels in order to articulate and differentiate analytical categories, so that the minimal act of analysis is a constitutive part of a sequence. It is this difference that, above all, accounts for the different strengths of the two mainstreams, which thus recapitulate major conceptual dichotomies in the history of modern science  $\rightarrow$  *idiographic vs nomothetic*, *verstehen vs erklären*,  $\rightarrow$  *emic vs etic*.

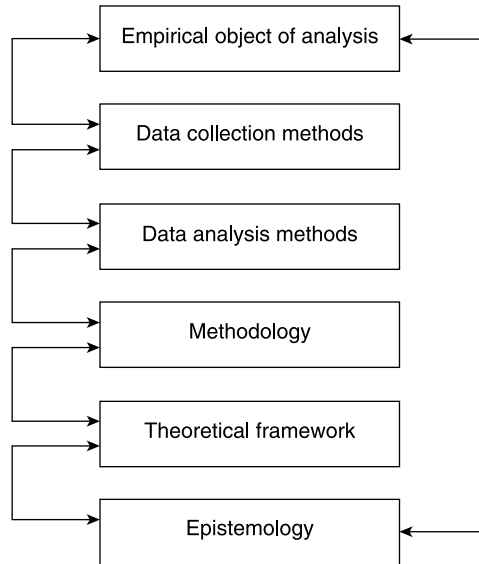

Figure 1 Six levels of empirical research

Current media and communication research has been undergoing a development of convergence between intellectual and disciplinary traditions since the 1980s, exploring the complementarity of qualitative and quantitative, humanistic and social scientific versions of the research process. Defined negatively, the field is pre-paradigmatic, lacking a consensual set of methodological, epistemological, and ontological premises (Kuhn 1970; → Paradigm). But, defined positively, the field has been the site of a dialogue between, in a weak sense, *paradigms* in the plural. While the process is open-ended, the evidence of publications and conferences suggests that convergence may continue, and might be consolidated with reference to epistemological and meta-theoretical frameworks that recognize the explanatory value of both qualitative and quantitative research; for example, scientific realism (Jensen 2002a; Pavitt 1999).

With each turn of the research dialogue, communication theory and “philosophy,” in the sense of an epistemology implying ontological as well as political commitments, are of the essence. In Figure 1, the epistemological level relates back to the empirical object of analysis, assuming preliminary definitions and justifications of what constitutes relevant “objects” of analysis, and what amounts to admissible forms of “analysis” enabling inferences beyond that object. Some venues of international communication research have tended to treat “theory” and “philosophy” as separate concerns and themes apart from the core business of research. To exemplify, the Philosophy of Communication Division of the International Communication Association, was formed in 1985 around “twin elements: theorizing communication and politicizing philosophy” (Erni 2005, 374). In practice, the division has been “a home to philosophical, critical, and cultural studies work” (Erni 2005, 371), implicitly as well as explicitly questioning theoretical and methodological premises in other divisions of that association. One of its dilemmas has been how to carve out a niche for theoretical reflection without remaining a niche to particular theories,

resisting a perceived scientific hegemony while engaging its “others” in dialogue. Certainly, it takes two parties to communicate, and reflexivity on the part of both parties to achieve a dialogue. An important challenge for future communication studies, across divisions, niches, and traditions, is how to accommodate and address communication theory and philosophy of communication, not as separate or self-sufficient practices, but as necessary conditions of communication research as such.

The struggles over research agendas, theoretical concepts, and analytical procedures, in the end, are part of the double hermeneutics of communication research. Communication studies examine a contested reality of communicative practices that everyday communicators as well as scholars care deeply about. An additional reason for theorizing communication at the beginning of the twenty-first century is its changing technological and institutional frameworks. The media – books, the press, broadcasting, the Internet – have long served as resources for reflexivity and deliberation on a macro-social scale, as institutions-to-think-with (Douglas 1987); digitization is affecting the very constituents and processes of these institutions – the who, what, and how of communication. Communication research performs the role of a second-order institution-to-think-with, without guarantees that its findings and insights may be adopted in either subsequent scholarship or everyday communicative practices. The communication of communication studies is an uncertain and unfinished business.

## Communicator Style

*Jon F. Nussbaum*

*Pennsylvania State University*

Communicator style has been conceptualized by Robert Norton (1978, 99) “to mean the way one verbally and paraverbally interacts to signal how literal meaning should be taken, interpreted, filtered, or understood.” Norton was influenced by well over 2,000 years of scholarly writings concentrating upon speech, linguistic, and writing styles, by the soft magic skills of magicians (Norton 1981), and by such prominent social scientists as Leary (1957), Schutz (1958), Bales (1970), and Sandell (1977), all of whom mentioned or alluded to communication styles within their theoretical writings. Perhaps he was most influenced by the work of Bateson (1972) and those scholars and therapists who belonged or were in some way connected to the “interactional view of human behavior” (Wilder & Weakland 1981).

On this basis Norton (1983) viewed communication style as a complex concept that consisted of two interdependent perspectives. First, communication style “is seen as a function that gives form to content” (1983, 19). The way we communicate provides information as to how the interactants are to understand the messages being delivered. “Style messages are signals about how to process content. Style adds to the color, tone, rhythm, and distinct ‘signature’ of one’s communication” (Norton & Brenders 1996, 75). The second sense of communication style “is seen as a function of consistently recurring communicative associations” (Norton 1983, 19). In this second sense, patterns of communication style can be observed by others and these others can associate certain styles of communicating across various contexts and time to an individual. Thus, individuals can, over time, become associated with certain styles of communicating.

As individuals attempt to make sense out of any message that is being sent, they must simultaneously interpret both the content of the message and the style with which the message is sent. This process of interpreting the content message and the style message is referred to as the *Law of Gestalt Formation* (Norton & Brenders 1996). The style component of the whole message is always powerful because communication style can change the primary message. “The form giving style can negate, contradict, exaggerate, dilute, disconfirm, play down, make nonsensical, obscure, intensify, or weaken the

primary message” (Norton & Brenders 1996, 78). It is important to note that nonverbal information (→ Facial Expressions) is not only a significant part of the selected information a sender uses to trigger meaning, but also a very powerful component of communication style when the nonverbal behaviors are interpreted as significantly reinforcing the message.

Norton (1978) operationally defined communicator style in terms of nine independent variables: dominant, dramatic, contentious, animated, impression leaving, relaxed, attentive, open, and friendly. The dependent variable within communicator style was named *communicator image* and represented an evaluative consequent: “I am a good communicator.” Each style or a combination of styles can be viewed as adding to an overall sense of what constitutes being a good communicator. On the basis of his conceptualization of communication style, Norton developed a 51-item *Communicator Style Measure* utilizing smallest space analysis (→ Research Methods; Scales and Indices). Each of the nine independent variables (styles) was measured using a five-item scale. Communicator image, the dependent variable, was measured utilizing a six-item scale.

Several of the communication style sub-constructs have received additional attention within the literature. In some instances, this additional research attention resulted in the development of expanded measuring instruments for specific style domains. Norton (1983) reviewed numerous investigations concerning the open, dramatic, and attentive styles of communicating. In each instance, these particular styles are associated with competencies in accomplishing certain interpersonal and relational outcomes. For instance, the *open communication style* is linked to self-disclosure (→ Disclosure in Health Communication). However, while openness can be a very successful strategy with which to accelerate the development of an intimate relationship by revealing information previously not known, and can signal that the individual desires to move the relationship beyond the current state by his or her willingness to share previously unknown information, at times openness can also be rather intimidating and inappropriate. An individual who is too open at the beginning of a relational encounter can damage or at least slow down the process of relationship development. In addition, different communicative situations require different levels of openness. Norton (1983, 128) writes “the open communicator allows the possibility of either rejection or disconfirmation, but, at the same time, invites affirmation.”

The *dramatic communicator* “vividly, emotionally, or strikingly signals that literal meaning is being highlighted or emphasized” (Norton 1983, 130). An individual who has the ability to utilize a dramatic style of communicating is able to signal that the content that is being shared is important. Tension can be created or elevated with the use of the dramatic style. A great deal of research has investigated the use of the dramatic style by teachers within classroom settings (→ Teacher Communication Style; Teacher Socio-Communicative Style). Positive student and teacher outcomes have been associated with the appropriate use of a dramatic communication style by instructors, and several studies have attempted not only to provide a causal link between a teacher’s dramatic style and effective teaching but also to improve teaching by changing the behavior of ineffective teachers.

The *attentive style of communication* “signals an ongoing willingness to provide feedback that the person’s messages are being processed in an alert and/or understanding

manner” (Norton 1983, 154). Attentiveness within any communicative encounter provides positive reinforcement to the sender of a message, signaling that the receiver is actively listening to the message, actively processing the message, and prepared to engage the sender in the conversation. Attentiveness has been strongly linked to competent communication skills. A good communicator is an individual who has an attentive style (→ Interpersonal Communication Competence and Social Skills).

Although Norton’s Communicator Style Measure has not been frequently utilized by communication scholars to capture style within interactions, the conceptualization of the style component of a communication encounter has been investigated within such diverse contexts as the patient–physician interactions (→ Health Communication; Patient–Provider Communication), management–worker interactions (→ Organizational Communication), and various family relationships such as parent–child, sibling, grandparent–grandchild, marital interaction, and therapeutic interactions (→ Family Communication Patterns; Intergenerational Communication; Marital Communication). In each of these relational contexts, the way one verbally and paraverbally interacts has been shown to be a significant predictor of successful interaction.

# Communicology

*Richard Leo Lanigan, Jr.*

*Southern Illinois University*

Communicology is a tradition in the human sciences studying → discourse in all of its semiotic and phenomenological manifestations of embodied consciousness and of practice in the world of other people and their environment.

Since the foundational work during the 1950s by Jürgen Ruesch in *Semiotic approaches to human relations* (1972), and by Ruesch and Gregory Bateson in *Communication* (1968), a widely accepted understanding of the networks of human discourse includes: (1) the intrapersonal level (or psychiatric/aesthetic domain), (2) the interpersonal level (or social domain), (3) the group level (or cultural domain), and (4) the intergroup level (or transcultural domain). These interconnected network levels contain the process outlined by Roman Jakobson's theory of human communication (1971, 1972). In homage to the phenomenological work in → semiotics and normative logics by Charles S. Peirce and Edmund Husserl (→ Phenomenology), Jakobson explicated the relationship between an Addresser who expresses (emotive function) and an Addressee who perceives (conative function) a commonly shared Message (poetic function), Code (meta-linguistic function), Contact (phatic function), and Context (referential function) (→ Models of Communication). Operating on at least one of the four levels of discourse, these functions jointly constitute a semiotic world of phenomenological experience, what Yuri M. Lotman (1994) termed the *semiosphere*.

Communicology is the critical study of discourse and practice, especially the expressive body as mediated by the perception of cultural signs and codes. It uses the methodology of *semiotic phenomenology* in which the expressive body discloses cultural codes, and cultural codes shape the perceptive body – an ongoing, dialectical, complex helix of twists and turns constituting the reflectivity, reversibility, and reflexivity of consciousness and experience. Communicology theoretically and practically engages in the description, reduction, and interpretation of cultural phenomena as part of a transdisciplinary understanding. The scientific research result is description (rather than prediction) in which → validity and → reliability are logical constructs based in the necessary and sufficient conditions of discovered systems (codes), both eidetic (based in consciousness) and empirical (based in experience). The methodology is inherently heuristic (semiotic) and recursive (phenomenological), being a logic in the tradition of Cassirer, Peirce, and Husserl (→ Qualitative Methodology; Research Methods).

Historically, the tradition of communicology emerged in 1931 when the American anthropologist and linguist Edward Sapir wrote the entry “Communication” for *The encyclopedia of the social sciences*. Here, Sapir was building on the monumental work of Ernst Cassirer (1957, 1995), who also wrote on the logic of the human sciences. Cassirer's semiotic phenomenology and Edmund Husserl's existential phenomenology were elaborated in Germany by Karl Bühler and in the USA by Wilbur Marshall Urban (1971). Urban's doctoral student Hubert Griggs Alexander was a graduate student in philosophy at Yale University studying under Ernst Cassirer, Edward Sapir, and Benjamin Lee Whorf. In 1967, Alexander wrote the first textbook devoted to explicating the connection among

communication, linguistics, and logic (1988). Then in 1978, Joseph A. DeVito wrote the first university textbook, *Communicology*. Last, the theoretical and applied foundation of communicology as a scientific discipline took firm shape with the publication of *The human science of communicology* (Lanigan 1992).

At the intercultural level, “communicology” is now widely used as an appropriate translation for the French *communicologie* and the German *Kommunikologie*. This shift in labels to communicology and communicologist has been due largely to a systematic effort to avoid misunderstanding. The confusion was encouraged by the historical ambiguity of what is “information theory” and “communication theory.” While Shannon and Weaver (1949) appeared to conflate the two, Jakobson proposed in 1960 to distinguish *communication theory* from information theory with reference to the semiotic and phenomenological aspects of human communication, as studied by the “rhetorical branch of linguistics.” Clarity of usage was not soon achieved, although a serious effort was made at the First World Congress on Communication Science, held in Berlin in 1977, following upon the 1976 publication of DeVito’s *Communicology*. Communicology now clearly distinguishes itself from information theory on the ground that communicology studies the full range of semiotic levels in discourse, i.e., the semantic (meaning), syntactic (patterning), and pragmatic (practicing) forms of discourse. By comparison, information theory (sometimes called *signal theory*) is more typically concerned with the syntactic parameters of physical signal systems (informatics), e.g., the electrical impulses that make up computer memory (→ Information). Thus, communicology proposes to replace “communication theorist” by *communicologist*. Suggested by DeVito in 1978 and by Vilém Flusser, who first used the term “communicology” in lectures during 1977–1978 and published his mature theory in 1996 as *Kommunikologie* (→ Photography), the name was acknowledged worldwide by the proceedings at the First World Congress on Communication and Semiotics in Monterey, Mexico, in 1993. The institutionalization of the terms “communicology” and “communicologist” took place in 2000 with the founding of the International Communicology Institute.

## Communities of Practice

Ana Cristina Ostermann

Universidade do Vale do Rio dos Sinos

Communities of practice are groups of people who share similar interests and objectives. In pursuing these interests and objectives, they make use of common practices, work with similar artifacts, and use a common language (Wenger 1998). The concept of community of practice was first coined by Lave and Wenger (1991), when discussing learning processes within a new framework, that of “situated learning.” In that publication, the authors explored the activities of certain groups, such as of nondrinking alcoholics, butchers, and midwives in Yucutan. These groups were related in their modes of learning, characterized by Lave and Wenger as “apprenticeship.” The authors conceived knowledge as a social process in which individuals participated in mutual learning at different levels, which depended on their authority in the group – whether a person was a newcomer or a long-timer. It was specifically the process through which a newcomer learnt from the more longstanding members that comprised the core notion of community of practice. Lave and Wenger named this process Legitimate Peripheral Participation (LLP).

### THE CONCEPT

In a later publication, Wenger (1998) systematized and elaborated on the concept. There, the author maintained that communities of practice arose through mutual engagement in

a joint enterprise, and that individuals shared repertoires of many kinds (e.g., routines, vocabulary, discourse). It is within this redefinition of communities of practice that Wenger claims that they can be defined along three main *dimensions*: (1) what they are about a joint enterprise that is understood by all members and is continually negotiated among them; (2) how it functions (people become members through shared practices and are related to each other by getting involved in those practices); (3) what it produces (the members build a shared repertoire).

Communities of practice are everywhere and have existed for as long as human beings have learnt together, and most of us are normally members of a large number of them (at work, school, home, in political and leisure activities, among others). In some of these communities we are core members, whereas in others we are more peripheral participants. We might have just joined some of them (newcomers), or we might have been members of some for as long as we have existed (long-timers). Some characteristics of communities of practice also vary. A community of practice can comprise a small or a large number of people. It might have a name, even though many do not. It might be intentionally formed or have incidentally arisen as a result of members' interactions. Moreover, it might last for years, going through different types of members, or it might exist intensely for only a short period of time. It might be formal or informal, be local or cover different countries. The community might meet face to face or only online, through computer-mediated communications technologies (CMCs). Furthermore, a community is constantly renewed as new members join the group and old members leave.

The concept of community of practice has been largely debated in the field of education (Barton & Tusting 2005). Community of practice steers away from the idea that learning is an individual process. Instead, it understands learning as social and as something that comes largely from our experience in participating in everyday life in different communities. In other words, "situated learning" presupposes that learning calls for a process of engagement in a community of practice. The concept has been extended since the early 1990s and applied to environments other than educational ones. It has gained special ground within organizational contexts and in the field of linguistics, especially in studies of language and gender.

## **ORGANIZATIONAL DEVELOPMENT**

Several attempts were made to redefine community of practice in ways that would be more relevant to the business environment. The main interest in doing so stems from the later publication by Wenger (1998), in which the author publishes an ethnographic study of a claims-processing unit in a large insurance company. Within organizational development, community of practice (commonly abbreviated within this area as CoP) is employed to demonstrate that performing a task demands more than technical knowledge or certain skills. Within organizational development, community of practice is defined as the process of social learning that takes place when people who have shared interest in a problem get together to collaborate over some time in order to discuss ideas, propose solutions, and create innovations. Scholars within that field claim that communities of practice can improve organizational performance as they create organizational value. Lesser and Storck (2001) suggest that one should think of a community as an engine for the

development of “social capital,” understood here as the stock of connections, relationships, and institutions that create a society’s social relations, as well as what binds them together and makes cooperation possible, such as trust, shared values, and shared behaviors.

On what concerns organizational development, Lesser and Storck (2001) go on defending the view that the social capital created within communities of practice leads to behavioral change that positively influences business performance. The characteristics associated with communities of practice within organizations are: connections among practitioners who might or not be co-located; relationships that build a sense of trust and mutual obligation; and a common language and context that can be shared by community members. Among the positive business outcomes identified by the authors through the formation and development of communities of practice are: decrease in the learning curve of employees; prevention of “reinvention” of the wheel; and generation of new ideas for products and services.

### LANGUAGE, DISCOURSE, AND GENDER

Language and discourse are crucial in the development of communities of practice, specifically in what concerns the development of shared repertoires. Users develop certain *linguistic and interactional patterns* as they join in activities in the several communities of practice of which they are members. Each community develops a set of linguistic and interactional behaviors which function in somewhat different ways in other communities. Within the field of linguistics, the concept of community of practice has been quite fruitful for studies that focus on the relationships between language and gender. Instead of seeing gender as a set of practices imposed on the individual by society, as essentialist approaches have done, a large number of scholars have turned to a position in which they see gender as a more dynamic construct that is learnt and performed, and that can subverted. It is a perspective on language and gender that finds its roots in the everyday social practices of specific communities (Eckert & McConnell-Ginet 1992).

Studies of *language and gender* within this perspective claim that gender identity is negotiated through the individuals’ interactions in specific communities. The concept, as used by scholars interested in language and gender, emphasizes the mutability of the linguistic expression of gender identity and assumes that intra-gender differences are natural (Ostermann 2003). Following the direction taken by various feminists, the body of research on language and gender in the 1990s began to defy essentialist links between gender and language that see gender as given (Eckert & McConnell-Ginet 1995). Since the early 1990s, in particular, there has been an increasing interest in considering a complex of issues involved in “doing” gender in language (Bergvall 1999). Penelope Eckert and Sally McConnell-Ginet’s essay “Think practically and look locally: Language and gender as community-based practice” (1992) was influential in shifting the focus of language and gender research to diversity. The essay criticized the binarism of “*women’s style*” and “*men’s style*.” By building upon the concept of community of practice, Eckert and McConnell-Ginet (1992, 1995) argue that gender identity too is negotiated through the individuals’ participation in communities of practice, and that even though individual and community identity might be experienced as constant, they are always going through changes.

Studies on language and gender through the perspective of community of practice (in the studies of language and gender, commonly abbreviated as CofP) assume that gender is “occasioned” within interaction (Stokoe 1998) and thus in order to understand gender one has to look at the situatedness of talk (Ostermann 2003). More specifically, one has to look for explanations by ethnographically investigating a particular community in their range of practices; i.e., not only their ways of talking, but also their beliefs, values, and power relations (Eckert & McConnell-Ginet, 1992; → Gender and Discourse).

As Eckert and McConnell-Ginet (1995) explain, the way people talk reflects and creates their association with some people and dissociation from others, their acceptance of some social practices and rejection of others, their claim to membership in some communities and not others. “And within communities of practice, the continual modification of common ways of speaking provides a touchstone for the process of construction of forms of group identity” (Eckert & McConnell-Ginet 1995, 470–471). Thus, becoming a member of a community of practice – such as at a new job – takes learning, and requires the “acquisition of sociolinguistic competence,” which is the process of gaining control over the discourse practices constitutive of that specific community (Holmes & Meyerhoff 1999, 174). In other words, by gaining more and more competence also in the discursive practices of a specific community of practice, an individual moves from a more peripheral position to a more central position in his or her membership.

A number of studies within the field of language and gender have been developed through the framework of community of practice, such as the investigation of the communities of practice in the lives of pregnant women, the negotiation of identity among female nerds at a US high school, the analysis of the discursive practices of all-female institutions that address violence against women in Brazil, and the investigation of the language used by women in a sexual assault tribunal.

Even though not directly addressed by its proponents, the concept of communities of practice seems to have a strong relationship to the concept of “habitus” (Bourdieu 1991), especially in what concerns the construction of shared practices and repertoires. *Habitus* represents the practices that are involved in structuring a person’s world and her or his place in it. It is particularly this aspect of habitus that is related to the concept of communities of practice. Thus, it is the situated, occasioned communities of practice in which groups mutually engage in specific activities, and in somewhat intensive ways, that give rise to a particular set of socially shared linguistic and nonlinguistic practices (Ostermann 2003).

## Community Integration

Lewis A. Friedland

University of Wisconsin-Madison

Community integration is a compound concept derived from sociology that addresses the two central questions of (1) how communities are formed, reproduce, grow, and change; and (2) what continually integrates or binds them together. The field of communications adds a third dimension, asking (3) what role communication plays in forming, sustaining, and integrating communities. Through much of the twentieth century, scholarship on community integration was primarily concerned with communities in geographic space. But, as virtual communities began to grow at the turn of the millennium, a fourth dimension of scholarship began to inquire about (4) the relationship between place-based and virtual communities.

The original questions on community integration draw directly from sociology's classical scholars of the nineteenth and early twentieth centuries – Tönnies, Durkheim, and Simmel. These questions were directly taken up and developed by the research program of the Chicago School of sociology in the first third of the twentieth century, especially by Robert Park, through the elaboration of the concept of the urban community as an ecology.

Communication scholarship has more often focused on specific processes that contribute to or predict local community integration, usually understood as the relationship between community integration and interest in local issues and civic participation. Beginning in the early 1970s, community began to be reconceptualized in network terms,

which reshaped core understandings of community integration. Further, the concept of the community as a “network of networks” laid the ground for the study of virtual community that would begin in the mid-1990s, as well as the relationship between communities grounded in space and place, and virtual communities.

## COMMUNITY

The idea of community forms the cultural background of our understanding of who we are (identity) and how we should relate to one another (solidarity). At the same time, “community” is a series of social structures with multiple, complex, and changing boundaries. From these elements – the cultural and normative understanding of community identity and solidarity, and the physical, spatial, and social-structural frameworks in which we live – humans develop a larger sense of community.

In his classical statement, Tönnies (1887/1963) distinguished between *Gemeinschaft*, the densely knit realm of intimate, private, and personal relations of family, kin, neighborhood, and traditional community, and *Gesellschaft*, the arena of society in which social relations are constructed from impersonal ties of contract and association. In the web of *Gemeinschaft*, individuals “remain essentially united in spite of all separating factors, whereas in *Gesellschaft* they are essentially separated in spite of all uniting factors” (Tönnies 1887/1963, 65). Tönnies deployed these types historically, seeing modern social development as a movement from *Gemeinschaft* to *Gesellschaft*, or from tightly integrated unitary societies to those based on looser ties of contract. Integration of *Gesellschaft*-like societies is directly dependent on both micro- and macro-social communication processes.

## INTEGRATION

Integration refers to the process through which social groups form and continue (or fail) to be bound together. Integration theory derives from the French sociologist Emile Durkheim, who proposed the distinction between “mechanical” and “organic” solidarity (Durkheim 1893/1960). *Mechanical solidarity* is produced in elementary societies, in which social groups are segmented and similarities rather than differences among groups predominate. Religious life forms what Durkheim calls a “collective consciousness,” which reflects core group values. As segmented societies develop, they become more complex, particularly driven by the development of towns and cities. A new division of labor develops, in which groups become more specialized. This leads to a new type of *organic solidarity*, in which groups function analogously to organs in the body: as living systems that have a distinct identity, but are defined and coordinated by higher level organic systems.

Integration, then, for Durkheim is closely tied to the division of labor, understood here as a system of specialized functions that can exist in science, politics, or religion, as well as the economy. This differentiation drives modern societies, as well as binding them together into a system of mutual dependencies. Further, integration for Durkheim has a moral dimension, as the division of labor integrates, but does not entirely displace, earlier forms of the collective consciousness. The fundamental ideas that groups hold about society and each other are generated through social integration. Integration is the central process holding society together.

## COMMUNITY INTEGRATION AND THE ROLE OF MEDIA

A central question is whether *types of communities* themselves correspond to forms of integration. Broadly, are all small towns of the *Gesellschaft* type, characterized by high levels of “mechanical” integration? Are large cities inherently subject to *Gemeinschaft*-like forms of division, integrated by an organic division of labor? Bender (1978) has cautioned that these are *types of social relations* that can be found, with variations, in all formations of modern societies, even in highly individuated societies of the postmodern type. Both Tönnies and Durkheim recognized that communication played a central role in shaping the form of community and integration, but neither placed it at the center of analysis. That was left to Robert Park and the Chicago School of sociology.

Park’s classic work “The city” (1915) founded the Chicago School of urban ecology. For Park, the driving force of urban ecology was the competition for land and the spatial patterns it generated, but he believed that cultural values – group norms and moral organization – should be studied for their contribution to community integration. Following Cooley (1909), Park observed that primary communities of face-to-face relations were being replaced by secondary relations of association, which are maintained through looser communication networks.

Park’s work can be considered as the major source and foundation for the study of *local media and community integration*. Park held that communication makes consensus possible among independent social groups, both within the culture of a given society and between generations. He also viewed → public opinion as a source of social control and rated the newspaper as the foremost agency to “control, enlighten and exploit public opinion” (Park 1915). However, for Park, change took place largely through shifting ecological forces among the natural areas of the city.

While making the general theoretical link between communication and integration, the Chicago School left no clear and unambiguous guidelines for later empirical research in this area. Janowitz (1952/1967), of the postwar “Second Chicago School,” more carefully located the media sources of community integration. He considered the metropolitan daily newspaper as being incapable of integrating the diverse interests and views of the modern urban community. Instead, it was the local urban weeklies covering more homogeneous neighborhoods that performed this function. If the local neighborhood press promoted consensus, then conflict and change in the city was worked out through associations and institutions bridging areas of the community. Building on Park, Janowitz provided a clearer path that mass communication scholars could follow.

## MASS COMMUNICATION AND COMMUNITY INTEGRATION

The concept of community integration entered the mass communication research field in 1960 with studies that examined the weekly press and a sense of urban communities (Edelstein & Larsen 1960). Based on the earlier work of Janowitz, the intensity of reading an urban weekly newspaper was related to various assumed indicators of social integration: (1) length of residence, (2) perceptions of feeling about being a part of community, and (3) neighborliness. Home ownership, a presumed influence on community ties, was found to be a good predictor of newspaper readership. Absence of community ties appears to reduce metropolitan newspaper readership.

Stamm and colleagues, in a series of studies beginning in the early 1980s, distinguished between community identification and involvement, and found that newcomers who put more effort into integrating themselves into the community sought information from many different sources. Jeffres and colleagues found that the length of residence and anticipation of remaining in the neighborhood were related to readership of suburban and community weeklies. Those who watched local television news more often placed more importance on ties to the neighborhood. Finnegan and Viswanath (1988) found that neighborhood involvement was related to spending more time reading the community weekly. Friedland and McLeod (1999) reviewed this literature and proposed a multilevel model for media and community integration, taking structural, processual, and normative variables into account.

The *designs and methods* used in integration research have been primarily sample surveys of individual citizens in single communities (→ Research Methods; Sampling, Random; Survey). Although important evidence has been generated from such designs, it is obvious that they are not sufficient to answer many crucial questions about the role of media in community integration. Communities are more than the sum of individual citizens' behaviors. An important exception has been the research program of Tichenor and colleagues (1980), who conducted comparative studies of community pluralism and media using content analysis and interviews with editors and citizens.

### **SOCIAL NETWORK STUDIES AND COMMUNICATIVE INTEGRATION**

In the late 1960s and early 1970s, the sociological study of community began to shift to the study of networks. Fischer et al. (1977) argue that interpersonal networks must be empirically studied, separate from theories of decline of unitary *Gemeinschaft*-like communities (→ Communication Networks; Network Analysis; Social Networks). Fischer argues that interpersonal networks form "personal communities," in which ties of intimacy to friends, neighbors, and others take on voluntary and associative qualities (→ Interpersonal Communication). In this view, community is not lost, but redefined through more multiplex, networked, social relations. Wellman, in a series of studies, redefined the community as a "network of networks" and, in parallel to Fischer, described the formation of networked individualism, in which individuals' personal networks, rather than larger group formations, are the foundation of community.

The idea of networked individualism leads directly to the question of how we understand the *boundaries between local and virtual communities*. If communities are no longer primarily defined by some combination of larger group relations (*Gemeinschaft* and mechanical solidarity) or those corporate relations characterized by association, professionalism, contract, and the division of labor (*Gesellschaft* and organic solidarity), but rather by the interlocking webs of individual networks, then it becomes more clear how genuine virtual communities form on the world wide web (→ Internet). The wide-ranging networks of web participants, linked by both common interest and weak social ties that potentially ramify globally, form an alternative to integration in locally bounded, physical community. Community integration is no longer limited by territory. Indeed, the global communication environment itself becomes the widest possible boundary for community integration, including strong and weak personal ties, group relationships, associational networks, and social solidarity.

However, as Friedland and McLeod (1999) have argued, local and regional structures continue to have considerable power in defining both the structures of community and media, and the framework of experience in which integration takes place, even in countries where the Internet has most highly penetrated. Rather than a simple expansion upward of the communicative boundaries of integration, the emerging structures of community integration require even greater attention to the multiple and embedded forms that community takes. Networked individualism frees individuals from the constraint of the most parochial local ties, but simultaneously opens new possibilities for local and regional association and solidarity. Increasingly, the study of community integration in communication will focus not simply on the border between the virtual and the local, but the entire networked communication ecology within which community integration occurs.

# Community Media

*Ullamaija Kivikuru*

*University of Helsinki*

The concept of community media is understood as referring to small media institutions, often specifically to radio stations established in the so-called developing countries. These media have become ever more popular in recent years. However, the history of the concept is considerably older and more complicated (→ Development Communication; Rural Development; Radio for Development).

The objective of community media is to create local affinity, and through it, development (→ Development Communication: Africa; Development Communication: Asia). The aim is to “give voice to the voiceless.” Community media are established and run by local people, most often by local nongovernmental organizations (NGOs) or development projects. However, they are often at least partly financed by external sources. Most community media do not use advertising, and in none of them does advertising income cover the costs of running the station.

In this context, local means either geographical “proximity,” that is, people living close to each other, or “locality,” more abstractly referring to people sharing a joint interest in politics, culture, or a hobby. The mode of addressing the public should be participatory (→ Participatory Communication). Although the concept of community media today mainly refers to non-industrialized societies in the so-called south, locality as a component for mediated communication does not belong to the southern media alone. Creating community through local media has been a cherished characteristic of mass media since the nineteenth century. However, in broadcasting the focus was predominantly on the national level, especially in Europe, where public service broadcasting was developed (→ Public Service Broadcasting: Law and Policy). The idea was to include local variation and attention to local minorities within a national frame. On the print side, local and regional → newspapers have survived side by side with national papers. They have had their own voice. Some papers devote a few pages each day to particular communities, others offer local attachments, and, most recently, the local axis has been strengthened via net versions focusing on local communities. The aim is to strengthen the links, both with local readers and local advertisers.

## FORMS OF COMMUNITY MEDIA IN VARIOUS WORLD REGIONS

In Mozambique, there are roughly 80 community media centers, and in South Africa there are more than 120 community radio stations. In South Africa, the notion of community media is established by the Constitution. Having both multiplicity of mediascape and “voice to the voiceless” as ideals in the implementation of democracy via media policy, the South African Constitution states that three forms of media should be found in the country: public media, private media, and community media (→ Citizens’ Media). Also, in countries such as Ghana, Zambia, Sri Lanka, and Thailand, community media were established in great numbers during the 1990s. In Mozambique and Sri Lanka, community media have grown into multimedia centers/→ telecenters, including not only a radio station but also other forms of mediated communication. The development of low-cost technology, such

as the simputer (low-cost computer), has made it easier to run community media, because of the decrease in equipment costs.

In the 1970s, another form of community media was very popular, especially in Africa. So-called *rural papers* were in fact reading material produced to support nationwide literacy campaigns in several sub-Saharan countries, especially in Kenya, Tanzania, and Zambia. The papers were produced by teachers, and their content was strongly educational. Later on, some rural papers were developed into so-called village papers, which paid less attention to literacy matters and, in fact, had ideals very similar to the community radio in the 1990s. The rural papers were predominantly financed by foreign donors, and their sustainability was low.

