# Transportation Theory

Melanie C. Green

University of North Carolina at Chapel Hill

Transportation into a narrative world refers to the feeling of being lost in the world of a narrative, of being completely immersed in a story and leaving the real world behind. This experience is a key mechanism underlying the influence of stories or narratives on individuals' attitudes and beliefs, and is also associated with media enjoyment. Although transportation has long been used as a metaphor for narrative experience, psychologists have conceptualized transportation into a narrative world as a distinct mental process, an integrative melding of → attention, imagery, and → emotions (Gerrig 1993; Green & Brock 2000, 701; see also Nell 1988). Transportation is a form of experiential response to narratives. It is psychologically similar to flow (Csikszentmihalyi 1990) or absorption, although both flow and absorption are more general concepts (individuals can experience flow in a variety of activities; absorption is a dispositional tendency to become immersed in experiences). Transportation is also similar to Vorderer's high involvement (→ Involvement with Media Content).

Transported readers may lose track of time, fail to notice events going on around them, or experience strong emotions. Such readers may experience participatory responses – the desire to communicate with narrative characters or help them toward their goals (Polichak & Gerrig 2002).

The key psychological ingredients of transportation are assumed to take place across different communication media, including text, audio, video, or any means of transmitting

a narrative account. Individuals may be transported into both factual and fictional narratives (→ Fiction; Storytelling and Narration); transportation does not depend on whether a narrative reflects real-world truth. Indeed, fiction can be a cue to engage in more immersive, less critical processing (Green et al. 2004b; → Suspension of Disbelief).

Although individuals may become engaged in non-narrative media (for example, science programs), transportation per se occurs solely or primarily in response to narrative communications. Narratives present a sequence of connected events and characters, typically in a causal chain that moves from beginning to end. In contrast, non-narrative persuasive communications (→ Persuasion; Argumentative Discourse) present propositions or evidence in support of a claim. Note that narrative does not necessarily mean fictional. Documentaries, news reports (→ Narrative News Story), and other nonfiction media products may have a narrative structure, or they may not. Non-narratives do not create alternative worlds for individuals to enter, and thus they may be less likely to engage emotions or create mental imagery.

Transportation is a pleasant state, yet individuals are frequently transported into narratives that evoke negative emotions (fear, sadness, or anger). The enjoyment of a transportation experience does not necessarily stem from the particular emotions evoked by a narrative, but from the process of temporarily leaving one's one reality behind (Green et al. 2004a; → Enjoyment/Entertainment Seeking).

The *transportation-imagery model* (Green & Brock 2002) highlights the role of visual imagery in transportation-based belief change. Images take on → meaning from their role in a story. Individuals' imagery ability and situations that allow for the formation of rich mental images increase the persuasive power of a story. The transportation experience links the vivid images with beliefs implied by the story. Over time, recalling the image may re-evoke large parts of the original communication, thus reinforcing the story-relevant beliefs.

## MEASUREMENT AND MANIPULATION

Transportation can be measured with a 15-item self-report scale (Green & Brock 2000; → Scales; Scales and Indices). Participants answer each item on a scale of 1 (not at all) to 7 (very much). Example items include "I was emotionally involved in the narrative while reading it" and "I could picture myself in the scene of the events described in the narrative." The scale has shown good internal consistency, as well as discriminant and convergent → validity. Transportation can be manipulated by varying story quality or the instructions given to readers. For example, instructions to focus on the surface aspects of the story, such as difficulty and grammar, produce lower transportation (Green & Brock 2000; for a related discussion, see Oatley 1994).

Pre-existing familiarity with an aspect of the narrative world can increase transportation. For example, individuals who reported greater knowledge about the fraternity/sorority system were more transported into a story about a man attending his fraternity reunion (Green 2004). Additional research is needed to determine the boundary conditions of this effect; some types of similarity or familiarity do not seem to consistently increase transportation (e.g., matching reader gender with main character gender).

The quality or craftsmanship of a text also influences transportation. Well-written and well-structured texts are more transporting. Bestsellers or classic texts are rated as more

transporting than stories created by psychologists for experiments, for instance (Green & Brock 2000). Although structural elements such as → suspense can lead to transportation, mystery or surprise per se are not necessary ingredients of transportation. Individuals can be transported when rereading or rewatching a narrative, especially a high-quality narrative.

