# Notes on Editors and Contributors

## GENERAL EDITOR

**Wolfgang Donsbach** is professor of communication and founding director of the Department of Communication at Dresden University of Technology, Germany. He has taught at the Universities of Dortmund, Mainz, and Berlin in Germany, and was a visiting professor at Syracuse University, USA, University of Navarra, Spain, and Harvard University, USA. He has been president of the World Association for Public Opinion Research (1995–1996) and the International Communication Association (2004–2005), as well as managing editor of the *International Journal of Public Opinion Research* between 1999 and 2007. His main research interests are in journalism, political communication, and exposure to communication. He is the author or editor of 13 books and over 100 articles in academic journals.

## ADVISORY EDITORS

**Jennings Bryant** is associate dean for graduate studies and research, CIS Distinguished Research Professor, and Reagan Chair of Broadcasting at the University of Alabama, USA. He received that university's Blackmon-Moody Outstanding Professor Award for 2000, was president of the International Communication Association in 2002–2003, and in 2006 received a Distinguished Scholar Award from the Broadcast Education Association and was elected a fellow of the International Communication Association. His research focuses on entertainment theory, media effects, and media, family, and children.

**Robert T. Craig** is a professor of communication at the University of Colorado at Boulder, USA, and a past president of the International Communication Association. He was founding editor of the ICA journal *Communication Theory* and currently serves on the editorial boards of six journals and as series editor of the ICA Handbook Series. His research publications have addressed a range of topics in communication theory and philosophy, discourse studies, and argumentation. *Theorizing communication: Readings across traditions* (co-ed. with Heidi L. Muller) appeared in 2007.

## AREA EDITORS

**Stuart Allan** is professor of journalism at Bournemouth University, UK. Recent books include *Online news: Journalism and the Internet* and the edited collection *Journalism: Critical issues*.

**Kevin G. Barnhurst** is professor and head of the Department of Communication, University of Illinois at Chicago, USA, where he has been a faculty scholar of the Great Cities Institute. His published works on journalism and media include *Seeing the newspaper*; *The form of news: A history*, co-authored with John Nerone; an edited

collection, *Media queered*; and the *Journalism Monograph* “News as art.” Among other honors and awards, he has been Fulbright Distinguished Chair in communication history, Vercelli, Italy; fellow of the Shorenstein Center, Kennedy School of Government, Harvard University, USA; and research fellow at the Media Studies Center, School of Journalism, Columbia University, USA.

**Charles R. Berger** is professor in the Department of Communication, University of California, Davis, USA. He is former president of the International Communication Association and editor of *Human Communication Research*, as well as co-editor of *Communication Research*. His research focuses on message production processes and the role that rational and experiential information processing systems play in the interpretation of threat-related messages.

**Hans-Bernd Brosius** studied psychology and medicine, and since 1996 has been professor of communication in the Department of Communication and Media Research, Ludwig Maximilian University of Munich, Germany. From 1998 to 2002 he was chair of the German Communication Association. From 2001 to 2007, he was also dean of the faculty of social sciences. His research interests include media use, media effects, and methodology.

**Cynthia Carter** is a senior lecturer at Cardiff University, UK. Her books include *Critical readings: Violence and the media* (2006), *Critical readings: Media and gender* (2004), *Violence and the media* (2003), *Environmental risks and the media* (2000), and *News, gender and power* (1998). She was chair of the Feminist Scholarship Division of the International Communication Association 2003–2005. She is founding co-editor of the journal *Feminist Media Studies* and on the editorial boards of *Communication, Culture, and Critique*, *Communication Review*, *Critical Studies in Media Communication*, *Journal of Children and Media*, *Sociology Compass*, and *Fifth Estate*.

**Robert T. Craig** is a professor of communication at the University of Colorado at Boulder, USA, and a past president of the International Communication Association. He was founding editor of the ICA journal *Communication Theory* and currently serves on the editorial boards of six journals and as series editor of the ICA Handbook Series. His research publications have addressed a range of topics in communication theory and philosophy, discourse studies, and argumentation. *Theorizing communication: Readings across traditions* (co-ed. with Heidi L. Muller) appeared in 2007.

**John D. H. Downing** is director of the Global Media Research Center, Southern Illinois University, USA. He is author of *Internationalizing media theory: Reflections on media in Russia, Poland and Hungary, 1980–1995* (1996) and *Radical media: Rebellious communication and social movements* (2001); editor in chief of *The Sage handbook of media studies* (2004); and co-author with Charles Husband of *Representing “race”: Racisms, ethnicities and media* (2005).

**Robert N. Gaines** is professor of communication at the University of Maryland, USA. He served as president of the American Society for the History of Rhetoric from 1986 to 1987

and as editor of *Advances in the History of Rhetoric* from 2002 to 2007. His rhetorical research has appeared in *Advances in the History of Rhetoric*, *Cronache Ercolanesi*, *Hermes*, *Philosophy and Rhetoric*, *Rheinisches Museum*, *Rhetoric Society Quarterly*, *Rhetorica*, and *Transactions of the American Philological Association*.

**Howard Giles** is professor of communication and assistant dean of undergraduate studies at the University of California, Santa Barbara, USA. His research has spanned many different intergroup contexts, including intergenerational relations around the Pacific Rim and civilian–police interactions. He is fellow and past president of the International Communication Association as well as the inaugural recipient of the Association’s Career Productivity Award (more recently named the Steven H. Chaffee Award).

**Carroll J. Glynn** is professor and director at the School of Communication, Ohio State University, USA. Dr. Glynn is senior author on two editions of *Public Opinion* and has published in a variety of refereed journals including *Communication Research*, *Public Opinion Quarterly*, *Journal of Broadcasting and Electronic Media*, and *International Journal of Public Opinion Research*.

**John O. Greene** is a professor of communication at Purdue University, USA. He is a former editor of *Human Communication Research* and is a recipient of the National Communication Association’s Charles H. Woolbert Research Award. He is a two-time recipient of the Gerald R. Miller Book Award and was the first person named as the Ann and Charles Redding Fellow at Purdue.

**Michael Griffin** is visiting professor of cinema and media studies at Carleton College, USA. An Annenberg Scholars Program Fellow, he was the first chair of the Visual Communication Studies Division of the International Communication Association. He is the author of numerous articles and book chapters on visual media and culture, and co-editor (with Karle Nordenstreng) of *International media monitoring* (1999).

**Bruce E. Gronbeck** is A. Craig Baird Distinguished Professor of Public Address, Department of Communication Studies, and director of the Center for Media Studies and Political Culture at the University of Iowa, USA. He is author or editor of 10 books on media theory and criticism, presidential campaigning, rhetorical criticism, argumentation, and public speaking, as well as dozens of articles and book chapters on such subjects. His work focuses on the intersection of rhetoric, politics, and media in the modern and contemporary eras.

**Robert L. Heath** holds a PhD from the University of Illinois, USA, and is professor emeritus of communication, University of Houston, USA. He has published 15 books and 100 articles and chapters. He has lectured extensively around the world, consulted, and won many awards for his publications. His academic work has concentrated on issues management, crisis management, and risk communication, as well as advancing the connections between the rhetorical heritage and public relations theory and practice. His publications include the *Handbook of public relations* (2001) and the *Encyclopedia of public*

*relations* (2005). He received lifetime achievement awards in 2007 from the Houston chapter of the Public Relations Society of America and from the Issue Management Council (Washington, DC).

**Klaus Bruhn Jensen** is professor in the Department of Media, Cognition, and Communication, University of Copenhagen, Denmark. Among his authored and edited volumes are *A handbook of qualitative methodologies for mass communication research* (1991), the UNESCO project *News of the world* (1998), and *A handbook of media and communication research: Qualitative and quantitative methodologies* (2002). Dr. Jensen is also the chief editor of a four-volume Danish media history (1996–2003).

**Hans Mathias Kepplinger** is professor of communications at the Johannes Gutenberg University of Mainz, Germany. His research interests include the effects of mass media, the role of mass media in election campaigns, the development of public conflicts and scandals, the influence of journalists' beliefs on the selection and presentation of news, and the relationships between the effects of information and the intentions and responsibility of communicators.

**Robin Mansell** has held the chair in new media and the Internet in the Department of Media and Communications, London School of Economics and Political Science, UK, where she is head of department, since 2001. She is president of the International Association of Media and Communications Research, 2004–2008. Prof. Mansell is lead editor of *The Oxford handbook of information and communication technologies* (2007) and author of *Mobilizing the information society* (2000).

**Debra Merskin** is an associate professor in the School of Journalism and Communication at the University of Oregon, USA, where she is head of the communication studies sequence. Her research focuses on stereotyping of women and other minorities in mass media representations. Dr. Merskin's research appears in *Mass Communication and Society*, *Howard Journal of Communication*, and *American Behavioral Scientist*, and she is co-editor (with Mary-Lou Galician) of *Critical thinking about sex, love, and romance in the mass media: Media literacy applications*.

**Katherine I. Miller** holds a PhD from the University of Southern California, USA, and is professor and director of graduate studies in the Department of Communication at Texas A&M University, USA. She is the author of textbooks in the areas of communication theory and organizational communication and has published extensively in the areas of emotion in organizations, workplace stress, and communication among health and human service workers.

**Stephen D. Reese** is Jesse H. Jones Professor of Journalism and associate dean for academic affairs in the College of Communication, University of Texas at Austin, USA. He is the author of *Mediating the message: Theories of influences on mass media content* (with Pam Shoemaker) and editor of *Framing public life: Perspectives on media and our understanding of the social world* (with Oscar Gandy and August Grant).

**Rebecca B. Rubin** is professor emerita of communication studies at Kent State University, USA. She has published over 75 articles and chapters in the areas of interpersonal relationship development, communication competence, communication education, personal and mediated relationships, and quantitative research methodology. She is the author of *Communication research: Sources and strategies* (with Alan Rubin and Linda Piele, 6th edn. 2005) and *The road trip: An interpersonal adventure* (with Randi Nevins, 1988), and editor of *Communication research measures: A sourcebook* (with Philip Palmgreen and Howard Sypher, 1994). She is profiled in *Women in communication: A biographical sourcebook* (ed. N. Signorielli, 1996).

**Winfried Schulz** is professor emeritus of mass communication and political science at the University of Erlangen-Nuremberg, Germany. He was awarded an honorary doctorate by Charles University, Prague, Czech Republic. His publications focus on political communication, mass media audiences and effects, news analysis, and media performance.

**Karen Tracy** is professor of communication at the University of Colorado at Boulder, USA. She is past editor of the journal *Research on Language and Social Interaction*, and is author of *Everyday talk: Building and reflecting identities*, *Colloquium: Dilemmas of academic discourse*, and more than 60 journal articles and book chapters. Recently she has been studying the communicative practice of US school board meetings, and she is the editor of a case study, *The prettier doll: Rhetoric, discourse and ordinary democracy* (2007), analyzing a controversy about race that occurred in one community's board meetings.

**Patti M. Valkenburg** is a professor in the Amsterdam School of Communications Research, University of Amsterdam, the Netherlands. She is the chair of the Research Center on Children, Adolescents, and the Media ([www2.fmg.uva.nl/cam](http://www2.fmg.uva.nl/cam)). She was chair of the Instructional and Developmental Communication Division at the International Communication Association, and the founder of the special interest group Children, Adolescents and the Media at the same organization. She has published 100-plus articles and chapters in prominent journals and books, and is on the editorial board of six journals in the field.

**A. A. Betteke van Ruler** holds a PhD from Radboud University Nijmegen, the Netherlands, and is professor of communication science, University of Amsterdam, the Netherlands. She is past president of the European Public Relations Education and Research Association and chair of the Public Relations Division of the International Communication Association (ICA). She has published many books, articles, and chapters and serves on the review board of many journals as well as of the ICA *Communication Yearbook*.

**K. Viswanath** is associate professor of society, human development, and health at the Harvard School of Public Health (HSPH) and associate professor of population sciences at Harvard's Dana Farber Cancer Institute, USA. He is also the chair of the Steering Committee of the Health Communication Concentration at HSPH and the director of the Health Communication Core of the Dana Farber Harvard Comprehensive Cancer Center. His primary areas of research are communication inequalities and health disparities, and mass media and public health.

**Peter Vorderer** is professor of communication and chair of the Department of Communication Science at the Free University Amsterdam, the Netherlands. He also is the scientific director of the Center for Advanced Media Research Amsterdam and editor of *Media Psychology*. His scholarly work focuses on exposure to media content, media effects, entertainment, and new technologies.

**Janet Wasko** holds the Knight Chair in Communication Research at the University of Oregon, Eugene, USA. She is author, co-author, or editor of 14 books including *Understanding Disney: The manufacture of fantasy* (2001), *Dazzled by Disney? The global Disney audiences project* (with Mark Phillips and Eileen Meehan, eds., 2001), and *How Hollywood works* (2003).

**Jürgen Wilke** has been professor of communication research at the Johannes Gutenberg University of Mainz, Germany, since 1988. He is honorary professor of the Lomonossov University, Moscow, Russia, and has taught as visiting scholar at the Universities of Washington, Seattle, USA, and Lugano, Switzerland. From 1986 to 1989 he was president of the German Association for Communication Research. His main areas of research include structure and history of mass media, news and news agencies, international communication, and political communication.

**Karin Gwinn Wilkins** holds a PhD from the Annenberg School for Communication at the University of Pennsylvania, USA, and is an associate professor with the Department of Radio-TV-Film at the University of Texas at Austin, USA. She has served as the chair of the Development/Intercultural Division of the International Communication Association and on the advisory board for the journal *Communication for Development and Social Change* as well as the World Congress on Communication and Development. Publications concerning development communication issues include *Redeveloping communication for social change: Theory, practice and power*, as well as articles in *Journal of Communication*, *Development and Change*, *Perspectives on Global Development and Technology*, *Keio Communication Review*, *Media Development*, *Gazette*, *Global Media Journal*, and others.

**Kyu Ho Youm** is the Jonathan Marshall First Amendment Chair in the School of Journalism and Communication, University of Oregon, USA. He has published extensively about communication law in major academic and professional journals. His research has been cited by US and other courts in ruling on freedom of expression.

## CONTRIBUTORS

Contributors' entries in this encyclopedia are listed at the end of each biographical note.

**Mark Aakhus** is associate professor of communication at Rutgers University, USA. He publishes in the areas of discourse, argumentation, technology, organizations, and communication. He is an associate editor for *Communication Methods and Measures* and serves on the editorial board for *Communication Theory* and the program committee for

the research community on the Pragmatic Web. He is co-editor, with James Katz, of *Perpetual contact: Mobile communication, private talk, and public performance* (2002). [Design Theory]

**Linus Abraham** is a professor of visual communication, cultural studies, and new media. He is currently the dean of the African University College of Communication (formerly the African Institute of Journalism and Mass Communication), Accra, Ghana. He has also taught at Iowa State University and the University of Minnesota, USA. His research interests are in the areas of visual persuasion, the role of images in contemporary forms of racism, and minorities in the media. [Metonymy; Structuralism in Visual Communication]

**Hanna Adoni** chairs the Department of Communication at the Max Stern Academic College of Yezreel Valley. She is professor emeritus of the Hebrew University of Jerusalem, Israel, where she served as chair of the Department of Communication and Journalism and as director of the Smart Family Institute for Communication Research, and is the incumbent Danny Arnold Chair in Communication. She is the former editor of *Devarim Achadim: The Israel Journal of Communication, Culture and Society*. Her research interests focus on mass communication, especially media and minorities, literacy, reading, and the new media technologies, and she has published extensively on these subjects. She is a co-author of *Social conflict and television news* (1990), *Twenty years of communication and culture in Israel* (2000), *Media, minorities and hybrid identities: The Arab and Russian communities in Israel* (2006), and, with Anat First, *Research and teaching of communication: Structural dilemmas and solutions*. [Communication as an Academic Field: Middle East, Israel]

**Walid A. Afifi** is an associate professor in the Department of Communication at the University of California, Santa Barbara. He has published widely on uncertainty and information management, has served as chair of the Interpersonal Communication Division of both the National and International Communication Associations, and is a member of the editorial board of several journals. He counts as his biggest achievements his marriage to Tammy and his role as father to Leila and Rania. [Uncertainty Management]

**Robert R. Agne** holds a PhD from the University of Colorado at Boulder, USA, and is assistant professor in the Department of Communication and Journalism at Auburn University, USA. He studies language and social interaction with an emphasis on identity problems people face in everyday interaction. Topics he has examined include the social interaction in psychic readings, friendship interaction, and the FBI–Waco telephone negotiations. [Action-Implicative Discourse Analysis]

**Iftekhar Ahmed** holds an MA from West Texas A&M University, USA, and is a PhD candidate in communication (telecommunication and media studies) at the Texas A&M University, USA. His research interests include the development and transformation of virtual research environments (VREs) or collaboratories, website interactivity, education technology, and human interaction in virtually networked society. He is a Pathway to Doctorate Fellow (2004) of Texas A&M University. [Decision-Making Processes in Organizations]

**Sameer Ahmed** is a JD candidate at the Yale Law School, USA. He is a 2004 Marshall Scholar, holding an MSt in legal research at the University of Oxford, UK, and an MSc in Middle East politics at the School of Oriental and African Studies, University of London, UK. [Censorship]

**Sun Joo Ahn** graduated from Seoul National University, South Korea, with a dual BA degree in communication and business administration. She currently works with Dr. Jeremy Bailenson in the Virtual Human Interaction Lab, Stanford University, USA, as a doctoral student in communication. Her ongoing research focuses on using facial tracking to predict behaviors and experimenting with human response to virtual self-representation. [Visuals, Cognitive Processing of]

**Icek Ajzen** is professor of psychology at the University of Massachusetts Amherst, USA. He has published several articles and books on attitude–behavior theories, including the classic monograph *Belief, attitude, intention, and behavior: An introduction to theory and research* with Martin Fishbein. [Expectancy Value Model]

**Zozan Akpınar** is a researcher at the Centre d'Analyse et de Recherche Interdisciplinaire sur les Médias, Institut Français de Presse, University of Paris II, France. [Kurdish International Broadcasting]

**Alan B. Albarran** is the director of the Center for Spanish Language Media, professor of radio, television, and film, and editor of the *International Journal on Media Management* at the University of North Texas, Denton, USA. The author of seven books in the area of media management and economics, he served as editor of the *Journal of Media Economics* from 1997 to 2005. Dr. Albarran also serves as consultant to media organizations, and has lectured and presented workshops in 19 countries. He previously served as president of the Broadcast Education Association and the Texas Association of Broadcast Educators. [Media Economics]

**Carlos Galvan Alemán** is an assistant professor of communication studies at James Madison University, USA, and has served as chair for the National Communication Association's La Raza Caucus and Latina/o Communication Studies Division. A Chicano, Mexican American, and Latino, he gives primacy to his relations as brother, *hijo*, partner, and *papá*. [Communication Modes, Hispanic]

**Stuart Allan** is professor of journalism at Bournemouth University, UK. Recent books include *Online news: Journalism and the Internet* and the edited collection *Journalism: Critical issues*. [Coffee Houses as Public Sphere; Media History]

**Brenda J. Allen** is a professor in the Department of Communication at the University of Colorado at Denver, USA. Among her numerous publications is a ground-breaking book entitled *Difference matters: Communicating social identity* (2004). She currently is co-editor of the *International and Intercultural Communication Annual*, and a member of several editorial boards. She has received numerous accolades for her work on diversity,

including her university's first Annual Award for Outstanding Achievement for Commitment to Diversity (2006). [Diversity in the Workplace]

**Craig Allen** holds a PhD from Ohio University, USA, and is an associate professor in the Walter Cronkite School of Journalism and Mass Communication at Arizona State University, USA. Previously a television news anchor and reporter, he is the coordinator of the Cronkite School's broadcast journalism program. He has written widely on local television news in the USA and on international news consulting. His additional research interests include mass media history and political communication. [Press Conference]

**Terre H. Allen** is a professor of communication studies and director of faculty development at California State University, Long Beach, USA. She is responsible for all faculty training and development activities for the nearly 2,500 faculty on the CSULB campus. She has authored numerous articles and book chapters on communication and student learning and has worked on several large-scale college-student success initiatives. [Distance Education]

**Tim Ambler** is a senior fellow at London Business School, UK. His research covers dynamic marketing capabilities, how advertising works, the evaluation of marketing performance, narrative disclosures in company annual reports, and regulation and deregulation by the EU and UK governments. His books include *Marketing and the bottom line* (2000, 2003), *Doing business in China* (2000, 2003), *The SILK road to international marketing* (2000), and *Marketing from advertising to Zen* (1996), and he has published in numerous journals. A member of the *Journal of Marketing*, *International Journal of Advertising*, and *Psychology and Marketing* editorial review boards and of the Economics Committee of the Advertising Association, he is a fellow of the Institute of Chartered Accountants in England and Wales and previously joint managing director of International Distillers and Vintners, where he was involved in the launch of Baileys, Malibu, and Archers and the development of Smirnoff vodka worldwide. [Advertising]

**Kay Amert** is professor in the School of Journalism and Mass Communication and director of the Typography Laboratory at the University of Iowa, USA. Her research focuses on the history of typography and emphasizes work done in Paris in the sixteenth century by such printers as Henri and Robert Estienne, Geoffroy Tory, and Simon de Colines. [Book]

**Soontae An** is an associate professor in the A. Q. Miller School of Journalism and Mass Communications at Kansas State University, USA. She is on the editorial board of *Communication Studies* and her publications have appeared in *Communication Law and Policy*, *The Oxford companion to the Supreme Court of the United States*, *Journalism and Mass Communication Quarterly*, *Journal of Advertising*, *Journal of Advertising Research*, *Journal of Media Economics*, *Journal of Health Communication*, and *Health Communication*. [Advertising Law and Regulation]

**Ann P. Anas** is research coordinator, communication and aging, at McMaster University, Canada. Along with Ellen Ryan, she has studied communication predicaments of older

adults and persons with disability, intergenerational communication, and life-story writing. For the past 10 years, she has been the coordinator of SHARE (Seniors Helping Advance Research Excellence), a group of approximately 300 adults aged 60 years and older who volunteer to participate in various communication and aging research projects at McMaster University. [Disability and Communication]

**Janis Andersen** is the dean of the School of Communication at Emerson College, USA. Previously she held administrative positions at San Diego State University, USA, including graduate dean. She and Peter Andersen are both past presidents of the Western States Communication Association, and she has served on the governing boards of the National Communication Association and the International Communication Association. [Teacher Immediacy]

**Peter Andersen** is professor of communication at San Diego State University, USA, and author of 150 published articles and book chapters on interpersonal, nonverbal, instructional, and health communication. He was Western Communication Association president and editor of the *Western Journal of Communication*, and served on 14 editorial boards of scholarly journals. His books include *The handbook of communication and emotion* (1998), *Nonverbal communication: Forms and functions* (1999, 2008), *The complete idiot's guide to body language* (2004), and *Close encounters: Communication in relationship* (2000, 2007). [Teacher Immediacy]

**Robin Andersen** is associate professor of communication and media studies at Fordham University and director of the peace and justice studies program. Her published research focuses on media and war, media influence on public opinion and social policy, and the impact of advertising and consumer culture on American society. She is author of *A century of media: A century of war* (2006) and *Consumer culture and TV programming* (1995), and co-editor of *Critical studies in media commercialism* (2000). She is frequently interviewed on media issues in the news media and educational documentaries. [War Propaganda]

**Chris Anderson** did his doctoral studies at the Columbia University Graduate School of Journalism, USA, focusing on journalistic authority, media history, and new media technologies. His writings have appeared in *The handbook of journalism studies*, *Making our media*, and *The media and social theory*. [Professionalization of Journalism]

**Donald L. Anderson** is an instructor in the program in applied communication at the University of Denver, USA. His interests include organizational discourse and change, writing in organizations, and the work of Mikhail Bakhtin, and his scholarly publications have appeared in the *Journal of Organizational Change Management* and the *Journal of Business and Technical Communication*. Dr. Anderson is also an organization development consultant and the author of a forthcoming text on organization development. [Bakhtin, Mikhail]

**James A. Anderson**, professor of communication, University of Utah, USA, is the author, co-author, or editor of 16 books including *Communication research: Issues and methods*

(1987), *Mediated communication: A social action perspective* (1988), *Communication theory: Epistemological foundations* (1996), and *The organizational self and ethical conduct* (2001). His 100-plus chapters, articles, and research monographs are on family studies, cultural studies, media literacy, organizational studies, communicative ethics, methodology, and epistemology. He is a fellow and past president of the International Communication Association. He has been the editor of *Communication Yearbook* and *Communication Theory*, associate editor of *Human Communication Research*, guest editor of *Communication Studies* and *American Behavioral Scientist*, and on the editorial board of seven other journals, and is executive editor of the *Rocky Mountain Communication Review*. Works on mediated communication research methods and theory are forthcoming. [Critical Rationalism; Field Research; Objectivity in Science; Paradigm]

**Mark Andrejevic** is an associate professor in the Department of Communication Studies at the University of Iowa, USA. He is the author of *iSpy: Surveillance and power in the interactive era* and *Reality TV: The work of being watched*. He is a research fellow at the Centre for Critical and Cultural Studies at the University of Queensland, Australia, and the editor of the Critical Television Studies series for Lexington Books. He is also the author of several book chapters on surveillance, popular culture, and digital media. [Reality TV]

**Charles Antaki** is professor of language and social psychology at Loughborough University, UK, where he is a member of the Discourse and Rhetoric Group in the Department of Social Sciences. His research interests are in conversation analysis. Among his recent publications is *Conversation analysis and psychotherapy*, edited with Anssi Peräkylä, Sanna Vehviläinen, and Ivan Leudar. [Identities and Discourse]

**Cristiano Antonelli** is professor of economics and director of the Department of Economics of the University of Turin, Italy. He is also managing editor of *Economics of Innovation and New Technology* and president of the International Center for Economic Research. He has been a Rockefeller Fellow at MIT, USA, and a visiting professor at the Universities of Paris X and XII, Lyon, and Aix-en-Provence, France, and at the University of Manchester, UK. He was vice president of the International Schumpeter Society in 2000–2004. [Information and Communication Technology, Economics of]

**Osei Appiah** is an assistant professor in the School of Communication at the Ohio State University, USA. His main research interests are in advertising effects on ethnic minorities, and the impact of ethnic identity on audiences' responses to media. His research has been published in leading academic journals in the discipline. [Ethnic Media and their Influence; Stereotyping and the Media]

**Paul Arblaster** teaches at the Centre for European Studies, Catholic University of Leuven, Belgium. He is the author of *A history of the Low Countries* (2006) and *Antwerp and the world: Richard Verstegan and the international culture of Catholic reformation* (2004), as well as articles on public communication in early modern Europe. [Postal Service, History of; Printing, History of]

**John S. Armstrong** is an assistant professor of communication studies at Furman University, USA. He teaches courses on television production and on mass communication theory, history, and law. Among his research interests are localism and media history. In 2002, he received the Broadcast Education Association's annual Kenneth Harwood Award for the USA's outstanding doctoral dissertation in the field of electronic media. He is currently gathering oral histories of South Carolina broadcasters. Prior to receiving his doctorate, he worked for 14 years as a television news producer. [Public Access Television]

**Ronald C. Arnett** is professor and chair of the Department of Communication and Rhetorical Studies at Duquesne University, USA. Arnett is author and co-author of six books and three edited projects, with his last book, *Dialogic confession: Bonhoeffer's rhetoric of responsibility* (2005), receiving the Eastern Communication Association's 2006 Everett Lee Hunt Award for Outstanding Scholarship. His latest book is *Communication ethics literacy: Dialogue and difference* (in press). [Rhetoric and Ethics]

**Neeraj K. Arora** is a research scientist and program director in the Division of Cancer Control and Population Sciences of the US National Cancer Institute in Bethesda, MD. His research focuses on facilitating the delivery of high-quality "patient-centered" care that is responsive to patient needs and optimizes their health outcomes. [Social Support in Health Communication]

**Jane Arthurs** has led the development of media and cultural studies at the University of the West of England, Bristol, UK, where she is professor and has worked since 1993. She has published *Television and sexuality: Regulation and the politics of taste* (2004), *Crash cultures: Modernity, mediation and the material* (2003), *The Crash controversy: Censorship campaigns and film reception* (2001), and *Women's bodies: Discipline and transgression* (1999). In *Feminist Media Studies*, Prof. Arthurs co-edits "Commentary and criticism" and co-edited a special edition on "New femininities," and her article "Sex and the City and consumer culture" has been reprinted in *Television: The critical view* (2007) and *Feminist television studies* (2007). She is on the editorial board of *Communication, Culture and Critique*. [Cultural Studies: Feminist Popular Culture; [Sex and Pornography as Media Content: Feminist Perspectives]

**Charles K. Atkin** is University Distinguished Professor and chair in the Department of Communication at Michigan State University, USA. He received the Decade of Behavior Award for his work on safety and health communication in 2006. His recent work has focused on health communication campaigns, particularly relating to prevention of breast cancer, drug abuse, drunk driving, and alcohol misuse among college students. Dr. Atkin has published more than 150 articles and chapters, and has co-edited two editions of *Public Communication Campaigns* with Ronald Rice. [Social Judgment Theory]

**Chris Atton** is a reader in journalism at the School of Creative Industries, Napier University, Edinburgh, Scotland. He is one of the leading international scholars in the study of alternative and radical media. Dr. Atton's books include *Alternative literature* (1996), *Alternative media* (2002), and *An alternative Internet* (2004). [Citizen Journalism; Underground Press]

**James L. Aucoin** worked in journalism for 15 years before earning a PhD from the University of Missouri School of Journalism, USA, in 1993. He is a professor at the University of South Alabama, Department of Communication, USA, and is the author of numerous academic articles and *The evolution of American investigative journalism* (2005). [Investigative Reporting]

**Robert K. Avery** is professor of communication at the University of Utah, USA. He is the author of *A history of public broadcasting* (2000, with John Witherspoon, Roselle Kovitz, & Alan G. Stavitsky), editor of *Public service broadcasting in a multichannel environment* (1993), and founding editor of *Critical Studies in Mass Communication*. [Instructional Television]

**Muhammad I. Ayish** is a professor and dean of the College of Communication at the American University of Sharjah, UAE. He earned his Bachelor degree in broadcast journalism from the University of Missouri-Columbia, USA (1979), while his PhD was earned from the University of Minnesota, Twin Cities, USA (1986). He has published three books on satellite television in the Arab world, women and media, and public relations, in addition to scores of articles in international journals. [Communication as an Academic Field: Middle East, Arab World]

**Gary E. Aylesworth** is professor of philosophy and former chair of the philosophy department at Eastern Illinois University, USA. His publications include translations of Martin Heidegger's *Basic concepts* and the *Heidegger–Jaspers correspondence*. He has authored articles on deconstruction and hermeneutics, as well as the entry on post-modernism in *The Stanford encyclopedia of philosophy*. [Rhetoric, Postmodern]

**Joe Ayres** is professor emeritus, Washington State University, USA, and adjunct professor at Gonzaga University, USA. He is the former editor of *Communication Education* and *Communication Reports*. His research has been concerned with explaining and remediating communication apprehension. [Communication Apprehension: Intervention Techniques; Speech Anxiety]

**Ana Azurmendi**, a media law professor at the University of Navarra, Spain, was a visiting professor at the University of Oxford, UK, at the University of Paris II, France, and in the joint doctoral program in media law of the UNAM, Occidente, and Iberoamericana universities, Mexico. She has published *Derecho de la información*, *La reforma de la televisión pública española*, *Textos basicos de derecho de la información*, and *El derecho a la propia imagen*. [Communication Law and Policy: Europe]

**Beth Babin-Gallagher** is a doctoral student at Arizona State University, USA. Her interests include predictors and outcomes of interpersonal communication processes. [Interpersonal Communication, Sex and Gender Differences in]

**Christine Bachen** is associate professor of communication at Santa Clara University, USA. Her research interests include young people's use of media within the context of family life, and the analysis of civic content of youth-oriented websites and computer

games. Recently published is “Portrayals of information and communication technology on world wide web sites for girls,” with C. Raphael, K. M. Lynn, J. Baldwin-Philippi, and K. McKee (2006). [Media Messages and Family Communication]

**Philip M. Backlund** is a professor of communication at Central Washington University in Ellensburg, Washington, USA. He received his PhD in speech communication from the University of Denver. He has published numerous articles and book in the area of educational assessment and gender communication. He is active in the National Communication Association and has twice received the NCA’s award for contributions to assessment. He has been honored three times by the students at Central Washington University as distinguished professor of the year. [Pedagogy, Communication in]

**Jean-Pierre Bacot** holds a doctorate in information and communication sciences. He obtained his HRD at the University of Burgundy, Dijon, France. He is presently a member of the research laboratory CIMEOS of the University of Burgundy, Dijon, and is also assistant editor for the scientific journal *Réseaux* (Paris). His most recent publications are *La presse illustrée au XIXe siècle: Une histoire oubliée* (2005) and *Les sociétés fraternelles: Un essai d’histoire globale* (2007). [Illustrated Newspapers]

**Jeremy N. Bailenson** received a PhD in cognitive psychology from Northwestern University, USA, and is currently the director of Stanford’s Virtual Human Interaction Lab. His main area of interest is the phenomenon of digital human representation, especially in the context of immersive virtual reality. [Cognitive Science; Psychology in Communication Processes; Visuals, Cognitive Processing of]

**Benjamin Bailey** received his PhD in linguistic anthropology from the University of California, Los Angeles, USA, and is associate professor of communication at the University of Massachusetts Amherst, USA. Much of his work focuses on negotiations of identity and meaning in face-to-face interaction. He is the author of *Language, race, and negotiation of identity: A study of Dominican Americans* and various articles and chapters on intercultural communication, language and identity, and multilingual talk. [Interactional Sociolinguistics]

**Michael Bailey** teaches media history and cultural theory at Leeds Metropolitan University, UK. He has published various articles on the history of the early BBC, and is currently working on a co-authored study of Richard Hoggart and an edited book entitled *Narrating media history* (forthcoming). He was recently awarded an HEFCE Promising Researcher Fellowship to undertake new research, provisionally entitled “Mediating faiths: Religion, media and popular culture.” He is an associate member of the Goldsmiths Media Research Programme, and a member of the international advisory board for the Louis le Prince Interdisciplinary Centre for Cinema, Photography and Television, University of Leeds, UK. [BBC]

**Selina Bajorek** holds an MSW from the University of Toronto, Canada, and writes and consults on issues related to disability, accessibility, and empowerment. She is co-author of the 2005

book chapter entitled “I just want you to know that “them” is me’: Intergroup perspectives on communication and disability” and the *Educational Gerontology* article “Coping with age-related vision loss in everyday reading activities.” [Disability and Communication]

**Susan C. Baker** recently completed her postdoctoral fellowship at the University of Queensland, Australia. She is currently an associate professor of psychology at Saint Francis Xavier University, Canada. Her research interests include health communication, cross-cultural psychology, second language learning, and acculturation. [Communication Accommodation Theory]

**John R. Baldwin** is professor of communication at Illinois State University, USA. He is co-editor of *Redefining culture: Perspectives across the disciplines* (2006) and *Communication theories for everyday life* (2005), as well as a contributor to intercultural classroom readers (*Intercultural communication: A reader* and *Readings in intercultural communication*) and journals (*Human Communication Research*, *International Journal of Intercultural Relations*, *Southern Journal of Communication*, *Howard Journal of Communications*, and *Interamerican Journal of Psychology*) in the area of intercultural and diversity communication. His research emphases include United States diversity, in terms of communication style and intolerance, and the communicative construction of “race” in Brazil. [Communication Modes, Western]

**Sandra J. Ball-Rokeach** is a professor of communication in the Annenberg School for Communication at the University of Southern California, USA. Her work most relevant to her entries in this encyclopedia is the development of media system dependency theory into communication infrastructure theory, in the context of the Metamorphosis Project ([www.metamorph.org](http://www.metamorph.org)) inquiry into the communication dynamics of civic engagement and health problem-solving behavior, under the forces of globalization, new communication technologies, and population diversity. [Digital Divide; Media System Dependency Theory; Migration and Immigration]

**Hyun Ban** is an associate professor of the Department of Mass Communication at the University of Incheon, Korea. His research interests are online journalism, new media, and journalism theories, such as agenda setting and framing. He has published papers in *Communication Research*, *Newspaper Research Journal*, and media-related books. He has a doctoral degree in journalism from the University of Texas at Austin, USA. [Soft News]

**Albert Bandura** is David Starr Jordan Professor of social sciences in psychology at Stanford University, USA. He is a proponent of social cognitive theory rooted in an agentic perspective. His landmark book *Social foundations of thought and action: A social cognitive theory* provides the conceptual framework for this theory and reviews the large body of research relevant to it. His book *Self-efficacy: The exercise of control* provides the definitive exposition of the centrality of this belief system in human self-development, adaptation, and change. [Observational Learning; Social Cognitive Theory]

**Nilanjana Bardhan** is an associate professor in the Speech Communication Department at Southern Illinois University Carbondale, USA. Her published research has focused on

international public relations, especially on HIV/AIDS issues, contemporary public relations practices in India, and critical analysis of public relations discourses and strategies. [Public Relations: Global Firms]

**Jo Bardoel** is an endowed professor of media policy with the Radboud University Nijmegen and a senior researcher with the Amsterdam School of Communications Research at the University of Amsterdam, the Netherlands. He worked for the NOS (now the NPO, Netherlands Public Broadcasting) board of governors for about 15 years. Bardoel's current research focuses on public broadcasting, national and European media policies, and journalism. At present he is the chairman of the Media Commission of the Council for Culture, the official advisory body for the Dutch minister of education, culture and sciences. [Netherlands: Media System; Public Broadcasting Systems]

**J. Kevin Barge** is professor of communication at Texas A&M University, USA. He is the author of over 40 articles and book chapters focusing on issues related to the conversational performance of leadership within organizational and group contexts. [Dialogic Perspectives]

**James R. Barker** is professor of organizational theory and strategy at the Management School, University of Waikato, New Zealand. He won the Academy of Management's Outstanding Publication of the Year award and *Administrative Science Quarterly's* Scholarly Contribution award for his work on self-managing teams. He now writes on organizational control in global markets. [Control and Authority in Organizations]

**Valerie E. Barker** is an adjunct professor at San Diego State University, USA, where she teaches communication theory and research methods. Her research interests focus on three broad areas of intergroup communication: the role of language in social identity, intergenerational communication from an intergroup perspective, and the influence of mass media in shaping and reflecting social identity. Dr. Barker's publications have appeared in *Language and Communication*, *Journal of Multilingual and Multicultural Development*, *International Journal of Aging and Human Development*, *Health Communication*, and *Journal of Communication*. [English-Only Movements]

**Brooke Barnett** is an associate professor in the School of Communications at Elon University, USA, and the director of the Elon Program for Documentary Production. Prior to coming to Elon she worked as news director, documentary producer, reporter, and host/producer in public television and taught at Indiana University, USA. She came to Elon in 2001. Her publications have appeared in *Journalism and Mass Communication Quarterly*, *Journalism and Mass Communication Monographs*, the *Journal of Broadcasting and Electronic Media*, *Visual Communication Quarterly*, and the *Federal Communications Law Journal*. She is the co-editor of *Multidisciplinary approaches to communication law research* and author of *Media coverage of crisis: The war on terror and the wars in Iraq*. [Privacy]

**Kevin G. Barnhurst** is professor and head of the Department of Communication, University of Illinois at Chicago, USA, where he has been a faculty scholar of the Great

Cities Institute. His published works on journalism and media include *Seeing the newspaper*; *The form of news: A history*, co-authored with John Nerone; an edited collection, *Media queered*; and the *Journalism Monograph* "News as art." Among other honors and awards, he has been Fulbright Distinguished Chair in communication history, Vercelli, Italy; fellow of the Shorenstein Center, Kennedy School of Government, Harvard University, USA; and research fellow at the Media Studies Center, School of Journalism, Columbia University, USA. [Journalism]

**Naomi S. Baron** is professor of linguistics and co-director of the TESOL Program at American University in Washington, DC, USA. A Guggenheim and Fulbright fellow, she is the author of *Alphabet to email: How written English evolved and where it's heading* (2000) and *Always on: Language in an online and mobile world* (forthcoming). Baron is on the editorial boards of the *Journal of Computer-Mediated Communication*, *Visible Language*, and *Language Sciences*. Her current research is a cross-cultural study of mobile phone use by young adults in Sweden, the USA, Italy, and Japan. [Linguistics]

**Carlos Barrera** is professor of Spanish media history and head of the Master in political and corporate communication at the University of Navarra, Spain. He is also History Section co-chair of the International Association for Media and Communication Research, and author of 10 books and more than 60 articles in journals and book chapters. [Spain: Media System]

**Jennifer L. Bartlett** is based in the School of Advertising, Marketing and Public Relations at the Queensland University of Technology, Australia. Her research, teaching, and practice are in public relations and corporate communication with particular emphasis on public relations, corporate social responsibility, and legitimacy. Her work is published internationally and has received a number of best paper awards. She serves on the Membership Committee of the International Communication Association and the editorial board of public relations journals in Australia and New Zealand, and is past Council member for the Public Relations Institute of Australia. [Corporate Social Responsibility]

**Benjamin J. Bates** is a professor of journalism and electronic media at the University of Tennessee, USA. He has written widely in the areas of media and information economics and policy, and the impact of digital technology on media systems and structures. He was a founding member of the editorial board of the *Journal of Media Economics*, and serves on two other editorial boards. He has served as a division head in the Association for Education in Journalism and Mass Communication and the Broadcast Education Association, was the first treasurer of the Association of Internet Researchers, and was the inaugural Sir David Beattie/Ericsson Professorial Research Fellow in Communication Technology and Policy at Victoria University, Wellington, New Zealand. [Cross-Media Marketing; Distribution; Markets of the Media]

**Leslie A. Baxter** is F. Wendell Miller Distinguished Professor of Communication Studies at the University of Iowa, USA. She has authored or edited six books and has written over

100 scholarly articles and book chapters on communication in personal and familial relationships. She is the recipient of several awards for her scholarship from a variety of professional associations. [Relational Dialectics]

**Geoffrey Baym** is assistant professor of media studies at the University of North Carolina at Greensboro, USA. His research examines emerging forms of broadcast journalism within the new media environment. He has published articles on the *Daily Show* in *Political Communication* (2005) and *MTV News* in *Journalism Studies* (2007). In addition, his work has appeared in the *Journal of Communication*, *Journalism*, and *Rhetoric and Public Affairs*, among others. [Infotainment]

**Wayne A. Beach** is professor in the School of Communication at San Diego State University, USA, adjunct professor in the Department of Surgery, and associate member of the Moores Cancer Center, University of California, San Diego, USA. He is the author of *A natural history of family cancer: Interactional solutions to medical problems*, and *Handbook of patient–provider interactions: Raising and responding to concerns about life, illness, and disease*. [Conversation Analysis]

**Michael J. Beatty** is professor of communication at the University of Miami, Coral Gables, USA. His research interests focus on constructing and testing models concerning the relationships among biological functioning, personality, and communication behavior. [Communiobiology]

**Bart Beatty** is an associate professor of communications at the University of Calgary, Canada. He is the author of *Fredric Wertham and the critique of mass culture* (2005), *Unpopular culture: Transforming the European comic book in the 1990s* (2006), and, with Rebecca Sullivan, *Canadian television today* (2006). [Canada: Media System]

**Martín Becerra** is associate professor in the Social Sciences Department at the National University of Quilmes, Argentina. He teaches courses in political economy of communications and media history. Dr. Becerra also teaches postgraduate courses at the National University of La Plata and the University of Buenos Aires, Argentina, and the Diego Portales University, Chile. In 2005 he was invited as a visiting professor to take the UNESCO Communication Chair at the Autonomous University of Barcelona. His research interests are in media policy in Latin America, focusing on concentration of the media system. With Guillermo Mastrini he has written *Periodistas y magnates: Estructura y concentración de las industrias culturales en América Latina* (2006). He also has published *Sociedad de la información: Proceso, convergencia, divergencia* (2003). His research articles have been published in Latin American and Spanish journals. [Concentration in Media Systems]

**Jörg Becker** is professor for political science at the Universities of Marburg and Innsbruck, Austria, and has been managing director of KomTech GmbH Research in Solingen, Germany, since 1987. He specializes in international cultural, media, and technology policy. Prof. Dr. Becker lectures extensively internationally, and is widely published in over 10 languages. [Bertelsmann Corporation]

**Lee B. Becker** is a professor in the Grady College of Journalism and Mass Communication at the University of Georgia, USA, and director of the James M. Cox, Jr., Center for International Mass Communication Training and Research. He also directs the *Annual Surveys of Journalism and Mass Communication*, which provide basic labor-force and education data on journalism in the USA. [Journalism Education]

**Johannes W. J. Beentjes** is professor of communication science at the Radboud University Nijmegen, the Netherlands. He graduated in psychology and wrote a dissertation on children's television viewing and reading (Leiden University, the Netherlands). He is a member of the Advisory Board of *Sesamstraat*, the Dutch version of *Sesame Street*. In addition to children and media, his current interests include the production, nature, and effects of persuasive communication. [Media Use across the Life-Span]

**Arnold S. de Beer** is a professor extraordinary in the Department of Journalism, Stellenbosch University, South Africa, as well as professor extraordinary, Media and Law Research Initiative, University of the Western Cape, South Africa. He is the founding editor of *Ecquid Novi: African Journalism Studies* and editor of the *Journal of Global Mass Communication*. His publications include *Global journalism* (ed. with John C. Merrill, 2004). [Communication as an Academic Field: Africa]

**Jon Bekken** is associate professor of communications at Albright College in Reading, Pennsylvania, USA. He is co-author of *The Industrial Workers of the World: Its first 100 years*, and was until recently editor of the IWW's newspaper, the *Industrial Worker*. Bekken has written for several alternative publications and produced public affairs programming on community radio. He has authored dozens of scholarly articles and book chapters on the labor and socialist press, newsboys, community radio, the retail book industry, radical economics, and other topics. [Alternative Journalism]

**George E. Belch** is a professor and chair of the Department of Marketing at San Diego State University, USA. Professor Belch teaches marketing communication, advertising management, consumer/buyer behavior, and strategic marketing planning. He has published more than 25 articles on advertising, marketing communications, and consumer decision-making in numerous leading academic journals. He also serves as a reviewer for several of those journals. He is the co-author of the world's leading integrated marketing communications textbook, with distribution to over 300 universities in the USA and internationally. [Integrated Marketing Communications]

**Michael A. Belch** teaches integrated marketing communications at San Diego State University, USA, where he has received numerous Outstanding Professor awards. He has also taught in France, the Netherlands, Slovenia, Spain, China, Chile, Colombia, China, Peru, Argentina, and Malta, and was the 2005 Direct Marketing Association Margaret Sellers Award recipient for San Diego's Outstanding Marketer. Dr. Belch also serves as director of academic programs at the Centre for Integrated Marketing Communications. He has co-authored more than 40 articles in academic journals on advertising, consumer behavior, and international marketing. Additionally, he co-authored with his brother

George Belch the number one IMC textbook, *Advertising and promotion: An integrated marketing communications perspective*, now in its seventh edition. [Integrated Marketing Communications]

**Luis Ramiro Beltrán** is a Bolivian communication scientist, journalist, and writer. For about 40 years he has had a distinguished career working across Latin America for the Organization of American States, Canada's International Development Research Centre, UNESCO, and the Johns Hopkins University. A graduate of Michigan State University, he was a visiting professor at Stanford University and at Ohio State University, USA, as well as a vice president of the International Association of Mass Communication Research. Author of numerous publications in several languages, he is especially notorious for his critiques of communication in his region and for his proposals for democratizing it, mainly by means of national communication policies. Outstanding among the many awards he has had conferred on him are the McLuhan-Teleglobe Canada Award (1983) and Bolivia's National Journalism Award (1997). [Development Communication: Latin America]

**Beth S. Bennett** serves as the department chair in communication studies at the University of Alabama, USA. She teaches undergraduate and graduate courses in rhetorical studies, for which she has received the National Alumni Association's Outstanding Commitment to Teaching Award. She has published work in the history of rhetorical theory, especially in the area of medieval rhetoric, in such journals as *Advances in the History of Rhetoric*, *Rhetorica*, and *Philosophy and Rhetoric*, as well as work in the areas of rhetorical criticism and critical thinking. She has served twice as president of the American Society for the History of Rhetoric, 1981–1982 and 1994–1995. [Rhetoric, Medieval]

**Bridget Bennett** is professor of American literature and culture in the School of English, University of Leeds, UK. She is the author of *Transatlantic spiritualism and nineteenth-century American literature* (2007). She is editor of Susan Willis Fletcher, *Twelve months in an English prison*, vol. 2 of *Women, madness and spiritualism*, eds. Roy Porter, Helen Nicholson, and Bridget Bennett (2003), *The damnation of Harold Frederic: His lives and works* (1997), and *Ripples of dissent: Women's stories of marriage from the 1890s* (1996); and co-editor of *Special relationships: Anglo-American affinities and antagonisms, 1854–1936* (with Janet Beer, 2002) and *Grub Street to the Ivory Tower* (with Jeremy Treglown, 1998). [Literary Journalism]

**William L. Benoit** is a professor of communication at the University of Missouri-Columbia, USA. He has written extensively on image repair (crisis communication) and political campaign communication. He has published 11 books and is ranked as one of the most productive scholars in communication on the basis of publication of articles. He served as editor of the *Journal of Communication* (2003–2005) and is currently editor of *Communication Studies* (2006–2008). In winter of 2006, he was a University Fellow at Hong Kong Baptist University. [Image; Image Restoration Theory]

**Rodney Benson** is assistant professor of culture and communication at New York University, USA. He is editor (with Erik Neveu) of *Bourdieu and the journalistic field*

(2005) and authored a chapter about alternative urban newspapers in *Contesting media power* (2003). He has also published articles on US and French journalism, comparative media systems, and globalization in the *American Sociological Review*, *Political Communication*, and *European Journal of Communication*. [Journalism: Normative Theories]

**Gary Bente** is professor of social psychology and media psychology at the University of Cologne, Germany. He is co-editor of *The textbook of media psychology* and of the *Journal of Media Psychology*. Major research interests lie in the area of nonverbal communication and person perception, extending concepts from face-to-face communication to computer-mediated communication and human–computer interaction. Dr. Bente is an experienced researcher and particularly known for the development of research methods and instruments, with a focus on measurement and computer simulation of nonverbal behavior. [Excitation and Arousal; Nonverbal Signals, Effects of]

**Günter Bentele** is full professor and holds a chair in public relations at the University of Leipzig, Germany. Author and co-author of 15 books, he has edited and co-edited 22 more books, and has written more than 170 scientific articles in the fields of public relations, communication theory, journalism, and semiotics. [Trust of Publics]

**Evangelia Berdou** obtained her PhD from the Department of Media and Communications, London School of Economics and Political Science, UK, in 2007. She is an Economic and Social Research Council Postdoctoral Fellow at the Science and Technology Policy Research Unit, University of Sussex, UK. Dr. Berdou's core interest lies in emergent forms of organization and production, especially peer production, and the new forms of agency and control afforded by information and communication technologies. [Open Source]

**Arthur Asa Berger** is professor emeritus of broadcast and electronic communication arts at San Francisco State University, USA, where he taught from 1965 until 2003. He was a Fulbright lecturer at the University of Milan, Italy, in 1963–1965 and visiting professor at the Annenberg School for Communication at the University of Southern California, USA, in 1984–1985. He is the author of more than 100 articles on media, popular culture, humor, and tourism studies and has published 60 books. His books have been translated into nine languages. [Artifacts; Tourism and Popular Culture]

**Bruce K. Berger** is professor and chairman of the Advertising and Public Relations Department at the University of Alabama, USA. He is also director of the Plank Center for Leadership in Public Relations at the University; the Center is dedicated to helping develop public relations leadership values and skills in the classroom and the practice. Prior to his academic career, he spent 21 years as a public relations practitioner and executive with two international corporations. He has worked on communications projects in more than 30 countries. [Lobbying]

**Charles R. Berger** is professor in the Department of Communication, University of California, Davis, USA. He is former president of the International Communication Association and editor of *Human Communication Research*, as well as co-editor of

*Communication Research*. His research focuses on message production processes and the role that rational and experiential information processing systems play in the interpretation of threat-related messages. [Interpersonal Communication; Power, Dominance, and Social Interaction]

**Guy Berger** is head of the School of Journalism and Media Studies, Rhodes University, South Africa. His commitment to democratic media activities has shaped his experiences in journalism and media training. His research interests are new media, media policy, convergence, and journalism education. Prof. Berger is a founding member of, and activist in, the South African National Editors Forum, and his research and views are frequently sought by media and government. He writes a fortnightly column online for South Africa's leading independent paper, the *Mail & Guardian*. [South Africa: Media System]

**Jane T. Bertrand** is director of the Center for Communication Programs and professor at the Johns Hopkins Bloomberg School of Public Health, USA. Prior to 1991, she was a faculty member at Tulane University School of Public Health and Tropical Medicine, USA, and she chaired the Department of International Health and Development 1994–1999. From 1991 to 2001 she worked on the USAID-funded EVALUATION and MEASURE Evaluation Projects, authoring several manuals on evaluation and indicators. She has conducted and published the results of numerous evaluations of reproductive health programs in Latin America, North Africa, and Sub-Saharan Africa. She teaches fundamentals of program evaluation at Hopkins. Current research interests include documenting the effects of communication programs on health behavior. [Communication Evaluation Research]

**Ronald V. Bettig** is associate professor in the College of Communications at the Pennsylvania State University, USA, where he teaches courses in political economy and critical/cultural studies. His pioneering book *Copyrighting culture: The political economy of intellectual property* (1996) provided one of the first contributions to a critical analysis of copyright. He is also co-author, with Jeanne Lynn Hall, of *Big media, big money: Cultural texts and political economics* (2003), which explores the effects of concentration in the culture industries on media content. He is a longstanding member of the steering committee of the Union for Democratic Communications, an organization dedicated to the pursuits of media scholars, producers, and activists. [Piracy]

**John Beynon** teaches in the Cardiff School of Creative and Cultural Industries, University of Glamorgan, Wales, UK, where he is professor and head of communication, cultural, and media studies. His last book was *Masculinities and culture* (2003) and his forthcoming one is a study of masculinities in a UK prison. His most recent published work charts the changing representations of “masculinities” on television from the 1960s to date. In the early 1990s he started the European Cultural Studies Network and was also a founder member of the Maastricht Center for Transatlantic Studies. [Masculinity and the Media]

**Wiebe E. Bijker** is professor of technology and society at Maastricht University, the Netherlands. He was trained as an engineer in applied physics, studied philosophy, and

holds a PhD in the sociology and history of technology. He is director of studies of the research MPhil degree programme in cultures of arts, science, and technology. He was president of the Society for Social Studies of Science, and is founding co-editor of the MIT Press monograph series “Inside Technology.” In November 2006 Bijker received the John Desmond Bernal Prize, awarded jointly by the Society for Social Studies of Science and Thomson Scientific. His research focuses on the relation between technology, society, and science. [Technology, Social Construction of]

**Helena Bilandzic** is an assistant professor at the University of Erfurt, Germany, where she teaches media effects theory, media psychology, and empirical methods. She earned her PhD from the Ludwig Maximilian University of Munich, Germany, in 2003 with a dissertation about television program selection. Her research interests include cultivation and narrative persuasion, media use, and qualitative and quantitative methodology. [Triangulation; Zapping and Switching]

**Daniel Biltreyst** is professor in film, cultural media studies, and international communication at Ghent University, Belgium, where he leads the Working Group Film and TV Studies ([www.wgfilmtv.ugent.be](http://www.wgfilmtv.ugent.be)). His research and publications are on film and screen culture as sites of (international) controversy, public debate, and moral/media panic. He has published in *European Journal of Communication* (1991, 1992, 1995), *Media, Culture and Society* (2000), *European Journal of Cultural Studies* (2004), *Understanding reality TV* (2004), *Media cultures in a changing Europe* (2004), *Big Brother international* (2004), *Communication theory and research in Europe* (2005), *Studies in French cinema* (2006), and *Youth culture and global cinema* (2006). [Media Conglomerates]

**S. Elizabeth Bird** is professor and chair, Department of Anthropology, University of South Florida, USA. She studies the role of the media and popular culture in everyday life, and teaches in media studies, popular culture, and folklore. Her books include *For enquiring minds: A cultural study of supermarket tabloids* (1992), *Dressing in feathers: The construction of the Indian in American popular culture* (1996), and *The audience in everyday life: Living in a media world* (2003), which won the International Communication Association’s Outstanding Book Award in 2004. She has published over 50 articles and chapters, and is a frequent consultant for various media. Her current research interests include community-based ethnographic projects on media and cultural heritage. [Tabloidization]

**Thomas Birkner** is research assistant and lecturer in journalism history and journalistic practice at the Institute for Journalism and Mass Communication Studies, University of Hamburg, Germany. He is author of *Comrades for Europe? Die “Europarede” Helmut Schmidts 1974* (2005). He is currently working on the development of German journalism in the late nineteenth and early twentieth centuries. [News Story]

**Herbert Bless** holds a chair in micro-sociology and social psychology at the University of Mannheim, Germany. His main research interests lie in how individuals construct social reality. Working on attitudes, stereotypes, consumer behavior, and general aspects of

decision-making, Prof. Bless's research focuses on context effects in social judgment, with a particular emphasis on the interplay affect and cognition. [Availability, Cognitive]

**Charlotte Bloch** is associate professor of sociology at the University of Copenhagen, Denmark. Her research areas include emotions in everyday life, emotions in organizations, and emotions in discourse. Her last book, in Danish, is *Flow og Stress*, the subtitle of which translates as "Moods and culture of feelings in everyday life" (2001). She is also the author of the book *Passion og Paranoia*; its subtitle translates as "Emotions and emotional culture in academia" (forthcoming). [Emotion and Discourse]

**Menahem Blondheim** holds a PhD from Harvard University and teaches communication and American studies at the Hebrew University of Jerusalem, Israel, where he serves as director of the Smart Family Institute of Communications. Among his publications are, as author, *News over the wires* (1994) and *Copperhead gore* (2006), and, as co-editor with Rita Watson, *The Toronto School of Communication theory* (2007). [Innis, Harold; Telegraphic News]

**Saskia Böcking** received her PhD from the University of Zurich, Switzerland, in 2007. She is currently a research assistant at the University of Zurich. Her research interests are media usage and effects (particularly entertainment), children and media, and quantitative and qualitative methods. She serves as a reviewer for national and international journals and conferences. [Suspension of Disbelief]

**Graham D. Bodie** is a doctoral candidate in communication at Purdue University, USA. He has published several articles in the areas of listening and information processing, online health information seeking, and communication pedagogy. He currently serves as the member-at-large, special projects, on the Executive Board of the International Listening Association. [Constructivism and Interpersonal Processes]

**Don M. Boileau** holds a PhD from the University of Oregon, USA, and has been teaching for over 40 years. He served in the Peace Corps in Korea. As director of educational services for the National Communication Association, he not only wrote on many areas of pedagogy but also worked with several conferences with other disciplines on teaching. He has published in *Communication Education* and other journals for various national and regional associations. Currently he is teaching at George Mason University, USA, and he also serves as parliamentarian for the Association of Teacher Educators and Kappa Delta Pi. [Scholarship of Teaching]

**Jay David Bolter** is the Wesley Chair of new media at the Georgia Institute of Technology, USA. He is the author of *Turing's man: Western culture in the computer age* (1984); *Writing space: The computer, hypertext, and the history of writing* (1991, 2001); *Remediation* (1999), with Richard Grusin; and *Windows and mirrors* (2003), with Diane Gromala. With Michael Joyce, he created Storyspace, a hypertext authoring system. With the Access E-Learning collaborators at Georgia Tech, he is helping to build augmented reality and mobile technology systems to stage dramatic and narrative experiences for entertainment and informal education. [Barthes, Roland; Postmodernism and Communication; Remediation]

**Heinz Bonfadelli** is full professor of communication at the Institute of Mass Communication and Media Research, University of Zurich, Switzerland. His research areas are uses and effects of mass media and public information campaigns. [Health Communication and the Internet; Switzerland: Media System]

**Melanie Booth-Butterfield** holds a PhD from the University of Missouri, USA, and is the Peggy Rardin McConnell Chair of speech communication and professor in communication studies at West Virginia University, USA. She has published her research in over 50 peer-reviewed articles, primarily in the areas of communication, cognition, anxiety and emotion, interpersonal/relational communication, and health. In health-related communication her research focuses on how various communication patterns and personality traits affect message reception, decoding, and ultimately behavior. Booth-Butterfield is the author of an interpersonal communication text, *Interpersonal essentials*, and a health communication text, *Influential health communication*. Her emphasis professionally is on using one-to-one communication to address real-life interpersonal and social problems. [Communication Apprehension and Social Anxiety]

**Cecilia Bosticco** holds an MA from the University of Dayton, USA, and has published numerous articles on grieving and the role of narratives in the grieving process. Her work has been published in such journals as *Omega: Journal of Death and Dying* and *Journal of Family Communication* as well as such edited volumes as *Narratives, health and healing* and *Emerging perspectives in health communication: Meaning, culture, and power*. [Death, Dying, and Communication]

**Jérôme Bourdon** holds a PhD from the Institute for Political Studies in Paris, France, and is head of the Department of Communications at Tel Aviv University, Israel. Among his recent publications is *Introduction aux médias* (2000), which has been translated into Italian and Portuguese. He is completing a book on the coverage of the Israeli–Palestinian conflict in the western media. [Television: Social History]

**Richard Y. Bourhis** is professor in psychology at the University of Quebec at Montreal, Canada (UQAM). He has published in English and French over 130 journal articles and chapters on cross-cultural communication, intergroup relations, immigration, acculturation, and language planning. He was director of the Concordia-UQAM Chair in Ethnic Studies from 1996 to 2006 and was recently nominated director of the Centre des études ethniques des universités montréalaises at the University of Montreal, Canada. [Ethnolinguistic Vitality and Communication]

**Marc Bourreau** is an associate professor in the Department of Economics and Social Sciences at Telecom Paris (ENST), France. He is also a research associate in the laboratory of industrial economics at the Center for Research in Economics and Statistics. His main research interests are economic and policy issues relating to broadcasting, telecommunications, and the Internet. He has published several articles on these topics in academic journals such as the *American Economic Review*, the *European Economic Review*, *Information Economics and Policy*, and *Telecommunications Policy*. [Economies of Scale in Media Markets]

**Shannon A. Bowen** is assistant professor at the University of Maryland, USA. She was the principal investigator on an ethics grant from the International Association of Business Communicators Research Foundation. She has published on ethics in organizational contexts, as well as on ethics of mass communication about terrorism. Bowen created models of ethical decision-making for the pharmaceutical industry, based on Kantian deontology. Her dissertation won the International Communication Association Public Relation Division's Best Dissertation Award. She also served as editorial advisor to *The encyclopedia of public relations*. Bowen has authored numerous book chapters, and published reports and articles in publications such as the *Journal of Business Ethics* and the *Journal of Public Relations Research*. [Public Relations Ethics]

**Nicholas David Bowman** holds an MA from the University of Missouri-St. Louis, USA, and is a doctoral student in the Department of Communication at Michigan State University (MSU), USA. His primary scholarly interests are the study of mass media uses and effects. He teaches the introductory and advanced mass media effects courses at MSU, and researches the cognitive, behavioral, and affective variables associated with the process of media enjoyment. [Computer Games and Child Development]

**Andy Boyan** is a doctoral student at Michigan State University, USA. He received his BA and MA from Washington State University, USA. His research interests include video games, cognitive skill differences, game quality, and how philosophy of science perspectives intersect with new media research paradigms. He serves on the editorial board of the student-run *Rocky Mountain Communication Review*. He participates in service to his department and fellow graduate students as an officer in the Michigan State Association for Graduate Students in Communication. He is a member of both the National and International Associations of Communication. [Uses and Gratifications]

**Oliver Boyd-Barrett** is director of the School of Communication Studies at Bowling Green State University, Ohio, USA. He has taught at California State University, USA; the Center for Mass Communication Research, University of Leicester, UK; and the Open University, UK. Dr. Boyd-Barrett's research deals with international news, and publications include *The international news agencies*, *Le trafic des nouvelles*, *Contra-flow in global news*, *The globalization of news*, *The media book*, and *Communications media, globalization, and empire*. [News Agencies, History of]

**Karen Boyle** is a lecturer in film and television studies at the University of Glasgow, Scotland, UK. Dr. Boyle is the author of *Media and violence: Gendering the debates* (2005) and has published a range of articles dealing with feminist responses to media violence and pornography. [Violence and the Media, History of]

**Patricia Bradley** is professor emerita at Temple University in Philadelphia, USA, where she was an associate dean and chair of the Department of Journalism following a professional career in broadcast and print. She is the author of *Slavery, propaganda and the American revolution*, *Mass media and the shaping of American feminism 1963–1975*, and *Women and the press: The struggle for equality*. She is currently writing an account of

American popular culture in the first part of the twentieth century. [Feminine Mystique; Women's Movement and the Media]

**David Brake** is a PhD researcher in the Department of Media and Communications at the London School of Economics and Political Science, UK. His thesis is an author-centered study of the practice of personal weblogging. He has co-authored a report for Becta (*Bringing educational creativity to all*) on how education and the appropriate use of technology can help the disadvantaged, contributed to *Harm and offence in media content: A review of the evidence*, and is currently researching the positive and negative impacts of the use of online social network services like MySpace and Facebook. [Personal Publishing]

**Dale Brashers** is an associate professor of speech communication at the University of Illinois at Urbana-Champaign, USA. His research on people living with HIV or AIDS has been funded by the National Institutes of Health. He received the 2001 International Communication Association's Young Scholar Award. [Marginality, Stigma, and Communication; Uncertainty and Communication]

**Marian Bredin** is associate professor in the Department of Communications, Popular Culture, and Film and the MA in popular culture at Brock University, St. Catharines, Canada. Her work has been published in the *Canadian Journal of Communication*, *Canadian Journal of Native Studies*, and elsewhere. [Cultural Appropriation]

**Frank Brettschneider** is professor for communication studies and communication theory at the University of Hohenheim, Germany. His research focuses on campaign communication, public opinion, media effects, and communication performance management. He is a member of the advisory board of the international institute for media analysis Media Tenor and director of the Centre for Communication Performance Management. [Horse Race Coverage; Negative Campaigning; Personalization of Campaigning]

**Richard W. Brislin** is Shidler College Distinguished Professor of Management, Shidler College of Business, University of Hawaii in Honolulu, USA. He is the author of *Understanding culture's influence on behavior* (2000) and was awarded the Regents Teaching Excellence Award, University of Hawaii, in 2004. One of his books, *The art of getting things done: A practical guide to the use of power*, was a Book of the Month Club Selection. For five years, he wrote a weekly newspaper column on culture, behavior, and the workplace. [Intercultural Communication Training]

**Elizabeth C. Britt** is associate professor of English at Northeastern University, USA, where she specializes in rhetorical theory and criticism, rhetoric of law, and ethnographic theory and methods. She is author of *Conceiving normalcy: Rhetoric, law, and the double binds of infertility* (2001), as well as numerous articles and book chapters. [Rhetoric and Ethnography]

**Michael Bromley** is professor of journalism and head of the School of Journalism and Communication at the University of Queensland, Australia. He is a former journalist who has taught in universities in the UK, the USA, and Australia, specializing in journalism

practices and the history of the newspaper journalism. He was a founding co-editor of the journal *Journalism: Theory, Practice and Criticism* and serves on the editorial boards of five journals. [Fleet Street]

**Peggy Simcic Brønn** is an associate professor and dean of the undergraduate public relations program at the Norwegian School of Management, Oslo, Norway. Widely published in journals (*Journal of Communication Management*, where she is European editor, *Corporate Reputation Review*, *Journal of Advertising Research*, *European Journal of Marketing*, *Journal of Public Policy*, and *Public Relations Review*), she has also contributed to several books on communication and is co-editor of *Corporate communications: A strategic approach to building reputation*. She teaches at bachelor's and master's level in Norway, is a consultant for a number of Norwegian firms, lectures to many groups mostly on the subject of reputation, and is the Reputation Institute's academic representative in Norway. [Communication Management]

**Fred E. Bronner** studied political science at the University of Amsterdam, the Netherlands. He worked for many years in market research for the commercial research institutes Veldkamp and TNS Nipo and was managing director of Veldkamp from 1987 to 2002. Working in commercial research, he kept ties with the academic world. His dissertation is about choice behavior. In 2002 he was appointed full professor of media and advertising research at the University of Amsterdam. His main research interests include increasing family democracy and the consequences for advertising, multimedia synergy, media experience, and the influence of mood upon advertising effectiveness. [Advertising Effectiveness, Measurement of]

**Lisa Brooten** is an assistant professor in the Radio-Television Department, College of Mass Communication and Media Arts, Southern Illinois University Carbondale, USA. Her research focuses on South East Asia, especially on Burmese independent media, and regional media reform efforts; on gender; on the militarization of everyday culture; and more generally on alternative media and social movements. She received a Fulbright fellowship to pursue media research in Thailand and the Philippines. [Grassroots Media; Independent Media Centers Network]

From 1998 to 2002 he was chair of the German Communication Association. From 2001 to 2007, he was also dean of the faculty of social sciences. His research interests include media use, media effects, and methodology. [Research Methods; Third-Person Effects]

**Duncan H. Brown** is an associate professor in the School of Telecommunications at Ohio University, USA. His research interests include telecommunications policy and the political economy of the media industries. He has published papers on issues of media ownership and control in journals such as *Television and New Media*, *Journal of Communication Inquiry*, *Journal of Broadcasting and Electronic Media*, and the *Journal of Radio Studies*. In

addition he has worked on questions related to the place of undergraduate media education in universities and the in-service training of media professionals. [Antitrust Regulation; Mergers]

**Stephen Howard Browne** is professor of rhetorical studies at Pennsylvania State University, USA. He is the author of *Jefferson's call for nationhood* (2003), *Angelina Grimke: Rhetoric, identity, and the radical imagination* (2000), and *Edmund Burke and the discourse of virtue* (1993). Prof. Browne served for many years as editor of the international journal *Philosophy and Rhetoric*, and continues to serve on the editorial boards of several disciplinary journals. He is currently at work on a project devoted to Hannah Arendt and the politics of memory. [Memory and Rhetoric]

**Marjan de Bruin** is senior lecturer and director of the Caribbean Institute of Media and Communication, University of the West Indies, Jamaica. She has been responsible for several projects to improve reporting, especially in the area of the environmental reporting and coverage of HIV/AIDS. She is deputy chair of the university's HIV/AIDS response program and is involved in the development of regional communication strategies for stigma and discrimination in relation to HIV/AIDS. Dr. de Bruin is an active member of the International Association for Media and Communication Research, of which she was vice president between 2000 and 2004. Her publications include articles in refereed journals, monographs, and chapters in books. [Gender and Journalism]

**J. Alison Bryant** holds a PhD from the University of Southern California, USA, and is senior research director of brand and consumer insights for the Nickelodeon/MTV Networks Kids and Family Group. She leads Nick's efforts to understand the digital lives of kids and families, conducting research on a variety of digital platforms (online, console and hand-held gaming, interactive television, mobile), and manages research for the magazine group. She is currently associate editor for the *Journal of Children and Media* and has edited two books, *The children's television community* and *Television and the American family* (2nd edn., with Jennings Bryant). [Sesame Street]

**Jennings Bryant** is associate dean for graduate studies and research, CIS Distinguished Research Professor, and Reagan Chair of Broadcasting at the University of Alabama, USA. He received that university's Blackmon-Moody Outstanding Professor Award for 2000, was president of the International Communication Association in 2002–2003, and in 2006 received a Distinguished Scholar Award from the Broadcast Education Association and was elected a fellow of the International Communication Association. His research focuses on entertainment theory, media effects, and media, family, and children. [Educational Media Content; Educational Television, Children's Responses to; Entertainment, Effects of; Selective Exposure]

**Richard Buchanan** is professor of design in the School of Design at Carnegie Mellon University, USA. He has published widely, and is an editor of *Design Issues*, an international journal of design history, theory, and criticism published by MIT Press. He is also a past president of the Design Research Society, an international learned society founded in the UK. [Design]

**Warren Buckland** specializes in film theory and contemporary Hollywood cinema. He is author or editor of *Directed by Steven Spielberg, Studying contemporary American film* (with Thomas Elsaesser), *Teach yourself film studies*, *The cognitive semiotics of film*, and *The film spectator*. He also edits the journal *the New Review of Film and Television Studies*. He is senior lecturer in film studies at Oxford Brookes University, UK. [Film Theory]

**Moniek Buijzen** is an associate professor at the Amsterdam School of Communications Research, University of Amsterdam, the Netherlands. Her research focuses on children's consumer behavior. She has received a prestigious grant for talented junior researchers from the Dutch National Science Foundation (NWO) and several awards from the International Communication Association. [Advertising: Responses across the Life-Span]

**Michael Bull** is a reader in media and film at the University of Sussex, UK, and has written widely on sound, music, and technology. He is the author of *Sounding out the city: Personal stereos and the management of everyday life* (2000) and *Sound moves: iPod culture and urban experience* (2007), and co-editor of *The auditory culture reader* (2003). He is also a founding editor of *Senses and Society Journal*, published by Berg. [Technology as Fashion]

**Jean-Claude Burgelman** is head of the Information and Communication Technologies Unit at the Institute for Prospective Technological Studies, Spain, one of the seven research institutes of the European Commission's Joint Research Centre. He has degrees in social sciences (PhD 1986) and in science and technology policy (MA 1991) from the Free University of Brussels (FUB), Belgium. Burgelman has been a professor in and chair of the Department of Communication Studies at the FUB and created the Studies on Media, Information and Telecommunications research centre. He is a board member of several journals in Information Society Technologies policy and is a member of the scientific board of the Communication Policy Research Conference and the International Telecommunications Society 2006 conference. [Ubiquitous Computing]

**Judee K. Burgoon** is a professor of communication, family studies, and human development, and site director for the Center for Identification Technology Research at the University of Arizona, USA. She has authored seven books and over 200 chapters and journal articles. Her research on deception has received extensive support from the Department of Defense, the Department of Homeland Security, and the National Science Foundation. She is a fellow of the International Communication Association, a recipient of its Steven H. Chaffee Career Productivity Award, and a National Communication Association Distinguished Scholar. [Deceptive Message Production; Interaction Adaptation Theory; Paralanguage]

**Roland Burkart** holds a PhD in media and communication studies from the University of Vienna, Austria, and a postdoctoral lecture qualification. Since 1997 he has been associate professor, and since 2003 honorary doctor, at Sofia University St. Kliment Ohridski, Bulgaria. Selected research interests and teaching activities are communication theory, mass media effects, audience research, and public relations. [Consensus-Oriented Public Relations]

**Peter Burke** is a fellow of Emmanuel College and was formerly professor of cultural history, University of Cambridge, UK. His books include *The fabrication of Louis XIV* (1992), *The European Renaissance* (1998), *Eyewitnessing* (2001), and, with Asa Briggs, *A social history of the media* (2002). He is a fellow of the British Academy, a member of Academia Europea, and recipient of its Erasmus Medal. His most recent book is *Languages and communities in early modern Europe* (2004). [Portraiture]

**Brant R. Burleson** is a professor of communication at Purdue University, USA. He has authored more than one hundred articles and chapters and has edited five books. In 2006 he received the Distinguished Scholar Award from the National Communication Association in recognition of a lifetime of scholarly achievement in the study of human communication. [Comforting Communication; Constructivism and Interpersonal Processes; Emotion]

**Robert Burnett** is professor and research chair of media and communication studies at Karlstad University, Sweden. He is the author of *Concentration and diversity in the international phonogram industry* (1990), *The global jukebox: The international music industry* (1996), and *Web theory: An introduction* (2003), and co-editor of *Perspectives on multimedia: Communication, media and information technology* (2004). [Popular Music]

**Brad J. Bushman** is professor of psychology and communication studies at the University of Michigan, USA), and a professor of communication science at the Free University Amsterdam, the Netherlands. For over 20 years he has conducted research on violent media effects. His research has been published in the top scientific journals (e.g., *Science*, *Nature*) and has been featured on television, on radio, in magazines, and in newspapers. [Violence as Media Content, Effects on Children of]

**Nigel de Bussy** is senior lecturer in public relations at Curtin Business School, Perth, Australia. He holds a PhD from Curtin University of Technology, Australia, and an MA from the University of Oxford, UK. He spent more than a decade in public relations practice before entering academic life. His research interests include internal communication and stakeholder management. [Stakeholder Theory]

**Richard Buttny** is a professor in the Department of Communication and Rhetorical Studies at Syracuse University, New York, USA. He graduated from the University of Massachusetts Amherst, USA, in 1983. His most recent book is *Talking problems: Studies of discursive construction*. He has published articles in journals such as *Discourse and Society*, *Language and Society*, and *Human Communication Research*. Areas of scholarly interest include accounts and social accountability, talking race, reported speech, public hearings, and risk communication. [Accounting Research]

**Patrice Buzzanell** is professor in the Department of Communication at Purdue University, USA, where she researches career, leadership, and work–life issues. She has edited *Rethinking organizational and managerial communication from feminist perspectives*, *Gender in applied communication contexts* (with H. Sterk and L. Turner), and *Distinctive*

*qualities of communication research* (in progress, with D. Carbaugh). She is president elect of the International Communication Association, chair of the Council of Communication Associations, research board member of the National Communication Association, and editorial board member for 13 journals. She has served as editor of *Management Communication Quarterly* and president of the Organization for the Study of Communication, Language and Gender. She advises the Anita Borg Institute for Women and Technology engineering team in EPICS: Engineering Projects In Community Service. [Sense-Making]

**Carl R. Bybee** is an associate professor of communication studies in the School of Journalism and Communication at the University of Oregon, USA. He is author of numerous articles and book chapters on media and democracy, with a focus on the politics of constructivism and consumer versus democratic culture. [Popular Culture and the News Media]

**Carolyn M. Byerly** is an associate professor in the Department of Journalism at Howard University, Washington DC, USA. She is a feminist critical theorist whose teaching and research focus on relationships between social movements and media, examining particularly the intersections of race, gender, sexual orientation, and the power structures of media. She is associate editor of the journal *Communication, Culture and Critique*, and a member of the editorial boards of the *Journal of Communication*, *Feminist Media Studies*, *Media and Cultural Politics*, and *Global Media Journal* (Mediterranean edition). [Sexism in the Media; Woman as Sign]

**David Cabianca** is an assistant professor in the Department of Design at York University, Toronto, Canada. He has received Master's degrees from Princeton University, USA, Cranbrook Academy of Art, USA, and the University of Reading, UK. His writing has appeared in *Emigre*, *Idea Magazine*, and *Visible Language*. [Infographics]

**Andrew Calabrese** is professor in the School of Journalism and Mass Communication, University of Colorado at Boulder, USA. His research focuses on the political economy of international communication, and on information policies, and has been published in *Media, Culture and Society*, *Info*, *Television and New Media*, *New Media and Society*, *Gazette*, *Global Media and Communication*, *Javnost – The Public*, *Continuum*, and *Telematics and Informatics*. [Privatization of the Media; Social Mobilization; UNESCO]

**John T. Caldwell** is professor and chair of cinema and media studies at the University of California, Los Angeles, USA. He has authored and edited four books (*Televisuality*, *Electronic media and technoculture*, *New media*, and *Production culture: Industrial reflexivity and critical practice in film/television*) and produced and directed the award-winning documentaries *Freak Street to Goa* (1989) and *Rancho California* (2002). [Television, Visual Characteristics of]

**Victor J. Callan** is professor of management at the University of Queensland, Australia. His research funded by grants from the Australian government focuses upon understanding aspects of organizational change, including the communication of change and the reactions of employees to corporate change. Callan's work on organizational change appears in the journals *Human Relations*, *Journal of Management*, *Personality and Social Psychology Bulletin*, and *Journal of Vocational Behavior*. [Intergroup Dimensions of Organizational Life]

**Karlyn Kohrs Campbell** is professor of communication studies at the University of Minnesota, Twin Cities, USA. She is a Distinguished Scholar of the National Communication Association (1992) and received the Distinguished Woman Scholar Award, Office of the Vice President for Research, University of Minnesota (2002). She is the author of *Man cannot speak for her* (1989), co-author of *Deeds done in words: Presidential rhetoric and the genres of governance* (1990), and editor and compiler of *Women public speakers in the United States* (1993, 1994). [Rhetorical Criticism]

**Marci K. Campbell** is professor of nutrition in the School of Public Health and Cancer Prevention and control program leader at the Lineberger Comprehensive Cancer Center, University of North Carolina at Chapel Hill, USA. She is the author of more than 80 peer-reviewed articles and several book chapters focused on health communication, health promotion, and tailoring research. [Tailoring, Communication and]

**Daniel J. Canary** is professor of communication at Arizona State University, USA. Co-author or co-editor of 10 books and many articles regarding interpersonal communication, he is past president of the International Network on Personal Relationships and is now serving a presidential term for the Western States Communication Association. [Interpersonal Communication, Sex and Gender Differences in]

**Heather Canary** holds a PhD from Arizona State University, USA, where she is assistant professor of communication. Her research interests include the co-influence of family and organizational processes, particularly regarding disability, policy, and knowledge construction. She has published research in journals such as *Communication Education*, *Communication Quarterly*, *Health Communication*, *Journal of Applied Communication Research*, and *Journal of Business Ethics*. [Organizational Structure]

**Joanne Cantor** is professor emerita of communication arts and director of the Center for Communication Research at the University of Wisconsin-Madison, USA. She has published more than 90 scholarly articles and chapters on the psychological effects of the mass media. Her focus on children's fright reactions to television and movies has resulted in a parenting book, *Mommy, I'm scared*, and a children's book, *Teddy's TV troubles*. She has also done research on media ratings and the impact of media violence on aggression. Dr. Cantor has testified before Congress and the Federal Communications Commission about these issues and appears frequently in the media. She also maintains an informational website, [www.tvtroubles.com](http://www.tvtroubles.com). [Fear Induction through Media Content in Children]

**Joseph N. Cappella** has a PhD from Michigan State University, USA, and is professor of communication and holds the Gerald R. Miller Chair at the Annenberg School for Communication, University of Pennsylvania, USA. His research has resulted in more than 100 articles and book chapters and three co-authored books. He is a fellow of the International Communication Association and its past president, a distinguished scholar of the National Communication Association, and recipient of the B. Aubrey Fisher Mentorship Award. [Planned Behavior, Theory of]

**Jill Caravelli** is a graduate student in communications at the University of Illinois at Chicago, USA. She completed her Bachelor's degrees in media studies and Spanish in 2005 at the University of Illinois at Urbana-Champaign, USA. [Celebrity Culture]

**Donal Carbaugh** is professor of communication and chair of the International Studies Council at the University of Massachusetts Amherst, USA. His first book, *Talking American*, was identified as a favorite book of the past twenty-five years in *Contemporary Sociology*. His most recent book, *Cultures in conversation*, was designated Outstanding Book of the Year by the International and Intercultural Communication Division of the National Communication Association. [Culture and Communication, Ethnographic Perspectives on; Ethnography of Communication]

**Aaron Castelan Cargile** is a professor of communication studies at California State University, Long Beach, USA, where he helped found InterACT, a peer education performance troupe. His research interests include interracial dialogue, Buddhist psychology, and language attitudes. He is an associate editor for the *Journal of International and Intercultural Communication* and his recent work has appeared in the *Journal of Multilingual and Multicultural Development* as well as *Race, Ethnicity, and Education*. [Language Attitudes in Intergroup Contexts]

**Walter J. Carl** is an assistant professor in the Department of Communication Studies at Northeastern University, USA. Dr. Carl's research on business discourse and how everyday word-of-mouth conversations are influential on the business enterprise has been published in *Management Communication Quarterly*, *Western Journal of Communication*, *Qualitative Research Reports in Communication*, and *Communication Yearbook 28*. [Business Discourse]

**Marvin Carlson** is the Sidney E. Cohn Professor of Theatre and Comparative Literature at the Graduate Center of the City University of New York, USA. He is the author of 13 books and over 100 articles in the areas of theatre history, theatre theory, and dramatic literature, and his work has been translated into 14 languages. His most recent book is *Speaking in tongues* (2006). [Theatre]

**Nico Carpentier** is an assistant professor working in the Communication Studies Departments of the Free University of Brussels (VUB) and the Catholic University of Brussels (KUB), Belgium. He is co-director of the VUB research centre CEMESO and a board member of the European Communication Research and Education Association. Dr. Carpentier's recent publications include *Researching media, democracy and participation*

(ed., 2006) and *Reclaiming the media: Communication rights and democratic media roles* (ed., 2007). [Communication Technology and Democracy]

**Craig E. Carroll** holds a PhD from the University of Texas at Austin, USA, and is assistant professor in public relations at University of North Carolina at Chapel Hill School of Journalism and Mass Communication, USA. He is vice chair of the International Communication Association's Public Relations Division. He has published on corporate reputation and the news media in various journals, book chapters, and encyclopedia entries. He serves on the editorial board of three academic journals. [Corporate Reputation; Organizational Image]

**Cynthia Carter** is a senior lecturer at Cardiff University, UK. Her books include *Critical readings: Violence and the media* (2006), *Critical readings: Media and gender* (2004), *Violence and the media* (2003), *Environmental risks and the media* (2000), and *News, gender and power* (1998). She was chair of the Feminist Scholarship Division of the International Communication Association 2003–2005. She is founding co-editor of the journal *Feminist Media Studies* and on the editorial boards of *Communication, Culture, and Critique*, *Communication Review*, *Critical Studies in Media Communication*, *Journal of Children and Media*, *Sociology Compass*, and *Fifth Estate*. [Feminist and Gender Studies]

**Edward L. Carter** is assistant professor of communications at Brigham Young University (BYU), USA. He holds a JD from the BYU J. Reuben Clark Law School and a Master of Science in journalism from Northwestern University, USA. He is licensed to practice law in Utah and is admitted to the bar of the US Supreme Court. [Libel and Slander]

**Lisa Cartwright** is professor of communication and science studies at the University of California, San Diego, USA, where she is also affiliated to the Program in Critical Gender Studies. Her books include *Practices of looking: An introduction to visual culture* (co-author Marita Sturken), *Moral spectatorship*, and *Screening the body: Tracing medicine's visual culture*. With Paula A. Treichler and Constance Penley, she edited *The visible woman: Imaging technologies, gender and science*. [Visual Culture]

**Anabela Carvalho** is assistant professor at the Department of Communication Sciences of the University of Minho, Portugal. She received a PhD from University College London (Department of Geography), UK, in 2002. Her research has been published in *Critical Discourse Studies*, *Public Understanding of Science*, *Risk Analysis*, and other journals and edited books. She is chair of the Science and Environment Communication Section of the European Communication Research and Education Association. [Portugal: Media System]

**Dan Caspi** is chair of the Department of Communications Studies and head of the Hubert Burda Center for Innovative Communications at the Ben-Gurion University of the Negev, Israel. He served as the first founder chair of the Israel Communication Association and was a board member of the Israeli Broadcasting Authority, 2000–2003. He has written and co-authored several books: *Media, minorities, and hybrid identities: The Arab and Russian communities in Israel* (2006, with Hanna Adoni and Akiba A.

Cohen), *The in/outside: The mass media in Israel* (1999, with Yehiel Limor), and *Media decentralization: The case of Israel's local newspapers* (1986). [Israel: Media System]

**Theresa Castor** is an associate professor of communication at the University of Wisconsin-Parkside, USA. Her research focuses on language use in organizational decision-making and meetings; she has studied a variety of organizational governance groups including a faculty senate, school board, and nonprofit boards. Dr. Castor's work has been published in *Management Communication Quarterly*, the *Journal of Business Communication*, and *New Directions in Teaching and Learning*. [Public Meetings]

**Fred H. Cate** is a distinguished professor of law and director of the Center for Applied Cybersecurity Research at Indiana University, USA. A frequent congressional witness and speaker before professional, industry, and government groups, he is the author of *Privacy in the information age*, *Privacy in perspective*, and *The Internet and the First Amendment*, and the editor of *Visions of the First Amendment for a new millennium* and of the sixth edition of *Mass media law* (with M. Franklin and D. Anderson). Prof. Cate is a senator and fellow of the Phi Beta Kappa Society and an elected member of the American Law Institute. [Privacy]

**John P. Caughlin** holds a PhD from the University of Texas at Austin, USA, and is an associate professor of speech communication at the University of Illinois at Urbana-Champaign, USA. His research examines communication in families and other close relationships, focusing on the causes and consequences of avoiding communication. His recent work has appeared in journals such as *Communication Monographs*, *Human Communication Research*, *Journal of Social and Personal Relationships*, *Communication Research*, and *Personal Relationships*. He is a winner of the Knower Outstanding Article Award from the Interpersonal Division of the National Communication Association, and in 2004 he received the Miller Early Career Achievement Award from the International Association for Relationship Research. [Family Communication Patterns]

**Young-Gil Chae** is a doctoral candidate at the Department of Radio-Television-Film in the College of Communication, University of Texas at Austin, USA. His primary academic interests are in various issues of critical development communication, communications for social changes, and international communication studies. In particular, his dissertation deals with critical communication processes for social change in the context of globalization. His research has been published in various international and local journals including *International Journal of Communication*, *Global Times*, *CyberPsychology and Behavior*, and *East-West Channel*. [Development Discourse]

**Amitava Chakraborty** is reader in the Department of Modern Indian Languages and Literary Studies at the University of Delhi, India. He teaches comparative rhetoric and comparative literary theory, and is working on a detailed history of rhetoric in ancient and medieval South Asia. He has reshaped the terms of rhetoric studies in India by incorporating a wider perspective including various modes of public communication along with literary studies. He is author of *Swarajmanan* (2006), a critical work studying the structures of dependency and moments beyond dependency in contemporary non-western theoretical

and critical practices. He has published more than 20 papers on various fields including non-western responses to postmodernism, popular cultural theory, and Sanskrit poetics. He serves on the editorial board of three literary journals. [Rhetoric in South Asia]

**Richard Chalfen** is professor emeritus of anthropology at Temple University, Philadelphia, USA, and Tokyo, Japan, and currently senior scientist at the Center on Media and Child Health, Children's Hospital Boston/Harvard Medical School, USA. He is the author of *Snapshot versions of life* (1987) and *Turning leaves: The photograph collections of two Japanese American families* (1991) and co-author of *Through Navajo eyes: An exploration in film communication and anthropology* (1997). [Amateur Photography and Movies]

**Tomas Chamorro-Premuzic** is one of the leading experts in the area of psychometric assessment. In the past 10 years, he has also provided expertise to several multinational companies, including JWT, Goldman Sachs, Unilever, Apple, and the BBC. Since obtaining his PhD degree from the University of London, UK, he has lectured in the UK at University College London, the University of Bath, and the London School of Economics and Political Science, and is currently a lecturer at Goldsmiths College. Together with Prof. Adrian Furnham, Chamorro-Premuzic is the author of the theory of intellectual competence, which provides a ground-breaking scientific framework for understanding the determinants of future work performance through an integration of individual differences in ability and non-ability traits. [Individual Differences and Information Processing]

**Michael Chanan** is a documentary filmmaker and film historian, although he started out as a music critic and launched into filmmaking with films on music for BBC 2; he has since written several books on music. In the 1980s he made a number of films in Latin America for Channel 4 and published books on the beginnings of cinema and on cinema in Cuba. He was professor of cultural studies at the University of the West of England, UK, 2001–2007, when he joined Roehampton University, UK, as professor of film and video. His latest film is *Detroit, Ruin of a City* (2005), and his latest book is *The politics of documentary* (2007). [Documentary Film, History of]

**Maurice Charland** is professor of communication studies and director of the Centre for Interdisciplinary Studies in Society and Culture at Concordia University, Montreal, Canada. He is the author of two foundational essays in rhetoric and communication studies, "Technological nationalism" (1986) and "Constitutive rhetoric" (1987); the latter received the Charles H. Woolbert Research Award in 2000. He is co-author with Michael Dorland of *Law, rhetoric, and irony in the formation of Canadian civil culture* (2002), awarded the 2002 G. J. Robinson prize for best Canadian Book of the Year in Communication Studies. He is a founder of Concordia University's interuniversity PhD program in communication and is on the editorial board of several major journals in rhetorical studies, including the *Quarterly Journal of Speech* and *Philosophy and Rhetoric*. [Rhetoric and Social Thought]

**Clive Cheesman** is an officer of the College of Arms in London, UK, the official body for regulating heraldry in England, Wales, and Northern Ireland, and is joint editor of the

journal *Coat of Arms*. He is a non-practicing barrister-at-law, was formerly a curator in the British Museum, and holds a PhD from the University of San Marino, San Marino. His relevant publications include *The armorial of Haiti* (2007). [Heraldry]

**Guo-Ming Chen** is professor of communication at the University of Rhode Island, USA. He is the founding president of the Association for Chinese Communication Studies. He is one of the editors of *China Media Research*, *Intercultural Communication Studies*, and *International and Intercultural Communication Annual*, and serves on the editorial board of five other journals. Chen's primary research interests are in intercultural, organizational, and global communication. He has published 21 books and over 100 articles and book chapters. [Communication as an Academic Field: East Asia]

**Rudong Chen** is an associate professor of the School of Journalism and Communication of Peking University, China, president of the Chinese Rhetoric Society of the World, and vice president and secretary general of the Rhetoric Society of China. He has published *Socio-psychological rhetoric*, *Chinese rhetoric for foreigners*, *Cognitive rhetoric*, *Contemporary Chinese rhetoric*, *Ethics of language*, and *Ethics of communication*. [Rhetoric in East Asia: China and Japan]

**George Cheney** is professor of communication, director of peace and conflict studies, and director of the Barbara L. and Norman C. Tanner Center for Nonviolent Human Rights Advocacy at the University of Utah, USA, and adjunct professor in management communication at the University of Waikato, Hamilton, New Zealand. He has published six books and more than 80 articles and chapters. His research and teaching interests include identity and power in organizations, employee participation and workplace democracy, professional ethics and popular culture, marketization and globalization, the social functions of dissent, and the rhetoric of war and peace. Recognized for teaching and research, he has lectured in Europe and Latin America. [Bureaucracy and Communication]

**Joseph L. Chesebro** holds an EdD from West Virginia University, USA, and is chair and associate professor in the Department of Communication at the State University of New York College at Brockport, USA. He has authored a number of articles on instructional communication and, with James McCroskey, he co-edited the book *Communication for teachers*. He also has received the New York State Chancellor's Award for Excellence in Teaching. [Teacher Clarity]

**Jay P. Childers** is assistant professor of communication studies at the University of Kansas, USA, where he teaches courses on rhetoric in popular culture and mediated politics. His work's central focus is on the influence of media, political rhetoric, and lay discourse on community. His work has been published in a number of national journals. [Rhetoric and Media Studies]

**Young Jae Choi** is assistant professor at Hallym University, South Korea. He has worked as a journalist with a national news wire service and a 24-hour cable news channel in Korea. He earned a journalism PhD at the University of Texas at Austin, USA, in 2004. [Local News]

**Lars Thøger Christensen** holds a PhD from Odense University, Denmark, and is professor of communications in the Department of Marketing and Management, University of Southern Denmark. In addition to five books, his research appears in *Organization Studies*, *European Journal of Marketing*, *Consumption, Markets and Culture*, *The new handbook of organizational communication*, *The handbook of public relations*, *Communication Yearbook*, and elsewhere. His latest book, *Corporate communications: Convention, complexity and critique* (with Mette Morsing and George Cheney), will be published in 2008. [Corporate and Organizational Identity]

**Clifford G. Christians** is the Charles H. Sandage Distinguished Professor and research professor of communications at the University of Illinois at Urbana-Champaign, USA, with joint appointments in journalism and media studies. He is co-author of *Good news: Social ethics and the press* (with J. Ferre and M. Fackler) and of *Media ethics: Cases and moral reasoning* (7th edn., with M. Fackler, K. Mckee, and R. Woods). [Ethics in Journalism]

**Wendy Hui Kyong Chun** is associate professor of modern culture and media at Brown University, USA. She is author of *Control and freedom: Power and paranoia in the age of fiber optics* (2006) and co-editor of *New media, old media: A history and theory reader* (2005). She has been a fellow at the Radcliffe Institute for Advanced Study at Harvard and a Wriston Fellow at Brown, and is on the editorial board of several journals in the field. [Digital Media, History of]

**Pamela Church Gibson** is reader in cultural studies at the University of the Arts London, UK. She has published extensively on film, fashion, fandom, and history. She has co-edited three books, including *The Oxford guide to film studies* with John Hill (1998). Recently she edited *More dirty looks: Gender, power and pornography* for the British Film Institute (2004), and she is currently working on a study of the relationship between cinema and consumption in the immediate postwar period. [Voyeurism]

**Steven E. Clayman** is professor of sociology and is affiliated with the Communication Studies Department at the University of California, Los Angeles. He has written more than 40 articles on the relationship between talk, interaction, and mass communication, and is the author (with John Heritage) of *The news interview: Journalists and public figures on the air*. [Broadcast Talk; Interview as Journalistic Form]

**Heather M. Claypool** is an assistant professor in the Department of Psychology at the University of Miami, USA. She has published several articles in top-tier journals in the field of social psychology, has received federal funding for her research, and currently serves on the editorial board of the *European Journal of Social Psychology*. [Memory, Person]

**Richard Clément** is professor of psychology at the University of Ottawa, Canada. His current research interests include issues related to bilingualism, second language acquisition, and identity change and adjustment in the acculturative process. He is a fellow of both the Canadian and the American Psychological Associations and currently president of the International Association of Language and Social Psychology. [Bi- and Multilingualism]

**Rebecca J. W. Cline** holds a PhD from Pennsylvania State University, is a senior scientist in communication and behavioral oncology at the Barbara Ann Karmanos Cancer Institute, and is associate professor of family medicine and public health sciences in the Wayne State University School of Medicine, USA. Her research focuses on the role of interpersonal communication in health, and currently includes investigating: parent–child interaction during painful and distressing pediatric oncology treatment-related procedures; physician–patient communication processes associated with reducing health disparities; macro-level factors that may influence the physician–patient relationship, including the Internet and direct-to-consumer advertising of prescription drugs; and social support, stigma, and other psychosocial processes associated with a slow-motion technological disaster. [Patient–Provider Communication]

**Paul Cobley**, reader in communications at London Metropolitan University, UK, is the author of a number of books, including *The American thriller* (2000) and *Narrative* (2001). He is the editor of *The communication theory reader* (1996), *The Routledge companion to semiotics and linguistics* (2001), and *Communication theories* (2006), co-edits two journals, *Subject Matters* and *Social Semiotics*, and is associate editor of *Cybernetics and Human Knowing*. [Communication: Definitions and Concepts; Culture: Definitions and Concepts; Discourse; Genre]

**Michael J. Cody** received his PhD from Michigan State University, USA, in research methods and social influence processes, and is now professor in the Annenberg School for Communication, University of Southern California, USA. He has written books in persuasion and interpersonal communication and he has edited volumes in accounts and social explanations, gender and communication, and entertainment-education. He edited *Communication Theory* (1999–2002) and is the current editor of the *Journal of Communication* (2009–2011). [Entertainment Education]

**Jonathan Cohen** is currently the chair of the Department of Communication, University of Haifa, Israel. His research focuses on media processes and effects, and primarily on the relationships of audiences with media characters and on impersonal media effects. He has served on the editorial board of *Communication Theory*, is currently a member of the editorial board of *Media Psychology*, and will be a member of the new editorial board of the *Journal of Communication*. [Identification]

**Robin R. Means Coleman** is an associate professor of communication studies and African American studies at the University of Michigan, USA. She is the author of *African-American viewers and the black situation comedy: Situating racial humor* (2000), and the editor of *Say it loud! African American audiences, media, and identity* (2002). [Symbolic Annihilation]

**Royal D. Colle**, a member of the Cornell University, USA, faculty for more than 40 years, has been active in development work in a variety of countries. He has been a consultant for a variety of international organizations including the World Bank, the World Health Organization, the Food and Agriculture Organization, the UN, the UN Fund for Population Activities, UNESCO, the US Agency for International Development, the UK

Department for International Development, and the Ford Foundation. His most recent publication (2007) is *Advocacy and interventions: Readings on communication and development*, available free online at <http://ecommons.library.cornell.edu/handle/1813/7749>. [Telecenters]

**David L. Collinson** is professor of leadership and organization at Lancaster University Management School, UK. He is the founding co-editor of the new journal *Leadership*. He has published six books, including *Managing the shopfloor* (1992) and *Managing to discriminate* (1990), and over 90 journal articles, book chapters, and research reports that develop a critical approach to organization, management, and leadership studies. His work on power, identity, management, gender, masculinity, safety, resistance, and humor has been widely cited. [Leadership in Organizations]

**James R. Compton** is associate professor in the Faculty of Information and Media Studies at the University of Western Ontario, Canada. He is author of *The integrated news spectacle: A political economy of cultural performance* (2004), and co-editor of *Converging media, diverging politics: A political economy of news media in the United States and Canada* (2005, with David Skinner and Mike Gasher). [Television Networks]

**Martin Conboy** is reader in journalism studies at the University of Sheffield, UK. He is the author of numerous books and articles on the history of journalism, including *The press and popular culture* (2002) and *Journalism: A critical history* (2004), and of books on the analysis of the language of news media, such as *Tabloid Britain: Constructing a community through language* (2006) and *The language of the news* (2007). He is on the editorial board of *Media History*, *Journalism Studies*, and *Journalism: Theory, Practice and Criticism*, a committee member of the Association for Journalism Education, and the co-editor of a series of books entitled *Journalism Studies: Key Texts*. [Newspaper, History of]

**Caryn A. Conley** is a doctoral candidate at New York University (NYU), USA, Stern School of Business, Department of Information, Operations, and Management Sciences, and studies behavioral aspects of IT. Her research interests include free/open source software development, distributed work, social networks, pro-social behavior, and behavioral decision-making. She earned her undergraduate degree from the McCombs School of Business at the University of Texas at Austin, USA, and worked as a consultant at PricewaterhouseCoopers prior to entering the doctoral program at NYU. [Network Organizations through Communication Technology]

**Mike Conway** is an assistant professor in the School of Journalism at Indiana University, USA. His research interests include the origins and development of television news, broadcast news content, and journalism history. Conway spent close to 20 years in broadcast news, most of that time in television working as a reporter, photojournalist, anchor, producer, and news director. [Broadcast Journalism; Television News]

**Leda Cooks** holds a PhD from Ohio University, USA, and is a professor in the Department of Communication at the University of Massachusetts Amherst, USA. Her

areas of teaching and research include intercultural communication, interracial communication, critical pedagogy, performance, media literacy, conflict, and constructions of identity and community. Recent publications include a co-edited book, *Dis-placing race: Whiteness, identity and performance*, a co-edited double issue on “The Teacher’s Body” of *Review of Education, Critical Pedagogy and Cultural Studies*, and chapters and journal articles on community-based learning and communication activism. [Feminist Media Pedagogy]

**W. Timothy Coombs** holds a PhD from Purdue University, USA, and is an associate professor in the Department of Communication Studies at Eastern Illinois University, USA. He is the 2002 recipient of the Jackson Jackson and Wagner Behavioral Science Prize from the Public Relations Society of America. His research led to the development and testing of the situational crisis communication theory. He has published a variety of book chapters and articles on crisis communication, as well as two books, *Code Red in the boardroom* and the award-winning *Ongoing crisis communication: Planning, managing, and responding*, which is in its second edition and has been translated into Chinese. [Crisis Communication; Internet Use across the Life-Span]

**Pamela Cooper** is a professor of communication at the University of South Carolina Beaufort, USA. She has published numerous books and articles on teacher training and received a National Communication Association’s Teaching and Learning Scholar Award in 2000. [Teacher Training in Communication]

**Anne Cooper-Chen**, professor of journalism at the Scripps School of Journalism, Ohio University, USA, earned her PhD from the University of North Carolina at Chapel Hill, USA. She worked full time as a journalist for 10 years in Virginia, Pennsylvania, and Tokyo, and is listed in *Who’s who in America*. Her publications include *Games in the global village* (1994), *Mass communication in Japan* (1997), and *Global entertainment media* (2005), as well as 10 book chapters. The founding director of the Scripps Institute for International Journalism, she established the Association for Education in Journalism and Mass Communication’s Entertainment Studies Interest Group. She has lectured at universities in Japan (as a Fulbright senior research scholar), China, Hong Kong, Korea, Australia, Malaysia, the Philippines, Taiwan, and Germany. [Anime]

**François Cooren** is a professor and chair of the Department of Communication of the University of Montreal, Canada. He is the current editor in chief of *Communication Theory* and a former chair of the Language and Social Interaction Division of the International Communication Association. He is the author of more than 25 articles published in peer-reviewed journals, 10 book chapters, and a book titled *The organizing property of communication* (2000). He is also the editor and co-editor of two other books. His research interests are organizational communication, communication theory, and language and social interaction. [Linguistic Pragmatics]

**Nathaniel I. Córdoba** is assistant professor of rhetoric and media studies at Willamette University, USA. His publications include essays in *Centro Journal* and *Quarterly Journal of Speech*. [Rhetoric and Class]

**Steven R. Corman** holds a PhD from the University of Illinois, USA, and is a professor in the Hugh Downs School of Human Communication at Arizona State University, USA, where he studies the relationship of talk and written communication to organizational networks and activity systems. He has served as a consultant and science panel member for the Department of Defense in the counter-terrorism arena, and directs the Consortium for Strategic Communication in the Hugh Downs School. He is also past chair of the Organizational Communication Division of the International Communication Association, and is a current and/or past member of the editorial boards of *Communication Monographs*, *Human Communication Research*, *Management Communication Quarterly*, *Progress in Communication Science*, and *Western Journal of Communication*. [Structuration Theory]

**Joep P. Cornelissen** is professor of corporate communication at the University of Leeds Business School, UK. His research interests include corporate and organizational communication, organizational metaphors, and language- and text-based research in strategy, management, and organization theory. He is author of *Corporate communications: Theory and practice* (2004). His research has been published in *Academy of Management Review*, *Organization Studies*, *British Journal of Management*, *Human Relations*, and the *Journal of Management Studies*. He is currently an associate editor of the *Journal of Management Studies* and sits on a number of editorial boards. [Corporate Communication]

**Simon Cottle** is currently professor of media and communications in the School of Journalism, Media and Cultural Studies at Cardiff University, UK, and was formerly director and chair of the media and communications program at the University of Melbourne, Australia. His most recent books include *Mediatized conflict: New developments in media and conflict studies* (2006) and *The racist murder of Stephen Lawrence: Media performance and public transformation* (2004). He is currently writing *Global crisis reporting*. [Conflict as Media Content]

**Justine Coupland** is a senior lecturer at Cardiff University, UK, and was assistant professor at the University of California, Santa Barbara, USA. Her research interests are in interactional sociolinguistics and critical discourse analysis, particularly in identity in talk and text, health and the life-span, and communication and relationships. She is working collaboratively on small talk, discourse, relationships, and aging. Dr. Coupland's teaching centers on the above research interests within three themes, taught at undergraduate and postgraduate levels: discourse and pragmatics (language use, meaning, and interpretation in social contexts); social interaction (critical discourse analysis, conversational management, power and solidarity, and small talk and gossip); and media communication (media texts and ideology, broadcast talk, and the intersection of the public and private domains). [Small Talk and Gossip]

**Christopher Craig** is Lindsay Young Professor of Classics at the University of Tennessee, USA. His many publications, including *Form as argument in Cicero's speeches*, are united by a focus upon Cicero's persuasive manipulation of his audience's shared knowledge of classical rhetorical precepts. Craig currently serves on several editorial boards, including

that of *Rhetorica*, the journal of the International Society for the History of Rhetoric. [Arrangement and Rhetoric]

**Robert L. Craig** is a professor of communication and journalism at the University of St. Thomas in St. Paul, Minnesota, USA. He teaches courses in media studies, visual communication, and graphic design. His critical research on advertising and design has been published in journals such as *Design Issues*, *Discourse and Society*, *Javnost – The Public*, *Journal of Advertising*, and *Journal of Communication Inquiry*. [Advertisement, Visual Characteristics of; Code; Newspaper, Visual Design of; Typography]

**Robert T. Craig** is a professor of communication at the University of Colorado at Boulder, USA, and a past president of the International Communication Association. He was founding editor of the ICA journal *Communication Theory* and currently serves on the editorial boards of six journals and as series editor of the ICA Handbook Series. His research publications have addressed a range of topics in communication theory and philosophy, discourse studies, and argumentation. *Theorizing communication: Readings across traditions* (co-ed. with Heidi L. Muller) appeared in 2007. [Communication as a Field and Discipline; Meta-Discourse]

**Diana Crane** is professor emerita of sociology at the University of Pennsylvania, USA. A specialist in the sociology of culture, arts, media, and globalization, she is the author of numerous articles and several books, including *The transformation of the avant-garde: The New York art world, 1940–1985* (1987) and *Fashion and its social agendas: Class, gender and identity in clothing* (2000). [Taste Culture]

**Sean Cubitt** is professor and director of the program in media and communications at the University of Melbourne, Australia. He is the author of *Ecomedia*, *The cinema effect*, *Simulation and social theory*, *Digital aesthetics*, and other works, and co-editor of *How to study the event movie: The Lord of the Rings – A case study*, *Against the grain: The third text reader*, and *Aliens R Us: The other in science fiction cinema*. He is on the editorial board of *Cultural Politics* and the advisory boards of 12 other journals. He is the editor in chief of the Leonardo Boo Series for MIT Press. [Special Effects; Virtual Reality]

**Nicholas J. Cull** is professor in the Annenberg School for Communication and the School of International Relations, University of Southern California, USA, where he directs the Master's in public diplomacy program. He has published widely on issues of media history. He is author of *Selling war* (1995), and co-editor of *Propaganda and mass persuasion: A historical encyclopedia, 1500–present* (2003). His *The Cold War and the United States Information Agency: American propaganda and public diplomacy, 1945–1989* is due out in 2008. He is president of the council of the International Association for Media and History. [Voice of America]

**Leslie Cunliffe** has worked at the School of Education and Lifelong Learning at the University of Exeter, UK, since 1989. He is a senior lecturer in art and art education. His research interests are mainly concerned with the relationship between socio-cultural and

psychological processes in art and art education. He has served on the editorial board of the *International Journal of Art and Design Education*. He has authored several chapters and research articles and has exhibited paintings and drawings at the Royal Academy of Art and other venues. [Painting]

**William R. Cupach** received his PhD in communication arts and sciences from the University of Southern California, USA. Currently he is professor of communication at Illinois State University, USA. His research pertains to problematic interactions in interpersonal relationships, including such contexts as embarrassing predicaments, relational transgressions, interpersonal conflict, and obsessive relational pursuit. In addition to numerous monographs and journal articles, he has co-authored or co-edited 10 books. He previously served as associate editor for the *Journal of Social and Personal Relationships* and is a past president of the International Association for Relationship Research. [Interpersonal Conflict]

**Michael Curtin** is professor of communication arts and director of global studies at the University of Wisconsin-Madison, USA. His books include *Redeeming the wasteland* (1995), *Playing to the world's biggest audience* (2007), and *Media capital* (forthcoming). He is co-editor of the International Screen Industries book series for the British Film Institute. [International Television]

**Peter Dahlgren** is professor in media and communication studies at Lund University, Sweden. His research addresses both mass and interactive media in late modernity and its culture, including such themes as democracy, identity, the public sphere, and civic engagement. His most recent publications are the edited *Young citizens and new media* (2007) and *Media and civic engagement* (forthcoming). [Television News, Visual Components of]

**Marianne Dainton** is a professor of communication at La Salle University in Philadelphia, USA, where she is also the associate chair. She has published two books, *Maintaining relationships through communication* and *Applying communication theory for professional life*, and has published in *Communication Monographs* and the *Journal of Social and Personal Relationships*, among others. Dainton is on the editorial board of three journals, and is a reviewer for an additional eight journals and four publishing houses. She has received La Salle's Holroyd Award for Distinguished Teaching. [Relational Maintenance]

**Nabil H. Dajani** is professor of communication at the American University of Beirut (AUB), Lebanon. He earned his BA and MA in sociology from AUB and a PhD in mass communications theory and research from the University of Iowa, USA. He specializes in the role of the media in society, with emphasis on the Lebanese and Arab media. Currently he is chairperson of the Board of Arab Reporters for Investigative Journalism and board member of the Center for the Freedom of the Press in the Middle East North Africa region. He is the author of several books, has published some 50 research articles in professional journals in English and Arabic, and has contributed to some 80 international and regional professional communication meetings. [Development Communication: Middle East]

**John Daly** is the Liddell Centennial Professor of Communication, University Distinguished Teaching Professor, Texas Commerce Bancshares Professor of Management, and an adjunct professor of pharmacy at the University of Texas at Austin, USA. He has published more than 100 articles and chapters in scholarly publications, and completed six books. Dr. Daly's interests focus on practical ways of improving the communication skills of individuals. He has examined topics such as shyness, personality difference in communication, communication difficulties people experience in their personal and professional relationships, and ways people advocate for their ideas. [Ingratiation and Affinity Seeking; Stage Fright]

**Lucig H. Danielian** is provost and vice president at the American University of Armenia. She works in the areas of democracy and institution-building and has been awarded Fulbright, Social Science Research Council/American Council of Learned Societies, and International Research and Exchanges Board fellowships for field research on elite and mass political communication processes in policymaking and consensus-building. [Accuracy]

**Ann L. Darling** holds a PhD from the University of Washington, USA, and is associate professor and chair of the Department of Communication at the University of Utah, USA, where she teaches courses in communication education and instructional communication. Her work on graduate student socialization and teaching assistant training has been published in journals such as *Communication Education*, *Journal of Thought*, and *Teaching and Teacher Education*. In 1987 her work on communication and teacher socialization with Ann Q. Staton received the national research award from the Association of Teacher Educators. She is now turning her attention to questions about public discourse about education and communication education and social justice. [Curriculum Studies]

**Gregor Daschmann** has been professor of communications at the Johannes Gutenberg University of Mainz, Germany, since 2006. From 2003 to 2006, he was professor of media and communication studies at the Hanover University of Music and Drama, Germany. He was chair of the Methodological Division of the German Communication Association (DGPK) from 2002 to 2006. Dr. Daschmann's dissertation about exemplification effects won the first prize in the dissertation award competition of the DGPK. [Exemplification and Exemplars, Effects of; Pluralistic Ignorance]

**Prabu David** is associate professor in the School of Communication at Ohio State University, USA. His work focuses on human-computer interaction and cognitive processing of media. He has published academic articles in areas such as communication technology, news memory, body image effects of the media, and public relations. He is on the editorial board of three journals and is a co-investigator on various funded health intervention projects. [Body Images in the Media; Dual Coding Theory]

**Sandra Davidson**, is an associate professor of journalism and adjunct associate professor of law at the University of Missouri-Columbia, USA. In summer 2006, she traveled to Cambodia and Vietnam as part of a Global Scholars program. For the fall 2005 semester,

she taught in London for the Missouri School of Journalism London Program. She made a US Information Agency trip to Mongolia in fall 1999 and spent six weeks in summer 1996 in Beijing working at the *Beijing Review*. Dr. Davidson's academic writings include "From spam to stern: Advertising law and the Internet," in *Advertising and the Internet: Theory and research* (2007), and "Journalism: The lifeblood of a democracy," co-authored with Betty Houchin Winfield, in *What good is journalism?* (2007). [Journalism: Legal Situation]

**William R. Davie** is the broadcast sequence coordinator and interim head of the Communication Department for the University of Louisiana at Lafayette, USA. He has led the Broadcast News Divisions of both the Broadcast Education Association and the Association for Education in Journalism and Mass Communication. He has served on the ethics task force of the Radio-Television News Directors Association, and has authored papers, journal articles, and book chapters on broadcast journalism and its effects. In addition to serving on the editorial boards of two journals, he is the co-author of two textbooks on electronic media and communication law. [Radio Broadcasting, Regulation of]

**John Davies** is assistant professor in the Department of Communication at the University of North Florida, USA. His research examines media uses and effects, entertainment theory, and media and sexual attitudes and behaviors. His recent research credits include publications in *Journal of Media and Religion*, *Journal of Current Issues and Research in Advertising*, and two co-authored chapters on selective exposure. [Selective Exposure]

**James W. Dearing** is senior scientist in the Institute for Health Research and co-director of the Center for Health Dissemination and Implementation Research with Kaiser Permanente Colorado, USA. He studies the diffusion of innovations throughout societal sectors and the implementation of innovations in organizations. Dearing serves on the United States National Research Council and Institute of Medicine performance review of the National Institute for Occupational Safety and Health. [Diffusion of Information and Innovation]

**Jamie DeCoster** is assistant professor in the Department of Psychology at the University of Alabama, USA. His research interests include social cognition, implicit learning/implicit measures, dual process models, connectionist models, and research methodology/statistics. Dr. DeCoster is a member of the Midwestern Psychological Association and the Person Memory Interest Group. [Memory, Person]

**Stanley Deetz** is professor of communication and director of peace and conflict studies at the University of Colorado at Boulder, USA. His several books include *Leading organizations through transitions* (2000), *Doing critical management research* (2000), *Transforming communication, transforming business* (1995), and *Democracy in an age of corporate colonization* (1992). He was a Senior Fulbright scholar and is a fellow of the International Communication Association (serving as its president, 1996–1997) and a National Communication Association Distinguished Scholar. He is also an active consultant for companies in the USA and Europe. [Organizational Ethics]

**Emmanuel Derieux** is a professor of communication law at the University of Paris II, France. Among his published books are *Droit de la communication* (Communication law), *Droit européen et international des médias* (European and international media law), and *Droit de la communication: Lois et règlements. Recueil de textes* (Communication law: Law. Textbook). [United Nations, Communication Policies of]

**Mark Deuze** is professor of journalism and new media at Leiden University, the Netherlands, and holds a joint appointment in the USA in the Department of Telecommunications, Indiana University, Bloomington. In 2002–2003 he was a Fulbright scholar at the University of Southern California Annenberg in Los Angeles, USA. His work has appeared in journals such as *New Media and Society*, *Journalism*, and *Journalism Studies*, and includes five books, among them *Media work* (2007). [Internet News; News Ideologies]

**Hazel Dicken-Garcia** is a professor of journalism and mass communication and member of the Academy of Distinguished Teachers at the University of Minnesota, Minneapolis, USA. Author of *Journalistic standards in nineteenth-century America*, which received the Kappa Tau Alpha Award in 1990, she earned a PhD in mass communication at the University of Wisconsin-Madison, USA. [Standards of News]

**James Price Dillard** is professor of communication arts and sciences at Pennsylvania State University, USA. He is the co-editor of *The persuasion handbook* and past editor of *Human Communication Research*, and currently serves on the editorial board of eight social scientific journals. His research emphasizes the role of emotion in persuasion. [Goals, Cognitive Aspects of; Goals, Social Aspects of]

**Gail Dines** is a professor of sociology and women's studies at Wheelock College in Boston, USA. She is co-editor of *Gender, race and class in media* and co-author with Robert Jensen and Ann Russo of *Pornography: The production and consumption of inequality* (1998). Dines has been featured in a number of documentary films, including *The Strength to Resist: The Media's Impact on Women and Girls*. [Pornography, Feminist Debates on]

**Paolo Dini**, a senior research fellow in the Department of Media and Communications at the London School of Economics and Political Science (LSE), UK, holds a PhD and MS in aerospace engineering from Pennsylvania State University, USA, and a BS in aeronautical engineering from the University of California, Davis, USA. Having taught physics and worked as an electronics engineer in the USA and UK over a period of 10 years, he was a research group leader at Media Lab Europe in Dublin, Ireland, before moving to LSE, where he coordinates EU research projects in digital ecosystems for sustainable socio-economic development and autonomic communications. He has published in applied aerodynamics, nonlinear physics, computer science, and social science. [P2P Networking]

**Wimal Dissanayake** is a professor in the Academy of Creative Media at the University of Hawaii, USA. He is also on the Affiliate Faculty of the Department of Political Science and Program for Cultural Studies at the University of Hawaii. He is the author and editor of a large number of books on communication, culture, and cinema, including *Asian theories*

of communication, *Melodrama and Asian cinema*, *Narratives of agency*, *Continuity and change in communication systems*, and *News media in national and international conflict*. Dissanayake has served as a member of the advisory editorial board of a number of journals including the *Journal of Communication*, *Communication Theory*, *World Englishes*, and *Framework*. [Development Communication: Asia]

**Monika Djerf-Pierre** is associate professor at the Department of Journalism and Mass Communication, Göteborg University, Sweden. She has been a visiting scholar at the University of Pittsburgh and University of California, San Diego, USA. Her research fields include media history, environmental journalism, political communication, the sociology of journalism, and gender in media organizations. Her work has appeared in journals such as *Journalism and Journalism Studies*, and she currently serves on two editorial boards. She was an invited member of two democratic audits in Sweden, and was an invited scholar to two public power commissions, 1989 and 2005. [Commentary]

**Marya L. Doerfel** holds a PhD from the University at Buffalo, USA, and is associate professor in the School of Communication, Information, and Library Studies at Rutgers University, USA. She studies the tensions of cooperation–competition evident across and within organizations and examines how specific qualities of network relationships impact organizations and their constituents. Her work analyzes social networks and communication content to show how they relate to situations in which networked partners find themselves simultaneously cooperating and competing. Doerfel has been awarded grants from the National Science Foundation, the Rutgers Research Council, and the Department of Homeland Security. Her scholarship is published in a variety of journals including *Human Communication Research*, *Communication Monographs*, *International Journal of Conflict Management*, and the *International Journal for Intercultural Research*. [Interorganizational Communication]

**Marco Dohle** graduated from the Hanover University of Music and Drama, Germany. He is an assistant researcher and lecturer in the Department of Communication and Media Studies, Heinrich Heine University of Dusseldorf, Germany. His research focuses on political communication, media use, and audience research, including the subject matter of co-audience perceptions. He is author and co-author of several articles within these fields. [Audience]

**Stephen K. Doig** is Knight Professor of Journalism, specializing in precision journalism, at Arizona State University (ASU), USA. Before joining the ASU Cronkite School in 1996, he was research editor of the *Miami Herald*, where he worked on computer-assisted projects that won the Pulitzer Prize for Public Service in 1993, the Goldsmith Prize for Investigative Reporting in 1994, and the Investigative Reporters and Editors Award in 1995. [Precision Journalism]

**Jörg Doll** is professor of psychology at the Universities of Bamberg and Hamburg, Germany. His research focuses on topics in social and pedagogical psychology. Currently, he is managing an interdisciplinary consortium of researchers that is planning a National Educational Panel Study for Germany. [Expectancy Value Model]

**David Domingo** is visiting assistant professor of online journalism at the University of Iowa, USA. He has been previously affiliated to Rovira i Virgili University, Spain, and conducted research on online newsroom working routines in Catalonia. He has edited *Making online news* (with Chris Paterson, in press), a collection of ethnographic cases from several countries. [Cross-Media Production]

**Wolfgang Donsbach** is professor of communication and founding director of the Department of Communication at Dresden University of Technology, Germany. He has taught at the Universities of Dortmund, Mainz, and Berlin in Germany, and was a visiting professor at Syracuse University, USA, University of Navarra, Spain, and Harvard University, USA. He has been president of the World Association for Public Opinion Research (1995–1996) and the International Communication Association (2004–2005), as well as managing editor of the *International Journal of Public Opinion Research* between 1999 and 2007. His main research interests are in journalism, political communication, and exposure to communication. He is the author or editor of 13 books and over 100 articles in academic journals. [Cognitive Dissonance Theory; Extra-Media Data; Festinger, Leon; Journalists' Role Perception]

**Johanna Dorer** is assistant professor in the Department of Communication Science at the University of Vienna, Austria. Since 1996 she has been a member of the Equal Opportunity Commission at the University of Vienna. She was a member of the Press Committee and the Culture Committee of the Austrian Federal Chancellery from 1997 to 2001. Dr. Dorer is author, editor, or co-editor of nine books and numerous scientific articles in the field of feminist media studies, media theory, public relations, journalism, and noncommercial media. [Feminization of Media Content]

**Lori Dorfman** directs the Berkeley Media Studies Group, USA, a project of the Public Health Institute, and lectures at the School of Public Health, University of California, Berkeley, USA. Dr. Dorfman works with public health advocates to apply media advocacy and conducts research on the public health aspects of news and advertising. [Media Advocacy in Health Communication]

**William Douglas** is a professor in the School of Communication at the University of Houston, USA. He received his doctorate in communication from Northwestern University, USA. He has conducted research in the area of relationship development and relationship maintenance. More recently, he has pursued an expanding research program in the area of television and the family, focusing most especially on the portrayal of the family and family relations. [Initial Interaction]

**Joe R. Downing** is assistant professor of corporate communications at Southern Methodist University, USA. His research has appeared in the journals such as *IEEE Transactions on Professional Communication*, *Journal of Applied Communication Research*, *Communication Education*, *Journal of Business Communication*, *Public Relations Review*, and *Technical Communication*. [Computers and Display Programs in Education]

**John D. H. Downing** is director of the Global Media Research Center, Southern Illinois University, USA. He is author of *Internationalizing media theory: Reflections on media in Russia, Poland and Hungary, 1980–1995* (1996) and *Radical media: Rebellious communication and social movements* (2001); editor in chief of *The Sage handbook of media studies* (2004); and co-author with Charles Husband of *Representing “race”: Racisms, ethnicities and media* (2005). [International Communication; Radio Free Europe/Radio Liberty; Transnational Civil Society]

**David M. Dozier** has conducted research on practitioner roles, research utilization in public relations practices, and gender issues. He has taught public relations at San Diego State University, USA, since 1980. He is the 2001 recipient of the Jackson Jackson and Wagner Behavioral Science Prize from the Public Relations Society of America and 1990 recipient of the Pathfinder Award for Excellence in Scholarly Public Relations Research, Institute for Public Relations Research and Education. He serves on the editorial review boards of the *Journal of Public Relations Research*, *Public Relations Review*, *Public Relations Journal*, and the *Journal of Communication*. [Public Relations Roles]

**Philip Drake** is a member of the Stirling Media Research Institute at the University of Stirling, UK. He has published on celebrity and stardom, screen performance, memory and film music, and intellectual property rights. Dr. Drake is currently writing a book on the political economy of stardom in contemporary Hollywood cinema and is co-editing a forthcoming edition of the journal *Cultural Politics* on the politics of celebrity. [Stars]

**Rob Drew** is an associate professor of communication at Saginaw Valley State University, USA. His scholarship centers on the deployment of popular music within interpersonal relationships and social settings. His work has appeared in *Popular Communication*, *Popular Music and Society*, *Symbolic Interaction*, *Journal of Contemporary Ethnography*, *Text and Performance Quarterly*, *Leisure Studies*, *Space and Culture*, and numerous edited collections. He is the author of *Karaoke nights: An ethnographic rhapsody*. [Popular Communication and Social Class]

**Sharon Dunwoody** is Evjue-Bascom Professor of Journalism and Mass Communication at the University of Wisconsin-Madison, USA, where she also serves as associate dean for social studies in the Graduate School and as a member of the governance faculty of the Gaylord Nelson Institute for Environmental Studies. She was president of the Association for Education in Journalism and Mass Communication in 2005–2006 and is a fellow of the American Association for the Advancement of Science and of the Midwest Association for Public Opinion Research. [Environmental Communication]

**William F. Eadie** holds a PhD from Purdue University, USA, and is professor of journalism and media studies at San Diego State University, USA. Previously, he served as associate director of the National Communication Association (NCA) in Washington, DC, USA, and in faculty appointments in Maryland, California, Minnesota, and Ohio. He has served as editor of the *Journal of Applied Communication Research*, and has

consistently championed efforts to conduct “research that makes a difference” in the communication discipline. He has served as president of the Western States Communication Association, and among the awards he has been given are NCA’s Golden Anniversary Monograph Award and the Samuel L. Becker Award for Distinguished Service to NCA and the discipline of communication. [Communication as an Academic Field: USA and Canada]

**Matthew S. Eastin** holds a PhD from Michigan State University, USA, and is an associate professor in the Department of Advertising at the University of Texas at Austin, USA. As co-director of the Texas Media Research Lab, his research focuses on new media behavior. From this perspective, he has investigated information processing as well as the social and psychological factors associated with game play involvement, new media adoption, e-commerce, e-health, and organizational use. Generally, his research utilizes information processing as a central mechanism to new media experiences (i.e., affect, identification, perceptions, etc.) and knowledge acquisition. [Computer Games and Reality Perception]

**Timothy Edgar** is an associate professor in the Department of Marketing Communication and director of the Health Communication Graduate Program at Emerson College, USA. He also is an adjunct clinical associate professor in the Department of Public Health and Family Medicine at the Tufts University School of Medicine, USA. Dr. Edgar is the lead editor of *AIDS: A communication perspective* (1992, with Mary Anne Fitzpatrick and Vicki S. Freimuth) and of *Communication perspectives on HIV/AIDS for the 21st century* (2007, with Seth M. Noar and Vicki S. Freimuth). [Social Marketing]

**Marc Edge**, an associate professor of mass communication at Sam Houston State University in Huntsville, Texas, USA, was a newspaper journalist in Canada for 20 years before completing his PhD in mass communication at Ohio University, USA. He is the author of *Pacific Press: The unauthorized story of Vancouver’s newspaper monopoly* (2001) and *Asper nation: Canada’s Most dangerous media company* (2007). [Cross-Ownership]

**Renee Edwards** is professor and chair of the Department of Communication Studies at Louisiana State University in Baton Rouge, Louisiana, USA. She was president of the Southern States Communication Association from 1997 to 1998 and serves on the editorial board of the *Southern Communication Journal*. Her recent research focuses on the role of individual characteristics that influence the interpretation of messages, with special attention given to the effects of sex and gender role. [Information Processing: Self-Concept]

**Nichole Egbert** is associate professor in the School of Communication Studies at Kent State University, USA. Her primary research interests include intersections of relational communication and health, particularly in the areas of social support and caregiving. Her research has appeared in such publications as *Health Communication*, *Journal of Health Communication*, *Communication Quarterly*, and *Communication Studies*. She is a past recipient of the International Communication Association/National Communication Association Health Communication Dissertation of the Year Award. [Teacher Comforting and Social Support]

**Christiane Eilders** is professor of communication studies at the University of Augsburg, Germany. Her main research interests concern the structure of the public sphere, information processing and opinion formation, news selection, and other issues of political communication. Dr Eilders is the author of books and articles on political editorials, news values in the reception process, and the mediatization of war. [Mediating Factors; News as Discourse]

**Mara Einstein** has been working in or writing about the media industry for the past 20 years. Her latest book, *Brands of faith* (forthcoming), is a social critique of marketing religion. Her first book, *Media diversity: Economics, ownership and the FCC* (2004), was the cause of much debate when this research was used by the Federal Communications Commission to aid in redefining the media ownership rules. Prior to academia, Dr. Einstein worked as an executive at NBC, MTV Networks, and major advertising agencies. She is an associate professor at Queens College, USA, an adjunct at the Stern School of Business at New York University, USA, and an independent marketing consultant. [News Corporation; Sony Corporation; Time Warner Inc.]

**Paul Ekblom** is professor of design against crime at Central Saint Martins College of Art and Design, University of the Arts London, UK, where he works on a range of studies and practical developments in product, environmental, and communications design. He also writes on crime futures and evolution including criminal arms races, and has created a range of generic frameworks for mapping causes of crime and preventive interventions, such as the “conjunction of criminal opportunity.” [Crime and Communication Technology]

**Lyombe Eko** is an associate professor in the School of Journalism and Mass Communication at the University of Iowa, USA. His research, which focuses on comparative media law and ethics, as well as international communication, has been published in several law review and international communication journals. He has been an associate professor at the University of Maine, USA, and an editor/translator at the Union of African Broadcasters in Nairobi, Kenya. He has produced several video documentaries on African topics. [Communication Law and Policy: Africa; Internet Law and Regulation]

**Michael G. Elasmr** holds a PhD from Michigan State University, USA, and is director of the Communication Research Center and associate professor of communication research at Boston University, USA. In 2003, he served as editor and author of chapters in *The impact of international television*. He has published and/or presented over 40 manuscripts, several of which have won prizes at international paper competitions. He currently serves on the editorial board of the *Journal of Broadcasting and Electronic Media*. He is a current member of the International Communication Association, the Association for Education in Journalism and Mass Communication, and the Broadcast Education Association (BEA). [Intercultural Media Effects]

**C. Michael Elavsky** is an assistant professor of communications at Pennsylvania State University, USA. He has several articles on the global music industries and music as cultural and political communication currently under review at numerous journals, and

his manuscript “Between the bloc and a hard place: Postsocialist identity, pop music, and the politics of the global music industry” is under consideration at several presses. [Culture Industries; Music Industry]

**Donald G. Ellis** is professor of communication in the School of Communication at the University of Hartford, USA. He is interested in communication issues related to ethnopolitical conflict with particular emphasis on conflict resolution, intractable conflicts, political communication, and democracy. Dr. Ellis is the past editor of the journal *Communication Theory* and the author of numerous books and articles including *Crafting society: Ethnicity, class, and communication theory*, as well as the recent *Transforming conflict: Communication approaches to ethnopolitical conflict*. He was a fellow at the Asch Center for the Study of Ethnopolitical Conflict at the University of Pennsylvania, USA, and a Fulbright scholar in Israel in 2004–2005. [Argumentative Discourse; Discourse Comprehension]

**Kathleen Ellis** is a graduate of the University of Denver, USA, and a former professor in the Communication Department in the University of Colorado at Colorado Springs, USA, who left the academy to serve as a missionary in South Africa. While still at the University of Colorado, Dr. Ellis’s teaching, service, and research to the campus focused on the assessment and evaluation of oral communication, perceptions of teacher confirmation, and organizational trust. [Teacher Confirmation]

**Martin Emmer** is assistant professor in the Department for Empirical Media Research and Political Communication at Ilmenau University of Technology, Germany. His research focuses on political communication, online communication, and quantitative research methodology. Since 2001 he has been administrating the biggest German longitudinal research project on political online communication ([www.politische-online-kommunikation.de](http://www.politische-online-kommunikation.de)). [Cluster Analysis]

**Richard Leo Enos** is professor and holder of the Lillian Radford Chair of Rhetoric and Composition at Texas Christian University, USA. He is the recipient of the Rhetoric Society of America’s George E. Yoos Award for Distinguished Service and was inducted as an RSA fellow in 2006. His primary area of research is in classical rhetoric. He is the author of *Greek rhetoric before Aristotle* (1993) and *Roman rhetoric: Revolution and the Greek influence* (1995). [Rhetoric, Pre-Socratic]

**Franz-Rudolf Esch** is a professor of business management and marketing at the Justus Liebig University in Giessen, Germany. He is also the director of the Institute of Brand and Communication Research and vice president of the German marketing association (Deutscher Marketing Verband). For more than 15 years, Prof. Dr. Esch has been engaged in research regarding brand management and consumer behavior. Among other activities on the advisory boards of several companies (e.g., as chairman of the marketing board of Volkswagen AG), he counsels with his consultancy ESCH. The brand consultants ([www.esch-brand.com](http://www.esch-brand.com)) work with quite a number of well-established companies in different lines of business concerning brand management and communication. [Marketing]

**Felix Eschenburg** studied psychology at the University of Marburg, Germany, and since 2004 has been a senior researcher in the Department of Psychology, University of Cologne, Germany. He acted as project leader for the University of Cologne in the European BioSec, and has planned and conducted laboratory as well as large-scale field studies on the usability and acceptance of biometric security systems and emergent interface technologies. He has a strong background in computer-mediated communication research and is an expert in multivariate data analysis and psychometrics. He has held courses and seminars on social psychology (group theories, physical attractiveness, empirical studies in social psychology), personality (intelligence), and media psychology (computer and video games, empirical research in media psychology). [Excitation and Arousal]

**Gabriela Martínez Escobar** is an assistant professor at the School of Journalism and Communication at the University of Oregon, USA. She is a documentary maker whose extensive creative work is centered on Latin American cultural, social, and political issues. She is the author of numerous documentaries including *Respire Guatemala* (2006) and *Qoyllur Rit'i: A Woman's Journey* (1999, 2006). Her areas of research encompass the study of global telecommunications and media ownership, culture and globalization, and social movements and their relationship to media. She currently serves on the executive board for the Center for the Study of Women and Society at the University of Oregon. [Subaltern Communities, Communication in]

**Charles Ess** is professor of philosophy and religion and distinguished professor of interdisciplinary studies, Drury University, Springfield, USA, and professor II, program for applied ethics, Norwegian University of Science and Technology, Trondheim, Norway. He has received awards for teaching excellence and scholarship, and published in comparative (east-west) philosophy, discourse ethics, history of philosophy, feminist Biblical studies, computer-mediated communication, and cross-cultural approaches to information and computing ethics. With Fay Sudweeks, Dr. Ess co-chairs the biennial conferences "Cultural Attitudes towards Technology and Communication," and has served as a visiting professor, IT University of Copenhagen, Denmark (2003), a Fulbright senior scholar, University of Trier, Germany (2004), and a guest professor, University of Aarhus, Denmark (2007). He is president of the Association of Internet Researchers (2007–2009). [Research Ethics: Internet Research]

**Frank Esser** holds a PhD from the Johannes Gutenberg University of Mainz, Germany, and is professor and chair of comparative media research in the Department of Mass Communication and Media Research at the University of Zurich, Switzerland. His research centers on cross-national studies of news journalism and political communication. He has published five books, including *Comparing political communication: Theories, cases, and challenges* (2004). [Media Effects, History of; Spin Doctor; Stimulus–Response Model]

**James S. Ettema** is professor and former chair of communication studies at Northwestern University, USA. He teaches courses focusing on the social organization and cultural impact of the mass media and new communication technologies. Among his books is

*Custodians of conscience: Investigative journalism and public virtue* (written with Theodore L. Glasser), which won a number of awards including the Sigma Delta Chi Award for research on journalism from the Society of Professional Journalists. [News Workers]

**William P. Eveland, Jr.**, is associate professor of communication and political science at Ohio State University, USA. His research examines the role of mass media, new communication technologies, and political discussion in producing politically informed and active citizens. He won the Young Scholar Award from the International Communication Association (ICA) in 2003 and has won top published article awards from the World Association for Public Opinion Research and the Political Communication Division of the ICA. [Political Knowledge]

**Anders Fagerjord** is associate professor in the Department of Media and Communication, University of Oslo, Norway. His research concerns questions of web media, convergence, and hypertext and multimedia theory. He has published articles on the concept of convergence and how web media may be understood as a blend of forms from earlier media, a “rhetorical convergence.” Dr. Fagerjord’s Norwegian textbook on web media, *Web-medier*, was published in 2006. Outside of academia, he has worked as a web designer and a radio host. [Digitization and Media Convergence]

**Jeanne Fahnestock** is professor of English at the University of Maryland, USA. She is author of *Rhetorical figures in science* (1999) and *A rhetoric of argument* (1982, with M. Secor). She has also published articles on argument theory, stylistics, the history of rhetoric, and the rhetoric of science. She has directed the professional writing program at Maryland and served on the board of the Rhetoric Society of America. [Style and Rhetoric]

**Andreas Fahr**’s scholarship focuses on mass communication, mainly from a media psychological perspective. He studied communication, psychology, and economics between 1989 and 1995 at the Johannes Gutenberg University of Mainz, Germany. Between 1995 and 2000 he worked as research associate at the Media Institute Ludwigshafen, Germany. Since 2000 he has been working as assistant professor in the Department of Communication and Media Research at the Ludwig Maximilian University of Munich, Germany. [Discriminant Analysis; Factor Analysis; Physiological Measurement; Real-Time Ratings (RTR)]

**Annette Fahr** has worked as research assistant in the Department of Communication and Media Research at the Ludwig Maximilian University of Munich, Germany, since 2001. Her research focuses on media psychology and methodology. In her doctoral thesis she examined information and entertainment perception of political talk shows. [Structural Equation]

**Gail T. Fairhurst** is a professor of communication at the University of Cincinnati, USA. Her research focuses on organizational communication, leadership, and organizational discourse. Her work has received numerous awards, including the 2005 Best Article award for the communication discipline from the International Communication Association.