Another form of community media, in the 1970s and 1980s, were the so-called *radio forums* in several African countries. Educational programs were broadcast by a national radio station, and people in the villages gathered to listen to them. After the program, a discussion forum was established. An extension agent led the discussion. The goal was to bring a national campaign to the local level and, simultaneously, to allow bottom-up reactions to the campaign goals (→ Development Communication Campaigns; South Africa: Media System).

In several Indian states, newspapers that have found their urban markets declining or stagnating have recently looked for new markets via local editions. In this “newspaper revolution” of the new millennium, village-level agents and civil society organizations have worked both as development actors and news gatherers in rural communities (→ India: Media System).

In Europe in the 1970s and 1980s, a movement to re-establish local radio stations emerged, based on ideals similar to the community media movement in the so-called south: to give voice to the voiceless, and to focus more strongly on local communities in all programming. The actors interested in local broadcasting were NGOs, trade unions, and commercial entrepreneurs. In most countries, national regulatory bodies were favorable toward this development and provided local stations with limited frequencies. But only a few local radio stations really became genuine local voices. Most developed into youth stations with very limited programming, mainly relaying international popular music charts to local audiences. In the case of radio and television broadcasting, local advertising markets have also been far weaker than local papers.

Most community radio stations and multimedia centers have an *educational policy line*. They reserve broadcasting time for campaign and project promotion as well as for talks with educational experts, and they invite local authorities to relay their messages. The dominant programming format is a live talk show or a studio discussion. In the most organized community media systems, such as in South Africa, Mozambique, or Thailand, a system of mini-scale news collection and preparation of news bulletins is organized as well. In some countries, the royalties for the music broadcast by these stations is organized via a system of annual payments to a fund supporting domestic musicians. However, quite often community radio stations break music → copyright regulations.

## PROBLEMS OF ORGANIZATION, OWNERSHIP, AND CONTROL

In an ideal case, the community media activity is based on volunteer work. Media monitoring studies have shown that community media, for example during election campaigns, have supplied the community with markedly different material than national media (→ Election Campaign Communication). However, local community leadership

might not at all be interested in the medium, or there might even be local-level forces that openly oppose the radio when it is considered critical of local governance.

Although the ideal is that community media would promote varied development activities in the community, communities frequently find their stations being taken over by one or a few projects. Sometimes women run the station, sometimes unemployed youth. Quite often senior citizens tend to keep a distance from the station, often due to the type of music played but also due to the topics discussed in the programs: family planning or sensitive political issues may be considered “improper” by them. Thus, the community media rarely offer a genuine solution for development problems, but provide a new tool for the strong ones in local communities.

Throughout the decades, the UN system, and especially → UNESCO, has been promoting community media ideology in different parts of the world. Today, international advocacy organs such as AMARC (World Association of Community Radio Broadcasters) promote community media, and, on the national level, most countries have councils or organs which try to strengthen the field. In the case of community radio or community television, NGOs acquire a frequency from a public authority, which also sets certain conditions for the license. The reach is most often around 50 kilometers, and the station is allowed to broadcast 12, 16, or 24 hours per day.

Local ownership has been found essential for smooth operation of these stations. The local community has to feel that the station is its own medium, otherwise it does not succeed. Most community radio stations in the developing countries are run by volunteers, although there are some stations that hardly differ from local commercial stations, neither by their output nor by their personnel structures. In South Africa, several such stations are found: for example, the oldest South African community radio station, Bush Radio in Cape Town, and Radio Juzi in Soweto. On the other hand, some community radio stations, especially in West Africa, have kept their strongly educational character. They focus almost entirely on health, agriculture, women’s status, and good governance.

Today, the community media belong to the local favorites of northern funding agencies such as national aid organizations, UNESCO, and the United Nations Development Programme (UNDP), because they have been found useful agents of both development and democracy (→ Development Institutions). In several countries and several elections, the community media have formed a profile different from the national media, whether publicly or privately owned (→ Ownership in the Media). The community media are closer to the public, and they allow local voices to express themselves. They have been found especially powerful in raising the status of women in communities. In Africa, women produce 80 percent of the continent’s food, but still the economic power has been in men’s hands. The community radio has been a strong supporter of, e.g., village-level mini-loans given to women (→ Development, Gender, and Communication).

Unfortunately, the status of the community media in developing countries is far from stable. Being off-air and again on-air is very usual for community stations. Although the cost of basic radio equipment has gone down, it still must be acquired. In many countries, public authorities provide basic equipment; in some others, foreign NGOs have been active in donating equipment; George Soros and the Open Society Institute have actively promoted the establishment of community media. Some critics have raised the question of whether donated equipment also brings with it regulative ties. All stations have

financial problems even after acquiring the equipment, because the running of a radio station requires funding even if the activity is based on volunteer work.

Volunteers tend to leave the stations for salary-based positions as soon as they have gathered basic skills. The great demand for programs has also become obvious. Programs produced and delivered free of charge have been welcomed. "Programs in brown envelopes" are a common phenomenon. So far, such programs have been produced by NGOs, but in principle, such practice also opens an avenue for outside pressures. In some countries, also government organs have started to either produce programs on certain development themes for community radio stations or sponsored the stations to produce programs on developmental issues. Again, concerns about embedded regulation have been raised.

### PROSPECTS

In general, structural policies promoting local communication have been achieved fairly easily although some governmental organs have remained suspicious of the oppositional potential embedded in local media. For example, an early UNESCO-sponsored community radio station in Homa Bay, Kenya was not allowed to operate for more than a few days in the 1970s before being closed down by the national broadcasting company, because it was located in an area known to be in opposition to the government then in power. However, a far more difficult issue is keeping the content focus on the local level. A mass medium, local, regional, or national, engulfs enormous volumes of material, and the production of genuinely local material has often turned out to be impossible. Further, volunteer forces do not have the tolerance and capacity to run local media on a continuous basis, however enthusiastic they are in the beginning. Thus, the establishment of a media institution in a very poor community often appears impossible, although it may be very good for the promotion of the well-being of the community.

*Digitization* and other forms of new technology enable interactive communication in broadcasting, and the Internet strengthens another form of community: instead of geographic closeness, Interest-based community media can reach to people living far apart, but sharing the same interests in politics, art, music, or sports. Again, a historical equivalent can be found. Several centuries ago, monks in monasteries living far apart from each other exchanged information and knowledge through newsletters written in Latin. The speed of the exchange was counted in months and years, but the idea was the same as the interest-based communities debating via the Internet. In the future, the concept of locality might have a far broader meaning than the one exercised in community media in developing countries (→ Communication Technology and Development).

## **Community Structure Model**

*John C. Pollock*

*College of New Jersey*

The community structure model explores links among community characteristics, media content, and effects of exposure to media content from a system perspective. Focusing on macro-constructs associated with media content and media effects, the community structure approach rejects the perspective that all studies of media and audiences can be reduced to the individual level of psychological phenomena. "Structure" refers to community – typically city-level – demographics or other aggregate measures of community identity, membership, participation, production, consumption, or access, ranging from income or education to health-care access (e.g., number of physicians per 100,000 population or percent municipal spending on health-care; → Exposure to Communication Content; Media Effects; Community Integration; Community Media).

Community integration structure modeling mirrors the injunction of the University of Chicago's Robert Park in the early twentieth century to study not only the impact of *media* on society (the prevailing model in media studies), but also the impact of *society* on media. Beginning with the famous studies of Philip Tichenor, George Donohue, and Clarice Olien (1973, 1980) and their several generations of graduate students, the community structure model has been transformed over several decades.

### **EXPANDING GEOGRAPHIC AND COMPARATIVE FOCUS**

Initial studies focused on cities or counties in Minnesota, with size and structure of the community as major predictors of news variation (Tichenor et al. 1980). This "structural pluralism" theory proposed that larger, more diverse, socially pluralistic communities would be associated with greater diversity in media, especially newspaper reporting on critical issues (→ Plurality). Elsewhere, Keith Stamm focused on one or two cities, linking community structure and political attitudes (1985).

From the mid-1990s onward, the theoretical work organized by Demers and Viswanath (1999) and national and international databases such as Lexis-Nexis and NewsBank helped generate propositions for broader historical and geographic sample frames,

illustrated in political communication work associating community social capital, media, and civic engagement; and in empirical, cross-city US national comparisons of structure and reporting (Pollock 2007). Indeed, cross-national analyses using entire nation-states as units of structure and leading national newspapers for news content have found significant links between gross domestic product, infant mortality rate or literacy rate, and reporting perspectives on United Nations' and nongovernmental organizations' fights against AIDS (Gratale et al. 2005; Eisenberg et al. 2006).

## MAJOR PROPOSITIONS

### Media Can Reinforce Social Control or Accommodate/Affirm Social Change

Traditional community structure studies have linked structure to “social control”: media reinforcing existing social, political, and economic configurations. In this tradition, media are highly responsive to powerful groups, functioning as “guard dogs” (Donohue et al. 1995) to generally serve elite over mass interests (Tichenor et al. 1980; Demers & Viswanath 1999, 4). An alternative view is that media can also be agents of social change, articulated strongly since the mid-1990s: “Mass mediated messages typically reinforce dominant norms and institutions, but relative to other social institutions – including the church, school, state and family – media have a greater capacity to criticize . . . established institutions and traditions (Demers & Viswanath 1999, 3).

Recent studies have confirmed specific links between community structure and reporting on social change. Using a media vector measure combining article prominence and direction, cross-sectional national studies of US cities find significant, positive associations between poverty or unemployment levels and reporting opposing capital punishment or supporting a patients' bill of rights (a “vulnerability” hypothesis); or between higher levels of privilege (education, income, professionals) in a city and support for women's rights (in Anita Hill's congressional testimony in the Clarence Thomas hearings) or stem cell research (a “buffer” hypothesis); or between higher levels of privilege and opposition to tobacco advertising to children (a “violated buffer” hypothesis); or between specific stakeholders, e.g., proportions of families with children of specific ages, or voting Democratic or Republican, and reporting on such issues as gun control or trying juveniles as adults (all “stakeholder” hypotheses; Pollock 2007). Other studies trace connections between percent Hispanic and variations in reporting on immigration reform, or percent Catholic and varied journalism regarding ethnic profiling, gay marriage, and gay adoption.

### Multiplicity of Structural Indicators

While early scholarship focused substantially on city size as an indicator of structural differentiation or structural pluralism, more recent work measures the *size of interest groups* (Hertog & McLeod 1995) and diversity, in particular ethnic diversity, estimating how much media either support (Gandy 1999; Hindman 1999; Hindman et al. 1999; Viswanath & Arora 2000) or (since 9/11) oppose ethnic or religious groups (Pollock et al. 2005). In addition, online US Census databases and more widely available marketing and

demographic data illuminate innovative, comparative US city structural measures of inequality, power, and stakeholder interests: privilege (college educated, family income of \$100,000+, professional occupational status); health-care access; vulnerability (unemployed or below the poverty level); and stakeholders (percent Catholic, evangelical, or mainline protestant; voting Democratic or Republican in presidential elections; different age/generation groups, families with children of various ages; percent African-American or Hispanic, or Arabic or Farsi speaking (Pollock & Yulis 2004; Pollock 2007).

### MODERN RESEARCH CHALLENGES

The community structure model is poised to move beyond initial curiosity to a robust theoretical framework addressing mainly four challenges. First, longitudinal and time series analyses (e.g., HIV/AIDS coverage over time in Pollock 2007, ch. 8) can validate the explanatory and predictive power of cross-sectional structural theory (→ Longitudinal Analysis). Second, flexible definitions of community reach beyond traditional political/geographic boundaries, using modern GIS data resources to compare smaller and larger geopolitical units and to embrace “networking communities” or cross-community network measures, a focus of work on tobacco control in Colorado (Buller et al. 2001, 357–372) and a variety of cyberspace communities defined by multiple relationships, measured by hyperlinks or memberships in chatrooms, mapping multiple “interpretive communities” (Berkowitz & TerKeurst 1999).

Third, → public opinion as a proxy for behavior combines different levels of analysis, whether structure and public opinion (Paek et al. 2005) or structure and leadership composition (Armstrong 2006). Fourth, combining community structure with other powerful theories such as diffusion or → social marketing theory can yield new propositions on the alignment of media with political and social change, helping target communities most receptive to messages promoting healthier behaviors (→ Diffusion of Information and Innovation; Health Communication).

## Community Video

George C. Stoney

New York University

Community video is one form of → community media. It is best defined by its objective, which is to stimulate participation in public affairs. The defining phrase might be “with the people, not just about them.”

John Grierson, in the late 1920s in the UK, began writing about its possibilities. His persuasive pen and leadership attracted young and able acolytes, who created the British documentary movement (→ Documentary Film, History of). Their purpose was “to put the working man on the screen,” not as an object of derision and comedy, which had been customary since Shakespeare created his sextet of “rude mechanics” in *Midsummer night’s dream*, but as fully responsible members of society.

Grierson’s persuasive polemics spread this idea throughout the empire, and it took root most impressively in Canada. In 1939 he was invited to transform the National Film Board into an instrument to unite the country to fight World War II. He and his staff used this as an opportunity to involve viewers in their own local affairs as well. Discussion leaders were sent to rural circuits, held screenings in trade union halls and church basements, and created town meetings – and always the purpose of the gatherings was to promote civic action (→ Social Movements and Communication). A similar pattern of use was developing in the early post-war years in the United States by adult educators, particularly those involved in changing attitudes and practices about healthcare and agriculture. Whatever the precise medium, be it 16 mm film, slides, posters, or audio recordings, the objective was to stimulate group discussion, leading to action for social change (→ Cinema; Photography; Poster; Radio; Radio: Social History).

A great leap forward, ideologically, came in the late 1960s, again at the Canadian Film Board, when young community oriented staff members, working with progressive government officials, created a program they called *Challenge for change* (→ Public Broadcasting, History of). They hypothesized that if ordinary citizens were involved in making media themselves, they would be more strongly influenced to make change happen. To hand was the Porta-pack, the first generation of consumer video-tape rigs (→ Video). Their early experiments were recorded on film. *VTR St Jacques* (1969), a half-hour program, ends with this essential voice-over: “Yes, but all this [the making and showing of the video recordings] is just a tool. The objective is to get people to act.”

In the decades since then, community media has found far more sophisticated devices, but objectives have remained much the same. The continued development of video technology has led to increasingly lower costs and more accessible equipment and production, the growth of media art centers that facilitated independent video production, and the expansion of amateur video production for personal and public purposes (→ Amateur Photography and Movies). Small portable video cameras were carried to neighborhood meetings, labor union actions, and protest demonstrations. At the same time, videographers were roughly divided between those who would foreground the professional quality and artistic excellence of the work itself and those who thought these things should be secondary to the primary purpose, which was to involve people in their own transformation. This tension can still be seen daily in the programming on the more than 3,000 community cable channels in the US that have been created since the early 1970s by those who believe the medium can foster community empowerment (→ Cable Television; Public Access Television).

In the 1970s and 1980s, as cable television systems were introduced to the nation’s urban areas, monopoly franchise agreements with municipalities routinely called for the inclusion and support of public access community cable channels. A portion of these channels were organized and funded to provide video training to community members

and to cablecast amateur, citizen-produced, community-based programming. Early experiments with these new opportunities, such as *Paper Tiger Television* in New York, drew a great deal of attention from community activist groups, and sometime led to satellite distribution of cable access programming nationally through networks such as *Deep Dish Television* (Halleck 2002). But the anchor for public cable access systems has been purely local community programming, from programs covering local high school sports to those featuring ethnic community music or dance, or those presenting weekly interviews with local community leaders.

Some *critics* have gone so far as to say there is a danger inherent in the medium of video itself. Television, they say, is usually viewed passively, in isolation, with the chance for active participation limited to the occasional invitation to “call in” or vote via an Internet poll. On the → Internet, video has tended to be restricted to brief presentations, due to memory and speed limitations, and has tended toward the curiosity or prank, revealing funny or taboo glimpses of embarrassing moments or shocking behavior on political websites or YouTube. Yet the power of exposing well-selected and provocative samples of reality on the screen to a group of viewers who share common problems and objectives is also widely recognized, particularly by community organizers. Experience has taught them that, to contradict → Marshall McLuhan’s well-worn phrase, the medium is *not* the message.

## **Comparative Research**

*Werner Wirth*

*University of Zurich*

*Steffen Kolb*

*University of Fribourg*

A specific comparative research methodology is known in most social sciences. Its definition often refers to countries and cultures at the same time, because cultural differences

*between* countries can be rather small (e.g., in Scandinavian countries), whereas very different cultural or ethnic groups may live *within* one country (e.g., minorities in the United States). Comparative studies have their problems on every level of research, i.e., from theory to types of research questions, → operationalization, instruments, sampling, and interpretation of results (→ Sampling, Random; Sampling, Nonrandom).

The major problem in comparative research, regardless of the discipline, is that all aspects of the analysis from theory to datasets may vary in definitions and/or categories. As the objects to compare usually belong to different systemic contexts, the establishment of equivalence and comparability is thus a major challenge of comparative research. This is often “operationalized” as functional equivalence, i.e., the functionality of the research objects within the different system contexts must be equivalent. Neither equivalence nor its absence, “bias,” can be presumed. It has to be analyzed and tested for on all the different levels of the research process.

### EQUIVALENCE AND BIAS

Equivalence has to be analyzed and established on at least three levels: on the levels of the construct, the item, and the method (van de Vijver & Tanzer 1997). Whenever a test on any of these levels shows negative results, a cultural bias is supposable. Thus, bias on these three levels can be described as the opposite of equivalence. Van de Vijver and Leung (1997) define bias as the variance within certain variables or indicators that can only be caused by culturally unspecific measurement. For example, a media content analysis could examine the amount of foreign affairs coverage in one variable, by measuring the length of newspaper articles. If, however, → newspaper articles in country A are generally longer than they are in country B, irrespective of their topic, the result of a sum or mean index of foreign affairs coverage would almost inevitably lead to the conclusion that the amount of foreign affairs coverage in country A is higher than in country B. This outcome would be hardly surprising and not in focus with the research question, because the countries’ average amount of foreign affairs coverage is not related to the national average length of articles. To avoid cultural bias, the results must be standardized or weighted, for example by the mean article length.

To find out whether construct equivalence can be assumed, the researcher will generally require external data and rather complex procedures of culture-specific construct validation(s). Ideally, this includes analyses of the external structure, i.e., theoretical references to other constructs, as well as an examination of the latent or internal structure. The internal structure consists of the relationships between the construct’s sub-dimensions. It can be tested using confirmatory → factor analyses, multidimensional scaling, or item analyses. Equivalence can be assumed if the construct validation for every culture has been successful and if the internal and external structures are identical in every country. However, it has to be stated that it is hardly possible to prove construct equivalence beyond any doubts (Wirth & Kolb 2004).

Even with a given construct equivalence, bias can still occur on the item level. The verbalization of items in → surveys and of → definitions and categories in content analyses can cause bias due to culture-specific connotations (→ Content Analysis, Qualitative; Content Analysis, Quantitative). Item bias is mostly evoked by bad, in the sense of

nonequivalent, translation or by culture-specific questions and categories (van de Vijver & Leung 1997). Compared to the complex procedures discussed in the case of construct equivalence, the testing for item bias is rather simple (once construct equivalence has been established): Persons from different cultures who take the same positions or ranks on an imaginary construct scale must show the same answering attitude toward every item that measures the construct. Statistically, the correlation of the single items with the total (sum) score have to be identical in every culture, as  $\rightarrow$  test theory generally uses the total score to estimate the position of any individual on the construct scale. In brief, equivalence on the item level is established whenever the same sub-dimensions or issues can be used to explain the same theoretical construct in every country (Wirth & Kolb 2004).

When the instruments are ready for application, method equivalence comes to the fore. Method equivalence consists of sample equivalence, instrument equivalence, and administration equivalence. Violation of any of these equivalences produces a method bias. Sample equivalence refers to an equivalent selection of subjects or units of analysis. Instrument equivalence deals with the examination of whether people in every culture agree to take part in the study equivalently, and whether they are used to the instruments equivalently (Lauf & Peter 2001). Finally, a bias on the administration level can occur due to culture-specific attitudes of the interviewers that might produce culture-specific answers. Another source of administration bias could be found in socio-demographic differences between the various national interviewer teams (van de Vijver & Tanzer 1997).

### THE ROLE OF THEORY

Theory plays a major role in three dimensions when looking for a comparative research strategy: theoretical diversity, theory drivenness, and contextual factors (Wirth & Kolb 2004). Swanson (1992) distinguishes between three principal strategies of dealing with international theoretical diversity. A common possibility is called the *avoidance strategy*. Many international comparisons are made by teams that come from one culture or nation only. Usually, their research interests are restricted to their own (scientific) socialization. Within this monocultural context, broad approaches cannot be applied and “intertheoretical” questions cannot be answered. This strategy includes atheoretical and untheoretical (referring to one national theory) studies with or without contextualization (van den Vijver & Leung 2000; Wirth & Kolb 2004).

The *pretheoretical strategy* tries to avoid cultural and theoretical bias in another way: these studies are undertaken without a strict theoretical background until results are to be interpreted. The advantage of this strategy lies in the exploration, i.e., in developing new theories. Although, following the strict principles of critical rationalism, because of the missing theoretical background the proving of theoretical deduced hypotheses is not applicable (Popper 1994;  $\rightarrow$  Critical Rationalism; Hypothesis). Most of the results remain on a descriptive level and never reach theoretical diversity. Besides, the instruments for pretheoretical studies must be almost “holistic,” in order to integrate every theoretical construct conceivable for the interpretation. These studies are mostly contextualized and can, thus, become rather extensive (Swanson 1992).

Finally, when a research team develops a meta-theoretical orientation to build a framework for the basic theories and research questions, the data can be analyzed using different

theoretical backgrounds. This *meta-theoretical strategy* allows the extensive use of all data and contextual factors, producing, however, quite a variety of often very different results, which are not easily summarized in one report (Swanson 1992). It is obvious that the higher is the level of theoretical diversity, the greater has to be the effort for construct equivalence.

## RESEARCH QUESTIONS

Van de Vijver and Leung (1996, 1997) distinguish between two types of research questions: *structure-oriented questions* are mostly interested in the relationship between certain variables, whereas *level-oriented questions* focus on the parameter values. If, for example, a knowledge gap study analyzes the relationship between the knowledge gained from → television news by recipients with high and low socio-economic status (SES) in the UK and the US, the question is structure oriented, because the focus is on a national relationship of knowledge indices and the mean gain of knowledge is not taken into account (→ Knowledge Gap Effects; Scales and Indices). Usually, structure-oriented data require → correlation or → regression analyses. If the main interest of the study is a comparison of the mean gain of knowledge of people with low SES in the UK and the US, the research question is level oriented, because the two knowledge indices of the two nations are to be compared. In this case, one would most probably use analyses of variance. The risk for cultural bias is the same for both kinds of research questions.

## EMIC AND ETIC STRATEGIES OF OPERATIONALIZATION

Before the operationalization of an international comparison, the research team has to analyze construct equivalence to prove comparability. In the case of missing internal construct equivalence, the construct cannot be measured equivalently in every country. The decision of whether or not to use the same instruments in every country does not have any impact on this problem of missing construct equivalence. An *emic* approach could solve this problem (→ Emic vs Etic Research). The operationalization for the measurement of the construct(s) is developed nationally, so that the culture-specific adequacy of each of the national instruments will be high. Comparison on the construct level remains possible, even though the instruments vary culturally, because functional equivalence has been established on the construct level by the culture-specific measurement. In general, this procedure will even be possible if national instruments already exist.

As measurement differs from culture to culture, the integration of the national results can be very difficult. Strictly speaking, this disadvantage of emic studies only allows for the interpretation of a structure-oriented outcome with a thorny validation process. It has to be proven that the measurements with different indicators on different scales really lead to data on equivalent constructs. By using external reference data from every culture, complex weighting and standardization procedures can possibly lead to valid equalization of levels and variance (van de Vijver & Leung 1996, 1997). In research practice, emic measuring and data analysis is often used to cast light on cultural differences.

If construct equivalence can be assumed after an in-depth analysis, an *etic* modus operandi could be recommended. In this logic, approaching the different cultures by using

the same or a slightly adapted instrument is valid because the constructs are “functioning” equally in every culture. Consequently, an emic proceeding should most probably come to similar instruments in every culture. Reciprocally, an etic approach must lead to bias and measurement artifacts when applied under the circumstances of missing construct equivalence.

It is obvious that the advantages of emic proceedings are not only the adequate measurement of culture-specific elements, but also the possible inclusion of, e.g., idiographic elements of each culture. Thus, this approach can be seen as a compromise of → qualitative and → quantitative methodologies. Sometimes comparative researchers suggest analyzing cultural processes in a holistic way without crushing them into variables; psychometric, quantitative data collection would be suitable for similar cultures only. As an objection to this simplification, one should remember the emic approach’s potential to provide the researchers with comparable data, as described above. In contrast, holistic analyses produce culture-specific outcomes that will not be comparable; the problem of equivalence and bias has only been moved to the interpretation of results.

### ADAPTATION OF THE INSTRUMENTS

Difficulties in establishing equivalence are regularly linked to linguistic problems. How can a researcher try to establish functional equivalence without knowledge of every language of the cultures under examination? For a linguistic adaptation of the theoretical background as well as for the instruments, one can again discriminate between “more etic” and “more emic” approaches.

*Translation-oriented approaches* produce two translated versions of the text: one in the “foreign” language and one after retranslation into the original language. The latter version can be compared to the original version to evaluate the translation. Note that this method produces etically formed instruments, which can only work whenever functional equivalence has been established on every superior level. Van de Vijver and Tanzer (1997) call this procedure application of an instrument in another language. In a “more emic” cultural adaptation, cultural singularities can be included if, e.g., culture-specific connotations are counterbalanced by a different item formulation.

Purely emic approaches develop entirely culture-specific instruments without translation. Two assembly approaches are available (van de Vijver & Tanzer 1997). First, in order to maintain the *committee approach*, an international interdisciplinary group of experts of the cultures, languages, and research field decides whether the instruments are to be formed culture-specifically or whether a cultural adaptation will be sufficient. Second, the *dual-focus approach* tries to find a compromise between literal, grammatical, syntactical, and construct equivalence. Native speakers and/or bilinguals arrange the different language versions together with the research team in a multistep procedure (Erkut et al. 1999).

### SAMPLING

Usually, researchers use personal preference and accessibility of data to select the countries or cultures to study. This kind of forming of an atheoretical sample avoids many

problems (but not cultural bias!). At the same time, it ignores some advantages. Przeworski and Teune (1970) suggest two systematic and theory-driven approaches. The quasi-experimental *most similar systems design* tries to stress cultural differences (→ Experiment, Natural; Experimental Design). To minimize the possible causes for the differences, those countries are chosen that are the “most similar,” so that the few dissimilarities between these countries are most likely to be the reason for the different outcomes. Whenever the hypotheses highlight intercultural similarities, the *most different systems design* is appropriate. Here, in a kind of turned-around quasi-experimental logic, the focus lies on similarities between cultures, even though these differ in the greatest possible way (Kolb 2004; Wirth & Kolb 2004).

Random sampling and representativeness play a minor role in international comparisons. The number of states in the world is limited and a normal distribution for the social factors under examination, i.e., the precondition of random sampling, cannot be assumed. Moreover, many statistical methods meet problems when applied under the condition of a low number of cases (Hartmann 1995).

## **DATA ANALYSIS AND INTERPRETATION OF RESULTS**

Given the presented conceptual and methodological problems of international research, special care must be taken over data analysis and the interpretation of results. As the implementation of every single variable of relevance is hardly accomplishable in international research, the documentation of methods, work process, and data analysis is even more important here than in single-culture studies. Thus, the evaluation of the results must ensue in additional studies. At any rate, an intensive use of different statistical analyses beyond the “general” comparison of arithmetic means can lead to further validation of the results and especially of the interpretation. Van de Vijver and Leung (1997) present a widespread summary of data analysis procedures, including structure- and level-oriented approaches, examples of SPSS syntax, and references.

Following Przeworski’s and Teune’s research strategies (1970), results of comparative research can be classified into differences and similarities between the research objects. For both types, Kohn (1989) introduces two separate ways of interpretation. Intercultural similarities seem to be easier to interpret, at first glance. The difficulties emerge when regarding equivalence on the one hand (i.e., there may be covert cultural differences within culturally biased similarities), and when regarding the causes of similarities on the other. The causes will be especially hard to determine in the case of “most different” countries, as different combinations of different indicators can theoretically produce the same results. Esser (2000) refers to diverse theoretical backgrounds that will lead either to differences (e.g., action-theoretically based micro-research) or to similarities (e.g., system-theoretically oriented macro-approaches). In general, the starting point of Przeworski and Teune (1970) seems to be the easier way to come to interesting results and interpretations, using the quasi-experimental approach for “most similar systems with different outcome.” In addition to the advantages of causal interpretation, the “most similar” systems are likely to be equivalent from the top level of the construct to the bottom level of indicators and items. “Controlling” other influences can minimize methodological problems and makes analysis and interpretation more valid.

# Competition in Media Systems

*Robert Picard*

*Jönköping University*

Media enterprises operating under various types of media systems globally all have incentives to perform well and compete with other media units and types for resources and a variety of rewards. The differences in how performance is determined and types of rewards provided vary among the systems, however.

Media systems result from a variety of factors, including political ideology and structures, the nature and structure of the economy, and history and culture, which produce the environment that influences the structure of media, their financing, and the constraints they face in nations. Although these factors differ in individual nations, there are sufficient commonalities in approaches across nations to categorize systems. Although there are no universally agreed upon classifications of media systems, Siebert, Peterson, and Schramm's classic volume *Four theories of the press* (1956), Hachten and Hachten's *World news prism* (1981), and the more contemporary *Comparing media systems* (2004) by Hallin and Mancini provide reasonable means for categorizing systems.

The classic 1956 classification of "four theories" asserts that media systems can be classified by the relationships between states and media, and that libertarian, authoritarian, Soviet communist, and social responsibility theories explain four different types of systems. During the past half century, however, critics have argued that the social responsibility approach exists in theory only, and no national media system is based upon it. In addition, the model was biased toward North America and western and eastern European systems, ignoring systems in the remainder of the world.

In the 1980s, Hachten addressed those criticisms and argued that authoritarian, communist, western, revolutionary, and developmental media systems could be identified globally. These conceptualizations have been relatively unchallenged except for efforts made by a number of scholars to parse the libertarian/western systems into sub-categories to explain different political, economic, and social contexts of media. Picard (1985) revealed differences in approaches in western Europe, with strong democratic socialist ideologies. More recently, Hallin and Mancini (2004) argued that three models – polarist/pluralist, democratic corporatist, and liberal – explain differences among nations pursuing the western/libertarian influenced media systems. Although these approaches to western/libertarian systems provide more clarity in state–press relations, the nature of competition under them does not differ dramatically so these need not be considered independently here (→ Political Communication Systems).

## THE NATURE OF COMPETITION

Competition involves rivalry among entities, whether they are organisms, animals, persons, or organizations. Competition is a fundamental principle of existence and central to understanding biology, ecology, economics, and business. Rivalry exists when resources necessary for development and survival must be divided, and this produces natural contention for those resources. The results of competition are not neutral: some

competitors benefit from the outcome; some are harmed by the outcome; in certain cases all competitors may be harmed.

The natural sciences recognize that rivalry for water, food, territory, and mating rights are the bases of competition among and between species and their members. Vegetation and creatures that are strongest, fastest, resistant to threats, resilient, and adaptive receive the rewards of greater resource consumption, survival, and propagation. In this competitive environment, those species that are fittest survive whereas weaker competitors face diminishment, specialize, or disappear.

Organizations, including media, also experience similar rivalry and struggle to survive and develop. This occurs because the environment in which they operate contains a pool of resources needed and desirable for the organization. Because available resources are not unlimited, media compete among themselves and with other organizations and entities for the resources. Rivalry exists for financial resources, access to influence, ability to distribute widely, attention of users, and a variety of other factors. It is recognized that competition yields rewards to organizations and users of their goods or services in terms of efficiency, innovation, prices, and service. The nature of competition and its roles in gaining advantage for and survival of some media under different media systems cannot be ignored. Regardless of system, competition results among entities as each struggles to gain resources, claim territory, and achieve its goals. Competition is used to determine issues involving resource allocation, choice, quality, service, and price in organizations.

There are essentially *three different degrees of competition* on a continuum from constrained competition to directed competition to unfettered competition. It must be recognized that there is no such thing as completely constrained or completely unfettered competition involving media because policies, substitutes, and differentiation limit their full development. Instead, there are differing degrees to which the elements of these polarities present themselves.

Individual nations evidence different patterns of competition among organizations and the various media are often treated differently because they are seen as having different roles and effects. As a result, one cannot classify media systems directly on this continuum, although authoritarian, communist, and revolutionary media systems overall tend toward the constrained and directed competition side, the developmental system more toward the central directed competition area, and the western/libertarian has tendencies toward directed competition and unfettered competition.