## **RESEARCH FINDINGS**

### **Relationships to Other Variables**

Transportation has a moderate positive correlation with empathy (as measured by the Interpersonal Reactivity Index [Davis 1983]; → Empathy Theory). Transportation also has a moderate positive correlation with Tellegen's (1982) "absorption," a more general tendency to become immersed in a range of experiences. Absorption is associated with susceptibility to hypnosis.

Need for cognition is an individual difference variable frequently used in persuasion studies (Cacioppo et al. 1984). It measures dispositional tendencies to engage in and enjoy effortful cognitive activity. Correlations between transportation and need for cognition vary across studies, but range from no correlation to a low positive one.

### **Transportation and Belief Change**

Individuals who are transported into a narrative are likely to change their beliefs in response to events or claims in a story. For example, transported readers of a story about a child being attacked in a shopping mall by a psychiatric patient were more likely than less-transported readers to believe that psychiatric patient freedoms should be restricted and that the world was unjust (Green & Brock 2000). Theoretically, attitudes formed or changed via transportation should be strong (persistent over time and resistant to counterpersuasion).

Transportation may aid in belief change in three ways. First, transportation reduces counterarguing about the issues raised in the story. Next, transportation may affect beliefs by making narrative events seem more like personal experience (Green 2004). If a reader or viewer feels as if she or he has been part of narrative events, the lessons implied by those events may seem more powerful. Finally, attachment to characters may play a critical role in narrative-based belief change. If a viewer likes or identifies with a character (→ Identification), statements made by the character or implications of events experienced by that character may carry special weight.

#### *Reduced Counterarguing*

Transported readers identify fewer "false notes" in a narrative, indicating greater acceptance of story content (Green & Brock 2000). Research on mental correction suggests that individuals need both motivation and ability to reject information that they do not wish to believe (e.g., Gilbert 1991). Transportation may reduce individuals' ability to counterargue assertions or events in the story because the reader's cognitive capacity is

committed to imagining story events. Transportation may also reduce motivation to counterargue. Transportation is typically a pleasurable experience, and interrupting this experience to critique the narrative or dispute the author's claims would detract from story enjoyment. Even when individuals have finished a story, they may be unlikely to go back and critically evaluate story events, especially if they do not believe that the story has influenced them.

It may also be more difficult to discount narratives because stories tend to be concrete, presenting the experience of particular (real or fictional) others, rather than abstractions. Indeed, people tend to generalize from a narrative exemplar even when the presented case is not typical (Strange & Leung 1999), especially if they are engaged in the narrative.

### *Feelings of Real Experience*

Direct experience with attitude objects can result in strong and enduring attitudes. Through vivid imagery and emotional involvement, transporting narratives approach direct experience more than other forms of persuasive messages.

Beyond their impressions of the → realism of the content of the story, individuals who are immersed in a story may also fail to recall whether a story was fact or fiction. If a fictional story is misremembered as fact, it may be even more likely to influence real-world beliefs.

### *Attachment to Characters*

Attachment to a protagonist may be an important determinant of the persuasiveness of a story. Individuals may develop deep affection for protagonists (liking, sympathy, or empathy), and hatred for story villains. They may develop parasocial relationships with the characters (→ Parasocial Interactions and Relationships), such that characters come to seem like friends. An additional dimension of connectedness may occur if individuals identify with a character. Identification is “a process that consists of increasing loss of self-awareness and its temporary replacement with heightened emotional and cognitive connections with a character” (Cohen 2001, 251). Identification may entail adopting a character's goals as one's own, and may make the character a model for desired behavior (as in social learning theory; → Learning and Communication; Observational Learning). Thus, attachment to characters may make the story more personally relevant to the recipient, and more powerful in changing real-world beliefs. (This process is in contrast to traditional forms of persuasion, where personal relevance of a message typically implies that the message has implications for an individual's own outcomes; see Slater & Rouner 2002.)

## **Individual Differences**

“Transportability,” the extent to which individuals readily become deeply transported into stories, can be measured as an individual difference (Dal Cin et al. 2004). This individual difference measure predicts transportation into later texts and films. Across studies, there is no gender difference in transportation, although men may be more transported into some kinds of stories, and women into others.