She is the author of *Discursive leadership: In conversation with leadership psychology* (2007) and co-author of *The art of framing: Managing the language of leadership* (1996). In addition to recent book chapters in *The new handbook of organizational communication* and *The Sage handbook of organizational discourse*, she is widely published in both communication and organizational science journals. She has also served on numerous editorial boards and currently serves as an associate editor for *Human Relations*. [Organizational Discourse]

**Lisa T. Fall** is an associate professor in the School of Advertising and Public Relations at the University of Tennessee, USA. She is an accredited member of the Public Relations Society of America. Her research has been published in journals such as *Public Relations Review*, *Journalism and Mass Communication Educator*, *Journal of Promotion Management*, and *Journal of Vacation Marketing*. [Spin and Double-Speak]

**David Fan** is professor of genetics, cell biology, and development and adjunct professor of journalism and mass communication, University of Minnesota, USA. He developed the ideodynamic model after noting a parallel between hormone biology and human communications: In biology, hormone-producing cells send identical chemical signals to affect other cells. In society, the publishers send identical copies of mass media messages to influence other people. [Cumulative Media Effects]

**Anthony L. Fargo** is an assistant professor in the School of Journalism, Indiana University, Bloomington, USA. He is a former newspaper reporter and editor. He has written numerous articles on the reporter's privilege issue for such publications as the *Cardozo Arts and Entertainment Law Journal*, *Communication Law and Policy*, *Journal of Broadcasting and Electronic Media*, and *William and Mary Bill of Rights Journal*. [Source Protection]

**Jerry D. Feezel** is a professor emeritus of communication studies and interim dean of the College of Arts and Sciences at Kent State University, USA. He has chaired the SCA Instructional Development Division twice and has been President of both the Washington and Ohio Speech Communication Associations. He has received both major awards from the Ohio association: Outstanding College Teacher and Distinguished Service Award. [Teacher Communication Concern]

**Lauren Feldman** is a PhD candidate at the Annenberg School for Communication, University of Pennsylvania, USA. Her research focuses on the effects of news and entertainment on political knowledge, attitudes, and engagement. [News Processing and Retention]

**Anthony R. Fellow** is chair of the Department of Communications at California State University, Fullerton, USA. He is author of *American media history* (2005), *The copy editors handbook for newspapers* (2007, with Tom Clanin), and *Writing in a multimedia world* (2004, with Tom Clanin and Andi Stein). [Muckraking]

**Bob M. Fennis** is associate professor in the Department of Marketing Communication and Consumer Psychology, University of Twente, the Netherlands. His research interests

include nonconscious processes in social influence and persuasion. His research has appeared in journals such as the *Journal of Consumer Research*, *Communication Research*, *Journal of Consumer Psychology*, *Journal of Advertising*, and *Journal of Business Research*. [Advertising as Persuasion]

**Douglas Ferguson** is a professor and graduate program director at the College of Charleston in South Carolina, USA. He is past editor of the *Journal of Radio Studies* and had many years' professional experience in the radio and television industry before getting his doctorate. His research focuses on new media and audience behavior. Dr. Ferguson's publications include numerous journal articles and three books on television. [Radio; Radio News]

**Sherry Devereaux Ferguson** is professor and graduate program director, Communication Department, University of Ottawa, Canada. She is the author of eight books, including *Researching the public opinion environment: Theories and methods* (2000) and *Communication planning: An integrated approach* (1999). She has designed and delivered training in strategic communications to more than 1,000 Canadian federal government communication officers since being involved in the 1988 Privy Council Office project. Her most recent book is *Public speaking: Building competency in stages* (2007). [Public Relations Planning]

**Jeff Ferrell** is a professor in the Department of Sociology, Criminal Justice, and Anthropology at Texas Christian University, USA. He is one of the founding and current editors of the journal *Crime, Media, Culture*, winner of the Association of Learned and Professional Society Publishers' 2006 Charlesworth Award for Best New Journal. He has written a number of books, including the recent *Empire of scrounge*. [Graffiti]

**Cara A. Finnegan** is associate professor of speech communication and art history at the University of Illinois at Urbana-Champaign, USA. She is author of *Picturing poverty: Print culture and FSA photographs* (2003) and editor of *Visual rhetoric: A reader in communication and American culture* (2008, with L. C. Olson and D. S. Hope). [Rhetoric and Visuality]

**John R. Finnegan, Jr.**, is professor and dean of the School of Public Health at the University of Minnesota, USA. His interest is studying the role of media in public health. [Secular Social Change]

**Anat First** is a senior lecturer and dean of the School of Communication, Netanya Academic College, Israel. Her main fields of research include media functions in the social construction of reality; mediated representations of minority groups, particularly women and Arabs; multiculturalism as reflected in various genres on prime-time television; advertising as the locus of the Americanization process of Israeli society; and dilemmas in teaching and researching mass media. She has published extensively on these subjects, and among her recent publications are "When the 'Holy Land' turns into real estate: National identity, globalization/Americanization, and representation of the land in Israeli advertising" (with E. Avraham, in press) and "Are they still the enemy? The

representation of Arabs in the Israeli news” (2004). [Communication as an Academic Field: Middle East, Israel]

**Shalom M. Fisch** is president of MediaKidz Research & Consulting and former vice president of program research at Sesame Workshop. For over 20 years, he has used educational practice and empirical research to help create TV series, websites, magazines, and other media that both entertain and educate children. He is the author of the book *Children’s learning from educational television: Sesame Street and beyond* and co-editor of “G” is for growing: *Thirty years of research on children and Sesame Street*. [Educational Media]

**Martin Fishbein** is the Harry C. Coles Jr. Distinguished Professor in Communication at the Annenberg School for Communication at the University of Pennsylvania, USA. He is also director of the health communication area in the Annenberg Public Policy Center and director of the theory and methods core of the University of Pennsylvania’s Center of Excellence in Cancer Communication Research. Developer of the theory of reasoned action and the integrative model of behavioral prediction, Prof. Fishbein has authored or co-authored six books and over 200 articles. [Reasoned Action, Theory of]

**Carla L. Fisher** holds an MA from Arizona State University, USA, and is a PhD candidate in communication arts and sciences at Pennsylvania State University, USA, a National Institute on Aging predoctoral fellow in Penn State’s Gerontology Center, and a 2007 Juran fellow. Her research focuses on how intergenerational family communication affects wellness across the life-span. She examines how families communicatively adapt to difficult transitions, particularly those associated with aging/development and health, in addition to how human development influences communicative behavior. She has co-authored several chapters and articles on developmental communication research. [Developmental Communication]

**Kristine Fitch** is professor and chair of communication studies at the University of Iowa, USA. Her book *Speaking relationally* won the Gerald Miller Award for Outstanding Research in Interpersonal Communication in 1998, and her article co-authored with Kathleen Valde won the Aubrey Fisher Award in 2004. She has edited or co-edited the interdisciplinary journal *Research on Language and Social Interaction* since 2005, and serves on six editorial boards of communication studies and discourse/pragmatics journals. [Directives]

**Mary Anne Fitzpatrick** holds a PhD from Temple University, USA, and is a Carolina Educational Foundation Distinguished Professor of Psychology and founding dean of a newly constituted College of Arts and Sciences at the University of South Carolina, USA. Her research and teaching focus on interaction in social and personal relationships with a special emphasis on marital and family relationships. She is a past president of the International Communication Association and recipient of its Career Productivity Award of 2001. [Marital Typologies]

**Kathy Foley** is a professor of theatre at the University of California, Santa Cruz, USA, and visiting professor in the cultural management graduate program at Chulalongkorn

University in Bangkok, Thailand. She is author of the Southeast Asia section of *The Cambridge guide to world theatre* and editor of *Asian Theatre Journal*, and her articles have appeared in *TDR*, *Modern Drama*, *Asian Theatre Journal*, *Puppetry International*, and other publications. She has curated exhibitions of “Puppets of South and Southeast Asia” and “Masks of Southeast Asia” for the East–West Center in Hawaii, the National Geographic Society in Washington, and other institutions. [Mask]

**Wes Fondren** is a PhD candidate at the University of Alabama, USA. His research interests are in media psychology, media effects, and research methods. He also holds a Master’s degree in divinity from Samford University, USA. [Educational Television, Children’s Responses to]

**Kirsten Foot** is associate professor of communication at the University of Washington, USA. Her research focuses on the reciprocal relationship between information/communication technologies and society. As co-director of the WebArchivist.org research group, she develops new methods for studying social and political action on the web. She is the co-author of *Web campaigning* (2006), and co-editor of *The Internet and national elections* (2007). She serves on the editorial boards of two journals, and co-edits the Acting With Technology series for MIT Press. [Archiving of Internet Content]

**John A. Fortunato** is a professor in the Fordham Graduate School of Business, USA, in the area of communication and media management. He is the author of *Making media content: The influence of constituency groups on mass media* and *Commissioner: The legacy of Pete Rozelle*. Dr. Fortunato has also published articles in *Public Relations Review*, *Texas Review of Entertainment and Sports Law*, and the *Journal of Sport Management*. [Commercialization: Impact on Media Content]

**Karen A. Foss** is Regents Professor and professor of communication and journalism at the University of New Mexico, USA. She was named Co-Gender Scholar of the Year by the Southern States Communication Association in 2005 and received the Francine Merritt Award from the National Communication Association in 2002 for her contributions to the lives of women in communication. She is co-author of *Feminist rhetorical theories*, *Women speak: The eloquence of women’s lives*, *Inviting transformation*, *Contemporary perspectives on rhetoric*, and *Theories of human communication*. [Rhetoric and Gender]

**Jesse Fox** holds a BA from the University of Kentucky and an MA from the University of Arizona, USA, and is a PhD student at Stanford University, USA, where she manages the Virtual Human Interaction Lab. Her research interests include media effects on interpersonal relationships, sexualized representations in new media, health communication, and media literacy. Currently she is investigating the potential uses of new media technologies in health behavior modification. [Cognitive Science]

**David A. Frank** is professor of rhetoric and associate director of the Robert D. Clark Honors College at the University of Oregon, USA. He is author of *Frames of evil: The holocaust in American film* (2006, with C. Picart) and *Shared land/conflicting identity: Trajectories of Israeli and Palestinian symbol use* (2002, with R. Rowland). [Rhetoric in the Middle East]

**Divina Frau-Meigs**, a Fulbright scholar, is professor of American studies and media sociology at the University of Paris III, France. She has published extensively in the areas of media content and the technologies and sub-cultures of the screen. Her other research interests deal with issues of media (self-)regulation and media literacy, on which she provides expertise for UNESCO and the European Union. In 2006, she was awarded the E-Toile d'Or of the Internet for her research on new information technologies. [Sex and Pornography Online]

**Vicki S. Freimuth** is director of the Southern Center for Communication, Health and Poverty, USA, a Center of Excellence in Health Marketing/Health Communication funded by the Centers for Disease Control and Prevention (CDC), and professor of communication at the University of Georgia. She was director of communication at the CDC from 1996 to 2003. She was the first recipient of the National Communication Association and the International Communication Association's Outstanding Health Communication Scholar in 1998 and the American Public Health Association's Distinguished Career Award in 2004. She has published widely in communication and health journals and is the co-editor of *Communication perspectives on HIV/AIDS for the 21st century*. [Health Disparities, Communication in]

**Derek Freres** is a doctoral candidate at the Annenberg School for Communication at the University of Pennsylvania, USA. He received his BA in psychology and MA in communication from the University of Pennsylvania. [Linear and Nonlinear Models of Causal Analysis]

**Benjamin Fretwurst** has been a research assistant at the Institute of Media and Communication Studies, Free University of Berlin, Germany, since 2002. He was a research assistant at the Institute of Communication Studies, University of Erfurt, Germany, from 2001 to 2002. He is editor of *Auswahlverfahren in der Kommunikationswissenschaft* (2005, with Volker Gehrau, Birgit Krause, and Gregor Daschmann) and *Fortschritte der politischen Kommunikationsforschung* (2007, with Birgit Krause and Jens Vogelgesang). [Definition; Hypothesis]

**Lawrence R. Frey** is a professor in the Department of Communication at the University of Colorado at Boulder, USA. He is the author or editor of 14 books, including *The handbook of group communication theory and research* (1999, with Dennis S. Gouran and Marshall Scott Poole), *New directions in group communication* (2002), *Group communication in context: Studies of bona fide groups* (2nd edn. 2003), and *Facilitating group communication in context: Innovations and applications with natural groups* (2006). [Group Communication]

**Lewis A. Friedland** is professor of journalism and mass communication and sociology at the University of Wisconsin-Madison, USA, where he heads the Center for Communication and Democracy. Friedland is the author of *Civic innovation in America* (with Carmen Sirianni) and conducts research on community ecology, complexity, and democracy. [Community Integration]

**Katherine T. Frith** has been a faculty member at Iowa State University, USA, Pennsylvania State University, USA, and Nanyang Technological University, Singapore, and is currently an associate professor at Southern Illinois University, USA. Prior to joining academia, she worked in New York as an advertising copywriter and creative director for J. Walter Thompson, DDB, and Grey Advertising. Dr. Frith has published three books, 12 book chapters, and over 30 scholarly articles in communications journals such as *Journalism and Mass Communication Quarterly*, *Current Issues and Research in Advertising*, *International Journal of Advertising*, *Asian Journal of Communication*, and *Journalism and Mass Communication Educator*. [Fashion]

**Romy Fröhlich** is a full professor of communication and media research at the Ludwig Maximilian University of Munich, Germany. A former president of the German Communication Association, she is a member of the associate editorial board of the scientific journal *Feminist Media Studies*. She has been a visiting scholar at the Ohio State University, USA, and the University of Newcastle (Australia). [Consonance of Media Content]

**Pascal Froissart** is professor of communications (maître de conférences) and head of undergraduate studies in communication at the University of Paris VIII, France. He is the author of *La rumeur: Histoire et fantasmes* (2002) as well as articles in scholarly journals. [Rumor]

**Paul Frosh** teaches in the Department of Communication and Journalism at the Hebrew University of Jerusalem, Israel. He is the author of *The image factory: Consumer culture, photography and the visual content industry* and editor (with Tamar Liebes) of *Meeting the enemy in the living room: Terrorism and communication in the contemporary era*. [Stock Photography]

**Ann Bainbridge Frymier** is an associate professor in the Department of Communication and associate dean of the Graduate School at Miami University, Oxford, Ohio, USA. She was president of the Eastern Communication Association and has been active in the National Communication Association. She also serves on the editorial board of several journals and has published over 20 articles and chapters on instructional communication. [Learning and Communication]

**Anthony Fung** is an associate professor in the School of Journalism and Communication at the Chinese University of Hong Kong. His research interests include the political economy of popular culture, gender and youth identity, and new media technologies. His latest publications are *New television, globalization, and East Asian cultural imaginations* (co-authored with Keane and Moran) and *Global capital, local culture: Localization of transnational media in China* (forthcoming). [Hong Kong Cinema]

**Robert N. Gaines** is professor of communication at the University of Maryland, USA. He served as president of the American Society for the History of Rhetoric from 1986 to 1987 and as editor of *Advances in the History of Rhetoric* from 2002 to 2007. His rhetorical research has appeared in *Advances in the History of Rhetoric*, *Cronache Ercolanesi*, *Hermes*,

*Philosophy and Rhetoric*, *Rheinisches Museum*, *Rhetoric Society Quarterly*, *Rhetorica*, and *Transactions of the American Philological Association*. [Rhetoric and Philosophy; Rhetorical Studies]

**Dariusz Galasiński** is professor of discourse and cultural studies at the University of Wolverhampton, UK. His published work concerns strategic and deceptive communication and, more recently, national and gender identities. He is currently working on projects on masculinity and mental health. His recent books include *The language of emotions* (2004), *The language of belonging* (with U. H. Meinhof, 2005), and *Men's discourses of depression* (forthcoming). He has sat on the editorial boards and teams of a number of international journals. [Deception in Discourse]

**Mary-Lou Galician** is head of media analysis and criticism in the Walter Cronkite School of Journalism and Mass Communication, Arizona State University, USA. She is the author of *Sex, love, and romance in the mass media: Analysis and criticism of unrealistic portrayals and their influence* (2004) and co-editor of *Critical thinking about sex, love, and romance in the mass media: Media literacy applications* (2007). She is also the editor and a major contributor to *The handbook of product placement in the mass media* (2004). The creator of *REALISTIC ROMANCE®*, she maintains the media literacy website [www.RealisticRomance.com](http://www.RealisticRomance.com). [Film as Popular Culture]

**Cindy Gallois** is a professor at the University of Queensland in Brisbane, Australia, founding director of the Centre for Social Research in Communication, and deputy executive dean of social and behavioural sciences. Her research focuses on intergroup language and communication. She is fellow of the Academy of the Social Sciences in Australia and past president of the International Communication Association. [Intergroup Accommodative Processes]

**Shiv Ganesh** holds a PhD from Purdue University, USA, and is a senior lecturer at the Department of Management Communication, University of Waikato, Hamilton, New Zealand. He has conducted and published research on globalization, nongovernmental organizations, information and communication technology, and global social justice. He is currently the principal investigator on a grant to study global social justice activism, funded by the Marsden Foundation of the Royal Society of New Zealand. His work has appeared in such outlets as *Communication Monographs*, *Management Communication Quarterly*, and the *Journal of Applied Communication Research*, among others. He is also co-author, with George Cheney, Lars Christensen, and Ted Zorn, of *Organizational communication in an age of globalization: Issues, reflections, practices*. [Organizational Communication: Postmodern Approaches]

**Barbara Mae Gayle** is the vice president for academic affairs at Saint Martin's University, USA. She was a 2001 Carnegie scholar and is a founding member and treasurer of the International Society for the Scholarship of Teaching and Learning. She is the co-editor of three books on meta-analytic contributions to the communication discipline. She is a member of the editorial board of *Communication Monographs*, *Women's Studies in*

*Communication*, and the *Journal of Cognitive and Affective Learning*. Her work has appeared in the *Journal of Applied Communication*, *Management Communication Quarterly*, *Southern Speech Communication Journal*, *Communication Research Reports*, *Communication Reports*, and *Communication Education*. [Classroom Questioning]

**Cecilie Gaziano** owns a consulting business, Research Solutions, Inc., in Minneapolis, Minnesota, USA. She is a fellow and past president of the Midwest Association for Public Opinion Research. She serves on the editorial board of *Newspaper Research Journal* and has authored or co-authored numerous journal articles and chapters in edited books on mass communication, public opinion, medical, and family-related research. She holds MA and PhD degrees in mass communication from the University of Minnesota and a BS in journalism from West Virginia University, USA. [Endorsement; Knowledge Gap Effects]

**Katja Gelbrich** is professor of marketing at Ilmenau University of Technology, Germany. She is the author of *Cross-cultural marketing* (2004, with Stefan Müller), which received the 2005 best textbook award of the Association of University Professors of Management. [Advertising, Cross-Cultural; Branding]

**Ken Gelder** is professor of literary and cultural studies at the University of Melbourne, Australia, where he teaches contemporary literature, genre fiction, and sub-cultural studies. His books include *Reading the vampire* (1994), *Popular fiction: The logics and practices of a literary field* (2004), and *Subcultures: Cultural histories and social practice* (2007). He has published three books on Australian literature and cultural politics, including (with Jane M. Jacobs) the influential study *Uncanny Australia: Sacredness and identity in a postcolonial nation* (1998). He is currently co-writing a book on contemporary Australian fiction and is coordinating a large-scale project on colonial Australian popular fiction, which includes the production of a digital archive as well as a series of anthologies on colonial popular genres. [Paperback Fiction]

**Salma I. Ghanem** is professor and chair of the department of communication at the University of Texas-Pan American, USA. She earned her PhD degree from the University of Texas at Austin in 1996. Her areas of research interest include agenda setting, framing, social issues and the media, and coverage of the Middle East. She is the recipient of the Outstanding Faculty Award for Professional Achievement in 1998, the Outstanding Faculty Award for Teaching in 2001, and the Provost Award for International Studies in 2006. Dr. Ghanem served as a communication specialist for Scott and White Hospital in Temple, Texas, and as a press and information officer for the Egyptian Mission to the United Nations in New York. [Newspaper]

**Eytan Gilboa** is professor of international communication and chair of the communication program at Bar-Ilan University, Israel, and a visiting professor of public diplomacy at the Annenberg School of Communication, University of Southern California, USA. He has published several books and numerous articles including *Media and conflict: Framing issues, making policy, shaping opinions* (2002). He is the recipient of the 2001 Best Article Award of the International Communication Association. [Media Diplomacy]

**Howard Giles** is professor of communication and assistant dean of undergraduate studies at the University of California, Santa Barbara, USA. His research has spanned many different intergroup contexts, including intergenerational relations around the Pacific Rim and civilian–police interactions. He is fellow and past president of the International Communication Association as well as the inaugural recipient of the Association’s Career Productivity Award (more recently named the Steven H. Chaffee Award). [Communication Accommodation Theory; Intercultural and Intergroup Communication; Social Identity Theory]

**Rosalind Gill** writes and researches about gender, media, and postfeminism; masculinities; changing experiences of work in the media; and the sexualization of culture. She worked for 10 years at the London School of Economics and Political Science, UK, until 2007, when she took up a professorship at the Open University, UK. In 2003 she was invited to address the United Nations as one of five international experts on women, media, and information and communication technologies. She is author of *The gender technology relation* (1995) and *Gender and the media* (2007), and sits on a variety of editorial boards. She lives in London. [Commodity Feminism; Postfeminism]

**Alison Gillwald** is associate professor at the Graduate School of Public and Development and the University of the Witwatersrand, South Africa. She is the research director of LINK Centre, which hosts Research ICT Africa!, an Africa-wide network that aims to fill the information and communication technology policy and regulatory research vacuum that exists on the continent. Prior to that she was appointed to the inaugural Council of the South African Telecommunications Regulatory Authority, having established the Policy Department at the Independent Broadcasting Authority. She is founding editor of the *Southern African Journal of Information and Communication*. [Communication Infrastructure]

**Sonja Glaab** has been an ERP fellow of the German National Academic Foundation, Germany, and Harvard University, USA, and is now following her graduate studies at Brown University, USA. Her research interests include the history of communication, mass media and terrorism, the effects of mass media, and social scientific methods. [Catharsis Theory]

**Theodore L. Glasser** is a professor of communication at Stanford University, USA, where he is also affiliated to the modern thought and literature program. His books include *Custodians of conscience: Investigative journalism and public virtue*, written with James S. Ettema. In 2002–2003 he served as president of the Association for Education in Journalism and Mass Communication. [Morality and Taste in Media Content]

**Phillip Glenn** is professor of organizational and political communication at Emerson College, Boston, USA. He is the author of *Laughter in interaction* (2003) and co-editor of *Studies in language and social interaction* (2003). He serves on the editorial boards of *Research on Language and Social Interaction* and *Communication Yearbook*. He has held Fulbright scholar appointments in the Czech Republic and the Republic of Moldova. His

current research and teaching interests include communication in conflict, negotiation, and mediation. [Voice, Prosody, and Laughter]

**Kathrina Glitre** is a senior lecturer in film studies at the University of the West of England, Bristol, UK. She is the author of *Hollywood romantic comedy: States of the Union, 1934–65* and co-editor of *Neo-noir* (forthcoming). Her current project – *Starring Cary Grant* – is funded by an Arts and Humanities Research Council Research Leave Grant, and focuses on casting and performance in classical Hollywood cinema. [Academy Awards]

**Carroll J. Glynn** is professor and director at the School of Communication, Ohio State University, USA. Dr. Glynn is senior author on two editions of *Public Opinion* and has published in a variety of refereed journals including *Communication Research*, *Public Opinion Quarterly*, *Journal of Broadcasting and Electronic Media*, and *International Journal of Public Opinion Research*. [Media and Perceptions of Reality; Public Opinion]

**Béatrice Godard** directs the bioethics programs at the University of Montreal, Canada. She is associate professor at the Department of Preventive and Social Medicine at the Faculty of Medicine of the University of Montreal. Her research work explores emerging ethical responsibilities in human and medical genetics and the development of frameworks for ethical decision-making in these fields. She sits on a number of ethics committees, including the National Research Council of Canada and the Fonds de la Recherche en Santé du Québec Research Ethics Committee. [Disclosure in Health Communication]

**Daena J. Goldsmith** is associate professor communication at Lewis and Clark College in Portland, Oregon, USA. Her research addresses couple communication about chronic health problems. In addition to her book *Communicating social support*, she has also published in *Communication Monographs*, *Human Communication Research*, *Social Science and Medicine*, *Journal of Social and Personal Relationships*, *Health Communication*, and *Communication Yearbook*. [Social Support in Interpersonal Communication]

**Roberta Michnick Golinkoff** holds the H. Rodney Sharp Chair in the School of Education at the University of Delaware, USA, is a member of the Departments of Psychology and Linguistics and Cognitive Science, and directs the Infant Language Project. She is the recipient of a John Simon Guggenheim Fellowship and a James McKeen Cattell Sabbatical award. Her latest books include *How babies talk: The magic and mystery of language in the first three years of life* (1999) and *Einstein never used flash cards: How our children really learn and why they need to play more and memorize less* (both with Kathy Hirsh-Pasek), and *Action meets word: How children learn verbs* and *PLAY = LEARNING: How play motivates and enhances children's cognitive and social-emotional growth*. [Language Acquisition in Childhood]

**Dennis S. Gouran** holds a PhD from the University of Iowa, USA, and is professor of communication arts and sciences and of labor studies and employment relations at Pennsylvania State University, USA. A specialist in the area of communication in decision-making and problem-solving groups, Prof. Gouran has published in excess of

100 books, chapters, and refereed articles dealing with this and related subjects. He has received numerous awards for his teaching, scholarship, and service. [Group Decision-Making, Functional Theory of]

**Gordon Gow** is assistant professor in the graduate program in communications and technology at the University of Alberta, Canada. From 2003 to 2006 he was a lecturer in the Department of Media and Communications at the London School of Economics and Political Science, UK, where he was director of the graduate programme in media and communications regulation and policy. He is author of *Policymaking for critical infrastructure*, which adopts a technology assessment methodology to study commercial wireless networks. He continues to work with organizations such as the International Telecommunication Union and the Canadian government on projects involving communications technology and public safety. [Technology Assessment]

**Karla K. Gower** is an associate professor of public relations at the University of Alabama, USA, and a fellow of the Plank Center for Leadership in Public Relations there. She was editor of *American Journalism* from 2000 to 2004 and serves on the editorial board of four journals in the fields of public relations, mass communication history, and law. She is the author of *Liberty and authority in free expression law: The United States and Canada* (2003) and *Legal and ethical considerations for public relations* (2nd edn. forthcoming). [Communication Law and Policy: North America]

**Maria Elizabeth Grabe** is an associate professor and the director of graduate studies in the Department of Telecommunications at Indiana University, USA. She is on the editorial board of three journals and is the 2007–2008 vice chair of the Journalism Studies Division of the International Communication Association. For the 2009 and 2010 conventions she will assume the chairmanship of that division. [Tabloid Press]

**Doris A. Graber** is professor of political science at the University of Illinois at Chicago, USA. Her books on political communication include *Processing the news: How people tame the information tide* (2nd edn. 1993), *Processing politics: Learning from television in the Internet age* (2001), which was the winner of the Goldsmith Prize for Best Academic Political Communication Book of 2003, and *Mass media and American politics* (7th edn. 2005). [Political Cognitions]

**Howard Grabois** received his PhD from Cornell University, USA, and is currently assistant professor and language coordinator at East Carolina University, USA. His primary research is in applied linguistics. Recent publications reflect his interest in the areas of sociocultural theory, cognitive linguistics, and service-learning. He has received two fellowships for his work in the last of these. [Comprehension]

**Lawrence D. Green** is professor of English at the University of Southern California, USA. He is past president (2003–2005) of the International Society for the History of Rhetoric. He has published widely on the history of rhetoric in Europe, the United States, and Asia. [Rhetoric, European Renaissance]

**Melanie C. Green** is assistant professor of psychology at the University of North Carolina at Chapel Hill, USA. She edited the books *Narrative impact: Social and cognitive foundations* (2002, with Timothy Brock and Jeffrey Strange) and *Persuasion: Psychological insights and perspectives* (2nd edn. 2005, with Timothy Brock). [Transportation Theory]

**John O. Greene** is a professor of communication at Purdue University, USA. He is a former editor of *Human Communication Research* and is a recipient of the National Communication Association's Charles H. Woolbert Research Award. He is a two-time recipient of the Gerald R. Miller Book Award and was the first person named as the Ann and Charles Redding Fellow at Purdue. [Action Assembly Theory; Information Processing]

**Shane Greenstein** is the Elinor and Wendell Hobbs Professor at the Kellogg School of Management, Northwestern University, USA. A selection of his writing is at [www.kellogg.northwestern.edu/faculty/greenstein](http://www.kellogg.northwestern.edu/faculty/greenstein). [Information and Communication Technology, Development of]

**Kimberly Gregson** is an assistant professor at Ithaca College, USA, in the Television-Radio Department. She received her doctorate in mass communication from Indiana University, Bloomington, USA. She has done research on news magazine photographs of presidential candidates, anime-related websites, advergames, and religion in the virtual world Second Life. She teaches qualitative and quantitative research methods, media planning, and video game design, and is involved in developing a new curriculum on video games. [Video Games]

**Rainer Greifeneder** is research scientist and lecturer at the University of Mannheim, Germany. His research interests center on the role of meta-cognitive strategies in judgment and decision-making, with a particular focus on subjective experiences. Dr. Greifeneder also investigates individual differences in decision-making such as satisficing and maximizing strategies, and how individuals subjectively perceive change. [Availability, Cognitive]

**Michael Griffin** is visiting professor of cinema and media studies at Carleton College, USA. An Annenberg Scholars Program Fellow, he was the first chair of the Visual Communication Studies Division of the International Communication Association. He is the author of numerous articles and book chapters on visual media and culture, and co-editor (with Karle Nordenstreng) of *International media monitoring* (1999). [Art as Communication; Visual Communication]

**Robert J. Griffin** is professor of communication at Marquette University in Milwaukee, USA, and directs its Center for Mass Media Research. His teaching and research focus on communication about environmental issues, energy, health, science, and risk. He has been principal investigator (PI) or co-PI on various federally funded research projects into environmental risk, and served on a National Research Council standing committee concerned with emerging issues in environmental contamination. A 2002 review article in *Public Understanding of Science* found Griffin to be one of the top three authors of refereed journal articles about environmental communication. [Environmental Communication]

**Mark Griffiths** is professor of gambling studies at Nottingham Trent University, UK. He is internationally known for his work in gambling and gaming addictions and has published over 175 refereed research papers, two books, 35 book chapters, and over 500 other articles. Dr. Griffiths has been awarded seven national and international awards for his work including the John Rosecrance Research Prize (1994), CELEJ Prize (1998), Joseph Lister Prize (2004), and the British Psychological Society Award for Excellence in the Teaching of Psychology (2005). [Addiction and Exposure]

**Jürgen Grimm** is professor of communication studies at the University of Vienna, Austria. He has worked extensively on media effects (physiological, psychological, and social), media entertainment, media violence, news and news reception, political communication, and the development of empirical methods. Dr. Grimm is a member of the German FSF-board (the organization for the voluntary self-regulation of television) and chairman of the VFM (society for the promotion of media research). [Frustration Aggression Theory; Physical Effects of Media Content]

**David J. Grimshaw** is international team leader (new technologies programme) with Practical Action and visiting fellow at Cranfield School of Management, UK. Previously at the University of Leeds and Warwick Business School, UK, his research projects include business use of geographical knowledge, knowledge exploitation, and e-business. He is author of *Bringing geographical information systems into business* (2nd edn. 2000) and joint editor of *IT in business: A manager's casebook* (1999). Dr. Grimshaw has published many papers in academic journals, at international conferences, and in the professional press. Recent reports include Connecting the first mile and Podcasting in the Andes. He is collaborating with the Universities of Sussex, Lancaster, and Durham, UK, on "Delivering public value from new technologies," funded by the Economic and Social Research Council. [Information Overload]

**Lisa Gring-Pemble**, an associate professor at New Century College, USA, is a Phi-Beta Kappa graduate of St. Olaf College, USA (1992), and received her MA (1996) and PhD (2000) in communication from the University of Maryland, USA. Drawing on her teaching experience, her research includes an emphasis on experiential learning and first-year learning communities. She is the author of *Grim fairy tales: The rhetorical construction of American welfare policy* (2003) and co-editor of *Political communication: An anthology of essential readings* (2007). Her work has appeared in *Quarterly Journal of Speech*, *Political Communication*, and *Communication Quarterly*. In 2005, she received the George Mason University Teaching Excellence Award. [Rhetoric and Narrativity]

**Bruce E. Gronbeck** is A. Craig Baird Distinguished Professor of Public Address, Department of Communication Studies, and director of the Center for Media Studies and Political Culture at the University of Iowa, USA. He is author or editor of 10 books on media theory and criticism, presidential campaigning, rhetorical criticism, argumentation, and public speaking, as well as dozens of articles and book chapters on such subjects. His work focuses on the intersection of rhetoric, politics, and media in the modern and contemporary eras. [Rhetoric and Orality-Literacy Theorems; Rhetorical Studies]

**Jacob Groshek** is a PhD candidate in the School of Journalism at Indiana University, USA, with emphases on political and international communication. He holds degrees in technology education and mass communication. He has published articles in *Journal of Broadcasting and Electronic Media* and *Social Science Computer Review*. [Development Institutions]

**Alan G. Gross** is professor of writing studies at the University of Minnesota, USA. He is author of *Starring the text: The place of rhetoric in science studies* (2006), co-author of *Communicating science: The scientific article from the 17th century to the present* (2002, with J. E. Harmon and M. Reidy), and editor of *Rhetorical hermeneutics: Invention and interpretation in the age of science* (1997, with W. M. Keith) and *The scientific literature: A guided tour* (2007, with J. E. Harmon). [Rhetoric of Science]

**Daniel M. Gross** is associate professor of English at the University of California, Irvine, USA, where he directs the composition program and teaches courses in the history and theory of rhetoric. He has authored *The secret history of emotion: From Aristotle's "Rhetoric" to modern brain science* (2006), co-edited *Heidegger and rhetoric* (2005), and authored articles appearing in *Rhetorica*, *Clio*, *Rethinking History*, *Philosophy and Rhetoric*, and *History of the Human Sciences*. [Pathos and Rhetoric]

**Peter Gross** is director and professor of the School of Journalism and Electronic Media, University of Tennessee, Knoxville, USA. He has published eight books and dozens of scholarly articles and chapters that focus mainly on media in eastern Europe. He has received fellowships, and research, lecture, and training awards and grants, from, among other institutions, Harvard University's Joan Shorenstein Center on the Press, Politics and Public Policy, J. F. Kennedy School of Government; the National Academy of Sciences, and the National Science Foundation. In 1996, Dr. Gross was a research fellow at the Woodrow Wilson International Center for Scholars in Washington, DC. [Balkan States: Media Systems]

**Lawrence Grossberg** is the Morris Davis Distinguished Professor of Communication Studies and Cultural Studies, Adjunct Distinguished Professor of Anthropology, and director of the University Program in Cultural Studies, at the University of North Carolina at Chapel Hill, USA. He is the co-editor of the international journal *Cultural Studies*. His most recent books in English include *Mediamaking: Mass media in a popular culture* (with Ellen Wartella, D. Charles Whitney, and MacGregor Wise, 2005), *New keywords: A revised vocabulary of culture and society* (with Tony Bennett and Meaghan Morris, 2005), and *Caught in the crossfire: Kids, politics and America's future* (2005). [Cultural Studies]

**James E. Grunig** is professor emeritus in the Department of Communication at the University of Maryland, USA, where he taught for 36 years. He is the author or co-author of five books on public relations and has published 250 articles, books, chapters, papers, and reports. Grunig was the director of a 15-year research project on Excellence in Public Relations and Communication Management. He has won seven major awards for his research and teaching in public relations and communication, and was one of the

founding co-editors of the *Journal of Public Relations Research*. [Excellence Theory in Public Relations]

**Laura K. Guerrero** is a professor in the Hugh Downs School of Human Communication at Arizona State University, Tempe, USA. She has published six books and over seventy articles and chapters on issues related to nonverbal and interpersonal communication. Dr. Guerrero has received several research awards, including the Gerald R. Miller Early Career Achievement Award from the International Association for Relationship Research and the Dickens Award from the Western States Communication Association. She currently serves on eight editorial boards. [Expectancy Violation; Gestures and Kinesics; Proxemics]

**Barrie Gunter** is professor of mass communication at the University of Leicester, UK, where he is also head of the Department of Media and Communication. He was formerly founder member of the Department of Journalism Studies, University of Sheffield, UK. He serves on the editorial boards of six academic journals in media and communications. He is author of 44 books and over 250 other publications on a range of media and communication topics, including news and audiences. [News Processing across the Life-Span]

**Albert C. Gunther** holds a PhD from Stanford University, USA, and is a professor in the Department of Life Sciences Communication at the University of Wisconsin-Madison, USA. His research focuses on the psychology of the mass media audience. He won the International Communication Association's 2006 outstanding article award for a hostile media effect study. [Hostile Media Phenomenon]

**Nurit Guttman** is on the faculty of the Department of Communication at Tel Aviv University, Israel, and was on the faculty of UMDNJ-Robert Wood Johnson Medical School, New Jersey, USA. She also heads the participatory social marketing program at the Rothschild-Caesarea School of Communication, Tel Aviv University. She has published a book on ethics in public communication campaigns. [Health Communication, Ethics in]

**Kenneth L. Hacker** is professor of communication studies at New Mexico State University, Las Cruces, New Mexico USA. He has edited two volumes on presidential candidates' images and one on digital democracy. He is currently working on a second book regarding digital democracy and is conducting research on how strategic political communication is used both in terrorist discourse and in counter-terrorist discourse. [Candidate Image]

**Robert A. Hackett** is professor of communication at Simon Fraser University, Vancouver, Canada, co-director of NewsWatch Canada, and co-founder of Canadians for Democratic Media. He has written extensively on journalism, political communication, and media representation. His recent works include *Remaking media: The struggle to democratize public communication* (2006, with William Carroll) and *Democratizing global media: One world, many struggles* (2005, co-edited with Yuezhi Zhao). Hackett serves on the editorial boards of *Journalism Studies* and four other journals in the field. [Objectivity in Reporting]

**Katharina Hadamik** lectures at diverse universities (Ghent, Belgium; Zurich, Switzerland; and Bochum, Germany). Her research and teaching address the transformation of media and journalism in central and eastern Europe as well as media systems and journalism cultures. She was the co-founder of the study and research program International Journalism at the University of Dortmund, Germany, where she worked from 1993 until 2003. From 1998 until 1999 she was a board member of the European Journalism Training Association. [Poland: Media System]

**Lutz M. Hagen** is professor of communication and head of the Institute of Media and Communication at Dresden University of Technology, Germany. His research focuses on the production, uses, and effects of news. He is the author of *Informationsqualität von Nachrichten* (Information quality of the news, 1994) and *Konjunkturnachrichten, Konjunkturklima und Konjunktur* (Economic news, business sentiment and the business cycle, 2005). [Political Media Content, Quality Criteria in]

**Michael L. Haley** is executive director of the International Communication Association. He is the co-author of three articles published in a special edition of *Professional Psychology: Research and Practice* (2001 with D. Pingitore, R. Scheffler, T. Sentell, and D. Schwalm). [International Communication Association (ICA)]

**Jon Hall** is senior lecturer in classics at the University of Otago, New Zealand. He is co-editor of the *Blackwell companion to Roman rhetoric* (2007, with W. J. Dominik) and has published various articles on the speeches, letters, and rhetorical works of Cicero. Most recently he has completed a book on politeness and politics in Cicero's letters, and has written and produced two DVDs on the performative aspects of Cicero's oratory. [Rhetoric, Roman]

**Kirk Hallahan** holds a PhD from the University of Wisconsin-Madison, USA, and is professor of journalism and technical communication at Colorado State University, Fort Collins, USA. His research interests include strategic communication, including message design. [Strategic Framing]

**Michael Hallemann** is head of the Department for Media Research and Service at Gruner + Jahr AG & Co. KG, Hamburg, Germany. He is author of *Das Gruner + Jahr Werbewirkungspanel: Ein neuer Ansatz zur Messung der Werbewirkung von Print im Mediamix* (2001) and *Das PKW Werbewirkungspanel: Informationsverhalten und Entscheidungsprozess vor PKW-Käufen. Werbewirkung und PKW-Kauf* (2004, with Renate Köcher). [Advertising Frequency and Timing]

**Martin E. Halstuk** is associate professor of communications at the Pennsylvania State University, USA, where he teaches communications law. A former reporter for the *San Francisco Chronicle* and editor at the *Los Angeles Times*, he has written numerous law journal articles on access to government-held information, and his research has been cited in legal briefs to the US Supreme Court. [Freedom of Information]

**Lauren M. Hamel** is a doctoral student in communication at Michigan State University, USA. Her research foci examine deception from both the production and reception perspectives, and health communication. [Deceptive Message Production]

**Cees J. Hamelink** is professor emeritus of international communication at the University of Amsterdam, the Netherlands. He is professor of public health and human rights at the Free University Amsterdam, professor for management of information and knowledge at the University of Aruba, and honorary professor at the University of Queensland, Brisbane, Australia. His 17 monographs include *The politics of world communication* and *The ethics of cyberspace*. He is editor in chief of the *International Communication Gazette* and honorary president of the International Association for Media and Communication Research. [International Association for Media and Communication Research (IAMCR)]

**Dale Hample** is associate professor of communication at the University of Maryland, USA. His main research interests are argumentation, message production, persuasion, and conflict management. He is the author of *Arguing: Exchanging reasons face to face* (2005) and co-editor (with William and Pamela Benoit) of *Readings in argumentation* (1992). [Message Production; Verbal Aggressiveness]

**Mark Hampton** is associate professor of history at Lingnan University, Hong Kong. He is the author of *Visions of the press in Britain, 1850–1950* (2004) and co-editor of *Anglo-American media interactions, 1850–2000* (2007). He is co-editor of the journal *Media History* and modern reviews editor for *H-Albion*. He previously taught at Wesleyan College in Macon, Georgia, USA, and has held visiting positions at the University of Hong Kong and at Sookmyung Women's University, South Korea. [New Journalism, Nineteenth-Century]

**Thomas Hanitzsch** is assistant professor in the Institute of Mass Communication and Media Research, University of Zurich, Switzerland. After working as a newspaper and radio journalist for several years he joined the academy in 2002 and received his PhD in communication and media studies from Ilmenau University of Technology, Germany. He is co-editor of the *Journal of Global Mass Communication* and *Handbook of journalism studies* (forthcoming). He is also the founder of the Journalism Studies Division of the International Communication Association. [Political Journalists]

**Hans V. Hansen** is associate professor of philosophy in the University of Windsor, Canada. He is the co-editor of *Fallacies: Classical and contemporary readings* (1995) and *Reason reclaimed* (2007). He is also co-editor of the journal *Informal Logic* and a co-organizer of the conferences held every two years by the Ontario Society for the Study of Argumentation. [Rhetoric and Logic]

**Marie Hardin** is associate professor of journalism at Pennsylvania State University, USA, where she is also associate director for research in the university's Center for Sports Journalism. She has published extensively in the areas of gender and sports media

representations and the experiences of women in the sports newsroom. [Sports as Popular Communication]

**Sibylle Hardmeier** works as a political and social scientist in Berlin, Germany, and Zurich, Switzerland. She has been assistant professor at the Department of Political Science at the University of Zurich. She was also research professor at the Social Science Research Center Berlin (WZB) and is managing director of PiCABIA GmbH. Her research focuses on political communication and public opinion; political behavior; and gender, representation, and democracy. [Populism and Responsiveness]

**Hanno Hardt** is professor of communication and media studies at the University of Ljubljana, Slovenia, and professor emeritus of journalism and mass communication and communication studies at the University of Iowa, USA. He is the author of several books and numerous articles on communication and media, most recently *Myths for the masses: An essay on mass communication* (2004). [Lasswell, Harold D.; Lazarsfeld, Paul F.; Lippmann, Walter; Picture Magazines]

**Teresa M. Harrison** is professor and chair of the Department of Communication at the University at Albany, USA. Her research focuses on democratic processes in organizations and the relationship between democracy and communication technologies. She has served as chair of the Organizational Communication Division of the National Communication Association and chair of the Communication and Technology Division of the International Communication Association. She serves on the editorial boards of three journals in the field and is managing editor of the *Electronic Journal of Communication* ([www.cios.org](http://www.cios.org)) [Participative Processes in Organizations]

**Joy L. Hart** is a professor of communication at the University of Louisville, USA. Her research and teaching interests center on health, organizational, and interpersonal communication. She has published a number of journal articles and book chapters and is currently completing a book on workers' narratives of plant closings. [Sex Role Stereotypes in the Media]

**Maren Hartmann** is an assistant professor at Berlin University of the Arts, Germany. In the past, she has worked at several universities in the UK, Belgium, and Germany, in both research and teaching positions. Since 2005, she has been chair of the Digital Communication and Culture section of the European Communication Research and Education Association. She has published widely in the field, concentrating primarily on new media and everyday life, and on cyberculture and the domestication concept. The latter interest has grown out of her work with the European Media, Technology, and Everyday Life network. [Domestication of Technology]

**Tilo Hartmann** is an assistant professor of communication research at the Free University Amsterdam, the Netherlands. He is currently vice chair of the Audience and Reception Studies Division of the European Communication Research and Education Association and member of the editorial board of *Media Psychology*. His research interests are in the

psychological aspects of media choice and exposure. [Intrinsic and Extrinsic Motivation and Volition; Presence]

**Uwe Hartung** studied communication, political science, and American literature at the Johannes Gutenberg University of Mainz, Germany, and the University of Maryland, USA. He was a long-time assistant to Hans Mathias Kepplinger in Mainz. Working at a desk at the Allensbach Institute, Germany, at the time of writing, he divides his time between publication projects at Dresden Technical University, Germany, and health communication research at the University of Lugano, Switzerland. [Instrumental Actualization]

**Nicolas Harvey** is presently a doctoral candidate at the Institute of Political Studies (IEP), University of Rennes 2, France, after graduate studies in political science at Laval University, Québec, Canada. His principal subjects of research are intellectuals, alternative media, the Global Justice Movement, and anti-Americanism. Harvey is also referee for the journal *Communication* and is a member of the scientific commission of the Rennes IEP. He has taught undergraduate and graduate courses at the University of Rennes 2 and the Catholic University of the West in the field of political sociology, sociology of communication, and globalization. [Le Monde Diplomatique]

**Jake Harwood** is professor of communication and former director of the graduate program in gerontology at the University of Arizona, USA. He has published more than 70 journal articles and book chapters. He is author of *Understanding communication and aging* (2007) and co-editor of *Intergroup communication: Multiple perspectives* (2005, with Howie Giles). Harwood's recent publications have appeared in *Personality and Social Psychology Bulletin*, *Journal of Communication*, *Communication Monographs*, and *Human Communication Research*. He currently serves as the editor of *Human Communication Research*. [Age Identity and Communication; Intergroup Contact and Communication]

**Uwe Hasebrink** is director of the Hans Bredow Institute for Media Research and professor of empirical communication research at the University of Hamburg, Germany. His main research interests are individual patterns of media use; transnational audiences and public spheres; and media qualities and public service. Dr. Hasebrink's recent publications include *Broadcasters and citizens* (2006) and "Media repertoires" (2006, *Communications*). [Exposure to Television]

**Mohd Safar Hasim** is professor of journalism at the School of Media and Communication Studies, National University of Malaysia. He was co-president of the Professional Education Section of the International Association for Media and Communication Research from 2000 to 2002. He has written several books, mainly on the legal history of the press, media, and communication in Malaysia, delving into press freedom and responsibility. His international contribution includes chapters for books published by Sage (India), Hampton Press (USA), and Orbicom (Canada). His current research interest is propaganda, terrorism, and information and communication technologies. [Malaysia: Media System]

**Ekaterina Haskins** is associate professor of rhetoric in the Department of Language, Literature, and Communication, Rensselaer Polytechnic Institute, USA. She has published numerous theoretical and critical essays on classical and contemporary rhetoric. Her book *Logos and power in Isocrates and Aristotle* (2004) won the Everett Lee Hunt Award from the Eastern Communication Association. Haskins currently serves as book review editor for the *Rhetoric Society Quarterly*. [Rhetoric, Epideictic]

**Kathleen C. Haspel** is an assistant professor of communication studies at Fairleigh Dickinson University, Madison, New Jersey, USA. She studies telephone talk in broadcasting, emergency services, and other institutional contexts. Her work has been published in the *Journal of Communication*. She has served as an officer of the Language and Social Interaction Divisions of the International Communication Association (secretary, 2001–2003), the Western States Communication Association (chair, 2004–2005) and the National Communication Association (vice chair elect, 2006–). [Telephone Talk]

**Robert Hassan** is a senior research fellow in the media and communications program at the University of Melbourne, Australia. He specializes in rhetorical theory and criticism. A National Communication Association (NCA) Distinguished Scholar and Rhetoric Society of America (RSA) fellow, he has received the RSA's George E. Yoos Distinguished Service Award and its Kneupper Award for best article (2000), and the NCA Public Address Division's Marie Hochmuth Nichols Award for best critical book (2000). He is editor of *Philosophy and Rhetoric*, author of *Vernacular voices: The rhetoric of publics and public spheres* (1999), and editor of *Rhetorical democracy: Discursive practices of civic engagement* (2003, with A. Grim). [Rhetoric, Vernacular]

**Richard Hawkins** is professor and Canada Research Chair in science, technology, and innovation policy at the University of Calgary, Canada. Prior to this he was senior advisor to the Organization for Applied Scientific Research (TNO) in the Netherlands and senior fellow in the Science Policy Research Unit at the University of Sussex, UK. In addition to academic work, Dr. Hawkins has extensive international experience as a policy advisor on technical regulation and standards for clients including the European Commission, the Organization for Economic Cooperation and Development, Industry Canada, the European Committee for Standardization (CEN), the British Standards Institution, and the Standards Council of Canada. [Communication Technology Standards]

**Robert Hawkins** is a professor in the School of Journalism and Mass Communication at the University of Wisconsin-Madison, USA. At the Center for Health Systems Research and Analysis, USA, recently awarded a grant for a Center of Excellence in Cancer Communication Research, he has developed software to inform people facing health crises. He has taught

at Murdoch University, Australia, and the University of California, Santa Barbara, USA, and was a Fulbright research fellow at Lund University, Sweden. He has served on the board of directors of the National Telemedia Council, on the editorial boards of the *Journal of Broadcasting and Electronic Media*, *Human Communication Research*, and *Communication Research*, as a consulting editor for six journals, and as co-editor of "Annual Reviews of Communication Research." [Attending to the Mass Media]

**Andrew F. Hayes** is an associate professor of communication at Ohio State University, USA. He is the author of *Statistical methods for communication science* (2005), co-editor of *The Sage sourcebook of advanced data analysis methods for communication research* (2007), and associate editor of *Communication Methods and Measures*. Dr. Hayes conducts research on statistical methods and public opinion and teaches undergraduate and graduate courses in statistical methods and research design. [Perceived Reality: Meta-Analyses; Sampling, Nonrandom; Sampling, Random]

**Jonathan Haynes** is professor in the English Department of the Brooklyn Campus of Long Island University, New York, USA. He has been a Fulbright senior scholar at three Nigerian universities. He edited the first book on the Nigerian video boom and has written numerous articles on the subject. [Nollywood]

**Michael Hazel** is an assistant professor of communication arts at Gonzaga University, USA. He earned his PhD from Washington State University, USA, after living in Japan for eight years. In addition to teaching in the USA, he taught for six years at Immaculate Heart College in southern Japan. His areas of interest include ethics, organizational communication, communication theory, research methods, communication apprehension, and intercultural and interpersonal communication. [Communication Apprehension: Intervention Techniques; Speech Anxiety]

**Robert L. Heath** holds a PhD from the University of Illinois, USA, and is professor emeritus of communication, University of Houston, USA. He has published 15 books and 100 articles and chapters. He has lectured extensively around the world, consulted, and won many awards for his publications. His academic work has concentrated on issues management, crisis management, and risk communication, as well as advancing the connections between the rhetorical heritage and public relations theory and practice. His publications include the *Handbook of public relations* (2001) and the *Encyclopedia of public relations* (2005). He received lifetime achievement awards in 2007 from the Houston chapter of the Public Relations Society of America and from the Issue Management Council (Washington, DC). [Organization–Public Relationships; Public Affairs; Public Relations]

**Lorna Heaton** is associate professor of communication at the University of Montreal, Canada. She is author of *The computerization of work: A communication perspective* (2001), with James R. Taylor, Carole Groleau, and Elizabeth Van Every, and of *Culture in design: The case of computer-supported cooperative work* (forthcoming). [Knowledge Management]

**Michael L. Hecht** is a Liberal Arts Research Professor of communication arts and sciences at Pennsylvania State University, USA. He is the co-editor of *Redefining culture: Perspectives across the disciplines* (2006) and the co-author of *African American communication: Exploring identity and culture* (2003) as well as the founder of the “Keepin’ it REAL” multicultural substance abuse prevention curriculum for adolescents. [Communication Modes, African]

**Radha S. Hegde** is an associate professor in the Department of Media, Culture and Communication, New York University, USA. She has published in the areas of transnational flows, diasporic identities, postcolonial feminism, and feminist ethnography. She has also written on reproductive politics and has a background in feminist activism. Her recent work examines the impact of neo-liberal globalization, transnational labor, and the politics of communication in India. She serves on the editorial boards of six major journals in the field of communication and media studies. [Feminist Media Studies, Transnational]

**Don Heider** is an author, researcher, and award-winning broadcast news journalist. He spent 10 years working in TV news as a photographer, reporter, producer, and manager. During his career he received five Emmy awards, a regional Edward R. Murrow, and a Tennessee Associated Press Award. He taught previously at American University, the University of Mississippi, and the University of Colorado, USA, and is currently associate dean and associate professor at the University of Maryland, USA. [Construction of Reality through the News]

**Heikki Heikkilä** is senior lecturer at the University of Tampere, Finland. He has published articles about the European public sphere, European news cultures, and public/civic journalism. His current work focuses on the effects of contextual changes (economic, technological, cultural, and political) on journalism. [Neutrality]

**Ari Heinonen** is senior lecturer in journalism in the Department of Journalism and Mass Communication at the University of Tampere, Finland. He is also docent of journalism at both the University of Tampere and the University of Jyväskylä, Finland. Dr. Heinonen’s research interests include journalism and new media, the changing journalistic profession, and journalism ethics. He has directed and participated in several national and international research projects on the changing nature of journalism in the age of the net. For several years he was the director of Tampere Journalism Research and Development Centre. [Blogger]

**Leon Hempel** has been a researcher at the Centre for Technology and Society at the Technical University of Berlin, Germany, since 1999. His main research field is the sociology of technology with a focus on the politics of surveillance, the militarization of urban space, and evaluation methodology. He coordinated the EU-funded project “Urbaneye” on the use and impacts of CCTV within public accessible space, evaluating extensive CCTV systems in London and Berlin. Hempel is the co-editor of the first German-language collection of texts on surveillance studies, *Image space control: Video surveillance and social change*. [Security and Surveillance Agencies]

**David Hendy** is reader in media and communication at the University of Westminster, London, UK. He is the author of *Radio in the global age* (2000) and *Life on air: A history of Radio Four* (2007). His current research lies broadly in the field of media and cultural history. Before joining the University of Westminster, he was a senior producer for the BBC, specializing in news and current affairs documentaries. [Radio Technology]

**Andreas Hepp** is professor of communication at the Institute for Media, Communication and Information at the University of Bremen, Germany. He was spokesman of the media sociology section of the German Communication Association from 2003 to 2007. He is author and editor of 13 books and more than 70 chapters and articles on different aspects of the relation between media and cultural change and inter/transcultural communication. [Case Studies]

**Joke Hermes** is professor of applied qualitative research in public opinion at INHOLLAND University, Diemen/Amsterdam, the Netherlands. She is co-editor of the *European Journal of Cultural Studies*. Her most recent published book is *Rereading popular culture* (2005). Cultural citizenship, popular culture, media, and diversity form her research interests. [Women's Media Genres]

**Omar Hernández Sotillo** is assistant professor in the Department of Communication, Monterrey Institute of Technology and Higher Education, Mexico. [TeleSur]

**Susan C. Herring** is professor of information science and linguistics at Indiana University, Bloomington, USA. She has a PhD in linguistics from the University of California, Berkeley, USA. Her research focuses on the linguistic and social aspects of communication mediated by new technologies, especially with regard to gender, interaction management, classification, and discourse analysis methodologies. She is the editor of *Computer-mediated communication: Linguistic, social and cross-cultural perspectives* (1996) and *Computer-mediated conversation* (in press), and co-editor of *The multicultural Internet: Language, culture, and communication online* (2007). [Language and the Internet]

**James K. Hertog** is associate professor of telecommunications at the University of Kentucky, USA. He received his PhD in mass communications from the University of Minnesota, USA. His research has focused on press coverage of social protest, political communications, and health communications. Current research focuses on minor political parties and candidate experience with the media during electoral campaigns. His work has been published in *Journalism and Mass Communication Quarterly*, *Journalism Monographs*, *Health Communication*, and *Communication Research*. [Social Movements and Communication]

**Bradford W. Hesse** is chief of the Health Communication and Informatics Research Branch at the US National Cancer Institute in Bethesda, Maryland, USA. He is program officer for the Centers of Excellence in Cancer Communication Research and program director for the biennial Health Information National Trends Survey. [Consumer Informatics]

**Kim D. Hester-Williams** is an associate professor of English at Sonoma State University. Her publications include: “Private parts: Battling barriers, forging friendships, creating collaborations,” in *Inscriptions 7: Enunciating Our Terms: Women of Color in Collaboration and Conflict* (1994); co-authored with Alma Sifuentes, “The reification of race in cyberspace: African American expressive culture, FUBU and a search for ‘beloved community’ on the net,” *Mots Pluriels* (2001); “The net: New apprentices, old masters,” [www.arts.uwa.edu.au/MotsPluriels](http://www.arts.uwa.edu.au/MotsPluriels); and “(Neo)slaves: Slavery and African American apotheosis in *The Matrix*, *CandyMan* and *The Green Mile*,” *Genders* (2004). [Reification]

**Douglas Blanks Hindman** holds a PhD in mass communication from the University of Minnesota, USA, and is an associate professor of communication in the Edward R. Murrow School of Communication at Washington State University, USA. He has held leadership positions in the Midwest Association for Public Opinion Research and in the Communication Theory and Methodology Division of the Association for Education in Journalism and Mass Communication. His research focuses on the role of new and old media in community adjustment to social conflict and change, and the social context of health communication. [Social Conflict and Communication]

**Randy Hirokawa** is the dean of the College of Arts and Sciences at the University of Hawaii at Hilo, USA. Prior to this, he served on the faculty at Pennsylvania State University, USA (1980–1984), and the University of Iowa, USA (1984–2005). His publications include three edited books, 36 refereed journal articles, and 24 book chapters. [Group Communication and Problem-Solving]

**Kathryn Hirsh-Pasek** is the Stanley and Debra Lefkowitz Professor in the Department of Psychology and the director of the Infant Language Laboratory at Temple University, USA. Dr. Hirsh-Pasek has written nine books, including *How babies talk* and *Action meets words*. Her recent book with Roberta Golinkoff, *Einstein never used flashcards: How children really learn and why they need to play more and memorize less*, won the Books for Better Life Award in 2003. She has published over 100 professional articles, is a fellow of the American Psychological Association and the American Psychological Society, and serves as the associate editor of *Child Development*. She is on the advisory board for CIVITAS and their Born Learning Series and on the research council for America’s Promise. [Language Acquisition in Childhood]

**Myiah Hutchens Hively** is a doctoral student in the School of Communication at Ohio State University, USA. Her research focuses on the influence of communication on political and health-related behaviors. [Political Knowledge]

**Pamela Hobbs** is a lecturer in communication studies at the University of California, Los Angeles, USA, where she received a PhD in applied linguistics, and is also an attorney licensed to practice in Michigan, USA. Her research interests include legal discourse, medical discourse, language and gender, and the evolution of communication. [Discourse in the Law]

**Janny C. Hoekstra** holds a PhD in economics from the University of Groningen, the Netherlands. She was a part-time professor in direct marketing at the Erasmus University Rotterdam, the Netherlands, 1994–2000, and since then has been a professor at the University of Groningen. Her research interests include the development of the marketing concept, customer relationship management, market orientation, customer lifetime value, direct marketing, and e-commerce. She has published papers in, among others, *Industrial Marketing Management*, *European Journal of Marketing*, *Journal of Direct Marketing*, *Journal of Market-Focused Management*, *Journal of the Academy of Marketing Science*, and *Journal of Retailing*. She speaks frequently at scientific and practitioners' conferences. In 1995 she was awarded the Direct Marketer of the Year award by the Dutch direct marketing association. [Direct-to-Consumer Advertising]

**Lindsay H. Hoffman** is an assistant professor in the Department of Communication at the University of Delaware in Newark, USA. She received her Master's and doctoral degrees from the School of Communication at Ohio State University, USA, under the advisement of Dr. William P. Eveland, Jr. Dr. Hoffman has received top paper awards from the International Communication Association and the Midwest Association for Public Opinion Research, and publishes political communication and public opinion research in both national and international journals. [Media and Perceptions of Reality]

**C. Ann Hollifield** is the Dowden Professor of Media Research and coordinator of the Michael J. Faherty Broadcast Management Laboratory in the Grady College of Journalism and Mass Communication at the University of Georgia, USA. She is an editor of the *International Journal on Media Management* and author of numerous journal articles, book chapters, and books on media management and economics and media effects on the economy and economic development. [Supply and Demand in Media Markets]

**Amanda J. Holmstrom** is an assistant professor of communication at Michigan State University, East Lansing, Michigan, USA. A recent graduate of Purdue University, USA, she twice received doctoral fellowships to support her research and was the recipient of awards recognizing both outstanding scholarship and outstanding teaching. [Comforting Communication]

**Derina Holtzhausen** is associate professor and director of graduate studies at the School of Mass Communications, University of South Florida, Tampa, USA. She teaches courses in public relations, strategic communication management, and research at undergraduate and graduate level. She is co-editor of the *International Journal of Strategic Communication*. Her PhD in communication science is from the University of Johannesburg (formerly Rand Afrikaans University), South Africa. Before joining the University of South Florida in 1997 she practiced communication for 25 years. Dr. Holtzhausen is a recipient of the Pathfinder Award from the US Institute of Public Relations for her original research agenda on postmodern public relations and continues to consult on strategic communication in the USA and South Africa. [Strategic Communication]

**Gregory G. Holyk** is a PhD candidate in political science at the University of Illinois at Chicago, USA. He is the author of several articles in cognitive psychology journals, such as *Memory and Cognition* and the *Journal of Memory and Language*. His dissertation research focuses on the foreign policy opinion gap between leaders and the general public. [Political Cognitions]

**Katharina Holzinger** is professor of international relations at the University of Constance, Germany. She is vice president of the German Political Science Association and a member of the editorial board of several political science journals. She has published in the field of political communication and deliberation, among others. At the University of Constance she directs a new research program on communicative dynamics of conflict and conflict resolution, and she teaches in an MA program on public administration and conflict management. [Conflict Resolution]

**James M. Honeycutt** is professor of communication studies at Louisiana State University (LSU), USA. He studies cognitive processing of messages, relational conflict/harmony, and physiological correlates. He is the founding director of the physiological, interaction lab “The Relation Station Match Box” at LSU. He is the author of *Imagined interactions: Daydreaming about communication* (2003) and editor of a forthcoming volume reviewing imagined interaction research, *Imagine that: Studies in imagined interaction*. He is associate editor of *Imagination, Cognition, and Personality* and on the editorial board of five journals. [Imagined Interactions]

**Jan-Christopher Horak** is acting director of the moving image archives studies program and a visiting professor at the University of California, Los Angeles, USA. He received his PhD at Münster University in Germany and has directed film archives at George Eastman House, Munich, and Universal Studios. He has published widely in more than 10 languages. [Hollywood; Photography]

**Robert Hornik** is Wilbur Schramm Professor of Communication and Health Policy at the Annenberg School for Communication, University of Pennsylvania, USA. Hornik led evaluations of more than 25 large-scale public health communication programs including the US National Youth Anti-Drug Media Campaign, and directs the Center of Excellence in Cancer Communication Research at the University of Pennsylvania. He is author of *Development communication*, and editor of *Public health communication: Evidence for behavior change*. [Information Scanning]

**Edward Horowitz** is an associate professor in the School of Communication at Cleveland State University, USA. He received his PhD in mass communication from the University of Wisconsin-Madison, USA. His research focuses on political socialization in three domains: among young adults in a post-9/11 world and during the continuing war against terrorism; among young adults who live in lower socio-economic communities (the culture of poverty); and among young adults in the post-communist nations of central and eastern Europe. He has spoken at the Council of Europe in Strasbourg, France, on the processes of political socialization among parents and adolescents. His work has

appeared in *Journalism and Mass Communication Quarterly* and *Communication Research*. He has also co-authored several book chapters on political socialization. [Political Persuasion]

**Andrew Hoskins** is associate professor of sociology at the University of Warwick, UK. He is author of *Televising war: From Vietnam to Iraq* (2004) and *Media and memory* (forthcoming), and founding co-editor of the Sage journals *Memory Studies* and *Media, War and Conflict*. [Collective Memory and the Media; Newscast; Newscast, 24-Hour]

**Brant Houston** is professor of journalism at the University of Missouri, USA, and executive director of Investigative Reporters and Editors, an international organization. He is co-author of *The investigative reporter's handbook* and author of *Computer-assisted reporting*. He was a reporter for 17 years. [Interpretive Journalism]

**Svennik Høyer** is professor emeritus, doctor philosophiae, and doctor honoris causa at the Department of Media and Communication, University of Oslo, Norway. His main research topics have been: party–press relations, longitudinal changes in the structure of the newspaper industry, the profession of journalists, and the history of journalism and newspapers. [Journalists: Professional Associations]

**Chia-Fang Hsu** received her PhD from Washington State University, USA, in 2002 and is currently an assistant professor of communication and journalism at the University of Wyoming, USA. Her research area concerns the development and interventions of communication apprehension. She was the chair of the Communication Apprehension and Competence Division of the National Communication Association from 2006 to 2007. [Communication Apprehension: Intervention Techniques; Speech Anxiety]

**Inga Huck** is a research assistant in the Department of Communication and Media Research, Ludwig Maximilian University of Munich, Germany. She studied communication, political science, and computer science. Her current research projects focus on real and presumed media effects. [Third-Person Effects]

**Heather E. Hudson** is director of the communications technology management program in the School of Business and Management, University of San Francisco, USA. Her research focuses on applications of information and communication technologies for socio-economic development and policies to extend affordable access to new technologies and services in rural and developing regions. Dr. Hudson has planned or evaluated communication projects in northern Canada, Alaska, and more than 50 developing countries and emerging economies. She has also consulted for the private sector, government agencies, consumer and indigenous organizations, and international organizations. She is the author of numerous articles and several books. [Communication Technology and Development; Satellite Communication, Global]

**Robert Huesca** holds a PhD from Ohio State University, USA, and is professor in the Department of Communication at Trinity University in San Antonio, Texas, USA. His research interests include alternative media and participatory communication for social

change. His research on alternative media and international and development communication issues has been published in a number of books and journals, including *Communication Studies*, *Gazette*, *Journal of Communication*, *Media, Culture and Society*, and the *Handbook of international and intercultural communication*. [Activist Media; Bolivia: Media System; Radio for Development]

**L. Rowell Huesmann** is Amos N. Tversky Collegiate Professor of Psychology and Communication Studies and director of the Research Center for Group Dynamics at the Institute for Social Research of the University of Michigan, USA. He is editor of the journal *Aggressive Behavior* and the recipient in 2005 of the American Psychological Association award for Distinguished Lifetime Contributions to Media Psychology. He has published two books and over 100 articles on media violence and aggression. [Violence as Media Content, Effects on Children of]

**Michael E. Hugu** is a research associate at Ohio State University's School of Communication, USA, where his research interests include public opinion, political communication, and science communication. His research has appeared in refereed journals such as *Political Behavior*, *Harvard International Journal of Press/Politics*, and *Journalism and Mass Communication Quarterly*. [Public Opinion]

**Mikayla Hughes** is an assistant professor of communication at the University of California, Davis, USA. Her research endeavors center on documenting how and why affective states, such as mood or emotion, impact message processing and decision-making. She has published research concerning deception detection accuracy and the motivations underlying nontraditional opposite-sex relationships. [Schemas, Knowledge Structures, and Social Interaction]

**Craig R. Hullett** is associate professor of communication at the University of Arizona, USA, and earned his PhD at Michigan State University, USA. His scholarship focuses on the development of the functional theory of attitudes, emotion as both a route for and goal of persuasion, and quantitative research methodology. His research follows the implicit goals of advancing theory and having practical importance; e.g., current work focuses on the processes underlying decisions to seek or avoid tests of STD status, with the goal of developing messages to maximize testing for young adults. His articles have appeared in *Communication Monographs*, *Human Communication Research*, *Health Communication*, and *Communication Research*, and he has authored many conference papers. He teaches graduate and undergraduate courses in health communication, persuasion, interpersonal communication, and research methods. [Meta-Analysis]

**Mary Lee Hummert** is professor of communication studies and vice provost for faculty development at the University of Kansas, USA. Her research focuses on the social cognitive processes linking age stereotypes and communication, with funding from the US National Institute on Aging/National Institutes of Health. Her most recent book, co-edited with Jon Nussbaum, is *Aging, communication, and health: Linking research and*

*practice for successful aging* (2001). [Intergenerational Communication; Social Stereotyping and Communication]

**Mark Huppín** is lecturer in communication studies and psychology at the University of California, Los Angeles (UCLA), USA. He received his JD degree from Stanford University, USA, and his PhD in social psychology from UCLA. He is an author of *Sexual rights in America* (2003, with Paul Abramson and Steven Pinkerton). [Sex and Pornography as Media Content, Effects of]

**Ian Hutchby** is professor of sociology at the University of Leicester, UK. He is the author of numerous books in the field of conversation analysis, including *Confrontation talk: Arguments, asymmetries and power on talk radio* (1996), *Conversation analysis* (1998, with Robin Wooffitt), and *Conversation and technology* (2001). His most recent books are *Media talk: Conversation analysis and the study of broadcasting* (2006) and *The discourse of child counselling* (2007). [Technologically Mediated Discourse]

**Holly R. Hutchins** is a retired senior corporate communications executive with 30-plus years experience with several major US companies, including Georgia-Pacific Corp. and Shell Oil Co. Mr. Hutchins has also served as an adjunct professor at the University of Houston, USA, and Central Oregon Community College in Bend, Oregon, USA, teaching graduate and undergraduate seminars in investor relations, business communications, and public relations management. [Financial Communication]

**Michael J. Hyde** is University Distinguished Professor of Communication Ethics in the Department of Communication at Wake Forest University, USA. He is author of *The call of conscience: Heidegger and Levinas, rhetoric and the euthanasia debate* (2001) and *The life-giving gift of acknowledgment* (2006); he also edited *The ethos of rhetoric* (2004). [Ethos and Rhetoric]

**Annika Hylmö** holds a PhD from Purdue University, USA, and is an independent consultant specializing in diversity and demographic impacts on organizational cultures and alternative workforms. Her research focusing on telework and changing organizational demographics is published in *Communication Monographs* and *Management Communication Quarterly*, among other outlets. She continues to serve on the editorial boards of several journals in the field. [Telework]

**Mohammad Ibahrine** has a PhD in political science from the University of Hamburg, Germany (2005), taught as lecturer at the University of Erfurt, Germany, and moved to Al Akhwhanyan University, Ifrane, Morocco. His research is focused on media and politics in the Arab world, communication technology, and foreign news coverage. [North Africa: Media Systems]

**Øyvind Ihlen** is a postdoctoral research fellow at the University of Oslo, Norway, and associate professor at Hedmark University College, Norway. He has published over 20 journal articles and book chapters, as well as two books. Two other books are in

preparation. His research appears in journals such as *Public Relations Review*, *Journal of Public Relations Research*, and *International Journal of Strategic Communication*, among others. Dr. Ihlen has been editor of a special issue of *Public Relations Review* on social theory and public relations. His current research focuses on the rhetoric and media coverage of corporate social responsibility. [Rhetorical Theory of Public Relations]

**Cornelia Ilie** is professor of English linguistics in the Department of Humanities at Örebro University, Sweden. She is author of *What else can I tell you?: A pragmatic study of English rhetorical questions as discursive and argumentative acts* (1994) and editor of *Language and ideology. Vol II: Descriptive cognitive approaches* (2001, with R. Dirven and R. M. Frank) and *Language, culture, rhetoric: Cultural and rhetorical perspectives on communication. Papers from the ASLA Symposium in Örebro, 6–7 November 2003* (2004). [Rhetoric and Language]

**Peter Ingwersen** is professor of information studies at the Royal School of Library and Information Science, Copenhagen, Denmark. He won the Derek De Solla Price Medal in 2005 for his pioneering work on the bibliometrics of the web and is co-author of the book *The turn: Integration of information seeking and retrieval* (2005). [Information Science]

**Yasuhiro Inoue** is a professor in the Faculty of International Studies at Hiroshima City University, Japan. He was a reporter for the Japanese national newspapers *Mainichi Shimbun* and *Yomiuri Shimbun*. He is the author of *Cyber election campaigning: U.S. presidential election 2000* (2003) and *Media literacy* (2004). His interests are media effects, political communication, and journalism. [Japan: Media System]

**Youichi Ito** is a professor emeritus at Keio University, Japan. He is the editor of several books, e.g., *Nyusu no kokusai ryutu to shimin ishiki* (International flow of news and public opinions, 2005) and *Bunka no kokusai ryutu to shimin ishiki* (International flow of cultures and public opinions, 2007). [Japan: Media System]

**Joel O. Iverson** is an assistant professor in the Department of Communication at Texas A&M University in College Station, Texas, USA. His research focuses on communication of knowledge and identity primarily in nonprofit organizational contexts. He has published in the *Journal of Applied Communication Research*, *Management Communication Quarterly*, *Non-Profit Management and Leadership*, *Non-Profit and Voluntary Sector Quarterly*, and others. He received his PhD from Arizona State University, USA, in 2003. [Learning Organizations]

**Shanto Iyengar** holds the Chandler Chair in Communication at Stanford University, USA, where he is also professor of political science. He is the author of several books including *News that matters: Is anyone responsible?* and *Going negative: How political ads shrink and polarize the electorate*. He was awarded the Murray Edelman Lifetime Career Award from the American Political Science Association in 1997. Iyengar also writes regularly for Washingtonpost.com. [Priming Theory]

**Nikolaus Jakob** is assistant professor and assistant director at the Department of Communication, Johannes Gutenberg University of Mainz, Germany. He is the author of *Öffentliche Kommunikation bei Cicero: Publizistik und Rhetorik in der späten römischen Republik* (Rhetoric and public communication in the life and the works of Cicero) and editor of *Wahlkämpfe in Deutschland: Fallstudien zur Wahlkampfkommunikation 1912–2005* (Election campaigns in Germany: Case studies 1912–2005). [Credibility Effects; Public]

**Matt Jackson** is head of the Department of Telecommunications at Pennsylvania State University, USA, where he teaches and conducts research on free speech, telecommunications law and policy, and copyright law. He has published articles in a variety of law reviews, communication journals, and edited volumes. From 2004 to 2006 he served as chair of the Law and Policy Division of the International Communication Association. [Copyright]

**Thomas Jacobson** is professor of communication and senior associate dean for academic affairs in the School of Communications and Theater at Temple University in Philadelphia, USA. He is past president of the Participatory Communication Research Section of the International Association of Media and Communication Research, and has over 50 publications in the form of co-edited books, book chapters, and journal articles. [Participatory Action Research]

**Adam Jacobsson** is assistant professor at the Department of Economics, Stockholm University, Sweden. His research focuses on media economics and the political economy of conflict and appropriation. [Quality of the News]

**Eva-Maria Jacobsson** is a PhD student at the School of Computer Science and Communication at the Royal Institute of Technology, Stockholm, Sweden. She has worked as a freelance reporter for Radio Örebro and as a marketing director for the Internet portal Passagen. Her research focuses on media economics and gender issues in new media. [Quality of the News]

**Canute James** is a senior lecturer at the Caribbean Institute of Media and Communication of the University of the West Indies, Jamaica. He is the author of “Journalism for Caribbean development: New perspectives in the age of economic globalization” in *CARICOM: Appropriate adaptation to a changing global environment* (2005) and “Crime in the Caribbean: Reform and progress” in *South America, Central America and the Caribbean 2006* (2006). [Caribbean States: Media Systems]

**Bernard J. Jansen** is an assistant professor at the College of Information Sciences and Technology at Pennsylvania State University, USA. Dr. Jansen has nearly 100 publications in the area of information technology and systems, with articles appearing in the *Communications of the ACM*, *IEEE Computer*, *ACM Transactions on Information Systems*, *Information Processing and Management*, and *Journal of the American Society for Information Science and Technology*, among others. He has received several awards and honors, including an Association of Computing Machinery Research Award and six application development

awards, along with other writing, publishing, research, and leadership honors. [Log-File Analysis]

**Sue Curry Jansen** received her PhD in sociology from the University at Buffalo, USA, and is professor of communication at Muhlenberg College, Allentown, Pennsylvania, USA. She is the author of *Critical communication theory* (2002) and *Censorship: The knot that binds power and knowledge* (1988, 1991). She is currently working on both early twentieth-century American media history and communication and neo-liberalism. [Censorship, History of]

**Otfried Jarren** is professor and head of the Department of Media and Communication Studies, University of Zurich, Switzerland. He was formerly professor of journalism at the University of Hamburg, Germany, and director of the Hans Bredow Institute there. His research centers on media policy, media regulation, and media structures as well as on media organizations. He has published a number of textbooks and handbooks on political communication. [Media Democracy]

**Sharon E. Jarvis** is an associate professor of communication studies and the associate director of research at the Annette Strauss Institute for Civic Participation at the University of Texas at Austin, USA. She is the author of *Symbolic capital: Political labels, symbolic capital and American life* and co-author of *Political keywords: Using language that uses us*. [Party Political Communication; Political Language; Political Symbols]

**James Jasinski** is professor and chair of communication studies at the University of Puget Sound, USA. He is the author of *Sourcebook on rhetoric* (2001). [Invention and Rhetoric]

**Per Jauert** is associate professor in the Department of Information and Media Studies at the University of Aarhus, Denmark. He is the author of the chapters about radio in *Dansk Mediehistorie I–IV* (Danish media history, 2003, ed. Klaus Bruhn Jensen) and editor of *Cultural dilemmas in public service broadcasting* (2005, with Gregory Ferrell Lowe). [International Radio]

**Martin Jay** is Sidney Hellman Ehrman Professor of History at the University of California, Berkeley, USA, where he specializes in modern European intellectual history. Among his works are *The dialectical imagination* (1973, 1996), *Marxism and totality* (1984), Adorno (1984), *Permanent exiles* (1985), *Fin-de-siècle socialism* (1989), *Force fields* (1993), *Downcast eyes* (1993), *Cultural semantics* (1998), *Refractions of violence* (2004), and *Songs of experience* (2005). [Scopic Regime]

**Leo W. Jeffres** is professor of communication at Cleveland State University, USA. He is the author of *Urban communication systems: Neighborhoods and the search for community* (2002), *Mass media effects* (1997), and *Mass media processes* (1994). He is on the editorial board of several communication journals and is the author of more than 60 journal articles and 80 conference papers. A former Fulbrighter, he was named a MAPOR Fellow

in 1998. He placed in the top 100 most prolific researchers in communication in a study of scholarship in 24 major communication journals from 1915 to 2001, and he was twenty-sixth in a study of research productivity in 24 communication journals from 1996 to 2001. [Climate of Opinion]

**Klaus Bruhn Jensen** is professor in the Department of Media, Cognition, and Communication, University of Copenhagen, Denmark. Among his authored and edited volumes are *A handbook of qualitative methodologies for mass communication research* (1991), the UNESCO project *News of the world* (1998), and *A handbook of media and communication research: Qualitative and quantitative methodologies* (2002). As executive director of Oklahoma Scholastic Media, she provides educational resources and support for high school media across the state. For three years, she has been part of an initiative to teach leadership principles to women journalists in Bangladesh. A new grant expands that initiative into Nepal and Pakistan. [News Cycles]

**Birgit H. Jevnaker** is associate professor of business development at the Norwegian School of Management, Norway. She is the editor of *Management of design alliances* (1998, with Margaret Bruce) and the author of numerous articles published internationally (e.g., in *Design Studies*, *Design Issues*, *Design Management Journal*, *Design Management Academic Review*, *Design Journal*, *International Journal of New Product Development and Innovation Management*, and *Nordic Organization Studies*). [Corporate Design]

**Carey Jewitt** is a reader in education and technology at the Institute of Education, University of London, UK. She is editor of the journal *Visual Communication*. Dr. Jewitt has published a number of books on visual and multimodal communication including the *Routledge handbook of multimodal analysis* (forthcoming), *Technology, literacy and learning: A multimodal approach* (2006), and *A handbook of visual analysis* (2001) edited with Theo van Leeuwen. [Visual Representation]

**Jan Jiráč** is an associate professor and vice dean of the Faculty of Social Sciences at Charles University in Prague, Czech Republic, and member of its Media Studies Department. He graduated in Czech and English language and literature at Charles University and his PhD was earned from the Faculty of Social Sciences. He is an author and co-author of books on media studies and many academic articles. He was a chairperson of the Council of Czech Television in 1997–2000. [Communication as an Academic Field: Eastern Europe and Russia; Czech Republic: Media System]

**John Jirik** is a PhD candidate in the Radio-Television-Film Department at the University of Texas at Austin, USA. He was a consultant at China Central Television (CCTV) from 2003 to 2005. Prior to that he worked as a television news producer at Visnews and then Reuters from 1992 to 1999, based in Moscow, Hong Kong, and Singapore. [China Central Television Channel 9 (CCTV-9)]

**Susanne M. Jones** is an associate professor in the Department of Communication Studies at the University of Minnesota, Twin Cities, USA. Her research focuses on the study of comforting communication, cognition and affect, and nonverbal communication in interpersonal relationships. Her articles and chapters have appeared in *Human Communication Research*, *Communication Research*, and the *Handbook of nonverbal communication*. She currently serves on three editorial boards. [Interpersonal Attraction; Politeness Theory]

**Garth Jowett** is professor of communications at the University of Houston, USA. He is the author (with Victoria O'Donnell) of *Propaganda and persuasion* and *Film: The democratic art*, and (with Ian C. Jarvie and Kathryn H. Fuller) *Children and the movies: Media influence and the Payne Fund controversy*. [Propaganda, Visual Communication of]

**Joo-Young Jung** holds a PhD from the University of Southern California, USA, and is a postdoctoral research fellow at the Graduate School of Interdisciplinary Information Studies, University of Tokyo, Japan. In her doctoral dissertation, she examined the influence of socio-cultural factors on Internet connectedness, which is a multidimensional indicator measuring the scope, intensity, and centrality of people's Internet use. Currently, she is doing a comparative study of people's connectedness to new communication technologies such as the Internet and mobile phones, focusing on several Asian countries. [Digital Divide]

**Adrienne L. Kaeppler** holds a PhD from the University of Hawaii, USA, and is curator of Oceanic ethnology at the Smithsonian Institution in Washington, DC, USA. She has carried out field research in Tonga, Hawaii, and other parts of the Pacific. Her research focuses on the interrelationships between social structure and the arts, especially dance, music, and the visual arts. [Dance]

**Richard Kahn** is an assistant professor of educational foundations and research at the University of North Dakota, USA. He has written frequently with Douglas Kellner on the intersections of new media ecologies and technopolitics. [Youth Culture]

**Lynda Lee Kaid** is professor of telecommunication at the University of Florida, USA. She previously served as the director of the Political Communication Center and supervised the Political Commercial Archive at the University of Oklahoma, USA. She is the author/editor of more than 20 books, including *The handbook of political communication research*, *Millennium election*, *Videostyle in presidential campaigns*, *The electronic election*, *Civic dialogue in the 1996 campaign*, *New perspectives on political advertising*, *Mediated politics in two cultures*, and *Political advertising in western democracies*. [Political Advertising]

**Jannis Kallinikos** is a reader in the Information Systems Group, Department of Management, at the London School of Economics and Political Science, UK. His major research interests involve the study of information and the forms by which it is implicated in organizations and society. He is the author of *The consequences of information: Institutional implications of technological change* (2006). [Human–Computer Interaction]

**Ali M. Kanso** is a professor in the Department of Communication at the University of Texas at San Antonio, USA. He received his PhD from Ohio University, USA. Kanso's research focuses on international advertising, marketing, and public relations strategies. His work has appeared in *Journal of Advertising Research*, *International Journal of Advertising*, *Marketing Intelligence and Planning*, *Asia Pacific Public Relations Journal*, *International Journal of Commerce and Management*, *Journal of Promotion Management*, *Service Business: An International Journal*, *Competitiveness Review*, *Business Research Yearbook*, and elsewhere. [Advertisement Campaign Management]

**Richard L. Kaplan** is a lecturer in the Department of Sociology at the University of California, Santa Barbara, USA. He received the Catherine Covert Prize for best published article in mass communications history in 1996. His book *Politics and the American press: The rise of objectivity, 1865–1920* was published in 2002. [Yellow Journalism]

**Stuart Jay Kaplan** is associate professor of communication at Lewis and Clark College in Portland, Oregon, USA. He received his PhD from the University of Oregon. He has published articles on visual communication, communication policy, and Internet free speech in *Communication*, *Communication Monographs*, *Journalism Quarterly*, *Critical Studies in Mass Communication*, and *Idaho Law Review*. [Metaphor]

**Christopher D. Karadjov** is an assistant professor of journalism at California State University, Long Beach, USA. He worked as a news reporter and editor in Sofia, Bulgaria, where he witnessed first hand the transformation of eastern Europe in the 1990s. Karadjov also reported for BBC London and the *Dallas Morning News* in Dallas, Texas, before receiving his PhD from the University of Florida, USA, and starting an academic career. [Foreign Correspondents]

**Kavita Karan** is a member of the faculty at the WKW School of Communication and Information, Nanyang Technological University, Singapore. Her research focuses on

social structures, risk perceptions, and the impact of preventive health communication strategies. [Social Capital and Communication in Health]

**Karim Karim** is associate professor in the School of Communication and Journalism, Carleton University, Canada. He is author of *Islamic peril: Media and global violence* (2nd edn. 2003), which won the Robinson Book Prize of the Canadian Communication Association. He has also edited *The media of diaspora* (2003). His research articles have appeared in *International Journal of Politics, Culture, and Society*; *Javnost – The Public, Information, Communication and Society*, *Canadian Journal of Communication*, *Journal of International Migration and Integration*, *Migrantenstudien*, *Nord-Süd Aktuell*, and UNESCO's *World culture report*. He previously worked as senior researcher and as senior policy analyst in the Department of Canadian Heritage. [Migrant Community Media]

**Jeffrey W. Kassing** holds a PhD from Kent State University, USA, and is an associate professor and chair in the Department of Communication Studies at Arizona State University, USA. He teaches graduate and undergraduate courses in organizational, applied, and environmental communication. His primary line of research concerns how employees express dissent about organizational policies and practices. His research has appeared in *Management Communication Quarterly*, *Communication Studies*, *Communication Quarterly*, *Communication Research Reports*, *Communication Yearbook*, and *Communication Reports*. [Dissent in Organizations]

**Tamar Katriel** holds a PhD from the University of Washington, USA, and is a professor in the Department of Communication and in the Department of Education at the University of Haifa, Israel. She works in the area of the ethnography of communication and discourse studies. She is author of *Talking straight: Dugri speech in Israeli Sabra culture*, *Communal webs: Communication and culture in contemporary Israel*, *Performing the past: A study of Israeli settlement museums*, *Dialogic moments: From soul talks to talk radio in Israeli culture*, and a Hebrew collection of essays entitled *Key words: Patterns of culture and communication in Israel*, as well as a range of articles in journals and book collections. [Storytelling and Narration]

**Janet Kaye** teaches media law and journalism courses as a lecturer in the Communication Department at Buffalo State College, State University of New York, USA. She has been a daily newspaper reporter and editorial writer in Los Angeles, and a federal government attorney practicing law in Washington, DC. [Open Meetings Law]

**Patricia Kearney** is professor of communication studies at California State University, Long Beach, USA, and is a recipient of her institution's Distinguished Scholar Award. Her research focuses on social influence and communication in the classroom. A regular member of several editorial boards, she has written a variety of textbooks and industrial training packages, and has published more than 100 research articles, chapters, and commissioned research reports and instructional modules. She is listed among the 100 most published scholars and among the top 15 female scholars in communication. She is the current editor of *Communication Education*. [Teacher Influence and Persuasion]

**Patrick Keating** is an assistant professor of communication at Trinity University in San Antonio, USA. He has also taught at Washington University, Stanford University, and Hofstra University, USA. He is currently working on a manuscript about Hollywood lighting. In addition to his work on the history of cinematography, he has published essays on Hollywood narrative, Italian neorealism, and the film theory of Pasolini. Before becoming a professor, he photographed several short films. [Cinematography]

**Kara Keeling** is assistant professor of media and cultural studies at the University of North Carolina at Chapel Hill, USA. She is author of *The witch's flight: The cinematic, the black femme, and the image of common sense* (forthcoming), and co-editor (with Colin MacCabe and Cornel West) of *European pedigrees/African contagions: A selection of writing by James A. Snead*. Her essays on cinema and popular culture have been published in the journals *Black Scholar* and *Women and Performance*, and elsewhere. [Black Feminist Media Studies]

**Emily Keightley** is lecturer in communication and media studies at Loughborough University, UK, where she gained her PhD in 2007 with a thesis titled "How women remember: Media and the experience of the past." She has published papers on the concept of nostalgia, the use of photography and music as vehicles of memory, and the use of memory as a research method in cultural studies. Her current research interests are in the emerging field of memory studies, particularly the role of media technologies in everyday acts of remembering. [Fictional Media Content]

**William Keith** is professor of communication at the University of Wisconsin-Milwaukee, USA. He is the author of *Democracy as discussion* (2007), as well as co-editor of *Rhetorical hermeneutics* (1998). He has published widely on the history of the speech field, and served as a consultant to the National Communication Association and the World Bank. [Speech Communication, History of]

**Kathy Kellermann** is president of ComCon KATHY KELLERMANN COMMUNICATION CONSULTING, a jury consulting firm. As a professor, Dr. Kellermann co-edited the *Journal of Language and Social Psychology*, authored the lead article in the 1992 "Chautauqua" in *Communication Monographs* on automatic and strategic communication behavior, developed perspectives on conversational constraints and memory organization packets, and conducted research in persuasion, interpersonal communication, and research methods. [Mindlessness and Automaticity; Scripts]

**Douglas Kellner** is George Kneller Chair in the Philosophy of Education at the University of California, Los Angeles, USA, and is author of many books on social theory, politics, history, and culture, including *Media culture, media spectacle* and *The postmodern adventure* (with Steve Best). [Youth Culture]

**Kathleen S. Kelly** is a professor in the Department of Public Relations at the University of Florida, Gainesville, USA. She is the author of two books on fundraising, including the field's first academic textbook, *Effective fund-raising management* (1998). Her research has earned her awards from leading professional associations, including the 2005

Outstanding Educator Award from the Public Relations Society of America (PRSA). She is a trustee of the Institute for Public Relations and a member of the Arthur W. Page Society and PRSA's College of Fellows. [Fundraising]

**Lynne Kelly** is professor and director in the School of Communication at the University of Hartford in Connecticut, USA, where she teaches courses in group and organizational communication, interpersonal communication, computer-mediated communication, and communication skills. She has received two awards for teaching excellence at the University of Hartford, the 1996–1998 Harry Jack Gray Distinguished Teaching Humanist, and the 1999 Roy E. Larsen Award for Excellence in Teaching. She has co-authored four books and has published or presented over 100 papers on communication topics. Her current research interests include the nature and treatment of shyness and speech anxiety as well as computer-mediated communication and relationships. [Reticence]

**Kevin R. Kemper** teaches law of the press, among other courses, as an assistant professor at the Department of Journalism, University of Arizona, USA. Dr. Kemper, with experience as a journalist, researches how governments make and control expressions across the world, as well as how increased profitability for media would promote freedom of the press and intellectual property rights. [Government Speech, Law and Policy on]

**Susan Kemper** is the Roy A. Roberts Distinguished Professor of Psychology and senior scientist in gerontology at the University of Kansas, USA. Her Language Across the Lifespan project addresses how aging affects the processing of spoken and written language, and includes comparative studies of healthy older adults and adults with Alzheimer's disease and Parkinson's disease. Her research ranges from studies of how aging affects language production and comprehension to studies of how to enhance older adults' comprehension through "elderspeak," a set of special speech modifications intended for older adults. [Aging and Message Production and Processing]

**Hans Mathias Kepplinger** is professor of communications at the Johannes Gutenberg University of Mainz, Germany. His research interests include the effects of mass media, the role of mass media in election campaigns, the development of public conflicts and scandals, the influence of journalists' beliefs on the selection and presentation of news, and the relationships between the effects of information and the intentions and responsibility of communicators. [Media Effects; Media Effects: Direct and Indirect Effects; News Factors; News Values; Public Opinion, Media Effects on; Reciprocal Effects]

**Jon F. Kerner** is the deputy director for research dissemination in the Division of Cancer Control and Population Sciences at the US National Cancer Institute, Washington, DC, USA. He completed his PhD in community psychology at New York University, USA, in 1980, and received postdoctoral training in cancer epidemiology, clinical trials design, and advanced multivariate statistical analyses at Johns Hopkins University School of Public Health, USA, in 1985. In his 20-year career as a cancer control investigator, Dr. Kerner developed more than 25 collaborative research projects and many knowledge-transfer networks with schools and departments of public health, community hospitals, American

Cancer Society units and divisions, and community-based organizations. He has made more than 200 presentations nationally and internationally, and has more than 70 peer-reviewed publications. [Research Dissemination]

**Robert L. Kerr** teaches media law classes for journalism and mass communication students at the University of Oklahoma, USA. Students voted him the 2004 recipient of his college's teaching award. He completed his PhD at the University of North Carolina at Chapel Hill, USA. His research focuses on First Amendment legal and public policy issues. He is the author of the forthcoming *The corporate free-speech movement: Cognitive feudalism and the endangered marketplace of ideas*. Prof. Kerr's most recent journal article is "Justifying corporate speech regulation through a town-meeting understanding of the marketplace of ideas," *Journalism and Communication Monographs* (2007). He has also published recent articles in *Journalism and Mass Communication Quarterly*, *Communication Law and Policy*, and *American Journalism*. [Intellectual Property Law]

**Joann Keyton** is a professor of communication at North Carolina State University, USA. She is editor of *Communication Currents* and associate editor of *Small Group Research*. She is the author of *Communication and organizational culture: A key to understanding work experiences*, and editor, with Pam Shockley, of *Case studies for organizational communication: Understanding communication processes*. [Organizational Culture]

**Do Kyun Kim** holds a PhD from Ohio University, USA, and is a lecturer at Northeastern University, USA, and expert in the fields of diffusion of innovation, social network analysis, media effects, and communication and social change. His research has focused on communication methodologies to design diverse diffusion strategies, such as health information diffusion and implementation of climate change prevention behaviors. He is also an affiliate researcher of the Center of Excellence in Climate Change Communication Research at George Mason University, USA. [Diffusion of Information and Innovation]

**Eun Joo Kim** is assistant professor of the Graduate School of Education and director of the Center for Teaching and Learning at Yonsei University, South Korea. She is the author of *Tools for effective teaching* (2006) and has published numerous articles on instructional communication, self-presentation, self-construals, and communication apprehension. Her current research interests include self-determination theories, online game addiction, relatedness, and psychological well-being. [Impression Management]

**Joohan Kim** is associate professor of communication at Yonsei University in Seoul, Korea. He was assistant professor at Boston College, USA, graduating from the Annenberg School for Communication at the University of Pennsylvania, USA. His articles have been published in *Journal of Communication*, *Mass Communication and Journalism Quarterly*, *Political Communication*, *Semiotica*, and *Human Studies*. [Communication Apprehension]

**Min-Sun Kim** is professor in the Department of Speech at the University of Hawaii at Manoa, USA. Focusing on the role of cognition in conversational styles among people from different cultures, her work centers on the cultural relativity of communication theories,

which culminated in her book, *Non-western perspectives on human communication* (2002). She has been chair of the Intercultural and Development Communication Division of the International Communication Association and president of the Korean American Communication Association. [Communication as an Academic Field: East Asia; Intercultural Norms]

**Young Yun Kim** is a professor of communication at the University of Oklahoma, Norman, USA. She is a fellow of the International Communication Association and a charter fellow of the International Academy for Intercultural Research. Her publications include *Becoming intercultural* and *Communicating with strangers* (with W. B. Gudykunst). [Acculturation Processes and Communication]

**Andrew King** is senior lecturer in the Media Department of Canterbury Christ Church University, UK, specializing in media history. He has published widely on nineteenth-century print media; his publications include *The London Journal 1845–1883* (2004) and, with John Plunkett, *Victorian print media* (2005). [Magazine, History of]

**Paul E. King** is a professor of communication studies at Texas Christian University, Fort Worth, USA. He has taught a course in listening for well over 20 years and has published research in the area of human information processing in journals such as *Communication Monographs*, *Human Communication Research*, *Communication Education*, and *Communication Quarterly*, along with others. In addition, Prof. King's interest in listening led him to gain extensive training and experience in mediation and conflict resolution. He regularly works as a consultant in those areas. [Listening]

**Terry A. Kinney** holds a PhD from the University of Wisconsin, USA, and is an associate professor in the Department of Communication at Wayne State University, USA. His research focuses broadly on verbal aggression, message design elements, and linking stress to well-being. He has published in *Human Communication Research*, *Communication Monographs*, *Journal of Language and Social Psychology*, *Journal of Social Psychology*, *Motivation and Emotion*, *Communication Research*, and *Academic Emergency Medicine*. He is currently editing a book that brings together an international group of scholars and researchers who are examining the fundamental hurting and healing properties of language. [Hate Speech and Ethnophaulisms]

**Spiro Kiouis** holds a PhD from the University of Texas, USA, and is currently an associate professor and chair in the Department of Public Relations at the University of Florida, USA. His research specializations include political communication, political public relations, and new media. His research has appeared in several leading journals, including *Communication Research*, *Journal of Communication*, *Harvard International Journal of Press/Politics*, *International Journal of Public Opinion Research*, *Journal of Public Relations Research*, and *Journalism Studies*. [Issue Management in Politics]

**Neil Kirkham** lectures in cultural studies at the University of the Arts London, UK. He is currently completing his PhD, which will be published as the monograph *Mere*

*pornographers?* He is also working on a number of essays, including a contribution to the forthcoming *Hard to swallow*. [Voyeurism]

**Jenny Kitzinger** is professor of media and communications research at Cardiff University, UK. She is author of *Framing abuse* (2004) and co-author of *The mass media and power in modern Britain* (1997), *The circuit of mass communication in the AIDS crisis* (1999), and *Human cloning in the media* (2007). [Sexual Violence in the Media]

**Ullamaija Kivikuru** is professor of journalism at the University of Helsinki, Finland. She has lived and visited frequently in eastern and southern Africa, studying in particular community-level media and media and democracy. She is one of the editors of the *Global Journal of Communication for Development and Social Change* and serves on the editorial board of four other international journals in the field. At home, she has been especially interested in questions of media and democracy, as well as media criticism. She is currently involved in a large program studying power relations in Finnish society. [Community Media]

**Mathias Klang**, after studying law, began working as a lecturer and researcher in legal informatics at Göteborg University, Sweden. His research is in the field of technology and rights and he completed his PhD on “Disruptive technology: Effects of technology regulation on democracy” in October 2006. Mathias is a team member of the Free Software Foundation Europe and Project Lead for Creative Commons Sweden. See the weblog at <http://digital-rights.net>. [Internet, Technology of]

**Jan Kleinnijenhuis** is professor of communication science at the Free University Amsterdam, the Netherlands. He is author of *Doing research in political science* (1999, 2006, with Paul Pennings and Hans Keman). His recent research articles deal with news effects on corporate reputation and on political preferences. [Negativity; Public Relations; Media Influence]

**Hans J. Kleinsteuber** is a professor of political science as well as of journalism and communication at the University of Hamburg, Germany. He is director of the Research Center Media and Politics and has published books and articles on comparative aspects of media systems, politics, economics, and technology as well as on global communication, travel journalism, etc. [Convergence of Media Systems]

**Wolfgang Kleinwächter**, professor of Internet policy and regulation at the University of Aarhus, Denmark, has been involved in the Internet Corporation for Assigned Names and Numbers and the World Summit on the Information Society since its beginning. He was a member of the Working Group on Internet Governance and serves as special advisor to the chair of the Internet Governance Forum. He has published numerous articles on Internet governance. [Domain Names; Internet: International Regulation]

**Christoph Klimmt** is assistant professor for mass and online communication at the Department for Journalism and Mass Communication, Johannes Gutenberg University of Mainz, Germany. He heads several research projects on video games and has been

involved in projects on media entertainment since the year 2000 at the Department of Journalism and Communication Research, Hanover University of Music and Drama, Germany. He currently serves on the editorial board of three international journals in communication and media psychology. [Enjoyment/Entertainment Seeking; Escapism]

**James F. Klumpp** is professor of communication at the University of Maryland, USA. He is author and compiler of *American rhetorical discourse* (2005, with Ronald F. Reid) and author of *Making sense of political ideology: The power of language in democracy* (2005, with Bernard L. Brock, Mark E. Huglen, and Sharon Howell). [Rhetoric in North America: United States]

**Mark L. Knapp** is Jesse H. Jones Centennial Professor in Communication and University of Texas Distinguished Teaching Professor at the University of Texas at Austin, USA. He is author of *Nonverbal communication in human interaction* (6th edn. 2005, with J. A. Hall) and *Interpersonal communication and human relationships* (5th edn. 2004, with A. L. Vangelisti). [Eye Behavior; Rhetoric, Nonverbal]

**Thomas Knieper** is visiting professor of media studies at the Technical University at Brunswick, Germany. He is a graduate statistician and received his doctoral degree in mass communication in 1995. His postdoctoral thesis in 2001 was about editorial cartooning. His primary interests are television series, political communication, journalism, and visual communication. [Caricature]

**Leanne K. Knobloch** holds a PhD from the University of Wisconsin-Madison, USA, and is an assistant professor in the Department of Speech Communication at the University of Illinois, USA. Her research addresses how communication shapes and reflects people's understandings of close relationships, particularly with respect to relationship development, relational uncertainty, and interdependence. Her work has been published in *Communication Monographs*, *Communication Research*, and *Human Communication Research*. [Relational Uncertainty]

**Silvia Knobloch-Westerwick** holds a PhD from the Institute for Journalism and Communication Research, Hanover University of Music and Drama, Germany, and is an associate professor in the School of Communication, Ohio State University, USA. Her research addresses media effects and message selection in entertainment media and news. [Information Seeking; Informational Utility; Mood Management]

**Susan Koch-Weser** is a postdoctoral fellow at the Harvard School of Public Health and an adjunct assistant professor at the Tufts University School of Medicine, USA. Her research focuses on how individual characteristics, such as literacy levels, and social structures, such as community organizations, contribute to or inhibit the flow of health information. [Social Capital and Communication in Health]

**Ascan F. Koerner** is an associate professor of communication studies and member of the interdisciplinary relationship research program at the University of Minnesota, USA. His

main interests are in the areas of family communication, social cognition, persuasion, and evolutionary theory. He has published in communication-related and interdisciplinary outlets, including the *Handbook of family communication*, *Communication Monographs*, and *Journal of Social and Personal Relationships*. [Relational Schemas]

**Steffen Kolb** is a lecturer at the University of Fribourg, Switzerland. Dr. Kolb is the author of *Mediale Thematisierung in Zyklen* (Media coverage in cycles, 2005) and *Verlässlichkeit von Inhaltsanalysedaten* (Reliability of content analysis data). [Comparative Research]

**Elly A. Konijn** is an associate professor of communication at the Free University Amsterdam, the Netherlands. She received a prestigious Aspasia grant from the Netherlands Organization for Scientific Research for her research into affect and the blurring borders of fiction and reality in media fare. Dr. Konijn has published in, among others, *Media Psychology*, *Discourse Processes*, *International Journal of Human-Computer Studies*, and *Developmental Psychology*. She has written several books, and co-edited *Mediated interpersonal communication* (forthcoming). [Affects and Media Exposure]

**Emily Zobel Kontos** completed an AB in biomedical ethics from Brown University, USA, and an ScM in the Department of Society, Human Development and Health at Harvard School of Public Health, USA. She is interested in translating health communication research into public health practice. Before returning to the Harvard School of Public Health to pursue her doctoral studies, she was the communications coordinator for the Nutrition and Physical Activity Unit at the Massachusetts Department of Public Health, USA. She also served as the health literacy studies coordinator at the Harvard School of Public Health. [Health Literacy]

**Cees Koolstra** is associate professor and research manager at the Department of Communication Science at the Free University Amsterdam, the Netherlands. His research focuses on mechanisms in and effects of media use, among them media multitasking, reading subtitles of TV programs, source confusion, and public understanding of science. He has publications in journals such as *Human Communication Research*, *Journal of Communication*, and *Communication Research*. [Multitasking]

**Barbara Köpplová** is an associated professor and vice dean of the Faculty of Social Sciences at Charles University in Prague, Czech Republic, and a member of its Media Studies Department. She graduated in Czech and German language and literature at Charles University and her CSc (equivalent of a PhD) was earned from the Academy of Sciences of the Czech Republic. She is an author and co-author of books on media studies and media history, and of many academic articles. [Communication as an Academic Field: Eastern Europe and Russia; Czech Republic: Media System]

**Irene Koshik** is associate professor in the Division of English as an International Language at the University of Illinois at Urbana-Champaign, USA. Her publications include articles in *Journal of Pragmatics*, *Research on Language and Social Interaction*, *Discourse Studies*, *Annual Review of Applied Linguistics*, and *Issues in Applied Linguistics*,

and a book titled *Beyond rhetorical questions: Assertive questions in everyday interaction*. [Questions and Questioning]

**Gerald Kosicki** holds a PhD from the University of Wisconsin-Madison, USA, and is associate professor in the School of Communication at Ohio State University (OSU), USA. He was faculty director of the OSU Center for Survey Research from 2001 to 2004. He manages an interdisciplinary program in survey education for the College of Social and Behavioral Sciences. [Perceived Reality as a Communication Process]

**Mariko Kotani** holds a PhD from Temple University, USA, and is an adjunct faculty member in the Department of English and the graduate program in the Department of International Communication at Aoyama Gakuin University, Tokyo. She was assistant professor (1999–2003) and associate professor (2003–2006) of communication, and the organizer of the lecture series “Communication Research: The State of the Art” (2002), in the Department of English at Aoyama Gakuin University. Her research has appeared in *Research on Language and Social Interaction*, *Intercultural Communication Studies*, and the book *Japanese apology across disciplines*. [Apologies and Remedial Episodes]

**Dan V. Kozlowski** is an assistant professor in the Department of Communication at Saint Louis University, USA. His research interests include media law and free expression issues, including a focus on international and comparative law. He has presented his research at numerous academic conferences and has published in *Communication Law and Policy* and *The Cooperstown symposium on baseball and American culture: 2005–2006*. [European Court of Human Rights]

**Marwan M. Kraidy** is associate professor at the Annenberg School for Communication at the University of Pennsylvania, USA. A former fellow at the Woodrow Wilson International Center for Scholars, he has authored *Hybridity, or, the cultural logic of globalization* and co-edited *Global media studies: Ethnographic perspectives*. His current book project is *Screens of contention: Reality TV and Arab politics*. [Arab Satellite TV News; Hybridity Theories]

**Michael W. Kramer**, professor and chair of the Department of Communication, has twice won teaching awards at the University of Missouri, USA. He has used the bona fide group perspective to explore theater and nonprofit groups. His research spans other areas including employee transitions as part of the assimilation/socialization process, uncertainty management, and emotion management. He co-edited a special issue on institutional review boards for the *Journal of Applied Communication*. He currently serves on five editorial boards for communication journals. [Bona Fide Groups]

**Nicole C. Krämer** is professor for social psychology (media and communication) at the University of Duisburg-Essen, Germany. Her research interests include the effects of nonverbal behaviour, embodied conversational agents in human–computer interaction, and the emotional effects of movies. Dr. Krämer has been awarded two best paper awards in the area of embodied conversational agents and has been invited as an expert in

nonverbal communication by the National Academies. She is currently editing a textbook on media psychology. [Nonverbal Signals, Effects of]

**Paul Krause** is professor of software engineering at the University of Surrey, UK. He holds a PhD in geophysics, and a BSc in pure mathematics and physics, both from the University of Exeter, UK. After seven years' research in low-temperature metrology, he moved into software engineering research, in which domain he has happily spent the last 20 years. Originally focusing on analysis and testing of embedded software systems, he is now increasingly blending hobby with work in studies of both natural and digital ecosystems. [P2P Networking]

**Marina Krcmar** holds a PhD from the University of Wisconsin-Madison, USA, and is an associate professor at Wake Forest University, USA. Her research focuses on children, adolescents, and the media. Her most recent research has examined the effect of violent video games on adolescents and the role of media consumption in adolescent risk-taking. Her research has appeared in *Journal of Communication*, *Human Communication Research*, *Media Psychology*, *Communication Research*, *Communication Theory*, *Journal of Broadcasting and Electronic Media*, and other journals. [Media Use by Children]

**Matthew W. Kreuter** is professor of community health and founder (1996) and director of the Health Communication Research Laboratory at the Saint Louis University School of Public Health, USA. He also directs the Center for Cultural Cancer Communication, one of four National Cancer Institute Centers of Excellence in Cancer Communication Research. [Culture and Health Communication]

**Klaus Krippendorff** is Gregory Bateson Term Professor for Cybernetics, Language, and Culture at the Annenberg School for Communication at the University of Pennsylvania, USA. He has authored and edited books on cybernetics, information theory, content analysis, and design, and published numerous journal articles and book chapters on communication theory, social science methodology, constructivism, epistemology, and emancipation. He is an elected fellow of several professional organizations, among them the American Association for the Advancement of Science and the International Communication Association (ICA), and has served on numerous editorial boards of communication journals and as ICA's president. [Cybernetics; Generalizability; Information; Reliability; Systems Theory; Validity]

**Kathleen J. Krone** is professor of organizational communication in the Department of Communication Studies at the University of Nebraska-Lincoln, USA. She is a past chair of the Organizational Communication Division of the National Communication Association. She is co-editor with Linda L. Putnam of the multi-volume reference work *Organizational communication* (2006). She has served on the editorial boards of the *Journal of Applied Communication Research*, *Management Communication Quarterly*, and *Communication Monographs*, and currently is serving as forum editor for *Management Communication Quarterly*. [Organizational Metaphors]

**Timothy Kuhn** is an associate professor in the Department of Communication at the University of Colorado at Boulder, USA. His interests revolve around understanding organizations as complex discursive systems, which directs his attention to processes of identity construction, knowledge development, and corporate social responsibility. His research has appeared in a variety of outlets, including *Organization Studies*, *Management Communication Quarterly*, *Human Communication Research*, and *Communication Monographs*. [Organizational Identification]

**Shanti Kumar** is associate professor in the Department of Radio-Television-Film at the University of Texas at Austin, USA. He is the author of *Gandhi meets primetime: Globalization and nationalism in Indian television* (2006), and the co-editor of *Planet TV: A global television reader* (2003). [Postcolonial Theory]

**Michael Kunczik** is professor of communication at the Department of Journalism and Mass Communication at the Johannes Gutenberg University of Mainz, Germany. He has researched violence and the mass media, theories of mass communication, international communication (images of nations and international public relations), mass media and social change, and media economics and ethics in journalism. [Functional Analysis; Latitude of Acceptance; Victimization, Secondary; Violence as Media Content, Effects of]

**Risto Kunelius** is professor of journalism at the University of Tampere, Finland. He is the director of the journalism program and the coordinator of graduate studies in the Department of Journalism and Mass Communication and a vice dean of the Faculty of Social Sciences. His main study interests have lately been journalism and professionalism, public journalism movement, global media events, and media history. He is a member of the editorial board of *Javnost – The Public*. [Plurality]

**Lucy Küng** is associate professor of media management and media economics at Jönköping University, Sweden. She is author of *Inside the BBC and CNN: Managing media organizations* (2000) and *Strategic management in the media* (2008), and editor of *The Internet and the mass media* (with Robert Picard and Ruth Towse, forthcoming). [Media Management]

**William M. Kunz** is an associate professor in the interdisciplinary arts and sciences program at the University of Washington Tacoma, USA. He is the author of *Culture conglomerates: Consolidation in the motion picture and television industries* (2006). He is also a four-time Emmy Award-winning producer with ABC Sports and NBC Sports and oversaw all television operations for the 2001 Goodwill Games in Australia for Turner Sports. [Diversification of Media Markets; Media Corporations, Forms of]

**David D. Kurpius** is an associate professor at theanship School of Mass Communication at Louisiana State University, USA. He has authored articles and book chapters on public journalism, primarily looking at the role of television. He worked as a television reporter, producer, and news director before earning his doctoral degree at the University of Wisconsin, USA. [Public Journalism]

**Anastacia Kurylo** is vice president of the New Jersey Communication Association and an assistant professor of communication arts at Marymount Manhattan College, USA. Previously she taught intercultural communication, interpersonal communication, organizational communication, and public speaking at the Borough of Manhattan Community College, New York University, Pace University, Rutgers University, and St. John's University, USA. She studies the interactions in which stereotypes are communicated and the consequences of these stereotypes for interpersonal, intercultural, and organizational outcomes. [Information Processing: Stereotypes]

**Dagmar Kusche** is currently an independent scholar in Eichstätt, Germany. Dr. Kusche studied journalism for his diploma at the Catholic University of Eichstätt and specialized in the system of mass communication in Colombia. In 1997 she did a doctorate in the history of Latin America and wrote a doctoral thesis on the problems of the formation of a national identity of Colombia in print media between 1900 and 1930. [Colombia: Media System]

**Betty H. La France** is an associate professor in the Department of Communication at Northern Illinois University, USA. Her scholarship focuses on interpersonal influence including the examination of destructive communication, and her analytic area of expertise is quantitative methodology and analysis. She has published in *Communication Monographs*, *Communication Quarterly*, *Communication Studies*, and other journals. [Attitude Functions]

**Barbara A. Lafferty** is an assistant professor of marketing at the University of South Florida, Tampa, USA. Her research interests include endorser and corporate credibility, cause–brand alliances, and social marketing. She has published articles in such journals as the *Journal of Advertising*, *Journal of Business Research*, *Psychology and Marketing*, *European Journal of Marketing*, *Corporate Reputation Review*, *Journal of Global Marketing*, and *Journal of Marketing Theory and Practice*, primarily writing about endorser credibility, corporate credibility/reputation, and cause–brand alliances. [Advertising, Endorsement in]

**Jacqueline Lambiase** teaches writing, technology, public relations, and qualitative research at the University of North Texas Department of Journalism in Denton, Texas, USA. Dr. Lambiase is co-editor of two books with Tom Reichert, *Sex in advertising: Perspectives on the erotic appeal* (2003) and *Sex in consumer culture: The erotic content of media and marketing* (2006). Her journal articles and book chapters focus on rhetoric, gender, computer-mediated communication, and social media. [Internet and Popular Culture]

**Erich Lamp** is an academic director and private lecturer at the Johannes Gutenberg University of Mainz, Germany. Research interests include the history and theory of public opinion and the methodology of public opinion research. [Public Opinion, Media Effects on]

**Claudia Lampert** is a senior researcher at the Hans Bredow Institute at the University of Hamburg, Germany. Her main research topics are media-related health communication

and media socialization. She took part in a project about the presence of alcohol on television and, in her PhD thesis, investigated the opportunities for entertainment education for health promotion with regard to adolescents. She is also a founding member of the German health communication network, [www.netzwerk-gesundheitskommunikation.de](http://www.netzwerk-gesundheitskommunikation.de). [Prevention and Communication]

**Derek R. Lane** is an associate dean in the College of Communications and Information Studies, associate professor in the Department of Communication, and the H. Lester Reynolds Endowed Professor of Engineering at the University of Kentucky, USA. His research interests focus on message reception and processing related to how individuals come to understand, organize, and use the information contained in face-to-face and mediated messages. [Classroom Instructional Technology]

**Annie Lang**, a professor of telecommunications at Indiana University, USA, studies motivated cognition and media. Her research has been funded by the National Institute on Drug Abuse and the National Institute of Mental Health. She received the Kreighbaum under-40 award from the Association for Education in Journalism and Mass Communication in 1997 and was elected a fellow of the International Communication Association in 2006. She serves on the editorial boards of six major communication journals. [Limited Capacity Model]

**Roy Langer** holds a PhD from Copenhagen Business School, Denmark, and is professor of communications in the Department of Communication, Business and Information Technologies, Roskilde University, Denmark. In addition to three books, he has published in journals such as *Corporate Communications: An International Journal*, *Corporate Reputation Review*, *Psychology and Marketing*, and *Qualitative Market Research*. [Legitimacy Gap Theory]

**Richard Leo Lanigan, Jr.**, is University Distinguished Scholar and professor of communication, Southern Illinois University, USA. He is founding director and fellow of the International Communicology Institute. He was a Fulbright senior fellow (People's Republic of China) and the founding chair of the Philosophy of Communication Division in the International Communication Association. [Communicology; Phenomenology]

**Maria Knight Lapinski** is joint-appointed as an associate professor in the Department of Communication, the National Food Safety and Toxicology Center, and the Michigan Agricultural Experiment Station at Michigan State University (MSU), USA. Dr. Lapinski received her doctorate in 2000 from MSU and her Master's from the University of Hawaii, Manoa, USA. She researches the impact of messages and social psychological factors on health and environmental perceptions and behaviors, with a particular interest in culturally based differences and similarities; to this end, she has conducted research projects in a number of countries in Asia, the Pacific Rim, Central America, and Africa. [Social Norms]

**Ladori Lara** is a doctoral candidate in the Department of Communication Arts and Sciences at the Pennsylvania State University, USA. [Teacher Communication Style]

**Robert LaRose** is a professor in the Department of Telecommunication, Information Studies and Media at Michigan State University, USA. He holds a PhD in communication theory and research from the University of Southern California, USA. He is the co-author of a widely used introductory textbook, *Media now*. [Habituation]

**Larsåke Larsson** is professor of media and communication at Örebro University, Sweden, and head of the public relations education/research section of the Media and Communication department. He is researching in three areas: journalism, public relations, and crisis communication. He is the author of several Swedish university textbooks in public relations. He has a background as an information manager and was in that period board member of one of the public relations associations in Sweden. [Media Relations]

**Dominic Lasorsa** is an associate professor of journalism at the University of Texas at Austin, USA. He is co-author of *How to build social science theories* (2004) and *The national television violence study* (1998). Her research investigates the role of the media in processes of racial/ethnic stereotype formation and application and can be found in journals such as *Communication Monographs*, *Communication Research*, *Media Psychology*, and the *Journal of Broadcasting and Electronic Media*, as well as in books such as *Media effects: Advances in theory and research*. [Media and Group Representations]

**Donald Matheson** is a senior lecturer in the School of Political Science and Communication at the University of Canterbury, New Zealand. Prior to that he worked at Cardiff and Strathclyde universities in the UK, and before that as a news reporter. He is co-editor of *Ethical Space: The International Journal of Communication Ethics* and the author of *Media discourses: Analysing media texts* (2005). His research interests are in journalism practice, particularly its digital forms, discourse analysis, and communication ethics. [Citizen Journalism, History of; Newspaper Journalism]

**Jörg Matthes** holds an MA in psychology from the University of Jena, Germany, and is a doctoral candidate and a faculty member at the Institute of Mass Communication and Media Research, University of Zurich, Switzerland. He has published in journals such as *Communication Research*, *International Journal of Public Opinion Research*, *Public Understanding of Science*, and *Communications: The European Journal of Communication Research*. [Schemas and Media Effects]

**Clemens Matuschek** is a research assistant at Hamburg Media School, University of Hamburg, Germany. His scientific and teaching focus is on music journalism, new media, and international comparative journalism research. As well, he has been and constantly is working for various German and American newspapers. [News Production and Technology]

**Marcus Maurer** is an assistant professor of communication science at the Johannes Gutenberg University of Mainz, Germany. He is author and co-author of several books and has published articles in journals like *Journal of Communication*, *Communication Research*, *International Journal of Public Opinion Research*, and *European Journal of Communication*. [News Audience; Televised Debates; Two-Step Flow of Communication]

**Aysha Mawani** is a PhD candidate in the Department of Art History and Communication Studies, McGill University, Canada. Her current research is focused on critical policy matters pertaining to globalization and governance, and specifically the tensions between trade and culture. She has extensive experience working within international organizations, including UNICEF and the UN Development Program in New York. [International Communication Agencies]

**Sharon R. Mazzarella** holds a PhD from the University of Illinois, USA, and is associate professor in the Communication Studies Department at Clemson University, USA. She is the editor of *20 questions about youth and the media* (2007) and *Girl wide web: Girls, the Internet, and the negotiation of identity* (2005). [Girl Culture]

**Gianpietro Mazzoleni** is professor of political communication at the University of Milan, Italy. He is the editor of *The media and neo-populism* (2003) with J. Stewart and B. Horsfield (2003), and author of the handbook *La comunicazione politica* (2004) and of *The politics of representation* with Juliet Roper and Christina Holtz-Bacha (2004). [Italy: Media System; Media Logic; Mediated Populism; Mediated Terrorism; Mediatization of Politics; Mediatization of Society]

**Matthew P. McAllister** is an associate professor in the Department of Film/Video and Media Studies at Pennsylvania State University, USA. He is the author of *The commercialization of American culture* (1996), and the co-editor of *Comics and ideology* (2001, with Edward H. Sewell, Jr., and Ian Gordon) and *Film and comic books* (2007, with Ian Gordon and Mark Jancovich). [Advertising, Economics of; Consumer Culture]

**Emile G. McAnany** is Schmidt Professor of Communication at Santa Clara University in Silicon Valley in California, USA. He has worked for almost four decades in communication for social change and is currently writing a book on the history of this field. He is the author/editor of 10 books and numerous articles and chapters. He previously taught at the University of Texas at Austin and Stanford University, USA. Current interest focuses on information and communication technologies for development. [Free Flow of Information; Rural Development; Schramm, Wilbur]

**Robert M. McCann** is an associate professor of management communication in the Marshall School of Business of the University of Southern California, USA. He received his PhD in communication from the University of California, Santa Barbara. Dr. McCann has published articles in journals that include *Human Communication Research*, *Communication Studies*, *Communication Yearbook*, *Communication Research Reports*, *Communication Reports*, *Journal of Cross-Cultural Gerontology*, and *Journal of Asian Pacific Communication*. He is also an editorial board member of the *Journal of Asian Pacific Communication*. Dr. McCann's primary research interests center on social perceptions of older individuals, workplace agism, and intergroup communication, primarily in cross-cultural contexts. His recent research projects have taken place in Thailand, Vietnam, Laos, Japan, South Korea, Taiwan, Australia, and the USA. [Mindfulness and Automaticity]

**Samuel McCormick** is an assistant professor at Purdue University, USA. He recently won the Donald C. Bryant Rhetorical Studies Award and a top paper award from the Religious Communication Association. His work has appeared in the *Quarterly Journal of Speech*, *Philosophy and Rhetoric*, and several edited volumes. [Hermeneutics]

**Linda L. McCroskey** has served on the editorial boards of the *Journal of Intercultural Communication Research*, *Communication Research Reports*, and *Communication Education*, and as a reviewer for *Communication Yearbook*. She has been an active reviewer, presenter, organizer, and respondent for the Association for Business Communication, Eastern Communication Association, Western Speech Communication Association, National Communication Association, International Communication Association, World Communication Association, Pacific and Asian Communication Association, Association for Information Systems, and Speech Communication Association of Puerto Rico. Dr. McCroskey has co-authored chapters in several seminal instructional and educational communication texts: *An introduction to communication in the classroom*, *Communication for teachers*, *Instructional communication: Rhetorical and relational perspectives*, *The handbook of nonverbal communication*, and *Organizational communication for survival: Making work, work!* [Teacher Affinity Seeking]

**Daniel G. McDonald** is professor of communication at Ohio State University, USA. He has published a number of articles in *Communication Research*, *Journal of Broadcasting and Electronic Media*, and other outlets. [Attention; Co-Viewing; Disowning Projection; Internet; Media Content in Interpersonal Communication; Radio Networks]

**Liz McFall** is lecturer in sociology at the Open University, UK. Her interests are centered upon economic life, work, and consumption in the nineteenth century. She is the author of *Advertising: A cultural economy* and a number of articles exploring nineteenth-century promotional culture, consumption, and life assurance. [Advertising, History of]

**Bernard McKenna** is a senior lecturer at University of Queensland Business School, Australia. He has published in *Applied Linguistics*, *Social Semiotics*, *Critical Discourse Studies*, and *Leadership Quarterly*, and is on the advisory board of several journals. Apart from his extensive research in critical discourse analysis and corporate and organizational communication, McKenna has latterly been researching the nature of wisdom in leadership. His co-authored book, *Managing wisdom in the knowledge economy*, is due in 2008. [Communication as an Academic Field: Australia, New Zealand, Pacific Rim]

**Catherine McKercher** is associate professor in the School of Journalism and Communication at Carleton University in Ottawa, Canada. She is the author of *Newsworkers unite: Labor, convergence and North American newspapers* (2002) and is co-editor of the forthcoming volume *Knowledge workers in the information age*. [Labor Unions in the Media]

**Luke McKernan** is head of information at the British Universities Film and Video Council, UK. Dr. McKernan is a historian of early and silent cinema. His publications include *Who's who of Victorian cinema* (1996, co-ed. with Stephen Herbert) and *Yesterday's news: The British cinema newsreel reader* (2002). [Cinematography, History of; Newsreel]

**Greg McLaughlin** lectures in media and journalism at the University of Ulster, UK. He is the author of *The war correspondent* (2002) and of articles on the media and conflict, including, most recently, "Profits, politics and paramilitaries: The local news media in Northern Ireland" (in *Local journalism and local media*, ed. Bob Franklin, 2006); and, with Stephen Baker, "Alternative press, the 'war on terror' and Northern Ireland" (in *U.S. and the other: Global media images on "the war on terror,"* eds. Stig A. Nohrstedt and Rune Ottosen, 2004). Dr. McLaughlin is currently writing a book with Stephen Baker on the role of propaganda in conflict transformation in Northern Ireland. [Balance]

**Douglas M. McLeod** is a professor of journalism and mass communication at the University of Wisconsin, USA. Before coming to Wisconsin in 2000, he taught for 11 years at the University of Delaware, USA. McLeod has published 75 journal articles and book chapters, and is currently working on a book examining how news framing of the USA Patriot Act influences audience assessments of issues related to national security and civil liberties. His research focuses on the effects of the media in the context of domestic and

international conflicts, including social protests. Specifically, he has focused on media framing and priming effects on knowledge, participation, attitudes, and perceptions. [Planned Social Change through Communication]

**Jack M. McLeod** is Maier-Bascom Professor Emeritus and former chair, Mass Communications Research Center, University of Wisconsin-Madison, USA. He is an International Communication Association (ICA) fellow (1988), the recipient of the ICA B. Aubrey Fisher Mentorship award for service to students and to communication research (1991), and co-recipient with Steven Chaffee of the ICA Murray Edelman award for career achievement (2001). He was Steven Chaffee's colleague and collaborator at Wisconsin for 17 years and remained a close friend thereafter. [Chaffee, Steven H.]

**Mark Lawrence McPhail** holds a PhD from the University of Massachusetts, USA, and is professor and chair of corporate communication and public affairs at Southern Methodist University. He is the author of *Zen in the art of rhetoric: An inquiry into coherence* and *The rhetoric of racism revisited: Reparations or separation?* His scholarship has been published in the *Quarterly Journal of Speech*, *Critical Studies in Mass Communication*, and *Howard Journal of Communications*, and his creative work has appeared in *Dark Horse Magazine* and *American Literary Review*. His research interests include rhetorical theory and epistemology, the rhetoric of racism, and visual rhetoric. [Rhetoric and Race]

**Robert D. McPhee** holds a PhD from Michigan State University, USA, and is a professor in the Hugh Downs School of Human Communication at Arizona State University, USA. Specializing in communication theory and methods and in organizational communication, he has served as chair of the Organizational Communication Division of the National Communication Association (NCA), as associate editor of *Human Communication Research*, and as book review editor of *Communication Theory*. Among his specific research interests are organizational hierarchies, organizational knowledge, the communicative constitution of organizations, and structuration theory. A book he co-edited, *Organizational communication: Traditional themes and new directions*, won the NCA Organizational Communication Division Research Award. [Organizational Structure]

**Denis McQuail** is professor emeritus in the School of Communication Research, University of Amsterdam, the Netherlands. Before teaching at Amsterdam, he was professor of sociology at the University of Southampton, UK. His recent publications include *Mass communication theory* (5th edn. 2005), *Communication theory and research* (ed., 2005), and *Media accountability and freedom of publication* (2003). He is an editor of the *European Journal of Communication*. [Americanization of the Media; Communication as an Academic Field: Western Europe; Media Performance; Models of Communication]

**Robin R. Means Coleman** is an associate professor of communication studies at the University of Michigan, USA. She is the author of *African Americans and the black situation comedy: Situating racial humor* (2000) and the editor of *Say it loud! African American audiences, media and identity* (2002). [Symbolic Annihilation]

**Mary M. Meares** is an assistant professor in the Edward R. Murrow School of Communication at Washington State University, USA. Her research focuses on diversity in the workplace, intercultural groups, virtual intercultural groups, and issues of voice. Topics include the use of technology as an outlet for employee dialogue and dissent, intercultural virtual groups, and diversity competence in organizations. Her dissertation on women's and minorities' perceptions of voice in the workplace won the National Communication Association's International and Intercultural Division Distinguished Dissertation award in 2003. Dr. Meares has published research in the *Journal of Applied Communication Research*, *Communication Research Reports*, and the *Journal of Intergroup Relations*. [Organizations, Cultural Diversity In]

**Jamie Medhurst** is director of learning and teaching and lecturer in film and television history at the Department of Theatre, Film and Television Studies, Aberystwyth University, Wales, UK. He is writing a history of independent television in Wales and is also researching the early history of television at the BBC. Dr. Medhurst has published on broadcasting history and policy in the UK. [Public Broadcasting, History of]

**Eileen R. Meehan** is a professor of radio and television at Southern Illinois University, USA. She is the author of *Why TV is not our fault* and co-editor of *Dazzled by Disney? The global Disney audiences project*, with Janet Wasko and Mark Phillips, and of *Sex and money: Feminism and political economy in the media*, with Ellen Riordan. Meehan's journal articles examine the audience and ratings commodities as well as transindustrial structure and commercial intertextuality. [Audience Commodity]

**Kevin Meethan** is a senior lecturer in sociology at the University of Plymouth, UK, and also a visiting professor at the Wageningen University, the Netherlands. He has a PhD in social anthropology from the University of Sussex, UK, and has been researching and writing about tourism for a number of years. His research interests include globalization, cultural change and consumption; the cultural industries; and regeneration policy. Dr. Meethan is an active member of the Tourism Research Committee of the International Sociological Association, and also a member of the British Sociological Association. He is a member of the editorial boards for *Tourism Today* and *Cultural Sociology*. [Tourism Industry]

**Srinivas R. Melkote** has been a teacher in the field of journalism and media studies for over 25 years. He has taught at universities in India and in the USA. He is currently a professor in the School of Communication Studies at Bowling Green State University, Ohio, USA. Prof. Melkote has published extensively on issues such as development communication, satellite broadcasting, health communication, and media effects. Among his publications is the widely used text *Communication for development in the third world*, co-authored with Leslie Steeves. Prof. Melkote's research interests include international communication, communication strategies for HIV/AIDS prevention, and health communication. [Development Support Communication]

**Toby Mendel** is the Law and Asia Programmes Director at Article 19, an international human rights organization based in London, UK, focusing on freedom of expression. He has

published widely in the area of access to information and freedom of expression, and has also advised governments and civil society on these issues. [American Convention on Human Rights; Inter-American Court of Human Rights; Licensing of Journalists; Right to Know]

**Kaitlynn Mendes** is a doctoral candidate at Cardiff University's school of Journalism, Media and Cultural Studies, UK. Her thesis examines representations of the second-wave feminist movement in the British and American daily press. She received her Bachelor of Journalism from Carleton University, Canada. Mendes is a member of the Prison Media Monitoring Unit and co-author of their bulletins (2006–2007). She is also serving her second year as the chair of the Media, Communications, and Cultural Studies Association Postgraduate Network. [Feminist and Gender Studies; Sexualization in the Media]

**Usha Menon** is faculty at the University of Illinois-Chicago, USA, and a recognized expert in behavior change theory and interventions. Her research focuses on the development and testing of theory-based, culturally relevant, tailored interventions to increase cancer screening behavior. A major emphasis of this research is on the reduction of health disparities in cancer prevention and increasing early detection among vulnerable populations. Dr. Menon is the 2006 recipient of the first Investigator with a Brilliant Future Award from the American Academy of Nursing/Council for the Advancement of Nursing Science. [Health Belief Model]

**Debra Merskin** is an associate professor in the School of Journalism and Communication at the University of Oregon, USA, where she is head of the communication studies sequence. Her research focuses on stereotyping of women and other minorities in mass media representations. Dr. Merskin's research appears in *Mass Communication and Society*, *Howard Journal of Communication*, and *American Behavioral Scientist*, and she is co-editor (with Mary-Lou Galician) of *Critical thinking about sex, love, and romance in the mass media: Media literacy applications*. [Fandom; Fashion; Popular Communication; Popular Culture; Popular Mythology]

**David Mertz** is an erstwhile academic philosopher and current freelance writer who has written for academic journals including *Social Epistemology*, *Bioethics*, *Rethinking Marxism*, and *Radical Philosophy Review*, and for technology publishers such as IBM, Intel, and O'Reilly. He has also written the programming book *Text processing in Python*. In these various careers, he has written in areas such as philosophy of science, political economy, computational and encoding theory, cryptography, and – guiltily – ethics. [Cyborgs]

**Thomas O. Meservy** is an assistant professor of management information systems at the University of Memphis, USA. He received his PhD from the University of Arizona, USA. His research focuses on using technology to automatically detect deception in audio and video. He has published in *IEEE Computer*, *IEEE Intelligent Systems*, and a variety of conference proceedings. [Paralanguage]

**Paul Messaris** is Lev Kuleshov Professor of Communication at the Annenberg School for Communication at the University of Pennsylvania, USA. He teaches and does research in

the areas of visual communication and digital media. His publications include *Visual literacy: Image, mind, and reality* (1994), *Visual persuasion: The role of images in advertising* (1997), and *Digital media: Transformations in human communication* (2006, co-ed. with Lee Humphreys). [Aesthetics; Digital Imagery]

**Michael Meyen** is professor of mass communication at the Ludwig Maximilian University of Munich, Germany. Research interests include media use, history of media, and history of communication studies. [Document Analysis; Historiography; Noelle-Neumann, Elisabeth]

**Janet R. Meyer** holds a PhD from the University of Michigan, USA, and is an associate professor in the School of Communication Studies at Kent State University, USA. Her research focuses on the cognitive processes underlying message production. Her work has appeared in *Communication Monographs*, *Communication Research*, *Communication Theory*, *Western Journal of Communication*, *Southern Communication Journal*, *Communication Studies*, *Communication Research Reports*, *Journal of Language and Social Psychology*, and several book chapters. [Message Editing]

**Miriam Meyerhoff** is professor of sociolinguistics at the University of Edinburgh, UK. She is particularly interested in language varieties emerging through social and linguistic contact and has done fieldwork on languages of the Pacific and the Caribbean. She is author of *Introducing sociolinguistics*, co-editor of *The handbook of language and gender*, and co-series editor of the Creole Language Library. [Language Varieties]

**Joshua Meyrowitz** is professor of media studies in the Department of Communication at the University of New Hampshire, USA, where he has won the Lindberg Award for Outstanding Scholar-Teacher in the College of Liberal Arts. He teaches courses in mass media, analysis of news, media research, and communication theory. He is the author of the award-winning book *No sense of place: The impact of electronic media on social behavior*. Dr. Meyrowitz's articles on media and society have appeared in numerous scholarly journals and anthologies, as well as in general-interest magazines and newspapers. His writings have been translated into 12 languages. [McLuhan, Marshall; Medium Theory]

**Marcus Michaelsen** is a PhD candidate in the Media Studies Department of the University of Erfurt, Germany, preparing a thesis on the social and political impacts of the Internet in Iran. From 2004 to 2006, he held a fellowship at the French Institute for Research in Iran, Tehran, working on different aspects of the Iranian media. His major research interests relate to the media, political transformation and development in Iran and other Islamic countries. [Iran: Media System]

**Alan C. Mikkelsen** holds a PhD from Arizona State University, USA, and is assistant professor of communication studies at Whitworth University, USA. He has written several articles and book chapters about communication in family relationships and he is on the editorial board of the *Journal of Family Communication*. His current

research focuses on the communication of closeness in adult sibling relationships. [Sibling Interaction]

**Frank E. Millar** is professor of communication at the University of Wyoming, USA. [Relational Control]

**Katherine I. Miller** holds a PhD from the University of Southern California, USA, and is professor and director of graduate studies in the Department of Communication at Texas A&M University, USA. She is the author of textbooks in the areas of communication theory and organizational communication and has published extensively in the areas of emotion in organizations, workplace stress, and communication among health and human service workers. [Organizational Communication]

**Peter V. Miller** is associate professor and chair, Department of Communication Studies, Northwestern University, USA. Since 2001, he has served as editor in chief of *Public Opinion Quarterly*. [Message Discrimination]

**Toby Miller** is chair of the Department of Media and Cultural Studies at the University of California, Riverside, USA. He is the author and editor of over 30 books and edits the journals *Television and New Media* and *Social Identities*. His latest books are *Cultural citizenship: Cosmopolitanism, consumerism, and television in a neoliberal age* (2007) and *Global Hollywood 2* (2005). His work has been translated into Japanese, Chinese, Spanish, German, and Swedish. [Television as Popular Culture]

**Vernon D. Miller** holds a PhD from the University of Texas, USA, and is an associate professor in the Departments of Communication and Management at Michigan State University, USA. His research on employment interviewing, newcomer socialization, information seeking, negotiation, and communication during organizational change has been published in *Communication Monographs*, *Human Communication Research*, *Academy of Management Review*, *Journal of Applied Communication Research*, *Management Communication Quarterly*, *Communication Research*, *Communication Studies*, *Journal of Managerial Issues*, and *The employment interview handbook*. [Organizational Assimilation]

**Young Min** is assistant professor of journalism and mass communication at Korea University, South Korea, and previously at Kyung Hee University, South Korea, and Elon University, USA. She obtained her doctoral degree in journalism from the University of Texas at Austin, USA, and her research interests include agenda setting, political communication, and media sociology. She has published research articles in *Journalism and Mass Communication Quarterly*, *Harvard International Journal of Press/Politics*, and *International Journal of Public Opinion Research*. [Accountability of the Media; Accountability of the News]

**Julien C. Mirivel** holds a PhD from the University of Colorado at Boulder, USA, and is an assistant professor in the Department of Speech Communication at the University of Arkansas at Little Rock, USA. His research explores communicative practices in institutional

settings. His scholarly work has appeared in several outlets including *Research on Language and Social Interaction*, *Discourse and Communication*, and *Health Communication*. [Gaze in Interaction]

**Vijay Mishra** is professor of English literature at Murdoch University, Perth, Australia. He has published widely on Australian literature and literary history, gothic literature, postcolonial theory, Indian literature and cinema, diasporas, and multiculturalism. Among his major publications are *Dark side of the dream: Australian literature and the postcolonial mind* (1991), *The gothic sublime* (1994), *Devotional poetics and the Indian sublime* (1998), *Bollywood cinema: Temples of desire* (2002), and *The literature of the Indian diaspora: Theorizing the diasporic imaginary* (2007). He is currently working on a book on Salman Rushdie. [Bollywood]

**Akira Miyahara** holds a PhD from Pennsylvania State University, USA, and is a professor of communication studies at Seinan Gakuin University in Fukuoka, Japan. Miyahara has focused his research on cross-cultural comparisons of Japanese interpersonal communication with Koreans, Chinese, Americans, etc., in pursuance of identifying specific concepts and theories of Japanese communication. He has written several books on communication theory and interpersonal communication in Japanese. [Communication as an Academic Field: East Asia]

**Bella Mody** is the DeCastro Chair in Global Media at the School of Journalism and Mass Communication, University of Colorado at Boulder, USA. Prior to her academic career, Dr. Mody worked on the Satellite Instructional TV Experiment in the Government of India from 1972 to 1978. She is editor of the *Handbook of international and development communication* (2002). [Television for Development]

**Andrew A. Moemeka** is a professor of communication at Central Connecticut State University, USA, with special research interest in social change and development. He has been a consultant to UNESCO, UNICEF, the UN Development Program, UN Population Fund, and Fulbright. He was a member of the UN Expert Group on the Right to Communicate. Dr. Moemeka has published books, book chapters, and numerous journal articles. [Development Communication: Africa]

**Fathali M. Moghaddam** was born in Iran, was educated in England, and is currently professor of psychology at Georgetown University, Washington, DC, USA. His main research area is culture and conflict, and his most recent books are *Great ideas in psychology* (2005), *From the terrorist's point of view* (2006), and *Multiculturalism, democracy, and intergroup relations* (forthcoming). [Communication Modes, Muslim]

**Wiebke Möhring** is research assistant at the Institute for Journalism and Communication Research, Hanover University of Music and Drama, Germany. Dr. Möhring works in the field of survey research, media systems, and local journalism. Together with Dr. Daniela Schluetz she published a book about survey design in 2003. [Exposure to Print Media; Interview; Interview, Qualitative; Interview, Standardized]

**Peter Monge** is professor of communication at the Annenberg School for Communication and Professor of Management and Organization at the Marshall School of Business, University of Southern California, USA. He has published five books, including *Theories of communication networks* (2003). He is a fellow and former president of the International Communication Association and a former editor of *Communication Research*. [Communication Networks]

**Kathryn C. Montgomery** is professor in the Public Communications Division, School of Communication, at American University, USA, where she directs the project on youth, media, and democracy. As founder of the Center for Media Education, she led a coalition of advocacy groups in a series of successful media policy campaigns on behalf of children and youth. She is the author of two books: *Target: Prime time. Advocacy groups and the struggle over entertainment television I* (1989) and *Generation digital: Politics, commerce, and childhood in the age of the Internet* (2007). [Child Protection, Media Regulations for]

**Marjolein Moorman** holds a PhD from the University of Amsterdam, the Netherlands, and is an associate professor at the University of Amsterdam and director of the Foundation for Fundamental Research on Brand Communication. Her research has concentrated mainly on the relationship between media environments and advertising effects, which was also the subject of her dissertation (2003). Her work has been published in several outlets, such as the *Journal of Advertising* and the *Journal of Advertising Research*. [Media Planning]

**Melanie Morgan** is an assistant professor of communication at Purdue University, USA, where she is the director of the largest public speaking course in the country. Dr. Morgan has authored *Presentational speaking: Theory and practice* and several articles on presentational speaking and communication skills. Her research interests include the study of fundamental cognitive processes underlying competent communication and message encoding in difficult and novel communication situations. This has been applied to the cognitive and motivational factors affecting the quality of interaction with older adults in interpersonal, family, and medical interactions. Her research has appeared in the *Journal of Communication*, *Journal of Southern Communication*, *Speech Communication*, and *Intercultural Communication Studies*. She teaches courses in communication skills and family communication. [Aging and Cognitive Processing; Message Design Logics]

**Michael Morgan** is professor and chair of the Department of Communication at the University of Massachusetts Amherst, USA. He is co-author of *Television and its viewers: Cultivation theory and research* (with James Shanahan, 1999), and editor of *Against the mainstream: Selected writings of George Gerbner* (2002). In 2002, he received the University of Massachusetts Distinguished Teaching Award. [Cultivation Theory; Mainstreaming; Reality and Media Reality]

**Sherwyn P. Morreale** is an assistant professor of communication at the University of Colorado at Colorado Springs, USA. For eight years, she served as the associate director of the National Communication Association, where she worked actively to promote

communication pedagogy and research. She is author of two communication textbooks and numerous other academic publications. [Student Communication Competence]

**Aldon Morris** is the Leon Forrest Professor of Sociology at Northwestern University, USA. He is the author of *The origins of the civil rights movement: Black communities organizing for change*. He is the co-editor of *Frontiers in social movement theory* (1992) and *Oppositional consciousness* (2001). He has published on a variety of topics including the civil rights movement, race, and W. E. B. DuBois. [Civil Rights Movement and the Media]

**Nancy Morris** is an associate professor in the Department of Broadcasting, Telecommunications and Mass Media at Temple University, Philadelphia, USA. Her articles on identity and globalization have appeared in *Media, Culture and Society*, *Journal of International Communication*, and elsewhere. She is author of *Puerto Rico: Culture, politics and identity* (1995) and co-editor of *Media and globalization: Why the state matters* (2001). [Cultural Imperialism Theories]

**Vincent Mosco** is professor of sociology and Canada Research Chair in Communication and Society at Queen's University, Canada. His 2004 book, *The digital sublime: Myth, power, and cyberspace*, won the 2005 Olson Award for outstanding book in the field of rhetoric and cultural studies. Mosco's most recent book, completed with Catherine McKercher, is titled *Knowledge workers in the information society* (2007). They are also writing a companion volume on unions and worker organization in the communication industry. Finally, Mosco is completing a revised edition of his 1996 book *The political economy of communication*. [Political Economy of the Media]

**Nick Mosdell** is lecturer, School of Journalism Media and Cultural Studies, Cardiff University, UK. Recent publications include *Too close for comfort? The role of embedded reporting in the 2003 Iraq War: Summary report* (with R. Brookes, J. Lewis, and T. Threadgold, 2004) and "Embedded reporting in war and peace" (with T. Threadgold, *Defence Management Journal*, 2004). [Embedded Journalists]

**Timothy P. Mottet** is a professor and Henry W. and Margaret Hauser Endowed Chair in Communication at the University of Texas-Pan American, USA. His research examines the role of communication, personality, and cognition in teaching and learning. He is co-editor of the *Handbook of instructional communication: Rhetorical and relational perspectives* and co-author of *Training and development: Enhancing communication and leadership skills*. Dr. Mottet's research appears in *Communication Education*, *Communication Quarterly*, *Communication Research Reports*, *Journal of Psychology*, and *Psychological Reports*. [Teacher Feedback]

**Patricia Moy** is the Christy Cressey Associate Professor of Communication at the University of Washington, USA, where she is adjunct faculty in the Department of Political Science. Her research revolves around issues of communication and citizenship; her studies examine mass and interpersonal communication effects on public opinion, civic engagement, and political cognitions, attitudes, and behavior. [Political Efficacy; Social Perception: Impersonal Impact]

**Megan Mullen** is associate professor of communication at University of Wisconsin-Parkside, USA. She is the author of *The rise of cable programming in the United States: Evolution or revolution?* (2003) and *Television in the multichannel age* (2007). She is one of the editors of the journal *Media History*. [Cable Television]

**Marion G. Müller** is associate professor of mass communication at Jacobs University Bremen, Germany. She is co-founder and since 2004 chair of the Visual Communication Division of the German Communication Association. Since 2007 she has also chaired the Visual Communication Studies Division of the International Communication Association (ICA), and been a member of the ICA board of directors. She is the author of the first German-language textbook on visual communication, *Grundlagen der visuellen Kommunikation*, and editor of several visual communication volumes, e.g. *War visions: Bildkommunikation und Krieg*. [Iconography; Poster]

**Dennis K. Mumby** is professor and chair of the Department of Communication Studies at the University of North Carolina at Chapel Hill, USA. He is the author (with Karen Ashcraft) of *Reworking gender: A feminist communicology of organization* (2004). He currently serves as chair of the Organizational Communication Division of the International Communication Association. He is a member of numerous editorial boards, including *Management Communication Quarterly*, *Discourse and Society*, and *Communication Theory*. [Organizational Communication: Critical Approaches]

**Graham Murdock** is reader in the sociology of culture at Loughborough University, UK. He was visiting professor at the University of California at San Diego, USA; the Free University of Brussels, Belgium; the University of Bergen, Norway; and Stockholm University, Sweden. He has written widely on the social and cultural organization of mass media and on the political economy of communication. He is former head of the Political Economy Section, International Association of Media and Communication Research. His work has been translated into 19 languages. Current research interests are the social impact of new communication technologies, the dynamics of risk, and communications and change. His latest books are *Media in the age of marketisation* (co-ed.) and *The GM debate: Risk, politics and public engagement* (co-author). [Commercialization of the Media; Commodification of the Media; Critical Theory]

**Andrew D. Murray** is senior lecturer in law at the London School of Economics and Political Science, UK. He specializes in information and communication technologies and communications regulation, and is the author of *The regulation of cyberspace: Control in the online environment* (2006). He serves on the editorial board of the *Modern Law Review*, is an independent expert for the Nominet UK Dispute Resolution Service and is a member of the Jersey State E-Commerce Commission. [Code as Law]

**Scott A. Myers** received his PhD in communication studies from Kent State University, USA, in 1995. He currently is an associate professor and PhD coordinator in the Department of Communication Studies at West Virginia University, USA, where he teaches

courses in instructional communication, small group communication, and communication theory. His research interests center on student–instructor communication as well as adult sibling relationships. He is a past editor of *Communication Teacher* and served as the executive director of the Central States Communication Association from 2004 to 2006. [Classroom Student–Teacher Interaction]

**Graham Mytton** was successively, between 1973 and 1998, a reporter and producer in the African department of the World Service, head of the Hausa-language programs, director of audience research, and finally controller of marketing for the World Service. Since leaving the BBC he has been involved in the use of market research in development, as well as pioneering work in audience research in previously uncovered parts of the world. He is the author of a major training manual on radio and TV audience research, which has been translated into many languages. [BBC World Service]

**Robin L. Nabi** is an associate professor of communication at the University of California, Santa Barbara, USA. Her research interests focus on the interplay between emotion and cognition in understanding the effects of mediated messages. Specific interests include the effects of discrete emotions on the cognitive processing of messages on social/health-related issues, the role of emotion in perception of risk and decision-making, the effects of entertainment media on attitude and behavior change, and factors that impact selective exposure to and perception of fictional TV programming. [Persuasion and Resistance; Selective Attention]

**Jacqueline Naismith** is director of postgraduate studies, Institute of Communication Design, College of Creative Arts, Massey University, Wellington, New Zealand. Her current research draws on both visual communication and sociological research methods and addresses relationships between historical graphic design and advertising; subjectivity formation; and the visual semiotics, rhetoric, and aesthetics of place. She is a member of the Visual Studies Division of the International Communications Association. [Cartography; Magazine, Visual Design of]

**Orayb Aref Najjar** is associate professor in the Department of Communication at Northern Illinois University, USA. Her latest publications include “New Palestinian media and democratization from below” (in *New media and the new Middle East*, ed. Philip Seib, 2007) and “After the fall: Attalia West Bank communist newspaper in a post-Cold War world” (*Rethinking Marxism*, 2007). [Communication Law and Policy: Middle East]

**Philip M. Napoli** holds a PhD from Northwestern University, USA, and is an associate professor in the Graduate School of Business at Fordham University, USA, and director of the Donald McGannon Communication Research Center. His research interests focus on media institutions and media policy. His books include *Foundations of communications policy: Principles and process in the regulation of electronic media* (2001) and *Audience economics: Media institutions and the audience marketplace* (2003). [Consumers in Media Markets; Media Policy]

**Bonnie A. Nardi** is a professor in the Department of Informatics in the Donald Bren School of Information and Computer Sciences at the University of California, Irvine, USA. Her interests are activity theory, human–computer interaction, computer-supported collaborative work, and interaction design. She is the co-author of *Acting with technology: Activity theory and interaction design* (with Victor Kaptelinin 2006). [Human–Computer Interaction]

**Amy I. Nathanson** holds a PhD from the University of Wisconsin-Madison, USA, and is an associate professor in the School of Communication at Ohio State University, USA. Her research focuses on the uses and effects of mass media among children. The majority of her papers focus on how parental mediation shapes children’s responses to television. Her work has appeared in a variety of outlets, including *Human Communication Research*, *Journal of Communication*, *Communication Research*, and *Journal of Broadcasting and Electronic Media*. [Parental Mediation Strategies; Socialization by the Media]

**David Natharius** is professor emeritus of communication and humanities, California State University, Fresno, USA. He is currently an adjunct professor in the Walter Cronkite School of Journalism and Mass Communication, Arizona State University, USA, where he teaches visual communication. Dr. Natharius is a past president of the Western States Communication Association. [Film as Popular Culture]

**Khadidiatou Ndiaye** is a doctoral candidate in the Department of Communication Arts and Sciences at Pennsylvania State University, USA. She has published on issues of culture and health and is a 2006 Council for the Development of Social Science Research in Africa Fellow. [Communication Modes, African]

**Ian Neath** is head of the Department of Psychology at Memorial University of Newfoundland, Canada. He is an associate editor of the journal *Memory and Cognition*, and has also edited two special issues on short-term/working memory for the *International Journal of Psychology* and for *Memory*. He has authored or co-authored two textbooks, several encyclopedia articles, and numerous journal articles and book chapters on various aspects of memory. [Memory]

**Peter Neijens** holds a PhD from the Free University Amsterdam, the Netherlands, and is professor and chair of persuasive communication in the Amsterdam School of Communications Research, University of Amsterdam. His research interests include media and advertising, public opinion, referenda, and public information campaigns. His publications include over 100 peer-reviewed publications in national and international journals and books. [Media Planning]

**Eduardo Neiva** is professor of communication studies at the University of Alabama at Birmingham, USA. He is a Fulbright scholar and the author of 12 books in Portuguese and English. His most recent works are *Communication games: The semiotic foundation of culture* (2007) and *Mythologies of vision: Image, culture, and visibility* (1999). He is the

author of numerous essays originally written in English and Portuguese that were translated into French, Spanish, Italian, and Japanese. [Perspective, Pictorial]

**Richard Alan Nelson** is a professor in the Manship School of Mass Communication at Louisiana State University, USA, and editor of *Journal of Promotion Management* and *Journal of Website Promotion*. His research interests include integrated marketing communications, public relations/public affairs, and strategic and global business ethics issues. Nelson is immediate past president of the International Management Development Association, author of *A chronology and glossary of propaganda in the United States* and the forthcoming *Propaganda: A reference guide*, and co-author of *Issues management: Corporate public policymaking in an information society* (with Robert L. Heath). Nelson's research has been published in *Journal of Advertising Research*, *Journal of Marketing*, *Journal of Marketing Communications*, *Public Relations Review*, *Service Business: An International Journal*, *Business Research Yearbook*, and other leading journals. [Marketing: Communication Tools]

**Josef Nerb** is professor of psychology at Freiburg University of Education, Germany, where he also serves as a vice dean for teaching and learning. He earned his PhD at the University of Freiburg and did a postdoc at the University of Waterloo, Canada, supported by an Alexander von Humboldt Foundation fellowship. His research interests include risk analysis, emotion research, instructional design, and building computational models of cognitive and affective processes. [Appraisal Theory]

**John Nerone** holds a PhD from the University of Notre Dame, USA, and is research professor in the Institute of Communications Research, University of Illinois at Urbana-Champaign, USA. He is author of *Violence against the press: Policing the public sphere in U.S. history* (1994), editor of *Last rights: Revisiting four theories of the press* (1995), and co-author of *The form of news: A history* (2001) with Kevin Barnhurst, which won the Suzanne Langer Award, Media Ecology Association, and the Book of the Year Award, International Communication Association. He also co-edits (with Robert W. McChesney) a University of Illinois Press book series in the History of Communication. [Journalism, History of; Narrative News Story; Penny Press; Violence against Journalists]

**W. Russell Neuman** is the John Derby Evans Professor of Media Technology in Communication Studies and research professor at the Institute for Social Research, University of Michigan, USA. His recent books include *The Gordian knot: Political gridlock on the information highway* (1997), *Affective intelligence* (2000), and *Media, technology and society* (in press). Dr. Neuman taught at the University of Pennsylvania, USA, where he directed the Information and Society Program of the Annenberg Public Policy Center. He also taught at Harvard and Yale and was one of the founding faculty of the MIT Media Laboratory, USA. His PhD is from the University of California, Berkeley, and his undergraduate degree is from Cornell University, USA. [Interaction; Interactivity, Concept of]

**Julianne H. Newton** is associate professor of visual communication in the University of Oregon School of Journalism and Communication, USA. Newton is author of *The burden*

of *visual truth* (2001) and co-author (with Rick Williams) of *Visual communication: Integrating media, art and science* (2007). Her research focuses on visual ethics, which uses ecological theory to examine the role of visual perception and media in the formation of self. [Media Ecology; Photojournalism]

**Sik Hung Ng** is chair of social psychology at the City University of Hong Kong. He is a fellow of the Royal Society of New Zealand and served as the president of the International Association of Language and Social Psychology (2004–2006). He is the author of *Power in language* (1993, with James J. Bradac) and the editor of *Language matters: Communication, culture, and identity* (2004, with Christopher N. Candlin and Chi Yue Chiu). [Power in Intergroup Settings]

**David Nicholas** is the director of the University College London (UCL) School of Library, Archive and Information Studies, UK. He is the founder of the UCL Centre for Publishing and of the Centre for Information Behaviour and the Evaluation of Research. Prof. Nicholas is also editor of the journal *Aslib Proceedings* and the principle investigator of the virtual scholar research program, a million-pound research program that has pioneered techniques to evaluate information seeking in virtual environments, including health, media, and scholarly publishing. [Open Access Journals]

**Bill Nichols** is professor of cinema and director of the graduate program in cinema studies at San Francisco State University, USA. His books include *Blurred boundaries* (1994), *Representing reality* (1991), and the edited volumes, *Movies and methods I, II*. A general introduction to film is forthcoming. [Documentary Film]

**Jeff Niederdeppe** is a Robert Wood Johnson Foundation Health and Society Scholar in the Department of Population Health at the University of Wisconsin, USA. His work, focusing on the effects of media campaigns and news coverage on health behavior and policy, has been published in *Journal of Communication*, *Communication Research*, *Communication Monographs*, and *Health Communication*, among other journals. [Information Scanning]

**Gerhild Nieding** is professor of developmental psychology at the University of Würzburg, Germany. Her research interests include children and the media, cognitive media psychology, development of story comprehension, and experimental methods. [Suspense]

**Jörg-Uwe Nieland** is assistant professor of political science at the University of Bochum, Germany, and fellow of a research group on governance at the University of Duisburg-Essen, Germany. His research and publications focus on strategic communication management and on relationships between politics and popular culture. [Politainment]

**Matthew C. Nisbet** holds a PhD from Cornell University, USA, and is a professor in the School of Communication at American University, USA, where he teaches courses in communication theory, political communication, and science communication. Published widely in the areas of political communication and public opinion, his current research

tracks scientific and environmental controversies, examining the interactions between experts, journalists, and various publics. Nisbet blogs about these topics at Framing Science ([scienceblogs.com/framing-science](http://scienceblogs.com/framing-science)), named a top political blog by the *New York Daily News*. He is a frequently invited speaker at conferences and meetings across the USA and Canada and he is often called upon for his expert analysis by news organizations, advocacy groups, and government agencies. [Agenda Building]

**Tsukasa Nishida** is a professor of intercultural communication at Nihon University, Mishima, Japan. He currently is interested in conducting research on uncertainty reduction processes among North American and East Asian nationalities. He is the author of *Ibunka no Ningen Koudou no Bunseki* (Intercultural communication behavior) and *Bridging Japanese/North American differences* (with William Gudykunst), among other works. [Anxiety Uncertainty Management Theory]

**Seth M. Noar** is assistant professor and associate member of the Graduate Faculty in the Department of Communication at the University of Kentucky, USA. He conducts research in health communication, including on health mass media campaigns, and recently co-edited *Communication perspectives on HIV/AIDS for the 21st century* (with Timothy Edgar and Vicki Freimuth, 2007). [Health Campaigns, Communication in]

**Kimberly A. Noels** is an associate professor in the Department of Psychology at the University of Alberta, Canada. Her research focuses on language and social psychology as it pertains to intercultural communication, cross-cultural adaptation, and language learning. [Language and Social Psychology]

**Kaarle Nordenstreng** is professor of journalism and mass communication at the University of Tampere in Finland. He is author and editor of *Media between culture and commerce* (with Els De Bens et al., 2007) and *Russian media challenge* (with Elena Vartanova and Yassen Zassoursky, 2001). He has been vice president of the International Association for Media and Communication Research (1972–1988) and president of the International Organization of Journalists (1976–1990). [Communication Research and Politics]

**Hillel Nosssek** is professor of communications in the School of Media Studies of the College of Management, Academic Studies, Tel Aviv, Israel. He is the co-editor of *Media and political violence* (2007) together with Annabelle Sreberny and Prasun Sonwalkar. Among other news analysis the book contains an overview of news in the introduction and two related articles authored by Nosssek: “Our news and their news” and “Terrorism and the media: Does the weapon matter to the coverage?” [News]

**Katharina Nötzold** is a Research Councils UK fellow at the University of Westminster’s Communication and Media Research Institute Arab Media Centre, UK. From 2005 to 2007 she worked for the Center of International Peace Operations, Berlin, Germany, and took part in Office for Democratic Institutions and Human Rights election observation missions in Azerbaijan and Montenegro. She has contributed articles to various magazines about different aspects of Lebanese media, press freedom in the Arab world,

and representations of Islam and Muslims in western media. She is the author of the forthcoming *Lebanese TV stations: The political elites' dominance over the visual space*. [West Asia: Media Systems]

**Jon F. Nussbaum** is a professor of communication arts and sciences and of human development and family studies at Pennsylvania State University, USA. He is the author of 10 books and over 75 research articles concentrating both on instructional communication and on communication across the life-span. [Communicator Style; Developmental Communication; Teacher Communication Style]

**Beata Ociepka**, head of the International Communication Section, Institute of International Studies, University of Wroclaw, Poland, specializes in international communication, especially public diplomacy, and in comparative studies on media systems. She is author or editor of about 60 book chapters and articles in Polish, German, Dutch, and Hungarian journals and of 10 books and monographs, most recently *Who is television for? Public service broadcaster model in post-communist central Europe* (in Polish, 2003), *Populism and media democracy* (in English, 2005), and *Public diplomacy* (in Polish and English, forthcoming). She serves on the editorial board of one of the main Polish journals and of a publisher in the field. Since 2004 she has been on the programming council of a regional public service television station in Poland. [Public Diplomacy]

**Penny O'Donnell** is a senior lecturer and teaches journalism studies in the journalism program at the University of Technology, Sydney, Australia. Her research focuses on the intellectual work of journalism with a particular emphasis on academic–practitioner engagement and the nexus between intergenerational change and education. Most recently she has published on a number of key challenges in Australian journalism including research and education futures, news and cultural diversity, journalism students and professional education, and reporting Indigenous and cross-cultural issues. [Communication Professions and Academic Research]

**Christine Ogan** is professor of journalism and informatics at Indiana University, USA, where she teaches international communication and development courses. She has published in a range of communication journals and is the author of *Communication and identity in the diaspora: Turkish migrants in Amsterdam and their use of media*. [Development Institutions]

**Peter Ohler** is professor of media psychology and media sociology at Chemnitz University of Technology, Germany. His research interests include cognitive media psychology, children and the media, playing, evolutionary psychology, and experimental methods. [Playing; Simulation]

**Daniel J. O'Keefe** is a professor of communication studies at Northwestern University, USA. He has received the National Communication Association's Charles Woolbert Research Award, its Golden Anniversary Monograph Award, and its Rhetorical and Communication Theory Division's Distinguished Scholar Award, the American Forensic

Association's Daniel Rohrer Memorial Research Award, the International Communication Association's Best Article Award and its Division 1 John E. Hunter Meta-Analysis Award, the International Society for the Study of Argumentation's Distinguished Scholar Award, and teaching awards from the Central States Communication Association and the University of Illinois. He is the author of *Persuasion: Theory and research*. [Elaboration Likelihood Model; Persuasion]

**Garrett J. O'Keefe** is professor and chair of journalism and technical communication at Colorado State University, Fort Collins, USA. He studies public opinion and environmental and health communication. Previously professor of life sciences communication and environmental studies at the University of Wisconsin-Madison, USA, he has co-authored three books and over 50 refereed publications. He has received several major research grants from such agencies as the US National Institutes of Health, National Science Foundation, Environmental Protection Agency, Department of Agriculture, and National Institute of Justice. [Video Malaise]

**Mary Beth Oliver** is professor of communications at Pennsylvania State University, USA. Her research focuses on the social, psychological, and emotional effects of media on viewers, and her work has appeared in *Journal of Communication*, *Human Communication Research*, and *Communication Research*, among others. She is currently co-editor of *Media Psychology*. [Personality and Exposure to Communication]

**Scott Robert Olson** is provost, vice president for academic affairs, and professor of speech communication at Minnesota State University Mankato, USA. He has published two university press books, 27 university press book chapters, and 21 research journal articles on communication, and has received grants totalling over \$25 million for communication and other research. He won an Emmy Award in 2003 for his work on the documentary film *Squeakers*. [Symbolism]

**John Omachonu** is professor of electronic media communication at Middle Tennessee State University, USA. His research has been published by *Feedback*, *Journal of Media Ethics*, *Communication Research*, and several trade journals. He also actively teaches in the areas of media law and ethics, and media management. [Right to Communicate]

**Merete Onsberg** is associate professor in the Department of Media, Cognition and Communication, Section of Rhetoric, in the University of Copenhagen, Denmark. She is author of *Praktisk argumentation* (1987, 1999, with Charlotte Jørgensen; revised edition forthcoming). She has published articles on various rhetorical subjects such as bodily delivery, rap, translation of dramatic verse, homiletics, and political ghost writing. One current project is the publication of a reconstruction of Gilbert Austin's gesture notations for the recitation of a poem. She has served on the board of her department and as leader of rhetoric at the university extension. [Delivery and Rhetoric]

**Sean Patrick O'Rourke** is associate professor and chair of communication studies at Furman University, USA, and past president of the American Society for the History of

Rhetoric. His research concerns rhetoric, legal rights, and protest, and has appeared in *Advances in the History of Rhetoric*, *Communication Reports*, *Rhetoric Society Quarterly*, *Southern Communication Journal*, and other journals. [Rhetoric in Western Europe: Britain]

**Sanya Osha** is currently with the Graduate School of Humanities, University of South Africa. He holds a PhD in philosophy and has held various research teaching and research positions in Nigeria, the Netherlands, the USA, and South Africa. He has also served as a vice president for the Association for Rhetoric and Communication in Southern Africa and is the author of *Kwasi Wiredu and beyond: The text, writing and thought in Africa* (2005) and *Ken Saro-Wiwa's shadow: Politics, nationalism and the Ogoni protest movement* (2007). [Rhetoric in Africa]

**Ana Cristina Ostermann** holds a PhD in linguistics from the University of Michigan, USA. She is currently an associate professor at the Universidade do Vale do Rio dos Sinos, Brazil. Her scholarly work focuses on the discursive basis of power relations and on the role of language in the construction of gender identity. Her research has ranged from the analysis of media discourse, particularly magazines addressed to teenage females, to the analysis of interactions with victims of gendered violence and of transgender identity. Currently, she is investigating the role of language in interaction in the humanization process of women's health-care in Brazil, especially in gynecological and obstetric consultations. [Communities of Practice]

**Ronald E. Ostman** is graduate professor of communication, Cornell University, Ithaca, New York, USA, where he also served as department chair. His international appointments include posts with the New Zealand Council for Educational Research, Wellington, the World Health Organization, Geneva, Switzerland, and a Fulbright fellowship to Pune University, India. Shorter assignments include workshops, research, and education postings to Bangladesh, Singapore, Thailand, Ethiopia, Egypt, and Greece. Most recently, Dr. Ostman was a scholar in research for the Commonwealth of Pennsylvania Museum and Historical Commission. He has authored/edited six books and publishes on public opinion, mass communication, and historical photography. [False Consensus; False Uniqueness; Social Perception: Unrealistic Optimism]

**James Owens** is in the Department of Communication at the University of Illinois at Chicago, USA, where he is studying the relationship between technical change, business models, and journalism practice. He is a co-founder of Chicago Media Action, a community media organization. [Journalism]

**Ashley Packard** is an associate professor of communication and digital media studies at University of Houston-Clear Lake, USA. She teaches media law and communication ethics and is the chair of the graduate program in digital media studies. Dr. Packard has written numerous articles about Internet law. Her forthcoming text on conflict of laws is *The borders of free expression*. She is also writing a textbook called *Digital media law*. [Conflicts of Law]

**Cinzia Padovani** is an assistant professor at the School of Journalism at Southern Illinois University Carbondale, USA. Her publications include *A fatal attraction: Public television and politics in Italy* (2005), also published as *Attrazione fatale: Televisione pubblica e politica in Italia* (2007). Her current research focuses on the digital TV transition in Italy and the EU, and on public broadcasting in various national contexts, including Jamaica and the UK. [Vatican Radio]

**Claudia Padovani** teaches international communication and communication governance at the University of Padua, Italy. She has edited special issues of *Gazette* (2004) and *Global Media and Communication* (2005). Publications include “Communication governance and the role of civil society: Reflections on participation and the changing scope of political action” (in J. Servaes and N. Carpentier, eds., *Towards a sustainable information society*, 2006), “The emerging global movement on communication rights: A new stakeholder in global communication governance?” (in D. Kidd, C. Rodriguez, and L. Stein, eds., *Making our media: Mapping global initiatives toward a democratic public sphere*, 2008), and “Debating communication imbalances: From the MacBride Report to the World Summit on the Information Society” (in J. Dean, J. Anderson, and G. Lovink, eds., *Reformatting politics: Networked communications and global civil society* (forthcoming). [New World Information and Communication Order (NWICO)]

**Esther Paglialunga** is professor of classical languages and literatures at the University of the Andes, Venezuela. She is author of *Manual de teoría literaria clásica* (2004) and translator of *La literatura griega de la época helenística e imperial* (R. Cantarella, 1972). She has written the *Handbook of literary classical criticism* and several articles about emotions in the Greek novel. [Rhetoric in Central and South America]

**Zhongdang Pan** is a professor in the Department of Communication Arts at the University of Wisconsin-Madison, USA. He has published, in both English and Chinese, research monographs and papers in the areas of political communication, Chinese media reforms, and media and value changes. [Framing of the News]

**Augustine Pang** is an assistant professor at the Wee Kim Wee School of Communication and Information at Nanyang Technological University in Singapore. His research focuses on strategic conflict management, crisis communication, image repair, and media sociology and systems. Dr. Pang has published in refereed journals, and has won several top paper awards at leading international conferences. [Contingency Model of Conflict]

**Stylianos Papathanassopoulos** is professor at the Faculty of Communication and Media Studies at the National and Kapodistrian University of Athens, Greece. He has written extensively on European media, with particular reference to the development and impact of the new media. His publications can be found in various media journals, and he is also the author of 13 books in Greek and English. [Public Interest; Satellite Television]

**Lisa Mullikin Parcell** is on the faculty of the Elliott School of Communication at Wichita State University, USA, and is the associate director of WSU-LINK there. She is a

co-author of *American journalism: History, principles, practices*. Dr. Parcell's research focuses on communication and media history, community engagement, and science communication. [Communication and Media Studies, History since 1968]

**David Pariser** is a professor of art education in the Faculty of Fine Arts, Concordia University, Montreal, Canada. He is the director of the art education certification program. Research interests include cross-cultural aesthetic responses, the study of life in classrooms, and the developmental trajectories of great artists when they were children. Dr. Pariser has received research funding from the Spencer Foundation, the American Psychological Association, and the Social Sciences and Humanities Research Council of Canada. [Child Art]

**Ahran Park** is a PhD candidate at the School of Journalism and Communication, University of Oregon, USA, focusing on media law and policy. She is also a teaching fellow in the communication law course for undergraduates. Before receiving a Master's degree in communication from Seoul National University, South Korea, she was a news reporter for *Chosun Ilbo*, a major daily newspaper there, reporting on the court and police beat. Her research interests revolve around issues of libel and invasion of privacy on the Internet. [Fair Trial and Freedom of the Press]

**WooSoo Park** is vice dean and professor of English in the College of English, Hankuk University of Foreign Studies, Seoul, South Korea. Among his publications are *Homo rhetoricus* (1995), *Rhetoric and literature* (1999), and *English Reformation and English Renaissance literature* (1994). His latest publication is *Shakespeare and the extension of man* (2006). He is the editor in chief of the *Korean Journal of Rhetoric*. [Rhetoric in East Asia: Korea]

**Malcolm R. Parks** is professor of communication at the University of Washington, USA, where he is also affiliated to the Health Marketing Research Center. His research focuses personal social networks, persuasion, health communication, and the development of interpersonal relationships in online, social, and work settings. He received the Woolbert Award from the National Communication Association for his research and the Hammer Award from the vice president of the USA for his applied organizational work. Between 1998 and 2006, he served as the associate vice provost for research at the University of Washington. [Online Relationships]

**Shawn J. Parry-Giles** is professor of communication at the University of Maryland, USA. She is author of *The rhetorical presidency, propaganda, and the Cold War, 1945–1955* (2001), *Constructing Clinton: Hyper-reality and presidential image-making in postmodern politics* (2002, with T. Parry-Giles), and *The prime-time presidency: The West Wing and U.S. nationalism* (2006, with T. Parry-Giles). [Rhetoric and Politics]

**Chris Paterson** is a senior lecturer at the Institute for Communication Studies at the University of Leeds, UK. He is the editor of *International news in the twenty-first century* (2004, with A. Sreberny) and *Making online news: The ethnography of new media production* (2008, with D. Domingo). He is a founder of the Working Group on Media

Production Analysis of the International Association for Media and Communication Research, and has worked in news and video production in the US. [Federal Communications Commission (FCC); International News Reporting; News Agencies]