Media are organizations that compete for limited resources and rewards. There are *intrinsic and extrinsic rewards* provided in the differing media systems and those rewards are related to the values held in the various systems. Intrinsic rewards involve nonmonetary, often psychological, rewards, such as knowing one has done a good job, that one has served society well, that one's efforts matter, and that one is appreciated. Extrinsic rewards include such things as financial gain and influence, as well as extrinsic symbolic rewards such as awards and notoriety that recognize intrinsic rewards.

Competition takes place for basic resources needed to create and sustain media enterprises, whether they are commercial or not-for-profit entities. The fundamental

resource is the capital necessary to acquire personnel, equipment, and facilities to begin operations, and then further resources in the form of regular revenue are necessary to sustain those operations. Capital can be provided by the state, the market, other organizations, or individuals, and sustaining funds can come from those sources in forms of allocations, grants, sales of the media product, or advertising sales. In many cases more than one source may be involved.

Once a media enterprise is established, it *competes for the attention, time, and purchases of media users* (→ Attention; Audience). Because the abilities of individuals to make temporal and monetary expenditures are limited, they can be conceived as scarce resources for which media organizations compete. The performance of media enterprises in meeting the needs and expectations of these consumers/audiences creates the reward of having more readers, viewers, listeners, or users for one medium or one media unit than another. Size of audience is significant because it creates additional rewards. It provides financial rewards of greater income and, if the media organization operates in a commercial system, it provides financial rewards resulting from the ability to attract more advertising and advertising revenue.

A concurrent reward is that size is related to significance, so one reward of size is improved access to important or notable persons, state agencies, and other institutions and entities in society. This improved access can be developed into prestige and influence that allows the media organization to affect opinion and the behavior of institutions and individuals.

When more than one media unit or medium exist, these compete between and among themselves for financial resources, attention, and influence. This competition takes place as intermedia and intramedia competition. *Intermedia competition* involves rivalry among different types of media such as television and newspapers, whereas *intramedia competition* involves contention among units of the same medium, such as two radio stations. Both types of competition occur simultaneously.

Intermedia competition primarily involves competition for the attention and time of audiences, and sometimes for expenditures by consumers. In commercially funded media, competition for the sale of advertising involves each medium's abilities to attract audiences, differing characteristics of the media involved, and their ability to deliver certain types of advertising messages. The competition among media is not equal, however, because of wide differences in availability and demand factors. The highest levels of competition for audiences and advertisers' times and expenditures take place among units of the same medium (intramedia competition), particularly if they serve the same audiences in the same locations.

Related to issues of competition are *issues of resource dependence*, that is, reliance on certain resources of survival. This may include sources of finance or revenue, required supplies and services, informational resources, etc. When dependency on a particular resource is high, significant efforts are made in preserving access to the resource, and organizations will aggressively compete with rivals for preferential quantities. In doing so, they may displace consumption by rivals or seek to exclude them from the resource.

In media, another form of competition related to these influence issues involves competition among ideas. The concept of the "*marketplace of ideas*" is an imperfect metaphor describing discussion and debate of differing ideas and issues as a forum for public deliberation and determining which is most meritorious.

It is possible for entities to gain competitive advantages that make it easier for them to sustain themselves than their rivals. This occurs when factors in the environment treat them preferentially or when they have adapted and developed in such a way that they are able to command more resources than their competitors. These advantages include factors such as preferential treatment by providers of required financial resources and supplies, better media products, social recognition, and better distribution abilities.

### COMPETITION IN DIFFERENT SYSTEMS

Competition is present in all media systems; however, the types of competition and how they are manifest differ significantly. The rewards that rivals seek to acquire through successful competition also differ in the systems. Using the model of media systems suggested by Hachten, we can consider those differences.

In the *authoritarian media system*, rulers control the media by determining who may operate media, the structure of media competition, and content. Exclusive rights to operate media are controlled by the leader. The ruler may operate the media as part of the regime, permit individuals supportive of the government to do so, or permit other individuals to operate media as long as they do not challenge the regime (→ Censorship). In authoritarian systems, competition for attention, time, and monetary expenditures of media users exists. If media are permitted to operate commercially and advertising funding is available, competition for that revenue may exist if more than one unit of the same media exist or multiple commercially funded media types are available. In authoritarian systems, there is no competition in ideas that threaten the ruling power. There are both extrinsic and intrinsic rewards in the authoritarian system, including beneficial relations with the ruler that bring preferential treatment such as access to the corridors of power, government financial support or actions that diminish the strength of or remove the threat of other competitors, and prestige.

In the *communist system*, competition exists for state or party financial resources to establish and operate media, as well as for the attention and time of media audiences and expenditures they make to purchase media products. Because there are often multiple media units and media types, there is competition among providers of content for prestige and influence. Access to information is not contested because media are seen as functionaries of government and the party; however, access to the most important leaders is limited primarily to the largest and most prestigious media so there is competition to grow and develop preferential status. Competition involving noncommunist ideas does not exist in the system, but competition among ideas within the range permitted does take place. Rewards in the communist media system include provision of greater financial resources by administrative authorities, wider distribution ability, prestige, notoriety, and better access to leaders. Intrinsic rewards related to service to society and the cause, and quality content, also exist.

In the *western/libertarian system* media enterprises are independent from government and operate as commercial private companies, not-for-profit firms, and public broadcasting entities (→ Public Broadcasting Systems). Media compete for capital and there is competition among providers for the attention, time, and financial expenditures of users. When advertising funding is sought, there is competition for that revenue. In

this system, there is competition among ideas, although industry structures can sometimes constrain it. Rewards in the western/libertarian system include financial rewards for commercial media and additional funding for noncommercial media, prestige, and access to persons of power and notoriety, as well as intrinsic rewards related to public service and quality.

Media in a *revolutionary system* are politically related, serving the purposes of revolutionaries to mobilize inhabitants to support their causes (→ Activist Media). In this system, there is competition for money from the revolutionary organization as well as for the attention and time of media users. That rivalry is often constrained by limited number of media present overall and limited number of revolutionary media. There is little competition for access to persons of power because revolutionary media are typically the mouthpieces of leadership. There is, however, great competition to become influential to the public. Rewards are primarily intrinsic and related to the success of the revolutionary movement.

Competition in *development media systems* includes competition for capital and the attention and time of media users, which is usually constrained by a limited number of existing media because of lack of available resources. There is often little competition to gain access to developmental authorities because they utilize these media for their social purposes. There are financial rewards in this system as the economic conditions improve, and rewards related to prestige and access to government officials. Intrinsic rewards for quality work and public service are also present (→ Participatory Communication; Development Communication; Development Journalism).

Competition thus exists in different media systems and is not merely a function of a market economy. Under all systems, financial resources must be allocated among competing requests for expenditures, and audiences must be attracted to expend their time and, often, money. Competition takes place among media for access to important persons and events and to gain prestige and influence. A more sophisticated view of the breadth and depth of competition needs to be embraced when considering rivalry within different media systems in order to understand the complexities of interactions in those systems.

## Compliance Gaining

Steven R. Wilson

Purdue University

The term *compliance gaining* refers to interactions during which one participant attempts to convince a second to perform some desired behavior that the second otherwise might not perform. Seeking and resisting compliance are common within personal relationships: an adolescent asks her parents if she can borrow the family automobile; a husband ignores his wife's hints to take out the garbage; a young man suggests to the person he has been dating that they see each other exclusively. Compliance-gaining episodes also occur within professional relationships: A mid-level manager asks her boss to reorganize which employees report directly to her; a dentist emphasizes the need for a patient to floss regularly; college students assigned to work together on a class project pressure a wayward member to complete his part of the project.

Attempts to seek or resist compliance vary in several respects. The person seeking compliance (called *the message source*) may state explicitly what the other party should do or may only hint at the desired behavior. Message sources may or may not explain why the requested action needs to be performed, how it benefits particular parties, or how it can be performed without undue effort; they also may express indebtedness, promise rewards, reference rules, or threaten undesired consequences. The person whose compliance is being sought (called *the message target*) may comply almost immediately, or instead may ask questions, suggest alternatives to the requested action, offer excuses for not complying, or refuse without explanation. The target person may comply only so long as the message source is watching or may internalize a rationale and continue performing the desired behavior over time.

Compliance gaining is an important area of study for three reasons. First, attempts to seek compliance can have important instrumental outcomes. When parents ask their adolescent child never to get into a friend's automobile if that friend has been drinking alcohol, at some point lives literally may depend on the effectiveness of this influence attempt. Second, seeking and resisting compliance are acts that reflect and impact relational closeness, commitment, and satisfaction. Couples who frequently enact demand-withdrawal sequences, for example, report lower levels of marital satisfaction (Caughlin & Huston 2002). Third, compliance-gaining interactions reveal interesting individual, situational, and cultural variations. Different people often approach the "same" situation in distinct ways, and most recognize that different situations call for different approaches. Two generations of research have explored the ways in which individuals seek and resist compliance.

### FIRST GENERATION: STRATEGY SELECTION

The term *compliance gaining* is closely associated with a research program initiated by Gerald R. Miller, a long-time faculty member at Michigan State University. Miller distinguished compliance gaining from traditional studies of → persuasion in two respects (Miller & Burgoon 1978). First, persuasion scholars usually focus on public and mass communication contexts, whereas compliance-gaining research focuses on dyadic and group contexts (→ Interaction; Interpersonal Communication). Although most people are as likely to encounter persuasive attempts from their friends, families, and co-workers as from product advertisements or political campaigns, up to that time persuasive attempts in personal relationships had been largely ignored. Second, persuasion scholars typically focus on message effects, whereas compliance-gaining research *focuses on message choices*. Persuasion scholars have investigated the impact of fear appeals, one-sided versus two-sided arguments, and other factors on audience attitudes. The same “effects” focus is present in research on sequential request strategies such as the “foot-in-the-door” technique (Cialdini 2001). As a complement, Miller called for research on how persons actually select means for seeking compliance.

Miller et al. (1977) conducted the pioneering investigation of compliance-gaining strategy selection. The “MBRS study” (from the initial letters of the authors’ names) was couched within a developmental view of interpersonal communication that assumes that individuals want to maintain a sense of control over their social environments and hence acquire strategies for influencing others (→ Relational Control). Message sources make predictions about the probable outcomes of using various compliance-seeking strategies, but the information used to do so changes as relationships develop. When the parties share an interpersonal relationship (i.e., know each other well), sources can rely on “psychological-level” knowledge – that is, information about how the message target is unique or different from others – to predict how the target will react to alternative strategies. In contrast, when the parties have a non-interpersonal relationship (i.e., do not know each other well), sources must rely primarily on sociological and cultural-level knowledge – that is, information about how the target is similar to others – to predict the target’s reactions. Drawing on this view, Miller et al. asked what compliance-seeking strategies were available to message sources, how their choice of strategies varied across situations, and whether there were stable individual differences in strategy choice.

Beyond setting a research agenda, the MBRS study provided a methodological exemplar for subsequent compliance-gaining research (→ Research Methods). Participants read hypothetical scenarios that varied in terms of whether the source-target relationship was interpersonal/non-interpersonal and whether the request would have short-term/long-term relational consequences and rated how likely they would be to use 16 different compliance-seeking strategies in each scenario. Participants reported greater likelihood of using a wide variety of compliance-seeking strategies when they shared a non-interpersonal rather than an interpersonal relationship with the target.

The MBRS study spurred a large body of research on how people select compliance-seeking strategies. Scholars debated the comprehensiveness of different typologies of compliance-seeking strategies and created typologies of resistance strategies. They mapped perceived dimensions of compliance-gaining situations, showing that people

distinguished the source–target relationship (e.g., intimacy, power) and the nature of the request (e.g., benefits to self and other, likelihood of target resistance). Scholars investigated whether situational dimensions predicted strategy choice, and searched for individual differences (e.g., dogmatism) in strategy selection as well as sex and gender differences.

Despite this flurry of activity, first-generation studies identified few reliable predictors of compliance-seeking strategy choice. Three criticisms of such studies eventually emerged (Kellermann 1994; Wilson 2002). First, studies were employing ad hoc lists of strategies that varied in numerous, unspecified ways. This made it difficult to discern whether strategies rated as likely to be used differed from less likely strategies in terms of explicitness, reasoning, politeness, or some other quality. Second, researchers were implicitly adopting implausible models of how individuals produce messages during conversation, assuming that individuals weighed predicted outcomes for many strategies and then “selected” and enacted an optimal strategy. Third, researchers vigorously debated the validity of having people rate their likelihood of using pre-formulated compliance-seeking strategies in response to hypothetical scenarios.

Research modeled on the MBRS study greatly diminished after 1990, and some claimed the study of compliance gaining did so as well. Such claims, however, conflate the phenomenon of compliance gaining with a particular research program (Wilson 1998). A newer generation of research continues to explore how individuals seek and resist compliance.

## SECOND GENERATION: GOAL PURSUIT

Contemporary compliance-gaining research is not couched within one research program; rather, research is guided by *several theoretical perspectives* (e.g., attribution/appraisal theories, politeness theories, the goal–plan–action model, → message design logics) and methods (e.g., written responses to scenarios, observation of naturalistic episodes) (Wilson 1998). Despite this diversity, contemporary research shares three assumptions about participants in compliance-gaining interactions. First, participants frame influence episodes around goals. Individuals do not conceive of their actions in broad terms such as “seeking or resisting compliance,” but in more specific terms such as asking for assistance, giving advice/avoiding unwanted advice, seeking permission, or getting others to follow the rules (Dillard 2004).

Second, people typically pursue *multiple, potentially conflicting, goals* when seeking or resisting compliance. Employees may want to change their boss’s ideas about a presentation, but they want to do so without alienating the boss. A college student wants to give her sister advice, but also wants to avoid sounding parental. Multiple goals arise from general norms for efficient and polite interaction as well as cultural definitions of roles and selves (Fitch 1998; Kim 2002).

Third, people have fleeting awareness of their goals and manage limits in their ability to adapt quickly. Because altering abstract plans requires cognitive effort, people may repeat the same argument in a louder tone of voice when more fundamental shifts in what goal is being sought or how it is being sought are needed (Berger 1997). Negative affect or stress may compound such tendencies.

Aside from assumptions about people, second-generation compliance-gaining studies share *four qualities*. First, contemporary research is *meaning-centered*, exploring how participants themselves conceive of seeking and resisting compliance. Participants achieve shared definitions of situations by orienting to goals, though at times individuals in the “same” interaction have different ideas about what is, or should be, going on. People from different cultures associate somewhat different relational meanings with influence goals (Fitch 1998). People with different message design logics (i.e., implicit theories of communication) also have different ideas about what is relevant or appropriate to say when seeking or resisting compliance.

Second, contemporary compliance-gaining research is *theoretically guided*. Theories highlight particular behavioral features/sequences as well as factors that predict such features. As one example, attribution theories direct attention to the accounts that message targets offer when resisting compliance as well as to the persistence with which message sources seek compliance; these theories assert that factors that influence judgments about why a target is resisting shape emotions/motivations and hence these message features (Wilson 2002).

Third, contemporary research is better attuned to the *incremental, interactive nature of compliance seeking* (Sanders & Fitch 2001). Researchers have used techniques such as videotaping conversations and afterwards asking participants to watch the tape separately and describe what they were thinking/feeling, to bridge the individual and dyadic levels of analysis.

Finally, contemporary research tends to be *contextually situated*. As one example, recent work has explored how compliance-gaining interactions in families with a history of child abuse or neglect differ from those in nonmaltreating families (Wilson et al. 2006). This work illustrates why compliance gaining remains an important area of study, but it is also undertaken with awareness that child abuse and neglect are multiply determined by risk factors at many levels of analysis (individual, dyad, community, culture) and hence analyses of compliance gaining must take this into account.

## Comprehension

*Howard Grabois*

*East Carolina University*

Human beings are uniquely able to understand sophisticated concepts through the use of language. Issues relating to comprehension encompass a wide variety of areas in linguistics, communication, and cognitive studies. Constructs regarding comprehension can be broadly divided into two theoretically diverse approaches, which diverge on the emphasis they place on cognition as an individual, self-contained process, or as a culturally situated one.

The first approach is distinctly *Cartesian*, with emphasis primarily on what takes place within the individual. It is profoundly influenced by the work of Noam Chomsky, who sees the systematic use of rules and representations as central for understanding language systems (→ Linguistics; Language and Social Interaction). Within this approach issues regarding comprehension primarily have to do with how people are able to parse sentences and construe word → meaning, with an emphasis on rules (principles and parameters) for the former, and component features for the latter.

Salient aspects of this orientation include the centrality of genetic endowment – the “hard wiring” that allows human beings to learn language – and the consequent emphasis on language universals, as well as the modularity of cognitive processes. This orientation has been criticized for a variety of reasons; among those most relevant to comprehension is that it draws upon and contributes to metaphors of mind that may not accurately or fully describe cognitive processes. The “mind as computer” metaphor constructs the mind as a largely self-contained mechanism that functions by using sophisticated algorithms that allow language input to be understood and produced. The conduit metaphor posits communication largely in terms of the packaging of meaning into words, which are transmitted to the interlocutor, where they are unpacked for understanding.

The second approach includes a variety of theoretical orientations that emphasize the social and cultural aspects of understanding, and the *co-construction of meaning*. From this perspective meaning is not simply packaged into words and unpacked by an interlocutor, but rather language itself is a significant tool for the construction of meaning. Theoretical orientations that are consistent with this approach include: cognitive linguistics in the tradition of George Lakoff, with its emphasis on  $\rightarrow$  metaphor and the centrality of embodiment for an understanding of human cognition; approaches to semantics that emphasize context, such as frame semantics; various forms of discourse analysis, particularly those that emerged from ethnographic traditions; and cultural-historical theory in the tradition of Vygotsky, with its emphasis on socially distributed cognition and the use of cultural artifacts as cognitive tools. These orientations share the belief that comprehension is not something that takes place primarily within the confines of the head, but rather in relation to contexts and environments that include interaction with others, and their intentions. In this way meaning is seen as negotiated rather than transmitted. While less theoretically unified than the Cartesian approach, these orientations in general have been criticized for not conforming to the standards of natural science, and for not providing sufficient models for understanding how cognitive processes are implemented within the brain ( $\rightarrow$  Cognitive Science; Schemas, Knowledge Structures, and Social Interaction).

Disagreements about how categories are formed within the mind reflect this theoretical division. On the one hand the classical approach – in reference to its roots in Aristotle – is predicated on the idea that category membership is based on a set of necessary and sufficient conditions. Hence, we know that a dolphin is a mammal based on its having specific features that define the category “mammal.” Categories are discrete, and all members that meet the criteria enjoy equal status. *Prototype theory*, on the other hand, holds that categories are constructed around real or idealized central members, or on the basis of family resemblance.

Boundaries can be fuzzy, and members can be better or worse exemplars of a category. Hence, a table is a better (more central) member of the category “furniture” than a telephone, and sparrows are better members of the category “bird” than penguins. Proponents of prototype theory hold that studies where subjects are able to rank category members as better or worse indicate the importance of prototypes for cognition and understanding. Proponents of the classical category, on the other hand, hold that the ability to rank membership is essentially an epiphenomenon related to experimental conditions, rather than a true indication of how cognitive processes work. With respect to comprehension, the classical category is highly consistent with the Cartesian approach to language and cognition, emphasizing processes within the individual, while prototype theory is consistent with approaches that emphasize negotiated meaning and the cultural aspects of communication.

While much research into comprehension is theory driven, there are also a number of specific issues that researchers within a variety of fields have addressed. In cognitive studies the roles of working  $\rightarrow$  memory ( $\rightarrow$  Memory, Message),  $\rightarrow$  attention, and auditory perception have been of particular interest. Within linguistics, areas besides syntax and semantics that have been investigated in relation to comprehension include the use and interpretation of speech acts (how we do things with words) and the role of communicative gestures that accompany language.

A significant question within → discourse analysis is whether understanding takes place primarily from the top-down, with lower-level language aspects being derived from discourse, or bottom-up, with discourse structure being built from lower-level linguistic structures such as syntax and semantics. Within the field of second-language acquisition significant research has been conducted on both listening and reading comprehension (particularly as regards vocabulary, background knowledge, and narrative schema), the relationship of comprehension to production, and the influence of affective factors such as motivation or anxiety. Issues relating to comprehension also extend to neuroscience, in efforts to better understand what takes place within the brain during communicative activity, with studies of aphasia playing an important role. Even literary theory, where questions of whether meaning is contained in the text or constructed by the reader in interaction with the text, deals with issues relevant to comprehension.

## **Computer Games and Child Development**

*John L. Sherry*

*Michigan State University*

*Nicholas David Bowman*

*Michigan State University*

Video games are a prevalent and profitable facet of the modern media entertainment industry (→ Video Games). Although children (anyone under the age of 18) comprise only 31 percent of the \$10 billion US video game market, their numbers are increasing. Whereas in the 1990s, only 60 percent of middle-school-aged children reported playing video games on a consistent basis, a 2001 study by the National Institute on Media and the Family reported over 92 percent of US children played video games, an increase of over 30 percent. Worldwide, the video game industry is expected to grow to over \$46.5 billion by the year 2010, with a growing portion of this market comprised of children.

Video games have been found to have both positive and negative effects on children, from increased academic test scores to increased aggression levels, but these mixed results, coupled with the increased popularity of video games carrying an “M” rating (for mature audiences only), have media researchers asking the question, “what effects are video games having on the development of today’s youth?” (→ Media Effects).

### **GAME USE DURING CHILDHOOD**

Several studies have found significant variation in video game play based on age and developmental stage. For example, children in the sensorimotor stage (age birth to two years) are just beginning to learn about concrete objects in their environment and cannot process symbolic information; consequently, studies on US children show that less than three percent play video games at this age. In the most recent study of media use among the very young (ages zero to six), video game play was found to be the least common recreational activity. Whereas over three quarters of young children play outside, read, or listen to music on a typical day, less than 10 percent of these children play video games. This play is severely limited: several studies report that young children play video games for less than six minutes per day, despite three quarters of them having a computer and around half of them having a game system in their home.

As children get older, their game play increases until it peaks in the preteen and early teen years. By ages 4 to 6 years – the middle of the pre-operational stage of development – over half of US children have been exposed to video games, and 16 percent report regular video game play; as children enter the concrete and formal operations stages, their game play increases significantly. A study of US school children reports that fifth-graders (children aged 11 years) play an average of 1.81 hours per day, and eighth-graders (children aged 14 years) play 2.46 hours per day. These numbers drop off at the eleventh grade (children aged 16 years) to 1.62 hours daily, and for young adults (aged 18 to 22 years), 1.73 hours daily.

Interestingly, a US Kaiser Family Foundation survey (Roberts et al. 1999) found that, when non-gamers are removed from survey data, video game play figures are similar across developmental stages. For example, 16 percent of children aged 2 to 7 years who play video games consistently (as defined by having played the day before the survey administration) play nearly 50 minutes daily. This compares to 45 percent of 8- to 13-year-olds who were daily players (at 1 hour and 9 minutes per day), and 30 percent of 14- to 18-year-olds who were daily players (at 1 hour and 5 minutes per day). However, there are some methodological issues that make interpretation of these results difficult. For example, the Kaiser Family Foundation survey questioned parents about child game use, while the other surveys reported on child responses. Often, there are sizable differences in reported playing time based on who fills out the survey, parent or child.

### **GENDER DIFFERENCES IN GAMING**

Patterns of gender differences in video game play appear fairly *early in development*. One study found that US boys averaged 1.5 hours more game play per day than girls across all developmental stages. Another study found that US boys from 8 to 13 years of age averaged 47 minutes of game play per day as compared to only 16 minutes per day for girls of that same age. The difference stays the same among 14- to 18-year-olds, with boys

(34 minutes) playing significantly longer per day than girls (7 minutes). In a recent meta-analysis of 90 media use studies, Marshall et al. (2006) estimated that US girls aged 7 to 10 years spend around 30 minutes per day playing video games, while boys of the same age spend more than twice as much time – nearly 71 minutes per day on average – playing video games. These numbers dropped off slightly with age, but the patterns remained the same: older boys (aged 13 to 18) reported playing 60 minutes each day, while older girls played less than 30 minutes. Studies with British youth reported similar patterns (→ Media Use by Social Variable).

Clear differences in *genre preferences* between boys and girls also exist (→ Selective Exposure). The results of four different studies on video game preference of US children are consistent: boys prefer action, fighting, shooting, adventure, and sports games, while girls prefer platform, puzzle, and educational games. These gender differences in game preference are observed as early as 10 years of age. One survey reported that children endorsed statements containing game gender stereotypes and showed clarity on which types of games are “boy games” or “girl games” (→ Sex Role Stereotypes in the Media; Stereotypes). British youth show a similar pattern of game preference by gender. Interestingly, Japanese youth – while showing similar patterns – reported playing fewer violent video games overall. Game sales reflect this trend, as violent video games rarely (if ever) top Japanese video game sales charts, whereas they frequently top the sales charts in the US and the UK.

Gender differences in game preferences have been attributed to *differences in cognitive skills* between boys and girls. Whereas girls have significantly better verbal abilities and tend to like puzzle games, boys tend to have greater capacities for targeting and mental rotational ability, and prefer games that utilize these skills (→ Cognition; Cognitive Science).

## VIDEO GAME USES AND GRATIFICATIONS

Part of the reason why we see differences in amount of game use by age may be because → uses and gratifications derived from game play also vary by developmental stage. Studies on US children show that, although competition and challenge are the highest rated reasons for playing video games across all age groups and genders, older teens (aged 16 years) and young adults (aged 20 years) primarily play video games as a means of social interaction with friends and as a way to get away from stress. Among 14-year-olds, game play is primarily a stress release, a cognitive challenge, and a means of social interaction. For 10-year-olds, their reasons are different. Although these children enjoy playing against friends and as a cognitive challenge against themselves, they also play for the fantastical desire to be a strong character.

It appears that games begin as exercises in mastery for younger children (as an intellectual challenge and as an expression of power fantasy), but become more of a social event as children progress through adolescence and into young adulthood. Studies of Japanese and British youth (aged 12 to 14 years), for example, report that companionship and preference for friends are often cited as motivations for video game play; similar results are found when looking at US children of comparable age.

## VIDEO GAME CONSEQUENCES

Scholars have found evidence of positive and negative effects on childhood development associated with video game play. One longitudinal study found that the young children

(aged 4 and 5 years) who were exposed to developmentally appropriate software had increased intelligence scores, nonverbal skills, dexterity, and long-term memory (→ Communication Skills across the Life-Span; Longitudinal Analysis; Memory), while children exposed to developmentally inappropriate software showed decreased creativity levels. Because the pre-operational stage is characterized by a child's understanding of physical space over abstract thought, video games that focus specifically on shapes and structures are most useful as educational and entertainment media for these children (→ Educational Media). Research on 7- and 8-year-olds – children in the pre-operational stage of development – found that children who played video games had better hand–eye coordination and reaction time than children who did not, and Subrahmanyam and Greenfield (1994) found that video game play could significantly increase spatial skills in 10-year-olds.

Children at the later stages of development are able to comprehend and play nearly all video games available. This is an area of concern for some scholars due to the content of the more popular video games. As of the end of 2006, the three top-selling video games in the US were all “M” rated; combined, these games have sold over 17 million copies. A → meta-analysis by Anderson and Bushman (2001) suggests that, although children are not as susceptible to short-term effects of media violence as adults are, they are significantly more influenced in the long term (→ Media Effects Duration; Violence as Media Content, Effects on Children of). These findings suggest that exposure to video game violence teaches children *antisocial norms and* → *schemas*, although they have been debated due to small effect sizes and lack of causality (Sherry 2001). In terms of academic growth and performance, studies have been inconclusive. One study, using eighth-grade students, found that the poorest performing students were typically the heaviest users of video games, while another study found no effect of game play – positive or negative – on classroom performance (→ Personality Development and Communication).

While there have been several studies examining patterns of children's video game usage and preference, existing research does not compare effects across ages or cognitive stages. Therefore, it is difficult to draw conclusions about the effects of video game play on childhood development. Research has been conducted with children on such diverse topics as learning from games, physiological reactance to games, and the role of personality in game use, but future research in these areas will be necessary to understand the role of gaming in child development beyond simple descriptions of game use and preferences.

## Computer Games and Reality Perception

Matthew S. Eastin

University of Texas at Austin

Immediately following the debut of Nintendo in 1995, researchers questioned what effects games like *Super Mario Brothers* had on those who played them (→ Computer Games and Child Development). Early → video games consisted primarily of objects or unidentifiable characters such as *Pac-Man*. Now, through several technological advancements, game play is more complex and has begun to visually mimic real life. For instance, within games and gaming communities of players, both male and female human forms of all races make up many of the characters.

And, with the arrival of online games, *multi-user environments* are increasing the number of video game players, the age of players, and the economic structure of play, thus, changing the outcomes and direction of video game research. Within the computer game literature, multi-user environments are defined as massive multi-user online games (MMOGs) or massively multi-player online role-playing games (MMORPGs; → Virtual Communities). Players of multi-user environments typically spend more than 20 hours each week playing alone or gaming with others (Yee 2006). MMOGs and MMORPGs can

consist of thousands of players. However, large gaming communities typically break down into manageable groups known as “guilds,” defined as a collection of players who share a common belief or outlook, and clans, defined as “an organized gaming team which enters leagues and tournaments” (Griffiths et al. 2003, 90). Unknown groups, typically small (2 players) or medium (2–20 players) in size, consist of players who, since they are only together for a specific mission, are usually not familiar with each other. Known groups, often clans or guilds, are usually medium in size and contain players who are familiar with each other and often play together (Ducheneaut et al. 2005). Although winning is considered a gaming motivation for these groups, players are also motivated to increase the status of their characters, or simply to game with and against others (Yee 2006).

As with some of the media effects literature, video game research is most broadly developed within antisocial gaming effects such as aggression (→ Media Effects, History of; Violence as Media Content, Effects of). Investigators have utilized several theories to explain offline outcomes and perceptions from mediated experiences, including arousal, excitation transfer, social learning, and cultivation (→ Cultivation Effects; Emotional Arousal Theory; Excitation and Arousal; Excitation Transfer Theory). From these theoretical frameworks, a comprehensive model on human aggression known as the general aggression model (GAM) was developed and applied successfully to the video game experience (Anderson & Bushman 2002).

The GAM suggests that situational and personal input factors combine to influence behavior through the present internal states of cognition, affect, and arousal. Personal inputs include variables such as trait aggression, while situational inputs have included violent and nonviolent game play. During game play, games provide a learning forum for behavior, including aggressive acts. Learned attitudinal and behavioral responses developed and rehearsed during game play can be transposed into real-life behavior and perceptions. The repetitive nature of game play creates a combined effect where long-term play develops schemas that are chronically accessible (Anderson & Bushman 2002).

In the case of the GAM, the social perception and reality of game play is a more hostile society. Using GAM logic, a recent → meta-analysis confirms a positive relationship between violent game play and aggressive outcomes (Anderson 2004). That said, the exposure and scripting process also has the potential to influence other game play behaviors (→ Scripts). Most recently, research has argued that realism (Eastin 2006) and realistic behaviors (Eastin & Griffiths 2006) facilitate the learning or scripting process. Complex environments and realistic gaming complicate the agenda and interpretation of research, perhaps rendering meta-analytic analyses ineffective. It is entirely possible that gaming could be a secondary goal of play. That is, the extent to which competitive game play is not the primary goal could attenuate real-world social perceptions. Many games require cooperation between group members; cooperative group play directs goal attainment to the group (Bonta 1997), which should decrease individual competitiveness and frustrations from game play, and subsequent aggressive outcomes. In short, those playing cooperatively with others should experience less aggression from game play than those playing individually.

From a *general exposure standpoint*, cultivation processes posit that heavy users of media such as video games are more likely to perceive a social reality consistent with the

“images, value systems, and ideologies propagated” (Weber et al. 2006, 351). Grounded in → cultivation theory, the first longitudinal study investigating potential influences on social perceptions from playing the online computer game *Asheron’s Call 2* found that “after playing the game, the participants in the treatment condition were more likely than those in the control group to say that people would experience robbery with weapons in the real world” (Williams 2006, 79; → Experimental Design; Longitudinal Analysis). Furthermore, significant findings were only discovered with “in-game and real-world parallels” (i.e., robbery with a weapon).

The ability to be anyone or anything within games presents a large obstacle for MMORPG or MMOG research, regardless of the theoretical framework. For instance, if “self” or “other” is central to game play, then scripting-type effects from play could be centrally focused within the game or character, and thus not carrying over into the real world. Although seemingly a positive outcome for role-playing exposure, it is important to note that, if true, then role-playing could also indicate that social relationships developed and maintained through game play represent weak relationships that are conveniently fostered through play. Regardless, amount and type of role-playing points to additional mediating (or moderating) factors to real-world social outcomes from game play.

In sum, the social reality of game play is hard to define. We know that there is a small but consistent effect on real-world outcomes, positive and negative (→ Social Behavior, Media Effects on). However, game complexities make studying and understanding video games difficult, or, at least, more difficult than previous media such as television, where content could easily be controlled.