### **Applications and Extensions**

Transportation theory has been applied to consumer settings. Individuals who mentally simulate experience with products (imagining themselves wearing a pair of running shoes) are transported, and thus show reduced critical thinking and a more positive attitude toward the advertisement and the product (Escalas 2004; → Advertising). Transportation is also relevant to → health communications, and may underlie some of the effects observed in → entertainment education, a technique that embeds health messages in stories (radio programs, telenovelas; see Singhal et al. 2003).

One aspect of transportation is that individuals may generate counterfactual alternatives to an unhappy ending of a story. This counterfactual thinking can enhance the persuasive power of the narrative (Tal-Or et al. 2004).

Over time, transportation may contribute to cultivation effects, in which individuals' beliefs come to reflect the world as reflected in television portrayals, rather than the real world (e.g., higher crime rates; → Cultivation Effects). Transported individuals may be especially likely to integrate televised portrayals into their real lives.

### **FUTURE DIRECTIONS**

Transportation requires some action on the part of the individual. At a minimum, the recipient must pay attention to the narrative. However, the extent to which transportation is under conscious control remains to be determined. (Individuals may not be able to force themselves to become involved in a text that they find boring, but perhaps can take themselves out of a narrative world through the use of distraction strategies.)

Future research should also explore the effect of interactivity (→ Interactivity, Concept of; Interactivity in Reception) on experiences of transportation. Being able to act in a narrative world may create an even deeper experience of immersion. However, virtual reality researchers studying → presence, the feeling of being in a virtual world, have noted two obstacles to transportation/presence: the technology itself may be distracting, and the narrative structure may need to be looser to accommodate user input (Biocca 2002; see also Klimmt & Vorderer 2003).

# Trap Effect

*Klaus Schoenbach*

*University of Amsterdam*

The “trap effect” of communication is a metaphor for an effect specifically on the uninterested, unmotivated, uninvolved members of the audience (Schoenbach & Weaver 1985). Those people are “trapped” and subsequently influenced by any type of communication that is frequent and striking enough to overcome their weak resistance. They do not care enough to raise the threshold against attempts to teach them something (→ Media Effects).

Originally, the trap effect was ascribed only to television and its political impact, accompanied by pedagogical hopes that television does good things to those citizens that other media cannot reach and influence – activates them politically, for instance (Blumler 1970; Noelle-Neumann 1970). In a key article, Blumler (1970) listed some possible reasons for such an effect of television. Political coverage on television, Blumler assumed, reaches more people than any other channel, and consequently also those who would not bother to turn to that type of information in other media. Because of its visual nature and its credibility, television may also be particularly persuasive (→ Credibility of Content). Finally, the uninterested among its viewers, once confronted by persuasive messages, could be particularly prone to be persuaded because “an uninvolved audience is a potentially persuasible audience” (Blumler 1970; → Persuasion).

Possible *theoretical underpinnings* of the trap effect are “passive learning” (Krugman & Hartley 1970), “incidental learning” (Culbertson & Stempel 1986), the “inadvertent audience” (Robinson 1973), and Petty and Cacioppo’s (1981) “peripheral route” of information processing (→ Elaboration Likelihood Model). All those concepts postulate that an uninterested (low-involvement) audience learns something from, and subsequently is influenced by, information if that information is only abundant and salient enough – although such an impact may not become deeply engrained in the minds of that part of the audience and consequently may not last long.

*Empirical evidence* for a particular trap effect of television’s political coverage, plausible as it may sound, has been surprisingly scarce and mixed so far (→ Television). Most frequently, the trapping power of newspapers has been more impressive. In their literature review, Schoenbach and Lauf (2002) found stronger effects of television on the uninterested, compared to the impact of newspapers, only in the very small segment of totally apathetic citizens. In their study of a campaign for the European Parliament in 12 European countries, Schoenbach and Lauf used the low-key, unexciting nature of that campaign with an uninterested electorate as a setting where trap effects should most likely occur. But even seemingly favorable national conditions, such as considerably more TV news coverage of the European elections than elsewhere and fewer TV channels to evade that coverage, did not support a trap effect of television (→ Elections and Media, History of; Television News). Instead, personal conversations were considerably better than television (and newspapers) at persuading the uninterested to turn out and vote (→ Interpersonal Communication).