**Pier Paolo Patrucco** is assistant professor of economics in the Department of Economics, University of Turin, Italy. He received a PhD in economics from the University of Nice Sophia Antipolis, France. He has been visiting fellow at the University of Manchester, UK; the Science and Technology Policy Research Unit, University of Sussex, UK; and the Robert Schuman Centre for Advanced Studies, European University Institute, Fiesole, Italy. His main research interests are in the economics of innovation and new technology. His works have been published in *Information Economics and Policy*, *Regional Studies*, *Cambridge Journal of Economics*, and *Economics of Innovation and New Technology*. He recently also contributed to *Global broadband battles: Why the US and Europe lag behind while Asia leads* (ed. Martin Fransman, 2007). [Information and Communication Technology, Economics of]

**Miles L. Patterson** is a professor of psychology at the University of Missouri-St. Louis, USA. He is the author or editor of three books, including *The Sage handbook of nonverbal communication* (with Valerie Manusov), and more than 65 chapters and articles on nonverbal communication. He was the editor of the *Journal of Nonverbal Behavior* from 1986 to 1992. [Environment and Social Interaction; Reciprocity and Compensation in Interaction]

**Thomas E. Patterson** is Bradlee Professor of Government and the Press at Harvard University's Kennedy School of Government, USA. His books include *The vanishing voter* (2002), *Out of order* (1993), *The mass media election* (1980), and *The unseeing eye* (1976). [Media as Political Actors]

**John J. Pauly** is William R. Burleigh and E. W. Scripps Professor and dean of the J. William and Mary Diederich College of Communication at Marquette University, USA. His current project is a book on the origins, influence, and legacy of the new journalism. [New Journalism]

**Charles Pavitt** is professor of communication at the University of Delaware, USA. He is the author of *Small group discussion: A theoretical approach and philosophy of science and communication theory*, along with more than 40 journal articles and book chapters. His current and recent research includes a set of studies of discussion content in problem-solving groups, arguments for scientific realism as a philosophy of science relevant to communication scholarship, a classification scheme for scientific communication theory based on form and content, and a multilevel analysis of the three-way interaction between batter handedness, pitcher handedness, and ballpark in baseball. [Communication: Relationship Rules; Group Communication and Social Influence]

**Wolfram Peiser** is a professor of communication science at the Ludwig Maximilian University of Munich, Germany. He received his PhD from the Hanover University of

Music and Drama, Germany (1995), and earned his postdoctoral lecture qualification at the Johannes Gutenberg University of Mainz, Germany (2004). His research interests and publications focus on changes of media systems and media use, linkages between media change and social change, media competition, and research methodology. [Political Media Use]

**Patrick De Pelsmacker** is professor of marketing at the University of Antwerp, Belgium, and part-time professor of marketing at Ghent University, Belgium. He is a visiting professor at the Solvay Business School, Free University of Brussels, Belgium; the University of Venice, Italy; the Copenhagen Business School, Denmark; and the Institute of Business Studies in Moscow, Russia. His main research interests are: marketing research, advertising effectiveness research, branding, and ethical consumer behaviour. He has written several books on marketing research and marketing communications, is the deputy editor of the *Journal of Marketing Communications*, and has published articles in international academic journals, such as *Journal of Advertising*, *Psychology and Marketing*, *Advances in Consumer Research*, *Journal of Consumer Affairs*, *International Marketing Review*, and many others. [Segmentation of the Advertising Audience]

**Richard M. Perloff** is director and professor at the School of Communication, Cleveland State University, USA. He is internationally known for his scholarship on the third-person effect. Perloff is author of books on persuasion and political communication and of review pieces in major communication anthologies. He is a fellow of the Midwest Association for Public Opinion Research. [Political Persuasion]

**Laurent Pernot** is professor of Greek language and literature at the University of Strasbourg, France, and past president of the International Society for the History of Rhetoric. His publications include *La rhétorique de l'éloge dans le monde gréco-romain* (1993), *Rhetoric in antiquity* (2005, trans. W. E. Higgins), and *L'Ombre du tigre: Recherches sur la réception de Démosthène* (2006). [Rhetoric, Greek]

**Elizabeth M. Perse** holds a PhD from Kent State University, USA, and is professor and chair of communication at the University of Delaware, USA. She is the author or co-author of over 50 published books, chapters, and journal articles and has been noted as a prolific mass communication scholar. [Media Effects Models: Elaborated Models; Media Effects, Strength of]

**Jochen Peter** holds a PhD from the University of Amsterdam, the Netherlands, and is an associate professor in the Amsterdam School of Communications Research there. His research interests focus on political communication and the social consequences of the Internet in general, and the implications of sexually explicit Internet material for adolescents' sexual socialization in particular. [Pornography Use across the Life-Span]

**John Durham Peters** is F. Wendell Miller Distinguished Professor of Communication Studies at the University of Iowa, USA. He has held fellowships with the National Endowment for the Humanities, the Fulbright Foundation, the Leverhulme Trust, and

the Institute for Advanced Studies at the Hebrew University Jerusalem. His books include *Speaking into the air: A history of the idea of communication* (1999) and *Courting the abyss: Free speech and the liberal tradition* (2005). [Communication: History of the Idea; Communication and Media Studies, History to 1968; Hermeneutics]

**Thomas Petersen** is a researcher at the Allensbach Institute and a lecturer at the Johannes Gutenberg University of Mainz, Germany. He is the author of *Das Feldexperiment in der Umfrageforschung* (2002) and *Alle nicht Jeder: Einführung in die Methoden der Demoskopie* (4th edn. 2005, with Elisabeth Noelle-Neumann). [Election Polls and Forecasts; Election Surveys; Public Opinion Polling; Spiral of Silence]

**Sandra Petronio** is a professor in the Department of Communication Studies on the campus of Indiana University-Purdue University, Indianapolis, USA. She is also a core faculty member in the Indiana University School of Medicine Center for Bioethics and a senior affiliate faculty member of the Charles W. Fairbanks Center for Medical Ethics at Clarian Health Partners, Indianapolis. In addition, she serves as adjunct faculty in the Indiana University School of Nursing. She is the immediate past president of the International Association for Relationship Research, past president of the Western Communication Association, and previous editor of the *Western Journal of Communication*. She has studied privacy and disclosure for 30 years, developing an evidence-based theory of how people manage private information. [Disclosure in Interpersonal Communication]

**Gary R. Pettey** is associate professor of communication, Cleveland State University, USA. His research coalesces around campaigning. He teaches public relations, research methodology, and analysis. [Political Persuasion]

**Michael Pfau** is professor and chair, Department of Communication, University of Oklahoma, USA. His research focuses on the influence of mass media communication and on resistance to influence, particularly inoculation. He has seven co-authored or co-edited books, including *Mediating the vote: The changing media landscape in U.S. presidential campaigns* (2007), and has authored or co-authored more than 100 journal articles and book chapters. The National Communication Association awarded him a Golden Anniversary Monograph Award. [War Correspondents]

**Barbara Pfetsch** is professor of communication and media policy at the University of Hohenheim, Germany. She has been a senior researcher at the Social Science Research Center Berlin, Germany, and a fellow at Georgetown University, Washington, the J. F. Kennedy School of Government, and the Center for European Studies at Harvard University, USA. Her work focuses on political communication from a comparative perspective. [Editorial; Political Communication Culture; Political Communication Systems]

**Catherine Waite Phelan**, chair and professor of communication at Hamilton College, USA, earned a PhD from the University of Illinois, USA, with an interdisciplinary degree in communication and philosophy. Her scholarship exhibits an enduring interest in technology and society. Recent publications address a theory of video that challenges

current assumptions regarding the role of television. Publications include *Mediation and the communication matrix* (2003). [Museum]

**Gerry Philipsen** is professor of communication at the University of Washington, USA. He has done ethnographic studies of multiple American communication codes and used those studies, as well as a large body of work by others, to build the theory of speech codes. He teaches communication in small groups; communication, conflict, and cooperation; and cultural codes of communication. [Speech Codes Theory]

**Mark R. Phillips, Jr.**, holds a doctorate from the University of Oregon, USA. He is the co-editor of *Dazzled by Disney? The global Disney audiences project* (2001). He currently lives and works from his home in St. Helens, Oregon, USA. [Media Marketing]

**Robert Picard** is the author and editor of 20 books on media economics including *The economics and financing of media*, *Media firms: Structures, operations and performance*, and *Media economics: Concepts and issues*. He is editor of the *Journal of Media Business Studies* and was formerly editor of the *Journal of Media Economics*. He is Hamrin Professor of Media Economics and director of the Media Management and Transformation Centre at Jönköping International Business School, Jönköping University, Sweden. Picard has been a fellow at the Shorenstein Center at Harvard University, USA, and has consulted for leading media companies in North America, Europe, Asia, and Latin America. [Competition in Media Systems; Subsidies for the Media]

**Magda Pieczka** is a co-editor of the *Journal of Communication Management* and a member of the editorial board of the *Journal of Public Relations Research*. She has published on aspects of the professionalization of public relations, notably expert knowledge. She teaches public relations and media in the School of Social Sciences, Media and Communication at Queen Margaret University, Edinburgh, UK. [Professionalization of Public Relations]

**Jan Nederveen Pieterse** is professor of sociology at the University of Illinois at Urbana-Champaign, USA, and specializes in globalization, development studies, and intercultural studies. Recent books are *Ethnicities, global multicultural: Pants for an octopus* (2007), *Globalization or empire?* (2004), and *Globalization and culture: Global mélange* (2003). [Postdevelopment]

**Patrick Lee Plaisance** holds a PhD from Syracuse University, USA, and is assistant professor in the Department of Journalism and Technical Communication at Colorado State University, USA. He has been published in *Communication Theory*, *Journalism and Mass Communication Quarterly*, *Journal of Mass Media Ethics*, and other journals. His textbook, *Media ethics: Key principles for responsible practice* is forthcoming. [Ethics of Media Content; Research Ethics]

**Fritz Plasser** is professor of political science and dean of the School of Political Science and Sociology at the University of Innsbruck, Austria. He has been author, co-author, or editor of 30 books and has published widely on campaigns and political consultancy from

a comparative perspective. His English-language publication *Global political campaigning* has been translated into four languages. [Political Consultant]

**Timothy G. Plax** is professor of communication studies at California State University, Long Beach, USA. He is listed among the most published scholars in the discipline, authoring over 150 periodicals, books, chapters, and technical reports. His research focuses on social change and communication in the classroom. [Classroom Management Techniques; Mentoring]

**Dana Polan** is a professor of cinema studies at New York University, USA. He is the author of seven books in film and cultural studies, including *Scenes of instruction: The beginnings of the U. S. study of film* (2007). He is finishing books on the television series *The French Chef* and *The Sopranos*. He is a former president of the Society for Cinema Studies, and former editor of its professional journal, *Cinema Journal*. [Cinema]

**John C. Pollock** holds a PhD from Stanford University and is a professor of communication studies at the College of New Jersey, Ewing, USA. A developer of the community structure approach linking community characteristics and reporting on critical issues in both national and cross-national research, with a special interest in health communication, he authored *Tilted mirrors: Media alignment with political and social change – a community structure approach* and has received grants from the Social Science Research Council, National Cancer Institute, and United Nations Foundation. He is the creator of the Health Communication Concentration at the College of New Jersey. [Communication and Social Change: Research Methods; Community Structure Model]

**Jean-François Polo** is associate professor of political science and director of international relations at the Institute of Political Studies in Rennes, France. His research focuses on cultural and audiovisual policy issues, and also on European Union–Turkey relationships. He recently published “De l’intégration à l’européanisation: Les groupes d’intérêts turcs à Bruxelles,” with C. Visier (in O. Baisnée and R. Pasquier, eds., *L’Européanisation*, 2007). Forthcoming is *La Genèse de la politique audiovisuelle européenne*. [Francophonie]

**Donnalyn Pompper** is an associate professor in the Department of Strategic and Organizational Communication at Temple University, USA. Prior to earning a PhD in mass media and communication, she worked in print journalism and corporate marketing communications. Her research agenda involves journalism production, gender–ethnicity issues, collective memory, and social risk. [Gender and Media Organizations]

**Lisa Pon** is assistant professor of art history at Southern Methodist University, Dallas, USA. She is author of *Raphael, Dürer, and Marcantonio Raimondi: Copying and the Italian Renaissance print* (2004); guest editor of the 2001 special double issue of *Word and Image*, “Printing matters: The materiality of print in early modern Europe”; and exhibitions review editor of *SHARP News*. [Prints]

**Marshall Scott Poole** holds a PhD from the University of Wisconsin-Madison, USA, and is professor of speech communication and senior research scientist at the National Center

for Supercomputing Applications, University of Illinois at Urbana-Champaign, USA. His research interests include group and organizational communication, information systems, collaboration technologies, organizational innovation, and theory construction. He is the author of over 100 articles and book chapters. He has co-authored or edited 10 books including *Communication and group decision-making*, *Theories of small groups: Interdisciplinary perspectives*, *Organizational change and innovation processes: Theory and methods for research*, and *The handbook of organizational change and innovation*. He has been named a fellow of the International Communication Association and a Distinguished Scholar of the National Communication Association. [Decision-Making Processes in Organizations]

**Carol Poster**, associate professor of English at York University, Canada, is author of *The facts of scripture and the idols of theory: Richard Whately's rhetorical theology*, editor of *The elocutionary movement*, and co-editor (with Linda Mitchell) of *Letter writing manuals and instruction from antiquity to the present*. Her translations include Plautus' *Stichus* and Aristophanes' *Clouds*. [Logos and Rhetoric]

**Jonathan Potter** has written on topics including constructionism, discourse analysis, cognitivism, psychology and institutions, child protection, literature, eating, reflexivity, relativism, racism, and science, method, and reality. He is one of the founders of the approach known as discursive psychology and is a world authority on the use of qualitative methods in psychology. He is currently professor of discourse analysis at Loughborough University, UK. [Intergroup Communication and Discursive Psychology]

**Raymond W. Preiss** is a professor of communication studies at the University of Puget Sound, USA. He is the co-editor of four books on meta-analytic contributions to the communication discipline. He served as editor of the *Journal of the Northwest Communication Association* and is a member of the editorial board of *Communication Monographs* and *Communication Education*. His work has appeared in *Human Communication Research*, *Communication Quarterly*, *Communication Research Reports*, *Communication Reports*, and *Communication Education*. [Classroom Questioning]

**Catherine Preston** is an associate professor in the Film Program, Department of Theatre and Film, at the University of Kansas, USA. Her fields of research are in visual culture studies, specifically media representations related to memory, gender, class, and new media. Current research projects involve the representation of aging in films by international women filmmakers, and a study of young girls' interactions with their visual environments, funded by the American Association of University Women. Work has been published in journals such as *Jump Cut* and *Visual Sociology* and as chapters in a variety of books. [Film Genres]

**Monroe E. Price** is director of the Center for Global Communication Studies at the Annenberg School for Communication at the University of Pennsylvania, USA, and professor of law at the Benjamin N. Cardozo School of Law at Yeshiva University, USA. Price also serves as director of the Stanhope Centre for Communications Policy Research

in London, UK, and chair of the Center for Media and Communication Studies at the Central European University in Budapest, Hungary. He served as dean of Cardozo School of Law from 1982 to 1991. Among his many books are a treatise on cable television, *Media and sovereignty*, and *Television, the public sphere and national identity*. [Foreign Policy and the Media]

**Vincent Price** is Steven H. Chaffee Professor of Communication and Political Science in the Annenberg School for Communication at the University of Pennsylvania, USA. A former editor of *Public Opinion Quarterly*, he has published extensively on mass communication and public opinion, social influence processes, and political communication. [Linear and Nonlinear Models of Causal Analysis; News Processing and Retention]

**Frank Priess** has a Master of Arts in political science, philosophy, and communication from the Johannes Gutenberg University of Mainz, Germany. He was the editor of the political section of a German newspaper. He was responsible for the Konrad Adenauer Foundation's regional program on media in Latin America from 1987 to 2006, among other projects. Since 2006 he has been the Konrad Adenauer Foundation's representative in Mexico. [Central America: Media Systems; Mexico: Media System]

**Chris Priestman** is head of media arts and design at Staffordshire University, UK. Between 1983 and 1993 he worked professionally in radio and sound design. His teaching combines his experience of radio practice with research into radio's institutional and theoretical contexts, focusing on new digital platforms. His publications include *Web radio: Radio production for Internet streaming* and a forthcoming co-authored study of the radio industry's responses to digitalization. [Radio: Social History]

**Christopher Pudlinski** is an associate professor of communication at Central Connecticut State University in New Britain, USA. His areas of research interest include the situated practice of support talk and consumer-run warm lines. He has published in such journals as *Discourse Studies*, *Communication Studies*, *Qualitative Research Reports in Communication*, and *Psychiatric Rehabilitation Journal*. [Support Talk]

**Yves Punie** joined the Institute for Prospective Technological Studies, Spain, in 2001. Before that he was interim assistant professor at the Free University of Brussels, Belgium, and senior researcher at Studies on Media, Information and Telecommunications there. Dr. Punie has worked on the social and technological aspects of ambient intelligence in everyday life, the future of the media and the media industries, social capital in the knowledge society, and privacy, security, and identity in the future information society. Currently, he is project manager of eLearning. [Ubiquitous Computing]

**Linda L. Putnam** is a professor in the Department of Communication at the University of California, Santa Barbara, USA. She is an elected fellow of the International Communication Association and the 2005 recipient of its Steven H. Chaffee Career Productivity Award, and a Distinguished Scholar of the National Communication Association. [Organizational Conflict]

**Peter Putnis** is professor of communication studies at the University of Canberra, Australia. The focus of his research is on international communication and media history, especially the political economy of international news production in the nineteenth and early twentieth centuries. He is co-chair of the History Section of the International Association for Media and Communication Research and is a past president of the Australian and New Zealand Communication Association. He serves on the editorial boards of *Media History* and the *Australian Journal of Communication*. [Australia: Media System; Telegraph, History of]

**Bas van den Putte** is associate professor in commercial communication and health communication at the Amsterdam School of Communications Research, University of Amsterdam, the Netherlands. Dr. van den Putte has published in journals such as the *British Journal of Social Psychology*, *Journal of Applied Social Psychology*, *Patient Education and Counseling*, *Psychology of Addictive Behaviors*, and *Preventive Medicine*. [Advertising Strategies]

**Thorsten Quandt** is a senior researcher at the Ludwig Maximilian University of Munich, Germany. His research interests include journalism, media innovations, and media theory. He has written and (co-)edited more than 50 scientific articles and books, both in Germany and in international contexts. His work has received several scientific awards, including top paper awards and the bi-annual Dissertation Prize of the German Association of Communication Research. [Network Analysis; Observation]

**Francesco Quatraro** got his PhD in economics at the University of Turin, Italy. He has been visiting scholar at the University of Manchester, UK, and at Columbia University, New York, USA. He is adjunct professor of microeconomics at the Department of Economics of the University of Turin and a postdoctoral fellow at the University of Nice Sophia Antipolis, France. His main interests are the economics of innovation and regional economics. He has recently published in the journals *Region et developpement* and the *Rivista Internazionale di Scienze Economiche e Commerciali*. [Information and Communication Technology, Economics of]

**Marc Raboy** is Beaverbrook Chair in Ethics, Media, and Communications in the Department of Art History and Communication Studies, McGill University, Canada. He is the author or editor of 13 books and more than 100 journal articles or book chapters, as well as reports for such organizations as UNESCO, the Japan Broadcasting Corporation, the European Broadcasting Union, the Policy Research Secretariat of the Government of Canada, and the Quebec Ministry for Culture and Communication. Dr. Raboy is also a founding member of an international advocacy campaign for communication rights in the information society. [International Communication Agencies]

**Jessica J. Rack** is a doctoral student in communication at Purdue University, USA. She is the recipient of a doctoral fellowship to support her research on communication strategies for the management of bereavement; other research interests include communication anxiety and family violence. [Emotion]

**Jon Radwan** is associate professor of communication and director of the communication studies major at Seton Hall University in South Orange, USA. He earned a PhD in speech communication from Pennsylvania State University, an MA from Northern Illinois University, and a BA from the University of New Hampshire, USA. He has published work on rhetoric, media, and religion in a range of scholarly journals including the *Journal of Media and Religion* and the *Journal of Communication and Religion*. [Religion and Popular Communication]

**Lana F. Rakow** is a professor of communication and women studies at the University of North Dakota, USA, and serves as director of the university's Center for Community Engagement. She is the author or editor of four books on gender and communication, including *Feminist communication theory*, co-edited with Laura Wackwitz (2004). [Women in the Media, Images of]

**Shoba Ramanadhan** is a doctoral student in the Department of Society, Human Development, and Health at the Harvard School of Public Health, USA. She is conducting research on health communication, cancer disparities, and new media technologies. She holds an MPH in health management from the Yale School of Public Health and a BA in biology from Cornell University, USA. She has work experience in the areas of chronic disease management, telemedicine in rural India, and marketing/strategy consulting. [Communication Inequality]

**Gerardo Ramírez Vidal** is a classical philology researcher and a professor of Greek at the National Autonomous University of Mexico. He has published studies about rhetoric, Greek classical oratory, and the sophistic movement. His publications include *La retórica de Antífonte* (2000), *La palabra florida: La tradición retórica indígena y novohispana* (2004, with H. Beristáin), and *La palabra y la flecha: Análisis retórico de textos de la Grecia antigua* (2005). [Rhetoric in North America: Mexico]

**Arthur A. Raney** is an associate professor in the Department of Communication at Florida State University, USA. His research centers on entertainment theory and media psychology. Specifically, he examines the enjoyment of various media contents such as drama, sports, and digital games, as well as the role that various factors such as moral judgment and cognitive schemas play in the enjoyment of media entertainment. His writings have been published in various entertainment-centered anthologies, as well as scholarly journals including *Journal of Communication*, *Media Psychology*, *Communication Theory*, and *Mass Communication and Society*. He also co-edited with Jennings Bryant the *Handbook of sports and media* (2006). [Affective Disposition Theories]

**Jennifer Rauch** is an assistant professor of journalism at Long Island University's Brooklyn Campus, USA. Before joining the academy, she was a professional journalist and publication specialist. Her articles examining alternative models of media – including the UN-sponsored news agency Inter Press Service, civic (public) journalism, and independently produced zines – have been published in the *Journal of Communication Inquiry*, *Journalism and Mass Communication Educator*, and *Popular Communication*. [Zines]

**Juliana Raupp** is professor of organizational communication at the Institute for Media and Communication Studies at the Free University of Berlin, Germany. Her research interests focus on organizational communication, communication management, political communication, and evaluation research. Dr. Raupp has published numerous articles and book chapters. Her most recent book publication is on political polling (2007). [Determination Theory in Public Relations]

**William K. Rawlins** is Stocker Professor of Communication Studies at Ohio University, Athens, Ohio, USA. His book *Friendship matters: Communication, dialectics, and the life course* was designated a 1993 *Choice* Outstanding Academic Book, and received the Gerald R. Miller Book Award in 1994 from the Interpersonal and Small Group Interaction Division of the National Communication Association. In 2002 he received The Theory That Has Left a Legacy Award: “The Dialectical Perspective” from the Communication Theory Interest Group of the Central States Communication Association. He presently serves on the editorial boards of six journals in the field and continues to study how communicating as friends facilitates the well-lived life for persons and societies. [Friendship and Communication; Friendship and Peer Interaction]

**Geoffrey Raymond** is assistant professor of sociology at the University of California, Santa Barbara, USA. He is co-editor (with Paul Drew and Darin Weinberg) of *Talk and interaction in social research* and a member of the editorial board of *Language in Society*. [Ethnomethodology]

**Joad Raymond** is professor of English literature at the University of East Anglia, UK. His books include *Pamphlets and pamphleteering in early modern Britain* (2003) and *The invention of the newspaper: English newsbooks, 1641–1649* (1996). [Newspaper, Antecedents of]

**Stephen D. Reese** is Jesse H. Jones Professor of Journalism and associate dean for academic affairs in the College of Communication, University of Texas at Austin, USA. He is the author of *Mediating the message: Theories of influences on mass media content* (with Pam Shoemaker) and editor of *Framing public life: Perspectives on media and our understanding of the social world* (with Oscar Gandy and August Grant). [Media Production and Content]

**Tom Reichert** holds a PhD from the University of Arizona, USA, and is an associate professor at Grady College, University of Georgia, USA. He has also taught at the University of Alabama and the University of North Texas, USA. Dr. Reichert’s research interests include media and politics, social marketing, and the content and effects of sex in advertising and the media. He has sold advertising for the *Orange County Register* in southern California, and served as deputy press secretary for US Rep. Jim Kolbe’s 1994 re-election campaign. Reichert is a member of the editorial review boards of *Journal of Promotion Management*, *Sexuality and Culture*, and *Journalism and Mass Communication Quarterly*. [Advertising, Emotions in]

**Scott A. Reid** is an associate professor in the Department of Communication at the University of California, Santa Barbara, USA. His research interests are focused on various

aspects of communication and intergroup relations. [Collective Action and Communication; Social Identity Theory]

**Jason B. Reineke** is a graduate student in the School of Communication at Ohio State University, USA. His research focuses on censorship, public opinion, and the intersection between communication theory, research, and the law. [Perceived Reality: Meta-Analyses]

**Carsten Reinemann** is an assistant professor of communications at the Johannes Gutenberg University of Mainz, Germany. He has published several books as well as articles in *Communication Research*, *Communications*, *European Journal of Communication*, *International Journal of Public Opinion Research*, *Journalism and Mass Communication Quarterly*, *Journal of Communication*, and *Press/Politics*. [Journalism: Group Dynamics; Televised Debates]

**Amy Reynolds** is an associate professor and associate dean for research and graduate studies in the School of Journalism at Indiana University, USA. Her research focuses on First Amendment history, media sociology, and the multidisciplinary study of communication and law. She has published three books, several refereed journal articles, and more than a half-dozen book chapters. Recent projects include a book on terrorism and the press and a book about how “breaking news” routines impact journalistic behavior as well as public policy. She received her MA in journalism from the Indiana University School of Journalism (1991), and her PhD in mass communication from the University of Texas at Austin, USA (1998). [Communication and Law]

**Nancy Rhodes** is a research scientist with the Institute for Social Science Research at the University of Alabama, USA. Her research currently focuses on the social context of risky behavior in teens, including smoking, drinking alcohol, and risky driving. [Attitude–Behavior Consistency]

**Jef I. Richards** is professor of advertising at the University of Texas at Austin, USA. He is author of *Deceptive advertising: Behavioral study of a legal concept* (1990) and co-author of *Advertising education: Yesterday – today – tomorrow* (2006), and his research appears in a variety of marketing, advertising, and law journals and books. [Advertising Ethics]

**Carola Richter** is a teaching and research assistant for international and intercultural communication at the University of Erfurt, Germany. She received an MA in Arabic studies, political sciences and journalism from the University of Leipzig, Germany. Her research and teaching interests focus on media systems in the Arab world and developing countries, communication strategies of Islamist movements, and migration and media. [Egypt: Media System; Gulf States: Media Systems]

**Rajiv N. Rimal** is associate professor in the Johns Hopkins Bloomberg School of Public Health, USA. His primary area of scholarship is in health communication, focusing on developing and testing theories pertaining to behavior change. He has worked in several countries in Africa (including Malawi, Namibia, Ethiopia, and Uganda) to develop and

test the effects of interventions designed to prevent HIV/AIDS-related behaviors. He served as chair of the Health Communication Divisions of both the International Communication Association and the National Communication Association. [Media Campaigns and Perceptions of Reality; Social Norms]

**Andreea Deciu Ritivoi** is associate professor of English and rhetoric at Carnegie Mellon University, USA. She is author of *Yesterday's self: Nostalgia and the immigrant identity* (2002) and *Paul Ricoeur: Tradition and innovation in rhetorical theory* (2006). [Rhetorics: New Rhetorics]

**Karen A. Ritzenhoff** is an associate professor of communication and women's studies at Central Connecticut State University, USA. She teaches documentary video production, broadcast journalism, and media and film studies. Her research is in women and film, new technologies, and media literacy, and she has published on Deutsche Film-Aktiengesellschaft documentaries in post-Wall Germany. [Video]

**Skip Rizzo** is a research scientist at the University of Southern California (USC) Institute for Creative Technologies, USA, and is a research professor in the USC Department of Psychiatry and the USC School of Gerontology. Dr. Rizzo conducts research on the design, development, and evaluation of virtual reality systems targeting the areas of clinical assessment, treatment, and rehabilitation, spanning the domains of cognitive, motor, and psychological functioning in both healthy and clinical populations. [Avatars and Agents]

**David Roach** is a professor and chair of the Department of Communication Studies at Texas Tech University, USA. He was awarded the National Communication Association's Scholarship of Teaching and Learning Award in 2000, and the Texas Tech University President's Excellence in Teaching Award in 2005. [Classroom Power]

**Felicia Roberts** is an associate professor in the Department of Communication and a faculty member of the interdepartmental program in linguistics at Purdue University, USA. She holds a PhD in English language and linguistics from the University of Wisconsin-Madison, USA. Her research focuses on the verbal, vocal, and nonvocal practices that constitute everyday and institutional life. [Transcribing and Transcription]

**Nancy L. Roberts** is professor of journalism and communication at the State University of New York at Albany, USA. She is the author (with M. and E. Emery) of *The press and America* (9th edn.) and other books. From 1983 to 2004, she was a faculty member in the School of Journalism and Mass Communication, University of Minnesota, Twin Cities, USA. [Peace Journalism]

**Jeffrey D. Robinson** holds a PhD in sociology from the University of California, Los Angeles, USA, and is currently an associate professor in the Department of Communication at Rutgers University, USA. Dr. Robinson uses the study of language and social interaction (e.g., conversation analysis) to investigate the dynamics and outcomes of

physician–patient communication, and publishes this work in both social science and medical journals (e.g., *Social Science and Medicine*, *Journal of General Internal Medicine*). He also studies the interactional construction of relationships between friends and family members, and publishes this work in communication and language journals (e.g., *Communication Monographs*, *Research on Language and Social Interaction*). In addition to teaching and research, Dr. Robinson teaches continuing medical education courses to practicing physicians. [Doctor–Patient Talk]

**Clemencia Rodríguez** is associate professor at the University of Oklahoma, USA. In 2001 she published *Fissures in the mediascape: An international study of citizens' media*. Dr. Rodríguez has conducted research since 1984 on citizens' media in different international contexts including Nicaragua, Colombia, Spain, Chile, and among Latino communities in the USA. In 2001, she, Dr. Nick Couldry, and Dr. John Downing founded OURMedia/NuestrosMedios ([www.ourmedianet.org](http://www.ourmedianet.org)), a network of citizens' media activists, artists, and academics. Since 2004 Dr. Rodríguez has been researching the role(s) of citizens' media in armed conflict regions in Colombia. [Citizens' Media; Radical Media]

**Hernando Rojas** holds a PhD from the University of Wisconsin-Madison, USA, where he is an assistant professor in the Life Sciences Communication Department. His research is centered on the relationship between communication practices and community engagement in three interrelated lines of inquiry: interpersonal communication and motivations for democratic engagement; the public sphere and emerging communication technologies; and how perceptions of media and media effects affect public opinion. His work has been published in leading communication journals including *Communication Research*, *Human Communication Research*, *International Journal of Public Opinion Research*, *Javnost – The Public, Journalism and Mass Communication Quarterly*, and *Mass Communication and Society*. [Behavioral Norms: Perception through the Media]

**Michael E. Roloff** is professor of communication studies at Northwestern University, USA. Currently, he is co-editor of *Communication Research* (with Pamela Shoemaker) and is senior associate editor of the *International Journal of Conflict Management*. His research has been published in a variety of journals including *Human Communication Research* and *Communication Monographs*. [Negotiation and Bargaining; Social Exchange]

**Holger Roschk** is a doctoral candidate in marketing at Ilmenau University of Technology, Germany. The research for his diploma thesis comprises the assessment and creation of methods for evaluating and managing intellectual capital in entrepreneurial and venture-capital firms. In his current research he deals with the impact of emotions and culture in the service recovery context. Further, he contributes to a cross-cultural teaching project involving several universities in England, Germany, and Russia. [Advertising, Cross-Cultural]

**David R. Roskos-Ewoldsen** is a professor in the Department of Psychology at the University of Alabama, USA. He was the co-founding editor of *Media Psychology* with Dr. Jennings Bryant and current editor (and founder) of *Communication Methods and Measures*. In addition, he serves on the editorial board for six communication journals.

Dr. Roskos-Ewoldsen is the immediate past chair of the Information Systems Division of the International Communication Association (ICA) and vice chair/chair elect of the Mass Communication Division of ICA. His interests include health communication, attitudes and persuasion, media psychology, and comprehension of media messages. [Attitude Accessibility; Attitudes; Computer–User Interaction]

**Karen Ross** is reader in mass communication and director of the Centre for Media, Arts and Performance at Coventry University, UK. She was visiting professor at the School of Politics, Queens University Belfast, UK (2001–2004). She has written extensively on issues of in/equality in communication and culture. Her books include: *Women and media* (with Carolyn Byerly, 2004), *Media and audiences* (with Virginia Nightingale, 2003), *Mapping the margins: Identity politics and media* (2003), *Women, politics, media* (2002), *Women, politics and change* (2001), *Black marks: Minority ethnic audiences and media* (2001), *Managing equal opportunities in higher education* (with Diana Woodward, 2000), and *Black and white media* (1996). She worked on a pan-European project focused on gender and reporting the European elections 2004, and a further study of the Northern Ireland Women’s Coalition. [Audiences, Female]

**Susan Dente Ross** is a First Amendment, freedom of information, and media scholar whose work on how anti-terrorism laws and policies have chilled free speech and free press in the USA has been widely cited and republished. An associate professor in the Edward R. Murrow School of Communication and an associate dean in the College of Liberal Arts at Washington State University, USA, she has served as a Fulbright scholar in Greece and Israel, where her research on media coverage of conflict in the Middle East, and her advocacy and training on peace journalism, are well known. [Gag Orders]

**Patrick Rössler** holds a PhD in communication from the University of Stuttgart-Hohenheim, Germany, where he was a research assistant before becoming assistant professor at the Ludwig Maximilian University of Munich, Department of Communication, Germany, and then full professor of media sociology and media psychology. Since 2004 he has been chair of communication science/empirical research at the University of Erfurt, Germany. In 2006 he was elected president of the German Communication Association and representative of the International Communication Association in Germany. He is editor of the book series “Internet Research” and “medien + gesundheit.” His main fields of scholarly interest are media effects research, new media developments and online communication, audience research, health communication, and history of magazines. [Coding; Media Use, International Comparison of; Scales and Indices]

**Eric W. Rothenbuhler** is professor of communication at Texas A&M University, USA, and was formerly at the University of Iowa and New School University, USA. He is the author of *Ritual communication* (1998), co-editor of *Media anthropology* (2005) and *Communication and community* (2001), and author or co-author of many articles and chapters on media, ritual, community, media industries, popular music, and communication theory. [Rituals in Popular Communication]

**Ulrike Röttger** is professor of public relations at the University of Münster, Germany. She is the editor of *Issues management* (2nd edn. 2003) and *Theorien der Public Relations* (Theories of public relations, 2004) and author of “Structural segregation and openness: A balanced professionalism for public relations”(with Jochen Hoffmann and Otfried Jarren, *Studies in Communication Sciences*, 2007). Her research, on socialization, information processing, and the active audience has been published in *Journalism and Mass Communication Quarterly*, *Communication Research*, *Journal of Communication*, *Communication Theory*, *Newspaper Research Journal*, *Journal of Broadcasting and Electronic Media*, and other scholarly publications. [Credibility of Content]

**David Rowe** is director and professor, Centre for Cultural Research, University of Western Sydney, Australia. His books include the sole-authored *Popular cultures: Rock music, sport and the politics of pleasure* (1995) and *Sport, culture and the media: The unruly trinity* (2nd edn. 2004), the sole-edited *Critical readings: Sport, culture and the media* (2004), and the co-authored *Globalization and sport: Playing the world* (2001). [Sports and the Media, History of]

**Ian Rowlands** is director of research at the Centre for Publishing, University College London, UK, and a founding member of the Centre for Information Behaviour and the Evaluation of Research. He is an expert in electronic publishing and scholarly communication and the holder of the Citation Analysis Award of the American Society for Information Science and Technology (1999). [Open Access Journals]

**Alan M. Rubin** holds a PhD from the University of Illinois at Urbana-Champaign, USA, and is professor emeritus and director emeritus of communication studies, Kent State University, USA. His primary research interests are the uses and effects of traditional and newer communication media. He is past editor of both the *Journal of Communication* and the *Journal of Broadcasting and Electronic Media*. Besides publishing articles, books, and chapters, he has given conference presentations and lectures in a dozen countries. He is a fellow of the International Communication Association and received the Distinguished Scholar Award from the Broadcast Education Association. [Regression Analysis; Social Behavior, Media Effects on]

**Rebecca B. Rubin** is professor emerita of communication studies at Kent State University, USA. She has published over 75 articles and chapters in the areas of interpersonal relationship development, communication competence, communication education, personal and mediated relationships, and quantitative research methodology. She is the author of *Communication research: Sources and strategies* (with Alan Rubin and Linda Piele, 6th edn. 2005) and *The road trip: An interpersonal adventure* (with Randi Nevins, 1988), and editor of *Communication research measures: A sourcebook* (with Philip Palmgreen and Howard Sypher, 1994). She is profiled in *Women in communication: A biographical sourcebook* (ed. N. Signorielli, 1996). [Educational Communication; Relationship Development]

**Jay Ruby** is a retired visual anthropologist who was the founder of the Temple University, USA, graduate program in the anthropology of visual communication. For over 40 years he has been exploring the relationships between culture and the visual world. Among his latest publications are *Oak Park stories: Ethnographic multimedia portraits* (2004–2006) and *Picturing culture* (2000). He is currently co-editing a history of visual anthropology with Marcus Banks. [Ethnographic Film]

**Rena M. Rudy** is a doctoral candidate in the Department of Communication at the University of California, Santa Barbara, USA. She earned a BA from Stanford University, USA, and an MA from the University of California, Santa Barbara. Her research interests involve the common socio-psychological processes underlying different types of response to entertainment media. [Desensitization]

**Georg Ruhrmann** is professor of communications at the University of Jena, Germany. He is a researcher in the project “Molecular Medicine and Television,” funded by the German Ministry of Science (2003–2006), and in the research group “Discrimination and Tolerance in Intergroup Relations,” funded by the German Science Foundation (2001–). [Risk Communication]

**Janet B. Ruscher** is a professor and the chair of the Department of Psychology at Tulane University in New Orleans, USA. Her empirical work considers the development of stereotypic impressions through conversation, racist and sexist language, and cross-race performance feedback. She is the author of *Prejudiced communication: A social psychological perspective*. [Prejudiced and Discriminatory Communication]

**Stephan Russ-Mohl** is director of the European Journalism Observatory ([www.ejo.ch](http://www.ejo.ch)) and professor of journalism and media management at the University of Lugano in Lugano, Switzerland. He was professor of journalism and media management at the Free University of Berlin, Germany, from 1985 through 2001. He got his PhD from the University of Constance, Germany, after studying public administration/public policy at Constance and at Princeton University, USA. As a freelancer, he contributes frequently to *Neue Zürcher Zeitung* and other print media. [Quality Press]

**Joseph Russomanno** holds a PhD from the University of Colorado at Boulder, USA, and is an associate professor in the Walter Cronkite School of Journalism and Mass Communication at Arizona State University, USA. There he teaches courses in mass media law and First Amendment theory. His publications include several articles in *Communication Law and Policy*. He is author of *Speaking our minds* (2002), editor of *Defending the First* (2005), and co-author of *The law of journalism and mass communication* (2007). [Freedom of the Press, Concept of]

**Ellen Bouchard Ryan** is professor in the Department of Psychiatry and Behavioural Neurosciences and in the Centre for Gerontological Studies at McMaster University in Hamilton, Canada. She focuses her psychological research on social cognitive aspects of communication and aging. Working within the communication predicament of aging

model, she and colleagues continue to examine communication predicaments experienced by vulnerable older adults with sensory, cognitive, and physical impairments and the roles of empowering communication in fostering personhood and successful aging with a disability. [Disability and Communication]

**Marie-Laure Ryan**, a native of Geneva, Switzerland, is an independent scholar based in Colorado, USA. She is the author of *Possible Worlds, artificial intelligence and narrative theory* (1991), *Narrative as virtual reality: Immersion and interactivity in literature and electronic media* (2001), and *Avatars of story: Narrative modes in old and new media* (2006). She has also edited *Cyberspace textuality: Computer technology and literary theory* (1999) and *Narrative across media* (2004) and co-edited the *Routledge encyclopedia of narrative theory* (2005). [Fiction]

**Miguel Sabido** received his BA from the National Autonomous University of Mexico in literature and drama, and his doctorate from the University Studies Centre, Monterrey, Mexico. He was the research vice president at Televisa for over 30 years, and has been a producer, writer, and director for television, radio, theatre, and cinema. He has published several books, including *Theory of the tone*. He is in the process of revising his book *The anatomy of the telenovela*. He is a pioneer in the use of media for a proven social benefit. Known as the father of entertainment education, he has received more than 100 national and international awards for his work. [Entertainment Education]

**Roger L. Sadler** is a full professor at Western Illinois University, USA, in the Department of Broadcasting. He has been teaching there since 1990. Dr. Sadler received his PhD from Indiana University, USA, in 1992. He is the author of the textbook *Electronic media law* (2005). Dr. Sadler also works part-time as a DJ at WJEQ-FM in Macomb, Illinois, and as a news reporter in the summers at WQAD-TV in Moline, Illinois, USA. [Television Broadcasting, Regulation of]

**Jakub Samochowiec** is a PhD student in the Department of Social and Economic Psychology, University of Basel, Switzerland. His interests lie in the intersection between communication, social perception, and intergroup relations. [Social Perception]

**Wendy Samter** is professor and chair of communication at Bryant University, Smithfield, USA. She is co-author of two books, *Children communicating: The first five years* (1997, with Beth Bonniwell Haslett) and *Explaining communication: Contemporary theories and exemplars* (2006, with Bryan B. Whaley). She was recently elected editor of *Communication Research Reports*. [Communication Skills across the Life-Span]

**Todd Sandel** is associate professor in the Department of Communication at the University of Oklahoma, USA. He was president of the Association for Chinese Communication Studies from 2006 to 2007, and an active member of the Language and Social Interaction Division of the National Communication Association. He is currently a Fulbright scholar, studying the acculturation and language development of members of transnational families in Taiwan. [Intimate Talk with Family and Friends]

**Karen Sanders** is professor in the Faculty of Communication and Humanities at the CEU San Pablo University in Madrid, Spain, having spent 11 years with the Department of Journalism Studies at the University of Sheffield, UK. She has written widely on ethics, journalism, and political communication. She has published *Ethics and journalism* (2003, now translated into Chinese) and *Morality tales: Journalism and political scandals in Britain and Spain in the 1990s* (2006). [Scandalization in the News]

**Robert E. Sanders** is professor of communication at the State University of New York at Albany, USA. He is author of the book *Cognitive foundations of calculated speech*, co-editor of *The handbook of language and social interaction*, and past editor of the journal *Research on Language and Social Interaction*. [Discourse, Cognitive Approaches to]

**Kent Sandstrom** is a professor of sociology at the University of Northern Iowa, USA. He is the co-author of three books: *Symbols, selves, and social reality: A symbolic interactionist approach to social psychology* (2006), *A meditation on social problems* (2002), and *Knowing children: Participant observation with minors* (1988). He has won the Outstanding Teaching Award and the Distinguished Service Award at the University of Northern Iowa. He has also received the Herbert Blumer Award from the Society for the Study of Symbolic Interaction. [Symbolic Interaction]

**Ulrich Sarcinelli** holds a chair of political science in the Department of Political Science of the University of Koblenz-Landau, Germany. He has been teaching as guest professor in the Department of Mass Communication and Media Research of the University of Zurich, Switzerland. His continuing research focuses on political communication and political culture. [Symbolic Politics]

**Stephanie Lee Sargent Weaver** is a research scientist in the Center for AIDS Research in the Rollins School of Public Health at Emory University, USA, and a research fellow in the Behavioral Research Center of the American Cancer Society. She has served as the chair of the Communication and Social Cognition Division of the National Communication Association from 2005 to 2006 and as research committee chair from 2003 to 2004, and currently serves as an executive board member. She also serves on the editorial board for several journals including *Communication Research Reports* and *International Journal of Listening*. [Measurement Theory; Operationalization]

**Amit M. Schejter** holds a PhD from Rutgers University, USA, and is assistant professor of communications at Pennsylvania State University, USA. He is a former delegate to the governing bodies of the European Broadcasting Union and a former member of its legal committee. He is co-author of *The wonder phone in the land of miracles* (forthcoming, with Akiba Cohen and Dafna Lemish). [European Union: Communication Law]

**Michael Schenk** is a full university professor at the University of Hohenheim, Germany. He holds the chair of communication science and social research and heads the research center for media economics and communication research. He is the author of *Medienwirkungsforschung*, a successful German compendium on media effects research. [Hovland, Carl I.; Order of Presentation; Sleeper Effect]

**Helmut Scherer** is professor for communication research and director of the Department of Journalism and Communication Research of the Hanover University of Music and Drama, Germany. His major research areas are media reception, public opinion, and political communication. [Longitudinal Analysis; Media Events and Pseudo-Events; Media Use by Social Variable]

**Bertram Scheufele** is a professor of empirical methods of communication science at the University of Jena, Germany. His research interests comprise political communication, public discourse, and media and violence. In these fields he works on media content, media effects, and quantitative and qualitative methods. The German Research Foundation has funded several of his projects. Together with Thorsten Quandt he initiated the scientific network and micro–macro links in communication research. [Content Analysis, Qualitative; Content Analysis, Quantitative; Discourse Analysis; Grounded Theory; Statistics, Descriptive; Statistics, Explanatory; Time-Series Analysis]

**Dietram A. Scheufele** is professor and director of graduate studies in the Department of Life Sciences Communication and professor in the School of Journalism and Mass Communication at the University of Wisconsin-Madison, USA. Scheufele has published extensively in the areas of public opinion, political communication, and science communication. He is the recipient of the Robert M. Worcester Award from the World Association for Public Opinion Research and the Young Scholar Award for outstanding early career research from the International Communication Association. At Wisconsin, Scheufele teaches courses in research methods, public opinion, media and politics, and digital democracy. [Framing Effects; Media Content and Social Networks]

**Daniela Schluetz** is senior consultant at Asero GmbH & Co. KG, Hanover, Germany, responsible for the application of scientific methods. She worked as a research assistant at the Institute for Journalism and Communication Research in Hanover and wrote her PhD thesis about computer games. Together with Dr. Wiebke Möhring, Dr. Schluetz published a book about survey design in 2003. [Interview; Interview, Qualitative; Interview, Standardized]

**RaLynn Schmalzried** received her BA in psychology and creative writing in 2005 from Baker University, USA. In May 2007, she earned her MSc from the University of Kansas, USA, where she is continuing her doctoral work in cognitive psychology and gerontology with Dr. Susan Kemper. Schmalzried is interested in several aspects of aging, including applied research and communication. [Aging and Message Production and Processing]

**Rüdiger Schmitt-Beck** is professor of political science at the University of Duisburg-Essen, Germany. His main research interests are in the areas of campaign communication, interpersonal communication, communication effects on political attitudes and participation, and voting behavior. Among his most recent publications are *Politische Kommunikation und Wählerverhalten* (Political communication and voting behavior, 2nd edn. 2002), *Do political campaigns matter?* (co-ed. with David M. Farrell, paperback edn. 2006), and *Non-party actors in electoral politics* (co-ed. with David M. Farrell, 2007). [Bandwagon Effect; Issue Voting; Underdog Effect]

Dr. Schneider also works as advisor for companies and institutions on editorial matters, program planning, public relations evaluation, and communication training. She is the author of numerous publications on media system, media innovation, and national and international journalism. [Exposure to Print Media]

**Steve Schneider** is professor of communications and information technology, and of political science, at the State University of New York Institute of Technology, USA. He is the co-author of *Web campaigning* (2006) and co-editor of *The Internet and national elections* (2007). He is a co-founder and co-director of WebArchivist.org, a research group that develops tools and techniques for large-scale web archiving of scholarly materials. [Archiving Internet Content]

**Klaus Schoenbach** is professor and chair of general communication science at the University of Amsterdam, the Netherlands, and of media science at Zeppelin University, Friedrichshafen, Germany. He is dean of communication and cultural management at Zeppelin University, served as chairman of the Department of Communication Science in Amsterdam, and was the founder of the Department of Journalism and Communication Research at the Hanover University of Music and Drama, Germany. He has been a visiting professor at several US universities. His major research and teaching interests are audience and effects of the mass media, media marketing, persuasive communication, and methods of empirical communication research. [Synchronization of the News; Trap Effect]

**Armin Scholl** studied communication science from 1982 to 1991 in Mainz and Münster, Germany. After research projects in journalism, communication research, and methodology at the University of Münster (Institute for Communication Science), from 1994 to 1998 he was assistant professor at the Free University of Berlin (Institute for Communication Science), Germany. Since 1998 he has been associate professor at the University of Münster. Scholl wrote his dissertation thesis on “Reactivity in the research interview” (1993) and has published a textbook on surveys and interviews (2003) as well as several articles on methodological issues. [Qualitative Methodology; Quantitative Methodology]

**Barbara Schouten** is an assistant professor at the department of Communications Science at the University of Amsterdam, the Netherlands. Her main research interests are intercultural health communication and doctor–patient communication. Her work has been published in journals such as *Patient Education and Counseling*, *International Journal of Intercultural Relations*, and *Journal of Dental Research*. [Bad News in Medicine, Communicating]

**Holger Schramm** is an assistant professor at the Institute of Mass Communication and Media Research, University of Zurich, Switzerland. He is chair of the Rezeptions- und

Wirkungsforschung (Media Exposure and Effects) Division of the German Communication Association. His research areas are media exposure and effects, entertainment and emotion research, music and media, sports and media, and methodology. [Exposure to Film; Exposure to Radio; Parasocial Interactions and Relationships]

**Jonathan E. Schroeder** is professor of marketing at the University of Exeter, UK, and visiting professor of marketing semiotics at Bocconi University, Milan, Italy. His PhD is in social psychology from the University of California, Berkeley, USA. He is co-editor of the interdisciplinary journal *Consumption, Markets and Culture*. His publications include the books *Visual consumption* (2002) and, with Miriam Salzer-Mörling, *Brand culture* (2006). [Fetishization]

**Rüdiger Schulz** is a senior project manager at the Allensbach Institute, Germany. He has been a lecturer at the Johannes Gutenberg University of Mainz, the University of Constance, and the Free University of Berlin, Germany, and currently lectures at the Zeppelin University in Friedrichshafe, Germany. [Copy Test and Starch Test; Readership Research]

**Winfried Schulz** is professor emeritus of mass communication and political science at the University of Erlangen-Nuremberg, Germany. He was awarded an honorary doctorate by Charles University, Prague, Czech Republic. His publications focus on political communication, mass media audiences and effects, news analysis, and media performance. [Political Communication; Political News]

**Astrid Schütz** is a professor of psychology at Chemnitz University of Technology, Germany. She teaches personality psychology and psychological assessment. Her research concerns individual differences in self-perception and strategies of self-presentation. She has studied self-presentation in politics, on the Internet, and in everyday life. Her work includes several studies focused on self-esteem, narcissism, and coping with stress. [Political Personality in Media Democracy]

**Frank Schwab** is scientific assistant at the Department of Media and Organizational Psychology, Saarland University, Germany. Dr. Schwab is editor of the special issue “Evolutionary psychology” of the *Zeitschrift für Medienpsychologie (Journal of Media Psychology)* and serves on the editorial board of *Media Psychology* and *Journal of Media Psychology*. [Evolutionary Theory]

**Carol B. Schwalbe** is an assistant professor of journalism at the Walter Cronkite School of Journalism at Arizona State University, USA. In 2006–2007 she was head of the Magazine Division of the Association for Education in Journalism and Mass Communication. During her professional career she was a senior articles editor for both *National Geographic Magazine* and *National Geographic Traveler*. [Magazine]

**Wolfgang Schweiger** holds an MA and PhD in communication studies from Dresden University of Technology, Germany. He is head of the Computer-Mediated Communication Division of the German Communication Association, and in 2007–2008 was deputy

professor at the Institute of Communication Science, Dresden University of Technology. His research interests include empirical methods, media use and effects research, and online research. [Online Media; Online Research; Text Analysis, Computer-Aided]

**Christine Scodari** is professor of communication and multimedia studies at Florida Atlantic University, USA. She is the author of *Serial monogamy: Soap opera, lifespan, and the gendered politics of fantasy* (2004) and numerous articles on film and/or television romantic comedy, science fiction, fandom, and other facets of popular communication. [Drama in Media Content]

**Allison M. Scott** holds an MA from the University of Illinois at Urbana-Champaign, USA, and is a doctoral student in the Department of Speech Communication there. Her research interests lie at the intersection of health and interpersonal communication, focusing specifically on how uncertainty and illness identity affect the way families manage health issues. She was a Department of Speech Communication fellow in 2004–2005. [Family Communication Patterns]

**Byron Scott** is professor emeritus of journalism at the University of Missouri-Columbia, USA. A former newspaper reporter, magazine writer, and editor of two national magazines, he headed the magazine program at the Scripps Journalism School of Ohio University, USA, before joining the Missouri School of Journalism in 1986 as holder of its first endowed chair, in magazine journalism. [News Magazine, History of]

**Craig R. Scott** holds a PhD from Arizona State University, USA, and is an associate professor in the Department of Communication at Rutgers University in New Brunswick, USA. His research related specifically to electronic meeting systems has been published in *Small Group Research*, *Western Journal of Communication*, *Communication Quarterly*, *Communication Reports*, and various book chapters. Related work on anonymous communication has been published in *Communication Theory*, *Management Communication Quarterly*, *Journal of Computer-Mediated Communication*, *Journal of Applied Communication Research*, and the *Free Speech Yearbook*. Dr. Scott currently serves on the editorial boards of three major journals in the field and is a member of the International Communication Association, National Communication Association, Academy of Management, and Association of Internet Researchers. [Meeting Technologies]

**Glenn Scott** is an assistant professor in the School of Communications at Elon University in Elon, USA. Prior to earning his doctoral degree from the University of North Carolina at Chapel Hill, USA, in 2006, he was a professional newspaper journalist for 20 years in the USA and Japan. His research interests include the examination of the shift of news content from printed forms to the Internet. [United States of America: Media System]

**Robert L. Scott** is professor emeritus at the University of Minnesota, Twin Cities, USA. He has published approximately 60 articles and books. At Minnesota he received an award for Outstanding Teaching from the College of Liberal Arts in 1982. In 2006 his

scholarship was recognized at Minnesota by having his name placed on the Scholars' Walk. He has received six awards for scholarship from various societies, including being named as a Distinguished Scholar by the National Association of Communication in 1992. [Rhetoric and Epistemology]

His work on communication and crisis management has appeared in *Journal of Health Communication*, *Journal of Organizational Change Management*, *The encyclopedia of public relations*, *Communication Yearbook*, and the *Handbook of public relations*. [Disasters and Communication]

**Chris Segrin** is professor and department head at the Department of Communication, University of Arizona, USA. He also holds adjunct appointments in the Departments of Psychology and Family Studies and Human Development. His research specialties are interpersonal relationships and mental health and family relationships. Prof. Segrin is author of *Interpersonal processes in psychological problems* (2001) and *Family communication* (2005, with Jeanne Flora), and past editor of *Communication Theory*. [Marital Communication]

**David R. Seibold** is professor of communication, and co-director of the graduate program in management practice, at the University of California, Santa Barbara, USA. He has published more than 100 articles and chapters in the areas of interpersonal, group, organizational, and applied communication, and is a former editor of the *Journal of Applied Communication Research*. [Applied Communication Research]

**Timothy L. Sellnow** is a professor at North Dakota State University, USA. Dr. Sellnow teaches, researches, and consults in organizational communication, focusing on organizational crisis and risk communication. He has served as a management consultant for a wide variety of organizations in the region. In 1999, he won the Central States Communication Association's Federation Prize for his crisis communication research. He is also a past recipient of North Dakota State University's Distinguished Educator Award for excellence in teaching. He has co-authored *Communication and organizational crisis* and *Effective crisis communication: Moving from crisis to opportunity*, and has worked directly with the Department of Homeland Security, Centers for Disease Control and Prevention, and the US Department of Agriculture on risk and crisis communication issues. [Organizational Crises, Communication in]

**Holli A. Semetko** is vice provost for international affairs and professor of political science at Emory University, Atlanta, USA, where she also serves as director of the Office of International Affairs and the Claus M. Halle Institute for Global Learning. Her most recent award-winning article is co-authored with Kees Aarts and was published in 2003 in the *Journal of Politics*. Her most recent book, entitled *Political campaigning in referendums: Framing the referendum issue*, co-authored with Claes de Vreese, was published in 2004 and in paperback in 2006. [Election Campaign Communication]

**Gianluca Sergi** teaches film and television at the Institute of Film and TV Studies at the University of Nottingham, UK. He has published extensively on contemporary Hollywood cinema. In particular, his research focuses on two key areas, namely filmmaking practices and the relationship between images and sound. He is the author of *The Dolby era: Film sound in contemporary Hollywood* (2004) and co-author with Alan Lovell of *Making films in contemporary Hollywood* (2005). He is currently completing a book on the role of entertainment in the cinema, called *Cinema entertainment*. [Film Production]

**Jan Servaes** holds a PhD from the Catholic University of Louvain, Belgium, and is professor and chair of the Department of Communication at the University of Massachusetts Amherst, USA. He is the author of *Communication for development: One world, multiple cultures* (2002, foreword by Jan Pronk) and editor of *Communication for development and social change* (2007). [Participatory Communication]

**Masoud Shadnam** is a PhD student in the management and organization studies area at the Faculty of Business Administration, Simon Fraser University, in Vancouver, Canada. He has a degree in industrial engineering and an MBA from Sharif University of Technology, Tehran, Iran. His research focuses on the relations of morality, power, and inequality in organizational life, particularly from an institutional perspective. [Institutional Theory]

**Dhavan V. Shah** is Maier-Bascom Professor at the University of Wisconsin-Madison, USA, where he studies and teaches political and strategic communication. He is faculty in the School of Journalism and Mass Communication and the Department of Political Science. His research concerns the social psychology of media influence, with particular attention to communication effects on political judgment, public opinion, consumer culture, and civic and campaign participation. [Behavioral Norms: Perception through the Media; Political Socialization through the Media; Social Capital, Media Effects on]

**Hemant Shah** is professor of journalism and mass communication at the University of Wisconsin-Madison, USA. He is author of *Newspaper coverage of interethnic conflict: Competing visions of America* (2004), and has published extensively on international communication and media representations of race and ethnicity. [Development, Geometry of; Development Journalism; Lerner, Daniel]

**Michael A. Shapiro** is an associate professor in the Department of Communication at Cornell University, USA. He is currently a co-editor of *Media Psychology*. He is the author of a number of book chapters and journal articles, including articles in *Media Psychology*, *Human Communication Research*, *Communication Research*, *Journal of Communication*, *Communication Methods and Measures*, *Journal of Broadcasting and Electronic Media*, *Journalism Quarterly*, *Communication Yearbook*, and *Journal of the American Statistical Association*. He is a past chair of the Information Systems Division of the International Communication Association and a former head of the Communication Theory and Methods Division of the Association for Education in Journalism and Mass Communication. [Memory, Message; Perceived Realism as a Decision Process]

**Dan Shaver** is an assistant professor in the Nicholson School of Communication at the University of Central Florida, Orlando, USA. He has a PhD from the University of North Carolina at Chapel Hill and an MBA from Wake Forest University, USA. He also has almost three decades of management experience in the US newspaper industry. His research has been published in various books and journals including the *Journal of Media Economics*, *Journal of Business Ethics*, *Journal of Media Business*, and *International Journal of Media Management*. [Circulation]

**Donald L. Shaw** is Kenan Professor, School of Journalism and Mass Communication, University of North Carolina at Chapel Hill, USA, where he has taught since 1966. In 1972, with Maxwell McCombs, he launched contemporary media agenda-setting research with a *Public Opinion Quarterly* article, sparking dozens of books and hundreds of journal articles. The Association for Education in Journalism and Mass Communication (AEJMC) selected Shaw and McCombs's *The emergence of American political issues* as one of the most influential communication books of the twentieth century. Shaw is a past editor of *Journalism and Mass Communication Quarterly*, was selected one of the top 40 educators of journalism of the twentieth century, and has received numerous awards, including the AEJMC 2006 Paul Deutschmann Award, recognizing research excellence over a career. [Separation of News and Comments; United States of America: Media System]

**Lenny Shedletsky** is professor of communication at the University of Southern Maine, USA. He is the author of *Meaning and mind: An intrapersonal approach to human communication* (1989) and *Human communication on the Internet* (with Joan Aitken, 2004), and co-editor of *Intrapersonal communication processes* (1995), and has written numerous articles and chapters. [Cognition]

**Kim Bartel Sheehan** is associate professor at the University of Oregon in Eugene, USA. She has held leadership positions in the American Academy of Advertisers and most recently edited the proceedings of the 2007 American Academy of Advertising Annual Conference. She serves on the editorial board of the *Journal of Advertising* and the *Journal of Advertising Education*. [Brands; Trademarks in the Media]

**John L. Sherry** holds a PhD from Michigan State University, USA, where he is an associate professor in the Department of Communication. His primary research interest is media effects, focusing on neurophysiological reactivity to media that explain the etiology of the media use and the effects those media have. Recent studies have discovered a neurophysiological mechanism explaining television and video game use as well as sex differences in video game use. He currently teaches courses in the effects of entertaining mass communication research and research methods. [Computer Games and Child Development; Uses and Gratifications]

**Mark Shevy** is an assistant professor at Northern Michigan University (NMU), USA, in the Communication and Performance Studies Department. He began teaching at NMU in 2007. He received his MA from Colorado State University, USA, and his PhD from the University of Wisconsin-Madison, USA. [Attending to the Mass Media]

**Donald C. Shields** holds a PhD from the University of Minnesota, USA, and is professor emeritus, Department of Communication, University of Missouri-St. Louis, USA, and lecturer, Department of Communication Studies, University of Missouri-Kansas City, USA. His co-authored book (with John F. Cragan), *Symbolic theories in applied communication research*, received the National Communication Associations' 1995 Book of the Year Award in Applied Communication. [Symbolic Convergence Theory]

**Dong Hee Shin** has been an assistant professor at Pennsylvania State University, USA, since 2004. He earned his PhD and Master's in telecommunications from Syracuse University, USA. He has been researching on telecommunications management and policy and has had a variety of consultancy experience in the field of telecommunications and information industry. His current project looks at the consequences of governmental policy and regulations on telecommunications and information infrastructure as well as the applications and implications of these services. His publications have appeared in several international journals such as *Information Research*, *Technological Forecasting and Social Change*, *Government Information Quarterly*, and *Telematics and Informatics*. [Satellite Communication, Regulation of]

**K. M. Shrivastava**, a media professional, is now senior professor at the Indian Institute of Mass Communication, New Delhi, India. He is author of *News reporting and editing* (1987, 2003), *Radio and TV journalism* (1987), *Media issues* (1992), *Media towards 21st century* (1998), *Broadcast journalism in the 21st century* (2005), *Media ethics: Veda to Gandhi and beyond* (2005), *News agencies from pigeon to Internet* (2006), and *Public relations in the digital era* (2007). [India: Media System]

**L. J. Shrum** is professor of marketing at the University of Texas at San Antonio, USA. His work on the psychological processes underlying media effects has appeared in numerous scholarly journals. He recently edited the book *The psychology of entertainment media: Blurring the lines between entertainment and persuasion*. [Attitudes, Values, and Beliefs, Media Effects on; Perception; Selective Perception and Selective Retention]

**Patricia M. Sias** is professor of communication in the Edward R. Murrow School of Communication at Washington State University, USA. Her research centers on workplace relationships. She has published articles in and served on the editorial boards of a variety of academic journals including *Communication Monographs*, *Human Communication Research*, *Management Communication Quarterly*, *Western Journal of Communication*, *Communication Quarterly*, and *Journal of Applied Communication Research*. She served as secretary and chair of the Organizational Communication Division of the National Communication Association. [Supervisor–Subordinate Relationships]

**Nancy Signorielli** holds a PhD from the University of Pennsylvania, USA, and is professor of communication and director of the MA program in communication at the University of Delaware, USA. She has conducted research on images in the media and how these images are related to people's conceptions of social reality (cultivation analysis) for the past 35 years. An original member of the Cultural Indicators Research Team,

she has published extensively on gender role images, television violence, and health-related images on television. She has written several books, including *Violence in the media: A reference handbook* (2005). Her research has appeared in numerous journals as well as in edited books on mass communication. [Cultivation Effects; Violence as Media Content]

**Herbert W. Simons** is professor of communication at Temple University, Philadelphia, USA, where he has taught rhetoric and communication since 1960. Founder of the Temple Issues Forum, he is now director of the National Communication Association (NCA) Forum. Simons's writings have earned him an NCA Distinguished Scholar award and four best article awards. Recipient of a Fulbright for teaching and two senior specialist Fulbrights, he has taught and lectured widely both in the United States and elsewhere. [Rhetoric and Psychology]

**Peter Simonson** is assistant professor of communication at the University of Colorado at Boulder, USA, where he teaches courses in rhetorical theory and the intellectual history of communication. He is the editor of *Politics, social networks, and the history of mass communications research: Rereading "Personal influence"* (2006), and co-editor of *Mass communication and American social thought* (2004). [Communication and Media Studies, History to 1968; Pragmatism]

**John Sinclair** is an Australian Research Council Professorial Fellow in the Australian Centre, University of Melbourne, Australia. His publications include *Images incorporated: Advertising as industry and ideology* (1987), *Latin American television: A global view* (1999), and *Televisión: Comunicación global y regionalización* (2000). He is co-editor/contributor, with Stuart Cunningham and Elizabeth Jacka, of *New patterns in global television: Peripheral vision* (1996), and, with Stuart Cunningham, of *Floating lives: The media of Asian diasporas* (2001). His current research addresses globalization of media, especially advertising, in Australia. [Advertising: Global Industry; Chile: Media System]

**Jane B. Singer** is a professor in the Department of Journalism at the University of Central Lancashire, UK, where she is the Johnston Press Chair in Digital Journalism; she also is an associate professor of journalism at the University of Iowa, USA. A former newspaper and online journalist, she has been studying print journalists' adaptations to a digital environment since the mid-1990s. [Online Journalism]

**Arvind Singhal** is Samuel Shirley and Edna Holt Marston Endowed Professor of Communication and Senior Research Fellow, Sam Donaldson Center for Communication Studies, University of Texas at El Paso, USA. Dr. Singhal is co-author or editor of eight books, including *Communication of innovations: A journey with Everett M. Rogers*, *Organizing for social change*, *Entertainment-education worldwide: History, research, and practice*, *Combating AIDS: Communication strategies in action*, *India's communication revolution: From bullock carts to cyber marts*, and *Entertainment-education: A communication strategy for social change*. [Rogers, Everett]

**Edith Smit** received a PhD from the University of Amsterdam, the Netherlands, in 1999, and holds the customer media chair there. Dr. Smit has a background in marketing, psychology. Her research focuses on advertising effectiveness, brand communication, and relationship media, and has resulted in various publications in the *Journal of Advertising*, *Journal of Advertising Research*, and *Journal of Business Research*. [Media Planning]

**Peter B. Smith** is professor emeritus of social psychology at the University of Sussex, UK, and is the author of *Understanding social psychology across cultures*. He was formerly editor of the *Journal of Cross-Cultural Psychology* and has served as president of the International Association for Cross-Cultural Psychology. [Cultural Patterns and Communication]

**Sandi W. Smith** holds a PhD from the University of Southern California, USA, and is director of the Health and Risk Communication Center and professor in the Department of Communication at Michigan State University, USA. She received the Distinguished Faculty Award in 2007. Her work centers on health persuasion in contexts such as reduction of extreme drinking on college campuses, awareness of environmental factors in breast cancer, and organ donation promotion strategies. [Self-Presentation; Social Judgment Theory]

**Matthew Soar** is an assistant professor in the Department of Communication Studies at Concordia University in Montreal, Canada. Dr. Soar teaches digital media production, and has a background in graphic design practice and media/cultural studies. His writing has appeared in *Cultural Studies*, *Jump Cut*, *Eye: The International Review of Graphic Design*, and the edited collection *Image ethics in the digital age*. [Graphic Design]

**Lawrence Soley** is Colnik Professor of Communication at Marquette University, USA. Dr. Soley's research articles have appeared in *Journalism Quarterly*, *Journal of Communication*, *Journal of Advertising*, *Journal of Advertising Research*, *Newspaper Research Journal*, *Journal of Broadcasting and Electronic Communication*, *Media Studies Journal*, and other publications. His research interests include private restrictions on free speech, unlicensed radio, and projective techniques. Dr. Soley is affiliated to the American Academy of Advertising, National Communication Association, and Association for Education in Journalism. Recent publications include *Censorship Inc.*, *Free radio: Electronic disobedience*, and *Radio warfare*. [News Sources]

**Jordan Soliz** is an assistant professor of communication studies at the University of Nebraska-Lincoln, USA. His research interests are in family and interpersonal communication, with an emphasis on intergroup dynamics within the family (e.g., intergenerational relationships, interethnic relationships). His research has appeared in *Communication Monographs* and the *Journal of Applied Communication Research*. [Interethnic Relationships in Families]

**Denise Haunani Solomon** is professor of communication arts and sciences at Pennsylvania State University, USA. She is a member of the International Communication Association, National Communication Association, and International Association for Relationship Research. She serves on the editorial board of six journals in the field,

and she is also an associate editor for *Personal Relationships*. Her research focuses on interpersonal communication and the experience of turbulence during romantic relationship transitions. [Uncertainty Reduction Theory]

**Prasun Sonwalkar** is senior lecturer in journalism studies at the University of the West of England, Bristol, UK. A former journalist, his publications include an edited collection (*Media and political violence*, with Hillel Nosssek and Annabelle Sreberny) and several chapters, journal articles, and reviews. [Terrorism and Communication Technologies]

**Glenn G. Sparks** is professor and associate department head in the Department of Communication at Purdue University, USA. He has studied media effects for over 25 years and is the author of *Media effects research: A basic overview*. He has conducted research on cognitive and emotional reactions to violent and frightening media and is currently working on research about the impact of new media technologies. His co-authored book *Refrigerator rights: Creating connections and restoring relationships* explores the role of media in daily life. He has served on numerous editorial boards and has been listed in several analyses as among the top researchers in the field of communication. [Fear Induction through Media Content]

**Lisa Sparks** is professor of communication at Chapman University, Orange, USA. She is editor of *Communication Research Reports*, serves on numerous editorial boards including *Journal of Applied Communication Research* and *Communication Quarterly*, and has served as a scientific reviewer for the National Cancer Institute, National Institutes of Health. She is author of *Health communication in the 21st century* (2007, with Kevin Wright and Dan O'Hair), and of *Handbook of cancer communication* (2007), and *Cancer communication and aging* (both with Dan O'Hair and Gary Kreps, in press). She served as principal investigator (PI) for a Robert Wood Johnson Foundation Grant, *Hablamos juntos: Improving patient-provider communication for Latinos*, to develop affordable models to help English-speaking providers communicate more effectively with their Spanish-speaking patients (with co-PI Gary Kreps, 2005). [Family Decision-Making]

**Amanda H. Spink** is professor of information technology, Queensland University of Technology, Australia. Her research focuses on basic, applied, industry, and interdisciplinary studies in information science, including theories, models, and experiments related to information behavior, cognitive information retrieval, and web studies. Her research has been supported by the National Science Foundation, ARC, NEC, IBM, Lockheed Martin, Alta Vista, Infospace, Vivisimo, Excite, and the Andrew R. Mellon Foundation. She has over 300 publications in information retrieval, web retrieval, and information behavior. Recent books include *Web search: Public searching of the web*, *New directions in cognitive information retrieval*, *New directions in human information behavior*, and *Web search: Multidisciplinary perspectives*. She was ranked the second most highly cited scholar in the field of library and information science 2001–2004. [Log-File Analysis]

**Brian H. Spitzberg** is a professor in the School of Communication at San Diego State University, USA. He is author, co-author, or co-editor of books on communication

competence, the dark side of relationships, and stalking and unwanted relationship pursuit, as well as of dozens of scholarly articles and chapters. He also serves as an active member of the San Diego District Attorney's Stalking Case Assessment Team, and is an active member of the Association of Threat Assessment Professionals, and on the editorial board of the *Journal of Social and Personal Relationships* and *Western Journal of Communication*. [Interpersonal Communication Competence and Social Skills]

**Jo Sprague** is professor emeritus of communication at San Jose State University, USA. Her research interests have centered on critical pedagogy, instructional communication, and the development of teaching associate communication. She has held leadership roles in professional associations and has applied the principles of instructional communication to faculty development across the disciplines. [Communication Education, Goals of]

**Lee Sproull** holds the Leonard N. Stern School Chair and is vice dean of faculty at the Stern School, New York University, USA. She is an internationally recognized sociologist whose research centers on the implications of computer-based communication technologies for managers, organizations, communities, and society. She is the author of more than 70 articles and books including recent handbook and encyclopedia articles on online communities. [Network Organizations through Communication Technology]

**Annabelle Sreberny** is professor of global media and communication at the School of Oriental and African Studies, University of London, USA, and director of the Centre of Media and Film Studies. She is a vice president of the International Association for Media and Communication Research. Recent books include *Media and political violence* (with H. Nossek and P. Sonwalkar, 2007) and *International news in the twenty-first century* (with C. Paterson, 2004). She is currently writing a book on the Iranian blogosphere with Gholam Khiabany. [Globalization Theories]

**Krishnamurthy Sriramesh** is associate professor, School of Communication and Information, Nanyang Technological University, Singapore. He has won several awards for teaching and research, including the Institute for Public Relations' Pathfinder Award. He co-edited *The global public relations handbook: Theory, research, and practice*, which won the National Communication Association's PRIDE award, and edited *Public relations in Asia: An anthology*. He has published over 50 journal articles and book chapters and presented over 60 research papers, seminars, and invited talks in over 20 countries. He serves as associate editor of *Journal of Communication Management* and on the editorial board of *Journal of Public Relations Research*, *Public Relations Review*, *Digital Review of the Asia-Pacific*, *Journal of Communication Studies*, and *Journal of Information and Knowledge Management*. [Public Relations, Intercultural]

**Don W. Stacks** holds a PhD from the University of Florida, USA, and is professor and director of the public relations program, School of Communication, University of Miami, Coral Gables, USA. He is the author of numerous articles, books, monographs, and papers on public relations and general communication topics. He has received the Institute for Public Relations' Pathfinder Award, the University of Miami's Provost

Reward for Scholarly Activity, and the Jackson Jackson and Wagner Behavioral Science Prize of the Public Relations Society of America Foundation, and was named as one of the Eastern Communication Association's Distinguished Research Fellows. In addition, he has received the PRSA Educator of the Year award and was named Professor of the Year by the University of Miami. [Public Relations Evaluation]

**Laura Stafford** is an associate professor in the School of Communication at Ohio State University, Columbus, USA. She has been the chair of the Interpersonal Division of the National Communication Association and the chair of the interpersonal communication division of the International Communication Association. She serves as an associate editor of the international interdisciplinary *Journal of Social and Personal Relationships* and as the editor of the *Journal of Applied Communication Research*. She is also on numerous editorial boards in the field of communication. [Dating Relationships; Long-Distance Relationships]

**Jordan Stalker** is in the Department of Communication at the University of Illinois at Chicago, USA. He previously served as a research associate for the Institute for New Media Studies at the University of Minnesota, USA. His research interests include the development of the American automobile radio, the use of technology in education and video game theory, and other confluences of technology and culture. [Partisan Press]

**Ann Q. Staton** holds a PhD from the University of Texas at Austin, USA, and is dean of the College of Arts and Sciences at Texas Woman's University, USA. She was professor and chair of the Department of Communication at the University of Washington, USA. She has published widely in the area of instructional communication, focusing on teacher communication concern, teacher socialization, student socialization, and educational reform discourse. She has served on the editorial boards of eight journals in the field. [Teacher Socialization]

**H. Leslie Steeves** is a professor in the School of Journalism and Communication at the University of Oregon, USA. She has written numerous articles on development communication, and co-authored (with Srinivas Melkote) the book *Communication for development in the third world: Theory and practice for empowerment*. She has had two Fulbrights for research and teaching in Africa. [Development, Gender, and Communication; Spirituality and Development]

**Linda Steiner** is professor in the Philip Merrill College of Journalism at the University of Maryland, USA. She is editor of *Critical Studies in Media Communication* and serves on the editorial board of six journals. She served a term as chair of the Department of Journalism and Media Studies at Rutgers University, USA. She has published books, book chapters, and journal articles on journalism history, media ethics, the feminist and alternative press, and changing conceptions of gender. [Feminist Communication Ethics; Feminist Media]

**Charles Steinfield** is a professor and Distinguished Faculty Award winner in the Department of Telecommunication, Information Studies, and Media at Michigan State

University, USA. He is editor, with Janet Fulk, of *Organizations and communication technology*, which received the Research Book of the Year Award from the Speech Communication Association in 1990, and author, with Thomas Baldwin and Steve McVoy, of *Convergence: Integrating media, information and communication*, which received the Cable Book of the Year Award from the National Cable Television Center and Museum in 1997. [E-Commerce]

**Clay Steinman** is professor of humanities and media and cultural studies at Macalester College in St. Paul, Minnesota, USA. A former journalist, he is the author of *Consuming environments: Television and commercial culture* (with Mike Budd and Steve Craig, 1999) and has written essays on critical media theory and on commodity flow, heterosexism, and racism in television for numerous anthologies and for such journals as *Critical Studies in Mass Communication*, *Cultural Critique*, *Journal of Communication*, *Journal of Film and Video*, and *Jump Cut*. He is the editor of *Key works in communication: Contemporary reformulations* (with Robert M. Entman, forthcoming). [Sign]

**Thomas Steinmaurer** is an assistant professor at the University of Salzburg, Austria. His research focus is on media systems, media history (television), and cultural change. He published the book *Tele-visionen* in 1999 and has other publications about the media system in Austria. He is chair of the Austrian Society for Communication Science and editor of *Medien Journal*. [Austria: Media System]

**W. Edward Steinmueller** is known for his work on the information and information technology industries, science and technology policy, and the relationships among social, organizational, and technological factors influencing innovation. He is a policy consultant on high-technology innovation and competition issues including intellectual property rights and standardization. [Virtual Communities]

**Robert L. Stevenson** graduated at the University of Washington, Seattle, USA, and was professor at the School of Journalism and Mass Communication at the University of North Carolina at Chapel Hill, USA. He taught at many universities outside of the USA and was an expert particularly in international communication. He died in November 2006, only a few days after having written the first draft of his entry in this encyclopedia. [United States of America: Media System]

**Charles J. Stewart** is the Margaret Church Distinguished Professor of Communication at Purdue University, USA. He served as head of the Department of Communication at Purdue University from 1988 to 1998, and was president of the Central States Communication Association from 1988 to 1989. He is the author of nine books and numerous articles and chapters in the areas of interviewing, persuasion and social movements, rhetorical criticism, and counseling. He has received the Murphy Award for Outstanding Undergraduate Teaching from Purdue University, is the recipient of the National Communication Association's Ecroyd Award for Outstanding Teaching in Higher Education, and is a founding fellow of the Purdue University Teaching Academy. [Rhetoric and Social Protest]

**Horst Stipp** is senior vice president, primary and strategic research, at NBC Universal in New York, USA. He received his PhD in sociology from Columbia University, USA, and has been involved in media research for over 30 years. He also teaches at Columbia University's Business School. His publications, in English and German, cover a wide range of topics, including children and television. He is co-author of a major study, *Television and aggression: A panel study* (1982). [Channel/Program Loyalty]

**Rudolf Stöber** has been professor of communication science at the University of Bamberg, Germany, since 2001. Selected publications include *Deutsche Pressegeschichte* (2005), "What media evolution is" (*European Journal of Communication*, 2004), and *Verbandsinteresse und Pressefreiheit* (1992). [Historic Key Events and the Media]

**Cynthia Stohl** holds a PhD from Purdue University, USA, and is a faculty member in the Department of Communication, University of California, Santa Barbara, USA. Her research focuses on organizational and network dynamics associated with globalization processes across a wide range of organizational types. Her most recent work addresses the relationship between emerging communication technologies and collective action organizing. The author of over 75 articles and book chapters, Prof. Stohl has been the recipient of several top paper and research awards, including the 1995 International Communication Association (ICA) Organizational Communication Division's Best Book Award. Most recently, she received the 2007 ICA Outstanding Article Award for her *Communication Theory* article (co-authored with Bruce Bimber and Andrew Flanagin), "Reconceptualizing collective action in the contemporary media environment." [Globalization of Organizations]

**George C. Stoney** is Paulette Goddard Professor of Cinema in the Tisch School of the Arts at New York University, USA, where he has been on the faculty since 1970. After graduation from the University of North Carolina at Chapel Hill, USA, he was a journalist concerned with southern politics and economics. In 1946 he became a filmmaker and, working with others, has produced more than 50 independent documentaries. From 1968 to 1970 he was guest executive producer of Challenge for Change at the Canadian National Film Board. He is a founding member of the Alliance for Community Media (1976) and currently serves on the board of Manhattan Neighborhood Network, the nongovernmental organization responsible for the community cable channels for the borough. [Community Video]

**Barbara Stooksberry** holds a BA and MA from the University of Texas at Austin, USA, and is an information specialist for the Texas State Board of Public Accountancy. She was previously journals editor for the International Communication Association for 10 years and earlier held writing and editing positions for the University of Texas, for the state of Texas, and for various state-wide trade associations there. She has also taught journalism as adjunct faculty at Austin Community College, USA. [International Communication Association (ICA)]

**J. Douglas Storey** holds a PhD in communication research from Stanford University, USA, and is an associate director at the Johns Hopkins Bloomberg School of Public Health,

USA, Center for Communication Programs. He has 30 years of experience in health and development communication and has lived and worked in more than 20 countries. His work spans a wide range of issues including infectious disease prevention, reproductive health, campaign evaluation, and entertainment education. From 1999 to 2002 he was director of the Coral Reef Rehabilitation and Management Program Public Communication Campaign in Indonesia, an award-winning national effort to promote awareness of and participation in community-based management of marine resources. Dr. Storey is current chair of the Health Communication Division of the International Communication Association. [Development Communication Campaigns; Development Communication, Planning of]

**Tanja Storsul** is associate professor in the Department of Media and Communication, University of Oslo, Norway. Her research interests are within the areas of digital media and telecom. Dr. Storsul focuses especially on political and economic developments within new media markets. Her current research project and publications concern the impact digitalization may have on television policy and market structures. [Digitization and Media Convergence]

**Joseph Straubhaar** is the Amon G. Carter Centennial Professor in Communication at the Department of Radio-Television-Film, University of Texas at Austin, USA. He received his MA and PhD from the Fletcher School of Diplomacy, Tufts University, USA. His research interests are in international communication and cultural theory; the digital divide in the USA and other countries; and comparative analysis of new technologies. [Dependency Theories; Modernity]

**Will Straw** is professor of communications within the Department of Art History and Communications Studies at McGill University in Montreal, Canada. He is the author of *Cyanide and sin: Visualizing crime in 50s America*, and a co-editor of the *Cambridge companion to pop and rock*. [Music Videos]

**Jürgen Streeck** teaches communication studies at the University of Texas at Austin, USA. He was the founding president of the International Society for Gesture Studies and serves on the editorial boards of *Gesture* and *Visual Communication Quarterly*. His publications have appeared in *Journal of Pragmatics*, *Discourse Processes*, *Research on Language and Social Interaction*, *Gesture*, and various other journals. His book *Gesturecraft: The manufacture of meaning* is forthcoming, and he is editor, with Charles Goodwin and Curtis LeBaron, of a forthcoming book on multimodality. [Gestures in Discourse]

**Kristina Strödter** is research assistant in the Faculty of Marketing at the Justus Liebig University, Giessen, Germany, and project collaborator at the Institute for Brand and Communication Research. She studied business management at the University of Bamberg, Germany, as well as at the Justus Liebig University. Strödter gained practical experience in Germany and England in the areas of pharmaceuticals, financial services, and consulting. For her PhD thesis she is working in the field of internal branding, especially employees' brand commitment. [Marketing]

**Jo Ellen Stryker** is an assistant professor in the Department of Behavioral Sciences and Health Education at the Rollins School of Public Health at Emory University, USA, and a Georgia Cancer Coalition Distinguished Cancer Scholar. Dr. Stryker's research focuses on the effects of public communication on health outcomes. [Health Communication and Journalism]

**Marita Sturken** is a professor in the Department of Media, Culture, and Communication at New York University, USA. She is the author of *Tangled memories: The Vietnam War, the AIDS epidemic, and the politics of remembering* (1997) and *Tourists of history: Memory, kitsch and consumerism from Oklahoma City to Ground Zero* (2007), and co-author of *Practices of looking: An introduction to visual culture* (2001). [Spectacle; Spectator Gaze]

**Tara M. Sullivan** is an assistant scientist in the Department of Health Behavior and Society at the Johns Hopkins Bloomberg School of Public Health, USA. Her research focuses on facilitating the use of health information in policy and programs and on improving the quality of family planning and reproductive health services. Dr. Sullivan's recent publications include "Skewed contraceptive method mix: Why it happens, why it matters" (with J. T. Bertrand, J. Rice, and J. D. Shelton, *Journal of Biosocial Science*, 2006) and "Changes in contraceptive method mix in developing countries" (with E. Seiber and J. T. Bertrand, *International Family Planning Perspectives*, in press). [Population Campaigns]

**Michael W. Suman** is research director of the University of Southern California, USA, Center for the Digital Future (formerly the University of California, Los Angeles [UCLA], Center for Communication Policy). In this capacity he has managed and coordinated the UCLA Television Violence Monitoring Project, the Surveying the Digital Future Internet study, and the World Internet Project. Suman, a PhD in sociology from UCLA, has taught sociology, anthropology, and communication studies in Japan, Korea, China, and the Marshall Islands. He now is a member of the UCLA faculty in the Department of Communication Studies. [Exposure to the Internet]

**Jenny Sundén** is assistant professor in media technology in the School of Computer Science and Communication, Royal Institute of Technology in Stockholm, Sweden. She received her PhD from the Department of Communication Studies, Linköping University, Sweden. She was a visiting scholar in the Department of English, University of California at Berkeley, USA, in 1998–1999. She has published primarily on new media, cultural studies, cyberfeminism, virtual worlds, online ethnography, and digital textuality. She is the author of *Material virtualities: Approaching online textual embodiment* (2003) and co-editor of *Cyberfeminism in northern lights: Digital media and gender in a Nordic context* (2007). [Cyberfeminism]

**Gerald Sussman** is professor of urban studies and communications at Portland State University, USA. He is the author of *Communication, technology, and politics in the information age* (1997) and *Global electioneering: Campaign consulting, communications, and corporate financing* (2005) and the editor of four other books and monographs on the political economy of communications. [Ownership in the Media]

**Elizabeth A. Suter** is an assistant professor in the Department of Human Communication Studies at the University of Denver, USA. Dr. Suter studies family, relational, and gender communication. Her most recent work focuses both on families with adopted children from China and on lesbian families, looking specifically at how such families are dependent on communication to not only claim family status, but also negotiate the veracity of their claim via discourse, rituals, and symbolic displays in interactions with family members, social networks, and community institutions. Her work has been published in *Journal of Family Communication*, *Journal of Social and Personal Relationships*, *Women and Language*, *Sex Roles*, *Journal of Family Issues*, *Journal of Lesbian Studies*, *Communication Review*, and *Qualitative Report*. [Heterosexism and the Media]

**Laura Szalacha** is faculty at the University of Illinois at Chicago, USA, where she is a research methodologist (quantitative, qualitative, and mixed method design) in the Center for Research Facilitation. Her substantive expertise lies in adolescent development, particularly lesbian, gay, bisexual, and transgender youth. Dr. Szalacha's evaluation of the Safe Schools Project for Lesbian and Gay Youth for the state of Massachusetts was the first to assess the effects of such school-based interventions state-wide. In addition she is the national research director for the Welcoming Schools project. [Health Belief Model]

**Peter Szyszka** is professor of organizational communication and communication management at Zurich University of Applied Sciences, Switzerland. He is the author of many articles written in German on establishing an organizational approach for public relations theory. He is also co-editor of *Handbuch der Public Relations* (with G. Bentele and R. Fröhlich, 2005). [Public Relations Field Dynamics]

**Richard F. Taflinger** is a senior instructor in the Edward R. Murrow School of Communication at Washington State University, USA. He teaches mass media criticism, screenwriting, and evolutionary psychology and communication, and researches all forms of popular culture, especially advertising and television programs and their effects on audiences. [Situation Comedies]

**Damian Tambini** is lecturer at the Department of Media and Communications, London School of Economics and Political Science, UK. He is an associate fellow at the Institute for Public Policy Research and at the Oxford Internet Institute, University of Oxford, UK. He is a fellow of the Royal Society of Arts and serves on the Advisory Groups of the Oxford Media Convention, BBC Creative Archive Licence Group, and Polis. From June 2002 to August 2006 Dr. Tambini was head of the programme in comparative media law and policy at the University of Oxford. He has taught and researched at Nuffield College, Oxford (postdoctoral fellow, 1998), Humboldt University, Berlin, Germany (lecturer, 1997), and the European University Institute, Florence, Italy (PhD, 1996). [Public Service Broadcasting: Law and Policy; Self-Regulation of the Media]

**Paul A. Taylor** is senior lecturer in communications theory at the University of Leeds, UK. He is the author of *Hackers: Crime in the digital sublime* (1999), *Hacktivists: Rebels with a cause* (with Tim Jordan, 2004) and *Digital matters: Theory and culture of the matrix*

(with Jan Harris, 2005). He is the founding editor of the *International Journal of Žižek Studies*. [Hactivism]

**Philip M. Taylor** is professor of international communications at the University of Leeds, UK. He is author of numerous works relating to the historical and contemporary applications of propaganda, especially in wartime. His books include *Britain and the cinema in the Second World War* (ed., 1988) and *Munitions of the mind: A history of propaganda from the ancient world to the present day* (3rd edn. 2003). [Propaganda in World War II]

**Russ Taylor** is a PhD candidate in the Faculty of Law at the University of Oxford, UK. He also holds a juris doctorate from George Mason University, USA, and a Masters of Science from the London School of Economics and Political Science, UK. In 2003, he co-founded OfcomWatch – a review and commentary website for media and communications policy in the UK. In 2006, he taught media and communications policy to Master's students at the Central European University in Budapest, Hungary. Working both in-house and in private legal practice for several years, he has advised numerous firms on dealing with matters of media and communications law and policy. [Telecommunications: Law and Policy]

**Olivier J. Tchouaffe** received his doctoral degree from the Radio-Television-Film Department, University of Texas at Austin, USA. He is originally from Cameroon. His concentration includes film studies, critical cultural studies, and minorities and media, as well as international communication and globalization. His dissertation title is “Cameroonian cinema and the films of Jean-Marie Teno: Reflexion on cinematic protest, archives and postcolonial fever.” [Radio France Internationale]

**Hedwig te Molder** is associate professor in the Department of Communication Science at Wageningen University, the Netherlands. Her work reflects a concern with both theoretical and applied aspects of discursive psychology and conversation analysis. Together with Jonathan Potter, she edited the volume *Conversation and cognition*. [Discursive Psychology]

**Gerard J. Tellis** is professor of marketing, Neely Chair of American Enterprise, and director of the Center for Global Innovation, Marshall School of Business, University of Southern California, USA. Dr. Tellis specializes in advertising, innovation, market entry, new product growth, and pricing. He has published over 80 papers and books, which have won 15 awards. He is also a trustee of the Marketing Science Institute and a senior research associate of Judge Business School, University of Cambridge, UK. [Advertising Effectiveness]

**Samuel A. Terilli, Jr.**, is an assistant professor at the University of Miami School of Communication and a practicing lawyer in Miami, Florida, USA. He is the former general counsel of the Miami Herald Publishing Company and former Miami managing partner of Ford and Harrison, a national law firm in the USA. He is a member of the board of directors of the National Student Press Association and is regularly listed in Best Lawyers in America in the First Amendment and Labor-Employment law categories. [Access to the Media]

**Thomas C. Terry** is currently a Park doctoral fellow in the School of Journalism and Mass Communication, University of North Carolina at Chapel Hill, USA. He was recently awarded an Impact Award for his research, “W. Horace Carter – the life outside: A weekly newspaperman’s Pulitzer-Prize-winning campaign against the Ku Klux Klan – 1953.” Terry was one of only a dozen students who received the highly competitive prize. [Separation of News and Comments]

**Mike Thelwall** is professor of information science and leader of the Statistical Cybermetrics Research Group at the University of Wolverhampton, UK, and sits on nine editorial boards. He is also visiting fellow of the Virtual Knowledge Studio in Amsterdam, the Netherlands, a docent at the Department of Information Studies at Åbo Akademi University, Finland, and a research associate at the Oxford Internet Institute, UK. He has developed tools for gathering and analysing websites, blogs, and social networking sites, including a research web crawler and software for statistical and topological analyses of site structures (through links) and site content (through text). He has published 119 refereed journal articles, five book chapters, and the book *Link analysis: An information science approach*. [Link Analysis]

**Paul J. Thibault** is professor in linguistics and communication studies, University of Agder, Kristiansand, Norway, and honorary professor, School of Foreign Languages and Literatures, Beijing Normal University, People’s Republic of China. Recent books include *Rereading Saussure* (1997), *Brain, mind and the signifying body: An ecosocial semiotic theory* (2004), *Agency and consciousness in discourse: Self–other dynamics as a complex system* (2004), and *Multimodal transcription and text analysis* (with Anthony Baldry, 2006). [Sign Systems]

**Pradip Ninan Thomas** is associate professor at the School of Journalism and Communication, University of Queensland, Australia. He is currently the vice chairperson of the Participatory Communication Section, International Association for Media and Communication Research, and is on the editorial board of three journals including *Media Development*. His forthcoming publications include *Strong religion/zealous media: Christian fundamentalism and communication in India* and “Selling God/saving souls: Religious commodities, spiritual markets and the media” (*Global Media and Communication*). [Communication as an Academic Field: South Asia]

**Susan Thomas** is director of academic writing and associate dean of teaching and learning, Faculty of Arts, at the University of Sydney, Australia, where she directs the first-year writing program she designed. Her teaching and research interests include histories and theories of rhetoric, writing studies, and American Civil War oratory, and she is a member of the editorial board of the *Young Scholars in Writing* journal, published by Pennsylvania State University, USA. Her most recent publication is a collection of essays entitled *What is the new rhetoric?*, and she is currently completing a monograph entitled *Teaching writing beyond US borders*. [Rhetoric in the South Pacific]

**Candice Thomas-Maddox** holds an EdD from West Virginia University, USA, and is associate professor of communication studies at Ohio University, Lancaster, USA, where

she also serves as division coordinator. Over the past 15 years, she has taught a variety of courses focusing on instructional communication. Thomas-Maddox has co-authored textbooks on the topics of quantitative research methods, interpersonal communication, and communicating with diverse students. She has served on the editorial boards for *Communication Education*, *Communication Quarterly*, *Communication Research Reports*, and *Communication Teacher*. Thomas-Maddox currently serves as president for the Ohio Communication Association, and she will serve as president for the Eastern Communication Association in 2009–2010. [Teacher Assertiveness]

**Peter A. Thompson** is a senior lecturer at the School of Communication in Unitec New Zealand. His main research interest concerns post-1999 broadcasting policy reforms in New Zealand, with a particular emphasis on public funding issues. He has also headed two projects involving international comparative studies of broadcasting funding systems (for the New Zealand Ministry for Culture and Heritage) and approaches to assessing quality in broadcasting (for the New Zealand Broadcasting Commission). His other research interest stems from his doctoral work investigating communication processes in global financial markets. [Public Goods]

**Teresa L. Thompson** holds a PhD from Temple University, USA, and is professor of communication at the University of Dayton, USA. Dr. Thompson edits the quarterly journal *Health Communication*, and has authored or edited five books and over 40 articles on various aspects of health communication. Her research focuses on issues related to provider–patient interaction, organ donation, disability and communication, and gender issues. Her co-edited volume *Handbook of health communication* won the 2004 Distinguished Book Award jointly sponsored by the Health Communication Divisions of the National Communication Association and the International Communication Association. Her work has been published in such outlets as *Human Communication Research*, *Social Science and Medicine*, *Sex Roles*, and *Public Opinion Quarterly*. [Death, Dying, and Communication]

**Daya Kishan Thussu** is professor of international communication at the University of Westminster in London, UK. Among his key publications are *News as entertainment: The rise of global infotainment* (forthcoming), *Media on the move: Global flow and contra-flow* (2007), *International communication: Continuity and change* (2nd edn. 2006.), *War and the media: Reporting conflict 24/7* (2003), and *Electronic empires: Global media and local resistance* (1998). He is the founder and managing editor of the journal *Global Media and Communication*. [Fourth Estate; Globalization of the Media]

**Dietmar Till** is assistant professor of German literature at the University of Tübingen, Germany. He is the author of *Transformationen der Rhetorik: Untersuchungen zum Wandel der Rhetoriktheorie im 17. und 18. Jahrhundert* (2004) and *Das doppelte Erhabene: Geschichte einer Argumentationsfigur von der Antike bis zum Ende des 19. Jahrhunderts* (2006). [Rhetoric in Western Europe: Germany]

**Stella Ting-Toomey** is professor of human communication studies at California State University, Fullerton, USA. She is the co-author of the text *Understanding intercultural*

*communication* (with Leeva Chung, 2005) and the co-editor of *The Sage handbook of conflict communication: Integrating theory, research, and practice* (with John Oetzel, 2006). [Intercultural Conflict Styles and Facework]

**Ana Tkalac Verčić** is an assistant professor of marketing communications and public relations at the Graduate School of Business and Economics, University of Zagreb, Croatia. As a Fulbright scholar she spent a year at the University of Maryland, USA. She authored or co-authored various articles and textbooks, mostly in the field of marketing communications and public relations. Her most recent publication is *Public relations metrics* (co-ed. Betteke van Ruler and Dejan Verčić). [Publics: Situational Theory]

**Karen Tracy** is professor of communication at the University of Colorado at Boulder, USA. She is past editor of the journal *Research on Language and Social Interaction*, and is author of *Everyday talk: Building and reflecting identities*, *Colloquium: Dilemmas of academic discourse*, and more than 60 journal articles and book chapters. Recently she has been studying the communicative practice of US school board meetings, and she is the editor of a case study, *The prettier doll: Rhetoric, discourse and ordinary democracy* (2007), analyzing a controversy about race that occurred in one community's board meetings. [Language and Social Interaction]

**Sarah J. Tracy** is associate professor and director of the Project for Wellness and Work-Life in the Hugh Downs School of Human Communication at Arizona State University, Tempe, USA. She teaches courses in organizational communication and qualitative methods, has authored more than 25 publications, and conducts research on issues of emotion labor, burnout, humor, work-life balance, identity, and workplace bullying. [Emotion and Communication in Organizations]

**Michael W. Traugott** is professor of communication studies and political science and senior research scientist at the Institute for Social Research at the University of Michigan, USA. His main fields of research are political communication and survey methods. He is a past president of the American Association for Public Opinion Research and the current president of the World Association for Public Opinion Research. He is the author of *The voter's guide to election polls* (with Paul J. Lavrakas, 2004) and the editor of the *Handbook of public opinion research* (with Wolfgang Donsbach, 2007). [Polls and the Media; Survey]

**Sabine Trepte** is an assistant professor for media psychology at the University of Hamburg and the Hamburg Media School, Germany. She won International Communication Association (ICA) paper awards and the ICA dissertation award, and published a book on social psychology and the media in 2007. She received her degrees from the University of Cologne and the Hanover University of Music and Drama, Germany. For postdoc studies Trepte visited the Annenberg School for Communication at the University of Southern California, USA. She serves on the editorial board of *Media Psychology*. Her areas of research interest include media psychology of entertainment, interaction with avatars, and communication in web 2.0. [Consistency Theories]

**Yariv Tsfati** holds a BA and MA from the University of Haifa, Israel, and received his PhD from the Annenberg School for Communication at the University of Pennsylvania, USA. His research focuses on various facets of public opinion, in particular on trust in media, the third-person effect, and campaign effects. His research was funded by the Israel Science Foundation, the German–Israeli Foundation, and other institutes. He received the Worcester Award for the year’s outstanding paper published in the *International Journal of Public Opinion Research* from the World Association for Public Opinion Research (2004). [Impersonal Effects; Journalists, Credibility of]

**Thomas Tufte** is professor in communication at Roskilde University, Denmark. He has worked and published within health communication in the past decade, undertaking research and consultancy in about 10 African countries as well as in Central America and Ukraine. He serves on editorial boards or advisory boards or as associate editor to a wide range of journals on communication and culture, including *International Journal of Health Communication* and *Communication for Development and Social Change*. He is chairperson of the HIP Edutainment Foundation, which promotes the use of edutainment as an efficient strategy in the fight against HIV/AIDS. Dr. Tufte is currently finalizing the research project “HIV/AIDS communication and prevention,” which deals with how young South Africans make sense of campaigns on HIV/AIDS. [Health Campaigns for Development]

**Kathleen J. Turner** is professor of communication studies at Davidson College in Davidson, USA. She authored *Lyndon Johnson’s dual war: Vietnam and the press* (1985) and edited *Doing rhetorical history: Concepts and cases* (1998). As a rhetorical analyst, she studies communication as a process of social influence, publishing essays in the areas of media, popular culture, politics, and women’s issues. She has served on the editorial boards of seven journals in the field and regularly reviews manuscripts for academic presses. In 2007 she received the Donald H. Ecroyd Award for Outstanding Teaching in Higher Education from the National Communication Association. [Rhetoric and History]

**Joseph Turow** is Robert Lewis Shayon Professor of Communication at the Annenberg School for Communication at the University of Pennsylvania, USA. He is the author, most recently, of *Niche envy: Marketing discrimination in the digital age* and series editor of the *New Media World* book program from the University of Michigan Press. [Gerbner, George]

**Kyle James Tusing** is an assistant professor of communication at the University of Arizona, USA. His research on interpersonal communication and persuasion has appeared in *Human Communication Research*, *Journal of Communication*, *Journal of Language and Social Psychology*, *Communication Quarterly*, and *The sourcebook of nonverbal measures: Going beyond words*. He is the 2006 winner of the College of Social and Behavioral Sciences Magellan Circle Award for excellence in undergraduate teaching at the University of Arizona. [Speech Fluency and Speech Errors]

**Dagmar C. Unz** is assistant professor in the Department of Media and Organizational Psychology at Saarland University, Germany. Currently, she is speaker for the special

interest group Media Psychology in the German Association of Psychology. She is one of the editors of the book series *Medienpsychologie* (Media Psychology) and serves on the editorial board of the *Journal of Media Psychology*. [Exposure to News; Schemas]

**Angharad N. Valdivia** is a research professor of communications, media studies, gender and women's studies, and Latina/o studies at the University of Illinois, USA, with specializations in gender, ethnicity, and popular culture in a transnational perspective. Most of her current research and publications focus on Latina media studies, especially on the mainstream. [Latina Feminist Media Studies]

**Thomas W. Valente** is an associate professor and director of the master of public health program in the Department of Preventive Medicine, Keck School of Medicine, University of Southern California, USA. He is author of *Evaluating health promotion programs* (2002), *Network models of the diffusion of innovations* (1995), and over 80 articles and chapters on social networks, behavior change, and program evaluation. Valente uses network analysis, health communication, and mathematical models to implement and evaluate health promotion programs designed to prevent tobacco and substance abuse, unintended fertility, and STD/HIV infections. He is also engaged in mapping community coalitions and collaborations to improve health-care delivery and reduce health-care disparities. [Social Networks; Stages of Change Model]

**Patti M. Valkenburg** is a professor in the Amsterdam School of Communications Research, University of Amsterdam, the Netherlands. She is the chair of the Research Center on Children, Adolescents, and the Media ([www2.fmg.uva.nl/cam](http://www2.fmg.uva.nl/cam)). She was chair of the Instructional and Developmental Communication Division at the International Communication Association, and the founder of the special interest group Children, Adolescents and the Media at the same organization. She has published 100-plus articles and chapters in prominent journals and books, and is on the editorial board of six journals in the field. [Fantasy/Imagination; Media Use and Child Development]

**Elizabeth Van Couvering** is researching "The power of search: Gate-keeping the Internet" as a doctoral student at the Department of Media and Communications, London School of Economics and Political Science, UK. She has also worked in online advertising for over a dozen years as a researcher and strategist. [Information Literacy; Internet Ratings Systems; Search Engines]

**Margot van der Goot** is a doctoral candidate at the Department of Communication at the Radboud University Nijmegen, the Netherlands. She is interested in studying media use from a life-span perspective; her research focuses on older adults and media use. She has written a literature review on older adults' television viewing that has been published in *Communication Yearbook 30*. [Media Use across the Life-Span]

**Shenja van der Graaf** is a PhD researcher at the London School of Economics and Political Science, UK, and a fellow at the Berkman Center for Internet and Society at Harvard Law School, USA. Her research focuses on the organization and management of innovation

and technology, especially demand-side innovation, product development, and media uses in media and software industries. She employs her experience in an extensive international network of companies including Turner Broadcasting, CiscoSystems, HakuHodo, and Ericsson, which has resulted in the edited volume *Information communication technologies and emerging business strategies*. [Media Literacy]

**Frans H. van Eemeren** is professor in the Department of Speech Communication, Argumentation Theory and Rhetoric in the University of Amsterdam, the Netherlands, and director of the research programme “Argumentation in discourse” of the Amsterdam School for Cultural Analysis. His publications include *Studies in pragma-dialectics* (with Rob Grootendorst, 1994), *Fundamentals of argumentation theory: Handbook of historical backgrounds and contemporary developments* (with Rob Grootendorst, A. Francisca Snoeck Henkemans and others, 1996), and *Logic and argumentation* (with Johan van Benthem, Rob Grootendorst and Frank Veltman, eds., 1996). [Rhetoric, Argument, and Persuasion]

**Theo van Leeuwen** is professor of media and communication and dean of the Faculty of Humanities and Social Sciences at the University of Technology, Sydney, Australia. He has published widely in the areas of social semiotics, critical discourse analysis, and multimodality. His books include *Speech, music, sound* (1999), *Introducing social semiotics* (2005), and, with co-author David Machin, *Global media discourse* (2007). The second edition of his *Reading images: The grammar of visual design* (co-authored with Gunther Kress) was published in 2006. He is a founding editor of the international journal *Visual Communication*. [Realism in Film and Photography]

**A. A. Betteke van Ruler** holds a PhD from Radboud University Nijmegen, the Netherlands, and is professor of communication science, University of Amsterdam, the Netherlands. She is past president of the European Public Relations Education and Research Association and chair of the Public Relations Division of the International Communication Association (ICA). She has published many books, articles, and chapters and serves on the review board of many journals as well as of the ICA *Communication Yearbook*. [Public Relations]

**Lyn Van Swol** holds a PhD from the University of Illinois at Urbana-Champaign, USA, and is an assistant professor in the Communication Arts Department at the University of Wisconsin-Madison, USA. Her research examines group communication and has recently been published in *Communication Research*, *Human Communication Research*, and *Group Processes and Intergroup Relations*. [Perceived Reality as a Social Process]

**Anita L. Vangelisti** is a professor in the Department of Communication Studies at the University of Texas at Austin, USA. She is author of *Interpersonal communication and human relationships* (with Mark L. Knapp, 2005) and editor of the *Cambridge handbook of personal relationships* (with Daniel Perlman, 2006). Vangelisti has served on the editorial boards of over a dozen scholarly journals and has received recognition for her research from the National Communication Association and the International Society for the Study of Personal Relationships. [Relational Termination]

**Elena Vartanova** is professor of journalism and mass media and founder of the chair in media theory and economics, Faculty of Journalism, Moscow State University, Russia, where she is also deputy dean for research. Her research interests are media economics, comparative media systems, the transformation of Russian media, and the role of new technologies in media change. She is a member of the International Council and head of the working group on the digital divide of the International Association for Media and Communication Research, and corresponding editor of *European Journal of Communication* and *Journal of Media Management*. She published the first Russian textbook on media economics (2003) and *Encyclopedia of world media industries* (2006), recognized as the best university book of the year in Russia. [Russia: Media System]

**Wayne F. Velicer** is the co-director of the Cancer Prevention Research Center and professor of psychology at the University of Rhode Island, USA. He has published more than 200 papers on topics in health psychology and behavioral statistics. In health psychology, his contributions include pioneering the application of computer-based interventions to health promotion. He is one of the principal developers of the transtheoretical model of behavior change. In behavioral statistics, his work has focused on factor analysis and component analysis, pioneered the application of time-series analysis to the behavioral sciences, and refined methods for measurement development. He was identified as one of the highest-impact authors in psychology (average citation per paper) by the major studies in 1992, 1996, and 2003. [Health Behavior Change, Transtheoretical Model of]

**Dejan Verčič** is professor of public relations at the University of Ljubljana, Slovenia, and a founding partner in Pristop. He is editor of *Public relations and communication management in Europe* (with B. van Ruler, 2004) and *The global public relations handbook* (with K. Sriramesh, 2003). [Co-Orientation Model of Public Relations]

**Peter C. Verhoef** is professor of marketing in the Department of Marketing, Faculty of Economics, University of Groningen, the Netherlands. He obtained his PhD in 2001 from the School of Economics, Erasmus University Rotterdam, the Netherlands. His research interests concern customer management. He has published extensively in leading journals, such as *Journal of Marketing*, *Journal of Marketing Research*, *Marketing Science*, and *International Journal of Research in Marketing*. He is an editorial board member of multiple leading marketing journals. He is also involved in executive teaching on customer management, and is the director and founder of the Customer Insights Center, University of Groningen. [Direct-to-Consumer Advertising]

**Piet Verhoeven** is associate professor at the Amsterdam School of Communications Research of the University of Amsterdam in the Netherlands. He is conducting research in the field of science, journalism, and the mass media, and of the corporate communications and public relations strategies of science-based industry. Dr. Verhoeven teaches several courses at MA and BA level, among others about public relations. [Mediatization of Organizations Theory]

**Paul Hendriks Vettehen** is an associate professor in the Department of Communication Science at Radboud University Nijmegen, the Netherlands. He has written articles on sensationalism in news and current affairs programs, television news processing, media use, and various methodological issues in communication research. He also serves as reviewer in five journals in the field. [Sensationalism]

**Bernadette Vine** is a research fellow on the Language in the Workplace project and corpus manager for the Archive of New Zealand English, both based at the School of Linguistics and Applied Language Studies, Victoria University of Wellington, New Zealand. Dr. Vine's research interests include workplace communication, leadership, and New Zealand English. She is the author of *Getting things done at work: The discourse of power in workplace interaction* (2004). [Power and Discourse]

**K. Viswanath** is associate professor of society, human development, and health at the Harvard School of Public Health (HSPH) and associate professor of population sciences at Harvard's Dana Farber Cancer Institute, USA. He is also the chair of the Steering Committee of the Health Communication Concentration at HSPH and the director of the Health Communication Core of the Dana Farber Harvard Comprehensive Cancer Center. His primary areas of research are communication inequalities and health disparities, and mass media and public health. [Communication Inequality; Health Communication; Social Capital and Communication in Health]

**Susana N. Vittadini Andrés** is associate professor in the Institute for Latin American Studies, Tamkang University, Taiwan, and member of associations such as the Latin American Studies Association, the Asociación Argentina de Derecho Constitucional, and the International Communication Association. She is currently a member of the international academic committee of *Urbe et Ius*, a legal journal. Her research focus is on free dailies and the consequences of new media for the newspaper market. She has published books and articles on newspaper development and media economics. [Scandinavian States: Media Systems]

**Karin Wahl-Jorgensen** is a senior lecturer at the Cardiff School of Journalism, Media and Cultural Studies, Cardiff University, UK. She is the author of two books, *Journalists and the public* (2007) and *Citizens or consumers?* (co-authored with Justin Lewis and Sanna Inthorn, 2005). She is editor of two forthcoming volumes, *Mediated citizenship* and the *Handbook of journalism studies* (with Thomas Hanitzsch). Her work on journalism, democracy, and citizenship has also appeared in more than 20 different journals. [Elections and Media, History of; Truth and Media Content]

**Silvio Waisbord** has been senior program officer at the Academy for Educational Development Center for Global Health Communication and Marketing, Washington, USA, since 2002. Presently, he is the advocacy and communication advisor for the USAID-funded Africa's Health in 2010 project. He has worked on communication issues related to various international health programs (infectious diseases, child and maternal health). Previously, he was associate professor and director at the Journalism Resources Institute of Rutgers University, USA. He is the author of *Watchdog journalism in South America: News, accountability, and democracy* (2000), and co-editor of *Media and globalization: Why the state matters* (2001). [Modernization]

**Jennifer H. Waldeck** holds a PhD from the University of California, Santa Barbara, USA, and is assistant professor of communication studies at Chapman University, Orange, USA. Her research interests are in organizational and instructional communication, with emphases on mentoring, training and development, effective assimilation of corporate employees, and how advanced communication technologies facilitate learning and performance improvement at work and in higher education. Her research has appeared in *Communication Monographs*, *Communication Education*, *Journal of Applied Communication Research*, *Communication Yearbook*, and several edited volumes. She has presented numerous conference papers at national and international conferences. She serves on the editorial board of *Communication Education* and is faculty advisor to Chapman University's Lambda Pi Eta chapter. She regularly teaches courses in organizational communication, persuasion, and research methods. [Teacher Self-Disclosure]

**Vincent R. Waldron** is professor of communication studies at Arizona State University, USA, where he teaches courses in interpersonal and organizational communication. He is co-author of the forthcoming book *Communicating forgiveness* and has recently published articles in such journals as *Communication Yearbook*, *Journal of Social and Personal Relationships*, and *Communication Quarterly*. [Feedback Processes in Organizations]

**Jeffrey Walker** is professor of rhetoric and writing at the University of Texas at Austin, USA. He is the author of *Bardic ethos and the American epic poem: Whitman, Pound, Crane, Williams, Olson* (1989), *Investigating arguments: Readings for college writing* (with Glen McClish, 1991), and *Rhetoric and poetics in antiquity* (2000), as well as articles in *College English*, *Rhetoric Society Quarterly*, *Rhetorica*, and other journals and edited volumes. [Rhetoric and Poetics]

**Kandi L. Walker** is an associate professor and director of undergraduate studies in the Department of Communication at the University of Louisville, USA. Her research interests are in the areas of family communication, personal relationships, health communication, and gender communication. She is co-editor of a book entitled *HIV/AIDS prevention and health communication*. She serves on the editorial board of two journals in the field of communication. [Women's Communication and Language]

**Devin L. Wallace** earned her PhD from Tulane University, USA, in 2007 in psychological sciences. She is currently an assistant professor at Towson University, USA, in the Department of Psychology. Her research activity is in the areas of stereotyping, prejudice, and intergroup dynamics. [Prejudiced and Discriminatory Communication]

**Joseph B. Walther** holds a PhD from the University of Arizona, USA, and is a professor in communication and in telecommunication, information studies and media at Michigan State University, USA. His research focuses on communication cues in relationship processes, with a particular focus on computer-mediated communication in personal, group, and work settings. [Personal Communication by CMC; Self-Presentation]

**Ning Wang** is a PhD student at the University of Southern California Institute for Creative Technologies, USA, and conducts research on the pedagogical agents in intelligent tutoring

systems and on emotions and nonverbal behaviors in virtual humans in virtual reality systems. [Avatars and Agents]

**Michaela Wänke** is a full professor of social and economic psychology at the University of Basel, Switzerland. From 2006 to 2008 she served as an associate editor of the *European Journal of Social Psychology* and in 2002 co-authored a textbook, *Attitudes and attitude change*. Her main research interests are in social cognition and in consumer psychology. [Social Perception]

**Wayne Wanta** is a professor in the School of Journalism at the University of Missouri-Columbia, USA. He is author of *The public and the national agenda: How people learn about important issues* (1997) and has published more than 50 articles in the areas of political communication, news media content, and media effects. [Gatekeeping]

**Melissa Bekelja Wanzer** is professor of communication studies at Canisius College, USA. She has published 20 articles in peer-reviewed journals and/or book chapters in the areas of instructional communication, relational communication, and health communication. She is currently co-authoring a textbook on interpersonal communication. She has received several teaching and research awards and serves on the editorial board of four journals in the field. [Teacher Use of Humor]

**Stephen J. A. Ward** is director at the Graduate School of Journalism and professor of journalism ethics, University of British Columbia in Vancouver, Canada. He is author of *The invention of journalism ethics* and associate editor of the *Journal of Mass Media Ethics*. He is principal investigator of a multiple-year study into the public communication of controversial science. He serves on six editorial boards for media ethics and science journals, and is a media ethics columnist and chair of the Ethics Advisory Board for the Canadian Association of Journalists. He has 15 years of experience as a foreign reporter, war correspondent, and newsroom manager. [Printer-Editors]

**Claire Wardle** is a lecturer at the School of Journalism, Media and Cultural Studies at Cardiff University in Wales, UK. She has published a number of articles about crime reporting, specifically the press coverage surrounding high-profile cases of child abduction and murder, in *Journalism Studies*, *Journalism: Theory, Practice and Criticism*, and *Crime, Media and Culture*. She also co-directs an “Innocence Project” within the department, working with students to overturn wrongful convictions in the UK. [Crime Reporting]

**Barbara Warnick** is professor and chair of communication at the University of Pittsburgh, USA. She served as president of the American Society for the History of Rhetoric in 1994 and as editor of the *Quarterly Journal of Speech* between 1996 and 1998. She presently serves on the editorial boards of five journals in the communication field. Her most recent books include *Rhetoric online: Persuasion and politics on the world wide web* (2007) and *Critical literacy in a digital era: Technology, rhetoric and the public interest* (2002). [Rhetoric and Technology]

**Janet Wasko** holds the Knight Chair in Communication Research at the University of Oregon, Eugene, USA. She is author, co-author, or editor of 14 books including *Understanding Disney: The manufacture of fantasy* (2001), *Dazzled by Disney? The global Disney audiences project* (with Mark Phillips and Eileen Meehan, eds., 2001), and *How Hollywood works* (2003). [Disney]

**Jody Waters** holds a PhD from the University of Texas at Austin, USA, and is currently assistant professor of communication at Southern Oregon University, USA. Her teaching and research focus on development communication, intercultural communication, sustainability and sustainable development, social movements, and communication and social change. She has worked on development projects in Mexico, Central America, Texas, Oregon, and Canada, and is currently involved in projects that seek community-level understanding of poverty, hunger, and homelessness within broader discussions of sustainability, and exploration of the speech communities formed from poverty. [Sustainable Development]

**Bernadette M. Watson** is a lecturer in the School of Psychology at the University of Queensland, Australia. She has just completed an Australian Research Council Scholarship in the area of health communication. Her research focuses on effective communication in the health context and includes research on the influence of identity and intergroup processes in patient–health-professional communication and in multidisciplinary health teams. She is an executive member of the International Association of Language and Social Psychology and is vice chair of the Intergroup Interest Group of the International Communication Association. [Intercultural Communication in Health-Care; Intercultural and Intergroup Communication]

**Ann Weatherall** is a reader in the School of Psychology at the Victoria University of Wellington, New Zealand. In 2007 she was awarded a Claude McCarthy Fellowship to help support a visiting scholar position in sociology at the University of California, Los Angeles, USA. She is the author of *Gender, language and discourse* (2002) and an editor of *Language, discourse and social psychology* (with Bernadette Watson and Cindy Gallois, 2007). [Gender and Discourse]

**David H. Weaver** is the Roy W. Howard Research Professor in Journalism and Mass Communication Research at the School of Journalism, Indiana University, USA, where he has taught since receiving his PhD from the University of North Carolina, USA, in 1974. He has published 11 books as well as numerous articles about journalists, the media in political campaigns, newspaper readership, foreign news coverage, and journalism education. His most recent book is *The American journalist in the 21st century* (2006). He is past president of the Association for Education in Journalism and Mass Communication and the Midwest Association for Public Opinion Research, and a fellow of the International Communication Association. [Agenda-Setting Effects]

**James B. Weaver, III**, holds a BS and MA from the University of Georgia, USA, and a PhD from Indiana University, USA. He is a research scientist in the Center for AIDS Research,

Department of Behavioral Science and Health Education, Rollins School of Public Health, at Emory University in Atlanta, USA, and a professor of communication and psychology at Virginia Polytechnic Institute and State University in Blacksburg, USA. [Experiment, Field; Experiment, Laboratory; Experiment, Natural; Experimental Design; Personality Development and Communication]

**René Weber** is assistant professor of communication at the University of California, Santa Barbara, USA. He earned several awards and honors, such as Michigan State University's New Faculty Award for the study *Neurophysiology of entertainment* and the Best Dissertation Award of the German and Swiss Marketing Associations for his work on TV audience prediction. [Audience Segmentation; Correlation Analysis; Nonparametric Analysis]

**Frank Webster** was educated at Durham University, UK, and the London School of Economics and Political Science, UK. He is author or editor of around 20 books, including *Theories of the information society* (3rd edn. 2006). He is professor of sociology, City University London, UK. [Information Society]

**James G. Webster** is a professor of communication studies and former senior associate dean at Northwestern University's School of Communication, USA. He has published extensively in the areas of audience behavior and measurement, including *Ratings analysis: The theory and practice of audience research* (2006) and *The mass audience: Rediscovering the dominant model* (1997). He has been on the editorial board of the *Journal of Broadcasting and Electronic Media* since 1985. [Audience Research; Nielsen Ratings; People-Meter; Rating Methods]

**Stefan Wehmeier** is a junior professor of communication at the University of Greifswald, Germany. He received his PhD in 1997 from the University of Münster, Germany. From 1998 to 1999 he worked as a journalist and as a public relations practitioner. From 2000 to 2006 he was assistant professor at the University of Leipzig, Institute of Communication and Media Science, Department of Public Relations, Germany. From October 2004 to March 2005 he had a grant to do research in management communication at the University of Waikato, Hamilton, New Zealand. His research interests include the development of mass media, public relations, and the application of sociological and managerial theories to communication studies. [Delphi Studies; Intereffication Approach in Public Relations]

**Lennart Weibull** has been professor of mass media research at the Department of Journalism and Mass Communication, Göteborg University, Sweden, since 1988. Dr. Weibull is co-directing the SOM-Institute for survey research, which conducts annual surveys on Swedes' attitude to politics and media. He has published books and articles on, among other things, the functions of newspapers, media ethics, and radio and television journalism. [Scandinavian States: Media Systems]

**Gabriel Weimann** is a full professor at the Department of Communication at the University of Haifa, Israel. His research interests include the study of media effects,

political campaigns, persuasion and influence, media and public opinion, and modern terrorism and the mass media. His books include *Communicating unreality* (2000), *The influentials: People who influence people* (1995), and *The Singaporean enigma* (2001). His papers have been published in journals such as *Journal of Communication*, *Public Opinion Quarterly*, *Communication Research*, *Journal of Broadcasting and Electronic Media*, and others. Prof. Weimann spent a year as a senior fellow at the United States Institute of Peace working on his research project on terrorism and the Internet. This project yielded a book, *Terror in the Internet: The new arena, the new challenges* (2007). [Entertainment Content and Reality Perception; Opinion Leader]

**Siegfried Weischenberg** is director and professor of the Institute for Journalism and Mass Communication Studies at the University of Hamburg and academic chair of journalism at Hamburg Media School, Germany. Dr. Weischenberg is the author of *Nachrichtenjournalismus* (2001), *Journalistik 1–3* (1998–2004), and *Die Souffleure der Mediengesellschaft* (with M. Malik and A. Scholl, 2006), and editor of the handbook *Handbuch Journalismus und Medien* (with H. J. Kleinsteuber and B. Pörksen, 2005). [News Production and Technology; News Story]

**Doreen Weisenhaus** is director of the Media Law Project and an assistant professor in the Journalism and Media Studies Centre, University of Hong Kong. A former prosecutor and city editor of the *New York Times*, she is the author of *Hong Kong media law: A guide for journalists and media professionals* (2007). [Communication Law and Policy: Asia]

**Hartmut Wessler** is professor of media and communication science at the University of Mannheim, Germany. His work focuses on comparative and international communication as well as empirical applications of theories of the public sphere. It has appeared in *Political Communication*, *Media, Culture and Society*, and other journals. He is co-author of *The transnationalization of public spheres* (2008), author of *Öffentlichkeit als Prozess* (The public sphere in procedural perspective, 1999), and co-editor of four other volumes. [Deliberativeness in Political Communication; Habermas, Jürgen; Knowledge Interests; Political Discourse]

**Robert A. White** was the research director at the Centre for the Study of Communication and Culture in London, UK, from 1978 to 1988 and director of the Centre for Interdisciplinary Studies in Communication at the Gregorian University in Rome from 1989 to 2006. He has published extensively in the areas of communication and development, communication ethics, and media-religion and culture. He is currently professor of communication at St. Augustine University of Tanzania. [Communication Strategies for Empowerment]

**Tim Whitmarsh** is fellow and E. P. Warren Praelector at Corpus Christi College and university lecturer in Greek language and literature, University of Oxford, UK. Until 2007 he was professor of ancient literatures at the University of Exeter, UK. Among his books are *Greek literature and the Roman Empire: The politics of imitation* (2001), *Ancient Greek literature* (2004), and *The Second Sophistic* (2005). [Rhetoric of the Second Sophistic]

**Jürgen Wilke** has been professor of communication research at the Johannes Gutenberg University of Mainz, Germany, since 1988. He is honorary professor of the Lomonossov University, Moscow, Russia, and has taught as visiting scholar at the Universities of Washington, Seattle, USA, and Lugano, Switzerland. From 1986 to 1989 he was president of the German Association for Communication Research. His main areas of research include structure and history of mass media, news and news agencies, international communication, and political communication. [Cuba: Media System; Germany: Media System; Propaganda]

**Holley A. Wilkin** holds a PhD from the University of Southern California (USC), USA, and is an assistant professor in the Department of Communication and affiliate of the Partnership for Urban Health Research at Georgia State University, USA. As a doctoral candidate and a postdoctoral fellow, she studied the communication connections of diverse ethnic communities as part of the USC Metamorphosis Project. [Ethnicity and Exposure to Communication]

**Karin Gwinn Wilkins** holds a PhD from the Annenberg School for Communication at the University of Pennsylvania, USA, and is an associate professor with the Department of Radio-TV-Film at the University of Texas at Austin, USA. She has served as the chair of the Development/Intercultural Division of the International Communication Association and on the advisory board for the journal *Communication for Development and Social Change* as well as the World Congress on Communication and Development. Publications concerning development communication issues include *Redeveloping communication for social change: Theory, practice and power*, as well as articles in *Journal of Communication, Development and Change, Perspectives on Global Development and Technology, Keio Communication Review, Media Development, Gazette, Global Media Journal*, and others. [Development Communication; Development, Geometry of; Social Movement Media, Transnational]

**Kenton T. Wilkinson** is Regents Professor in Hispanic and International Communication in the College of Mass Communications at Texas Tech University, USA. His international communication interests include mass media and free trade, and cultural-linguistic media markets. He also specializes in US Spanish-language media and its Latin American connections, especially in Mexico. He has served as principal investigator on research grants focused on improving Hispanic-oriented health communication in the USA. [Cultural Products as Tradable Services]

**David Cratis Williams** is associate professor of communication at Florida Atlantic University, USA. He has edited five books, including most recently *Contemporary perspectives on argumentation* (with F. van Eemeren, P. Houtlosser, and M. D. Hazen, 2006), and co-edits *Controversia: An International Journal of Debate and Democratic Renewal* (with M. J. Young). He is also executive director of the North American Russian Communication Association and director of the International Center for the Advancement of Political Communication and Argumentation. [Rhetoric in Northern and Central Asia]

**Tony Williams** is professor and area head of film studies in the Department of English at Southern Illinois University Carbondale, USA. His publications include the co-edited *Vietnam War films* (1994); *Hearths of darkness: The family in the American horror film* (1996); *Larry Cohen* (1997); *Body and soul: The cinematic vision of Robert Aldrich* (2004); and many others. [Hong Kong Cinema]

**Steven R. Wilson** is professor of communication at Purdue University, USA. He is the author of *Seeking and resisting compliance: Why people say what they do when trying to influence others* (2002) as well as of more than 50 journal articles and book chapters investigating interpersonal influence, parenting and child abuse, conflict and negotiation, and politeness and identity management. He has chaired the International Communication Association Interpersonal Communication Division and served as associate editor for the interdisciplinary journal *Personal Relationships*. He was a visiting scholar at the School for Mass Communication Research at the Catholic University of Leuven, Belgium, during the fall 2006 semester. [Compliance Gaining]

**Dwayne Winseck** is associate professor, School of Journalism and Communication, Carleton University, Ottawa, Canada. He is author of *Reconvergence: A political economy of telecommunications in Canada* (1998), co-author with Robert Pike of *Communication and empire: Media, markets, and globalization, 1860–1930* (2007), and co-editor of *Media in global context: A reader* (1998) as well as of *Democratizing communication: Comparative perspectives on information and power* (1997). [Consolidation of Media Markets; Global Media, History of]

**Brian Winston** is the Lincoln Professor of Communications at the University of Lincoln, UK. He started his media career in 1963 on Granada TV's *World in Action*. In 1985, he won a US Emmy for documentary scriptwriting. He was director of the Glasgow University Media Group, producing *Bad news* (1976) and *More bad news* (1980). He won Best Book of the Year in 1998 from the American Association for History and Computing for *Media technology and society*. His latest book is *Messages: Free expression, media and the west from Gutenberg to Google* (2005). [Freedom of Communication]

**Werner Wirth** is full professor for empirical research at the Institute of Mass Communication and Media Research of the University of Zurich, Switzerland. His research focuses on diffusion, adoption, and use of new media as well as cognitive, emotional, and persuasive aspects of media use, media reception, and media effects. Prof. Wirth is author or editor of 12 books and over 80 articles. He is co-editor of the *Journal of Media Psychology* and of several book series. [Comparative Research; Emotions, Media Effects on; Involvement with Media Content; Navigation]

**Russ Witcher** is an associate professor of English-communication at Tennessee Tech University in Cookeville, Tennessee. He is the author of *After Watergate: Nixon and the newsweeklies* (2000) and *A contextual analysis of movie director Oliver Stone's "Nixon"* (2004), and the editor of *Articles, interviews and book excerpts (1976–2000) on Richard Nixon's legacy* (2003). Dr. Witcher is currently writing a book about the US Senate and the Vietnam War following the withdrawal of American troops. [Watergate Scandal]

**Kim Witte** holds a PhD from the University of California, USA, and was a professor in the Department of Communication at Michigan State University (MSU, USA, for several years before taking a leave of absence to work for five years at the Johns Hopkins University's Center for Communication Programs, USA, where she managed large-scale communication research projects in Africa and India. Now she is a research consultant and writer, as well as adjunct professor at MSU. [Extended Parallel Process Model; Message Effects, Structure of]

**Kokkeong Wong** is associate professor of communication at St. Norbert College, De Pere, Wisconsin, USA. His research interests are media and globalization, US media, and media and cultural developments in Singapore and Malaysia. His publications include *Media and culture in Singapore: A theory of controlled commodification* (2001) and "Asian-based development journalism and political elections: Press coverage of the 1999 general election in Malaysia" (*Gazette*, 2004). [Singapore: Media System]

**Holger Wormer** is professor and chair of science journalism at the Institute of Journalism at the University of Dortmund, Germany. Between 1996 and 2004 he was science editor on the national German newspaper *Süddeutsche Zeitung*. He specializes in issues of quality and ethics in science and journalism and in investigative science reporting. He won two journalism awards and his study courses at the University of Dortmund have been awarded prizes by Bertelsmann and the Volkswagen Foundation. [Science Journalism]

**Dominic Wring** is senior lecturer in communication and media studies at Loughborough University, UK. He is author of *The politics of marketing the Labour Party* and lead editor of *Political communications: The British general election of 2005*. He is chair of the International Political Science Association's Research Committee on Political Communication and associate editor for Europe of the *Journal of Political Marketing*. [United Kingdom: Media System]

**Carsten Wünsch** is research associate in the Department of Media and Communication Research at the University of Leipzig, Germany. Dr. Wünsch is second chair of the Media Uses and Effects Division in the German Communication Association. [Transactional Models]

**Robert S. Wyer** is visiting professor, Hong Kong University of Science and Technology, and professor emeritus, University of Illinois at Urbana-Champaign, USA. Research interests include knowledge accessibility, comprehension, memory, social inference, the impact of affect on judgment and decisions, attitude formation and change, and consumer judgment and decision-making. Publications include *Social comprehension and judgment* (2004), *Handbook of social cognition*, and numerous journal articles and book chapters. He is editor of the Advances in Social Cognition series and former editor of *Journal of Experimental Social Psychology* and *Journal of Consumer Psychology*. Awards include the Alexander von Humboldt Special Research Prize for Distinguished Scientists, the first Thomas M. Ostrom Award for Distinguished Contributions to Person Memory and Social Cognition (1998), and the 2008 Distinguished Scientist Award of the Society for Experimental Social Psychology. [Automaticity]

**Ronald A. Yaros**, assistant professor in the Department of Communication at the University of Utah, USA, is director of the Lab for Communicating Complexity Online. His research explores both formal and informal education of content in computer-mediated environments. His classes employ extensive use of technology, including blogs, WebCT, and other new media, to facilitate and enhance student participation, collaboration, research, and assignments. [Course Organization Programs in Education]

**Nick Yee** is a recent PhD graduate from the Department of Communication at Stanford University, USA, who researches social interaction and self-representation in immersive virtual reality and online games. Over the past six years, he has surveyed over 40,000 players of massively multi-player online role-playing games on a wide variety of issues, such as age and gender differences, motivations of play, relationship formation, and problematic usage. At Stanford's Virtual Human Interaction Lab, he works with Jeremy Bailenson in designing and analyzing experimental studies exploring social interaction in virtual environments. [Psychology in Communication Processes]

**Emily Chivers Yochim** was recently awarded her doctorate in communication studies from the University of Michigan, USA. Her primary areas of interest include gender and the media, subculture theory, and youth cultures, and her dissertation, "‘This is how I think’: Skate life, corresponding cultures and alternative white masculinities," discusses the ways in which adolescent males accept and reject the norms of hegemonic masculinity. Dr. Chivers Yochim has also published in *Media, Culture and Society*. [Symbolic Annihilation]

**Jina H. Yoo** holds a PhD from Michigan State University, USA, and is an assistant professor in the Department of Communication at the University of Missouri-St. Louis, USA, where she teaches interpersonal communication, social influence, and research methods. Her research areas include the impact of the first impressions in interpersonal communication and the impact of using emotional messages in public health campaigns. [Self-Presentation]

**Kyu Ho Youm** is the Jonathan Marshall First Amendment Chair in the School of Journalism and Communication, University of Oregon, USA. He has published extensively about communication law in major academic and professional journals. His research has been cited by US and other courts in ruling on freedom of expression. [Fairness Doctrine]

**Marylyn J. Young** is the Wayne C. Minnick Professor of Communication emerita at Florida State University, USA. She has published four books, including *Nuclear energy and security in the former Soviet Union* (with D. Marples, 1997) and *Flights of fancy, flight of doom: KAL 007 and Soviet–American rhetoric* (with M. K. Launer, 1988). Dr. Young is the author of numerous scholarly essays and book chapters on political rhetoric in the former Soviet Union. [Rhetoric in Northern and Central Asia]

**Usha Zacharias** is associate professor in the Department of Communication at Westfield State College, Massachusetts, USA. She is co-editor of the Commentary and Criticism section of *Feminist Media Studies*. Her work on gender, citizenship, and media has been

published in *Social Text*, *Critical Studies in Media Communication*, *Cultural Dynamics*, and several anthologies. Her primary research is based on fieldwork conducted among marginalized castes/communities in India. Her recent work, part of a project funded by the International Development Research Consortium, is on the biopolitical shift in women's citizenship among the fish-worker castes who live on the coastline coveted by the tourism industry in Kerala, India. She has also published articles in the Indian media and worked as consultant to the Ford Foundation, India. [Identity Politics]

**Ansgar Zerfass** is professor of communication management at the University of Leipzig, Germany. He holds a university degree and doctorate in business administration and a postdoctoral lecture qualification in communication science, and has worked in management positions at various companies for 10 years. He is member of the board of directors of European Public Relations Education and Research Association. He is author and editor of 15 books on strategic communication, public relations, and online communication, among them *Handbuch Unternehmenskommunikation* (2007). [Positioning Theory]

**Yan Bing Zhang** is an assistant professor at the University of Kansas, USA. Her research focuses on intercultural, intergenerational, and mass communication, particularly regarding cultural values, age stereotypes, conflict management, and media effects. Frequently, she examines these issues from a cross-cultural perspective. Her work has been published in US and international communication journals. Dr. Zhang's teaching interests include intercultural/intergroup communication, mass communication, East Asian communication, and quantitative research methods. [Communication Modes, Asian; Conflict and Cooperation across the Life Span]

**Shuhua Zhou** holds a PhD from Indiana University, USA, and is an associate professor at the College of Communication and Information Sciences, University of Alabama, USA. His research focuses on the cognitive processing of mediated messages as well as media content, form, and effects. Professionally, he worked for more than five years in the news department of GDTV in China. [China: Media System]

**Dolf Zillmann** is Burnum Distinguished Professor Emeritus of Information Sciences and Psychology at the University of Alabama, USA, and fellow of the American Psychological Association. His research in communication comprises the influence of the news on the perception of social issues, the effectiveness of educational presentations, the appeal and selection of media entertainments, and the enjoyment of comedy, tragedy, suspenseful drama, horror, erotica, sports, and music. His research in psychology focuses on aggression, sexuality, and emotional behavior generally. His authored, co-authored, and co-edited books include *Hostility and aggression*, *Connections between sexuality and aggression*, *Selective exposure to communication*, *Media effects*, *Responding to the screen*, *Media, children, and the family*, *Exemplification in communication*, and *Media entertainment*. [Emotional Arousal Theory; Empathy Theory; Excitation Transfer Theory; Media Effects Duration]

**Barry J. Zimmerman** is a distinguished professor of educational psychology at the Graduate School and University Center of the City University of New York, USA. He has

served as president of Division 15 of the American Psychological Association (APA). He received the Senior Scientist Award of Division 16 of APA and the Sylvia Scribner Award of the American Educational Research Association for his research on social cognitive and self-regulatory processes. [Bandura, Albert]

**Astrid Zipfel** is lecturer for communication and media studies at the Department of Social Sciences at the Heinrich Heine University of Düsseldorf, Germany. Dr. Zipfel's research focuses on media violence, political communication, public relations, and advertising effects. [Violence as Media Content, Effects of]

**Thomas Zittel** is researcher at the Mannheim Center for Social Science Research of the University of Mannheim, Germany, and Fernand Braudel Fellow at the European University Institute in Florence, Italy. His research interests cover electronic democracy, political campaigns, normative and empirical theories of democracy, and political representation. Most recent publications include *Participatory democracy and political participation* (co-ed. with Dieter Fuchs, 2007) and "Comparative legislative behavior" in *The Oxford handbook of political institutions* (co-authored with Eric Uslaner, 2006). [E-Democracy]

**Pierre Zoberman** is professor of literature at the University of Paris XIII, France. His books *Les Panégyriques du roi prononcés dans l'Académie française* (1991) and *Les Cérémonies de la parole* (1998) won awards from the French Academy. He has published extensively on all aspects of seventeenth-century French literature, eloquence, and culture, on theory of literature, and on rhetorical aspects of queer studies. [Rhetoric in Western Europe: France]

**Theodore E. Zorn** is professor of management communication and associate dean for management development at the Management School, University of Waikato, Hamilton, New Zealand. He is former editor of *Management Communication Quarterly* and former chair of the Organizational Communication Division of the National Communication Association. Recent publications include a co-edited book, *Management communication: New Zealand and Australian cases*, and articles in *Health Communication*, *Communication Yearbook*, *New Media and Society*, *Journal of Applied Communication*, and *Management Communication Quarterly*. [Change Management and Communication; Organizational Change Processes]

**Marvin Zuckerman** is retired professor emeritus of the University of Delaware, USA, where he taught and conducted research for 33 years. He received his PhD in clinical psychology in 1954 from New York University, USA. He has published over 200 articles and book chapters and eight books. The last published were *Sensation seeking and risky behavior* (2007), *Psychobiology of personality* (2nd edn. 2005), and *Vulnerability to psychopathology* (1999). He is a fellow of the American Psychological Association and the Association for Psychological Science and a past president and current member of the International Society for the Study of Individual Differences. [Sensation Seeking]

# Preface and Acknowledgments

## *The International Encyclopedia – A Team Product*

On September 14, 2004, I received an email that changed my life for the next three and a half years: “Dear Professor Donsbach: September greetings. I hope that the summer has treated you well, with time for both work and play . . .” The summer of 2004 had indeed treated me well. A few weeks after the International Communication Association (ICA) conference in New Orleans (it was the year before Hurricane Katrina hit the city), my family and I had spent two wonderful weeks at Lago Maggiore in northern Italy. It was as if I had known that it would be the last extended vacation for three years in a row.

The email came from Elizabeth Swayze, then editor and later senior editor of communication and media studies at Blackwell Publishing, and it was the first stage of an invitation to become the general editor of *The International Encyclopedia of Communication*, to be published jointly by Blackwell and the ICA. After I had shown my initial interest Dr. Michael Haley, executive director of the ICA (who obviously had his share in my name being suggested), contacted the association’s publication committee. The second crucial email (January 2005) read “Wolf, the publication committee had no problem with you assuming the editorship and recommended this to the executive committee. They also had no issue. So, you are clear to sign a contract. Good luck with this venture. It could be a lot of fun actually. Michael.” At that point I was trapped.

But I was also astonished, to say the least, that I had been asked to take over this role in a project that has led to the biggest publication in our field by far. Although labeled from the beginning “the *international* encyclopedia,” the volumes would be in English, and it was clear that despite all efforts to make it truly international the majority of the contributors would be American. Why then pick a European? My first reaction was: the ICA is really taking seriously its commitment to opening itself up. When I was asked to run as president of the association there were some doubts as to how far this commitment was a political statement, meant to represent an aspiration more than to document a reality. But this offer *had to be* serious and it indicated a very special point in the development of our biggest association in the field: it is now a truly international association and the geographical disproportions that still remain, particularly in membership, reflect only the existing disproportions in people working in communication, resources, and academic output. Therefore, my first thanks go to the ICA, not for nominating me as the general editor, but for successfully going in this direction of becoming a truly international association.

I had never before worked on a project that involves so much cooperation. Producing the content of the encyclopedia has really been a network achievement. Creating this network was probably one of the most crucial tasks because of the specific nature of our field. The borders of the field of communication are so differently defined around the globe that – taking all the areas included together – we have a huge conglomerate of subjects in front of us. There is no one – even among the most seasoned and experienced scholars – who can survey this field and claim to have sufficient knowledge in all areas. And certainly the general editor cannot claim this. Rhetorical Studies and Visual or

Developmental Communication, to name a few, are areas in which the general editor's competence is not much higher than in, say, sinology. In this situation the editorial network structure comes into play.

In close cooperation with the divisions and interest groups in the ICA, we picked colleagues each of whom had the competence and energy to become an editor of one of the 29 areas into which we had divided the field. The first task of these *area editors* was to suggest headwords into which their specific field could be sub-divided. We started this process in the fall of 2005. Of course, visions of how to divide a field into headwords and perceptions of the relative importance of one's own field differed widely, and it needed some months to arrive at the overall architecture of the encyclopedia and, to some extent, of the whole field of communication. Representing areas of and approaches to communication research in quantitative indicators as well as in topicality was not always a smooth process, but it was one in which all area editors finally valued the overall success of this project more highly than the status of their own area.

At the next step, area editors were crucial for securing quality of content by picking the right contributors. Again, it was the area editors who suggested names of possible contributors for the entries in their area. And again, we had to negotiate sometimes to limit geographical or epistemological "ethnocentricity." The 1,339 headwords are authored by about 1,100 scholars from 47 countries. Needless to say, there is still at least a geographical imbalance, but it is much smaller than it would have been without the understanding and commitment of the area editors to making this a truly *international* encyclopedia.

And finally, the area editors' most important and time-consuming work was editing the manuscripts in their area. Starting with a rather complex (as it later turned out, somewhat too complex) system for the editorial workflow (for which the general editor takes all responsibility . . . ), area editors worked with their contributors in a multistep process to produce the best possible representation of the structure and evidence in their own fields. The area editors have been the academic bones of this project and their contribution to the overall quality of content cannot be overestimated. The reader will find their names at the beginning of each volume.

But our system of checks and balances to secure quality went one step further. As the general editor I needed at least two very experienced scholars to help me develop guidelines and policies, to solve conflicts, and to check in the final stage the quality of writing. In *Jennings Bryant* (University of Alabama) and *Robert T. Craig* (University of Colorado) I found the ideal persons to do this job. Jennings and Bob, both past presidents of the ICA, are highly connected with almost the whole field of communication, have a bird's-eye view of research in almost the entire field, are hard-working, reliable, and committed colleagues, and are fun to work with. They became the *advisory editors* of the encyclopedia and they did a tremendous job in helping me oversee and direct the whole process, giving me guidance and inspiration, and – most of all – adding to the academic authority of the project.

This international network of area editors and advisory editors was linked to the editorial headquarters in a medium-sized city in the east of Germany: Dresden. Starting from scratch, I was lucky to find my closest cooperator in *Nadine Bernhardt*, the encyclopedia's first editorial assistant. Nadine was still a student when I hired her in the

spring of 2005, and she worked for this project on a research-assistant basis. She graduated in the summer of 2006, somehow (and successfully) combining her studies with her day-to-day involvement in one of the biggest publication projects in the field, and became an official employee of the university. Our different professional statuses never played a role when cooperating on the project and developing its architecture and rules. She has a critical mind and is quick, efficient, and reliable. She gave the first feedback on all the ideas I had developed on how to proceed and she brought many good ideas herself to the project. Within a few months, Nadine became a well-known name among hundreds of scholars who corresponded with her day by day.

The editorial team was complemented by *Uwe Hartung*, who gained his PhD from the University of Mainz, had already worked for me as editorial assistant on the *International Journal of Public Opinion Research* (of which I am the managing editor), and holds joint positions at the universities of Lugano (Switzerland) and Dresden. Uwe's experience in the field allowed him to review the final drafts that arrived at the general editor's office and to edit them in parallel with me. I would never have been able to read and edit all 1,339 myself and I could totally rely on his judgment.

Four months before the entry submission deadline, in April 2007, Nadine made me almost collapse when she told me about her decision to leave the university and take a job in the industry at the end of June. But again, I was lucky in finding a replacement early enough for the remaining two months. *Anja Wild*, about to receive her Master's degree in communication at Dresden University, took Nadine's job. She was supported by *Anne Lehwald*, who just had received her degree. Both young women worked hours and hours during evenings and weekends to meet the schedule agreed between us and Blackwell. Like Nadine, they never thought much about working to contract but were committed to getting the job done.

While leaving total control over content to the editors, Blackwell Publishing gave us all the support we needed to accomplish the project. *Elizabeth Swayze* was one of the people who created the idea of this encyclopedia at the publishers and has stayed with us throughout, being always responsive, supportive, and – what is most important – understanding that this is before anything else an academic endeavor and not a commercial one. This also applies to Blackwell's books publishing director for the social sciences and the humanities, *Steve Smith*, who gave us the necessary resources, watched us from a distance, and only got involved when necessary.

Early on, when the general structure and contracts were settled, *Ken Provencher* had become our main contact at Blackwell. Ken was what they called the “development project editor, cultural and communication studies,” but more concretely he was our alter ego at Blackwell. Almost all editorial decisions concerning structure and format were made with Ken and there must have been thousands of emails flying between Nadine in Dresden and him – until he also left the job, at almost the same time as Nadine. Ken went to USC to get a PhD in critical studies at the School of Cinematic Arts. When I got this news a short time after learning that Nadine was leaving, I doubted for a moment if it would be possible to accomplish the project under these circumstances. But again, the transition to our new alter ego at Blackwell went smoothly. *Tiffany Mok* took over and from the first moment was on top of things. Her main job was controlling the workflow, chasing delayed manuscripts, and discussing with us measures to stay on track with our

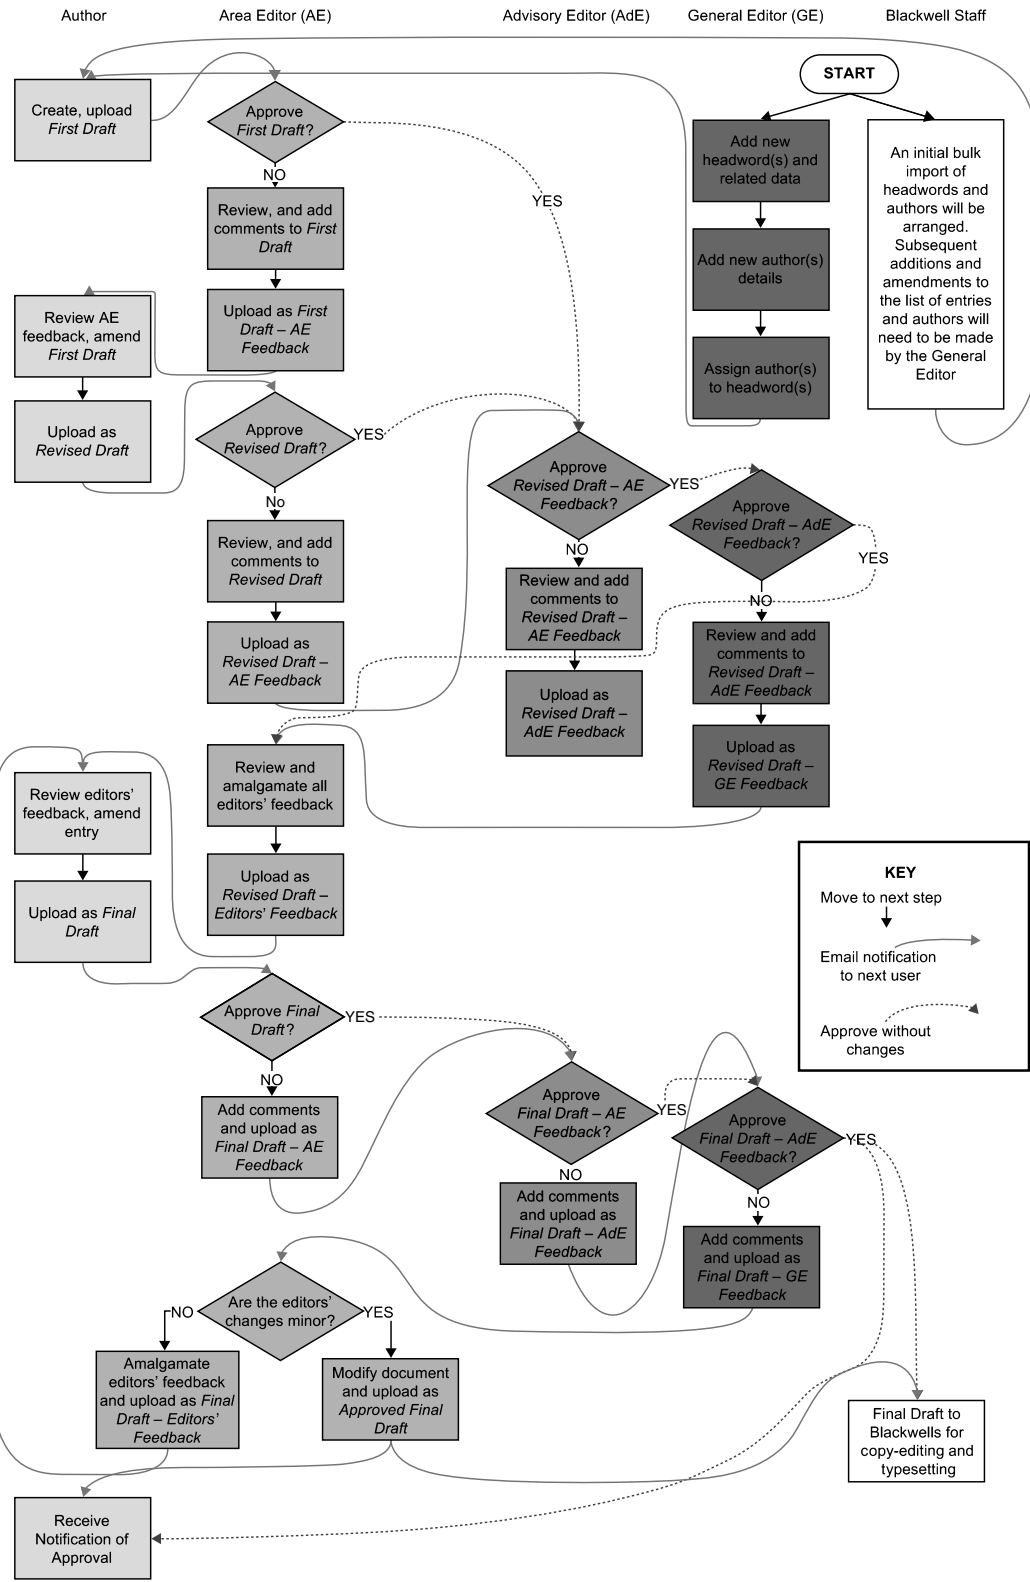

schedule. She also had the great idea of hiring toward the end of the submissions period what we called “the clean-up team,” a group of scholars to whom we reallocated headwords whose original contributors were missing in action. Tiffany was later assisted by *Christine Lagasse*, an assistant to Steve Smith.

On the other side of the Atlantic, the British part of Blackwell in Oxford, UK, took responsibility for the technical production of the work. *Tim Beuzeval*, web production team manager, has been in charge of the website, i.e., the technical skeleton of the whole process. It was no easy task for him to transfer our detailed ideas about the submission and review process into a computer program. Our review system included several loops of revisions and editing between contributor, area editor, advisory editor, and finally general editor. The chart opposite shows the challenge that Tim was facing. He managed to accommodate even our weirdest requests and helped us avoid some unnecessary extravagances. *Simon Eckley*, production manager, discussed with us the formal makeup of the encyclopedia. *Fiona Sewell* of Wordfusion was the leader of the team of copyeditors who really read the manuscripts with diligence and a clear mind and found, to our embarrassment, many mistakes and inconsistencies that had slipped through the editing process.

Losing my editorial assistant and the project editor in the middle of the battle was not the only major turbulence along the way. In late November 2006 we received the news that Blackwell Publishing had been taken over by an even bigger fish in the publishing business, John Wiley and Sons Inc. However, very soon we received signals that the new company, Wiley-Blackwell, is as much committed to the project as the old one, i.e., Blackwell alone. From that time on we have not seen any indication that this is not the case, and it was very satisfying for us to see that not much had changed for our colleagues at Blackwell with whom we had cooperated so closely.

To produce 12 volumes with peer-reviewed academic content of high quality within less than three years has only been possible because of the existence of the Internet and email. I have not read one manuscript on paper and not exchanged one conventional letter with anybody. Thanks to the brilliant engineering of Tim Beuzeval a lot of things happened automatically and in an orderly workflow. But this also meant having the encyclopedia project with me day and night and wherever I and my laptop were. The worldwide distribution of contributors made this a project that never slept. Somebody in Europe, Asia, or the Americas was always awake and communicating and many times we urged our colleague on the other side to finally go to bed, knowing the time difference between Dresden and, say, Oregon.

When dealing with about 30 editors and more than 1,100 contributors, many things happen along the way. We mourn the death of one of our contributors (who was also a close friend to me), Bob Stevenson of the University of North Carolina, whose two entries we were able to get finalized with the help of dear colleagues so that Bob is represented in this encyclopedia. Several colleagues became ill and finally were unable to submit. Some others faced temporary challenges. Michael Griffin, one of our area editors, sent us pictures of his house after a major storm had hit Minnesota and left him for four days without electricity. Among the hundreds of emails we were dealing with each day was the following from one of our contributors: “I have completed the document, expanded, amended and added references and suggested readings. However, I am in a lounge in

Lisbon airport, and the machines here don't allow the sending of attachments. I will arrive in Luanda tomorrow at noon, and in the course of tomorrow afternoon I hope to find somewhere from where to send the file. Sorry about the delay." Two hours later: "I have power again and I am back on the job. I will take care of the entry and send it tomorrow." This shows the commitment of our colleagues, their eagerness to do the job and to do it well – despite all obstacles.

At the end, I can only express my deep gratitude to all these colleagues who have in many different roles contributed to the encyclopedia. This product of an international network is also an indication of the momentum that our field has. We hope that these volumes will contribute to spread our approaches and our evidence throughout the world and in many different spheres of society. We have done, and we do, our best to demonstrate how far good communication research is in the public interest of all.

Wolfgang Donsbach, General Editor  
Dresden, March 2008

# Introduction

## The Challenges of this Encyclopedia

The reader of this introduction who expects of it a concise description of what the field of communication is and an overview of its state of the art will be massively disappointed. I am very confident, however, that this overview can be found within this encyclopedia. In my view, the best available account, describing development, fields, paradigms, and current problems of the academic side of “communication,” is an entry by one of the advisory editors, and therefore I refer readers to Robert T. Craig’s entry on “Communication as a Field and Discipline.” In a pluralistic manner, being fair to the rival camps, it gives a detached, analytical, and encompassing description of where we came from and where we stand today – at least to the extent of what can be said in 6,000 words.