## Computer–User Interaction

*David R. Roskos-Ewoldsen*

*University of Alabama*

The world wide web has revolutionized the ways in which people communicate (→ Exposure to the Internet; Internet). People can have simultaneous online chats with colleagues across the world. Yet, people often communicate with a single individual so the communication is in many ways like → interpersonal communication – except not face to face. Chatrooms have been created for many reasons, ranging from social interaction with liked others to sharing information about highly specific topics (→ Personal Communication by CMC). Likewise, web communities have sprung up within and around many different games. Massively multiplayer online games (MMOGs) – most notably *World of Warcraft* – have online communities within the games, such as the guilds that exist in *World of Warcraft*, and online communities that exist outside of the game to discuss the game. Even console-based → video games such as the *Halo* franchise have online communities. Again, there are communities that exist to discuss *Halo* and there are communities that are created while playing the game online as people communicate with each other. Research on computer–user interaction has focused on how changes in the audience – mediated versus face-to-face – influence how people communicate with each other and the consequences of these differences (→ Exposure to Communication Content).

*Early speculations* concerning communication in online communities were rather stereotypic. The expectation was that chatrooms devoted to medical topics would almost exclusively focus on providing information to the users, with the consequent focus on information accessibility on the part of the interface designers (Pena & Hancock 2006; → Information Seeking). Likewise, the expectation was that communication in guilds in *World of Warcraft* or between team members in *Halo* would be primarily focused on task-oriented issues because people were communicating to achieve some goal within the game, and the communication would be more hostile or negative because these are violent games.

The extant research challenges the stereotypes about communication in online communities. In a study of communication in an online community dealing with medical issues, people often went to the online community *seeking empathy and support* – not just factual information. In hindsight, people who are dealing with medical issues should seek

information *and* empathy. As Preece (1999) notes, designers need to be sensitive to the needs of the people participating in the online community and let the people determine what type of content is going to be sought and what is not (→ Human–Computer Interaction). Likewise, a study of communication in an online gaming community found that the assumption that the communication would primarily be task-oriented was not supported. Pena and Hancock (2006) found that substantially more socio-emotional statements were produced than task-oriented statements. While the participants in this community are there to play a game, they are probably participating in an online community because they are seeking more than the gaming experience. They are seeking interaction with other humans. Indeed, one of the important reasons for participating in online games is to spend time with friends or to make new friends. Both of these examples illustrate that the communication in online communities reflects the function that the communication is serving for its participants.

While there is a clear lack of research on communication in online communities, the existing literature suggests several interesting *insights into online communication*. First, research on perspective-taking theory found that people tend to do a poorer job of taking the perspective of the other people they are communicating with online (Jarvela & Hakkinen 2003). This makes sense because there are fewer contextual cues to help people adequately interpret and understand what other people are trying to communicate. However, these perspective-taking skills are a critical part of goal-directed and task-oriented communication because perspective taking is critical to adapting to other people. On the other hand, research also suggests that the longer a person spends on the web communicating with other people, the more sophisticated they become at online communication (Pena & Hancock 2006). For example, more experienced online communicators are more fluent in their use of emoticons. So the limitations in perspective taking demonstrated in some studies may disappear with greater experience of communicating on the web.

Research on communication in online communities is in its infancy. There are many things that need to be done to advance our understanding of how communication operates in these domains. What is the impact of a lack of nonverbal communication such as vocalics (how words are stressed) or paralanguage (“ums” and “ahs”) on how people interpret emotion? Do emoticons, e.g., the “smiley,” adequately address these limitations? Communication in online communities provides unique opportunities for studying basic interpersonal communication processes. Likewise, it is an exciting time for studying the impact of web design on how people communicate in online communities. Does the option of one-to-one communication that is found in many online websites as an alternative to one-to-many communication increase empathic communication in these communities? If the community involves a moderator, how does that moderator impact empathy in that community? More research is necessary to address how the design of these communities impacts how people communicate within them.

# **Computers and Display Programs in Education**

*Joe R. Downing*

*Southern Methodist University*

Communication instructors use two broad categories of display programs in their classrooms. The first category is whiteboard technology (→ Classroom Instructional Technology). When delivering a lecture, instructors make notes on the whiteboard using a special stylus. The text is digitized, so the whiteboard subsequently becomes the display program. Instructors can email these digitized notes to their students or post their lecture notes to courseware packages like Blackboard (→ Course Organization Programs in Education). An *interactive whiteboard* represents the latest technology in this area. In class, students can use their laptop computers, which are connected to a local wireless network to collaborate on a project. The group's output is displayed on the interactive whiteboard.

The second category of display programs are *software applications* which instructors use to create visual aids (→ Design; Graphic Design). Popular presentation software packages include Microsoft PowerPoint (Windows and Macintosh), Keynote (Macintosh only), and OpenOffice.com (→ Open Source). Monitors/plasma TVs and overhead LCD projectors display the output that presentation software applications create.

The use of presentation software – especially *PowerPoint* – is widespread. Microsoft officials contend that nearly 30 million PowerPoint presentations are delivered each business day (Mahin 2004). Despite their popularity, little empirical research examines how students and instructors can benefit from using these technologies in the classroom (→ Learning and Communication). Indeed, most empirical research was done in the late 1980s when a visual aid included an overhead transparency as often as a presentation software slide.

In general, researchers have argued that both students and instructors can benefit from using visual aids like PowerPoint. The use of presentation software is most effective when instructors combine both verbal and visual supports into their presentation (Vogel et al. 1986). Visual learners and English as a Second Language (ESL) students can benefit especially when their instructors use display program technologies in the classroom (Atkins-Sayre et al. 1998). Instructors' use of visual aids, researchers contend, helps students take better class notes and increases their recollection of lecture material (Hamilton 1990). However, there is little evidence that instructors' use of visual aids – or, more recently, presentation software slides – increases students' long-term retention of lecture material. So far, no instructional research has been conducted on the efficacy of digital and interactive whiteboards.

Several academics and practitioners, including Edward Tufte (2003), are vocal critics of speakers' reliance on presentation software applications like PowerPoint. PowerPoint, they argue, is popular because the software mirrors Westerners' tendency toward rational, linear arguments (→ Communication Modes, Western; Rhetoric, Argument, and Persuasion). The verbal support for this mode of argumentation often relies on statistical data and expert opinion (→ Rhetoric and Logic). Speakers then include each piece of verbal support as an individual bullet point and, in doing so, outline their argument. As a result, speakers may neglect to tie their ideas together for the listener. Instead, from the listeners' perspective, each bullet point acts merely as a sound bite (→ Sound Bites). In sum, critics argue, PowerPoint hides the structure of presenters' arguments.

An emerging cadre of PowerPoint scholars, designers, and practitioners urge speakers to supplement their traditional (logical) forms of verbal support with narrative forms of argument (→ Rhetoric and Narrativity). Instead of relying too heavily on bulleted lists of text, speakers can use images that support their stories (→ Visual Representation). These images can focus on the actors, plot, and inherent conflict (between central characters or broader ideas) that make stories resonate emotionally with an audience. Speakers' use of these narratives can also meet the needs of international listeners who prefer nonlinear types of arguments.

## Concentration in Media Systems

*Guillermo Mastrini*

*University of Buenos Aires*

*Martin Becerra*

*National University of Quilmes*

Concentration of ownership in the media sector presents important problems for the cultural industries. First, concentration creates dominant positions for some players, which can affect the necessary pluralism of ideas in a society (→ Plurality). From another point of view, there are strong pressures to allow strong players in a given market because of the growing trend toward globalization in cultural markets (→ Globalization Theories). The digitization of the whole field of cultural production and technological convergence processes have also stimulated concentration (→ Competition in Media Systems; Media Conglomerates).

### THE PROBLEMS OF CONCENTRATION

As Sánchez Tabernero and Carvajal have specified, “concentration can be analyzed from the market viewpoint or from the perspective of the companies. In the first case, concentration increases when the position of dominance or influence of the main companies becomes stronger, the public’s power of choice is reduced and when some ‘independent

voices' disappear. From the business point of view, concentration implies industrial growth of the communications groups" (2002a, 15). Economic centralization explains how a few players increase control of the means of production in a given society. From a critical perspective, the main danger with concentration is the trend toward oligopoly (i.e., when the market is dominated by a small number of companies) and monopoly (when the market is dominated by a single firm, instead of a large number of companies).

Less critical theories are more tolerant of concentration. For instance, Schumpeter (1943) argues that imperfect markets with a certain amount of concentration stimulate innovation and economic development, so long as this dominant position does not entail abuse over long periods of time. And classical economic theories support the self-regulatory capacity of the market and underestimate the ability of state action to prevent concentration.

The concentration of media systems implies a process whereby a certain set of companies tends to increase the relative or absolute number of units that they control (Miguel de Bustos 1993). This phenomenon involves companies adopting *two strategies of growth*: internal growth takes place when new products are created to gain markets thanks to investment and accumulation; external growth involves the purchase of other companies. Even though the capital demands tend to be larger for external growth, it has the advantage of immediate growth with foreseeable risk. In the cultural sector, internal and external growth result in three forms of concentration, which are also found in other industries.

First, *horizontal integration or monomedia* expansion occurs when a company produces various final products within the same type of business. Monomedia expansion takes place within the same business, with the objective of increasing market share, eliminating idle capacity of the company, and allowing the formation of economies of scale. This type of concentration developed early in the history of the press, with the consolidation of press groups. There is also strong monomedia concentration in the phonograph and cinema markets.

Second, *vertical integration or expansion* takes place when companies that operate in different stages of the value or supply chain are added. In this case, the companies expand with the objective of embracing different phases of production, from raw materials to the finished product, in order to obtain a reduction of costs and better supply. This type of concentration generally allows for the lowering of the costs of intermediation. Transactional costs are reduced and the power of suppliers and dominant buyers become more limited. Particularly in the audiovisual sector, companies depend on reliable access to content and/or distribution of this content. This type of concentration has been growing worldwide during the past two decades (→ Cost and Revenue Structures in the Media).

Third, *diagonal or lateral growth* of conglomerates represents diversification outside the original business, with the objective of reducing risks by developing synergies. According to Gillian Doyle (2002), evidence suggests that diagonal growth is the most effective way to facilitate the sharing of specialized content or a supply structure. Diversification allows companies to disseminate the costs of the risks involved in innovation in a variety of formats and methods of distribution. The appearance of the → Internet has apparently promoted this possibility. Another example of such growth strategies is the conglomerate growth of the daily press, which has tried to explore more profitable sectors, such as TV (→ Cross-Media Marketing; Cross-Media Production). This is a long-term strategy with the objective of securing safer investments, to counteract the slightly lowering trend of decreasing profit rates.

Alberto Pérez Gómez (2002) identifies *five forms of concentration*: horizontal integration or monomedia; vertical integration; multimedia integration, when a company controls different types of media; conglomeration, when a company goes beyond the communications sector; and internationalization, when a company transcends national boundaries. Because of the growing convergence between the telecommunications, computer, and audiovisual sectors, some authors argue for the need to incorporate the category of convergence into the processes of concentration (Miguel de Bustos 2003). In this way, convergence would include offline activities that move toward the Internet. These forms can obviously complement or juxtapose each other (→ Convergence of Media Systems; Digitization and Media Convergence).

As a result of concentration processes, companies acquire a firmer standing and act as barriers to the entrance of other companies. In an international and dynamic market, companies often face a dilemma on how to grow: either by acquisition – purchasing smaller firms – or by merging with international groups.

The multiplication of mergers and acquisitions of companies in the information/communication sector has given rise to a new structure of conglomerates, replacing the traditional corporate structure of these firms. Despite the growing levels of concentration, the existence of thousands of small companies with a short life and little economic relevance is still functional to the process, whereby they renew the market by exploring new formats.

*Measuring concentration* poses a problem. There are several recognized methods and indicators, such as the index of relative entropy, the GINI index, which can be represented by a Lorenz curve, the four-firm concentration ratio (CR4), and the Herfindahl–Hirschman (HH) index. Although concentration can be measured, it is much more complex to quantify its effects on pluralism and diversity.

Another important problem is analyzing the *issue of control*. Historically, media companies have been family owned. Yet recent decades have seen a gradual change toward dispersed capital companies. In order to understand concentration processes as such, it is necessary to analyze the different forms of control and participation in the large groups or conglomerates.

## **DIFFERENT APPROACHES TO CONCENTRATION**

There are *three dominant positions* on concentration: first, a liberal perspective that does not question concentration processes except for the case of monopoly; second, the critical school, which identifies concentration of ownership as one of the main capitalist mechanisms for its legitimacy; and, third, an eclectic position that does not share the critical view, but is concerned about the risks of concentration and argues for state interventionism to limit it.

From a *liberal perspective*, Eli Noam (2006) claims: “Pluralism is important. But there is no conceptual, practical or legal way to officially define and measure the vigor of a marketplace in ideas. The best one can do is to count voices, and assume that in a competitive system, diversity of information increases with the number of its sources.” To improve the analysis of the impact of media concentration of ownership, Noam divides the HH index (which is a sign of market power) by the square root of the number of voices. In this way, the index allows for consideration of different markets.

Other recent works in the United States intend to show that the presence of the big media conglomerates does not affect informational → balance, sources, or even electoral

behavior (Groseclose & Milyo 2005; Della Vigna & Kaplan 2006; → Election Campaign Communication). From this perspective, concentration of ownership would not be a threat for democratic societies.

In Europe, the liberal thesis is found in the works of Spanish authors such as Alfonso Nieto, Francisco Iglesias, and Alfonso Sánchez Taberero. Nieto and Iglesias (2000) point out that “the power to inform under circumstances of monopoly are not legitimate . . . but a direct sign of political or economic power which hinders competition in the information market.” Alfonso Sánchez Taberero and Miguel Carvajal (2002b) believe that the concentration of media markets has clear limits because an inordinate amount of growth could lead to paralysis. Even though these authors recognize that the concentration of power can be an obstacle to free competition and to the exchange of ideas, they emphasize that growth processes should not be stopped because that would interfere with success and innovation.

A study conducted by World Bank researchers points out that in modern societies and economies, the availability of information is central to the best decision-making by citizens and consumers because of efficiency. The media are intermediaries that collect information and place it at the disposal of consumers and citizens, and, according to the researchers, private organization of this content is superior to public organization (Djankov et al. 2001).

From another perspective, the *critical school* has denounced the processes of concentration of ownership (→ Critical Theory). In a pioneering work, Ben Bagdikian (1983) shows how the owners of the media promote their own values and interests. Their interference in editorial policies can be either indirect, through the influence of editors and self-censorship, or direct, through the rewriting of text. Furthermore, the concentration of ownership in the hands of the economically dominant sectors tends to inhibit the expression of voices critical of the system. Following the same lines, but more recently, Edward Herman and Robert McChesney (1997) draw attention to the risks of communications concentration at a global level, transcending historical national barriers: “According to the logic of the market and convergence, we should expect the global oligopoly of the media to evolve gradually to an even larger communications oligopoly.”

In Europe at the beginning of the 1990s, the British researcher Graham Murdock observed with concern the conflicts inherent in concentration: “Press freedom was seen as a logical extension of the general defense of free speech. This was plausible so long as most proprietors owned only one title and the costs of entering the market were relatively low . . . By the beginning of this century the age of the chain ownership and the press barons had arrived, prompting liberal democratic commentators to acknowledge a contradiction between the idealized role of the press as a key resource for citizenship and its economic base in private ownership” (Murdock 1990).

In Spain, the work of Enrique Bustamante (1999), Ramón Zallo (1992), and Juan Carlos Miguel de Bustos (1993) stands out among Latin researchers studying these issues. The work of Miguel de Bustos provides a detailed analysis of the structures and strategies of media groups.

There is also work that represents an *intermediate group* with respect to the two previous schools. Gillian Doyle (2002) offers two ways of approaching the subject. On the one hand, she presents economic and industrial arguments that tend to favor a more legal

approach to the problem, with an inclination to allow some level of concentration. On the other hand, she also discusses perspectives that focus on society and citizens, political power, political pluralism, and cultural diversity.

Pérez Gómez (2002) analyzes the advantages and disadvantages of concentration in media systems. In the first case, he underlines the exploitation of synergies and economies of scale, as well as the possibility to improve distribution and lower costs. Bureaucracy and limits to competition stand out as the risks. Yet, the major problems are not so much in the economic area but with the issue of information pluralism. Pérez Gómez is not conclusive as to whether concentration affects pluralism of information, and argues that it is very difficult to determine the cases in which it does influence it.

Finally, Carles Llorens Maluquer (2001) envisages the need to defend pluralism and diversity in the media, which shape public views, although not exclusively. He warns that the homogeneity of audiovisual services has more to do with competition than with the concentrated structure of the industry. According to him, “the liberalization of the audiovisual sector has promoted pluralism, but the levels of diversity remain the same or have decreased.”

## EMPIRICAL STUDIES

Several works have approached the difficult task of studying empirically the processes of concentration of media ownership. In most of them the analysis is focused on the national structure in certain countries. A much smaller number of studies have analyzed concentration on a regional scale, with a comparative approach.

Europe is the region with the greatest work on the subject. At the beginning of the 1990s, the Commission for the European Community sponsored a study by Booz-Allen and Hamilton on pluralism and concentration in the media (1992). This report shows a strong concern with the risks that pluralism would encounter when faced with concentration processes, especially in the distribution and consumption of media. The study analyzed the situation of *twelve member countries of the European Community* at the time. Even though the main focus was centered round consumption, it highlighted the predominance of the public media, as well as the growing role of the large media groups in the main European markets. It also sent a warning about the incipient transnationalization of broadcasting, currently limited by national frontiers. The researchers’ proposal was to harmonize different legislation in order to guarantee pluralism (→ Communication Law and Policy: Europe).

A more recent study commissioned by the *Netherlands Media Authority* analyzed the levels of concentration of ownership in the national and regional press, radio, and television markets (Ward 2004). The study takes into account the percentage of audience share and turnover of the first three operators of each country and the presence of media groups that hold assets in diverse media markets (cross-ownership). The report states that there are several regulatory instruments that guarantee pluralism in media markets. Nevertheless, it warns that the concentration processes are reaching the levels established by law. Even though the public media still retain a considerable market share in radio and television, the report points out that since the 1990s, the concentration of media ownership has increased on a yearly basis (→ Netherlands: Media System).

Another study conducted in eighteen *eastern European countries* shows the growing level of concentration of the media in the region. Even though the passage from state-owned media to mixed systems after the fall of the communist regimes led to the appearance of a significant number of new media, both print as well as electronic, a strong concentration process based on a market rationale took place rapidly. A new group of media came onto the stage after a privatization process where the interests between the media and political parties became a matter of fact. The report emphasizes the following common denominators: small and fragmented markets, a strong bond between media owners and political parties, state influence through the granting of subsidies, a monopoly in press distribution, and the growing presence of foreign capital. The report recommends the establishment of limits to the concentration of media ownership (Petkovic 2004).

In *Latin America*, Mastrini and Becerra (2006) have done research that takes into account the structure of the cultural industries' markets and their levels of concentration. In the first place, the economic relevance of the information/communications sectors was analyzed; second, measurement of concentration levels was assessed in six different markets (press, radio, open television, paid television, basic telephony, and mobile telephony) of ten countries in the region. Finally, the study analyzed the main media groups in each country. The results show a very high degree of concentration in all cases. In fact, the research shows that the first four operators dominate 80 percent of every market.

These are not the only studies of media concentration. However, these are useful examples of how concentration studies have been conducted. The research does not typically include a methodology to relate concentration of ownership with media content. All of these cases highlight the high level of concentration reached in the different markets, the presence of media and communication groups that have dominant positions in several media markets, and the need to have regulations that protect content diversity and media pluralism.

## **Conflict and Cooperation across the Life-Span**

*Yan Bing Zhang*

*University of Kansas*

Conflict is pervasive and has been examined extensively in various relationships and communication contexts (Hocker & Wilmot 1991; Putnam & Poole 1987). Communication

scholars, however, have only recently begun to investigate this phenomenon from a life-span perspective, suggesting that communication among people at different ages deserves special attention. Nussbaum (1989) argued that people of different ages not only experience life events in unique historical contexts, but also develop different physical, cognitive, and psychological selves (→ Development Communication). In line with the life-span perspective, recent research on intergenerational communication in conflict situations has demonstrated several key factors influencing individuals' conflict styles, including age, age stereotypes, and cultural values. From the life-span perspective, the focus of this article is to explore the nature of conflict, conflict styles, intergenerational conflict management, and how younger and older adults differ in their perceptions and attributions of conflict and conflict-management styles.

### CONCEPTUALIZING INTERGENERATIONAL CONFLICT AND MANAGEMENT STYLES

Putnam and Poole (1987) state that conflict is “the interaction of interdependent people who perceive opposition of goals, aims, and values, and who see the other party as potentially interfering with the realization of these goals” (p. 552). In a similar vein, Hocker and Wilmot (1991) define conflict as “an expressed struggle between at least two interdependent parties who perceive incompatible goals, scarce resources, and interference from others in achieving their goals” (p. 21). Conflict can be functional and dysfunctional; its constructive functions are contingent upon appropriate management. Therefore, in the last few decades, scholars have sought to identify, conceptualize, and teach the preferred and most effective conflict styles in various relational and communication contexts (→ Conflict Resolution).

Thomas and Kilmann (1974) identified *five major conflict-management styles*: competing, collaborating (or problem-solving), avoiding, compromising, and accommodating (→ Interpersonal Conflict). These five styles have been applied, adapted, and validated in slightly different ways in research. Conceptually, the *competing style* focuses on the needs of the self over those of another by using an assertive communication style in an uncooperative manner to defend a personal position. The *problem-solving style* attempts to generate a plan of action in a cooperative manner that is mutually satisfying to all parties. The *avoiding style* has been identified with withdrawal and failure to take a position through an unassertive and uncooperative response with low concern for self and the other party. The *compromising style* emphasizes mutual concession-making by following the middle ground. The *accommodating style* is a self-sacrificing approach featuring the other person's satisfaction through being unassertive and cooperative.

A few studies have provided justification for combining compromising and problem-solving (e.g., Cai & Fink 2002). The accommodating style specified in Thomas and Kilmann (1974) has been largely ignored. Recently, however, research has found that the accommodating style, which emphasizes relational harmony and not necessarily problem-solving, is a distinctive style. In addition, the four conflict styles of *competing*, *avoiding*, *accommodating*, and *problem-solving* are found to be applicable to intergenerational communication research (e.g., Zhang et al. 2005), which has been examined from interpersonal and intergroup perspectives (→ Intergenerational Communication).

Each individual's communication behaviors are influenced by a personal identity, a social identity, and a cultural identity (→ Age Identity and Communication). While personal identity is composed of individuals' unique characteristics (e.g., polite, honest, and hardworking), social identity develops as a consequence of membership in a particular group within one's culture. Without denying the impact of one's personal identity, the life-span perspective on intergenerational communication incorporates intergroup and intercultural theories to enhance our understanding of the particular ways in which people from different generations manage their interactions. Intergenerational conflict management thus refers to an ongoing communication process where younger and older adults negotiate and manage their interactions as individuals while also considering group differences.

### **THEORETICAL FRAMEWORKS AND INTERGENERATIONAL CONFLICT**

Aside from the interpersonal conflict frameworks, several intergroup theories speak of the nature of conflict management in intergenerational relationships. Tajfel's (1981) *Social Identity Theory* (SIT) maintains that human beings have an innate need to organize their social world into categories or groups (e.g., age groups) and to show positive ingroup distinctiveness in social comparisons in order to gain self-esteem (→ Social Identity Theory). As a consequence of this categorization, individuals might ascribe to group traits, behave in stereotypical group ways, and show ingroup favoritism and outgroup prejudice and discrimination. Grounded in SIT, Howard Giles's *Communication Accommodation Theory* (CAT) examines how different motivational processes influence communication styles, as well as the attributions, evaluations, and intentions for future interaction that people make as a result (→ Communication Accommodation Theory). Guided by CAT, Ellen Ryan's *Communication Predicament of Aging* (CPA) model was developed to explain roles of age stereotypes in intergenerational communication (→ Social Stereotyping and Communication). In its simplest form, the CPA model outlines how young people's speech accommodations based on age stereotypes may create a negative feedback cycle for older adults (Ryan et al. 1986; → Intergroup Contact and Communication).

Guided by these theoretical frameworks, research on intergenerational communication has revealed unsatisfying young-to-old and old-to-young communication behaviors that are sources of intergenerational conflict. In intergenerational communication, conflict may arise due to generational differences over lifestyle choices, habits, worldviews, and political beliefs, and the negotiation of these differences often involves verbal or behavioral expressions. Conflict can easily escalate if these differences are not managed well. Zhang (2004) examined Chinese college students' written accounts of their intergenerational communication experiences in conflict situations to uncover conflict-initiating factors. Results indicated five major types of initiating factors including old-to-young criticism, old-to-young illegitimate demand and rebuff, young-to-old criticism and disagreement/generation gap. Comparison of the initiating factors identified in this study with previous studies on interpersonal conflict (e.g., Witteman 1992) reveals that some of the categories are shared (e.g., criticism, illegitimate demand, and rebuff) and some are different (i.e., *young-to-old* criticism and disagreement/generation gap, *young-to-old* rebuff and older

adults' physical/mental inability). While the most frequent initiating factor in interpersonal conflict is annoyance, the most frequent initiating factor in intergenerational context is criticism. These results indicate the influence and functions of age and age stereotypes in intergenerational communication in conflict situations.

Several studies have been conducted as initial forays into *intergenerational conflict management styles*. Bergstrom and Williams (1995) took an intergroup perspective to examine young people's perceptions of intergenerational conflict. They manipulated age in order to make the target either an older person or a young adult in a work setting. Results indicated that respondents reported most satisfaction with an older co-worker who was cooperative and least satisfaction with a young co-worker who competed. Bergstrom and Nussbaum (1996) examined younger and older adults' general conflict-style preferences. Participants completed a conflict questionnaire and recalled and described a recent conflict scenario. The researchers found that younger participants scored higher on the control style whereas the older sample scored higher on the solution-oriented style. They also found that the younger adults preferred to use non-confrontational style as the depth of the conflict increased, but depth of conflict did not affect older adults' reports of style preference. Bergstrom and Nussbaum (1996) claimed that preference for solution-orientation in conflict management increases as individuals age (→ Communication Skills across the Life-Span). Supporting this view, Cicirelli (1981) found a negative relationship between the age of adult children and their report of conflict with their parents, indicating that maturity likely minimizes the base for conflict between them.

Zhang et al. (2005) examined intergenerational *conflict management styles in China* from both older and younger adults' perspectives. Older and younger Chinese adults were randomly assigned to evaluate one of the four conversation transcripts in which an older worker criticizes a young co-worker. The young worker's response to the older worker's criticism was manipulated to reflect competing, avoiding, accommodating, or problem-solving. Results demonstrated that older participants favored the accommodating style over the problem-solving style. Young adults either preferred the problem-solving style to the accommodating style, or judged the two styles as equally positive. The findings revealed the combined effects of age-group membership and cultural values on how conflict styles are evaluated (→ Communication Modes, Asian).

Suitor and Pillemer (1988) examined intergenerational conflict in the family context between *adult children and elderly parents* who live together. The researchers' telephone interviews with 372 older adults revealed that the conflict frequency in general was reported as very low. From the perspectives of adult development and intergenerational relations, they explained that older adults were irritated less often in their relationships with young adults, due to more developed social maturity and emotional control. Among the reported conflicts, adult children's dependence on housing and need for financial assistance were listed as sources of conflict in addition to other factors such as how money is spent, who should do household chores, and the child's job. In general, previous research has indicated that young adults have more trouble differentiating between salient and non-salient conflict than older adults; thus older adults may not report those very same interactions as salient conflict (Sillars & Zeitlow 1993). From both elderly parents' and adult children's perspectives, Clarke et al. (1999) uncovered six most common themes of conflict between aging parents and their adult children, including communication and

interaction styles, habits and lifestyle choices, values, religion, work, and household standards. Close examination of the conflict themes reveal several frequent initiating factors centering on issues of interaction style (e.g., old-to-young criticism), most often listed by young adults, and generational difference in personal habits and lifestyle, most often cited by older adults.

Intergenerational conflict management from the life-span perspective emphasizes the influence of age-group membership, age stereotypes, and culture on the process. Yet much of the research on negative aspects of relationships such as conflict has focused on young adults' views. In addition, there has been little effort devoted to deriving theoretical explanations for why and how young versus older adults differ in perceptions and attributions of conflict. As age is a fundamental aspect of social categorization similar to other intergroup distinctions such as gender and race, future research should examine the influences of age salience on intergenerational conflict-management styles.

## Conflict as Media Content

*Simon Cottle*

*Cardiff University*

Conflicts are endemic to the known social world and can be defined straightforwardly as struggles between opposing interests and outlooks. How the media report and represent conflicts have been questions throughout the history of media and communications research. From early studies of propaganda in World War I to the latest research into the media's role in propagating, post-9/11, the US-led "global war on terror," media researchers have analyzed and theorized the multiple roles, dimensions, determinants, and impacts of media conflict reporting. In addition to studies of war reporting, countless others have examined, for example, how minority groups and protesters have been labeled and stereotyped in the media and how new social movements and cultural identities seek media access and symbolic recognition; how moral panics, public crises, and political scandals are performed and conditioned on the media stage (→ Scandalization in the News); how some conflicts become forgotten or hidden in dominant news agendas and how in others the media become involved in forwarding peace processes; how natural disasters and humanitarian emergencies are signaled around the world and how global risks, such as the fallout from nuclear accidents, migrating health pandemics, or climate change, become periodically symbolized and dramatized, discussed and debated (→ Agenda Building; Cottle 2006; in press).

Everyone, it seems, from elected presidents to eco-warriors, now looks to the media to advance strategic aims and symbolic claims. Some protagonists have considerable institutional advantages over their opponents and unashamedly use them to manipulate media agendas to insure that their preferred message gets across (or, equally, that damaging information never finds its way into the media sphere). The resource-poor and institutionally powerless, for their part, are apt to resort to creative tactics or turn to new media in their bid to gain media space and symbolically counter structural imbalances of power.

Environmentalists and antiwar protestors, for example, have become adept at deploying symbols and cultural myths or at staging stunning media events – “dissent events” – to attract the media spotlight (→ Media Events and Pseudo-Events). Whether pursued strategically by powerful corporate and government interests, or more tactically by diffuse cultural identities, the media have become a prized arena for the waging of conflict.

The discourses, symbols, and themes of media representations serve to variously define and legitimize or deny and delegitimize conflict aims (→ Symbolic Annihilation; Bias in the News). Conflict protagonists can be humanized, heroized, and held in high moral esteem or publicly dehumanized, denigrated, and even demonized. And conflicts can also be presented in historical context, discussed in terms of perceived or real injustices, and portrayed as politically dynamic and culturally meaningful, or they can be depicted as random violent events, seemingly without context or cause, perpetrated by criminals, pathological crowds, and bloodthirsty states or reified in Manichean terms as a “clash of cultures.” It is in and through the array of contending voices and views that manage to access the media and thus have the opportunity to publicly “put their case” that the state of democracy in today’s societies is revealed and publicly constituted.

The voluminous research into media conflict has also helped to recover the complex interactions between media and conflict processes as they unfold through time and in relation to political and other contingencies (Cottle 2006; → Reciprocal Effects). Researchers are increasingly cognizant of the dynamic nature of media conflicts and how representations of the same are often contested within and outside the media and how and why these can change across time (Wolfsfeld 1997). Critical sights are prematurely narrowed if media conflict representations are presumed to remain constant or invariant across different fields of conflict, say war, environment, crime, or political scandal, or when ideas of “media bias,” “distortion,” or even “propaganda” are uncritically assumed (→ Construction of Reality through the News). These concepts often do not have the necessary analytical precision and overlook epistemological issues surrounding media representations and analysis. Enemies and opposing parties, by definition, are likely to hold to different beliefs, values, and historical accounts, so recourse to notions of “nonbiased” media representations based, say, on “experts” and “evidence,” “history” and “truth,” can often simply compound, not reconcile, contending world outlooks. With few notable exceptions (Herman & Chomsky 1988), researchers today distance themselves from earlier monolithic views of mainstream media as instruments of “propaganda” working at the behest of dominant political and corporate elites. Nonetheless, most acknowledge the continuing structural imbalances, market imperatives, and political alignments of western mainstream media and how conflicts involving state interests such as war, terrorism, and foreign policy continue to summon government and military attempts at media control and censorship (Allan & Zelizer 2004). These, however, are often opposed by media professionals, and other shaping factors of media conflict are also at work. Deep-seated news values (“violence,” “deviance,” “drama,” “elite orientation,” “human interest,” and “spectacular images”), as well as the known “event orientation” of news and journalism’s reliance on key institutional sources and their definitions of events are all key explanatory factors in media conflict studies (Gitlin 2003/1980; Murdock 1981; → News Factors; News Values).

Today’s media ecology includes traditional media of mass publicity, press, and broadcasting as well as new digital and interactive media such as the Internet. Here

top-down, vertical communication flows from the “few to the many” by national elites are rapidly being supplemented by wider networks of bottom-up and horizontal communication flows conveyed by diverse groups and individuals around the world in “many-to-many” mode (Bennett 2003). This complex of media forms and flows makes attempts at censorship and control of conflict representations increasingly difficult. Globalizing communications and “contraflows” of alternative and oppositional views and voices render national borders and political cultures increasingly porous and contribute also to the historical “transformation of visibility” (Thompson 2000). Here powerful elites and their misdeeds are more readily exposed in the media than hitherto and they can often become subject to public censure in media-led scandals.