If a whole field can be packed into an encyclopedia it means that there is at least some chance of defining its borders and naming its consensual evidence. Despite the fact that methodological and meta-theoretical disputes occur in any discipline (and belong to the sciences by default), communication has still been different in this from most of the other disciplines, particularly the natural sciences, which at least are more or less unanimously defined according to the scope of their objects and the canonization of their evidence. Textbooks, readers, or encyclopedias in, for instance, physics or economics might differ in nuances but their range of content and their presentation of what is the state of the art would be quite similar even when published in different regions of the world. Communication, on the other hand, has always ranked rather low on an imaginary scale of disciplinary coherence.

Nevertheless, over the last decades this field (whether it is a “discipline” is a more transcendent question) has reached some maturity that was not there a few decades before, and the attempts to present the vast body of our evidence to students and practitioners, for instance in the form of encyclopedias, is a clear sign of this. Previous projects of this kind were Barnouw’s four-volume *International Encyclopedia of Communications* (1989), Schement’s three-volume *Encyclopedia of Communication and Information* (2001), and Johnston’s four-volume *Encyclopedia of International Media and Communications* (2003). But none of these reached the scale of this *International Encyclopedia* in terms of scope of content, international representation, and mere size.

The identity and characteristics of this encyclopedia can best be explained when describing the challenges that the people involved were facing and that we hope we have met.

### CHALLENGE 1: REPRESENTING THE PLURALITY IN THE FIELD

*The International Encyclopedia of Communication* is a project that has been developed by the International Communication Association (ICA) and Blackwell Publishing (which has in the meantime become Wiley-Blackwell), the publisher of most ICA journals and an ICA book series. Thus, the identity of the ICA as the biggest international association in the field of communication has influenced the identity and content of this publication.

## 2 Introduction

However, this identity is not a single and clearly defined one, as it is in most other disciplines, but composed of a patchwork of subjects, theories, and methodological approaches. This plurality within the ICA finds its expression in the scope of these 11 volumes plus 1 index volume. After the general editor had been appointed by the ICA Executive Committee it was the first objective to find an editorial structure that represents this plurality. It has never been a one-man show, meant to display to the readers what the general editor's preferred subjects and approaches are. Instead, it was meant to display what the people who are organized in the ICA – and these are 4,000 scholars in almost 70 countries – have defined as the valid and relevant evidence.

Thus, we started from the ICA divisions and interest groups and sought their input on content and people. However, structuring the encyclopedia could not mean just copying the divisional structure of the association onto the editorial parts of the publication. The structure of the academic association has, of course, not developed in a “theoretical” or at least logical way but is due to individual initiatives, urgent social problems, and many other reasons. Thus, it could not well serve as the blueprint for a publication that was charged with presenting to everybody (and not only ICA members) a quite coherent and systematic picture of the field. Thus, less than two-thirds of the ICA divisions and interest groups are represented as “editorial areas,” the structure underlying all 1,339 entries in the encyclopedia. Those ICA divisions that do not find their label as an editorial area are by no means less important and not at all misrepresented. Their subjects and evidence just slipped under the roof of newly created areas, many of which followed a simple communication model from message production, content, and exposure to message effects. For instance, the ICA does not have a division “Media Effects,” but it was clear from the beginning that we had to compile the approaches and the findings on this (probably most important) field in one editorial area. “Exposure to Communication Content,” “Reality Perception through the Media,” and “Media Systems in the World” are other areas that do not represent ICA divisions.

Communication is anything but a clearly defined field – within countries and even more so between countries. The ICA, for instance, has a much broader scope than most national and regional associations in Europe, which are more focused on mediated communication, while the ICA also includes interpersonal communication, language and social interaction, and organizational communication. It has been a big challenge to accept the leadership of a publication of which a lot of the content is almost totally *terra incognita* for the general editor. I would never have thought that I could ever become the editor of a publication with headwords like “Marital Typologies,” “Linguistic Pragmatics,” or “Organizational Metaphors.” But here it is, and it is part of the collateral damage of the whole endeavor that the general editor learned a lot: first, he learned what can go under the umbrella of “communication studies and research” if one looks at the field from a global perspective, and second, he learned what interesting ideas, approaches, and evidence these fields have to offer. It was just a pity that the material that went through my hands (or better: across my screen) became so voluminous that this soon ended in an information overload.

This broad definition of the field is the reason why the area editors became so important for this project. The result of the deliberations in which – in addition to the division chairs – the two advisory editors, Robert T. Craig and Jennings Bryant, were

closely involved was the list of 29 editorial areas that are now the backbone of the alphabetically ordered entries in these volumes. Each of these areas needed a responsible area editor, a scholar who was capable of surveying the area's subjects and of critically but fairly evaluating the different approaches. Thus, the selection of the area editors was the second crucial stage that would decide how well we would represent true scholarship without bias. Again, the division chairs and the advisory editors were involved in this search and some of the chairs became the editors of the areas that represented their division. The area editors are the true gatekeepers for the quality of the encyclopedia's content (see below).

Thus, in the way the borders of this encyclopedia's content are defined (encompassing almost all areas that somewhere in the world sail under the flag of "communication"), in the way we sub-divided this field into a variety of areas (defining 29 specific sub-fields), and in the way in which we came up with a list of area editors (all scholars who were internationally acknowledged in their respective fields), we did our best to present to the reader a most representative picture of what we do and what we know in communication.

## **CHALLENGE 2: FINDING A COHERENT SYSTEM OF HEADWORDS**

Part of this striving for a valid representation of the field's reality then became the search for headwords. Defining editorial areas is one thing, filling them with headwords that are somehow coherent *across the areas* is another. It became the area editors' first task to suggest between 30 and 50 topics that should be dealt with by individual entries in the encyclopedia. In addition, the area editors were to indicate the possible length category for each entry. Basically, the encyclopedia has entries of three length categories, ranging from under 1,000 to 2,000 and 3,000 words. As could be expected, the perceptions of how such a list might look like and how many headwords would best represent the respective areas differed widely.

The general editor's biggest misjudgment was probably his estimate of how much time it would need to negotiate the headwords. With every list that the area editors submitted it became more difficult to keep an overview of how the headwords on this growing list would relate to each other and would form, in their totality, the coherent representation of the field that we were going for. Toward the end we reached a state of entropy in which we thought several times a day it might be best to drop the ball and start again.

The reason for this entropy was the fact that, by default, such an encyclopedia's content is not organized along one dimension (in which every new headword would just add to the already existing content) but consists of several dimensions. Therefore, the same subject could appear several times in different contexts (or technically speaking: in several editorial areas). Take, for example, the characteristics of media content. They are the product of journalists (area: Journalism), who work in institutional environments and role settings (area: Media Production and Content) that are partially defined by economic (area: Media Economy), legal (area: Communication and Media Law and Policy), technical (area: Communication and Technology), and other (area: Media Systems in the World) structures, are perceived or not by the audience (area: Exposure to Communication Content), and can lead to a certain reality perception (area: Reality Perception through the Media) and other effects (area: Media Effects) that can only be measured by applying

## 4 Introduction

specific methods (area: Research Methods). This example can easily be extended by adding more areas where media content plays a role, like Visual Communication or Rhetorical Studies. Thus (and again only as an example), “bias,” “framing,” and “stereotyping” of news are all constructs that appear several times at several spots and in different contexts.

In some cases this multiplicity is due not only to the different perspectives from which the contributor looks at a subject but also to different epistemologies. When the first drafts began to come in, it became clear that the ideal of an “internal plurality” where each and every entry presents the subject from all perspectives, including all epistemologies, is an impossibility in the social sciences. Internal plurality (a term used in many countries for the expectations of the content of public service broadcasting) would have offered to the reader the full perspective on each headword’s subject. This is, indeed, the case in most entries, and for many headwords there are no rival approaches or evidence to present. But for others there are, and in some cases the editorial areas as a whole (like some divisions in the ICA) correlate with specific epistemologies and methodologies. As a consequence, the reader will find a mixture of internal and external plurality, the latter presenting the same topic or problem from different angles in different entries. This is not ideal for an encyclopedia entry (where the reader expects *the* state of the art), but we think that the intensive use of cross-references to other headwords solves this problem to a great degree. And we are aware that some contributors will not like these cross-references in their text because the “other” text might challenge their view.

The 1,339 entries of which this encyclopedia consists are only one of many solutions one could have come up with to the problem of organizing the field. Many inconsistencies and other deficiencies were met and dealt with during the process; others were recognized too late to be corrected or will only be recognized by the critical reader.

### **CHALLENGE 3: SECURING QUALITY**

The system of headwords is intrinsically to do with quality management. The next and even more difficult and crucial dimension was the quality of the entries themselves. The first decisive step here was, again, people! The area editors, with the background of their first-class knowledge of their fields, suggested names of possible contributors that we discussed in close consultation with the advisory editors. Of course, even the best scholar’s horizon is finite and communication networks do exist, and are necessary - not least for research activities. Therefore, certain correlations – be they of a geographical, epistemological, or institutional nature – between the area editors and the contributors in their area have been inevitable. Nevertheless, if the biographic and bibliographic records of most contributors had not already given proof of their expertise in the field they were writing about, then the quality of their entries would have done so.

To secure the quality of each and every entry we implemented a rather complex system of reviewing. The first draft of each entry was commented on by the area editor only, then eventually revised and uploaded as a “revised draft” onto the encyclopedia website, which sent it to the appropriate advisory editor, from where it arrived with comments at the general editor. For about two-thirds of the entries the three-step editing process provided an almost printable manuscript after the first loop, and the general editor and his

colleagues only had to change formal matters and add cross-references. In one-third of the cases the manuscript went through a second loop, which was started by the area editor's amalgamating previous comments from advisory and general editors and the production of a new draft. This did the job in most cases; in a few we had to start a third loop in which again all editing levels were involved.

By far the majority of comments were suggesting minor changes and amendments, in most cases because the entry was too long. Very rarely was the critique by the editors more fundamental, for instance the manuscript being highly ideological, being almost evidence-free, or not presenting an account of what communication research had produced in terms of systematic academic research. We lost only two of the approximately 1,100 contributors over disagreement on content, and in neither of these cases was the decision made by one person only.

The way the contributors approached their entries differed quite considerably. Despite the publication on the encyclopedia website of writing guidelines and a sample article by the general editor, the style of the manuscripts varied. Some contributors wrote exclusively in a true encyclopedia style without references in the text, while others felt uncomfortable not mentioning the source of evidence for particular content. These style differences again correlated with epistemology. Entries from the "hard science" hemisphere of communication research approach contained on the average more in-text references, because their contributors were used to reporting more concrete evidence on their subjects, while many of the more qualitative or "critical" entries preferred a more essayistic style. Again, after intense discussions, we did not attempt to level all entries to the same formal style but decided to leave these peculiarities, at least to a certain extent. In any case, at the ends of entries the reader will find lists of references to literature the text is based on or for further reading. Our weakness for plurality also made us allow one entry that consists of nothing but a dialogue – between a rhetorician and a psychologist – a brilliant way of describing the different approaches of both disciplines (which was the entry's objective).

#### **CHALLENGE 4: MAKING THIS AN *INTERNATIONAL* ENCYCLOPEDIA**

Taking the membership structure of the ICA as an indicator, two-thirds of communication scholars live and work in the US and most of the research journals of international relevance are published there. It comes as no surprise then that there is not one country in the world that comes even close to the US in terms of academic institutions in the field of communication, research grants and research projects, and finally research output measured quantitatively in the number of publications and qualitatively in the relevant theories and results. Therefore, there is something like a natural and legitimate bias toward communication research in the US – and to a lesser degree in central Europe: there is just more research output there than in other regions of the world, and trying to totally level these disproportions in a publication like this encyclopedia would indeed induce discrimination by geography to the disadvantage of contributors from the US.

However, some variance in the visibility of scholars from different regions can also be explained by factors other than just academic output and quality. Language is one of

these. The lingua franca of research has for long been English and, as mentioned above, the major publications are in English. As a consequence, today deans and hiring committees in many countries expect that candidates for jobs and promotions have published in English. But not everybody can and should meet these expectations. Important journals, some of them having much longer traditions than today's relevant English-language journals, would eventually disappear or become academically insignificant if this trend were to continue. Nevertheless, students in the UK, Australia, or central Europe have the option of concentrating on these international, i.e., English-language, journals.

But in many regions of the world, English is far less widespread, even the brightest students have difficulties in writing their excellent work down in a foreign language, and translation is often not an option because of cost. In some regions there is also an understandable inhibition from disregarding one's own language and culture just for the sake of being more visible in an international "academic market."

We have tried to counter as far as possible this imbalance between geographical regions, which is only to some extent a "bias." One-third of the area editors are non-US scholars and the 1,100 or so contributors come from 47 countries. Further, probably the comment most often used in the editing process (at least by the general editor) was that an entry was too "US-centric" and neglected research in other areas. The contributors were usually very responsive to such comments and the next versions much better. The imbalance described here in academic resources and output and the language barriers still leave their mark in this publication also. Nevertheless, we would claim that it is a truly "international" encyclopedia of communication and one that does justice to the identity of its sponsoring association, the ICA.

### **CHALLENGE 5: MANAGING THE PROJECT TECHNICALLY**

We all learned how to produce this work while doing it. We had no exact blueprint for an encyclopedia of this size. *The Blackwell Encyclopedia of Sociology*, edited by George Ritzer, came closest but still used different editorial procedures and made a different use of the website. The key factors in managing the project became the website and email. Most of the editors and certainly the general editor never worked on paper. This became a double-edged sword, however. On the one hand, we had clean desks and could travel light; on the other hand, the project was always with us, at least when our laptops were in reach.

We almost met the original timetable for completion of the editorial work. But this was only possible because we switched to direct contact with contributors who were late, bombarding them with emails, calling them up, even visiting them in their offices when possible. Without the support of the publishers we would not have been able to solicit the manuscripts in due time. In some cases we had to reallocate entries to other contributors, some of them to the "clean-up team" that we had recruited about two months before the deadline.

A project of this scale needs clear procedures, timetables, and responsibilities. Every day of delay would have had an impact on the workflow at the publishers, who had to hire copyeditors and reserve resources at the printers. But timeliness is also an academic value, because the relevance of research evidence decays and the faster the production the fresher the content.

## HOW TO USE THE ENCYCLOPEDIA

The 1,339 entries are printed in an alphabetical order throughout the first 11 volumes. The length of an entry usually is some rough indicator of its centrality in the field. There are longer overview articles for the editorial areas. A reader who wants to get a first impression of approaches, keywords, and methods in, for instance, political communication is well advised to first look at this overview article.

Cross-references to other headwords have been extensively used to guide the reader to content that is more or less directly related to what he or she reads in any one entry. They are indicated by an arrow before the headword in the text, e.g., in the entry on “Academy Awards” readers are referred to “(→ Special Effects)” and “→ Cinematography.” Cross-references also have helped us to meet the length standards, because very often it was possible to just refer to a specific entry instead of explaining a certain theory or construct in the entry at hand. At some later point we might use the structure of the cross-references in all entries as a dataset that shows the underlying structure of this fascinating field of communication. But this will be a new project.

Of course, there will be many readers of this *International Encyclopedia of Communication* who – despite the size of this project – do not find what they are looking for, or who find it written from a different perspective than they had expected. We anticipate this criticism and we are looking forward to it in order to improve the next editions in print and online. For now, this is what more than 1,100 scholars worldwide present as the best theories and methods and as the most relevant results in this fascinating and socially crucial field of communication.

Wolfgang Donsbach, General Editor

## Academy Awards

*Kathrina Glitre*

*University of the West of England*

Over 1 billion people in more than 200 territories watched the Academy Awards telecast in 2006. The Oscars are the most influential entertainment awards in the world, an enduring phenomenon affecting not only the film industry, but also radio, television, and advertising, with an increasingly global impact.

The Academy of Motion Picture Arts and Sciences was founded in 1927, with the aim of improving the industry's status. The first Academy Awards were announced prior to the ceremony (a private banquet with 270 guests) in May 1929. The 15 awards included Outstanding Picture, Actor, Actress, and separate awards for Comedic and Dramatic Direction; Warner Bros. received a Special Award for *The Jazz Singer*, the only talkie mentioned. The statuette (designed by Cedric Gibbons) was produced for the occasion and remains largely unchanged; the nickname "Oscar" was not used officially until 1939.

There have been various *changes to the awards*, often in recognition of changing technologies. Sound Recording became a category for 1929/1930, with awards for Music (Scoring) and Music (Song) added in 1934. Special Effects was introduced in 1939 and later split into Sound Effects and Visual Effects (1963) (→ Special Effects). Between 1939 and 1966, → Cinematography and Art Direction were split into black-and-white and color achievements. Costume was added in 1948 (also split between black-and-white and color until 1956). Other awards were introduced: Supporting Actor/Actress (1936); Documentary (1941); Make-up (1981); and Animated Feature Film (2001). This list is not comprehensive, but indicates key changes in → Hollywood filmmaking, particularly the emphasis on spectacle.

The Academy is organized into separate *branches*, e.g., Acting, Direction, Writing, Cinematography. Nominations are generated by the relevant branch, whose members are presumed best qualified to recognize quality within its area of specialty: the Acting Branch nominates actors, the Direction Branch nominates directors, etc. All Academy members can nominate Best Pictures. Foreign Language Films are nominated by the country of production and then selected by a special Academy committee. All active members then vote on all categories. The Academy's tastes can partly be explained by its honorary membership: the Board of Governors invites people to join (Award nominees are automatically invited). Since only those with proven ability are invited to join, and membership is for life, members tend to be relatively old. They are also predominantly male:

the Board of Governors currently comprises 35 men and seven women; with the exception of Acting, branches are also male-dominated (→ Gender and Media Organizations).

These unintentional biases are significant, not least because of the *economic impact* of an Oscar nomination. Nomination improves bargaining power for future projects, but also brings immediate economic benefits. A 2001 study estimated that a Best Picture nomination can be worth US\$11 million in domestic ticket sales alone (e.g., prior to nomination, *Million Dollar Baby* was playing in 147 US theaters; the weekend after, it was playing in 2,010), while a Best Actor/Actress nomination is estimated to add US\$1 million. Nominations can also impact on sales of related merchandising, such as soundtracks and books.

Historically, the Awards have played an important part in media and communication. From 1930 to 1944, a portion of the ceremony was broadcast on local radio. In 1945, the ABC network began national broadcasts, while the Armed Forces Radio Service made the first overseas broadcast; together, they reached an unprecedented audience of 50 million in 1948. The NBC network broadcast the first televised ceremony in 1953. In 1959, 80 million Americans watched or listened to the show, while a further 100 million were reached overseas. This increasing audience affected the amount paid for TV rights. Disney-owned ABC currently pay US\$37 million for the domestic rights – money well spent, since the Academy Awards consistently tops the ratings, enabling ABC to demand exceptionally high rates for advertising: in 1999, they charged US\$1 million per 30-second commercial (totaling US\$58 million); by 2004, this had risen to US\$1.5 million. Buena Vista International Television (also Disney-owned) currently hold the rights to overseas licensing, expanding to new territories in Japan, Latin America, and Vietnam in 2006.

The Awards themselves have also become more international. Foreign-language films are technically eligible for *any* award, as long as they meet the normal requirements (theatrical release in Los Angeles for seven consecutive days); in practice, the Academy has always privileged English-language films. Levy (2001) estimates that 70 percent of nominees have been American, 20 percent British, and only 10 percent other nationalities; however, the majority of these non-American nominations were still for work on American films. The first foreign-language film to receive an award was *Shoe-Shine*, in 1947; a Special or Honorary Award was given to a foreign film most years afterwards, until the Foreign Language Film category was added in 1956 (*La Strada* won). The 1960s saw actors, actresses, and directors being nominated for foreign-language films (mostly European): Sophia Loren was the first actress to be nominated and still the only one to win (*Two Women*, 1961); Roberto Benigni is the only actor to win (*Life is Beautiful*, 1998). Foreign directors gained a higher number of nominations – including Federico Fellini (four times), Ingmar Bergman (three times), and Akira Kurosawa – but not one received the award. Nonetheless, two things are clear: foreign-language films became more “visible” in the 1960s (the height of European art cinema); and the Academy’s understanding of the world has expanded over the last 40 years to include European, East Asian, and Latin American cinema. African, Asian, and Middle Eastern cinema, however, rarely reaches their radar. Hollywood’s dominance means that the Academy Awards retain a global audience, but the reverse effect – global cinema reaching America – is notably weaker.

## **Access to the Media**

*Samuel A. Terilli, Jr.*

*University of Miami*

Access to the media encompasses the efforts and rights of individuals and groups to represent their views through the pages or airtime of established media entities – private or public. It should not be confused with access to information (→ Freedom of Information; Right to Know) or even the related question of open-access television (→ Public Access Television). The access-to-media question typically arises when a political candidate wants advertising or free airtime or when a person, business, or group demands time (or space) to reply to a news report or present a competing analysis (→ Right of Reply). More broadly, the question asks whether society can or should force a publisher or broadcaster to devote space or time to diverse subjects and viewpoints.

### **COMPETING PHILOSOPHIES**

Whether the public should have narrow, broad, or even any access-to-media rights is a question on which free expression advocates often disagree (Barendt 2005). The *opponents of mandated access* see government intervention or compulsion as dangerously contrary to free expression. Proponents argue access, even if compulsory, improves the quality and breadth of expression and serves the public interest (Barron 1973).

If government may compel speech and thus interfere with private allocation of newspaper space and broadcast time, access opponents insist, journalists are not truly free because some will refrain from controversial speech to avoid compulsory access (Schmidt 1976). This view, common in the United States, for example, reflects a strong suspicion of government and a conception of expressive rights as rights against government and not also against large or concentrated media entities or as positive rights to an informed and fair debate (Barendt 2005).

The *countervailing view* focuses on the power of the modern news media, the concentration of ownership of major media outlets (→ Concentration in Media Systems), the reciprocal value of equal opportunity to speak among all speakers, and the public nature of broadcast licenses that allocate a finite electromagnetic spectrum. The scarcity or finite spectrum argument is losing its force as technological advances provide more diversity among the broadcast media. Without creating absolute or comprehensive public rights of access to private or public news media, some legal systems, such as those in France, Germany, and elsewhere in Europe, place a greater emphasis on access and reply rights as well as pluralist interests (Barendt 1989, 2005; Paraschos 1998).

### **SIGNIFICANT FACTORS AFFECTING NATIONAL POLICIES**

In evaluating the access-to-media question across national borders, there are six questions on which national law and policy often turn: (1) Does the society distinguish between print and broadcast media and, among broadcasters, between those using public airwaves and those transmitting by cable or satellite? (2) Are there differences in the law applicable to private media and that applicable to government-funded, -owned, or -controlled media? (3) Does the society have relatively few media outlets (or highly concentrated ownership) and a greater need for access rights? (4) What is the history of the society, from civil liberties to experiences with war or genocide? (5) Does the law examine the nature of the relevant statement to determine if a reply or access right is triggered (e.g., differences between opinions and statements of fact and between private persons and public officials)? (6) Is the mode of communication fairly new and thus more likely to be regulated, possibly including some equal access obligation?

Although not exhaustive, this list allows one to evaluate thoroughly different approaches to access rights, as shown by a comparison of the law in the United States and Canada with that of several European countries and the European Union generally.

### **ACCESS TO MEDIA IN THE UNITED STATES AND CANADA**

The law in the United States, until the late 1980s, reflected a sharp contrast between broadcast and print media. The key decisions of the Supreme Court were *Red Lion Broadcasting Co. vs FCC* (unanimously upholding in 1969 at least one part of the → Federal Communications Commission's → *fairness doctrine*, requiring, among other things, the airing by broadcast licensees, at their expense, of a reply by a person attacked or criticized), and *Miami Herald vs Tornillo* (unanimously declaring in 1974 Florida's right of reply statute unconstitutional because newspapers enjoyed a strong First Amendment right, rooted in history, to control content of and access to their pages, in contrast with the regulated broadcast media). The Supreme Court saw the two media through different historical and legal lenses and found the First Amendment more protective of the print media.

In *Red Lion*, the court reasoned that any regulatory interference with broadcasters through mandatory rights of reply was permissible because the broadcaster held its license in trust for the public and through government's apportionment of the scarce electromagnetic spectrum. This decision did not recognize a general right of public access to the broadcast media. The right of reply was a limited one, conditioned on the FCC rule

and triggered by the personal attack. The Court held in *Tornillo* that the limited power to mandate access or replies in the broadcast media did not extend to the print media. The Court stressed the First Amendment right of editors to select the news, and the fear that mandatory rights of reply would cause some to avoid controversial issues and thus deprive the public of information or opinion. The case did not address other media access questions.

With the development of cable and other technologies, the spectrum scarcity and public trusteeship regulatory rationales fell out of favor in the 1980s, as did the fairness doctrine (Barron 2003; → Cable Television; Satellite Television). The fairness doctrine, of which the personal attack or reply rule was one part, required that broadcasters devote a reasonable amount of airtime to public issues and present competing points of view on important public issues. The doctrine did not require equal treatment of issues or viewpoints, and broadcasters made the ultimate reporting decisions. Nonetheless, by requiring the reporting of diverse ideas and issues, the fairness doctrine was the pinnacle of compelled access to any US media.

The FCC rescinded in 1987 the fairness doctrine rules requiring presentation of diverse views, but left largely intact the rules regarding personal attacks, licensure, indecency, political advertising, equal candidate airtime, replies to political editorials opposing a candidate, and media cross-ownership. In 2000, a federal appeals court ordered the FCC to abolish the personal attack and political editorial rules as well.

Compelled access and replies are, therefore, essentially dead in the United States (Barron 2003). Occasionally public interest groups unsuccessfully petition Congress for reinstatement of the fairness doctrine. Broadcasters and newspapers that publish replies and diverse views do so for good business or other reasons, including state laws that often limit defamation damages if a publisher or broadcaster has published a retraction.

Although Canada's free expression law differs from that of the United States in several respects, Canada, like the United States, provides neither reply nor broad media access rights and protects expression only against government violations (Barendt 2005). In contrast, the → American Convention on Human Rights provides a strong right of reply without limitation of other legal remedies, but neither the United States nor Canada is among the more than 20 countries of the Americas that have ratified the convention.

## ACCESS TO MEDIA IN EUROPE AND ELSEWHERE

European countries and the European Union do not as a rule recognize broad, judicially enforced access-to-media rights, but *European law* generally shows a greater concern for social and media pluralism than American law does (Paraschos 1998). Public broadcasters tend to face stricter regulation and scrutiny in terms of fairness, quality, and breadth of news coverage than do private broadcasters or newspapers. Most European countries have not adopted constitutional rights of access (by individuals or groups) to any media, though rights of reply, subject to various details, in the print and broadcast media are more common (Schmidt 1976; Coliver 1993; Paraschos 1998). A refusal of a newspaper to publish a reply may, for example, allow one to seek a judicial review and remedies, including fines, publication of the reply, or a right to file a defamation action. The European Union has acknowledged through Chapter VI, Article 23, of EU Directive 89/552/EEC of 3 October 1989 that "any natural or legal person, regardless of nationality, whose legitimate interests, in particular reputation and good name, have been damaged

by an assertion of incorrect facts in a television programme must have a right of reply or equivalent remedies” (→ European Union: Communication Law).

*The UK* has historically maintained a traditional or negative rights approach to this question by protecting expression against only governmental interference and not against the news media itself or other commercial interests, though it has also provided more informal rights of reply (Barendt 2005). The UK has tried, with limited success, various means (e.g., voluntary news councils) of encouraging publication of replies and alternative viewpoints – an approach also tried in the United States.

France, Germany, and other EU members have not generally enforced broad public rights of access to the news media or used judicial intervention to ensure fairness or impartiality in news coverage (Coliver 1993; Paraschos 1998). Many, however, recognize individual and societal interests in avoiding governmental or commercial media domination of programming schedules (Barendt 2005) and provide an assortment of remedies to people who believe they were covered unfairly.

*France* provides for both the right of an individual to respond to a publication in which he or she is identified and the right of a public official to reply when the newspaper has falsely reported about the official’s activity (Coliver 1993). Concerns for pluralism are strong in France and elsewhere in Europe. French courts have ruled that Parliament must balance individual expressive rights in broadcasting with other values, including pluralism (Barendt 2005). Italy and Germany, for example, recognize the rights of the public or recipients of information as well as the speakers, but do not emphasize pluralism in the same manner as France does.

In *Germany*, the Constitutional Court has ruled that because broadcasting freedom must serve free expression, broadcasters do not have complete freedom to determine program schedules and must take into account the interests of viewers. German constitutional rulings also require that government prevent domination of broadcasting scheduling and programs by commercial and state interests (Barendt 2005).

The European Convention on Human Rights and Fundamental Liberties (ECHR) may prove to be a basis less for positivist access rights and more for general broadcast regulation and diversity (Barendt 2005). Individuals may bring to the → European Court of Human Rights claims that a European state violated rights under the ECHR, including Article 10, which protects essentially negative rights against governmental interference. Article 10 does not create access-to-media rights, but it focuses on broadcast licensing and allows free speech limitations only when “necessary in a democratic society.” The ECHR in 1994, in *Informationsverein Lentia vs Austria*, ruled that a state broadcast licensing system or public monopoly interfered with media pluralism and was allowed only if necessary to achieve quality programming. Because the electromagnetic spectrum was no longer a serious constraint, the Court ruled Austria could license private broadcasters and require quality programming of them. The Court did not apply Article 10 to create a positive right of access to the public monopoly, but did apply it to open new channels or diversity within the regulated environment (Barendt 2005).

Other countries, including western and nonwestern societies, present both similar and significantly different approaches to the access question. Analyses of access questions in those countries must begin with fundamental questions about local laws and approaches to freedom of the press and expression generally. Some reflect at least a degree of western

influence. *Japan*, for example, reflects not only its own heritage, but also the influence of the American occupation following World War II (Haiman 1987). Japan reflects a legal and journalistic approach that is less adversarial than that found in the United States or many European countries, but nonetheless Japan has allowed courts to require the publication or broadcast of corrections to remedy certain falsehoods that injured reputation (Haiman 1987). Nondemocratic or authoritarian regimes present additional problems in the analysis of access to media because the media in those countries are generally subject to stringent governmental control.

## **Accountability of the Media**

*Young Min*

*Korea University*

The accountability of the media is a normative notion that underlies the balance of freedom and social responsibility across media structure, performance, and product. In order to grasp the concept, we need to understand how closely related the two competing values of freedom and responsibility are.

*Press freedom* has been constitutionally protected to guarantee a → free flow of information by which citizens are empowered and directly involved in public life (→ Freedom of the Press, Concept of). From the birth of the press its freedom has been strongly connected with social expectations for the media to protect the → public interest and to improve the quality of democracy. This is why James Carey points to the First Amendment to the United States Constitution as “a compact description of a desirable political society” (Merritt & McCombs 2004, 13). In short, the most important rationale of press freedom lies in the belief in the positive role of the media to build desirable citizenship, community, and democracy.

In that regard, press freedom is not an absolute value or a natural right. Even in most advanced democracies, press freedom has been constrained for various reasons – when it is in conflict with other constitutional rights or in order to satisfy various public interest requirements. Settling conflicts between different constitutional rights is largely a legal matter, and limiting the freedom of the media so as to fulfill its social responsibilities involves many complicated issues. Fundamentally, it is a matter of balancing *freedom* and *responsibility*, and two measures have been used primarily for that purpose: *the market* and *the law*. Neither approach, however, has proven successful. The free market measures often fail to secure plurality in media ownership and diversity in media content, and many other public interest requirements have been sacrificed at the expense of pursuing business profits. On the other hand, legal regulations, such as → censorship and other repressive measures legislated to protect the public good, often infringe freedom itself.

Many alternatives to these two approaches have been suggested, the most important, arguably, being the concept of *social responsibility*. The theory of social responsibility emphasizes the importance of media freedom to scrutinize power and to provide accurate information (→ Fourth Estate); there are calls further for the media to serve as a public forum for the exchange of comments and criticisms and to fulfill its responsibility to represent culturally and politically diverse perspectives. The theory suggests that the media’s obligations to society be fulfilled primarily by self-regulation, i.e., by the voluntary efforts of media owners and practitioners (→ Ethics in Journalism; Professionalization of Journalism). Governmental intervention, however, is not ruled out; state regulation is justified when public interest is at stake and internal regulation is not sufficient. However, social responsibility theory was overly optimistic about the media’s willingness to meet its responsibilities and the efficacy of self-control. Although the theory contributed to the notion of media responsibility and to promoting a positive understanding of freedom as freedom *for*, not as freedom *from*, it was not successful in detailing exactly how to hold the free market media socially responsible. The concept of media accountability fills in such a lacuna.

Linguistically, *accountability* and *responsibility* are linked to the general notion of answerability: responsibility concerns more the question of *what* while accountability is related more to *how*. Otherwise stated, the key issue of responsibility is to define to what social needs the media should respond while that of accountability has to do with how to compel the media to respond to those needs (McQuail 2003). Media accountability, however, remains in a conceptual muddle. Among various competing definitions, the one provided by Dennis McQuail is particularly noteworthy. According to him, media accountability refers to both “voluntary and involuntary processes by which the media

answer directly or indirectly to their society for the quality and/or consequences of publication” (McQuail 2005, 207). Along this line, media accountability can be considered to involve two sub-dimensions: *liability* for any harm caused by publication and *answerability* for the quality of publication.

In short, media accountability is a much wider concept than self-regulation, denoting both the media’s legal obligation to prevent or reduce any negative consequences of its practices and its moral duty to provide quality service for the public. Accountability is also a process-oriented concept defining how the media answer, to whom, and for what. There exist diverse ways of achieving media accountability, which include legal and legislative regulation, and involve the market, the civil society (or the public), and the media profession itself (McQuail 2003). No single approach can be sufficient; various combinations are desirable. In the long run, the approaches that emphasize the role and responsibility of civil society and/or the media profession – approaches concerned more with quality control – should play a more central function. In this respect, it is worthy to mention the media accountability system (MAS) suggested by Bertrand (1997; 2005). MAS aims at improving the quality of the media primarily by evaluation, monitoring, education, and feedback. The idea of MAS emphasizes the roles of media owners, professionals, and members of the public in defining the media’s responsibilities and in dealing with the transgressions. MASs may take a variety of forms; they can include printed or broadcast documents (opinion boxes, letters-to-the-editor, online message boards, or forums for immediate feedback; codes of ethics; journalism reviews; regular media sections; etc.), involve individuals or groups (in-house critics, media reporters, press ombudsmen, citizens appointed to editorial boards, press councils, other pressure groups, etc.), and consist of various processes (education, journalist training, regular opinion surveys, non-commercial research, etc.). To sum up, media accountability represents an effort to establish the rules by which the media perform socially expected functions in a democracy while preserving freedom and extending it to more people and incorporating more diverse voices.

# Accountability of the News

Young Min

Korea University

The notion of media accountability concerns how to balance *freedom* and *social responsibility* in various aspects such as *media structure*, *performance*, and *products*. Accountability of the news is a notion concerning media products, especially *public affairs reporting* (→ News). News accountability may involve two different sub-dimensions: *liability* and *answerability* (McQuail 2005). The former mainly addresses the issues of how to prevent or reduce potential harm or danger caused by news content and focuses on imposing on the media material penalties based upon private or public laws. The latter notion, on the other hand, concerns how to control and improve the *quality of news* and emphasizes more noncoercive measures such as debate, negotiation, and dialogue between the news media and their claimants (→ Quality of the News). The notion of answerability is most concretely expressed in various *codes of ethics* or professional conduct that journalists or media industries have voluntarily accepted as their own professional or managerial guidelines (→ Ethics in Journalism; Professionalization of Journalism). The answerability approach further underscores the role of news critics and those people affected by the news, beyond that of media owners and practitioners.

In sum, news accountability is a normative notion which explores how to balance freedom and quality content serving → public interests, and it can best be reached by combining external (or imposed) and internal (or voluntary) regulations. The law and codes of ethics deal with essentially the same issues and they mainly include: truthfulness, honesty, and accuracy of information; correction of errors; prohibition of discrimination on the basis of race/ethnicity/religion; respect for privacy; prohibition of accepting bribes or any other benefits; fair means in information collection; prohibition of any outsider influences on the journalistic work; prohibition of discrimination on the bases of sex/social class; freedom of expression of any kind; and professional secrecy (Sonnenberg 1997). And these issues can be condensed into a few more fundamental normative expectations for the news: *freedom* and *independence*, *equality* and *diversity*, and *truthfulness*. These can also be regarded as the most essential qualities required for the news to be socially accountable (→ Standards of News; see Kovach & Rosenstiel 2001; McQuail 2005).

Throughout its history, the pursuit of *freedom* has been the most respected value guiding media practice. Among a wide variety of ways of interpreting press freedom, the concept of accountability is close to a positive notion of liberty which emphasizes “freedom for” rather than “freedom from” (→ Freedom of the Press, Concept of; see McQuail 2003). This perspective does not acknowledge the absolute value of press freedom. Press freedom is rather a form of moral duty and is relative to ends. Press freedom essentially means the state of being independent from external pressures such as governmental, financial, or organizational forces. It can, hence, be a good indicator of press freedom whether the news reports relevant and significant matters even if no immediate profits or political advantages are expected. Such editorial independence can

best be achieved with the support of the public, whose members are the audiences, consumers, and voters. In short, serving more people with quality content can be the best way for the news media to secure their freedom.

*Equality* is another important normative quality expected of the news. The norm of equality is a principle underscoring news service for more voices and opinions based upon the rule of *fair access* in time, space, and priority (→ Fairness Doctrine). Equality, therefore, is closely relevant to such normative criteria as *diversity* and objectivity (McQuail 2005). Diversity in the news primarily refers to the degree to which the content truly and exhaustively reflects a range of perspectives on a given issue or a range of informational and cultural needs in a society. Objectivity, often equated with neutrality, has been a dominant norm of western journalism (→ Objectivity in Reporting). Neutrality assumes no partisan orientation, but news may advocate a particular side if such advocacy is based upon factuality, accuracy, relevance, and completeness. In this regard, the notion of due impartiality – the idea which supports subjective judgment and advocacy for certain values such as freedom, human rights, justice, and democracy – can be deemed a more proper acting guideline to accomplish objective reporting.

Meanwhile, the *disinterested pursuit of truth* has been noted as the first obligation of journalism (Kovach & Rosenstiel 2001). The principle of truthfulness should not be equated with mere → accuracy. Through relevant and complete accounts of the day's intelligence, in addition to accurate and factual reporting, a truthful reflection of reality can be reached. Of course, news is not a mere mirror of reality; it provides a socially constructed version of reality and, in so doing, influences the public's perception of reality. Because of the power of news in defining reality, the truthfulness criterion cannot ever be overlooked. As in social sciences, the pursuit of the truth should be a never-ending “sorting-out process that develops between the initial story and the interaction among the public, newsmakers, and journalists over time” (Kovach & Rosenstiel 2001, 42).

In conclusion, what is of major importance regarding news accountability is to control and improve the quality of news based upon the criteria discussed so far. Such quality news can bring the public various benefits: it can perform a systematic scrutiny of power; it can stimulate a participant democracy; and it can function as a → *public sphere* where different ideas, beliefs, and views are discussed and, as a result, public opinion can be formulated. There might be various forms and means to accomplish news accountability, such as regular ombudsman programs, in-house critics, news watchdog groups, press councils, and journalist education as well as codes of ethics, legal regulations, and fair competition in the market. Among others, the role of the members of the public is most important to hold the news accountable to various expectations in a participant democracy.

## Accounting Research

*Richard Buttny*

*Syracuse University*

Research on verbal accounting examines how language is used to retrospectively explain or make sense of events. Citing one's motive or describing the context may serve to portray events in a different way – as understandable, excusable, or less culpable. An accounting can range from a lengthy discourse (a narrative or courtroom cross-examination) to a single word or nonverbal substitute, e.g., a shoulder shrug. In routine circumstances accounts are not necessary; persons, actions, and events speak for themselves. The need for accounts typically arises when something problematic or out of the ordinary occurs. Another's question, challenge, or blame makes an account relevant from the actor (Goffman 1971).

A distinction may be drawn between “accounts *for* actions” and “accounts *of* actions.” Accounts *for* actions arise in response to some troubles or blame; accounts attempt to remediate (→ Apologies and Remedial Episodes) the incident or one's responsibility for it (Scott & Lyman 1968). *Excuses* are a paradigmatic kind of account. Accounts may serve as a reason for why one did what one did. Accounts *of* action involve a person's sense-making for events such as relationships, personal crises, or life-course changes. A story-like account or narrative would be the paradigmatic form. Narratives can account by conveying a temporal sequence of events, the cast of characters, and the actor's part in portraying events in a particular way (→ Storytelling and Narration). This approach captures our need to interpret our lives, particularly in times of stress or trauma (Orbuch 1997).

Given that an accounting is offered to other(s), the *recipient* may honor the account or not. An account may not be addressed at all by the recipient; it may be considered incontestable. Alternatively the recipient may question the account, thereby prompting further accounts (→ Questions and Questioning). The larger the problematic event, the more likely the actor's accounts will be questioned. Accounts are typically partial and selective, so it is difficult to tell the whole story in the initial accounting. Persons may be probed by recipients so that accounts get incrementally unpacked and expanded. Accountings are collaboratively achieved among interlocutors. Persons may alter their account as it is retold to different recipients (Manusov 1996).

The uses and evaluations of accounts have been studied in everyday communication as well as in a variety of specialized or institutional settings, e.g., in the courtroom, therapy sessions, medical examinations, and business negotiations. Accounts have been studied

from a variety of theoretical and methodological perspectives, most notably from the *language and social psychology approach* (Cody & McLaughlin 1990) and from the *language and social interaction tradition* (Buttny & Morris 2001). The former collection of approaches typically examines the efficacy of different types of accounts in remediating a breach. The latter tradition looks at accounts as texts or as exhibited within a transcript and examines the various interactional moves and collaborations in co-constructing the social reality of events.

# **Acculturation Processes and Communication**

*Young Yun Kim*

*University of Oklahoma*

Millions of people cross cultural boundaries each year (→ Migration and Immigration). Immigrants and refugees seek a new life away from their familiar grounds, along with various groups of temporary sojourners – from employees of multinational corporations, missionaries, diplomats, and military personnel, to professors, researchers, high school and college students, musicians and artists, and doctors and nurses. Although individual circumstances may differ widely, all strangers in a new environment embark on the common project of *acculturation*.

### **APPROACHES AND RELATED CONCEPTS**

Research on acculturation has been extensive across social science disciplines. The term was first adopted in the 1930s by the Social Science Research Council to represent the new

inquiry in cultural anthropology. The Council provided the parameters for this new field of inquiry, which dealt with “those phenomena which result when groups of individuals have different cultures and come into first-hand contact with subsequent changes in the original pattern of either or both groups” (Redfield et al. 1936, 149).

Early anthropologists such as Herskovits (1958) observed the dynamics of change in traditional cultures and the presence of kin, friends, and social organizations within immigrant communities. Sociologists such as Glazer and Moynihan (1963) have addressed issues pertaining to the processes in which minority groups are integrated into the political, economic, and social structures of the society. More recently, researchers in social and cross-cultural psychology and intercultural communication have investigated acculturation at the individual level, dealing primarily with intrapersonal and interpersonal issues. Szalay and Inn (1988), for instance, examined how thought patterns of immigrants changed over time, while Gudykunst (2005) focused on the two ubiquitous psychological experiences of uncertainty and anxiety (→ Anxiety Uncertainty Management Theory). Other individual-level studies have researched acculturation of native-born domestic ethnic minorities, such as Native Americans (Kim et al. 1998), who face acculturative pressures from the mainstream culture.

From the perspective of the individual, *acculturation* refers to the learning, practicing, and internalizing of the symbols and behaviors prevalent in the new cultural environment. Acculturation often accompanies *deculturation*, that is, unlearning or replacement of some of the symbols and habitual practices of the original culture, at least in the sense that new responses are adopted in situations that previously would have evoked old ones. The interplay of acculturation and deculturation experiences facilitates *adaptation*, that is, the process of internal change in the individual so as to achieve a relatively stable, reciprocal, and functional relationship with a given environment. As some of the old cultural habits are replaced by new ones, individuals acquire increasing proficiency in self-expression and the fulfillment of their various social needs.

Changes occur more readily in superficial areas such as overt role behavior than in areas involving deeply held beliefs and values. Given sufficient time, even those who interact with natives with the intention of confining themselves to only superficial relationships are likely to be at least minimally adapted to the host culture “in spite of themselves” (Taft 1977, 150). The theoretical directionality of adaptive change is toward *assimilation*, a state of psychological, social, and cultural convergence to those of the natives. Although full assimilation is a lifetime goal even for long-term immigrants, the long-term trend of cultural convergence has been amply documented in numerous studies of immigrants and subsequent generations.

The cumulative-progressive trajectory, however, has been challenged by some investigators since the 1970s following the movements of civil rights, ethnic power, and ethnic identity. Berry’s (1980) model, for example, reflects such a pluralistic concern. It is built on two basic conscious or unconscious identity choices each individual can make: “Are [ethnic] cultural identity and customs of value to be retained?” and “Are positive relations with the larger society of value and to be sought?” The response types (yes, no) to these two questions are combined to produce four acculturation outcomes: *integration* (yes, yes), *assimilation* (no, yes), *separation* (yes, no), and *marginality* (no, no). Berry’s model emphasizes multiple psychological choices individuals can make and the

corresponding identity outcomes with respect to their original culture and the host society. As such, the model offers an alternative approach to the traditional conception of acculturation as the unitary process of new cultural learning and acquisition.

### THE COMMUNICATION FACTORS

Communication is the carrier of all social processes and the essential means for organizing, stabilizing, and modifying human life. It is through communication that individuals learn to interact easily with others in a given cultural community. Documenting and incorporating an extensive body of research evidence, Kim (2001) offers an interactive model in which the following communication factors link an individual to a new cultural environment.

*Host communication competence* is defined as the totality of an individual's capabilities pertaining to communicative engagement with the host environment in accordance with the verbal and nonverbal codes, norms, and practices of the host culture. This concept includes linguistic and cultural knowledge as well as the affective-motivational aptitude to appreciate and participate in the emotional and aesthetic sensibilities of the natives including the experiences of joy, humor, and beauty, as well as anger and despair. Host communication competence directly influences, and is influenced by, participation in *host social communication* activities. The primary mode of social communication is *host interpersonal communication* in face-to-face encounters with local people. Active participation in such direct contacts facilitates the development of host communication competence and supportive personal relationships. Newcomers also participate in the host social processes via a wide range of public and mediated forms of *host mass communication*, from radio, television, newspaper, magazine, and movie, to art, music, and drama. By engaging in such public communication activities, strangers are able to expand the scope of their acculturation experiences beyond the immediate social context with which they come into daily contact.

Communication activities of newcomers often involve their co-ethnics or co-nationals, as well. Whether we speak of American military posts in the former West Germany, or African immigrants in Spain, ethnic communities provide newcomers with access to *ethnic interpersonal communication* activities. Many immigrant communities have organized some form of mutual-aid or self-help organizations (→ Ethnolinguistic Vitality and Communication). Such organizations render assistance to those who need material, informational, emotional, and other forms of social support. In addition, immigrants in many communities enjoy *ethnic mass communication* activities such as watching satellite television programs or recorded movies and music tapes, and reading ethnic newspapers that are available locally or accessible via the Internet and other technological means (→ Ethnic Media and their Influence). Initially, participation in ethnic social communication may provide important support functions for newcomers. Prolonged and exclusive reliance on *ethnic social communication*, however, tends to discourage and impede acculturation in the host environment at large. Suro (1998) attributed Hispanic immigrants' relatively slower pace of socio-economic advancement in the United States (compared to Asian and European immigrants) to the ease with which they visit and maintain ties with their home countries.

Figure 1 The stress–adaptation–growth dynamic (Kim 2001, 59)

### COMMUNICATION, STRESS, AND TRANSFORMATION

The experiences of host social communication necessarily entail *stress*. In studies of short-term sojourners, terms such as *culture shock* and *transition shock* capture stress reactions including irritability, insomnia, insecurity, and loneliness, as well as defensive reactions such as denial, avoidance, and withdrawal. Relatedly, the process of sojourner adjustment over time has been depicted in the *U-curve hypothesis*. This model explains that people typically begin a cross-cultural sojourn with optimism and elation, followed by the subsequent “trough” depicting a stage of hostility and emotional difficulty, a recovery stage characterized by increased language knowledge and cultural learning, and a final stage in which anxiety is largely gone and new customs are accepted and enjoyed. The U-curve hypothesis has been extended to the *W-curve* by adding the experiences of *re-entry shock* and readjustment upon returning home (Ward et al. 2001).

Stress is also central to Kim’s (2001) theory of cross-cultural adaptation. In this theory, the adaptation process is explained as an unfolding of the *stress–adaptation–growth dynamic*. As shown in Figure 1, the stress–adaptation–growth dynamic plays out not in a smooth, arrow-like linear progression, but in a cyclic and continual “draw-back-to-leap” movement. As a newcomer strives to meet the challenges of the host environment, some aspects of the host culture are incorporated into his or her *host communication competence*. A “crisis,” once managed, presents an opportunity for new learning and self-renewal. To the extent that stress is responsible for frustration and anxiety, it is also credited as a necessary impetus for new learning and growth. Kim further explains that, as the fluctuations of stress and adaptation diminish over time, a calming of the overall life experiences takes hold and a largely monocultural identity begins to shift toward an increasingly “intercultural” identity.

With the advent of electronic communication and globalization, one no longer has to leave home to experience acculturation. Through direct contacts as well as via mass media and other technological means of communication, people around the world are increasingly exposed to the images and sounds of once-distant cultures. In many urban

centers, local people are routinely coming into contacts with foreign-born individuals. This rapidly developing phenomenon of crossing cultures at home promises a new chapter in the continuing evolution of acculturation theory and research.

## **Accuracy**

*Lucig H. Danielian*

*American University of Armenia*

Journalists operate under an ethic that includes a respect for truth as demonstrated by the accuracy of the information delivered to the public (Sartori 1987). On the basis of that accuracy, it is assumed, public opinion is formed in a democracy. Accuracy is closely related to the journalistic norms of fairness and objectivity and to the credibility of producers of news (→ Fairness Doctrine; Objectivity in Reporting; Journalists, Credibility of). The “mirror” metaphor for the journalistic norm of the accurate reflection of facts may be popular among journalists, but every mirror reflects some distortion (Romano 1986; Ettema and Glasser 1998). In news production, deadlines and time constraints can distort accuracy (→ Reality and Media Reality).

Schudson (1978) provides a history of how American journalism came to rely on news based on facts and accurate information in the era of the → penny press. Competition among rival newspapers allowed the public to compare news accounts for accuracy in reporting. The competition for a broad audience through advertisers moved American newspapers away from a party press format, in which opinion is supreme, with the dependence of multiple newspapers on wire services also promoting news based on facts and not opinion (→ Partisan Press; News Agencies). By the end of the nineteenth century, editors were very much focused on the who, what, where, when, and how and were concerned with avoiding libel (→ Libel and Slander) and criticism from rival newspapers. Bennett (1988) explains that the emphasis on commodified news provided a better mass market product. Schudson quotes Theodore Dreiser from the 1890s when he walked in to the city room of the *New York World* and saw cards on the walls declaring “Accuracy! Accuracy! Accuracy! Who? What? Where? When? How? Facts?”

Accuracy is achieved through professional newsmaking processes such as fact-checking and the use of multiple sources, and basing news stories on what journalists observe or can document through credible sources, without embellishing or misleading. It is closely related to fairness, and to → balance. The omission of pertinent facts, or the misrepresentation of facts, is an unforgivable violation of the journalistic ethic, and journalists can lose their jobs over such transgressions.

In Leo Bogart’s (1979) survey, more than 700 editors of US newspapers, when asked to define the attributes of quality journalism, placed accuracy at the top of their list. Leading publications have taken steps to preserve that value. The *New York Times* created two new positions in 2003, a public editor to maintain high standards of accuracy and fairness and a standards editor to oversee training programs in accuracy and to develop programs to effectively track accuracy. The current Code of Ethics and Professional Conduct of the Radio-Television News Directors Association states that journalists should present the news accurately, and the American Society of Newspaper Editors Statement of Principles includes an article on truth and accuracy (→ Journalists: Professional Associations).

Fact-checking is a tool used in newsrooms to catch inaccuracies before they make it into news reports. Students at the Medill School of Journalism at Northwestern University learn the lesson of no tolerance for errors when they receive a grade *F* for any news assignment with even a single inaccuracy. Journalists must check concrete facts such as distance, addresses, phone numbers, people’s titles. Organizations such as Fairness and Accuracy in Reporting, Accuracy in Media, and USC’s Factcheck.org are public watchdogs that focus on the accuracy and objectivity of news reports.

Online news media give rise to greater concern about accuracy in news reports because information can be disseminated before it is checked (Anderson and Arant 2001; Puttnam 2003). There is also a whole set of new problems surrounding corrections to online errors because so much is archived without being updated. The question for online news and the 24-hour news channels is which new value should take precedence, being first or being accurate.

## **Action Assembly Theory**

*John O. Greene*

*Purdue University*

Action assembly theory (AAT) seeks to explain message behavior (both verbal and nonverbal) by describing the system of mental structures and processes that give rise to those behaviors (→ Message Production). As such, AAT is a member of the broader class of cognitive theories of message production. AAT, in turn, is itself an umbrella category for any of a variety of actual and potential specific theories that share certain central features, most prominently the notion that actions are created by integrating (or assembling) elemental features represented in → memory in code systems reflecting multiple levels of abstraction. Two distinct exemplars of this class are found in Greene (1984, 1997).

The initial impetus for the development of AAT was a set of fundamental observations concerning the nature of behavior and behavioral production – among them the observation that behavior is simultaneously patterned and creative. The approach of AAT is to ascribe the patterned character of verbal and nonverbal messages to action features represented in long-term memory. The creative character of behavior, then, comes from the integration of such features to form *unique collocations* – thoughts and actions that the individual may never have thought, heard, seen, or said before.

In the language of AAT, “action features,” the fundamental building blocks of thought and overt action, are stored in memory in units called “procedural records.” The theory

then specifies two processes involved in making use of action features to produce messages: “activation” (the process by which features relevant to one’s goals and ongoing activities are selected), and “assembly” (the process of integrating activated features). The result of assembly is the “output representation” – a constantly evolving representation of one’s thoughts and overt verbal and nonverbal behaviors.

“Second generation AAT” (Greene 1997) extends this framework and incorporates some additional constructs. In this theory, the nature of the assembly process is depicted as one of *coalition formation*. Consciousness, or the phenomenal awareness of thoughts and action specifications, is held to be a function of the level and duration of activation of a coalition of action features. Consciousness is ascribed a functional role in bringing executive processes such as planning, editing, and rehearsal into play.

AAT, then, views behavior as a constellation of coalitions of action features, in which those coalitions are only loosely related (if at all), and only some coalitions come to be manifested as overt action. The time scale on which these coalitions emerge and decay is quite brief (i.e., typically less than a second). As a consequence of the nature of the activation and assembly processes, behavior is less cohesive than we might typically assume. Thoughts may not “come out” as we intend; behaviors may reveal more than social actors themselves apprehend; inconsistencies may emerge between behavioral “channels” (Greene 2000, 2006).

Other features of the theory also merit mention. Among these, in contrast to common-sense notions that message production reflects a top-down, ideation-to-behavior ordering, AAT posits that lower-level action specifications can drive higher-order mentation. As a further example, second-generation AAT invokes no conception of a limited pool of processing resources to account for familiar multiple-task limitations on performance.

Because difficulties in assembly are held to be reflected in the time required to formulate and execute messages, a number of studies conducted within the AAT framework have examined speech fluency and various temporal characteristics of speech (see Greene 1995). These studies have included investigations into the impact of attempting to design messages that address multiple goals, and the effects of advance message planning on speech fluency. Another program of research has examined the impact of practice, or skill acquisition, on the speed of message production (see Greene 2003). AAT has also been applied in studies of the nature of the self, → communication apprehension, and the behavioral correlates of deception (→ Deceptive Message Production). Ongoing work is devoted to exploring “creative facility” – individual differences in the ability to formulate novel, socially appropriate messages.

## Action-Implicative Discourse Analysis

Robert R. Agne

Auburn University

Action-implicative discourse analysis (AIDA) is an approach to analyzing talk or text in a social context. It is a relatively new method of → discourse analysis, developed by Karen Tracy in 1995. AIDA views communication as composed of different practices in which communicators are problem-solvers. People reflect on what they did do (or would do) in interaction and respond to interactional problems and challenges they experience (or anticipate experiencing) with the aim of working toward what they think would create the best situation. AIDA is conducted in close relationship to grounded practical theory (Craig & Tracy 1995), a view of inquiry that contrasts with scientific perspectives that seek to describe, predict, and control “what is” in the world. AIDA, as well as practical theory more generally, is concerned with providing opportunities to discuss what “ought to be.”

AIDA's primary focus has been on analyzing communication practices in institutional settings. AIDA works by reconstructing the complex of participants' problems and their situated ideals regarding the practice in question through close examination of conversational moves and strategies. Practice can refer to specific communication actions that are cut across situations, such as “intellectual discussion” (Tracy 1997a) or “negotiation” (Agne & Tracy 2001). It can also refer to activities identified by specific participants in specific situations, such as school board meetings (Tracy & Muller 2001), or citizens' telephone calls to the police (Tracy 1997b).

Reconstruction involves three related *analytic tasks*. A first is to describe the problem communicators face within a particular practice. A second is to describe conversational practices that reveal both problems and techniques that participants use to manage them. Finally, reconstruction is about what participants see as the ideal way of responding when confronted with problems. AIDA is a normative approach. Drawing on Aristotle's idea

of phronesis – good judgment, wisdom, thoughtful deliberation, and reasonableness – AIDA seeks to cultivate normative practices by developing new ideas and raising thought-provoking questions. As its name indicates, AIDA is a method in which analysis is intimately connected to the actions that pertain to the practice in question; analysis should have implications for good, moral, or reasonable action. AIDA does not just describe the communicative world. It has implications for what people should be doing to create a more civil society.

*Analysis using AIDA* is an inductive process, focusing on recorded interaction, usually from an institutional setting. An argument is arrived at by transcribing the interaction in detail, attending to conversational particulars such as pauses, intonation, stress, volume, overlap, and, as some research has included, visual behaviors (e.g., Mirivel in press). Analytical points about participants' implicit interactional achievements emerge from an iterative process of forming hunches about what is going on in the interaction, referencing relevant scholarly literature, and finding specific evidence in the transcript. Analytical points are refined as they become more specific claims. Claims are then organized to form a central claim in the report with sub-claims that are supported with evidence in the transcript.

Given AIDA's focus on problematic communication, episodes amenable for analysis are those in which communicators are seen to be pursuing multiple goals or when those goals are in competition. AIDA is rhetorically influenced in that communicators are seen as purposefully and strategically managing those goals, making arguments for desired identities, relationships, and situated ideals. Doing analysis also requires learning about the social context and/or culture in which the transcribed episodes take place. For analysts to make proposals about problems and ideal situations, they must understand the social environment.

An *example* of a study using AIDA is Agne and Tracy's (2001) analysis of the Waco standoff negotiations between the Federal Bureau of Investigation (FBI) in the US and a religious group, the Branch Davidians, in 1993. FBI reports frequently referred to Branch Davidian leader David Koresh's talk as "bible babble." Agne and Tracy argue that using this dismissive label to describe the difficulty the FBI had in dealing with Koresh contributed to the FBI's failure in convincing him and the Davidians to surrender. One strategy demonstrating the problem with this label was that Koresh effectively positioned himself as an expert on the Bible and religious matters and the FBI negotiator as a novice. This and the FBI's lack of challenging the reasonableness of Koresh's religious claims helped legitimate God as a key player in the standoff and Koresh as God's rightful spokesperson.

## Activist Media

Robert Huesca

Trinity University

Activist media are radio, television, and other media practices that aim to effect social change and that generally engage in some sort of structural analysis concerned with power and the reconstitution of society into more egalitarian arrangements. Many activist media practices are also committed to principles of communication democracy, which place at their core notions of popular access, participation, and self-management in the communication process. These dual characteristics – structural analysis and democratic communication practice – often create a tension that some activist media projects are unable to negotiate successfully (→ Development Communication; Media Democracy Movement).

The topic of activist media is closely related to development communication inasmuch as they both focus on the uses of communication for *social change* (→ Social Movements and Communication). But the traditional twin concerns of structural analysis and communication democracy distinguish these two fields of study. Studies of activist media emerged in response to transnational, capitalist communication with the goal of countering class, gender, ethnic, and other forms of domination, placing it within the tradition of critical scholarship (→ Critical Theory). At the same time, activist media have established a commitment to democratic communication principles, forging relationships with underrepresented groups and social movements (→ Participatory Communication).

Perhaps the earliest example of activist media practice can be traced to the *Bolivian tin miners' unions* and their establishment of radio stations beginning in 1947 (→ Bolivia:

Media System). This practice reached its peak in the late 1960s with about 30 stations that augmented the union struggle against a private oligarchy, then later a state monopoly, and finally brutal military dictatorships. Dozens if not hundreds of activist media exemplars have followed the path blazed by the tin miners' radio stations, including two well-documented cases: the people's reporters of Nicaragua and Video SEWA (Self-Employed Women's Association) of India (→ Community Media; Community Video). Following the 1980 revolution, the ruling Sandinista party gave journalistic training to workers and *campesinos* (peasant farmers) and provided preferential access to a network of radio stations to discuss issues, problems, and solutions to problems facing poor people. Likewise, Video SEWA directly involved poor women – mostly vendors – in the production of videos that not only focused on their everyday struggles, but also shared information with the association's 30,000 members.

Scholarship of these sorts of media practices received a great deal of theoretical attention, starting in the 1970s, especially in Latin America. The rise of authoritarian regimes in the 1970s and 1980s in Latin America resulted in the exile of numerous intellectuals, who began forming important research centers such as the Latin American Institute for Transnational Studies (ILET) and the Center for the Study of the National Environment (CEREN). These attracted the attention of notable scholars including Armand and Michele Mattelart, Fernando Reyes Matta, and Herbert Schiller, among others. Bolstered by → UNESCO's calls for a New World Information and Communication Order (→ New World Information and Communication Order [NWICO]), these scholars argued that communication democracy was the key to achieving wider reforms in politics, economics, culture, and society. The central task that animated this research was how to create a communication *praxis* (a neo-Marxist term meaning theoretically informed practices) that was simultaneously democratic and participatory in structure, while oriented toward radical social change in outcome.

In accounting for the wide variety of specific, activist media practices that emerged around the world, scholars began to use the dichotomy of process versus product to make sense of apparent contradictions in different projects. Media projects with a process focus tended to emphasize grassroots participation, access to technology, and personal empowerment (→ Communication Strategies for Empowerment). Activists taking this approach paid scant attention to the quality of the audiovisual products, size of audience, or impact on external readers, listeners, or viewers. In contrast, activist media producers with a product orientation were willing to sacrifice significant grass-roots participation in order to achieve objectives of producing high-quality and persuasive audiovisual programs capable of attracting a mass audience. Observers of this process/product dichotomy have called for research and practices that can reconcile the difference by consolidating isolated micro-projects and linking them with broader social movements (→ Development Communication: Latin America).

Despite a return to democracy in Latin America and an apparent rise in civic movements around the world, interest in activist media has not declined in recent years. Indeed, the early stimulus to resist transnational, capitalist communication domination is more relevant than ever with increased media conglomeration occurring worldwide. A robust, recent example of the activist media movement is the establishment of *Indymedia* centers: highly democratic, digital news operations that emerged in opposition to the

1999 meeting of the World Trade Organization in Seattle. The centers practice → “open source publishing” wherein the members of the Indymedia movement act as journalists using print, video, audio, and photography to document events from the perspective of activists in a wide array of social justice movements. Since its emergence, Indymedia has mushroomed to include over 110 centers in 35 countries around the world. Studies of these centers demonstrate that they often emerge out of specific social movements (e.g., feminist, environmental, gay rights), but tend to continue as protests against the tendency toward neo-liberal globalization policies imposed by transnational regulatory bodies.

A persistent challenge for activist media regards the assessment of their *outcomes*. Many of the objectives of both process- and product-oriented projects, such as empowerment and social transformation, are difficult to measure and evaluate. Furthermore, activist media projects are typically low-budget operations of limited reach or short duration. Nevertheless, scholars have documented numerous instances of such projects with seemingly profound impacts on participants and have argued that in the long term, activist media do play a role in significant social changes.

# Addiction and Exposure

Mark Griffiths

Nottingham Trent University

For many people the concept of addiction involves the ingestion of a drug. However, there is now a growing movement that views a number of behaviors as potentially addictive, including some that do not involve the ingestion of a drug, such as gambling, sex, and exercise (Orford 2001; Griffiths 2005). Increasing research into behavioral addictions has also concentrated on a particular sub-group that has been termed “technological addictions.” Technological addictions are nonchemical (behavioral) addictions that involve excessive human–machine interaction. They can either be passive (e.g., watching television) or active (e.g., playing video games), and usually contain inducing and reinforcing features, which may contribute to the promotion of addictive tendencies. Possible activities that could be included under this category are such activities as television addiction, computer addiction (e.g., hacking, programming), video game addiction, mobile phone addiction, and Internet addiction (→ Exposure to Communication Content).

Addiction is a complex *biopsychosocial process* and always results from an interaction and interplay between many factors, including the person’s biological and/or genetic predisposition, their psychological constitution (e.g., personality factors, unconscious motivations, attitudes, expectations and beliefs, etc.), their social environment and exposure (i.e., situational characteristics), and the nature of the activity itself (i.e., structural characteristics; Shaffer et al. 2004; Griffiths 2005). These many factors highlight the interconnected processes and integration between individual differences (i.e., personal vulnerability factors), situational characteristics, structural characteristics, and the resulting addictive behavior. However, there is little evidence that increased exposure alone to potentially addictive activities necessarily leads to higher rates of addiction, although increased access and opportunity to engage in the behaviors does usually lead to more people participating in that behavior. This is commonly referred to as the availability hypothesis (Griffiths 2003).

At a very simplistic level, addictions boil down to constant reinforcement (i.e., rewards). A person cannot become addicted to something unless they are constantly rewarded for the behavior they are engaged in. Many activities involving technological interaction are potentially addictive although the number of people who are truly addicted is small in number (Griffiths & Davies 2005; Widyanto & Griffiths 2006). Many addictions come about by the *partial reinforcement effect* (PRE). This is a critical psychological ingredient of addiction, whereby the reinforcement is intermittent, i.e., people keep responding in the absence of reinforcement, hoping that another reward is just around the corner. For instance, knowledge about the PRE gives a → video game designer an edge in designing appealing games. Magnitude of reinforcement is also important. Large rewards lead to fast responding and greater resistance to extinction – in short, to more addiction. Instant reinforcement is also satisfying. Online gaming involves multiple reinforcements in that different features might be differently rewarding to different people. In video games more generally, the rewards might be intrinsic (e.g., improving your highest score, beating your friend’s high score, getting your name on the “hall of fame,” mastering the machine) or extrinsic (e.g., peer admiration).

In these cases, the interactive technologies may provide an alternative reality to the user and allow them feelings of immersion and anonymity that may lead to an altered state of consciousness (→ Computer Games and Reality Perception; Interactivity, Concept of). This in itself may be highly psychologically and/or physiologically rewarding. For a small minority of people this will lead to addiction, where the preferred activity is the single most important thing in that person's life and for which they compromise and neglect everything else in their life.

It has been argued that the only way of determining whether behavioral addictions (such as video game, mobile phone, and Internet addictions) are addictive in a non-metaphorical sense is to compare them against clinical criteria for other established drug-ingested addictions (Griffiths 2005). However, most people researching in the field of technological addiction have failed to do this, which has perpetuated the skepticism shown in many quarters of the addiction research community. The main problems with the *addiction criteria* suggested by most researchers in the field is that the measures used (1) have no measure of severity, (2) have no temporal dimension, (3) have a tendency to overestimate the prevalence of problems, and (4) take no account of the context of how the technology is used. There are also concerns about the sampling methods used. As a consequence, none of the surveys to date conclusively shows that technological addictions exist or are problematic to anyone but a small minority.

At best, they indicate that technological addictions may be prevalent in a significant minority of individuals but that more research using validated → survey instruments and other techniques (e.g., in-depth → qualitative interviews) are required. Case studies of excessive players and users may provide better evidence of whether technological addictions exist by the fact that the data collected are much more detailed. There are → case study accounts in the literature that appear to show that excessive video game players and Internet users display many signs of addiction (e.g., Young 1996). These case studies tend to show that the activity is used to counteract other deficiencies and underlying problems in the person's life (e.g., relationships, lack of friends, physical appearance, disability, coping, etc.).

As with all addictions, there is a potential for long-term damage but the good news is that very few people appear to have developed such problems in relation to increased access to technology. Healthy enthusiasms add to life; addictions take away from them. The vast majority of excessive users of interactive technologies claim their activity has positive effects for them. Many people use interactive technologies excessively without their having any negative impact on their lives at all.

## Advertisement Campaign Management

*Ali M. Kanso*

*University of Texas at San Antonio*

The key to unified and successful advertising campaigns is solid management. Each advertising campaign contains visible as well as unseen aspects. To the average consumer, a campaign is a series of advertising messages that look or sound alike. To the practitioner, a campaign embodies a wide range of activities that may include brainstorming, consumer → surveys, or media analysis. What distinguishes one campaign from another is the degree to which each aspect is connected and whether or not the effort achieves measurable objectives. A campaign may start out as cohesive but at the end the messages may lose focus due to lack of careful planning and strategic execution (→ Advertising Strategies).

In many situations the advertiser relies heavily on advertising to promote her product (→ Advertising as Persuasion). However, in some cases, she will broaden her campaign to include other types of marketing communication such as direct marketing, publicity, and sales promotion (→ Marketing: Communication Tools). This entry focuses exclusively on advertising.

As a communication tool, → advertising must consider the type of product and internal as well as external factors affecting the sponsor's relationships with its publics. Managing the advertising campaign involves *several processes*, although various firms and agencies may call them by different names. These processes are: (1) conducting a situation analysis, (2) identifying problems and opportunities, (3) establishing short-term and long term-objectives, (4) determining the advertising appropriation and budgeting, (5) developing a creative strategy, (6) selecting appropriate media to convey messages to the intended audience(s), and (7) outlining a plan to measure the campaign outcome.

### CONDUCTING A SITUATION ANALYSIS

The first step in managing an advertising campaign is gathering data about the company, consumer, market, product, and competition. This background information is usually

referred to as “situation analysis.” The main purpose of the analysis is to provide a research foundation that can be used to establish objectives and specify strategies and tactics (→ Strategic Communication). The analysis should be organized, structured, and detailed. Information on the company’s mission, finances, resources, products/services, sales trends, market share, etc. usually comes from primary sources such as company staff and secondary sources such as trade journals and syndicated data.

The *consumer analysis* involves five major areas: (1) consumers’ demographics and psychographics, (2) their wants and needs, (3) their use of the product/service, (4) their attitudes toward the product/service, and (5) their motivations to buy the product/service. Various techniques can be used to collect data on the consumer. Among these techniques are focus groups, depth interviews, projective tests, surveys, and the VALS system (→ Research Methods).

The McCann-Erickson agency calls the consumer analysis “pulse” – a deep immersion in the consumers’ lifestyle to gain insight into and understand how a → brand or new product can operate within their lives and to meticulously analyze issues that affect how brands are interpreted and categorized (→ Branding; Media and Perceptions of Reality).

The *market analysis* is an extension of the consumer analysis. However, many advertisers treat this section separately to organize additional sources of information that focus mainly on geographic data, and help media planners identify areas to allocate their media investment. Various resources can be used to analyze the market, for example, in the US the widely used resources are: Simmons Market Research Bureau, for information on product usage; Buying-Power Index, for predictions of sales potential; and Standard Rate and Data Service, for information about spot radio, spot television, and newspapers.

*Product analysis* assesses how the physical and psychological attributes of the product match up with consumers’ needs and wants. Since a major purpose in managing the campaign is to build or protect a brand’s personality, some advertisers focus their analysis more on the brand than on the product, especially when they look for new growth. They attempt to explore the existing associations of the brand, identify competitive perceptual territory, define the brand meanings that best capture what the brand gets credit for, articulate the corresponding personality traits, and reshape and reorder the work to come up with an integrated and coherent vision for the brand (→ Integrated Marketing Communication).

*Competitive analysis* identifies options that consumers consider in their purchasing decisions. The competition is both direct and indirect. One of the most important techniques used here is perceptual mapping. It examines where a company or brand fits into the consumer’s perception of the product category or brand (positioning). The map also helps define the brand’s image, which is influenced by functional aspects of the brand and psychological attributes associated with the brand’s heritage.

## **IDENTIFYING PROBLEMS AND OPPORTUNITIES AND ESTABLISHING ADVERTISING OBJECTIVES**

Getting useful baseline information is only half the task. Therefore, in step two, advertisers must also process the findings to offer direction to the people working on the campaign. One of the most common ways to process the information is through SWOT

*analysis* (an acronym derived from strengths, weaknesses, opportunities, and threats). The procedure involves a close look at: (1) the firm's prior and current marketing, (2) financial and organizational competencies, (3) actual or potential areas of profitability, and (4) forces that threaten the firm's growth.

After identifying opportunities, the next step is to establish clear, specific, singular, realistic, measurable and time-bound *advertising objectives*. These objectives can either capitalize on opportunities or overcome problems facing the business firm. In specifying the campaign outcome, the manager confronts perhaps the most intriguing characteristic of advertising: its link to sales. In general, business firms invest money in advertising on the assumption that stimulating demand for their brand will increase sales. However, consumers do not automatically purchase a product or service as a result of their exposure to advertising messages.

In fact, advertising is only one of many factors that contribute to sales. A sale objective may be appropriately assigned to advertising in direct-response situations. Consumers develop thoughts or attitudes about a product or service before they decide whether or not to purchase it. If advertising can establish awareness or create a favorable attitude in target audiences, then these effects may trigger a purchase response. There is a lack of agreement on the intent of advertising objectives. Some practitioners claim that objectives should be stated in terms of sales while others want objectives set in terms of communication effects. Until measurement problems connected to sales are overcome, campaigners should consider establishing advertising objectives in terms of communication criteria.

Regardless of the nature of advertising objectives, four components should be clearly covered in a statement of objective: the target audience(s), the message to be delivered, the desired effects, and the outcome measurement. The definition of a *target audience* begins with a concise statement of demographics and psychographics. For example, female household heads living in the northeastern region of the US, aged 35–44, employed outside the home, with two or more children, who enjoy outdoor activities, and read business and self-help publications. The *message content* is a clear description of the competitive benefits of the product or service. The *desired effects* specifies what advertising intends to accomplish: establish awareness, develop interest, build a positive attitude toward the product, etc. The intended effect must be clearly measured (*outcome measurement*), for example, to increase the percentage of the target audience who believe that the new car is environmentally safe from 10 to 25 percent in six months.

## **DETERMINING THE ADVERTISING APPROPRIATION AND BUDGETING**

Advertising budgeting is an essential management function. Advertisers should weigh the relative importance of price, product, or brand before deciding how and where to allocate advertising expenditures. Several methods are available to business firms. One is *all you can afford*. The main advantage of this method is its simplicity. It is also a good option for companies of limited resources.

Another method is *competitive parity*. Here the competition's expenditures serve as a benchmark against which the firm determines its strategy. A third method is *percentage of sales*. This approach involves multiplying past or anticipated sales by a certain percentage to determine the amount of money to be appropriated for the advertising budget. Still

another method is called *objective and task*. Here the planner defines specific objectives and then determines the various tasks to achieve these objectives.

## DEVELOPING A CREATIVE STRATEGY

The creative strategy is not just a lofty term. Its main purpose is to give copywriters and art directors a concise and clear document outlining exactly what these creative people need to know to turn out great advertising. Some advertisers label it their work plan. Advertising agencies and departments do not use a standard format for the creative strategy. However, major components of the strategy should include: definition of the key problem that the creative person attempts to solve; description of the product or service in reality and perceptually; identification of the persons who are most likely to purchase the product/service; clarification of the direct and indirect competition; specification of the competitive consumer benefits; articulation of the reasons that support the benefit claim; determination of the tone or personality that advertising will give the product or service; formulation of a call for action.

Along with the above components, there should be a big idea that offers a common bond to unify the campaign messages. Some of the famous big unifying ideas have been:

<i>Big Red Gum</i>	Makes your breath so fresh you'll want to kiss a little longer
<i>Energizer</i>	Toy bunny keeps going and going because Energizer batteries last long
<i>Serta</i>	The counting sheep are out of work because Serta mattresses make you sleepy
<i>Toasted Mini-Wheats</i>	Has good taste and nutrition for the adult and the kid in you

In a very competitive information marketplace, the big idea helps the advertiser's message break through the *clutter*. The strategy should also specify the creative approach that best meets the advertising objectives. Advertisers have at least seven alternatives: affective, brand image, generic, positioning, pre-emptive, resonance, and unique selling proposition.

## SELECTING APPROPRIATE MEDIA

The main purpose of media is to deliver messages effectively and efficiently. In general, media decisions evolve out of the creative strategy. The media plan starts with the development of media objectives (→ Media Planning). However, sometimes these objectives are stated in terms of reach and frequency (e.g., the percentage of the potential audience to be reached and the frequency with which that audience should be exposed to the advertiser's message).

Several decisions have to be made before setting media objectives. Among these decisions are: (1) identifying the target audience(s) to be reached, (2) selecting the geographic market to strengthen exposure to advertising, (3) determining the desirable level of reach within a time period, (4) specifying the frequency (repetition) of an advertising message, (5) deciding the timing and continuity of the campaign to reach potential consumers, and (6) selecting the media tools that offer the best match with the intended market (→ Advertising Frequency and Timing).

Some media planners call the first four decisions "strategies" because they constitute rules to deliver advertising messages and attempt to give the advertiser a competitive edge. They also label the last two decisions "tactics" because they help implement strategies.

## OUTLINING A PLAN TO MEASURE THE CAMPAIGN OUTCOME

Insightful evaluation is vital to all aspects of the campaign. In a fiercely competitive market, metrics can offer the business firm an edge over its rivals. Most importantly, evaluation helps the company avoid costly blunders and increase the effectiveness of advertising (→ Advertising Effectiveness). The question for the management is not whether or not to measure but *what to measure* (→ Advertising Effectiveness, Measurement of).

Measuring the campaign effectiveness is a dynamic process that should involve four stages of the campaign: at the beginning of the creative process, at the end of the creative process, during the campaign when advertising appears in the media, and after the campaign. Each stage may require different techniques. For instance, in the first stage (concept testing), one may conduct focus group sessions or experiments to test creative concepts, themes, or claims. In the second stage (copy testing), consumer feedback to rough advertising messages may be obtained through informal interviews to either better develop the message or predict its effectiveness. In the third stage (concurrent testing), tracking studies can be conducted to monitor the campaign pulse and keep in close contact with consumers' thinking and feelings. Thus, personal or telephone interviews, or mall intercepts, can be used to determine consumers' awareness and attitudes toward the product/service. In the last stage (post-testing), various kinds of survey can be used to measure the communication and behavioral effects. Among the most commonly used are recognition, recall, awareness, attitudes, sales, and inquiries.

## CONCLUSION

Managing the advertising campaign is a challenge that involves many interrelated decisions and requires strategic thinking. A manager who wishes to produce and implement an effective campaign must have a radar system that continuously monitors forces affecting the market and carefully forecasts the consumers' wants and needs. He or she must also have vision that sees beyond the ordinary. Some advertisers call it a communication campaign instead of an advertising campaign because their efforts may include new technology, public relations, sales promotion, etc.

Major agencies, such as McCann-Erickson, prefer to label the campaign a "road map" to get great communication. They emphasize the significance of connecting with consumers and developing insights into their minds. Regardless of the campaign label, the advertising discipline faces a great challenge – an unpredictable consumer in an increasingly changing world. Solid management is always needed to proactively consider the consumer and environment.

## **Advertisement, Visual Characteristics of**

*Robert L. Craig*

*University of St. Thomas*

Advertisements organize typography and art (photographs, illustrations, and graphics) into designed layouts. Advertising's visual characteristics can be described historically by analyzing their style, or functionally by analyzing their role in advertising rhetoric (→ Advertising).

Modern advertising appeared during the Industrial Revolution. In the early nineteenth century, most ads, like the goods they promoted, were locally produced. Written in a news style and set in type like today's want ads, they verbally described the attributes, availability, and price of a product or service. They were seldom illustrated. Occasionally small, crude linecuts that showed the product and complemented the copy were employed (→ Advertising, History of).

As the Industrial Revolution progressed and markets expanded, businesses began to compete visually to distinguish their products. Some tried typographic strategies such as bigger, decorative type, printing ads larger, and reiterating the product's name in text type (→ Typography). Others employed multiple type styles, ornaments, rules, and illustrations in a single ad, creating the cluttered, eclectic look called Victorianism. Textual hyperbole exaggerated brand claims to be the "best," "first," "most perfect," etc. *Sophisticated illustration* first came into advertising in full-color lithographic → posters and advertising trade cards featuring romanticized country scenes, mythology, fairy tales, foreign exoticism, and dramatic literary scenes. The sentimental pictures were enjoyable to look at but often communicated little about the product. William Morris initiated the English Arts and Crafts movement (1860–1890), which criticized Victorian excesses and revived a simpler, more harmonious aesthetic. Late in the century, Morris's Kelmscott Press set professional standards for the allied arts of typography, illustration, printing, and design (→ Printing, History of).

*Fine artists* improved advertising imagery. In 1891, French artist Henri de Toulouse-Lautrec designed a lithographic poster, *Moulin Rouge, La Goulue*, whose bold, simple lines and colors anticipated modernism and launched Art Nouveau design style. It featured minimalist, naturalistic illustrations with soft, sensuously curved, vertically flowing lines, eschewing large amounts of text for small amounts of hand lettering (→ Art as Communication; Graphic Design). Imagery began dominating advertising design.

In the twentieth century, businesses recognized that advertising was no longer news about products but → persuasion. Advertising agencies and researchers began testing persuasive strategies. Psychologists argued that suggestive appeals made through imagery worked better than written hyperbole exaggerating products' benefits (Craig 1992). Research showed that simple, artistic, large-space, illustrated advertising helped people notice and remember products (Craig 1992). Images depicting the product in idealized settings are highly effective (→ Advertising Effectiveness). Psychologists argued that the key to stimulating consumers was to show products fulfilling human needs and desires through suggestive illustration (Craig 1992; → Advertising, Emotions in).

This fundamental *shift toward visual rhetoric* was accompanied by technical advances in photoengraving that allowed artists to completely retouch photographs, idealizing them as artists had previously done with illustrations. In image advertising, the product, candidate, or political policy is visually associated with positive cultural symbols (→ Symbolism). Because the images do not verbalize claims, their meaning must be inferred by the reader, leaving the process open to manipulation and disinformation (→ Advertising as Persuasion). For example, in an automobile advertisement when a handsome, well-dressed man is pictured addressing the doorman as he enters a smart mansion, the reader is meant to infer that his character, taste, and social class are an index of the car's qualities (→ Sign; Code). Likewise, today's conservative lobby groups adopt fake, democratic-sounding pseudonyms, and use common looking models to disguise their corporate interests.

Twentieth-century art movements like Futurism, Dadaism, and Constructivism revolutionized advertising design by combining dynamic photography, photomontage, and sans serif types in explosive, asymmetrical designs. A visually shocking break with the past, they were often difficult to read. But German Bauhaus School designers László Moholy-Nagy and Herbert Bayer and German typographer-designer Jan Tschichold countered with a cleaner, functional style that aimed to communicate rather than shock. *Art Deco artists* created an elegant, streamlined style that also communicated quickly. After World War II, the movement to simplicity was completed with International Style design, which stripped away everything inessential and arranged image and type in austere, asymmetrical, grid layouts with lots of white space. This widely adopted style helped advertising messages cut through the clutter and fast pace of modern life.

Today's advertisers combine strong imagery and typography with clever copy to create a *synergistic whole* in standard layout patterns: image ads, copy-heavy ads, grid ads, fine art ads, or postmodern ads. Image ads rely on photos, photomontages, illustrations, or graphics to carry the message through a number of approaches: direct representation of the product, visual narrative, visual analogy or metaphor, visual humor, exaggeration, understatement, or irony. Copy-heavy ads rely on copy to describe a product in detail and to tell consumers why they should buy technical products like automobiles, electronics,

and medicines. A variation is the circus ad, which borrows the busy format of old circus posters. It connotes bargain pricing, and is often employed by grocery and book stores. Grid ads may be symmetrical or asymmetrical. The former are called “panel ads.” They divide space equally, filling the panels with pictures. Copy appears at the top or bottom of the page or in one of the panels. Asymmetrical grids are called “Mondrian ads” after De Stijl artist Piet Mondrian’s practice of breaking space into unequal rectangles. Fine art ad styles rely on artistic media such as sketches, watercolors, oil paintings, abstract formalism, or art photography to carry connotations of creativity. Fine art ads may also visually “quote” the masterworks of art, sculpture, and architecture to contextualize the product. For example, one firm created authenticity by placing its olive oil in front of a da Vinci painting.

Postmodern ads derive from art and design based in electronic, digital communication. Photoshop and Illustrator created unprecedented ease of type and art manipulation, skills, which were once highly technical and expensive, and thus limited to professionals (→ Digital Imagery; Postmodernism and Communication). Designers combined hand-drawn, graffiti-like letterforms, conflicting period art and ornament, distorted photographs, surrealist-like photomontages, and functionless lines and shapes running in all directions. Early adopters, like Nike, employed postmodern style to attract hip, young audiences. But more recently, businesses have simplified, tamed, or discarded its most radical forms to ensure that the ads can be read quickly.

# **Advertising**

*Tim Ambler*

*London Business School*

Advertising has been defined as “Any paid form of non personal communication about an organization, product, service, or idea by an identified sponsor” (Alexander 1965, 9).

Advertising intrudes into our lives and is not always welcome. Some scholars suspect that we are being manipulated by dark arts (e.g., Packard 1957). This entry examines current practice from three perspectives: the advertiser, the consumer, and society at large.

*Advertisers* know, roughly, what they want to achieve and seek to do so efficiently. A situation vacant ad may be read by 1,000 people but if the firm finds one successful candidate and that was the cheapest solution, then the “waste” of the other 999 is immaterial. That is why the most often quoted adage about advertising, “Half the money I spend on advertising is wasted; the trouble is, I don’t know which half” (attributed to John Wanamaker and Lord Leverhulme), is so unhelpful. To understand what the advertiser can expect for the money leads to the exploration of how advertising works, how ad performance can and should be measured, and how to improve that performance (→ Advertising Effectiveness; Advertising Effectiveness, Measurement of).

We then take the perspective of the *consumer*. Advertising provides some benefits to consumers but some argue that it also encourages them to spend money on products they do not need and/or inflates the prices they have to pay. Some also argue that advertising is responsible for excessive consumption of, e.g., foods high in sugars, salts, and fats or alcohol by young people. In short, advertising produces counter-productive behavior from the consumer’s point of view, or so it is alleged. How do the positives compare with the negatives?

Finally we take the perspective of *society* as a whole and the extent to which advertising is a benefit or a curse. Governments are now among the largest spenders on advertising, which makes it harder for them to be generally hostile to the techniques, and yet they have to deal with malpractice, typically through regulation. This can take three forms: self-regulation by the industry, legal regulation, and “co-regulation” which has become fashionable (e.g., for broadcast media in the UK) as a compromise between the two (→ Advertising Law and Regulation).

Although this entry is mostly concerned with marketing communications for → brands by for-profit companies, advertising is also important for individuals, notably classified, and not-for-profit organizations such as charities and governments.

## HISTORY

Since the dawn of time, sellers have been seeking to attract attention and present their wares in ways that encourage sales. A recent classified ad for a second-hand bicycle is substantively the same as an ad for a Roman chariot 2,000 years ago. Media have changed, notably broadcast and digital, and our understanding of how ads work has changed, but advertising itself has changed much less. Advertising has always provided information, used emotional appeals to sell to us, and reminded us. But it used to be less pervasive than it is today because of the limited media and the limited number of goods then available for trading (Norris 1980).

*Advertising agencies* have existed since at least the eighteenth century but their formal standing as experts dates from the mid-nineteenth century in developed markets and the late twentieth century in the late developers. These “full service” agencies offered the complete range of advertising services to advertisers while at the same time being paid by the media carrying the ads. Competitive pressures have eroded the fixed commission

system, with advertisers now demanding, in effect, control of the media discounts and paying the agencies a mix of lower rates of commission, fees, and payment by results (Lace 2000). With increasing media complexity in the late twentieth century, most agencies have split into “creative” and “media-buying” agencies with their minor roles covered by other specialist agencies, e.g., public relations and events (Lears 1994).

The importance of small start-up agencies is as great as it ever was but globalization has also promoted mergers of the larger, more mature, agencies into perhaps half a dozen multinationals led by WPP and Omnicom, followed by a second tier of worldwide groups and partnerships (Lears 1994). But the turnover of talented individuals and the avoidance of brand conflicts have maintained stability of the sectors, in the UK at least but probably worldwide too.

By 2000, an estimated US\$233 billion was spent on local and national advertising, while sales promotion expenditures increased to more than US\$250 billion (Belch & Belch 2001). This is significant because with classic packaged goods, or fast-moving consumer goods, advertisers have shifted budgets from advertising to promotions, but the slack has mostly been taken up by new advertisers such as financial services and government. As a share of world GDP, however, advertising appears to have grown (WARC 2006).

*Measurement techniques* have become more sophisticated partly in response to advertiser demands to see quantified results and partly as advertisers and their agencies have taken a more scientific approach to understanding how advertising works (e.g., Pedrick & Zufryden 1991). *Content* has increased in variety with more entertainment and appeals to emotion but this has largely been driven by the wish to exploit new media. Perceptions of different advertising styles may be seen as evolutionary by those involved but the changes in style also reflect the fashion cycles that are necessary to maintain the appearance of novelty (Fox 1984; for a fuller account of the history of advertising see McDonald & Scott 2007).

## THE ADVERTISER'S PERSPECTIVE

This section follows the process of commissioning advertising through to assessing the results. In practice, the process is rarely as tidy as shown here: circumstances dictate changes in decisions and choices made in the “wrong” sequence. Specifically, we look at determining goals and briefing agencies, agreeing the budget, choosing and scheduling media, pre-testing (or “copy testing”) the campaign before it runs, and subsequent evaluation.

### Determining Goals and Briefing Agencies

In recent years, the brief from client to agency setting out the requirements has been increasingly formalized (IPA 2003). Ideally the client should have already resolved with the advertiser's other senior management how, preferably in quantified terms, the advertising could help achieve the corporate goals and roughly what budget would be available for the purpose. Experience from previous campaigns plays a major part in the assessment. In other words, what do we want from the advertising versus what expenditure, and is that value for money credible?

The briefing itself is an interactive process as the agency brings its own experience and negotiating skills, typically, to making the goals easier to achieve and the budget bigger. What should emerge from the process is a clear identification of the target market and the changes the advertising should achieve. These may be indicated by changes in intermediate measures such as awareness or attitudes to the brand, or changes in behavioral measures such as sales or penetration, i.e., the percentage of the market trying the brand. These goals, ideally, should be few and quantified and subsequently used for pre- and post-testing to identify achieved performance. That rarely happens in practice (Ambler & Goldstein 2003).

But the brief is a great deal more than establishing the benchmarks for later performance evaluation. It needs to motivate and excite the creatives (art and copy) to produce brilliantly productive work (Fletcher 1997). The brief should not describe the means, i.e., what the ad should contain, but the end, i.e., challenge the agency with what the campaign should achieve. Creatives love tight briefs and hate open-ended ones; one cannot solve a problem that is not there. A tight brief also proscribes what an ad must *not* do, e.g., use young people when advertising a brand of alcohol.

### **Agreeing the Budget**

Apart from the horse trading mentioned above, there is no shortage of more or less scientific approaches to budget setting. Practitioners like to claim that they set the budget to maximize projected return on investment (ROI). This plays well with peers and their financial colleagues but it is a myth, and even if it could be done ROI is the wrong financial objective (Ambler & Roberts 2006).

One reason it cannot be done is that the creative content (copy) has not, at this stage, been decided and nor have the media. The copy and the media are the key factors in ad performance, and estimating not only what the advertising will achieve but the counterfactual (what would have happened without the advertising) calls for considerable confidence. Research (e.g., Low & Mohr 1999) indicates that formal models are rarely used to identify profit-maximizing budgets but when they are, they are simply treated as one input among many (West 1995).

More firms than would admit to it practice the “affordable” method, i.e., the money the company can spend without jeopardizing a respectable profit for the year. Two other methods remain popular: maintaining a constant advertising to sales ratio and doing much the same as the previous year (March et al. 1989). Nerlove & Arrow (1962) argued in favor of constant ratios if elasticities and margins are stable.

A better theoretical approach recognizes that ads work in two stages: they change *brand equity* (what is in consumer heads) and brand equity, at a later date, changes consumer behavior. That may imply that the goals for the ad campaign should be set by changes in brand equity (intermediate) metrics and the budget made available in those terms. In practice few advertisers formalize brand equity measurement in that way. Furthermore the correlation between intermediate and behavioral metrics can be poor so that clients typically prefer the latter, e.g., sales or penetration or profit, where advertising can measurably deliver those goals.

### Choosing and Scheduling Media

Media neutral planning (MNP; Saunders 2004) waxed and waned in the UK rather rapidly in the early 2000s. It shared with the more substantive → *integrated marketing communications* (IMC; Schultz 1993) the idea that communications should be planned from the consumer's perspective. MNP went much further in suggesting that campaigns should be tailored first to the relevant media for the target market and creative matters considered only after that. Most other practitioners see creative and media considerations as being interactive. IMC primarily argues that communications should be consistent with each other and with what the consumer should reasonably be expected to take on board.

From whichever place one begins, the target market should ultimately determine the relevant media both in terms of readership and in providing the appropriate context for the copy. An ad depending on high fashion and addressed to young women should clearly not appear in the *Sporting Life* which is read by middle-aged men more interested in horses than fashions. Thus media considerations are less driven by reach (how many people see it), frequency, or the cost per 1,000 readers (or viewers) than the relevance of the media and whether, in that context, the message is likely to work.

This in turn leads to the question of *how* the ads might be expected to work. For a new product or brand, the primary aim is, typically, achieving awareness. Thereafter advertising works mostly through two approaches, broadly classified as either active or central processing, involving argument and logic, or passive peripheral processing, which relies on cues (→ Elaboration Likelihood Model). Other scholars have reached similar, but not identical, conclusions that advertising *persuades* the viewer to do something they would not otherwise do (the strong theory) or merely *reinforces* existing habits (Jones 1996).

### Pre-testing (or “Copy Testing”) the Campaign

Pre-testing is a contentious topic. Predictiveness is dubious and ads are rarely pre-tested against the particular goals for the campaign. Specialist agencies, such as Millward Brown, more usually test with their standard metrics which has the advantage, of course, of using other campaign tests as benchmarks (Ambler & Goldstein 2003). Even if pre-testing is poor value in assessing campaign proposals, it has advantages such as gaining top management approval. Protagonists for pre-testing include Pieters & Wedel (2004).

### Post-Campaign Evaluation

Post-campaign assessment, on the other hand, is not contentious in principle although there are various competing approaches. Specialist research agencies, once again, tend to use their standard metrics rather than the original campaign goals. Post-campaign assessment usually takes the form of “tracking,” i.e., the key brand equity metrics are consistently monitored over time, for example, on a monthly basis (for a summary see White 2005).

A key factor is that the advertiser is looking for changes in brand equity, in other words brand effects, not advertising effects. According recognition and recall of the ad may lead to brand effects but they are not valuable effects in themselves.

### THE CONSUMER'S PERSPECTIVE

From as early as the first half of the nineteenth century, there has been public ambivalence toward advertising (Nevett 1982). It is seen as manipulative, intrusive, and seeking to persuade us to buy what we do not need (such as lottery tickets) or to buy what is bad for us (such as alcohol, tobacco, or fatty foods). Because brand leaders are typically more expensive than their private label equivalents, some argue that advertising causes us to pay more than we should.

On the other hand, advertising pays for the media we enjoy such as → television, → newspapers, and the → Internet. Quite often we enjoy the ads themselves which enter into general parlance such as “It does what it says on the tin” (Ronseal). Calfee (1997) has made the case for the defense, as has the Advertising Association in the UK and the equivalent trade associations in other countries. Advertising provides information and reminds us, quite often, of what we have bought before and may intend to buy again.

### THE SOCIAL PERSPECTIVE

Opponents of advertising claim that it commercializes culture, undermines values, and leads to less happiness as society is reminded of what it cannot afford (→ Commercialization: Impact on Media Content). Supporters argue that advertising merely mirrors society as it is (Fox 1984). They see it as a necessary part of a healthy market and contend that it has contributed to the growth of GDP and widespread prosperity (O’Guinn & Faber 1991).

The truth, as always, lies somewhere in between. Advertising in itself is neither good nor bad, but it can be good or bad in the way it is used. Accordingly, most countries have developed regulation as a means to control “bad,” or potentially harmful, advertising while allowing “good” advertising a reasonably free rein. Regulation, much of it self-regulation, has grown rapidly since the 1960s to meet increasing cultural sensitivities but also to dissuade governments from interfering. Self-regulation is seen as being more flexible and responsive to consumer protection than legal rules, but governmental wish to control the industry has led to “co-regulation,” i.e., government retaining the right to intervene when they deem it necessary. For example, the Code of Advertising practice in the UK is administered by a trade committee with an independent chairman which can, and does, amend the Code when the need arises, rather than following the lengthy and cumbersome process of changing UK law. Ofcom, the UK government quango, is an example of co-regulation in the UK (see [www.ofcom.org.uk](http://www.ofcom.org.uk)).

# Advertising, Cross-Cultural

*Katja Gelbrich*

*Ilmenau University of Technology*

*Holger Roschk*

*Ilmenau University of Technology*

With the globalization of markets, advertisers are faced with the question whether to internationally standardize their campaigns or to tailor them to each country's target audience. This controversial issue is discussed in the so-called *standardization/differentiation debate* in international marketing literature. Although standardization has the advantage of saving cost, companies that stress global standardization do not necessarily perform better than others (Samiee & Roth 1992). This is because standardized advertising campaigns run the danger of misunderstanding and violating cultural rules in the target markets. Hence, cultural differences are a reason why many companies favor a more localized approach (Kanso & Nelson 2002).

*Culture* can be defined as the collective programming of the mind (Hofstede 1984; → Culture: Definitions and Concepts). This means that individuals of the same culture share specific values, i.e., they agree on what is considered to be desirable. Several theories (e.g., learning theories, cognitive dissonance theory, and cognitive response theory) and related empirical findings suggest that advertising is most persuasive if it conforms with what recipients consider to be desirable (Gengler & Reynolds 1993; → Advertising Effectiveness; Advertising as Persuasion; Cognitive Dissonance Theory). Therefore, effective advertising on international markets should insure that the advertising message is consistent with the mental programming of each target group. In other words, advertising is (or should be) a mirror of the culture it is directed toward (→ Cultural Patterns and Communication).

The following questions have to be dealt with when adapting advertising to various cultural contexts: What advertising objectives are reasonable and feasible in the target culture? What should the advertising appeal be like? What sex roles should be portrayed in the ad? How much information should the ad contain? What symbols may be used?

## RESEARCH TRADITIONS

Research on cross-cultural marketing communication is usually based on Hofstede's (1984) landmark study (→ Cultural Studies). The author identified four dimensions reflecting cultural values, namely power distance (extent to which human inequality is accepted), individualism–collectivism (degree of an individual's social integration), masculinity (extent to which the dualism of sexes is recognized), and uncertainty avoidance (extent to which unstructured or unfamiliar situations make individuals feel uncomfortable). In a follow-up study, long-term orientation (degree of future-oriented behavior) was added as a fifth dimension.

More recently, House et al. (2004) introduced the GLOBE study (Global Leadership and Organizational Behavior Effectiveness), which offers a more comprehensive view on cultures. The GLOBE researchers differentiate between ingroup collectivism (degree to

which members of a culture are affiliated with their organizations or families) and institutional collectivism (degree to which institutions encourage collective behavior). Moreover, they identified three additional dimensions, namely assertiveness (degree to which members of a culture are assertive, confrontational, and aggressive), humane orientation (degree to which members of a culture are friendly, generous, and altruistic), and performance orientation (degree to which performance is encouraged).

### ADVERTISING OBJECTIVES

Advertisers set forth specific goals to be accomplished (e.g., attracting attention, creating a certain brand image, or increasing the purchase intention of the target audience). However, these objectives have to be adapted to the degree to which advertising is accepted in different cultures. Although consumers around the world seem to perceive this marketing instrument as an inevitable part of everyday life, recipients in some societies are more skeptical than in others. It has been found that consumers in New Zealand, Denmark, Sweden, and Singapore in particular have a less positive *attitude toward advertising* than consumers in other countries, while recipients in the US, India, China, and the UK have a more positive attitude than their counterparts in other cultures (Durvasula et al. 1993; 1999; Zhou et al. 2002; Young et al. 2003; Mukherji 2005). The positive attitude of (urban) Chinese consumers, for instance, can be explained by a political peculiarity of the country. Advertising was restricted in the communist era and is relatively new to the Chinese. This is why they enjoy it, although it has been revealed that they have less trust in this marketing instrument than American consumers (Zhou et al. 2002). In general, advertisers should be cautious about using extremely persuasive appeals in cultures where acceptance of advertising is low (e.g., Denmark, Sweden), but rather stress alternative goals, such as attention or image creation.

In addition, adequate advertising objectives can be derived from three cultural dimensions, namely individualism–collectivism, performance orientation, and uncertainty avoidance. In *collectivistic* cultures (like Japan and Korea), for instance, little is explicitly stated in written or spoken messages, because people consider verbal communication to be only part of the overall message. They rely rather on contextual cues from which they derive the meaning of what is verbally expressed. That is why such societies are also referred to as high-context cultures. Advertising in such societies should not be too persuasive, but rather aim at anchoring a product in the recipient's mind. People in *individualistic* cultures, such as the US, tend to communicate more explicitly (low-context cultures). Hence, high-pressure selling is a common practice in these societies. In the US especially, advertising is often directly aimed at selling a product.

The US also allows comparative advertising messages that seek to persuade the audience by comparing a brand's performance with specific, named competing brands. In societies with a lower *performance orientation* score, such as Germany, comparative advertising is restricted. Islamic societies tend to have an even weaker performance orientation. In some of them (e.g., Saudi Arabia), comparative advertising is completely prohibited (→ Advertising Law and Regulation). Indians, while more in favor of advertising in general, were found to perceive this kind of communication as insulting to their intelligence. This may be due to their low *uncertainty avoidance* score, which implies a

high tolerance for ambiguity. Since Indian consumers do not feel offended by contradictory or inconsistent information, they are receptive to subtle messages rather than simple and direct selling propositions.

### ADVERTISING APPEALS

Advertising often appeals to values such as adventure, freedom, and economy (→ Attitudes, Values, and Beliefs, Media Effects on). The goal is to condition a product in such a way that the audience associates it with these values. A commonly used research method to identify values stressed in advertising appeals is content analysis (→ Content Analysis, Qualitative; Content Analysis, Quantitative). Extensive content-analytic research on advertising campaigns across cultures indicates that the values stressed tend to correspond with the countries' scores on Hofstede's cultural dimensions, although economic and political transitions (e.g., in Korea) may be responsible for some contradictory results (e.g., Tse et al. 1989; Albers-Müller & Gelb 1996; Cho et al. 1999; Lin 2001; Müller & Gelbrich 2004; Han & Shavitt 2005).

In cultures with high power distance, such as Japan, advertising more often appeals to *status values* than in more egalitarian cultures like the US. Corresponding to these societies' value systems, prestigious products or services may serve as status symbols to provide evidence of the owner's or user's social position (provided that this strategy fits the product or service).

Whereas *performance* and *hedonism* are more often appealed to in individualistic rather than collectivistic cultures, the opposite is true for *sociability*. Although performance and hedonism seem to be mutually exclusive at first glance, they do not need to be (e.g., "hard-working people should also have fun").

In cultures with high uncertainty avoidance, people feel uncomfortable in new, unstructured situations. Preserving tradition helps to prevent such situations and to ensure stability. Since tradition is passed down from the older generation, advertising in "anxious" cultures tends to portray elderly people more often than advertising in cultures with low uncertainty avoidance. However, the differences are relative. Advertisers generally tend to refrain from portraying elderly people, but the few exceptions can be observed most often in cultures with high uncertainty avoidance.

A disadvantage of content analysis is that it only reveals what advertising is like rather than what it should be like. It fails to measure the effectiveness of an ad in terms of ad cognition, attitude toward the ad, brand cognition, attitude toward the brand, or purchase intention. However, contemporary research provides evidence that recipients actually prefer advertising that appeals to *culture-conform* values. For example, North American consumers evaluate individualist-laden culture-congruent advertising more favorably in terms of the above-mentioned effectiveness measures than collectivism-laden advertising appeals. The opposite holds true for their Chinese counterparts (Teng & Laroche 2006).

### SEX-ROLE PORTRAYAL

Sex roles are learned during the socialization process and differ from culture to culture. In *masculine* cultures, such as Japan, sex roles are rather distinct. Men should be determined and success oriented, whereas women are supposed to be modest and affectionate. Since

these societies are dominated by men, they follow masculine ideals (e.g., performance and success). In *feminine* cultures, such as Denmark and Sweden, sex roles overlap. These cultures tend to stress feminine ideals (e.g., social welfare, mutual support).

These sex roles are reflected in advertising. Relationship portrayals (spouse/boyfriend/girlfriend, parent, homemaker) are more frequently displayed in feminine than in masculine societies (Milner & Collins 2000), while the ratio of men to women shown at work is greater for masculine cultures than for feminine ones. The same can be observed for the ratio of men to women depicted as top executives (Müller & Gelbrich 2004). However, these results are relative. Even in feminine cultures, more men than women appear in work and top management roles, while women are more often portrayed in non-job activities (→ Women in the Media, Images of).

### INFORMATION CONTENT

Information cues (e.g., quality, nutrition, price, new ideas) help to reduce the uncertainty involved with a product purchase (Abernethy & Franke 1996). Although information seems to be something that is fairly objective, informative advertising is not at all culture-free. In particular, the scope of uncertainty during product purchase, and/or the degree to which this uncertainty is perceived as uncomfortable, vary from culture to culture. In cultures with high uncertainty avoidance, informative advertising is particularly useful for consumers to reduce their perceived risk of purchasing the “wrong” product. Consequently, advertisements on these markets contain more information cues – and in particular more price information – than in less “anxious” societies. Furthermore, advertisers refrain from introducing new ideas to consumers in cultures with high uncertainty avoidance (Müller & Gelbrich 2004).

The individualism–collectivism (low- to high-context) dimension also explains varying levels of information content in ads. People in high-context cultures are not used to exchanging explicit details when communicating. Therefore, commercials in these cultures contain fewer information cues in general and a lower level of price information in particular than in individualistic, low-context cultures, such as the US (Al-Olayan & Karande 2000).

Beyond culture, macro-economic variables such as gross domestic product (GDP) per capita or literacy level are responsible for the amount of information content provided in different societies. In three Arab countries, for example, the information content of magazine ads was found to increase with a country’s level of literacy. Similarly, the higher the per capita GDP the higher the level of price information (Karande et al. 2006). To sum up, studying culture is helpful when deciding upon the appropriate amount of information content for industrialized countries. In developing countries, however, advertisers should be aware of economic constraints that militate against the use of informative advertising. Since information cues are conveyed by text messages, illiterate people will not understand them. In this case, it is more reasonable to make use of symbols and images.

### SYMBOLS

A symbol is something that means more than it seems to at first glance. Symbols may be pictures or images, but also concepts, words, or whole sentences. A light bulb, for

instance, can stand for “enlightenment,” the caduceus is used as a symbol for medicine, and a virgin may represent immaculateness. Symbols are interpreted and decoded on the basis of *social agreements*, and hence may evoke diverging associations in different cultures.

In most European countries a stork, for example, symbolizes the birth of a child, but in Singapore it stands for the early death of a child. The French associate nudity with beauty and nature, while Russians, on the contrary, perceive depictions of naked people as displeasing and offensive. To Germans the term “Oriental” tends to be associated with stereotypical images of camels and veiled women, whereas Americans are more likely to associate it with kimonos and chopsticks, stereotypical images from East Asia. Even the concept of beauty, which is shared by all human beings, is represented by different symbols. In Milan and Madrid women with black hair are regarded as beautiful, whereas women with blonde hair are more highly rated in Hamburg and London (Bjerke & Polegato 2006). International advertisers should therefore ensure that the symbols they use are *equally decoded* in the target markets. As a minimum, a positive symbol in one culture should not trigger any negative connotation in another.

### NON-CONFORM ADVERTISING

Violating cultural values, for example, by depicting unfavorable sex roles, leads to less effective advertising. As the case of Benetton several years ago showed, consumers can be offended by advertising they consider to be unethical or politically incorrect. The Italian clothing company’s shock advertisements, depicting, for example, a black woman as a wet nurse, and an unwashed newborn baby with the umbilical cord still attached, gave rise to not only public criticism, but campaigns to boycott the company’s products. However, most advertisers follow the rule of adhering to the values of the target culture, and so appear undifferentiated from their competitors. In a heavily advertised market, breaking with traditional values may attract the attention of the target audience and build up a unique brand identity.

However, *non-conform* advertising has the advantage of novelty only when used for the first time. The more it is used the more the novelty wears thin and attention fades. This may be the reason why sex-role portrayal has become even more stereotypical in Australian advertising. Depicting the ideal of a working woman was new when only a few women were part of the workforce. As more women started to work, the novelty wore off and it received less attention (Milner & Higgs 2004). In the long run, non-conform advertising works only if the target audience actually seeks to distinguish itself from its own culture. Such *transnational target groups* are usually well educated, well off, and cosmopolitan. They are particularly receptive to luxury goods, durable consumer goods, and travel and hospitality services.

## **Advertising, Economics of**

*Matthew P. McAllister*

*Pennsylvania State University*

The economics of → advertising are crucially important in understanding the history of modern mass media as well as their continued development. Sometimes called “indirect” funding (compared to the “direct” funding provided by consumers to such media as books and recorded music), advertising as an economic institution involves several different industries and collectives. Advertising’s influence as a revenue stream for media is arguably a more significant social force than the symbolic power of explicit commercial content like television advertisements. Advertising revenue fundamentally influences not just the placement of ads in the media, but also the nonadvertising content and dissemination of funded media. This is increasingly true even for media and cultural forms that traditionally have not depended upon the generation of advertising revenue, such as theatrically released films and video games (→ Media Economics).

### **DEVELOPMENT OF ADVERTISING’S ECONOMIC LINKS TO MEDIA**

In the history of modern media, advertising has grown from a supplemental source of media income, to a dominant source, to (in some cases) an exclusive source. Although early newspapers and magazines carried advertisements, the main source of revenue was from readers. This changed with industrialization and the establishment of advertising agencies, brand marketing, and national markets, all of which encouraged companies to place ads in new and established media to market their goods and services. In the United States, by approximately 1900 both the newspaper and magazine industries generated a majority of their revenue from advertising rather than from readers. This shifted the basic *economic logic of the media*, as media users went from being the direct revenue providers – the customer/market of media – to being the product sold to the media’s larger customer, advertisers. Today, print media such as newspapers and magazines average about 65–75 percent of their revenue from advertising (→ Cost and Revenue Structures in the Media; Media History).

Although it was not clear during radio’s early development that it would be advertising-supported, in the US through a variety of powerful commercial and policy maneuvers the medium eventually more fully embraced an advertising revenue system than did even the earlier print media. Following this, → television developed as a fully advertising-supported system from the beginning. Virtually 100 percent of for-profit broadcasting revenue, then, is generated from advertising. The economic influence of

advertising was further shown in media that were created to only carry advertising and promotional messages; such media include billboards, catalogs, and other forms of direct mail. More recent forms such as websites may be entirely funded by advertising, or exist only to serve as advertising (such as websites for products). In television, infomercials – a half-hour block of time bought by an advertiser – serve a similar function and have become an expected source of income for both local stations and national networks.

## ECONOMIC FIGURES AND TRENDS

Industry summaries of advertising-spending trends and amounts may factor in measured and/or unmeasured media. Measured media include traditional mediated advertising venues: print media such as newspapers and magazines, broadcast and cable entertainment media, billboards and the growing marketing venue of the → Internet. Unmeasured media spending typically involves marketing and promotional activities such as direct mail, couponing, catalogs, and sponsorship at special events.

The economic scope of global advertising is enormous and ever growing. Global spending on advertising increased in the US from under \$450 billion in 2001 to approximately \$640 billion projected for 2007 (Coen 2006). The US is by the far the top country in terms of advertising spending, accounting for nearly half of global revenue. However, spending in many other countries keeps pace with ad growth in the US and in some, such as China, it is growing at a significantly faster rate (Table 1).

The advertising industry involves an interplay of three powerful economic players: advertisers, advertising agencies, and media companies. Even though individuals can be advertisers – especially through classified advertising in newspapers and websites – easily the most visible and influential advertisers are multinational conglomerates, with the top companies spending billions each year to maintain a global promotional presence and establish a coherent and imposing global brand image (Table 2).

*Advertising agencies* are engaged in a variety of activities, including campaign creation and → marketing research. An important function is media planning and buying, in which the advertising agency serves as a liaison between the advertiser and media in

Table 1 Top countries by measured media ad spending, 2004

Rank	Country	Spending (US\$ billion)
1	United States	141.0
2	Japan	38.0
3	United Kingdom	18.4
4	Germany	18.3
5	France	11.1

which ads are to be placed. Often compensation to the agency involves a percentage of ad placement costs charged by the media. One characteristic of modern advertising agencies is the globalization of very large advertising/marketing organizations, often holding organizations that own several powerful, globally spanning individual advertising agencies. Not only do these global holding organizations control many full-service agencies that integrate many marketing, promotional, advertising, and public relations functions, but their huge size allows them leverage in their negotiations with media companies. Illustrating a heavy ownership concentration in advertising agencies, the top four marketing organizations – Omnicom Group, WPP Group, Interpublic Group of Cos, and Publicis Groupe – through the advertising agencies that they owned, accounted for over 55 percent of 2004 measured media billings in the United States (*Advertising Age* 2006, 45).

In terms of advertising spending by media, in the US *direct-mail advertising* receives a higher revenue than any other single medium, followed by newspapers and televisual forms. Although the Internet is still fairly low on the list, its growth has typically been much greater than average, and traditionally powerful advertising media such as newspapers and broadcast network television find that their growth is lower than average for advertising revenue across all media (Table 3).

**Table 3** Advertising spending by medium in the United States, 2005

Rank	Medium	Amount (US\$ billion)
1	Direct mail	55.22
2	Newspaper	47.33
3	Broadcast TV	44.29
4	Cable TV	23.65
5	Radio	19.64
6	Yellow Pages	14.23
7	Consumer magazine	12.85

Large media companies such as Time Warner, Viacom, and Disney account for a large share of the advertising revenue (→ Media Conglomerates). In fact, companies such as these are both among the top receivers of advertising revenue (through the ad-supported media companies they own) *and* the top spenders of advertising (through the marketing of their own media products such as theatrical films and DVDs). Such multiple roles by large conglomerates encourage the creation of large-scale cross-promotional campaigns and licensing.

## DEFENSES AND CRITICISMS OF ADVERTISING'S ECONOMIC INFLUENCE

Advocates for the benefits of advertising's economic effect contend that advertising lowers prices because it encourages mass production and thus economies of scale. Proponents also argue that advertising stokes economic growth by encouraging spending. The benefits of "free" media – media funded primarily by advertising, with no direct and obvious economic cost to media users – also has been highlighted, especially with broadcast media and "controlled circulation" magazines distributed without immediate cost to targeted markets.

Criticisms of advertising's effect upon a nation's economy include the barrier to entry for new goods and services that the expectation of large advertising budgets creates. A similar argument is made about the emphasis on political advertising, especially in countries with few restrictions on such paid practices. A common charge is that the high expense of advertising spending during a political campaign severely limits the potential pool of viable candidates for office (→ Political Advertising).

Much critical work has been devoted to understanding how advertising as an economic force has influenced – and continues to influence – the ideological and democratic limitations of media. Critics such as Bagdikian (2000) and Baker (1994) have argued that advertising encourages the growth of large and powerful *media monopolies* (→ Concentration in Media Systems). When media companies grow, they can offer advertisers large coverage and efficient placement – exploiting economies of scale – and thus disadvantage smaller media companies with less reach. Others have noted the explicit attempts by advertisers to remove ideas critical of advertisers or advertising in media by withdrawing advertising revenue, or the susceptibility to self-censorship by media that the potential threat may encourage. Ideas that are critical of commercialism generally – or even overly negative about the larger institutions or norms of society – may likewise find resistance in advertising-supported media. The exclusionary tendencies of advertising media also extend to the intended audiences. Generally, audiences who have disposable income, are willing to spend that income, and are willing to try many different kinds of brands are the ideal type of audience that advertisers would like to reach; advertising-supported media may tend to emphasize the creation of content that appeals to such audiences, thus excluding nonadvertising-desirable audiences. On the other hand, advertising encourages *entertainment-oriented content* in media to keep ratings/readership high, and consumerist messages to create a receptive climate for selling messages.

The economics of advertising will continue to change, perhaps radically, as media become cluttered with advertising, advertising agencies embrace → integrated marketing communications, traditional media become increasingly desperate to prevent further

erosion of their share of available advertising spending, and digital technologies integrate more fundamentally with traditional media forms. The concept of *branded entertainment*, where advertisers integrate the selling function in traditionally autonomous entertainment and news forms, is a trend of the new promotional millennium and one that changes the economic conventional wisdom of advertising. More specifically, product placement and sponsorship are increasingly found in various media, including broadcast media. These promotional strategies alter the nature of advertising deals with such media, making them more expansive in scope by entering the system during the early stages of media content development and production. Feedback-oriented digital technologies such as on-demand viewing and target marketing techniques like database marketing and mining potentially make media companies into audience-information brokers that collect and leverage different audiences' media consumption patterns. Media companies that are both major carriers of advertising and major advertisers for their own products will continue to blur the distinctions between the traditional categories of advertisements and nonadvertising media content.

# Advertising Effectiveness

Gerard J. Tellis

University of Southern California

How effective is advertising in contemporary markets? What does advertising effectiveness mean? By the term “advertising effectiveness,” we mean what change → advertising achieves in markets. Advertising also creates changes in awareness, → attitudes, beliefs, and intentions. These are all valid effects of advertising. However, in the interest of focus and parsimony, this entry focuses on the effects of advertising on *only market behavior*.

This topic has been the subject of research from the time firms began to advertise. Scientific research has begun to accumulate especially in the last 50 years (Tellis 2004; Tellis & Ambler 2007). This research falls within one of two paradigms: behavioral research and econometric research. *Behavioral research* uses theater or lab experiments to address the effects of advertising on awareness, attitudes, beliefs, and intentions (→ Experiment, Laboratory). On the other hand, *field research* uses field experiments (→ Experiment, Field) and econometric models to assess the effects of advertising on market behavior. This entry will attempt to classify and summarize what has been learnt from the latter paradigm of research.

We use six terms quite generically here: product, firm, → brand, consumer, market, and sales. The term “product” refers to any good, service, idea, or person being advertised. The term “firm” refers to any organization doing the advertising, whether it is a for-profit company, governmental agency, or nonprofit institution. The term “brand” refers to the names under which the firm advertises the product. The term “consumer” refers to the target of the advertising. The term “market” refers to the aggregate of consumers. The term “sales” refers to the aggregate behavioral response of the market of consumers, sought by an advertiser, such as unit sales, \$ revenues, registrations, votes, subscriptions, etc.

We can classify field research into three groups: contemporaneous effects of ad intensity, dynamic effects of ad intensity, and effects of ad content. These subjects are the focus of the next three sections.

## CONTEMPORANEOUS EFFECTS OF AD INTENSITY

We can further classify research in this area by which one of three aspects of advertising intensity the research addresses: weight, elasticity, or frequency.

### Research on Advertising Weight

The term “weight” refers to the level or intensity of the advertising budget. Weight studies examine the effect of differences in ad budget across time periods or regions. The main focus of such studies is to determine whether an increase in budget translates into a proportional or profitable increase in sales of the advertised product. The same criterion holds for a decrease in advertising. Researchers have carried out over 450 market experiments to assess the effectiveness of advertising. Details of these studies are in Tellis (2004) or Tellis and Ambler (2007).

Research from weight studies leads to the following four *important and surprising findings*. First, changes in weight alone do not cause dramatic or substantive changes in sales. That is, a big increase in weight does not boost sales while a big cut in advertising does not decrease sales. Second, prolonged cessation of advertising sometimes leads to deleterious effects on sales. Third, if advertising is effective, its effects are visible early on in the life of a campaign. Conversely, if advertising is ineffective early on, then repetition will not create or enhance its effectiveness. Fourth, changes in media used, content of the ad, product advertised, target segments, or scheduling of ads are more likely to cause changes in sales than are changes in weight alone.

These results suggest three *implications*. First, firms could be over-advertising; as a result, cutbacks in advertising do not lead to a loss in sales. Second, advertising may have delayed or even permanent effects, so that continued advertising at the same level is not always necessary. Third, a firm's budget increase or original budget itself may be more fruitfully employed in changes in media, content, target segments, product, or schedule rather than in weight alone.

### Research on Advertising Elasticity

Advertising elasticity is the percentage change in sales for a 1 percent change in the level of advertising. It is free of any units. Studies in advertising elasticity focus on the rate and shape of the mathematical function by which sales respond to advertising. Researchers estimate this function via a branch of science called econometrics (Dekimpe & Hanssens 2007). Thus, research on advertising elasticity allows a more fine-grained analysis of advertising effectiveness than does research on advertising weight. There are over 400 estimates of advertising elasticity carried out in numerous studies across countries, product categories, and time periods. Meta-analyses of this literature summarize the mean advertising elasticity and explain its differences across various characteristics of firm, product, and market (Assmus et al. 1984; Sethuraman & Tellis 1991).

Research on advertising elasticity leads to the following *important findings*. First, across all studies, the mean estimated advertising elasticity is about 0.1, i.e., about one twentieth the corresponding price elasticity. Second, advertising elasticity is higher in early than late stages of the product life cycle, for food than other products, in Europe than the US, and for durables than non-durables, especially in comparison to the price elasticity. Third, advertising elasticities are lower in models that incorporate advertising carryover and exogenous variables than in those that do not, and in models that are multiplicative than in those that are additive. Fourth, however, advertising elasticities are invariant over the measure of the dependent variable, the measure of the product, or the method of estimation.

These results suggest the following four *implications*. First, price discounting may lead to greater increase in sales than does an advertising increase; however, whether that increase is profitable would depend on the level of price cut, which consumers use it, and how much of that gets to the ultimate consumer rather than being pocketed by distributors (Sethuraman & Tellis 1991). Second, advertising may be more profitable for new products, while price discounting may be more profitable for mature products. Third, advertising may be more profitable for durables, while price discounting for may

be more profitable for non-durables. Fourth, advertisers in the US may be over-advertising or those in Europe may be under-advertising.

### Research on Ad Frequency

A firm's advertising budget normally impacts consumers through the exposure of consumers to ads through the media. The term "frequency" refers to the number of ad exposures each consumer receives in a particular time period. The advertising budget in a time period ultimately translates into a sequence of individual exposures targeted to one or more consumers. Similarly, sales may be considered an aggregate of consumers' choices of brands, called brand choice. Research on ad frequency normally examines the effect of ad frequency on consumer choice. Such research provides a more fine-grained and insightful analysis of advertising response than does that on advertising elasticity or advertising weight. In particular, such research can indicate the optimal level of exposures the advertiser should target at a particular market segment or even a particular consumer. However, research on ad frequency is not without limitations. Knowing the optimal frequency does not immediately translate into ascertaining the optimal budget. The advertiser would still need models that relate advertising frequency to budget and consumer choices to sales. So the tradeoff here is between detail and insight versus managerial usefulness.

Research on advertising frequency leads to the following *five findings*. First, the effects of advertising exposure are less prominent and immediate and more fragile than those of price or promotion on brand choice. Second, in general, increasing frequency of exposures increases probability of brand choice at a decreasing rate. Third, for mature, frequently purchased products, the optimum level of exposure *may* be relatively small, ranging from one to three exposures a week. Fourth, brand loyalty *may* moderate response to ad exposures, in that established brands have an earlier and lower peak response to ad exposures than newer brands. Fifth, brand choice *may* be more responsive to the number of consumers the ad reaches than to the frequency with which it is repeated.

These findings suggest some *implications*. First, advertisers need to target loyal and non-buyers of their products with differing levels of exposures. Second, consistent with findings from prior sections, heavier exposures need to be reserved for new consumers and brands.

### DYNAMIC EFFECTS OF AD INTENSITY

Research on advertising effectiveness has focused on three dynamic aspects of advertising: carryover effects, wear-in, and wear-out.

#### Research on Advertising Carryover

The carryover effect of advertising is that effect it has on sales *beyond* the moment or time of exposure. Econometric studies have typically estimated the size and duration of the carryover effect of advertising. Here again there are a large number of studies, which have been analyzed in a couple of → meta-analyses. This section summarizes findings from these meta-analyses as well as the primary studies themselves.

Research on advertising carryover leads to the *following main findings*. First, advertising typically has some carryover, so that all its effectiveness does not occur in the contemporaneous time period to its exposure to the consumer. Second, the estimated effect of advertising depends on the level of data aggregation. Estimated carryover effects tend to be longer with the use of more aggregate data. In general, the more disaggregate the time period of data, the less biased is the estimated effects of advertising carryover. In general, the effect of advertising *may* last for fairly short periods – hours, days, or weeks – rather than for long periods such as months or years. Third, advertising's effects vary by region, city, and time of the day.

These findings suggest the following three *implications*. First, advertisers should neither assume their advertising has only contemporaneous effects nor assume that it has very long-term carryover. Second, advertisers need to evaluate the carryover effect of their advertising and do so with as temporally disaggregate data as they can find or collect. Third, advertisers need to analyze effects by region and time period rather than rely on simple generalizations.

### Research on Wear-In and Wear-Out

A series of exposures of an ad is called an advertising campaign (→ Advertisement Campaign Management). Wear-in and wear-out are effects of an ad campaign. Wear-in is the effect of an ad that keeps increasing with repetition of the ad within the campaign. On the other hand, wear-out is the effect of an ad that keeps decreasing with repetition of the ad within a campaign. If they occur, wear-in normally does so early in the life of a campaign while wear-out normally does so late in the life of a campaign.

Research on wear-in and wear-out leads to the following *important findings*: *wear-in* either does not exist or occurs quite rapidly. It occurs more slowly when exposures are spread apart, when consumers are not forced to attend to the ad, for ads that contain emotional appeals rather than arguments (→ Emotion), for consumers who are not highly motivated to attend to the ad or actively processing the ad content, and in markets relative to theater or lab settings. Wear-in also might be stronger with ads that have higher persuasion scores.

Ad campaigns *wear out* if run long enough. Wear-out occurs more slowly for ad content that is complex, emotional, or ambiguous, for ads that are less rather than more effective, for infrequently rather than frequently purchased products, for exposures spread apart rather than clustered together, for light rather than heavy viewers of TV, and for campaigns with increasing variety of ads or ad content. A break in a campaign may lead to an increase in effectiveness of the ad; if that happens, the ad wears out even faster than it did the first time around. In rare cases, possibly for new products, advertising seems to have permanent effects. That is, the effect of advertising persists even after the advertising is withdrawn.

These findings have several *implications* for advertisers. Most importantly, an ad which is ineffective early on should be discontinued. It is futile to assume that an initially ineffective ad still needs to wear in, because wear-in is rapid or nonexistent. Second, the findings suggest typical types of wear-in and wear-out that advertisers may expect for their campaign, depending on the characteristic of that campaign. However, whenever

resources and time permit, advertisers should test their ads for wear-in and wear-out and accordingly decide on the duration of the ad campaign.

### EFFECTS OF AD CONTENT

The term “content” refers to what is in the ad as opposed to its external characteristics, such as weight or frequency. Aspects of content include the appeal (argument, emotion, and endorsement), the duration or length, the use of color, sound, or video, the amount and type of text, etc. While a vast number of theater and lab studies have examined the effectiveness of various aspects of ad content, only a few market studies have done so. Thus, generalizations of findings in this area need to be made cautiously.

Research on ad content seems to suggest the following *preliminary findings*. First, changes in the creative, medium, target segment, or product itself sometimes lead to changes in sales, even though increases in the level of advertising by itself does not. Second, informative appeals may be more important early rather than late in the product’s life cycle. Conversely, emotional appeals may be more effective late rather than early in a product’s life cycle.

These findings have two important *implications* for advertisers. First, to increase effectiveness, advertisers should modify content more than increase weight or frequency. Second, advertisers need to test and typically vary the content of their advertising with the life stage of the product.

# Advertising Effectiveness, Measurement of

*Fred E. Bronner*

*University of Amsterdam*

In the 1990s, accountability of advertising came high on the agenda in the commercial communication world. As a result a growing need for knowledge about the way the media environment influenced advertising effectiveness emerged. Standardized tools and new media studies were developed. And after 2000, greater actionability for media planners even on a day-to-day basis was incorporated into these measurement tools. Nowadays there is little argument in the commercial as well as academic world that campaigns should be monitored to better manage them in the marketplace (→ Advertisement Campaign Management).

Several factors were responsible for this development. On the advertisers' side, financial control and return on investment (ROI) were stressed more in relation to advertising efforts than in the period before. The enormous growth of traditional and new media types and vehicles combined with an increase in commercial messages fighting for attention. This situation made involved parties curious as to which advertising messages are "getting over the hurdle." As Franz (2000, 459) concluded: "This is the situation media research has to face in the near future: an unimaginable number of media for a more or less constant number of media users with limited time, money and (most important) attention capacities. The psychological key to coping with the overwhelming variety of media is selectivity." And → advertising effectiveness studies are necessary to conclude which messages can "fight" against this increasing selectivity and which messages get attention.

In this entry three topics will be elaborated. Which research designs are adequate for measuring ad effect? Which key performance indicators, divided into advertising response and brand response, have to be selected? What future developments, like more insight into low attention processing, can we expect?

## RESEARCH DESIGN

Studying advertising effectiveness has an easy part and a difficult part (Bronner & Reuling 2002). Measuring advertising awareness and advertising response is the easy part. Any advertising study can measure awareness either *continuously* ("tracking design"), where different groups of respondents are contacted on a monthly, weekly, or daily basis, or *pre/post* (before and after the campaign), where different groups of respondents are contacted at two different points in time. The difficult part is to answer the questions "What was the effect of the campaign upon brand response variables like brand awareness, brand sympathy, and brand usage?" and, if there is an increase in positive direction, "Is this increase due solely to the advertising campaign?"

### Problems of the Pre/Post Model

Simple tracking and pre/post designs are not enough to answer these difficult questions, for two reasons: (1) an upturn in → attitudes or → brand ratings may have had nothing

to do with the advertising; and (2) the chicken-or-the-egg problem arises if the “campaign aware” group has more positive attitudes or brand ratings than the “not-aware” group. The difficulty is to answer the question, “Was the increase in the number of positive ratings solely due to the advertising campaign?” Perceptions and behavior could have improved for a variety of reasons. The increase may have had nothing to do with the advertising.

### Problems of the Exposed/Non-Exposed Model

Another possibility is to carry out only a post-measurement and divide it into two segments: exposed and non-exposed. Some researchers try to deduce effects by cross-tabulating these two groups with effect variables. But it is clear that  $\rightarrow$  selective exposure can cause differences. If young people are more exposed and in advance have more positive attitudes, the correlation between exposed and positive attitudes is spurious. One also needs the “starting scores” of exposed and non-exposed citizens.

If, say, the post-measurement shows that the “exposed” group uses more energy-saving devices than the “non-exposed” group, can advertising receive the credit for this change? Not necessarily! As is often observed, it may be that a positive attitude toward energy saving has increased advertising awareness. In other words, the exposed population may already have had better energy-saving attitudes before the campaign than the non-exposed.

In commercial advertising studies we see the same phenomenon: people with sympathy for brand X have a higher advertising awareness of that brand. So in a post-measurement the exposed have a higher brand X sympathy score than the non-exposed. It is obvious that we cannot ascribe this difference to the campaign. The exposed population already had sympathy for brand X long before the campaign started. This is what is sometimes called the “chicken-or-the-egg problem”: which came first – brand sympathy or ad awareness?

### Combination of the Two Models as a Solution

What is the solution? When we combine the two designs (pre/post and exposed/non-exposed) we obtain a very powerful tool (Table 1). For each effect variable, the campaign effect score  $E = (a - b) - (c - d)$ . The part  $(c - d)$  can be considered as an indicator about developments taking place in the world concerning this effect variable that are not due to the campaign. Thus the term  $(c - d)$  represents the changes that take place separately from the campaign. So we can separate campaign influence from other factors such as high levels of media attention.

The main question in the scheme above is how to establish in the pre-test whether someone is exposed to the campaign or not. The solution is the use of panels ( $\rightarrow$  Survey). Data are collected in two ways. In the *combined panel/ad hoc design* a pre-measurement is

Table 1 Logic of methodological designs for campaign effects

	Before ( $t_0$ )	After ( $t_1$ )
Exposed	b	a
Non-exposed	d	c

carried out in sample X. After the campaign this sample is subjected to a limited reinterview, only to establish if they were exposed to the campaign or not. These exposure scores are added to the pre-measurement. An independent post-measurement is carried out in sample Y in which both exposure and effect variables are measured.

In a *panel design* a pre-measurement is carried out and after the campaign a full reinterview with effect variables and exposure questions takes place. Many clients consider the first of these options as too expensive and statistically complicated. The second option, a panel with full reinterviewing, is easy to grasp and delivers adequate data for the scheme.

## KEY PERFORMANCE INDICATORS

*Strategic communication management* is a method in which communication is continuously measured and analyzed and the media strategy is adapted to improve its effectiveness and efficiency (→ Strategic Communication). Den Boon et al. (2005, 64) make the following comparison to explain the core elements of strategic communication management: “it works like driving a car: concentrate on where you want to go, where the other cars are and how the vehicle is performing. Use a dashboard with a navigator to help get where you want to go.” These authors also describe the five central elements of strategic communication management, all centered on key performance indicators: (1) definition of key performance indicators by the advertiser in relation to brand and target group; (2) monitoring of own key performance indicators and those of the competition; (3) analyzing performance of the media and their synergy in terms of effectiveness and efficiency in achieving these key performance indicator targets; (4) analyzing media strategy in terms of optimal contact frequency of different media and optimal timing; and (5) adapting media and creative strategy.

Of course the measured indicators vary according to campaign and measurement model, but a general line can be detected and Table 2 sketches the most used metrics.

## Ad Response

Daniel Starch wrote as long ago as 1923 that for an advertisement to be successful it must be (1) seen, (2) read, (3) believed, (4) remembered, and (5) acted upon. In the Starch

Table 2 Key performance indicators in advertising effect studies

		<i>Dependent variable</i>	
		Ad response	Brand response
<i>Type of reaction</i>	Cognitive	Spontaneous recall of ad	Top-of-mind awareness
		Recognition of ad	(Un)aided brand awareness
		Detailed recall	Familiarity with brand
	Affective	Specific ad beliefs	Brand image/liking
		General ad likeability	Brand relationship/loyalty
	Conative	Coupon response	Purchase intention
		Website visit	Trial

philosophy, as today, an advertisement must first be seen. So we start the detailed description of the cells of Table 2 with ad response—cognitive. How can we measure adequately if a consumer has seen an ad (*cognitive response*)? In the research world there are two schools of thought on this: (1) measure spontaneously (recall, e.g., “What brand of beer was advertised during TV program x?”), or (2) show the TV commercial or print ad and ask if the consumer has seen it (recognition). The discussion of which method is better has been going on for 40 years. Smit studied this problem in several experiments (→ Experiment, Laboratory) and concludes (1999, 110) that measuring noticing ads by means of recognition results in more correct claims. DuPlessis (1994) has an explanation for this result: visual prompts (as used in recognition) fit the memory traces better than verbal prompts (as used in recall). Advertising is largely visual, so it is logical to use visual methods to measure effects.

For *affective ad response* in a standardized approach, one set of beliefs about ads is used to be able to compare strong and weak points of the ads over all beliefs. But because campaigns and resulting ads have different communication goals, a better approach seems to be to adapt the measured beliefs to the goals.

For *conative ad response* behavioral measures can be used – as opposed to relying on consumer research to measure if the ad is seen and what consumers’ reactions are. In the classic situation coupon response was such a measure. Nowadays print ads and TV commercials include in many cases a lead to an Internet site or a free telephone number. Post hoc qualitative research among coupon senders or site visitors can indicate more about the advertisement’s role.

### Brand Response

The effect of advertising upon brand awareness (*cognitive brand response*) is in nearly all effect studies measured in three steps: top of mind (“Which beer brands do you know?” – first one mentioned), spontaneous (“Which beer brands do you know?” – all brands mentioned), aided (“Here is a list of beer brands with their logos. Which ones do you know at least by name?”). Familiarity can also be measured and is a more nuanced scale (“just heard of/know just a little/know fair amount/know very well”; → Memory; Information Processing).

For the measurement of *affective brand response* the brand that is the focus of the campaign and the main competitors are measured on a salient list of attributes (brand beliefs) relating to corporate-, product-, and user-profile facets. Smit et al. (2007) describe validated instruments that can be used, for example the multidimensional brand personality construct proposed by Aaker (1997), based on the famous “Big Five” in personality research.

Likely changes in behavior (*conative brand response*) are measured through the introduction of such measures as purchase consideration and intention. Purchase intention measures on a kind of probability scale are a generally accepted measure for the conative part of brand response. For new products a trial measure is more common (“As you may have heard brand x is bringing out . . . How likely is it that you would try them in the first few months after they become available in the shops?”). Another measurement tool is using a constant sum procedure (“Please divide 100 points over the brands in your

evoked set in relation to buying probability”). The advantage of this procedure is that we get a better understanding of the relative position of a brand.

## FUTURE DEVELOPMENTS

At least three developments will influence ad measurement: low attention processing, simultaneous media usage, and multimedia synergy effects.

As already stated, recognition is a more powerful memory system than recall, but as Heath (2004) states, advertising can influence future buying decisions even when subjects do not recollect ever having seen the ad. His *low-attention-processing (LAP) model* uses passive and implicit learning to create and reinforce links between elements in advertising and emotional “markers” in semantic memory. It predicts that advertising can work being seen several times, and that brand associations reinforced by this repetition may remain in memory long after the ad itself has been forgotten (Heath 2004, 37). Neuro-marketing may shed more light on this phenomenon in the next years.

Increasing *simultaneous media exposure* also raises questions on how media advertising should be planned and measured in the near future (Schultz et al. 2005). Consumers use increasingly multiple forms of media, all at the same time; younger people especially sometimes use three or more media at the same time (e.g., Internet, radio, TV). They are exposed to messages simultaneously. What about conflicting message exposures occurring simultaneously?

Finally, the use of *multimedia and cross-media strategies* will influence the measurement of advertising effectiveness. Successful campaigns more and more use several media types to effectively communicate their message (Bronner & Neijens 2006). Interaction of different media in one campaign can have a number of synergy effects (Bronner 2006). Multimedia campaigns show higher brand effects (Chang & Thorson 2004). In the effect research in the future there will be a strong need not only to detect the effects of a campaign but also to be able to ascribe these effects to certain media or combinations of media.

## Advertising, Emotions in

Tom Reichert

University of Georgia

Emotions are fundamental to the human experience, so it is not surprising that advertisers employ emotional appeals to evoke specific feelings in consumers. Today's commercials, print ads, and Internet interstitials generate a range of emotional reactions from humor and elation to shame and disgust, from arousal and fear to sorrow and pity (→ Excitation and Arousal).

Emotions serve several roles in → advertising. An important function of emotional stimuli is to attract viewers by capturing their → attention. Advertisers only have a few moments to hook viewers before they switch channels, turn the page, or scroll down a website, and emotional information is particularly adroit at getting noticed (→ Exposure to Communication Content). Once advertisers have that attention, feelings are used to associate a product or service with a particular emotion. Often advertisers simply use narratives to entertain consumers with the intention that consumers will return the favor with a purchase.

## DEFINITION

Aristotle identified “pathos” as emotion-based argument designed to play upon the audience’s fears and desires. Advertising is a paid form of persuasive communication – compact 30-second arguments – conveyed through the media by an identified sponsor (→ Persuasion). Marketers use advertising to create awareness, to inform, and to position their goods and services as they attempt to convince consumers that their brands are preferable to the competition. Advertisers use verbal (commonly referred to as “copy”) and visual information to generate certain feelings within audiences. Specifically, advertisers use → stereotypes, symbols, and narrative devices to evoke these reactions.

Emotion is often defined as strong feelings or an aroused mental state directed toward a specific object. Emotions are manifested cognitively, behaviorally, and physiologically (→ Emotion). There are several *competing conceptualizations of emotion*. In the 1980s, for instance, work in consumer behavior, borrowing from discrete emotion models, identified several basic emotions such as joy, elation, fear, and surprise. More recent work has found that fundamental emotions map within a two-dimensional model consisting of arousal and pleasure. It is generally thought that emotion is responsible for the human propensity to move toward stimuli and situations that are pleasurable and to move away from or avoid information that signals danger. Current research suggests that emotion colors most experiences and influences many decisions.

During the 1980s, consumer behavior researchers also reported that attitude toward the ad – the feelings consumers experience when viewing an ad – could both directly and indirectly influence thoughts and feelings toward the brand as well as purchase intention, especially for low-involvement and previously unknown products. The value of emotion in advertising is increasing as research continues to show, especially in the area of brain imaging, that emotion influences much of the consumer decision process. Not surprisingly, some of the most memorable commercials are those that evoked powerful feelings.

## HISTORY

Early advertising was not as emotion-evoking as it is today. From the beginnings of modern advertising through the early 1900s, advertising was chiefly informational in nature. Ads were simple and consisted primarily of text, much like today’s classified ads, as advertisers announced new services or the availability of products and informed potential consumers how to procure those products. As advertising developed into a profession during the second half of the nineteenth century, the *AIDA approach* (attention, interest, desire, and action), a hierarchy-of-effects model, guided much advertising thinking. Desire represented the emotional component of the persuasion process that was considered necessary to move consumers to take action. Much training in advertising and persuasion-based professions such as advertising sales continues to utilize AIDA-type models (→ Advertising as Persuasion).

In the early 1900s the look of advertising was altered by printing technology as well as by several creative directors who believed it was important to use images to evoke feelings, for example of status and patriotism (→ Printing, History of). Glossy magazine ads for Cadillac emphasized the status and prestige associated with ownership of the automobile.

The diffusion of → television in the 1950s represented a powerful means of *combining images and audio* in commercial messages to evoke emotions. An early commercial for the pain reliever Anacin in the US, notably annoying though highly successful, anecdotally gave viewers a headache as they watched an animated mallet pound repeatedly on-screen. Created by television advertising pioneer, Rosser Reeves, the Anacin commercial is often pointed to as an example that advertising does not have to be liked to be effective. Other successful ad campaigns that annoyed viewers include “Don’t squeeze the Charmin,” featuring Mr Whipple admonishing shoppers not to squeeze toilet tissue in the supermarket, and a campaign for Wisk, the laundry detergent that removed the “Ring around the collar.”

The role of emotion in advertising increased as many products achieved parity and consumer behavior research become more sophisticated. For example, today many commercials for investment brokers such as Merrill Lynch strive to emphasize security and comfort as a means of differentiation.

Emotion plays a significant role in → political advertising as well. Tony Schwartz created several notable political ads that evoked strong emotions about election candidates. In one memorable spot for Lyndon Johnson’s US Presidential re-election, the image of a girl pulling petals from a daisy was juxtaposed with a countdown to a nuclear explosion. The commercial was designed to evoke fear and doubt about the candidacy of Johnson’s opponent, Barry Goldwater. Political advertising can either seek to foster positive feelings toward the sponsoring candidate or to disparage an opponent by evoking fear and distrust. Much research has found negative advertising to be very effective in political campaigns because the negative emotions come to be associated with the targeted candidate.

### COMMON APPEALS

Although advertisers attempt to appeal to a range of emotions that include pleasantness, elation, accomplishment, and guilt, three *emotional appeals* represent the majority of emotional appeals in consumer advertising.

Estimates indicate that up to 50 percent of mainstream consumer advertising is *humor*-based. These messages contain instances of slapstick humor, self-disparaging spokespeople, and funny slice-of-life stories. Humor is thought to work by attracting and maintaining attention, enhancing liking for the brand, and by creating favorable feelings that can become associated with the brand. Not surprisingly, humor is thought to be more effective for low-involvement products. “Where’s the beef?” was a very popular campaign from the mid-1980s that Wendy’s restaurants used to compare its hamburgers to those of its competitors. In the signature commercial, a grandmotherly woman continually asks an employee, “Where’s the beef?”

On the other end of the spectrum, marketers endeavor to persuade consumers by creating *feelings of tension and fear*. Using the concept of fear appeals as in the communication field, ad creators attempt to scare consumers by creating fear and perceptions of threat. As a result, consumers become more vigilant in their search for alternatives to reduce their vulnerability. Usually toward the end of the commercial, the marketer’s brand or service is positioned as a preferred alternative to reduce the threat and to protect oneself and the family. Products such as auto and home insurance,

retirement savings, and theft prevention devices are often advocated using threatening appeals. Ads for personal-care products also employ fear appeals. For many decades, Listerine executives emphasized the social ostracism, loss of romance, and dead-end careers caused by halitosis. The mouthwash was touted as a proven way to avoid such undesirable outcomes (→ Fear Induction through Media Content).

It is estimated that from 10 to 20 percent of mainstream advertising contains *sexual images and references*. These images mostly consist of images of scantily clad women in provocative poses or couples in heated embraces. Research shows that sexual information evokes an emotional response that, depending on the receiver and contextual variables, is positively arousing. Sexy images attract and maintain attention and often serve to communicate a compelling benefit of buying and using a brand. Research supports a distraction hypothesis such that sexual information is more likely to be remembered at the expense of brand information (e.g., brand name, headlines). However, consistent use of ads that contain sex can serve to imbue brand identities with sexual meaning. For example, Calvin Klein and Victoria's Secret are brands that evoke sexual thoughts and feelings because of their long-running use of sexualized ad images. As expected, sexual appeals most often appear in ads for low-involvement and expressive products (e.g., fashion, fragrance, entertainment).

### MEASURING EMOTIONAL RESPONSES

Emotional reactions to advertising are assessed several ways in industry and academic research. The most common method involves asking participants to view a commercial and to respond to semantic differential items, adjective checklists, or visual representations of states of feeling. In some industry research settings, commonly referred to as copy-testing, viewers are verbally asked to rate their feelings on an interval scale. A closely related method, often used in political advertising research, requires respondents to register their feelings in real time by turning a dial. A criticism of these methods is that they introduce potential bias and inaccuracy because they force viewers to cognitively assess their emotional state.

To avoid response bias, researchers have increasingly employed physiological indicators to assess emotion. Feelings can be measured by monitoring perspiration (e.g., galvanic skin response), facial muscle contractions, pupil dilation, and heart rate. Although these methods are costly and require expertise to administer, they are considered to offer a more reliable reflection of the emotional responses consumers experience when viewing advertising compared to paper-and-pencil-based measures (→ Advertising Effectiveness, Measurement of; Research Methods).

More recently, researchers have begun to look to *brain science and brain imaging* to assess emotion in response to advertising. Magnetic resonance imaging (MRI) technology is used to determine areas of the brain that are stimulated by certain advertising features. Such methods are promising but prohibitive to most researchers because of cost and lack of availability for this type of research. However, brain imaging and other advanced methods answer calls from within the field, from both practitioners and scholars, to better understand the role of emotion and consumer response. For example, in 2003 the Advertising Research Foundation joined with the American Association of Advertising

Agencies to sponsor research designed to enhance emotion assessment and to increase understanding of the role of emotion in the consumer behavior process.

## **Advertising, Endorsement in**

*Barbara A. Lafferty*

*University of South Florida*

In the fields of consumer research, communications, and → persuasion, few concepts have been studied more over the decades than that of endorsers in advertisements. An endorser can broadly be defined as any individual who appears in an advertisement as a spokesperson for that product. The endorser can be a well-known actor, athlete, or any other person with celebrity status (→ Celebrity Culture; Stars), or another perceived expert such as a doctor, a scientist, or even the CEO of a firm. Using credible or celebrity endorsers to promote the product is a popular advertising technique used worldwide to attract → attention to the ad, enhance the persuasiveness of the message, increase recall of the ad, and make the brand stand apart from competitive products.

The origins of endorsers in advertisements can be traced to source credibility research in social psychology (Hovland & Weiss 1951–1952; Hovland et al. 1953; → Credibility Effects; Hovland, Carl I.). According to Hovland's model, the effectiveness of a message depends on the expertness and trustworthiness of the source. *Expertness* is defined as the perceived ability of the source (endorser) to make valid assertions. *Trustworthiness* is defined as the perceived willingness of the source to make valid assertions. The expertise and trustworthiness of an endorser in an ad are the two most important dimensions to credibility. An endorser that is seen as knowledgeable, someone with expertise, is more persuasive than one with less expertise. However, the influence of an expert endorser will be diminished if the person is seen as untrustworthy, i.e., dishonest, unethical, or unbelievable.

A third dimension, *attractiveness*, is sometimes associated with credible endorsers. The roots of source attractiveness also trace back to social psychological research. McGuire's (1985) model proposed that a message is more effective if the source is familiar, likeable, and/or similar to the receiver (consumer). *Familiarity* is knowledge about the endorser through exposure; *likeability* is affection for the endorser as a result of his or her physical appearance and behavior; and *similarity* is the supposed resemblance between the endorser and the consumer. If the endorser is seen as attractive to the consumer then persuasiveness is enhanced.

To a lesser extent, the dimension of *power* has been associated with endorsers in advertisements, but little work has been done with this construct. Power is the extent to which the endorser is perceived as having control over positive or negative sanctions and the ability to monitor whether or not the recipient accepts the endorser's position.

Over the decades, research has confirmed that expertise and trustworthiness are important dimensions of credible endorsers in advertisements. Attractiveness also has been found to be an important dimension, but not in every case. Ohanian (1991) found that attractiveness was not as strong as expertise when respondents indicated their intent to purchase a product. Other research found that endorser attractiveness enhances evaluations of the product when the attractiveness of the endorser was related to the product, as in the case of shampoo or cosmetics (Petty & Wegener 1985; Kamins 1990).

Beyond the expertise, trustworthiness, and attractiveness that the endorser brings to the brand, there are many culturally acquired meanings that are associated with the endorser that can explain why some celebrity endorsers work better than others. According to McCracken (1989), meaning is transferred from the endorser to the product on the basis of the roles they assume in their careers as well as their gender, age, status, personality, and lifestyle.

More recent research on endorsers indicates that while credible endorsers can influence perceptions of the advertisement and indirectly influence perceptions of the brand in a positive manner, the credibility of the company exerts a stronger direct effect on consumer's attitudes toward the advertisement, the brand, and their likelihood of purchasing the product (Lafferty & Goldsmith 1999).

While the use of endorsers is widespread and their ability to enhance the communication process is generally agreed upon, using endorsers is not without risks. A celebrity's behavior may embarrass the company and may compromise the → image of the brand that the endorser is promoting. Many endorsers have a morals clause in their contract

that allows the company to terminate the contract if a controversy arises. In addition, to insure the optimal success of an endorser, it is important that the endorser has star power but does not overshadow the product. The endorser also should be relevant to the advertiser's audience for that product. Finally, if an endorser is the spokesperson for too many products or companies, the endorser becomes overexposed. This can be detrimental to both the endorser and the companies.

## **Advertising Ethics**

*Jef I. Richards*

*University of Texas at Austin*

Simply stated, “ethics” refers to standards of conduct derived from moral values. Those standards vary greatly from discipline to discipline and person to person, and even philosophers approach ethics from multiple directions (Spence & Van Heekeren 2005, 8). But in its most basic form these are concepts of right and wrong behavior, not limited to what is required by law (Drumwright & Murphy 2004; → Communication and Law; Advertising Law and Regulation). Law deals with only a limited range of “wrong” behavior, especially in the context of → advertising. In the US, for instance, the First

Amendment, along with practical enforcement limitations, prevent it from addressing most issues (→ Right to Communicate; Freedom of Communication). For the remainder, only the ethical standards of those involved in the advertising process stand as protection for consumers.

Public perception of advertising often is that “ethics” is a concept foreign to its practitioners. An annual “honesty and ethics” poll by Gallup consistently finds the public ranks advertising among the least ethical professions (e.g., Saad 2006). Indeed, study after study consistently finds that about 70 percent of consumers think that advertising often is untruthful (Calfee & Ringold 1994; → Truth and Media Content). This perceived ethical poverty, not surprisingly, leads to widely varying concerns and criticisms.

Whether or not advertising is conducted in an ethical manner ultimately is judged by the harm, or perceived harm, it does to consumers and to society as a whole (→ Media Effects). Advertising is criticized as causing people to buy products for which they have no need, manipulating the consumer, contributing to stereotyping (→ Stereotypes; Social Stereotyping and Communication), demeaning women (→ Women in the Media, Images of), and preying on children (→ Media Use by Children), along with a long list of other negative social impacts. Although some effects are intended by its creators, many or even most are potentially unintended consequences (Pollay 1986).

### INTENDED EFFECTS

Concerns about the intended effects tend to revolve around the manipulative potential of advertising. The distinction between advertising as → *information*, as → *persuasion*, and as *manipulation* is fundamental to assessing this impact on the → audience. In fact, research has shown that most advertisements contain few informational cues like price, quality, contents, etc. Informing consumers puts the decision-making power in their hands, while persuasion or manipulation tend to move that power progressively toward the advertiser. Besides the obvious fact that such a shift can negate consumers’ free will, a free market economy is erected on the principle of *consumer sovereignty*, whereby consumers hold decision-making power in the marketplace, so this arguably would undermine the entire economic system.

There is significant debate about whether advertising is sufficiently influential as to cause such negative effects (→ Advertising Effectiveness; Advertising Effectiveness, Measurement of), just as there are questions regarding media effects generally. It often is suggested that advertising creates wants or desires in consumers, but others counter that it merely helps to satisfy pre-existing wants. Consistent with → third-person effects theory, research indicates that people do tend to overestimate the effects of advertising (Gunther & Thorson 1992).

Because the power of advertising is subject to debate, criticisms related to these intended effects often dwell on the advertiser’s purpose or method. The ethics of forgoing facts and information in favor of reliance on images and emotional associations, for example, has received considerable attention. The most extreme example is the use of subliminal appeals, to bypass conscious thought processes. But evidence indicates that subliminal stimuli have no impact on purchase behavior.

One other aspect of intended effects looks at the product or service the advertiser intends to sell. Consequently, whether or not advertising should be used to sell ostensibly

harmful products like tobacco, alcohol, etc., has been subject to exhaustive exploration among scholars (e.g., Pollay 1993). However, most research and scholarly attention are centered on various effects that likely were not intended by the advertiser.

### UNINTENDED EFFECTS

It is the “side-effects” of advertising that most concern many observers, and most interest many researchers. Because advertising is so pervasive a part of modern cultural experience, with some clear influence on that culture (→ Culture: Definitions and Concepts), discussion of those effects comes from numerous disciplines. Some health researchers, for example, study what → direct-to-consumer advertising is doing to the pressure placed by patients on their physicians, while some scholars in women’s studies explore the impact of advertising on women’s self-images. Indeed, new issues arise regularly, as new promotional techniques, new products, and new media are introduced to society that might present some new risk to the audience.

Some people are more at risk than others, thereby placing a greater ethical burden on advertisers who target those people. While the power of advertising to affect consumers individually and collectively is uncertain, it is generally recognized that some categories of consumer are more susceptible to those effects. The elderly, the immobile, the transient, the poor, and the poorly educated are such groups. Probably the most studied “susceptible” group, though, is children.

Children have become a serious target for advertisers in recent years, and because of their minimal cognitive and social development there is evidence that they may be more easily swayed than adults and that the youngest of them do not understand the selling purpose of advertising (Roedder John 1999). Schools, in fact, have become a major vehicle for reaching youth, as manufacturers are discovering more and more means by which to promote their products within the halls and on the grounds of those child-centered venues (→ Advertising: Responses across the Life-Span; Developmental Communication).

Beyond attention to vulnerable populations there is a variety of issues entailing advertising’s effects on other segments of society, or on society as a whole. Because advertising’s purpose generally is to sell products, the collective effect of this effort is seen as promoting consumption and a consumer lifestyle. This, in turn, may lead to depletion of our natural resources and an inversion of the free market structure by increasing demand and, again, shifting power from the consumer to the supplier.

A corollary of this is that advertising contributes to what many feel is a serious weakness of modern society: materialism. As clear as this negative consequence of advertising may appear to the casual observer, it is not without arguments to the contrary. Schudson (1984), for example, presents evidence that society is not as materialistic as commonly believed, including the fact that the majority of retail sales occur during the weeks just before Christmas as products are purchased for gift-giving.

Other prospective effects not typically intended by advertisers include the stereotyped portrayals of gender and racial roles, ethnic cultures, professions, and so forth (→ Stereotyping and the Media; Sex Role Stereotypes in the Media). This is a complicated topic because stereotyping is efficient communication, it aids in targeting groups of

consumers, and it can be used to humorous effect, but it also can create or perpetuate negative beliefs about the depicted type.

Advertising also is claimed to affect value systems (→ Attitudes, Values, and Beliefs, Media Effects on), including the dilution of cultural values, especially where advertising from first world countries is exported to the third world. But related to that is the concern that traditional values (e.g., modesty) even within the first world are diminished by the prevalence of modern values like the sexual sell. And the fact that advertising often uses poor grammar, misspellings, and other linguistic convolutions leads to concerns about its potential for polluting language, as well.

Although the list of suspected effects is effectively endless, with new topics added almost daily, one other issue is particularly worthy of mention. Because advertising funds many media, along with the news and entertainment content they carry, much attention has been given to the potential for abusive influence by advertisers (Baker 1994). A concern is that because the media rely on advertisers, of course, they may be told to exclude certain content under threat of losing future financial support. But perhaps an even greater concern is that the media may self-censor to avoid offending advertisers, even without overt influence. The audience, as a result, may be receiving highly filtered or even biased news and entertainment (→ Bias in the News). This criticism, too, has been subject to counterargument (→ Media Production and Content).

## **DEVELOPING AND PLACING ADVERTISEMENTS**

As advertising has developed more sophistication, advertisers and their agencies have become more advanced in their collection and use of consumer data. Once the province of those engaged in direct mail advertising, data mining is now a key to many print, broadcast, and online advertising campaigns. The methods by which advertisers collect that information, and the uses to which it is put, have grabbed public attention and even aroused fear. As children became serious users of the → Internet parents became especially concerned about advertisers “talking” to the youngest members of their households, since children can be more willing to disclose private facts about themselves and their families. And when advertisers began sharing data with their “marketing partners,” to build enormous databases with hundreds of pieces of information about individual consumers, concerns that advertisers might lack ethical self-restraint resulted in law-makers and regulators taking a closer look at these practices.

Related to these growing worries over privacy is the growing annoyance over advertisers’ methods that intrude into consumers’ private lives. Telemarketing, unsolicited “junk” mail, and their Internet counterparts, spam and pop-up advertisements, all have provoked articles alleging advertisers have crossed some ethical line. A number of laws have resulted to deal with these offenses (→ Internet Law and Regulation), as the result of arguments and, in some cases, research showing that consumers are offended by these techniques.

Even the billing practices of advertising agencies have garnered major attention in the context of ethics. Not long ago the head of a major advertising agency was found guilty of over-billing the government, which resulted in her receiving jail time and being ordered to write a code of ethics. General business ethics, then, also plays a role in the ethics of advertising.

## THE BROADER VIEW

Most research dealing with advertising ethics focuses on a specific effect or criticism of advertising, like those above, rather than studying the broad ethical principles or codes. There is a stream of research that looks at whether or not advertising professionals are concerned about ethics (Drumwright & Murphy 2004), but relatively little has been done in that area and the results are mixed. The Catholic church even conducted research into whether or not advertising is ethical, and likewise drew conclusions that were both positive and negative (Pontifical Council for Social Communication 1997).

Because much of this deals with policy and societal values – what should be, rather than what is – a large portion of the research in this area is critical, qualitative, even legal, rather than quantitative in nature. This is a difficult area of research, because the issues often evoke strong emotions even in the researchers. Some of those studies clearly are conducted with a priori agendas. Therefore, it is no surprise that conclusions are unclear. But because advertising touches every aspect of society, and appears to have great cultural influence, people from a broad range of disciplines obviously believe it is important that advertising be handled responsibly.

## Advertising Frequency and Timing

Michael Halleemann

Gruner + Jahr AG & Co. KG

The frequency and timing of advertising message exposures plays an important role in advertising campaign management, specifically media planning. However, when planning an advertising campaign, this is not as important as addressing questions about the advertising goal (what is to be achieved), the target groups (who is to be reached), and the budget (amount). The question at the heart of the overall strategy is how many exposures are ideally needed to reach a target person and within what time frame (→ Advertisement Campaign Management; Advertising Strategies; Media Planning).

A number of restrictions must be faced when resolving this question: the budget is limited, the time frame of the advertising campaign is often determined by exterior circumstances, the chosen media are not endlessly available, etc. Determination of the exposure frequency and timing is also closely linked to other elements of the media schedule. Generally though, this is a multilayered, interactive, and, in the ideal case, integrated process. In practice, the decisions of media planners are strongly influenced by their own experiences and the standard work processes in their companies. However, there are a whole range of supportive tools and theories.

### ADVERTISING EXPOSURE AND COVERAGE IN MEDIA PLANNING

The number of times a target person is exposed to an advertisement is by no means the only control parameter used in media planning. One of the most important *planning parameters* is the total gross number of exposures, also known as gross rating points (GRPs), i.e., the total number of exposures achieved with one advertising campaign, usually expressed as a percentage of the target group but written without the percentage sign. If, for example, a target group of persons aged between 20 and 40 years is reached with 200 GRPs, then this means that each person has an average of two exposures to the ad. However, this provides no information about how many exposures reach each individual. Even people with zero exposures are included in this calculation. In media planning practice, only the average number of exposures, based on the total number of persons reached, is used. This opportunity-to-see (OTS) parameter is obtained by dividing the total number of exposures by the net coverage or the total number of persons

who were reached at least once. OTS is therefore the average number of times the target persons are reached by an advertising campaign.

A more detailed breakdown provides *information about the exposure distribution*, i.e., the exact number of persons reached by what dosage of exposures. This exposure distribution can form the basis for defining “effective coverage” if one assumes, for instance, that a certain number of exposures is necessary in order to achieve a specific advertising goal. Only a certain number or dosage of exposures, for instance three or more exposures, is then taken into account in the effective coverage. All of these parameters can then be used as a control parameter for media planning, when addressing the issue of which advertising agent in what genre of media is selected and occupied – in other words, which TV station, and which programs and advertising blocks are chosen for broadcasting the spots; in which → magazines ads are placed, etc. Large institutionalized market media studies or electronic measuring devices such as → “people-meters” form the basis of the media plans, which also supply the basic data on coverage and exposure build-up. The measures and processed data are then incorporated into media planning programs. The probable use and probability distribution, frequently the binominal model, are often used as a reference. Here, the intermedial or cross-media genre planning poses an ongoing challenge, in which the exposure levels of various media must be compared and evaluated. The type and quality of the planning data prepared for various advertising media also vary considerably, and very heavily influence the planning process.

### HOW MANY EXPOSURES ARE NECESSARY?

With regard to the planning requirements for frequencies of exposure and timing, it is difficult to *define general rules*. Time and again, research projects have confirmed the tremendous individual-level effects of advertising. A lot of studies from the 1960s and 1970s emphasized the amount of time and number of exposures. “Needless to say, the results of this research have been inconclusive and sometimes contradictory,” state Wicken and Solomon (1998). Nevertheless, media agencies have rules of thumb, e.g., for the desired advertising pressure in an advertising medium during a campaign in the shape of GRPs or OTS per week or month. These rules of thumb have most certainly arisen from everyday experience, from “heuristic” insights, in the best possible sense. However, they do not remain constant, either in terms of the time factor or by international comparison. After all, media environments are subject to fundamental and ever faster processes of transformation that are characterized by different cultural and technical starting conditions.

Thus, suggestions for achieving advertising pressure in specific cases are generally stated quite broadly. In their *annotated bibliography* of condensed research on advertising effects over a quarter of a century, Schönbach et al. (2002) write that the optimal frequency of exposure to an advertisement is somewhere between 2 and 20. However, the majority of research summaries that make a statement are probably closer to three or four exposures. A large number of individual studies also suggest that three or more exposures is a good control parameter for “effective coverage.” On the other hand, one can assume that if an individual is subjected to a large number of exposures, it will have a *wear-out effect* on him or her (Wicken & Solomon 1982). Too much of the same advertising leads to saturation, boredom, no longer noticing an ad, or even – in rare cases, presumably – to

reactance. As a rule, too much exposure to the same ad will no longer have an effect and, in financial terms, will simply lead to overspending. Good advertising campaigns try to avoid such wear-out effects by clearly changing the motif, mostly within the context of a general theme and a solid degree of recognition.

### **EFFECTIVE FREQUENCY VERSUS REGENCY PLANNING**

The theory that a consumer requires several exposures for an ad to have a certain effect ultimately draws on scholarly thinking and the assumption that there exists an effect or response curve. One basically assumes that every exposure produces a certain effect. This usually leads to a diminishing rise in the saturation function, which corresponds to the law of declining marginal utility.

In addition to the theory of effective frequency, another partly competing theory called “recency planning,” conceived by Erwin Ephron (1997), was first introduced in the mid-1990s. The theory of recency planning is essentially concerned with the sales promotion function of advertising, and it has played a major role in media planning and research in the United States, in particular. It is based on the assumption that advertising is most effective when a consumer wants to buy or replace a certain product. Hence, from this perspective, the receiver determines the effectiveness of the exposures. Advertising messages are most effective shortly before a potential buyer makes his or her purchase decision. The first exposure is the most effective. In recency planning it is, therefore, not important whether a certain frequency of exposure is achieved, but rather whether the consumer is driven in the right direction prior to an act of purchasing. In the case of doubt, one exposure is sufficient. And since one is generally unaware when the purchasing act will take place, the recency model *advocates continuous advertising* and an advertising plan over short periods of time. With its recommendation for week-based advertising plans, the recency planning model harmonizes with measuring instruments such as John Philip Jones’s short-term advertising strength formula (STAS), which, to put it succinctly, measures the success of advertising according to the weekly sales following the advertising exposure (Jones 1995; Ephron 1997; McDonald 2004).

The argument behind this approach is not so much the declining efficiency of multiple exposures with a number of people as the higher efficiency of exposures with people who would not have been reached otherwise. An advertising plan based on this view would not be concerned with trying to achieve a certain effective frequency within a given time frame, but would instead be focused on trying to reach as many people as possible within that period. In other words, the recency model demands as high a coverage as possible. It is driven by very strong, short-term, sales-oriented research and an “instrument single source” household panel for measuring effectiveness.

Yet the discussion is not limited to a debate between effective frequency and recency planning. According to Colin McDonald (2004), it merely adopts a “new level of complexity.” Instead of merely applying rules of thumb, the planner’s or media researcher’s task is to optimize advertising measures in individual cases. Needless to say, certain rules apply that are not only aimed at directly conveying impetuses to buy, but also, in the classical sense, to conveying a message, as with “instruction.” This message might be concerned with the creation of an image and brand management or establishing

purchase preferences (→ Branding). Here, product launches, repositioning, or simply “new ideas” constitute special cases. Results from panel research also confirm that, e.g., when buying a car, new exposures that build on previous exposures over a longer period of time are considerably more effective than exposures that have no antecedents (Buhr & Halleemann 2005). At the same time, many studies have demonstrated that purchase decisions and product uses are strongly influenced by attitudes, brand preferences, images, etc. However, from a purely short-term perspective, the influence of advertising on these long-term tendencies that flow into the brand depot can hardly be measured.

### TIMING AND MONITORING ADVERTISING SUCCESS

To measure the effect of their advertising campaigns, many advertisers and agencies perform ongoing *advertising tracking*, in which indicators such as ad awareness, a → brand’s degree of popularity, → images, willingness to buy, etc. are asked about. Advertising recall or recognition tests are conducted to measure how well an ad is remembered. The trend of the measurement data allows one to draw conclusions about the effectiveness of advertising campaigns, the need for a change of motif, or the level of advertising pressure needed.

Modeling aimed at trying to establish a statistical link between advertising effectiveness indicators and the budget is also frequently carried out. Ideally, sales modeling will show how much advertising pressure (in terms of GRPs) is necessary, how long-term its effect is (“ad stock”), and in which periods one should advertise in order to support sales.

Modeling also offers clues about the *timing of advertising*. There are no general rules concerning this. Recency planning clearly recommends continuous advertising over very short planning periods. The only exception would be purely seasonal products, for which there are no buyers on the market during certain periods, e.g., Christmas trees. Yet so-called “flighting” is very common. This is when there are several clearly defined advertising phases per year, with intervals in between. Flightings are often used when budgetary constraints make it impossible to conduct continuous advertising. Special cases include “pulsing,” the fast interchange between high and low advertising pressure and intervals; “waving,” with rising and falling advertising pressure; as well as the “burst,” a short, massive advertising campaign, used, for instance, for launching a product. “Frontloading” is often used with product launches, i.e., the campaign starts with high advertising pressure, which then steadily declines. But the opposite, “backloading,” which is the steady increase of advertising pressure in order to make an advertising campaign more dramatic, is also possible (Hofsäss & Engel 2003).

Great importance is often assigned to *observing competitors’ advertisements*. If it is not possible to keep pace with the main competitor and to achieve a high share of advertising (share of spending) or share of voice (share of exposures), we recommend a niche strategy of periodic evasions, with little or no active competition. Based on this view of achieving a high share of advertising in order not to be completely engulfed by the competitor, the “flighting” strategy of applying short, intense advertising pressure is a logical choice. Yet this theory is contentious and has in any case not been empirically substantiated.

There is certainly no ideal method of planning advertising pressure and timing. Both are closely interlinked and interdependent. The experience of practitioners in media

agencies and of major advertisers plays a large role, supported by the continuous observation of campaigns with tracking, panel research, and statistical modeling as a control instrument of increasing importance.

## **Advertising: Global Industry**

*John Sinclair*

*University of Melbourne*

Advertising is the key link in the mutually sustained global expansion of consumer goods and services industries and the media of communication that carry their commercial messages. In this structural context, → advertising is much more than the → images and brand names (→ Brands; Branding) that form the surface of → consumer culture. It is the life-blood of the media, and the motive force behind media industry development. Further, it is the publicly most visible dimension of → marketing, that is, the cultural industry that seeks to connect the producers of consumer goods and services with their potential markets, and in fact, to bring those markets into being. This integrated institutional relationship between production and consumption, with the advertising agency at its center, may be referred to as the “manufacturing–marketing–media complex.”

Advertising agencies produce and place advertising for their “clients,” the consumer goods or service companies that are the actual advertisers (not just “manufacturers”).

However, although the clients pay their “agents” for these services, agencies also derive income directly or indirectly from the media in the form of a sales commission paid in consideration of the media space and time, such as newspaper pages or television “spots,” that the agencies purchase on behalf of their clients (→ Advertising, Economics of).

## **FROM THE MULTINATIONAL TO THE GLOBAL ERA**

The period since World War II has seen the internationalization of the advertising industry proceed in tandem with the emergence of the “multinational,” now global, consumer goods corporation, as well as with the international expansion of new media by their capacity to carry commercial messages to → audiences. US-based advertising agencies in particular were backed by “common account” agreements with their clients from their home market, that is, the advertisers would have the same agency act for them in all the foreign markets in which they were becoming active. As well as arriving with such clients, US agencies were able to quickly dominate the advertising industries of the countries they entered because of their experience with the relatively new medium of television, the advertising medium par excellence.

By the 1970s, the influx of US advertising agencies had provoked some local resistance, and they became one of the targets of the rhetoric against “cultural imperialism” in that decade (→ Cultural Imperialism Theories). Subsequent expansion then had to proceed more through joint ventures in conjunction with national agencies. At this stage, internationalization was largely driven by US-based national corporations that built up a number of overseas subsidiaries and hence transformed themselves into “multinational” or “transnational” corporations. However, in the era of globalization, corporations no longer necessarily have a home in any one particular country, in terms of either their management or their capital investment. Globalization is marked by an interpenetration of different sources of capital and complexity of corporate structure and management that transcend any single national base (→ Globalization Theories). This is particularly well illustrated by the advertising industry, above all in the emergence of the “megagroups,” or groups of global advertising agencies.

## **ARCHITECTURE OF THE GLOBAL ADVERTISING INDUSTRY**

Megagroups are organizational and financial structures under which major international advertising agency networks, global corporations in themselves, have been consolidated so they can be coordinated at a higher level of management. This corporate architecture is probably unique to the advertising industry, as it arises from the history of the advertising business itself, and the patterns of growth it has assumed at the international level in recent decades.

Although the very first of these groups to be formed was in the US in the 1960s (the Interpublic Group), it was the British agencies Saatchi & Saatchi and WPP that transformed the industry internationally in the 1980s. Advertising agencies had traditionally been owned by their principals and/or staff, but this imposed limits on their growth in the global era. What the British agencies did was to raise capital by making themselves into

Table 1 Global architecture of the advertising industry

Megagroup	Country of origin	Media buying agencies and “creatives”
Omnicom	US	BBDO, DDB, TBWA, <i>OMD</i>
WPP	UK	JWT, Ogilvy & Mather, Young & Rubicam, Grey, <i>Group M</i>
Interpublic	US	McCann Erickson, FCB, Lowe, <i>Universal McCann</i>
Publicis	France	Saatchi & Saatchi, Leo Burnett, <i>Starcom, Zenith Optimedia</i>
Dentsu	Japan	Dentsu, Dentsu Young & Rubicam (+ 15% Publicis)
Havas	France	Euro RSCG, Arnold, <i>MPG</i>

Note: “Creatives” are listed in italics.

Source: *Advertising Age* (2006)

public companies, which then funded the acquisition of other agencies. Thus, WPP famously bought up two of the biggest and best-known US-based agencies, J. Walter Thompson (now JWT) in 1987 and Ogilvy & Mather in 1988. Around the same time, three big US agencies joined with each other to form Omnicom, while the French-based agencies Havas and Publicis also formed international groups in the 1990s.

Apart from the growth imperative, these epoch-making moves were motivated by the need to manage “client conflict” in a world in which the advertising industry was serving fewer but bigger clients on a global basis. Such advertisers do not tolerate a conflict of interest in which their advertising agency is also handling an account for one of their competitors. The global group is a solution to this problem – for example, Colgate and Unilever are competing clients, but the WPP group can keep them both, with Young & Rubicam handling Colgate, while Unilever goes through Ogilvy & Mather.

Table 1 summarizes the global architecture of the advertising industry, listing the groups in their order of size, as of mid-2006. The huge Japanese agency Dentsu has been included, for although it operates as a single agency, it has a share in Publicis, as well as a longstanding joint venture with Young & Rubicam.

The division of labor between the two key advertising functions of “creative” and media buying agencies has been consolidating in separate businesses over the last decade, that is, respectively, the production of advertising campaigns (→ Advertisement Campaign Management) and the placing of advertising in the media. The former is more in accordance with everyday perceptions of what advertising agencies do, but the strategic purchase of media space and time by “media agencies” is the most traditional and consequential of the whole range of functions that specialized agencies now perform for clients. Thus, in addition, the global groups characteristically include companies in related marketing disciplines, such as → public relations, and perhaps more specific forms of advertising, such as direct mail and, of increasing importance, “interactive” or Internet advertising (→ Direct-to-Consumer Advertising).

## ISSUES IN GLOBAL ADVERTISING

The first issue is the impact of trends in the advertising industry upon media development throughout the world. In an era in which advertisers have become more concerned

to measure the results of their advertising expenditure, and skeptical about the ability of traditional media, especially broadcast television, to deliver such results, the flow of advertising expenditure toward new media, notably subscription television (“pay-TV”) and, more dramatically, the Internet, is undercutting the “mass” media we have known in the past. Furthermore, there is growing evidence that newer forms of commercialization are blurring the traditional line between advertising and information/entertainment content. Agencies are now assisting advertisers with producing “branded content,” and advising on product placement, sponsorship, and other forms of nonadvertising promotion via the media.

Even before the advent of the multichannel environment offered by pay-TV, we had entered a “post-broadcast” era in which media choices became much more tailored to individuals and less social. Following cable and direct satellite services (→ Cable Television; Satellite Television), personal digital recorders (PDRs) have now appeared on the horizon, the latest in the spread of ever more interactive, mobile, and individuated modes or “platforms” for accessing audiovisual information and entertainment. For advertisers, this means ever more precise and personalized targeting of prospective consumers. The consequent drift to nonadvertising forms of promotion is tending to undermine the basic, traditional business model on which the relationship between advertisers and the media has rested since the advent of commercial broadcasting, namely, with the media amassing audiences for sale to advertisers, and instead, the trend will propel growth in new means of marketing delivery, particularly the mobile phone, the Internet, and interactive TV. This implies on the one hand a more fragmented society, but on the other, a more interactive relationship between producers and consumers.

Second, there are issues surrounding the relationships between advertisers and their agencies. This relates to the degree to which global advertisers dominate in a given national market, and still favor common account arrangements, now referred to as “global alignment.” Such a practice has the effect of locking out local or national agencies from ever winning the large, lucrative accounts of advertisers that are aligned globally with the global agencies, unless the local or national agencies themselves become affiliated with one of the global megagroups.

Either way, globalization is having an impact. However, also of interest is the precise pattern and extent of global–local interpenetration within the main agencies in a given country. The joint venture arrangements that characterized the 1970s continue to provide mutual benefits: the local agencies gain access to the global clients, while the global agency acquires local cultural knowledge. Yet perhaps it is no longer meaningful to distinguish between global and local agencies at all, in an era in which global agencies can make campaigns look local, and vice versa.

A third set of issues is more concerned with cultural questions of how advertisers and their agencies are approaching their markets. Of particular interest are the precise ways in which global products and advertising for them are being “glocalized,” that is, modified in accordance with local culture, including language. Contrary to theorists’ fears, global advertisers and agencies have not created a homogeneous world. Some inherently global products and services can be standardized, or advertised with the same global campaign in all markets, such as airlines. Most others require globalization, or an even more tailored approach, taking account of not just national cultural differences, but religious or rural/

urban differences. In this respect, we can see how culture, especially language and religion, forms a bastion against global advertising, but also how global advertising seeks to camouflage itself behind local cultures.

A fourth set of issues concerns the capacity of governments to properly regulate advertising in the global era (→ Advertising Law and Regulation), with its pressures for free trade and prevailing neo-liberal ideology favoring industry self-regulation, in spite of current public policy questions such as the role attributable to advertising in the problem of childhood obesity.

## PROBLEMATICS AND PROSPECTS

With the advent in social theory of poststructuralism and postmodernism (→ Postmodernism and Communication), the diversification of feminism, and the eclipse of Marxism, much less attention is now paid to advertising than in the heyday of critical work on advertising in the 1970s and 1980s. At that time, there was a social science literature that tended more toward behavioral effects, while a political economy approach pursued the ownership and control of advertisers and their agencies, and analyzed their business strategies (→ Political Economy of the Media). Within a → cultural studies or media studies perspective, there was a concentration on the cultural codes and ideological meanings of advertisements themselves as texts.

In contrast, recent theory and research have largely moved away from the study of advertising as such, and more toward consumer culture in general. In the process, there is also a useful fusion being achieved between the traditionally antagonistic camps of political economy and cultural studies, under the rubric of “cultural economy” (Jackson et al. 2000). There is also a recent “anthropological turn” developing, with anthropologists doing ethnographic fieldwork in advertising agencies, or among consumers and viewers of ads (Malefyt & Moeran 2003).

Although there has not been a truly comprehensive, internationally comparative, and historically contextualized work on the manufacturing–marketing–media complex since Armand Mattelart’s *Advertising international* of 1991, Frith and Mueller’s *Advertising and societies: Global issues* (2003) is a useful guide to the more recent literature.

## Advertising, History of

Liz McFall

Open University

Advertising is a tenacious form. Originating in the commercial impulse to promote sales, versions of what might loosely be termed → “advertising” can no doubt be traced to wherever and whenever surplus product has needed to be disposed of. The proverb “good wine needs no bush,” for instance, is at least 2,000 years old. It refers to the vintner’s practice, common until well into the seventeenth and eighteenth centuries, of hanging shrubs or ivy around the door to indicate wine or beer available for sale within. The sense of the practice contained within the proverb is quite familiar – good products need no extra promotion.

There are probably numerous other instances of advertising-like activity in early history, but usage of the word in its contemporary sense appears to date from the latter part of the sixteenth century. The term “advertise” itself is from the French meaning to inform, warn, or announce. It is not the only term to have been associated with the products and practices of commercial promotion. In the eighteenth and nineteenth centuries, commercial promotion was often described as “puffing,” with the related terms “puff” and “puffery” in widespread use. Other terms, including “blast,” “bubble,” and “push,” were also used to describe commercial efforts to boost sales, although, as in the case of the “South Sea Bubble,” these terms were often associated with speculative, dubious, or fraudulent activity. By the close of the nineteenth century, “advertising” had become the preferred term for the practices, products, and institutions of commercial promotion. The subtle changes in the language of promotion reflect broader changes in the technical and technological arrangements that have made up the institutions, form, and media of the advertising field.

Journalists, historians, and social and cultural theorists have approached advertisements as mirroring dominant values, → attitudes, and habits and thus as prime source material for divining the “spirit” or “pattern” of the age. This view of advertisements as socio-cultural source material has structured critical academic work within the disciplines of communication studies, sociology, and cultural and media studies (→ Critical Theory; Cultural Studies). For a variety of reasons, including the difficulty of gaining access to advertising agencies and sourcing historical evidence concerning working practices, work in these critical traditions has tended to focus upon *form* with advertisements analyzed as “texts” (→ Text and Intertextuality). This has sometimes been at the expense of analysis of the practice of advertising – the production processes, institutions, and media that make up the industry. A broad understanding of the advertising field, however, should encompass both elements.

## INSTITUTIONS

The modern sense of advertising as a commercial promotional endeavor can be traced partly to its institutional origins in attempts in the late sixteenth century to establish bureaus or registry offices where people could come for commercial information. Theophraste Renaudot established the *Bureau d'adresse et de rencontre* in France in 1630 and published one of the first advertising newspapers. This model informed the formation of similar offices and advertising papers in London and across Europe in the eighteenth century. These offices were variously described as centers of "adresse," "intelligence," "discoveries," "encounters," and "advice." By the middle of the eighteenth century, advertising newspapers proliferated across Europe in forms ranging from the state monopoly *Intelligenzblatt* in Prussia to the mixed economy of commercial newspapers in England. The office function, however, was largely superseded by the growing network of coffee houses across countries like England, France, and Prussia (→ Coffee Houses as Public Sphere; Public Opinion).

*Coffee houses* were intrinsically multifunctional, acting as centers for the communication and the exchange of commercial, political, cultural, and educational information as much as social and recreational venues. They played a central role in the development of city financial institutions (most notably Lloyds of London, which famously took its name from a coffee house), sometimes acting as travel agents, insurance agents, hotels, retailers, and what we would probably now call "conference centers." Their main connection, however, was to the press and thus to advertising. The earliest coffee houses distributed → newspapers and acted as reading rooms, some even promoting their own newsheets (→ Newspaper, History of).

Coffee houses were known for their role as forums for rational debate, but their significance as information centers for business and commerce should not be underestimated. Among other things, coffee houses took on the role of the *bureaus d'adresse*, as institutional spaces where commercial activity could be publicized and promoted. They were supported in this endeavor by publishing and/or circulating advertising sheets like the *City Mercuries* and John Houghton's *Collection for the Improvement of Husbandry and Trade*. In London, the production of the *Mercuries* was inextricably linked to the coffee house trade, as coffee houses provided the key institutional mechanism for both gathering information and distributing the papers. Coffee houses were also closely linked to another key player in the early institutional development of advertising; the proprietary medicine trade. Proprietary medicine manufacturers or "quacks" were one of the largest and earliest proponents of advertising and they conducted much of their business through coffee houses, which often displayed and sold their products.

It was out of these early connections to coffee houses and newspapers that the *advertising agency system* developed. The first British advertising agency has been identified as Tayler and Newton, established in 1786. This was followed by Whites in 1800 and then in rapid succession in 1812 by Reynells, Lawson and Barker, and Deacons. These early advertising agencies were very closely linked to the newspaper industry. It has been supposed by historians and theorists of consumption and communication that these early agencies existed not to design or advise upon advertising but simply to sell advertising space in newspapers. While space-selling was a key activity in many early agencies, it is likely that the first agencies took on a broader variety of work than this might suggest.

Surviving archive material shows agencies involved in a number of activities including the distribution of news and newspapers, political parliamentary correspondence, and advice on the design and placing of advertisements. In addition, some nineteenth-century agencies in both Britain and the United States combined the sale of advertising space with a diverse range of services ranging from stationery and bookselling, coffee house trade, insurance, and coal sales to dentistry and undertaking. This diversity of function can be traced in many fields and is a reflection of a very different, pre-professionalized occupational structure. By the early twentieth century, advertising agencies in their recognizable contemporary form had begun to dominate the institutional field, with agencies increasingly offering a broad range of service functions to a number of clients or “accounts” under the “full-service agency” model.

*Full-service* was the term adopted by agencies, including for example James Walter Thompson and NW Ayer in the US and Benson’s in the UK, which sought to offer a complete, professional advertising service. Full-service agencies aimed to provide services that some agencies considered the province of the clients, including research and creative design (involving artwork, layout, and text or “copy”), in addition to account management and media space-buying. Such agencies would typically bill clients for advertising space that they bought at a commission (usually around 15 percent) from the media. Agencies would then retain this commission.

The full-service agency model competed with other institutional arrangements. Until well into the twentieth century, some advertising agencies provided a minimal advertising service, concentrating instead upon offering very low rates for advertising space by “commission splitting” or by bulk buying space, often in obscure, low-circulation journals, a practice known in the industry as “farming.” In addition, some large firms preferred to keep the design of their advertising in-house. By the middle of the twentieth century, the advertising industry had largely settled along the lines of the full-service model. At the end of the century, the institutional field remained dominated by large full-service agencies, but the field retains some diversity with “small-shop” specialist and “boutique” agencies coexisting alongside transnational advertising agencies (TNAAs). The latter are typically the products of long histories of international acquisitions, consolidation, and mega-mergers.

## FORM

Historians differ over the precise dates and status of the first printed advertisements. The word “advertisement” appears in print in the sixteenth century and over newspaper press announcements in the seventeenth century. These early examples were not really “advertisements” as the term is understood today. Rather, as evidenced by the publication in the 1600s of numerous notices of absconding servants, missing spouses, and stolen property under the heading of “advertisements,” the term was roughly interchangeable with “announcement” or “notice”. By the 1700s the heading “advertisement” was deployed in newspapers like the *London Post Man* to refer specifically to particular types of advertisement, for instance publisher’s notices. Other eighteenth-century newspapers, including the *Daily Courant*, disdained advertisements completely, refusing to accept them and referring to paid notices as “impertinences.”

Reservations about *accepting advertisements* had a strong hold on the press until well into the nineteenth century. While newspapers had a vested economic interest in accepting advertisements (as is often the case today, when many newspapers and other media depend upon advertising revenue for their continued existence), this vied with a powerful moral opprobrium. This ambivalent position is illustrated in the draconian regulations many newspapers imposed upon advertisers. The best known of these was the “agate-only” rule, which stipulated that paid advertisements could be accepted but must use only very small, classified typefaces. Advertisements that broke the column rules or featured illustrations were technologically difficult for newspapers to reproduce. This was not the only reason that newspapers were reluctant to accept them: equally important was the view that they were vulgar, frivolous, and anti-competitive. Advertisers used numerous techniques to circumvent these regulations and achieve display effects, for instance by using drop capitals, repetition, and acrostics. A small agate-type advertisement repeated numerous times across columns can be manipulated to produce patterns or spell out other words, and advertisers made inventive use of such techniques.

Although agate-only regulations were relaxed by the early twentieth century, newspapers remained reluctant to admit illustrated advertisements, often either refusing them or admitting them only at prohibitively expensive rates. Partly as a result of this regulative environment, advertisers used *other media* to create visual impact. Trade cards, broadsheets, and posters were used throughout the eighteenth and nineteenth centuries, and these often featured an array of typefaces, visual effects, and illustrations. These advertisements often look “busy” by contemporary standards. Advertisers used a variety of typefaces and borders and often a number of small illustrations in an attempt to stand out. This contrasts with the minimalist styles that came to dominate by the end of the twentieth century, with the widespread association of “white space” with quality and distinction in both press and poster advertising.

In addition to visual display, historical advertisements also feature a range of rhetorical, persuasive devices. The language or “copy” of historical advertisements is often judged “innocent,” “crude,” or merely informative in comparison with contemporary equivalents. It is clear nevertheless that historical advertisements aimed to produce changes in the behavior of their audiences by using a range of different persuasive strategies (→ Persuasion). Pre-twentieth-century advertisements feature such devices as poetry, jokes, puzzles, rhythm, association, endorsement, and emotional blackmail in addition to product information. Samuel Johnson’s eighteenth-century comment regarding “the improper disposition of advertisements,” by which “the noblest objects may be so associated as to be made ridiculous,” reveals the very long historical disapproval of the rhetorical excesses of advertising. Purveyors of persuasive advertising have received steady criticism across the centuries on a variety of grounds including dishonesty, manipulation, vulgarity, and irritation, as well as social, political, economic, and, increasingly, environmental irresponsibility.

## MEDIA

Advertising is an institution that has, throughout its history, utilized a wide range of technologies to allow it to communicate with the public. Contemporary concerns about

the industry's unprecedented saturation of public and private space often center upon the use of new media technologies like radio, television, and the Internet to bring advertising into private, domestic spaces.

In Britain, nineteenth-century commentary in newspapers like *The Times*, in publications like *Punch*, and in short books and essays, combined with various legislative measures designed to regulate outdoor advertising, indicate that this capacity to intrude is not necessarily the province of any particular media technology. Advertising at the time had the capacity to pervade public and private space, urban and rural locations. Specifically, advertisements were posted or painted on walls, streets, windows, bridges, public transport, trees, barns, and cliff-faces. Bill-posters and direct mail also helped to ensure that advertising got into residential domestic spaces. In the early nineteenth century, outdoor advertising was largely unregulated and it is therefore impossible to gauge precise volumes.

Published comment and legislation nevertheless indicate high levels of public awareness of the "nuisance" of outdoor advertising. A series of legislative efforts began with the 1817 Metropolitan Paving Act and the 1839 Metropolitan Police Act, which were both intended to curb street advertising. The *popularity of outdoor advertising* in part reflects the restrictions imposed upon newspaper and periodical advertising. Poster advertising was not only relatively unregulated but offered greater reach and permanence than newspaper advertising. In addition, by the 1820s techniques had developed that allowed the production of large poster displays featuring up to 36 sheets printed up with large woodcut letters and illustrations. Sites for the display of such posters were, however, unregulated and unlicensed, and competition for sites and space within them was fierce. This led to a climate of nuisance bill-posting in which over-sticking, the defacing of private, residential property, and violent confrontations between rival bill-stickers were so commonplace that they became the stuff of urban folklore, immortalized in music hall songs. By the end of the nineteenth century, poster sites increasingly came under the jurisdiction of advertisement contractors who had purchased the exclusive right to particular hoardings. This, allied with an active stance on the enforcement of anti-bill-posting legislation, resulted in a new, more ordered poster display system.

From around the 1830s, gas lanterns were used to illuminate posters and retail premises, and by the 1870s, magic lanterns displays animated advertising messages. By such means, advertising played a significant role in the visual environment of nineteenth-century industrialized cities. Although important, posters were far from the only advertising media in widespread use. *Placard bearers* were also an extensively used form of outdoor advertising. Men, women, and children in smart, brightly colored costumes, carrying boards announcing drapers, pens, whisky, accommodation, exhibitions, and other services and events, were a common urban sight throughout the nineteenth century.

In post-Civil War America, individuals often worked in groups, sometimes sporting a letter or phrase each that linked up to spell out product names or slogans. Alternatively, placard bearers were got up to resemble the object advertised. These human peripatetic advertisements could also take more bizarre forms. "Obtrusive demonstrations," Charles Manby Smith remarked at the time, were commonplace in London, creating "a regiment of foot, with placarded banners; sometimes one of cavalry, with bill-plastered vehicles and bands of music; sometimes it is a phalanx of bottled humanity, crawling about in labeled

triangular phials of wood, corked with woful faces; and sometimes it is all these together, and a great deal more besides" (1853, 279).

Nineteenth-century advertising media also featured some largely forgotten devices and contraptions known as "*advertising machines*" or "*advertising vans*." These mobile devices came in a variety of shapes: globes, pyramids, and mosques shepherded by exotic others described at the time as "hindoos" and "arabs" were popular. Advertising vans varied enormously in shape but the emphasis was on scale and impact. These horse-drawn devices occasioned bitter complaint about the disruption they caused, terrorizing horses and stopping traffic. Contemporary accounts describe vans flanked by drummers, trumpet players, and other colorfully dressed attendants. The use of the term "drummer" to describe, pejoratively, a traveling salesman most likely originates in such displays. These mobile devices were complemented by large stationary devices designed to carry advertisements that stood in busy thoroughfares. Described in Sampson's (1874) history as "hideous glass obelisks," these appear to have fallen into disuse by the end of the century.

Much outdoor advertising was adapted to suit busy urban environments, but other forms traveled further afield. *Advertising clock cabinets* appeared in public houses; flagstones were stenciled; envelopes, notepaper, sails and bathing machines in coastal resorts, railway embankments, and even copper coins carried advertising; and trade cards, stickers, and handbills were posted through doors and distributed on the streets, in shops, and on buses, and even dropped by balloons from the air.

*The country* provided little respite, according to contemporary accounts: "You wander out into the country, but the puffs have gone thither before you, turn in what direction you may . . . Puff, in short, is the monster megatherium of modern society" (Smith 1853, 278); or according to *The Times* in 1892 "advertisements are turning England into a sordid and disorderly spectacle from sea to sea . . . Fields and hillsides are being covered with unwonted crops of hoardings. The sky is defaced by unheavenly signs." The magazine *Punch* regularly satirized this promotional environment, publishing cartoons featuring, for instance, Marble Arch converted into an advertising station in 1846, or the moon "improved" by advertising messages in 1886. In addition, a stunning array of merchandise was used to carry advertising, and cross-merchandising of tie-ins with well-known books and plays was well underway by the close of the nineteenth century. Through such means nineteenth-century advertising messages pervaded both public and private, urban and rural environments.

# Advertising Law and Regulation

Soontae An

Kansas State University

The role of → advertising as a pervasive communication continues to expand around the world. In response, many societies face greater challenges in regulating advertising in a manner that shields the public from deceptive and unfair conduct. Many legal sources regulate advertising practices, and the legislative rationale for curbing this unique type of speech has been vigorously debated. Given that all the laws must be consistent with the principles of freedom of speech (→ Freedom of Communication; Freedom of the Press, Concept of), how to define commercial speech and the amount of constitutional protection it should be afforded are key issues among scholars and legal professionals.

## FORMS OF REGULATION

Although the scope of advertising law and regulations varies from country to country, regulation is generally manifested as self-regulation by the industry and statutory regulation by various government bodies. In many countries, self-regulation – voluntary, industry-wide control by advertisers – complements legal regulatory systems. Its great flexibility and adaptability offer realistic solutions in rapidly changing marketing environments. Hybrid forms have replaced the most basic form of self-regulation by the industry. Consumer representatives, as in the Netherlands and Canada, or public members, as in Italy, the United Kingdom, and the United States, participate to develop and enforce industry codes and standards. For instance, in the US, public members are drawn from a pool of distinguished educators, attorneys, and other public authorities.

### Statutory Regulation and Self-Regulation

In the US, the National Advertising Division (NAD) closely monitors national consumer advertising, responds to complaints, and enforces voluntary cooperation among advertisers. Individuals, organizations, or competitors who are concerned with the truthfulness or accuracy of an advertisement can make complaints. When the NAD and an advertiser fail

to reach a satisfactory settlement, an appeal can be made to the National Advertising Review Board (NARB). NAD and NARB findings and recommendations are published at the conclusion of each inquiry, and any unresolved cases can be forwarded to an appropriate government agency, in most cases the Federal Trade Commission (FTC).

Given that each self-regulatory system offers a different set of standards and codes, the International Chamber of Commerce (ICC) plays an important role in coordinating efforts to develop international guidelines and policies. The ICC publishes the International Code of Advertising Practice, which is used and integrated into many self-regulatory systems around the world. The ICC not only assists countries in developing codes, but also handles complaints when the scope of a dispute spans multiple countries, or in cases where national self-regulatory systems do not exist. Other key international organizations that promote self-regulation in advertising include the International Advertising Association (IAA) and the World Federation of Advertisers.

Although self-regulation is less expensive and offers faster solutions than government regulation, voluntary cooperation is not always sufficient. With statutory regulation, a variety of judicial tools can be utilized to achieve prompt and efficient control of advertising practices. In the US, several federal administrative bodies have jurisdictions to regulate specific types of advertising. The agencies include, but are not limited to, the Federal Trade Commission (FTC), the Food and Drug Administration (FDA), the → Federal Communications Commission (FCC), and the Securities and Exchange Commission (SEC). The FTC is the principal regulatory agency for advertising, and its rulings are not only legally binding, but also exert great influence on setting the standards for state and industry regulatory bodies.

### **The Contribution of the Courts**

In the United States, state and local governments also monitor advertising practices. For many years, state laws evolved without raising the issue of the First Amendment and its protection – or lack thereof – of commercial speech. In fact, for a long time, advertising was considered to be outside the realm of freedom of expression. When the US Supreme Court first considered the issue in *Valentine v. Chrestensen* (1942), it firmly discounted the notion that advertising deserved First Amendment consideration. Without providing much legal reasoning, the court decided unanimously that “purely commercial advertising” was not the type of speech protected by the First Amendment. For more than 30 years, the *Valentine* decision was regarded as the prevailing judicial precedent concerning commercial speech. In 1976, it was explicitly overruled by the US Supreme Court in *Virginia State Board of Pharmacy v. Virginia Citizens Consumer Council*. In this landmark case on commercial speech, the court declared that a Virginia state law banning the advertisement of prescription drug prices was unconstitutional, emphasizing consumer interests. It reasoned that such advertisements conveyed vital information to the public and that a free enterprise economy depended upon a free flow of commercial information (→ Free Flow of Information).

The US Supreme Court outlined more specific guidelines for the protection of “purely commercial advertising” in *Central Hudson Gas and Electric Corp. v. Public Service Commission of New York* (1980). In overturning a statute banning certain advertising by utilities,

the court developed a four-part test for determining the constitutionality of advertising regulation. The four key questions are: (1) whether the advertising at issue is lawful and truthful; (2) whether the asserted governmental interest is substantial; (3) whether the regulation directly advances the governmental interest; and (4) whether the restriction is no more extensive than necessary to further the governmental interest.

Compared to the US Supreme Court's continuous efforts to characterize commercial speech, the courts in Europe have generated less theoretical and conceptual argument on commercial speech doctrine (Barendt 2005). Contrary to the US Supreme Court's categorical approach, the European courts have tended to apply the same principles to both commercial and noncommercial expression. For the European Union, treaties are the primary source of law, and the Maastricht Treaty signed in 1992 incorporates by reference the European Convention on Human Rights. Article 10 of the European Convention on Human Rights decrees freedom of expression, and the European Courts have held that Article 10 applies to commercial expression. Unlike the US Supreme Court, which once put commercial expression outside the realm of freedom of expression, the → European Court of Human Rights has never excluded commercial expression from constitutional protection. It is worth noting, however, that in practice the courts in Europe are generally more willing to defer to governmental regulations (Shiner 2003). As a result, legal challenges to governments' infringements on commercial speech based on Article 10 of the convention have been relatively few.

## FIELDS OF REGULATION

### The Case of Tobacco

The advertising of controversial products, such as cigarettes, demonstrates a substantially different application of the commercial speech doctrine. Unlike in the US and Canada, a comprehensive ban on tobacco advertising has been imposed in many European countries. In the UK, for instance, most forms of tobacco advertising are prohibited as a result of the Tobacco Advertising and Promotion Act 2002. The US Supreme Court would invalidate such a comprehensive ban on the grounds that there are other less restrictive means.

In fact, in *Lorillard Tobacco Co. v. Reilly* (2001), the US Supreme Court struck down a statute falling well short of a comprehensive ban. At issue was a Massachusetts law banning outdoor ads and point-of-sale ads for tobacco products within 1,000 feet of public playgrounds and schools. The court agreed that the state had a substantial interest in protecting young children, but declared the rule much more extensive than necessary. Similarly, the Supreme Court of Canada invalidated a comprehensive ban on cigarette advertising in *RJR-McDonald Inc. v. A-G of Canada* (1995).

### Differentiating Commercial and Noncommercial Speech

Despite differences in commercial speech jurisprudence, it is clearly not protected to the same extent as many other forms of speech, such as political ideas. As stated in *Central Hudson*, commercial expression should be truthful and legal in order to be protected

under the First Amendment. However, there is no requirement under traditional First Amendment analysis for the underlying activity to be lawful or the speech not to be false or misleading. For noncommercial speech cases, the government should demonstrate “compelling” interest rather than just “substantial” interest. In a milestone case on libel, *New York Times v. Sullivan* (1964), the US Supreme Court stated that political advertisements, though paid for, were fully protected by the Constitution (→ Libel and Slander). Political speech, including political advertising, is at the top of the constitutional hierarchy of protected speech, thus subject to strict scrutiny.

The same principle can be found in the European Court of Human Rights trial *Barthold v. Germany* (1985). Barthold, a veterinary surgeon, was disciplined for advertising his services in a newspaper interview, hence breaching professional codes. Barthold defended the remarks he made about the absence of a veterinary night service in Hamburg, in which he incidentally mentioned his own name and services, as public discussion of a matter of general interest. The court sided with Barthold, maintaining that the German advertising restrictions could potentially deter a professional from contributing to public debate on a matter of importance.

Considering the different constitutional standards for commercial speech, categorizing an expression as commercial or noncommercial becomes a key issue. In fact, defining commercial speech was the key issue in *Kasky v. Nike*, a 2002 California Supreme Court case. In an effort to respond to public criticism of the underpayment and mistreatment of overseas workers, Nike launched a public relations campaign with press releases and letters to newspapers. Sued by consumer activist Marc Kasky over the truthfulness of its statements, Nike claimed that its responses were not made in an advertising format and argued that the campaign statements were an important matter of public controversy entitled to full First Amendment protection. Conversely, the California Supreme Court characterized Nike’s campaign as commercial speech subject to state statutes that prohibited false and misleading advertising. The court pointed to Nike’s profit motive, stating that the company’s public relations campaign was ultimately aimed at persuading consumers to buy its products. In January 2003, the US Supreme Court agreed to hear an appeal, but in June of the same year, the court dismissed the case without offering highly anticipated resolutions.

As the Supreme Court of Canada pointed out in *Ford v. A-G of Quebec* (1988), commercial information leads to informed economic choices, an important individual self-fulfillment. Therefore, as expressed in *Virginia Pharmacy*, the interest in matters of public interest may be as keen as those in political ideas. However, some scholars and commentators strongly argue against the value of commercial expression and its constitutional protection (see Shiner 2003). Amid the continued debate on commercial speech jurisprudence, advertising continuously evolves and becomes increasingly ubiquitous. Nonetheless, the fundamental question of the distinction between commercial speech and noncommercial speech remains unclear and awaits further legal reasoning.

## Advertising as Persuasion

Bob M. Fennis

University of Twente

Advertising as → persuasion may be defined as an instrumental and intentional form of commercial communication by which a deliberate attempt is made to convince consumers of the value of the message position, i.e., the product or brand advertised. Advertising as persuasion focuses on the impact of advertising stimuli on cognitive, affective, and behavioral consumer responses (Kardes 2002). Implied in this conceptualization is a focus on the effectiveness of advertising on the individual level, rather than on a more aggregate level. Advertising stimuli can pertain to message elements (e.g., advertising format, the use of fear appeals, humor, sex, music, or number of arguments), source elements (e.g., brand familiarity, endorser characteristics such as fame, attractiveness, or credibility), or channel elements (e.g., visual versus nonvisual means of communication). Cognitive responses include belief and attitude formation and change (→ Attitudes). Affective responses include the influence of ads on → emotions and mood. Behavioral responses pertain to purchase and choice behavior, consumer decision-making, and brand loyalty.

Although this definition suggests a linear process and passive receiver, the body of research paints another picture. That is, any impact advertising may have depends largely on the way the consumer responds to the message, understood as the extent and valence

of information processing in response to the message. In this entry, we will discuss classic, contemporary, and future approaches to the study of advertising as persuasion.

### CLASSIC APPROACHES

Founded in the late 1940s, a Yale University team sought to systematically disentangle the persuasion process (“*Yale Studies*”; Hovland & Janis 1959; → Media Effects, History of). Their findings are a generally acknowledged source of reference for explaining the psychological impact of advertising. This program of research was spurred, in part, by the realization of the US army by the end of World War II that persuasion constituted a powerful means by which a nation’s population could be mobilized, as witnessed by the success of the propaganda of the Nazis (→ Propaganda in World War II). As a loose framework, the Yale group arranged their studies around → Harold Lasswell’s (1948, 37) classic communication effects formula: “who says what to whom in which channel with what effect.” Hence, the program studied the effects of various source factors (“who says”) such as credibility and expertise, message factors (“what”) such as the use of fear appeals or message sidedness, the role of individual differences of message recipients (“to whom”), and different types of dependent variables (“with what effect”). This line of research featured the so-called message-learning approach to persuasion: Any form of persuasion, including persuasion resulting from exposure to advertising, involves a four-stage process: attention, comprehension, yielding, and retention. Hence, persuasive ads are those that are attention grabbing, easy to comprehend, convincing, and memorable (see Kardes 2002).

In line with the message-learning approach to persuasion, William McGuire (1968, 1989) developed a *theory of* → *information processing* that acknowledged various basic stages of persuasion. In addition, he stressed the importance of recipient activity. McGuire’s theory holds that persuasion is mediated by at least three main steps that occur hierarchically: attention, comprehension, and yielding (→ Attention; Comprehension). McGuire stipulated that recipient characteristics influence the extent and impact of each of these processes. For instance, a recipient’s self-esteem may facilitate reception (because of a positive influence on comprehension), but may adversely affect yielding. Similarly, a person’s intelligence as measured by an IQ test may have a positive impact on reception, but a negative one on yielding.

Although the foregoing theories have been developed and tested with various types of persuasive communication in mind, *hierarchy-of-effects models* have been conceptualized specifically by advertising practitioners and researchers to account for the impact of commercial communication on purchase behavior. Although their empirical value is generally low, and they are considered obsolete in the academic community, their influence is still pervasive in the field of advertising practice, probably because of their heuristic value. In short, and in line with the frameworks discussed earlier, hierarchy-of-effects models posit that advertising affects behavior through a fixed sequence of stages. The best-known exponent of these is the so-called *AIDA-model*, an acronym that describes the effectiveness of advertising as a sequence of attention, interest, desire, and action. Over the years, modifications to this model have been proposed, each involving a different acronym, including “AIDCA” (attention, interest, desire, conviction, action), “ACCA”

(awareness, comprehension, conviction, action), and “AIETA” (awareness, interest, evaluation, trial, adoption).

Apart from a fixed sequence of stages, these models share the notion of a fixed “think–feel–do” sequence in which all advertising is processed via a cognitive stage (“what do I think about it?”), followed by an affective stage (“how do I feel about it?”), and finally a behavioral stage (“how do I act with regard to it?”). The think–feel–do sequence has proven to be problematic as an account of the various ways that ads are processed. The most prolific problem associated with these hierarchies is that the fixed sequence of processes presupposes a relatively high level of consumer involvement: the prototypical consumer is exposed to an ad, which invariably spurs his or her interest, induces desire, and so on. However, high consumer involvement levels are the exception rather than the rule. To accommodate this reality, contemporary approaches to examining ad effectiveness acknowledge that people often process information in less effortful ways.

### CONTEMPORARY APPROACHES

The → *elaboration likelihood model* (ELM; Petty & Cacioppo 1981, 1986; Petty et al. 1983) and the *heuristic systematic processing model* (HSM; Chaiken 1980; Chaiken et al. 1989) are considered “dual process models” (Chaiken & Trope 1999). These models assume that persuasion (defined as attitude change in response to exposure to a persuasive message) may be a function of two distinct modes of processing that anchor a controlled–automatic continuum. “Central route” (the ELM annotation) or “systematic” (the HSM annotation) processing occurs when consumer motivation and/or ability is high. Under these conditions, persuasion is the result of careful scrutiny of the true merits of the product that is advertised in the message. Consequently, attitude change is a function of the quality of the arguments presented in the message. This attitude change is thought to be highly predictive of behavior. Thus, product attitudes formed or changed systematically via the central route may predict purchase behavior, depending on their valence. In contrast, when motivation and/or ability is low, persuasion comes about via less effortful means, i.e., via “peripheral route” or “heuristic” processing, respectively. Under these conditions, consumers base their evaluations on message elements that offer shortcuts for inferring something about product quality.

The *unimodel* (Kruglanski & Thompson 1999; Kruglanski et al. 1999) is more parsimonious than the ELM or HSM; it basically poses one key process instead of two. Based on lay epistemic theory, the unimodel holds that advertising affects persuasion through a process of implicit hypothesis testing by the consumer, influenced by the structure of the message elements presented to support the advertised product, the ability of the consumer to engage in effortful processing, and the motivation that may influence the extent and/or direction of processing. In contrast to dual process models, the unimodel holds that *all* message elements (i.e., arguments and other persuasive elements) in an ad are essentially processed the same way (through a single route), to the extent that these elements are deemed relevant for the position in the ad.

The acronym MODE stands for *motivation and opportunity as key determinants of persuasion*. The model (Fazio 1990) shares with dual process models and the unimodel the emphasis on both motivation and a specific form of ability (i.e., opportunity) as

factors affecting the extent and/or direction of ad processing. Like these models, it posits that when motivation is high and opportunity abundant, extensive information processing may occur that results in product or brand attitudes that guide future (purchasing) behavior (→ Attitude–Behavior Consistency). In addition to these models, however, the MODE model is more optimistic regarding the attitude–behavior link when either motivation and/or opportunity is low. In that situation, the MODE model would hold that highly accessible attitudes (e.g., brand attitudes that have evolved over a prolonged period of exposure to extensive advertising) might still affect choice behavior, albeit without any extensive processing. When exposed to the attitude object (i.e., the product or brand), the valence of this accessible attitude triggers a process of selective perception, by which either positive or negative aspects of the object are highlighted. This drives behavior, such that largely favorable attitudes result in approach behavior (e.g., purchasing the product), whereas negative attitudes induce an avoidance response.

### FUTURE DIRECTIONS

All frameworks discussed so far rely on *conscious* consumer processing as a basis for understanding persuasion effects, although they differ in the proposed extent and direction of this processing. This leaves open a vast reservoir of consumer persuasion and behavior phenomena that has been left largely unaddressed: unconscious influences of advertising on consumer behavior. Since the beginning of the new millennium, a renewed interest in automatic and unconscious consumer processes (→ Mindlessness and Automaticity) has flourished, spurred, in part, by work on automatic construct activation (i.e., “priming”; Bargh 2002). This trend has even accumulated in renewed research attention to one of the great myths of advertising as persuasion: subliminal influence of ad-related stimuli (Dijksterhuis et al. 2005; Strahan et al. 2002).

## Advertising: Responses across the Life-Span

Moniek Buijzen

University of Amsterdam

Advertising responses are the thoughts, emotions, and behaviors generated by exposure to a commercial message (Petty & Cacioppo 1996). Responses to → advertising can be divided into *three general types*: cognitive, affective, and behavioral responses. Studies on cognitive responses focus on recall or recognition of advertisements and brands. Affective response studies concentrate on likes and dislikes of advertisements and brands. Finally, behavioral response studies investigate the extent to which people are persuaded by advertisements; for instance, to purchase the advertised brand.

Advertising research has shown that the extent to which consumers respond to persuasive information varies greatly across different stages of life (Friestad & Wright 1994; John 1999). In particular, *children* are more receptive to persuasive information than adolescents and adults, because they have less experience and domain-specific knowledge that they can use while processing advertisements. It has been suggested that children are more easily swayed by an attractive advertisement, because they are less able than adolescents and adults to come up with critical thoughts and counterarguments while being exposed to persuasive information (Young 1990).

During childhood and adolescence, children develop various advertising-related competencies, which are increasingly known as “advertising literacy” (Livingstone & Helsper 2006; → Media Literacy). These competencies function as a filter when processing advertising messages (→ Information Processing). For instance, children who are not yet capable of understanding the selling purpose of advertising may see commercials primarily as entertainment, while children who do realize that advertising is intended to persuade are more likely to critically evaluate its content.

John (1999) has distinguished five competencies of *advertising literacy* that emerge in the developmental sequence from preschool to adolescence: (1) distinguishing commercials from programs, (2) understanding advertising intent, (3) recognizing bias in advertising, (4) understanding of advertising tactics and appeals, and (5) applying advertising knowledge and understanding. The acquisition of the various advertising literacy competencies can, in large part, be explained by children’s cognitive and social development (→ Development Communication).

A first step in the acquisition of advertising literacy is the ability to make a distinction between advertising and program content. It has been shown that children in early childhood (4–7 years) have difficulty distinguishing commercials from television programs and view advertising primarily as entertainment (Martin 1994). Second, during middle childhood (ages 8–11), children are progressively more able to recognize advertising, and show a basic understanding of advertisers’ motives and intent. Several authors have argued that children’s understanding that advertisers intend to sell should be distinguished from their understanding that advertisers intend to persuade (Young 1990; Martin 1994; John 1999). These authors assume that the understanding that advertising exists to persuade people and is, therefore, inherently biased requires more sophisticated cognitive and social skills. As a result, the third advertising competency, recognizing bias and deception in advertising, is likely to develop at a later stage in childhood than understanding of selling intent.

The fourth competency of advertising literacy, more specific insight into advertisers’ tactics and appeals, requires advanced cognitive and social skills. It is, generally, assumed that this competency does not develop until early adolescence (ages 12–14). This development is likely to vary for different types of tactics. For example, understanding of camera and editing techniques may emerge at an earlier stage than the more abstract understanding of product symbolism in advertising, which includes, for instance, linking the product with social or sexual success (Belk et al. 1984; → Advertising Strategies).

Finally, the development of advertising literacy is not only a matter of obtaining the necessary knowledge and understanding, but also of acquiring the information-processing skills that enable the viewer to apply the advertising knowledge and understanding

while processing an advertisement (→ Information Processing). Information-processing theories suggest that children in early childhood lack the skills to come up with critical thoughts and counterarguments when watching commercials, while children in middle childhood need to be cued to raise counterarguments (Roedder 1981; John 1999). During the adolescent years, they become capable of independently accessing and applying advertising literacy skills when watching commercials. From this age onwards, advertising responses are comparable to those of adults.

As yet, advertising research has predominantly focused on children's ability to discriminate between commercials and programs and their understanding of advertising intent (Martin 1994). Although it is assumed that recognizing bias and deception in advertising and knowledge of advertising tactics emerge later in the developmental sequence, it is unclear at what age these more sophisticated aspects of advertising literacy emerge. Moreover, there is a lack of knowledge on the differential impact of the different aspects on the cognitive, affective, and behavioral responses to advertising. To gain a full understanding of advertising responses across the life-span, future research should recognize the conceptual complexity of advertising responses and assess at what age different advertising competencies emerge.

# Advertising Strategies

*Bas van den Putte*

*University of Amsterdam*

Advertising strategy is the set of decisions an organization takes with respect to the employment of → advertising to reach one or more objectives among a specific target group. Each advertising strategy is based on the → marketing strategy that encompasses the strategic decisions regarding all marketing activities, such as packaging, price, distribution, and promotion. Within this set of marketing activities, advertising is part of the promotion strategy. Besides defining target group and communication objectives, main parts of the advertising strategy are message strategy and → media planning strategy (→ Advertising Frequency and Timing).

A further difference can be made between message strategy and creative execution strategy. The message strategy is defined by the communication objective that is addressed by an advertisement; the creative execution defines how this objective is addressed. Though the ultimate goal of advertising is to maintain and increase the level of brand sales, most often advertising is employed to reach intermediate goals. Most important of these is communicating how a brand is positioned among its competitors (→ Positioning Theory). Other often employed intermediate goals are brand awareness and generating a general positive feeling toward the brand.

## TYOLOGIES OF ADVERTISING STRATEGIES

Many overviews of message strategies have been published and there is no generally agreed-upon typology. Nevertheless, a central element of most typologies is the difference between informational advertising that appeals to the rational mind and emotional advertising that appeals to the feelings of consumers (→ Cognition; Emotion). Instead of the term “emotional strategies,” often the term “transformational strategies” is used. *Informational strategies* include factual, more or less objective, information, whereas *transformational strategies* aim at relating the advertised brand to more subjective characteristics such as emotions, personal values, or group symbols. Transformational strategies transform the experience of using or owning the brand by adding a psychological dimension to the objective utility of the product.

### Vaughn’s FCB-Grid

One of the best-known advertising typologies is the “*FCB-grid*” by Vaughn (1980; the grid is named after the author’s company, Foote, Cone & Belding), which consists of four quadrants, defined by two dimensions: level of involvement and a thinking–feeling dimension. In the high-involvement/thinking quadrant of the FCB-grid, the consumer is highly involved with the purchase decision and makes a rational decision based on functional information. Therefore, in this situation an informative strategy should be used. In the low-involvement/thinking quadrant, involvement is low and buying behavior is habitual because the consumer wants to spend as little time and brain activity as possible on buying products. In this quadrant, the habit formation strategy is advised.

The primary aim of advertising is to remind consumers of the existence of the → brand. In addition, coupons and free samples can be used to stimulate trial behavior. In the two feeling quadrants, three purchase motives are relevant: ego gratification, sensory gratification, and social acceptance. In the high-involvement/feeling quadrant, the consumer seeks ego gratification, that is, the need to defend, enhance, and express one's basic personality. For this quadrant, the advice is to apply the affective strategy that aims at relating the brand to the personality of the consumer. The low-involvement/feeling quadrant is reserved for products where involvement is low and the purchase decision is based on sensory gratification, that is, the desire to please one or more of the five senses. The *satisfaction strategy* stresses how the brand stimulates personal satisfaction, and induces product trial so people can experience the brand. Finally, social acceptance can be relevant in situations of both low and high involvement. Advertising can address the need to be viewed favorably in the eyes of other.

### The Rossiter and Percy Typology

Another well-known typology, which is closely related to the FCB-grid, is the Rossiter and Percy (RP) grid. The RP-grid also has four quadrants, but these are defined in a different way. A first important difference between the RP-grid and the FCB-grid is that in the former, brand awareness is a necessary condition before any of the strategies defined by the grid can be effective. If brand awareness is low, the advertising strategy should primarily aim at increasing brand recall and/or brand recognition. A second important difference is that in the RP-grid feelings are relevant in all quadrants.

A distinction is made between negative motivation that is mainly relevant in the thinking quadrants and positive motivation that is mainly relevant in the feeling quadrants (called transformational quadrants in the RP-grid). A negative motivation occurs if people are motivated to avoid negative emotions that, for example, are evoked by unwanted situations. Informational advertising strategies should convince consumers that the brand can help to avoid or to solve problems. Positive motivation is related to positive emotions that occur in the case of social approval, sensory gratification, or intellectual stimulation (i.e., the possibility to explore and acquire new information and expertise). People are positively motivated to experience these emotions, and transformational advertising strategies should address these emotions.

### Other Typologies

In the 1980s and 1990s, several other less well known typologies were published. The advertising strategies that are outlined in these typologies largely overlap, though the terminology might differ slightly. One of the most cited of these typologies is the “*brand concept management framework*” of Park et al. (1986), in which three main brand concepts are discerned: functional, symbolic, and experiential. A “functional brand concept” is appropriate for brands that fulfill functional needs, such as problem-solving products. The “symbolic brand concept” can be used if brands have a symbolic function with respect to communicating to other people what kind of person the user is, or communicating to other people to what group(s) the user belongs. The symbolic brand concept is also useful if consumers use a brand because it matches their own personality and if consumers feel

that they can realize who they are by using this particular brand. Finally, the “experiential brand concept” can be used for products that provide variety or sensory pleasure (e.g., food). A good strategy for this type of brand is communicating what people experience when they use the product.

### **Behavioral Determinant Models**

To examine what the most important consumer motives are, often social-psychological behavioral determinant models are used. However, these models do not correspond well to most advertising typologies, either because in a typology two or more behavioral determinants are addressed by the same message strategy, or because two or more strategies are formulated that aim at the same behavioral determinant. Therefore, Van den Putte formulated an *integrative framework for effective communication (IFEC)* that integrates the main characteristics of many of the above typologies with social psychological theories (Van den Putte & Dhondt 2005). The IFEC stipulates that there are three conditions that every successful advertising campaign must fulfill: (1) people should be aware of the brand, (2) people must have a general positive feeling about the brand, and (3) the campaign should make clear what consumer motive or consumer need the brand fulfills. Social-psychological behavioral determinant models can be used to find the most important behavioral determinant(s) in order to select the potentially most effective advertising strategy.

In the IFEC, nine advertising strategies are discerned. The *awareness strategy* aims at establishing top-of-mind brand awareness by using novel or unusual formats. The *likeability strategy* aims at entertaining consumers in order to achieve appreciation of the advertisement. In the long run, this is meant to lead to a positive general feeling toward the brand. The *information strategy* aims at convincing consumers that the advertised brand offers them relevant, preferably new or improved, instrumental advantages. The *emotions strategy* aims at associating the brand with specific feelings, often by showing people who experience certain emotions in a product usage situation. The *identity strategy* aims at convincing consumers that the identity of the brand matches their private self-identity or self-image. Within this strategy, the brand is seen as a person, having its own personality. This strategy is focused on the consumer as an individual.

The *social strategy* aims at convincing consumers that the brand can be used to communicate their social identity to others or to seek approval by others. This strategy is focused on consumers as members of a social environment with which they interact. The *self-efficacy strategy* aims at convincing consumers that a brand can help them to make difficult behaviors more easy to perform. The *sales response strategy* aims at bringing about an immediate consumers’ response, often by communicating a temporary special offer. The *variation strategy* aims at appealing to consumers who seek variety in their life, either to discover new possibilities or to prevent boredom with daily routines.

With respect to all of the above-mentioned typologies, scientific empirical research is scarce. Whether the formulated advertising strategies succeed in attaining their objectives has hardly been studied. Insofar as research is published, it is almost always performed by the developers of the typology or grid.

## CHOOSING AN ADVERTISING STRATEGY

An important question is how the most effective possible advertising strategy can be chosen. Generally it is advised, besides maintaining and increasing brand awareness, that the advertising strategy should match the main purchase motives of consumers. For instance, if brand choice behavior is most strongly influenced by the opinion of others, the social strategy is the preferred option. This matching hypothesis has hardly been studied in the context of the above typologies, but there is some indirect support from studies that examine the role of attitude function. In these, it is found that if for consumers the function of their attitude is to evaluate how brand use can maximize instrumental advantages, they are more influenced by an informative strategy that communicates brand characteristics than by a social strategy that communicates how other people evaluate the brand user.

Some doubt about the → validity of the matching hypothesis is found in studies that apply attitude base theory. Whereas *attitude function theory* concentrates on the function that an attitude has for a consumer, attitude base theory concentrates on how the attitude is formed. The attitude base is cognitive if it is primarily formed by cognitions, and affective if it is primarily formed by affect. It is found that if consumers have little experience and weak cognitions or weak feelings, a matching strategy should be used.

For example, an informational strategy should be used if the attitude base is cognitive. However, if consumers have much experience and strong cognitions or strong feelings, a mismatching strategy should be used. In this latter situation, an emotional strategy should be used if the attitude base is cognitive, and an informative strategy if the attitude base is affective. So far, mismatching effects have only been found in tests of attitude base theory. The mismatching hypothesis has never been tested in the context of other theories. Though in most theories and advertising typologies, the assumption is that the advertising strategy should match the motives of the consumer, it might be that this only holds for consumers who have weak cognitions and feelings toward the brand. Of course, this last situation is often the case because consumers generally are weakly involved with the brand.

## Advocacy Journalism

*Robert Jensen*

*University of Texas at Austin*

The term *advocacy journalism* describes the use of journalism techniques to promote a specific political or social cause. The term is potentially meaningful only in opposition to a category of journalism that does not engage in advocacy, so-called *objective journalism* (→ Objectivity in Reporting).

This distinction tends to be a focus of attention in the United States, especially in the second half of the twentieth century, rather than elsewhere in the world; use of these terms does not necessarily translate to other political landscapes, though US (and more generally western) models are becoming dominant (→ Journalists' Role Perception). In western Europe, some newspapers have long identified openly with a political position, even though journalists from these papers are considered professionals not typically engaged in advocacy (→ Party–Press Parallelism). For example, in Italy *Il Manifesto* identifies itself as a communist newspaper philosophically but does not associate with any party and operates as a workers' cooperative (→ Italy: Media System). In developing nations that have become independent since World War II, journalism was typically part of freedom movements in support of liberation from colonialism. Many independent publications retain the opposition to entrenched power, for example, the *Hindu* in India.

The press in the United States, which was distinctly partisan well into the nineteenth century, developed objectivity norms that now define the practices of corporate commercial news media. Many journalists found (and find) these norms constraining, and in the political fervor of the 1960s and 1970s, advocacy journalism emerged with counterculture and revolutionary political activity. Other terms used for practice outside the mainstream include *alternative*, *gonzo*, or → *new journalism* (→ Alternative Journalism). Within those forms, journalists may openly identify with a group or movement or remain independent while adopting similar values and political positions.

This advocacy/objectivity dichotomy springs from political theory that asserts a special role for journalists in complex democratic societies. Journalists' claims to credibility are based in an assertion of neutrality. They argue for public trust by basing their report of facts, analysis, and opinion on rigorous information gathering. Professional self-monitoring produces what journalists consider an unbiased account of reality, rather than a selective account reflecting a guiding political agenda.

At one level, the term *advocacy* might be useful in distinguishing, for example, journalistic efforts clearly serving a partisan agenda (such as a political party publication) from those officially serving nonpartisan ends (such as a commercial newspaper). But the distinction is not really between forms of journalism as much as between persuasion and journalism (→ Activist Media). Although so-called objective journalism assumes that, as a rule, disinterested observers tend to produce more reliable reports, a publication advocating a cause might have more accurate information and compelling analysis than a nonpartisan one. The intentions of those writing and editing the publication are the key distinguishing factor.

More complex is categorizing different approaches to journalism by those not in the direct service of an organization or movement. Can those who advocate a particular philosophical or political perspective – but remain independent of a partisan group – produce journalism that the general public can trust?

An extended example is helpful here. In the general sense of the term, freelance reporter John Pilger (Australian-born, now living in the United Kingdom) could be considered an advocacy journalist, and *New York Times* reporter John Burns an objective journalist. Both are experienced and hard-working, with a sophisticated grasp of world affairs, and both have reported extensively about Iraq. Pilger writes primarily for newspapers and magazines in the UK but has a large following in the US, and he also is a documentary filmmaker. Burns writes almost exclusively for the *Times* but also gives frequent interviews on television and radio programs about his reporting. Antiwar and anti-empire groups circulate Pilger's reports and screen his documentaries, but, like Burns, he describes himself as an independent journalist and rejects affiliations with any political groups.

However, Pilger is openly critical of US and UK policies toward Iraq, including unambiguous denunciations of the self-interested motivations and criminal consequences of state policies. His reporting leads him not only to describe these policies but to offer an analysis that directly challenges the framework of the powerful. Burns, in contrast, avoids such assessments, not only in news reports but also in articles labeled *analysis*. His reporting tends to accept the framework of the powers promoting these policies, and his criticism tends to question their strategy and tactics, not their basic motivations. In some sense, both journalists advocate a particular view of state power and how it operates in the areas they cover. Both have reputations for accurate reporting: the difference lies in their interpretations. In the language of mainstream journalism Burns would be considered objective but not Pilger.

This example illustrates the limits of conceptions of journalism as practiced in the media industries, especially those under corporate commercial control. All reporters use a framework of analysis to understand the world and report on it. But reporting that contains open references to underlying political assumptions and conclusions seems to

engage in advocacy, while the more conventional approach appears neutral. Both are independent in the sense of not being directed by a party or movement, but neither approach is in fact neutral. One explicitly endorses a political perspective critical of the powerful, while the other implicitly reinforces the political perspective of the elite.

Accounts of the world, including journalistic ones, must begin from some assumptions about the way the world works (→ News Ideologies). None is neutral. Further research and examples from countries outside of North America and Europe would enrich the literature of advocacy journalism.

## **Aesthetics**

*Paul Messaris*

*University of Pennsylvania*

In the context of communication studies, aesthetic theory may be defined as the attempt to understand people's enjoyment of certain forms of communication – such as stories, movies, music, dance – that are apparently attended to for their own sake, despite their lack of any ostensible instrumental value. Although this type of enjoyment can be considered an inherent feature of human biology (Dissanayake 1992), the specific experiences that give rise to it differ widely among the cultures of the world (→ Intercultural and Intergroup Communication). Simply put, the study of aesthetics seeks to answer two basic questions: what do people like or dislike about such experiences – and why?

The idea that aesthetic judgments have a bearing on, or somehow derive from, real-world practical imperatives has traditionally met with considerable resistance in the western intellectual tradition, from A. G. Baumgarten and Immanuel Kant to certain postmodernist theories (Prettejohn 2005; → Postmodernism and Communication). Such resistance has been accompanied by a normative insistence that what is distinctive

about the aesthetic realm is whatever goes beyond the type of response that connects a work of art to the utilitarian goals of everyday life. Indeed, in this view of aesthetics, our contemplation of objects and events in the environment is aesthetic only if it is disinterested (see N. Carroll 1999, 170ff.). This aesthetic stance may be motivated by a desire to emphasize the values that are internal to art, or by an attempt to insulate the representational arts from moral judgments and censorship (Jenkins 2003).

### ATTRACTIVE OBJECTS IN REPRESENTATIONAL MEDIA

A useful starting point for reconsidering aesthetics within communication research is the distinction between representational and nonrepresentational media. In the case of *representational* media such as pictures or movies, one obvious component of aesthetic pleasure is our appreciation of certain types of sensory experiences in the real world. If the physical characteristics of some people, things, or places appeal to us, representations of those characteristics in pictures or other media may please us as well.

Of particular interest is research linking aesthetic preference to functional aspects of real-world visual pleasure (→ Functional Analysis). Paradigmatic instances are studies of facial attractiveness and the literature on landscape preference. A number of experiments, typically based on computer-manipulated images of *human faces*, have established a cross-cultural preference for symmetrical facial features (e.g., Little & Jones 2003; Perrett et al. 1999; Rhodes et al. 2001; → Facial Expressions). One explanation may be that bodily symmetry serves as an external symptom of an organism's capacity to cope with genetic and environmental stress. Accordingly, a preference for symmetry may be an evolutionary adaptation during mate selection (Thornhill & Gangestad 1999). In the area of *landscape preference*, an influential treatise by Jay Appleton (1990) has posited that there is a species-wide human tendency to favor pictorial landscapes that contain two features: "prospect," i.e., places from which the environment can be surveyed for danger or opportunity; and "refuge," i.e., places offering concealment from threat and protection from the elements. Although tastes in landscapes are certainly shaped by culture, as well as by individuals' life experiences, the evidence for some degree of cross-cultural commonality in such judgments is substantial (Stamps 1999). In sum, this suggests the broader hypothesis that the human capacity for aesthetic responses to mediated experiences is derived, at least in part, from our need to make adaptive judgments about the formal features of people, places, and things in the real world.

### THE APPEAL OF NARRATION

This hypothesis seems less relevant for aesthetic experiences that go beyond the external "beauty" or "attractiveness" of objects. In particular, such experiences relate to the large category of *narrative fiction* – including not only verbal storytelling, but also TV shows, theater plays, musicals, etc. (→ Fiction; Fictional Media Content; Storytelling and Narration; Theatre; Cinema). When we enjoy a → Hollywood movie, we may do so because we find some of the images, or the people in them, beautiful or attractive, but our more likely reaction will involve an evaluation of the story as "exciting," "suspenseful," "moving," etc. Still, such narrative experiences may be compatible with the hypothesis just noted:

by identifying with fictional characters to whom positive things are happening, the consumer of fiction may vicariously experience pleasures that correspond to the rewards of real-world success or achievement (Keen 2006; 2007). Alternatively, a major source of our enjoyment of some fiction may simply be the spectacle of good things happening to people we like or sympathize with (N. Carroll 2006).

The hypothesis, however, becomes problematic when the events of a narrative fiction would be undesirable or harmful in real life. There is a substantial explanatory literature on why humans expose themselves to, and derive pleasure from, stories about misfortune, violence, horror, and suffering. Much of this literature is premised on some variant of Aristotle's (all too brief) explanation of the appeal of tragedy: we voluntarily attend to stories of misfortune and calamity because they allow us to confront various fears and anxieties in a fictional context and thereby experience *catharsis* of such feelings. But this theory does not accord with the available empirical evidence. Direct tests of the catharsis hypothesis have failed to support it, and, on the contrary, there is a large body of research indicating that exposure to anxiety-provoking fiction leads to an increase in audiences' anxieties (Zillman 1998; → Catharsis Theory; Fear Induction through Media Content; Fear Induction through Media Content in Children). An alternative to the catharsis approach is to assume that we enjoy terrible or pitiful stories because the awful things in them are happening to someone else and not to us, as implied indirectly by empirical findings in the area of social comparison research (e.g., Taylor & Brown 1994; → Social Comparison Theory). Still, this alternative offers only a partial account of the aesthetic appeals of fiction. In an attempt to give a more comprehensive explanation of our engagement with fiction – as empathy or identification as well as a motivation to witness the unpleasant – a recent, and growing, body of literature has turned to another variant of the kind of evolutionary psychology adopted by Appleton and like-minded investigators of face and landscape preference. This body of literature sees fiction as part of an evolutionarily adaptive activity whose function is to allow for the vicarious rehearsal of social relationships and the enhancement of human beings' capacity for anticipating the contingencies of their social and physical environments (e.g., J. Carroll 2003; Hernadi 2002; Tooby & Cosmides 2001).

### **THE CHALLENGE OF NONREPRESENTATIONAL MEDIA**

In an evolutionary and functional perspective on aesthetics, *nonrepresentational* media pose a special challenge. Traditionally, the move away from representation in the work of visual artists (→ Visual Representation) – and, to a more limited extent, in the literary arts – as well as in the professional criticism of the visual arts, has been associated with the insistence on a disinterested aesthetic stance. Walter Pater's famous saying, "All art constantly aspires towards the condition of music," summarizes this approach to art and aesthetics (→ Art as Communication).

Even in the case of music, however, there is a substantial body of writing – in music theory per se, but also in ethnomusicology, history, and even social psychology – arguing that the connection between aesthetic preference and real-world values can never be severed. This general argument takes two relatively distinct forms. At one level, writers have sought to trace various lines of continuity between a culture's music or → dance

forms, on the one hand, and that culture's extra-musical features, on the other. Notable examples of this approach include Steven Feld's (1990) analysis of the connections between music and soundscape (the everyday sounds of the natural environment) among the Kaluli of New Guinea, Alan Lomax's (2004) extensive cross-cultural research on the relationship between dance styles and work movements, Judith Hanna's (1988) writings on dance performance and sex roles, and William McNeill's (1995) historical account of the connections between dance and rituals of social solidarity. At a different level, a highly influential book by Leonard Meyer (1956) suggested that all forms of musical enjoyment can be understood as entailing a single common element – namely, the appreciation of compositional and performative skill. By extension, Larry Gross (1973) has argued that the root of all art – whether superficially representational or not – lies in a biologically and culturally functional human tendency to appreciate skill. Societies may choose to reserve the label “art” only for those skillful activities that do not have any obvious utilitarian purpose (e.g., the movements of a dancer versus the movements of a manual laborer). But, in this view of aesthetics, the psychological mechanisms involved in the appreciation of the former are extensions of processes involved in the appreciation of the latter – and, indeed, would not exist without them.

Although this last approach to aesthetics has the appeal of inclusiveness, its adequacy as an all-encompassing aesthetic theory is questionable. Perhaps the biggest challenge is the argument that certain kinds of representational art (pornography being a pertinent example) are appreciated primarily for their content and not for the skill that went into shaping the form of that content. Indeed, filmmakers typically insist that the ideal viewer should be unaware of the process of artistic creation (Messaris 2006). Therefore, the most satisfactory synthesis of existing theories may be one that preserves the distinctions among different forms of aesthetic experience – looking at representational images (→ Visual Communication), reading verbal fiction, listening to music, etc. – and considers a diversity of aesthetic principles relating to function, form, as well as content, rather than searching for a single formula that attempts to explain everything.

## Affective Disposition Theories

Arthur A. Raney

Florida State University

Media scholars and consumers alike ponder the question “why do we enjoy the stories we enjoy?” Affective disposition theory is one of the leading explanations of the enjoyment

process. The theory – more accurately, set of theories – conceptualizes enjoyment of media content as a product of a viewer’s emotional affiliations with characters and the storyline outcomes associated with those characters. Although the theory does not seek to predict whether an individual will like or dislike a specific character or story, it provides keen insight into the process through which people enjoy these things (→ Emotion; Enjoyment/Entertainment Seeking).

## **BACKGROUND**

As suggested above, affective disposition theory is a title given to a set of propositions about the media enjoyment process that, throughout the entertainment literature, is also referred to simply as “disposition theory,” “disposition theories,” and “disposition-based theories” (→ Entertainment, Effects of). The first such theory was developed to describe how people appreciate jokes involving the belittling of a person or group. The principles of the resulting “disposition theory of humor” (Zillmann & Cantor 1972) were subsequently applied to the appreciation of drama and sports, yielding the “disposition theory of drama” (Zillmann & Cantor 1976), and the “disposition theory of sports spectatorship” (Zillmann et al. 1989), respectively.

Entertainment scholars have also applied the key concepts of the theory to examine → suspense, frightening entertainment, action films, reality-based television shows, crime-punishment dramas, and even news programming. Differences between these genres dictate subtle differences in the application of the theory’s principles, rendering efforts to develop a single, all-encompassing affective disposition theory somewhat problematic. However, as discussed below, the process by which enjoyment is derived through dispositional affiliations and subsequent character outcomes is similar regardless of the media content. For the sake of clarity and because the majority of the work in the area has focused on it, fictional drama will be used as an example in the following section (→ Fiction).

## **THEORETICAL UNDERPINNINGS**

As noted above, affective disposition theory posits that enjoyment of media content is a function of a viewer’s emotional responses to characters and to the outcomes experienced by those characters throughout an unfolding narrative. In short, the theory predicts that enjoyment increases when liked characters experience positive outcomes and/or when disliked characters experience negative ones. Conversely, enjoyment diminishes when liked characters experience negative outcomes and/or disliked characters experience positive ones.

According to the theory, viewers of fictional drama form alliances with the characters portrayed. Stated more simply, drama viewers like and cheer for certain characters, while despising and rooting against others. Because these alliances are based primarily on emotional reactions to the characters, the affiliations formed are called “affective dispositions.” Accordingly, these affective dispositions can range from extremely positive through indifference to extremely negative, and may fluctuate as the story unfolds. With regard to enjoyment, these feelings held toward the characters are of ultimate importance.

As one might expect, though, the nature of drama and, indeed, the social nature of humans guide the formation of dispositional affiliations to some degree, preventing viewers from capriciously selecting whom they revere and revile. The drama viewer's emotional side-taking must be morally justified. According to affective disposition theory, viewers continually judge the *rightness or wrongness of a character's actions*. As a result, viewers come to like characters whose actions and motivations are judged to be morally correct, while viewers dislike characters whose actions and motivations are judged to be morally incorrect.

Once characters are liked, viewers can empathize with (i.e., experience anticipatory emotions toward) their troubles and hope for their triumph over them, in much the same way as happens with real-life companions (→ Empathy Theory). In fact, as in relationships in reality, the stronger the positive feelings held, the stronger the empathic reaction. On the other hand, once characters are despised, viewers cannot empathize with them and are morally justified in wishing for their demise. In the same way, then, the stronger the negative affect felt toward the hated character, the stronger the negative or counterempathic reaction. If the outcomes wished for by viewers are depicted in the narrative, then enjoyment increases in proportion to the strength of the affective dispositions held. If those hoped-for outcomes are not portrayed, then enjoyment suffers in proportion to the strength of the affective dispositions held.

### WHAT AFFECTS DISPOSITIONS?

A key factor in determining emotional reactions to characters, as well as a key mechanism for enjoyment of drama, is *empathy*. Measured as an individual-level variable, empathy varies across viewers, leading to measurable differences in reactions to media characters. For example, persons with higher levels of empathy have been shown to be more likely to sympathize with the victim of a fictional crime and in turn more likely to enjoy a film in which the crime is avenged. However, empathy is of interest *after* dispositions are formed. As Zillmann noted, "affective dispositions toward persons or their personas virtually control empathy . . . Empathy seems to be governed by such morally derived dispositions" (1994, 44–45).

To be expected, several scholars have analyzed the *process of moral judgment* that leads to dispositions. The work demonstrates that the strength of affiliations held toward characters can vary quite a bit between viewers, presumably due to differences in the unique, subjectively held moral compositions of viewers. Such differences are assumed by the various moral development perspectives that exist. Furthermore, it is thought that moral reasoning is governed and influenced by a complex constellation of factors. Consequently, viewers think about and respond to characters differently, with differing results. In short, if affective dispositions toward characters are derived from moral evaluations of their actions and motives and if viewers differ in the way moral evaluations are made, then affective dispositions toward characters should vary between individual viewers. Finally, because enjoyment is dependent upon these affective dispositions, viewers enjoy certain dramatic narratives more or less than others.

A few entertainment scholars have sought to identify factors that govern the crucial moral judgments of characters. For example, authoritarianism has been associated with

greater liking of reality-based crime dramas, while attitudes about vigilantism and punitive punishment have been shown to predict enjoyment of crime-based fiction. In fact, Raney and Bryant (2002) offered a model to describe the process of disposition formation in both affective and cognitive terms. The researchers demonstrated that both affective (e.g., empathy) and cognitive (e.g., subjectively held attitudes about real-world justice) variables were predictive of moral judgments within crime-punishment entertainment, with the outcome of those moral judgments predicting overall enjoyment.

Thus, affective disposition theory contends that dispositional affiliations are developed as the actions and motivations of characters are viewed, with the consumer evaluating the moral correctness of those actions and motivations through their own moral lens. As a result, viewers like and dislike characters to varying degrees. The valence and intensity of those affective dispositions lead the viewers to *generate anticipations about the characters' futures*. For liked characters, success is hoped and failure is feared. For hated characters, failure is hoped and success is feared. Enjoyment results from comparing those anticipations to the actual outcomes portrayed. More specifically, highly liked characters engender intensely hoped-for outcomes that when met result in relief, pleasure, and enjoyment. When the hoped-for outcomes are not observed, however, enjoyment suffers. This is the basic affective disposition theory formula.

## FUTURE RESEARCH

A review of the various expressions and applications of affective disposition theory yields several principles common across them all. Four such principles are noted below, with suggested lines for future research. First, affective disposition theory is *primarily concerned with the enjoyment of media content*. As noted above, although the theory cannot predict liking or disliking of a specific character or story, it can serve as a useful aide in understanding the process through which people enjoy these things. Enjoyment is widely accepted as playing a central role in media entertainment experiences; enjoyment as a complex process is similarly acknowledged. Researchers universally embrace the role of affective disposition theory in explaining a portion of the enjoyment puzzle, but they also point to the limitations of any one theory to explain all instances of media enjoyment. More research is needed to examine how the principles and phenomena described by affective disposition theory interact with other psychological and motive conditions of the enjoyment experience.

Second, affective disposition theory *concerns emotional responses* to media content. Affect is at the heart of the theory, with empathy identified as the primary mechanism guiding emotional responses to characters and their plights. Additionally, researchers acknowledge that various cognitive processes (e.g., moral judgment) play a significant role in the disposition-formation process. In fact, some contend that certain cognitive structures, such as story schemas (→ Schemas and Media Effects), may actually precede affective responses. Future research must seek to better understand the relationship between affective and cognitive structures in the media enjoyment process.

Third, affective disposition theory contends that media enjoyment starts with and is driven by the *viewer's feelings about characters*. Although empathy and other emotions and attitudes have been identified as important contributors to these feelings, they surely

do not completely predict the disposition-formation process. For instance, it is reasonable to assume that various content features (e.g., camera movements, sound effects, music) would influence the formation and maintenance of affective dispositions, as would the individual's viewing environment, age, or moral maturity. Future research should seek to better understand the complexity of the affective disposition formation process.

Finally, affective disposition theory acknowledges and relies upon *differences between viewers'* emotional responsiveness, personal experiences, basal morality, and countless other psychological factors. Because humans are constantly changing, our responses to media content should likewise be dynamic and perhaps somewhat unpredictable across time. For example, prior attitudes about certain characters (→ Parasocial Interactions and Relationships), mood (→ Mood Management), pre-existing attitudes about genre (→ Selective Exposure), motivation for viewing (→ Uses and Gratifications), ability or willingness to attend to the narrative, and many other factors should influence the enjoyment process. Future research should attempt to integrate these well-established media entertainment effects traditions with affective disposition theory.

# Affects and Media Exposure

Elly A. Konijn

Free University Amsterdam

Recently, the influence of affects and emotions in media exposure on the impact of media has become indisputable. Formerly, the emphasis was largely on cognitive aspects such as recall, learning, thoughts, and beliefs. The affective aspects were reserved for entertainment media, mostly limited to processes of involvement and gratifications (→ Involvement with Media Content; Entertainment, Effects of). Nowadays, the borders between entertainment and → news and information fare get blurred. Entertainment programs like *The Simpsons* and *Survival* claim to be reality-based (→ Reality TV), whereas news items and information programming increasingly make use of emotionalizing cues, such as personal anecdotes and zooming in on “crying faces” (→ Narrative News Story; Soft News). The Fox news broadcast of the invasion of the US army in Iraq in the second Gulf War, for instance, appeared like a → video game such as America’s Army, including the upbeat music. The blowing up of the World Trade Towers in New York (9/11) seemed a gruesome science fiction at first hand, whereas fiction-based TV shows like *ER* inform many on real-life hospital affairs.

Thus, *two developments* emphasize the importance of studying the role of affects in media exposure: (1) the media (i.e., program-makers) increasingly use dramatic techniques (→ Drama in Media Content; Hollywood); and (2) cognitive or information functions of the media increasingly coincide with affective and entertainment functions. Therefore, after defining affect, its role within the realm of media exposure will be discussed: in media entertainment, in → persuasion and commercial contexts, and across the → Internet.

## POSITIONING AND DEFINING AFFECTS

Affect is often used as an even broader concept than → emotions, generally covering the various forms of emotional phenomena and used to distinguish an affective, feeling state from → cognition and thoughts. However, a strict separation between cognition and affect can hardly be hold from contemporary emotion psychology. The positioning of affect versus cognition dates back to Descartes, who proposed a strict separation of body and soul, which has ever since distinguished rationality and emotionality (Damasio 1994) and still excites heated debates among current emotion scholars. Today, however, the polarization of physiological change versus cognition as actually defining affect is seen as merely a matter of definition that depends on how strictly cognition is defined as purely rational thought and fully conscious. Most scholars now acknowledge cognitive appraisal perspectives, including evolutionary and neurobiological scholars (e.g., LeDoux 1996; Panksepp 1998; Barrett & Wager 2006 → Appraisal Theory). That is, a certain degree of understanding the situational meaning in relation to personal concerns is necessary for an emotion to occur. Thus, the recent loosening of positing affect versus cognition in emotion psychology parallels the blurring of the cognitive and information functions and the affective and entertainment functions of media fare.

Affect covers various concepts, such as moods, feelings, and emotions. *Mood* is often applied to an enduring affective state, characterized by being global and not clearly elicited by an external event. Moods are not felt as motivated by inner drives related to situational demands. Moods may also have a biochemical source (e.g., epinephrine) or may be experimentally induced, as in some media exposure studies (e.g., Lang 2000). *Emotion* is more clearly defined by a specific event, with a beginning and ending. It is the awareness of situational demands, personal concerns, action readiness, and often physiological change, along with hedonic quality. Emotions comprise the felt need to act or not to act, to serve one's needs, goals, or concerns (Frijda 1986). Others define emotions as characterized by increased activity in the sympathetic nervous system due to vital implications of threats and rewards for the human system (Rolls 1999). Hence, when no personal concerns are touched by an event, no emotion will occur.

A crucial *difference between affects and emotions* is that emotions have an object and relate to meaningful events, whereas affects are rather free-floating and objectless (Russell & Barrett 1999). Affect refers to consciously accessible feelings and their neurophysiological counterparts. Thus, affect is usually reflected in varying degrees of pleasure–displeasure, or positive–negative affect, as well as (de)arousal or (de)activation. Furthermore, affects are conceptualized as longer-lasting phenomena than emotions.

Finally, the concepts of affect and emotion are used to refer not only to subjective experiences but also to (*visible*) *behavioral expression* (e.g., facial expressions, verbal and nonverbal behavior), especially in communication. However, it is important to note that *experiencing* (felt) emotions should be differentiated from the *expression* of emotions (depicted). For example, sadness expressed in a media message (e.g., tears) does not necessarily imply sadness in the observer (→ Nonverbal Communication and Culture).

## **AFFECTS AND MEDIA ENTERTAINMENT**

Many media entertainment scholars have studied how people experience affects through entertainment products (Bryant et al. 2003; Bryant & Vorderer 2006). Actually, it is an odd phenomenon: why should we feel concerned with nonexistent characters? Zillmann and colleagues have developed various theories to *explain affective responses to media exposure* and why people seek such experiences. In short, they state that people selectively expose themselves to particular media programs in order to manage their moods; to keep up or restore pleasant states or to avoid negative affect (→ Mood Management). While being exposed, people get aroused by what they see or read, experience suspense, excitement, fear for the hero, etc. The relief of such arousal when the dramatic conflict is resolved causes a pleasant state (→ Excitation Transfer Theory). Because it is human nature to empathize with the sufferings of others, particularly loved ones (→ Empathy Theory), we feel empathic distress and fear for the fate of the sympathetic protagonist (and enjoy his or her victory), whereas we hope for the devastation of his or her rivals (→ Affective Disposition Theories).

Uses-and-gratifications theory states that we seek media exposure for various reasons, informative, social, affective, or dispersion seeking in nature (→ Escapism; Uses and Gratifications). Social comparison theory (e.g., Suls & Wheeler 2000) states that it helps to make ourselves feel better to look at others suffering (→ Social Comparison Theory).

This may also explain the phenomenon of “Schadenfreude” – pleasure at another’s misfortune. Furthermore, emotion psychology might explain why we seek to get affected by media exposure just for the sake of being moved – for the emotional experience itself. It is a basic human need to have emotions, because emotions set one into motion (“I feel, therefore I live”). Also, emotional competence is acquired through media exposure, which is important to cope with emotional encounters in everyday life. Finally, media exposure supports the social sharing of emotions, which is a basic human need. In the last century, our social world has extended to mediated worlds, thereby extending opportunities for emotional encounters.

Many *media entertainment theories* somehow evolved around getting involved with the characters, dating back to Aristotle’s notion of catharsis. Numerous concepts have evolved to refer to a process of affective bonding; for example, involvement, → identification (similarity or wishful identification), parasocial interaction (→ Parasocial Interactions and Relationships), empathy (cognitive and affective), perspective taking, transportation (→ Transportation Theory), → presence, and immersion. However, these concepts are often not very clearly defined and are difficult to separate from one another. Furthermore, the measurement of these concepts has often been blurred by liking for the character or program. Therefore, various scholars have proposed using an umbrella concept (e.g., emotional involvement) and further defining related concepts in terms of various degrees of emotional involvement/empathy and distance/detachment. Liking a character may then be defined as a tradeoff between involvement and distance (Konijn & Hoorn 2005). For example, in wishful identification the character is liked *because* it is distinct from the viewer or reader, whereas most involvement conceptualizations view only similarity as constituent for liking.

An implicit fallacy is the assumption that more involvement implies more enjoyment, thereby suggesting that disliking a character would entail disliking a program (→ Enjoyment/Entertainment Seeking). However, many examples may be given where characters are disliked, yet the program is liked – sometimes even because the character is disliked. For example, gruesome heroes in video games make games “cool.” The role of negative affects in (interactive) media exposure in optimizing enjoyment is an understudied area (e.g., why should we dispositionally like murderers?). Promising new perspectives integrate neuroscience into entertainment research (Weber et al. 2006). Future research may disentangle complicated affective processing of information in liking media fare – whether we like or dislike bad characters, we may still enjoy the program.

## AFFECTS AND PERSUASION IN COMMERCIAL CONTEXTS

Affects within the context of persuasion, ads, and commercials (→ Advertising, Emotions in) have evolved as a field in its own right, mostly studying fear appeals and humor (→ Fear Induction through Media Content). Fear-inducing displays are mostly used in prevention campaigns, for example showing rotten lungs to reduce smoking behavior (→ Prevention and Communication). Furthermore, attaching sexual affect to commercial content is a well known phenomenon (e.g., sexy women selling cars or, more subliminal, masking the word SEX in a liquor label). Creating an association of positive affect with a product or service will generally lead to a positive attitude toward that product, thereby

increasing purchase behavior. The positive affect connected with fear appeals lies in the relief following advertised recommendations. The results of such affect-laden exposures, however, are mixed (Obermiller et al. 2005). One reason is that consumers may remember the affect-arousing image (e.g., the joke) but not the message. Also, the affect-laden images may not match with the advertised product (e.g., women and trucks). Furthermore, the affective appeal may not arouse the intended affect (e.g., laughter among adolescents instead of fear) or may not be relevant to the consumer (e.g., considering oneself not vulnerable).

Recently, there has been a substantial increase in interest in general affective responses and specific emotions to persuasive media exposure, because “emotions sell” – even negative affect seems more effective than no affect (Williams & Aaker 2002). An increasingly popular development is *product placement* – the deliberate embedding of commercial messages (e.g., brands) in entertainment programming (including video games); for example, actors drinking Coca-Cola and wearing Nikes, thus blurring the lines between entertainment and persuasion (Shrum 2004). Even without deliberate product placements, television programs convey a considerable amount of information about consumption behavior; serving as guidelines for many viewers as consumers. Mixed results of studies in product placements suffer from methodological problems (e.g., not controlling for confounding factors).

A comparable format has been used in → *entertainment education* to convey pro-social and health messages (Singhal et al. 2004). Entertainment education is based on social learning theories in which the principal carriers are modeling and role models. Emotional involvement with characters in entertainment programming increases the likelihood of adopting a character’s lifestyle and emulating his or her behavior. The social sharing of entertainment (e.g., watching with friends) may further increase the affective response and the program’s effectiveness. Thus far, most research in entertainment education has taken place in “the field,” as it is popular in underdeveloped countries. Current attempts are being made, however, to develop learning environments in video games (serious games).

Future research may focus on the more general role of affect and emotional involvement, instead of discrete emotions, while processing ads, commercials, and promotion materials. Also, the role of negative affects should be further studied. Affective processing may prevail over cognitive processing, thus blurring the awareness of being exposed to commercial/persuasive materials. Affect may trigger heuristic processing of information, thereby inhibiting elaboration of arguments. Relatedly, emotions may inhibit or bias cognitive processing. Theoretically, an integration of media entertainment and persuasion research is a challenge for future scholars.

## **AFFECTS ACROSS THE INTERNET**

Media exposures through the world wide web are another important source for evoking affect in its users. Not only is much traditional media fare exposed on the Internet, but newly invented offerings can also be found, such as online gaming and interactive TV-related response options. Furthermore, the Internet hosts a lot of mediated → interpersonal communication, often accompanied by affect (e.g., online romance or hate speech; → Mediated Social Interaction). Influential moves are occurring that deserve attention

from communication scholars. An example is Pro Ana, an online virtual character promoting anorexia and self-starvation. Millions of adolescent girls worldwide follow “Ana” and show extreme levels of affective bonding through postings on related websites and blogs.

*Role-playing games* (Vorderer & Bryant 2006, 1–9) are an intriguing mixture of traditional media and technological innovation, allowing one to present oneself as a “fictional” character in virtual worlds and to create one’s own narrative. Some players even represent 50 different personalities online (keeping records of them offline). The “what if” scenarios and forced changes in perspective taking (e.g., Israeli prime minister versus Palestinian Authority in the game *Peacemaker*) are probably the main carriers of (educational) effectiveness. Furthermore, *cybersex* is an affect-arousing media exposure, holding a position somewhere between interactive pornography, sexually laden movies, and intimate affairs (→ Sex and Pornography Online).

Affective computing (Picard 1997) is yet another emerging research field, which focuses on designing affect in the communicative processes with computers to make the interaction more “life-like” or human-like. For example, embodied agents, avatars, or virtual humans are designed to enrich the computer-mediated communication processes (→ Avatars and Agents). Such human-like interface characters are also designed to detect the user’s emotions and to respond empathically. Virtual characters can be found in an increasing array of media fare on the Internet, including promotion and political campaigns, and are effectively used in a range of applications, such as in health-care, psychotherapy, and education.

For example, the virtual *Laura* was designed into a health-care system to motivate people to do physical exercises. *Laura* was most effective when she showed “emotional behavior” (Bickmore et al. 2005). Others found that “empathetic” characters were more trustworthy than non-emotional characters (Brave et al. 2005). Also, interesting parallels with media entertainment crop up. The *FearNot!* system was developed to teach children to deal with bullying behavior in schools through emphatic engagement with the bullied child. In *Façade*, users interfere in the marital problems of a materially successful, young virtual couple, leading to emotionally laden conversations that change the course of the virtual couple’s lives. Clearly, fruitful cross-fertilizations between scholars in media entertainment, media psychology, and affective computing are awaited.

## AFFECTS AND MEDIA INFORMATION PROCESSING

Affect and emotions play an important role on their own in processing the information derived from media exposure (→ Information Processing). Studies have shown the effects of emotions on → attention and recall of the news (Lang 2000; → Exposure to News; Memory). Others have found → selective attention (Brosius 1993) and → framing effects of emotion (Nabi 2003). Various scholars assume that affective processing limits the capacity to cognitively process the news, that emotions narrow one’s focus and affect the way information is stored in memory. When it comes to the role of affect in acquiring information from fiction (i.e., entertainment media), systematic studies are scarce. Studies in the context of narrative fiction (e.g., → cultivation theory) have already shown that fiction may lead to attitude changes equal to – and sometimes even greater than –

those that result from nonfiction stories. However, these studies have hardly either focused on the role of affect and emotion or used audiovisuals in experimental designs to systematically study how affects influence information processing from fiction.

Mood inductions are generally used in psychology to study the effects on a person's judgment of subsequent stimuli. One review concluded that feature films are most effective in evoking moods (Westermann et al. 1996). This and other information suggested that emotionalized viewers are more inclined to take fiction for real than are non-emotional viewers, especially when negative emotions are aroused (Konijn et al. in press). Affective processing of mediated information (e.g., through emotional involvement, mood induction, emotional framing, or otherwise) may constitute a decisive factor in adopting the represented (fictional) information and in incorporating the media message into one's worldview. Because emotions are our "life-vests," they tell us which events and what information should be taken seriously – mediated or not.

In all, affect plays a significant role in the selection, processing, and effects of media exposure. Future research should further detail how affective processing of media fare impacts the information gained from it; that is, how affective responses to media offerings modify the way in which the presented information is perceived, stored, retrieved, and valued, and becomes integrated into our real-life knowledge structures, whether fictitious (entertainment) or factual (news) media. Given the hybrid status of many current visual media messages, which creates ambiguity with regard to their "reality status," studies in the role of affect are becoming increasingly important as they give us information on the underlying processes of the media's power to influence people. This is particularly important given our current "mediated society," in which we not only develop intimate relationships online, but also acquire our real-world knowledge in large part through mediated exposure, in which affects and emotions play a vital role to get messages across.

## Africa: Media Systems

Winston Mano

University of Westminster

This entry concentrates on media systems in countries of Sub-Saharan Africa. The Sub-Saharan media system was born in the colonial era. Following the partition of Africa in

Berlin in 1884, the colonial era saw the establishment of mass media systems that initially served minority white settlers located in the emerging urban centers. Both early print and broadcasting frameworks were affected by the different policies and approaches of the colonial powers. The use of European languages, state-biased ownership systems, and limited media freedom are among colonial media attributes that continue today. The national media systems and countries discussed as part of this region are anything but homogeneous because Sub-Saharan Africa is huge and diverse. It covers 42 mainland countries and 6 island nations located south of the Sahara desert. Although the penetration of communication media has picked up in the past 50 years, only radio comes near to being described as a “mass medium.”

### GENERAL TRENDS

The spread and access to the mass media in Sub-Saharan Africa has been a highly uneven process. Estimates vary as accurate and up-to-date figures are very hard to find, but development has been rapid in the past 50 years. Among old media, → radio has achieved the best penetration owing to its affordability and adaptability. The estimated number of radio sets in Sub-Saharan Africa (excluding South Africa) rose from 460,000 in 1955 to over 70 million in 1995. What is even more remarkable is that there was a tenfold increase in the number of radio sets between 1955 and 1965 and a fourfold increase over the next decade. Sub-Saharan Africa had 158 million radio broadcasting receivers in the late 1990s, up from 33 million in 1970 (Mytton 2000).

Even the largely urban and elitist medium of → television has shown remarkable growth in Africa. UNESCO estimated that in 1997 Sub-Saharan Africa had 1,396 million television sets compared to 299 million in 1970 and 749 million in 1985 (→ UNESCO). The figures for print media titles published in Sub-Saharan Africa in the late 1990s show at least 224 daily newspapers with a combined circulation of 12 million, a marked increase from 199 newspapers in 1970, which had a combined circulation of just 4 million (World Bank 2006). Today’s rapid growth of the African media belies the fact that these mass media are recent and that they were mainly introduced during the colonial era.

### PRINT MEDIA

One of the most obvious features of Sub-Saharan African media is the way print media were introduced in different parts of the region. The press in English-speaking West Africa was the earliest in Sub-Saharan Africa. The *Royal Gazette* and *Sierra Leone Advertiser*, first published in 1801, appear to be the region’s oldest newspapers. The *Royal Gold Coast Gazette* (published in 1822, in present-day Ghana) was founded by Charles L. Force, a former American slave, who had previously established the *Liberia Herald* in 1820. Missionaries also introduced → newspapers to Sub-Saharan Africa, a good example being in 1859, when they started Nigeria’s first newspaper, *Iwe Thorin*, in the Yoruba language. Factors that led to a viable early newspaper sector in West Africa included the presence of a large population that was western-educated and the absence of a colonial settler population that could undermine the development of the press in West Africa, as it did in other regions of Africa.

By contrast to patterns in West Africa, in Anglophone *Southern and Central Africa*, the press was largely introduced by European settlers. By the time the Cape Colony's administration passed the 1828 press law, the press was already 28 years old. The law stipulated that press operators were to deposit 300 pounds plus the equivalent sum in guarantees and then they were free to publish, subject only to libel laws (Bourgault 1995; → Libel and Slander). The most notable newspapers at this time included the *Cape Argus*, founded in 1857. In 1881, Cecil John Rhodes bought the controlling interests in the *Cape Argus*, using his vast wealth to grow it into a major newspaper chain expanding northward through South Africa, into Southern and Northern Rhodesia (now respectively Zimbabwe and Zambia). The Argus Group and other mining concerns established the Bantu Press in 1931 to channel indigenous African views from politics and keep an opposition press from developing in Southern and Central Africa.

The beginnings of the press in *East Africa* were not different from other parts of Africa. It was largely created for its settler population. The first paper was established in the Kenyan coastal city of Mombasa in 1902 by a member of the Asian community, A. M. Jeevanjee. From 1910 it was operated from the mainland under the title the *East African Standard*, which still exists today. In 1930, Jeevanjee established the *Tanganyika Standard* in Tanganyika (now Tanzania) and much later set up the *Uganda Argus* in Kampala. The *Standard* papers' rivals in East Africa included the Nation Group, owned and financed by the Aga Khan of the Ismail Islamic sect. The *Daily Nation* and the *Sunday Nation* began publishing in 1960. The Indian community in East Africa generated enough wealth from trade to be able to produce a chain of papers, an undertaking that was beyond poor, indigenous East Africans.

The *French colonial administration* in Africa actively discouraged the development of the press in the colonies. A heavy tax was placed on imported newsprint and printing machinery. The French, in keeping with their policy of assimilation of Africans into French culture, preferred to freely circulate newspapers produced in the metropolis to their African colonies. It was much later, in the 1930s, before citizens who were deemed to be in good standing with the French colonial authorities were allowed to publish in the colonies. The few African-owned papers established to serve white settler interests included *Le Reveil du Senegalais*, *Le Petit Senegalais*, and *L'Union Africaine*. *Le Gri Negre* and *La Phare du Dahomey*, set up in the 1920s in Dahomey (now Benin), are examples of papers that were published outside French rules (Bourgault 1995). Most basically, a distinction can be made between the underdeveloped and underresourced press system in Francophone Africa and the relatively and technically strong settler press model in Anglophone Southern Africa.

## RADIO

The introduction and organization of broadcasting closely followed colonial political and administrative systems. Radio was introduced in the 1920s, first in South Africa, and then developed further in 1927, when the British East Africa Company began a → BBC relay service for settlers, broadcasting from Nairobi, Kenya. In 1932, the British established the Empire Service, designed to serve their colonies and dominions, including Anglophone Africa. This service relayed the BBC from Salisbury, Southern Rhodesia (now Zimbabwe)

in Southern Africa and from Lagos, Nigeria in West Africa. The Nairobi service broadcast in local languages (Kikamba and Kikuyu). The Accra, Gold Coast (now Ghana) radio service, which was started in the mid-1930s, had additional relays in Sekondi, Kumasi, and Korofidua. Not only did the service have African personnel, but by the 1940s it was broadcasting in Ewe, Twi, and Hausa. The British deliberately promoted the use of local languages in an attempt to build an African audience. The British spread radio to most of Anglophone Africa by the early 1940s.

The French, unlike the British, who wanted to provide something of a public service to their colonies, pursued an entirely different policy and initially delayed the start of broadcasting in their colonial territories. Radio broadcasting started in French Africa in 1931 in Madagascar, with Radio Dakar established in 1939 in Senegal. French colonial policy of direct rule was mirrored in broadcasting, as all programming was initially French in orientation and in delivery. Broadcasting served French citizens and underscored the value of colonial rule among French elites. In the Belgian Congo (now the Democratic Republic of Congo), the Jesuits at Albert College in Leopoldville (now Kinshasa) established in 1937 a small-scale radio station, broadcasting in French for two hours a week on Sundays and holidays. In 1939, a radio engineer, J. Hourdebise, began a private station called Congolia, which provided daily services in French but also in Lingala, Swahili, and Chiluba. The Belgians left broadcasting to private individuals or religious groups. In both the French and the British colonies, radio was from the outset an arm for colonial policies.

### THE TELEVISION AGE

The television age came to Sub-Saharan Africa in the late 1950s, which was the end of colonial rule for many countries in the region. Elite and urban in character, television depended on foreign programming and was initially used mainly for entertainment purposes. The medium was introduced in Ibadan, Nigeria, in 1959 and also later in Enugu, resulting in the country having two television stations before it gained independence from Britain in 1960. Other Sub-Saharan African countries that got television before national independence include Kenya, Zambia (Northern Rhodesia), and Zimbabwe (Southern Rhodesia), but it is important to stress that these early television services were mainly targeted at the white settler communities. Countries that got television after independence in the early to mid-1960s include Sierra Leone, Burkina Faso, Sudan, Gabon, Cote d'Ivoire, Congo, Niger, Senegal, Madagascar, Ghana, Djibouti, Equatorial Guinea, and the Democratic Republic of Congo (Zaire). Ethiopia and Liberia, two countries that were never colonized, also got television at this time.

It ought to be mentioned that some Sub-Saharan African countries resisted television for many years. These include Namibia (formerly South West Africa), which introduced the medium in 1981, and also Mali, the Seychelles, and Somalia, which created their services in 1983. Burundi did not have television until 1984. Cameroon and Chad delayed television until 1986 and 1987, respectively. In Southern Africa, South Africa resisted television until 1976, because of what was seen by the apartheid government as its "morally corruptive" influence and fears that it could provide information that would strengthen anti-apartheid forces (→ Cultural Imperialism Theories). Lesotho did not have television until 1988 and nor did Botswana until 1989. Television was introduced to

mainland Tanzania and Rwanda in the 1990s. Malawi launched its first national television station in January 1999 and Botswana did the same in July 2000. However, for most countries in the region, the television age coincided with national independence but the medium sadly remains a symbol of national status that hardly goes beyond the major African cities (→ Television for Development).

## **INDEPENDENCE AND DEMOCRATIZATION**

Although colonial media were used to suppress and misinform Sub-Saharan Africans, alternative media also helped them achieve political independence in the 1960s. African nationalists, such as Nigeria's Nnamdi Azikiwe, Ghana's Kwame Nkrumah, and Malawi's Kamuzu Hastings Banda, used the media to articulate their ideas about national independence. As a way of dealing with resistance from colonial authorities, these African nationalists adopted various strategies, including going underground with the press and its liberation rhetoric through pamphlets, tracts, clandestine radio, and word of mouth, known under different names in different parts of Sub-Saharan Africa (Nyamnjoh 2005; → Activist Media; Advocacy Journalism). The push for African independence in the late 1950s and 1960s was partly aided by economic and geopolitical changes that took place after World War II and also by the attempts to liberalize colonialism by the colonial authorities.

Post-independence media systems were close to one-party systems (→ Partisan Press; Party–Press Parallelism). The reason was that, once in power, these nationalist governments expanded their mass media systems and, with the help of UNESCO and bilateral aid organizations, they experimented with the ideas of development and modernization using the mass media (→ Development Communication: Africa). In the processes of nation building, the ownership and control of broadcasting was more centralized than that of print media. To a large extent, some of the previously westernized communication models and media systems were indigenized after independence. For example, in Zaire under Mobuto Seseseko, the media were nationalized and newspaper titles were changed. In many countries, British and French models of broadcasting, and to a lesser extent print media and journalistic practices, were nationalized and attempts were made to localize → media policies.

For example, most media policies in Sub-Saharan Africa, certainly in Tanzania and Zambia, prioritized radio over other mass media because it had more resonance with local life. This is particularly true of television, which largely depends on programs produced in western countries. African independence also saw increased attempts by the new states not only to own but also to control the mass media. State → censorship and persecution of journalists (→ Violence against Journalists) increased as weak African governments sought to suppress criticism from the media for much of the period after the 1960s. African journalists are poorly paid and most media organizations are underfunded. On the whole, the legacy of western notions of media culture and practice is yet to be adequately reformed in order to address the expectations of the majority of Africans, especially those living in rural Africa.

In the 1990s, the changing African media became central to the new struggle for greater political and economic independence. In response to demands by international and local pressure groups, more and more African countries opened up their media and telecommunications sectors. Before 1990, only a few African countries allowed commercial or

nonstate radios; for example, Africa No. 1 in Gabon, Radio SYD in Gambia, Radio ELWA in Liberia, and Trans-World Radio in Swaziland. By 2005, most countries had opened up their broadcasting sectors after many years of state monopoly of the sector.

The 1990s ushered in a boom in private, local, community, and commercial radio stations in some regions, for example in West Africa, where 76 stations were established in less than 5 years up to 1996 (→ Community Media). In Burkina Faso and Mali, most of these new stations are in rural areas and are of a nonprofit public service character. Other countries that have allowed private broadcasting include Uganda, Rwanda, Burundi, Zambia, Namibia, Senegal, and Botswana. After majority rule in 1994, South Africa made huge efforts to reform and democratize the South Africa Broadcasting Corporation (SABC) into a genuine public service broadcaster. The country has also opened up its media sector greatly. By contrast, Zimbabwe is one of the countries that is yet to open up its broadcasting sector, and for much of its period of independence from Britain, since 1980, it has been less tolerant of private media. For example, in September 2003, police in Harare stormed the offices of the *Daily News* and shut the “opposition” newspaper, ostensibly banning it for refusing to register with the government-appointed Media Information Commission (MIC). In general, a wave of democracy in the 1990s brought with it multipartyism and a degree of media pluralism in many Sub-Saharan African countries.

### **INTERNET AND MOBILE COMMUNICATION**

From 2000 to 2006 the percentage of → Internet users in Africa grew 625.8 percent, with the bulk of Sub-Saharan African users in South Africa (5.1 million), Nigeria (5 million), Sudan (2.8 million), Zimbabwe (1 million), and Kenya (1 million). According to the 2006 World Development Indicators of the World Bank, the number of mobile phone subscribers in Sub-Saharan Africa rose dramatically from 7.5 million in 1999 to 76.8 million in 2004, and between 2000 and 2004, fixed-line and mobile phone subscribers increased from 31 per 1,000 to 84 per 1,000. This growth was mainly driven by a 400 percent increase of mobile phone subscribers in the region. Four times as many people had access to mobile phones as to fixed-line phones in Sub-Saharan Africa in 2004 (World Bank 2006), making Africa the first place where mobile subscribers outnumber fixed-line subscribers.

Although spectacular growth has been achieved in the mobile phone and Internet sectors, the overall picture in Sub-Saharan African countries seems to suggest that a very small group of privileged Africans have benefited. For example, in 2006 there were 32.8 million African Internet users (3.6 percent of the African population, about 3 percent of users in the world) in a continent with an estimated population of 915 million (14.1 percent of the world’s population; → Digital Divide). However, one needs to be skeptical of these figures, not only because of the efficacy of methods used to generate the statistics but also because of their failure to reflect multiple user dimensions, of say mobile phones, which are prevalent in Africa.

### **THE TWENTY-FIRST-CENTURY AFRICAN MEDIA SYSTEM**

Regulatory and technological issues dominate the twenty-first-century African media system. There are increased calls and moves toward more diverse media frameworks.

State monopolies have been undermined by a wave of deregulation, commercialization, and privatization of broadcasting and telecommunications. Demands for democratic changes have included calls for the democratization of the media spaces, and technological changes have increased technical options, allowing plurality in the telecommunications and broadcasting sectors (→ Communication Technology and Development).

A small but significant number of Africans is now able to receive popular radio and television content via terrestrial, satellite, cable, and Internet. Most countries are taking advantage of the rapid development of new communications technologies and digitization. For example, Cameroon and Mozambique now also use the capital-intensive cable television format. South Africa's Multichoice Digital Satellite Television (DSTV), a digital subscriber management company and the first pay-TV service in Sub-Saharan Africa, grew from M-Net, a single channel pay-TV service that was set up in South Africa in 1986. By 2002, Multichoice was providing 55 TV channels and over 40 audio channels for a monthly subscription of US\$45. In 2006, Multichoice was part of a group of big players in African broadcasting that include the BBC and Canal France International (CFI), which provide free-to-air networks delivered by satellite to local African television stations, which then broadcast the channels in whole or part. The networks are CFI, which styles itself as a program bank, and Africa Broadcast Network (ABN), which grew from program distributor ABC and TV Africa and received financial backing from the International Financial Corporation in 2001. In 2003, ABN broadcast one-hour prepackaged programs, typically consisting of American programs, to Ghana, Kenya, Zambia, Nigeria, and Tanzania (→ Digital Media, History of; Satellite Television).

Sub-Saharan Africa has also seen a dramatic growth in the indigenous entertainment production industry. For example, the burgeoning video film industry in Nigeria, now dubbed "Nollywood," has become Africa's answer to India's → Bollywood and America's → Hollywood industries. Rapid technical developments and affordable equipment are giving Africans a chance to produce and consume their own images. Internet radio stations, online newspapers, and digital music libraries are set to continue revolutionizing the Sub-Saharan African media scene (→ Online Media). However, the point can be made that the evolution of the African media system currently works in favor of new market-based operators, which are not producers but peddlers of foreign-produced content, within the parameters defined by colonial legacies. Information for citizenship is minimal in media diets that are urban-biased and market-driven. To sum up, Sub-Saharan Africa's emerging media system is diverse and fast growing but to a large extent is still influenced by its colonial legacy.

## **Age Identity and Communication**

*Jake Harwood*

*University of Arizona*

Communication plays a substantial role in influencing understandings and self-presentations with regard to age. While the immutable passing of time (and rising chronological age) is at the heart of life-span development issues, our age group identifications and the age groups into which we are categorized are not deterministically organized by chronological age. Rather, age identities and categorizations are considerably more malleable. Gender or ethnicity category distinctions remain relatively impermeable over time, and the boundaries between such groups remain fairly rigid and clear for most people (people who are multiracial “passing” as members of other groups, or who are transsexual/transgendered, constitute exceptions here). In contrast, age group memberships change with time and divisions between age groups are fuzzy and highly negotiable. As a result, they are perhaps more open to social construction (→ Discursive Psychology). This provides opportunities to study the communicative practices that people employ to manage their age identities. Negative age stereotypes and prejudicial (ageist) attitudes are also common. Despite the fact that most of us will (or hope to) get old, many young *and* old people hold negative views of older adulthood (Kite et al. 2005). Hence, age presents unique opportunities and points of interest for identity scholars.

## INTERGENERATIONAL PROCESSES

One approach to age identification and communication has been to examine intergenerational processes driven by age categorizations (→ Intergenerational Communication). Grounded in → social identity theory (Tajfel & Turner 1986) and communication accommodation theory (Shepard et al. 2001), this work has looked at how age stereotypes lead to patronizing speech from young to old (Hummert & Ryan 2001). Younger people who stereotype older adults as deaf or mentally impaired sometimes use a speech style similar to baby talk (→ Intergroup Accommodative Processes). This is often dissatisfying for older adults, and can yield negative outcomes for older people as they are assumed to be incompetent by those overhearing such speech.

Theoretical development in the study of intergenerational communication has centered on the communication predicament of aging model (Ryan et al. 1986). Some work has broken down the components of the patronizing speech style, identifying which may be functional for impaired older people, which are perceived as nurturing, and which serve no useful function (Kemper & Harden 1999). Identity issues are relevant because intergroup age stereotyping processes are closely related to age identities – social identity theory demonstrates that negative stereotypes reinforce positive ingroup identities (→ Prejudiced and Discriminatory Communication).

Other intergenerational processes have been tied to life-span identifications: storytelling (Nussbaum & Bettini 1994; → Storytelling and Narration); attribution (Erber & Prager 2000; → Attribution Processes); reproaching (Miller-Day 2004); disclosing painful experiences (J. Coupland et al. 1988), and intergenerational conflict (Zhang et al. 2005; → Conflict and Cooperation across the Life-Span). The specific processes described in most of this research are culturally limited. Research needs to pay attention to cultural variability in age-identity-related communication processes (Harwood 2007). For instance, Zhang & Hummert (2001) describe a process of *laodao*, a specifically Chinese pattern of repetitive complaining from old to young.

## MANAGING AGE IDENTITY IN DISCOURSE

A second area of research has examined how age identities are raised, manipulated, avoided, and negotiated in naturalistic language use (→ Identities and Discourse). This includes work examining the disclosure of chronological age (DCA) in older adulthood (i.e., when older adults tell others exactly how old they are). N. Coupland et al. (1989) discuss two functions for DCA. First, it serves a disjunctive function, positively contrasting current health status with what might be subjectively expected (e.g., “I’m doing well for 73”). Second, it serves an accounting function, explaining a negative state as a function of age (e.g., “I’m not as fast as I used to be; at 73, you can’t expect too much!”). N. Coupland et al. note that accounting and disjunction both serve self-presentation functions for the individual. The speaker is framed as doing either better than, or at least as well as can be expected given their age. However, both draw on an underlying presumption of decline and decrement that occurs with age – they reinforce assumptions about aging and decline.

Beyond DCA, J. Coupland et al. (1991) have identified other ways in which age categories can be invoked in discourse. For instance, an age-related role can be mentioned

(widow, student, retiree), or descriptions of the past or of changes over time can be made (e.g., noting that you remember when a residential subdivision was just a field). These authors argue that such comments are (like DCA) strategic activities that invoke age for particular discursive purposes. They are, then, *generational alignments*, ways in which we align ourselves with particular age groups or generations for particular purposes. The uniquely fluid nature of age groups lends itself to this process, but similar processes could be identified with other groups (e.g., at certain junctures it may be useful to emphasize womanhood, while at other times it may be strategically marginalized in talk). More coverage of a wide variety of links between discourse and life-span position is provided in N. Coupland & Nussbaum (1993).

### AGE IDENTITIES AND THE MEDIA

Age identities are also shaped by media presentations and portrayals. Research examining media underrepresentation of older people has demonstrated the lack of value placed on this group (Robinson et al. 2004). Interestingly, most samples of → television examined also underrepresent very young people (children and adolescents). Hence, both ends of the life-span tend to be marginalized in “mainstream” television. Such findings appear to be cross-culturally relatively stable. Quantitative analyses have also considered the *quality* of old-age portrayals in the media, noting that older people are often portrayed negatively (→ Stereotyping and the Media).

Less work has considered the complexities of age portrayals from a qualitative perspective, although there is some work examining age representations in websites (Harwood 2004), skin care and tanning discourses (J. Coupland 2003), Internet chat rooms (Lin et al. 2004), and on specific television shows (Harwood & Giles 1992). Further work is needed to examine the ways in which aging is used in cosmetics advertising (e.g., anti-wrinkle creams) and how age is marked in → news stories.

Older adults engaged in counter-stereotypical activities (sky diving, robbing banks) are often described in ways that could be interestingly unpacked by discourse scholars. Advertising portrayals also deserve more attention. For instance, the grandparenting relationship is being used in interesting ways in a number of recent print advertisements in North America: ads have appeared with the implicit message that using the product/service will result in enhanced relationships with grandchildren. These are undoubtedly designed not just to appeal to grandparents, but also to capitalize on the more general positive affect associated with grandparenting. Hence, a life-span-related role identity is being used to trigger affect that is then associated with a product. The extent to which such strategies are effective, and their effects on perceptions of the role relationship (e.g., idealization of grandparenting as a result of the ads) lead us to very interesting empirical questions (→ Advertising).

### AGING AND HEALTH

Aging is often treated as synonymous with ill health and decline, often with profound implications (N. Coupland & Coupland 1990; Hummert & Nussbaum 2001; → Health Communication). Aging is also a contested issue within health-care itself. N. Coupland &

Coupland (1999) describe some of the ways in which anti-ageist medical philosophies are invoked by physicians in dealing with older patients (→ Doctor–Patient Talk). These philosophies are well intentioned and for many patients may serve to move them out of a mindset where aging and ill health are seen as inextricably linked. However, N. Coupland & Coupland (1999) also note that some patients may find comfort in attributing health problems to age – it may be psychologically functional to see a problem as “normal for my age” rather than abnormal (and therefore pathological). Anti-ageist discourses can also themselves be seen as ageist at times, for instance when they reinforce ideas that older adults need protection from ageism, are unable to think critically about their own life-span position, and need to be shielded from certain “realities.”

## Agenda Building

*Matthew C. Nisbet*

*American University*

Agenda building refers to the process by which news organizations and journalists feature, emphasize, and/or select certain events, issues, or sources to cover over others. Research in the area is closely linked to but distinct from the agenda-setting tradition which examines the connection between the issues portrayed in the news media and the issue priorities of the public (McCombs 2004). Agenda building is also related to work in political science on *policy agenda setting*, which focuses on how news coverage both reflects and shapes the priorities of government officials, decision-makers, and elites (Baumgartner & Jones 1993; → Agenda-Setting Effects).

The *news agenda* is defined as the list of events or issues that are portrayed in coverage at one point in time or across time. *Events* are discrete occurrences, such as the release of a government report on greenhouse gas emissions or a presidential speech on Iraq.

An *issue* can be a series of related events that are grouped together within a larger category of meaning such as climate change, the environment, the war in Iraq, or foreign policy. *Sources* include the voices, actors, or groups featured in news coverage such as government officials, environmentalists, or antiwar protesters (Reese 1991; → News Sources).

The agenda-building literature is characterized by a diversity of theoretical and methodological approaches. However, a common thread is that news coverage is not a reflection of reality, but rather a manufactured product, determined by a hierarchy of social influences that span levels of analysis (→ Reality and Media Reality). Macro-level factors involve economic, cultural, and ideological variables along with ownership structure and industry trends. Mid-range influences include organizational routines, professional norms, → journalist role perceptions, and source strategies. Individual-level influences derive from socio-economic, political, and psychological orientations of journalists (Shoemaker & Reese 1996).

### IDEOLOGICAL AND INDUSTRY-LEVEL FACTORS

At this level of analysis, there is a heavy emphasis on research on the news agenda and its relevance to the media's performance as a democratic institution. Critical theorists argue that media agendas tend to pay close attention only to the events, political figures, and issues that favor the interests of elites and that fall within a narrow range of political perspectives. The news agenda therefore serves a *hegemonic* function, maintaining a cohesive ideology and set of values that protects the status quo power structure (Reese 1991; → Critical Theory).

Beyond this critical perspective, other research has explored the impact of ownership structure on news attention to community issues or to the plurality of perspectives considered newsworthy (Demers 1999; → Ownership in the Media). Additionally, several scholars have examined how changes in technology and market forces have displaced coverage of policy-oriented *hard news* issues with coverage of more sensational and celebrity-oriented → *soft news* topics (Hamilton 2004; → Media Economics). A fourth area of research has focused on *inter-media agenda setting*, or the tendency for different types of news outlets to mirror closely the set of issues covered by just a few national news organizations (→ Quality Press; News Agencies) or to converge simultaneously on a single high-profile national story (Reese 1991).

### ORGANIZATIONAL AND PROFESSIONAL FACTORS

Most of the research on agenda building has focused on workplace and professional-level influences that shape news attention. This research investigates the unofficial set of ground rules that govern the interactions between journalists and their sources, leading to a negotiation of newsworthiness. This co-production of news often privileges attention to certain issues, views, and societal actors over others (Berkowitz 1992; Cook 1998).

News organizations are profit-driven enterprises that are chiefly concerned with transforming complex events into appealing stories for their news consumers. Faced with financial, political, and time pressures, journalists routinize their daily work by relying on → news values such as prominence, conflict, drama, proximity, timeliness, and objectivity

(→ News Factors). Moreover, they rely heavily on storytelling themes and narrative to package complex events and issues and to make them appealing to specific audiences. In reporting the news, they follow a set of socially prescribed role expectations that are based on organizational rules, professionally derived standards of ethics and quality, and societal expectations relative to commonly held beliefs such as patriotism or religion (→ Ethics in Journalism; Quality of the News).

In order to further promote predictability, journalists have a tendency to rely heavily on routine channel sources and *information subsidies*. Examples include official government actions and events, the release of scientific journal articles or expert reports, and other *pseudo-events* (→ Media Events and Pseudo-Events). Finally, media organizations make predictable the unexpected by assigning their journalists to news bureaus and beats, including government institutions or to a societal sector such as science or business (Shoemaker & Reese 1996).

These routines result in systematic patterns in news attention and sourcing. Studies find that the majority of news stories are source-generated, with government and industry officials having the strongest impact on the news agenda. Other actors – including lawyers, doctors, celebrities, and scientists – wield media influence because of their perceived social legitimacy. Few stories are “discovered” by way of enterprise reporting. In most cases, even objective indicators related to the economy or the environment are made newsworthy by the actions and claims of sources. In addition, the authority bias of journalists tends to lead to a close *indexing* of only the official views expressed in a policy debate, ignoring in coverage nonofficial sources that might offer dissent (Bennett 1990). As a result, in order to gain media agenda status, many nonauthoritative sources are forced to piggyback on favorable focusing events and/or invest heavily in cultivating personal contacts with journalists (Danielian 1992; → News Routines).

The heavy reliance by journalists on familiar narratives means that in order to generate continued coverage of an issue, journalists must be able to fit the issue into a broader storyline. Visible conflict, personality clashes, and dramatic claims in relation to risks and morality allow journalists to construct a “news saga” that they can cover for more than a day or week. As a result, issues that remain defined in more thematic and technical ways are less likely to receive wider media attention (Nisbet & Huye 2006; → Conflict as Media Content).

## **SOCIAL COMPOSITIONAL AND INDIVIDUAL-LEVEL FACTORS**

In shaping the selection of stories, several studies have focused on the political and social predispositions of journalists. In the US context, partisanship remains the most contentious among possible individual-level influences. In defense of journalists, many scholars argue that it is much more likely that professional and organizational norms override any political bias in coverage decisions. Yet survey research shows a significant relationship between the political beliefs of journalists and their responses to hypothetical coverage decisions, even among American journalists who prefer a tradition of political → neutrality (Patterson & Donsbach 1996). Other research finds connections between the racial, religious, class, and geographic composition of newsrooms and the selection of stories (Shoemaker & Reese 1996). More recent work applies theories from social psychology to understand journalistic decisions. This emerging approach argues that the cognitive and

emotional needs of journalists can help explain common agenda-building phenomena, ranging from pack journalism to political bias (Donsbach 2004; → *Bias in the News; Journalism: Group Dynamics*).

## **RESEARCHING THE AGENDA-BUILDING PROCESS**

Each approach to observing and tracking the agenda-building process features certain advantages and limitations. Content analysis is by far the most frequently used method (→ *Content Analysis, Qualitative; Content Analysis, Quantitative*). In combination with measuring the amount of media attention to an event or issue, this “visible source impact” approach (Berkowitz 1992) also involves tracking the standing given in coverage to certain actors or institutions over others. Researchers may also closely examine news stories for the use of routine channel sources that appear to have served as the news peg for coverage. The more prominent the actor in coverage or the more frequently appearing a specific type of news peg, the greater the influence that particular source is inferred to have on the agenda-building process.

A limitation for many of these content studies is their scale, with studies focusing on news coverage of an issue at just a few news outlets, over just a few years, within a single national setting, or using the agenda at the national elite newspapers as a proxy for the broader news agenda. Several studies have tracked coverage of an issue over a decade or more, identifying the important reciprocal relationships between media agendas and policy arenas (Nisbet et al. 2003; → *Time-Series Analysis*). Content analysis studies are also limited in that they only examine news coverage as the final product of the agenda-building process. Even though several valid and reliable interpretations are possible from this type of analysis, there remains some degree of uncertainty regarding the actual inputs to the process or the specifics of the process itself. Other studies attempt to build on the “visible source impact” approach with a tallying of source–media coverage success rates. This method involves comparing press releases from key sources and then noting their success rate in shaping news coverage.

Though employed less frequently than content analysis, → survey studies of journalists add many valuable insights to agenda building and news coverage decisions. In survey studies, self-reported attitudes and behaviors of journalists are often correlated with news organization attributes and/or news content measures. More innovative survey studies have embedded quasi-experimental designs that tap the influence of role perceptions and political beliefs in shaping coverage decisions. These survey studies, however, can be very expensive, with respondent participation rates a function of cost. Finally, future research needs to return to the classic ethnographic and observational studies of journalistic decision-making. Although these methods can be time-intensive, expensive, and suffer from either a lack of representativeness and/or observational bias, this original work helped lay the foundation for an entire field of media sociology, and should not be abandoned.

## **FUTURE RESEARCH**

Regardless of the method applied to the study of agenda building, future research faces several central questions. First is the reality that no single issue exists in isolation from

other issues. Every news organization has a limited carrying capacity, meaning that the outlet can pay attention to only a finite number of problems at any given time. Consequently, unless carrying capacity increases, the rise of one issue to agenda status means that another issue is likely to be bumped from consideration (Hilgartner & Bosk 1988). Yet despite this “natural law” of public arenas, a major problem is that very few agenda-building studies examine coverage of an issue within the context of the wider competitive media environment.

Second, with technological changes and increasing audience fragmentation, future research needs to explore more carefully the relationship between traditional news organizations and their many emerging competitors. Conservative and religious cable news channels, pan-Arab satellite TV news, Internet portals such as Google, Yahoo!, and YouTube, and even portable handheld devices are all examples of alternative news agendas. Moreover, with the rise of these new media platforms, the definition and role of the journalist is changing, with → bloggers and → documentary filmmakers shaping traditional news agendas and reaching either mass publics and/or important targeted audiences.

Finally, since many agenda studies examine coverage of an issue or events only across a limited time period, very few researchers consider the potential power exerted in achieving agenda success early on in the history of a debate. For example, if in early coverage of an issue a select few sources can strategically define their position, as well as the alternatives available for discussion, they can shield themselves in future coverage from counter-arguments, making it difficult for opposing sources to even gain news attention. In addition, by gaining agenda status and subsequently altering the framing of an issue, sources can control which news beats or types of journalists cover an issue and even influence the type of policy arena where debate over an issue takes place. This connection between agenda building, frame building, and its impact on the trajectory of an issue remains an under-theorized area of research (Nisbet & Huye 2006; → Framing of the News).

## Agenda-Setting Effects

David H. Weaver

Indiana University

One of the most oft-cited approaches to studying media effects that emerged in the early 1970s is known as the agenda-setting effect (or function) of mass media. First tested empirically in the 1968 US presidential election by University of North Carolina journalism professors Maxwell McCombs and Donald Shaw (McCombs & Shaw 1972), this approach originally focused on the ability of the mass media to tell the public what to think *about* rather than what to think. This was a sharp break from previous media effects studies that had focused on what people thought (their opinions and attitudes) and on behaviors such as voting and purchasing various goods and services (→ Media Effects, History of).

In their original 1968 study, published in *Public Opinion Quarterly* in the summer of 1972, McCombs and Shaw quoted Bernard Cohen, author of *The press and foreign policy*, who wrote that the press “may not be successful much of the time in telling people what to think, but it is stunningly successful in telling its readers what to think *about*” (Cohen 1963, 13). They also quoted from Kurt and Gladys Lang’s chapter on the mass media and voting in Bernard Berelson’s *Reader in public opinion and communication*: “The mass media force attention to certain issues. They build up public images of political figures. They are constantly presenting objects suggesting what individuals in the mass should think about, know about, have feelings about” (Lang & Lang 1966, 468; → Cumulative Media Effects).

To empirically test this agenda-setting effect of mass media, McCombs and Shaw content analyzed four local newspapers, the *New York Times*, *Time*, *Newsweek*, and the NBC and CBS evening news broadcasts (→ Content Analysis, Quantitative), and compared the rankings of the key issues by these news media with undecided voter respondents' answers to a → survey question asking them what they were most concerned about at the time (the two or three main things that they thought the government should concentrate on doing something about). This study produced some very strong correlations between the rankings of issues by the media and by the public (→ Correlation Analysis), leading to the conclusion that the public learns not only about a given issue but also how much importance to attach to that issue from the amount of information in news reports and its position.

Since this initial study of media agenda setting, there have been several hundred studies carried out by scholars in the US and other countries such as Germany, Great Britain, Israel, Italy, Japan, the Netherlands, Spain, Taiwan, and others. Most of these studies have focused on the relationship between news media ranking of issues (by amount and prominence of coverage) and public rankings of the perceived importance of these issues in various surveys, a type of research that Dearing and Rogers (1996) have called *public agenda setting*, to distinguish it from studies that are concerned mainly with the causes of changes in the media agenda (*media agenda setting*) or the impact of media agendas on public policy agendas (*policy agenda setting*).

The evidence from scores of such public agenda-setting studies is mixed, but on the whole it tends to support a positive correlation – and often a causal relationship – between media agendas and public agendas at the *aggregate* (or group) level, especially for relatively unobtrusive issues that do not directly impact the lives of the majority of the public, such as foreign policy and government scandal. At the *individual* level, the evidence is not as strong (McLeod et al. 1974). That is, the *individual* rank orders of issues are not necessarily the same as the *aggregate* ranking compiled from many individual answers to the question about the most important issue facing the country (or state or city or community).

## METHODS OF STUDYING AGENDA SETTING

In addition to examining the relationships between media and public agendas at the aggregate and individual levels, it is also possible to study single issues over time using either aggregate (group) or individual-level data. McCombs (2004) has described these *four different approaches* (entire agenda, aggregate level; entire agenda, individual level; single issue, aggregate level; and single issue, individual level) in terms of a four-cell typology, which he calls the Acapulco typology because it was first presented at the annual conference of the → International Communication Association (ICA) there in 1980 (Table 1).

He calls the first perspective (studying an entire agenda at the aggregate or group level) “*competition*” because it examines an array of issues competing for media and public attention. It was the approach used in the original 1968 Chapel Hill study, and it has been the most common approach employed in agenda-setting research since that time. It has also yielded notably stronger correlations between media and public agendas than studies

Table 1 The Acapulco typology: four perspectives on studying agenda setting

Focus of attention	Aggregate data	Individual data
Entire agenda of issues	I Competition	II Automaton
Single issue	III Natural history	IV Cognitive portrait

Source: McCombs (2004, 31)

using individual-level data to compare media and individual persons' agendas (an approach that McCombs calls "automaton"). He notes that another way of thinking about this approach is in terms of the ability of the news media to mobilize a constituency among the public for a particular issue.

Probably the second most common approach to studying agenda setting has been the use of aggregate data to study media coverage and public concern about single issues over time (an approach that McCombs calls "*natural history*"). Using media content and aggregate public opinion data over time, it is possible to track the rise and fall of media attention to and public concern over particular issues, and to get a sense of whether increased media attention precedes, coincides with, or follows an increase in public concern – essential information for inferring a causal relationship. A seminal study using this approach is Funkhouser (1973), who correlated news media coverage of major issues during the 1960s with public opinion and real-world conditions during the decade.

It is also possible with this approach to see if the relationship between media attention and public concern over a particular is linear or nonlinear – something that has been explored in relatively few agenda-setting studies (see, for example, a chapter by William Gonzenbach and Lee McGavin on a methodological analysis of agenda setting in McCombs et al. 1997, which explores the use of time-series analysis in studying agenda setting and cites several studies employing nonlinear analysis by David Fan, Jonathan (Jian-Hua) Zhu, and Russell Neuman). This chapter suggests that the methods of nonlinear approaches can be seen in the equations and analysis of some agenda-setting studies, and that one of the most significant contributions of agenda-setting research is to take a leading role in re-examining assumptions about linear relationships.

One of the earliest and most thorough studies to do this was by Hans-Bernd Brosius and Hans Mathias Kepplinger (1992), who questioned the linearity assumption of much agenda-setting research and who proposed four nonlinear models of the relationship of media coverage and public opinion: *threshold* (a certain level of media attention is necessary to affect public concern); *acceleration* (public concern increases or decreases faster than media coverage); *inertia* (public concern increases or decreases at a slower rate than media coverage); and *echo* (unusual peaks in media coverage have long-term effects on public concern; → Linear and Nonlinear Models of Causal Analysis).

The third perspective or approach to studying agenda setting is to use individual-level public data to study a single issue over time. It has been called "*cognitive portrait*" by McCombs (2004) and is less common than the natural history approach using aggregate public data. Examples of the cognitive portrait approach include experimental studies in which the salience of a single issue for each individual person is measured before and after

exposure to news programs where the amount of exposure to various issues is controlled. Shanto Iyengar has done a number of these studies (Iyengar 1979; Iyengar & Kinder 1987). Jian-Hua Zhu, in his chapter with William Boroson on a cross-sectional and longitudinal analysis of individual differences in McCombs et al. (1997), has also analyzed single issues over time by disaggregating public opinion data by educational and income levels, an approach that seems to fall in between the natural history and cognitive portrait approaches.

The fourth approach, called “*automaton*,” has been the least studied. It involves comparing entire rankings of issues for each individual person with various media rankings of issues, and typically these correlations are much lower than those found when comparing an aggregate ranking of issues with media rankings (see McLeod et al. 1974; Erbring et al. 1980). This is not surprising because it would be a return to a “hypodermic needle” or very powerful media effects model that has not received much support from empirical studies since the 1940s (→ Stimulus–Response Model).

## **A SECOND LEVEL OF AGENDA SETTING**

In the majority of studies to date, the unit of analysis on each agenda is an *object*, a public issue. But objects have *attributes*, or characteristics. When the news media report on public issues or political candidates, they describe these objects. Due to the limited capacity of the news agenda, however, journalists can only present a few aspects of any object in the news. A few attributes are prominent and frequently mentioned, some are given passing notice, and many others are omitted. In short, news reports also present an agenda of attributes that vary considerably in salience. Similarly, when people talk about and think about these objects – public issues, political candidates, etc. – the attributes ascribed to these objects also vary considerably in their salience.

These agendas of attributes have been called “the second level” of agenda setting to distinguish them from the first level, which has traditionally focused on issues (objects), although the term “level” implies that attributes are more specific than objects, which is not necessarily true. The perspectives and frames that journalists employ draw attention to certain attributes of the objects of news coverage, as well as to the objects themselves (→ Framing Effects; Framing of the News).

## **AGENDA SETTING AND FRAMING**

Tankard et al. (1991, 3) have described a media frame as “the central organizing idea for news content that supplies a context and suggests what the issue is through the use of selection, emphasis, exclusion and elaboration.” Entman (1993, 52) argues that “to frame is to *select some aspects of a perceived reality and make them more salient in a communicating text, in such a way as to promote a particular problem definition, causal interpretation, moral evaluation and/or treatment recommendation* for the item described” (italics in original). McCombs (1997, 37) has suggested that in the language of the second level of agenda setting, “framing is the selection of a restricted number of thematically related attributes for inclusion on the media agenda when a particular object is discussed.” He argues that there are many other agendas of attributes besides aspects of issues and traits

of political candidates, and a good theoretical map is needed to bring some order to the vastly different kinds of frames discussed in various studies. This he sees as a major challenge and opportunity for agenda-setting theory in its exploration of the second level.

Not all scholars agree that second-level agenda setting is equivalent to framing, at least not to more abstract, or macro-level, framing. Gamson (1992) has conceived of framing in terms of a “signature matrix” that includes various condensing symbols (catch-phrases, tag lines, exemplars, metaphors, depictions, visual images) and reasoning devices (causes and consequences, appeals to principles or moral claims). Some would argue that second-level agenda setting is more similar to the first part of this matrix than to the second, because it is easier to think of condensing symbols as attributes of a given object, but more difficult to think of reasoning devices as attributes.

Nevertheless, there are similarities between second-level agenda setting and framing, even if they are not identical processes. Both are more concerned with *how* issues or other objects (people, groups, organizations, countries, etc.) are depicted in the media than with *what* issues or objects are most (or least) emphasized. Both focus on the most salient or prominent aspects or themes or descriptions of the objects of interest. Both are concerned with ways of thinking rather than objects of thinking, and with the details of the pictures in our heads rather than the broader subjects. But one primary difference between the two approaches, in addition to those mentioned above, is that second-level agenda-setting research has been more concerned with the relationship between media and audience ways of thinking than has framing research, which has concentrated more on how the media cover and present various subjects.

### AGENDA SETTING AND PRIMING

Several scholars have tried to link agenda-setting research with studies of “priming” (→ Priming Theory) that examine the effects of media agendas on public opinion as well as public concerns (McCombs et al. 1997). The focus on the consequences of agenda setting for public opinion can be traced back at least to Weaver et al. (1975, 471), who speculated in their 1972–1973 panel study of the effects of Watergate news coverage that the media may do more than teach which issues are most important – they may also provide “the issues and topics to use in evaluating certain candidates and parties, not just during political campaigns, but also in the longer periods between campaigns.” The basic idea of priming is that by increasing the perceived salience of some issues or topics (and also their attributes), media coverage can influence the criteria or standards by which certain people or groups are evaluated.

Not all scholars agree that priming is a consequence of agenda setting, however. Some have argued that both agenda setting and priming rely on the same basic processes of information storage and retrieval, where more recent and prominent information is more accessible (→ Information Processing; Memory). Regardless of these debates, it seems likely that an increase in the salience of certain issues, and certain attributes of these issues, does have an effect, perhaps indirect, on → public opinion. A recent article by Son and Weaver (2006) confirms that the media attention to a particular candidate, and selected attributes of a candidate, does influence his or her standing in the polls, cumulatively

rather than immediately. And an earlier study by Weaver (1991) found that increased salience of an issue was associated with public opinion and behavior regarding the issue.

### PROBLEMS AND FUTURE DIRECTIONS

Toshio Takeshita (2006) has identified what he considers to be *three critical problems* with agenda-setting research: process, identity, and environment. The *process* problem focuses on the degree to which agenda setting is automatic and unthinking; the *identity* problem is concerned with whether second-level or attribute agenda setting will become indistinguishable from framing or traditional persuasion research; and the *environment* problem stems from the development of communication technology and the subsequent growth in the number of news outlets, and whether that will reduce and fragment the agenda-setting effect of media at the societal level. Takeshita (2006) suggests that *future research* on agenda setting should focus on the factors that distinguish “genuine” or deliberative agenda setting from “pseudo-”agenda setting that is automatic and unthinking. He also suggests focusing on how the salience of certain attributes of a given object (be it an issue or a candidate) leads to the development of attitudes toward that object.

In addition to these suggestions, it seems clear that more research is needed to clarify the similarities and differences between second-level agenda setting and framing, on the salience and perceived importance of issues and attributes, and on the conditions under which media agendas are likely to influence not only public but also policymakers’ agendas. And there needs to be more research on the influences on the media agenda from various sources. Agenda setting should be conceptualized as a societal-level process as well as an individual-level one. Not all agenda-setting processes should be analyzed at the psychological level. Some must be studied at the societal or cultural level to gain a richer understanding of how these processes occur, and the forces that shape them.

## Aging and Cognitive Processing

Melanie Morgan

Purdue University

The body of work on aging and information processing has consistently indicated that, generally, cognitive performance deteriorates with age (Park & Minear 2004). Measures of speed, reasoning, and working memory all indicate a negative trend for age. Although these findings may seem bleak, there are some domains that remain intact. For instance, knowledge seems to continue to accumulate well into old age.

One distinction that must be drawn when examining the effects of aging on cognitive processing is that between primary and secondary aging. *Primary or normal aging* is the inevitable process of deterioration that occurs as we move through the life-span and when a diagnosis of dementia has been eliminated. *Secondary aging* results from effects of the environment and disease. There is clear evidence that pathologies (e.g., dementia, loss of cardiovascular functioning, etc.) associated with aging are also associated with less efficient

cognitive processes or abilities. Related to primary aging, three areas warrant attention: the relationship between aging and commonly assessed processing variables, the theoretical and methodological issues associated with this area, and finally, recent developments in the field of cognitive aging (→ Information Processing; Cognition; Memory).

## AGE-RELATED CHANGES IN COGNITIVE PROCESSING

### Processing Speed

As we age, the speed with which we perform certain mental operations declines. More specifically, scores for processing speed show negative age trends and are obvious before the age of 50, but probably begin in the early 20s. One large-scale national study indicated that the average performance on measures of processing speed for young adults in their early twenties was near the 75th percentile while adults in their early seventies performed near the 20th percentile (Salthouse 2004). Processing speed is often measured by how rapidly an individual can make same/different judgments about pairs of symbols, patterns, or letters.

The relationship between age and processing speed is extremely strong and linear. However, it is also important to note that these age-related declines are not associated with increases in between-person variability. Instead, the trend is for increased age to be associated with a smaller range in scores.

Speed of processing has received a large amount of attention and has been hypothesized as the major underlying mechanism for all cognitive deterioration. Although there are competing theories proposed in the literature, the processing-speed theory has been well developed and has received a considerable amount of empirical support (Salthouse 2004).

There are two underlying mechanisms regarding processing-speed theory. First, the *limited time mechanism* asserts that the time to perform later operations is hampered when a large portion of the available time is expended on earlier operations. The second mechanism proposed is the *simultaneity mechanism*, which is based on the idea that the products of earlier processing may be lost by the time later processing is completed, thereby making relevant information no longer accessible when it is needed.

### Memory

Findings related to memory and aging are less straightforward than processing speed and can be best understood by examining different types of memory. Memory can be conceptualized as a set of systems rather than a single entity. These include short-term and long-term memory, and both are comprised of various subsystems.

#### *Short-Term Memory*

Short-term memory is composed of both primary and working memory. *Primary memory* is the ability to store a small amount of information that has been recently experienced. *Working memory* is the integration of processing and storing information in a transient short-term system. Tasks involving working memory include encoding and decoding

messages, understanding text while reading, or mentally performing a math problem. Given that working memory is integral to everyday functioning, it has been examined extensively in investigations of aging and cognition.

Working memory is measured using complex span tasks. For example, the backward digit span from the Wechsler Memory Scale Letter–Number Sequencing task is one commonly used measure. In this test, individuals are presented with a string of intermingled letters and numbers (e.g., M83GH6). They are then asked to repeat the string back in alphanumeric order (e.g., GHM368). Another popular measure is the Reading Span task. This asks individuals to read a sentence and answer a question about it while remembering the last word of that sentence.

As with processing speed, older adults experience a decline in working memory capacity as they age (Park 2002). Working memory begins to decrease in the twenties and a gradual decline is evident with each passing decade. However, with the appropriate environmental support some of these age differences can be mitigated. For example, teaching older adults to write down items that they may forget later has been shown to enhance working memory.

### *Long-Term Memory*

Long-term memory is comprised of two components: implicit or nondeclarative memory and explicit or declarative memory. *Implicit memory* is measured by tests that rely on prior experience or learning but do not require deliberate recollection (e.g., accuracy and reaction time). *Explicit memory* is measured by invoking stored information and is a purposeful or intentional process. In tests of explicit memory, participants are instructed to engage in conscious recollection such as recall or recognition tasks.

Explicit memory can be further differentiated into semantic and episodic memory, and this particular sub-division becomes particularly important in regard to aging. *Semantic memory* contains facts and knowledge about the world and the meanings of words or concepts. Semantic memory is relatively preserved across the adult life-span as measured through vocabulary and general knowledge tests. Semantic memory performance increases through the early sixties followed by a gradual decline (Zacks & Hasher 2006).

In contrast, *episodic memory* contains information associated with one's experiences. It is the ability to recall the specific features of the spatial and temporal contexts in which events occur. Episodic memory can be measured by prospective memory, face recognition, name recognition, action memory, sentence memory, word recall with or without a distractor task, source memory, and memory for activities. The data clearly indicate age-related deficits related to episodic memory.

*Procedural memory*, a type of implicit memory, refers to skills that have been highly rehearsed such as motor skills or cognitive skills. Findings indicate that procedural memory is minimally affected by age.

In the context of aging, *repetition priming* is often utilized to examine implicit memory. Examinations of repetition priming involve two phases. First, subjects are oriented to the task and exposed to some experimental materials. This is followed by a sentence completion or perceptual identification test that requires participants to use some of the earlier experimental materials and some new materials. The goal in these studies is to determine whether subjects benefit from previous exposure to experimental materials.

Age differences with regard to repetition priming have been found to be quite small relative to changes in episodic memory (→ Memory, Message; Memory, Person).

### **Inhibition**

Inhibition is the process by which we are able to selectively process information. It allows us to stay focused on the most relevant issues or stimuli and ignore extraneous information or thoughts (Hasher & Zacks 1988). As we age we have more difficulty focusing on target information and thus our attention is spread across both irrelevant and relevant information, making us less efficient.

The findings in general indicate that our ability to inhibit irrelevant material does decline with age. Some of the most significant findings related to inhibition involve the ability to process discourse (e.g., off-target verbosity; → Aging and Message Production and Processing).

### **Intelligence**

It is overly simplistic to view cognitive aging only in terms of processing mechanisms or capabilities. Older adults bring knowledge and experience to situations and these resources remain stable even while processing capabilities may be diminishing. One issue of importance in cognitive aging is to understand the relationship between simultaneous growth in knowledge and decreases in processing abilities. While both longitudinal and cross-sectional studies have found marked declines in abilities such as encoding of new memories for episodes or facts, working memory, and processing speed, areas such as autobiographical memory, semantic knowledge, and emotional processing remain relatively stable across the life-span. Vocabulary test abilities increase until around age 50, after which they tend to level off or slightly decline (Salthouse 2003).

In order to fully understand the findings related to intelligence, it is important to distinguish between fluid and crystallized intelligence. *Fluid intelligence* can be conceptualized as a broad set of abilities related to information-processing skills involved in reasoning, abstracting, and problem-solving. Fluid intelligence is unique to an individual and is not imparted through systematic influences such as culture. *Crystallized intelligence* refers to knowledge that is acquired through experience and education and is demonstrated through verbal comprehension and concept formation. It reflects the cultural knowledge component of intelligence.

It is widely accepted that with age comes greater knowledge and experience and that this accumulated wisdom may offset or compensate for other age-related declines. This effect has been documented in some laboratory experiments, although some data suggest that when completing the same task, young adults depend on processing efficiency whereas older adults depend more on accumulated knowledge (Salthouse 2004).

Although there is a tendency to overlook the relationship between physical health and mental acuity, sensory changes may be good indicators of cognitive efficiency. Changes in sensory abilities such as visual and auditory acuity may increase the cognitive load necessary to function in a given situation and this increase in effort may be distracting, thereby making it more difficult to remember or make associations with what was heard

or seen. Declines in vision, auditory acuity, balance, and muscle strength are all good indicators of changes in cognitive ability because they probably are concomitant with changes in the brain.

## METHODOLOGICAL ISSUES

One of the biggest issues facing researchers in the area of cognition and aging is whether the focus should be upon age-related effects on a single variable or process, or whether the focus should include several domains examined simultaneously. The former, referred to as *micro-approaches*, are often used with small samples from divergent groups (e.g., young vs old). The benefit of these approaches is that they can identify specific processes at both the behavioral and possibly the neuropsychological level, which may enhance our understanding of aging and cognition. The limitation of these methods is that the examination of a process in isolation may hinder our understanding by obscuring the interactions among various processes, which may be important.