## **Conflict Resolution**

*Katharina Holzinger*

*University of Constance*

Conflict resolution, in general, deals with ways of eliminating, terminating, or settling all kinds of conflict. Conflict can be broadly defined as a state of opposition, incompatibility, contradiction, or disharmony of statements, beliefs, goals, interests, or values among or

within individual or collective actors, and the observable processes of dealing with these differences. The notion of conflict thus has two aspects: (1) the “state of opposition,” which can be established and analyzed without any reference to the behavior of the parties; for example, opposing interests or contradictory claims of the parties to a conflict, and (2) the actual “conflict behavior” of the parties; for example, physical force or verbal dispute. The first aspect relates to the causes or motives behind the conflict; the second to observable action. Conflict behavior may take two forms: physical action, as in the use of force, and communicative action, as in arguments or disputes.

### TYPES OF CONFLICT

Conflict is ubiquitous and not even restricted to social → interaction. It can take place within individuals (intrapersonal → cognitions or → emotions), between individuals (partners, neighbors), between societal groups (religious or ethnic groups, social strata), and between more or less organized collectives (e.g., in industrial relations), most notably, states (international conflict and war; → Intercultural and Intergroup Communication). The objects of conflicts are manifold: scarce commodities, money, income and property distribution, power positions, individual or political goals, values, ideologies, religion, and so forth.

Given this background and depending on research interest, various *typologies of conflict* have been proposed. Examples of simple dichotomous typologies are the distinctions of latent or manifest, antagonistic or nonantagonistic, and functional or dysfunctional conflict. An early and encompassing typology was provided by Dahrendorf (1959), who divided conflict according to the affected actors, reaching from the individual to the nation state into role, group, class, party, and international conflict. Holzinger (2004), concerned with the communicative resolution of social conflict, distinguishes three types according to the substance of conflict: conflict over facts, over values, and over interests. Game theoretic typologies classify various constellations of conflict according to the degree of opposition of interests: the level of conflict is highest in zero-sum games while nonzero-sum games (such as the prisoners’ dilemma or the battle of the sexes game) include also motives for common action. Coordination and harmony games, by contrast, do not include any conflict of interest (e.g., Rapoport et al. 1976; Scharpf 1997).

### TYPES OF CONFLICT RESOLUTION

Like conflict behavior, conflict resolution may take the two basic forms of physical action and communication. Physical force may be used to terminate conflicts. However, in a more demanding meaning, any resolution of conflict will have to rely on communication. The notion of conflict resolution or dispute settlement may imply various meanings. First, the most ambitious is an understanding of conflict resolution that aims at the *elimination of the causes or the motives* behind the conflict. If the causes are eliminated, no future outbreaks of conflict behavior are to be expected. One example is the clearing up of a misunderstanding leading to conflict behavior. Another example is the misperception of a conflict constellation by the parties. A classical story used in the literature on mediation may illustrate this. Two sisters quarrel over a lemon until the mother joins in and finds

out that one of the sisters wants the juice while the other one wants the peel for baking a cake (Amy 1987). Perceived conflict turns out to be no conflict in the first meaning outlined above, although there was conflict behavior. We can thus assume that such a solution is stable.

Second, a less ambitious notion of conflict resolution aims at the *termination of destructive conflict behavior*. There are basically two ways of achieving this. First, the parties in conflict can voluntarily come to an agreement they can live with. The conflict is settled. However, there remains a problem of implementation and compliance, as there may be incentives to deviate from the agreement. The solution is thus not stable; the conflict behavior may break out again. Second, one party may have the power to impose a particular “solution” on the other. The manifest conflict is terminated, but it is not “resolved” in any demanding meaning of the term. Examples of this kind of termination are decisions taken by the winner of a war or by the superior party in a hierarchical setting. There will usually be winners and losers in such a situation. The solution is less stable than in the case of voluntary agreement discussed above, because the inferior parties will be dissatisfied with it.

Modern societies have developed sophisticated mechanisms for the resolution of conflict. These mechanisms include:

- 1 *Hierarchies and physical force*: conflict resolution by power and force or in hierarchies will usually lead to winners and losers and will terminate a conflict rather than dissolve it. The stability of the solution will certainly depend on the power difference of the parties, but also on the legitimacy of a hierarchical relationship.
- 2 *Laws and courts*: dispute resolution by laws and courts, based on general rules and their interpretation by a neutral party, possesses legitimacy and will thus produce more acceptance and stability, although it might also create winners and losers.
- 3 *Majority voting*: the same is true for the resolution of a conflict by majority voting. It has democratic legitimacy but creates losers. Conflict will not be eliminated; however, it can be settled and terminated, at least for some time.
- 4 *Negotiation and consensus-based procedures*: the highest potential for reaching a stable settlement has unanimity or consensus as a decision rule. As all parties must agree with the solution found, there are no clear winners or losers. All parties win something, but usually do not get everything they wanted. In negotiations, a compromise can be reached by the willingness of the parties to make concessions. Bargaining usually does not strive for the elimination of the conflict of interest, but for only its settlement. In procedures based on argumentation or deliberation, a consensus can be achieved by reasoning and by convincing the other parties of one’s own position. Consensus-oriented arguing has the potential to eliminate those aspects of a conflict that result from opposing views on values or facts, and may thus lead to the full resolution of a conflict. However, mechanisms based on unanimity are very demanding in terms of finding a solution at all.
- 5 *The involvement of a neutral party*: such mechanisms as arbitration in industrial relations build on the ideas of fairness and impartiality. Whether these procedures lead to a stable resolution of conflict depends not only on the quality and the impartiality of the arbitrators’ proposal, but also on whether it is obligatory. If it is accepted by the parties, it has a better chance of surviving.

## ALTERNATIVE DISPUTE RESOLUTION

Apart from these classical mechanisms of conflict resolution in society, various so-called alternative dispute resolution (ADR) mechanisms have been developed during recent decades (Pruitt & Carnevale 1993; Goldberg et al. 2003). There are many different models of ADR – negotiation, moderation, conciliation, mediation, round tables, policy dialogues, consensus conferences, planning cells, participatory technology assessment, deliberative discourse, just to name a few.

*Four elements* are constitutive of ADR procedures, although they are not all present in each model. *First*, they are built on communicative strategies of problem solution – information exchange, rationality, and “de-emotionalization” play a great role. The hope is that conflict can be eliminated altogether (or at least in some aspects). *Second*, they are consensus-based and aimed at win–win solutions. Nobody should be worse off after an agreement has been found, so there are no losers. *Third*, many of them include the presence of a neutral third party in various roles, as a moderator, mediator, or arbitrator. This contributes to the objectivity, impartiality, and, thus, acceptability of the solution. *Finally*, most ADR models are based on enhanced participation; that is, not only elected representatives but all stakeholders, or even all citizens, should have a chance to take part in the procedure. These four elements imply an ambitious notion of conflict resolution: if possible, the mechanisms should lead to the complete elimination of the conflict; if this is not the case, they should produce an agreement that is as stable as possible.

## THE ROLE OF COMMUNICATION

Any attempt to resolve a conflict or to terminate conflict behavior will usually be accompanied by some communication – which need not necessarily contribute to the resolution. There are *three functions for communication* in dispute settlement. *First*, it provides information on facts related to the object of conflict and information on the values, goals, interests, beliefs, and emotions of the parties. *Second*, communication takes the form of bargaining such as demands, offers, threats, and concessions signaling the willingness of the parties to agree to a compromise. *Third*, it can take the form of arguing. Arguments are exchanged and reasons are given in order to convince the other parties of the validity of one’s claims and to come to a consensus (Holzinger 2004).

Two abstract *models of communicative conflict resolution* have become especially influential: the Harvard concept of negotiation (Fisher et al. 1997) and the theory of communicative action and discourse ethics by Habermas (1984, 1993). The *Harvard concept* proposes four principles for objective negotiation. First, the parties shall learn to distinguish between the substantial problem and the emotional aspects of the conflict. Second, the parties shall concentrate on their interests, not on positions. Third, the parties shall develop options advantageous for both sides. Fourth, neutral criteria shall be applied in order to find a fair solution. These rules imply that the parties should not sacrifice their interests but try to find a fair compromise. The third and fourth rules ask for the search for information and for argumentation and justification. The hope is that the parties find a solution that is welfare-enhancing (win–win) and fair.

Habermas proposes a procedure for the justification of norms and values in a society. The procedure is called the “ideal → discourse” or the “ideal speech situation,” within which *verständigungsorientiertes Handeln* – that is, consensus-oriented argumentation – can take place (→ Habermas, Jürgen; Political Discourse; Public Opinion). The goal is the rational justification of norms; i.e., it is about collective decisions over rules valid for the whole society. The ideal speech situation is subject to a range of normative conditions. It has to be public; all concerned shall take part; the participants have to be equal; they have to be truthful and not opportunistic; the participants shall be impartial and their interests “generalizable”; and their preferences must be open to change. It is only the “power of the better argument” which counts. A norm is valid if all participants of a practical discourse achieve a consensus that this norm is valid (“principle of discourse ethics”). The consensus can be achieved as a result of the “principle of universality,” which secures impartiality. A valid norm must satisfy the condition that the consequences following from general compliance to it for each individual’s interests will be accepted by all concerned individuals.

The Harvard concept conceives of the process of conflict resolution as a bargaining situation. It focuses on the settlement of a conflict of interests, and emphasizes compromise and the willingness to concede. Communication serves to create more information and generate impartiality and objectivity. However, discourse ethics focuses on argumentation and reasoning. Habermas is concerned about conflict over values and norms in society and emphasizes the role of justification, persuasion, and consensus. The two concepts vary more strongly in which kinds of conflict they have in mind than in the normative rules they develop. Both rely on information, justification, and impartiality. The main difference is that the Harvard concept accepts opposing interests as given and looks for ways of accommodation, whereas Habermas requires the parties in a conflict to be willing to sacrifice their personal interests.

Research in conflict resolution is very dispersed in social science. It takes place in many disciplines, such as psychology, sociology, law, political science, and economics, and it comprises normative and analytical approaches. Although there are interdisciplinary research centers, such as the *Harvard Program on Negotiation*, research areas as different as studies in international conflict and peace, in the resolution of social and institutionalized political conflict, on ADR, or on personal conflict so far lack a common analytical framework. Future research would gain by doing more systematic comparison of the performance of the different conflict resolution mechanisms for various types of conflict.

## Conflicts of Law

*Ashley Packard*

*University of Houston-Clear Lake*

The term “conflicts of law” refers to the procedures courts use to determine the appropriate law and place to settle a claim in cases involving litigants from different nations or sovereign states within federations. This area of law encompasses three separate but related concepts: *personal jurisdiction*, *choice of law*, and *enforcement of foreign judgments*. In Europe conflict of law is more commonly called *private international law*. Its corresponding branches are *adjudicative jurisdiction*, *prescriptive jurisdiction*, and *enforcement jurisdiction*.

In the context of communication, these issues come into play when publishers or broadcasters are sued in jurisdictions other than their own for material they disseminate. A New York magazine that publishes an article about a Japanese businessman, for example, could be sued for defamation in Tokyo if the subject feels his reputation was harmed there. In such a case, the forum court in Japan would first have to determine whether it has personal or adjudicative jurisdiction – or, in other words, the power to hear the claim. A court may exercise personal jurisdiction over conduct that occurs within its territory or that involves its citizens. It may also exercise jurisdiction if the effect of the injurious conduct occurs within its borders, regardless of where the actual conduct took place.

In cases involving international litigants, courts are obliged to consider the *interests of other states* that might assert jurisdiction as well. This practice, known as comity, is generally equated with reasonableness. In general, exercise of jurisdiction is considered reasonable if there is a link between the person, natural or a corporation, and the state; if the person has consented to exercise of jurisdiction; if the person regularly does business in the state; or if the person engaged in an activity outside the state that had a

substantial and foreseeable effect within the state. If the court determines that, in the interest of justice and convenience of the parties involved, it would be better to try the case in another forum, it may refuse to exercise jurisdiction under the doctrine of *forum non conveniens*.

European Union nations have simplified the process of resolving cross-border disputes by adopting the *Brussels Regulation*, a treaty specifying the rules for exercising jurisdiction among EU members (→ European Union: Communication Law). Elsewhere, nations have attempted to form international agreements on jurisdiction with less success. The Hague Convention on Private International Law established an international agreement for business-to-business choice of court decisions. But it failed to accomplish its larger goal of developing a general agreement on jurisdiction and recognition of civil judgments, because the negotiating parties could not agree on the appropriate criteria for exercising jurisdiction over foreign defendants.

Once a court assumes jurisdiction, it must decide the law to prescribe in the case. The court may apply the law of the forum (*lex fori*), which is common when the legal question is procedural, or related to the rules used to decide a case. Or the court may apply the law of the site where the tort or delict was committed (*lex loci delicti commissi*), which is normally the case when the legal question is substantive, or related to the rights and obligations of the parties involved. So, assuming that the Japanese court in the earlier example asserted jurisdiction over the New York magazine, it would then have to decide whether to apply the defamation laws of Japan or New York.

Civil law nations, such as Japan and most European countries, predominantly determine choice of law interest based on the principle of territoriality. The *lex loci* doctrine operates under the theory that people should expect to be held accountable for the laws of the places where they visit or engage in business – or, in the case of media, where they publish or broadcast. The rule also fosters simplicity and predictability.

Most commonwealth nations, like Australia and Canada, rely on *lex loci* for choice of law as well, although they may institute exceptions in certain cases. For example, although the United Kingdom recognizes *lex loci* as the principal doctrine to be used in tort cases, it exempts defamation from the rule. Defamation cases still fall under its common law rule of double actionability, which requires a tort to be actionable under English law as well as the other nation's law before English courts will consider it.

*Lex loci* was also the prevailing theory in the United States until the mid-twentieth century. Now, however, while territoriality is still a factor in determining personal jurisdiction and choice of law in the United States, it is considered insufficient to rely on it alone. Most US courts have endorsed the approach recommended in the *Restatement (Second) of the Conflict of Laws*, which is to apply the law of the state with “the most significant relationship to the occurrence and parties” (American Law Institute 1968). Many also employ interest analysis, in which the forum court is expected to consider the needs of state and international systems, the relative interests of the forum and other states that may be interested in the issue, the protection of litigants' expectations, the policies underlying the particular law, predictability and uniformity of result, and ease of adjudication in its choice of law. Interest analysis is more nuanced and flexible than *lex loci*, but it also lacks predictability, an important consideration in legal systems based on *stare decisis*.

The borderless nature of the Internet has magnified already inherent tensions in conflicts of law (→ Internet; Internet Law and Regulation). The traditional practice of relying on the place where the harm is felt to determine jurisdiction and choice of law exposes Internet publishers to potential legal action wherever the material can be downloaded (→ Online Media). And, because standards for content vary among nations, Internet publishers can be sued in foreign jurisdictions for content that would be legal in their own country. But the Internet is just the latest in a series of modern advances that have pushed legal issues beyond sovereign boundaries. Broadcast television and radio, satellite and other types of telecommunication technology have raised similar concerns (→ Telecommunications: Law and Policy; Satellite Communication, Regulation of).

This dilemma has inspired calls to harmonize conflicts of law among member nations of the European Union. The EU has a choice of law agreement for contractual obligations already in place. Member nations are now trying to reach an agreement on choice of law issues in noncontractual obligations. But the treaty, dubbed “Rome II,” has been impeded by contradictory views on the latitude courts should have in determining choice of law in defamation and invasion of privacy torts, particularly in the context of Internet publication (→ Libel and Slander; Privacy).

Courts that render judgments against foreign defendants are powerless to enforce them outside of their own jurisdictions. But most nations show deference to foreign legal decisions in the hope of encouraging reciprocal recognition of their laws and judgments. This deference is not without exception, however. Courts can refuse to enforce foreign judgments that conflict with their nation’s fundamental public policies.

# Consensus-Oriented Public Relations

Roland Burkart

Sofia University St. Kliment Ohridski

Consensus-oriented public relations (COPR) is a concept for planning and evaluating → public relations (PR). Especially in situations with a high chance of conflict, companies and organizations are forced to present good arguments for communicating their interests and ideas – in other words, they must make the public understand their actions (→ Corporate Communication; Crisis Communication). Therefore, in the viewpoint of COPR, understanding plays an important role within the PR management process (Burkart 2004).

## THEORETICAL BACKGROUND

On the one hand, the COPR model ties up with Grunig and Hunt (1984) and the PR goal “mutual understanding” within their two-way *symmetric model of public relations*. Grunig and Hunt argue that primarily in situations with a high chance of conflict, PR must try to establish mutual understanding between organizations. On the other hand, the theory and terms of communication used for the COPR model are the ones established by → Jürgen Habermas in his theory of “communicative action” (1981). According to this theory, communication always happens as a multidimensional process, and each participant in this process needs to accept the validity of certain quasi-universal demands in order to achieve understanding.

This implies that the partners in the communication process must mutually trust that they fulfill the following criteria: (1) intelligibility (being able to use the proper grammatical rules); (2) truth (talking about something the existence of which the partner also accepts); (3) trustworthiness (being honest and not misleading the partner); and (4) legitimacy (acting in accordance with mutually accepted values and norms). As long as neither of the partners has doubts about the fulfillment of these claims, the communication process will function uninterruptedly.

However, these ideal circumstances are an ideal type of imagination – they hardly ever occur in reality. Often, basic rules of communication are violated and therefore there is a certain “repair mechanism,” which is called → *discourse*. Discourse means that all persons involved must have the opportunity to doubt the truth of assertions, the trustworthiness of expressions, and the legitimacy of interests. Only when plausible answers are given will the flow of communication continue.

Basically, Habermas distinguishes three types of discourse (Fig. 1). In an *explicative discourse*, we question the intelligibility of a statement, typically by asking, “How do you mean this?,” or “How shall I understand this?” Answers to such questions are called “interpretations.” In a *theoretical discourse*, we question the claim of truth, typically by asking “Is it really as you said?,” or “Why is that so?” Answers to such questions are called “assertions” and “explanations.” In a *practical discourse*, we question the normative rightness (legitimacy) of a speech act by doubting its normative context, typically by asking “Why have you done this?,” or “For what reason didn’t you act differently?” Answers to such

questions are called “justifications” (Habermas 1984, 110 ff.). A fourth aspect, i.e., the claim of trustworthiness (typical questions: “Will this person deceive me?”, “Is he/she mistaken about himself/herself?”), is an exception as it cannot be subject to discourse because the communicator can prove his or her truthfulness only by subsequent actions (Habermas 1981, vol. 1, 69).

Discourses must be free of external and internal constraints. However, this is what Habermas calls “contrafactual” because the “ideal speech situation” that would be required for this does not exist in reality. We only act as if it were real in order to be able to communicate (Habermas 1984, 180).

The process of “understanding” is not an end in itself. Normally we pursue the intention of putting our interests into reality. Thus, understanding becomes the mean for the coordination of actions, as the participants involved in this process aim at synchronizing their goals on the basis of common definitions of a situation (Habermas 1981, vol. 1, 143f., 385f.). This leads to the conclusion that commonly accepted definitions of a situation need undisturbed processes of understanding as a prerequisite for deciding what should be done in a given case.

### **PUBLIC RELATIONS AS A PROCESS OF UNDERSTANDING**

The COPR model focuses on the above prerequisites. PR managers who reflect on the basic principles of communication will always orient their activities in accordance with possible criticism maintained by the public. However, the COPR model is not a naive attempt to transfer Habermas’s conditions of understanding directly onto the reality of PR. In view of the theory’s contrafactual implications, this would be inadequate. It was rather a goal to gain from Habermas’s concept of understanding new ideas for the analysis of real PR communication. The main impact of creating the COPR model was the possibility of *differentiating communicative claims*, so that this process of questioning can now be analyzed more systematically.

Especially in situations where conflicts are to be expected, PR managers have to take into account that their messages might be questioned by critical recipients. Members of the publics involved will offer their doubts about the truth of presented PR information, especially when confronted with numbers, other data, and facts. They will question the trustworthiness of the company and its communicators, as well as the legitimacy of the company’s interests (→ Trust of Publics). This is illustrated in Figure 1.

For example, if a community plans to build a waste disposal site, this will most likely cause disturbance among the local residents. Sometimes even a citizens’ initiative will be formed that aims at bringing down the project. Normally the local media will support the protests, so a conflict situation can be expected (→ Advocacy Journalism). On the basis of the COPR model, the PR managers of the company planning the landfill should consider that (1) any assertion they make will be examined concerning its truth, e.g., whether figures about the quantity of waste to be deposited are correct, whether air, plants, wildlife, groundwater, etc. are really not endangered; (2) the persons, companies, and organizations involved will be confronted with distrust, e.g., representatives of companies might be taken as biased, experts/consultants as incompetent or even corrupt; (3) their intention for building the landfill will be doubted in principal, either because the basic

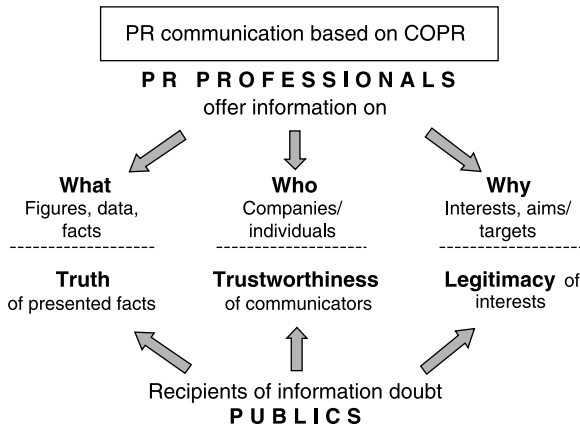

Figure 1 PR communication based on consensus-oriented public relations

strategy for waste disposal is questioned (e.g., by preferring waste avoidance as an alternative to landfills), or because the choice of the site for the landfill is seen as unjustified (e.g., because the region has just started developing tourism). Only if it is possible to eliminate such doubts, or, even better, if doubts are prevented from the very beginning, can the flow of communication not be disturbed (→ Corporate Reputation).

### PLANNING AND EVALUATION OF COPR

In the COPR process, four steps with corresponding objectives can be distinguished. These steps must be adapted to the actual conflict situation, in order to use COPR as a planning tool. This also makes it possible to evaluate the success of PR activities not only in a summative sense (at the end of a PR campaign) but also in a formative way (meaning step by step). For instance, on the information dimension, the following questions can be asked: “Have the relevant facts been presented?” (What?), “Have the main company figures been mentioned?” (Who?), and “Have the project goals been justified?” (Why?).

In the case of a planned landfill in Austria, the conception of COPR was useful for analyzing and explaining the consequences of the PR activities that the company launched in the conflict that arose from their project (Burkart 1993, 1994). A representative survey showed that the acceptance of building the landfill correlated convincingly with the degree of understanding. Respondents who tended to accept the project were not only better informed but also less likely to question the trustworthiness of the planners and the legitimacy of the choice of site for the landfill.

Nevertheless, the COPR model is not a recipe for generating acceptance. People cannot be persuaded to agree to a project by pressing a “PR button,” because acceptance can only emerge among the persons involved if the process of understanding has worked successfully. The prerequisite for this is that the need for dialogue and discourse on the side of the public is taken seriously by the companies and communication managers concerned, especially when the former feel restricted or even threatened by company interests and plans.

## **Consistency Theories**

*Sabine Trepte*

*Hamburg Media School*

In social psychology, consistency theories constitute a body of four theories: → Leon Festinger's → cognitive dissonance theory (1957), Fritz Heider's balance theory (1946, 1958), Charles Osgood and Percy Tannenbaum's consistency theory (1955), and Rosenberg's model of affective–cognitive consistency (1956).

Consistency theories are characterized by the assumption that humans strive for a balanced state of → cognitions and behaviors. If a set of cognitions or of cognitions and behaviors are contradictory in some manner to the person experiencing them, a state of imbalance, i.e., “dissonance,” occurs. The affected person perceives this state as unpleasant and is therefore motivated to reduce dissonance. Both behavior and cognitive activity are suitable for reducing dissonance.

### **COGNITIVE DISSONANCE THEORY**

The most influential of these four theories is Leon Festinger's cognitive dissonance theory. Initiated by this contribution, consistency became one of the most studied topics in social psychology from 1960 to 1970. The theory implies that people fall into an unpleasant

state of affairs if the different cognitions (thoughts, → attitudes, beliefs, states of behavior awareness) and the behaviors they produce are inconsistent. According to Festinger (1957, 13), “two elements are in dissonant relationship if, considering these two alone, the obverse of one element would follow from the other.” Consequently, to reduce dissonance a person might change or add elements that led to dissonance, or he or she might engage in active behavior either to avoid situations and information that increase dissonance or to actively reinterpret the situation or information.

The → *selective exposure hypothesis* states that dissonant information is avoided except when attitudes are very strong or very weak. If attitudes are strong, the affected person can find enough opposing arguments to integrate dissonant information into his or her cognitive system. If attitudes are weak, this person might better discover the truth and change his or her personal attitude. In this manner dissonance is avoided more effectively over time. In subsequent research on cognitive dissonance, → selective perception and selective retention were observed.

Varying kinds of selective exposure have been differentiated in terms of which information was selected, how much importance and meaning viewers and listeners allocated to it, and how they evaluated this type of media content. Researchers applying cognitive dissonance theory in empirical research discovered a number of methodological and theoretical problems, and found that the theory is unable to predict information behavior in the way its protagonists first thought possible. Nevertheless, cognitive dissonance can explain some variance in exposure to news, although the valence (positive or negative), the news value, and the positioning of a news item can overrule its influence on exposure (Donsbach 1991).

## BALANCE THEORY

Heider’s balance theory was derived from gestalt psychology (1946, 1958). Additionally, its formulation was influenced by Lewin’s field theory, i.e., all kinds of human perceptions such as objects or events can be summarized into a cognitive field (1951). Balance theory describes the relationships between a certain person (P), another person (O), and an attitude, object, or topic (X). A balance between all three elements is said to occur if they have positive relationships, e.g., P liking O (positive relationship), O disliking X (negative relationship), and P disliking X (negative relationship). This example depicts a balanced triad. It is supposed to be perceived as pleasant and remain stable over time.

Humans can encounter eight different relationships, four of which are balanced and the other four unbalanced. According to Heider, people prefer to have attitudes that are consistent with each other compared to those characterized by inconsistency. Humans try to retain consistency in their attitudes toward and in their relationships with other people and elements of the environment. People try to establish *balanced triads* in their day-to-day lives. As a consequence of unbalanced triads, people are motivated to alter elements and relationships within them. For instance, they could terminate the relationship with another person (O) or change their attitude toward an object or an event (X). However, we humans do not always try to resolve inconsistency in that way. Sometimes people would rather “reorganize” triads. For instance, they would not talk rudely about another person’s (O) hobby (X), if they liked this person but not the hobby. In empirical studies

subjects rated balanced triads as more pleasant and stable; however, research also shows that real-life triads are much more complex and that assumptions from balance theory are not always able to predict the complexity encountered in real-life triads.

The most important expansion of balance theory has been suggested by Newcomb (1953, 1961, 1978), who differentiates between balanced and unbalanced triads as well as triads without balance. He also investigates the relationship O has to P. A triad “without balance” is defined as one in which the P–O relationship is negative in at least one direction, e.g., O dislikes P. Accordingly, no interpersonal system can be defined and therefore the question of balance is not posed. Also, Newcomb addresses the relevance of relationships as a determinant of consistency. If, for instance, the relationship between P and O is perceived as very important, they are more likely to establish a state of balance.

### **CONSISTENCY THEORY AND AFFECTIVE-COGNITIVE THEORY OF CONSISTENCY**

This idea is also depicted in the *consistency theory* by Osgood and Tannenbaum (1955; Tannenbaum 1968). The authors expand balance theory in terms of quantifying how positively or negatively the other person (O) and the attitude, object, or event (X) are evaluated. These evaluations are made on semantic differential → scales. Osgood’s semantic differential method measures attitudes on a bipolar scale with opposite adjectives at the poles (e.g., good–bad, strong–weak). Subjects are asked to rate an object between the poles of given adjective pairs. Poles usually range from –3 to +3. The five spaces in between –3 and +3 are not indicated by words or numbers. Respondents are asked to check the space in between both poles that best indicates their attitude.

Congruity occurs if a person (P) evaluates an object (X) in a similar manner to how another person (O) did. If the evaluation relationships are balanced (e.g., a person evaluates an object as positively as another person did and both these people like each other), yet differ according to their quantitative value (e.g., P evaluates the object very positively, but O appreciates it only mildly), incongruity is the consequence. As with the other consistency theories, incongruity implies an unpleasant state of mind and leads to increased motivation to re-establish congruity.

Rosenberg’s *affective–cognitive theory of consistency* states that attitudes encompass a cognitive and an affective component (1956, 1960). The affective component implies the evaluation of the attitude object (e.g., positive evaluation of a politician) and the cognitive component implies the instrumental means (e.g., knowing that the politician is a Republican). Accordingly, humans strive for consistency among affective and cognitive components of their attitudes. Empirical research on this subject matter provided sound evidence that changes in one component will lead to the motivation to alter the other (Rosenberg 1960).

### **STATE-OF-THE-ART OF CONSISTENCY THEORIES**

Since 1960, consistency theories have increasingly lost recognition in social psychology, because information processing models have gained popularity and because consistency theories lack the complexity to predict behavior. In fact, in some instances, people may be

happy in situations characterized by imbalance and inconsistency. Yet despite criticism, consistency theories have inspired an enormous body of research and, until today, many of these results cannot be predicted by other approaches.

Apart from their outreach in social psychology, consistency theories have had a tremendous impact on the understanding of selective exposure to communication. In fact, they are still used to explain selective exposure, along with other theories such as → mood management or theories of social identity (→ Social Identity Theory). The impact of consistency theories for communication certainly lies in their scope to predict motivation. Communication scholars are able to define all kinds of subsequent actions of perceived inconsistency (e.g., selective exposure to mass media), cognitions (e.g., evaluation of mass media content or attitude change), and emotions. However, not all of the four theories named above have been equally addressed in communication research.

The theory of cognitive dissonance has gained the most attention and it has very often been applied to explain selective exposure to → news and advertisements (→ Advertisement, Visual Characteristics of). However, research on mass media effects has usually been realized in the form of correlational field research. Cotton (1985) and Donsbach (1991) have reviewed research on consistency theories in psychology and communication within recent decades. Accordingly, corresponding work addressed the question of how attitudes, e.g., toward political parties, are related to selective exposure to newspapers. It was hypothesized that subjects with strong or weak beliefs in political parties or candidates only show moderate interest in selective exposure, because they do not experience dissonance. On the contrary, a person with a moderate belief in a certain party or candidate shows strong interest in publications dealing with the subject matter, because he or she experiences cognitive dissonance. Findings produced in → field research of this kind were not always replicated in laboratory research conducted earlier in the domain of social psychology (→ Experiment, Laboratory).

Research on cognitive consistency was criticized on the grounds that it lacked appropriate consideration of inter-individual differences and characteristics of media content and format. Also, it was noted that scholars were not able to explain whether cognitive dissonance or some other psychological process was the reason for selective exposure. In addition, communication scholars have very often used cognitive dissonance as a theoretical inspiration rather than taking into account all corresponding research conducted in social psychology before. For instance, Donsbach (1991) holds that this manner of dealing with cognitive dissonance theory in communication hindered its development. Instead of doing rigorous research and appropriately recognizing such work, similar designs have been replicated over and over again. Cotton (1985) suspected that research on cognitive dissonance might decrease or even extinguish, because results are unequivocal and no new, inspiring issues have been raised. Donsbach (1991) argues that only rigorous research and consideration of all results on consistency theories can lead to adequate and ground-breaking progress. Consequently, the future directions that research on consistency theories will take are regarded as obscure.

## **Consolidation of Media Markets**

*Dwayne Winseck*

*Carleton University*

Consolidation refers to the expansion of media firms through mergers and acquisitions. Formally, it is distinct from the concentration of media markets, although the terms are often used interchangeably. To some observers, consolidation responds to the growth of new television networks and cable and satellite channels – e.g., MTV, HBO, ESPN, CNN, Fox News, Canal 1, A&E, Al Jazeera – and the splintering of audiences into niche markets (→ Television Networks; Cable Television; Satellite Television; Audience Segmentation; Arab Satellite TV News). Even the grip of the → Hollywood majors – Columbia, → Disney, Paramount, Twentieth Century Fox, Universal, and Warner Bros – over US and international film audiences appears to be slipping, with their share of the US market tumbling from 85 percent in 1994 to 66 percent in 2004. Throw into this mix the Internet's endless websites, downloading services, and innumerable blogs, and the idea of media

concentration seems anachronistic. As Benjamin Compaine (2001) states, “the democracy of the marketplace may be flawed but it is . . . getting better, not worse.”

Others disagree. Over the course of six editions of *The (new) media monopoly*, Ben Bagdikian has argued that while thousands of firms exist in the US media business, the number controlling half or more of the broadcasting, newspaper, and film industries has fallen from 23 in 1990 to just five in 2004 (→ Culture Industries). Robert McChesney (2000) concurs, arguing that by 1999 six conglomerates controlled most of the media market within the US, and even globally. In contrast to those who see more channels as an index of greater competition (*numerical diversity*), these observers focus on *source diversity* – the number of media owners in a market.

### EVIDENCE

Applying the method of concentration ratios (CR4; → Concentration in Media Systems) to the US, Alan Albarran (2003) found strong evidence of concentration in markets for music (CR4 98 percent; → Music Industry), television networks (CR4 84 percent), film (CR4 78 percent), and cable systems (CR4 61 percent). In terms of national → newspaper ownership, however, the top four owners controlled just under the 50 percent threshold (48 percent), although 98 percent of American cities have only one daily newspaper.