In contrast, *macro-approaches* to cognitive aging utilize large samples of 100 or more adults across a wide age range. These approaches are correlational in nature and examine the patterns in relationships among variables. Supporters of this paradigm argue that age-related effects on particular cognitive tasks may be symptoms of broader phenomena. Therefore, independent examination of these variables fails to provide a complete understanding of cognitive processing in the aging context.

A second methodological issue concerns the fact that true experimental investigations are not possible because age cannot be manipulated by the experimenter. Some scholars argue that the focus should be on comparing pre-existing groups that share various lifestyle characteristics. Other researchers argue that the best method to overcome this limitation is to make some type of intervention that will then alter an individual's cognitive performance, making it possible to determine which manipulations influence the relationship between age and performance on a particular cognitive task.

A third methodological concern involves *proximal versus distal factors*. The former refer to individual differences between age groups at the time of assessment. In contrast, distal factors involve differences occurring much earlier in the life-span. The question becomes one of whether we should try to explain differences in performances based on information gleaned at the time of assessment, or whether differences should be explained in terms of earlier life experiences.

Finally, one of the biggest issues for research regarding aging concerns the nature of the cross-sectional design. Are cross-sectional differences informative about the age-related changes in processing, or should all conclusions be based on longitudinal trends? Conclusions drawn from static cross-sectional designs may reflect cohort effects and other confounds, and may fail to capture all of the effects of the aging process.

## RECENT DEVELOPMENTS

Recent developments in *neuroimaging techniques*, such as positron emission tomography (PET) and functional magnetic imaging (fMRI), have brought new data to bear on theories of age-related changes in processing speed, inhibition, and working memory.

Some of the most promising data show that older adults and younger adults recruit different areas of the brain to perform the same task. This has led researchers to question why this bilateral recruitment occurs. It has been hypothesized that bilateral recruitment may be a compensatory mechanism for older adults or it may be related to an inability to suppress activation (Park & Gutches 2006).

Much of the knowledge regarding cognitive aging has been derived under highly constrained laboratory conditions (→ Experiment, Laboratory). While such conditions have been necessary to control for a variety of confounds, it is also important to determine whether information processing differs on the basis of the *cultural, social, or environmental conditions* in which it occurs. Park and Gutches (2006) argue that many of the declines in cognitive aging experienced in western cultures are also experienced in other cultures. However, it appears that culture does impact neurocognitive aging. Park and Gutches (2006) found that older adults from Asian and western countries experience differences in activation of processing areas when completing the same behavioral task. This developing area of cultural psychology promises to inform us about the adaptability of the neurocognitive system and the biological imperatives that are unrelated to culture.

Real-world investigations, as opposed to laboratory investigations of information processing, are important in determining how age-related declines affect our day-to-day functioning. This research has established that *environment does affect information processing*, especially in the case of memory. For example, research indicates older adults remember to take medications more reliably than middle-aged adults. These results have been explained in terms of environmental demands. Older adults typically operate in an environment with very different demands than middle-aged adults. Middle-aged adults are normally required to balance competing demands from work and family. Therefore the chaotic characteristics of the environment may impact memory performance more than does underlying cognitive ability. Other studies (Chasteen et al. 2001) have also determined that context does play an important role in everyday behavior and may ameliorate the effects of decline in information processing in our everyday lives. A complete theory of cognitive aging should integrate context.

While we know a great deal about what happens to information processing as we age, we know less about the underlying mechanisms of why we experience these declines. However, new research in the areas of neuroimaging may be able to answer some of these questions. Naturalistic studies are extending what we know about information processing and how we cope with age-related declines. These studies may uncover intervention strategies that will enable us to maintain healthy minds across the life-span.

## **Aging and Message Production and Processing**

*Susan Kemper*

*University of Kansas*

*RaLynn Schmalzried*

*University of Kansas*

Aging affects many aspects of → message production and processing. The nature of conversation changes: unlike young adults, dyads of older adults mix talk about the past with talk about the present which may help them achieve a shared sense of → meaning and personal worth. Conversations with older adults are often marked by “painful self-disclosures” of bereavement, ill health, immobility, and assorted personal and family

problems which may maintain “face” by contrasting personal strengths and competencies with past problems and limitations, and coping with personal losses and difficulties. Older adults tend to adopt a “not-listening,” “disapproving,” or “over-protecting” style when interacting with young adults. Older adults are perceived as more rigid and negative in their speech which may provide a reason for avoiding conversations with older adults (Nussbaum & Coupland 2004; → Intergenerational Communication).

However, three issues have dominated discussions of age-related differences in message production and processing: the use of elderspeak by others when communicating with older adults, the occurrence of off-target verbosity in the speech of older adults, and the frequency of word-finding problems experienced by older adults.

### **ELDERSPEAK**

Elderspeak is an accommodation by others to communicating with older adults, either in response to actual communication needs of older adults or to → stereotypes associated with aging. As a speech register, elderspeak is characterized by exaggerated pitch and intonation, simplified grammar, limited vocabulary, and a slow rate of delivery (Kemper et al. 1994). Like similar speech registers directed at young children, foreigners, and household pets, it conveys the assumption that the recipient is cognitively impaired. Ryan et al. (1986) argue that elderspeak contributes to the social isolation and cognitive decline of older adults. Other research has suggested elderspeak expresses a sense of disrespect and limits conversational interactions (→ Language and Social Interaction).

Hummert (1994) has shown how stereotypes of older adults contribute to the use of elderspeak. Young, middle-aged, and elderly adults hold positive and negative stereotypes of older adults. Positive stereotypes include those Hummert labels as the *Perfect Grandparent*, the *Golden Ager*, the *John Wayne Conservative*; negative stereotypes include the *Severely Impaired*, *Despondent*, *Shrew/Curmudgeon*, and *Recluse*. Young adults believe it is appropriate to use elderspeak when addressing older adults judged to be *Severely Impaired*, *Despondent*, and *Reclusive*.

Kemper and colleagues have explored the *nature and use of elderspeak* addressed by young adults to older adults in a laboratory setting (Kemper & Harden 1999). This research has demonstrated that elderspeak is composed of two sets of parameters. The first, which may benefit older adults, includes semantic elaborations and repetitions. The second set of correlated parameters includes modifications to fluency, prosody, and grammar; these parameters do not benefit older listeners but are perceived by older adults as patronizing. It is possible to develop a form of elderspeak that benefits older adults and is not perceived as patronizing or belittling. This beneficial form of elderspeak provides semantic elaborations by repeating or expanding instructions while avoiding off-putting changes to fluency and prosody.

### **OFF-TARGET VERBOSITY**

Hasher and Zacks (1988) proposed that inhibitory mechanisms weaken with age, affecting older adults’ conversational skills by permitting the intrusion of irrelevant thoughts, personal preoccupations, and idiosyncratic associations. They have linked such

inhibitory deficits to off-target verbosity, first noted by Pushkar Gold et al. (1988), who describe it as involving both excessive production and meandering, diffuse responses to questions. Further research has attributed off-topic verbosity to poor performance in frontal lobe functioning. Older adults who produce more off-topic speech tend to have difficulty in other inhibitory tasks, such as the Stroop task (Pushkar et al. 2000).

Burke (1997) argues that off-target verbosity arises in social settings in which older adults construe their task as monologic and thus generate a chain of internal associations. For example, when asked to reveal autobiographical information, an older adult is more likely to produce a long series of internal associations whereas a young adult may discuss a single incident. James et al. (1998) noted that speech samples collected from older adults were, indeed, more verbose than those obtained from young adults but only when they were describing personal, autobiographical topics. However, these autobiographical narratives were rated as more informative and interesting than the more focused, less verbose narratives of young adults.

### WORD FINDING

Older adults report that one of the most annoying problems they face is the inability to recall a well-known word, name, or title (Burke & Shafto 2004). Word-finding problems disrupt conversations, often shifting the conversation from the topic under discussion to a focus on the older adults' memory problems (→ Speech Fluency and Speech Errors). Word-finding problems are often referred to as *tip-of-the-tongue experiences* (TOTs). Burke and her colleagues have provided an explanation of TOTs: the transmission-deficit hypothesis. This hypothesis suggests that the mental connections between an idea, the word that stands for that idea, and how to pronounce that word can become weak as a result of aging or disuse. A TOT will result when one or more of the connections between the idea, word, and its pronunciation are broken. The speaker may have the sense that the word is on "the tip of the tongue," perhaps being partially aware of the letter it begins with, the number of syllables, or similar sounding words.

While older adults may experience more TOTs and word-finding problems than young adults, the mechanisms appear to be the same. In a test, James and Burke (2000) induced TOT states in young and older adults by asking general knowledge questions such as "What word describes a word that reads the same both forwards and backwards?" The questions were interspersed in a list of words. Sometimes, these words shared sounds with the target word; sometimes they were unrelated to the target word. Young and older participants were more likely to produce the target word, "palindrome" after reading "palisade" than after reading unrelated words. White and Abrams (2002) report that words sharing the first syllable with a target such as "abdicate," e.g., "abacus," "abrogate," are more effective at reducing word retrieval failures than words sharing other phonologically features with the target, e.g., "indigent," "handicap," and "duplicate." This research suggests that one of the keys to reducing word-finding problems or resolving occurring problems is to keep talking: the target word may be cued by another word or phrase that restores broken connections between the idea, word, and its pronunciation.

These concerns, the use of elderspeak, off-target verbosity, word-finding problems, converge in the study of the *effects of dementia* on message production and processing

(→ Disability and Communication). Whether arising from Alzheimer's disease or other neuropathologies, dementia accelerates and exaggerates age-related changes to language and communication, contributing in turn to caregiver burden (Savundranayagam et al. 2005). The development of discourse-based strategies for family members and caregivers has the potential to improve care and enhance the quality of life for older adults with dementia (Dijkstra et al. 2002).

## EMERGING ISSUES

New models of aging have contributed to the emergence of new lines of research on aging and message production and processing. A growing area of investigation concerns *dual task processing* (→ Aging and Cognitive Processing). Older adults appear to have more difficulty combining tasks, such as listening to one's source of information (e.g., someone's voice), while ignoring another (e.g., a television broadcast) (Tun et al. 2002). Indeed, even walking and talking at the same time appears to challenge older adults' abilities to do two things at once (Kemper et al. 2003). The demands of compensating for age-associated sensory, muscular, or motor changes (such as presbycusis or sarcopenia) may over-task older adults, detracting from their ability to process or produce messages.

Another new area of investigation concerns the so-called *positivity effect*. In the face of shrinking time horizons, older adults may be motivated more by emotional regulation than by knowledge acquisition, preferring to attend to and remember positive information (Carstensen et al. 2003). This greater emphasis on maintaining positive well-being and avoiding negative moods may affect older adults' discourse and social interactions, especially when their motivations conflict with young adults' information-seeking biases.

A third emerging area is the *use of technology* to overcome age-related sensory and cognitive changes (Fisk et al. 2004). "Smart" hearing aids and eyeglasses can compensate for sensory losses; medical check-ups can be conducted over the Internet; older adults' activity cycles can be monitored by motion detectors implanted in doorways and hallways; collision avoidance systems can protect older drivers; and grandparents can keep in touch with their grandchildren by text-messaging. Yet this technology also creates new problems: How to optimize the pitch and prosody of synthesized speech for older adults? Will older adults accept and trust health and medical recommendations administered by a "nurse-bot" (→ Doctor–Patient Talk)? How can websites be designed to facilitate older adults' search and retrieval of information?

# Alternative Journalism

*Jon Bekken*

*Albright College*

Alternative journalism is a fluid concept, often casually attributed to a wide array of media practices unified only by being different from the journalism in so-called mainstream media. Such a “definition” can encompass everything from local entertainment weeklies thick with advertising to the clandestine media of revolutionary movements. Recent scholarship has moved beyond this approach to focus on practices that challenge the communicator/audience divide typical of mainstream media, including the range of voices presented, the privileging of marginalized and excluded news sources over traditional elites, a conscious identification with the audience being served, and a conception of journalism that promotes social action (Atton 2002; Downing 2001; → Citizens’ Media; Community Media; Development Journalism; Media Democracy Movement; Social Mobilization).

Although the term is of relatively recent origin, commonly dated to the → *underground* press of the 1960s, alternative journalism has been around as long as journalism itself (→ Journalism, History of). Dissidents have contested the terrain of mass communications since the beginnings of recorded history, from the underground printing presses used in eighteenth-century France to the anonymizers and remote hosting sites bloggers use today to evade local censors (→ Blogger; Censorship). Throughout the nineteenth century, Chartists and socialists made newspapers a central part of their efforts to build an oppositional working-class culture and campaign for their demands. In the twentieth century, Soviet Bloc dissidents circulated their ideas through Samizdat, underground writings reproduced by hand or with carbon paper. Despite an impressive apparatus of state terror, the Shah’s regime was toppled in Iran by dissidents who communicated their message through clandestine tape recordings and religious sermons. Pirate radio has been used around the world by guerrilla movements but also by community groups and unions looking for a means to give voice to their concerns. The photocopier facilitated an explosion of personal and highly specialized micro-media, often produced by people trying to create an alternative public space for community building and action (→ Zines). And today myriad alternative voices claim space on an Internet increasingly dominated by commercial enterprises.

## ALTERNATIVE PUBLIC SPHERE

Alternative journalism, then, embraces advocacy and oppositional practices over objectivity, and does not so much *serve* its audience as constitute a process of cultural empowerment, creating and maintaining an alternative public sphere which enables diverse publics to speak in their own voice (→ Advocacy Journalism; Citizen Journalism; Objectivity in Reporting; Public Sphere).

Alternative journalists have always challenged the professionalization that increasingly characterizes the mass media (→ Professionalization of Journalism). The labor and socialist press of the early twentieth century combined staff reports with articles written

by readers, often describing their own working conditions and local struggles. These newspapers were often published by cooperative associations that raised the necessary funds, elected editors and oversight boards, and convened regular public meetings at which editors reported to their readers, heard their concerns, and sought a mandate to continue (→ Radical Media). Labor newsreels and photo clubs in the 1920s and 1930s similarly gave voice to rank-and-file workers, not simply documenting their struggles but engaging those workers in communication as part of a broader emancipatory project that sought to transform participants and audiences alike (→ Participatory Communication). Community radio continued and expanded upon this tradition as early as the 1950s. More recently, groups such as the Independent Media Centers and South Korea's Media Act have revived the tradition of training media activists (→ Independent Media Centers Network).

Because of this close connection to the grassroots, alternative journalists have been able to break news stories or offer perspectives unavailable to established media, a phenomenon documented for the United States each year by Project Censored. Few who followed alternative journalists' reports would have shared the otherwise seemingly universal astonishment at the US–British failure to uncover weapons of mass destruction in post-invasion Iraq. Alternative journalists forced the horrors of slavery and child labor onto the national agenda, exposed war crimes in Chechnya and Vietnam, published the first accounts of the AIDS epidemic, and gave voice to victims of police brutality and political repression around the world (→ Peace Journalism).

## FROM UNDERGROUND TO ALTERNATIVE

Alternative journalists work in a wide variety of media, including → newspapers and → magazines published on behalf of youths, immigrants, minorities, social movements, and cultural and political outsiders (→ Minority Journalism; Social Movements and Communication). But the boundaries of alternative journalism can be remarkably permeable. In the United States, the Association of Alternative Newsweeklies is a trade association of newspapers, many with roots in the underground press, that combine advocacy journalism (some quite aggressively, others only occasionally) with events listings and cultural coverage.

Pacific News Service (PNS) followed a different trajectory. Founded during the Vietnam war, PNS expanded its coverage in the 1970s to include alternative perspectives on Africa and Latin America, and reports on US issues told from what the editors described as a “chicken's eye view,” or news from the bottom-up. More recently, it transformed itself into New America Media, syndicating (and translating as necessary) news and commentary from a wide variety of ethnic newspapers (→ Ethnic Journalism), and also sponsoring media for youth including YO! Youth Outlook, a website for homeless youth, and *DeBug*, a bilingual magazine for young workers in California's Silicon Valley.

The Independent Press Association (IPA), founded as an alliance of left-leaning magazines, followed a similar trajectory. Its New York City office brings together ethnic and community newspapers in a regional association that promotes their stories to a broader public while offering an advertising co-op and other assistance to its member papers. When the national IPA collapsed, dragged down by the bankruptcy of its

magazine distributor (killing several alternative magazines in the process), the New York office survived, perhaps because of its stronger local base.

Around the world, the periodical remains one of the most common venues for alternative journalism, including daily newspapers such as Germany's *die tageszeitung*, founded in 1978 as a cooperatively owned daily closely aligned with alternative social movements. With more than 5,000 readers having paid in to the publishing cooperative, *die tageszeitung* harks back to an earlier tradition of workers' publishing societies which played a key role in sustaining oppositional journalism in the face of a hostile political economy. More commonly, alternative dailies today serve immigrant communities alienated from mainstream media by linguistic or cultural barriers. A wide array of less frequent publications serve other disenfranchised publics, from Venezuela's *El Libertario* to the Zimbabwe Congress of Trade Unions' the *Worker*.

### ORGANIZING AN AUDIENCE

In a world where the channels of communication (broadcast outlets, satellite frequencies, or shelf space on newsstands) are increasingly controlled by transnational corporations and sold to the highest bidder, alternative journalists often struggle to reach an audience.

Alternative film and video makers have historically had to organize their own audiences. In the 1930s, the Film and Photo League exhibited its newsreels and films in mutual aid society and union halls. In 1968, the Argentine documentary and film manifesto *Hora de los hornos* was shown clandestinely, in private homes and other venues (with breaks built in for discussion during each four-hour showing). Today, independent documentarian Robert Greenwald largely relies upon house showings and online DVD sales to distribute his films on Fox News, the Iraq war, and Wal-Mart.

Perhaps the most prolific medium for alternative journalism is now the → Internet, which has enabled many to *publish* their information cheaply and quickly, circumventing economic and other material constraints. Best known is Indymedia, initially founded in 1999 to facilitate coverage of the World Trade Organization summit in Seattle and which quickly grew to nearly 200 independent media centers operating in more than 50 countries on six continents. Indymedia centers make their facilities available to anyone wishing to practice journalism, reserving the right to remove material that violates their standards. The result is an eclectic combination of audio and video files, photographs, running reports, announcements, polished articles and commentary, some produced to professional standards and much of it more akin to raw notes.

Indymedia centers have also supported other alternative media. During the 2000 Republican Convention in Philadelphia, for example, Amy Goodman's nationally syndicated radio program, *Democracy Now*, was produced from an independent media center, which also published a free daily newspaper offering accounts of events in the streets to supplement the photographs and reports posted online and bring them to a wider audience.

Many alternative newspaper, → radio, and → television outlets also rely on the Internet to make their content available. Pacifica's *Free Speech Radio News* is syndicated over the Internet and relies on the web to collect reports and organize its broadcasts. Costa Rica-based Radio Internacional Feminista broadcasts bilingual programming over the Internet, which is often subsequently rebroadcast over conventional radio stations

(→ Feminist Media). In Minnesota, the Workers Independent News Service's daily newscast uses the Internet for direct access to listeners and to distribute the program to radio stations. The international trade union site LabourStart, based in London, in turn compiles WINS and other feeds for its international online audio service. In Argentina, alternative videographers have turned to the Internet for their *Ágora TV*, continuing the legacy of *Utopia TV*, closed in 1997 after five years of illegal broadcasts and relentless police persecution.

## CRASHING THE MARKETPLACE OF IDEAS

Probably the most common venue for alternative video journalism today remains → public access television. Cable systems in Belgium, Brazil, Canada, Fiji, Finland, Guatemala, Norway, Uruguay, and the United States generally make time available to any citizen. In the Netherlands, organizations can secure regular broadcast time in proportion to their membership. Corporate-controlled outlets have also been harnessed to the cause. During the 2006 Houston, Texas, janitors' strike, union members posted videos documenting their struggle to YouTube. Palestinian media activists have made similar use of the venue, although such journalism constitutes only a small fraction of the site's offerings.

Alternative journalism achieves a broad reach through radio, with thousands of member stations in the Association Mondiale Des Radiodiffuseurs Communautaires (AMARC). There have been attempts to launch broadcast community television outlets as well. Italy has seen several low-power pirate stations in a loose *Telestreet* movement. In the summer of 2001, for example, *Disco Volante Street TV* produced short broadcasts addressing neighborhood concerns ranging from the conditions of undocumented immigrants to architectural barriers hampering the movement of the disabled, before the Ministry of Communication shut it down.

Today alternative journalists work in every medium, ranging from clandestinely circulated news bulletins to the Free Speech television network, carried on the Dish Network satellite service (and also distributing programming to many cable outlets). In South Korea, Labor News Productions has produced more than 100 videos since 1989 and trained hundreds of media activists. For distribution, they organize showings in union halls and other venues, play videos at factory gates at shift changes, broadcast over public access facilities on the country's RTV satellite, and air labor programming over Hyundai Motors' in-house cable system, a right enshrined in the union contract. Korean labor videographers work closely with other media activists in the country, but also participate in a growing international movement that in 2006 saw international labor media conferences in South Africa, Turkey, and the United States. The *Indymedia* movement is similarly international, even though limited access to the Internet hampers its growth in much of the world.

Although the so-called *marketplace of ideas* remains relentlessly inhospitable to alternative journalism, media activists are seizing on new technologies and underserved audiences in their continuing quest to forge a new kind of media practice.

## **Amateur Photography and Movies**

*Richard Chalfen*

*Temple University and Center on Media and Child Health*

While the invention of the camera and advancement of → photography are best known in the contexts of the history of technology or the emergence of a new art form, cameras have been used for more than commercial concerns, scientific interests, or artistic work. From the earliest use of the camera and the emergence of consumer models of camera technology, nonprofessional photography has had an important parallel history. Ordinary people have taken their cameras home to produce the most frequent of all photographic imagery on a worldwide basis, namely the personal, nonprofessional production and use of personal pictures including snapshots, family albums, home movies, home video, and, more recently, family websites and even personal camera phone images. Amateurs have played a significant role in advancing the visual documentation of the everyday, of the private features of family life. Results have been highly valued in personal ways but far less so in commercial or scholarly contexts.

Photographic and image scholarship has been relatively slow to respond in any serious or sustained way. Home-mediated amateur forms of imagery comprise the least studied and critically reviewed mode of pictorial communication within the mediascape of

our contemporary symbolic environment. Some attention has been given to artistic approximations such as folk art or the snapshot aesthetic school, or to historic locations in fine art, or cinema as related to (and occasionally included in) → documentary film. Other efforts include some sociological and anthropological interest in indigenous media. Other authors have found connections of amateur photography to memory, to inventions of the past, to family socialization, to literary biography and autobiography, and to a lesser extent, to therapy and the detection of pathology.

Two points of neglect are significant. The generic, vernacular home-grown model has been ignored in favor of unusual examples as when a historically significant event has been accidentally recorded with home equipment (e.g., Zapruder 8 mm footage of the assassination of John F. Kennedy, video recording of the Rodney King beating). The increasingly popular use of cellphone cameras and blog display (London Tube bombing) are calling further attention to amateur camera use.

Second, a communication paradigm has been seldom used; image content has been attended to at the expense of attention to communicative process. In general, a singular focus on vernacular photography as a pictorial expressive form, as culturally sensitive communicative messages, unrelated to art, has been rare. While amateur stills, film, and video represent the world in different ways they also represent different experiences for both image-makers and viewers.

Much amateur photography evolves from George Eastman's 1888 innovations and new motion-picture technology in the early 1930s. *Changes in three contextual factors* have unsettled the meaning of any reference to amateur photography and moviemaking. First, the meaning of "amateur" has undergone revisions as different models and types of camera use have increased, e.g., casual family "snapshot" photographers, camera club members (using darkrooms, entering contests and exhibitions), camera-phone photographers, and other people who are involved and serious about photography without financial compensation. Second, the range of consumer technology available for nonprofessional photography has expanded, from box cameras, to single-use (or throwaway) cameras, to instant cameras, to digital cameras and now cameras embedded in mobile telephones. And third, the range of the pictorial formats has grown in popularity and variety, e.g., instant photography, photo-booth images, digital cameras, phone-pictures, 16 mm to 8 mm to Super-8 and then to a range of video formats, and the like.

The international existence and immense popularity of amateur photography and movies fit into a more general framework, namely, *home media*. When compared to mass media and formally structured modes of mass communication, home media attends to all forms of informally derived media, theoretically and practically framed as part of home culture. The cross-cultural study of home media includes a range of expression generated in spoken and written forms as well as pictorial/visual, mediated forms that are shared and retained primarily within private and personal networks of friends, family, clan, caste, and community. The production, content, use, and reception of visual home media can be seen as embedded within media culture, visual culture, and the home mode of visual communication (Chalfen 1987; 1991).

Studies integrating home media and visual communication center around the need to develop models for both qualitative and quantitative description and analysis – specifically for how snapshots, family albums, and home movies/videos (and now family web pages)

can be studied as cultural documents within the contexts of personal anthropology, indigenous imagery, visual narrative structure, family folklore, photo-therapeutic applications including metaphorical meanings of “Kodak culture,” “Sony society,” and “Polaroid people.”

*Future study of amateur photography* will need to address technological convergence resulting in new image formats (→ Digital Imagery). Interaction of home and mass modes of communication are increasing from a penetration of amateur still and motion-picture forms. We find fabricated snapshots in professional advertisements and fine art; we see filmic facsimiles of home movies in documentary and art film; fabricated home movies are made for feature films, video examples are edited into popular television programs, and most recently, home-video excerpts are put on commercial websites such as YouTube. Examples of amateur and professional imagery are appearing next to one another on news broadcasts, as photojournalists compete with blog-displayed amateur pictures. In short, amateur photographs as home media will continue to escape the home with greater frequency and, in turn, present new opportunities for study and theory-building.

## **American Convention on Human Rights**

*Toby Mendel*

*Article 19, Global Campaign for Free Expression*

The American Convention on Human Rights (ACHR) is the leading Organization of American States (OAS) human rights treaty. Adopted in 1969, it came into force in 1978. It guarantees, among other things, the right to freedom of expression (→ Freedom of Communication; Communication and Law). The ACHR was preceded by the OAS Charter, the founding document of the OAS, which includes only limited guarantees of

human rights, and the American Declaration of the Rights and Duties of Man, both adopted in 1948. The latter provides a simple guarantee for the right to freedom of “expression and dissemination of ideas, by any medium” (Article IV).

Article 13 of the ACHR contains very detailed provisions on freedom of expression. In some respects, it is similar to its international counterpart, Article 19 of the *International Covenant on Civil and Political Rights (ICCPR)*. Like Article 16, Article 13 guarantees everyone the right to “seek, receive, and impart information and ideas,” regardless of frontiers and using any form of communication, including oral, written, print, or art (→ Freedom of Information).

Like the ICCPR, the ACHR permits States to restrict freedom of expression, but any restriction must be established by law and be necessary to protect the rights or reputations of others, national security, public order, or public health or morals. This list is identical to its counterpart in the ICCPR. Article 13 also differs in important ways from its international and regional counterparts and, overall, it is generally regarded as being much stronger in nature. It expressly rules out any form of prior censorship, except in relation to public entertainments, for the sole purpose of protecting children. Although prior censorship is regarded with suspicion in all human rights systems, other international courts have not gone so far as to rule it out completely.

The ACHR also explicitly rules out indirect means of restricting freedom of expression, such as governmental or private abuse of controls over newsprint, broadcasting frequencies, or equipment used to disseminate information. Although this is probably implicit in the general guarantee, the prevalence of this form of restriction means that its explicit prohibition in the ACHR has practical importance. Finally, the ACHR, like the ICCPR, provides that incitement to war and hatred on the basis of race or other group affiliation shall be an offense punishable by law. The ACHR, however, provides only for the prohibition of incitement to lawless violence or a similar illegal act, whereas the ICCPR covers incitement not only to violence but also to discrimination and even hostility. The ACHR is thus consistent with US law in the area of hate speech which, unlike most other countries in the world, does not penalize speech which promotes mere hatred, as opposed to a specific illegal act.

The ACHR also differs from other human rights treaties inasmuch as it makes specific provision for a right of reply for anyone injured by inaccurate or offensive statements disseminated by a legally regulated medium of communication. The exercise of the right does not affect any other legal entitlements the claimant may have. It is significant that this right is limited to “legally regulated” media, so that it does not extend to newspapers where they are not legally regulated, as is the case in many countries.

The ACHR establishes two bodies to promote implementation of its provisions. The first, the *Inter-American Commission on Human Rights* was first established as an autonomous OAS body in 1960, prior to the enactment of the ACHR, as a vehicle for promoting the implementation of the rights in the Declaration. It was subsequently provided for in the ACHR itself. The Commission has a broad promotional mandate which includes fostering awareness and making recommendations to States to further the protection of human rights. It also has the power to consider individual or group complaints concerning alleged violations of the ACHR, but only when the State in question has voluntarily accepted its jurisdiction. In accordance with accepted international practice,

such complaints may be accepted only when the State's internal systems for resolving the problem, normally including an appeal to the courts, have been used without success (known as exhaustion of domestic remedies). If the alleged facts tend to establish a violation, the Commission must try to promote a "friendly settlement" between the parties. If this is not possible, the Commission issues a Report on the case containing its views as to whether there has in fact been a violation and including recommendations as to remedies. These recommendations are not formally (legally) binding on the State.

Second, the ACHR establishes the → *Inter-American Court of Human Rights*. Only States and the Commission may refer a case to the Court, but the latter may do so only after it has issued its own Report on the matter, and the State has failed to take measures to redress the problem. As with the Commission, cases may be referred to the Court only where the State in question has voluntarily submitted itself to the Court's jurisdiction. For the most part, it is the Commission that refers cases to the Court, although there have also been some significant Advisory Opinions, where States have referred matters to the Court for its opinion outside of the context of a contentious dispute. Unlike the Commission, the decisions of the Court are legally binding and States formally undertake to comply with them. For the most part, States do respect the decisions of the Court.

## **Americanization of the Media**

*Denis McQuail*

*University of Amsterdam*

The term "Americanization" has been used with varying intended meaning and with varying degrees of precision over the last three or four decades of communication research. The common element is a reference to a process or trend affecting either the media of countries external to the USA or the generality of media and media-related practices globally (→ International Communication). When and where the term is used, it is usually based on the assumption that American mass media are in some respects dominant and

ubiquitous and exert a strong pull on other systems to become like them or to incorporate content imported from the USA.

The term (or the idea behind it) has been applied both positively and negatively, but more often the second. Three main contexts of its use can be distinguished. The first relates to the general debate about “cultural imperialism” that began in the 1960s (→ Cultural Imperialism Theories; UNESCO; New World Information and Communication Order [NWICO]; Francophonie); the second to the consequences for European media in particular of the internationalization of → satellite television transmission following the 1977 World Administrative Radio Conference (WARC; → Satellite Communication, Global), and of the subsequent trend toward privatization of audiovisual media. The third context has been provided by a pessimistic assessment of the condition of political communication and the relation between media and politics at the end of the twentieth century.

## GLOBAL POLITICAL BACKGROUND FOLLOWING WORLD WAR II

The background to these interrelated contexts is provided by the circumstances following the end of World War II in 1945. The main relevant components of the situation were the great extension of American power in the world, the destruction or disarray of most of the European media, and the start of a global ideological struggle between communism and the “free world,” in which the media became a principal weapon.

The imminent *arrival of* → *television* (as a new medium frontier awaiting development) added another element. Relevant also was the basic division of the world into an impoverished and undeveloped south and east and a richer north and west. Although the term was not in circulation at the time, it can be inferred that “Americanization” of the media and media systems would involve an openness to → news and entertainment produced in great surplus by American media industries, a commitment to liberal values and freedom of expression (→ Freedom of Communication), and a fundamental reliance on the free market in place of government financing and control. In the earliest postwar phase, Americanization could be and was associated with positive notions of democratization, economic development, and liberation from restrictive cultural and political systems (e.g. Lerner 1958). In the liberated or occupied territories of Europe and the Far East, it offered the chance of a new beginning (→ Radio Free Europe/Radio Liberty). Media systems and journalistic practice were reconstructed with some reference to American professional practice, even if American “mass culture” was still regarded in Europe with traditional suspicion.

In respect of the first context named above, the climate surrounding American media influence changed quite radically during the 1960s, as the undoubted dominance of American media in much of the world was reinterpreted as evidence of (at best) unwitting → propaganda for western capitalism and consumerist values and (at worst) naked neo-imperialist ambitions (e.g. Schiller 1992).

The causes lay less in any objective change of circumstances than in the rise of *New Left* → *critical theory* at home and the rising consciousness of subordination in what was then being called the “third world.” The attack on American media and their influence was spearheaded and given intellectual weight during the early 1970s by Latin American

researchers in particular. The region, semi-developed economically, was most vulnerable to penetration by American media, for cultural and economic reasons, especially in the context of the Cold War. Covert American support for the coup d'état against Allende in Chile in 1973, following a domestic propaganda war by Chilean media, provided ammunition for critics. A diaspora of Chilean intellectuals fixed part of the blame on the baleful influence of American media. The contemporary rise in the 1960s and beyond of semiological theories and methods for exposing the hidden messages of media content added to the possibilities for blaming the media. All American-originated content, however seemingly innocuous, become potentially suspected of hidden propagandism.

### STUDIES OF GLOBAL MEDIA FLOWS

The tide of ideological criticism became inextricably mixed during the 1970s with a wider and less politically inspired campaign for a more *balanced flow of international communication*, following an accumulation of evidence that showed that most news in the world, on television or in print, tended to be dominated by the concerns of America, if not actually by American content, even in distant countries with other, more pressing concerns. The general findings were shown in “world maps” drawn in proportion to the presence of different territories in world news (e.g., Gerbner & Marvanyi 1977; → Gerbner, George).

The reasons could be found more in the operations of → news agencies and in the culture economics of news media than in conscious imperialism, but Americanization was nevertheless widely seen by many media theorists, even if not by world populations, as a problem condition for the rest of the world. Much the same applied to the unbalanced flow of televised entertainment, with American products seemingly in excessive supply (Varis 1974). UNESCO became a forum for debates on the issue and acquired a reputation for anti-Americanism as a result. The issue cumulated in the appointment and then reporting of the MacBride Commission (2004) into the causes and solutions of problems in this territory. By the 1980s, however, the world was changing quite rapidly (and world media as well) and the broad issue was to some extent defused without resolution.

Shortly before this date, elements of the debate were summed up in the title of a very influential book by British media scholar Jeremy Tunstall: *The media are American* (1977). This on the one hand confirmed and explained American media dominance in the twentieth century and on the other hand pointed to quite large areas of world media, aside from the communist world, that were not particularly dominated by the USA, notably India and the Arab world.

### CHANGES IN EUROPEAN FILM AND TELEVISION

The second context in which “Americanization” became a current term was more specific and no longer political in any primary sense. As Tunstall had shown, World War I had dealt a severe blow to the nascent but flourishing film industries of several European countries, leading to an easier postwar US dominance in 1945. Even so, there were renewed aspirations to rebuild national film industries in Europe, aided initially by economic restrictions on US imports (→ Hollywood). Preferential treatment was given for reasons of cultural and linguistic nationalism to domestic production. The new television systems

were sheltered in most of Europe by national governmental monopolies, and these restricted both advertising and foreign imports.

These protectionist regimes were under strain for economic reasons and facing collapse by the end of the 1970s for some new reasons, especially the arrival of new (re)transmission technologies by way of cable and satellite that threatened national sovereignty of the air waves, and by the rise of governments (especially in the UK and Germany) that either welcomed or tolerated privatization and expansion of television systems for their own reasons (→ Public Service Broadcasting: Law and Policy; United Kingdom: Media System; Germany: Media System; Television Broadcasting, Regulation of).

The expansion and transformation of European television in the 1980s and beyond could only take place on the basis of a large importation of (primarily) American television films, drama, and entertainment. European audiovisual industries were quite underdeveloped. The main exception to the trend was the UK, which remained largely self-sufficient, but in fact its expansion was also quite limited until the 1990s. These developments were also coincidental with the accelerated formation of a new European Community institutional framework and identity, beginning with expansion to 12 nations and elections to a European Parliament in 1979. One central project was the formation of a common European space in which all communications could flow freely and where hopefully strong new cultural industries would flourish. The implementation of the EU directive “Television without frontiers” in 1989, following a period of debate, was hailed as a victory for European media and seen as an undesirable new form of protectionism by the USA (→ European Union: Communication Law).

Against this background, “Americanization” came in Europe to incorporate several elements: *too many US imports* per se; negative features of content, especially superficiality, “dumbing down,” and homogenization; unfair competition with domestic cultural production; too much → advertising (widely seen as the great vice of American television); and “commercialization” of the media generally. The last of these implied subordination of editorial and cultural standards to short-term profit, neglect of public service objectives, and weaker democratic accountability, plus a tendency to private media monopoly (→ Concentration in Media Systems).

Less clearly, “Americanization” also meant the *adoption of formats* and of news values and media customs that were thought to typify American television in particular. The evidence seemed to confirm early fears, with high proportions of US-originated entertainment on many of the new commercial channels and a gradual flight of audiences from the once dominant national public broadcasters. However, not all the fears mentioned were confirmed, especially not the projected decline or dilution of news and information services (→ International News Reporting). Moreover, research also established that “Americanization” was a limited phenomenon in extent and in time, not an unstoppable disease of the system. The taste for American content was real enough, but so was the preference for home-grown fiction and entertainment, the national language, and things local and regional.

### **A THIRD PHASE OF “AMERICANIZATION”**

The third phase of “Americanization” was associated with a different kind of critique, originating both in the USA and in Europe. Its causes are obscure, but a common element

was a view that the media were becoming increasingly powerful and important as well as global, and increasingly driven by commercial imperatives and by a set of media-cultural values that were often at odds with the true informational needs of citizens and of other social institutions (→ Commercialization: Impact on Media Content). Attention focused on → political communication, with a link being made between the evidence of decline in political participation, trust, and interest and certain dominant tendencies and practices of the media (→ Video Malaise).

The latter included a persistent neglect of, or negativity toward, politics and politicians, a concentration on → “infotainment” and personalities, and a neglect of substantive issues (→ Soft News). More specifically, the media were being used and seen to be used as tools of → political marketing and manipulation rather than as a means of democratic public communication. In an influential study, Swanson and Mancini (1996) used the terms “Americanization” and → “modernization” interchangeably to describe the planned use of media in election campaigns, with potentially negative effects on citizen trust and involvement (→ Election Campaign Communication). Techniques of professional campaign management first developed in the USA were shown to be imported into other countries. For some critics (e.g., Blumler & Kavanagh 1999), the term → “mediatization” of politics was regarded as more satisfactory than “Americanization,” but the general effect at the time was hypothesized as more harmful than otherwise for a healthy public sphere.

To some degree, the relevance and specificity of these three instances of the idea of “Americanization” have been dissipated. It has always been a *rather weak concept* and the attributed effects were often due to more general changes in media practice and culture and other powerful driving forces, such as those of technology or the market. However, a broader notion of “Americanization” survives in the proposition advanced by Hallin and Mancini (2004, 254–9) that a dominant (liberal) model of media relations with politics and of a more homogenized journalistic culture worldwide does owe much historically to American influence over an extended period (→ Political Communication Systems).

As a postscript, we might also note that Tunstall (2007) has revisited the theme of his work of 30 years ago and recorded the relative, but very marked, decline in the hold of America over foreign media firms, content, and audiences and the loss of control over the new world agenda. Americanization has not been reversed but has rather faded into the background of influences and, by implication, can no longer be blamed for the continuing or new failings of media elsewhere.

## **Animation**

*John A. Lent*

*International Journal of Comic Art*

History has belied the field of animation with misplaced emphases and ethnocentric retellings. First, animation did not start with Walt Disney and Mickey Mouse; the first animated show was *Pantomimes lumineuses*, produced in Paris in 1892 by Emile Reynaud. Second, the pioneers were not solely the Americans James Stuart Blackton, Winsor McCay, John Randolph Bray, or the Fleischer brothers; others were animating in Argentina, where Quirino Cristiani made the world's first feature-length film, *El Apóstol* (The Apostle), in 1917; and in the UK, Spain, Russia, Germany, France, Italy, and Scandinavia, and parts of Asia, such as India, Japan, and China. Early in the twentieth century, the German avant-garde film community took to animation through the experiments of artists such as Hans Richter, Walther Ruttmann, Viking Eggeling, and Lotte Reiniger, and in France, Emile Cohl and Georges Méliès added much to the quality of early animation; Cohl with his graphics, Méliès with his ability to blur the line between live action and animated cinema.

Some of the earliest animation in Asia resulted out of necessity and experimentation. In India it happened when in 1915 → cinema pioneer G. W. Phalke did not have sufficient film stock to continue making features and resorted to doing animated shorts. In Japan

Seitaro Kitayama, Junichi Kouchi, and Oten Shimokawa in the 1910s separately and successfully experimented with producing animation. In China in the early 1920s the four Wan brothers, curious about animation, slavishly experimented until accidentally, they were able to “make the pictures move.”

In a second phase, from the late 1920s through 1950s, animation advanced from a toy-like novelty to an *industry and art form*. In the US, studios such as those of Walt Disney, the Fleischer brothers, Pat Sullivan, Paul Terry, Leon Schlesinger, and Fred Quimby developed assembly-line systematization that often treated creators as mere cogs in a production wheel, which eventually led to efforts at unionization and strikes. Besides labor exploitation, animation as big business also stimulated commodification of → cartoons and characters, and later (the 1960s), runaway production (to Asia and Australia) to seek stable and inexpensive labor pools. Still, artistically, the US in the 1930s through 1950s turned out world-class animation, with memorable characters, beautiful music, moving stories, and excellent technical skills, including a series of Disney features beginning with *Snow White and the Seven Dwarfs* (1937); Warner Bros.’ time-honored characters such as *Bugs Bunny* and *Road Runner*; MGM’s *Tom and Jerry* series, and the United Productions of America cartoons, revolutionary with their stylized approach, graphic diversity, and unconventional stories.

Animation masters came to the fore elsewhere during this period, including *experimentalists* such as New Zealander Len Lye, known for his drawing on film, and Norman McLaren, who, after 1941, made Canada’s National Film Board an important haven for animators. In Europe, George Pal, Alexandre Alexeïeff, Oskar Fischinger, John Halas, Joy Batchelor, Paul Grimault, and Jirí Trnka each contributed to establishing animation as an art form.

Political-economic phenomena of the 1930s–1950s, including World War II, the division of Europe, and the triumph of communism in China, North Korea, and North Vietnam, greatly affected animation. As expected, during the war, all sides used cartoons to denigrate the enemy and build home-front morale (→ Propaganda in World War II). More profound was the division of Europe into east and west. Within western Europe, the artistic and financial weakness of animation relegated it to a lower status than cinema, while in eastern Europe, animation, supported by the state, found favor in the Soviet Union and in countries previously not known for animation. Among these were Czechoslovakia (popular for its puppet animation), Yugoslavia and its Zagreb school (known for its limited animation, and avant-garde graphics and subjects), and Poland (famous for its art films). By the time of the fall of the Soviet Union and communist eastern Europe in 1990, most countries and states within the USSR (especially Estonia) had thriving animation. China experienced its golden era of animation after 1949, at first following the Soviet model, but after the mid-1950s developing its own style, techniques (including brush painting), and stories based on Chinese proverbs and legends.

Since the 1960s, animation has faced many *challenging changes* brought about mainly by the growth of → television, the quick pace of corporatism and commercialization (→ Commercialization of the Media), the conversion from hand-made to computer-generated animation (→ Digital Imagery), and the changeover from state-planned economy to capitalism in Russia, eastern Europe, and China. Since it entered the market economy in the late 1980s, China has abandoned much of its artistic animation and has

increased production from a few hundred minutes to 80,000 minutes of animation yearly. In the US, after experiencing a low stage in the late 1970s, animation made a comeback with a spate of TV prime-time shows following *The Simpsons* in 1989, perennial theatrical features, and increased licensing/merchandising.

Globally, among other trends, local animation must compete with Japanese → anime in many countries, especially in Asia. Universally, animation is being reinvented, finding new outlets, such as → video games, DVDs, and cell phones, and new uses, particularly → special effects. Animation has also expanded to many countries of Africa, Asia, and Latin America, and has benefited in recent years by higher levels of professionalism (more festivals, training opportunities, competitions, associations), government recognition and support (South Korea, China, and Thailand), and by globalization (overseas markets, co-productions). On the downside, in many countries, production has speeded up at the expense of quality – often to meet the gluttonous appetite of television. State funds for experimentation have dried up, several aspects of animation have been taken over by media moguls focused only on the bottom line, and training has concentrated on computer technology, not the specific techniques of animation.

## **Anime**

*Anne Cooper-Chen*

*Ohio University*

The term “anime” is abbreviated from the Japanese word *animēshon*, which in turn is a direct transliteration of the English word → animation. Comprised mainly of TV series created in Japan, anime features distinctive characters, long-running storylines, and unique aesthetics (→ Cartoon). As Japan’s most visible export, anime and related products – *manga*, toys, action figures, and → video games – challenge the worldwide dominance of and serve as an alternative to US popular media (→ Comics). Starting as a major

influence in about 1995 and abetted by the Internet, Japanese pop youth culture has spread not just to the US, but also to western Europe, East Asia, and Latin America.

About a quarter of the Cartoon Network's programming features anime, from *Adult swim's Dragon ball* and *Inuyasha* to children's shows like *Pokemon* and *Yu-Gi-Oh*. Stylistically, Mamoru Oshii's *Ghost in the shell* inspired in part the *Matrix* trilogy, while Quentin Tarantino's *Kill Bill* films feature anime-style segments (→ Cinema).

By the 1990s, the US anime market was worth about \$500 million annually. With even mainstream chain stores selling anime, by the mid-2000s, sales rose to close to \$1 billion, not counting related merchandise. (Translated *manga* alone rose from \$50 million in sales in 2000 to \$140 million in 2005 in North America.) However, to put US sales in perspective, consider that the overall Japan market amounts to \$26–\$34 billion and that no anime film has achieved the \$40–\$50 million *Shrek* box-office range. On DVD, all three *Inuyasha* movies combined sold just over 1 million US copies in 18 months.

That saga of a time-tripping junior high girl and a half-demon was, in 2007, still running on the Cartoon Network. One full TV series season usually includes 26 half-hour episodes. In addition, the field of anime includes long-form theatrical films with higher quality visuals, such as Hayao Mizaki's *Spirited away* (winner of the US 2003 Animated Feature Oscar). A third form, original video animations (OVAs), are usually one-shot productions, shorter than films and released directly to video. An OVA (e.g., *Tenchi muyo*) can even spawn movies and TV series.

One can think of the cartoon segment of the Japanese media industry as a pyramid (→ Japan: Media System). At the bottom reside *manga*, thick periodicals printed on cheap newsprint that contain multiple storylines. At the next level are cartoon books of popular storylines that originated in *manga* form. (A few of these cartoon books are translated into English for a growing foreign fan base.) Moving up, one finds some of the books taking on life as Japanese-language TV anime, films, or OVAs. Of those, a few find their way overseas, either dubbed or subtitled.

## GENRES

Most anime include a variety of thematic elements – action, comedy, drama, fantasy, horror – making them difficult to categorize. The setting may be contemporary, futuristic, historic, or fantastical. Certain specific Japanese-language designations, however, do apply to anime. Of these, some genres take their names from their target audiences:

- *Josei* (young woman), example: *Nana*;
- *Kodomo* (child), example: *Doraemon*;
- *Seinen* (young male adult), example: *Oh my goddess*;
- *Shōjo* (young lady, little girl), example: *Card captor Sakura*;
- *Shōnen* (boy), example: *Dragon ball*.

Other genres take their names from their content:

- *Bishōjo* (beautiful girl; anime featuring attractive female characters), example: *Magic knight Rayearth*;

- *Bishōnen* (beautiful boy, featuring “pretty” and elegant boys and men), example: *Fushigi Yūgi*;
- *Ecchi* (meaning “H,” short for *hentai*, a Japanese designation of indecent sexuality, featuring mild sexual content), example: *Love Hina*;
- *Hentai* (abnormal, perverted, featuring erotica), example: *La blue girl*;
- *Mahō shōjo* (magical girl; a sub-genre of *shōjo*), example: *Sailor moon*; this sub-genre is referred to as “big eyes save the world” (see below);
- *Mahō shōnen* (magical boy; the male equivalent of *Mahō shōjo*), example: *DNAngel*;
- *Mecha* (mechanical, featuring giant robots), example: *Mobile suit Gundam*;
- *Moé* (endearing; featuring extremely perky or cute characters), example: *Little snow fairy sugar*;
- *Sentai/Super Sentai* (fighting team, featuring a superhero team), example: *Cyborg 009*;
- *Shōjo-ai/yuri* or GL (girl love, featuring love and romance between female characters), example: *Revolutionary girl Utena*;
- *Shōnen-ai/yaoi* or BL (boy love, featuring gay love and romance between male characters), example: *Gravitation*.

Some anime titles have content even narrower than those above, focusing specifically on racing cars, golf, boxing, or the French maid fantasy.

## TECHNIQUES AND STYLE

At the start of the twentieth century, Japanese filmmakers experimented with the animation techniques that were being developed in France, Germany, the US, and Russia. The early Japanese animators believed that animation had to mimic live-action dramas. Then, in the 1950s and 1960s, popular US series were imported into Japan using “limited animation” (which lowered production costs by decreasing the number of cell drawings per minute). In 1963, the limited animation form was tried in *Tetsuwan atom* (Mighty atom); when it met with phenomenal success (a rating of 40.7 percent), the genre was off and running. The anime style still uses a limited number of drawings, with intensive effort put into each one. During the 1970s, anime further separated itself from its foreign roots.

A noticeable anime (and *manga*) hallmark is characters’ unnaturally large eyes, a legacy of the revered artist Osamu Tezuka (1928–1989). Inspired by the exaggerated features of US cartoon characters such as Betty Boop and those in classic films like *Bambi*, Tezuka drew large eyes – not necessarily to achieve a foreign look, but because eyes could empathetically reflect emotions (→ Disney). When Tezuka began drawing *Ribbon no Kishi*, the first *manga* specifically targeted at young girls, he further exaggerated the size of his characters’ eyes. Tezuka and later artists simply carried the big-eye print conventions into anime.

The *chibi* (super deformed) character style features not only huge eyes, but an enlarged head and small body. Other common motifs include, especially in comedic anime, bulging veins on foreheads (anger), a giant sweat-drop (disbelief), and thin facial lines (embarrassment). The male gaze, when aimed at women, can take the form of ridiculously bulging eyeballs.

More than 1,000 TV anime programs have been produced in Japan since the first TV animation was broadcast in 1963, the 30-minute series *Tetsuwan atom. As Astro boy*, the series was successfully exported to the west.

## ANIME EXPORTS

In the later 1960s, the world got its first large-scale exposure to anime via the dubbed *Speed racer* children's TV series, even though many viewers probably did not think of it as Japanese. After a lull in the 1970s, a wave of imports – notably *Star blazers* and *Robotech* – resumed in the early to mid-1980s. In the 1980s, as anime was accepted as mainstream in Japan, a boom in production ensued, especially of adult-oriented TV series. There followed another export lull, this time due to the increased value of the yen. Then, in 1988, the confusing, violent theatrical film *Akira* was released.

The year 1995 marked a turning point for exports; *Dragon ball* and *Sailor moon* appeared as dubbed US TV series, while *Ghost in the shell* was released in 1996, eventually peaking at 51 US theaters. These anime acted as placeholders somewhat low on the public radar until the arrival in 1998 of two blockbusters: the money-making *Pokemon* for children and *Dragon ball Z*, an epic good vs evil story told over 260 episodes. Would non-Japanese audiences accept storylines that were not self-contained in a single episode? The Cartoon Network, which took a chance on *Dragon ball Z* as a daily after-school program, saw it rise to become the channel's top-rated show. France is another large export market. Beginning in about 1993 with popular translated *manga*, Frederic Boilet's translation of the sophisticated *To a distant town* appeared in 1998.

Choosing new fare for western viewers can be dicey. In 2006, the Tokyo Big Sight convention center housed the annual Tokyo International Anime Fair, which included a sprawling trade show, closed-door industry symposiums, and awards ceremony; it attracted 100,000 or so fans. When the Frognation company's *Eureka seven* received three awards, including best TV anime, the Cartoon Network promptly acquired the show.

Earlier, Disney had bought the international distribution rights to many of Hayao Miyazaki's films. To date, *Princess Mononoke*, *Spirited away*, and *Howl's moving castle* have appeared in many US theaters. Bringing "very Japanese" works, such as some of Miyazaki's films, to western audiences entails special challenges. Nowadays a "light touch" approach to localization has proved popular with fans as well as general viewers. Music, however, usually does change when an anime is licensed to another country.

For any anime, cross-national processing involves many steps. After a basic translation, an editor studies the script as he or she watches the show, getting a feel for the characters. Then, while holding auditions, a major decision involves how close the English voices should be to the original Japanese ones.

Each actor records alone, so he or she can concentrate on synchronizing the mouth movements, making it difficult to generate the chemistry needed between characters. Child actor Aaron Dismuke, 11, as Edward in the fantasy-adventure *Fullmetal alchemist* had a special problem: to complete the recordings before his voice changed. Another dilemma is difficult-to-translate puns and wordplays. In the case of OVA, the audience will mainly be serious anime fans, which means staying especially close to the original. Video and DVD releases include not only OVAs, but also TV series and films judged not to be commercially viable for general audiences.

## FANS

Terms for non-Japanese anime fans range from Japanophile to wapanese (wannabe-Japanese, who, for example, use Japanese words in their English sentences) to *otaku*. *Otaku* is a Japanese pejorative term used to refer to a geek obsessed with anime and *manga*. Derived from an honorific Japanese term for another's house or family, the term was first used by author Akio Nakamori in his 1983 series *Otaku no Kenkyu* (An investigation of otaku) and later when writing about rapist/serial killer Tsutomu Miyazaki, a recluse apparently obsessed with imitating pornographic anime and *manga*.

*Otaku* provides the name for Baltimore's annual August anime convention, *Otakon*, the biggest on the east coast; it attracted 22,000 fans in 2006. Just 15 years earlier, in 1991, the first US manga/anime convention was held in Anaheim, California. Costume contests, or *cosplay*, play a central role at US fan conventions, which usually feature musicians from Japan and voice actors.

*Baka-con* was created by a fan group. The anime fan club phenomenon, common at even small US colleges, has reached secondary schools. The US anime fan community, although numerically not very large, has influence because of its affluence, intelligence, and motivation. Fans' devotion to anime, however, can have ethical and even legal implications.

Although it is a violation of copyright laws in many countries, some fans watch fansubs, recordings of anime series that have been subtitled by fans – preferred by many over dubbing. The ethical implications of producing, distributing, or watching fansubs are topics of much controversy even when fansub groups do not profit from their activities and cease distribution of their work once the series has been licensed outside of Japan.

Adults brought up in the early 1990s on *Pokemon* and *Dragon ball Z* may create a market for more mature anime as they age. Beyond anime, many western fans' interests may spread to Japanese music, celebrities, film, fashion, and language. In the US, anime's status in the mid-2000s ranks between a niche phenomenon (in middle America) and – especially on the two coasts and larger cities – a major cultural force.

# Antitrust Regulation

*Duncan H. Brown*

*Ohio University*

As a neo-liberal approach to media policymaking has spread, many nations have relied more heavily on competition and the marketplace to shape the structure and output of their electronic media industries. The result has been a greater reliance on antitrust laws designed to maintain a competitive marketplace rather than industry-specific regulations (→ Media Policy; Media Economics). Indeed, this faith in the marketplace to produce optimal outcomes has been so great that it has often led to a view that promoting competition is virtually the only concern policymakers should have. But there has also been a countervailing force at work. In an era of growing media globalization and regionalization, many governments have seen the need to allow media corporations to grow in order to compete in this new global media economy. The result has often been a reluctance to apply antitrust laws as rigorously as in the past (→ Globalization of the Media; Media Conglomerates).

## ORIGINS OF ANTITRUST REGULATION

In the United States, antitrust laws developed in the late nineteenth century as a reaction to the growth of big business. These laws were designed to limit the economic and political power of these firms and their ability to collude in the creation of cartels to dominate an industry by destroying potential competitors and setting prices at levels that harmed consumers.

Wells (2002) has observed that this reaction against cartels was a particularly American phenomenon. Their existence in other countries was often tolerated and sometimes even supported by governments as a way of stabilizing markets. However, following World War II, the United States began to actively export its ideas about the role of antitrust laws. Wells notes that these efforts were successful in Europe but failed elsewhere, for example in postwar Japan.

## ANTITRUST AND THE ELECTRONIC MEDIA

The application of antitrust law in the case of a specific industry requires both the definition of the relevant market and an assessment of the level of competition within that market. But defining the boundaries of the relevant market in the case of electronic media industries can be especially difficult. For example, if there are two competing providers of satellite radio to a nation, how should that market be defined if they wish to merge? Is it just the existing satellite radio market that should be considered? Or should terrestrial radio broadcasters be seen as participants in the market? Perhaps even providers of online services allowing consumers to download music should also be included (→ Competition in Media Systems; Markets of the Media).

Napoli (2001, 153–176) has noted the difficulty in *defining the geographic market* for media products before making an assessment of the level of competition, since, while

satellite services are aimed primarily at a national market, competition between broadcast radio or television stations often takes place in a more localized market. In addition, Napoli also distinguishes between various content markets and audience markets. Here the concept of substitutability is important in the assessment of the level of competition in a media market. For example, in an audience market, two competing broadcast radio stations may be attracting audiences with little or no overlap. To a potential advertiser the members of one audience are not substitutable for those of the other. However, as Napoli points out, even if the relevant market can be defined, the issue of how to assess the level of competition in that market is not without its problems.

Various *competition-concentration indices* have been used, including, in the United States perhaps most frequently, the Herfindahl-Hirschman Index (HHI), which is calculated by summing the squares of the revenue shares of all participants in a market. This works well if the measure chosen for the analysis is the share of the total advertising revenue attracted by all participants in a market. The problem with this type of assessment of the level of market concentration in media industries is that while this kind of measure may produce an index that is too low to allow companies to use their market power to fix prices, the level of market concentration may still be seen as harmful to the democratic conversation. An inability to control advertising rates may not correlate with a desire for a diversity of voices to be heard in a community (→ Plurality).

## ANTITRUST AND THE MARKETPLACE OF IDEAS

In the approach promoted by the Chicago School of economics, the central issue in antitrust law is whether a company can use its market power to fix prices. This view came to dominate antitrust enforcement in the United States during the 1980s. From this viewpoint, antitrust law is solely concerned with levels of competition and market efficiency. It does not address the role communications media play in a democratic society by providing access to a wide range of diverse voices (→ Journalists' Role Perceptions); that is, the creation and maintenance of a "*marketplace of ideas*." While the application of antitrust laws in a way that is solely designed to promote economic efficiency will probably also promote some of the democratic ideals embodied in the concept of the marketplace of ideas, the question is what it will miss. For example, a market may be found to be entirely unconcentrated provided it does not give any of those operating in that market the power to raise prices, even if a particular category of media content is entirely absent. This could include the complete absence of media products reflecting the lived experiences of specific cultural or ethnic groups. In the case of a geographically defined local media market, there could also be no local content, with all media outlets in that market being programmed from remote locations.

As a result of this narrow definition of antitrust as a purely economic issue, there has been a reluctance in the United States to stop media → mergers. Vertical integration leading to the creation of media conglomerates has rarely been challenged. Whether or not these mergers might harm citizens, rather than consumers, has been ignored in favor of the argument that such mergers create market efficiencies. Some have argued that this is a major flaw in the Chicago perspective and particularly troublesome in the way the antitrust laws have been used to assess large media mergers in the United States (Conrad

1996–1997). They also conclude that case law and legislative history do not support this narrow interpretation of the role of antitrust laws to the exclusion of concerns about the marketplace of ideas (Stucke & Grunes 2001, 273–275).

### **ANTITRUST AND THE CONCENTRATION OF MEDIA OWNERSHIP**

As the number of sector-specific rules limiting media mergers has decreased, some have expressed a concern that the application of antitrust law has proved an ineffective substitute for those rules in halting what they perceive to be the growing concentration of media ownership (→ Concentration in Media Systems). Their concern is related to the concept of the marketplace of ideas discussed above, and they fear that the growing concentration of ownership is creating a situation where the leaders of a few large media conglomerates have the power to control the content of that marketplace of ideas (Baker 2002; McChesney 2004, 235–240). They call for antitrust laws to be applied with a focus not only on the benefits of allowing increasingly large media conglomerates to achieve market efficiencies, but also on the harm this may do to maintaining a vigorous democratic debate (→ Media as Political Actors).

Critics of this line of thinking have responded by arguing that the media industries are not highly concentrated if one considers *all* media. They point to the proliferation of new media technologies in recent years, especially the → Internet, and suggest that this is actually increasing diversity of control (→ Communication Technology and Democracy). They also argue that ownership does not necessarily confer control, since the day-to-day decisions made in the many divisions of a media conglomerate must be left to managers and cannot be overseen by the individual leaders. This argument is, however, countered by noting that while operational control over the day-to-day operations of media conglomerates may have passed to managers, the owners still have allocative control (Williams 2003, 73–95). For example, setting the expected profit margin for a particular division within a media corporation can have profound impacts on its day-to-day operations without any direct intervention. The need to make greater profits can result in decreased numbers of reporters in a newsroom or a reduction in the number of pages in a newspaper and the elimination of some types of news.

In conclusion, a reliance on antitrust law to regulate media industries, especially when those laws are interpreted solely in terms of whether companies can use their market power to set prices, may be inadequate to protect some of the democratic ideals raised by the special role media industries play in the democratic process.

## **Anxiety Uncertainty Management Theory**

*Tsukasa Nishida*

*Nihon University*

William B. Gudykunst (1985) extended Berger and Calabrese's (1975) → uncertainty reduction theory to explain the reduction of uncertainty in intergroup encounters as the first step in developing anxiety/uncertainty management (AUM) theory. He developed a model of intergroup communication by integrating URT and social identity theory in several stages. Gudykunst and Hammer (1988) also developed a version of the theory that used uncertainty and anxiety to explain intercultural adjustment. This version contained 24 axioms. Uncertainty involves the inability to predict or explain others' attitudes, behavior, and feelings. Anxiety involves feelings of being uneasy, tense, worried, or apprehensive.

At about the same time, Gudykunst (1988) included notions of intergroup anxiety into a *general theory of effective interpersonal and intergroup communication*. This version of the theory contained 13 axioms. Neither of the 1988 versions of the theory was designated AUM. According to Gudykunst, intercultural communication is one type of intergroup communication. He used the notion of the “stranger” as a central organizing concept. “Strangers” are defined as individuals who are present in a situation, but are not members of the ingroup.

Besides intergroup factors, anxiety, expectations, and outcomes were included in the theory. Gudykunst regarded anxiety as the fundamental problem with which all humans must cope, and he wrote that it is present anytime individuals communicate. To better understand either interpersonal or intergroup encounters, therefore, anxiety was

incorporated into the theory. Regarding expectations, he also wrote that → stereotypes and → attitudes create expectations. Generally, he concluded that positive expectations reduce uncertainty and anxiety, whereas negative expectations increase uncertainty and anxiety. Pertaining to outcomes, Gudykunst argued that uncertainty reduction itself can be considered an outcome of communication. He noted that it is also a process. He defined effective communication as minimizing misunderstandings within the theoretical framework.

The Gudykunst (1988) version of the theory included axioms that addressed both effective communication and intercultural adjustment. Gudykunst (1990) applied the theory to diplomacy, a special case of intergroup communication. Gudykunst (1993) focused on anxiety and uncertainty management: for example, maintaining anxiety and uncertainty between minimum and maximum thresholds to make effective communication possible. And he integrated Langer's notion of mindfulness as a moderating process between anxiety/uncertainty management and effective communication mindfulness. He used the label AUM for the first time in this publication. This version of the theory contained 49 axioms.

It was important for him that the 1993 version of the theory focused on interpersonal and intergroup communication competence. Unlike the 1988 version of the theory, the 1993 version of the theory was designed to be a *practical theory*. The change in focus from anxiety and uncertainty reduction to anxiety and uncertainty management, as well as focusing on practical application instead of just explaining effective communication, changed the fundamental nature of the theory.

The 1995 version of the theory contains 94 axioms (Gudykunst 1995). This effective communication version was written with respect to individuals communicating with strangers. The intercultural adjustment version of the theory, in contrast, was written with respect to strangers entering new cultures and interacting with host nationals. The 1995 version of the theory incorporated ethnic aspects of communicating with strangers and maintained the goal of being a practical theory. This version of the theory of interpersonal and intergroup communication effectiveness was later updated.

Gudykunst revised the intercultural adjustment version. In 1998 he outlined how it could be used to design intercultural adjustment training programs, and later updated it again (→ Intercultural Communication Training). Bill Gudykunst's legacy can be seen in the vast amount of empirical research that his writings have inspired in North America and Japan.

## Apologies and Remedial Episodes

Mariko Kotani

Aoyama Gakuin University

Apology is an action in which one admits the wrongful nature of an act and one's responsibility for it in dealing with some type of problematic situation; for instance violations of social expectations, offenses, rule-breaking behaviors, social predicaments, and embarrassment. The concept can be traced back to *apologia*, the speech of self-defense identified in Greek rhetoric. The first scholar to give much attention to this action in face-to-face settings was → Erving Goffman, who treated it as part of a remedial interchange. The remedial interchange is a sequence of exchanges in which one tries to change the meaning of an action that is potentially offensive to one that is acceptable through the uses of such acts as excuses, justifications, and apologies (→ Accounting Research).

Unlike an *excuse*, in which one admits the wrongfulness of an act but denies one's full responsibility, or a *justification*, in which one admits the responsibility but denies that the act itself was wrong, an apology admits both to the wrongfulness and to one's responsibility for the act, often with an expression of remorse. Goffman treated a remedial interchange as a unit basically consisting of four moves, namely remedy (i.e., accounts, apologies, or requests), relief, appreciation, and minimization, whereas other researchers have used slightly larger units, such as an accounting sequence and a remedial episode, for observing actions including apologies.

The concept of apology is important because it helps us understand the way in which society is maintained through individuals' everyday conduct. In apologizing, one demonstrates that one is guilty of an offense and, at the same time, shows one's willingness to adhere to the rule that one has violated (Goffman 1971). In other words, by apologizing the offender claims that his or her act was an exception to the rule, and, as a result, the original rule is sustained. The concept is also important in understanding the way in which individuals restore their preferred images of self, or "face." In interactions, one's face is sometimes supported by the other and thus maintained, but at other times, it can be threatened. The latter type of situation occasions an apology. The desire to restore one's own or the other's

face, as well as the relationship with the other, is a motivating factor for an individual to offer an apology.

The role of apologies has been examined in a wide variety of contexts including criminal and civil justice systems and mediation, medical malpractice, national and international political incidents and historic events, corporate image restoration, marital and family relationships, psychotherapy, literary texts, and public speech. Three *areas of research*, in particular, have investigated various dimensions of apologies in face-to-face interaction. First, social psychological research has examined the *relationship between apology and other concepts* (e.g., guilt, embarrassment, aggression, forgiveness, healing processes, and repairing trust) and the *relationships among variables* (e.g., age, sex, culture; offender's reputation, degree of remorse, responsibility, and intentionality; nature of relationships; severity of the offense; extent of damage; absence or presence of apology; content of the apology; effectiveness of apology versus other actions; timing of the apology; restitution and punishment; and consequences).

Second, researchers studying accounts have treated apology as a *concession*, one type of accounting strategy in the category that includes excuses, justifications, and refusals. Third, research in pragmatics and applied linguistics has typically treated apology as a *speech act* and a *politeness* strategy. It has attempted to identify strategies of apologizing (e.g., an acknowledgment of responsibility, an account) and their linguistic forms (e.g., "I'm sorry," "It won't happen again"). Note that most pragmatics research has considered accounts to be an apology strategy, whereas accounting research has treated apologies as a type of accounts. Pragmatics research has also investigated situations that require apologies, factors that influence the choice of strategies, cross-cultural differences in the uses of apology, and the similarities between apologies and thanks. Whereas some researchers begin with functions (e.g., admitting responsibility) and then collect their linguistic forms, others begin with forms and identify their functions.

Recent research has considered how apology is conceptualized and practiced in other speech communities and what happens when two interactants have two different meanings for apology (→ Communities of Practice). Researchers have increasingly collected natural data using *ethnographic methods* (→ Ethnography of Communication) as opposed to questionnaires, role-play, laboratory experiments, and analyses of textbooks. *Conversation analysis* has begun to explore sequential positions of apology and its preference organizations by treating it as the first or second pair part in adjacency pairs (→ Conversation Analysis). The source of both strengths and weaknesses in apology research might be that it has been conducted in many disciplines and languages and that these researchers have tended to operate within their own disciplinary and geographic boundaries.

## Applied Communication Research

David R. Seibold

University of California, Santa Barbara

Applied communication research refers to a *type of communication scholarship* as well as to a *sub-field of communication* with which that research is identified. In the more specific sense, applied communication research is communication scholarship that emphasizes the creation of knowledge about communication in specific contexts, applicable to social issues, and often for the solution of societal problems. The research typically is theory-driven or has the potential for (re)formation of theory, but theory building is neither the immediate nor the principal purpose of applied communication studies. Rather the hallmark of applied communication scholarship is its social relevance, for it is simultaneously (often primarily) directed by a concern with the usefulness of the research findings for illuminating pressing social issues, for improving practice, or for redressing societal problems. To a lesser extent, applied communication researchers therefore are concerned with the dissemination of that knowledge and its effective application by persons with a stake in the solution to social issues.

In the broader sense, applied communication research references a sub-area of the discipline (→ Communication as a Field and Discipline). Applied communication scholarship has contributed to, and been nurtured by, the creation of formal structures in the field of communication that foster research which explores and enhances the relationship between communication theory and practice in applied contexts. The structures include divisions within professional associations and awards for scholarship; a dedicated journal and special issues of others; conferences and proceedings; edited volumes; graduate programs or emphases; curriculum tracks, individual courses, and textbooks; among others. Most prominent in the United States but in evidence worldwide, these structures have served to define applied communication as a sub-field of communication. That sub-field, in turn, has been an umbrella for many professional agendas and research foci.

### **APPLIED COMMUNICATION RESEARCH AS SCHOLARSHIP: EMPHASES AND TRENDS**

Article II of the Constitution of the National Communication Association, the largest communication association in the United States, proclaims: “The purpose of this Association shall be to promote criticism, *research*, teaching, and *application* of the artistic, humanistic, and scientific principles of communication” (emphases added). Despite the fact that *research* and *application* are inherent in the NCA’s mission, applied communication researchers have found it necessary to address issues that are crucial for any nascent field of study: finding its identity, contesting foci, debating an agenda, elaborating methods, and so forth.

While Eadie’s (1982) “case for applied communication research” was significant for justifying applied communication as a field of scholarship, the meaning of applied communication research has been contested since then. Disputes surrounding the legitimacy of applied research as scholarship, the problematic dichotomy between “basic” and “applied” research, whether there should be an agenda and boundaries (Eadie 1994; O’Hair 2000), and the relationship between theory and practice have arisen and abated (see reviews in Seibold 1995; 2000). On the last point, most applied communication researchers acknowledge the recursivity of theory and practice, but do not agree on the extent to which theory and practice are *equal* aspects of applied communication research nor the extent to which they can/must be mutual informing and reforming (Seibold 2005). Applied communication researchers also differ on where to enter the circle for analytic or ameliorative purposes and how to insure both are not lost in that process, including how to preserve scholarship in the process of service. An extension of that realization has been debate surrounding the depth of engagement desirable in applied communication research, and recognition of researchers’ potential to “make a difference” in the amelioration of the problems others live and they research. For some this is an ethical imperative (Conquergood 1995; Frey 1998) – “we are part of the problem or part of the solution” (Frey et al. 1996) – although there have been rejoinders (Seibold 2000; Wood 2000).

There also are discernible trends in applied communication research. First, the range of → research methods has broadened to include quantitative, qualitative, ethnographic, archival, experimental, and rhetorical methods. Second, as an extension of the field of communication, applied communication research reflects its disparate nature and emergent character. The evolving nature of the field has been mirrored in the evolution of the contents and contexts of applied communication research. cursory examination of articles published in the *Journal of Applied Communication Research (JACR)* since 1990 reflects the scholarly foci of all divisions in the National Communication Association, the journal’s sponsoring organization, as well as the types of scholarship produced by many of the sections and interest groups of that broad-based communication association. Since the field is in flux, it is inevitable that the foci and methods of applied communication research will change too.

Third, applied communication scholarship speaks specifically to more specific problems than ever before. Applied communication researchers have studied a wide range of social problems: child abuse, domestic violence, sexual harassment, smoking cessation,

skin cancer prevention, employee participation, organ donation, hospice care, intergroup conflict, delivery of health-care and social services, ageism, gender equality, children's self-efficacy, exposing negative campaigning, and anti-gang advertisements, to name a few of just research projects reported in *JACR*. The expanding scope of applied communication research has been the result of many factors, including correlative changes in the field as a whole, the sheer increased number of scholars doing applied communication research and their depth of engagement with social issues increasingly regarded by citizens and nonacademics as problems, and more limited and focused projects in specific contexts.

Fourth, not enough applied research speaks broadly to a range of social problems. This may be a consequence of a concern with describing, critiquing, and reforming practice over building theory. Few general communication-related theories have been available for application to a range of problems. The emphasis on case analyses has resulted in rich but less general findings, and the relatively few large-scale, grant-supported projects in the area leaves applied communication research quite focused on specific contexts and pressing issues.

### **APPLIED COMMUNICATION RESEARCH AS A SUB-FIELD: INSTITUTIONALIZATION**

Cissna et al. (in press) locate the genesis of applied communication research in the “speech” tradition of communication (→ Speech Communication, History of). They identify four factors contributing to the development of the applied communication sub-field: (1) American communication scholars’ struggle for disciplinary identity dating to 1914 when 17 Midwestern US teachers of speech separated from the National Council of Teachers of English to pursue the theory and practice of their pedagogical commitment; (2) the drive over the next 60 years among members of what is now the National Communication Association (NCA) to build research-based knowledge of communication; (3) in addition to generating theoretical findings of importance to other scholars, the desire to create knowledge that contributes to the solution to social problems – especially stimulated by societal tumult in 1960s America; and (4) commitment to insuring that stakeholders are aware of and can utilize communication scholarship (→ Planned Social Change through Communication). The “Disciplinary Roots and Importance of Communication Research” section of the NCA website reflects the last two impulses: “The discipline of communication – grounded in a rich and ever-expanding intellectual tradition, generating a wide range of disciplinary and interdisciplinary research, and engaged with major industries – is dedicated to *addressing critical social needs and improving lives* through basic and *applied research*” (emphases added).

As Cissna et al. (in press) chronicle, the institutionalization of applied communication research in America occurred through a number of concurrent applied projects in the 1970s. Annual publication of a compendium of abstracts of → *organizational communication* articles, while not necessarily focused on social problems, highlighted field studies that also were perceived as more “applied” than dominant experimental laboratory investigations. The development of the → International Communication Association audit project reflected the close cooperation of academics and practitioners in that

association's Organizational Communication Division, the only such unit in a major academic communication society. By 1977 the Speech Communication Association (SCA) – changed to the National Communication Association in 1997 – had created an Applied Communication Section, the first of its kind. A home for nonacademic members of SCA, academics interested in consulting, and scholars conducting applied research, APCOM sponsored research panels at annual meetings, supported a Section newsletter, and provided opportunities for its nearly 500 members and potential members to interact. The mission statement of the Section emphasized “discussion, study, and analysis of application of communication principles to communication problems” in a variety of organizational contexts. Regional communication associations affiliated with SCA soon sponsored their own applied communication divisions or created homes for applied research within other units, and in 1995 APCOM became a formal Division in SCA (see Cissna et al., in press).

Applied communication research was further institutionalized through the creation of another formal structure in the 1970s – a journal devoted entirely to scholarship on applied communication and the first scholarly venue in the field of communication with “applied” in its title. The first issue of the *Journal of Applied Communications Research* appeared in 1973. It was published as a private enterprise by academics Mark Hickson and Don Stacks, in part as an outlet for context-specific, participant observation, ethnographic and applied research that they found missing from sponsored journals. The founders sought articles that analyzed data collected in contexts outside university labs, and that dealt with important social issues. Articles in the first several issues included research on presidential communication, documentary broadcasting, → advertising and → marketing, marital conflict (→ Marital Communication), communication among the Choctaw Indians of America, interactions involved in childrearing, and an editor's essay (Hickson 1973).

The *Journal of Applied Communications Research* was acquired by the University of South Florida in 1981 under the editorship of Communication faculty, and its title was modified slightly to the current *Journal of Applied Communication Research (JACR)*. The focus of the *JACR* also expanded to “questions and problems regarding pragmatic social phenomena addressed through the analysis of human communication” with published articles not constrained to particular methods, contexts, or epistemology (Cissna 1982). The Speech Communication Association assumed publication of *JACR* in 1990, under the editorship of Bill Eadie. Eadie sought to publish research that explored specific communication problems or situations (or whose results were immediately applicable to them), that provided important information about the problem or situation, and that was securely based in theory but whose immediate purpose was not theory building. Over the years, articles have appeared representing all areas of the field: intergenerational, political, instructional, intercultural, organizational, interpersonal, and mass communication among many others. *JACR* increasingly has published studies of new communication technologies, intergroup communication, gender communication, legal communication, social justice, environmental and risk communication, gerontological and health communication, crisis communication, and family communication at the same time as the field of communication (including the units in its scholarly societies) has expanded to include formal focus on these areas. A recent issue, for example, included studies of maternity leave

policies and practices in US organizations, how parents who have experienced the death of a child communicate with persons in their social network, and the socialization of emotion management among municipal firefighters. Recent editors of *JACR* have developed conventions to bridge the findings reported in each article to practice (e.g., portions of the Discussion section devoted to application of the results).

Other structures have evolved over the past two decades that have further institutionalized applied communication research: journal special issues devoted to applied communication research (O'Hair 2000; Petronio 1999); major conferences on conceptions of and the future of the area, as well as ensuing publications (e.g., Cissna 1995); inauguration of the NCA Applied Communication Division's annual award for outstanding article and creation of the association-wide Gerald M. Phillips Award for Distinguished Applied Communication Scholarship to honor a body of applied communication research; development of graduate programs that emphasize applied communication scholarship; and applied communication courses and textbooks (Cragan & Shields 1996).

Researchers steeped in a → journalism tradition would not find "applied communication research" to be historically problematic or salient for their identity (→ Journalism Education). The "applied" character of their work has been presumed (→ Communication Professions and Academic Research). This also appears to be true, *internationally*. Examination of the International Federation of Communication Associations, Federation of Communication Societies, Council of Communication Associations, and numerous regional and national communication association websites around the world (mission statements, constitution, divisions, task forces) reveals scant reference to "applied communication research." Current and former officers of several of international societies interviewed by the author expressed uncertainty about the meaning of applied communication research. As one officer indicated: "It is not a term we use a lot. A lot of research reported at our conferences is inspired by a desire to make practice better and so is justified in terms of its potential or actual applications . . . We do not have a section called applied (communication) research. We tend to organize our activities, especially at conferences, around themes."

Nor do journals sponsored by these organizations engage in debates or offer commentaries explicitly related to applied communication research. For example, over the past 10 years the *Asian Journal of Communication* and the *Keio Review* had no forums or reviews separately dedicated to applied communication research. The editor of a prominent European communication journal indicated, "some authors may make reference to applied communication, but most of those are from things done in the U.S."

There are a few exceptions internationally, instances where applied communication or applied communication research is referenced explicitly. The mission statement of the → International Association for Media and Communication Research includes the following: "We welcome both theoretical and applied research, as well as research conducted at both micro and macro levels of analysis" ([www.iamcr.org/content/view/83/204/](http://www.iamcr.org/content/view/full/83/204/)). Reference to "applied communication" in the "Identity of the DG PuK" section of the German Communication Association (DG PuK) website ([www.dgpuk.de/english/identity.htm](http://www.dgpuk.de/english/identity.htm)) alludes to applied research methods and contexts as well as their relationship to basic research. Furthermore, some international universities have applied communication departments and offer applied communication degrees. Reference to

applied communication in these international associations, departments, and degree programs is unusual. Although applied communication research appears to be integral to international communication scholarship, the term seems not to have entered the lexicon outside American scholarship and scholarly institutions.

# Appraisal Theory

Josef Nerb

Freiburg University of Education

The evening news on TV presents extensive coverage of an oil spill just off the Spanish coast. The audience sees the sinking of an oil tanker in a severe storm, learns that it has leaked tens of thousands of tons of heavy fuel oil, and watches pictures of birds fighting a hopeless fight for survival as their feathers are agglutinated. It will be mentioned that at the moment the cause of the accident is still obscure. To analyze the effects of this media coverage on the audience it will be crucial to know what kind of cognitive processes and emotional reactions are likely to occur (→ Emotions, Media Effects on; Information Processing). For example, the identification of a clearly responsible human agent is likely to elicit anger and anger-congruent cognitions, whereas the recognition that matters were out of anyone's control more often leads to predominantly sad reactions. "Appraisal theories of emotions" offer a more complete and systematic linkage between such cognitive evaluations of a situation and emotional reactions (see Scherer et al. 2001, for an overview).

More generally, these theories link cognitive evaluations about the significance of a situation for a person's goal or well-being – that is, the cognitive appraisals of a situation – to that person's emotional experiences (→ Cognition; Emotion). For example, the appraisal that a situation is positively relevant for a person is seen as determining positive emotions, whereas the appraisal of negative relevance for a person is regarded as determining negative emotions. Of course, there are additional appraisals and it is assumed that different patterns of appraisals further differentiate emotions. Within appraisal theories, emotions are seen as continuous processes, changing as appraisals are added or revised.

Whereas the famous theory of James (1884) had argued that humans are not afraid of a bear and then run, but rather are afraid because they perceive themselves running, appraisal theorists insist on the *primacy of the initial evaluation of the situation*. Without the perception of the bear in the first place, its evaluation as a life-threatening animal, and the understanding that attacking it oneself is impossible, people would neither run nor be afraid. Appraisal theorists assume that initial evaluation or, in theoretical jargon, the situational appraisal causes experienced emotions (Roseman & Evdokas 2004). In contrast to Schachter's two-component theory of emotion (Schachter & Singer 1962), appraisal theories do not consider physiological arousal a necessary precondition for emotional reactions (→ Emotional Arousal Theory).

Although theorists disagree over details, granularity, and number of appraisal criteria, there is considerable consensus regarding the central and most important criteria for differentiation and elicitation of emotional reactions (Ellsworth & Scherer 2003). For example, most appraisal models include an evaluation of the degree to which a situation or event is consistent with, or conducive to, achieving one's goals (→ Goals, Cognitive Aspects of). This criterion differentiates between positive and negative emotions. Another important criterion is agency or responsibility for an event: an event might be caused by

the self, other persons, or by situational circumstances (→ Attribution Processes). Other important criteria are one's own potential to cope with the consequences of the event, and the event's normative significance; that is, its compatibility with prevalent moral standards. Novelty, unexpectedness, and pleasantness (or valence of a stimulus) are also among the core appraisal criteria.

Most appraisal theories assume *emotions to be caused by appraisal*, assuming a linear causal relationship between appraisal and emotion. Some theorists have challenged this view and postulate in one form or another reciprocal causation between cognitive appraisal and emotion. If the appraisal–emotion link is not a simple, causal relationship, then both cognitive interpretation and development of an emotion should emerge over time in a dynamic, bidirectional way (Lewis 2005). This stance implies that an emotion is continuously enhanced or modified by changes in appraisal, while appraisal is progressively updated by emotional influences on perceptions, judgments, or memories.

Adopting such a dynamic appraisal–emotion relationship has important implications for analyzing media effects. This was shown by Nerb and Spada (2001), who developed the computational model ITERA for analyzing and predicting media effects assuming a *dynamic, bidirectional appraisal–emotion relationship*. Using fictitious but realistic newspaper reports about an environmental problem, the authors manipulated attributes determining the agent's responsibility for environmental damage (knowledge about the riskiness of an action; motive of the actor). Manipulating these appraisals of responsibility not only influenced participants' felt anger and sadness but also affected ratings on non-manipulated attributes of the negative event. The effects on those non-manipulated variables were coherent with the overall emotional reactions of the participants. For example, in one study the manipulation of whether a company had control over the actions that caused an environmental problem not only affected ratings for anger, but also led to affective coherent judgments about the motive and knowledge of the agent. Although nothing was mentioned in the news report about the motive of the agent and whether the company could foresee that its action could imply a negative outcome, participants found that the company had more knowledge about the riskiness of the action and had a more negative motive when the action was controllable than when it was uncontrollable (→ Framing Effects). Thus, participants' construals of the situation are consistent with the underlying appraisal pattern for anger.

*Recent developments within appraisal theory* are concerned with the social aspects of the genesis of emotions. According to this view, emotion process does not unfold in a micro-world that only involves the emotional stimulus and the individual concerned, but is always embedded in a broader social context (Fischer et al. 2003). Thus, people include in their appraisal of a situation the way in which other people judge, evaluate, or behave in response to an emotional situation; this is called social appraisal. As a consequence, experienced emotions might not need to be the result of one's own situational appraisals; rather, it might be others' communicated appraisals that cause or modulate emotional responses.

## Arab Satellite TV News

Marwan M. Kraidy

University of Pennsylvania

Arab → satellite television emerged in the context of the 1991 Gulf War. Since then, the evolution of the industry has evinced two changes of direction. First, there was a shift, in the 1990s, from officially sanctioned national broadcasting systems to a process of regional media integration (→ West Asia: Media Systems; Egypt: Media System; North Africa: Media Systems; Communication Law and Policy: Middle East). The second shift occurred around 2000, toward specialization and niche markets. The years 1991, 1996, and 2003 witnessed industry milestones. First, politically connected Saudi entrepreneurs launched the Middle East Broadcasting System (MBC) in London, and the Egyptian government launched the Egyptian Satellite Channel (ESC) in 1991. Then came the launch of *Al Jazeera* and the initiation of satellite operations by Lebanese broadcasters LBC and Future TV in 1996. In 2003, *Al Arabiya* went on the air as a Saudi-financed rival to *Al Jazeera*. As of 2007, there were more than 250 Arabic-language, transnational satellite television channels.

Though Arab satellite channels began broadcasting in the 1990s, the policy and technical infrastructure of Arab satellite television had *developed over three decades*. The Arab satellite organization ARABSAT was established in April 1976 as an organization affiliated with the Arab League. Oil-rich Saudi Arabia bankrolled ARABSAT, and the Saudi capital Riyadh housed ARABSAT's headquarters. First-generation satellites were launched in the 1980s, and several generations have been put into orbit since. In 1998, the Egyptian government, long a political rival of the Saudi royal family for pan-Arab leadership, launched the satellite NILESAT. Pan-Arab broadcasters could also use the European satellite HOTBIRD and still others. In the 1990s, Arab states either removed or stopped enforcing restrictions on satellite dish ownership, and some states developed "media cities" with financial and labor incentives to national, Arab, and western companies. Dubai leads the way, with other less influential cities operating in Egypt and Jordan.

The combination of satellite technology (→ Television Technology), war, and economic considerations led to a *regionalization of Arab television*, aided by the presence of more than 200 million viewers living on a vast stretch of land from Morocco to Iraq and sharing the Arabic language. The new satellite channels attempted at first to replace terrestrial channels with a general format, mixing news and entertainment.

In → *news*, transnationalization led to the "anywhere but here" news phenomenon, where each channel took the opportunity to criticize all countries and policies except the country in which that channel was based or that financed its operations. Al Jazeera, the much-hyped Qatari news channel (→ Newscast; Newscast, 24-Hour) critical of US policies on the Middle East, is credited with creating a *pan-Arab* → *public sphere*, and criticized for neglecting local issues specific to countries or communities. The channel occasionally featured dissidents discussing sensitive political topics, but because of the need to retain a transnational audience, a small number of "big" issues such as the Arab-Israeli conflict and the US occupation of Iraq took the lion's share of news attention (→ Conflict as Media Content), at the expense of local issues.

The most significant genre on Arab news channels was the *political talk show* (→ Broadcast Talk). Though national broadcasters in Lebanon and Egypt aired this type of programming in the 1970s, the satellite era witnessed a proliferation of talk shows featuring charismatic, opinionated, and antagonistic guests. The most famous is Al Jazeera's *Al-Ittijah Al-Mu'akiss* ("The Opposite Direction"), a spin-off from → CNN's now defunct *Crossfire*. The verbally aggressive journalist Faisal Al-Qasim hosted two guests in a pugilistic debate on issues varying from the attacks of September 11, 2001, to cultural globalization, to the impotence of Arab regimes, to US policies in the Middle East. Other shows have featured feminists debating clerics, dissidents arguing with regime representatives, and controversial artists defending their work. These talk shows were a dramatic illustration of the variety of opinions aired in Arab public discourse. Specialized satellite channels also attempted to lure niche audiences. This was especially the case with economically oriented channels, for example focusing on real estate (Al 'Iqariyya), or business news (CNBC Arabiya). This has led industry leaders Al Jazeera and Al Arabiya to increase their coverage of stock markets and commodity prices.

Arab satellite television presents a unique case of a regional media industry developing rapidly both qualitatively and quantitatively, and creating a vibrant and complex regional sphere of information and culture. Relying on a transient and transnational workforce

working increasingly on format-based productions destined for the pan-Arab market, and concentrated in Beirut, Cairo, and Dubai, Arab satellite television has established a strong regional, and even global, presence, especially in the case of Al Jazeera, which has penetrated the elite club of global news channels and challenged western hegemony over international news (→ Satellite Communication, Global; International Television).

# **Archiving of Internet Content**

*Steve Schneider*

*State University of New York Institute of Technology*

*Kirsten Foot*

*University of Washington*

Communication scholars interested in new media are increasingly archiving content of the → Internet or “web content,” and studying web archives to examine retrospectively content produced and distributed on the web, and the behavior of those producing, sharing, and using the world wide web. Although web archiving has been actively pursued since the mid-1990s, new media scholars have more recently begun to find web archives

helpful as they seek to understand developments related to the web in a variety of ways. These may involve adapting traditional methods of social research such as content analysis (→ Content Analysis, Qualitative; Content Analysis, Quantitative), ethnography (→ Ethnography of Communication), focus groups, → surveys, and experiments (→ Experimental Design) or developing methods such as network ethnography (→ Network Analysis), hyperlink analysis, and other approaches to structural or phenomenological analyses of the web (→ Online Research).

## RESEARCH HISTORY

The impetus for web archiving, for both scholarly and historical purposes, dates from the 1980s, as institutions increasingly shifted their records from paper to electronic form. With the advent of the world wide web in the early 1990s, this concern grew significantly, as greater numbers of institutions and individuals began producing documents in digital form only, rendering traditional modes of archiving less reliable as instruments to preserve records of social phenomena. By 1995, an opportunity to address this concern emerged with the development of *web harvesting programs*. Web harvesters or crawlers are applications that traverse the web following links to pages, initially from a set of pre-defined seed URLs. Harvesters were initially developed by search engines such as Alta Vista to overcome the increasingly impossible task of indexing the web through human cataloging techniques. Web harvesting technologies gave life to the notion of archiving web materials via the web itself (→ Digital Media, History of; Internet, Technology of).

Three *pioneering efforts* to archive the web appear to have developed nearly simultaneously in 1995–1996: the Pandora Project by the National Library of Australia, the Internet Archive in the United States, and the Royal Library of Sweden. The impetus behind web archiving activity was clear: the web was doubling in size every three to six months from 1993 to 1996 and it appeared to many observers that it had the potential to become a significant platform on which a wide variety of social, political, scientific, and cultural phenomena would play out. Some individuals at institutions such as libraries and archives whose mission included the preservation of cultural and historical artifacts and materials recognized the challenge that digital materials presented and began developing techniques and institutions to address these challenges.

## THE PROCESS OF WEB ARCHIVING

The construction of a web archive and accompanying infrastructure to facilitate scholarly analysis includes *four distinct processes*. First, the archive creators identify web pages and/or websites to be collected and specify rules for archiving page requisites, such as images, and for following links on archived pages. Next, crawling software is employed to collect the desired web objects (including html pages, images, etc.), and the archive creators verify that the crawl yielded an appropriate quantity and quality of archived objects. Analysis of archived objects – for example, to determine changes from one archived impression to the next – may then be performed, and metadata associated with archived objects can be created. Finally, a system for displaying archived impressions is developed and an interface created to provide access to the archive. The interface may support

searching or facilitating selection of archived objects on the basis of metadata. Primary analyses may be completed using web archives created by scholars to examine specific questions. Secondary analyses use web archives created by other scholars, libraries, or archive organizations.

Each of the four processes of web archive construction poses significant technical challenges for researchers. Identification of pages or sites to be collected in an archive should be done in a systematic, clearly specified, and replicable process. If the objects in an archive represent a sample of web content relevant to a particular topic, the specification of the identification process is especially important to demonstrate the validity of the archive in relation to the pool of relevant web materials that were accessible at the time the archive was created. Further, specifications or rules regarding page requisites such as images and how links should be treated by the crawling software, entail additional challenges and have a significant impact on the number, types, and quality of pages archived and made available for scholarly analysis.

The actual collection of desired objects from the web, and subsequent storage of these objects on disks for future review and analysis, are relatively straightforward tasks. The challenge increases when archivists and scholars wish to be able to move from an archived page to other archived pages in hyperlink paths that were available when the archiving took place. This requires replicating the hyperlinked structure of the archived pages as it existed at the time of collection. Verification, especially in a large collection, is usually done at a macro level, based on some expectation of the total size of any given crawl. It is not often possible to physically review each archived page to insure that an accurate representation is available in the archive.

Once objects have been archived, archivists need to address the task of *generating and storing metadata* at a level of analysis appropriate to the anticipated research. Crawl programs generally produce log files documenting their processes which provide invaluable metadata about the archived objects. These log files need to be associated with the archived objects and considered as part of the archive itself. Archived objects can also be interrogated by software programs to develop additional machine-generated metadata. Further, scholars or analysts can be given an opportunity to create user-generated metadata about individual pages or sets of pages.

Finally, in order to make a web archive useful to scholars and other analysts, there must be a *system to search* for and display archived objects. Ideally, the search system will allow scholars to query the archive on the basis of all available metadata and to return a list of pages or objects matching the specified metadata. The system to display archived pages should clearly identify the source of the archived object and its archival date. Navigation to other archived impressions of the same object can also be provided.

## ETHICAL AND OTHER CHALLENGES

In addition to this range of technical challenges, the processes associated with archiving web content yield significant and important ethical challenges as well. First and foremost, web crawling programs potentially impose costs on the servers of the sites being crawled and on the owners of the sites being crawled. These costs – which can include bandwidth charges, denigration of service quality, loss of control over copyrighted information, and

loss of privacy – ought to be taken into consideration by archivists. While a cost–benefit analysis may indicate that the benefits outweigh the costs, it should be acknowledged that the costs are not likely to be borne by the archiving entity. Scholars creating web archives may be under some obligation to insure that the archive is collected using crawling protocols that are acceptable to the producers of the sites being archived. For example, some institutions may require that producers of archived sites give permission to be crawled; others may restrict the distribution of archived pages to protect copyright and/or privacy (→ Research Ethics; Research Ethics: Internet Research).

In addition to creating their own web archives, some communication scholars also find value in web archives that have been created by others. There are additional challenges in working with the latter type of archive. Specifically, scholars working with web archives that have been collected as part of a general library or archive will need to address issues of sampling and boundaries, representation and selectivity, and archival standards.

The collection policy of an extant web archive, to the extent that it is available to the scholar, will provide an excellent window into the issue of sampling and boundaries. The range of sites collected and the criteria used to identify and specify the objects in the archive, will reveal a particular *sampling strategy*. In addition, the specification of which links to follow – and which to exclude from the archive – may be part of the collection policy. As all archives have boundaries or edges – representing the web space where pages or content linked from archived pages were not archived, the relevance of these boundaries to the representativeness of the archive should be examined. Scholars wishing to make generalizations based on sampled content should address these issues explicitly in their research.

Issues of representation and selectivity of archives are part of a somewhat broader set of issues associated with web archiving. First, there is growing concern that substantial archives of web content may *exclude significant portions of the web* – specifically, websites produced outside of North America, Europe, and Asia. This may become an increasingly salient issue for scholars interested in global issues and trends. In a related vein, it may be that archives will tend to include pages and sites that are highly ranked on prominent search engines – in a sense, replicating and perhaps reifying web traffic patterns while marginalizing less prominent websites. Finally, web archives will likely adhere to different standards, certainly in the near term while standards are being developed. Standards of verification, metadata, watermarking, and preservation may make research using web archives somewhat challenging.

Large institutions such as national libraries have engaged in both broad-based and thematic web archiving. In broad-based crawling activities, a web crawling program will start its archiving activity from sets of URLs that have no particular content relationship to each other. The web crawling program collects objects to be included in the archive by following links from the seed objects. This *automated collection process* continues indefinitely until all paths from the seed objects are exhausted or time and resources available reach their limit. A thematic web collection is an archive of web objects identified and captured using a set of URLs believed to be relevant to a specific theme or topic. A set of carefully selected URLs is used as the “seeds” for collecting activity. These URLs, representing either sites or pages of interest, are crawled at an established periodicity and with clearly specified rules concerning the crawling of linked pages and objects. For example, a crawler might be instructed to start at a given set of base URLs, to crawl all pages and page

requisites with URLs from within the domain of the base URLs and to repeat this crawling procedure once per week for six months. These activities often result in archives with terabytes of archived objects. Scholars, especially those interested in studying the development of websites over time, may be particularly interested in thematic collections.

## **Argentina: Media System**

*Guillermo Mastrini*

*University of Buenos Aires*

Argentina is located in the southernmost part of Latin America. It has more than 38 million inhabitants, the main language is Spanish, and the Catholic religion is predominant. Since 1983 it has had a democratic system of government which formally guarantees press freedom in its Constitution. Article 14 of Argentina's National Constitution sets the guarantees for *freedom of expression*. The legal framework limits itself to the regulation of citizens' rights and journalists' responsibilities. Since the return of democracy freedom of expression has been exercised, although it has sometimes faced legal challenges on interpretation (→ Freedom of Communication).

Argentina has a robust media structure. There are many newspapers around the country, six of which have national coverage. Radio and television have a national outreach through a system that privileges licenses to the private sector. State-run radio stations and TV channels also have a nationwide presence, yet with very small audiences. Even though the end of the 1990s saw the appearance of national broadcasting systems, commercial exploitation of radio broadcasting has a local character. In 2005 nonprofit community radio broadcasting was authorized.

In this region of Latin America informal ties exist between the state and the media owners (Sinclair 1999). The predominance of a *commercial model*, based on private ownership, is complemented by unwritten pacts of mutual convenience. In this way, the

media owners benefit from the freedom to operate in the market, while the state maintains informal control over the content (→ Commercialization of the Media). However, this has not precluded the existence of tensions between the political and business sectors.

For the 15 years from 1974 to 1989 Argentina's media system was unique: a near state monopoly working on a competitive and commercial basis. In effect, many TV channels and radio stations were left in the hands of the state, which limited itself only to the control of content. Television and radio stations were managed commercially and competed for mass audiences. It was during the military dictatorship that the current Broadcasting Act of 1980 was approved.

The difficulties of establishing a democratic regulatory framework reflect the *structural characteristics* of Argentine broadcasting: early dependence on foreign capital and production; historical centralization of the system around Buenos Aires; discrimination against nonprofit organizations; regulation and control coming under the umbrella of central government; privatization of profits and nationalization of debts. The continuation of these policies point at a complex hegemonic social-institutional network (→ Political Economy of the Media). The use of the public media for the dissemination of official activities remains common.

Argentina saw an early development of the *press*, which went hand in hand with a high literacy rate in regional terms. This is evidenced by the foundation of two important dailies: *La Prensa* (1869) and *La Nación* (1870). Both still represent politically and economically powerful groups. The newspaper *Clarín* came out in 1945, during Juan Domingo Perón's first government, albeit with no political ties. *Clarín* has become the country's major publishing success and main newspaper in terms of print run in the Spanish-speaking world. Its economic power enabled it to expand, particularly during the 1990s, to other media sectors. The group now owns newspapers, terrestrial TV and cable channels, radio stations, information technology firms, cinema productions, and entertainment companies.

There are more than 100 daily newspapers, six of which have national outreach. The country boasts 56 newspapers for every 1,000 inhabitants. The printed press is still largely financed by Argentine capital. Recent trends in the regional press are its growing impoverishment (it depends largely on government advertising), as well as the growing number of acquisitions by larger national media groups – although the number of publications remain roughly unchanged.

The model adopted for *broadcasting* was generally inspired by the North American system, with a family ownership structure. Though it is still run along commercial lines, the internationalization of markets in the 1990s has led to the surge of new management forms, in line with international strategies (→ Globalization of the Media).

The 1960s saw the consolidation of the broadcasting model that predominates today roughly along the same lines: private companies that compete for audiences, centralization of production in Buenos Aires, and a dependence on North American capital. During the 1970s and 1980s the main TV channels came to depend on the state. The military dictatorship (1976–1983) benefited by staging a strong propaganda campaign. The same happened, to a lesser extent, during the government of Raúl Alfonsín (1983–1989), who did not know how to modify the media legacy of the dictatorship – and ultimately lacked political will to do so.

During Carlos Menem's first government (1989–1995) Argentina began the process of the privatization of broadcasting and telecommunications services, whose predominant features since then have been: the emergence of international capital flows; an accelerated process of mergers and acquisitions; adaptation of the legal framework to private sector interests; and instability of the control bodies.

Both radio and television have a strong *penetration index* of 98 percent of households. There are 850 legal radio stations and 2,000 that operate without state permits. There are 43 television channels and 50 percent of households have cable TV. In recent years there has been a strong growth of Internet access (25 percent of the population) and mobile telephony (66 percent). The economic crisis of 2001 significantly affected the whole media industry, which managed to overcome this setback only during 2004. From a high of US\$4 million in the 1990s the advertising market plummeted to US\$1,000 million.

*Media policies* in Argentina present an evident paradox: strong state intervention with a lack of a state policy taken in the interest of society as a whole. The state has had a decisive influence in the broadcasting sector (defining licensing terms, granting subsidies, sanctioning a legal framework), but at the same time it has lacked a sustained policy. Instead, it has acted by responding to the demands of the moment.

## **Argumentative Discourse**

*Donald G. Ellis*  
*University of Hartford*

The concept of argument has a long history in communication. An argument is a concluding statement that claims legitimacy on the basis of reason. But argumentative

discourse is a form of interaction in which the individuals maintain incompatible positions. More specifically, argumentative discourse directs attention to the arguments of naïve social actors engaged in intersubjective social interaction rather than the nature and structure of abstract arguments (Willard 1989).

The traditional notion of argument has the *logical syllogism* as its elemental structure. Thus, the concluding statement ( $A = C$ ) is logically necessitated in:  $A = B$ ,  $B = C$ , therefore  $A = C$ . A politician who states that “Democrats are liberals; my opponent is a democrat; therefore, my opponent is a liberal” is arguing from such syllogistic logic. Argument in this case is abstract and separate from the perspective of social actors. Aristotle first recognized that people did not actually argue formally and posed the enthymeme as a practical syllogism. That is, a speaker would leave a listener to fill in some part of the syllogism (Bitzer 1959). Expressed as an enthymeme the above statement might be, “My opponent is a democrat and therefore a liberal.” This leaves the audience to fill in the missing premise about the relationship between democrats and liberals. Although enthymemes recognize the role of people, they remain modeled on the syllogism.

Recent formulations by Brockriede (1975) and O’Keefe (1977) accept a distinction between *two senses of argument*. There is *making* an argument and *having* an argument. Making an argument is constructing a product and can be done alone. Having an argument is an interpersonal or conversational experience. Argumentative discourse is in the tradition of having an argument rather than making one. It is argument as a type of communication between two or more people who perceive themselves to have incompatible positions; that is, argument as dialogue rather than monologue such that the interaction involves extended polarization that is negotiated in conversation (Schiffrin 1985). Argumentative discourse is less concerned with traditional “rationality” than with the naïve actors’ understanding of the ongoing interplay of social processes (e.g., psychological, sociological, political, and emotional) that actually characterize the interactional context of arguing.

A study by Maoz and Ellis (2001) demonstrated argumentative discourse by analyzing *arguments between Israelis and Palestinians*. Israeli Jews typically espouse ideals of equality, fairness, and justice but nonetheless hold negative feelings and hostility toward the other group. This creates an ideological and interactional dilemma in that arguments must be worked out in the face of contradictory personal perceptions. One way the interactants work this out is by arguing from ground, or the point at which one can argue no further. Thus, both Israeli Jews and Palestinians import sacred issues into the argumentative discourse (“the land,” “the Bible,” “freedom”) that function to mitigate the possibility of personal association with a position that is antagonistic to the other side. By arguing that the land is “sacred” and decreed in the Bible the Israeli Jews avoid the impression that they are expressing personally held negative or distasteful attitudes. Because both sides reason from fixed personal and political positions they reproduce their longstanding disagreements and maintain their argumentative and political impasse.

## Arrangement and Rhetoric

Christopher Craig

University of Tennessee

The category of arrangement (Greek *oikonomia*, *taxis*; Latin *dispositio*) in classical rhetoric includes both the “natural” ordering of the parts of a speech and the changing or truncating of that order to adapt to specific circumstances. While it may also embrace the ordering of premises in arguments, those concerns are fully treated under invention rather than arrangement. Similarly, the most basic level of arrangement, that of individual words and clauses, is properly subsumed under style (→ Rhetoric, Greek; Rhetoric, Roman; Style and Rhetoric).

The canonical division of the parts of a speech derives from judicial rather than from deliberative or epideictic oratory. There are *four essential parts*. The introduction (*prooimion*, *exordium*) renders the audience well disposed, attentive, and receptive; the narration (*diegesis*, *narratio*) is brief, clear, and probable; the proof (*pistis*, *argumentatio*) is convincing; the conclusion (*epilogos*, *peroratio*) both summarizes and appeals to the → emotions. Some writers add one or more other parts: after the narration, a proposition stating what is to be proven; a partition enumerating the different arguments to be advanced (common); a refutation, separated as a free-standing section following the proof (very common); and a digression immediately before the conclusion.

Adaptive or “artistic” arrangement omits or transposes parts as needed for the specific case. So, for example, a narration may be omitted entirely, or may be divided into smaller narratives before different sections of the argument.

The treatment of each part of the speech seems to be the organizing principle of the earliest rhetorical teachings of Corax and Tisias in the mid-fifth century (→ Rhetoric, Pre-Socratic). This principle, which we see in the remarks of Plato's Socrates at *Phaedrus* 266d–267d., organized subsequent handbooks. Aristotle (384–322 BCE) and his followers took a different tack, placing invention before arrangement among their five activities of the orator: invention, arrangement, style, memory, and delivery (→ Invention and Rhetoric;

Memory and Rhetoric; Delivery and Rhetoric). Aristotle's *Rhetoric* in fact treated only the first three, and treated arrangement after style (3.13–19). Clearly arguing against earlier authorities, he stipulates two essential parts of the speech, namely proposition and proof, but will also allow introduction and epilogue. For each of the three types of speeches, Aristotle treats each part of the speech in a way that anticipates the canonical functions, with much attention to managing the prejudices of the audience. The slightly later *Rhetorica ad Alexandrum* similarly treats the function and content of each of the parts, organizing the discussion under each of the three types of speeches (29–38).

The next complete rhetoric we have, the anonymous Latin *Rhetorica ad Herennium* of the early first century BCE, preserves and refines the discussion of the parts, but dramatically relocates their treatment. Explaining all five activities, it focuses primarily upon judicial oratory and incorporates in its treatment of invention the stasis theory of Hermagoras. The treatment in order of the parts of speech with their special attributes becomes the organizational skeleton for this discussion of invention. The free-standing treatment of arrangement (3.16–18) now functions mainly to note the possibility of adapting arrangement to special circumstances and to prescribe ordering of arguments with the weakest in the middle (cf. Quintilian 5.12.14). The anonymous author refers the reader to his discussion of invention for the natural order of the parts of the speech and of the ordering of premises in formal rhetorical argument. This subsuming of the teaching of the attributes and functions of the parts of speech under the discussion of invention, seen also in the treatment of judicial speeches in Cicero's contemporaneous *De inventione*, will become standard, although the older tradition is still seen in the free-standing discussion of the parts of the speech and their functions in Cicero's *De oratore* (2.307–332). Quintilian's *Institutio oratoria*, the great compendium of the classical rhetorical tradition written in the 90s BCE, completely subsumes arrangement under invention both in the discussion of the parts of the speech and even in the treatment of adaptive arrangement. Quintilian's free-standing discussion of arrangement (book 7) is instead a series of further comments on the ordering and content of arguments generated through stasis theory.

The theory of the order, functions, and characteristics of the parts of speech, even though subsumed under invention, remains a robust feature of classical rhetoric. To the extent that treatises ignore or assume stasis theory and its refinements, arrangement becomes even more prominent. This is clear in two third-century BCE Greek handbooks geared to declamation: the influential rhetoric of Apsines and the idiosyncratic Anonymous Seguerianus. The latter organizes his discussion of invention, arrangement, and style under each of the parts of the speech.

Arrangement was of course not immune from controversy. So, for example, Apollodorus, rhetorician to Caesar Augustus, insisted that a speech must have all four parts in fixed order. Theodorus, rhetorician to Augustus' successor Tiberius, famously disagreed. Lausberg et al. (1998, §§ 260–442, 443–452) offers an exhaustive synchronic sketch of the classical categories of arrangement, largely marshaled under invention.

## Art as Communication

Michael Griffin

Carleton College

Since the modern era in the west, art has increasingly been defined as distinct from communication. Since Kant and Hume, discriminations of sensory beauty and “delicacy of taste” have been invoked in judgments of → aesthetic value that separate those forms of communication that qualify as art from those that do not. Gross has argued that an important part of the process of art appreciation is the “perception and evaluation of the competence displayed by the artist” (Gross 1973, 124). That is, does the reader or viewer attribute skill on the part of the artist to “the selecting, transforming, and ordering of the elements” (Gross 1973, 127) that constitute the work of art, and see these creative actions as intentional? For Gross these demonstrations of competence may be appreciated anonymously, as examples of conventionally recognized ability or talent, but most often they depend upon the valorization of an individual artist, the repository of the skill that is distinguished.

Yet in most cultures for most of human history, the creation of art has been a socially organized activity, central to the communication of shared religious beliefs, mythic understandings of the world, and social relations. Indeed, the rise of technologies of mass communication were theorized in the twentieth century in terms of their relationship to the traditional arts, and the resulting media content often characterized as “popular arts,” the product of newly emerging → “culture industries” (Seldes 1956; Lowenthal 1984; Adorno 2001; → Popular Culture; Printing, History of).

Modernist definitions of art as nonutilitarian and honorific have tended to separate art activity from religion, education, craft, and other forms of functional communication in favor of an emphasis on individual self-expression, formalism, emotional evocation, or representations of the mysterious, the subconscious, or the ineffable. This has involved a movement away from the reaffirmation of common cultural knowledge and shared community values toward the marking of elite knowledge and memberships. Thus, the main recent sense of the word “art” has referred to “creative” or “fine” art, and its communicative effect has shifted from the conscious articulation of social knowledge and cultural heritage to the idea of unique and innovative individual expression. Modern fine art has even been described as a “project of negation,” that is, the progressive breaking free from established cultural practices, generating “a growing canon of prohibitions: representation, figuration, narration, harmony, unity” (Bernstein 2001, 21).

### **ART, CULTURE, AND SOCIAL RELATIONS**

Defined as a human activity transcending modern history and modernist aesthetic philosophy, art is more likely to be seen as a wide-ranging process of creative production that reflects and projects social relations, political power, and cultural beliefs and practices. As such, it encompasses ancient architectural structures, statues, obelisks, bas-reliefs, pottery, masks, and funerary arts, as well as the conventional fine arts of poetry, literature, drama, music, painting, and prints. These and other forms of artistic creativity have functioned as powerful social communication in virtually all cultures, reproducing established cultural heritage (Bourdieu & Passeron 1977) and the ideological assumptions and social order of those social, economic, and political structures that support, or require, their creation (→ Culture: Definitions and Concepts; Cultural Studies).

Studies in the sociology and social history of art identify artistic production as both the communication of prevalent ideas in a particular culture at a specific point in history, and, on a more micro-level, the result of the specific institutional and organizational contexts in which production processes, individual and collective, take place. Thus Baxandall (1972) documents the system of contractual agreements between patron and painters in fifteenth-century Italy, explaining how required applications of gold leaf and aquamarine to a → painting’s surface served to publicize or reaffirm the patron’s social status. Wolff (1993) asserts that the modernist notion of the alienated artist working against the grain of social convention is itself a historically specific concept resulting from the breakdown of patronage, and from the separation of production from consumption in capitalist markets. The artist’s dependence on impersonal markets, she notes, is not so different from the limited autonomy of all workers, and art in late modernism can be seen to communicate essential features of late capitalism.

Berger (1972), building from Benjamin (1968), makes a similar argument about the transformation of art from unique creations made to fulfill a particular role in a specific place and time, to art in the modern era that is easily reproduced and proliferates in multiple forms and contexts. The communicational function of paintings, such as those done by Michelangelo to adorn Pope Julius II’s Sistine Chapel in the Vatican, shifts when panels of the ceiling are lifted from their original context and reproduced in advertisements or on T-shirts (→ Visual Culture; Advertisement, Visual Characteristics of). The

**Figure 1** A panel depicting the creation of Adam by Michelangelo Buonarroti, from the Sistine Chapel ceiling in the Vatican, Rome  
*Source:* Art Resource, New York

original design and placement of such paintings had significant religious and doctrinal implications. A central panel of the Sistine Chapel ceiling contains a painting that visually links the creation of Adam to the future coming of *woman* and the Christ child, Jesus (Fig. 1). As part of a sequence of illustrations depicting scenes from the Book of Genesis that projects above the pope's own chapel, this image creates a powerful visible connection between ideas and beliefs concerning the creation of man, the salvation of mankind, the church, and the pope himself. To remove any part of this tangibly coordinated arrangement and reproduce it elsewhere is to lose the original constellation of potential meaning, and to create a new network of references within a different social and physical context.

Art's function as communication is highly dependent upon its specific social use within particular institutional and organizational networks. In the modern era, as forms of art were loosed from traditionally situated contexts and reproduced within the more ephemeral flows of industrial communication media, a tension developed between humanist conceptions of art as transcendent creativity and sociological and materialist conceptions of art as a form of social communication. Marxist literary critics and art historians emphasized art as a product of the "social and ideological contingencies" of specific historical circumstances. "Humanist criticisms of the sociology of literature and art," according to Wolff, "are often . . . attempts to rescue a notion of 'creativity' which allows to art a special transcendence of all contingencies, particularly social and ideological contingencies" (1993, 69).

For European and American sociologists in the twentieth century, the fragmentation of art forms and the rise of mass-mediated popular culture effaced distinctions between art and craft at the same time as it reinforced the notion of “fine art” as a symbolic indicator of social status. Mass culture critics of the post-World War II era observed the degradation of both authentic “folk art” and “high art” by the proliferation of a standardized and parasitic “mass culture” (Rosenberg & White 1957; Bernstein 2001). Gans (1974) argued for a more nuanced view, describing a more elaborately class-stratified, yet democratic, hierarchy of → taste cultures. Bourdieu described knowledge of and participation in art as an important constituent of “cultural capital” enhancing the communication of social power and status (Bourdieu & Passeron 1977). Becker (1982) has foregrounded the collective nature of artistic production, consumption, and valuation, pointing to the meaning of artistic activity for the social communication of groups. The cooperative creation of artworks (in art studios, camera clubs, or film crews), the viewing, reception, and purchase of artistic products by audiences and networks of fans or connoisseurs, and the definition and evaluation of art itself by educational institutions, galleries, and museums, all involve the sharing and exercise of assumptions, communication practices, and definitions within social groups (Phillips 1982; Bourdieu 1991; Gross 1995).

Sociologies of art have effectively expanded the definition of art beyond “fine art” to include media or popular arts. Photography and the cinema, having been institutionalized in the museum and education systems, are now widely accepted as art forms (→ Photography; Cinema). Popular music, dance, and theatre (along with film and television) have come to be known as the “performing arts.” Advertising art has become perhaps the most ubiquitous form of imagery in the world, reflecting a movement away from aristocratic, religious, and state culture and power to business or corporate culture and power. Yet visual and verbal references to fine art are still commonplace in advertising, employed as signs meant to communicate social prestige.

### **VISUAL ART AS DESIGN AND ILLUSTRATION**

The capacity of figural and pictorial art to provide literal mappings and reflections of the world has facilitated the descriptive power of visual media, and by extension its persuasive and manipulative potential (→ Cartography; Portraiture; Photojournalism; Documentary Film; Propaganda, Visual Communication of). Edgerton (1991) makes the case that developments of pictorial perspective in the visual art of late medieval and Renaissance Europe directly contributed to the communication and diffusion of scientific knowledge and the acceleration of the technological advances that followed (→ Perspective, Pictorial). The potential for *mimetic art* to convincingly represent realistic scenes, situations, and relationships enhances its power to communicate persuasively about the social world, blurring the boundaries between art, entertainment, advertising, and information (→ Theatre; Television; Realism; Realism in Film and Photography; Visual Representation). But as Edgerton demonstrates, the design practices of picture-makers, in this case the precision of the geometric schema developed for perspectival grids, not just the appearance of naturalism, can powerfully influence the role of art in communication.

Today, what have come to be known as the *digital arts* involve techniques of design, and the use of iconographic symbol systems, as much as or more than naturalistic depictions

(→ Digital Imagery; Sign Systems). Iconography, the study of the range of pictorial symbols that a culture uses systematically to convey meaning, is as relevant to contemporary television, or the world wide web, as it is to Japanese landscape painting or the religious painting of medieval Europe (→ Iconography). What has become more uncertain in contemporary media arts is the degree to which artistic evaluation relates to effective communication, or to the recognition of skillful execution. Often in the past, the value of art was inseparable from its value as communication. Today, art and → visual communication have become ever more separately defined.

It might be argued that things have not changed so much, that art is still most important for its role as a marker of social position, its function as social communication. But the functions of artistic communication have multiplied, and its emphases have shifted: from providing material as painting, print, or building for the propagation of dominant or shared cultural ideas, values, and beliefs (Worth 1981; Bourdieu 1993), to the recognition and appreciation of skill in the performance of shared cultural practices (Gross 1973), to the romanticization and celebration of the artist as alienated, heroic, or tragic figure, and finally to the modernist distinctions between art and communication that continue to serve as powerful signs of social membership, status, and taste (Bourdieu 1984). These shifts may primarily represent changes in the perceived roles of audience members, from ready acceptance of cultural heritage and social destiny, to active appreciation of culturally valued skills, to resistance against convention and a desire for greater freedom, to alienated and divided consumers of taste cultures.

## Artifacts

*Arthur Asa Berger*

*San Francisco State University*

Artifacts are generally understood to be simple objects that show human workmanship. They are important to scholars for the role they play in reflecting a society's level of technological development and aesthetic taste, among other things. Archaeologists analyze artifacts and other aspects of everyday life from ancient civilizations and try to reconstruct these civilizations from the artifacts they have left behind. Sociologists and other social scientists, as well as culture critics, are also interested in artifacts – in the broadest sense of the term – using them and other aspects of material culture to gain important insights into values, beliefs, and ideological aspects of the society or culture being studied (→ Culture: Definitions and Concepts). The study of artifacts can be approached from a number of disciplines. In recent years, scholars have expanded the definition of artifacts to include foods, fashion objects, and relatively simple machines.

The great Dutch historian Johan Huizinga (1924) focused on the symbolic significance of everyday objects, reminding us that medieval thinkers believed that “all things would be absurd if their meaning would be exhausted by their function and their place in the phenomenal world, if by their essence they did not reach into a world beyond this. This idea of a deeper significance in ordinary things is familiar to us as well, independently of religious convictions” (→ Symbolism).

One of the most celebrated studies of the cultural and symbolic significance of artifacts and everyday life was made by the French semiotician → Roland Barthes, in books like *Mythologies* and *Empire of signs*. In *Mythologies* Barthes explored the cultural and ideological significance of artifacts such as soap powders, detergents, sheets, and toys. As an example of his approach, consider his insights into French toys: “French toys *always mean something*, and this something is always entirely socialized, constituted by the myths

or the techniques of modern adult life: the Army, Broadcasting, the Post Office, Medicine (miniature instrument-cases, operating theatres for dolls), School, Hair-Styling (driers for permanent-waving), the Air Force (Parachutists), Transport (trains, Citroens, Vedettes, Vespas, petrol-stations), Science (Martian toys)” (Barthes 1972, 53).

These toys, Barthes suggests, prepare French boys and girls for their future roles as adults in French society and indoctrinate them with the myths that those who dominate French society want them to believe. There is, therefore, a great deal of hidden ideological significance to toys and, as his other essays show, other aspects of everyday French life too. In *Empire of signs* Barthes dealt with objects such as Japanese chopsticks, dinner trays, Pachinko (slot machines), and packages, along with popular foods like sukiyaki and tempura (→ Cultural Studies).

What Barthes and other analysts of artifacts and the material culture in which they are embedded show is that artifacts can provide a great deal of information if we know how to “read” them. Among the different methodologies for analyzing or “reading” artifacts are: → semiotics, which regards them as → signs, or more precisely as signifiers whose significance has to be assessed; sociology, which focuses on their functionality and their role in society; archaeology, which uses historical knowledge and scientific techniques to date ancient artifacts and other methods to determine what stage of technological development the society had achieved; and cultural criticism, which uses a variety of disciplines and techniques to interpret the meaning and significance of artifacts. In his book, *Bloom’s morning*, Arthur Asa Berger used this approach to deal with the cultural meaning of such artifacts as clock radios, electric hairdryers, shoes, toasters, garbage disposals, and trash compactors.

Ernest Dichter, considered to be the father of motivation research, analyzed artifacts from a psychoanalytic perspective, explaining in *The strategy of desire* that “the objects that surround us do not simply have utilitarian aspects; rather, they serve as a kind of mirror which reflects our own image. Objects which surround us permit us to discover more and more about ourselves” (Dichter 2002, 91). His interest in these objects was based on a desire to understand human motivation and how it could be used to sell certain products and services. Our interest in artifacts and objects reflects a broader interest in understanding human beings, what motivates them, how they arrange their societies, and other topics of a similar nature.

# Attending to the Mass Media

*Mark Shevy*

*Northern Michigan University*

*Robert Hawkins*

*University of Wisconsin-Madison*

Mass communication's impact has been shown at an individual level and in society at large, yet all mass communication must pass through the same narrow gateway before having these varied effects. Unless people receive mass communication through their eyes, ears, or touch, and cognitively process it, it is powerless. This is why researchers are interested in studying attention – it is a necessary condition for all mass communication effects (→ Media Effects). Attention is a central factor in understanding what it means to watch → television, read the → newspaper, listen to the → radio, or use the → Internet. It has an impact on what type and magnitude of effects result from media. Although attention is a part of receiving and processing messages from all types of media, television has drawn most of the attention research. Consequently, much of what we know about attention comes from research on attention to television.

## WHAT DO WE MEAN BY ATTENTION?

### Attention as Focus

In everyday terms, “paying attention” describes the way we look and listen intently to see and hear a stimulus such as another person or a mass medium. However, in cognitive mass communication research (→ Cognition; Cognitive Science), “attention” has a more precise meaning – a state of cognitive focus on a particular stimulus. Looking and listening are external manifestations of attention, not the attention itself. Attention thus involves directing sensory organs toward the acquisition of messages and other stimuli and allocating cognitive resources toward processing them. As such, it is the first step in prominent models and theories used in media psychology research. For example, the information-processing model of active media learning (→ Information Processing; Learning and Communication) depicts cognitive processing as a linear path where attention to media must occur before information recognition or elaboration. Likewise, → Albert Bandura's social cognition theory (→ Social Cognitive Theory), a foundational theory for much research on social-behavioral effects of mass communication (→ Social Behavior, Media Effects on), places attention as the first of four processes through which audiences learn and repeat behavior modeled in mass communication (→ Observational Learning). Television viewers must first focus on a character's behavior before that behavior can go through retention, motivational, and production processes.

Although attention as cognitive focus sounds like a singular construct, there are in fact two separate aspects: (1) where cognitive focus is directed (an either/or matter) and (2) the amount of effort directed to it. The two are of course related, but they often appear as quite different research issues or involve different → operationalizations. Clearly, if one's

focus is not directed to a message then no effort is involved; and if one attempts to focus on more than one stimulus at once, the amount of effort on each may be limited. But beyond such cases, questions about where one focuses and the amount of cognitive resources applied are simply different, despite carrying the same label. We also need to distinguish between “attention” and “selection.” Selection (→ Selective Exposure) refers to processes that lead to attention, particularly the first, direction-of-focus, meaning.

### Operational Definitions of Attention

Attention to mass media is operationally defined and measured in a number of ways. Self-reports can allow people to state what stimulus received their attention or how much effort they directed to it. Visual regard (eyes on screen) clearly suggests attention is given to a stimulus when people look at it, but, as noted below, can also inform us about the amount of effort. Cardiac deceleration often occurs when a new stimulus is introduced, suggesting that heart rate can indicate attention (→ Physiological Measurement). Likewise, depressed alpha power in electroencephalogram (EEG) monitoring seems to be an orienting response indicating the onset of attention and an indication of more effortful subsequent processing as attention continues. Most recently, functional magnetic resonance imaging (fMRI) research shows patterns of cortical activity associated with attention and shifts in attention. One of the first experiments to apply fMRI methods specifically to media attention found a distributed cortical network activated by “coherent, edited video action sequences,” but not by randomly edited video (Anderson et al. 2006, 21). This network, which plausibly helps make sense of comprehensible film and video sequences, contained individual regions previously associated with selective visual attention and other reception processes.

It is important to note that all of these operationalizations are indirect measures of attention. They seem to indicate that attention is occurring or in other cases to indicate degree of activation, but they cannot specify for sure what thoughts or other cognitive processes actually take place.

### WHAT CAUSES ATTENTION?

Most research pursuing this question is directed at the first (i.e., where focused) aspect of attention, although the same question can apply to amount of cognitive effort as well. There are two classes of answers. The first is that attention stems from an automatic biological drive to attend to new or changing stimuli, resulting in *involuntary orienting responses* to the medium or some feature within it. The second is that attention is a *controlled and strategic process* (though perhaps overlearned and automatic). Although the two explanations have often been posed as competitive, it is clear that both operate.

### Medium-Directed Processes

Orienting responses are based on the basic biological tendency to orient oneself toward changes in one’s environment (a survival response before “fight-or-flight,” for example). A typical mass communication orienting response occurs when people who are not looking at the television turn and look in reaction to a sound or brightness change in a TV

program, or perhaps to devices such as cuts between scenes or object movement, whether representing character actions or camera pans (collectively, these stimuli have been referred to as “formal features”). Such reactive causes of attention can also be seen in other indicators of attention and with other media, such as cardiac orienting responses during voice changes in radio messages (Potter 2000). Early television attention research assumed a very broad role for the orienting reflex, such as eliciting children’s attention during educational moments of *Sesame Street* by associating those moments with cues that would demand the response, and it has been the basis of anti-television positions arguing that television turns viewers into mindless hypnotics captured by its formal features. Orienting responses occur quickly and often in response to very brief stimuli, and have been quite important in research on limited cognitive capacity for communication (→ Limited Capacity Model).

### **Audience-Directed Processes**

Despite an initial inclination to interpret children’s attention to *Sesame Street* as largely due to orienting responses, research led by Daniel Anderson in the late 1970s and early 1980s encountered results that did not fit well with that explanation. Similar stimuli (with adult males vs adult females, different kinds of audio cues) produced more or less visual attention, or the onset, continuation, and offset of the same stimulus might be equally likely to initiate looking (Anderson & Lorch 1983). A key study experimentally retained the exact same formal features, but altered their comprehensibility through scene order changes or foreign language audio. Even children as young as 2 years looked on the basis of comprehensibility rather than the presence or absence of the formal features (Anderson & Kirkorian 2006). In other words, the correlations between formal features and visual attention, even in very young children, are not simply (and perhaps not even mainly) due to orienting responses. Instead, the association apparently results from learning associations between formal features and types of television content, which then allows the viewer to use the features as cues for attention management (Anderson & Kirkorian 2006). The associations between meaningful information and formal features of content become richly developed, enabling viewers to be very efficient at strategically looking at television only at moments most likely to give them the information they desire. As viewers learn to expect the type of information they will find with formal features, attentional responses based on those expectations can become essentially automatic (Lorch et al. 1979). Viewers can also form a style of strategic viewing by using expectations based on content such as story grammar and not just formal features (Hawkins et al. 1995). The reader should beware of a tendency to associate medium-directed causes with low levels of cognitive effort and audience-directed causes with more effort (e.g., “passive” vs “active” attention). There may possibly be some such correlation, but it is not conclusively established, let alone absolute.

## **WHAT’S GOING ON DURING ATTENTION?**

### **Limits to and Division of Attention**

According to cognitive science, the brain has a limited capacity for processing → information; if it were to try to fully process all information from all available sources, it would

suffer from → information overload. Attentional processes protect the brain against that overload (Allport 1989). If multiple stimuli are potentially providing information, attentional mechanisms may allocate more cognitive resources to one stimulus and less to the others to accommodate limited processing capacity. For example, a person might pay primary attention to surfing the Internet, but also lightly monitor a television. If an important word or sound came across the television, the person might shift primary attention to the television. Researchers such as Lang and colleagues (2006) and Armstrong and Chung (2000) study how the limited cognitive resources allocated through attention might be split between media and other activities. Getting people to shift attention from one stimulus to another is a common experimental technique used to determine how much cognitive effort people give to a stimulus.

### **Attentional Inertia**

Anderson coined the term “attentional inertia” to describe the widely observed but counterintuitive phenomenon that look lengths are distributed in a log-normal way (much of what is described below comes from research on television, but similar results were obtained when the phenomenon was explored with other media or activities). That is, short looks are much more common than long ones (with the limit that there are relatively few shorter than a half-second). Typically, 40 percent of looks at a television program are 1.5 seconds or less, and only about 10 percent of all looks are longer than 15 seconds. Based on this and other findings, Anderson proposed that looks become progressively more stable and reflect greater cognitive processing the longer they continue, and findings on decreasing distractibility and increasing learning the longer looks have been in progress has supported this interpretation (Anderson & Kirkorian 2006). An interesting consequence of attentional inertia is that it may be able to drive attention across content boundaries and thus be an important involuntary basic converse to habituation. However, some recent research suggests that inertia at boundaries may be affected as much or more by strategic as by nonstrategic processes, leaving the nature but not the consequences of attentional inertia uncertain (Hawkins et al. 2002).

A related set of research has examined whether looks of different lengths might also reflect different causes. Surprisingly, viewers who employ a relatively high percentage of very short looks (under 1.5 seconds) comprehend more than those whose look distribution contains a high proportion of only slightly longer looks (1.5–5.5 seconds). Hawkins et al. (1997) suggested that the very shortest looks (which they called “monitoring looks”) reflect a strategy of mentally checking television content regularly to direct attention when it would be most useful for comprehension, and that the slightly longer looks (which they called “orienting looks”) might have been longer because viewers were having to figure out what was going on from scratch.

### **WHAT DOES ATTENTION DO?**

As an allocation of varying degrees of cognitive effort toward a media stimulus, attention plays a role in most, possibly every, cognitive, affective, and behavioral media effect

(→ Attitudes, Values, and Beliefs, Media Effects on). Although this is the case, most attention research has focused on attention's impact on learning and the physiological responses used in operationally defining attention.

Attention is a necessary condition for *learning*, and greater attention can lead to better learning of central information and reduced learning of incidental information. Note that time spent looking at the television is not necessarily related to better learning or *comprehension* of material, as indicated by the comparison of shorter and longer looks mentioned above. Also as discussed earlier, attention to television can lead to the learning of expectations about content based on salient formal features and story grammar, which are then used for strategic monitoring. Apart from strategic viewer goals, some research also suggests that attention elicited by formal features can increase comprehension and → *memory* (Anderson & Burns 1991; → Memory, Message). For example, rapid and moderate action can draw attention to central story content, increasing its comprehension for elementary school children (Calvert et al. 1982). Increasing the rate of edits in a program may increase memory by increasing attention to and encoding of television message content without significantly increasing cognitive load (Lang et al. 2000).

While increasing attention to television can improve learning from it, television often leads to less learning than other methods of real-life instruction. (This is labeled “video deficit.”) Having a television on in the background can serve as a *distraction*, disrupting attention given to play or other learning activities such as homework.

### **ARE THERE MEDIUM DIFFERENCES IN ATTENTION?**

Attention research across different media is too scant to provide a conclusive answer to this question, though it is reasonable to assume that the same basic cognitive mechanisms underlie attention no matter what the medium. Differences in attention strategy and level may result, however, from the varying features of different media and the way in which people interact with them.

*Print media* such as newspapers require readers to actively seek information by turning pages, scanning for articles of interest, and skimming articles to find interesting information. This amount of effort and these strategies for finding information differ from those of *television*, where viewers have the option of being much more passive. This does not mean all readers give the same amount of effort to reading, since there are likely varying levels of → automaticity in carrying out these strategies. Print media also provide more content control than television (e.g., readers can slow down their reading pace, back up to reread sentences, skip sections, and read selections out of order). Attention strategies for *audio-only* media such as radio or MP3 players may be similar to those used for the audio portions of television, but differences in how and where attention is focused without a visual component in the message should be investigated. *Computer-mediated* communication such as the world wide web and learning software often combines the features of print, audio, and video. It also adds unique structures such as hypertext, which allows users to seek further information in which they are interested, and pop-up windows and banner ads that often interrupt or divide attention.

All of these variables have the potential for affecting where and how much attention is given to a message at a point in time. More research is needed within individual media

and comparing media to better understand the extent to which attention processes and strategies are similar or different across media.

# Attention

Daniel G. McDonald

Ohio State University

The concept of attention is one of the oldest and most commonly used in the communication literature. The concept is fraught with connotations that typically have little to do with the use of attention in a particular study because of its origins in vernacular language and the difficulty in separating everyday meaning from scientific meaning. To make matters more complicated, as Michell (1990) has noted, different operations often define different concepts, suggesting hundreds of attention concepts in the communication literature alone.

Attention might be described as different concepts within particular levels of communication, and may best be understood through its oldest definitions. In its original use, the concept meant to take heed or to be ready to accompany someone. Over time, usage evolved into the military version of attention, which refers to a readiness for commands. These usages, and the connotations that have developed since, have been used to suggest that attention is a precursor to action of some sort. That is, in research at a macro-level, a *society's attention* may refer to the issues that are the objects of governmental policy.

*Organizational attention* may similarly refer to those objects or actors in the environment that the organization focuses on. At the *individual level*, we perhaps see the most varied uses of the term, but all incorporating some sense of a precursor to → memory or learning processes. Attention may refer to eye contact between two persons involved in a conversation (→ Eye Behavior), the selection of news articles for reading (→ Selective Exposure), the inability to stay “on task” or complete tasks (as in attention deficit disorder), or the tendency to focus one’s eyes on a television screen (→ Exposure to Television). At a more micro-level, individual attention refers to some of the activities involved in → *information processing*. Although the concept of attention makes the most sense in terms of one actor (e.g., an individual, an organization, or a social system), some recent work includes the *concept of joint attention*, which focuses on the overlap in attention between two individuals, such as a child and parent (Kaplan & Hafner 2006). Here the focus is on the term as it has been used in the communication literature derived from concepts of psychology.

## MODELS AND CONCEPTUALIZATIONS OF ATTENTIONS

At their root, models of attention describe how and what information can be processed. At any point in time, there are many different stimuli impinging on our senses (both external and internal). Attention is the process of filtering those stimuli to allow our concentration on only a few of them. Some signals (such as the noise we generate when breathing) are handled on a nonconscious level most of the time. However, this still leaves numerous external stimuli that we must deal with. In a noisy crowd, we can concentrate on one conversation and make sense of most of it to the exclusion of other conversations going on around us (the “cocktail party phenomenon”), yet we will react if, in one of the conversations near us, someone mentions our name. We may shift our attention to that

other conversation to try to understand what was being said about us. If we do so, we are likely to have missed a portion of the conversation we were engaged in before our name was mentioned. Such issues led early attention researchers to a principle called the “*law of prior entry*,” which suggested that only a single signal can be processed at a given time (Reynolds & Flagg 1977). These examples illustrate several ideas related to the concept of attention: first, that attention is a filtering mechanism – all attention is selective (→ Selective Attention; Selective Perception and Selective Retention), and second, that our attentional processes have constraints in the form of a limited processing capacity for stimuli that are to be processed concurrently (→ Limited Capacity Model). Attention is thus the process of allocating our processing capacity among different incoming stimuli (both internal and external).

### **Broadbent’s Filter Theory**

Although attention has always been a part of the field of psychology (e.g., James 1890), it was not until the decline of strict behaviorist models that serious study was given to developing a model of how attention works. Broadbent (1958) demonstrated that *physical dimensions of stimuli* (e.g., color, loudness, etc.) are most useful in enabling discrimination and selection for processing. Further, he showed that individuals have some control over the selection of content within a particular situation. Broadbent built on the state of research at the time to develop the “filter theory” to answer the question as to how the available processing capacity is allocated among incoming signals. He suggested a “sensory receptor” to receive incoming stimuli, followed by three major components of attention: a selective filter, a limited capacity channel, and a detection device.

In this model, the sensory register acts as a kind of buffer, holding all incoming stimuli for quick analysis of physical features that might indicate importance for further processing. After this, the “marked” signals are passed to the selective filter, which screens out everything that does not require further processing. Broadbent suggested that the selective filter could be “fine tuned” to allow for, or screen out, certain characteristics identified in the pre-attentive processing. From the selective filter, the stimulus moves into the limited capacity channel to receive further processing. Under Broadbent’s model, which was widely adopted in the 1950s and early 1960s, selection among stimuli is based entirely on the physical properties of the sensory information – no meaning is extracted.

### **Alterations to Filter Theory**

It has become clear that some of the components of Broadbent’s model are robust, such as the sensory store, which survives in models today with many of the same characteristics as identified by Broadbent, but typically separated as iconic and echoic store. However, the model of much of the process after sensory reception has been altered. By the 1960s, it had become clear that certain aspects of meaning must be extracted earlier in the attention process. Treisman (1969; Treisman & Gelade 1980) developed a modification (*attenuation theory*) that suggested that, rather than a simple all-or-nothing switch, the selective filter served to attenuate those signals that are least relevant to ongoing concerns.

By 1967, Neisser's "analysis by synthesis" model appeared. In this model, patterns of expectations are developed and these are used in the pre-attentive filtering as a warning about what types of signals are likely to be expected; when those signals arrive in the pre-attentive phase they are more likely to be passed on for further filtering.

In the 1970s, researchers began to further refine the idea of *limited capacity*. Whereas earlier formulations focused on the idea of one message, these researchers noted that, if cognitive demands are low, it is often possible to process two messages concurrently (such as when we read a book and watch TV at the same time). In the revised view, rather than a single channel of information being processed, the idea was that, although limited, various tasks took only a certain amount of capacity, so that one could perform multiple tasks as long as their combined processing needs did not exceed the capacity available. Additional work focused on the relationship between arousal and attention (Kahneman 1973; → Excitation and Arousal). Such work further complicated our models because it was found that our ability to attend to a task rises with arousal up to a particular point, and then decreases, in an inverted U-shape.

Most recently, spreading *activation models* (→ Priming Theory) have been incorporated into models of attention to help explain why certain message components may be processed more efficiently than others. Much of the current work focuses on the use of positron emission tomography (PET) scans and functional magnetic resonance imaging (fMRI) to examine the brain during information-processing tasks, to obtain a better understanding of the relationship between attention and other neural processes. Noguchi and his colleagues (2007), for example, recently examined the speed of perceptual neural activity and found that attention led to an increase in both neural intensity and speed, suggesting that attentional processes, which are somewhat under our control, are able to modulate information-processing activity.

## APPLICATIONS IN COMMUNICATION RESEARCH

As mentioned at the outset, since its beginnings, the field of communication has employed the concept of attention in a number of ways. As the field of psychology has progressed from global uses of the term to more specific and micro-level conceptualizations, the field of communication has followed, with a respectable lag. Early work on public speaking and the audience for public speakers examined audience members' attention; work in political communication and media effects focused on attention as a precondition for learning about what was stressed in the news or in politicians' stands on issues (Chaffee & Schleuder 1986; → Audience). These more global meanings of attention form a core of research on attention as an observed behavior that, it is likely, provides a reasonable estimate of attention processes that are occurring within individuals.

The more recent developments in psychology that focus on the *cognitive process of attention* offer more exact descriptions of what occurs within our brains, and so offer a different look at communication processes from what was obtainable, or even conceivable, earlier. Although equipment for measuring attentional processes by fMRI or PET scanning remains out of reach of most communication researchers, the research that has been done in that area has had an influence on the thinking and conceptualization of communication problems.

Most of the immediate application has been in the area of mass communication processes and learning, affect, or → persuasion. Lang and her colleagues, for example, have used the limited capacity aspect of attention to develop a model of media message processing in a variety of contexts (Lang 2000; → Affects and Media Exposure). This body of work is focused on the attempt to understand how media content structures interact with attention processes in *learning and emotional responses*. While Lang and her colleagues often use psychophysiological devices to measure reactions under predictions of certain attention constraints or conditions, others have resorted to paper-and-pencil measures, questionnaires, or other, more traditional techniques for measuring while employing the tenets of current models of attention. Miller and Leshner (2007), for example, used a signal detection analysis to investigate the impact of “disgusting” news stories on processing resources and resultant memory. Wirth et al. (2007) have used current models of attention to investigate the concept of → presence in a multimedia environment.

Work on *attention and spreading activation* has been instrumental in developing models of persuasion as used by both mass communication and interpersonal communication scholars (Petty & Cacioppo 1986; Chaiken et al. 1989). Scholars in other areas of → interpersonal communication have been slower to incorporate contemporary attention models into their research, perhaps because the research topic is less likely to be concerned with micro-processes than is mass communication research, which often deals with learning and other media effects. Of the few examples of such application, most study nonverbal communication processes. Phillips et al. (2007), for example, have used current models of attention and working memory to investigate the use of social cues in nonverbal behavior, while Lieberman et al. (1988) used attention models and what was known about attention processes to examine nonverbal decoding ability.

Because it is crucial to our understanding of *learning and memory*, the concept of attention continues to hold center stage at a number of levels of analysis within communication research. As researchers in cognitive psychology and neuroscience learn more about the micro-level components of attention processes, researchers in communication will continue to take that knowledge and apply it to central problems in the discipline. As increased skills develop in multilevel modeling and advanced statistical analysis, we are likely to see a real contribution of communication in bridging between micro and larger levels, potentially developing links between individual information processing and group processes.

## **Attention to Media Content across the Life-Span**

*Elizabeth Lorch*

*University of Kentucky*

Children, adolescents, and adults use many types of media. These include varieties that do not require input from the user, such as print media, movies, → video tapes, DVDs, music, and television, as well as those with more extensive interactive possibilities (→ Interactivity, Concept of), such as → video games, computer applications, and → Internet resources. As the media landscape has become more varied and extensive, children and adolescents in particular have increased use of these newer media (Rideout et al. 2005). However, at all ages studied, → television has maintained its place as the most commonly used medium (→ Media Use across the Life-Span). Further, characteristics of television enable a variety of measures of → attention (e.g., eye movements, visual orientation to the screen, probe responses to events). Perhaps for these reasons, television is the focus of

most studies of attention to media. Developmental differences in attention have been studied most systematically across childhood and adolescence, with far fewer studies examining attention to media in adults, especially in older adults (→ Attending to the Mass Media; Developmental Communication).

### **PATTERNS OF ATTENTION TO TELEVISION**

Since the introduction of television, popular conceptions of television viewing often have characterized children as “zombies” who are captured by television and stare fixedly at the screen. Naturalistic and laboratory studies of how children watch television generally deny this stereotype. Many studies document key commonalities in patterns of looking at and away from television among infants, children, and adults. Across ages, most looks are very short (less than 3 seconds), with a minority of extended looks at the television (Richards & Anderson 2004; → Spectator Gaze). Individuals typically divide attention between television and other activities, with attention patterns revealing systematic influences and consistencies in how attention relates to viewers’ comprehension and learning.

Similarities in patterns do not mean, however, that attention to television is unchanging across development. The percentage of time actually spent looking at television at home or in the laboratory increases steadily from infancy through the end of elementary school, levels off during middle school, and finally declines somewhat during adolescence and adulthood (Anderson et al. 1986). In general, increases in percentage of attention to television are due to more time spent in longer looks as children’s age increases. In turn, such long looks appear to enable greater engagement and deeper processing of content (→ Information Processing), as viewers are less distractible and remember more content presented during long looks (Lorch et al. 2004; → Memory). Although the overall percentage of time looking at television declines during adolescence and adulthood, these ages maintain a mixture of short and long looks at television (Hawkins et al. 1995).

### **THEORETICAL ACCOUNTS OF FACTORS INFLUENCING PATTERNS OF ATTENTION**

Several theoretical viewpoints on attention to television concur that children, from an early age, are active viewers whose visual attention to television is guided by ongoing comprehension, expectations, and purposes for viewing (Huston et al. 2007; → Communication Skills across the Life-Span). For example, Anderson and Lorch (1983) proposed that for young children, a look at the television may begin in response to any of several possible reasons, including stimuli that elicit orienting responses; formal features that signal informative, appealing, child-relevant content; and cues derived from the behavior of other children. Once a look has begun, its continuation primarily depends on the child’s ongoing judgments of whether program content is comprehensible and on the fit of the content to the child’s purposes. In this view, developmental changes in patterns of attention stem primarily from cognitive development and associated developmental changes in comprehension processes.

Huston et al. (2007) discussed similar factors as influences on visual attention, but traced the evolution of three overlapping models of the development of children’s

attention to television: exploration-search, stimulus sampling, and the traveling lens model. *Exploration-search* refers to a sequence likely to occur when an individual of any age encounters a new stimulus environment. Initially, the individual is dominated by exploration, characterized by relatively disconnected, brief attention to perceptually salient aspects of the stimulus. With greater familiarity, it is possible to become more systematic and goal-directed, with attention increasingly guided by knowledge, expectations, and strategies. With age and experience with a medium, many exploration-search sequences accumulate, resulting in an overall developmental change toward more systematic search underlying attention patterns. For example, the very youngest viewers, infants and toddlers, largely are exposed to television not designed for them. They may explore but process little content, primarily reacting to the changing sights and sounds of television. By as early as 1.5–2 years of age, however, children begin to respond more systematically to features that are not merely salient but signal content that children are likely to find relevant or entertaining (Valkenburg & Vroone 2004). For example, the presence of children's voices, peculiar voices, sound effects, animation, and puppets cue children to the child-relevance of the content.

In the *stimulus sampling model*, Huston et al. conceptualized a series of decisions children make about whether to continue a look at the television. At the beginning of a look, decisions are most heavily a function of formal characteristics, once again those that are indicative of informative, interesting, child-relevant content. If a look continues, more extensive, deeper cognitive processing takes place, such that a subsequent decision is affected by both current comprehension and initial expectations about content (Rolandelli et al. 1991). As further cycles occur, later decisions are increasingly influenced by deeper processing and more elaborated expectations about story content (Hawkins et al. 1995). In addition, the stimulus sampling model incorporates developmental changes in these cycles of decisions. For younger children, the continuation of a look at the television may be more dependent upon superficial features of the program than for older children, who are more likely to make elaborated decisions based on deeper processing of content (Rolandelli et al. 1991; → Selective Attention).

The *traveling lens model* builds upon the ideas of exploration-search and stimulus sampling. According to the traveling lens model, attention is maximized at optimal levels of complexity, novelty, and predictability. These optimal levels “travel” with development and experience with the medium, story structure, or a particular program. Relative to infants and toddlers, children's ongoing comprehension increasingly influences their attention across the preschool years. If children are making sense of a program and judging it to be “for them,” they are more likely to sustain attention than if the program seems confusing or adult-oriented. Preschoolers' attention also begins to show influences of familiarity with specific programs (e.g., the meaning of formats in *Blue's Clues*) and about story structure in general (→ Educational Television, Children's Responses to).

During middle childhood and adolescence, the cycle of decisions during stimulus sampling and optimal settings of the traveling lens are affected by considerable increase in media experience and substantial development in comprehension skills. Children and adolescents make more of their own programming choices than do younger children, select a wide variety of general audience programming, and combine television viewing with the use of other media (Rideout et al. 2005). Regarding comprehension skills,

children become more sophisticated at building an ongoing representation of the interrelations among story events during viewing. Not until later in elementary school do children become consistent at understanding complex production techniques (e.g., flashbacks) and characters' emotions, intentions, and motivations. Older children and teens also become more skilled at connecting groups of events to an overall theme. With age, children add to their store of world knowledge, and so become capable of appreciating a wider variety of situations. Associated with expanding → media literacy and development in comprehension skills with age, attention patterns reveal increasing effects of event centrality, causal structure, and plot development. For example, school-age children have been found to look at the television more during presentation of material that adults rated as important (i.e., central) to the plot of the story than during material rated as low in importance, and to increase attentional engagement on the basis of subtle cues to the centrality of the content (Lorch et al. 2004).

It was mentioned earlier that at all ages, the majority of looks last less than 3 seconds, with only a minority of extended looks at the television. This distribution of looks that is typical across age also is characterized by a phenomenon known as “attentional inertia,” based in the observation that the longer a look at television is maintained, the more probable that the look will continue to be maintained, regardless of content or content changes. As such, attentional inertia is thought to represent an automatic, nonstrategic means of insuring occasional engagement with material that might not otherwise be sampled, assisting in providing cognitive challenge to advance development (Anderson & Lorch 1983; Richards & Anderson 2004).

### **ATTENTION TO MULTIPLE MEDIA**

Although individuals at all ages divide attention between television viewing and other activities, children and adolescents increasingly divide their attention and activities among multiple media in complex → multitasking. Adolescents watch television while using computer software, or play music while interweaving instant messaging and a video game. To date, there is no specific evidence that individual activities suffer as a result of divided attention, but systematic studies of attention divided among media are yet to be pursued.

### **RESEARCH DIRECTIONS**

Although research has provided a wealth of theory and research concerning developmental change in attention to television across childhood and adolescence, several aspects of attention to media need more extensive developmental investigation. As media materials increasingly are produced that are targeted at infants and toddlers, more investigations of attention are needed among these youngest audience members. Studies of developmental changes in attention to media other than television also are called for but are only in early stages for print media, video games, and computer use. As noted above, although children and adolescents are known to engage in media multitasking, studies of divided attention to media are lacking. Finally, although media use continues throughout adulthood, little information exists concerning attention to media in older adults, indicating a need for more systematic research on attention to media across the entire life-span.

## **Attitude Accessibility**

*David R. Roskos-Ewoldsen*

*University of Alabama*

Attitude accessibility concerns how quickly an → attitude is activated from → memory. Attitudes that are more accessible from memory are more predictive of behavior, influence what messages are attended to, and how those messages are processed, and are more

stable across time. Unfortunately, little is known about how to change the accessibility of attitudes from memory, particularly with regards to how persuasive messages influence accessible attitudes (→ Information Processing; Memory, Message).

## THEORETICAL FOUNDATION

Consider the following *example*. Suppose you see a spider – you might have a very quick “yuck” response. The fast yuck response indicates an accessible attitude toward spiders. You do not have to think about whether you like spiders, rather, the mere presence of a spider results in the activation of your attitude. On the other hand, imagine you are walking down a sidewalk with a friend looking for a place to eat. Your friend points to a Portuguese restaurant and suggests you try it. In this instance, you may have to think about whether you like Portuguese food, because you are not sure what you think of it, before deciding that it is good. The fact that you have to ponder whether you like something suggests that either you have a relatively inaccessible attitude or you have never formed an attitude toward that object.

Attitudes have been studied across a number of different disciplines for the past 100 years. There have been many different ideas concerning the structure of attitudes. Based on work in cognitive psychology, researchers began exploring the structure of attitudes in memory (→ Cognition). *Associative network models* are among the most influential approaches to understanding memory. According to such models, within memory there are various nodes that represent concepts. For example, you probably have a “spider” node in memory. The nodes are connected to other related concepts. So your spider node might be connected to “web,” “eight legs,” “poisonous,” “Spiderman,” “eats insects,” “Wilbur” (the spider in the children’s book *Charlotte’s Web*), and so on. In addition, energy is hypothesized to spread from an activated node to other related nodes. So if you saw a spider, activation would spread to other related nodes such as “web.” Drawing on this network model of memory, we can think of attitudes as associations between objects and evaluations of those objects. In other words, concepts could have attitudes connected to them within this semantic network. Your “spider” node might have a “yuck” link to it and this link corresponds to a negative attitude toward spiders.

One of the assumptions of network models of memory is that the *strengths of the links* between concepts in memory can vary. In our example, the link between “spider” and “yuck” is very strong so that “yuck” is activated and comes to mind easily when “spider” is activated. However, the link between “Portuguese food” and “good” is relatively weak so that “good” is not activated when “Portuguese food” is first activated. To the extent that an evaluation is strongly associated with the object, the evaluation will be highly accessible: that is, when the node for the attitude object (spider) is activated, the strength of the association will insure that, due to spreading activation, the node containing the evaluation of the object (yuck) is also activated. When the strength of the connection reaches a certain level, the attitude becomes automatically accessible from memory. In this instance, when you see a spider and the corresponding node in memory is activated, the evaluation of that object is quickly and effortlessly accessed. In this way, attitude judgments can be made rapidly and without extensive reflection.

In contrast, for attitudes that are not accessible, the associations between the object and the evaluation of that object are not strong and the activation of the object will typically

not spontaneously activate the evaluation of the object. Or it could be that this object has no evaluation associated with it in memory. This line of thinking suggests a *nonattitude to attitude continuum*. At the extreme, attitude end of the continuum are situations such as “spider” where the attitude is automatically activated from memory when the object is encountered. In contrast, the nonattitude end of the continuum refers to objects where there is no attitude with an evaluation stored in memory. Of course, most attitudes probably lie somewhere between these two extremes. Most people, when asked, can report their evaluation of a wide range of attitude objects. For any given person, some of these attitudes will be strong and very quickly retrieved, others may be relatively weak and slowly accessed, but for most attitude objects, people are able to report where on a continuum their attitude lies.

### THE IMPORTANCE OF STUDYING ATTITUDE ACCESSIBILITY

Accessible attitudes predict where people orient their attention. People live in a complex world with myriad different objects constantly competing for attention. Evolutionarily, it makes sense that people should be more likely to notice things that they like or dislike. Noticing something threatening – or rewarding – in the environment would clearly help an organism to survive. Research has found that attitudes do serve an orienting function because they direct attention to attitude-evoking objects, and this is particularly true of accessible attitudes (Roskos-Ewoldsen & Fazio 1992).

Accessible attitudes predict how people process a message. With more accessible attitudes toward the topic of a message we are more likely to critically or centrally process that message (→ Elaboration Likelihood Model). A series of experiments also demonstrated that message recipients with more accessible attitudes toward the source of a message are also more likely to centrally process that message (Roskos-Ewoldsen et al. 2002). Basically, the automatic activation of an attitude toward the topic or source of the message acts as a cue that this is an important message that needs to be carefully processed.

Accessible attitudes predict how biased a person will be when processing a message. Attitudes have long been hypothesized to influence how we perceive objects in the environment. If you like a particular football team, infractions called against that team are more likely to be perceived as arbitrary or capricious. Numerous studies have found that attitudes color how people see the world (Fazio et al. 1994). Attitudes that are more accessible are more likely to result in *biased perceptions* of objects. In a study of the 1984 US presidential election, people with more accessible attitudes toward the candidates were more likely to judge that their candidate won the presidential or vice-presidential debate. Research has even found that the accessibility of people’s attitudes toward capital punishment will influence their judgments of the quality of scientific evidence on the effectiveness of capital punishment.

Accessible attitudes predict behavior. Attitudes were studied initially because they were thought to *predict behavior* (→ Attitude–Behavior Consistency). However, the relationship between attitude and behavior is more complex than the simple idea that attitudes predict behavior. Studies have demonstrated that attitudes that are highly accessible from memory are more likely to predict behavior than attitudes that are not accessible from memory in a wide range of behaviors including voting, tobacco and alcohol use, product choice, environmental behaviors, feminist behaviors, and game play.

The basic idea is that an attitude can affect behavior only if the attitude has been activated from memory. Typically, social situations are characterized by ambiguity because there are many potential interpretations of the situation. How the situation is perceived plays an integral role in how people respond to that situation. Consequently, any factor biasing the interpretation of a situation should influence how the individual responds to that situation. As discussed earlier, attitudes exert a profound influence on the *interpretation of ambiguous information*. This biased interpretation allows attitude to affect how a person responds to situational cues. For example, when someone sees a spider the situation is typically perceived as repulsive. Once the interpretation of the situation is colored by attitude, the behavior within the situation is likely to be consistent with the attitude(s) that influenced the interpretation of that situation. When the presence of a spider results in the situation being perceived as repulsive, the person should act accordingly by calling an exterminator, using bug spray, or stepping on the spider.