A study of media ownership by the *Canadian Senate* (2004) found similar trends. The top five newspaper groups’ share of circulation grew from 73 percent in 1994 to 79 percent by 2003. In terms of television, the top five groups accounted for just 31 percent of all stations in 1980, but by 2000 that grew to 68 percent. These groups’ share of audiences for all channels in English-speaking Canada also rose from 42 to 50 percent between 1997 and 2002.

In a *global market* consisting of hundreds of firms and worth \$258 billion (2005), ten firms account for 81 percent of revenue: Time Warner (\$43.7 billion), Disney (\$31.9 billion), Bertelsmann (\$28.9 billion), News Corp (\$25.3 billion), Viacom (\$24.1 billion), Comcast (\$22.7 billion), NBC/Universal (\$14 billion), Pearson (\$7.5 billion), Fuji Television Network (\$5 billion), and ITV (\$3.9 billion). All of these firms are conglomerates, seven are listed on *Fortune’s* list of the global 500 (2005) and all are based in the US (6), Britain (2), Germany (1) or Japan (1). Each derives the lion’s share of its revenue from domestic markets and from Europe, North America, and Japan; only a fraction of their revenues comes from the rest of the world (→ Media Conglomerates; Time Warner Inc.; Bertelsmann Corporation; News Corporation).

### EXPLANATIONS

Consolidation and concentration can be explained in several ways. Some argue that consolidation has historically occurred in cycles, first between the 1880s and the first decade of the twentieth century, then in the 1920s, 1960s, 1980s, and again from the late 1990s until, roughly, 2004. The current cycle is notable by the *sheer size* of some of the transactions, as illustrated by the unprecedented, but ill-fated, AOL and Time Warner deal, initially valued at \$166 billion in 2000 but which fell to \$106 billion a year later. A few deals have been transnational in scope, such as Universal Studios’ purchase by the French

diversified conglomerate, Vivendi, in 2000 (\$35 billion), although the failure of that deal spawned further consolidation when GE/NBC acquired Universal Studios in 2004.

One outcome of current trends is the unprecedented common ownership that now exists between the major television networks and Hollywood in the US: Twentieth Century Fox and the Fox Network (1985), Disney with ABC (1995), Time Warner and the WB network (1995), CBS and Viacom (1999), and NBC/Universal (2004). Hollywood majors have also countered the mounting impact of independents by taking them over, as exemplified by Disney and Viacom's acquisition of Miramax and Dreamworks, respectively, in 2005. Policy shifts in Canada have fueled acquisitions *across* the media by Bell Globe Media, Canwest, and Quebecor between 1998 and 2000. In Britain, the amalgamation of Granada and Carlton in 2003, after disastrous investments in digital terrestrial television brought both to the brink of bankruptcy, furthered concentration in the national television market.

These trends also reflect the *influence of financial markets* on media firms. Media firms have turned to financial markets since the late-1990s more than ever in the past, with over half of all venture capital pouring into the communications media sector in 1999 (Picard 2002, 175). This is significant because financial markets abhor risk and prefer specific types of media firms, notably conglomerates, Internet companies, and those with a deep reservoir of content. While financial forces fueled a wave of consolidation, they also spawned a speculative bubble that triggered the collapse of some firms – WorldCom, Adelphia, Hollinger, Vivendi – and led to others becoming ongoing targets of investigation into corporate malfeasance, such as Time Warner. Nonetheless, an enduring monument to the dot-com bubble remains: the increased proportion of the media business accounted for by conglomerates. Even those who do not usually take a critical stance claim that empire-building and personal hubris are now driving forces behind the consolidation of media markets, alongside traditional concerns with profits (Demers & Merskin 2000).

A web of alliances among media firms has also *substituted cooperation for the sharp edge of competition*. Such alliances typically function as part of broader strategies that aim to counteract the risk of creating content for fickle audiences. The failure rate of media goods is far higher than in other industries, with unsuccessful television series, films, books, and music CDs vastly outnumbering successful ones. Hollywood releases hundreds of films a year, but only a few are box-office winners. However, since the cost of reproducing content is low, firms can achieve economies of scale by delivering content to as many audiences across as many media as possible. Time Warner and Viacom's decision to close down their rival networks – the WB and UPN, respectively – in 2006, while launching their jointly owned CW network, is an example of this strategy. Time Warner and Comcast also divided several cable systems they had acquired from AT&T in 2003 after it abandoned its push into the cable business, and from Adelphia in 2004 after that firm's owners pled guilty to pillaging the corporation for personal ends. The two companies also joined Cox Communication and Advance Newhouse to develop a new video-on-demand service, while Comcast combined with the PBS in 2005 to launch a new children's channel, KidsSprout.

Media firms also use deep pockets, alliances, and litigation to *shape the evolution of new media*. News Corp is particularly noteworthy in this regard, with its purchase of MySpace (\$580 million), gaming and entertainment site IGN.com (\$620 million), and the top sports site in the US, Scout Media (\$60 million) in 2005. Similarly, ITV acquired Friends

Reunited (\$200 million) in 2005, while Viacom bought Neopets (\$160 million), a children's website in the US, in 2004, and iFilm.com in 2005. Alliances with cellular telephone companies and computer firms such as Apple and Microsoft have also allowed these firms to stake out a key role in new mobile television, music, and film download services. While the largest deal in the post-bubble era occurred in 2006 when Google took over the video-sharing site, YouTube (\$1.65 billion), that transaction was preceded by agreements with NBC Universal, SonyBMG, Time Warner, Viacom, and News Corp that served three goals: (1) to implement content identification technology to help these companies maximize control over their content; (2) to share traffic and advertising revenue; and (3) to share access to Google's technology.

### DANGERS OF CONSOLIDATION

These agreements will not give these firms "perfect control" over their content, but will help to preserve their dominant role in the media economy. They will also allow them to shape the evolution of new technology, undermining claims that new technology is inherently antagonistic to concentrations of power. That the → Internet is not immune from such tendencies can be seen in Google's dominance of the → search engine market (50 percent), with the Yahoo!, MSN and Time Warner/AOL share accounting for 47 percent, yielding a CR4 of 97 percent – far exceeding the standard of concentration outlined above. This is why Google is such a powerful force in defining the relationship between the "old" and "new" media.

The *staying power of the global media giants* can be seen in the fact that Time Warner, Disney, and NBC possess four of the top ten Internet news sites in the US, while the *New York Times*, *Tribune* Newspapers, Knight Ridder, and *USA Today* account for another four. The fact that other top news sites rely on these sources and a handful of global news agencies for their content further magnifies this influence (→ Online Media). With almost no original news of their own, Yahoo! and Google do little to diversify the range of available news sources. Similar patterns hold globally, where the same firms dominate, with the exception of the BBC and three Chinese sites. The latter rely solely on reports from the state-controlled Chinese media.

Many critics argue that the biggest consequence of consolidation lies in the ability of media owners to *influence media content* and, thus, people's view of the world. While some claim that this potential has been sharply diminished by the rise of the modern corporation, where ownership is dispersed and control rests in the hands of managers, with media workers relatively free to do as they please within the limits of professional norms and good business practice (Demers & Merskin 2000), four of the top ten global media companies remain owner-controlled: News Corp (Rupert Murdoch), Bertelsmann (heirs to founder Carl Bertelsmann), Viacom (Sumner Redstone), and Comcast (Roberts Family). Moreover, in Australia, Canada, and Latin America, among other places, owner-controlled media firms remain the norm, suggesting that it is premature to sound the death knell of media moguls who can use their outlets to pursue political and ideological goals. However, identifying causal links between owners, content, and people's beliefs is fraught with difficulties, including the anecdotal nature of the evidence and the well-known limits of media effects research.

A larger view of the issues considers the consequences of consolidation on the *allocation of resources within media firms*. While some believe that the deeper pockets of media conglomerates allow them to commit more resources to production, news gathering and so forth, a counterargument is that resources are being diverted from these goals to meet the high cost of financing mergers and acquisitions. The merger between Granada and Carlton television in Britain, for example, led swiftly to the closing of the 24-hour ITV News channel and centralization of news production for all of its other channels in London (→ Television News; Newscast, 24-Hour). In 2006, NBC announced that it would cut 700 people, eliminate news bureaus in favor of a centralized operation in New York to feed NBC, MSNBC, CNBC, and its Spanish-language network, Telemundo, and replace high-cost, early prime-time drama with cheaper reality TV and game shows. Overall, the number of network journalists has fallen by over one-third since 1985 in the US, while international news bureaus have been slashed. This trend is especially acute in Canada, where the number of international bureaus operated by Canwest has fallen from nine in the late-1990s to two. The scope of such changes differs between firms, but the trend is clear: integrated news operations that serve multiple channels, budget cuts, fewer journalists, less foreign bureaus, and high-cost drama series replaced by low-budget programs.

These trends are bound by audience tastes and the complexity of the media business, but several points remain to be made in any final assessment of the consolidation of media markets (→ Audience). First, audiences now have more channels than ever, but source diversity is shrinking. Second, consolidation has created deep rifts within the media. Media workers report that bottom-line pressures now have a greater impact on their work than in the past, that the influence of owners, managers, and advertisers is increasing and that their trust in executives is falling (Project for Excellence in Journalism 2006). Lastly, the push by conglomerates to expand the scope and duration of copyright laws, aggressive litigation, and use of digital rights management technologies is subtly biasing the architecture of the media in favor of control and closure versus the values of openness and real diversity that are the *sine qua non* of democratic societies.

## Consonance of Media Content

Romy Fröhlich

Ludwig Maximilian University of Munich

The mass media are an important, if not the most important, factor in the development of free opinion in democracies. That is to say that the media have a specific democratic responsibility (McQuail 1987, 117–118). It is no wonder that, apart from freedom of speech, free journalism, and a free media system, the *diversity of media* is seen as being the most important condition for the emergence and progression of democracies (→ Concentration in Media Systems). A heterogeneous media structure is also seen as being an important condition for the development of a diverse and pluralistic media content, representing a balanced diversity of viewpoints on political issues and opinions (→ Plurality). This again is conceived as an important condition in the development of a diverse and pluralistic → public opinion and sound comprehension by citizens of political coherences and procedures in democracies.

On the other hand, low competition and too much homogeneity within the media system is seen as a threat to a diverse and pluralistic media content. This notion presumes that ownership concentration has a direct (negative) effect on the content variety of media. However, a pluralistic media structure and competition within the media system alone are no guarantee for the prevention of consonance of media content. This is especially true for nonfictional media content like news.

### CAUSES OF CONSONANCE

Noelle-Neumann and Mathes (1987, 410) define consonance as “uniformity of facts and arguments which do not result from reality but from a choice made by the communicators” (→ Construction of Reality through the News). Consequently, among the numerous and different theories of influences on mass media content (see, for example, Shoemaker & Reese 1991), those approaches that deal with the professional role of journalists are most prominent (Fishman 1980; → Media Production and Content). As journalists employ similar professional skills within the process of news production, they tend to select similar issues or events for publication (→ Gatekeeping; Journalism: Group Dynamics). To put it simply: all journalists write about the same things in the same way. This originates from the fact that, generally speaking, journalists have a similar professional pattern in

selecting events for publication. The result is a certain homogeneity (consonance) of news discourse despite there being a pluralistic media system. However, there are striking differences between news cultures of journalists of different types of media and even more between those of different (national) cultures (→ Journalists' Role Perception; News as Discourse).

The reasons for journalists' similar professional pattern in selecting events and producing news are manifold. The most important ones are: (1) governing professional principles of → news values and interpretation strategies lead to a commonly shared professional understanding of "newsworthiness" (→ News Factors); (2) respective professional routines at different types of media (TV, radio, newspapers, etc.) result in a commonly shared professional understanding of what "fits" to a specific type of media and what does not; (3) the standardization of journalistic education makes sure that those governing professional principles and routines are widely accepted within the journalist corps. In general, they are not questioned and are passed on from generation to generation (→ Journalism Education). (4) Furthermore, as a result of the professional necessity for orientation, media and journalists tend to be geared toward each other. Within this process of professional co-orientation, prestige media like, for example, leading national quality newspapers play the role of an → opinion leader for journalists (→ Quality Press). Both phenomena, co-orientation among journalists and opinion leaders among prestige media, further contribute to the consonance of media content.

Other causes of media consonance arise from aspects which are inherent in the media system: (5) as media/journalists rely heavily on the messages and news investigated and edited by news agencies and wires (for example, Associated Press [AP], Reuters, or Deutsche Presse Agentur [DPA]; → News Agencies), they very often use this kind of ready-made news material and adopt it without any changes. Thus, the news material of news agencies and wires are a further component of the emergence of media consonance.

Another factor, (6) → public relations (PR), increasingly influences the journalistic process of news production (Baerns 1985; Turk 1986; Turow 1989). PR produces ready-made news material and, thus, further enhances the consonance of media content. In particular, communicators from the political and economic spheres of society increasingly aim to control and homogenize their communication output. Through the help of spin doctors and PR consultants, many of whom are former journalists and media people and thus familiar with the needs and requirements of the media, politicians and managers aim to offer journalists perfectly styled news. This leads to a greater control of messages and content through the source of a message (→ Strategic Framing). The less time and fewer personnel at hand in the editorial room, the greater the chance of PR material (like, for example, press releases) being published in the media. This is especially true in times of media economic crises, when editorial rooms are short-staffed and editorial responsibilities are outsourced, meaning the media rely heavily on professional PR material (→ Public Relations: Media Influence).

Finally, apart from the classical professional principles of news production mentioned above, Herman and Chomsky (1988) additionally emphasize another possibly important cause for the consonance of media content, in particular of political news: (7) a certain interdependency between the political and economic system on the one hand and the media system on the other (see also Dreier 1982; Gerbner et al. 1982). Those inter-

dependencies undermine the freedom of the press and the development of a free public opinion. They are most evident in totalitarian systems but also exist in democracies, although less obviously. Herman and Chomsky (1988) drew on the analysis of American media coverage of Nicaragua and El Salvador, which was found to be extremely one-sided. While at that time the American media consonantly portrayed the socialist Sandinistas and their regime in Nicaragua negatively, they kept silent in the case of El Salvador, which suffered from the same political misery but was governed by a totalitarian military regime supported by the US government.

### **CONSEQUENCES OF CONSONANCE**

Media critics such as Chomsky (1989) argue that the consonant news of the American media brought about a factitious and simulated consonant public opinion tamed in the interest of the political and economic elites. The general concept of media consonance is related to the concept of homogeneity of public opinion: it is assumed that the higher the degree of media consonance, the higher the homogeneity of public opinion. As agenda-setting theory would suggest, the consonance of the media with regard to a single agenda of issues will in turn be reflected in a similarly consonant public agenda (→ Agenda-Setting Effects). It indicates that public opinion is highly influenced by the media agenda represented within media news. The supposed correspondence of media consonance and homogeneity of public opinion figured prominently in Noelle-Neumann's (1993) development of the theory of the → "spiral of silence," which among other things presumes that all-dominant consonant media content is picked up on by the public as the dominant and/or the majority's opinion. In this regard, consonance of media content with a high degree of consonance of issues and opinions consequently is considered to be an obstruction to the development of a pluralistic opinion within a democratic society. The more complex and diverse a modern democratic society is, the more complex and diverse the need for the public (opinion) to be represented in/through the media. In short: media consonance is considered a threat to democracy. This makes consonance of media content a most popular object of research.

### **DISTINGUISHING CONSONANCE AND FOCUSING**

Although the general concept of content consonance comprises both consistency of issues and topics as well as of opinions and interpretations, Eilders (2002) suggests a terminological differentiation: she describes a correspondence of issues as "focusing" and a correspondence of opinion as "consonance." This allows more detailed empirical analysis of consonance of media content and a more analytical understanding of the phenomenon (→ Content Analysis, Quantitative). This is important and most relevant, as studies show that focusing (of issues) in the news does not necessarily lead to consonance (of opinions) among the media. Her own content analysis on German quality newspapers and the work of the American researcher Guido Stempel (1985) show that, although the media often concentrate on the same issues and topics, they editorialize or comment on them differently (Eilders 2002). This is due to the respective ideological profiles and editorial positions of newspapers, which generally govern rather the specific framing of an issue than the selection

of an issue for publication (→ Framing of the News). However, Eilders even found variation from this rule.

Furthermore, Eilders (2002) calls for a systematic consideration of the time dimension when dealing with the concept of media consonance, which means that one can only speak of media consonance if, for example, different newspapers report on the same issues or express the same opinion on an issue at the same time. This is increasingly relevant, as content stability over time is considered to be an important condition for media effects. However, research has not yet developed a commonly shared consensus on what exactly should be understood as high/strong/dangerous or low/weak/safe consonance of media content. Hence, a clear perception of a normative degree of content consonance (in terms of quantity and/or duration/continuance) does not exist.

# Construction of Reality through the News

*Don Heider*

*University of Maryland*

Between the local newspaper, radio updates, the evening television newscasts and now updates via the → Internet, your PDA or your cell phone, → news seems ubiquitous. But where does news come from? How does what you read and hear and view get to the point of being published or broadcast? Fundamentally, news is a construction, and the nature of that construction is important to how we shape our view of the symbolic and mediated reality of the world (→ Reality and Media Reality; Constructivism). So how are those symbols created and recognized, and what role do the mediators, the news producers, play in shaping how we think about the world around us?

## COMPLEXITY OF NEWS DECISIONS

News gathering may seem a simple process. An event happens, reporters go and gather facts, they write the stories, and we read or hear the stories (→ Objectivity in Reporting). On occasion it may happen just like that. But what remains invisible are the dozens and sometime hundreds of decisions that went on behind the scenes, invisible to news consumers, before that story was covered, reported, written, or edited.

Let's take a seemingly straightforward example. Two men enter a bank, produce weapons, fire shots to frighten patrons and employees, take a large amount of cash, and escape. Is this a news story or not? The answer is: it depends. Each news organization, each news community, each news manager may differ in the determination of what is or is not newsworthy, or in other words, what will and will not be covered and published (→ News Values). There are some fairly simple considerations: was anyone hurt or killed, how many people were affected, was the amount of money taken large, have the suspects been apprehended, and were there unusual circumstances surrounding the robbery? Then there are other factors, which may be determined by the location of the robbery. In Cheyenne, Wyoming, bank robberies may not be a common occurrence, therefore would warrant coverage. In Los Angeles, there may well be too many robberies in a single day to make any one single incident important enough to report.

Another set of criteria used may be how much is happening that particular day. In other words, what are the competing events of the day: is it a busy day with much to cover or is it a slow news day? Yet another set of considerations might include the historical context for this story, in other words, is this one in a series of robberies that have occurred? Furthermore, what is the news organization's policy about reporting crime? Some might put a premium on crime news given its prurient interest among viewers – others may choose not to publish every random crime committed in favor of more substantive news. What about the individuals making the news decisions – have they been the victim of a crime, what is their attitude toward crime stories, what are they trying to accomplish with each day's news? Also built into this decision-making matrix are factors such as where in the city the robbery took place; was it in an affluent area, was it in a poorer part of town, and what was the racial-ethnic background of the perpetrators?

Race, class, and other sociological facts can easily come into play in the decision-making process.

### **NEWS DECISIONS AS A SOCIAL PROCESS**

These are just a few of the hundreds if not thousands of considerations that surround decisions about news each day in every news organization. When we pull back for a broader look at any given news event and the coverage that may or may not occur, one thing becomes rather obvious: news is a socially constructed product. This social construction of news results in a certain view of a community and of the world at large. The day's news is a result of many decisions, policies, and circumstances. It is a social process, part institutional culture, part human dynamics.

A number of keen observers have helped with our understanding of the social construction of news. In 1922 → Walter Lippmann described the way in which people construct pictures in their heads based upon the often incomplete reporting on public affairs. In his scathing critique of journalism and public opinion, Lippmann, a journalist himself, was struck by how little the public knew and how easily this knowledge was manipulated. Lippmann recognized the power that he and others had over influencing what stories were covered and how they were covered. He also observed how willing people were at times to believe what they read because of a lack of knowledge.

So what influences news workers in all the decisions they make, from choosing what stories to cover, to whom they will interview, to what a headline might say (→ News Factors)? Edward J. Epstein made the case in 1973 that organizational constraints heavily influenced the way in which news was put together. In 1978 sociologist Gaye Tuchman made a strong argument for how news is socially constructed in her study of four news organizations over a ten-year period. She found that embedded routines and categories in the news process determine much of how decisions are made. Herbert Gans published *Deciding what's news* in 1979, his study of network news organizations and national news magazines, pointing out in great detail how journalists are strongly influenced by their beliefs, their own social standing, their organizational culture, and their sources. Both of these studies, along with Mark Fishman's *Manufacturing the news* (1988, 1st pub. 1980), demonstrated the way in which the structure and routines in news operations play a direct role in influencing news selection and decision-making.

### **NEWS AS MEANING-MAKING**

A group of later studies represented a shift away from looking at structures and routines to a stronger look at meaning-making in news (→ Meaning). This represents a shift from analyzing structural concerns to analyzing the texts and discourses themselves that are presented in news products (→ Discourse; Text and Intertextuality). Unlike Fishman, Gans, or Tuchman, Herman & Chomsky (1988), for example, offered little evidence from studying news operations or news workers themselves, but instead concentrated on the news products, what journalists produced, to make their case that the political elite control ideas delivered through news media. Taking a less political-economic perspective, James Carey proposed the ritual model of communication, writing about how news can be seen

as a means by which people survey the world each day to reinforce what they already believe. He wrote, “A ritual view of communication will focus on a different range of problems in examining a newspaper. It will, for example, view reading a newspaper less as sending or gaining information and more as attending a mass, situation in which nothing new is learned but in which a particular view of the world is portrayed and confirmed” (1989, 20).

Stuart Hall was influential in thinking and writing about ideology and news, and in particular the way in which media in general and often news media in particular impose an imagined coherence on ideas. He argued against the idea of a neutral ideology of news media (→ Neutrality; Balance; Bias in the News) and showed a number of ways in which meaning was constructed and audiences were able to read or decode these messages. Todd Gitlin (1980) drew on Antonio Gramsci’s hegemony theory, to show how the news media marginalized the left in coverage of the anti-war movement of the 1960s. Moloch & Lester saw value in not looking to news as a source of reality, but instead analyzing news to find the “purposes which underlie the strategies of creating one reality or another” (1974, 111). Later scholars have showed how race, gender, and class influence what news is covered, how it is covered, and how it is presented, as well as what stories are routinely ignored (see Entman 1990; Campbell 1995; Heider 2000, 2004).

# Constructivism

*Thomas R. Lindlof*

*University of Kentucky*

Constructivism refers to the philosophical perspective that human beings actively participate in creating their psychological selves and social worlds. Translated to the social sciences, where it is often known as “social constructivism” or “constructionism,” Constructivism is commonly considered to be a paradigm of its own (→ Paradigm), with epistemological tenets and methods of inquiry that contrast sharply with those of objectivist science (→ Communication Theory and Philosophy).

## KEY TENETS OF CONSTRUCTIVISM

Many varieties of Constructivism have been developed in the social sciences and humanities, most of them adhering to the tenet that reality is actively constructed – that is, created, maintained, and transformed – by human actors, not passively assimilated from the environment. As a corollary to this tenet, most forms of Constructivism reject the idea that meaning is materially fixed in time or place (→ Meaning). Instead, meaning is considered to be prolific, ever-changing, and subject to negotiation. Humans are conceived as *cognizing subjects* who construe the world according to their purposes, stocks of knowledge, and semiotic resources. This meaning-making activity establishes the “factual” nature of the world (in the form of institutions, policies, laws, rules, objects, technologies, and so forth) at the same time that it justifies belief in those facts. Whenever constructivists speak of a “social construction,” they are normally referring to this reification of experience: the object or event that seems natural or inevitable, but is actually the outcome of a historical process of negotiation (or management) of meanings by human agents. However, social constructions can also be the subject of dispute due to the competing value claims or meanings that people may attribute to them.

Another key tenet of Constructivism concerns the *role of science itself*. Most forms of Constructivism reject the independence thesis of objectivist science, which holds that any truth statement must answer to a world that exists independently of human consciousness and interests (→ Objectivity in Science). Constructivists contend that science does not literally discover a single, uniform reality “out there.” Rather, different kinds of scientific discourse, which embed different modes of perceptual encoding and interpretation, have the effect of bringing different versions of reality into being. Thus, there is a strong relativistic theme in constructivist thought and research.

Finally, again in contradistinction to objectivist science, the methods of constructivist inquiry tend to be explicitly *reflexive*. If everything we know is at least partly of our own making, then constructivist scholars can choose to – and often must – reflect on the situated practices and reality assumptions that help shape knowledge about social, psychological, and aesthetic phenomena. Indeed, there is a significant constructivist presence in science and technology studies, focusing on how knowledge claims are constituted in the activities of scientists, laboratory work, discourse, and artifacts (Van Den Belt 2003). Qualitative strategies such as ethnography (→ Ethnography of Communication) and

→ discourse analysis are among those best-suited for carrying out reflexive research projects (→ Qualitative Methodology).

## DEVELOPMENT OF CONSTRUCTIVISM

Early proponents of the view that truth (or reality) is made, not found, include George Berkeley and Giambattista Vico. But a key figure in developing the logic for Constructivism was the German philosopher, Immanuel Kant. In his “transcendental analytic” in *The critique of pure reason* (1781), Kant argued that sensory impressions contribute to a person’s knowledge of the world insofar as they can be perceived and organized through “categories.” In other words, humans have no direct access to external reality, but instead rely on a priori concepts (categories) to apprehend its features. Numerous questions arose from this formulation, not least of which is the role of experience in defining and shaping the content of these concepts. However, the Kantian idea that concepts mediate our contact with the world had a significant impact on the early development of psychology and the social sciences.

Edmund Husserl, the founder of phenomenological philosophy (→ Phenomenology), is often credited with articulating the nature of conscious experience in everyday life. Two of his arguments hold special importance for Constructivism. First, Husserl argued that human consciousness is rooted in intentional acts. That is, the material status of things is of no real consequence. Rather, it is our psychic relationships with an object – the intentions we have for acting toward it – that constitute the relevant ontological data. Second, Husserl called attention to the profoundly taken-for-granted quality of the life-world of everyday existence. This “natural attitude” – or commonsense orientation – consists of layers upon layers of meaning that are seldom questioned in the daily course of living. A proper investigation of the structure of consciousness, according to transcendental phenomenology (Husserl 1970, 1st pub. 1936), involves a series of analytic moves that “bracket” (or suspend) the components of the natural attitude. Only by systematic efforts such as these can an analyst truly understand not just *what* a thing is, but *how* a thing appears real.

While Husserl was interested in the universality of individual consciousness, it was Alfred Schütz who brought phenomenology into social science. In *The phenomenology of the social world* (1932) and other works, Schütz focused on the problem of how the natural attitude arises as a social phenomenon and how it takes different forms in society (Natanson 1968). The contributions of his decades-long work, as they pertain to Constructivism, are essentially threefold. One of these has to do with the definition of meaning. Building upon Weber’s study of human action and *verstehen* (→ Verstehen vs Erklären), Schütz conceptualized meaning as a way of regarding the stream of action, either by reflecting upon an already-completed act, or by projecting an action about to begin. In this way, meaning and social action mutually inform each other and together produce a moment-by-moment sense of goal-direction in the ego. Schütz also posited *intersubjectivity* as the process by which the constructs of everyday experience emerge. That is, understandings of reality stem mainly from the reciprocal, face-to-face relations we have with contemporaries; however, relationships with predecessors (those who lived before us) and successors (those who live on after we die) also play significant parts in shaping

our sense of social reality and where we are positioned biographically. Finally, Schütz sought to explain how we can navigate a complex social world in which we are largely ignorant of other individuals' motives, goals, and subjective meanings. He theorized that *typifications* – or, constructed generalizations about roles, motives, actions, and institutions – are among the principal “stocks of knowledge” used to interpret the scenes around us. Some of these typified schemes are employed very broadly (e.g., the routine actions of selling and buying), while others are more context-specific (e.g., a politician's understandings of voters' interests). By using typifications, it is possible to act in socially intelligible ways in public without possessing expert knowledge of every content domain or being intimately familiar with every person we encounter. Our sense of an objective reality of mundane life is heightened by the fact that typified schemes are so successful in getting us through the day – and are so seldom questioned by others or ourselves.

The ideas developed by Husserl, and Schütz in particular, inspired further explorations into the constructed nature of everyday life. Peter Berger and Thomas Luckmann's *The social construction of reality* became a classic text in the sociology of knowledge. It is largely due to this work that the term “social construction” came into wide usage. The central question for sociological theory, Berger and Luckmann argued, is how subjective experiences become “objectified” as a world of things (Berger & Luckmann 1966, 18). Their tentative answer, drawing upon Schütz as well as Karl Marx's social determinism and Émile Durkheim's functionalism, is that society's “reality-maintaining procedures” enable individuals to learn and “internalize” certain identities and role performances, as well as the stocks of knowledge that support them.

Considering reality construction at a micro-social level is *ethnomethodology* (→ Ethnomethodology). In his *Studies in ethnomethodology*, Harold Garfinkel (1967) proposed a theory of how interlocutors are able to make orderly sense of their world from the resources they have at hand. The basis of any culture's most trusted, self-evident notions of reality, from this point of view, is nothing more nor less than the artful “methods” that competent members use to coordinate meaning. For example, an ethnomethodologist would approach the study of family not by explicating the concept itself, but by a meticulous analysis of the contexts and social practices in which “family” is referenced, i.e., studying how family “is done.”

By the mid-twentieth century, constructivists had largely accepted, and begun to explore the ramifications of, the idea that language and other symbol systems are critical to the process of reality construction. Ludwig Wittgenstein's later work, *Philosophical investigations* (1953), was influential in constructivist circles, especially for his claim that “language games” animate the “forms of life” of human existence. *Symbolic interactionism* (→ Symbolic Interaction), following from its intellectual forebear, → *pragmatism*, put language and other significant symbols at the center of its explanations of social interaction. The semiotics of Charles S. Peirce (→ Semiotics), the mind-self-society formulation of George Herbert Mead, and the social dramaturgy of Erving Goffman, among others, laid the groundwork for studying communicative action in social life. Arguably, symbolic interactionism is the theory most closely aligned with the spirit of Constructivism, an affinity suggested in W. I. Thomas's famous dictum: “If men define situations as real, they are real in their consequences.” Much of the methodology for doing constructivist-informed research, including participant observation (→ Observation), depth interviewing

(→ Interview, Qualitative), and → grounded theory, was also developed by symbolic interactionists.

At the end of the twentieth century, Constructivism and its allied research programs had established niches in all of the social science disciplines. The humanities also embraced the social phenomenology implicit in the emerging theories of texts, readers, and processes of semiosis. Constructivism itself was infused with a new sense of vitality and relevance as the “crisis of representation” bubbled up from cultural anthropology, and philosopher-critics like Richard Rorty and Michel Foucault articulated new views of cultural relativism and radical contingency. And, by hybridizing with such intellectual movements as feminist epistemology (→ Feminist and Gender Studies), → gay, lesbian, bisexual, and transsexual studies, race theory, postmodernism (→ Postmodernism and Communication), and → postcolonial theory, the concepts and methods Constructivism uses for studying the production of meaning are increasingly harnessed to issues of identity, political voice, and empowerment in multicultural worlds.

## CONSTRUCTIVISM AND COMMUNICATION

The field of communication was not immune to Constructivism’s advancement in the academy. If anything, communication is commonly recognized as the chief means by which the social world is created, understood, and reproduced across time and space. As Anderson observes in *Communication theory*, “the constructed nature of reality and knowledge” now underpins a number of theories in the field of communication (1996, 36).

In mass communication, all of the components of the media circuit – production, content, and reception – are potent sites of meaning production (→ Information Processing; Media Production and Content; Media and Perceptions of Reality). Whereas early studies of media production focused on the decision-making for filtering events (→ Gatekeeping) or presenting the news, constructivist studies look at how organizational routines and workers’ practices actually create – or “manufacture” – the news product (→ News Routines). Gaye Tuchman’s *Making news* (1978) is an early and important exemplar of this kind of research. Also, some authors see the → news value of → news factors, i.e., as a tool for journalists to apply in order to construct social reality (Schulz 1976). Recent studies stress the interdependency of media with other institutional entities in the co-construction of media products.

Another stream of media research concerns the *construction of social representations*. Traditionally, content was given essentialist meanings, such as news, entertainment, advertising, pornography (→ Entertainment Content and Reality Perception; Construction of Reality through the News). Constructivists, however, regard media content as texts (→ Text and Intertextuality) laden with hegemonic, ambiguous, or contested signifiers, which can be activated in various ways depending on the reception context. News is often conceptualized as a discourse that organizes story elements in such a way as to suggest the existence of a social problem, or to “*frame*” conflicts in moralistic or ideological terms (→ Framing of the News; Framing Effects). For example, Yar (2005) analyzed the published claims of a global movie “piracy” problem. The author concluded that the media industries promoted the social construction of widespread copyright violation in order to exaggerate the dimensions of the problem and encourage intensified policing.