Finally, accessible attitudes are *more persistent and last longer* than less accessible attitudes. A common finding is that an attitude that is changed by a persuasive message will revert back to the original attitude across time if nothing is done to reinforce the changed attitude. However, if the changed attitude is more accessible from memory, then it is less likely to revert back to the original attitude.

### MAKING ATTITUDES MORE ACCESSIBLE

Research on persuasion and social influence has traditionally focused on changing the extremity or valence of attitudes. However, given the functionality of accessible attitudes, research on social influence should also focus on how to make attitudes more accessible from memory. Unfortunately, little research has focused on how to make attitudes more accessible. We do know that attitudes based on direct experience with the object are more accessible from memory. Likewise, making repeated attitudinal judgments of an object increases the accessibility of the attitude toward that object. Consistent with this research is the finding that repeated viewing of a commercial resulted in more accessible attitudes. However, research from cognitive and social psychology suggests at least two more ways to increase attitude accessibility: expectations and cognitive elaboration.

When people anticipate future evaluative encounters with an object, they develop more accessible attitudes toward that object. In other words, the expectation that the attitude will be functional increases the accessibility of the attitude from memory. For example, comparative advertising may motivate people to spontaneously form attitudes because of the explicit evaluative comparison of one → brand to a successful (and hence, probably liked) brand. Comparative advertisements have been found to increase the accessibility of attitudes toward the new product more than noncomparative advertisements that contained the same information about the new product (→ Advertising Effectiveness).

Systematic or elaborative processing of a message's content has also been hypothesized to result in more accessible attitudes from memory due to the greater amount of cognitive "work" involved in such processing, with the result being better integrated attitudes that are more accessible from memory. In short, elaboration of the message's content paves more associative pathways for the given attitude and strengthens those pathways linked to the attitude.

## **Attitude–Behavior Consistency**

*Nancy Rhodes*

*University of Alabama*

The central question addressed by the concept of attitude–behavior consistency is whether people act in accord with their → attitudes. In other words, does knowing a person's attitude allow one to predict that person's behavior? Our naïve theories lead us to believe that this is true: we assume that attitudes guide behavior. Although it may initially seem self-evident, the story is more complex than our intuition would suggest, and this area has been the focus of an enormous volume of research going back nearly a century. Researchers are interested in this relationship because they have a desire to use attitudes to predict how people will behave. Such predictability may be important, for example, if a car manufacturer wants to predict the strength of the market for cars using alternative fuels for the coming year.

## HISTORICAL BACKGROUND

Historically, attitudes were thought to be an important topic to study because early researchers assumed that attitudes are strongly related to behavior. Thus, it was thought that attitudes would provide a good proxy to behavior: asking people how they felt about things was easier than observing them engaging in activities (→ Observation; Survey). However, a classic study conducted by LaPierre in the 1930s was an early demonstration that attitudes may not always coincide with actions. In this study (LaPierre 1934), a survey was sent to hotel and restaurant proprietors asking them their attitudes toward serving customers of Asian origin. During this period in the history of the US, prejudice against Asians was strong. Thus it was unsurprising that a majority of respondents indicated that they would deny service to Asians. However, these establishments had earlier been visited by an Asian couple who were working with the researcher. In their tour of 250 hotels and restaurants, they were served by all but one proprietor. Clearly, the stated attitudes of the proprietors were not reflected in their actions when confronted with customers seeking food and lodging. Other work questioning the assumption that attitudes guide behavior began to accumulate. An influential paper published by Alan Wicker in 1969, which reviewed 42 studies examining the correlation of attitudes to behaviors, found only a weak relationship.

Wicker's paper set off a controversy over the importance of attitude research. Proponents of Wicker's position wondered whether there was any point in continuing to study attitudes if they did not predict behavior, which was consistent with a general climate of criticism of academic social science prevalent at the time (Elms 1975). Other researchers suggested that Wicker's conclusions may have been extreme. Overall this controversy fostered a somewhat contentious climate that nonetheless produced an abundance of creative ideas about the relationship of attitudes to behavior.

## THE PROBLEM OF SPECIFICITY

One response to the concern that attitudes were not predictive of behavior was the observation that behaviors and attitudes are often measured at *different levels of specificity* (→ Measurement Theory). In the typical attitude survey, the attitude question is a very general assessment of an attitude object, such as “global warming,” whereas the behavioral measurement is an observation of a very specific single opportunity to engage in an action, such as signing a petition in favor of legislation to reduce carbon emissions. Among other researchers, Fishbein and Ajzen (1974) pointed out that, psychometrically, attempting to correlate one very specific construct with another construct that is very vague is problematic and would tend to reduce the observed correlations. The solution proposed by Fishbein and Ajzen was twofold. First they suggest measuring behavior more generally, that is, creating an aggregate measure of behavior in much the same way as an attitude scale is constructed. This aggregate measure of behavior can become a reliable measure of a general propensity to behave just as a multi-item attitude scale is a more reliable measure of attitude than a single attitude item.

The second solution to the problem of specificity of measurement is to assess attitudes more precisely. According to Fishbein and Ajzen, the solution was to measure the attitude

toward performing the behavior at a particular point in time. For example, instead of asking a potential voter whether they had a favorable attitude toward a particular candidate, it was preferable to ask whether they had a favorable attitude toward voting for that candidate on Election Day next Tuesday. Asking the attitude question with that level of specificity improved the ability to predict behavior. Fishbein and Ajzen later went on to refine their ideas into models known as the theory of reasoned action and the theory of planned behavior (→ Reasoned Action, Theory of; Planned Behavior, Theory of).

### **MODERATORS OF THE ATTITUDE-BEHAVIOR RELATIONSHIP**

While Fishbein and Ajzen were focused on the specificity of the measurement of the attitude and the behavior, other researchers focused on understanding *under what conditions* attitudes predicted behaviors. These moderating conditions have clustered around individual differences in personality, variables that affect the strength of the attitude, and characteristics of the situation.

#### **Personality**

One group of researchers was particularly interested in the types of people for whom attitudes serve as behavioral guides. These researchers, led by Mark Snyder at the University of Minnesota, observed that attitudes serve as an inner code of conduct for some people, whom they termed *low self-monitors*. These people know how they feel about an issue and are unswerving in behaving consistently with that attitude. In contrast, *high self-monitors* tend to behave consistently with the social demands of the situation. Not surprisingly, the correlation between attitudes and behaviors is higher for low self-monitors than for high self-monitors.

Cacioppo and Petty (1982) identified a construct they termed *need for cognition* that ordered individuals along a continuum representing the extent to which they enjoy thinking about things (→ Information Processing; Limited Capacity Model). People who score high in need for cognition have a tendency to enjoy puzzling over complex problems and seek out complex intellectual challenges. In contrast, those low in need for cognition tend to prefer simple, black and white explanations. As might be expected, attitudes appear to be more predictive of behavior for people who are higher in need for cognition than for those who are lower.

#### **Attitude Strength and Accessibility**

There are many ways to think about what makes an attitude strong. Among the aspects of attitudes that have been studied in the context of attitude strength are confidence, extremity, importance, self-relevance, knowledge, and direct experience. Whatever index is used to identify strong attitudes, the findings are generally consistent: strongly held attitudes are more predictive of behavior than attitudes that are held more weakly. For example, many people have attitudes about whether Mac or personal computers (PCs) are preferable. Those for whom a well-functioning computer is important for accomplishing their day-to-day tasks have had extensive experience working with both types of computers,

and who have extensively researched the features of the different computer models and their operating systems, will be more likely to purchase the computer they have the most favorable attitude toward, because their attitude toward the computer would be more strongly held.

Another way to think about strong attitudes is to consider how quickly an attitude judgment comes to mind upon encountering an attitude object. Russell Fazio and his colleagues were primarily concerned with → *attitude accessibility*, or how easily attitudes are activated from memory. According to this research, when attitudes are highly accessible, they are quickly activated in memory and thus are more likely to be acted upon than less accessible attitudes. The pathway described in this model is that accessible attitudes are activated immediately upon encountering an attitude object. This activation then guides interpretation of relevant information, such that the information about the attitude object is perceived to bolster the existing attitude. These perceptions of the attitude object, in conjunction with a consideration of social norms, define the situation for the perceiver and thus lead to behavior that is consistent with the attitude. These processes are generally thought to occur relatively spontaneously and without much effort for attitudes that are highly accessible. Overall, findings with respect to attitude accessibility have supported the idea that accessible attitudes are more predictive of behavior than less accessible attitudes.

### **Characteristics of the Situation**

Finally, an additional moderator of the attitude–behavior relationship is the strength of the situation in which the behavior might occur. Just as attitudes can be described as being strong or weak, situations also vary in strength. A strong situation is one in which the range of acceptable behaviors is very narrow, whereas a weak situation has a wider range of potential behaviors. For example, in a college class the range of behaviors is quite limited: college students are expected to sit quietly and listen to the lecture, take notes, and perhaps politely ask a question for clarification. Thus a college lecture class represents a strong situation. In contrast, the expected behavior at a large fraternity party is quite vast: individuals may be expected to drink heavily or not much; they may dance wildly to the music or stand still; they may talk excitedly with many other party-goers or quietly converse with one person. Thus a fraternity party could be characterized as a weak situation because of the range of expected behaviors. Research indicates that attitudes are more predictive of behaviors when the situation is weak than when the situation is strong: Strong situations constrain behavior to the extent that all people behave similarly regardless of their attitudes, whereas in a weak situation, where the prescribed behavior is not clear, attitudes are far more likely to guide one’s choice of action.

### **THE EFFECT OF BEHAVIOR ON ATTITUDES**

Thus far, this entry has examined the attitude–behavior relationship from the perspective of how attitudes influence behavior. However, the attitude–behavior relation can also occur in the reverse direction: behavior can affect attitudes. The decades of research investigating cognitive dissonance and self-perception theory demonstrated that engaging

in counterattitudinal behavior is likely to change one's attitudes to be consistent with the behavior (→ Cognitive Dissonance Theory).

This is most likely when the outcomes of one's actions are negative, when the behavior is public, and when there is no other easy explanation for having engaged in the behavior. For example, going to see a horror film with friends might change your attitude toward horror films. A recent study demonstrated that it is one's strong attitudes that are most likely to guide behavior, whereas the attitudes that are subject to change through behavior are more likely to have been weak attitudes.

## **Attitude Functions**

*Betty H. La France*

*Northern Illinois University*

The functional approach to → attitudes specifies that people hold attitudes because those attitudes serve a purpose. Functions address the psychological motivations *why*

individuals hold their attitudes. Initial theorizing about attitude functions assumed that an attitude served a primary function ( $\rightarrow$  Functional Analysis). Shavitt (1990) demonstrated that although certain attitude objects (e.g., air conditioners) lend themselves to one primary function, other attitude objects (e.g., American flag) are more likely to be served by multiple attitude functions. Understanding *why* an attitude forms offers an insight into the process of attitude change. Although several functions have been identified, the conceptualizations scholars offer are similar to the functions established by Smith et al. (1956), Katz (1960), and Herek (1987).

Smith et al. (1956) defined three attitude functions. The *object appraisal function* is conceptualized as attitudes that form as immediate evaluations of attitude objects. The purpose of this evaluation is to quickly categorize an object, so it may be acted upon as part of the categorical group to which it belongs. The *social adjustment function* reflects the ability of attitudes to promote or maintain relationships with desired others or to highlight differences with disliked others. *Externalization*, the third function, occurs when an attitude is held because the attitude-holder experiences an intrapersonal conflict, and the attitude is held in order to address this conflict.

Katz (1960) described four functions. The *value-expressive function* operates when the benefit to the attitude-holder comes from the expression of a core value the holder associates with the self-concept. The *ego-defensive function* is similar to Smith et al.'s (1956) externalization function. The *instrumental function* recognizes that people hold attitudes because those attitudes maximize rewards and minimize costs for the holder. Positive attitudes are held for objects that bring pleasure to the holder; negative attitudes are created when objects are associated with unpleasant attributes. The *knowledge function* reflects attitudes that are held so the individual is able to organize objects and reduce uncertainty. Eagly & Chaiken (1993) note this function parallels schematic conceptualizations of attitudes in which objects are placed into existing categories that parallel the attributes of the new stimuli. Although Eagly & Chaiken (1993) report that a combination of Katz's (1960) knowledge and instrumental functions is similar to Smith et al.'s (1956) object appraisal function, the idea of categorizing the object indicates a deeper processing of the stimulus. Instead, the knowledge function parallels what Herek (1987) identified as the experiential-schematic function.

Herek (1987) identified two experiential functions where attitudes are formed based on previous interaction(s) with an attitude object. The experiential-schematic function forms when an object, whose attributes parallel pre-existing  $\rightarrow$  schemas for other objects, is placed into an existing cognitive category. An experiential-specific function is created when objects cannot be placed into pre-existing schemata; these attitudes are isolated from other attitudes as long as there are no generalizations made between the attributes of the object and other schema. La France and Boster (2001) demonstrated that these functions are usefully conceptualized as one *experiential* function continuum where individuals whose attitudes function experientially do so more or less schematically.

Smith et al. (1956) inferred certain functions existed through extensive interviews ( $\rightarrow$  Interview; Interview, Qualitative). Since then, several approaches for measuring functions have emerged. One such approach is the individual-difference approach, which assumes that functions can be assessed indirectly by measuring personality constructs. Perhaps the most extensive application of this approach is Snyder's use of self-monitoring

to assess the social adjustment function (manifest in high self-monitors) and the value-expressive function (manifest in low self-monitors).

A more direct approach to measuring functions has been open-ended responses that are coded for functionally relevant information (Shavitt 1990). Attitude function → scales have been developed (Herek 1987), and some scholars have modeled the process of function formation (Lapinski & Boster 2001). As scholars created measures of functions, a variety of attitude objects have been used in functional research.

Scholars guided by the functional approach to attitude change have consistently found evidence for the *matching effect* (see Maio & Olson 2000). Evidence of the matching effect demonstrates that changes in cognition occur when messages are perceived to contain attitude-function-relevant information versus attitude-function-irrelevant information. One explanation for this effect is that it is a result of biased message processing. Individuals attend to favor information that contains messages consistent with their attitude function (→ Cognitive Dissonance Theory). Consistent with this explanation, Lavine & Snyder (1996) found perceptions of message quality were higher for individuals who were presented with a functionally relevant message compared to research participants who read a functionally irrelevant message. In the most direct test of the biased processing explanation, Julka & Marsh (2005) found arousing functionally relevant messages were more persuasive than merely salient functionally relevant messages.

# Attitudes

David R. Roskos-Ewoldsen

University of Alabama

Attitudes have long been a focus of study by social scientists. In the first edition of the *Handbook of social psychology* in 1935, Gordon Allport referred to attitudes as an indispensable concept for social psychology. Today, attitudes have become an essential concept for the social sciences. Attitudes, defined as an evaluative response to an object or thing, are critical to the study of → persuasion; person → perception; reactions to politicians, racism, and stereotyping (→ Stereotypes); responses to the media; and so on. This entry will provide an overview of the nature of attitudes and how to measure them, summarize the tripartite model of attitudes, and review recent research on explicit and implicit attitudes.

## THE NATURE OF ATTITUDES

In everyday talk in English, when someone is said “to have an attitude,” it generally means the person takes a negative or critical view of the world. However, for social scientists, the standard definition of an attitude is simply that it is a *hypothetical construct involving the evaluation of some object*. First, attitudes are hypothetical constructs because they cannot be directly observed. Rather, attitudes are measured indirectly through a variety of different measures. Second, attitudes involve evaluations of how positively or negatively a person judges something. This evaluation can stem from any number of sources including a person’s beliefs, behavior, and affective reactions to the object. Third, attitudes are directed toward some object or thing. In this instance, “object” is broadly defined and can include things such as Diet Coke or convertible cars, ideas such as democracy or postmodernism, individuals such as your neighbor or groups of people such as foreigners, and so forth. The key point is that attitudes are directed at something.

*Earlier definitions* of attitudes included additional characteristics of attitudes that are not included in the current definition. In particular, attitudes were typically thought to be relatively enduring. But research now indicates that attitudes can be very sensitive to the context in which the attitude is expressed. In different contexts, people will express different attitudes. Further, literally thousands of studies on persuasion have attested to the fact that attitudes can be changed – sometimes fairly easily – and the result of the persuasion attempt is a changed attitude. According to more traditional definitions of attitudes, the changed attitude would not be an attitude because it was not enduring. Another development in thinking about attitudes involved the functions that attitudes serve for people (→ Attitude Functions).

While there are numerous different ways to measure attitudes, two methods are particularly common. The first is a semantic differential scale. A semantic differential scale involves having people judge their evaluation of an object along a scale anchored at each end by polar opposite adjectives, e.g., good/bad (→ Scales; Scales and Indices). Consider the following scales designed to measure someone’s attitude toward capital punishment:

Capital punishment	
Bad	Good
Acceptable	Unacceptable
Right	Wrong
Illogical	Logical

A person with an extremely positive attitude toward capital punishment should be more likely to check near “good,” “acceptable,” “right,” and “logical,” while a person with a more neutral attitude might check positions in the middle between the two adjectives depending on whether the attitude was slightly positive or negative, and a person with an extremely negative attitude should be more likely to place checks near “bad,” “unacceptable,” “wrong,” and “illogical.”

The second way attitudes are measured involves *Likert scales*. Likert scales present a statement and having people indicate how much they agree or disagree with the statement. The following Likert scale could be used to measure attitudes toward capital punishment.

Capital punishment is never justified, no matter how horrible the crime						
1	2	3	4	5	6	7
Strongly disagree					Strongly agree	

Persons with more positive attitudes toward capital punishment are more likely to disagree with the statement and to circle 1, 2, or 3, depending on how positive their attitude is toward capital punishment. Conversely, a person with a negative attitude toward capital punishment would be more likely to agree with the statement and to circle one of the higher numbers. A person with a neutral attitude would circle 4, indicating they neither agree nor disagree with the statement.

Recent research and theorizing on attitudes suggests that they may be more complex than these scales indicate. For instance, people can have *ambivalent attitudes*. Attitude ambivalence refers to situations where people simultaneously have both positive and negative evaluations of an object. Consider the giving of blood. A person may have a positive attitude toward giving blood because it is an altruistic act, but at the same time, he or she may have a negative attitude toward giving blood because it hurts and makes him or her feel queasy. To measure attitude ambivalence, two Likert scales can be used. Both are anchored at the neutral point (or 0): the first asks a person to judge only the positive aspects of the object (a 0 to 3 scale), while the second asks the person to judge only the negative aspects of the object (a 0 to –3 scale). Using the example of giving blood, a person may circle 2 on the positive scale and –2 on the negative scale. A further limitation of semantic differential and Likert scales is that there are other characteristics of attitudes that they do not capture, such as how confidently the person holds the attitude or the accessibility of the attitude from → memory (→ Attitude Accessibility).

### TRIPARTITE MODEL OF ATTITUDES

Early definitions of attitudes usually held that attitudes were comprised of three elements: affective, behavioral, and cognitive. While definitions of attitudes have shifted to simply

specifying attitudes as evaluations, this evaluation is generally thought to encompass these cognitive, behavioral, and affective components. The beliefs one has about an attitude object, how one acts toward the object, and how one feels about the object are most often thought of as the main components of an attitude. The tripartite model of attitudes has been extremely influential in shaping research and theorizing on attitudes. Research now suggests that these three components of attitudes can influence the development of attitudes which, once formed, can influence affect, behavior, and cognition.

The *affective component* of an attitude is the emotional or visceral reaction to the attitude object, that is, one's feeling that the object is good or bad. The "yuck" reaction to a cockroach involves the affective component of the attitude. There are many different ways that affective reactions can be learned including classical and operant conditioning. Classical conditioning, for example, simply involves repeated associations of positive or negative feelings with the attitude object. This example demonstrates how affective responses to an object influence the development of an attitude, but strong attitudes can also influence the affective reactions that people have when encountering that object. As people develop more extreme or stronger attitudes toward a politician, they will begin to have stronger affective reactions to that politician.

The *behavioral component* of an attitude refers to the actions taken in regard to the attitude object. This is the component that has historically been considered the most important. The initial justification for studying attitudes was that they predict behavior. And, while the relationship between attitudes and behavior is complex, attitudes do predict behavior in many instances ( $\rightarrow$  Attitude–Behavior Consistency). Likewise, research has shown that people's behavior influences their attitudes. People who do not have well-formed attitudes may look at their behavior to determine if they have a positive or negative attitude toward an object. For example, people may not have strong feelings about a particular band, but when asked whether or not they like it, they may consider that they listen to the band frequently because a room mate listens to it, and they don't ask the room mate to turn off the music, and therefore they reason that they must like the band. Likewise, dissonance theory predicts that if people engage in behavior that is very inconsistent with their attitudes, they may change their attitudes to be consistent with the behavior ( $\rightarrow$  Cognitive Dissonance Theory).

The *cognitive component* is generally thought to encompass the thoughts and beliefs related to the attitude object. Some people argue that beliefs and attitudes are the same thing. For example, how is the belief that Diet Coke tastes good different from a positive attitude toward Diet Coke? The distinction between attitudes and beliefs is that beliefs are often thought of in terms of how likely they are to be true (e.g., Diet Coke typically tastes good unless the syrup is mixed incorrectly). However, it would seem strange to talk about an attitude as being true most of the time. The beliefs about an object will influence what a person's attitude is toward the attitude object. The preponderance of pro- or anti-thoughts is a good indication as to whether the attitude is favorable or unfavorable toward an issue. However, it is also important to note that attitudes can influence the beliefs that people develop. For example, attitudes can bias how information is processed so that people are more likely to accept information that is consistent with their attitude or to distort information so as to make it consistent with their attitude.

## IMPLICIT AND EXPLICIT ATTITUDES

An important distinction that has recently emerged in the study of attitudes involves explicit versus implicit attitudes. This distinction arose from research on stereotyping and racism where it was found that people's explicitly stated attitudes and beliefs were not racist, but that oftentimes their behavior would display subtle forms of racism. The racist behavior reflected implicit associations that the person had developed between a certain group and negative attitudes. Out of this research grew the idea that people can have both explicit attitudes that they can readily express and implicit attitudes that are more difficult to express, but can influence the person's affect, behavior, and cognitions just as explicit attitudes do.

More recently, research has suggested that explicit attitudes reflect a person's beliefs. These explicit attitudes are easy to measure using traditional paper and pencil measures such as those discussed above. Furthermore, they appear to be easy to change using standard persuasive techniques. Implicit attitudes, on the other hand, reflect associations between the attitude object and various affective reactions such as fear that have been learned over time. Measures of implicit attitudes are more complex than measures of explicit attitudes and typically involve some type of task that measures how long it takes a person to make various kinds of judgments such as the tasks that are used to measure attitude accessibility. Currently, there is little consensus on how to change implicit attitudes (Gawronski & Bodenhausen 2006).

# Attitudes, Values, and Beliefs, Media Effects on

L. J. Shrum

University of Texas at San Antonio

Because of the extensive penetration of media into society, and the different purposes and types of information conveyed, there are a number of possible media effects. For the sake of simplicity, these possible media purposes are categorized as those intended to persuade (e.g., → advertising, → propaganda), inform (e.g., → news), or entertain (e.g., narrative television, film). In addition, these effects operate on different aspects of the person, affecting their beliefs (mental association between objects and attributes), → attitudes (evaluations of objects), and values (abstract ideals).

*Persuasive media effects* have often been thought to be powerful (→ Media Effects, History of). This public belief in massive media effects reached its apex around the time of World Wars I and II, when extensive research was conducted to understand and harness the supposed power of propaganda. Indeed, the power of Adolf Hitler was often used as an example of a strong effect of mass-mediated propaganda. However, the validity of the belief in massive media effects began to be challenged by empirical research. As previous research was analyzed across studies, and new studies were conducted, scientists were finding that persuasive media did not always induce expected attitude change. For example, studies showed that military training films increased knowledge about issues but did not change attitudes (Hovland et al. 1949) and that the impact of media during presidential elections was to reinforce existing attitudes rather than change them (Lazarsfeld et al. 1948).

As scientists further scrutinized the available research, they observed that not only were the expected persuasion effects often not obtained, but the effects were moderated by a number of contextual or situational factors. That is, under certain conditions, mass-mediated persuasive messages might exert relatively strong effects, but under other conditions, those exact same messages might have little or no effect at all. From this observation, more contemporary models of → persuasion were developed. These models generally posited a dual route to persuasion. That is, certain conditions, such as message involvement or importance, influenced the processing of the information, which in turn influenced which aspects of the message were attended to (and to what degree), which in turn affected the persuasiveness of the message. Two of the most widely cited models include the → Elaboration Likelihood Model (Petty & Cacioppo 1986) and the Heuristic-Systematic Model (Chaiken et al. 1989). The dual-process models helped illuminate some of the inconsistent findings in the persuasion literature, including mass media effects.

*Information media* such as news have also been shown to have effects on audience values, attitudes, and beliefs. At the societal level, one of the prominent theories of news media effects is called *agenda setting* (→ Agenda Setting Effects). This theory posits that news does not necessarily tell us what to think, but its power lies in its ability to set the agenda, or tell us what to think about. In other words, news makes certain issues more

salient than others through frequency and intensity of coverage, and this process influences audience beliefs about what issues are important.

Although the general point of agenda-setting theory is that the news influences beliefs about the importance of issues, there are other possible indirect effects of extensive news coverage. One is the belief in the prevalence of a problem, and thus corresponding effects on beliefs about the probability of being a victim of a problem. For example, the news media often cover sensational events (e.g., child kidnappings, tainted Halloween candy) extensively. The corresponding impression in news audiences is that these effects occur often, when in fact they are relatively rare (→ *Exemplification and Exemplars, Effects of*). Other studies have provided supporting evidence that exposure to such things as news about crime influences fear and concern about crime (→ *Violence as Media Content, Effects of*).

An abundance of research has provided evidence that *entertainment media* can have important effects on the attitudes, values, and beliefs of audience members. In many respects, these effects operate in much the same way as the effects noted for persuasive media and news media. However, the observed effects of entertainment media consumption may be best understood as unintended effects, in the sense that these media do not necessarily intend to persuade or inform (→ *Entertainment, Effects of*).

Probably the most widely cited theory of such media influence is → *cultivation theory*. The theory, which focuses exclusively on television viewing, posits that television presents a distorted view of the world (e.g., more violence, more affluence, more dishonesty and distrust), and that frequent viewing causes viewers to incorporate these distortions into their real-world attitudes and beliefs (→ *Cultivation Effects; Gerbner, George; Media and Perceptions of Reality; Reality and Media Reality*). Quite a bit of research has accumulated to support this proposition (for a review, see Shanahan & Morgan 1999). Frequency of viewing has been shown to be positively related to estimates of the prevalence of crime and violence (Gerbner et al. 1977), drug use, prostitution, and alcoholism (Shrum & O'Guinn 1993), and the prevalence of affluence and ownership of luxury products (O'Guinn & Shrum 1997). In addition, frequency of television viewing has been shown to increase the importance of material values (Shrum et al. 2005). Finally, research that has investigated the processes underlying these effects have shown that they operate in much the same way as persuasive media effects and information media effects (for a review, see Shrum 2007).

The findings across the three domains just reviewed show that the media do have effects on audience values, attitudes, and beliefs. These effects occur when they are intended (e.g., persuasive media), but also when they are unintended (e.g., entertainment media). Moreover, although short-term beliefs and attitudes are often easily affected by media, longer-term, enduring attitudes and values (and their corresponding behaviors) are less easily changed.

## Attribution Processes

Valerie Manusov

University of Washington

Attributions are the cognitive and communicative processes involved in making sense of why someone acted the way he or she did. This → sense-making usually revolves around attempts to determine the *cause* (i.e., why) and/or *who is responsible* for an action. Studied initially as a largely internal, psychological process (e.g., Heider 1958), researchers in communication often look to verbal explanations as examples of expressed or communicated attributions (e.g., Burleson 1986; Roghaar & Vangelisti 1996). Generally, attribution processes are considered an offshoot of people's tendency to want to understand the world around them. This sense-making transpires in our thoughts (cognitive attributions), and we talk it out with others (communicated attributions). In fact, as we talk about why we think someone acted as he or she did, we often change our minds about the attribution we originally held (→ Psychology in Communication Processes; Cognition).

### HISTORY OF ATTRIBUTION SCHOLARSHIP

Early work focused on attributions of what Heider (1958) called *causal locus*, or the judgment of where a cause came from (i.e., internal or external to the person who engaged in the

action). Since then, researchers, most notably Weiner (1995), have identified a large number of other attributional dimensions, including assessments of a behavior's intentionality, controllability, stability, specificity, and valence. These dimensions help to reflect the variety of attributions people can make, both in their heads (the internal or cognitive attributions noted above) and in their talk (the expressed or communicated attributions noted above).

A number of theories have been developed to explain and predict attribution processes and outcomes. The first set of theories is often referred to as *normative* because they explain the ways that people ought to make good or valid attributional judgments (e.g., Jones 1979). For example, Kelley (1971) found evidence that we rely on three types of assessments to determine the best explanation for an event. He called these factors "distinctiveness" (i.e., our assessment of whether or not a person's behavior is different in one situation from other situations); "consistency," or the extent to which a person's behavior is the same over time; and "consensus," which concerns the behavior of similar others in similar situations.

As researchers looked more toward how people make cognitive attributions in interaction, however, they became increasingly interested in the *errors* or *biases* in people's attributions (see, e.g., Ross 1977). For example, researchers have identified a "fundamental attribution error" that involves people assessing the cause of another's action to largely internal or dispositional characteristics (e.g., personality) rather than to the myriad external or environmental influences that may have influenced an action. A corollary of the fundamental attribution error, the "actor-observer bias," concerns the tendency to attribute one's own behavior to situational factors while attributing the behavior of others to internal characteristics. People also make what have been called "self-serving attributions": rather than find the most likely cause, we often take cognitive shortcuts that allow us to find a cause that works well for our own sense of self and our self-presentation.

### CONTEMPORARY DIRECTIONS IN ATTRIBUTION SCHOLARSHIP

Although attribution processes occur across a large number of situations, contemporary research on attributions tends to focus on what can be thought of as → applied communication contexts. For example, researchers from a number of academic fields study the attributions that people make in their close relationships, most notably marriage. A general bias has been found when looking at the link between relational satisfaction and attributions. Specifically, people who are more satisfied tend to make what have been called *relationship-enhancing attributions*, providing attributions that distance their partners from unfavorable behavior and giving their partner credit for positive behavior. Those in less satisfied relationships tend to make what have been labeled as *distress-maintaining attributions*, judgments that blame the partner for undesirable actions and do not give him or her credit for more favorable actions. Research also shows that satisfaction and attributions may be mutually causal: people tend to be more satisfied later in their relationships when they make more benign attributions early on; they also tend to make more negative attributions if they are dissatisfied (see, e.g., Johnson et al. 2001; → Marital Communication).

Attributional processes have also been examined for what has been termed communication's "dark side." Specifically, researchers have looked toward the ways in which people who abuse their spouses or children make different patterns of attribution

for their own and their family's behavior. Abusers tend to see their own behaviors as unstable and external (that is, they may say, "I am not an abuser; I hit her only because she provoked me"). They also tend to see the other person as blameworthy and as having behaved negatively intentionally ("I would not have pushed him if he had not said what he said; he said that to upset me"). Other research on attribution processes focuses specifically on attributions that occur during communicative interactions, such as conflict (→ Interpersonal Conflict; Conflict Resolution). Researchers have found that people are more likely, for example, to avoid conflict if they believe that another's behaviors are unlikely to change, i.e., they make a stable attribution for the source of the conflict (for an expanded review of this literature, see Manusov & Spitzberg, in press).

There are also *moral* and *legal consequences* to the attribution processes that people make. For instance, people treat those with HIV differently when they attribute the person's HIV status to something internal and controllable (e.g., one's own "risky behavior") rather than to something external and uncontrollable (e.g., getting HIV from a blood transfusion or via childbirth). People are also likely to get shorter prison sentences when they are seen as less responsible for the crime. Recently, one court case in Australia found the parents responsible for their child's behavior and fined them on the basis of this attribution (White 2005).

Whereas attribution processes occur about and within communication interactions, their study has been criticized in a number of ways. Some scholars argue that attributions are more of a psychological rather than a communicative process and should therefore not be studied by communication scholars. Conversely, some who study communicated attributions assert that they are a language act and not a cognitive one and should be assessed more as a language form than a cognitive process. Others have argued for the salience of attributions themselves in communication but argue that attribution theories are not viable as theories. Still others are concerned with the best ways to assess attributions (i.e., with rating scales, in talk, based on what dimensions). Overall, however, attribution processes are, for many in our field, a vital part of communication.

## Audience

Marco Dohle

University of Dusseldorf

The audience is an essential part of mass communication processes, and since the beginnings of communication research, it has been one of its central topics. As regards

mass communication, the term “audience” describes the sum of all persons who receive or received (parts of) a media offering. Thus, audience is a group participating in the public communication process but normally it is not involved in the making of its contents. Audience is not a lasting social formation; it rather originates as the case arises via → exposure to communication content.

The general concept of audience is quite abstract. For a more specific analysis, it is possible to differentiate between selected audiences: in this way, audience can be distinguished by its used media (e.g., television audience), channel/product (e.g., → CNN audience), or content (e.g., → News Audience). In the same way audience can be classified according to social characteristics (e.g., women vs men), or the location of use (e.g., American audience). Quite often audience is also characterized by its needs (e.g., information-oriented audience; → Audience Segmentation; Media Use by Social Variable).

### EMERGENCE AND CHARACTERISTICS

The origins of the traditional audience are commonly seen to come from ancient Greece and Rome, where people gathered in stadiums and theaters to attend organized literary and musical works or games and circuses. According to McQuail (1997), one cannot speak of a “mass media audience” before the circulation of printed → books and their use by a reading public at the end of the sixteenth century. New printing techniques, the development of audiovisual media, and factors such as an increased reading capability finally led in the second half of the nineteenth and the early twentieth century to the formation of what we today call a mass media audience (→ Printing, History of; Media History).

Contrary to the traditional audience, the mass media audience is not assembled where the received contents take place or are produced. The audience of mass media is *dispersed*: as a general rule, the individual audience members are spatially separated from each other or, at the most, assembled only in small groups (→ Co-Viewing). The members of an audience do not know and do not see each other; they do not communicate with each other either. However, they are aware that they are not the only recipients of mass media content, but that a co-audience exists. A media offering can be received by all the members of an audience at the same time, although a temporally separate use is more common. The size of the audience can vary and is in principle unlimited – ranging from a small number of readers of a special interest magazine to the hundreds of millions watching the final of the soccer world cup.

### TRADITIONS OF AUDIENCE RESEARCH

There are various approaches to systematize the research into media audience. Taking the purpose of the research as the starting point, audience research can be separated into two sections, despite some overlaps: applied and academic audience research.

#### Applied Audience Research

Applied or commercial audience research determines on, the one hand, data about the audience’s media usage in order to offer exact information about its composition to

commercial industry; these data form the basis for advertisement prices in the media. The most basic unit in this case is the number of users reached. On the other hand, the evaluation of content can be measured additionally.

Applied audience research is of great economic importance. This is why various methods and systems to gather data about media usage from participants exist in many countries. As regards the press and books, the size of the audience can be ascertained through sales figures. However, data acquired through → surveys in which interviewees are asked about their actual use of particular publications are regarded as more valuable. A further instrument that is applied quite often for inquiry about TV usage is the storage of usage data via technical devices connected to the TV (→ Nielsen Ratings; People-Meter).

Commercial audience research has been criticized quite vehemently: the focus on quantitative methods and the interest in mere contact data leads to a sheer “head count” (Ang 1991, 56); each practice is said to have weaknesses, too. In addition, a focus on the results of audience research causes the arrangement of the contents only in accordance with the recipients’ needs, thus neglecting normative functions of mass media. Nevertheless, applied audience research is part of the most developed domains of empirical social research (→ Applied Communication Research).

### **Academic Audience Research**

Academic audience research is a field with different research traditions and interfaces to almost all other areas of communication science. As Webster states, “it is hard to imagine any form of media studies that is not, on some level, about audiences” (1998, 190). Equally manifold are the goals of academic audience research: the audience is the center of attention when investigating the reasons for media usage and the selection of certain offerings, or the experience during reception. Likewise, academic audience research can comprise investigation of the audience in line with media effect analyses or with inquests about the adoption of media and their embedment in the everyday life of a particular recipient. Furthermore, datasets from applied audience research are often used for detailed analyses, for example for the compilation of audience typologies or longitudinal analyses of media reception.

Jensen and Rosengreen (1990) systematize *five traditions* in academic research of the audience: effects research, → uses and gratifications, literary criticism, → cultural studies, and reception analysis. These traditions can be distinguished according to the type and focus of theory and the type of methodology and empirical approaches. However, the authors note that, especially in the literary research tradition, the audience plays only a minor role in comparison to the analysis of contents.

### **CONCEPTIONS OF THE AUDIENCE**

Academic research on the usage of media content often focuses on the individual user. A reasonable way to represent different traditions of audience research and to enlarge the perspective on the audience as a whole is given in the attempt to systematize the research field according to which audience perception is hypothesized (Webster 1998; Bonfadelli 2004).

The perception of audience as a mass regards the media users as a large group being acted upon by media messages – Webster terms this view the “*audience-as-outcome*” model (1998, 193f.). The most prominent scientific term for this perception is the stimulus–response model, which failed to prove tenable. Nonetheless, even nowadays one can often find in analyses the notion of a mass to be protected from the power of the media.

Applied audience research and its associated advertisement industries and media corporations also conceive audience as a mass, but more in the sense of a target group (→ Advertising). The audience is seen as *potential consumers* whose attention is to be attracted. In particular, the number and duration of media contacts is quantified. In doing so, the audience is divided into target groups, which are determined, for example, by means of socio-demographic criteria or lifestyle typologies (→ Segmentation of the Advertising Audience). The composition of a target group should be as homogeneous as possible in order to achieve positive reactions of all recipients to the respective advertisement messages. The value of a target group mainly depends on its assumed purchasing power.

Behind the conception of the *audience as social protagonist* lies a more normative perspective, which understands the audience in its role as citizen or collective actor who is to inform him- or herself about social and political topics and who is to form an opinion. A precondition for this is the provision of certain information – allowed, for example, by establishing broadcast stations regulated by the state or by public law. In the context of the social protagonist idea, the questions that are discussed include, among others, which sub-groups of the audience inform themselves politically via the media, and what information received from the media is consulted for a systematic forming of judgment (→ Public Opinion; Political Discourse).

The perception of the audience as an *accumulation of active individuals* is often considered the counter-draft to the mass concept. It massively confines the assumption of omnipotent → media effects. Its basis is the idea that individuals use the media selectively to satisfy their own needs and interests (→ Selective Exposure). This conception is mainly associated with the uses and gratifications approach. The research in this approach has shown that many cognitive, emotional, and social needs are seen, depending on the individual and the situation, as having different levels of importance, and are met by the different media offerings to varying degrees.

The interpretation of the audience as *fan culture* is also based on the view of active media users. It is mainly part of the cultural studies tradition, in which the meaning of culture, including the usage of media, as an everyday practice is explored. Fans, as in fans of a TV series or of an actor/actress, can therefore be regarded as a specific group of an audience because they, for example, include media content in their everyday life to a high degree, join in fan communities, and often proceed productively, for instance in the compilation of fan magazines (→ Fandom).

## CURRENT EMPHASES AND FUTURE DIRECTIONS

Much importance is attached to some questions of audience research, as they are currently playing a major part and will be relevant in the future, too. A central question is whether the audience should be conceived as an *accumulation of individuals* or as a

*social group*. While especially its spatial separation suggests understanding the audience members as independent of each other, it appears that during phases of the reception process it can be important for users to be aware of other recipients. Such co-audience perceptions could include assumptions on size, simultaneity, social structure, and the experiences of exposure to other consumers. In this way, it is possible that a recipient uses a media offering because he or she knows that many people are doing so and, thus, can feel part of a large audience community.

Additionally, the growing consequences of *audience segmentation or audience fragmentation* are also being discussed. The increased diversity of offerings on the media market as well as social processes of individualization caused the media *audience* to consist of many diverse audiences. These in themselves homogeneous groups are being specifically served via the media's target group orientation. From the perspective of an integrative function, which the media are supposed to have in a society, this phenomenon can be perceived as problematic, although it could be demonstrated that there exist many overlaps between the different audiences.

Another central question deals with the development of the mass audience in a *new media environment* (→ Exposure to the Internet). This topic is also part of the context of fragmentation. In addition, it is relevant in the context of internationalization of the audience (→ Media Use, International Comparison of). New media, especially the Internet, feature a large plurality of usually worldwide diffused and available offerings. These offerings feature new forms of acting and experiencing due to their high potential for interaction. As the diffusion of the Internet in many countries does not seem to have come to an end yet, it is not possible to anticipate if – as has been observed so far – certain audience groups, such as younger persons, use the Internet more often than others.

# Audience Commodity

Eileen R. Meehan

*Southern Illinois University*

The audience commodity is the main product produced by media that earn their primary revenues from advertisers. Traditionally, advertiser-supported media have included → newspapers, → magazines, and commercial forms of → radio, broadcast → television, and → cable television. Advertiser-supported media are often contrasted with media whose primary sources of incomes are audiences: → books, recorded music, and films. Depending on which source is the principal source of revenue, a media company will tailor its content to satisfy the demands of either advertisers or audiences (→ Commercialization of the Media; Commodification of the Media; Cost and Revenue Structures in the Media).

In essence, the primary source of revenue functions as the proverbial customer exerting demand in the marketplace and thereby shaping the product. In theory, then, films should tell us more about what people want to see and television programs should tell us more about what advertisers think will increase the sales of their goods and services (→ Consumers in Media Markets). For advertiser-supported media, the task is to assemble an audience commodity – that is, a group of persons to whom advertisers want to sell their wares (Advertising, Economics of).

The implication is that advertisers will target consumers of brand-name products: people with the disposable income and access to the retail system who believe that brand names enhance their social status and who buy brand-name products both habitually and impulsively (→ Brands). Not targeted by advertisers are consumers who research products, identify products that are interchangeable (fungible) except for brand name, and make purchases on the basis of the lowest available price and fungibility. Such rational buyers are relatively unswayed by advertisers' emotionally charged claims. This suggests that advertiser-supported media will not target rational consumers by providing content designed to attract them. This implication is quite significant for media that provide → news, information, and analysis if, indeed, the audience commodity for such media is made up of irrational consumers.

From 1950 to the present, advertisers have increasingly narrowed the audience commodity in demographic terms (→ *Audience Segmentation*). The most significant demographic categories describe youthful audience commodities: 18–34 year olds, 12–17 year olds, and 9–14 year olds (the so-called “tween market”). These categories are further refined according to gender, social identities, and economic status. Typically, advertisers pay higher prices for youths who are male, white, and upscale. For example, in television, the audience commodity for which advertisers pay the highest price is comprised of white males who are 18–34 years old, and living in upscale households that subscribe to cable. As that cluster of categories becomes naturalized into *the* target audience commodity, all other viewers are treated as specialty audience commodities. Among them are downscale viewers, women, African-Americans, Hispanics, and people older than 34 or younger than 12.

For companies that own advertiser-supported media, the principal economic challenge is to efficiently assemble content that will attract an audience commodity for sale to advertisers. In economic terms, the notion of efficiency has two important dimensions:

the cost of assemblage should be as low as possible and the sale price should be as high as possible. That relationship insures that company profits will be high. In contrast, as active consumers of audience commodities, advertisers seek the highest quality and largest quantity of targeted audience commodities at the lowest price. These economic concerns shape the operations of firms that measure audience commodities.

Executives representing media companies, advertisers, and advertising agencies avoid publicly discussing the implications of the audience commodity for their operations. Instead, they claim that advertisers want to reach as many people as possible and so support media outlets that give audiences what they want and need. This view was (and is) often repeated by cultural scholars analyzing the symbols, images, narratives, etc. embodied by media artifacts.

Political economist Dallas Smythe (1977) argued that such a focus on ideology constituted a “blindspot” that drew attention away from the actual product manufactured by commercial media: the audience commodity. Content was the “free lunch” that lured people into spending time with media so that they could be packaged and sold to advertisers. The existence of the audience commodity was confirmed by information commodities like the A. C. Nielsen Company’s television ratings (→ Nielsen Ratings). Because the audience commodity was assembled in order to learn what products to buy, entertaining or educating the audience commodity was largely irrelevant. Audience members thus “performed essential marketing functions for the producers of commercial goods” (Smythe 1977, 000). Although unpaid, these activities were productive: they made sales for advertisers (Jhally 1982; Livant 1982; → Audience; Audience Research).

Smythe provoked considerable debate. Graham Murdock (1978) posited that Smythe’s argument should be limited to purely commercial media and ought to recognize that the audience commodity could also use the cultural materials embodied in the free lunch. Responses noted the increasing commercialization across all media (Smythe 1978; Livant 1979), which intensified under deregulation (Meehan 2006). Research into the ratings industry demonstrated similar economic constraints on the manufacture of ratings, refining Smythe’s view of information commodities and confirming his main argument regarding audience commodities (Meehan 1993). Smythe’s contribution to the field’s understanding of media’s *raison d’être* as businesses continues to shape research.

## Audience Research

*James G. Webster*

*Northwestern University*

Audience research is a broad term that, in principle, denotes the systematic study of any → audience for any purpose. In practice, the term usually connotes efforts to describe and analyze patterns of media consumption, often for some commercial or administrative purpose. Such research became commonplace in the early twentieth century as new forms of mass media were introduced (e.g., film and radio) and those media became increasingly intertwined with the business of advertising and marketing. Contemporary audience research uses a wide range of theories and methods, which can be organized using the familiar labels of theoretical vs applied, quantitative vs qualitative, and, somewhat less conventionally, syndicated vs custom research.

### THEORETICAL VS APPLIED AUDIENCE RESEARCH

Theoretical audience research operates on two conceptual levels; *micro and macro*. The former tends to look at audiences from the “inside out,” adopting the perspective of an individual audience member. Of theoretical interest are questions about what motivates media selections, what stimuli command attention, how media are used in everyday life, what meanings and/or pleasures are derived from use, and how people engage media as consumers and fans. The relevant bodies of theory run the gamut from the social scientific (e.g., Blumler & Katz 1974; Zillmann & Vorderer 2000), to the humanistic (e.g., Morley 1992; Hills 2002). The latter, *macro-level research* tends to look at audiences from the “outside,” in an attempt to understand their characteristics and behaviors in the aggregate. This perspective sees audiences as markets and/or publics and is often rooted in economics and marketing (e.g., Webster & Phalen 1997; Napoli 2003). Working at this level of analysis has allowed researchers to develop models or “laws” of audience behavior (e.g., Rust 1986; Goodhardt et al. 1987; De Vany 2004).

Applied audience research provides information that can be acted upon by institutions and media industries. It is more prevalent than theoretical research, due primarily to the commercial character of most media systems. Since the early days of radio, advertisers

have demanded surveys documenting the size and composition of the otherwise invisible audience. This gave rise to audience “ratings” research, which has become essential to the operation of advertiser-supported media throughout much of the world (→ Nielsen Ratings). Such data provide the basis for buying and selling audiences, and can be useful in supporting macro-level theoretical research. Commercial motives also drive a variety of research efforts measuring more “qualitative” aspects of the audience. These include surveys and various ethnographic methods designed to assess audience preferences, attitudes, lifestyles, and product usage. Foundations and nonprofit organizations may also do applied research to determine how media are used and whether they are meeting various social or instructional objectives. The producers of the children’s television series *Sesame Street*, for example, have a long history of conducting evaluative research.

### QUANTITATIVE VS QUALITATIVE AUDIENCE RESEARCH

*Quantitative research methods* are common in audience research (→ Quantitative Methodology). The most prevalent is → survey research, which is based on some form of probability sampling. Audience ratings companies use surveys to estimate audience size and demographic composition for an ever growing number of media (e.g., radio, television, movies, video games, out-of-home, Internet, etc.). Other regularly scheduled surveys are used to provide syndicated reports that relate people’s product purchases and personal characteristics to their media use, or assess their familiarity with and liking for various programs and celebrities (i.e., Q scores). One-of-a-kind surveys are often used to gauge media preferences, levels of engagement, opinions, and other administratively or theoretically useful information (→ Public Opinion Polling). Very large, nonrandom, samples or panels are also sometimes used to gather data. In fact, newer media technologies that produce a record of their use (e.g., server logs or digital cable boxes) offer the prospect of survey-like behavioral data based on a census rather than a sample (→ Rating Methods).

Quantitative audience research is not, however, confined to surveys. Media industries routinely measure the appeal of their offerings. Television and movie industries have long used a kind of theater-testing in which prospective viewers are recruited to watch a forthcoming film or pilot program. Respondents view the show in an auditorium and are asked to score various aspects of what they see – often in a near continuous manner that allows researchers to assess the ebb and flow of audience reactions. Such testing can help executives decide whether to go forward with a project, and if so, how to modify or promote it. Similar techniques have been used to measure people’s reactions to political communication and candidate debates. True experiments are relatively uncommon in applied audience research, but have been, and continue to be, a staple of more academically oriented theoretical research (e.g., Zillmann & Vorderer 2000); (→ Experiment, Field). Laboratory research sometimes features the use of physiological measures including eye movement, heart rate, and galvanic skin response (→ Experiment, Laboratory).

Although quantitative methods predominate, *qualitative methods* are increasingly popular in both applied and theoretical audience research (→ Qualitative Methodology). Sometimes labeled audience ethnographies, these techniques include focus groups, unstructured interviews, and participant observation (→ Ethnomethodology). Focus groups, in which a moderator guides a small number of recruits in a discussion, have long

been a staple of marketers and programmers. The method has been used to develop products and ad campaigns, craft radio station formats, assess media personalities, and, in the case of more theoretical research, help determine how people “decode” or assign meaning to media texts (e.g., Morley 1992). Similarly, in-depth → interviews and → observation have been used by both theorists and practitioners to understand the social uses of television, how people adapt to the introduction of digital video recorders (DVRs), and concurrent media use throughout the day.

### **SYNDICATED VS CUSTOM AUDIENCE RESEARCH**

*Syndicated audience research* is a standardized research product that is sold to multiple subscribers. It plays an important role in media industries because its costs can be distributed across many buyers, and it provides a credible, “third party” accounting of audiences independent of the media or advertisers. The most visible form of syndicated research is audience ratings. Measurement companies in the US and much of the world record audience behaviors using a variety of techniques, some of which are quite expensive (→ People-Meter). These data are processed and packaged as different reports that constitute a “currency” used to buy and sell audiences (Napoli 2003; Webster et al. 2006).

Like many forms of information, producing such research has high “first copy” costs, and very low marginal costs. Moreover, the product is a → “public good.” Once created, its supply is not diminished by consumption. These characteristics give the syndicators flexibility in pricing to attract additional business. They also make it difficult for new competitors to enter the market, since challengers will incur first-copy costs with uncertain prospects for displacing the competition and recovering those costs. Further, incumbent syndicators typically offer products that are the result of an ongoing negotiation between clients with disparate interests (e.g., advertisers and media). Their estimates reflect a compromise upon which all agree to conduct business, and their numbers become embedded in the routines of the affected industries. Even modest changes can upset the ecology of the system. Hence, in established industries it is not uncommon to see one syndicator emerge as the principle, quasi-official scorekeeper for the medium in question.

*Custom research* is tailor-made to suit the needs of a particular client. Media organizations often conduct research for their own internal consumption. Radio stations offering popular music formats will, for example, conduct “call-out” telephone surveys to assess the popularity of current hit songs. Alternatively, outside research firms and consultants are sometimes hired to gather data and make recommendations. Since these studies are designed to client specifications they can be quite useful internally, although for external consumption they lack the apparent objectivity of syndicated research.

### **CRITICISMS OF AUDIENCE RESEARCH**

Because of its central, and highly visible, role in the operation of media industries, syndicated research, and in particular audience ratings, has been the object of criticism. Generally, critics have one of three concerns: the accuracy of existing services, the need for different regimes of measurement, and more radical challenges to the entire enterprise of measurement.

In the US alone, billions of dollars in advertising are allocated in accordance with audience ratings. Programming is, in turn, cancelled, renewed, and/or cloned on the basis of those estimates. Increases in the sheer abundance and portability of electronic media, along with advertisers' desires to reach ever more narrowly defined target markets, has caused many in the industry to ask whether the current system is *sufficiently accurate*. While bigger, more representative samples and better behavioral measures always remain a possibility, they must be weighed against their costs. Quality is one of the factors upon which industry participants inevitably compromise.

A related concern addresses the appropriate *object of measurement*. The new media environment seems to invest audience members with ever greater control over what they see and when they see it. Advertisers worry that a simple count of "eyeballs" is no longer enough to guide their expenditures. As a result, there is growing interest in measuring the extent to which people are "engaged" with the media they consume. Such efforts are not new. "Qualitative ratings" have been used in western Europe and were briefly available in the US during the 1980s. The problem is reaching consensus on a useful definition of such factors, agreeing how to measure them, and finding clients willing to pay the price.

A much larger and more radical charge is that all commercially motivated audience research is part of an undesirable enterprise bent on *colonizing and commodifying audiences* (→ Audience Commodity). It is true that media industries often reduce people to one-dimensional members of a target market, or assign them value on a "cost per thousand" basis. Whether the public is, on balance, harmed by this is debatable (e.g., Ettema & Whitney 1994; Webster & Phalen 1997). While audience research inevitably fails to capture all the complexities of media consumption, the machinery of measurement has the virtue of making the audience manifest to institutions that desperately seek its attention.

# Audience Segmentation

*René Weber*

*University of California, Santa Barbara*

“Audience segmentation” or “audience fragmentation” is a phenomenon that describes the process of partitioning mass audiences into smaller and smaller segments. It is considered as an inevitable outcome of competition in media markets (→ Competition in Media Systems). Hence, audience segmentation is expected to be stronger in high- rather than in low-competition media environments (→ Audience).

## MODELS OF AUDIENCE SEGMENTATION

The phenomenon of audience segmentation has been introduced to describe changes in the concept of an audience through the transition from old to new media environments. McQuail (1997) summarizes the concept of audience segmentation by means of four models that represent different stages in the transition. For television, which has experienced the most dramatic changes, McQuail (1997) defines these models as follows. The *unitary model* describes the early years of television (in the 1950s), when viewers either had no ability to select a program, because there was only one channel available, or could select at most among two or three channels. All viewers shared essentially the same television experience – there was more or less a single audience for the programs of one or a few channels. The *pluralism model* describes a status of “limited diversification” that came with an increased supply of television content and television channels. In many countries that introduced television in the 1950s, this development started in the late 1970s and 1980s. Besides channel diversification, viewers experienced temporal diversification. In addition to prime-time television, viewers were able to watch television during the daytime, in the morning, and at night. Further, most television markets diversified locally in this phase of transition, which meant that viewers could find programs that were unique for different locations (e.g., local television news or comedy and drama shows with stories from a particular region and only available in local television markets).

In the 1980s and 1990s, the multiplication of channels in many television markets made it possible that specific (special interest) channels had specific audiences and that viewers’ selective exposure differed significantly from that of the majority of viewers (*core-periphery model*). At the same time, most viewers still shared a common set of a few (general interest) channels. Mainstream content like national news, popular entertainment

shows, and famous movies attracted audiences of all kinds to share experiences. The core-periphery model of audience segmentation is currently the dominant one in countries with multiple channels (including cable and public service channels).

Finally, the *breakup model* describes a situation in which no audience (or at least no core audience) exists any more. Viewers are distributed over many different channels. There is no systematic pattern that explains viewers' channel selection. Viewers do not share or only sporadically share viewing experiences. This model of audience segmentation has not yet been realized but may be underway. New developments such as video on demand, digital TV, digital video recording, and online television, for example, may completely eliminate traditional programming and the temporal synchronization of viewers. In this environment every viewer creates his or her own "channel" with a program schedule that fits best to individualized patterns of viewer availability (→ Television; Television: Social History; Satellite Television).

Although television has experienced the most radical changes in the new media environment, McQuail's four stages of audience segmentation are not limited to television. All stages can be easily transferred to other traditional mass media such as radio and print. However, applying McQuail's models to non-traditional, interactive media, like the → Internet or → video games, is more difficult. While the breakup model still assumes viewers that freely select specific (but given) content that has been prepared by professional content producers, non-traditional media environments provide a platform to exchange content among multiple (professional or nonprofessional) content producers and content consumers.

In highly interactive media forms such as modern video games, for example, users generate their own content (→ Interactivity, Concept of; Interactivity in Reception). In new-generation role-playing video games, users become immersed in virtual worlds and narratives in which they are represented by virtual characters or avatars (Chan & Vorderer 2006; → Avatars and Agents). Usually, a virtual world has been created by a game producer and defines the rules and the theme of a video game as well as the possible depth of content generation. Beyond this, however, video-game experiences are individualized and depend highly on the players' decisions and interactions with the virtual environment. This means that audience segmentation in this media environment addresses both the free selection of a media platform among many alternatives and the generation of, and response to, individualized content. Hence, one might add to McQuail's four models of audience segmentation a fifth: the "*individualization model*." This defines the highest possible degree of audience segmentation, and the term "audience" may even appear inappropriate in this media environment. This raises the question of how the term "audience" is actually defined, and what exactly constitutes an audience.

## THE AUDIENCE CONCEPT

At the beginning of mass communication research, the term "audience" was more or less defined as the group of simultaneous receivers of messages at the end of a linear communication process (i.e., essentially an information transfer from one meta-communicator to many individual receivers). This definition mainly addressed listeners of traditional radio and television (→ Stimulus-Response Model; Media Effects, History

of). Since then, this conceptualization has been replaced by an understanding of audiences as active participants who are resistant to influence, selective, and defined by concerns and needs, as well as depending on specific social and cultural contexts (cf. McQuail 1997, 2005; Webster & Phalen 1997). Advertisers, journalists, filmmakers, and media managers all have different perspectives on and understandings of audiences. Moreover, the linear communication process from the early definition of audience has been supplemented by interactive and transactional processes.

Even simultaneous reception of messages no longer applies to contemporary definitions of audiences. Like radio stations and networks, which claim to reach specified audiences by aggregating listener and viewing ratings across time, new media forms may accumulate large audiences over time. The definition and use of the term “audience” require neither a temporal nor a directional restriction. As McQuail (1997, 143) puts it: “It is not just that the mass audience had fragmented physically as a result of multiplication and abundance of media outlets . . . , but that the meanings of ‘audience’ have multiplied.”

### **AUDIENCE POLARIZATION**

Another concept that is closely related to audience segmentation is that of audience polarization (Webster & Phalen 1997). Audience polarization is defined as the tendency of individuals to move to the extremes of either consuming or avoiding some class of media content. Classes of media content can be defined solely by content (e.g., program genres) or by content and structures that are used to deliver content (e.g., TV channels).

For example: audience segmentation posits that in a multi-channel TV environment, overall market shares of channels become increasingly smaller. However, audience segmentation does not explain whether low market shares result from everyone spending a smaller amount of time watching a particular channel or whether some subset of the audience is spending less time watching single channels and more time watching other particular channels. The more audience segments differ in composition between channels, the higher the extent of audience polarization. Or to put it in statistical terms: the more homogeneous audiences are within channels and the more heterogeneous audiences are between channels, the higher the extent of audience polarization. Similar heterogeneous audiences across channels would be an indication of low audience polarization.

Audience polarization helps to understand the social implications of the new media environment. For example, if fewer and fewer people share media experiences, one may consider audience polarization as a threat to cultural (or national) identities (cf. Katz 1996).

### **EMPIRICAL EVIDENCE OF AUDIENCE SEGMENTATION AND POLARIZATION**

In a recent study, Webster (2005) re-examined empirically the phenomenon of audience segmentation and polarization. He concludes that audience segmentation is well underway and has been rather underestimated than overestimated. In the United States, for example, the three big nationwide networks (ABC, CBS, and NBC; → Television Networks) together rarely reach average audience shares of higher than 20 percent nowadays. Moreover, audience segmentation is occurring everywhere in multi-channel

TV environments. In addition to audience segmentation, there is empirical evidence for a modest audience polarization. This tendency, however, is still mainly driven by the structure of the media environment itself. Many TV channels, for example, are still not available to all audiences.

On a *methodological level*, audience segmentation can be studied by using standard audience research methods (→ Audience Research; Rating Methods) such as → survey and diary techniques. In most multi-channel TV environments so-called → “people-meters” are well established. These record electronically who watched which channel at what time (→ Nielsen Ratings). The combination of media usage data with the stated preferences, needs, and opinions of people can be used to better understand the compositions of audience segments. Statistical cluster and classification procedures are frequently applied for this purpose (→ Cluster Analysis; Discriminant Analysis; Factor Analysis).

## **Audiences, Female**

*Karen Ross*

*Coventry University*

The ways in which “the audience” has been conceptualized have moved, historically, through an arc from passive to active to interactive, and the embodied audience has become fragmented as the media industry tries to deliver niche audiences to particular

advertisers. One such segmented audience is that of the group “women,” even though an archetypal “woman” does not actually exist. However, many researchers have nonetheless focused on the ways in which women, as a specifically gendered audience, have reacted to and engaged with media such as TV and film, and how they consume genres which are supposed to be especially appealing to women, such as soaps, romantic fiction, and magazines. Work in this field has often been feminist in orientation and has mostly focused on women’s relationship with texts, although some work makes comparisons between women and men in terms of their enjoyment of particular media forms. However, the history of researchers’ engagement with the female audience is, in some ways, exemplified by the overdetermination of research studies on soaps and magazines.

### RESEARCH HISTORY

Research on the gendered audience spans more than half a century, although even 50 years ago, there were contradictory views on what kind of women were consuming popular cultural products (→ Soap Operas). For example, while some studies identified the “typical” consumer of radio soaps as working-class women with little education and limited possibilities for advancement, others in the same period suggested that women across *all* class positions enjoyed this genre. However, there was a little more agreement about some of the other (imagined) characteristics of the typical member of the female audience, including that she was usually married, between the ages of 18 and 35, and with some education. Herta Herzog’s analysis of soap consumers was more “positive” than other studies because she argued that audiences used soap opera to learn about aspirational middle-class values and behaviors (1944). Later studies did begin to conceptualize soap audiences as being more educated than previous studies had suggested but still characterized them (still predominantly women) as being socially lacking or isolated, watching soaps to escape the tedium of their dull lives.

By the 1980s, much mainstream work on soap audiences still maintained that there was a correlation between social interaction and sociability in the real world and the extent of soap watching. This reinforced the idea that soaps function as a surrogate friend for social inadequates (→ Parasocial Interactions and Relationships). But what was often absent from these somewhat positivist and generally harsh analyses of the soap audience was any real sense of the discursive and pleasurable possibilities for social interaction based on a shared enthusiasm for particular shows. This analytical gap was puzzling since there was often an acknowledgment running through such studies that viewers *did* talk about shows with other people and that they derived pleasure from both individual consumption and the post-broadcast discussion with friends, family, and/or workmates. Arguably, it was the interest of (women) researchers who wanted to explore the genre of soap as a specifically gendered practice, aimed at women and enjoyed by women, that marked a shift in the way in which the audience for soaps began to be perceived during the late 1970s and early 1980s. It became possible and even desirable to think about “popular” texts as foci for serious scholarly analysis, and with that shift came an understanding of the significance of popular culture in the lives of ordinary people.

In particular, Dorothy Hobson’s (1982) ethnographic research (→ Ethnography of Communication) on the British series *Crossroads* made a significant departure from the

more usual research mode. Hobson went to women's homes and recorded the conversations she had about their viewing experiences of and responses to the show. She specifically aligned herself with her participants as a sister *fan* and was thus able to provoke candid discussions as a consequence of a shared and knowing interest. What Hobson found were viewers who enjoyed the show but were often embarrassed to admit they watched, or defensive about their guilty pleasure, expressing an internalized disdain for the series which they had "learned" from cultural critics.

Focusing on the same genre but using a different approach, Ien Ang's study (1985) of *Dallas* found, rather surprisingly, that most viewers who participated in her study believed the show to be "realistic" and congruent with their own lives and experiences. Ang's answer to this apparent conundrum was to theorize a notion of "emotional realism," so that the pleasures of affect for audiences were derived from a shared sense of personal tragedy, allowing them to empathize at an emotional level with the pain associated with familiar renditions of domestic dysfunction. Ang's work also made very clear that women and men derived different pleasures from their watching and were interested in different aspects of the narrative. In contemporary studies of Latin American women, similar understandings of "reality" were also observed, especially the incorporation of existing class-, race-, and gender-based tensions (Mayer 2003; Tufte 2002).

Contemporary work on women and soaps has both continued the ethnographic turn and revived more structured research modes. As with earlier studies, current researchers have been keen to credit audiences with sophisticated deconstructive and interpretive skills, trying to understand their viewing behaviors and pleasures as forms of active engagement rather than passive dislocation, and assuming, for example, that soap fan networks have the potential (and reality) of providing sites of resistance for women to engage in critical discourses about sex-role stereotyping and expectations. In this way, the process of discussing plotlines and character development in their favorite soap can actually enable women to use those narrative themes as a springboard for much wider debates about their own lives and those of other women they know.

The potential of a safe rehearsal of one's own life choices through the discussion of soap characters' circumstances is an important function for audiences, where the shared experience of bad luck or poor outcome provides strong identifications between audience and character. It is the narrative produced by audiences which constitutes the primary site of resistance, not the primary text itself, which is more usually encoded in line with the dominant conventions of a patriarchal status quo. However, some scholars have argued that soap opera itself is a subversive genre, since its staple ingredients of broken marriages, casual sex, unintended pregnancies, domestic violence, and petty crime are directly antithetical to the socially acceptable norms of romantic love contained within the domesticated marriage arrangement and good citizenship (Lovell 1981). Soap opera's interest in and portrayal of women's lives provides useful gender role correctives to the more normative renditions of femininity and masculinity found in the archetypal Hollywood film.

### **WOMEN WATCHING FILM**

While the principal focus for much academic study of women and film has been textual analysis, the highly gendered nature of which can be partially attributed to the ground-

breaking work of Laura Mulvey (1975), part of the development of “seeing” film through a gendered frame has engaged some feminist media scholars in looking beyond the text and their own interpretation toward the views of the audiences. Helen Taylor’s (1989) work in the late 1980s sought precisely to rupture the firm hold that “the text” had on film researchers and to counter the dangers inherent in theories which irrevocably situate women and men in fixed subject positions based on so-called sex-based characteristics. She showed the multiplicity of readings that audiences could bring to a single cultural product, let alone a genre such as the “woman’s film,” and identified the importance of historical specificity in understanding changing responses to texts, since her respondents were women who had seen the original screening of *Gone with the Wind* in 1939. Such studies placed the female spectator at the center of the analysis in ways which gave her importance in her own right, as possessing agency, rather than being simply “positioned” by the text (→ Text and Intertextuality).

Key tropes in popular culture are those of crime and violence, commonly paired, and researchers have begun to differentiate women and men audiences for this genre, often with surprising results. For example, women can be as enthusiastic for blood and gore as men; although many films in this broad genre frame women as victims, the audience is often encouraged to identify with the woman looking for revenge; and women will sometimes invent reasons for liking certain kinds of films, in say kick-ass martial arts genres, by suggesting they watch because they appreciate the high level of fighting skills displayed by the protagonists (→ Violence as Media Content). As the audience intellectualizes aspects of the content, the text is transformed into an object of aesthetic appreciation, giving the viewer a high-culture “defense” for her enjoyment. Such are the ways in which women’s position and required behavior in society are constrained by prescribed norms of femininity, it is little wonder that women have had to invent strategies which allow them to breathe.

## THE GENDERED AUDIENCE FOR NEWS

If soaps are regarded as the archetypal women’s genre, then news and current affairs are seen as of almost exclusive interest to men. It is often taken almost as read that women are not interested in news and that as a genre it is very much the domain of men. Consequently, although there have been any number of studies which have focused on how audiences understand news discourse, both print and broadcast, few of those studies disaggregate findings in terms of gender.

Women’s actual interest in politics is rarely reflected in their on-screen characterizations or as a thematic in either fiction or fact-based programs, which ignore the very real interest that “ordinary” women have in the political process and the policies that affect all our lives. Karen Ross (1995), who has conducted research on female audiences for news, explored the ways in which British women viewers engage with the images of themselves routinely portrayed in news media and the extent to which they negotiate or challenge traditional gender orthodoxies. Ross’s participants fully understood the existence of specific slants and foci in news reporting, commenting that programs are too politically biased, too male-oriented, and don’t talk to or about women in any depth. What that study showed very clearly was that, contrary to popular opinion, women do watch news and current affairs programs and when asked specifically about their consumption,

the great majority of respondents reported that they always watched or listened to at least one news program every day and most read a newspaper regularly (→ News Audience).

### WOMEN AND MAGAZINES

The ways in which advertising influences girls' and women's sense of self-worth through the representation of women and women's bodies in magazines have received considerable and enduring scrutiny over the past few decades in a number of nations. The vast majority of this work suggests that magazines work to the detriment of their readers in terms of the perpetuation of heterosexist norms about appropriate forms of femininity, causing dissatisfaction among women (readers). This dissatisfaction can turn inward, producing an escalation in eating disorders, as well as outward, as women purchase increasing numbers of products selling the impossible dream which is obviously unrealized (unrealizable), thus perpetuating the tragic cycle of dissatisfaction/expectation/trial/dissatisfaction.

While much audience research is situated within a white western paradigm, a number of important studies look beyond the Anglophone world. Some of these show that irrespective of the traditional norms of "sanctioned" femininity associated with a particular country, young women may still aspire to the version of white bodily perfection promoted by global (fashion) advertising: they still want to be Kate Moss. For example, although the young *Japanese women* in one study felt that it was important to have a career, they also wanted to be married (Luther & Nentl 2001). In another, focused on ethnic identification, *black women* identified closely with black models but white women did not display the same affinity with white models, possibly because black women were more likely to promote positive, community-based self-esteem than their white sisters (David et al. 2002). Another complicated finding is that women will often have contradictory responses to the advertising world's insistence on what passes for beauty, simultaneously acknowledging the importance of the Eurocentric ideal and admiring specific national norms of beauty, particularly in developing countries.

### THE INTERACTIVE WOMAN

Most feminist media scholarship on women as audience has tended to focus on women's appreciation and understanding of particular "female-oriented" texts, what they mean to women and their lives, and how women work with content both on their own and with others. However, these studies have generally assumed the audience is passive, in the sense of simply "watching" or "reading" material. More recently, though, the rapid developments in information and communication technologies mean that we have to rethink what it means to be an audience, including a gendered audience, and consider the (potential, at least) shifts in power between the audience and the artifact (→ Technology and Communication). At the time of writing, if women like watching *Xena: Warrior Princess* but want to see Xena and Gabrielle in a more explicit embrace, they can watch or even create alternative storylines on any number of Xena fan sites. If women want to read news which resonates with their own interests and lifestyle, they can access any number of online newspapers and magazines on both mainstream and women-focused websites (Harcourt

1999). If women want to watch a film but don't want to go to the cinema on their own, they can rent a DVD and watch it at home, including star interviews and outtakes.

The more active, discerning audience has not escaped the notice of media owners and advertisers, who now recognize the *active audience* in new ways as they seek to keep their attention and loyalty. For example, the producers of reality TV shows such as *Big Brother* let audiences play an active part in how the show develops over a period of weeks by voting off contestants. The relative power of the audience would seem to have grown, and although these innovations impact on women as well as men, how women and men actually experience being interactive is often quite different. These differences (and similarities) offer new sites for interrogation for feminist cultural studies scholars keen to understand these new practices of audience-hood and to identify the extent to which traditional discriminations are being maintained or challenged in this brave new world (→ Cultural Studies). Feminist political economists are also interested in questions about whether these new interactive arrangements between women audience members really change either women's relationship to the media industries or their social status. Meehan's (2002) work, which considers gender in the commodity audience, offers a foundation. Among other things, she asks whether one can understand women's true power as a commodity audience without also examining women's economic status, their wages, and their ability to render meaningful institutional decisions made within media industries.

To be sure, for some time now, the emancipatory potential of new technology *has* been both celebrated and challenged by feminist and other scholars (→ Internet). In particular, there has been anxiety not to over-romanticize the Internet as always and everywhere a force for good. Early supporters of the web celebrated its facility to offer not only a quasi-community in which to affirm membership but also a safe space in which to "try out" different versions of ourselves, but others have been much more cautious about the web's allure. In particular, the overt and covert "rules" that limit and delimit user involvement continue to cause concern, as does the increasing availability of pornographic material and images.

Interestingly, the same gender skews which exist in relation to audience involvement and participation in older forms of media are also found in new technologies in terms of access and involvement. In other words, "old" forms of differential access, based on personal characteristics such as gender and age as well as geography (the North–South divide), are replicated in this new medium, as any number of studies on the "digital divide" have found. The male-dominated development of new technologies is thus conceptualized as being yet another way in which to entrench gender divisions. Several studies in both the developing and the developed world show that women's use of the Internet is often squeezed between discharging their domestic and family responsibilities. Most gender-focused work on information and communication technologies (ICTs) has tended to look at the ways in which women audiences and users are marginalized and even excluded from the marvels of the world wide web. However, a few more recent studies have explored the active relationship which women have as consumers and users of new technologies, both in general terms and in terms of being specifically targeted as niche audiences (→ Digital Divide; Exposure to the Internet).

## **Australia: Media System**

*Peter Putnis*

*University of Canberra*

European settlement of Australia commenced with the establishment in 1788 of a British penal settlement in what later became the city of Sydney. While Australia was inhabited by an estimated 750,000 Aboriginal people, the continent was claimed as a possession of the British Empire. By the middle of the nineteenth century Australia comprised six internally self-governing colonies centered on the capitals of Sydney, Melbourne, Brisbane, Adelaide, Perth, and Hobart. With federation in 1901 these colonies became States of the Commonwealth of Australia, a constitutional democracy based on a federal division of powers.

Australia, with a culturally diverse population of over 20 million in 2006, has had a long, continuous experience of democratic government based around a party system dominated by two political groups, the Australian Labor Party on the one hand and a coalition of conservative parties on the other. Under the federal system of government the powers of the Commonwealth Parliament are formally limited to areas of national importance, such as foreign relations, defense, and immigration. The Australian Constitution also gives the Commonwealth responsibility for the regulation of “postal, telegraphic, and other like services.” Under this provision, the Commonwealth has taken responsibility for the regulation of all broadcasting and telecommunications in Australia.

There are no press laws requiring newspaper licensing. The federal government’s power over the press is limited to its general corporate affairs responsibilities and foreign investment policies. It has, at times, used these to limit the extent of foreign ownership of the press. There is no constitutional provision that explicitly guarantees freedom of the press. Australia has maintained the English tradition that freedom of speech is adequately protected by common law (→ Freedom of Communication; Freedom of the Press, Concept of).

The European settlement of Australia in the nineteenth century took place at a time of rapid growth of the press in Britain, enabled by technological advances, liberalization of taxation and other government controls, and increasing levels of literacy. The growing importance of the press in social and political life was also reflected in Australia’s development. Australia’s first newspaper, the *Sydney Gazette*, which commenced publication in 1803, was published by the authority of the Governor. However, by the 1830s controls had been largely lifted and seven papers had been established in New South Wales. As settlements spread to inland areas, stimulated by gold rushes and agricultural development, the printing presses followed. In the 1890s it was observed that it was not unusual for towns of around 10,000 inhabitants to have four newspapers. It was also observed that in the Australian colonies there was approximately one newspaper title per 7,000 inhabitants, while in Great Britain there was one per 18,000. The current distribution of newspapers reflects nineteenth-century settlement patterns. While there are two national papers, the *Australian* and the *Australian Financial Review*, the press is largely locally oriented.

## PRESS DEVELOPMENTS

Since the 1920s the trend has been toward a reduction in the number of titles and a *concentration of ownership*. In 1923 there were 26 dailies in Australia’s six capital cities with 21 independent owners. By 1950 this had fallen to 15 dailies with 10 owners. Since then further metropolitan newspapers have closed, including all afternoon papers, and there has been a marked increase in the concentration of ownership. While Melbourne and Sydney retain two daily newspapers, all other cities are served by a single daily newspaper (→ Concentration in Media Systems).

Press *circulation*, relative to population, has declined more sharply in Australia than in any comparable country. Between 1970 and 2000 newspaper circulation reduced by half from 321 to 162 per 1,000 population. On the same measure, newspaper circulation reduced by 29 percent in the United Kingdom and 33 percent in the United States (Tiffen & Gittins 2004). In 2006, a total of 731 newspapers were listed in Margaret Gee’s *Australian Media Guide*, including over 400 regional and country newspapers, around 160 suburban

papers, and over 100 ethnic papers. Of the 11 major national or metropolitan dailies there were two which had daily average circulations of around 400,000 or more, five with average circulations of around 200,000, with the remainder having lower circulations.

The circulation of Saturday editions of major papers such as the *Age* (Melbourne) and the *Sydney Morning Herald* are some 80 percent larger than weekday circulations while the four newspapers with the highest circulation are Sunday newspapers. This suggests a reduced role for the daily newspaper, a trend linked to the idea that society is becoming increasingly time-poor and the fact that broadcasting has largely supplanted the traditional “latest news” function of newspapers. It is also argued that the decline in relative circulation can be linked to the concentration of press ownership in Australia and the fact that most cities only have a single newspaper (Tiffen 2006).

Rupert Murdoch’s → News Corporation accounts for just under 70 percent of the total circulation of major papers in Australia. The other major players are John Fairfax Limited, with 21 percent of the circulation and WA Newspapers with 9 percent. A fourth significant player, Rural Press Limited, owns the national capital’s *Canberra Times* and over 150 country papers. While these existing newspaper groups are profitable, it is extremely unlikely that any new daily newspapers will be launched in Australia given declining total circulation and the fall in the total newspaper proportion of advertising expenditure.

The major newspaper groups successfully operate *Internet editions* and associated services. Fairfax Digital is the leading news website with an average of 3.2 million unique browsers per month in 2005–2006, followed by Ninemsn (an offshoot of the Channel 9 television network) and News Limited’s website. Newspaper companies do not have significant interests in the broadcasting media in Australia because of government restrictions which have, since 1987, restricted cross-media ownership in any single market and so have prevented a company from having major newspaper and television interests in a single city.

## BROADCASTING SYSTEM

There is a dual system of radio and television broadcasting with two state-owned networks, largely funded by the federal government, operating side by side with government-licensed commercial operators. Regular radio broadcasting began as a commercial operation in 1923. In 1932 twelve existing radio stations were nationalized and formed the basis of the Australian Broadcasting Commission (ABC), modeled on the → BBC. The ABC now operates four national radio networks consisting of 60 metropolitan and regional stations throughout Australia as well as an international radio service broadcasting to Asia and the Pacific. A second publicly funded network, the Special Broadcasting Service (SBS), was established in 1978 and currently broadcasts in 68 languages to all major centers in Australia (→ Public Broadcasting Systems).

In 2006 there were about 260 commercial radio stations and 360 community radio licenses. With 37 million radio receivers, radio is arguably the most pervasive medium in Australia. A 2003 survey found that 70 percent of the population regularly listened to commercial radio, 51 percent to the ABC or SBS and 18 percent to community radio. In the early 1990s the government lifted restrictions on the number of radio stations a company could own and on foreign ownership. This led to a rapid consolidation of ownership,

accompanied by national networking. The metropolitan market is now dominated by three major owners while a single operator dominates the regional market, owning over 90 stations.

Regular commercial and public service television broadcasting began in 1956. In the early decades of television, programs from the United States and the United Kingdom were dominant. The period from 1970 to 1990 is regarded as the high point of Australian television drama while in the 1990s and 2000s lifestyle programs and reality TV have come to the fore. A strong tradition of public service television, through the ABC and SBS, continues albeit in an era of reduced government support. It is also suggested that, given the abundance of media made available through new technologies, there is a reduced community need for public broadcasting, though others argue that the role of public service broadcasting in providing an independent and noncommercial space for comment and discussion is as important as ever (Jacka 2006).

Commercial radio and television broadcasters are regulated by a licensing system administered by the Australian Communications and Media Authority (ACMA). The principle that has underpinned television regulation has been that, as spectrum allocation involves leasing a scarce and powerful resource to private interests, it is appropriate to attach conditions to licenses which reflect the public interest. These conditions cover programming (e.g., requirements for Australian content) and codes of practice. This rationale has, however, been challenged in more recent years with the increased availability of spectrum associated with the shift from analogue to digital broadcasting (→ Radio Broadcasting, Regulation of; Television Broadcasting, Regulation of).

## REGULATION AND NEW TECHNOLOGIES

Before 1987 media companies combined interests in television, newspapers, and radio in single markets and could exploit synergies between different areas of their business, for example in advertising sales. However, as already indicated, the government introduced restrictions on *cross-media ownership* in 1987. Concurrently, a rule which had limited ownership to two television stations was dropped and replaced by an audience-reach rule which treated Australia as a single television market. This, accompanied by the development of a domestic satellite system from 1985, encouraged networking. These changes led to a major restructuring of the industry with the result that the commercial free-to-air television system, though it comprises over 40 commercial channels, is now dominated by three networks, Channels Seven, Nine, and Ten. This has led to an increased uniformity of free-to-air programming across Australia.

Subscription television was introduced in 1995 utilizing both cable and satellite delivery systems (→ Cable Television; Satellite Television). While the subscription TV share of the viewing audience has been growing, uptake has been relatively slow, with around 23 percent of homes connected by 2004 compared to 88 percent in the US and 50 percent in the United Kingdom. The most powerful player in the Australian subscription television landscape is Foxtel, jointly owned by the Australian telco Telstra (50 percent), News Corporation (25 percent) and Publishing and Broadcasting Limited (25 percent).

The first decade of the twenty-first century has seen further major changes to the structure and regulation of the Australian media arising from the recognition that the cross-media ownership laws are obsolete in an era of *technological convergence*, the switch

from analogue to digital broadcasting, and the increasing number of available media distribution platforms, especially the Internet. The government-initiated switch to a fully digital broadcasting system by 2012 has opened up new opportunities for multichanneling. Internet streaming and podcasting of radio has quickly established itself, and similar developments in television are anticipated (→ Digitization and Media Convergence).

The availability of new technologies is also leading to the fragmentation of traditional audience cohorts. In the decade 1995–2004 Australians, on average, watched free-to-air television for over 20 hours per week. This audience is, however, slowly declining in response to greater media diversity, particularly in the youth market where the uptake of new technologies is very strong.

Between 1998 and 2005 the number of Australian households with a computer increased from 44 percent to 67 percent, while the number of households connected to the Internet increased from 16 percent to 56 percent. The Internet is lightly regulated in Australia, though the 1999 Broadcasting Services Amendment (Online Services) Act is designed to limit objectionable content hosted within Australia (→ Exposure to Communication Content).

## **Austria: Media System**

*Thomas Steinmaurer*

*University of Salzburg*

Austria is a parliamentary democratic federal republic with a population of 8.26 million. The official language is German; regional official languages are Croatian, Slovenian, and Hungarian. The historical development of its media system can be divided into the

following phases: the period 1621–1848 under the influence of censorship; the abolishment of censorship in the year of the revolution (1848); and the adoption of freedom of opinion and press freedom in the constitution of 1867, which facilitated the development of a modern press in Austria. The elimination of the parliament in 1933 brought measures to regulate the press again, and Austria's annexation by the Third Reich (1938–1945) led to a phase when the press was controlled by a totalitarian regime. After this there was a time of prosperous development with increasing modernization (Schmolke 1996).

The beginnings of broadcasting in Austria date back to 1924, when the Radio-Verkehrs-Aktiengesellschaft (RAVAG) started its operations. Initially founded as a monopoly with close proximity to the state, RAVAG was easily incorporated into the Third Reich broadcasting company in 1938. After World War II, broadcasting was constituted as a monopoly company under governmental influence in 1957. The public broadcaster *Österreichischer Rundfunk* (ORF), founded later, emanated from this station, and held a monopoly position until 1993 in the radio broadcasting sector and until 2001 in the television sector.

Today, Austria's media system can be characterized as typical of a small European state which is under the strong influence of a bigger neighbor market, in this case that of the Federal Republic of Germany (→ Germany: Media System). The relatively late introduction of the dual broadcasting system with public and private stations, as well as the particularly high degree of concentration in the press sector, can be regarded as identifying features. According to Hallin & Mancini (2004) Austria's media system can be associated with the (north-central European) "democratic corporatist model," characterized by a process (albeit interrupted) of democratization, moderately defined lines of conflict, consent orientation, organized pluralism, corporatism, and a strong welfare state.

With 19 independent newspapers and (still) two newspapers owned by political parties, the *Austrian press* landscape is shaped by the dominance of a small number of big publishing houses. The tabloid paper *Neue Kronen-Zeitung* has been the uncontested market leader for many years. With a readership share of more than 40 percent, it is one of the biggest newspapers worldwide in proportion to the size of the population. In the late 1980s bigger publishing houses from Germany began efforts to establish themselves in the Austrian market, which intensified the process of concentration.

In the year 2000, the development of market concentration was further intensified when the biggest publishing house entered into cooperation with the predominant publisher of magazines. Following an international trend, the publication of free daily newspapers led to an increase in the variety of titles. Four new papers, representing a counterbalance to the newly founded paper *Österreich* in September 2006, brought a new dynamic into the market. A press subsidies scheme, introduced in 1975, tries to ensure that there is variety in the market.

Since the 1950s *radio* broadcasting has been chiefly in the hands of the public broadcasting company, ORF. In the course of its operation it established four radio stations, thus building up a broad offer. It took a long time before private providers were admitted, in 1993. In the year 2006 about 60 commercial and four public radio stations were competing on a regional and national level, making ORF stations still the market leaders. Besides public and private radio, there are also programs for language minorities and noncommercial stations.

As in the radio broadcasting sector, the public ORF was also the only *television* broadcaster in Austria for many years. After a first reform in the late 1960s, aimed at

reducing political influence on the broadcasting company, the first steps in modernization included a comprehensive reform of the ORF program. Up to the time of writing, the ORF has been funded through a compulsory television license fee (currently about 51 percent of income) as well as advertising revenues (currently about 34 percent of income). Although foreign broadcasts could be received through cable and satellite transmission (in more than 85 percent of households), and competition, mainly from German private television channels, became fiercer, ORF was the last public television broadcasting company in Europe to lose its monopoly position, in 2001. This long phase as a monopolist enabled the ORF to expand its market position, with an average market share of about 50 percent today. Since 2002 one private Austria-wide channel (ATV plus) and three local channels have been broadcasting with modest market shares. Austria's step into digital television was made in 2000 with satellite television broadcasting (ORF digital) and with terrestrial transmission of digital television in 2006.

It was not until Austria's EU accession in 1995 that the telecommunications monopoly was opened up. In 1996 the first mobile phone provider started operations, and developed dynamically soon after. Above all, the late 1990s showed a clear increase in the size of the market. In comparison to other European countries the level of *Internet* access increased quickly, and it measures up to the international level today. Overall, the telecommunications market has been characterized by strong rates of growth in mobile and data communication, showing consolidation processes in the market dynamic after liberalization.

## **Automaticity**

*Robert S. Wyer*

*Hong Kong University of Science and Technology*

Automaticity in information processing is best conceptualized in terms of its antithesis. “Deliberative” processing involves the comprehension and use of information for a

particular purpose (e.g., to make a judgment or decision, to communicate to others, etc.). This processing is conscious and intentional; it requires some degree of cognitive or motor effort, and it is volitional. In contrast, behavior is automatic if it does *not* have one or more of these characteristics. That is, it is unintentional *or* it is performed unconsciously without awareness *or* it is effortless *or* it is unable to be controlled. Although these criteria are not independent, a behavior is often characterized as automatic if it meets any one of them (→ Cognition; Information Processing; Mindlessness and Automaticity).

Of the four criteria for inferring automaticity, *lack of awareness* is most widely investigated. Numerous experiments demonstrate that stimuli to which people are exposed subliminally (below the threshold of conscious awareness) can influence not only the concepts they use to interpret information but also the information they use as a basis for inferences and the standards they employ in making comparisons (→ Experimental Design). Furthermore, these stimuli can activate goal-directed behavior and can have a direct impact on behavioral decisions (→ Goals, Cognitive Aspects of).

It is important to specify what people are aware or unaware of. As in the preceding examples, people can be unaware of a stimulus itself. In other cases, however, they might be aware of a stimulus but be unaware of the mental processes that govern its interpretation and use. For example, people who hear that someone wants to cross the Atlantic in a sailboat might interpret the behavior as “adventurous” but be unaware of the factors that led them to select this description rather than “reckless.” Alternatively, a person might form a favorable or unfavorable impression of someone on the basis of an → interaction with the person but be unaware of the specific features of the person that gave rise to this impression. Finally, people might be aware of a stimulus but not be aware of its influence. As one study shows, for example, individuals can be aware of a person’s ethnicity but unaware of its impact on their judgments of the person or their interpretation of his or her behavior. Similarly, people might be aware that they are in a good or bad mood but unaware of the influence that these feelings have on their evaluation of a person or object they happen to encounter.

The effects of subliminally activated concepts and knowledge are *unintended*. However, stimuli of which people are aware can also have unintended influences on their behavior. An example is provided by the “chameleon effect,” or a tendency for individuals to imitate the nonverbal behavior of persons with whom they are interacting (crossing their legs, rubbing their chin, etc.) without intending to do so. People often use the events and situations they see on television as bases for inferring the incidence of these events in the real world. Consequently, heavy television viewers tend to overestimate the incidence of events and situations that are over-represented in this medium (violent crimes, or people with swimming pools in their back yard; → Cultivation Effects; Media and Perceptions of Reality). However, the use of this source of information is unintentional, and calling attention to these effects can lead individuals to adjust for their influence.

The third criterion for inferring the automaticity of behavior is the extent to which people are able to control its occurrence (*controllability*). Native English speakers may find it impossible not to understand the statement “the boy kicked the ball.” At the same time, they cannot help but recognize that “the ball kicked the boy” is nonsensical, and that it can be understood only by engaging in deliberative processing (e.g., constructing a mental image of a ball with legs beating up on the boy). Similarly, it is difficult for

Americans not to recognize that the statement “Abraham Lincoln was Prime Minister of England” is untrue. Efforts to exercise control over a behavior can sometimes have unintended effects. This possibility is exemplified by research on the effects of thought suppression. That is, conscious attempts to suppress the use of a stereotype in making judgments can be effective in the short run. However, the attempts to suppress the stereotype actually increase the tendency to use it later, once conscious efforts to avoid using it no longer exist.

Behavior and judgments are performed automatically to the extent that their performance requires no cognitive resources (*efficiency*). This possibility is typically examined by asking individuals to perform two tasks, A and B, simultaneously (e.g., to remember an eight-digit number while making judgments of visual stimuli). If one task, A, is performed just as quickly and well when people are simultaneously performing B as when they are not, one can conclude that B is performed automatically. For example, research shows that gender stereotypes have similar effects on judgments of a target person regardless of the cognitive demands placed on them by performing a secondary task, whereas behavior and trait information has less effect when other cognitive demands are high. This suggests that the implications of  $\rightarrow$  stereotypes for judgments, unlike those of other types of information, are identified and applied automatically.

*Daily life activities* normally involve a mixture of both deliberative and automatic processing. A driver may consciously think about the way to a restaurant and may intentionally look for street signs that indicate where to turn. Moreover, the person may deliberately slow down to let a pedestrian cross the street. At the same time, he or she may not be conscious of the specific actions performed to attain these goals (turning left, stopping and starting the car, etc.). Similarly, writers may think consciously about the wording of a sentence they construct. Yet, many of the specific words and phrases they employ may come to mind automatically. A conceptualization of individuals’ responses to communications will ultimately require an understanding of how these two types of processing interface.

# Availability, Cognitive

*Rainer Greifeneder*

*University of Mannheim*

*Herbert Bless*

*University of Mannheim*

The term “availability heuristic” refers to a judgmental rule of thumb for estimating frequencies and probabilities. It states that individuals determine frequencies and probabilities “by the ease with which relevant instances come to mind” (Tversky & Kahneman 1973, 207). The logic underlying the availability heuristic holds that frequent and probable events are well represented in memory and are therefore easy to retrieve. Reversing this link, the experienced ease associated with retrieving specific events from memory can be used as an indicator for the frequency and probability of events. For example, when asked how many different game shows are currently aired on TV, one may determine how easy or difficult pertaining instances can be recalled and base the judgment on the experienced ease or difficulty associated with this recall (“If it so easy to recall examples of different game shows, then there must be many”).

The availability heuristic generally yields accurate results since frequent events are better represented in memory than infrequent ones. However, when experiences of ease or difficulty are influenced by factors other than frequency of prior exposure, the availability heuristic may be misleading. In particular, events are also more easily recalled the more recently the event occurred or was otherwise activated (recency effect), the more attention they received during encoding (salience effect), or the more the situational context of the retrieval matches the initial encoding context (congruency effect). Consequently, despite being generally accurate, the availability heuristic may produce misleading results too. As a prominent example, it has been demonstrated that individuals overestimate the prevalence of *extreme* causes of death, e.g., flood, homicide, tornado (Combs & Slovic 1979). The striking bias was, obviously, not a result of “reality,” but was rather a consequence of media coverage, which, it has been suggested, tends to over-report sensational events (→ Exemplification and Exemplars, Effects of). Over-reporting is likely to render extreme events very accessible, thus increasing the ease with which related pieces of information can be brought to mind. Therefore, whenever media coverage does not reflect true variation in the environment (e.g., because of over-reporting of extreme events), frequency judgments are likely to be biased due to the judgmental implications of the availability heuristic (→ Priming Theory; Media and Perceptions of Reality; Reality and Media Reality).

The above examples suggest that individuals may rely on the ease or difficulty associated with retrieving information from memory when forming frequency and probability judgments. In a classic study, Tversky and Kahneman (1973) demonstrated this by asking participants whether there are more English words that begin with the letter *r* than those that have the letter *r* in the third position. Usually, individuals judge words that begin with the letter *r* to be more frequent than those with *r* in the third position, despite the reverse being true. Presumably, this is because it is easier to recall words that

begin with a particular letter than those in with the letter in a particular position, and the experienced ease of retrieval signals that there are many words of this kind. Although numerous studies employing different tasks and settings have supported these results, a closer look at the supporting evidence raises the questions of whether the effects of the availability heuristic are indeed mediated by experiences of ease or difficulty. On the one hand, words that begin with *r* are *easier* to recall; on the other hand, however, individuals are also likely to recall *more* words of this category. While the first explanation rests on the experienced *ease* as initially hypothesized by Tversky and Kahneman, the second explanation rests on the *content information* that is recalled. Addressing this confusion, Schwarz et al. (1991) developed a paradigm that allows for disentangling the competing explanations of ease versus content. Participants recalled either six or 12 instances of prior self-assertive behavior and subsequently judged their own self-assertiveness. As recalling six instances is easy, while recalling 12 is difficult, the implications of experienced ease versus recalled content information were diametrically opposed. In particular, if participants relied on their experiences of retrieval ease, they would judge their own self-assertiveness more positively after recalling six (easy) rather than 12 (difficult) instances – after all, if it is easy to come up with instances, one has to be self-assertive (and vice versa for experiences of difficulty). Contrarily, if participants relied on the content information, they would judge their own self-assertiveness more positively after recalling many rather than few instances, because more material was retrieved from memory. Judgmental results were in accordance with the ease- but not the content-explanation, thus underscoring that the effects of the availability heuristic are indeed mediated by experiences of ease or difficulty.

Three recent developments deserve particular mention. For one, it has been demonstrated that not only judgments of frequency and probability, but also *evaluative* judgments of many kinds may be affected by experiences of ease or difficulty. For instance, judgments about consumer products, about health-related issues (→ Health Communication), or about other individuals may be informed by the ease with which relevant pieces of information come to mind.

In a more loose relation to the original idea that ease of retrieval influences judgments of frequency and probability, one could speculate that individuals may draw inferences about the importance or adequacy of a given topic for the present situation. If this were the case, issues that are strongly covered in the media – and are thus easily accessible – would be considered important because they come to mind so easily. Such a mechanism could account for the agenda-setting function of the media, besides a more traditional mere priming approach (→ Agenda Setting Effects; Priming Theory).

Moreover, one may ask *how often* or *when* individuals rely on the experienced ease as opposed to the recalled content? First, experiences of retrieval ease are likely to be relied on in conditions of low processing motivation/capacity, that is, when individuals either do not want to or cannot invest much cognitive resources in the formation of judgments and decisions (→ Trap Effect). Second, experiences of retrieval ease are likely to be relied on if individuals are in a positive (rather than negative) mood state, or if individuals are low (rather than high) in depressive symptomatology. Third, experiences of retrieval ease are likely to be relied on if individuals currently or dispositionally experience uncertainty. Finally, experiences of retrieval ease are likely to be relied on only if they are perceived to be diagnostic for the judgment in question.

## **Avatars and Agents**

*Ning Wang*

*University of Southern California*

*Skip Rizzo*

*University of Southern California*

The term “avatar” derives from the Sanskrit word *avatāra*, meaning “incarnation” and has been used to describe a deliberate descent of a higher being into mortal realms for special purposes. Avatar also has a long history of use in Hindu texts to characterize the human appearance on earth of various Hindu gods such as Vishnu, Shiva, and Ganesha. More recently, avatar has become a *popular term in new media technology* to describe the digital representation, human or otherwise, of a real person in a virtual world. This use of the term emerged initially as a text construct in multiple user dungeons (MUDs), text-based social gathering points and chatrooms that became popular in the early days of the → Internet, and then later on to describe a two-dimensional icon used on Internet forums (Damer 1997; Fink 1999; Blackwood 2006) and other digital communities or the form of a three-dimensional human model used in computer games (Lessig 2000). For example, a person can use an avatar to represent himself or herself in a meeting held in an online virtual environment such as *Second Life* or similarly as a tutor in the course of conducting a distance learning activity.

*Avatars* can be designed to suit the “owner’s” choice of how they want to be represented, whether it be a realistic representation of their actual appearance, an idealized form, or even a surreal character or animal. They are operated in digital worlds typically using mouse and keyboard interfaces and are akin to a puppet controlled by a puppeteer. Users can interact through their avatar with other avatars that also represent other live users

who are “present” in a virtual space. The most common mode of communication between avatars is text-based, whereby the user can communicate in shared digital worlds by typed speech that appears in close proximity to their avatar for others to read. In these interactions vocal prosody and body/face gesture-based expressions of emotion are typically limited, so a variety of text codes have evolved to serve this function (→ Voice, Prosody, and Laughter). However, some digital environments can allow for basic keyboard control of a limited set of “universal” body and facial actions to serve the purpose of expressing → emotion and for the enhancement of believability.

By contrast, an *agent* is a more complex software entity that “possesses” or retains a certain level of autonomy or even some level of artificial intelligence. In real life, an agent can be a representative who acts on behalf of other persons or organizations for a variety of purposes (e.g., publicity, real estate, FBI, etc.). In digital technology, an agent is often referred to as a *software agent*, which is an abstraction or a logical model that describes software that acts for a user or other program in a relationship of agency (Franklin & Graesser 1996). Software agents can be autonomous, exhibit artificial intelligence, such as learning and reasoning, and may communicate and cooperate to achieve an objective. Viewed in this fashion, an autonomous agent is a system situated within (and as a part of) an environment that senses that environment and acts on it, over time, in pursuit of its own agenda so as to affect what it senses in the future (Franklin & Graesser 1996). Such agents are self-contained and capable of making independent decisions and taking actions to satisfy “internal” goals based upon their software and the sensed environment.

An *intelligent agent* is a software agent that exhibits some form of artificial intelligence that assists the user and acts on their behalf. In some literature, intelligent agents are also referred to as autonomous intelligent agents, which means they can act independently, and will learn and adapt to changing circumstances. With recent advances in digital technology, intelligent agents have become more common in everyday life. For example, *buyer agents* from shopping websites can explore a network (e.g., the Internet) to retrieve information from various vendors about a product that a customer wants to purchase. These agents, also known as “shopping bots,” work very efficiently for commodity products such as CDs, books, and electronic components. In addition to finding a product at the lowest price, buyer agents can also offer users a list of products that the user might like to buy on the basis of what he or she is buying now and has bought in the past. Amazon.com is a good example of a site that employs this type of shopping bot (→ E-Commerce).

In recent years, there has been growing interest in a particular form of intelligent autonomous agent – one that looks and acts like a human being. These software entities, often called *virtual humans*, can be designed to engage in conversation and participate in collaborative tasks while inhabiting a simulated environment. Such virtual humans have been created for use in a variety of applications, including primary education (Biswas et al. 2005), training (Swartout et al. 2006), and therapy (Marsella et al. 2003), as well as in marketing and entertainment. With continuing advances in virtual human technology, one could speculate on a wide variety of areas where their impact could be felt. History students could visit simulations of ancient Greece and debate Aristotle. Persons with social phobia could practice interpersonal interaction skills in the safety of their homes. Social psychologists could study theories of communication by systematically modifying a virtual human’s verbal and nonverbal behavior as they interact with other virtual

humans. Virtual human teachers could provide engaging and tireless educational activities that apply pedagogical best practices anytime, anywhere, and at any pace that learners require.

However, the construction of useful and believable virtual humans is still a challenging task and requires multidisciplinary effort. Since a virtual human agent is designed to emulate a real human, people have high consensual expectations as to how it should look and act, and will be disturbed by or misinterpret even minor discrepancies from human norms. Virtual humans must act and react in their simulated environment, drawing on the computer science domains of automated reasoning and planning. To hold a conversation, they must exploit the full gamut of natural language research. To create virtual human bodies that can be controlled in real time requires significant computer graphics and → animation knowledge (→ Graphic Design). And designers of embodied virtual human agents must draw heavily on the disciplines of psychology and communication to create entities that can effectively convey nonverbal behavior, emotion, and personality. In this regard, the creation of a virtual human is still a daunting task, but research is progressing on multiple fronts. Although Asimov's benevolent robots are still a distant fantasy, realistic interactive virtual humans will almost certainly populate our near future, guiding us toward new opportunities to learn, enjoy, and consume.

## Bad News in Medicine, Communicating

*Barbara Schouten*  
*University of Amsterdam*

Any information that produces a negative alteration to a person's expectations about the future can be defined as bad news (Buckman 1992). Notwithstanding that there are instances in which information is in all probability universally appraised as bad, such as the sudden diagnosis of a fatal disease, most published articles on the topic adhere to the basic assumption that bad news is subjective and depends on individual differences in personality, personal resources, cognitive appraisals, expectations, and so on.

Medical information, then, is defined as bad news only when a patient appraises it as such after its disclosure. The medical literature has focused primarily on the physician's perspective on communicating bad news. Research investigating the patient's perspective is scarce. Questions include how to break bad news successfully, and how physicians and patients experience the delivery of bad news. The two questions are strongly related, for physicians' and patients' experiences not only guide how bad news is communicated, they also partly define the extent to which the communication of bad news can be considered successful (→ Health Communication; Doctor–Patient Talk).

### RESEARCH TOPICS

The medical literature on communicating bad news has been largely nonempirical, involving editorials, reviews, and opinion pieces. In the paradigms typically used to study the communication of bad news empirically, physicians are asked to recall a time when they communicated bad news and to report on their experiences and difficulties associated with delivering the news. In a few other studies, the patients' perspective is examined by either assessing their preferences for bad news delivery in general or by retrospectively assessing how they have experienced a specific bad news transaction. While these self-reports have yielded valuable information about and insight into difficulties faced by health-care professionals and patients' needs with regard to the communication of bad news, the extent to which these data reliably reflect actual practice is unknown. Only a handful of studies have made use of observational strategies to investigate actual physician–patient interactions during bad news transactions (e.g., Eggly et al. 2006). The lack of observational data may partly be because the setting is an inherently difficult

one to study, and because ethical considerations limit the feasibility of observational studies.

In most studies, participants have been physicians working in a variety of medical disciplines in which the communication of bad news is common, such as oncology, surgery, pediatrics, emergency departments, and family practice. Typically, they are asked to report what they do when planning and delivering bad news to patients, and which difficulties they face. Other kinds of participants in studies on the communication of bad news have included patients and (medical) students, who might have experienced delivering or receiving bad news. For example, Eberhardt McKee and Ptacek (2001) studied the topic by asking college students about their recollection of a time they had delivered bad news. In Ptacek and Ptacek's study (2001), cancer patients provided information about how their physicians delivered bad cancer-specific news to them and to what extent they experienced stress while they received the news.

### IDENTIFYING THE RIGHT WAY TO COMMUNICATE BAD NEWS

If physicians are to have any hope of successfully breaking bad news, there must be systematic, observable ways in which this type of communication can be done well, and done badly. That is, there must be reliable indicators of successful communication of bad news. Due to the lack of rigorous empirical research on the topic, no perfect manner of breaking bad news has yet been identified.

However, some frequent *correlates of successful delivery* have been mentioned repeatedly across articles (see Ptacek & Eberhardt 1996 for a literature review). These correlates can be grouped into three different categories: content of the message (what and how much information is given); facilitation (where and when information is conveyed); and support (emotional support during the interaction).

With regard to the *message's content*, appropriate behaviors include giving clear and honest information, allowing patients time to ask questions and express emotional concerns, using simple language, showing a confident and competent attitude, and letting patients know that bad news is coming (i.e., start the conversation with a warning shot). In addition, doctors should check what patients already know and summarize and repeat information if necessary. A crucial aspect of delivering a bad news message is that doctors maintain a balance between honesty and sensitivity.

The *facilitation dimension* mainly refers to the physical setting in which the news is delivered. Bad news should be delivered in a quiet location that offers patients privacy and minimizes the chances of interruption. Furthermore, doctors should take care to have sufficient time to insure that all information can be communicated at a time that is convenient for the patient.

Finally, the *support dimension* includes such behaviors as offering hope and showing care and respect for the patient, identifying the patient's support network, and having them present during the interaction, if desired by the patient. An essential aspect of supporting the patient is acknowledging his or her distress and letting the patient know that it is all right to be emotional.

The identified correlates of successfully breaking bad news are quite similar to the patient-centered communication style advocated for doctor-patient interactions in general. As the patient-centered communication style has repeatedly been shown to be associated with better

health-related outcomes for patients, it is reasonable to assume that in the particular case of delivering bad news, the same type of communication style can be successful too. In addition, scarce empirical research indicates that there is agreement between patients and physicians on the important dimensions of the bad news process. It should be noted, though, that systematic empirical research on these correlates of the delivery of bad news is lacking, and observational data reflecting the actual practice of the communication of bad news are practically nonexistent. Thus, the extent to which these correlates are reliable and valid indices of successfully communicating bad news remains open for empirical research.

### **PATIENTS' EXPERIENCES**

When asked to recall a bad news episode, most patients report positive experiences; they are satisfied with what is said and how it is said. However, many patients also report a gap between the amount of information they received and the amount of information they desired. This finding has often been reported in the medical literature, and may partly stem from physicians underestimating the extent to which patients want to be informed about their illness. Most patients want to be told the whole truth, though. In addition, ethical and legal considerations (i.e., informed consent) oblige doctors to inform their patients fully and to share the decision-making process with them.

Apart from patients' desires and legal requirements, another important reason to give adequate information lies in its influence on outcomes. That is, adequate information provision during bad news consultations is related to greater patient satisfaction, fewer depressive and anxiety disorders, and better coping strategies. Thus, the way a bad news message is communicated to the patient seems to have a profound influence on patients' emotions, attitudes, and how they view their future.

Although it is complicated to define what adequate information entails exactly, there seems to be a broad consensus of opinion about what patients want to hear and how they want the news to be delivered. In general, physicians with a caring attitude who show concern for their patients and give them time to talk and ask questions are better received than physicians displaying a cold professional detachment. In addition, Parker et al.'s (2001) study has shown that aspects related to the content dimension are the most important, again indicating that patients place a high value on being adequately informed.

### **PHYSICIANS' EXPERIENCES**

Research has shown that after delivering the bad news message, doctors tend to respond to their patient by assuring them immediately that they can at least control, if not cure, the disease. Why do doctors respond in this way, instead of first acknowledging the patient's distress and eliciting any underlying concerns? Part of the answer can be found in the so-called *MUM effect*, the reluctance to transmit bad news. Not only is bad news communicated less quickly compared to good news, it is also communicated less fully and less frequently. Explanations for the occurrence of the MUM effect can be grouped into three categories: communicator's self-concern, which reflects the costs associated with delivering bad news; communicator's concern with recipient, which relates to negative

effects of the news for the receiver; and communicator's concern with norms, which is related to societal rules that govern social interactions (Eberhardt McKee & Ptacek 2001).

With regard to doctors' self-concern, the costs of communicating bad news are primarily related to *difficulties in handling their own emotions*. For instance, doctors might fear being blamed by the patient or expressing their emotions, or might feel guilty at not being able to cure the disease. These feelings of inadequacy may stem partly from exaggerated expectations of the possibilities of medicine, on the part of both doctors and patients. Concerns related to the recipient of the bad news are associated with doctors' fear that giving bad news will lead to undesirable emotional reactions that have long-term harmful consequences. The reluctance to eliminate hope goes a long way back in history, and Hippocrates' advice to conceal most things from the patient, and reveal nothing of his or her future or present condition, still seems to live on in today's world of medicine. However, most patients cope better with open disclosure of bad news than with the uncertainty of not knowing what is wrong. Besides, by shielding the patient, the doctor takes away the opportunity for the patient to react and behave in his or her own way to the news. Finally, concerns with norms include general rules that govern social interactions, such as the norm to help. A last concern not mentioned above but quite often expressed by doctors is the lack of adequate training and guidance in delivering bad news. However, many protocols and guidelines have been developed that may be of use in the communication of bad news.

## GUIDELINES

A summary of available guidelines on breaking bad news can be found in Fallowfield and Jenkins (2004). The most well known are probably *SPIKES*, a six-step protocol for delivering bad news, and the Australian guidelines developed by Girgis and Sanson-Fisher (1995). Both guidelines include specific steps that physicians should take during the communication of bad news. While these guidelines may be helpful, though, they lack a theoretical foundation and are not based on rigorous empirical evidence, making it troublesome to establish their effectiveness. Moreover, the few randomized controlled trials (RCT) – the gold standard to provide evidence for clinical care guidelines – that have been carried out so far leave little room for optimism. Not only do these studies suffer from major methodological shortcomings (sampling errors, lack of follow-up data, etc.), results indicate no or inconsistent effects regarding various important outcome measures, such as patients' knowledge, satisfaction, and psychological adjustment.

Hence, no gold standard as to how bad news should be communicated is yet available. To be able to draw more definite conclusions about how to successfully communicate bad news to patients, far more methodologically sound research is needed. In the meantime, given the many unanswered questions with regard to the communication of bad news in medicine, the best clinical approach remains to ask the patient explicitly about his or her preferences and to tailor the information disclosure to the needs of the individual.

## Bakhtin, Mikhail

Donald L. Anderson

University of Denver

Mikhail Mikhailovich Bakhtin (1895–1975) was a Russian philosopher, scholar, and cultural theorist who devoted his writings to the study of language and social structure as it appeared in literature. He was educated in classical studies and taught as a schoolteacher before moving to a small town in Russia to escape the social and political revolution of 1917–1918. During this time he met two colleagues, Valentin Voloshinov and Pavel Medvedev, with whom Bakhtin would study and debate politics and philosophy, and who formed the core of the “Bakhtin circle.” (The three men would inform one another’s writings to such an extent that today there is continuing debate about the original authorship of many of their published volumes.) In 1929 Bakhtin completed his work *Problems of Dostoevsky’s poetics*, as well as his essay “Discourse in the novel.” He later became a professor in a small college where he was little known until the 1950s and 1960s. Interest in Bakhtin spread when his major works were translated into English in the 1970s and 1980s. Bakhtin’s name is now included among the most prominent social theorists of the twentieth century.

Bakhtin’s views on language contrasted with those of linguists who he believed misrepresented language by seeing it as a system of rules and failed to appreciate the function of language

in its social and cultural context. Of Bakhtin's major concepts, *dialogue* is the one that has attracted the attention of most scholars, and it is often considered the umbrella concept for his work (Holquist 1990). While Bakhtin's concept of dialogue can mean many things, in one of his central uses of the term he makes it clear that we are to see the world (or life) as a great dialogue, full of conversations and utterances on many themes and topics, where utterances respond to others' utterances, and expect a response of their own, even when the utterance is directly addressed to a single respondent. He thus encourages us to see not just a single utterance, but the utterance's relationship to others. Every speaker is always participating in a larger dialogue in which there have been utterances on similar themes and topics in the past, where the speaker's contribution is a part of the evolution of the dialogue. Sometimes this participation is explicit and easily identifiable, other times it is subtle and indirect. Bakhtin's idea that the text exists in a web of other texts and contexts has become adopted in postmodern and other theoretical circles as intertextuality (→ Text and Intertextuality; Dialogic Perspectives).

Both societal change and differences in worldview exist because of (and are reflected in) *heteroglossia*. Heteroglossia refers to a multiplicity of languages and dialects that contrast against the unified consistency of a single language or culture. In addition to national languages and dialects within a single language, we use multiple languages for different purposes in different settings. These languages reflect different views on the world, with different ideologies, theories, and perspectives. In any culture, Bakhtin argues, some of these languages give preferred, dominant, and accepted meanings, while others work against the dominant meanings. Bakhtin refers to the former as centripetal forces working to create ideological unity, and to the latter as centrifugal forces working against that centralization to develop new meanings. This tension between centralization and decentralization is always evolving and developing, so much so that this process exists in every utterance (Bakhtin 1981, 272).

Most sub-disciplines in communication studies have been significantly influenced by Bakhtin's work, rethinking commonplace beliefs and concepts from a dialogic perspective. In *interpersonal communication*, Baxter and her colleagues (Baxter 2004; Baxter & Montgomery 1996) have developed a relational dialectics perspective that has taken the implications of Bakhtin's dialogue and his writings about the self to rethink a number of widely held beliefs about interpersonal relationships such as relationship development, closeness, and interactional competence. In *organizational communication*, Anderson (2005) has used Bakhtin's concept of double-voiced words to describe how, in organizational change, speakers use quotations from other speakers to understand typical organizational practices and to imagine how future language might change when organizational practices change. *Rhetoricians* have also found much to adopt from Bakhtin's work. Hopkins (1989) analyzed the rural dialects in Flannery O'Connor's *Wise Blood* as heteroglossia, which she argued brings readers closer to characters and makes the characters' ideologies more explicit. In *language and social interaction*, Tannen (2004) used Bakhtin's notion of polyvocality to show how speakers articulate utterances as if spoken by the family pet in order to distance themselves from their own speech. The function of dialogue and the development and negotiation of meaning in social life draws together each of these studies, all influenced by a Bakhtinian philosophy about the nature and function of social discourse.

## Balance

Greg McLaughlin

University of Ulster

Balance is one of the most contested concepts in the wider academic and public debates about the role of the media in society, but the concept is particularly relevant to public service broadcasters, with the UK's → BBC being an international exemplar, for whom balance often is a specific mandate (→ Television News; Public Broadcasting Systems). While the print media claim objectivity in their routines of news gathering, reporting and editing, they are not legally required to be balanced (→ Objectivity in Reporting). The newspaper may express its institutional voice, its political worldview, in its comment and analysis pages, and it may offer space to alternative viewpoints in the interests of genuine pluralism or to broaden its readership. (→ Plurality; Partisan Press; Party–Press Parallelism). The public service broadcaster, however, has a legal obligation in many societies to be balanced and be seen to be balanced, and it is internally and externally regulated to that end. The requirement to represent or give public access to a range of opinions in public debate without favor applies especially to → news and current affairs and must be demonstrable either within a program or across the range of such program within a certain time frame (→ Media Performance).

### PROBLEMS WITH THE BALANCE NORM

Regardless of regulation, however, normative, liberal assumptions of balance have long been open to challenge and dispute. The response of broadcasters has been to point to

these very same disputes and claim that “bias is in the eye of the beholder” or that if they are offending all sides of political debate equally then they must be upholding their public service duty of impartiality (→ Bias in the News). This rather relativist *debate* opens up every time public service broadcasters such as the BBC cover controversial issues in politics, and military or industrial conflict. Most major political parties in western, liberal democracies closely monitor broadcast coverage of politics for any evidence of explicit bias or imbalance in favor of rival parties. In the US, organizations such as the liberal Fairness and Accuracy in Reporting (FAIR) and the conservative Accuracy in the Media (AIM) have long played a watchdog role in lobbying for “balanced” coverage of politics, but usually always from their own partisan perspective. Most recently, celebrity campaigners such as Michael Moore and Al Franken have stirred the debate about structural bias in the American media system, which is seen to favor right-wing politics and corporate power (→ United States of America: Media System).

It is difficult in such debates to get a clear reality check on what is balanced or biased because every critic has a different idea of where the “center-ground” actually is, or of how the interests of all sections of the public should be represented. Furthermore, one could argue that with every charge of “liberal bias” comes a different understanding of what “liberal” means. Yet public service broadcasters themselves would refrain from absolutist definitions of balance and its application. For example, the BBC Guide of 1990 pointed out that impartiality “does not imply absolute neutrality, nor detachment from basic moral and constitutional beliefs. For example, the BBC does not feel obliged to be neutral as between truth and untruth, justice and injustice, compassion and cruelty, tolerance and intolerance” (cited in McNair 1994, 28). This article of faith has since been excised from editorial guidelines but its core value is still implicit in the BBC’s pronouncements on impartiality. Its conception of balance, as that of all public service broadcasters around the world, is not neutral but deeply ideological and system maintaining (see for example Glasgow University Media Group 1976). In Britain, all broadcasters, public or private, are regulated by the Office of Communications (OfCom). In the United States, the responsibility lies with the → Federal Communications Commission (FCC). These state regulators exercise control over all aspects of broadcasting from licensing and the allocation of transmission frequencies to regulating content according to legal standards of taste, decency, and impartiality (→ Fairness Doctrine). However, the broadcasters also have their own internal, regulatory structures designed to ensure compliance with the provisions of state regulation. There is an argument that when it comes to the question of balance, external critics need to hold broadcasters accountable on the standards they set themselves, not on standards set by external political agendas (→ Public Service Broadcasting: Law and Policy).

### INTERNAL REGULATIONS

As with all areas of programming, the BBC’s news and current affairs output is guided by the policies, principles, and commitments set out in the BBC Charter, effectively the BBC’s license to broadcast. However, the day-to-day editorial management of news is the responsibility of the News and Current Affairs Directorate and is regulated by published editorial guidelines, including those on impartiality and diversity of opinion, which, it claims, lie “at the heart of the BBC’s commitment to its audiences.” The guidelines set out

the broadcaster's commitment to "a properly balanced service consisting of a wide range of subject matter and views broadcast over an appropriate time scale across all our output" and to "take particular care when dealing with political or industrial controversy or major matters relating to current public policy." They also remind us that "the BBC is forbidden from expressing an opinion on current affairs or matters of public policy other than broadcasting" (BBC Editorial Guidelines n.d.).

The American Public Broadcast Service (PBS) operates similar editorial policies with regard to balance, committing it to "present, over time, content that addresses a broad range of subjects from a variety of viewpoints." As with the BBC, therefore, there is the question of reasonable extent. The phrase "over time" means that affiliate stations, or their editors and producers, are not obliged to balance every available viewpoint in a single item or program but "to consider not only the extent to which the content contributes to balance overall, but also the extent to which specific content is fairly presented in light of available evidence." As a condition of broadcast, the PBS may require a producer to "further the goal of balance by deleting designated footage or by including other points of view on the issues presented or material from which the public might draw a conclusion different from that suggested by the content" (PBS Editorial Standards n.d.).

## EXTERNAL REGULATIONS

In the UK, section 5 of Ofcom's Broadcast Code (2005) commits all broadcasters, public or private, "to treat controversial subjects with *due* accuracy and impartiality" (emphasis added). The key, qualifying word here is "due," meaning that the application of impartiality should be "adequate or appropriate to the subject and nature of the programme," not that "every argument and every facet of every argument has to be represented" (OfCom Broadcast Code n.d.).

In the US, the FCC has specific legal obligations to impartiality contained within the Public Broadcast Act 1967 (and subsequent amendments). Sub-part D, section 19, of the Act requires from all public broadcasting stations "strict adherence to objectivity and balance in all programs or series of programs of a controversial nature" and that their commitment to objectivity and balance, including efforts to address public concerns about perceived failures in this commitment, should be made transparent to viewers.

## THE ACADEMIC CRITIQUE OF BALANCE

Public debates about balance in television news are usually founded on common sense or partisan perceptions rather than hard, empirical evidence (→ Hostile Media Phenomenon). However, there is a considerable body of academic research that seeks to measure imbalance or bias using quantitative and qualitative analysis (→ Content Analysis, Quantitative; Content Analysis, Qualitative). One of the most comprehensive studies has been that by the Glasgow University Media Group. Their series of books, *Bad news* (1976), *More bad news* (1980), and *Really bad news* (1982), represents a sustained, longitudinal study of British television news in the latter half of the 1970s (→ Longitudinal Analysis), particularly the role of industrial disputes in exacerbating Britain's economic crisis during that period. The group found that news coverage amplified the role of strikes while

playing down the problem of mismanagement and disinvestment in key industries, and that the news privileged definitions of the problem from management sources over those from the trade union movement.

In the US, studies of American prime-time news coverage of the Vietnam War took a similar analytical approach. Lawrence Lichty (1973) and Daniel Hallin (1986) provided quantitative evidence that television news coverage of the war did not focus on images of death and injury among American troops to the extent perceived in the wider public debate about the role of the media in losing the war. This correlates closely with a study of British broadcast coverage of the war in Iraq, in 2003, which concluded that the BBC was among the most pro-war of all the broadcasters in its framing, again quite contrary to popular assumptions at the time (Lewis and Brookes 2004). In more recent studies, academics have challenged standards of balance in American news coverage (in the press as well as broadcasting) of local and presidential election campaigns (Lake Dates & Gandy 1985; Busterna & Hansen 1990; D'Alessio & Allen 2000; Niven 2001; Carter et al. 2002).

Broadcasters cannot guarantee absolute impartiality in their news and current affairs output but it is nonetheless essential that they be accountable and transparent in their editorial policies and production methods, key requirements for a truly public broadcasting system. Sometimes, however, political pressure can breed inhibition and oversensitivity to external perceptions of the service. In June 2007, a BBC internal report attracted widespread media attention for its scathing critique of the Corporation's tendency to "liberal group think" and its undue privileging of public campaigns such as Make Poverty History or Bob Geldof's Live 8 event in 2005. The title of the report, "From Seesaw to Wagon Wheel" (cited in Gibson 2007), referred to what the authors thought was a move away by the BBC from its commitment to balance and toward a tendency to build liberal consensus around such popular, public campaigns. One could argue that this misses the point, for it is not a case of moving from one position to the other. As a public broadcaster with a long history, the BBC has always sought to occupy the center ground, and its insistence on balance has been a means to that end. Yet the center ground is never fixed but shifts from era to era, a problem that applies to most public broadcasters around the world. The principle of balance, therefore, is not simply an editorial procedure or safeguard against undue bias but a key function of public broadcasting as an institutional ideology.

## Balkan States: Media Systems

Peter Gross

University of Tennessee

The Balkan states, situated in southeastern Europe, include Albania, Bosnia-Herzegovina, Bulgaria, Croatia, Macedonia, Montenegro, Romania, and Serbia. Altogether, the Balkan states have a population of almost 54.5 million people of very diverse ethnic, linguistic, and cultural backgrounds. Montenegro is the smallest of these states and Romania the largest. The Balkan states are emerging democracies with parliamentary systems; Bulgaria and Romania joined the European Union on January 1, 2007, and others aspire to do so in the future.

### MEDIA IN TRANSITION

The media in the Balkan states have traveled a long way since being freed from the Marxist-Leninist straitjacket in 1989, but becoming professional media that reflect and serve full-fledged democracies is still beyond the horizon. The desire to join the European Union and pressure from western → journalism, human rights watchdog organizations, governments, and other supranational organizations have effected some modest changes in the region's media, both to the laws and regulations that relate to them (→ Communication Law and Policy: Europe) and to the practice of journalism.

Despite the progress made, there are still nagging problems that ensure that the media remain only minor contributors to the process of democratization and examples of an institution that has not been allowed to fully reach the status it should have or play the roles it must play in a democracy. One common post-1989 development is the tremendous *increase in the number of media* in the region, in some cases doubling, tripling, or quadrupling the number of outlets available during the communist era, and the free access to indigenous and foreign media offerings. The new constitutions in the region confirm the importance of the freedom of the press and of speech (→ Freedom of the Press, Concept of) but the Freedom House Report (Karlekar 2006) judges the media in all Balkan countries to be only “partly free.”

Culture, the media’s history, the nature of the communist experience, the presence or absence of underground media during the communist era (→ Underground Press), and post-1989 economic and political development make for some distinctions between the region’s media.

The → *privatization of the media*, particularly the press, was accomplished in the very early 1990s outside of a legal context and regulatory agencies or rules, either spontaneously or mediated by the state, according to Coman (2000). The press was the first to privatize; radio and television, partly because they depend on frequency allocations, were obliged to wait for new broadcast laws to be enacted.

The post-communist media outlets almost instantly became vehicles for the political interests and aspirations of newly formed political parties and their politicians, whose numbers also climbed vertiginously after 1989. The post-communist elites have in great measure perpetuated the communist mentality that made control and manipulation of the media, anathema in mature democracies, perceived necessities. These undemocratic elites were not always able to control or manipulate all media, however, and the battle to minimize or eliminate such attempts continues with ever-changing levels of success. Media control and manipulation were made possible by the political atmosphere and overall culture in the Balkan nations, constant since 1989 with only minor modifications, the economic struggles of the media outlets, high taxes levied on the media, and the system of state and government advertising.

Public broadcasting (→ Public Broadcasting Systems) is perhaps the least free in the Balkans, and Splichal’s (1994, 48) observations in the mid-1990s in great measure still hold true: broadcasting is “largely subordinated to the state authorities and party elites rather than to public accountability” (→ Accountability of the Media). The situation of Romania’s public broadcasting, for example, epitomizes that in the region; according to Coman and Gross (2006, 104), it “struggles with the vestiges of the old, leftover mentalities from the communist era, a bloated staff, and the ever-present threat of government interference.” Major attempts at breaking this pattern were made in a number of countries, with mixed results. In Bosnia-Herzegovina, for example, reform of public broadcasting stalled in 2005 and media independence was threatened, as it was in Montenegro.

Media ownership in the region is diverse, running the full gamut of possibilities: media are owned by the state, individuals and corporations, political parties, churches, and other groups. Additionally, the dominance of *foreign media groups*, particularly at the local and regional levels of the Balkan press system, give rise to concern, according to the European Federation of Journalists (2004) report. Foreign media groups are present in

Albania (Italian), Bulgaria (German, Greek, British, Eurocom), Croatia (German, Finnish, Austrian), Macedonia (German), Romania (German, Swiss, Finnish, French, Luxembourgger, American), Serbia (German, American), and Slovenia (Austria, Germany, Sweden).

While the media landscape in the Balkans changed in 2005 and 2006, Balkan journalists and western observers bemoan the negative side-effects of commercialization: lack of social responsibility and of a better understanding and acceptance of media roles and functions in democracies, and the absence of ethics and professionalism (→ Ethics in Journalism).

## **JOURNALISM**

Without indigenous models of good journalism, Balkan journalism developed helter-skelter in response to the personal whims of journalists and editors, the legacies of advocacy journalism from the pre-communist and communist eras, and political and economic exigencies. Ethical problems abound, ranging from unconfirmed and anonymous sources and reporting that is opinion-based and tenuous, to the acceptance of bribes and pure propaganda presented in the guise of news stories. The verification of facts, when they are the basis of news stories, is often shoddy.

The worst breaches of professional and ethical rules occur during election campaigns, when journalists are apt to work for a politician or a political party while they are employed by a news media outlet. Or as Siroka (2005, 67) describes the Macedonian case, “the media . . . tendentiously compile (dirty) material to be used . . . in the course of the campaign in order to discredit certain political opponents, which is in a way directed by some [*sic*] political structure that uses or abuses certain journalists/media.”

Ethics codes have sprung up throughout the region but to no avail, because there has not been any universal commitment to abide by them, mechanisms to enforce these codes are missing, and the overall culture in the region exhibits a deficit of concern for ethics. Furthermore, the journalists’ general lack of organization and power gives them little leeway in self-policing and no leverage to combat those who have no interest in seeing a professional, ethical journalism develop. Working for several news outlets at the same time, for politicians and political parties during elections, accepting money and other gifts for writing favorable articles or for not covering certain stories are only some of the unethical behaviors of Balkan journalists.

Coupled with tenuous job security for journalists and low pay, the attempted manipulation and control of journalism have led to a return to → censorship in some cases and more often to self-censorship. The Committee to Protect Journalists (2005) reported that, as is the case in the other countries in the region, journalists in Bosnia-Herzegovina, Serbia, and Croatia “commonly practice self-censorship to avoid pressure or harassment from nationalist politicians, government officials and businessmen who use advertising revenue, threats, and occasionally violent attacks to ensure positive coverage.”

Balkan journalists are in danger. In April 2006, Bulgarian journalist Vasil Ivanov’s apartment was bombed in response to his investigation (→ Investigative Reporting) of the abuse of inmates in the Sofia central prison, according to the Committee to Protect Journalists (2005). That same month, a municipal court in the southern Serbian city of Prokuplje upheld a lower court’s verdict that found an RTV Kursumlija editor guilty of criminal defamation. Such incidents, together with other modes of intimidation and

threats, were a common occurrence during the 1990s and have only slightly decreased in the new century.

The trend of violence, intimidation, and threats against and harassment of journalists began shortly after communism's demise and was at one time or another fueled by governments, political parties, politicians, businessmen, officials at state, regional, and local level, and organized crime groups. Throughout the 1990s, reports Henrikas Yushkavitshus (World Press Freedom Committee 2006), a → UNESCO communications advisor, physical → violence against journalists was “the ultimate form of censorship.”

## LEGAL FRAMEWORK

Freedom of the press has improved in the last few years. Of particular importance are the changes in defamation laws; in Bulgaria, Croatia, Romania, and Serbia-Montenegro defamation is still under the criminal code but is no longer punishable with imprisonment. In Croatia, if there is intent to harm, defamation is still considered a criminal offense punishable with imprisonment, as it is in Serbia, where the defendant can be imprisoned for up to six months if he or she cannot pay the fine levied after a guilty verdict. In Bosnia-Herzegovina defamation is a civil matter, and in Albania it remains under the criminal code and is punishable with imprisonment, however, prime minister Sali Berisha ordered government officials in October 2005 to use the right of reply rather than sue the journalists for defamation.

Additional burdens for journalists and media organizations are created by the *absence of legal protection of sources* (→ Source Protection) and an interpretation of access-to-information laws in the countries where they were enacted that is seldom in favor of the news media. Things have improved in Croatia, where a press law enacted in 2003 restricted access to public data and reduced the protection of journalistic sources at the same time as it guaranteed press freedom and journalists' rights, and in Montenegro with the adoption of the Law of Free Access in 2005.

Despite attempts by politicians to enact press laws, most Balkan nations have opted not to have such laws. Albania is an exception; its 1997 Press Law is vague enough to allow for a heavy-handed interpretation by the government, despite the law providing for broad freedom of the press.

Post-communist broadcast legislation was enacted in Albania in 1998, Bosnia-Herzegovina in 2005, Bulgaria in 1996, Croatia in 1999, Kosovo in 2006, Macedonia in 1997, Romania in 1992, and Serbia-Montenegro in 2002. The new legislation addressed both public and commercial broadcasting, the organization of the ruling broadcast councils, their membership, and their mode of selection or appointment.

Small, tentative improvements are indeed discernible in the majority of the Balkan countries. A survey of Serbian journalists, made public by the International Federation of Journalists in April 2003, identified four major extant problems, however, that are shared across the region: political pressure, self-censorship, political constraints in editorial policy, and lack of courage on the part of editors. Altogether, the Balkan media and their journalism are works in progress, and their evolution depends as much on a better understanding of the role of media in democratic society and the professionalization of journalism as it does on the democratic evolution of political culture.

## **Baltic States: Media Systems**

*Epp Lauk*

*University of Tartu*

The three countries on the southeastern shore of the Baltic Sea in northeast Europe – Estonia, Latvia, and Lithuania, known collectively as the Baltic states – had been subject to the empire-building policies of neighboring countries around the Baltic Sea since the thirteenth century before they first achieved independence from 1918 to 1940. In 1939, the Molotov–Ribbentrop Pact brought them within the sphere of Soviet influence and they were incorporated into the Soviet Union as Soviet Socialist Republics (SSRs) in 1940. Since regaining independence in 1991, the Baltic states have aligned their future with western Europe by joining both NATO and the EU in 2004. While the similarity of their historical paths and their geopolitical situation might seem to have created the conditions for a common development of their media, their ethnic, linguistic, religious, and cultural peculiarities have resulted in three different systems, which are among the smallest in Europe with potential audiences of 1.36 million in Estonia, 2.33 million in Latvia, and 3.46 million in Lithuania (see Table 1).

Table 1 Basic data on the Baltic states

Country and type of political system	Territory (1,000 sq. km)	Population and % ethnic distribution (2006)	Official language	Name of Parliament and no. of members/ parliamentary parties (2007)	GDP per capita 2006 (US\$)
Estonia Parliamentary republic	45.2	1.32 million Estonians 68 Russians 26 others 6	Estonian	Riigikogu 101/6	9,936
Latvia Parliamentary republic	64.6	2.29 million Latvians 59 Russians 29 others 12	Latvian	Saeima 100/7	6,587 (2005)
Lithuania Parliamentary republic	65.2	3.40 million Lithuanians 84 others 16	Lithuanian	Seimas 141/9	8,899

Source: [www.state.gov/r/pa/ei/bgn/5377.htm](http://www.state.gov/r/pa/ei/bgn/5377.htm); [www.state.gov/r/pa/ei/bgn/5378.htm](http://www.state.gov/r/pa/ei/bgn/5378.htm); [www.state.gov/r/pa/ei/bgn/5379.htm](http://www.state.gov/r/pa/ei/bgn/5379.htm), accessed June 20, 2007

The press in the Baltic countries emerged in the seventeenth century in the foreign languages of the dominant members of society – the Baltic Germans in Estonia and Latvia, and the Poles in Lithuania. The first periodical publications in national languages appeared in Estonian in 1766, Latvian in 1768, and Lithuanian in 1823. Newspapers in these languages were published regularly only in the second half of the nineteenth century. When these states first gained independence after World War I, the press in each country was not restricted until the parliamentary democracies were replaced by authoritarian regimes in Lithuania in 1926, Estonia in 1934, and Latvia in 1934. Subsequently, the centralized standards of the all-Soviet media were introduced in 1940–1941 and from 1944 onwards (→ Newspaper, History of).

### MEDIA UNDER SOVIET RULE

The main goal and function of the Soviet Communist media system was → propaganda in support of the power of the Communist Party elite. All the media, as well as printing, publishing and distribution facilities, were owned, supervised, and controlled by the Communist Party, and fully subsidized from the state budget (→ Censorship). The media system in each SSR was hierarchical. The most important newspaper was the organ of the Communist Party – one national daily in each Republic's national language and its counterpart in Russian. The next most important were the national dailies of the Communist Youth League, again in Russian and in the national languages. Locally, one Communist Party daily was allowed in each city and district, and an evening paper in the larger cities.

The most authoritative source of foreign and all-Union information was the government news agency TASS (the Telegraph Agency of the Soviet Union). The national news agency of each Republic was permitted to produce and distribute only news of national and local importance. Broadcasting followed a similar hierarchical structure, with the most important radio and TV channels in Moscow and national state television and radio in the SSRs.

### MEDIA IN TRANSITION

The Soviet media system in the Baltic countries had begun to collapse during the independence movements in 1988–1990, and with the societal transition to democracy and a free market economy was entirely transformed. This process involved a transition from socialist to capitalist property structures in the media markets and the enforcement of media-related legislation (→ Media Policy). The Constitutions of all three countries guarantee the freedom of expression, the right of citizens to receive information, and the prohibition of censorship (→ Freedom of the Press, Concept of). The 2006 press freedom index of 168 countries by Reporters without Borders ranks Estonia in sixth to seventh position together with Norway, Latvia in tenth to thirteenth, and Lithuania in twenty-seventh to twenty-eighth.

There are seven main features of media development common to the Baltic states after 1990:

- 1 *Privatization* of the state-owned press. Initially, existing editorial teams privatized their publications by establishing hundreds of small joint-stock companies which were then sold to local entrepreneurs who turned them into small national companies. A consolidation of the larger national companies dominating the market led inevitably to foreign takeovers (→ Privatization of the Media; Ownership in the Media).
- 2 *Fundamental structural changes* caused by privatization and the consequent inflow of foreign media capital. This led to diversification and fragmentation of the press and broadcasting markets in the early 1990s.
- 3 *Stabilization and increasing competition*. This resulted in fairly concentrated media markets and liberal market models by 2000.
- 4 *Total technological restructuring* of newsrooms as a result of rapid technological development during the late 1990s and early 2000s.
- 5 *Intensity of competition* for limited audiences and advertising revenue has led to a high degree of commercialization, the decline of journalistic standards, and a decrease of public trust in the media (→ Commercialization of the Media).
- 6 *Strong shift toward commercial broadcasting*. This has eroded the position of public service broadcasting, the audience share of which is from 11 percent in Latvia to 18 percent in Estonia in 2007.
- 7 *Unions of journalists* have not been able to gain authority among journalists either as professional organizations or as trade unions (→ Journalists: Professional Associations).

The basic structures of the media systems in the Baltic States are summarized in Table 2.

Table 2 Media systems in the Baltic states, 2005–2007

Country	Print media	Broadcasting	New media
Estonia	71 newspapers, including 13 dailies, of which 7 are national (4 in Estonian, 3 in Russian); all dailies have online editions; highest circulation 65,000 (national tabloid); 8 national weeklies, c.150 general interest magazines, and c.200 other periodicals	1 national public service broadcasting company (Estonian National Broadcasting) since June 1, 2007, including 1 public TV company (Eesti Televisioon) and 4 national and 1 local public service radio channels, 3 commercial TV channels (2 national, 1 local), and 27 commercial radio stations	39% of households with Internet access (2005); 63% of inhabitants aged 15–74 used the Internet during the first half of 2007
Latvia	103 newspapers, including 22 dailies, of which 14 are national, 8 local; 366 magazines and other periodicals	1 public service television company (Latvijas Televīzija), with 2 national channels LTV1 and LTV7; 1 public service radio organization (Latvijas Radio), with 5 channels (3 national, 2 local), 43 commercial radio channels (3 national); 24 local and 2 national commercial TV channels; 42 cable TV operators	42% of households with Internet access, and 36% of inhabitants using Internet at least once a week (2005); 129 Internet service providers (2004)
Lithuania	354 newspapers; top 10 dailies have total circulation of 341,000; c.390 magazines and other periodicals	1 public service television and radio company (Lietuvos Nacionalinis Radijas ir Televīzija) with 2 public TV channels and 2 public radio stations; 41 commercial radio stations; 27 commercial TV broadcasters; 55 cable TV operators	16% of households with Internet access, and 28% of inhabitants using Internet at least once a week (2005); 98 Internet service providers (2004)

### DOMINANT CHARACTERISTICS

While there is not a common pattern of ownership among the three Baltic media systems there are three broad patterns. First, there is a dominance of Nordic media capital in the Baltic states. Eesti Meedia AS (92.7 percent owned by Norwegian Schibsted ASA) and AS Ekspress Grupp (100 percent Estonian) produce over 70 percent of newspapers and magazines in Estonia. Furthermore, through Eesti Meedia AS, Schibsted owns Kanal 2, one of the two commercial TV channels with national coverage, 34 percent of the largest commercial radio chain with six stations, and the largest and most modern printing enterprise Kroonpress. In addition to Schibsted, Nordic holdings in Estonia include Bonnier AB (Swedish), Egmont Holding International AS (Danish), and Alma Media (Finnish).

The Latvian press market is split between two major publishing groups. Latvia's largest oil transit company Ventspils Nafta has shares in several print and publishing companies

Table 3 Top dailies in the Baltic states (Estonia and Lithuania 2007, Latvia 2004)

Country	Title	Readership (1,000)/ potential audience share (%)
Estonia	<i>SLÕhtuleht</i>	273/22.6
	<i>Postimees</i>	230/21.9
	<i>EestiPäevaleht</i>	145/13.8
	<i>Äripäev</i>	77/7.4
	<i>Tartu Postimees</i>	73/6.9
Latvia	<i>Diena</i>	282/– <sup>a</sup>
	<i>Latvijas Avize</i>	239/–
	<i>Neatkarīga Rita Avize</i>	105/–
	<i>Vesti Segodnja</i> (in Russian)	168/–
Lithuania	<i>Chas</i> (in Russian)	122/–
	<i>Vakaro žinios</i>	578/22
	<i>Lietuvos rytas</i>	488/18.6
	<i>15 minučių</i>	430/16.4
	<i>Respublika</i>	214/8.2
	<i>Kauno diena</i>	162/6.1

<sup>a</sup> For Latvia, the audience share is not freely available (data can be bought).

Source: World Press Trends 2005; TNS Emor (2007); TNS-Gallup (2007)

and owns the third largest daily *Neatkarīga Rita Avize*. The Swedish Bonnier Group, through its 63 percent holding in AS *Diena*, controls the largest national daily *Diena* (readership of around 300,000), 11 regional newspapers, and seven magazines, distribution and subscription services, and printing facilities. Table 3 shows the top dailies in the Baltic states, with their readership and potential audience share.

Second, the Lithuanian press market is still dominated by three national firms, Lietuvos Rytas UAB, Respublikos Leidiniu Grupe, and Achemos Grupe. Nordic capital entered the market in the spring of 2006 through the purchase of the largest regional daily *Kauno diena* by the Norwegian Orkla Media.

Third, there is trans-national ownership of regional networks. The Baltic News Service (BNS), the largest information agency in the region, is owned by Alma Media (Finnish); the online news portal *Delfi* (with its Russian language counterparts in Estonia and Latvia) is owned by Findexa (Norwegian), the Scandinavian–Baltic television network TV3 (with the channels in all Baltic countries) is owned by Modern Times Group (Swedish), and Bonnier (Swedish) owns the business newspaper *Dagens Industri*, which is edited and produced by local offices in all three countries.

Regulations that would restrict foreign ownership rights or cross-media ownership do not exist in the Baltic region, neither is there special legislation to support media diversity and pluralism (→ Plurality; Cross-Ownership). Competition legislation applies to the media sector for the provision of the conditions that insure free-market competition. There are also a few provisions in the other laws and broadcasting regulations that prohibit monopoly. Broadcasters in Latvia, except for public broadcasters, may not have

more than three programs. A political party or a commercial entity that is controlled by a political party may not own a radio or television station.

## **RADIO AND TELEVISION**

All three countries have adopted laws that regulate broadcasting and advertising which are aligned with the EU “Television without Frontiers” directive (1989/1997). The general principles and rules of this directive incorporated by each country’s laws concern the European works quota, the rules on the content and permissible amount of the daily and hourly advertising time, the use of exclusive rights, and the broadcasting of events of major importance to the public, and the right of reply. These principles also require advertising to be distinguishable from other program content, a ban on tobacco advertising, surreptitious advertising, and advertising that works against the interests of children (→ Television Broadcasting, Regulation of; Radio Broadcasting, Regulation of). All countries have passed advertising laws that also apply to the mass media (→ Advertising Law and Regulation). More general mass media laws exist only in Latvia and Lithuania.

The Lithuanian Law on Provision of Information to the Public (adopted as Mass Media Law in 1996, and amended in 2000) regulates the functioning of all mass media and lays down the obligations and liabilities of journalists, public information producers, and disseminators (who must be registered in the Register of Enterprises). Every broadcaster in Lithuania must obtain a license from the Radio and Television Commission, an independent institution for the regulation and supervision of the activities of radio and television broadcasters, and is accountable to Parliament. The Commission consists of 12 members, one of whom is appointed by the President, three by Parliament, and the remaining eight by professional organizations (architects, journalists, composers, writers, cinematographers, artists, actors, and periodical press publishers). The Law on the National Radio and Television provides specific regulations for the funding, administration, and functioning of the National Radio and Television and the legal basis for the formation of the Lithuanian Radio and Television Council, which functions as the highest governing body for the organization. The Council consists of 12 members who are prominent individuals in the social, scientific, and cultural spheres (of whom four are appointed by the President and four by Parliament). Lithuanian National Radio and Television belongs to the state and is 75 percent funded by the government.

The Latvian Law on Radio and Television (adopted 1995, amended in 2001) regulates both private and public broadcasters, as did the Estonian Broadcasting Act (adopted in 1994, amended in 2001, 2004) until June 2007. Then the Estonian Parliament adopted the National Broadcasting Act, according to which the public broadcasters Estonian Television and Estonian Radio will be merged into one organization: Estonian National Broadcasting (ENB). The supervisory body for ENB will be the Estonian Broadcasting Council, which is accountable to Parliament and financed by the government. The Council consists of nine members, five of whom are appointed by Parliament from among MPs in accordance with political balance, and four from among recognized specialists in the fields related to public broadcasting functions.

The Latvian Law on Press and Other Mass Media (adopted in 1990, revised in 1998) states that all mass media are subject to preliminary registration at the Ministry of Justice

and that the right of establishing and publishing of mass media belongs only to legal persons and legally capable natural citizens. The Law explicitly prohibits monopolization of any kind of mass media as well as censorship. The Latvian National Radio and Television Council is granted broad powers ranging from the definition of broadcasting policies to the granting and withdrawal of licenses. It appoints the directors and board members of the Latvian National Radio and Television and also deals with viewer complaints. It comprises nine members appointed by Parliament, who must be Latvian citizens and well known to the public. No more than three members can belong to the same political party. The Council is financed by the state.

## **Bandura, Albert**

*Barry J. Zimmerman*

*City University of New York*

Albert Bandura is a pioneering researcher of social modeling in the media (Zimmerman & Schunk 2002). He was born on December 4, 1925 in a rural hamlet in northern Alberta, Canada. He first achieved prominence as an undergraduate at the University of British Columbia by winning the Bolocan Award in Psychology. After completing his doctorate at the University of Iowa, he accepted a faculty appointment at Stanford University, where he has remained for more than 50 years. He was elected President of the American Psychological Association (APA) in 1974, and has won numerous awards for his research, such as the William James Award and the Gold Medal Award for Distinguished Lifetime Contribution to Psychological Science of the APA.

Bandura's initial research focused on the mechanisms governing observational learning of aggression, which he reported in a book entitled *Social learning and personality development*. In a series of seminal experiments using an inflated "Bobo" doll, he found that children readily imitated a social model's aggressive behavior toward the doll when they had an opportunity to interact with it (→ Violence as Media Content, Effects of; Violence as Media Content, Effects on Children of). This vicarious increase in aggression

occurred after viewing either live or electronically mediated models. At the time, it was widely believed that modeled violence would have a cathartic effect and diminish an observer's aggressive drives rather than increase them (→ Catharsis Theory). Bandura's contrary findings immediately thrust him into a heated national debate on the effects of televised violence on children. He was invited to testify before numerous congressional committees and national commissions on his research findings.

A second focus of Bandura's modeling research involved children's development of self-regulatory capabilities. In a book entitled *Social foundations of thought and action: A social cognitive theory* (1986), he discussed research indicating that children readily adopted high standards for self-reward after observing a model justify and adhere to those standards. He also found that children who observed a model forgo small immediate rewards for larger long-term rewards were more likely to wait for the delayed rewards than nonobservers. Clearly, these social learning experiences led children to internalize important standards that significantly affected their self-regulation and motivation (→ Observational Learning; Personality Development and Communication). Bandura also discussed research on the pervasive role of modeling in children's cognitive and linguistic development (Rosenthal & Zimmerman 1978; → Language Acquisition in Childhood). The importance of this cognitive dimension of social learning experiences led him to expand its role in his theory, to rename his approach "social cognitive," and to focus his subsequent research more directly on cognitive elements of observational learning, such as changes in self-beliefs of observers (→ Social Cognitive Theory; Cognitive Science). He was particularly interested in an observer's perceived capabilities to learn or perform a particular task, which he labeled self-efficacy beliefs. Bandura's innovative research on these beliefs culminated in a 1997 book entitled *Self-efficacy: The exercise of control*. His theoretical analyses broadened scientific understanding of the diverse effects of social modeling experiences on an observer's self-efficacy beliefs and self-regulatory attainment.

Because of recent advances in communication technology, such as the growth in → cable television, the impact of social modeling has expanded. Drawing on Bandura's research, Miguel Sabido (1981), a producer at Televisia in Mexico City, developed serial dramas to promote society-wide changes, such as improved national literacy and family planning in Mexico. The programs portrayed people's daily lives and the problems they face, and modeled strategies for overcoming them and vicarious incentives for adopting the modeled solutions. David Poindexter (2004), Director of Population Communication International, adopted the Sabido's serial drama method as a new focus of his organization. This methodology applied principles from social cognitive theory to raise the status of women, curtail the spread of HIV/AIDS infection, and foster environmental conservation in Africa, Asia, and Latin America (→ Development Communication; Environmental Communication; Health Campaigns for Development).

These worldwide applications demonstrated how the modeling experiments contributed to unforeseen applications to alleviate some of the most urgent global problems. These applications involved the integration of social cognitive theory and social diffusion theory regarding three key components, which include processes that govern the acquisition of knowledge and innovative patterns of behavior, the adoption of the innovations in practice, and the social networks through which they spread. Bandura formed a productive partnership with → Everett Rogers (1995), a pioneer in the study of the diffusion of

innovations, to use the latest media to speed the adoption of modeled practices designed to alleviate human problems on a global scale (→ Diffusion of Information and Innovation).

## **Bandwagon Effect**

*Rüdiger Schmitt-Beck*

*University of Duisburg-Essen*

The bandwagon effect is a phenomenon of → public opinion impinging upon itself: in their political preferences people tend to follow what they perceive to be majorities in society. This implies that success breeds further success, and alternatives that appear to enjoy a broad popular backing are likely to gain even more support. The effect's metaphorical label dates from late nineteenth-century American politics and alludes to the wagon in a parade that carries the band, and thus attracts a large audience of followers who join in to enjoy the music.

The bandwagon effect is one of several hypothesized manifestations of “impersonal influence” – effects on individuals' attitudes, beliefs, or behaviors that derive from these persons' impressions about the attitudes, beliefs, or behaviors of collectives of anonymous others outside the realm of their personal contacts (Mutz 1998; → Social Perception: Impersonal Impact). Other examples are the → “underdog effect,” complementing the

bandwagon effect by assuming a negative impact of perceived majority opinion, and the notion of “strategic” or “tactical” voting, which expects electors to refrain from choosing their candidate or party of first preference if they perceive it to be only weakly supported by others, in order not to waste their vote.

The bandwagon effect manifests itself in various forms. At elections, voters may choose parties or candidates because they expect them to win. The same happens in referenda, when perceptions of majority support help certain proposals gain additional votes. Perceived opinion distributions within the mass public can also lead to changes of attitudes. Election studies suffer from bandwagon effects, when in post-election surveys respondents claim to have chosen the winner although they did not actually do so (→ Election Surveys). Parties and candidates try to capitalize on the bandwagon effect during election campaigns when they seek to convey the impression that they are highly popular among voters.

The media are the main source of information on preference distributions among the citizenry at large (Mutz 1998). Published findings from public opinion polls are an important type of such mass feedback, although not the only one (→ Election Polls and Forecasts; Polls and the Media; Public Opinion Polling). Due to the pervasive trend toward “horse-race journalism” the question of who is ahead and who is trailing behind is ascribed high → news value in modern election coverage (→ Horse Race Coverage; Election Campaign Communication). Accordingly, journalists and politicians have also become key sources of mediated statements about the mass public’s political sympathies (→ Political Persuasion). Stylistic devices like exemplars or man-in-the-street interviews help journalists to convey impressions of where the public stands regarding candidates, parties, or issues (→ Exemplification and Exemplars, Effects of).

As reporting on public opinion is thus a multifaceted phenomenon, the quality of the information on which citizens base their impressions is critically relevant. Many studies indicate that media audiences are not sufficiently capable to distinguish between sources of valid information, such as well-conducted polls, and sources of dubious significance. They may thus fall victim to → “pluralistic ignorance,” deriving preferences from impressions about the opinions of their fellow citizens that are actually wrong. People’s impressions of majorities and minorities are also often biased through projection. The → “false consensus” or “looking-glass” effect distorts perceptions of mass opinion and may lead people to assume that their own positions enjoy far broader public support than is actually the case. However, for elections it has been shown that the power of “wishful thinking” tends to recede as polling day draws nearer.

Although the notion of the bandwagon effect has fascinated social scientists for decades, empirically it has proven elusive. Only in recent years have carefully designed studies succeeded in demonstrating that the bandwagon effect really exists, both with regard to vote choices at elections and referenda, and with regard to issue attitudes. Its theoretical background has also only recently come to be better understood, mostly due to careful studies by Mutz (1994, 1998). Bandwagon effects typically occur under conditions of weak commitment on the part of voters, and a shortage of information other than the distribution of mass support. Hence, American primary elections where voters have to choose between mostly unknown candidates that all run for the same party (Bartels 1988), or referenda about complicated issues (West 1991), appear more conducive to bandwagon effects than do general elections.

How bandwagon effects are triggered depends on citizens' political involvement. Politically detached people tend to rely on the "consensus heuristic." Like consumers who need a new car but lack the expertise to judge which one is best, they take majority opinion as a proxy for the most intelligent choice, thus becoming able to form a preference without collecting any detailed information. Among more involved citizens, perceived majorities may trigger a "cognitive response mechanism" (→ Perceived Reality as a Communication Process). They think about reasons why so many others may have come to support a particular alternative, and thus persuade themselves to jump on the bandwagon. Empirically and conceptually, these hypotheses are better supported than other strands of theorizing, like the idea that going with the winner is somehow intrinsically rewarding, or the assumption that bandwagon effects are mainly a result of conformity for fear of isolation (→ Spiral of Silence).

## **Barthes, Roland**

*Jay David Bolter*

*Georgia Institute of Technology*

Roland Barthes (1915–1980) was a French philosopher, semiotician, and literary and media theorist. Over three decades, he produced articles and monographs concerned with the general problem of how different systems of communication operate. His

activity spanned the periods in which authors who are identified with structuralism, and then those identified with poststructuralist and postmodernist theory, dominated critical debates in France and elsewhere. Barthes joined in these debates, often critiquing prevailing intellectual views on one hand and contemporary popular culture on the other.

Barthes's first major work was *Writing degree zero* (1st pub. 1953), in which he took part in the discussion on existentialism and Marxism that marked French intellectual life in the early 1950s. Barthes's turn toward → structuralism produced a series of short essays, eventually published as *Mythologies* in 1957: these were semiotic analyses of diverse cultural forms and everyday artifacts, such as detergents, wine and milk, wrestling, and popular entertainment. In the programmatic essay "Myth today," Barthes defined "myth" not in traditional literary terms, but instead as a second-level semiological system, or meta-language, extending the linguistics of Saussure, and facilitating the examination of tensions between the uncoded (or denotative) and the coded (or connotative) levels of signification (→ Semiotics). *The fashion system* (1st pub. 1963) is a systematic work of structuralism, in which Barthes analyzed the "vestimentary code" of French women's fashion, as depicted in magazines. In general, Barthes's structuralist analyses of the 1960s had a significant influence on qualitative media studies. His 1964 essay "Rhetoric of the image" further provided communication scholars with powerful tools for analyzing images and their relationship with texts.

While those working in communication studies found Barthes's structuralist essays most immediately useful, students of film, art history, and literary theory drew inspiration from Barthes's writings from the mid-1960s to 1980. In this period, Barthes influenced and was influenced by those who were questioning structuralism as a theory of communication (→ Postmodernism and Communication). He was in dialogue with Jacques Derrida when Derrida was producing works such as *Of grammatology* and *Writing and difference*, critiquing key western notions about the nature of and warrant for written communication. Barthes's *The empire of signs* (1st pub. 1970) shows this influence; the book examined elements of Japanese culture in a set of short chapters superficially resembling those in *Mythologies*. Rather than identifying mythic structures, however, Barthes described breakdowns of systematic communication in what he called "an emptiness of language which constitutes writing" (1982, 4).

In 1967, Barthes produced his essay "Death of the author," in which he challenged the assumption that the author of a given work served as the guarantor of the work's meaning. Barthes's position resonated with those of Derrida, Foucault, and a new generation of literary theorists and critics in Europe and North America, who were no longer satisfied with the traditional view of the transcendent value of canonical literary texts and the subordinate position assigned to theorists and other readers of these texts.

Barthes participated in this poststructuralist redefinition of the relationship of author, text, and reader, and he helped to foster in communication studies a greater awareness and appreciation of literary and other critical theory. He produced a classic example of poststructuralist critique in *S/Z* (1st pub. 1970), a close reading of "Sarrasine," a story by Balzac. *Image – Music – Text* (1977), a collection of Barthes's essays, included "From work to text," which defined a key distinction between "writerly" and "readerly" texts. A work is a frozen production of an author as authority figure; works constitute the literary canon and are not in that sense available for dialogue with other works in a culture. A text, however, is open to such dialogue (→ Text and Intertextuality). Barthes's distinction,

again, fit nicely with the work of Derrida and other deconstructionists as well as “reader-response” theorists such as Stanley Fish. At this same time, Wolfgang Iser and others were developing a distinct, empirically oriented approach to the study of the reader’s response. All of these theorists began from the premise that the process of reading is one of actively constructing the meaning of a text (→ Interactivity in Reception).