Research of *media audiences* has also been strongly influenced by Constructivism (→ Audience; Audience Research). In the 1980s, television and other media began to be studied as resources in the interpretive activity of families, peer groups, sub-cultures, and other social formations. Thus, people form their own meanings of content, irrespective of why it is produced or what the content seems to represent by some objective standard. This does not mean that meaning is a product of “free will” or the solitary individual; meaning, whether in audiences and other situations, always arises from the individual’s experience in social collectives. In social action studies, for example, media content acquires meaning only as it is joined in a line of social action within a specific context (see Schoening & Anderson 1995 for the underlying theory; → Media Content in Interpersonal Communication). In studies of interpretive communities, meanings of media texts gain coherence within groups of people who share pools of knowledge and interpretive strategies (Jensen 1991). However, the degree of local control that audience members exercise in making meanings (versus sources of influence from outside the social formation) remains the subject of lively debate.

Similarly, social constructionist studies of how people perceive and use communication technology challenge the formerly prevailing view of technological determinism. For example, the *social influence model* attempts to explain how group interactions affect the meanings attributed to technology (Campbell & Russo 2003). This focus on the formation of users’ perceptions – including perceptions of how technology supports lifestyles and social needs – offers a clear alternative to the assumption that technical features are the driving force behind consumer behavior. In addition, the social construction of online identity and socio-cultural community has become a vibrant area of research in the rapidly maturing field of Internet and other computer-mediated communication studies (for overview, see Lievrouw & Livingstone 2006).

In interpersonal communication, Constructivism is most readily associated with the theory and research program of the same name (→ Interpersonal Communication). Originally developed by Jesse Delia and his colleagues (see Delia et al. 1982), this “constructivism” is a derivation of the term “construct,” which in turn refers to the mental constructs (or schemas) hypothesized to store and organize information representing the characteristics, qualities, intentions, or emotional states of other persons. The theory posits that the more abstract, differentiated, and integrated this system of personal constructs, the better able a person is to manage the production of meaning in face-to-face interaction. Some of the ways in which a person with high cognitive complexity exhibits greater competence are by generating listener-adapted messages and engaging in emotionally supportive communication. Although the theory is rooted to some degree in symbolic interactionism, its epistemology builds primarily on a structural-developmental worldview (especially the theories of George A. Kelly, Heinz Werner, and Jean Piaget). As such, “constructivism” is concerned with the measurement of stable features of the construct system at the individual level of analysis, and thus generally allies itself with the assumptions and practices of objectivist science (Anderson 1996, 207–208).

Social constructionist approaches have long been employed for studying close relationships, organizational and small group cultures, intercultural communication, and the performance of community. In all of these scenes, researchers typically attend closely to the ways in which language is used to reproduce or transform cultural conditions like

solidarity, schism, and empowerment. The dialogical *construction of self or identity* is a salient theme in much of this scholarship. Increasingly, communication scholars are forging meaningful, even intimate, relationships with the people they study. They are also inventing novel ways of using narrative to “re-construct” these relationships. This trespassing of boundaries between the self and other, and between → fiction, introspection, and analysis, has led to a profusion of experiments in writing constructivist accounts (e.g., Clair 2003). Although it is too soon to say what future directions these new styles of scholarship will take, or whether the knowledge they contribute will have lasting value, it seems clear that they offer some of the most vivid demonstrations yet of the possibilities inherent in the constructivist paradigm.

The constructivist approach has been criticized mainly for denying the objective reality of the world. In the view of scientific realists, a “ready-made” world of objects and processes exists independently of the sense-making activity of human beings. People may entertain multiple, open-ended meanings, but the ontology of physical and social worlds is already settled and thus predetermines which meanings count as the “correct” ones. For example, we may describe an object such as a rose in a variety of ways, depending on our interests. But the names we create do not literally construct the object. Nor is every name an equally valid description of an exemplar of the category “rose.” In other words, our freedom to improvise “meaning” ends at the point of reference to objective reality. This argument, according to the realist perspective, undermines the relativistic foundation of constructivist thought (see Devitt 1991).

## **Constructivism and Interpersonal Processes**

*Brant R. Burlison*

*Purdue University*

*Graham D. Bodie*

*Purdue University*

As Phillips (2000) observes, the term → constructivism is associated with numerous doctrines and positions in the social sciences, but in the communication discipline constructivism is most associated with a theory of individual differences in communication skills developed by Jesse Delia and his colleagues at the University of Illinois in the 1970s. Although constructivism originally focused on individual differences in interpersonal competence, it has been applied to numerous communication events and behaviors. It has served as the foundation for theoretical and empirical analyses of relationship development and maintenance, cultural influences on communication, language acquisition and communicative development, socialization processes, and communication instruction. It has also been applied to numerous communication events and processes in business, families, education, health-care, mass media, and politics (for reviews, see Delia 1987; Applegate 1990; Gastil 1995; Coopman 1997; Burlison & Caplan 1998; Burlison 2007).

## DEVELOPMENT OF THE CONCEPT

Constructivism was initially developed to understand how people's interpretations of the social world shaped their communicative behavior. Early versions of the theory were influenced by the Swiss psychologist Jean Piaget (1896–1980) and the American philosopher George Herbert Mead (1863–1931), both of whom believed that effective communication depended on the ability to “take” (or imaginatively construct) the perspective of others. Thus, early constructivist work focused on how individual differences in social perception related to the use of effective forms of communication.

As it developed, constructivism focused on the explanation of *functional communication competence*, the ability to generate and process messages that enable people to accomplish their social goals efficiently and effectively (→ Interpersonal Communication Competence and Social Skills). Four processes involved in functional communication receive attention within constructivism: (1) → *message production*, the process of generating verbal and nonverbal behaviors intended to obtain desired responses from others; (2) *message processing*, the activity of interpreting the communicative behavior of others in the effort to understand the meaning of that behavior (→ Comprehension; Listening); (3) *interaction coordination*, the process of synchronizing message production and processing activities (along with other behaviors) in social episodes so as to achieve smooth and coherent interchanges (→ Social Interaction Structure); and (4) *social perception*, the process of identifying and making sense of entities and events in the social world, including experiences of ourselves, others, and social relationships, situations, and institutions (→ Social Perception).

## THEORETICAL DETAILS

Constructivism addresses *four issues for each aspect of functional competence*: (1) the nature and forms of specific functional competencies (i.e., what counts as skillful behavior in each process); (2) the determinants of skillful behavior for specific functional competencies (i.e., models of competence, including abilities and motivations required for skilled communication practice); (3) the antecedents of skilled communication (i.e., the biological predispositions, socialization experiences, and educational efforts that cultivate communication skills); and (4) the consequences of individual differences in specific functional competencies (i.e., the effects of skilled communication for multiple outcomes in varied domains of life).

Although *social perception* is not a communication process per se, constructivism maintains that it plays a central role in virtually all communicative conduct since making sense about the self, others, and social situations is critical to effective communication. Social perception proceeds through several processes, including identifying affect, making attributions, forming impressions, integrating information, and taking the other's perspective (Moskowitz 2005). Each process can be performed more or less well; thus, social perception is a skill (or a set of skills) on which individuals differ. According to constructivism, all social perception processes occur through the cognitive structures that Kelly (1955) termed “interpersonal constructs” – cognitive schemes that apply to the thoughts, behaviors, and qualities of others. Individuals' systems of interpersonal constructs are more or less differentiated (numerically large), abstract (have elements referring to

concrete qualities such as appearance or abstract qualities such as traits), and integrated (organized, connected, and accessible). People with more differentiated, abstract, and integrated systems of interpersonal constructs have higher levels of interpersonal cognitive complexity. Consistent with the constructivist view that all social perception processes proceed through the application of interpersonal constructs (→ Individual Differences and Information Processing), extensive research has found that interpersonal cognitive complexity predicts several social perception skills and performance on numerous social information processing tasks (Burlison & Caplan 1998).

Constructivism gives extensive attention to the *role of social perception in message production*. Message production is a complex process composed of many different skills; constructivism has focused on the particular skill of producing highly person-centered messages, which take into account and adapt to the subjective, emotional, and relational aspects of communicative contexts. As a general quality of messages, person-centeredness assumes a somewhat different form depending on the primary communicative goal pursued: highly person-centered persuasive messages exhibit greater concern with the goals and desires of the persuasive target; highly person-centered *regulative messages* seek to induce the other's understanding of and compliance with behavioral rules by getting the other to reflect upon and reason through the consequences of his or her problematic behavior; and highly person-centered comforting messages acknowledge, elaborate, and legitimize the feelings of distressed others and encourage them to express and explore their feelings. Highly person-centered messages are more likely than less person-centered messages to attain desired primary goals (e.g., persuading, regulating, comforting) and secondary goals (e.g., self-presentation, relationship maintenance), especially in demanding communicative contexts (→ Goals, Cognitive Aspects of; Goals, Social Aspects of); further, the regular use of person-centered messages is associated with long-term outcomes such as personal acceptance and professional success (Burlison 2007).

Constructivism maintains that the competence to produce highly person-centered messages is a *function of both relevant abilities and motivations*. In particular, advanced social perception skills are seen as a critical determinant of person-centered message use since they facilitate identification of and adaptation to characteristics of message recipients and social situations, generation and pursuit of multiple social goals in interactions, and deeper insights about the dynamics of human thought, feeling, and behavior. Extensive research has found substantial associations between interpersonal cognitive complexity (and other assessments of social perception skill) and the use of person-centered messages in a variety of social settings (see reviews by Coopman 1997; Burlison & Caplan 1998).

Another factor that contributes to the use of person-centered messages is the *availability of procedural memories* or plan elements that contribute to message construction; persons with more plan elements available are more likely to use highly person-centered messages (→ Memory; Memory, Message). In addition, because producing person-centered messages often involves considerable effort, their use is dependent on several types of motivation, including "goal motivation" (the desire to achieve a particular outcome), "effectance motivation" (the producer's belief that he or she is capable of achieving the goal), and "normative motivation" (the producer's belief that it is socially appropriate for him or her to use particular messages with the recipient). These motivations are influenced by a

variety of personality traits (e.g., emotional empathy, locus of control orientation) and aspects of the communicative situation (e.g., the source–recipient relationship).

## APPLICATIONS

To date, constructivism has provided less detailed analyses of message processing and interaction coordination than it has of social perception and message production. Sketches of message processing (Burlinson 2007) and interaction coordination (Burlinson & Caplan 1998) explain individual differences associated with these processes in terms of underlying differences in social perception skills.

Constructivism gives considerable attention to the antecedents of communication skills and their development, especially the influence of parents and peers during the course of primary socialization (Burlinson et al. 1995). Two caregiver practices that contribute to social perception and message production skills are (1) using language that explicitly mentions internal states (feelings, intentions), and (2) using person-centered messages when nurturing and disciplining the child. Frequent interaction with peers, especially those with good communication skills, may also contribute to developing the interpersonal constructs, procedural memories, and motivations that underlie skillful communication.

Constructivism assumes that humans *actively interpret the world*, construct meaningful understandings of it, and act in the world on the basis of their interpretations. Given these assumptions, constructivist research frequently employs free-response research methodologies (Delia et al. 1982). These include Crockett's (1965) Role Category Questionnaire (RCQ) for measuring interpersonal cognitive complexity. This task has participants write impressions of people known to them; these impressions are subsequently scored for qualities such as construct differentiation and abstractness by expert coders. Skill at producing person-centered messages is typically assessed by having participants generate messages in response to hypothetical or actual situations (rather than select messages from researcher-supplied lists of strategies); the generated messages are then coded or rated by experts for degree of person-centeredness and other qualities. These free-response methods are not only natural tasks for research participants, but they also preserve participants' spontaneous structuring of the social world and provide what are regarded as highly valid assessments of relevant theoretical constructs. Constructivist research also makes use of standard social science methods such as closed-ended questionnaires, rating scales, forced-choice response formats, and researcher-supplied items.

Constructivism has demonstrated value as a communication theory. It is general, flexible, and broad, having been applied to different skills exhibited by different types of people in different situations. It is testable, and has produced one of the largest bodies of empirical findings in the communication discipline, with corroborations of its predictions suggesting the accuracy of the theory. It is heuristic, having generated novel analyses of numerous communicative phenomena, and it has been fruitfully synthesized with other theories. It also has noteworthy limitations; constructivism has narrowly focused on the contribution of social perception to the use of person-centered messages and has not given sufficient attention to the processes through which messages are generated and received. In addition, some concepts in the theory need further specification, and greater effort should be made to apply the theory to skill enhancement.

## **Consumer Culture**

*Matthew P. McAllister*

*Pennsylvania State University*

Consumer culture, the creation and cultivation of self- and social meaning from the marketing, purchase, and display of commodified goods, is a central characteristic of

modern and postmodern society. Although related to other forms of culture, such as commercial culture, material culture, and popular culture, it is a theoretically distinct realm that includes the symbolic qualities attributed to mass-produced goods, brand logos, product packaging, advertising campaigns, retail spaces, shopping activities, and consumption-centered media content. How these symbolic goods and activities relate to modern life, the self and social groups – and their destructive and/or emancipatory implications – have comprised much scholarship and debate in the humanities and social sciences.

## DEVELOPMENT OF CONSUMER CULTURE

There is no exact starting date for the creation of modern consumer culture. Although tied to the beginnings of industrialization, it could also be said to have existed in some forms as long as rudimentary capitalism existed. More specifically, British royalty emphasized and displayed the need to be fashionable in the 1500s. Colonialism exoticized spices and other goods from colonized lands. In the nineteenth century, popular events such as the Great Exhibition in London in 1851 and other World Fairs displayed and promoted industrialized goods.

Also at this time, in industrialized countries, mass manufacturing forced companies to market themselves outside of the companies' home communities, developing the idea of → branding as a sales and promotional technique to generate symbolic trustworthiness. The expansion of nationally distributed mass media, especially the national → magazine, facilitated the use of → advertising to create *universally known* → brands and symbolic linkages to these brands. Advertising was especially key in the development of consumer culture in that it inculcated people as consumers, teaching them not only the difference between brands, but also what the idea of a brand is and its legitimization as something to be trusted even more than one's own skills or the local merchant (→ Advertising, History of). Such legitimization was especially important in the establishment of consumer culture, given that earlier generations made many of their own goods or bought locally produced bulk goods.

Mail-order catalogs offered images of manufactured commodities, especially to rural and isolated households. The separation of work from other sectors of life cultivated leisure as an element of life, as did the rise of a middle class with disposable incomes. The creation of branded retail spaces that displayed goods rather than merely distributing goods also elevated modern consumerism, and encouraged shopping as a pleasurable activity. Finally, such meaning creation occurred in a context of great social change, in which traditional symbolic realms (religion, the family, local community) became unsettled, and universally understood commercial symbols offered meaning stability.

From its beginnings, consumer culture *intersected with class, gender, and race*. Although many mass-produced goods were available to the middle and upper classes, working-class people often labored long hours to produce or display goods they could not afford (a trend accentuated in modern globalization). Consumer culture was also strongly gendered. Shopping areas and non-spouse approved credit could create women-centered activities and spaces in the public domain. However, many image-oriented and emotionally laden brand strategies were designed to appeal to the prejudicial market construction of the

purported irrational female consumer (Paterson 2006). Despite claims that the new consumer culture could be democratic and inclusive of everyone (with money, that is), people of color still often found that they were excluded from such participation, even with money to spend. The use of terrible stereotyping in early advertising – often more subtle but nevertheless present even today – also highlighted the social divisions still central in consumer culture.

Critical historians such as Stuart Ewen (1976) view the development of consumer culture, and advertising's role in this development, as profoundly hegemonic, both solving mass capitalism's problem of overproduction by encouraging participation in capitalism while also placating workers (via the promise of valorized, branded goods) who found themselves alienated from the corporate, mass-manufacturing workplace. Other historians, such as Gary Cross (2000), although recognizing the negative elements in early consumer culture, nevertheless argue that this development helped ease individuals through the great social changes of the early twentieth century in a way that minimized social and psychological trauma.

Later developments further refined and accentuated consumer culture. Credit and installment plans and discounted "bargain basements" allowed the middle class to have access to upper-class-coded goods. Electronic media such as radio and television not only could display commodities via sound and video channels, but also economically were even more dependent upon, and thus beholden to, advertising revenue than print media such as newspapers and magazines (→ Commercialization of the Media). Lawrence R. Samuel (2002) contends that the display and celebration of products in early television advertising rejuvenated US consumerism after years of thrift cultivated by the Depression and World War II (→ Commodification of the Media).

New retail spaces such as malls systematized and aestheticized the shopping experience. Corporate and postindustrial capitalism increased advertising and marketing budgets while refining target marketing. Globalization encouraged an emphasis on universally recognized and understood symbols and an even sharper distinction between sites of production (often exploitative) and consumption (→ Globalization of the Media). Marketing research gradually became more sophisticated, focusing on demographics, psychographics, and lifestyles to facilitate, or even manipulate, purchasing. By the late 1990s, marketing firms used ethnographic and other naturalistic techniques to complement more quantitative methods.

## **MEDIA AND YOUTH IN CONSUMER CULTURE**

The media continue to play a key role in consumer culture. Media, of course, carry advertisements, the most explicit voice for consumerist messages. The level of advertising in society has steadily risen with the increase in both the number of media outlets and media organizations' expectations for advertising revenue. In addition, media promote the consumption of media products, such as commercials and publicity for DVDs and pay-per options on television, an emphasized factor in the era of large-corporate media synergy. To offer a selling-friendly symbolic climate for advertisers, many elements of media content – from lifestyle magazines to self-improvement television programs – are commodity- and consumption-oriented even in their nonadvertising messages

(→ Commercialization: Impact on Media Content). Direct purchasing opportunities are increasingly integrated in media use, with the development of home-shopping options on television and the ease of online shopping and purchasing via the Internet and other interactive media. The convergence of audiovisual media content with mobile delivery systems such as mobile phones broadens the reach of consumption-oriented messages and activities.

Much scholarly attention has been devoted to how young people are inculcated into consumer culture, including the heavy commercialization of youth culture. Works such as Juliet B. Schor's *Born to buy* (2005) and Alissa Quart's *Branded* (2003) focus on the continued targeting of youth by commercial interests (→ Youth Culture).

### CRITICISMS AND DEFENSES

Scholars reacted early to the social implications of these trends, establishing arguments critical of consumer culture as well as counterpoints from scholars who see positive developments in modern consumerism.

Commodity fetishism – defined broadly as the separation of a commodity from its production context and the subsequent consumption-oriented celebration of such commodities – was a term coined by Karl Marx and subsequently adopted and developed by other scholars writing about consumer culture, including Judith Williamson, Sut Jhally, and Robert Goldman (→ Fetishization).

Thorstein Veblen's *Theory of the leisure class* (1899) introduced and critiqued what he labeled as conspicuous consumption, in which the display of symbolic commodities by the *nouveau riche* was used to distinguish themselves from other classes, ultimately encouraging class envy and excessive debt. This criticism was updated in more recent times by such scholars as Juliet B. Schor (1999). Consumption as a way to reify social difference also finds resonance with the work of Pierre Bourdieu, who argues that it is often used to display different forms of capital and enact social distinctions between groups. The notions of consumer distinction and envy as enacted in a highly segmented, market-researched, and interactive consumer culture is explored by Joseph Turow (2006; → Consumers in Media Markets).

Scholars associated with the Frankfurt School also have been influential critics. Theodor W. Adorno and Max Horkheimer argued that mass-produced and marketed goods foster standardization and homogenization, smothering creativity and cheating/deceiving citizens. Similar points were made in Herbert Marcuse's book, *One-dimensional man* (1964), which claimed that advertising and consumer culture inculcate false needs in people and thus degrade critical awareness (→ Critical Theory). Standardization in modern consumer culture is an element explored by sociologist George Ritzer in his argument on the "McDonaldization" of society. Although not from the Frankfurt tradition but influenced by it, Guy Debord, in *Society of the spectacle* (1967/2004), argued that the commodity-based spectacle – as exemplified by high-profile media events and advertising campaigns – is a defining characteristic of modern life that deflects attention from larger capitalist inequities and indignities (→ Spectacle).

Recent criticisms of consumer culture have similarly focused on the anxiety, low self-esteem, materialism, and vulnerability to advertising claims about self-image sparked by

heavy emergence in consumer culture. The environmental destruction and waste that overconsumption promotes have also been a concern of many scholars, especially Sut Jhally (2006).

Other arguments emphasize the emancipatory elements of consumer culture. Consumer culture offers symbolic materials that may be used to create unique cultural identities and cohesion, for instance. Market niches may recognize social groups marginalized by other sectors of society. How consumers may play with consumption activities and resist meanings imposed from above has been advocated by such scholars as Michel De Certeau, John Fiske, and Henry Jenkins (→ Cultural Studies). James B. Twitchell argues for the positive social benefits of both advertising and materialism (see, for example, 1999).

Activism against consumer culture offers a counter-voice, even if it seems to be a whisper compared to corporate-amplified consumption messages. Groups that have organized against the excesses of consumer culture include, in the US, Consumers' Research Inc. (founded in the 1920s) and, in Canada, Adbusters. Movements such as various forms of counterculture in the 1960s and environmentalism also offer critiques against consumerism. However, many critics have noted consumer culture's ability to co-opt and depoliticize such critical elements, including Goldman's notion of → commodity feminism.

## Consumer Informatics

*Bradford W. Hesse*

*US National Cancer Institute*

In its broadest sense, consumer informatics can refer to that branch of the field of communications dedicated to understanding and improving the use of online information resources by the → public. Online information resources have been made available to consumers in a variety of different market sectors, from airline ticketing and travel to the online distribution of goods and services. In these instances, the online interactions replace interpersonal encounters as the basis for generating value to a sponsoring organization's bottom line. Communication researchers are often brought in to be sure the structure of the communication is made as user friendly and satisfactory as possible; unsatisfactory structures will drive away customers (→ Computer–User Interaction; E-Commerce). In a more specific sense, the study of consumer informatics has gained its greatest currency in the area of medicine and healthcare (→ Health Communication).

The French term *informatique* was coined in the early 1960s to describe the potential benefits, especially in science, of sharing data and tools electronically by mounting them online in a remotely accessible, networked fashion. Not long after the term was introduced, scientists and engineers began exploiting the communication capabilities of informatics technologies to support electronic mail, discussion groups, document sharing, and other types of collaborative information activities online (→ Information and Communication Technology, Development of). It was not long before the benefits of networked computer environments as communication media were felt by these professionals. Networked professionals used the connective features of the online technologies to overcome barriers of geographic distance and social isolation (Hesse et al. 1993).

In the 1970s and 1980s, the term “informatics” became commonplace in medical environments, where demands for information were high. Departments of *medical informatics* emerged in hospitals throughout the US, Europe, and Asia. Interdisciplinary teams of computer scientists and biomedical researchers began exploring ways of using informatics

technologies to overcome barriers in delivering medical expertise to underserved areas, an activity referred to as “telemedicine.” Digital library projects became popular as a way of making the breadth of medical literature available to physicians.

Up until the early 1990s, the benefits of informatics technologies were primarily available to professionals working in science, medicine, engineering, or education. During the last decade of the twentieth century, two events co-occurred that would change that. The first was a proposal from scientist Tim Berners-Lee, at the CERN High Energy Physics Laboratory in Switzerland, to create an interconnected computer environment making it simple for users to share information online in graphical ways. He called his concept the “world wide web.” The second was a movement by the US Congress that would open the benefits of the world wide web to the general public (→ Internet; Internet, Technology of).

These two events, occurring at a time when ownership of personal computers was becoming commonplace, opened up the advantages of an online transaction environment to consumers. Repercussions would soon be felt through all aspects of the global economy and in communication. Entire market sectors would restructure to take advantage of global access to consumers, eliminating the need for intermediaries, and accelerating the effects of competition on price and access (Friedman 2005). The communication environment would become increasingly more interactive, decentralized, personalized, and information-rich (Viswanath 2005).

As the US Congress opened access to the Internet in the 1990s and the world wide web caught on as an understandable access point for consumers, medical informatics specialists began exploring methods of using information technologies to meet the needs of healthcare consumers. The term *consumer health informatics* was coined by researchers in Canada to distinguish the emerging field from its roots in the more clinically based medical informatics (Eysenbach 2000).

The expansion of research activities into the area of consumer health informatics was also catalyzed by a general rise of consumerism among recipients of healthcare. Many observers have noted that previous generations of patients behaved with general passivity in response to their healthcare. Newer generations, accustomed to finding what they wanted through online computer access, appeared to be taking a more assertive role in their health decision-making. Designed appropriately, consumer informatics tools could help empower these patients by giving them the support they need to be proactive in their own health maintenance over their life-spans (Nelson & Ball 2004).

With this background, Eysenbach and Jadad (2001) suggested that the field of consumer health informatics should be considered as a whole *new discipline in online communications research*. Its goals should encompass analyzing, formalizing, and modeling consumer preferences and information needs; developing systems to integrate those needs into the broader biomedical research and delivery enterprise; investigating the effectiveness and efficiency of consumer informatics applications to improve health outcomes while stemming the tide of escalating healthcare costs; and studying the effects of consumer informatics systems on public health, the patient–provider relationship, and personal quality of life (Eysenbach & Jadad 2001).

The need for protecting public health through a scientifically garnered evidence base is as high in the case of consumer informatics as it is for general medicine. For example,

the unequal diffusion of consumer informatics technologies may actually worsen concerns over health disparities by creating a → digital divide in health-related knowledge (Viswanath et al. 2006). Likewise, diffusing a consumer health information system without the benefit of a “socio-technical” evidence base may cost millions of dollars in unnecessary expenditures or, worse, may put the public at risk from unsafe clinical practice (Coiera 2004). As in other areas of medicine, a solid evidence base is needed to guide the development of consumer informatics technologies in productive and safe ways (Hesse & Shneiderman 2007).

## **Consumers in Media Markets**

*Philip M. Napoli*

*Fordham University*

Communication researchers have devoted a substantial amount of attention to understanding consumers in media markets. The processes by which audiences select between the various content options available, as well as the mechanisms by which media organizations seek to understand, anticipate, and respond to these choices have traditionally resided at

the core of research focusing on media consumers. The study of media consumers fits within the somewhat broader framework of → audience research and is distinguished by its attention primarily to the economic dimensions of media consumption and the processes by which audiences select media products – as is reflected in the use of the term “consumers” (→ Media Economics; Exposure to Communication Content).

It is important to emphasize that to speak of media *consumers* reflects the adoption of a certain perspective on the interaction between media organizations and individuals; one that is, by connotation, primarily commercial or economic in nature. This is, of course, just one of a number of possible lenses through which scholars can examine the complex interactions between media audiences and media content providers. Perspectives that emphasize the cultural or political dimensions of the interaction between content providers and audiences, for example, address vitally important issues that are somewhat outside the bounds of the narrow conceptualization of the audience as consumers (→ Cultural Studies; Uses and Gratifications). Media content providers, of course, perceive of their audiences primarily through a consumer-oriented lens. Therefore to develop an understanding of this perception – as well as of its broader implications – is also an important element of research examining consumers in media markets, which helps to generate insight into the behavior of media institutions (Napoli 2003; → Audience Commodity).

### **ATTENTION AND MONEY AS LIMITED RESOURCES**

Studying the behavior of media consumers requires a focus on the allocation of two scarce resources: attention and money. The time spent consuming media has continued to expand according to many measures – most likely due to increased multitasking on the part of consumers (in terms of both consuming media while engaging in other activities and consuming multiple media simultaneously). Nonetheless, the attention of media consumers itself remains a scarce resource (Lanham 2006), particularly in an increasingly fragmented and cluttered media environment, in which available content options are growing exponentially, all of which compete aggressively for consumer attention.

Similarly, there is a limit to what consumers can spend on media. Some research has even suggested that the proportion of income that consumers spend on media has remained relatively constant over time, despite the continued introduction of new technologies and content options into the media system (McCombs 1972). Although the validity of this assertion has been questioned, it remains nonetheless important to consider the limitations in consumers’ financial resources that can impact media consumption and consequently create an environment in which different media technologies and content options compete for a pool of resources that is, in all likelihood, not increasing at a rate that is commensurate with the rate at which the media system as a whole is expanding (see Dimmick 2002).

### **KEY LINES OF RESEARCH**

Early efforts to understand media audience as consumers can be traced (as can many elements of communications and market research) to → Paul Lazarsfeld. Work such as

his 1946 study, *The people look at radio*, helped to establish a tradition of examining the interaction between audience member and content provider primarily through a consumers-oriented lens. Work such as this was often funded at least in part by various sectors of the media industries, which also helps to explain its focus on media audiences primarily as consumers (see also Steiner 1963).

While early research on media consumers examined issues such as consumer satisfaction with various media products, over time the study of media consumers has come increasingly to focus on understanding how consumers choose to expose themselves to various media products. This focus on exposure can be seen, for example, in the well-known “*program choice*” literature (see Owen & Wildman 1992). This body of primarily theoretical work has sought to develop predictive models of consumer content selection and media organization content provision under various circumstances of consumer preferences, channel capacity, and competitive conditions (→ Selective Exposure). The program choice literature was developed primarily in response to media policymakers’ needs (→ Media Policy), as an approach for determining the benefits (in terms of format/genre diversity) of competitive versus monopolistic or oligopolistic conditions in the programming market. However, this line of research is also notable for its early efforts at developing theoretical approaches to the process by which consumers select individual media products, even if many of these theoretical models (including the more recent ones) have tended to oversimplify the dynamics of media consumption (Napoli 2003).

Empirical work inspired to some extent by the program choice literature has delved into a wide range of *factors that impact consumers’ choices* in regards to individual media products. This work has considered both audience factors (i.e., the characteristics of the media consumers, such as tastes, preferences, and awareness of various content options) and media factors (i.e., the quantity of content options, the range of media consumption technologies available) in an effort to account for both the structural-level and individual-level factors that impact consumers’ choices in the media marketplace (Webster & Phalen 1997). Work in this vein has addressed questions such as the extent to which media consumers’ individual → genre or format preferences drive their media consumption; how content selection is impacted by changes in the technological environment (such as increased channel options or increased technological choices); and, more broadly, the extent to which media consumers exhibit passive versus active tendencies in their media consumption (and how such tendencies may vary across different media types and across different demographic categories).

The primary objective of research in this vein is, of course, to identify consistent and predictable patterns in consumer choice that can both have applied utility and yield theoretical insights into the dynamics of cultural consumption. For instance, audience researchers have frequently found evidence of a *double jeopardy effect* which characterizes media consumption (Webster & Phalen 1997). Specifically, research has shown that, despite popular perception, the common notion of the “small but loyal audience” is largely a fallacy. Rather large audiences tend to be made up of higher proportions of loyal audience members (i.e., frequent consumers) than smaller audiences. Consequently, content that attracts small audiences is doubly endangered – by both the small size of the audience and the fact that these audience members are not likely to be frequent consumers of the content.

Another macro-level trend among media consumers that has received a substantial amount of attention from researchers involves the “*one-way flows*” of *media products*. Research on one-way flows has illustrated enduring patterns in media consumer behavior involving (as the name suggests) the tendency for the consumption of media products to flow from large markets to small markets (both nationally and internationally), but seldom vice versa. Such patterns reflect an important tendency among media consumers to gravitate toward content produced for larger markets, due in large part to the higher production budgets associated with it (Owen & Wildman 1992).

Indeed, both the double jeopardy effect and one-way flows reflect the significant extent to which consumer behavior is affected by the underlying production budgets of the available content. To the extent that audiences tend to gravitate to higher-budget over lower-budget content, so arise the difficulties associated with niche content reflected in the double jeopardy effect, and the tendency of one-way flows from large markets to small markets.

### **THE NEW MEDIA ENVIRONMENT AND THE PREDICTABILITY OF MEDIA CONSUMERS**

Research on the behavior of media consumers does, however, face an increasingly difficult task in terms of identifying consumer behavioral patterns in media environments that are becoming increasingly fragmented, increasingly complex, and, consequently, increasingly unpredictable. The much greater channel capacity of many media technologies, the rise of alternative distribution technologies, and the increased interactivity of the new media environment (→ Interactivity, Concept of) all contribute to a media landscape that is vastly different from the one in which early researchers could, for example, in the television context demonstrate with great consistency predictable patterns of “audience flow” from one program to the next.

One important pattern that has emerged, however, is that the tremendous fragmentation of the media environment has not been accompanied by a comparable fragmentation of media audiences. Rather, audiences exhibit a consistent tendency to cluster around relatively few content options, even when their available choices expand dramatically (see Hindman 2007; Neuman 1991).

As this *clustering tendency* helps to illustrate, at the broader level of media consumer behavior we see fairly predictable patterns across the aggregate of content options. In contrast, however, perhaps one of the most enduring themes of the literature on media consumers is the tremendous uncertainty that inevitably revolves around the process by which consumers select individual content options. From the “nobody knows anything” mantra that long has permeated the film industry, and research into motion picture audiences (e.g., DeVany 2004), to the “all hits are flukes” perspective reflected in research on the production and consumption of television (see Bielby & Bielby 1994), media consumers have been, and continue to be, very difficult to predict. For these reasons, media usage often has been conceptualized as a *two-stage process*. The first stage – the decision to consume a particular medium – is reasonably predictable and exhibits fairly stable behavioral patterns. The second stage – the selection of the individual content option – is, in contrast, highly unpredictable.

## **MEDIA ORGANIZATIONS AND MEDIA CONSUMERS**

To the extent that an understanding of media audiences as consumers is typically a perspective characteristic of the media organizations providing consumers with content, research on media consumers has also frequently addressed the related subject of how these organizations perceive their consumers (Turow 1997), as well as the subject of how these organizations cope with the many distinctive and unpredictable characteristics of media consumer behavior (Napoli 2003).

For instance, the process by which media consumer behavior is translated into tangible information to guide decision-making and to facilitate transactions between content providers and advertisers has received an increasing amount of attention (Anand & Peterson 2000; Ang 1991), particularly in light of the increased difficulties that the increasingly fragmented and complex media environment pose for the organizations charged with effectively measuring consumer behavior (Napoli 2003; → Advertising, Economics of). A particular point of focus of this research has been on how technological or methodological shifts in the *systems for measuring the behavior* of media consumers can alter how media organizations perceive the composition and behavioral characteristics of their consumers and the competitive dynamics of their markets. It is also important to note that a tremendous amount of scholarly criticism has been leveled against commercial audience measurement systems and their usage (→ Nielsen Ratings; People-Meter), in light of their substantial methodological shortcomings and the associated questions about whether any legitimate representation of true media consumer behavior is (or even can be) captured by these systems (e.g., Ang 1991; Meehan 1984).

Along related lines, a substantial body of literature has developed that explores the mechanisms by which media organizations (both content providers and advertisers) place value on *different categories of media consumers*, and on the information sources that feed into the formulation of these valuations (Turow 1997). To the extent that the value of media consumers is, within the context of advertising supported media, tied to their behavior as consumers of other products and services, understanding how the media and advertising industries effectively link these two areas of consumption is central to understanding the interaction between media consumer and content provider.

## **CONTEMPORARY ISSUES AND CHALLENGES IN THE STUDY OF MEDIA CONSUMERS**

The study of media consumers today faces its greatest challenges in terms of effectively accounting for the ever growing array of media choices that are available, and in terms of effectively accounting for the various ways in which the interaction between content provider and consumer is changing. In a highly fragmented media environment, questions regarding the mechanisms by which media consumers become aware of the content options available to them become increasingly important – particularly in terms of developing an understanding of how consumers utilize the wide range of new search and navigation tools available to them in the new media environment.

Similarly important are broader questions regarding the political, economic, and cultural implications associated with the increased fragmentation of media consumers

(Sunstein 2001; Turow 1997). And, in a technological environment in which consumers have increasing control over when, where, and how media content is consumed, researchers inevitably must devote greater attention to these micro-level dynamics of consumption that provide for increasing variation in the consumption process across individual media consumers. And finally, research is only now beginning to address the wide range of questions arising from a contemporary media environment (particularly in the online realm) where the line between producer and consumer of media content is becoming increasingly blurred.

# Content Analysis, Qualitative

Bertram Scheufele

University of Jena

Like quantitative content analysis, qualitative content analysis is an empirical method of social sciences for analyzing live or recorded human communication such as → newspaper articles, protocols of → television news or programs, transcripts of → interviews, or protocols from → observations (→ Content Analysis, Quantitative). This written or transcribed material is called text material in this context (→ Text and Intertextuality). From a general perspective, there are two main differences between quantitative and qualitative content analysis. First, quantitative content analysis works deductively and measures quantitatively. In this respect, quantitative content analysis decomposes the text material into different parts and assigns numeric codes to these elements or parts. Of course, such parts are not just words, but are rather issues, statements, arguments, or bundles of → meaning. By contrast, however, qualitative content analysis works inductively by summarizing and classifying elements or parts of the text material and assigning labels or categories to them. In this respect, qualitative content analysis searches rather for “coherent” meaning structures in the text material.

Second, quantitative content analysis can deal with a large quantity of text material. Qualitative content analysis, on the other hand, is limited to a few pieces of text material – whether these are newspaper reports, interview transcripts, or observational protocols. In practical respects, one can say that quantitative content analysis applies category schemas for the purpose of measuring quantitatively, whereas qualitative content analysis develops categories in a qualitative, rather inductive, or → hermeneutic, way. Further differences that are emphasized by advocates of → qualitative methodology or the qualitative paradigm will be discussed later.

## DIFFERENT VIEWS ON QUALITATIVE CONTENT ANALYSIS

In a wider sense, the term “qualitative content analysis” subsumes quite different and various methods and techniques of analyzing text material qualitatively or hermeneutically. Examples are → grounded theory, → discourse analysis, and the *objektive Hermeneutik* (“objective hermeneutics”) of Oevermann et al. (1979). In a more narrow sense, qualitative content analysis is a label for a specific type of qualitative text analysis that was developed by Mayring (2002). This type of qualitative content analysis tries to close the gap between the so-called quantitative paradigm and the qualitative paradigm. Following Mayring, all research comprises qualitative and quantitative steps, and the difference between the two paradigms lies only in the different weightings attached to them. From a more “orthodox” standpoint of qualitative research, Mayring’s version of qualitative content analysis is not open and flexible enough for social reality, however. There are rules and advice that seem to be too quantitative for strict qualitative research. From a more affirmative point of view, Mayring’s content analysis has the advantage of being a systematic and more transparent research method, when compared, for instance, to objective hermeneutics (Oevermann et al. 1979), but also compared to grounded theory.

Which argument one follows is a function of one's standpoint in relation to qualitative or → quantitative methodology. The following sections first discuss basic features of qualitative content analysis from a general qualitative perspective. Second, two prominent versions or techniques of qualitative content analysis are explained in further detail. The first version is the qualitative content analysis developed by Mayring (2002). The second is the research program and technique of Oevermann et al. (1979), called "objective hermeneutics." As mentioned already, other qualitative techniques of text analysis can be subsumed under the label "qualitative content analysis" as well. The two selected versions probably represent the two poles of what can be called content analysis in qualitative research. Mayring stands for a vision of bringing qualitative content analysis nearer to the methodological standards of quantitative methodology. While his position is clearly based in the social sciences, Oevermann and his colleagues stand for a vision of qualitative content analysis being rather at home in the field of the humanities.

### **BASIC FEATURES OF QUALITATIVE CONTENT ANALYSIS**

Following Lamnek (1995), qualitative content analysis is not simply a "smoother" version of quantitative content analysis. Qualitative content analysis is in fact different in its core features and in its methodological background. As mentioned already, many advocates of the qualitative paradigm do not accept Mayring's version of qualitative content analysis since it seems too "quantitative" for them. From their point of view, qualitative content analysis should rather rely on the crucial features of qualitative research in general, which are then applied to content analysis more specifically. Lamnek (1995), for instance, mentions four basic features.

The first is *openness*. In terms of qualitative content analysis, researchers should be open enough to social reality by avoiding theoretically deduced and completely standardized → coding schemas. Thus, qualitative content analysis affords analyzing text material without pre-defined coding units, dimensions, or categories. This is similar to the coding procedures known from grounded theory, which can be seen as one technique of qualitative content analysis, as mentioned above. The main task in qualitative content analysis in terms of openness is to understand the meaning and concepts used and applied by the subjects under examination. For this purpose, qualitative researchers analyze text material "produced" by these subjects, for instance in a qualitative interview which has been transcribed (→ Interview, Qualitative). In sum, researchers do not apply their own categories but understand the meaning of subjects' everyday categories.

The second feature is *communicativity*: social reality is established by and in interaction or communication. Thus, we can assume that all subjects interacting or communicating have a common meaning ground. This means that subjects share some knowledge about the motives and structures of interaction and communication, i.e., about how and why people act and communicate this and not that way, what they mean by certain concepts, and so on. Text material – for instance, the protocols of observing interactions or the transcripts of interviews – should therefore not be decomposed into different separate dimensions or categories as in quantitative content analysis. To meet the aspect of communicativity, text material should rather be interpreted "coherently." This was emphasized by Kracauer (1952), who criticized quantitative content analysis for focusing merely on the manifest

structures of communication and thereby neglecting the latent meaning or latent text structures, e.g., ironic aspects of communication. Furthermore, qualitative content analysis does not aim at possible effects of the text material, but aims at decoding the subjects' meaning, which is represented in the text material. Oevermann's objective hermeneutics, for instance, tries to extract the "objective latent meaning structures" from the text material. Finally, the feature of communicativity also affords that researchers themselves should come into contact with the subjects they examine – for instance, in qualitative interviews.

The third feature is *naturalistics*. This standard is especially important for collecting or generating text material. If researchers interview a subject or a group of persons, they should keep the situation in which they collect information about subjects' interaction or communication, as natural as possible. The subjects being interviewed should feel as though they are in a natural environment. Furthermore, this criterion affords that the interview transcripts or observational protocols, for instance, should use the language of the "common man."

Finally, the fourth feature is *interpretativity*. It comprises two aspects: (1) qualitative content analysis aims at understanding everyday interpretations and attributions of meaning, and (2) it aims at typifying, i.e., at constructing patterns of meaning by analyzing the text material, and does not aim at representative statements about communication or interaction in the sense of a qualitative methodology.

### MAYRING'S VERSION OF QUALITATIVE CONTENT ANALYSIS

The version developed by Mayring (2002) does not provide a prefabricated instrument for qualitative content analysis appropriate for each study. It is rather a bundle of techniques, which have to be specified and adapted to the specific research questions of one's own study. Different techniques can also be mixed or merged. In most of his publications, Mayring distinguishes *three techniques of qualitative content analysis*: summarizing transcribed or written material, structuring this material, and exploring its context. By applying these techniques, the original material is condensed into a category schema. While quantitative content analysis looks at text material more closely and open-mindedly only at the time when categories are being developed or in the pre-test, qualitative content analysis does so continuously for the purpose of improving the process of "condensation" step by step. This adjustment to the original text material is done sequentially and not permanently as in grounded theory.

*Exploration* means analyzing the context of the text material. This can be the author's biographical context, his or her emotional state when being interviewed, as well as the social or cultural context in which a newspaper report was written. More popular are the techniques of summarizing and structuring. The aim and result of *summarizing* is a condensed or shortened version of the original text material – like a summary of a story. The process of summarizing can be visualized by an isosceles triangle standing on its tip. Mayring provides several rules and advice for reducing text material, for deleting paraphrases identical in meaning, and for generalizing paraphrases and integrating them on a pre-defined level of abstraction. These sub-techniques resemble the macro operations known from cognitive psychology and linguistics. The final system of general phrases or sentences, i.e., the "condensed version" of the original text material, is then applied to the material again for "verification."

The aim and result of the third technique of *structuring* is a structured cross-section of the original text material. The technique can be broken down into different subtypes. Mayring distinguishes between formal structuring, content structuring, scale structuring, and typification. Formal structuring means analyzing the text material, e.g., with syntactical or semantic criteria in mind, or identifying thematically related paragraphs and summarizing them. Content-bound structuring means filtering certain issues and aspects from the material and generalizing them – usually by starting with roughly defined categories or dimensions. This technique is quite similar to the empirical way of generating categories known from quantitative content analysis. Scale structuring means estimating the text material, e.g., on an ordinal scale that resembles the valence or intensity type of quantitative content analysis. Typification is a form of structuring that aims at prototypes or ideal types in the sense of Max Weber. Here, one focuses, e.g., on extreme aspects in the text material. By combining different dimensions or aspects, one obtains ideal types.

All four forms of structuring follow the same logic. First, one theoretically defines the criteria or dimensions of structuring. Then one defines the values of these dimensions, searches for examples in the text material, and formulates coding rules for categories. With this “raw” coding guide, one analyzes the text material and modifies the categories and values, examples, and coding rules. This procedure can be repeated several times until one obtains the final category system. There are some computer programs that have been specially developed for qualitative content analysis, which help to structure the text material and even allow for additional → cluster analyses based on qualitative material.

Compared to other methods of qualitative text analysis, the Mayring version has *three advantages*. First, all techniques can be combined and modified for the purpose of the specific study. For instance, in a specific study one can summarize and generalize text material as a first step, and identify ideal types or prototypes based on this generalized material as a second step. Second, Mayring provides detailed rules, which help to keep research intersubjectively transparent as well as systematic, but still open and flexible enough in a truly qualitative sense. So, in contrast to, e.g., hermeneutics, the Mayring version of qualitative content analysis can be checked intersubjectively. Finally, the elements of other types of qualitative text analysis – such as categories from discourse analysis – can easily be integrated into Mayring’s structuring techniques. For instance, one can ask for anti-Semitic → stereotypes when structuring transcripts, e.g., from parliamentary debates or when analyzing right-wing propaganda. But one can also use the results of summarizing or structuring techniques as a category system in a conventional code-book and apply them to a larger amount of material (e.g., many newspaper reports) in a quantitative content analysis.

### **OEVERMANN’S VERSION OF QUALITATIVE CONTENT ANALYSIS**

Mayring’s version of qualitative content analysis is at home in the social sciences. Oevermann and his colleagues developed objective hermeneutics as a version of qualitative content analysis from the perspective of the humanities or *Geisteswissenschaften*. Several concepts and terms are easier to understand if one keeps the origin of objective hermeneutics in mind – which is family therapy. In a narrow sense, Oevermann et al. (1979, 181–182) understand objective hermeneutics as a technique of interpreting

transcripts of interaction, especially family talk. In a wider sense, objective hermeneutics is a technique for analyzing any kind of text or transcribed (communication) material.

The second part of the label “objective hermeneutics” reflects that this type of qualitative content analysis works hermeneutically. The first part of the label refers to the fact that each text represents a reality with an objective meaning structure. This objective meaning is detached from the speaker’s intentions (e.g., the intention of a mother in family interaction) as well as from the listener’s perception. Only in an ideal communication setting would all three fit perfectly. The difference between an objective meaning, on the one hand, and the intention of a subject speaking or the perception of a subject listening, on the other, is important. In this respect, objective hermeneutics follows Max Weber’s concept of ideal types. In his methodological study, however, Mathes (1988) emphasizes that intentions are often more important than any kind of objective meaning in communication research. Nevertheless, framing patterns in public → discourse can be considered as some type of an “objective,” i.e., socially shared or common meaning (→ Framing Effects). Thus, objective hermeneutics is not as far away from other methods of text analysis as it may seem at first sight.

Furthermore, objective hermeneutics calls for rules and standards as well, and claims to be a formalized, scientific technique of interpreting text material. Yet, these standards or rules are based on a *different concept of “objectivity”* than in social sciences and in quantitative methodology. All steps of interpretation in objective hermeneutics are undertaken by a team of three to seven researchers. Such teamwork aims at a discursive or consensual concept of “objectivity”: all researchers try to find the objective meaning by discussing all possible meanings. By contrast, quantitative content analysis calls for intersubjectivity, i.e., for documenting and explaining all steps (sampling, units, dimensions, categories, etc.) in order to allow replications by other researchers.

There are *three main principles in objective hermeneutics*. The first principle, extensive interpretation, affords collecting all possible interpretations of a text – even the unlikely ones. The second principle, complete interpretation, calls for considering even the smallest units of meaning. The third principle, sequential interpretation, calls for a process of eliminating alternative meanings by starting from one part of the interview transcript, observational protocol, etc., then moving to the next part of it, and so on. By this process, the structure of the transcribed communication emerges step-by-step. Different strategies serve to meet these principles. In the structural analysis, for instance, all available “objective” material, e.g., about the biographies of the interacting or communicating subjects, is collected. This is comparable to the exploration technique in Mayring’s version of qualitative content analysis, in some respects.

The core strategy of objective hermeneutics, however, is the “*detail analysis*,” which comprises two parts. The first part is reconstructing the communication figure as mentioned in the text and identifying the most likely objective meaning. The second part is making statements about structures, types, or pattern – for instance, about general social pattern in families. This is somewhat comparable to the structuring technique in Mayring’s version of qualitative content analysis. Both parts of the detail analysis decompose into different steps. Three of them are mentioned in the seminal publication by Oevermann et al. (1979). The first step is paraphrasing the meaning from the perspective of an ordinary reader. The second step is explicating the subjects’ possible intentions. The

third step is explicating the objective structure, i.e., the motives and consequences of interaction or communication, which are represented in the text.

From an overall perspective, objective hermeneutics is certainly the more time-consuming version of qualitative content analysis, and the one where teamwork does not meet the standard of intersubjectivity from the strict standpoint of social sciences. By contrast, Mayring's version is closer to the general procedures of the social sciences and therefore is criticized by the proponents of qualitative methodology for being too close to quantitative methodology.

## **Content Analysis, Quantitative**

*Bertram Scheufele*

*University of Jena*

Quantitative content analysis is an empirical method used in the social sciences primarily for analyzing recorded human communication in a quantitative, systematic, and

intersubjective way. This material can include newspaper articles, films, advertisements, interview transcripts, or observational protocols, for instance. Thus, a quantitative content analysis can be applied to verbal material, and also to visual material like the evening news or television entertainment. Surveys, → observations, and quantitative content analysis are the main three methods of data collection in empirical communication research, with quantitative content analysis the most prominent in the field (→ Survey). In other disciplines like psychology or sociology quantitative content analysis is not used as widely.

## QUANTITATIVE AND QUALITATIVE CONTENT ANALYSIS

Ole R. Holsti (1969) defines quantitative content analysis as “any technique for making inferences by objectively and systematically identifying specified characteristics of messages.” Bernhard Berelson (1952) speaks of “a research technique for the objective, systematic and quantitative description of the manifest content of communication.” There has been much debate on this classical definition of quantitative content analysis: what does the word “manifest” mean, and is it possible to analyze latent structures of human communication beyond the surface of the manifest text, i.e., the “black marks on white”? In a more practical sense, the word “manifest” should be interpreted in terms of “making it manifest.” For example, if one were to look for irony in political commentaries, the construct of “irony” is not manifest in the sense of being directly identifiable from “black marks on white.” Whether or not there is irony in a commentary has to be interpreted. Thus, before a commentary is coded, it has to be precisely determined what words, phrases, key words, or arguments should serve as indicators for the category “irony.” In other words, this “latent” aspect of communication is made manifest by its definition.

With newspaper articles, the logic of quantitative content analysis can be described as a systematic form of “newspaper reading.” Here, the reader, i.e., the person charged with coding, assigns numeric codes (taken from a category system) to certain elements of the articles (e.g., issues or politicians mentioned in articles) by following a fixed plan (written down in a codebook). Of course, one does not analyze only one but many articles, reports, or commentaries from different newspapers. In this respect, quantitative content analysis differs from qualitative content analysis (→ Content Analysis, Qualitative). While qualitative content analysis is limited to a number of roughly 50 to 100 sample elements (e.g., newspaper reports, interview transcripts, or observational protocols), quantitative content analysis can deal with a huge number of sample elements. Qualitative content analysis works rather inductively by summarizing and classifying elements or parts of the text material and by assigning labels or categories to them. Quantitative content analysis, however, works deductively and measures quantitatively by assigning numeric codes to parts of the material to be coded – which is called *coding* in quantitative content analysis.

## FIELDS OF APPLICATION

Originally, quantitative content analysis was linked to propaganda research, for instance, propaganda material in World War II. Nowadays, quantitative content analysis is applied to many different forms of human communication like print and television coverage,

public relations, entertainment, advertisements, photographs, pictures, or films. For instance, subjects of analysis can include national images in media coverage about foreign affairs, the role models presented in television advertisements, the kind and quality of arguments in company press releases, or the features of actors in modern Asian film. In theoretical terms, quantitative content analysis is being applied to many different fields of research in communication science, for example, in analyzing the kind of issues covered by the media in the context of *agenda-setting* (→ Agenda-Setting Effects). Similarly, quantitative content analysis is a key method in the cultivation approach, where it is called *message system analysis* (→ Cultivation Effects). In both these approaches, content analysis is combined with a survey in field design. Further applications of quantitative content analysis are in: *election studies*, where it is used to examine election campaigns themselves or media coverage about the candidates, parties, and campaigns; and in *media coverage* of or public discourses on social problems and issues like racism, social movements, or collective violence.

### PURPOSES OF QUANTITATIVE CONTENT ANALYSIS

Generally speaking, there are three major purposes and thus three basic types of quantitative content analysis which follow the popular “Lasswell formula,” which asks *who says what, to whom, why, to what extent, and with what effect*. The first purpose is to make inferences about the antecedents of communication, for example, examining the coverage of a liberal and a conservative newspaper (*who*). If there is a political bias in the commentaries or in the news reports (*what*), the bias would be explained (*why*), e.g., differences between the newspapers in their editorial lines or political orientation.

The second purpose is merely to describe communication (*what, to what extent*). Here, different techniques can be applied (which are described below). The third purpose is to draw inferences about the effects of communication (*to whom, with what effect*). Agenda-setting and cultivation studies are good examples for this basic type of quantitative content analysis. Yet, strictly speaking, such an inference is not possible when nothing but the message is examined. Additionally, a survey should be carried out, for instance, before a statement is made about mass media coverage influencing people’s thoughts and perceptions of the world, as in the cultivation approach. The reason for this can be explained by → constructivism. From the constructivist point of view, quantitative content analysis is a reactive method, like surveys for example, since the message to be coded is not fixed in an objective sense. Several people reading the same message may interpret it differently due to their individual schemata, beliefs, and attitudes. Thus, when making inferences about message effects, one should carry out not only a quantitative content analysis but also a reception study or an effects study.

### TYPES OF QUANTITATIVE CONTENT ANALYSIS

There are different types of quantitative content analysis, i.e., different techniques of describing human communication. The first focuses on *frequencies*, where one merely counts, e.g., the appearance of issues, persons, or arguments in newspaper coverage. Many studies using the agenda-setting approach are such simple frequency content

analyses, and most rely only on media archives. Thus, they do not examine the content or text, e.g. of a newspaper article, but focus only on the headline. This is a simplified version of quantitative content analysis.

The second technique focuses on *tendencies*. The above-mentioned example of political bias in the commentaries of a liberal and a conservative newspaper is a good example. In another example, the analysis would not only measure the number of articles on nuclear energy, but also their viewpoint on the issue, e.g., by noting the advantages and disadvantages mentioned. If the advantages reported exceed the disadvantages, the article would be observed to be “in favor” of nuclear energy, while if the disadvantages reported exceed the advantages, it would be considered to show “disapproval” or a “negative tendency.”

The third technique does not only focus on tendencies, but also on intensities. Here, one would not just code on an ordinal scale (using, e.g., “positive,” “ambivalent,” and “negative”), but use interval measurement (e.g., “strongly positive,” “positive,” “ambivalent,” “negative,” and “strongly negative”).

Finally, there are also several techniques that meet the popular objection that quantitative content analysis “disassembles” communication. Critics of quantitative content analysis (e.g., Siegfried Kracauer) claim that quantitative content analysis cannot examine relations between elements of communication, i.e., the semantic and syntactical structures of communication. They argue, for instance, that when arguments and persons in newspaper reports are counted separately, the fact that arguments are raised by persons is neglected; or that when statements are separately coded, the fact that a statement can refer to another statement, e.g., by supporting it, is not taken into account. The latter objection may apply with reference to most agenda-setting studies, but it is not a justified objection against quantitative content analysis in general.

A good example of a technique that meets the semantic and syntactical structures of communication is the *Semantische Struktur- und Inhaltsanalyse* (Semantic Structure and Content Analysis) developed by Werner Früh. Without going into detail, the technique considers various elements of communication as well as the relations between them; for instance, it analyzes persons and roles mentioned in newspaper articles, but it also examines time aspects like anteriority and so-called “modifications” like persons’ features or local specifications. In addition, it looks for so-called “k-relations,” such as causal, intentional, or conditional relations as well as for “R-relations” mentioned in, e.g., news reports. Thus, newspaper articles are deconstructed into micro-propositions, but the semantic structure and content analysis reconstructs all relations between these micro-propositions.

Most quantitative content analyses examine text or verbal material, i.e., transcribed or recorded human communication. Studies analyzing visual material like films, television advertisements, or televised debates between presidential candidates are comparably rare. There are three major reasons for this. First, copies of newspaper articles are easier to access than copies of the evening news, for instance; in retrospective studies (which most quantitative content analyses are), especially, visual material is often no longer available. Second, visual material is more complex than verbal or text material. For example, television news not only provides information via the audio channel but also via the visual channel. Since verbal and visual information can deliver different messages, one

has to code both streams of information. This is more expensive than just coding print news. Finally, coding visual material like evening news on television requires more detailed coding instructions and more complex category definitions than a codebook for analyzing newspaper coverage.

A more or less recent development in quantitative content analysis is automatic, that is, computer-assisted, content analysis, where a computer program counts keywords and searches for related words in the same paragraph, for example. Before the coding process begins, all the relevant keywords or phrases in a so-called coding dictionary – an equivalent of the codebook of a conventional content analysis – have to be listed. While there has been some progress in this technique, it will be a while before the human coder becomes redundant.

Current challenges for quantitative content analysis stem from the world wide web, where the content of a private weblog, arguments in online chat, or the pictures in an online gallery can be subject to analysis. Compared to newspaper coverage, for example, a content analysis of online communication can be quite a problem. Here, the population from which a sample is taken for analysis is not fixed but changes from day to day, or even more quickly. It is therefore important to store all relevant communication for a specific study. But even if this were possible, one seldom has a view of the complete population since the world wide web, or the Internet, as a whole is not easy to grasp. Thus most studies that analyze online communication work with samples that are more or less clearly defined.

## STANDARDS

Like any other method in the social sciences, quantitative content analysis has to meet certain standards of quantitative empirical research. The first criterion of intersubjectivity calls for transparent research. This means that all the details of a quantitative content analysis have to be described and explained so that exactly what has been done is clear. The second criterion of systematics requires that the coding rules and sampling criteria are invariantly applied to all material. The third criterion of → reliability calls for the codebook to be dependable. Different coders do not always agree on coding. For example, one coder may identify an argument in a newspaper article as argument 13 from the argument list in the codebook, while another coder will choose argument 15, with the result that the numeric codes assigned to the argument in the newspaper article do not match. Yet, in other cases the two coders may agree. Using all codings of both coders, one can divide the doubled number of matching pairs (e.g., 17 identical codings) by the number of all codings of the first coder and the number of all codings of the second coder (e.g., 20 codings each), to obtain a ratio called the *Holsti-formula*, which is a simple reliability coefficient. In this example we would find  $R = 17 * 2 / (20 + 20) = 0.85$ . The values of all reliability coefficients range from 0 (no matching at all) to 1 (perfect matching). Another popular reliability coefficient – better known from index calculation – is Cronbach's alpha  $\alpha$ .

The fourth standard for a quantitative content analysis is → validity. An instrument of empirical research, i.e., the codebook with reference to CA, can claim to be valid when it measures what it intends to measure. For instance, if the codebook contains a category

“stereotype,” then the coders should not measure political bias or irony when applying the coding rules for this category, but code stereotypes. According to Klaus Krippendorff, there are different forms of validity. The type of validity in the example can be called *face validity*. *Predictive validity* and *concurrent validity* both refer to an external criterion measure for validating data obtained by a quantitative CA. Such a measure may be another quantitative content analysis or may be statistical data from governmental sources. With concurrent validity the validity test is administered at the same time as the criterion is collected. With predictive validity, scores are predicted on some criterion measure.

## CONTENT ANALYSIS AS RESEARCH PRACTICE

The research process using quantitative content analysis comprises six steps. It usually begins with theoretical considerations, literature review, and deducing empirical hypotheses. In the second step, the sample material that is to be coded, i.e., examined with the codebook, is defined. In the third step, the coding units (e.g., articles or arguments) are described. In the fourth step, the codebook with the category system is developed and pre-tested. The actual measurement, i.e., the process of coding, represents the fifth step of a CA. The final step is data analysis and data interpretation.

Most quantitative content analysis requires multilevel sampling, for instance, analysis of campaign coverage would involve the choice of a limited number of national newspapers which represent diverse political standpoints (e.g., from liberal to conservative). On the next level the time span to be analyzed (e.g., every day in the critical phase of the election campaign) is set. On the next level, the articles to be coded are determined (e.g., all articles on the front page). Usually the sample is called the unit of analysis. The *coding unit*, however, is the most important unit in quantitative CA. It defines the level of measurement. For example, if the features of an article (e.g., the main issue of the article) are examined, the single article is the coding unit, but if the attributes of an argument (e.g., the issues mentioned in an argument) are examined, then the single argument is the coding unit. In the first case, 100 articles (with 5 arguments per article) will lead to 100 codes, in the second case the same number of articles will produce 500 codes. The level of coding depends on the sample size as well as on the research question. If the study focuses on argumentation structures, the article will not be chosen as the coding unit. If political coverage in 10 newspapers in the last 50 years is the focus of the study, the argument or statement will not be chosen as a coding unit, otherwise a vast number of cases will have to be coded.

## Contingency Model of Conflict

*Augustine Pang*

*Nanyang Technological University*

The contingency theory of strategic conflict management, which began as an elaboration, qualification, and extension of the value of symmetry propounded in the excellence theory, has, over the last decade, come into its own and emerged as an empirically tested perspective. This entry consolidates the maturation and advances of the theory.

Much of the literature on effective → public relations and conflict management had been built on Grunig & Grunig's (1992) and Grunig & Hunt's (1984) *excellence theory* (→ Excellence Theory in Public Relations). Four models of excellence have been posited: in a "press agency/publicity model" the organization is only interested in making its ethos and products known, even at the expense of half-truths. The "public information model" is predominantly characterized by one-way transfer of information from the organization to its publics; the aim is to provide information in a journalistic form. In a "two-way asymmetric model," instead of a rigid transference of information, the organization uses → surveys and polls to persuade the public to accept its point of view. Finally, in a "two-way symmetric model" the organization is more amenable to developing a dialogue with the public: communication flows both ways between the organization and the public (→ Organization–Public Relationships), and both sides are prepared to change their stance, with the aim of resolving the crisis in a professional, ethical, and effective way. The two-way symmetrical model has been positioned as normative theory, stating how organizations should be practicing public relations (PR) and regarded as the most ethical and effective manner of doing so.

The contingency theory, however, saw a different reality. The complexity in → strategic communication was best represented by a *continuum of stance*, not by a limited set of models of excellence, its proponents argued. A continuum would be far more grounded in reality and able to portray the variety of PR organizations' practice in a conflict. The contingency theory, thus, argued that the organizational response to the PR dilemma at hand, has, at one end of the continuum, advocacy, and at the other end, accommodation, along the continuum:

*Pure advocacy* ----- *Pure accommodation*

The theory offered a matrix of 87 factors, arranged thematically, that the organization could draw on to determine its stance. Between advocacy, which means arguing for one's own case, and accommodation, which means giving in, was a wide range of operational stances that influenced strategies, and these entailed "different degrees of advocacy and accommodation" (Cancel et al. 1997, 37). Along this continuum, the theory argued that any of the factors could affect the location of an organization on that continuum "*at a given time regarding a given public*" (Cancel et al. 1999, 172). The theory, thus, sought to understand the dynamics, within and without the organization that could affect an organization's stance. By understanding these dynamics, it elaborated and specified the conditions, factors, and forces that underpinned such a stance.

To test the theoretical veracity and the applicability of the theory, Cancel et al. (1999) found further insights into the relative influences of the factors in positing the organization's position, thereby spawning the contingency terms, "predisposing" and "situational" variables.

There were *factors that influenced the organization's position on the continuum* before it interacts with a public; and there were variables that influenced the organization's position on the continuum during interaction with its publics. The former have been categorized as predisposing variables, the latter as situational variables. Some of the well-supported predisposing factors Cancel et al. (1999) found included: (1) the size of the organization; (2) corporate culture; (3) business exposure; (4) PR to dominant coalition; (5) dominant coalition enlightenment; (6) individual characteristics of key individuals, like the CEO.

These factors were supported in the crisis management literature. For instance, → organizational culture had been found to be a key factor in ensuring the formulation of a sound crisis plan and excellent crisis management (→ Crisis Communication). *Situational variables* were factors that were most likely to influence how an organization related to a public by effecting shifts from a predisposed accommodative or adversarial stance along the continuum during an interaction. Some of the supported situational factors included: (1) urgency of the situation; (2) characteristics of the other public; (3) potential or obvious threats; (4) potential costs or benefit for the organization from choosing the various stances (Cancel et al. 1999).

Besides the predisposing and situational variables, Cameron et al. (2001) later found that there were occasions when accommodation was not possible at all, due to moral, legal, and regulatory reasons. They labeled them as *proscriptive variables*. Six were identified: (1) when there was moral conviction that an accommodative or dialogic stance towards a public may be inherently unethical; (2) when there was a need to maintain moral neutrality in the face of contending publics; (3) when legal constraints curtailed accommodation; (4) when there were regulatory restraints; (5) when senior management prohibited an accommodative stance; and lastly, (6) when the issue became a jurisdictional concern within the organization and resolution of the issue took on a constrained and complex process of negotiation. The proscriptive variables "did not necessarily drive increased or extreme advocacy, but did preclude compromise or even communication with a given public," argued Cameron et al. (2001, 253).

These theoretical discoveries would have carried little weight if they had no relevance to real-life situations. For instance, to understand how contingency theory was a realistic description of the practitioners' world and why the two-way symmetrical model was

impractical and inflexible, Yarbrough et al. (1998) applied it to how conflicts were managed during the 1996 Atlanta Committee for the Olympic Games (ACOG).

While many subsequent studies had applied the contingency theory interorganizationally, Pang et al. (2006) took it further and applied it intraorganizationally in their study of conflict between an organization's dominant coalition and its executives in the implementation of a regional crisis plan (→ Organizational Conflict). This further boosted the theory's versatility and rigor as a viable conflict management lens.