Barthes’s writings in the 1970s are particularly resistant to classification, as evidenced by his 1975 “anti-autobiography” *Roland Barthes by Roland Barthes* and his fictional 1977 *A Lover’s Discourse*. His final and in some ways most personal book was *Camera lucida* (1st pub. 1979), a lyrical analysis of photography through a series of examples. Here, Barthes explored the tension between the indexical nature of → photography and the apparently arbitrary character of its cultural interpretation. He maintained, on the one hand, that a photograph does have a value as a record of an actual moment. On the other hand, a photograph has meaning through its special quality to affect us as viewers. A photograph is always an image of something past, always recalling death. Furthermore, there is an element in any photograph that seems tangential to the main representational subject, but is in fact central to our reaction as viewers. Barthes called this element the “punctum.” The picture whose punctum was most compelling for Barthes was one of his mother as a girl; Henriette Barthes had died three years before he wrote *Camera lucida*. Barthes himself died at 64, soon after completing this book and a month after being struck by a truck in the streets of Paris. The circumstances of his death have often been interpreted as confirming the melancholy of his final book.

## **BBC**

*Michael Bailey*

*Leeds Metropolitan University*

The BBC started life not as a public corporation but as a private company. Formed in 1922, the early BBC operated as a cartel, consisting of several wireless manufacturers, including the Marconi Wireless Telegraph Company, one of the main pioneers of wireless telephony.

Though it was to all intents and purposes a private enterprise, its license to broadcast in Britain was regulated by the state, under the auspices of the Post Office. A further peculiarity of British broadcasting was that, just as broadcasters required permission to broadcast, so too were the listening public required to obtain an official license for listening in.

Whilst these regulatory provisos conferred certain economic benefits upon the BBC, not least an exclusive monopoly to broadcast and an entitlement to half of the license fee, broadcasting was subject to what was then an unusual degree of public control and officialdom by comparison with other media. This was especially so during the early years of the BBC when it had to weather a number of national crises (e.g., the General Strike in 1926), during which it was expected by the government of the day to represent the national interest, taken to be synonymous with the government's aims and objectives. Having said this, for reasons of political tact it was important that the BBC maintain an appearance of neutrality. The answer was to reshape the Company into a quasi-autonomous public authority, effectively run by a state-appointed executive Board of Governors (→ Public Broadcasting, History of).

### **TRANSFORMATION TO A PUBLIC CORPORATION**

The transformation of the BBC into a public corporation was signaled by the Crawford Parliamentary Committee, called into being to specifically consider the future of broadcasting. Of the many recommendations, the most significant proposal was that "broadcasting be conducted by a public corporation acting as a Trustee for the national interest, and that its status and duties should correspond with those of a public service." And so it came about that on January 1, 1927, the BBC was effectively nationalized under Royal Charter, and as such became one of the earliest examples of a national public utility (→ Public Broadcasting Systems).

One of the main advocates of the BBC's alteration into a public corporation was John Reith, the first General Manager and Director General of the BBC. Born a Scotsman, and a lifelong devout Christian, Reith's part in shaping the policy of the BBC, not least its public service ethos, was distinct. Following the example of Matthew Arnold, the nineteenth-century poet and educationalist, Reith wanted to make available as widely as possible the best that has ever been thought, said, or written. However, Reith's lofty idealism and high-mindedness bore all the hallmarks of nineteenth-century conservative paternalism. Ridden with a deep-rooted contempt for anything that detracted from his own political and religious beliefs, Reith was specially incapable of empathizing with the listening public. Consequently, much BBC culture during the interwar period was restricted to programs that were deemed appropriate for the moral and cultural well-being of the nation, prompting some listeners to tune in to the European radio stations (e.g., Radios Normandie and Luxembourg) for more popular programming, particularly on a Sunday when the BBC would permit only religious broadcasts.

### **CHANGING PROGRAMMING POLICIES**

The outbreak of World War II in 1939, a year after Reith retired as Director General, marked a new era in the history of the BBC. Wartime placed new demands on radio:

Britain now faced a crisis in national security. In its programming policy the BBC had to discover and broadcast what actually, as opposed to ideally, constituted the nation's identity. It had to identify with and personify the things for which Britain and its people were fighting if national morale and the war effort were to be sustained. Contrary to Reith's policy of cultural uplift, BBC policy was now defined principally in terms of popular entertainment, as evidenced in the establishment of the Forces Programme (later to become the Light Programme) and programs such as *Worker's Playtime* and *Music While You Work*.

This populist tendency was to prove irreversible, even after the war ended. The prospect of having to undergo yet another period of social reconstruction forced the BBC to follow a path of development less tied to the cultural and political rationalities that had characterized much of the interwar period. Though intended as a "cultural pyramid" for listeners to work their way up through, the BBC's adoption of a new tripartite system – banded into highbrow (Third), middlebrow (Home), and lowbrow (Light) – immediately after the war was indicative of the way in which the Corporation became increasingly resigned to continuing its output of popular broadcasts and allowing the listener to choose what they preferred to listen to.

### COMMERCIAL COMPETITION

This change in policy was even more pronounced from the 1950s onwards following the introduction of *Independent Television* (1955), based on the American model of commercial broadcasting and the attendant rise in disposable income and mass consumerism. Though radio broadcasting remained popular, demand for television coverage increased dramatically, forcing the BBC to acknowledge that the new medium was here to stay and that it would have to embrace television if it was to remain the main channel for broadcasting in the UK. For many BBC employees this was deeply problematic insofar as their preference was for the spoken word and sound broadcasting generally. Television, however, placed greater emphasis on the image, which, in comparison to radio, was deemed vulgar and lowbrow. Ironically, those employees who were enthusiastic about pioneering the new medium were lured away by the better pay offered by ITV (Independent Television).

A further problem for the BBC was that television was expensive to produce. Unlike ITV, which received advertising revenue and benefited considerably from increases in transmission hours, the BBC had to make do with the income it received from the yearly license fee. Nor could it spend its budget just on television, as could ITV. Not surprisingly, the BBC's audience share decreased significantly, a position from which it would recover only some years later. Whilst ITV undoubtedly challenged the BBC's ascendancy, in fact the two systems complemented one another reasonably well, and effectively operated as a "cozy duopoly" until the introduction of Channel 4 in 1982.

Another major change during this period was the emergence of so-called *pirate radio* in the 1960s (e.g., Radios Caroline and London; → Piracy). Unlike the BBC, which still offered only mixed programming, pirate stations broadcast continuous pop music, making them highly popular, particularly with young listeners. The BBC responded with the launch of Radio 1 (1967), its first dedicated pop music network. At the same time, the

Light Programme was renamed Radio 2, the Third Programme became Radio 3, and the Home Service was called Radio 4. Pirate radio was also to provide the catalyst for the development of more interactive radio formats during the 1970s, such as “access radio,” whose output tended to be more participatory and community-focused. Reactive as ever, the BBC belatedly established a network of local radio stations in many of Britain’s major urban centers. However, it would be some time before the local stations were properly funded, and even then, BBC headquarters regarded them to be of secondary importance.

In spite of the pressures from increasing competition, the BBC continued to inspire a regulatory regime in which it was seen as providing a touchstone against which conceptions of impartiality, diversity, quality, and public service were measured and configured into statutory or discretionary regulatory mechanisms and codes of practice. Even the commercially funded ITV contractors were required to broadcast public service programs; those that failed to fulfill their public service remit risked having their franchises revoked when they came up for renewal, and some did. The BBC, on the other hand, could do no wrong, as evidenced in the findings of the Pilkington Report (1962), whose recommendations resulted in the BBC being awarded a second television channel, which it called BBC2 (1964). The new channel gave the BBC a fresh appeal, with an emphasis on experimental and minority interest programs (e.g., the science series *Horizon*, epic documentaries such as *Civilisation*, *The Ascent of Man*, and *The Great War*, and the talk show *Late Night Line-Up*). It also broadcast populist programmes, taking the fight for ratings to ITV, and in some cases, beating them (e.g., *Match of the Day*, *Till Death Us Do Part*, and *The Likely Lads*). Yet another triumph was the introduction of regular color broadcasts (1967), the BBC being the first European network to do so. The BBC had vindicated itself and in so doing silenced its critics, for the time being at least.

### POLITICAL TURBULENCES

The institutional influence of the BBC and the Reithian public service legacy upon which it was founded only really abated with the 1980s and 1990s, a period that witnessed what was then the most significant overhaul to the ecology of British broadcasting, particularly the infrastructure of the BBC, which was made to adapt to the cultural hegemony of neo-liberalism. This was particularly so during the Thatcher years (1979–1990), throughout which the BBC was subject to unprecedented criticism and external pressures. The Conservative government was particularly critical of the BBC’s license fee, which was antithetical to laissez-faire market economics. A committee of inquiry was set up under the chairmanship of Sir Alan Peacock to recommend alternative means of funding. To everyone’s surprise Peacock’s report fell short of recommending that the license fee be replaced or supplemented by advertising or pay-per-view. Meanwhile, the BBC continued to produce programs that questioned the political status quo (e.g., news reportage of the Falklands War, and controversial series such as *Real Lives* and *Secret Society*), thus asserting its editorial autonomy and commitment to impartiality, even though this period culminated in the sudden departure of Alistair Milne, the first BBC Director General to resign as a result of political meddling.

The hostilities between the Conservative government and the BBC have since been characterized as a battle between competing ideologies, the effects of which are still being

played out today. In response to renewed attacks from the commercial broadcasting lobby demanding it become more publicly accountable, the BBC has reinvigorated the discourse of public service with its newly pledged commitment to “building public value,” a managerial discourse aimed at costcutting and efficiency drives, all of which has impacted on the quality and creativity of its program-making. Other examples of the ways in which the BBC has become more market-responsive include BBC Online, the move of the evening news from 9 p.m. to 10 p.m., increased competition with satellite and cable broadcasters for a greater audience share of new digital media, the use of consumerist rhetoric to justify its public expenditure, and plans to relocate parts of the BBC to the regions, such as Manchester in the north of England. Whilst some of these developments are to be commended, others are potentially detrimental to the BBC’s public service ethos and its unique relationship with the public as citizens.

### THE BBC LEGACY

Notwithstanding the continuing shift towards populist broadcasting, the BBC remains one of the world’s most influential and celebrated cultural institutions, widely revered as an authoritative source of information, trusted worldwide as a keeper of truth and the public interest. For many, its public service model still embodies the cornerstone of British broadcasting and is held up as a beacon for guiding any future regulatory reforms. The 2006–2016 Agreement and Charter largely guarantee the immediate future of the BBC as being allowed to continue to function as an independent, publicly funded broadcasting service.

Whilst no government has abused its position as paymaster, the threat to do so is always a possibility and cause for anxiety at times when the two institutions have been at loggerheads, as has been the case following the recent spat surrounding the war on Iraq and the controversial Hutton report. What is clear is that media institutions like the BBC will, more than likely, play an increasingly important role representing a diversity of competing political, cultural, and geographical communities, movements, and groups, not just in Britain but worldwide. The government has a responsibility, therefore, to ensure the BBC is appropriately funded and protected from the increasing pressures of creeping commercialism, whose sole concern is the pursuit of profits, often at the expense of democratic broadcasting. Such guarantees would ensure the future well-being, not just of the BBC, but of the ecology of British broadcasting as a whole.

## BBC World Service

Graham Mytton

*Audience Research Training and Consultancy*

The → international radio station with the largest global audience and the one with the best-known name, the BBC World Service, began as the Empire Service on shortwave in 1932. Today, while most of its estimated weekly audience of 183 million (all figures given here are for 2007) continue to rely on direct transmission on shortwave and medium wave from the BBC's own transmitters, it is also available via satellite, on mobile phones, on the → Internet, and through hundreds of local radio stations in countries around the world (→ Radio Technology). BBC World, a global → television service in English, is funded and organized separately. Organized within the World Service itself was a new TV service in Arabic. On radio, the World Service broadcasts in English and 33 other languages.

The original Empire Service was intended to be a link between the metropolis and the immense empire Britain then ruled. In the vastly changed world of today, when Britain's world role is much reduced, the English services are aimed both at mother-tongue English speakers and at the growing number of people for whom English is a major second language, one that they are comfortable to use as a source of → news and → information. The global weekly audience for English output is estimated at 38 million.

### SERVICES AROUND THE WORLD

#### Africa

The largest audience for English is in Nigeria, where it is estimated from surveys that the weekly audience (presently mainly reliant on shortwave because the government there has put restrictions on local retransmission) is over 5 million, 15 percent of the global audience for English. The extraordinary success of the BBC's African English output in Nigeria and elsewhere in Africa has undoubtedly arisen as a result of its daily reporting of events around the continent. Its main daily news magazine programs *Focus on Africa* and

*Network Africa* are probably the most listened to radio news programs from any source in Africa. The BBC has an unrivalled network of reporters and stringers in Africa, almost all of them nationals of the countries from where they report. Sport, the arts, health issues, and daily life in African cities and rural areas make up much of the rest of the special English-language programs specially made for the African continent (→ Africa: Media Systems).

French and Portuguese as well as services in indigenous African languages are broadcast and these also have large audiences. Since 1991, when effective central government collapsed in Somalia, the BBC's Somali language service has in effect been the only truly national Somali radio service able to reach Somalis in all parts of a very divided country. It also has a large following among the now vast Somali diaspora, who can listen to the output via the Internet. A major service provided at the height of the 1991 crisis and in the years since has been a regular feature that seeks to put Somalis in touch with missing relatives and friends lost in the upheavals.

### **The World Service and Human Needs**

This is a recurring feature of the BBC World Service. During and after major *humanitarian crises*, different parts of the output have been directed to informing and assisting those many people displaced and in danger. Similarly, the ethnic tragedies in Burundi and Rwanda in 1994 led to the establishment of a special Great Lakes service in the two languages of these countries, Kinyarwanda and Kirundi, bringing news and programs of special relevance to communities in conflict.

Meeting human needs for information has been at the heart of the World Service's mission, and its many initiatives in this respect have usually been very successful. It was this feature of the World Service that prompted Kofi Annan, then secretary-general of the United Nations, to describe it in 1998 as "perhaps Britain's greatest gift to the world this century." Malcolm W. Browne wrote in the *New York Times*, "The BBC is for the free mind, what Oxfam is for the hungry" (quoted in BBC External Services 1982, 4). The importance of the BBC in meeting information needs in areas of crisis and human deprivation led during the 1990s to the establishment of the World Service Trust, an educational and development agency that had as its mission to "use the creative power of media to reduce poverty and promote human rights by inspiring people to build better lives" (BBC World Service Trust n.d.). This initiative came at a time when development agencies and governments in the developed world were beginning to realize the vital importance of improved communication of relevant information in the global fight against poverty, ignorance, and disease (→ Radio for Development; Development Journalism). Its many projects included broadcast series on such major global health problems as HIV/AIDS and malaria (→ Health Campaigns for Development; Media Advocacy in Health Communication; Health Communication and Journalism).

### **Arabic Service**

The largest of the BBC's 33 language services aside from English was the Arabic service. It was the first foreign-language broadcast when it started in 1938 as a British response to Italian fascist propaganda broadcasts to the Arab world. During major conflicts in the

Middle East it reached very large audiences, especially in Egypt, Saudi Arabia, and the Gulf States (→ Egypt: Media System; West Asia: Media Systems; Gulf States: Media Systems). During the 1991 Gulf War its audience grew substantially in all countries where surveys were conducted at the time of the war, but since then the spread of satellite TV broadcasts and especially the success of Al Jazeera, the first Arab TV news channel to provide good → journalism to the area, radio has been in some decline (→ Arab Satellite TV News). It was with this in mind that the BBC launched an Arabic TV service in 1995, which was carried on a Saudi-owned subscription satellite channel. But when certain news items were cut in breach of strict agreements signed that this would not happen, the BBC ended the service. Some of the BBC Arab journalists made redundant by the closure moved to the newly established Al Jazeera and helped win this service the wide following that it later enjoyed. But 10 years later, in 2005, the World Service announced a new TV service to start in 2007. Funds for this new service were found by closing down 10 other language radio services.

### HISTORY OF THE WORLD SERVICE

There have been four distinct phases in the BBC World Service's 75-year history. The first was the *empire phase*, from the beginning in 1932 for the next few years. This was then overtaken by the *challenge of fascism* and Nazism and the subsequent world war. At the start of hostilities in September 1939, there were broadcasts in English and just seven other languages. By 1945 the total number of other languages had risen to 45. For many the BBC was the voice of hope and freedom, especially after the fall of most of Europe to German conquest and when the UK was virtually alone. In many occupied countries the BBC was the only source of alternative news and the only voice of resistance.

After the war, new circumstances led to a *major expansion* of services to communist countries of Europe and East Asia, and this can be seen as the third phase, which continued until the end of communism in Europe. During the years immediately after the war, several west European language services established during the war years were closed and in their place new services were started, especially to the newly emerging countries in Africa.

The fourth phase followed the *end of the Cold War*. Major changes in the world of media posed several challenges to all international radio broadcasters. All of them relied heavily on shortwave. At the same time as communism ended, new technologies were beginning to be available, especially the Internet. That development was coincidental. But it had a big impact on all international radio transmissions. Several international services cut back heavily on shortwave because they believed, wrongly, that it was in terminal decline and would inevitably be replaced by new delivery systems. In some areas this did happen. But far more important than the issue of which delivery technology to use was another major development in media landscapes. This grew out of the ending of the world engagement between state-dominated economies and the free market. Until 1990 most countries in the world continued to have radio and television systems that were run as state institutions. This was especially true in the former Soviet bloc but it was also the case almost universally in the French, British, and other European nations' former colonies in Africa and Asia. The end of the Cold War and the collapse of many state-dominated economies brought in their wake a liberalization of the air waves. It became increasingly possible to deliver programs and services direct by satellite to the many new

independent radio stations that emerged in many countries in all continents. But this was not possible everywhere, and even when it was, local rebroadcasts did not usually extend far beyond the cities in which they are located. It remained true that more than half the BBC World Service's global radio audience continued to rely on shortwave.

### **ORGANIZATION, INDEPENDENCE, AND POLICIES**

The vigorous independence of the BBC in its domestic services was a great strength of the World Service, a feature not enjoyed by other major international services such as the → Voice of America, → Deutsche Welle, or → Radio France Internationale. The journalistic principles and practices of both the domestic and international services were the same. This enabled the BBC to assert that, despite the state funding of the World Service, it was not a government mouthpiece. Like the BBC in the UK, the World Service maintains a fierce independence. Surveys of audience opinion around the world showed that most listeners valued its independence, authority, comprehensiveness, and reliability.

There are problems, however, in appearances. Arabic broadcasting from Britain was originally a response to Italian fascist → propaganda in Arabic that had been targeted at countries where Britain was actively involved – notably Egypt and Palestine. Some in the British government had doubts about whether the BBC was the right body to undertake the task, given its impartiality and practice of giving all sides to a story. And there were many within the BBC who did not really like the idea of being involved in something that was a response to someone else's propaganda. It might make it look as if the BBC was now actively engaged in the same kind of thing. The BBC's founder, John (later Lord) Reith, however, strongly believed that broadcasting in Arabic was a proper role for the BBC and that providing reliable and independent information was the best way to counteract propaganda. He won the argument. The government agreed at this point to provide the funds needed for international broadcasting by the BBC. Then began a relationship that was always difficult and at times strained. The BBC World Service received virtually all its funds from the Foreign and Commonwealth Office (FCO). For the financial year ending April 2007, the grant-in-aid was £239.5 million (US\$470 million).

The FCO has sometimes tried to have influence on or be involved in decisions about matters of editorial policy. The BBC has always resisted this. However, we return to the matter of appearances and how the BBC looks to those to whom its services are directed. One major problem with the new emphasis on Arabic is that it makes the World Service very slanted in its global balance. Until the end of the twentieth century, it had a balanced output in terms of continent coverage. But with the closure of nearly all its European language services, cutbacks elsewhere, and what might be regarded as a very heavy emphasis on reaching Muslim areas (a TV service in Farsi for Iran was planned for 2008 and a similar service in Urdu for Pakistan) made it look as if the BBC World Service had made a special thrust toward reaching Muslims. It looked as if more than a third of the BBC's expenditure would be on the Middle East. Was this the BBC doing the government's bidding? Almost certainly not; in all probability the FCO would like to push this trend further and might well prefer to see the BBC pull out of many of the other languages altogether. The FCO had a Public Diplomacy Board, but the BBC was not a member and attended its meetings only as an observer. The BBC has always resisted the

World Service being seen as any part of government's international diplomacy. It remains committed to independent journalism and a truly international public service.

## **Behavioral Norms: Perception through the Media**

*Dhavan V. Shah*

*University of Wisconsin-Madison*

*Hernando Rojas*

*University of Wisconsin-Madison*

Social norms entail learned expectations of behavior or categorization that are deemed desirable, or at least appear as unproblematic (Sherif 1936) for a specific social group in a given situation (→ Social Norms). Mass media have been found to help shape → perceptions of behavioral norms (→ Observational Learning; Media and Perceptions of Reality). These perceptions are consequential for health behaviors, social and sexual practices, democratic participation, and a range of other outcomes.

Certain social norms that are considered of extreme importance are typically elevated to the category of legal norms and are enforced through institutional apparatuses. Other

norms remain subject to less formalized modes of social control, including systems of rewards and punishments based precisely on sociability that include different combinations of isolation and recognition. Social scientists have long focused on certain key institutions of socialization in which those generalized expectations of behavior are learned by a new generation, namely the family, formal education institutes, and peer group interactions. Mass media are increasingly recognized as another important institution of socialization and cultivator of behavioral norms (→ Socialization by the Media).

Social scientists began to acknowledge media as an important socialization institution with the explosion of mass communication in the twentieth century. In addition to the transmission of information, mass media also convey behavioral expectations, offering role models as well as interpretive schemas to define a situation (→ Schemas and Media Effects). Different empirical research traditions within communication and related fields provide evidence of how media influence perceptions of social reality and “cultivate” attitudes and beliefs about the world. The emergence of the indirect effects paradigm has highlighted the importance of media for the perception of social norms, and explored the implications of these perceptions in greater detail (→ Media Effects: Direct and Indirect Effects). As a consequence, the study of media and perceptions of behavioral norms have become an important area of research in different areas of communication research including politics, health, gender, and identity.

## **SOCIAL NORMS**

Scholars working within the social norms paradigm are certain of the influence that social norms exert on individual and collective behavior. Yet the processes by which this influence occurs and the role of communication in this process are contested domains (Yanovitzky & Rimal 2006). In some early conceptualizations, social norms were understood as external social artifacts that regulated rewards and punishments within a group. Through a process of internalization these norms were incorporated by the individual (Sherif 1936). Social norms exist in all realms of human activity as a system of customs and/or laws of expected behavior in a given situation, and these customs and laws are expressed individually as values, attitudes, beliefs, and opinions.

Social norms of course are not unproblematic; they can be contradictory, evolve, and are perpetually challenged by emerging phenomena that test the limits of previously accepted expectations. Most individuals navigate the social world accepting certain norms while rejecting others, a “choice” that is socially constructed but also an individual expression. These choices result from, but also determine, our group affiliations. More current approaches view social or group norms as “regularities in attitudes and behaviors that characterize a social group and differentiate it from other social groups” (Hogg & Reid 2006, 7; → Group Communication).

## **MEDIA AND SOCIAL NORMS**

Social norms are “formed, reformed and maintained through human communication” (Yanovitzky & Rimal 2006, 2). In smaller groups people can infer the group’s norms from

explicit communication and implicit behaviors (Hogg & Reid 2006), but in larger groups mass media serve as conveyors of both words and actions.

These characterizations of groups are critical in helping us navigate the social world. Most importantly, they contribute in the *construction of our own identity* (for a review of this social identity perspective see Hogg & Reid 2006; → Social Identity Theory). In part who we are is determined by the groups we belong to and our emotional attachment to these groups. By categorization into groups, as well as out of groups, the individual self is defined in terms of similarities and dissimilarities to patterned behaviors. This process of identity construction entails not only adherence to perceived group norms, since what a “typical” group member would do in a given situation is what “I” should do in that situation provided I feel part of this group, but also the expectations “I” have about the behaviors of members of other groups. Consistency between group norms (potentially internalized as attitudes) and behavior increases with the importance attributed to group membership.

Media would contribute to this process of self-identity formation based on group portrayals with or to which a person sees some correspondence or attachment. Media working as socializing agents would then *provide role models* of “appropriate” attitudes and behaviors both reinforcing group norms and, more fundamentally, exemplifying the available group affiliations available at a given point in time.

To a certain extent all communication research traditions provide evidence of the importance of mass media in the perception of behavioral norms. From agenda setting and its focus on the relative importance of social problems that is provided by media attention (Althaus & Tewksbury 2002; → Agenda-Setting Effects), to cultivations of social reality by the disproportionate and continuous presentation of exemplars (Williams 2006; → Cultivation Effects), to more critical accounts in which elites secure consent for a given political order through the production and diffusion of meaning and values through mass media (Carragee & Roefs 2004; → Power and Discourse), the notion that media transmit behavioral norms is implied. Nevertheless, the case for a direct relationship between exposure to mass media and differential perception of social reality is probably exemplified best by the cultivation tradition, according to which sustained exposure to mediated messages, particularly television, cultivates a common outlook on the world in which mediated reality becomes more important than real-world experiences (→ Cultivation Theory).

Based on this notion of social norms and the power of media in their construction and dissemination, there is a long tradition of interventions in the form of communication campaigns that seek to alter certain social behaviors by providing cognitive or emotional appeals intended to influence what is considered “normal” (→ Communication and Social Change: Research Methods). In addition to the direct effects of these campaigns it has been argued that media, by changing the social acceptability of a behavior and influencing the direction of public policy, influence the social behavior indirectly through institutional changes enacted by policymakers.

### **INDIRECT EFFECTS OF MEDIA?**

According to third-person and hostile media perspectives in mass communication (→ Third-Person Effects; Hostile Media Phenomenon), media influence can also occur on the basis of the expectation individuals have of the effects of mass media on others. For

example, Gunther et al. (2006) have suggested that adolescents' smoking behavior is predicted not only by their exposure to smoking-related media content but more importantly by the perceived (not the actual) prevalence of smoking among their peers, which is a function of their likely exposure to smoking-related content. It appears then that being exposed to smoking-related content makes an adolescent more likely to smoke not only because of the direct persuasive effects of these messages, but also and mostly through a presumed influence process in which we judge the media will influence others, so our perception of what is the norm is altered.

This *presumed influence* is precisely what the social norm intervention approach has in mind when it relies on correcting misperceptions about social norms in order to affect behaviors. Based on the notion of pluralistic ignorance, i.e., the misperception that a disproportionate number of people engage in certain behaviors or hold certain beliefs, the social norms approach seeks to change certain behaviors that are considered risky by providing information about the "true" norm. For example, regarding alcohol consumption among US college students, there is evidence that despite how prevalent this behavior is, most students will actually overestimate the alcohol consumption of their peers and this overestimation ultimately affects their consumption. Working on this logic, certain communication campaigns that have sought to correct the misperception by providing information about "true" norms have been successful in reducing both pluralistic ignorance on the subject and alcohol consumption (Smith et al. 2006).

Beyond this realm of risky behaviors, media representations of social reality can affect our *perceptions of current public opinion* and in doing so alter the composition or expression of certain opinions, which ultimately may impact the political process (Mutz 1998). Beliefs about the relative prevalence of an opinion that result from the assumption of impersonal media influence can provide important cues about the social environment and local context. In fact, it has been argued that people are often exposed to perspectives and behavioral norms via mass media that they would not encounter through their interpersonal relationship, especially as they relate to the consumption of information and consumer products (Schor 1998).

More fundamentally, the perception of the → climate of opinion and associated judgments about the likelihood of people expressing those opinions have been linked to individual willingness to speak out, with individuals less inclined to talk if they believe others who share their views are silent (Glynn et al. 1997; → Spiral of Silence). Inferences based on journalists' presentations of the contending positions on an issue can influence perceived norms and the nature of the response by the perceiver (Gunther & Storey 2003).

With the emergence of computer-mediated communications, the influence of climates of opinion in interpersonal opinion expression persist (Price et al. 2006) and new domains for the cultivation of social norms appear. Williams (2006), for example, provides evidence of how online role playing cultivates fear of crime in the online domain. The development of social norms in online environments and their implications for social perceptions and behaviors are an emerging domain of research interest (→ Technology and Communication).

## **Bertelsmann Corporation**

*Jörg Becker*

*KomTech GmbH Research*

Bertelsmann Corporation, with headquarters in the small northern German city of Gütersloh, is one of the largest multinational media, information, and consulting corporations worldwide (→ Media Conglomerates), with a turnover of almost 20 million euros

and about 100,000 employees (all figures here are for 2006). If the size of the company is assessed on the basis not of annual turnover but of its credit rating with banks, then for many years Bertelsmann has been the world's largest multinational information concern, as (unlike many US companies) it has been debt free for a long time.

The following six companies belong to Bertelsmann: Gruner and Jahr magazine publishers (14 percent share of turnover), the → television group RTL (29 percent), the publishing house Random House (10 percent), 50 percent of Sony BMG Music Entertainment (10 percent), the Direct Group Bertelsmann with its worldwide book clubs (13 percent), and the consultancy company Arvato (24 percent). Bertelsmann is the world market leader in → book publishing (in the USA, it owns among others Random House, Knopf, Doubleday, Ballantine, and Bantam Dell) and book clubs; in the music business Bertelsmann is among the five music majors (→ Music Industry); and it is market leader in Europe for → magazines.

The current Bertelsmann concern began as a small publisher of Christian song and text books, founded in 1835. The publishing house continually expanded and focused on popular novels; at the end of the 1930s it employed 400 people. Up until the 1990s the company claimed to have been opposed to the National Socialists, but research work into the group by historian Saul Friedländer established the opposite: during World War II, Bertelsmann-Verlag was one of the most important suppliers of books for soldiers on the front. Among those who wrote those front books were numerous Nazi authors (for example, Will Vesper and Hans Grimm).

After 1945, Bertelsmann initially focused on the West German market. Overtaking the traditional book business, it took control of the West German book market with special book clubs whose members could buy books regularly and at particularly good prices. Later the company complemented its mail order book business with mass-issue cheap novels sold in bookshops of its own where only club members could buy. By the 1960s the West German book market was too small for the company, so it took its first step toward internationalization by founding the first book club in Franco's Spain in 1962.

Spain was an obvious choice for Bertelsmann because it was an ideal stepping stone to the large Spanish-language book market in Latin America. Bertelsmann became particularly active in Colombia (→ Colombia: Media System). Every second book printed in that country comes from one of the two Bertelsmann printing companies. When Spain joined the EU in 1986 Bertelsmann was able to further strengthen its position in the Spanish market.

The year 1986 marked a strategic turning point in Bertelsmann's internationalization strategy to the extent that it was the year the company began investing significantly in the US media market. After the complete takeover of the company Bookspan from → Time Warner Inc. by the Bertelsmann company in early 2007, it is now regarded in the US as the largest direct supplier of music, films, and books (→ United States of America: Media System).

Whereas the Bertelsmann company has been always innovative in its traditional business sector, the book market, its approach to the new media technologies and markets (pay-TV, databases, the → Internet) was mostly conservative. Only when the new and recent growth markets had undergone a phase of self-adjustment, ridding themselves of too many actors, did the Bertelsmann concern enter those markets, simply by buying up

existing smaller innovative players in the new technologies and then taking the lead in individual sub-markets with the combined forces of a multinational concern.

With the emergence of the Internet, however, and the disruption of the media and information branch by the dot.com bubble in 2000, Bertelsmann's former global book market was no longer what it used to be. This became evident, for example, in its purchase and reselling of shares in America Online (AOL) or in the, for Bertelsmann, very expensive copyright court cases involving the commercial online music service Napster. Meantime Bertelsmann's method of raising capital also changed. While the family company, which is not publicly listed on the stock exchange, traditionally drew its investment capital from its profits, in spring 2007, it founded a private equity fund along with Citigroup, Private Equity, and Morgan Stanley Principal Investments, so as to be able to acquire urgently required capital through the controversial methods of finance investors.

The concern's turnover allocation in the mid-2000s was also a drastic indicator that the old book world was dead. A quarter of Bertelsmann turnover by then was being made by the services its subsidiary Arvato provided. This company offered technical and administrative services to the most varied companies, heading the conservative think tanks in Germany that were successfully supplying privatization models to German local governments for public institutions and services (schools, roads, hospitals, cultural institutions, etc.). The East Riding County Council in Yorkshire, England, was a showpiece in this respect: for the period 2006–2014, Arvato took over the entire, formerly sovereign public authority administration of the city for the sum of 200 million euros.

In response to these developments, at the much-frequented Internet site [www.anti-bertelsmann.de](http://www.anti-bertelsmann.de), socially involved individuals and groups in Germany set themselves up in opposition to the privatization of public institutions and services by the Bertelsmann Corporation.

## Bi- and Multilingualism

*Richard Clément*

*University of Ottawa*

Approaching bilingualism and multilingualism from a communication perspective sheds light on a phenomenon which otherwise would appear static and asocial. Merriam-Webster's online thesaurus defines *bilingualism* as "the ability to speak two languages: the frequent oral use of two languages," and *multilingual* as "of, containing, or expressed in several languages" and "using or able to use several languages." The apparent simplicity of these definitions is, however, deceptive for a number of reasons.

### DEFINITIONAL PROBLEMS

First, they fail to make the distinction between bilingualism as a collective characteristic defining nations and bilingualism as a person's competence in one or more languages. As we will see below, the distinction is crucial to our understanding of bilingualism as the product of the interplay between individuals and their context.

Second, defining bilingualism at a national level entails, in itself, a number of difficulties. Since there are approximately 5,000 languages distributed in 200 countries, most would be characterized by a state of relative bilingualism. For a state to qualify as bilingual does not, however, follow from a simple head count. A key question, here, is: how do we distinguish a language from a dialect? Normally, languages are not mutually intelligible. Dialects, however, as varieties of one language differentiated by grammar, vocabulary, and accent may or may not be mutually intelligible. European French speakers would probably not understand the Creole dialect spoken in the French West Indies but they would probably understand the French spoken in Canada. Does that make Creole a language and French Canadian a dialect? Not necessarily. According to Weinreich (1945, 13), "A language is a dialect that has an army and a navy." This introduces the issue of power hierarchies in the definition of languages (→ Power in Intergroup Settings). Languages are not languages unless they are recognized as such by the state and this usually entails the obligation to support their acquisition, maintenance, and use. Hence, a state-level degree of bilingualism is heavily dependent on the political and social climate.

The third set of definitional problems is related to individual bilingualism or *bilinguality* (Hamers & Blanc 2000). A bilingual person could be someone who can speak two languages perfectly. However, there are those who suggest that even a minimal knowledge of both languages is enough to qualify one as a bilingual. Adding to the confusion is the fact that a strictly linguistic definition may not be appropriate. Apart from linguistic competence, Skutnab-Kangas (1981) proposes three other definitions of bilingualism based respectively on its developmental aspects, its functions for the individual and the community, and the speaker's identification and attitudes toward the second language community. This perspective supports the social and political underpinnings discussed above regarding societal bilingualism. It compels us to view bilingualism as heavily embedded in its social context and communication practices.

Each of the questions raised by these definitional problems will be discussed in turn. When we refer to bilingualism or multilingualism, we do not only mean languages in contact, but also the people from various cultural origins using these languages. Bilingualism is, therefore, an intercultural communication (IC) phenomenon (→ Acculturation Processes and Communication). While bilingualism and multilingualism have not been much explored in the literature on IC (see Gudykunst & Mody 2002), I will argue that the two fields of research share many concepts that are similar and that showing these would highlight their complementary characteristics (→ Intercultural and Intergroup Communication).

## BILINGUALITY

Acquiring and using a language other than the first language learned is a matter of fact in most areas of the world. A distinction is usually made between simultaneous and successive bilingualism. In *simultaneous bilingualism* both languages are acquired simultaneously, whereas in *successive bilingualism* the second language is acquired later in life. The first description of simultaneous bilingualism is attributed to Ronjat (1913) who observed the linguistic development (in French and German) of his son Louis from birth to age 4. Ronjat made positive conclusions about the development of his son. Since then, there have been numerous studies of simultaneous bilingualism which generally confirm what the early studies found: that children developing both languages simultaneously from an early age are able to differentiate their languages at an early stage and are not at any disadvantage in terms of language acquisition compared to their monolingual peers. However, achieving such a state of “balanced bilingualism” is subject to the existence of contextual factors such as the equal status of the languages, their equal valuing by parents, and the availability of a language community for each language, as well as individual factors such as positive attitudes toward bilingualism and the languages.

These factors are also present, under other labels in numerous IC theories. The importance of a network representing each language is expressed in Kim’s (1986) representation of the relation between second language (L2) competence and individual communication networks. Specifically, she relates network heterogeneity and the relative importance of outgroup members in the network to the achievement of outgroup communicative competence (→ Communication Networks). Similarly, Gudykunst’s (2005) → *anxiety uncertainty management theory* proposes that situational processes such as norms for interacting with L2 speakers as well as the individual’s connection with the L2 speakers act as determinants of communication effectiveness and intercultural adjustment. Finally, → *communication accommodation theory* (e.g., Gallois et al. 1995) underlines the importance, among other factors, of interpersonal and intergroup factors in determining the individual’s accommodative orientation. None of these theories deals specifically with development. They do, however, lay out concepts and constructs pertaining to the broader issue of communicative behavior. As suggested by MacIntyre et al. (1998), L2 usage is fundamental to L2 acquisition.

The factors affecting successive bilingualism (the acquisition of L2 after L1 has been established) are by and large identical to those affecting simultaneous bilingualism. Research results underline the importance of such factors as linguistic aptitude, learning strategies, and personality factors such as introversion. These aspects find little

correspondence in the IC literature. Pioneering work on the question of *motivation* does, however, cross many of the IC paths. Gardner & Lambert (1972) originally proposed that motivation is, with linguistic aptitude, the factor determining L2 competence. They further showed that L2 motivation was closely linked to attitude toward the L2 community and an interest in becoming similar to valued members of that group, a tendency which they labeled “integrativeness.” Originally aimed at describing the Canadian situation, research over three decades has shown that L2 motivation, as affectively based in intergroup attitudes, is a determining factor in L2 competence in numerous settings across the world. And this connects with aspects of the IC theories described above. Since the original research, many alternative motivational models have been created (Clément & Gardner 2001). In all cases, however, the affective basis of the motivation is linked to contextual factors (→ Language Attitudes in Intergroup Contexts).

Besides intergroup attitudes, the more recent literature has supported the importance of *L2 confidence* as a determinant of L2 behavior and competence. L2 confidence corresponds to the belief in being able to react adaptively to situations involving the use of a second language. It is related to positive self-ratings of competence and a lack of anxiety when using the second language (Clément 1980). It originates from situations where contact with the L2 community is both frequent and pleasant. Thus, while positive attitudes may orient the individual toward the L2 community, intercultural contact generates the confidence required for L2 interaction and, in so doing, promotes L2 competence as well as others consequences of L2 acquisition to be discussed below (MacIntyre et al. 1998).

Anxiety and uncertainty are also concepts found in IC theories. Notably, Gudykunst (1985) proposed a general theory of interpersonal and intergroup communication in which anxiety management occupies a central role. Accordingly, reconciling intergroup and interpersonal communication hinges on defining as the “stranger” any other person, whether or not they are perceived as culturally different. Specifically, it is suggested that the influence on communication effectiveness of the motivation to interact with strangers, the reaction to strangers, the social categorization of strangers, and the connection with strangers are mediated (in part) by an anxiety management system.

### **SOCIETAL BILINGUALISM**

Many descriptions of bilinguality may convey the impression that the phenomenon is individually based or, at best, relevant to dyadic interactions. The reference above to the attitudinal context of bilingual development and L2 acquisition, however, situates it at the intersection of individual and societal processes. This question has, therefore, come to be a key issue for government authorities in a number of countries. *Language planning* has been the political and administrative instrument used to promote and protect languages according to predetermined societal options. Accordingly, the state may determine the goals of language education; the medium of interaction with government agencies, tribunals, and schools; and the relative visibility of different languages in public and commercial signs – the linguistic landscape. These actions are often premised on the idea that a minority situation will not only entail the loss of L1 but may also result in the disappearance of entire cultural groups.

Under the concepts of additive and subtractive bilingualism, Lambert (1978) proposed that language learning outcomes could be very different for members of majority and minority groups. Notably, subtractive bilingualism would refer to a situation where members of a minority group would come to lose their first language as a result of learning the second one. Additive bilingualism, on the other hand, refers to situations where members of a majority group acquire L2 without losing L1. This notion of relative group status was subsequently formalized by Giles et al. (1977) under the concept of ethnolinguistic vitality (→ Ethnolinguistic Vitality and Communication), which encompasses demographic representation of the communities, their institutional representation, and the socio-economic status of their members. Ethnolinguistic vitality is linked to a family of language phenomena, and the results obtained to date show a consistent relation between these structural factors and first language retention and competence among minority group members.

These aspects find an echo in Kim's (2005) *contextual theory of interethnic communication*. Accordingly, language behavior is described along an associative–dissociative continuum controlled by various aspects of the communicator, the situation, and the environment. Associative verbal behavior would correspond to attempts at modulating messages to adjust to one's interlocutor whereas dissociative verbal behavior would seek to establish communicative distance. While no mention is made explicitly of usage of L2 to accommodate the interlocutor, that type of behavior would be considered associative. Kim's theory also describes the environment in terms of institutional equity, relative ingroup strength, and environmental stress, all aspects of the context that are likely to influence associative/dissociative behavior in a manner consistent with ethnolinguistic vitality theory.

## SOCIAL AND COGNITIVE CONSEQUENCES

A relevant issue here is the idea that positive benefits from L2 acquisition and usage will be achieved only to the extent that the first language and culture are well established within the individual (Clément 1980; Hamers & Blanc 2000). This presupposes a familial, educational, and social context that allows the development and transmission of the first language and culture. Although such conditions may be present for majority group members, they may not characterize the situation of minority group members, immigrants, refugees, and sojourners. The relative status of the first- and second-language speaking groups and the linguistic composition of the community are here key determinants of the linguistic and cultural outcomes of second language acquisition.

Specifically, as suggested by identity-based IC theories (Gudykunst & Mody 2002), there is an intimate link between communicative processes and *individual identity*. To the extent that a context brings about loss of the first language, it will also bring about loss of the first cultural identity. Noels & Clément (1996) have shown this to be the case among minority group members but not among majority group members. The systemic relationships between societal conditions and language loss, therefore, risk bringing about results that are the opposite of the intended goal of bilingualism programs.

A similar argument may be proposed as concerns *cognitive consequences* of bilingualism. It was originally thought that bilingualism would produce negative consequences for

cognitive functioning. The study by Peal & Lambert (1962), however, showed that bilinguals scored higher than monolinguals on verbal and nonverbal intelligence tests and showed a more diversified intelligence structure. According to these authors, bilinguals have the ability to manipulate two symbolic systems and thus analyze semantic features in greater detail. Subsequent studies have resulted in the conclusion that bilinguals have greater metalinguistic awareness and cognitive flexibility, that is, they are better able to distinguish the symbol from its specific meaning which gives them an advantage in most school-type cognitive abilities. According to Hamers & Blanc's (2000) sociocultural interdependence hypothesis, positive cognitive outcomes will result only where both first and second languages are valued.

In conclusion, the picture that emerges, whether from the perspective of IC theories or of theories dealing specifically with bilingualism and bilinguality, shows a phenomenon that is closely interwoven with social factors pertaining to the community at hand. Whereas IC theories are generally formulated in more abstract terms than bilingualism theories, they do not cover some specific aspects, such as linguistic and cultural attrition, or cognitive enhancements, which have been the prime focus of interest in societies that value cultural diversity. Most theories (in either camp) attempt, however, to explain these phenomena through complex multitiered mechanisms. They vary in emphasis and epistemological style but none of them makes predictions that are diametrically opposed to the others.

## Bias in the News

Tien-Tsung Lee

University of Kansas

In societies with a tradition of partisan news media (→ Partisan Press), whether news organizations have a political bias in their reporting is less of a concern. In other environments where mainstream news media purport to be fair and objective, and journalists are expected to be neutral gatekeepers instead of partisan advocates (→ Advocacy Journalism; Journalists’ Role Perception), whether or not the news media have a bias would receive close scrutiny from politicians, scholars, the general public, and journalists themselves. It is common for observers to perceive a political bias, which reduces their trust in the news media, and triggers their criticism of both media organizations and journalists (→ Media Production and Content).

### DEFINITIONS AND DIMENSIONS OF BIAS

A bias can be understood as a preference or inclination. A media bias, the opposite of objectivity (→ Objectivity in Reporting), can be defined as differential treatment of (e.g., favoring) a particular side of an issue, which can be measured quantitatively or qualitatively. If one side receives proportionally less news coverage, or apparently more negative, inaccurate, or unbalanced coverage, a bias is shown (see Simon et al. 1989). Some may

argue that an absolute objectivity is impossible to achieve, and therefore the term “bias” – the antonym of “objectivity” – should be replaced by a term such as “favoritism.”

McQuail (1992) identifies four types of bias on the basis of a typology of open versus hidden, and intended versus unintended. A *partisan* bias is open and intended, such as an editorial endorsement. *Propaganda* is intentional yet hidden, such as the result of a firm’s or a government’s public relations efforts. An *unwitting* bias is open and unintended, such as the fact that certain news topics are covered while others are not. Finally, *ideology* is unintended and hidden, and therefore is difficult to define or detect as it is “embedded in text” (1992, 194). Interestingly, the accusation that the news media have a liberal – which is ideological – bias is common in the US. Critics do not seem to have a problem finding evidence to support this claim.

The manifestation, as well as criticism, of a media bias generally consists of three aspects: the ideologies and party affiliations of journalists, actual media content, and the structure of media organizations. Using the United States as an example, its news media are constantly accused of having a *liberal bias*. Lichter et al. (1986) report that most reporters in large media outlets identify themselves as liberal and supporters of the Democratic party, which is perceived as a type of bias. Donsbach and Patterson (2004), who have investigated whether reporting is affected by journalists’ own attitudes and ideologies, conclude that journalists’ partisanship, especially in the US, has little effect on their news decisions. Echoing Gans (1979), Donsbach and Patterson also argue that journalists tend to hold somewhat “progressive” but “safe” views on social issues (2004, 260). Consequently, even though anecdotal examples of liberal or pro-Democratic coverage can be found occasionally, most systematic analyses of media content (e.g., Niven 2002) have found little or no political or partisan bias in mainstream news media.

Another group of media critics (e.g., Altschull 1995) believes that mainstream media, especially those in the US, have a *conservative bias*, partially due to the media’s corporate ownership, as evidenced by their support for a capitalist and two-party-system status quo. Some observers (e.g., McLeod & Detenber 1999) argue that alternative political views are often considered un-newsworthy and therefore are ignored by mainstream media, or receive unfairly negative coverage. In addition to partisan or political biases, the media have been accused of having *racial, gender, religious, and class biases*.

### POSSIBLE REASONS BEHIND A PERCEIVED BIAS

Media critic Michael Parenti (1996) offers several explanations for a general belief that the media have a political bias. First, due to the media’s corporate ownership, conservative voices are dominant and can repeat their complaints more often than liberal critics. Second, conservative politicians and commentators habitually attack the media to put them on the defensive. Third, the reporting of social realities in the news, such as wrongdoings in the government and large corporations, or poverty and pollution, can be considered liberal in nature. Similarly, a group of media scholars (Domke et al. 1999) argue that conservative and Republican elites’ strategic and frequent complaints have convinced both the media and the general public of the existence of a liberal and pro-Democratic bias.

Another line of research offers an alternative understanding of the perception of a media bias. “*Hostile media*” studies suggest that supporters of an issue or a group tend to

believe the media favor their opponents (→ Hostile Media Phenomenon). In other words, supporters of political or social groups or issues (e.g., Middle East conflicts, or liberals versus conservatives) tend to perceive the media as being unfair or even hostile to their own cause or side while favoring their opponents, and hence a media bias is perceived. Therefore, the perception of a media bias is likely caused by an observer's own bias. However, this argument does not exempt journalists from taking responsibility for accurate and objective reporting.

One more approach to understanding perceived biases in the media is the fact that audiences are likely to seek exposure to political information they tend to agree with, and process information in a way that *matches their existing view* (→ Selective Attention; Selective Exposure). However, if they happen to see a viewpoint in the news that they disagree with, they likely perceive a bias. At the same time, consumers may categorically assume all information from a certain source is completely biased and therefore not worth their attention. If citizens in a society are not exposed to, or are not open-minded about, perspectives they do not necessarily agree with, there can be some negative consequences in a participatory democracy.

### STRUCTURAL FACTORS BEHIND MEDIA BIASES

Conceptually, biases are difficult to avoid because news content is a reality selectively constructed by journalists (→ Construction of Reality through the News). Because of limited space and time in any medium (known as the “news hole”), decisions on topics and reporting angles must be made, and any selection itself can be seen as a form of bias. Certain forms of biases have been well studied, such as the overrepresentation of “official sources” and the lack of alternative viewpoints in the news. Possible explanations for such phenomena include the structure of a news organization, the ritual of news gathering, and the position of news organizations in a social structure.

Studies on the production of news, particularly on news gathering and gatekeeping (e.g., Tuchman 1978), suggest that journalists often operate under a *news beat system*, which makes news gathering easier given a news organization's limited resources. This system is biased toward official sources because they are easy to access. Also, journalists are socialized to adopt certain criteria of newsworthiness, which also might favor the power status quo (→ News Values). For instance, a reporter would automatically contact the spokespersons of the local police or fire department when a fire or crime occurs, likely because such officials are most apt to have relevant information. In addition, journalists are trained to judge newsworthiness in a way that reflects the power structure in society. For instance, politicians and business leaders are considered more important than common citizens. Therefore, the former group's voices are heard more frequently in the news. In other words, such figures often have the power to shape the agenda of news coverage (→ Agenda-Setting Effects).

Because the news media are part of the social structure, the variety of viewpoints reported in the news is related to the level of pluralism in a community, according to Tichenor et al. (1980). In a less pluralistic community structure, official voices tend to dominate news discourse, and groups or opinions critical of the local power structure tend to be absent in the news, which is also a form of media bias (→ Community

Structure Model). Furthermore, because the news media are part of a society, it is expected that they would reflect the dominant ideologies of the society in which they operate (also see Shoemaker & Reese, 1996, on a hierarchical model of factors affecting news content). For instance, in a capitalist country, reporters as well as audiences are unlikely to question such a system, and opinions critical of this economic system tend to be marginalized in the news. This itself can be seen as a form of media bias.

## **Black Feminist Media Studies**

*Kara Keeling*

*University of North Carolina at Chapel Hill*

Black feminist media studies is a growing body of scholarly work that looks at the intersection of media, race, and gender, with a specific focus on women of African descent. This field of research most often designates scholarship produced in the United States or

Europe that explores the ways that film, television, broadcast and print news, and new media (and, less often, radio) produce messages and ideas about women of African descent and the possible ways in which these representations influence political, economic, and cultural structures in society (→ Feminist and Gender Studies).

The *purview* of black feminist media studies is potentially very broad because the appellation “black” refers to different groups of people in different parts of the world. Even when “black” is restricted to people of African descent, it encapsulates an entire diaspora of people who may identify as or be identified as “black” within a given culture. In addition, the “media,” at least according to their broadest definition, designate a number of channels for sending signs by means of an ordered system (→ Sign; Woman as Sign). Many modes of communication fall within such an expansive definition of media. Currently, “black feminist media studies” takes as its object the production of media by, for, or about women of African descent. Significantly, the characterization of these studies as “feminist” highlights the political investment of the scholarship; it is interested in participating in efforts to build more just and egalitarian political, economic, and social conditions for black women.

Like media studies in general, black feminist media studies draws on a *range of methods and disciplines*. Ethnography (→ Ethnography of Communication), textual analysis (→ Text and Intertextuality), → critical theory, and → historiography are among the methodologies employed in the production of black feminist media scholarship. Scholarship has been produced from within the disciplinary formations of communication studies, mass communications, film and television studies, cultural studies, art history, history and literary studies, among others. Despite the diversity in methods, disciplinary location, and training of its practitioners, black feminist media studies scholarship shares a central set of issues.

One of the issues that has been central to black feminist media studies has been to assess the quality and implications of historical and contemporary *representations of women of African descent*. Analyses of these representations have provided explanations and insights into the ways in which black women are perceived not only via media but within society more broadly. Such “readings” of black women’s representation seek to explain how they operate ideologically to maintain existing power relations and thus where the ideological work they do might be challenged (→ Media and Group Representations).

Black feminist media studies also has been concerned with assessing, analyzing, and interrogating *media produced by women of African descent*. Political economy analysis, for instance, has produced quantitative analyses of media (→ Qualitative Methodology) in which black women have played a decision-making role regarding that media’s content. Qualitative analyses and readings of media produced by black women have also made an important contribution to the development of black feminist media research (→ Content Analysis, Qualitative). Additionally, ethnographic studies of black women’s media consumption practices and patterns have added to this rich and increasingly varied area of investigation.

Most of the *changes in black feminist media studies* over time have occurred as the range of media considered under the rubric of “media studies” has expanded due to technological innovation and methodological changes that have influenced disciplines historically concerned with the study of media. Film, broadcast, and print media initially were the

primary media considered. However, the increasing prevalence of new media has encouraged more black feminist media scholars to consider the significance of the Internet and other forms of digital media. At the same time, the increasingly interdisciplinary scholarship produced by academics working across disciplinary assumptions and institutional locations has led to more multifaceted forms of black feminist scholarship.

*Issues of sexuality* have long been of concern to black feminist media scholars. Issues have included investigations into the ways that black female bodies are sexualized in various media's representations of them, and questions regarding the ways that differences in sexual orientation complicate the consolidation of the category "black woman" (→ Gay, Lesbian, Bixsexual, and Transgender Media Studies; Heterosexism and the Media; Sexualization in the Media). Scholars will continue to engage with questions around the representation of black lesbians and other queer black women as they become increasingly visible in the media – or rendered invisible within a new (white) queer visibility more broadly.

Black feminist media studies is becoming progressively more *transnational in character* as scholars around the world gain access to a wider range of black feminist scholarship produced outside of the United States and Europe (→ Feminist Media Studies, Transnational). The widening availability of this work offers opportunities for dialogues among scholars that may open avenues of investigation that are more attentive to issues of place and space than current black feminist scholarship tends to be. Since at least the 1980s, black feminists in the US and Europe have become more strongly connected to other feminists of color, including American indigenous, Chicana and Latina, and Asian feminists (→ Latina Feminist Media Studies). These dialogues and collaborations constitute an engaging body of work that is sometimes referred to as "women of color feminism."

# Blogger

Ari Heinonen

University of Tampere

A blogger is a publisher of or contributor to a weblog. Weblogs are online publications that typically present contents in inverse chronological order, time-stamped, and with hyperlinks pointing at original sources online that bloggers refer to. Usually weblogs are conversational, so that readers' comments appear along with the bloggers' own postings (→ Internet).

Bloggers emerged in large numbers during the early 2000s, along with easy-to-use, often free weblog publishing software. The entirety of all weblogs is called the *blogosphere*. Technorati, a website providing news about the phenomenon, estimates that about 50 million blogs existed on computer networks worldwide as of August 2006 (Sifry 2006). Most bloggers have nothing to do with journalism; their weblogs represent personal online literary forms without aiming to deliver current affairs information of public interest (→ Personal Publishing). However, many bloggers operate close to or within → journalism, processing and publishing information in a manner that resembles journalistic routines. Bloggers have shaped → online journalism and sparked academic and professional debates about changing definitions of *journalist* and *journalism* (→ Online Media; Professionalization of Journalism).

From the perspective of journalism, bloggers fall into four categories on a continuum which illustrates their relationship with institutional media and professional journalism: citizen, audience, journalist, and media bloggers. *Citizen bloggers* are publishers of weblogs who operate outside of media companies. These bloggers may not intend to, or even prefer not to, produce journalism, but when publishing current affairs information they may “commit journalism” (Lasica 2002). Citizen bloggers may adopt roles as media commentators, specialized writers, or amateur reporters. Some bloggers monitor professional journalists, exposing on so-called *watchblogs* the deficiencies in journalists' work. Sometimes eyewitnesses turn into occasional citizen reporters by publishing on blogs first-hand information of news events. More sustained journalism can be found in blogs that experts maintain to cover issues in their own fields, or in community blogs that neighborhood amateur reporters publish to cover everyday life in their milieus. Citizen bloggers have also become a source of story ideas for professional journalists (→ Citizen Journalism).

*Audience bloggers* contribute to weblogs that media organizations provide either within or attached to their core publications. The audience contributions may appear closely linked to newsroom reports, but most are located in areas separate from newsroom contents. Gathering communities of audience bloggers may strengthen user loyalty to an online publication, resulting in improved regard for the media brand name. Audience bloggers may also generate a mutually beneficial dialogue between the newsroom and the audience, enhancing the quality of journalism by increasing the transparency of the reporting process.

*Journalist bloggers* are professionals who publish journalistic weblogs outside their home media institutions. The blogosphere lures them in by promising uncontrolled self-publishing space to deal with and comment on issues from viewpoints and in a style that

would not fit into the journalists' home institution. Some media companies forbid blogging by employees even outside working hours, but most professional journalists are free to blog without coming into conflict with their employers. In another variation, some journalists use blogs to showcase their work. These bloggers may be aspirants seeking to work in journalism or may be seasoned freelance professionals.

*Media bloggers* are also professional journalists, but they contribute to weblogs that their media employer maintains related to its online publication. Media bloggers may not adhere to as strict a journalistic code as they do in news writing. While allowing a more personal approach, the employer nevertheless applies some editorial judgment to the media blogger's output. Media bloggers may detest some characteristics of weblogs, such as the freedom of readers to comment on blog postings. Some media bloggers cover special events for their publications, such as elections or big sports events. They may write blog entries to publish more personal or less newsworthy musings about the event. Other media bloggers maintain blogs to comment and reflect on developments in their beats. Still others use the conversational feature of weblogs to share news ideas with readers before writing an article, drawing from the knowledge of their audience. Some newsrooms even publish notes from editorial meetings on a blog and engage readers in conversations about news decisions.

Bloggers may be a harbinger of more diverse and democratic communication, which online publishing technology can enable, as first predicted when the world wide web emerged in the mid-1990s (Castells 1996). Bloggers, along with podcasters, wiki-publishers, and other social media actors, challenge the institutional media and the journalism profession by offering competing or complementing information about news events and issues. The participatory features in blogging also highlight the lack of personal contact between conventional journalists and their audiences. The activity of bloggers may also question professional journalists' ownership of journalism by demonstrating that others can also deliver relevant current affairs information to wide audiences. Within established journalism, bloggers have created a new content genre that has rapidly become a customary element in the array of online publications (→ Journalists' Role Perception).

## Body Images in the Media

*Prabu David*

*Ohio State University*

Visual portrayals of women in the media tend to emphasize idealized standards of thinness and beauty that are beyond the reach of most women. The systematic analysis of the body type of fashion models (Silverstein et al. 1986) provide convincing evidence that women portrayed in glamorous roles in the popular media are thinner than the average woman. Moreover, these studies report that the normative standards of thinness have increased in the last few decades.

The increasing glamorization of thinness in the media is in stark contrast to epidemiological evidence, which points to an overweight and obesity epidemic in the population. Critics argue that the idealized thinness and digitally enhanced beauty portrayed in the media are beyond the reach of most women (→ Feminist and Gender Studies).

Idealized portrayals of women can be traced to the Renaissance artists and Venus sculptures by the Greeks. The interesting difference, however, is that these portrayals were not intended to serve as models of attractiveness for the average woman. Venus represented ethereal beauty, depicting godly standards, which women were not urged to imitate. In contrast, in → popular culture, the fashion model is presented as someone to emulate, whose thinness and attractiveness can be achieved through discipline, diet, exercise, and the consumption of fashion and beauty products.

### EVIDENCE FROM RESEARCH

Exposure to the thin media ideal is not without consequence. Body image distortion (Botta 1999), body dissatisfaction, body esteem, mood and eating disorder symptoms (Harrison 2001) are correlated to exposure to media ideals (→ Image). The case for the effect of media on body image is built upon research that includes media criticism, content analysis (→ Content Analysis, Quantitative), → surveys, and controlled laboratory experiments (→ Experiment, Laboratory). The findings from these different research traditions point to a significant association between exposure to media and body dissatisfaction, particularly among women with certain vulnerabilities. Even though it is

difficult to demonstrate a clear causal link, the associational evidence between media variables and body dissatisfaction is quite compelling.

*Early research* focused on the scientific analysis of media content. In these studies, researchers found that fashion models were becoming increasingly thinner and that the standards portrayed by these ideals were drastically different from the shape and size of the average woman. At the time these findings were being reported, a surge in diagnosed cases of eating disorders, such as anorexia nervosa, were also reported in the media. The increase in portrayals of thinness and a concurrent increase in eating disorders in the population led to the examination of the link between media and body image.

With data from content analysis, media critics argued that unrealistic portrayals of thinness and attractiveness were in part responsible for body dissatisfaction among women, which in some extreme cases led to clinical outcomes, such as eating disorders. Further, some critics argued that the body dissatisfaction created by advertisers was not just incidental, but a strategic effort to create body dissatisfaction that could be exploited to market beauty and weight management products.

Even as these content-based arguments began to emerge, social scientists began to examine individual differences that explained body image effects. It appeared that despite the broad reach of the media, only some women were affected by body image distortions. Researchers began to examine what makes some women vulnerable (Stice et al. 1994). Two *key variables* emerged out of this research: social comparisons with media portrayals (Heinberg & Thompson 1992; Tiggeman & McGill 2004) and internalization of thinness norms (Thompson et al. 2004). Using in-depth interviews (→ Interview, Qualitative), focus groups, and surveys, it was found that women who compared themselves to bodies of fashion models had higher levels of body dissatisfaction and eating disorder symptoms. Later research suggested that social comparisons provided only a partial explanation of body dissatisfaction and it was the internalization of thinness norms that were more critical. Through a series of studies, researchers built the argument that although body dissatisfaction was widely prevalent in young women, those who internalized comparisons with media ideals were more at risk for clinical disorders such as anorexia or bulimia.

The study of body image media effects also focused on media → genres and their differential impacts. Among different media, the use of *fashion magazines* was found to be a significant predictor of body dissatisfaction (Thomsen et al. 2002). Given that fashion magazines are filled with how-to tips to improve body image, the strong tie between fashion magazine use and body dissatisfaction is not surprising (→ Fashion; Magazine). In the same vein, certain types of *television programs* that emphasize thinness have been found to be related to body dissatisfaction. However, these findings rest entirely on correlational evidence that does not explain whether these types of media create body dissatisfaction or whether women with high dissatisfaction are drawn to these types of media (→ Correlation Analysis). In other words, although findings from survey research suggest a relationship between media use and body dissatisfaction, these findings do not establish media as a causal factor.

To address the causal effects of media use and body image dissatisfaction, researchers have used a variety of creative laboratory experiments with some common characteristics. In the *typical body image experiment*, participants are asked to provide a baseline

assessment of body image. Then respondents are assigned randomly to a control condition or to one of the treatment conditions (→ Sampling, Random). In the control condition, participants are shown images of inanimate objects or normal-sized models, whereas in the treatment condition, participants are shown images of thin fashion models or celebrities. Usually the images of fashion models are placed within a magazine or television program to hide the intent of the study. After exposure, study participants are asked to repeat body image assessments using the same pre-test scale. The pre- and post-test difference in body image is compared between participants in the control condition and the thinness-emphasized condition.

A *review of findings* from such experiments suggests that even after controlling for the effects of baseline body image, dissatisfaction is greater among participants in the treatment condition than in the control condition (Groesz et al. 2002). Moreover, body image dissatisfaction from the experimental treatment is not distributed uniformly among participants. Participants with a higher drive for thinness and higher propensity to internalize are affected more by the experimental treatment. The findings from these controlled experiments, together with corroborating findings from content analysis and surveys, set the stage for a persuasive argument that the media indeed contribute to body dissatisfaction among women.

### OTHER FACTORS THAT AFFECT BODY IMAGE

The media are only one of a constellation of variables that could explain body dissatisfaction. Researchers advocate a biopsychosocial model that takes into account biological, psychological, and social factors (Polivy & Herman 2002). *Biological factors*, such as body mass index or age of maturation, could play a role. Similarly, individual differences could explain the endorsement and internalization of the ultra-thin ideal, resulting in a strong drive for thinness.

*Race, ethnicity, and nationality* also shape perceptions of attractiveness and thinness. Within the United States, researchers have examined differences in body image satisfaction among Caucasians, African-Americans, and other ethnic groups (David et al. 2002). Findings suggest that Caucasians express a stronger drive for thinness than other ethnic groups, although other groups are not immune from the pressure to be thin.

The effect of media on body dissatisfaction is not limited to women in developed countries. These days, supermodels and multinational advertising campaigns have a global audience, including *women in developing countries* where hunger and poverty are still prevalent. Even in these countries, women from the more affluent segments of society report body dissatisfaction. To make matters worse, when images of western supermodels are exported to developing countries, they set unrealistic norms not only in shape, size, and attractiveness, but also in skin tone.

Although much of the body image research has focused on women, recent efforts show that *men* are also susceptible to these effects. Surveys and laboratory experiments demonstrate that the media can induce body dissatisfaction about muscularity or fitness, leading to dysphoria. Given the widespread reach of the media, it is not surprising that men, too, are subject to some of the same pressures as women, although women are subjected to more exacting standards of youth and attractiveness (→ Masculinity and the Media).

Furthermore, much of the research on body image media effects are based on convenience samples of college-age women primarily from the United States, Australia, and Europe. For a fuller understanding, it is necessary to examine media effects in diverse populations with women from different age groups and socio-economic backgrounds.

### **SOME STRATEGIES TO COUNTERACT BODY IMAGE MEDIA EFFECTS**

To counteract the influences of body image media effects, a number of initiatives are being explored. Various groups are pursuing *media advocacy* to persuade advertisers to exercise more responsible advertising (→ Media Advocacy in Health Communication). As a result of these advocacy efforts, advertisers face increasing pressure to present fashion models with body types that are closer to that of the average woman. Another advocacy objective has been to discourage advertisers from using the super-thin, waif-like fashion models. Although these advocacy efforts have had some success, perhaps the best form of defense is training and instruction in → media literacy.

Media literacy efforts focus on *educating the audience* about digital manipulation techniques used to achieve the air-brushed glamorous look that we are accustomed to seeing on billboards and in fashion magazines. Literacy training educates the population on how advertisers simulate glamour through digital manipulation (→ Advertising). Integrating such literacy training in school curricula could help adolescents understand that the body image ideals presented in the media are simply artificial constructions of attractiveness and thinness that even movie stars and supermodels can only aspire for.

Both media advocacy and media literacy are centered on approaches to thwart the negative effects of the media. Other approaches involve using the media to create positive outcomes, such as encouraging young women to be physically active (Thompson & Heinberg 1999). One of the positive trends in advertising and media portrayals is the increasing use of the athletic body type as an ideal. Although the athletic ideal could be equally unrealistic (Bissell & Zhou 2004), in light of the overweight and obesity crisis, it is possible that media portrayals that encourage physical activity and wellness may be beneficial. The potential positive media effects of such portrayals are being examined by researchers.

## Bolivia: Media System

Robert Huesca

Trinity University

The evolution of the media system in Bolivia has been shaped by the nation's particular geography, demography, culture, politics, and economy to produce a contradictory blend of innovation, richness, stagnation, and poverty. Land-locked in South America, Bolivia is perennially one of the most impoverished and politically unstable nations in Latin America, a legacy that has negatively impacted the development of the media system. Despite this legacy and general tendency, Bolivia is also home to some of the most innovative media practices in the world, especially in the area of community radio.

Bordered by Argentina, Brazil, Chile, Paraguay, and Peru, Bolivia has just over 9 million inhabitants occupying a space of 1.1 million square kilometers, making it about the size of France and Spain combined. The nation gained independence from Spain in 1825 and experienced an armed revolution in 1952. The revolution ushered in major reforms such as the nationalization of the mining industry and the redistribution of lands to peasants, which precipitated class conflicts, political unrest, and a series of

military coups. The nation has experienced more than 200 different governments since independence and suffered periods of hyperinflation in the mid-1980s which hit 12,000 percent in 1985 alone. Civilian rule returned in 1982, since which democratic elections have been held for its president (who serves a single five-year term) and two houses of congress, a Chamber of Senators, and a Chamber of Deputies. Current per capita income is US\$2,900 per year, and 64 percent of the population lives in poverty. Bolivia has the largest ethnic Indian population (55 percent) in all of Latin America, and Spanish became the dominant language only in the last quarter of the twentieth century. Literacy has improved in the past 20 years, with a rate of 87 percent overall.

## HISTORY AND REGULATION

Media regulation in Bolivia has been contradictory and inconsistent since independence. Freedom of the press is constitutionally protected, but journalists have suffered from intimidation and arbitrary detention, especially in periods of social and political unrest (→ Freedom of the Press, Concept of). Freedom House ranked Bolivia as a “partly free” country in 2005, while Reporters without Borders placed Bolivia seventy-sixth out of 167 countries surveyed in terms of press freedoms. By and large, the media system today is run privately with the state participating nominally in television and radio production and telephone service. Accurate and reliable statistics do not exist regarding basic data such as the number of daily newspapers, television and radio channels, circulation figures, and other indicators of media development. Nevertheless, Bolivia – along with Guatemala, Honduras, and Nicaragua – is considered one of the least developed Latin American nations in terms of its media system according to the “media utilization index” developed by the United Nations’ Economic Commission for Latin America and the Caribbean (CEPAL) (→ Development Communication: Latin America).

*Print journalism* in Bolivia has a complex tradition which combines partisan affiliation with critical questioning that often stimulates repression from the very party it supports (→ Partisan Press). Print journalism was not established in Bolivia until shortly before independence in 1825. Republican victors at the time obtained “portable” presses, which had been exclusively in the hands of the military, and began printing ephemeral newspapers. The early press largely represented and promoted elite interests, arguing that civic rights were the domain of educated and cultured men who were literate in Spanish, which was spoken by only 20 percent of the population at the time. Despite its close relationship with powerful elites, the Bolivian press began advocating the causes of workers and peasants, while denouncing the ruling oligarchy and aristocracy.

The next major turning point for print media occurred during and after the 1952 revolution, when the National Revolutionary Movement (MNR) came to power. The party had set up newspapers to advocate its pro-worker policies, and younger journalists with leftist leanings suddenly supplanted news professionals who had traditionally embraced conservative values. They formed a national organization called the Bolivian Federation of Press Workers (FTPB), which took over by force, and later by election, the old-line Journalists Association of La Paz (APLP). The Federation became the focal point of repression in the years of dictatorship beginning in 1971, with one newspaper, *Presencia*, losing 14 of its 17 reporters to jail or exile.

Contemporary print journalism continues the partisan tradition with almost all newspapers known to reflect a particular political position, ideology, or party view. Concrete figures regarding the number of newspapers and circulation are difficult to acquire in Bolivia. Estimates on the numbers of daily newspapers published in 2006 ranged from 18 to 24, with eight of them based in the country's functional capital of La Paz. According to 1996 figures from UNESCO, daily newspaper circulation in Bolivia totaled 55 per 1,000 residents, compared with 98 per 1,000 in neighboring and more economically prosperous Chile. The most influential newspapers are *Presencia*, *La Razón*, and *El Diario de La Paz*, which are all based in La Paz. The most dispassionate of the three is *Presencia*, founded in 1952 under the auspices of the Roman Catholic church. It is considered the best consistent source of professional, centrist journalism in the country. *La Razón* started publishing in 1990 and represents a liberal perspective; in recent years it has emerged as a highly influential newspaper on political matters. The oldest of these three newspapers is *El Diario de La Paz*, which was founded in 1904 and reflected the conservative tendencies of its owners for most of the twentieth century. Calling itself the "Dean of the National Press," it has become more open to leftist party and union perspectives since the 1990s, breaking away from its staunch conservative reputation.

### ELECTRONIC MEDIA

The advent of television was late in Bolivia, with the first station going on the air in 1969. The development of television is best understood as occurring in two phases. The first phase began in 1969 and was characterized by tight state control. From 1969 to 1984, the state was the only authorized broadcaster, with one national channel and eight regional university channels. In early 1984 the Bolivian senate passed legislation allowing private television broadcasting. Coupled with the adoption of free market economic policies and the availability of inexpensive electronic equipment, the legal opening stimulated entrepreneurs, political activists, and local communities to enter the television arena. Within two years, Bolivia saw 45 new stations enter the broadcast field. The de facto private broadcast policy finally became legal in 1986 with the adoption of the General Rules on Television Service, which granted licenses for 10-year intervals. Along with this regulation, the state passed legislation imposing import restrictions on content, requiring national or local productions to constitute 25 percent of programming in 1986, increasing to 40 percent in 1990. Despite the proliferation of channels, between 75 and 80 percent of all content is imported fare (much of it pirated), with Bolivian productions consisting of news and sports programs (→ Television Broadcasting, Regulation of).

Estimating the number of television stations in Bolivia is difficult. One author noted a swift proliferation of stations after the 1984 policy changes and counted 72 channels operating in the country by 1992. Most of the new signals operated locally, financed themselves through utility taxes or local contributions, and broadcasted signals of between 100 and 1,000 watts. The few large national and regional networks, however, are advertising-financed for the most part and owned by powerful business interests tied to mining, agricultural production, and import-export trade. These owners are also often tied to political parties, and several national personalities have emerged from television to run in elections. Currently, Bolivia has nine national and regional networks, the best known being ATB, Red Nacional, Bolivision,

and Red Uno. UNESCO figures from 1997 placed television receiver distribution at 116 per 1,000 residents, compared with 215 per 1,000 in neighboring Chile.

Radio is the most developed sector of the communication system in Bolivia and the one area where this country has established an international reputation for innovation in media practice (→ International Radio; Radio Broadcasting, Regulation of). Radio transmission in Bolivia began in 1929. Currently, the country hosts 171 AM, 73 FM, and 77 SW signals, more stations than neighboring Chile, despite having about half the population. The number of radio receivers in the country in 1997 was estimated at 5.2 million or 675 per 1,000 inhabitants, compared with 5.1 million and 354 per 1,000 in Chile, according to UNESCO figures. The structure of radio in Bolivia is largely divided into a large commercial sector, a vigorous religious segment (primarily the Catholic church), and a small state presence.

### PROGRAMMING ACCLAIM

The area of international renown, however, regards *community radio*, affiliated either with unions of tin miners or with the Catholic church (→ Community Media). The world's first known community radio stations emerged in Bolivia in 1947 in the mining region of the *altiplano* or high plain. Newly formed and officially recognized tin miners' unions established radio stations bankrolled by the dues of their members, who constituted the most important economic sector of the country during the 1940s. The stations programmed broadly, but were best known for establishing practices that were both highly participatory and strongly resistant to authoritarian regimes. For example, the stations developed the practice of the "open microphone," where personnel would make daily visits to public markets and other gathering places to give voice to ordinary people. They also developed "people's reporters" by training neighborhood and rural representatives to report news from their areas. The stations are legendary for mobilizing populations in times of military coups through the creation of "radio chains" (live retransmissions from one signal to another), and have suffered by having their stations bombed and closed down by the army. In their heyday in the late 1960s, the stations numbered around 30, but since the collapse of the price of tin, the exhaustion of the mines, and the mass firing of workers, all in the mid-1980s, the stations have virtually disappeared.

The other major force for community radio in Bolivia has been the Catholic church, which established its first station in 1955 and created an important network, Bolivian Radio Education (ERBOL), 12 years later. In its early years, ERBOL focused on literacy training, but has evolved to be more of a participatory network by working closely with more than 800 grassroots organizations and 2,500 community groups oriented toward social change (→ Participatory Communication). Community radio was given a boost in May 2004 when the President signed a law recognizing community stations with special licensing provisions. The new law is unprecedented in the Americas because it does not limit power, frequencies, or the airing of commercial announcements.

Finally, in the areas of telephony and Internet connectivity, Bolivia is largely underdeveloped and difficult to examine in terms of accurate figures. Current figures place the number of telephone landlines at 625,400. The introduction of cellular technology has skyrocketed, however, with 1.8 million sets in operation. Figures from

CEPAL indicate that Bolivia and Guatemala are the countries with the fewest networked computers per capita in Latin America. Nevertheless, the government does not impose any sorts of block, censorship, or restriction on Internet activity.

## **Bollywood**

*Vijay Mishra*

*Murdoch University*

When a descriptor becomes more than its immediate signified – the concept that it refers to directly – we begin to feel that there is something special, something rather unusual about it. Such a descriptor is “Bollywood.” The word refers to a film industry situated in Mumbai/Bombay (the slash here is important because without its colonial name, “Bollywood” cannot be generated).

Bollywood has such pervasive currency in just about every part of the world that even the *Oxford English dictionary* (2005) has an entry for it: “a name of the Indian popular film industry, based in Bombay. Origin 1970s. Blend of Bombay and → Hollywood.” The OED acknowledges the strength of a film industry which in 2006 produced 152 films but which, since the coming of sound in 1931, has produced some 10,000 films. This figure is

not to be confused with the number of films produced in India overall. The latter would take the total number to well beyond 50,000.

### ECONOMIC DIMENSIONS OF BOLLYWOOD

The numbers in all respects for Bollywood are quite staggering: a \$3.5 billion per year industry which employs some 2.5 million people, ticket sales close to 4 billion every year, and a growing international market for the films. Films such as *Salaam Namaste* (2005), *Veer-Zaara* (2004), *Kal Ho Na Ho* (2003), *Devdas* (2002), and *Kabhi Khushi Kabhi Gham* (2001) had box office collections of between \$1.5 and \$3 million in the US and between £1.5 and £2.5 million in the UK.

The short time span of these figures indicates the exponential demand for Bollywood in the UK and US Indian diaspora at the turn of the twenty-first century, even if India's share in the global film industry, valued in 2004 at \$200 billion, was less than 0.2 percent (Thussu 2007). One would have expected better returns from the UK but even there the Bollywood market accounted for just 1.1 percent of gross box office receipts in 2004 (Thussu 2007). At the forefront has been Yash Raj Films, a film company which quite self-consciously feeds the diaspora with values which it feels will alleviate the diaspora's unrelenting unhappiness for being untimely ripped from their homeland.

Additionally, the impact on → cable and → satellite television has also been enormous. B4U (a British Bollywood movie channel launched in London in 1999) is now available on eight satellites in more than 100 countries. With fanzines such as *Cine blitz*, *Filmfare*, *Movie*, and *Stardust* available globally online and in hard copy immediately after production, the Bollywood experience is growing into a worldwide phenomenon (→ Culture and Communication, Ethnographic Perspectives on).

### DEVELOPING THE BOLLYWOOD GENRE

Like any postcolonial form, Bollywood → cinema dealt with big issues – the idea of the nation-state, communal harmony, justice – all rendered through a melodramatic genre which grew out of a combination of the sentimental European novel, the Indian epic traditions, Persian narratives, a fair bit of Shakespeare, and the influential Parsi theatre, the last of these a form which effectively created the dramatic genre which was to become Bollywood cinema (→ Film Genres; Theatre). In this phase Bollywood was not unlike Hollywood as it reworked its base genre, created subtexts around its great actors (K. L. Saigal, Ashok Kumar, Dilip Kumar, Devanand, Raj Kapoor, Nargis, Madhubala, Meena Kumari), its auteurs (Mehboob Khan, Raj Kapoor, and Guru Dutt), and its film studios. Fanzines fed on all of these, and it could be said that with a few significant shifts – the arrival of the “angry young man” character of Amitabh Bachchan being one such rare shift – the form remained more or less intact. Indeed, from *Devdas* (1935) to *Maine Pyar Kiya* (1989), Bollywood cinema was a single interconnected syntagm (→ Semiotics).

Then came a *sudden redefinition* not so much of the form itself (which continued to be melodrama) but its mode of production, consumption, circulation, and its effects (→ Film Production). In the late 1980s a combination of disco dance and Michael Jackson (popularized a few years earlier by Mithun Chakraborty) was superimposed upon the old

staple of Bombay popular film, the sentimental song, in films such as *Ashiqui* (1990) and *Dil* (1990) (→ Popular Culture). The year is important inasmuch as these films also mark a decisive shift in theme, moviemaking techniques, and implied spectator. Youth, in the form of Shah Rukh Khan, Salman Khan, Amir Khan, and Abhishek Bachchan (to name a few), returns to Bollywood with the same kind of excitement which had brought Dilip Kumar, Raj Kapoor, and Devanand to cinema in the late 1940s and early 1950s.

But there had also been a major *shift in the nature of capital* – from the old manufacturing-based wealth (so well documented in Mani Ratnam’s recent film *Guru* [2007]) to a new kind of wealth, which moved swiftly via cyberspace. This wealth was also a virtual wealth made and unmade as well on the → Internet. The postmodern Bollywood, where the old depth of language and dialogue (hallmarks of classic Bombay cinema as seen, for example, in the 1953 *Parineeta*) is replaced by a “technorealism” (seen in the remake of *Parineeta* [2006]) at the level of production and the “mise-en-scène,” became the marker of Indian modernity (Rajadhyaksha 2003). With a difference, though – this (post)modernity negotiated a new definition of the spectator and a new definition of the subject of cinema (→ Postmodernism and Communication).

### AUDIENCE OF BOLLYWOOD FILMS

At the *level of spectator*, the implied viewer was no longer made up primarily of Hindi-Urdu speaking Indian denizens and those in the Middle East or the old Indian plantation diasporas (Fiji, Trinidad, Guyana, Surinam, Mauritius, and the like) but included, in growing numbers, South East Asians and the people of the new Indian diaspora of late capital (→ Globalization of the Media). The latter – the well-to-do Indian diasporas of the UK, the US, Canada, and Australia; rich but also uneasy in supposedly multicultural nation states and often unable to connect directly with these nation states’ own popular cultural forms – began to emerge as the target audience, while in India, too, the growth of a new middle class with disposable incomes created lifestyles seemingly similar to the Indian youths in the diaspora. Bollywood captures this new consuming class across national boundaries (→ India: Media System) – again, with a difference though.

Bollywood has a remarkable *mediating function*, inasmuch as it relocates, re-presents, and repackages contemporary culture for re-consumption by the diaspora (→ Culture: Definitions and Concepts). The shift from Bollywood as a postcolonial form (aimed at defining the nation, its values, and so on) to Bollywood as a transnational form responding to a new consumer community, whether within India or in the diaspora, is now its fundamental characteristic (→ Postcolonial Theory). The hype around Bollywood, if not its global box office success, however limited, captures this trend. Expressions such as “Bollywood industry,” “Bollywood bonanza,” “Bollywood fix,” “Bollywood shakedown,” “Bollywood romp,” “Bollywood breaks,” “Bollywood dancing,” “Bollywood calendar,” “Bollywood experience,” “Bollywood culture,” and “Bollyweb” are now not uncommon. Indeed, Bollywood is a signifier of Indian modernity itself: Aishwarya Rai, the current Queen of Bollywood, performs at the closing ceremony of the 2006 Commonwealth Games in Melbourne, and the British television show *Celebrity big brother* (2007) suddenly becomes global news because of racial slurs made against its Bollywood star Shilpa Shetty by her housemates in the show.

### THE NEW BOLLYWOOD

Implicit in the Lloyd Webber–A. R. Rahman musical *Bombay dreams* is a whole new definition of the subject of the Bollywood film. The basic themes of love, desire, and separation, of the lure of the city and its material benefits, of the stability of the family are all there, but these are being slowly transformed at the level of → discourse and at the level of representation. At the level of discourse, languages proliferate – Punjabi and English (as in *Kal Ho Na Ho* and *Dhoom 2* [2006]), regional dialects (as in *Omkaara* [2006]), Bombay slang (as in *Lage Raho Munnabhai* [2006]) – the English word “love” replaces its Urdu-Hindi equivalents; at the level of representation, the old “Bombay realism” is being replaced by a distinctly Bollywood “technorealism” and this distinctiveness is readily obvious in films such as *Don* (2006; a remake of the original Amitabh Bachchan *Don* of 1978) and *Dhoom 2*, where Bangalore software seems to overtake the camera. There is another distinctiveness, and this is in the two recent adaptations of Shakespeare: *Maqbool* (2006, based on *Macbeth*) and *Omkaara* (2006, based on *Othello*). In both of these Shakespeare is modernized in very Indian ways; in *Omkaara* with the use of Indian dialects; in *Maqbool* with its subtext of the Bollywood film industry itself.

The argument about Bollywood as a “hype” and in its late modern form as a new “technoreality” comes together graphically in Sanjay Leela Bhansali’s 2003 version of the P. C. Barua/Bimal Roy classic *Devdas* (1935/1955) based on Saratchandra Chattopadhyay’s 1917 sentimental novel in Bengali of that title. In Bhansali’s high-tech version of the film, the homage is neither to the writer of the novel nor to P. C. Barua and Bimal Roy (as the credits in the film declare) but to “Bollywood,” which now takes over *Devdas* and models it in its new image; the cinematic fidelity is not to an earlier form but to the film’s own postmodern, simulacral modes of representation (→ Visual Representation). Where classic Bollywood cinema (the pre-postmodern variety) indicated an impossible love through lyric and metaphor, the new *Devdas* shows the suffering Paro holding on to an everlasting flame to signify her equally tragic love for Devdas (Fig. 1). Sentimental

Figure 1 Still from *Devdas* (2002)

melodrama (the dominant form of Indian cinema) remains intact but its representation and effects have been radically altered (→ Genre).

With all the claims of globalization and transnationality, Bollywood remains different, and largely inaccessible, in its totality, to people not immersed in its form. In spite of all the borrowings from Hollywood (storyline, music, mise-en-scènes), Bollywood is the late modern face of India and of the Indian diaspora (Mishra 2002). For, in the end, it tries to be modern without throwing away its grounding in rather ancient ways of doing things (seen as late as 2006 in the film *Babul*), and these ways will always insinuate a different, an Indian, splitting of reason (→ Habermas, Jürgen).

## **Bona Fide Groups**

*Michael W. Kramer*

*University of Missouri*

The bona fide group construct grew out of a concern over the external → validity and generalizability of studies conducted on zero-history, laboratory groups. More than just a focus on studying naturally occurring groups, a bona fide group perspective focuses on characteristics of naturally occurring groups that do not exist in laboratory groups

(→ Experiment, Laboratory). The first conceptualization of this by Linda Putnam and Cynthia Stohl (1990) emphasized that naturally occurring (bona fide) groups have stable but permeable boundaries, are interdependent with the immediate context, and have links between the boundaries and context. So unlike artificially created groups, in bona fide groups, group membership frequently changes, the group's internal dynamics are influenced by the external environment, and its members are influenced by their simultaneous membership in other groups. For example, an ad hoc committee frequently experiences membership changes as personnel are reassigned, is interdependent with the administrator who convened the group and with other groups who provide it with resources, and is affected by the divided loyalties of its members as they balance their involvement in the ad hoc committee with other departmental and social groups.

Further elaborations of the bona fide group perspective have contributed to the understanding of the complexity of groups in context. Putnam and Stohl (1996) emphasized that bona fide groups cannot be considered containers with unambiguous boundaries, and focused on how group identity is formed. Group identity is influenced by the degree of belongingness to the target group and the loyalty and commitment to other groups. In an extension of the bona fide group perspective, John Lammers and Dean Krikorian (1997) elaborated on aspects of context including the fact that bona fide groups operate at multiple levels, are simultaneously tightly coupled (interdependent) in some areas and loosely coupled (independent) in other areas, are resource-dependent, and have competing internal and external authority or power systems. Further, a bona fide group should be considered in terms of its age, its task duration, the characteristics of its members, and its institutional history (→ Group Communication).

Since its conception, a bona fide group perspective has generated a significant body of research including at least one entire edited volume of studies (Frey 2003). The bona fide group perspective provides insight into understanding such diverse topics as how a medical device sales representative can temporarily become part of a surgical team (Lammers & Krikorian 1997), how members balance their simultaneous membership in work, family, and social groups while participating in a community theater group (Kramer 2002), and how the different agendas brought to a government community cooperative by its members' multiple group memberships decreased its effectiveness (Keyton and Stallworth 2003).

Scholars sometimes mistakenly assume the importance of classifying or categorizing a particular group as a bona fide group. However, as Putnam and Stohl (1994) point out, all naturally occurring groups exhibit characteristics of the bona fide group; it is simply a question of the degree to which the researcher attends to these characteristics. In reflecting on research using a bona fide group perspective, Stohl and Putnam (2003) conclude that it will continue to expand the breadth of group research by exploring more varied group contexts through a range of research methods and by focusing research on the impetus and impact of both internal and external communication on group processes.

## **Book**

*Kay Amert*

*University of Iowa*

The book is a durable vehicle for words and images and often is a central artifact in cultures with the written word. Those produced in the era before the advent of printing are unique “manuscript” books that were made by hand (→ Printing, History of). The book became the first mass medium, and conventions for its presentation shaped those of later media. It can be distinguished from other printed and electronic media by the substantial length of its texts and by the diversity of its content, which ranges from the worldly and practical to the poetic and sublime. Because books both comprise and safeguard the working memory of humanity, they are inherently conservative at the same time as they announce what is new. Thus the book is a complex artifact: it reveals the personal, social, and cultural values of a period, and it can be “read” in a variety of ways (→ Typography).

The many genres of content that have developed in modern book publishing demarcate organizational boundaries within the industry, affiliations of authors, commercial identities of bookstores, the arrangement of books within shops and libraries, and the particular interests of book clubs or readers’ groups. While most books are edited, designed, produced, promoted, and distributed by the processes discussed below, the field of book publishing is diverse and includes small presses, specialty publishers, government publishing, the private press, and artists’ books, inspiring many variant practices.

## **MATERIALS AND FORM**

Materials used in the construction of books must be light enough to be amassed in quantity and flexible enough to be rolled or folded. Papyrus, parchment, and paper all meet these requirements, with machine-made paper predominant in modern times. For economy, the sizes and shapes in which such materials originally are produced often act as determinants of the formats of books. Books must be comfortable in hand and most are regular in shape. The rectangles of the book page appear in both “portrait” (upright) and “landscape” (sideways) dispositions, or more rarely as the square. Page shapes often are built on the rationality of such whole number proportions as 2 : 3, 3 : 4, or 5 : 8, supplemented by more dynamic square-root proportions and special proportions such as the golden section. By design or of necessity, book formats sometimes break out of these norms: “elephant” folios and miniature books are two examples, and pictorially shaped books have an ancient lineage, as well (→ Design).

Comprehension of the content of most books requires a specific sequence of pages to accumulate meaning. Imposition (the placement of pages) and binding determine and enforce that order. Binding techniques for books include simple “stabbing” and side-sewing, machine sewing, adhesives, and “mechanical” methods reliant on devices. Hard covers offer protection and durability, while soft covers permit economy and portability.

## **EDITING AND PRODUCTION**

Editing books involves the selection and shaping of texts for publication. Formerly patrons and currently mostly corporate bodies with an interest in ideas or profit sponsor this process, providing its material and means. Editors channel and reshape texts, guided by dictionaries and manuals that insure consistency and predictability in the use of language and the presentation of thought.

The book was reorganized in its first 100 years as a mass medium. A period of experiment begun in the mid-fifteenth century introduced such things as the title page and printer’s device. Most texts were fragmented to create small, easily comprehensible units, and labels were added to identify parts. Prefaces and forewords were derived from manuscripts, but other elements of the book’s apparatus including page numbers and indexes were new to the book as a mass medium and continue to govern its presentation. The apparatus of the book is expansible or collapsible, but the nature and order of its components remains consistent and predictable.

Producing the book has almost always required the use of teams of people and specialized equipment, in the modern era in an industrial setting to accomplish typesetting, proofreading, printing, and binding. The introduction of computers into this process from the 1960s changed the process of typesetting and revised writing and editing practices, eliminating steps in production and altering relations among personnel.

## **ART AND BOOKS**

The earliest writing systems were fundamentally pictorial and the book continues to embrace pictoriality as a principal mode of communication or as a complement to texts.

In the era of the manuscript book, images often were objects of contemplation and were inserted by hand using direct, autographic techniques such as drawing and painting. A long tradition of the decoration of the page also developed in the manuscript era. Printmaking techniques that produced multiples replaced earlier methods. Across all cultures, the earliest of these techniques was the woodcut, often followed by metal engravings and then by processes like intaglio or lithography which adapted alternative methods of printing. The pictorial precision of → photography encouraged its inclusion in books as well as other printed media from the late nineteenth century. Images began to be digitized late in the twentieth century, speeding their transfer by electronic means and favoring their inclusion in books.

While long a tradition in the east, the modern artist's book came to the fore in the west in the late nineteenth century. Late twentieth-century technological change brought artists face to face with issues related to the book: some altered texts to subvert or convert meanings; others produced "installations" that reflected on accretion of knowledge or the worthiness of the many promises made by the form and content of the book.

## **DISTRIBUTION**

Transport of books became a logistical problem of some significance with the advent of the book as a mass medium, and the weight and bulkiness of books in numbers continues to be at issue in an era that permits the electronic transfer of texts and images. Bookstores originated in scribal and printers' workshops and spread in cities as specialized boutiques. An increase in literacy and in the number of bookstores promoted specialization and the establishment of genre-oriented bookshops.

The computerization of book ordering and shipping begun in the late twentieth century reduced diversity among bookstores, encouraging centralization and the development of uniform chains. Online sale and the electronic ordering of books further unified bookselling by providing access to the combined resources of used and antiquarian bookstores and the fresh output of book publishers, vastly increasing the number of titles accessible by this means (→ Personal Publishing).

The book review developed as a evaluative service for modern readers confronted with an array of texts. Reviews typically reprise the substance of a text, estimate its cultural value, and promote acquaintance with authors, texts, or publishers. Initially sponsored by magazines and newspapers, the reviewing process recently has been democratized by the advent of personalized, online reviewing.

## **LIBRARIES AND CONSERVATION**

In the era of the manuscript book, libraries were formed by individuals or developed for the corporate study and duplication of books in religious or academic settings. The durability of both manuscripts and printed books also lent them to amalgamation and protection by courts, governments, and religious institutions. Enlightenment thought fostered the notion of the individual reader as educable through the silent instruction provided by books and thus suggested the development of lending and then free public libraries. Modern economies in book production encouraged the formation of personal

libraries for “everyman.” Digitization of books enables the creation of “virtual” libraries, but challenges copyright and other forms of legal protection.

The need for the conservation of ancient manuscripts and printed books led to the development in the twentieth century of a science of book conservation dedicated to understanding historical materials and book production methods and to discovering ideal conditions for preservation. But it also emerged to address the consequences of a decline in the quality of materials and binding methods that began in the nineteenth century. Residual acidity in papers produced from the mid-nineteenth century, for instance, creates slow, internal “fires” that can destroy books.

## READING

Rapid reading of lengthy texts depends in part on the nature of the book as a “still” medium. The mechanics of silent reading involve revoicing the text in the mind and “hearing” the voice of an author or character, an operation that has been of some interest to modern literary theorists. The need for instantaneous recognition of character or word shapes accounts in part for the conservatism common in the development of writing styles and text fonts. The “transparency” of fonts permits a reader to partake of a text without undue consciousness of its vehicle.

The visual organization of the book page operates in much the same way and has many of the same purposes. The *mise en page* or layout of book pages is related to the body, with “head” and “foot” margins to orient the reader. In most books, pages also are subdivided in regular ways that are satisfying to the eye. The “restfulness” of a typical book page enables the concentration necessary for reading and leaves the reader in charge, fully acquainted with a plan for the “consumption” of the text (→ Graphic Design).

## PEOPLES OF THE BOOK

Some of the power of the book is revealed in the social or cultural organization that forms around them. Religions, for example, often are built on acquaintance with texts contained in books. The modern professions, whether law, medicine, or scholarship, also revolve around acquaintance with texts. But social groupings also evolve in response to such things as common interest in the books of a particular author or in those central to a popular cultural phenomenon. This produces differing ideological commitments, senses of identity, and styles of living based on sharing the ideas contained within books.

Study of the book began with the compilation of book lists. Bibliography developed to bring precision to this task and now takes into consideration factors relevant to both the composition of texts and the construction of the physical book. Early histories of printing and publishing usually focused on the medium of the book and spawned biographical studies of such figures as printers, publishers, and illustrators. New understanding of the power of the book has led in the modern period to more intensive study of its workings in an interdisciplinary context. Literary theorists delve into such things as the “fiction” of the author’s voice or paratextuality as a way of framing the experience of the reader. In the late twentieth century, intellectual historians opened paths for understanding such things as hidden aspects of the book trade, the impact of printing on culture, and aspects of

the “coming of the book” linked to technical, visual, economic, labor, and geographic concerns.

## **Branding**

*Katja Gelbrich*

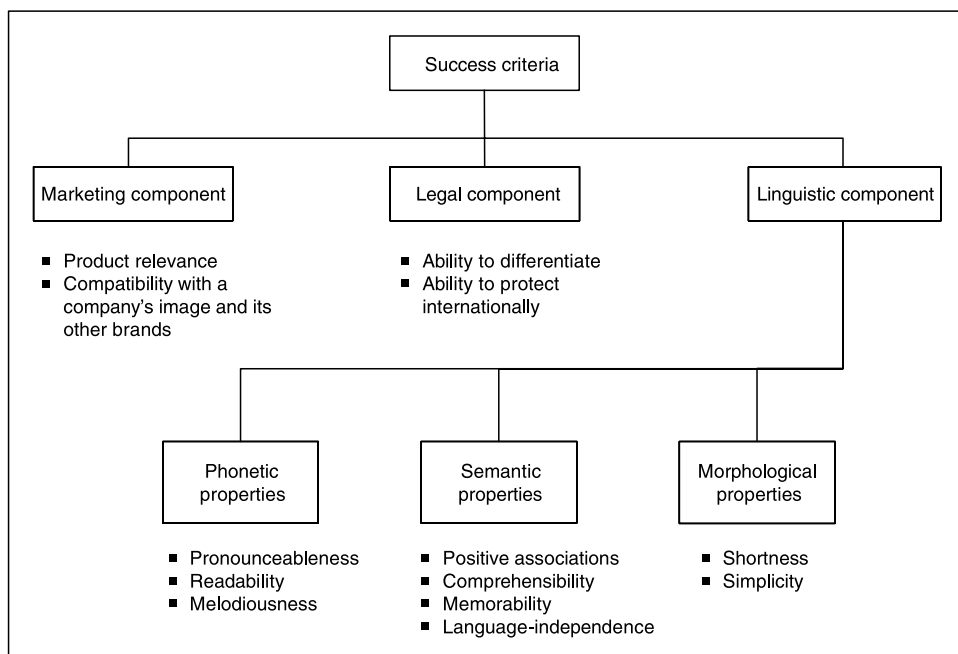

*Ilmenau University of Technology*

The term “branding” is used for the identification of offers (products and services). Etymologically, the origin of the word can be found in the branding of cattle. Initially, the spectrum of meanings was closely restricted to the pure act of naming. In the course of time, a more tailored definition of branding was suggested: integrated and harmonized use of all marketing mix instruments with the aim of creating a concise, comprehensive, and positively discriminating brand image within the relevant competitive environment (→ Image; Marketing). However, this all-embracing concept is not clearly distinguishable

from brand management. Hence, *another definition* situated between these two extremes has become widely accepted: the so-called magic triangle of branding. The triangle has the following three sides: brand name, trademark (for example, a logo), and product design and packaging. It is the task of branding to balance these three sides so that they position a brand uniquely (see also Aaker 1991; Aaker & Joachimsthaler 2000; → Brands).

## BRAND NAME

Faced with the increasing globalization of many markets, the issue of the creation of *global brand names* has recently received a lot of attention (Aaker & Joachimsthaler 1999; → Globalization of Organizations). The criteria mentioned in this context (for example, short, simple brand names that release positive associations and are easily understandable and easily remembered) are of course also important for the branding of *national brands*. In a global context, however, such criteria as “short, simple, easily remembered” have to be more strictly observed or differentiated (cf. Fig. 1). This is valid, for instance, for a brand’s suitability to release positive associations. This is because associations frequently draw on symbolic meanings and symbols that are usually only understandable within one cultural realm (→ Symbolism). With regard to the phonetic properties (easily pronounceable and readable as well as melodious), global brand names also have to meet tougher demands. The so-called *speech universals* play a special role in this context. They are

**Figure 1** Success criteria of global brand names  
 Source: Following Huang and Chan (1997, 322)

similarly effective in all alphabetical languages. One example is the universal sound symbolism of the vowels a and o (= large) and i (= small). Another one is the special effect that certain consonants have: brand names beginning with a plosive (= b, d, g, k, t) are significantly better recalled and recognized than other brand names.

### BRAND LOGO

A decisive role is attributed to the brand logo (Buttle & Westoby 2006). This is due to the fact that, like all visual stimuli, it is processed more easily and quickly than the verbal stimulus of the brand name. Moreover, visual impulses are more memorable than verbal ones and take a direct path to stored associations in the brain (→ Visual Communication; Visuals, Cognitive Processing of; Advertisement, Visual Characteristics of). For this reason, *image logos* are used more often than script logos. The images may in turn be abstract icons or tangible pictures (cf. Fig. 2). From the relevant research on data processing, it is known that tangible graphic stimuli are better processed and remembered than abstract picture impulses. However, Esch and Langner (2001) found that, paradoxically, with regard to brand logos, people tend to convert the originally tangible (image) logos step by

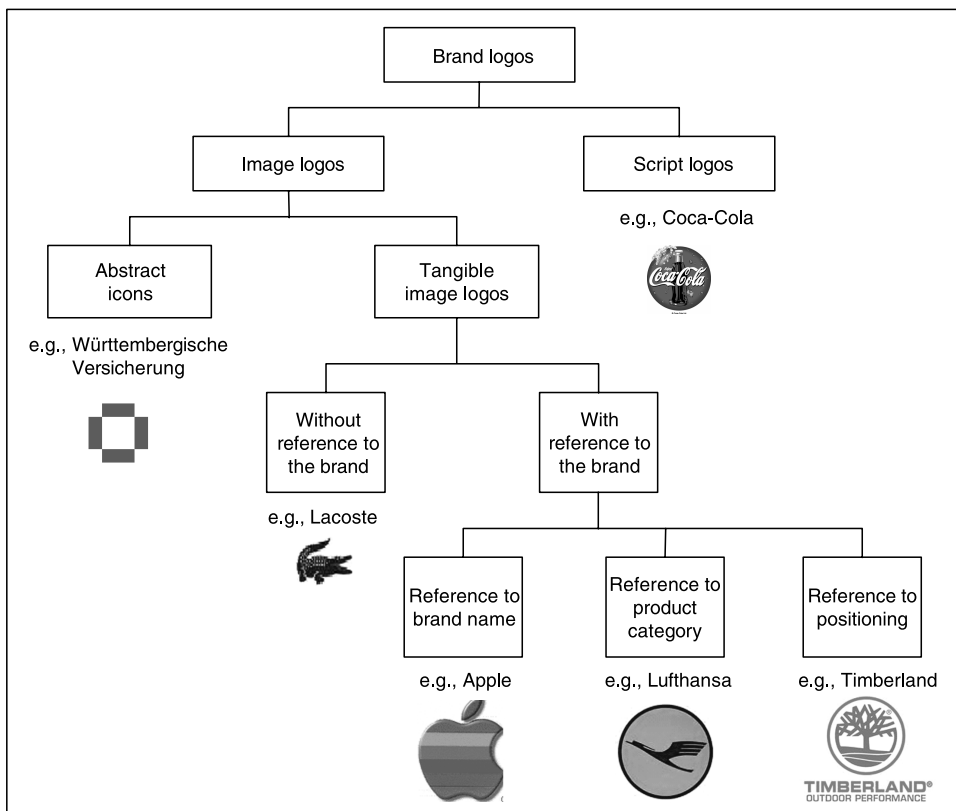

Figure 2 Brand logo types  
 Source: Adapted from Esch and Langner (2001, 498)

step into abstract (image) logos (e.g., the realistically represented Shell scallop into a stylized scallop; → Iconography).

Independently of these fundamental problems, a great number of criteria have to be taken into consideration during the creation of brand logos (for example, the ease of identification, differentiation, and intelligibility, and the sympathy effect). Additionally, one has to decide which *social techniques* can guarantee that these criteria are fulfilled and in which design. Among those techniques are the use of cognitively surprising impulses that question established perception expectations, the use of emotional impulses (for example, through giving the logo childlike characteristics), and particularly the use of physically intense impulses. The organizational dimensions in this case are the structure (e.g., simplicity vs complexity), color (e.g., signal colors), and form. It can be proven, for example, that *symmetrical forms* are better perceived, used, and recalled and are furthermore more agreeable than asymmetric forms. But even within the category of symmetrical logos, essential differences have been found: Triangular forms tend to appear more lively, and round forms trigger associations in the direction of tenderness and softness. Square forms, on the other hand, may appear quiet and deliberate, when they are perceived as “passive” due to environmental factors, or hard and strong, when their context makes them appear “powerful.”

## PRODUCT DESIGN AND PRODUCT PACKAGING

To the same extent as the brand name and logo, the → design and packaging have to contribute to the high-quality, unique positioning of a brand (Bloch 1995). This can be obtained by a characteristic form and color as well as other features (for example, materials). However, the ability forms (i.e., regular, closed, and symmetrical ones), and by areas that do not contain too many colors and graphics. Brand names and brand logos should possess, however, a strong contrast between figure and background, i.e., the figure should stand out clearly from the respective background. Finally, Langner and Esch (2004) identified the *factors of brand* → *aesthetics* that are important in this connection:

- Harmony: Do the colors, shapes, and images used in product design and packaging evoke the same associations and match the brand positioning?
- Modernity: Does the target group feel that product design and packaging are up to date?
- Sophistication: Do product design as well as packaging signal elegance and exclusivity?
- Emotionality: Do product design and packaging trigger positive feelings?
- Complexity: Is the design overloaded and unclear on the one hand or too simple and boring on the other hand?
- Intimacy: Do product design and packaging correspond to the brand knowledge and/or brand scheme of the target group?

# **Brands**

*Kim Bartel Sheehan*

*University of Oregon*

In the late 1800s, a brand was a tool used to identify ownership. Cattle ranches placed their brands on their cattle, and biscuit manufacturers burned their brands onto the barrels containing their products. As manufacturing processes improved throughout the Industrial Revolution, brands became a way for parity products to differentiate themselves (Pope 1983).

Today, a brand is a symbol that embodies a range of information connected with a company, a product, or a service. Elements of a brand include a name, a logo, and other visual elements such as images, colors, or type fonts (→ Typography). The term “brand name” is often used interchangeably with the term “brand,” although a brand name is specifically the written or spoken linguistic elements of a brand. In this context, the brand name constitutes a type of trademark, if the brand name exclusively identifies the brand owner as the commercial source of products or services. A brand owner may seek to protect proprietary rights in relation to a brand name through trademark registration (→ Marketing; Trademarks in the Media).

Many brands have demonstrated a unique durability and sustained competitive advantage that many view as unmatched by any other corporate asset. Every year, *Interbrand* calculates the brand value of the world's top brands. Brand value is calculated as the net present value of the earnings the brand is expected to generate and secure in the future for a specified one-year time period. The world's most valuable brand, Coca-Cola, is more than 118 years old and has a brand value of US\$67 trillion. While the top five brands (Coca-Cola, Microsoft, IBM, GE, and Intel) are all US-based, international brands Nokia (Finland), Toyota (Japan), and Mercedes-Benz (Germany) are included in the top 10. Many brands have survived a string of different corporate owners. The combination of durability and commercial impact make brands a key corporate asset equally for companies marketing to consumers and to other businesses.

Through the various communication methods used by marketers (including → advertising, packaging, → public relations, and direct sales), brands provide information to consumers (→ Advertising Strategies; Integrated Marketing Communications). Individuals interpret this information, and a brand image is created in the minds of consumers. Once this brand image is in place, consumers develop a set of expectations for the branded product or service. These expectations, or values, are referred to as brand equity, an intangible asset related to associations made by individuals regarding the product or service.

Brands become valuable to consumers who want or need products that are better than satisfactory, and they provide consumers with a range of different benefits. First, brands indicate *value and quality* to many consumers (Ries & Ries 2004). Brand advertising promotes and encourages the development of quality products for consumers to buy (Schudson 1984), since advertisers will not want to risk spending money to develop a brand image for a product that will not perform up to expectations. When price parity exists, some consumers perceive brands to be a better value than non-branded items (Shavitt & Lowrey 1998).

Consumers can use brand information to *defend their own purchase decisions*, which minimizes cognitive dissonance, an internal conflict about a decision that occurs after the decision is made (→ Cognitive Dissonance Theory; Consistency Theories). Finally, consumers use some brands to indicate to other consumers who they are, or *who they would like to be*. Consumers make certain purchase decisions (such as automobile decisions) based not only on the functional qualities of the brand, but also on what owning the brand says about the consumer to others. This brand image is often associated very closely with advertising messages for the brand (→ Advertising Effectiveness).

Brands *are valuable for companies* as well. When consumers purchase a brand that they like, the brand is contributing to the commercial success of the company and to the creation of shareholder value. If a consumer associates a brand with quality, the brand can command a higher price than a weaker brand, and this then contributes to company profits. Strong brands, which resonate strongly with consumers, allow for reduction in advertising expenditures. Brand advertising can be defensive in that it can try to prevent consumers who are currently satisfied with the brand from switching to other brands (Schudson 1984). Several studies have attempted to calculate *brands' contributions to shareholder value*. Interbrand's (2006) study of the "best global brands" concluded that brands account for more than a third of shareholder value in the average company, and in many cases for more than 70 percent of shareholder value.

A strong brand can be used as a platform to launch related products; for example, the strength of the Coke brand led to the *introduction of other popular brands* such as Diet Coke and Cherry Coke (Bottomley and Holden 2001). However, brand strength will not always translate into a successful brand extension. Coca-Cola's attempt to market "New Coke" as a replacement for its flagship brand was met with hostility from consumers, and the product was quickly pulled from the US market. Companies can also benefit from other aspects of the brand, such as *brand loyalty* and *brand equity*. Brand loyalty is a consumer's decision to continue to purchase the brand without considering other options. Brand loyalty is created by a consumer's continued positive experiences with a brand, and often translates into brand equity. Brand equity facilitates a more predictable income stream, increases cash flow by increasing market share, and is an asset that can be sold or leased.

In a world of abundant choices such influence is crucial for commercial success and creation of shareholder value. Even nonprofit organizations have started embracing the brand as a key asset for obtaining donations, sponsorships, and volunteers (Twitchell 2004). This represents a movement to have brands represent a company's key values in order to connect with a consumers on a deeper, more emotive level.

## **Brazil: Media System**

*José Marques de Melo*

*Methodist University of São Paulo*

Brazil is the fifth largest country in the world, surpassed only by Russia, China, the USA, and Canada. It has over 180 million people, the largest Portuguese-speaking population

in the world. Independent since 1822, Brazil suffered in the nineteenth and twentieth centuries from several military and authoritarian regimes, and became a republican democracy again in 1988, with a president as head of the government, being elected every four years. One of the world's developing nations, Brazil maintains both modern territories, inhabited by the wealthier classes, and traditional spaces, which are associated with impoverished social segments. Fittingly, the country's media system reproduces these polar oppositions. It is shaped by the coexistence of industrial products (high tech), in demand within its consumer society, and craft arts, which circulate in the marginalized communities.

### HISTORICAL AND CULTURAL BACKGROUND

Starting in the sixteenth century, Brazil's territory was disputed by various European powers (Portuguese, French, and Dutch). The dominant tool of communication along the coastline was *tupi-guarani*, an indigenous language. This *lingua franca* prevailed for almost three centuries and was systematized by the Jesuits for pedagogical reasons.

The *discovery of gold* in Brazil's hinterlands encouraged the Portuguese to expand and consolidate their colonial settlements in the country, a task that required them to bring in workers from other parts of the world. White settlers coming from Europe or recruited in Portugal's Asian colonies (Goa, Macau, Timor), along with Africans brought in as slaves, added to the existing racial mix between the Portuguese and the indigenous population. As a result, there was an inevitable linguistic conflict between the assimilated populations and the newcomers, which led the colonial government to intervene and impose the mandatory use of the Portuguese language.

This process generated *numerous tensions*, which caused the language to change. Words, phrases, and accents belonging both to African dialects and to indigenous languages began to mix with each other. As a result, there appeared a spoken linguistic code that was legitimized by its use among the subaltern classes but remained apart from the written language preferred by the elites. Communication among the working classes stayed close to orality and was dominant in the colony's hinterlands, while the idle classes remained connected to the linguistic affectations of the imperial court. In this rhetorical dissonance we will find the roots of the asymmetrical configurations that characterize the media system in Brazil nowadays.

For centuries, the country's vast extension and irregular landscape prevented media flows from reaching Brazil's hinterlands. This explains why transportation by the ocean was preferred as a means of interconnecting the cities along the coast (Salvador, São Vicente, Recife, Rio de Janeiro) and the metropolitan center (Lisbon), and why communication with the settlements in the hinterlands (Minas and Goiás) was so difficult. As a result, there appeared *regionalized cultural patterns*, which shared the same linguistic code but were separated by differences between local customs (→ Culture: Definitions and Concepts). This "cultural archipelago" remained practically unchanged until the twentieth century, when the use of fluvial transportation helped optimize communication between different parts of the country. Little by little, highways, railroads, air transportation, and information technology have helped lift the obstacles that prevented the circulation of material and symbolic goods.

The overall situation was worsened by the cultural policies adopted by the Portuguese crown during the colonial era. Shortly before the country's independence (early nineteenth century), there were still no schools, universities, press, libraries, mail service, or other cultural apparatus. The intellectual backwardness and cognitive sluggishness of the colonial era delayed the civilizing process in the independent nation. The majority of Brazil's society was made up of black slaves (illiterate, oppressed, and impoverished). The ending of slavery did not happen until the late nineteenth century. Even then, the abolition was not followed by public policies that emphasized cognitive inclusion and social mobility. Left to their own resources, the former slaves increased the migration movements from the countryside to the cities, thus creating marginalized communities, which are the seeds of the slums scattered all over the metropolitan areas today.

In those spaces, the impoverished communities create rudimentary communication flows. Relying on popular cultural manifestations that are reminiscent of rural traditions, they struggle to adapt to city life, as they encounter experiences produced by mass media flows (cinema, the music industry, radio, television).

### **SYMPTOMS OF TRANSITION**

These two Brazils confront, interact with, and complement each other. The traditional manifestations of folk communication reinterpret and recreate the mass media discourses that are associated with the modern country. Because of the elites' hesitant approaches to existing social inequities, the gap between the two currents was narrowed throughout the twentieth century.

The *arrival of foreign immigrants* (educated and politically conscious) helped develop the print media in the country. More recently, educational opportunities for the urban working classes have helped increase the circulation of → newspapers and → magazines. And the higher level of education among the middle classes has contributed to the improvement of content material on television, as has been the case with the *telenovelas*. But if there is no significant change in the existing forms of social exclusion and educational poverty, which affect large pockets of Brazil's society, the two media subsystems will remain active, corresponding to the cultural needs of distinct, distant, and segregated audiences (→ Access to Media).

### **INDUSTRIAL SUBSYSTEM AND LEGAL FRAMEWORK**

At the beginning of the twenty-first century, Brazil's communication industry has the hegemony of audiovisual media, mainly → television, followed by → radio. TV is present in 90 percent of all households and radio reaches 87 percent of all residences. The role of print media is small, if not residual.

In 2005, → advertising expenses in Brazil reached a total of US\$6,689 million. Most of it, as much as 61.9 percent, was used in television advertising, a percentage that has remained unchanged in the past ten years. Radio advertising represents 4.2 percent.

The legal framework established by the 1988 Constitution guarantees press freedom and preserves private ownership of media industry (→ Freedom of the Press, Concept of). Foreign investors are forbidden to control more than 30 percent of the business capital.

Print media are opened to investments, but electronic media remain as state monopolies, granted to private operation according to rules established by the parliament.

## NEWSPAPERS

Restricted to privileged segments of Brazil's society, newspapers help shape → public opinion. Their readers are members of the country's power elite in government, civil society, and the media industry. There are around 3,098 newspapers in the country, of which only 535 are printed daily. Their circulation is concentrated in the wealthiest regions of the country (southeast and south), where we find 75.5 percent of all titles.

Regional circulation is an important feature. There are no daily national newspapers in Brazil. While a few do enjoy "national prestige" and cover subjects of public interest, most of their readers live in the same region in which the newspapers are printed. Circulation is modest compared to examples in other countries. The total number of copies printed daily is 8 million. Assuming that each copy is read by an average of three people, there is a readership of approximately 24 million people. This excludes at least two thirds of all Brazilians.

The papers with the largest circulation are, fittingly, those that enjoy "national prestige": *Folha de São Paulo* (297,000 copies), *O Globo* (258,000), and *O Estado de São Paulo* (218,000). Their leadership, however, is being threatened by tabloids published by large corporations and read by the urban working classes. This is the case with *Extra*, which has a daily circulation of 250,000 in Rio de Janeiro, uses colloquial language, and covers everyday subjects (→ Tabloid Press). This tendency indicates the advertisers' preference for those media whose form and content are accessible to the majority of potential consumers. Another share of the advertising investment goes to print media, with newspapers taking 16.3 percent of the total, compared to magazines, which receive only 8.8 percent. The Internet's share is almost residual (1.7 percent), a little less than half of what is spent on billboards (4.3 percent; → Advertising, Economics of).

## RADIO AND TELEVISION

The main source of education, information, and entertainment for the subaltern classes, *radio* was historically a local or regional medium, but after satellite is being linked by national networks. The system is composed of two fighting segments: a powerful commercial sector with 3,668 stations controlled by entrepreneurs and politicians, and a popular sector with more than 10,000 small stations not completely legalized, but well managed by social movements, religious communities, ethnic groups, and radical societies (→ Radio Networks).

Just as we begin to enter the digital era, *Brazilian television* shows unequivocal signs of strength. Brazil has 9 television networks, with 406 broadcasting stations, of which 386 are privately owned and 20 are state run. Brazilian television reaches 48 million households in 5,564 municipalities throughout the nation. It is the medium with the greatest socio-cultural impact on Brazilian society (→ Television Networks).

The country's leading TV network for several years, Rede Globo, has 50 percent of all viewers in Brazil. The other half is disputed by the eight competing networks: SBT (19.4 percent), Bandeirantes (13.1 percent), Record (9 percent), and Rede TV (2.3 percent),

with the others taking the remaining viewers. Most programs are nationally produced, the preference going to entertainment (fiction, sports, and comedy), followed by information (news). Looking at the figures for the main network (Rede Globo), we easily notice that *telenovelas* take up most of the airtime (50 percent), followed by music and comedy shows (19 percent), news (17 percent), sports (8 percent), and films (6 percent).

In the 1950s and 1960s, a significant percentage of all programs were imported from foreign countries, mainly the United States. Brazil's television industry has since then gradually reduced its dependence on imports. In fact, it became an exporter of television content in the last two decades of the twentieth century. Rede Globo, for instance, exports *telenovelas*, music shows, and sports programs to over 100 countries. Recently, other companies have entered the audiovisual market. The Record network's *telenovelas* have been a hit in neighboring Latin American countries and distant Portuguese-speaking countries in Africa (→ Globalization of the Media).

## INTERNET

The → Internet has enjoyed enormous growth in Brazil. In 10 years of regular service, it has reached an ever-expanding audience. It is estimated that the Internet now has 26 million users in Brazil, which corresponds, not coincidentally, to the number of daily newspaper readers in the country. But since the Internet has more diverse content, one expects that number to increase in the next few years.

Internet users belong to the upper social strata. Of those, 57 percent are considered wealthy and 31 percent are middle class. Almost half of all users are young, between 10 and 24 years old. What do Brazilian Internet users look for? Most of them log on to the web for practical reasons, although a significant number of them admit a preference for entertainment.

## CRAFT ARTS SUBSYSTEM

Cut off from both the print media and the Internet, the disenfranchised communities that inhabit the outskirts of Brazil's major cities rely on rudimentary forms of expression to reinterpret messages disseminated by the mass media and to share their own opinions, information, or advice. Both those who are disenfranchised – the landless, homeless, jobless, etc. – and those who are culturally marginalized – members of religious sects, political dissidents, sexual minorities, and the physically impaired – use alternative forms of communication. They all resort to discursive strategies to survive, maintaining social cohesiveness, facing prejudice, and preserving ethnic identities and ethical values.

The folk media subsystem remains autonomous in relation to the mass media subsystem, but it also addresses its counterpart dialectically. Sometimes it serves as a mediator that filters and transmits meanings generated elsewhere. At other times, it fills in the gaps left open by the mass media. The interactive tension between folk media and mass media adds strength and vitality to Brazil's transitional status in the early twenty-first century.

## **Broadcast Journalism**

*Mike Conway*

*Indiana University*

Broadcast journalism extends news to radio and television. The first broadcast journalists came from other media including newspapers, news and photo magazines, theater newsreels, motion pictures, documentary films, and radio (→ Television News), and the mix of media influenced the development of broadcast journalism. For example, job titles came from newspapers (*reporters* and *editors*) and from motion pictures (*directors* and *producers*), along with some original coinages (such as *anchor*).

In the United States, CBS, NBC and a few other television stations offered news programs before World War II (Conway 2006), but the service expanded after the war, when television diffused to a larger population (→ Television Networks). Some local stations limited expenses by hiring a few employees to read wire copy into a camera, to make phone calls on local stories, and to take occasional pictures with a silent film camera. Other US operations such as WFIL (Philadelphia), WBAP (Fort Worth), and WPIX (New York) invested in a team of photographers and reporters to blanket the coverage area and fill → newscasts with local coverage. More viewers turned to network and local television news until it eclipsed newspapers in the 1960s as the most popular source of news in the United States.

In England, Japan, the Netherlands, and other nations that employed a user fee to pay for television, broadcast journalism tended to focus more on public affairs news. In countries such as France, the government kept television under close watch, turning broadcast journalism into more of an official service (→ France: Media System). After Nazi Germany used the airwaves for propaganda, the Allies set up a public broadcasting system (ARD, later joined by ZDF; → Germany: Media System) not under government control, but under broadcasting councils with representatives from labor, churches,

industrial groups, and government. In India and other parts of the world, UNESCO first introduced television as a communal information source especially for rural areas (→ Public Broadcasting Systems; UNESCO).

Although television is highly visual, film (and later video) photographers rarely make editorial decisions about what to cover or how to present stories. Early television news marginalized photographers because network news managers came from print or radio backgrounds (Frank 2003). Professional training programs repeated the pattern, so that television → photojournalism rarely had its own courses or sequences, except as a vocational skill. As a result, local television photographers typically earn less than reporters and news producers.

As the lines between news and entertainment began to blur in the 1980s (→ Commercialization of the Media; Infotainment), the US Congress cut back government regulations that forced stations to present public affairs programming and increased the number of radio and television stations each corporation could own (→ Television Broadcasting, Regulation of). News programming then had to compete with entertainment for viewers, which reduced political and government reporting and increased emphasis on crime news and features, presented with shorter sound bites and flashy graphics. In local radio news, owners cut news staffs and offered cheaper generic programming. Local television news became a profit center for stations, which made newscasts more frequent but increased the pressures to economize. Market-driven journalism presents the least expensive news acceptable to advertisers and consumers (McManus 1994). News departments unable to hire enough reporters for local stories instead relied on newspapers, wire services, and public relations firms for story ideas. Public broadcasting established a small niche of news programming, but politicians constantly threatened to cut funding.

The influence of government or advertisers has colored the way broadcast journalists do their jobs. In Hong Kong, the Netherlands, the Pacific Islands, Spain, Taiwan, and the United States, broadcast journalists rank at or near the bottom among their peers in autonomy to choose what stories to cover and how to interpret the news (Weaver et al. 2006).

In Asia, Taiwan has distinctly western news, with local versions of popular US programs such as *60 Minutes* and *Meet the Press*, despite the mostly eastern influences on other television programming. In China, the government determined the direction of most news programming through the 1980s, when it began loosening some restrictions. The most popular program each year on China Central Television (CCTV) is the Spring Festival Eve Gala, with more than nine out of ten families watching. The four-and-a-half-hour program celebrates national unity, partly by ignoring the country's 55 minority groups (Zhang 2004). Al Jazeera, based in Qatar, has adopted US news practices such as heated political debate, dramatic visuals, live coverage, and criticism of government decisions, altering the news landscape in Middle Eastern nations that previously stifled dissent.

In the twenty-first century, broadcast news across the globe ranges from stark public affairs programming, through 24-hour live coverage, to sensational tabloid shows (→ Newscast, 24-Hour). Advertiser-based systems have moved away from the public affairs model, and publicly funded services are adopting a flashier approach because of pressure from either nearby or satellite commercial stations.

## **Broadcast Talk**

*Steven E. Clayman*

*University of California, Los Angeles*

Most radio and television programming encompasses talk in some form, but the term *broadcast talk* is usually understood as a specific category of programming in contrast to both fictional entertainment and traditional news. It refers to various programming genres that are broadly informational, to some extent nonscripted, and organized around processes of interaction (→ Narrative News Story). Although some are ad hoc events produced independently (e.g., campaign debates, town meetings), most are regularly scheduled programs produced by broadcasters themselves (e.g., news interviews, celebrity talk shows, radio call-in shows). Each genre involves some combination of public figures, media professionals, and ordinary people as interactional participants.

### **HISTORICAL DEVELOPMENT**

Broadcast talk programming has grown substantially in recent decades, especially in the medium of television. A variety of forces have contributed to this development, with technological and legal changes leading the way as enabling factors. In the US, and to a lesser extent in England, the number of television channels and news outlets has increased in part because of the advent of cable television. At the same time, satellite feeds

and more portable news gathering equipment have facilitated live encounters with newsmakers virtually anywhere in the world (→ Cable Television; Satellite Television). And in the US, the demise of the → Fairness Doctrine in 1987 (a → Federal Communications Commission [FCC] regulation mandating that broadcasters offer a range of views on controversial issues of public importance) has reduced inhibitions stemming from government oversight of program content (→ Television Broadcasting, Regulation of; Radio Broadcasting, Regulation of). These changes have expanded opportunities for the development of new interaction-based forms of informational programming.

At the same time, economic conditions have encouraged broadcasters to exploit the opportunities. This has been an era of tremendous volatility in the media marketplace on both sides of the Atlantic, with existing broadcast networks facing a succession of new competitors, starting with cable and the VCR and culminating in the personal computer and the → Internet. In the 1980s, the three major commercial television networks in the US – ABC, NBC, and CBS, which had long been stable corporate entities devoted primarily to communications – were each bought out by conglomerates which assumed substantial debt and were much less willing to allow their news divisions to remain insulated from the pressures of the bottom line. All of this has made broadcasters much more concerned about production costs and audience ratings and more willing to experiment with new formats for informational programming (→ Commercialization of the Media).

Moreover, such experimentation has taken place in an occupational culture which places a high value on programming attributes that favor broadcast talk. There is the well-known *preference for “live” programming* – the presentation of raw events that are, or appear to be, unfolding “in the present tense” (Timberg 2002, 4) – as the distinctive province of broadcasting. As one network news executive put it, “the highest power of television journalism is not in the transmission of information, but in the transmission of experience” (quoted in Epstein 1973, 39). Coupled with the preference for events-as-they-happen is a parallel *preference for discourse* that is informal and conversational in style, thereby addressing the audience in a familiar and inclusive way. Audience members, it is believed, want to feel that they are being “talked with” rather than “lectured at.” In this evolving context, formats based on spoken interaction have been particularly attractive. Such formats are inexpensive to produce, and embody qualities of “liveness” and “informality” which are regarded as both intrinsically televisual and popular with audiences.

## MAJOR GENRES

As broadcast talk has grown more prominent, it has become a focus of scholarly research from conversation analytic, discourse analytic, and other perspectives (→ Discourse Analysis; Conversation Analysis; Content Analysis, Quantitative). This research suggests that while the number and variety of talk programs is truly vast, most can be grouped into a few readily recognizable → genres based on characteristic constellations of participants, subject matter, and most importantly the form of interaction through which they are conducted. These interactional forms vary in the degree to which they differ from “casual” or ordinary conversation. At the conversational end of the continuum are

modes of broadcast talk that are freewheeling and informal, with opportunities for participation relatively unconstrained (e.g., celebrity talk shows, radio call-in shows). At the other end of the continuum are modes that are more formal in character, with dimensions of participation such as the order of speakership and the length and content of contributions to some extent determined in advance (e.g., formal debates, news interviews). Any given form of broadcast talk reflects the communicative objectives of program or event producers, as well as professional norms and other institutional constraints. Notwithstanding the existence of fuzzy generic boundaries and marginal cases, the following genres may be distinguished.

*Interviews* involve a program host who elicits talk from a public figure. Most interviews are organized primarily around questions and answers (→ Questions and Questioning), although the degree to which a question–answer framework is maintained varies substantially across programs and marks a variety of interview sub-genres. *News interviews*, which typically involve a professional journalist as interviewer and a politician or other newsworthy person as interviewee (e.g., *Meet the Press* and *Nightline* in the US, *Newsnight* in England), adhere closely to the question–answer framework. This is consistent with the journalist’s professional obligation to maintain a formally neutral posture. Journalist-interviewers systematically restrict themselves to the activity of questioning, so much so that they generally avoid producing declarative assertions except as prefaces to questions or as attributed to third parties. Correspondingly, journalist-interviewers also avoid producing even brief receipt tokens (e.g., “uh huh,” “oh,” “okay,” etc.) that might be interpreted as indicating support for what the interviewee has just said.

Other interview sub-genres adhere more loosely to a question–answer framework. *Partisan interviews*, conducted by political commentators or activists rather than journalists, may involve more nonquestioning and overtly opinionated contributions by interviewers (→ Partisan Press; Advocacy Journalism). *Celebrity interviews*, involving those from the entertainment industry and a live studio audience, are conducted in a less formal style which allows for conversational forms of feedback. And *panel interviews*, involving multiple interviewees from diverse perspectives, often combine episodes of interviewer-driven question–answer exchanges with episodes of direct interchange between interviewees. This sub-genre straddles the boundary between the interview and other genres such as the panel discussion and the debate (see below).

*Panel discussions* involve a host in interaction with multiple participants offering a variety of perspectives on a common theme. Although participants have traditionally been drawn from the ranks of political insiders and other experts (e.g., *Washington Week in Review*, *The McLaughlin Group*), some variants involve celebrity entertainers and are conducted in a less “serious” mode (e.g., *Real Time with Bill Maher*).

*Debates* involve a clash between participants representing opposing points of view. As a genre of broadcast talk, the debate form encompasses both ad hoc and relatively formal events held during election campaigns, as well as regularly scheduled programs that are less formal but essentially confrontational (e.g., *Crossfire*, *Hannity and Colmes*). Among campaign debates, there has been considerable experimentation with different formats, ranging from the traditional debate format of presentation and rebuttal, to formats in which the candidates respond in turn to questions from a panel of journalists or from ordinary people. In the latter arrangements, the campaign debate incorporates elements

from other interactional genres, namely the presidential news conference and the town meeting.

*Audience participation formats* involve interactions between program hosts and members of the audience, who may be co-present in the studio (as in daytime TV talk shows such as *Kilroy* in England or *Oprah* in the US) or phoning in from home (as in radio call-in shows). Since many programs that feature audience participation also involve politicians, experts, or ordinary people as program guests, the resulting tripartite interactions combine audience participation with elements from other interactional genres, e.g., host–guest exchanges characteristic of interviews, guest–guest confrontations characteristic of debates (→ Interactivity in Reception). Ordinary people, who lack both the authority of certified experts and the legitimacy of professional journalists, face distinct challenges when making contributions to such discussions. On the other hand, many audience participation programs are organized in ways that favor common sense knowledge over professional expertise.

### IMPLICATIONS FOR COMMUNICATION SCHOLARSHIP

The rise of broadcast talk poses both challenges and opportunities for communication scholarship. Such talk transcends many fundamental dichotomies that have long been taken for granted in social science and media studies, most notably the split between interpersonal and mass communication, between public and private spheres, and between media and society. Broadcast talk is a vehicle for communicating to a mass audience, but it is at the same time comprised of interpersonal communication processes. It is an important component of the public sphere, but is constituted through practices of talk-in-interaction that have been adapted from ordinary conversation and are thus rooted in the private sphere. And unlike traditional news, its significance lies not only in the stories it tells *about* the world at large, but also in that its interactional conventions and practices embody forms of sociality that are an intrinsic and constitutive part of that world.

Therein lies the promise of research in this area. Since broadcast interactions involve public encounters between associates of diverse institutions – journalists and other media professionals, government officials and other elites, and ordinary people from diverse backgrounds – the manner in which these encounters unfold is shaped by, and in turn contributes to, a multiplicity of institutions and their interrelations. Correspondingly, their study provides a unique window into these societal arrangements. Just as the conventions that organize news interviews can shed light on the profession of journalism and its evolving relationship to the state, the conventions that organize audience participation formats can shed light on constructions of the public in relation to officials, experts, and other elites. Accordingly, studies of broadcast talk have the potential to expand the reach of communication research in ways that bear on broader aspects of social life.

## **Bureaucracy and Communication**

*George Cheney*

*University of Utah and University of Waikato*

In his monumental work *Economy and society*, Weber (1978, 1st pub. 1922), explained bureaucracy both in terms of principles of societal order and with respect to its place in the modern world. In seeking to answer the fundamental question “How do we understand un-coerced obedience?” Weber examined the history of societies and empires ranging from ancient China to the United States, arguing that kernel elements of the bureaucratic form could be seen in record-keeping on personnel at least 5,000 years ago. More important, Weber developed his three *ideal types of authority* and, by extension, organization from that historical survey and comparative analysis. In that sense, it is appropriate to speak of the ways bureaucracy arose through cultural patterns and experience (Crozier 1964). The authority types and their corresponding organizational manifestations are: charismatic authority (and the corresponding organizational type of a religious sect), traditional authority (and monarchy), and legal-rational authority (and bureaucracy).

## **UNDERSTANDING BUREAUCRACIES**

With the dawn of the industrial revolution in 1750, the growth of the factory system, the spread of the railroads, and the appearance of the telegraph in the nineteenth century, and the advance of electronic communication in the first half of the twentieth century, bureaucracy became the system of choice for organizations of great size and geographic reach. Spurred by concerns about the spoils system of political appointments and a concern for instituting systems of administration that were scientifically accountable, the governments of Germany, France, the United Kingdom, and the United States instituted civil service programs in the late nineteenth and early twentieth centuries through which bureaucratization was employed to support fairness in personnel matters. Indeed, it is no accident that scientific management arose at the turn of the twentieth century, for it relied heavily on the impulse toward standardization that had become quite influential by the 1880s, in part as a response to severe economic turbulence and unpredictability within multinational capitalism.

As Weber (1978) outlined, the key features of bureaucracy in practice include: a fixed division of labor; a clearly defined hierarchy of positions; hiring and promotion on the basis of technical and publicly known qualifications, including assessments by qualified superiors; remuneration according to specified and rationalized salaries; commitment to the office as a career; the creation of management or administration; separation of work from family or home life; and written rules governing duties and the performance of work. Bureaucracy is considered by most informed observers to be a hallmark of post-Enlightenment society, yet many of its implications for social consciousness, social interaction, and overall well-being remain to be investigated (Albrow 1987).

In the popular political imagination today, bureaucracy is typically understood in negative terms and without reference to its specific features. In part, this is because of fundamental misunderstandings about what constitutes bureaucracy in practice and because of the way the system is mocked or cynically used for purposes of personal or group advantage (Gouldner 1984). That is to say, “bureaucracy” functions consistently as a “devil term,” associated almost exclusively with the public sector, the welfare state, Keynesian economic policy, and presumed inefficiency – in contrast to the celebrated efficiency of private enterprise. So powerful are these associations that in political debates, as well as in corporate boardrooms, the precise nature of bureaucracy is little considered.

In allied areas of organizational studies, especially in sociology and management/organizational behavior, bureaucracy has been the prevailing model of organization, with the machine being its root or implicit metaphor (Burrell & Morgan 1979). Periodically, the model has been reconsidered, not only to complicate the received view of Weber’s (1978) theory but also in recognition and support of bureaucracy’s significant advantages. Notably, Perrow (1979) offered a strong defense of bureaucracy’s opposition to particularism, and Reed (2003) argued for a re-evaluation of bureaucracy in terms of its potential for institutional reform.

## **RESEARCH AREAS**

Within communication studies, bureaucracy has been almost wholly the concern of organizational scholars, although we find some references to it in → critical theory,

→ cultural studies, and → health communication. Bureaucracy is understood in these specialties as the dominant mode of organizing work in the modern world; all other structures of work and organization are consequently measured against it. For critical theory and cultural studies, as two examples, bureaucracy represents a defining institution of → modernity, with attendant constraints and possibilities. Within health communication, bureaucracy is a concern alongside market forces in terms of the impact on care (and caring) of patients/clients (Lammers & Geist 1997). Bureaucratic organization has been the model most often subscribed to by organizational communication scholars, and until the study of emergent organization in the 1990s, bureaucracy was the taken-for-granted model within the system's theoretic approach.

In accord with Weber's (1978) framing of bureaucratic → organizational structure within the context of legal-rational authority, bureaucracy has been considered as a contemporary expression of *logos*, especially in terms of the impulse toward the transparent articulation of rules, norms, and standards (see Tompkins 1987 on the parallelisms between Aristotle's "artistic proofs" and Weber's three ideal types of authority. Bureaucracy's claim to universality rests in large part on its abstraction of standards from specific contexts, be those based in individual, community, or broader cultural concerns. Feminist scholars have accepted such an analogy, at least implicitly, but at the same time have challenged the presumed universality of bureaucracy, first, by raising the issue of the gendered nature of modern organizational structures (Ferguson 1984); second, by examining closely the constraints that bureaucratic organizing places on individual expression and therefore on social bonds (Mumby & Putnam 1992); and third, by considering bureaucracy in terms of the gendered discourses that preserve its institutional status (Ashcraft & Mumby 2004).

Bureaucracy has also been investigated in terms of the possibilities for its transcendence within so-called alternative organizations, including those explicitly or implicitly feminist (Ashcraft 2006), worker cooperatives (Cheney 1999), and radically democratic social movements (Harrison 1994). In this respect, bureaucratic structure is often treated as an *impediment* to democratic participation (Abrahamsson 1977). Through such studies, we find evidence of the enduring temptation of bureaucratization as well as its functional utility for organizing larger-scale and growing enterprises in all sectors (Heckscher & Donnellon 1994), although there are numerous successful cases of "hybrid" organizational forms.

Research from disciplines including communication, management, sociology, and public administration have found bureaucracy to have a generally chilling effect on relationships and micro-interaction. Two books by public administration scholars offer lengthy treatises on this subject (see Denhardt 1981; Hummel 1994). In more specific terms, bureaucracy is seen as emphasizing formality over informality, expediency over mutual understanding, distance over intimacy, and standardized prescription over local expression.

In recent years, as → marketing and customer service have come to dominate organizations in all sectors, the implications for bureaucracy have been considered. Du Gay's analyses have deconstructed the celebrated models of "customer/consumer service" and "entrepreneurship," showing how bureaucracy, faithfully applied, is more responsive to the public good than either of the other models as they have been typically formulated (e.g., Du Gay 2000).

## FUTURE RESEARCH

With respect to communication and organizational studies, there are several areas of investigation that remain un(der)explored. Briefly these include: an in-depth consideration of bureaucracy's relation to matters of "difference," examining how standardization can be "blind" while also neglecting personal circumstances; a close analysis of everyday rationalities in terms of bureaucracy's influence on human affairs beyond the boundaries of work and organization; an exploration of the ethical dimensions of bureaucracy, particularly in terms of how it can protect against individual whim and narrow economic interests.

In sum, bureaucracy remains one of the defined models for organization in the (post)modern world. It has broad historical and cultural foundations, and it continues to influence the ways in which persons orient toward, cope with, and interact within organizations. While the strictly economic–philosophical–psychological image of the rational actor has been undermined in several ways, it persists as an important point of reference in organizational life. For communication scholars, it is particularly important to explain, understand, and evaluate the day-to-day operations of rationality in terms of how it is symbolized and performed.

## Business Discourse

*Walter J. Carl*

*Northeastern University*

Studies of business discourse examine how the work of a business institution gets accomplished through talk and texts. Academic and practitioner interest in business discourse has emerged in a social context where business institutions, notably corporations, have a powerful presence in the world. Close attention to business discourse is predicated on the following suppositions: that people spend a significant portion of their lives in business institutions, that this work gets accomplished primarily through talk and texts (especially as managers and in a knowledge economy), and that there are better and worse ways to practice discourse. The study of business discourse is international and approached from multiple disciplines and perspectives, including various forms of → discourse analysis – such as → action-implicative discourse analysis, discursive psychology, and critical discourse analysis – conversation analysis and ethnomethodology, organizational communication, management theory, sociolinguistics, pragmatics, genre analysis, ethnography, and narrative analysis.

### CHARACTERISTIC FEATURES OF BUSINESS DISCOURSE

There are two characteristic features of research in business discourse: first, the insight that discourse represents a form of situated social action, and second, a disposition toward investigating actual language use in work settings (Bargiela-Chiappini et al. 2007). The notion that discourse is situated social action can be traced back to the “linguistic turn” in the social sciences, through speech act theory, and conversation analysis. From these traditions we learn that language is a dominant system through which social reality is constructed and social actions such as blaming, bullying, complimenting, or justifying are accomplished. Furthermore, talk cannot be understood without attention to the context in which it is produced, and for researchers of business discourse, this context is primarily the corporate work setting. Thus, it is not uncommon to see business discourse

researchers turn their attention to such topics as decision-making, facilitative management, leadership, meeting interaction, and strategizing, among others.

Differentiating business discourse from related terms like institutional discourse, professional discourse, and organizational discourse can be tricky. Poncini (2004) explains that professional discourse characteristically involves institutional settings such as courtroom and clinical interaction. These forms of institutional interaction are themselves differentiated from everyday interactions on the basis of three characteristics: (1) goal-orientation (for example, people in institutional settings interact to accomplish a task, not just to “hang out”), (2) distinctive constraints (for example, lawyers in a courtroom have certain restrictions about when and what types of questions are to be asked), and (3) features of inferences unique to a setting (for example, sharing personal details about one’s symptoms and ailments may be seen to violate a personal boundary when talking with an acquaintance, but is perceived as expected and desirable in doctor–patient interaction; Drew & Heritage 1992). Bargiela-Chiappini and Harris (1997) suggest that a decisive feature that differentiates professional discourse from business discourse is the identities of the participants; professional discourse usually involves a lay person and an expert (as in doctor–patient interaction) whereas business discourse involves participants coming together for the purposes of business and in a business setting (that is, in the context of organizations whose *raison d’être* include the profit motive, growth, or simply survival (Poncini 2004). Alternatively, Putnam and Fairhurst (2001) excluded settings that were primarily dyadic in nature, such as doctor–patient and clerk–customer interactions, as sites of → organizational discourse; for them, organizational discourse cuts across multiple organizational levels and units.

A seminal piece of work that illustrates these features of business discourse is Deirdre Boden’s work *The business of talk* (1994). She contends that talk is the “lifeblood” of the enterprise that shapes, and is shaped by, its structure, a view with similarities to Anthony Giddens’s notion of structuration. For Boden, meetings are a rich site in which to analyze the iterative, recursive relationship between talk and structure, in part due to their routine and ritualistic occurrence. Her analysis investigates recordings and transcripts of actual meeting discourse to describe the social organization of meetings: their openings, turn-taking, and closings. She is able to document, on a turn-by-turn basis, how the business organization literally gets talked into existence.

## **GENERATIVE TENSIONS THAT ANIMATE BUSINESS DISCOURSE RESEARCH**

There are a number of tensions and debates that stimulate dialogue among business discourse researchers, including the roles of context, power, and prescription. While these three issues are not unique to business discourse, they do animate this emergent field.

First, the *question of context* often plays out in terms of “how much” context beyond the text or conversational transcript researchers draw on to support their analyses. That is, do researchers analyze the textual elements exclusively (such as memos, letters, meeting transcripts, etc.), or do analysts draw on ethnographic knowledge of the specific business context (for example, knowledge of who authored specific discourse, for what purposes, the conditions in which it was produced, how it was received, etc.)? Some researchers

combine both approaches in the same study. For example, Samra-Fredericks (2003) combines conversation analysis of transcripts with ethnographic detail of the context to study how certain business strategists are more interactionally effective than others at influencing strategic processes. Other researchers contend that there are advantages to utilizing both approaches separately in a kind of reflexive dialogue at each stage of the research process to help generate new analytical insights (Barry et al. 2006). Another way the question of context is relevant to business discourse research concerns the notion of culture, not only the specific business culture of a company, but also national cultures. Indeed, a great deal of business discourse research seeks to make cross-national or cross-cultural comparisons. For example, Bargiela-Chiappini and Harris (1997) followed up Boden's important work on meeting discourse by investigating the similarities and differences in British and Italian business meetings.

Second, the *question of power* invigorates business discourse research in at least two ways. By looking at power from a language and social interaction perspective, researchers investigate how people "do" power, or how power gets enacted, in business settings. In their book *Power and politeness in the workplace* (2003), Janet Holmes and Maria Stubbe show how different forms of power are accomplished in a senior management meeting of a white-collar organization. As one example, they documented how some members influence group decisions by redefining situations in the area of their expertise even though they may hold a lower status in the organizational hierarchy (or more accurately, how their identities as experts are made more salient in the group's interaction than their identities as persons of lower positional status).

A second view of power, informed by critical discourse analysis, highlights how what gets taken for granted as the natural state of things (that is, "reality") usually serves the interests of the dominant group while marginalizing other perspectives and groups. For example, in her book *Good to talk? Living and working in a communication culture*, Deborah Cameron interrogates whether the discourse of empowerment that permeates corporate training materials actually benefits those lower in the hierarchy as it claims to do. Rather than employees being liberated from constraint, Cameron concludes that they are taught to discipline themselves so that they can be more flexible and work within those constraints, to become more team-oriented, to resolve conflicts, and to control emotions that could potentially disrupt the values of efficiency and order prized by business management (→ Power and Discourse).

Third, the *question of prescription* concerns different aims of the research endeavor. On the one hand there are those researchers whose primary focus is on describing how language is used in or by business organizations toward the end of understanding the process, while other studies investigate situated language use toward the end of informing pedagogy, training, and how to do it "better" (such as how to be a more effective leader, strategist, facilitator, etc.).

Early work in business discourse research often adopted an applied, *pedagogical focus*, largely owing to its roots in the dominant interests of the business communication field. However, other research aims largely for understanding how language is used in business settings, such as Francois Cooren's (2004) attempt to understand how texts exercise agency in business settings. Still other research attempts to first describe and understand business discourse and then apply those insights in the workplace. As an example,

researchers contributing to the Language in the Workplace Project in New Zealand blend detailed descriptions of workplace interactions with the needs of workplace practitioners. Rather than workplace practices being prescribed with a decontextualized list of dos and don'ts, a dialogue is created between academic researchers and workplace practitioners with the goal of generating an appreciation for the complexity of language use (Jones & Stubbe 2004).

### FUTURE OF THE FIELD

The future of business discourse research promises a more nuanced and sophisticated understanding of talk-in-interaction in and by business organizations. As these enterprises evolve new ways of working, roles and relationships inevitably change. These create opportunities for researchers to understand how organizational members develop and employ flexible, discourse-based competencies where talk and texts are not simply means to an end, but in large part the work itself. Further, for critically minded researchers, it serves as a further call to critique whose interests are served by such changes in business enterprises.

Second, the field is likely to see an expansion of its scope to include non-members producing talk and texts about business enterprises in their everyday discourse. An excellent example of this is the renewed interest in consumer-to-consumer word-of-mouth communication and consumer-generated media where the discourse about companies, produced by people unaffiliated with those companies, has been shown to have a consequential impact on the performance of the business enterprise (Carl 2006).

Third, due to the complexity of modern business enterprises it is to be expected that no one disciplinary or analytic tradition will monopolize business discourse research. There is already burgeoning cross-fertilization among disciplines, such as those between scholars of language and social interaction and organizational communication. This trend will likely continue to see greater collaboration among multiple disciplines and analytic frameworks as scholars and practitioners continue to seek insights into the interactional business of doing business.

## Cable Television

*Megan Mullen*

*University of Wisconsin-Parkside*

The term “cable television” typically refers to a form of subscription-based multichannel program delivery that relies on cables or wires. At first, cable television existed almost exclusively to extend the reach of broadcast signals, but more recently it has also delivered an array of additional program services – primarily satellite networks such as MTV (Music Television), HBO (Home Box Office), and → CNN (Cable News Network; → Satellite Television; Television Networks).

### START OF CABLE TELEVISION

As a technology, wired forms of → radio and → television transmission were sometimes used by national public service broadcasters to extend or supplement their coverage areas – as was the case with the British Broadcasting Corporation (→ BBC) starting with radio in the 1930s. The technology, known as “rediffusion” or “relay,” helped the BBC approach its goal of universal service. Also, smaller European nations such as Belgium and the Netherlands, in spite of having their own public service broadcasters, used cable-type technologies to import additional signals from nearby countries. In subsequent decades, cable-type technologies also were enlisted by some national governments, for example during certain periods in Argentina and China, as a means of maintaining central control of programming. Elsewhere, including in India and the former Soviet Union, “gray market” coaxial cable networks were used to share programming among residents of neighborhoods or apartment blocks. As a distinct and cohesive industry, though, cable’s origins lie almost exclusively in North America (→ Television Technology).

Most North Americans first became aware of broadcast television during the 1940s, following the end of World War II. However, access to television tended to center in major urban areas, where stations were located and where residents could receive the signals of those stations using set-top (“rabbit ear”) antennas. Other parts of the continent, particularly rural and mountainous areas, lacked access. In the US, the → Federal Communications Commission’s 1948–1952 station licensing freeze only worsened the situation. Meanwhile, Canada was just starting its national broadcast television service, and Canadians were – wherever possible – beginning to watch stations from across the border (→ Television: Social History).

Thus, during the late 1940s and early 1950s, some enterprising individuals in areas underserved by broadcast television devised means of extending television stations' signals. They built very tall receiving antennas known as "headends" (often located on mountaintops) to capture the nearest signals and used wire (most commonly coaxial cable) to deliver them to residents of communities lacking television service. Most charged a monthly fee for this service – which was termed *community antenna television* (CATV). Initially, those drawn to the business tended to be appliance dealers, radio station operators, and various other people with expertise in electronics. Before long, though, the demand for CATV service in communities without television service began to draw in even those without any experience in broadcasting or electronics.

### EXPANSION OF SERVICES

Throughout the 1950s and 1960s, while there was no shortage of demand for the retransmission of broadcast television channels, CATV operators also were interested in expanding the scope of their service. Quite a few had enlisted microwave relays as a means of bringing in the signals of popular stations from locations too far away for reception by a community antenna alone. A handful had also begun to offer *local channels* (in most cases nothing more than a camera panning a clock and a thermometer to provide "time and temperature"), prefiguring the public access channels that would arise in the decades to follow. Also around this time a pay-TV industry was developing in both the US and Canada. Although only one pay-TV operation was directly affiliated with the CATV industry, many CATV operators were optimistic about adding pay channels to their systems in the future – a vision that would be realized in the 1970s with the launch of pay cable channels such as HBO and Showtime. Mexico's cable industry was also starting at this point; cable networks began to be built there in the 1960s to extend the coverage of Telesistema Mexicano (TSM), at that time the leading private television broadcaster.

But in the US during the 1960s, CATV operators began to face new challenges from government policymakers. The oft-stated objective in this was to uphold the FCC mandate to serve the "public interest" as defined in the 1934 Communications Act – a weak mandate within an almost exclusively advertiser-funded broadcasting system. Several sets of regulations were aimed at preventing harm to broadcast television from CATV systems and effectively prevented the CATV industry from doing business in medium to large broadcast television markets. Since these markets represented the areas of greatest revenue potential for CATV, the measures stalled that medium's growth considerably (→ Television Broadcasting, Regulation of). Regulation inevitably lags behind the promise of a new technology, though, and no sooner had the FCC curtailed CATV's growth in the US than that same medium was absorbed into a set of utopian discourses aimed at reforming television generally – now known as "Blue Sky." Parties ranging from government task forces to private think tanks to professional associations forwarded visions for transforming CATV into a purveyor of a broad range of channel options, interactive services, and even document delivery services.

Some other events in the US also helped move CATV forward, including victories in two critical copyright cases. By the early 1970s, with business-minded Richard Nixon in the White House, the policy climate around cable grew more lenient. New regulations

allowed cable into more broadcast markets, and operators gained more programming choice. At this time, the White House's Office of Telecommunications Policy (OTP) instituted the policy of "Open Skies," which allowed free-market competition in the communications satellite industry. In contrast, stricter regulation of cable television in Canada began to emerge in the years following the 1968 creation of the Canadian Radio-television and Telecommunications Commission (CRTC), an entity charged with protecting the sovereignty of Canadian media industries. In 1975, the CRTC stated that cable was a "chosen instrument of public policy" and set in place regulations addressing such concerns as what channels and services cable companies might or should make available, reasonable subscription rates, and provisions for public access channels. Canada would continue to be challenged, though, by the easy access its residents had to US television outlets – both broadcast and cable.

### THE ROLE OF SATELLITE TV

The growth and flourishing of satellites in North America during the early 1970s was a major determinant in transforming CATV into modern cable television throughout all of North America and eventually elsewhere. In 1975, HBO, a fledgling US pay-TV service operated by Time, Inc. and delivering its signal to various locations in upstate New York and Pennsylvania by microwave, began to use satellite to deliver its programming nationwide. This breakthrough encouraged other enterprising individuals and companies to launch similar satellite-carried cable "networks." Most of these were pre-existing terrestrially based operations, including Ted Turner's Atlanta "superstation" WTCG (later WTBS) in 1976 and televangelist Pat Robertson's Christian Broadcasting Network (CBN) in 1977. By 1980, there were around a dozen satellite cable networks in the US. In Canada, policymakers were beginning to grapple with the likely impact of the expanding US cable industry on its own public television system. By this point also, Mexico's private multichannel broadcaster Televisa had adopted satellites as a means of distributing Spanish-language programming both within Mexico and into the US – the start of the broadcast and cable network Univision. Satellites and the existing cable infrastructure would be significant factors as Mexico grew into a major player in the Spanish-language television market throughout the Americas.

The 1980s saw the launching of dozens of additional cable networks in multiple countries, in fact. For the US, these included *premium* networks such as HBO and its competitor Showtime, which charged subscribers directly for access to their programs, and *basic* networks such as MTV, CNN, and Lifetime, which came "bundled" together in a package for which subscribers were charged a flat monthly fee. While Canadian cable operators were able to import some of these networks from the US, the larger trend there was to develop indigenous networks to offer similar programming categories while still complying with "Canadian content" quotas. In both countries, this decade also saw the rise of new types of cable services such as home shopping and pay-per-view channels.

In 1984, the first ever cable-oriented legislation was passed in the US – the Cable Communications Policy Act – and only eight years later, the Cable Consumer Protection and Competition Act. Both were only moderately effective at keeping up with the rapidly changing nature of cable television service. By the early 1990s, cable television clearly was morphing into a different sort of industry as it both merged with other telecommunications

technologies, such as the nascent Internet, and contended with new competition from both direct broadcast satellites (DBS) and telephone companies. Legislators would attempt to address this scenario in the more comprehensive 1996 Telecommunications Act.

The policy shifts within the US and the overall popularity of multichannel television services in North America have rippled throughout the entire world since the 1990s (even earlier in some countries). In countries with longstanding television service (such as many in western Europe), established public channels now face competition from both privately funded broadcast channels as well as cable or DBS services. In *developing countries*, satellite transmission (sometimes enhanced by terrestrial cable) has made it possible to deliver television over large territories, which could not have been served effectively by either broadcast or cable networks – as in the case of Indonesia, for example. Policy analysts see this as a mixed blessing, given the virtually inescapable fact that it is much easier for satellite companies to import programming produced by and for other countries than to have it produced locally – perpetuating situations of cultural imperialism. Nonetheless, the presence of satellites and multichannel television also allows the possibility that the cost savings achieved by efficient means of distribution will generate more resources and incentives to develop indigenous programming infrastructures.

### **CABLE TELEVISION AND THE INTERNET**

During the late 1990s and early 2000s, cable companies throughout the world began to supplement their extensive program packages with high-speed → Internet access, also known as “broadband,” and cable telephone service, which relies on the Internet and voice over Internet protocol (VoIP). Nearly all cable companies now engage in a marketing practice known as “überbundling,” in which television program packages, Internet access, and cable telephone are sold as a package for a single monthly fee.

Today, the international cable television industry faces challenges from several other multichannel and Internet-based technologies. Since the early 1980s, cable has competed with direct-to-home (DTH) satellite. Starting in the early 1980s, large backyard C-band dishes allowed people to receive the signals of cable networks in the same way that cable operators did at the headends (a practice kept in check by signal scrambling technologies that essentially force dish users to pay for access to the channels). In the 1990s came much smaller Ku-band DBS dishes that allow even urban apartment dwellers an alternative to cable service. As of the early twenty-first century, telephone companies also offer cable-type service using high-speed Internet technologies (→ Technology and Communication).