In a follow-up study, historically and internationally comparative analyses of election campaigns in Europe and the US revealed that a trap effect of television exists, albeit a weak one, if there are not many TV channels to choose from, such as in the US of the 1950s and early 1960s (Schoenbach & Lauf 2004). And newspapers can also overwhelm their uninterested readers. Finally, the richer information environment of first-order (e.g., US presidential) elections seems to be necessary for a trap effect. Low-key elections such as the ones to the European Parliament may not reach the critical mass of information needed for trapping an uninvolved audience. In other words, the trap effect of television is not as self-evident as it seems in theory.

As a reaction, Schoenbach and Lauf have embedded the concept of a trap effect into a wider framework. Is it really plausible to expect a trapping potential only from television – or at least a greater potential than from newspapers? Instead, under certain conditions, trap effects on the uninvolved should occur more or less for all so-called “display” or “push” media (Schoenbach & Lauf 2004) – and that is not only television, but also → radio, → newspapers and → magazines, personal conversations, and → posters, for instance.

*Display channels* typically provide us with a comparatively fixed information offer, supposed to be consumed “as is,” with not too many options for the audience to select or change anything. As opposed to “research” or “pull” media, such as the → Internet, display media are able to surprise their audiences more easily and to confront them repeatedly with topics they may not be interested in (see also Noelle-Neumann 1973). Those features should be good for a trap effect.

Research media, instead, allow greater user control. They provide more opportunities to select than display channels, but also require more decisions by their users about what kind of information to look for, and thus make more motivation of their recipients necessary. This is why skeptics fear that the Internet lends itself to only caring about one’s own personal hobbies and avoidance of all types of information one is not really interested in, particularly politics (Sunstein 2002; Tewksbury 2003; Prior 2005).

Indeed, according to a recent and comparative field study, printed newspapers seem to “trap” their audience better than their online counterparts when it comes to being aware of a wider range of societal issues, and of political and economic ones, in particular (Schoenbach & Waal, in press). This is evidence for a trap effect that is not restricted to television anymore. Instead, the trap potential of communication channels, or even of single communication messages, must be envisaged as a continuum – from an information offer that is absolutely predictable and patiently waits to be requested (and thus is not capable of trapping anybody) to one that is both obtrusive and surprising, and thus “catchy,” for everybody.

## Triangulation

*Helena Bilandzic*

*University of Erfurt*

Triangulation is a metaphor for research strategies that employ different methods, theories, or data sources in order to capture social reality in a comprehensive manner, reflecting appropriately the multifaceted nature of social objects. While all research approaches in themselves have certain shortcomings, a combination of several approaches may compensate for one another’s weaknesses and provide a more complete picture. The term triangulation originally comes from geodesy and refers to a procedure that uses the known distance between two points in order to determine the unknown distance to a third point (Flick 2004).

Denzin (1989) expands the idea of triangulation to *four research strategies*: triangulation with data, methods, theories, and investigators. *Data triangulation* involves using several data sources that vary in time, space, and persons. For example, to investigate the role of → television for the cohesion of a social group, it may be useful to interview different kinds of social groups like families, college students, and childless couples. Here, the

research objects differ, but the method is the same. Observing the same individuals in different situations, for example watching them use their mobile phones at home or on public transport, is another example of data triangulation. This strategy seeks to investigate the same social phenomenon in different circumstances, and tries to find new aspects until theoretical saturation is achieved; it constitutes a parallel to theoretical sampling in → grounded theory (Flick 2004).

In contrast, *methodological triangulation* involves the same object being investigated with different methods (between-method triangulation), e.g., combining → interviews and → observation to study television viewing habits (→ Exposure to Television); or with different instruments of the same method (within-method triangulation), e.g., using subscales in a standardized questionnaire. The research logic of the latter version is straightforward: both studies should produce the same results, which is similar to the idea of → reliability in quantitative research (→ Quantitative Methodology). Using different methods, however, might result in different insights or give information about completely unrelated aspects of the phenomenon. If different methods do not have the ability to capture the same phenomenon, the goal cannot be to validate methods with each other, but to gather different insights that complement one another (Erzberger & Kelle 2003). For example, observing television viewing may reveal patterns of behavior that viewers may not be sufficiently aware of to reproduce them in self-reporting; confronted with the results from the observation in an interview, however, people may be better able to provide subjective views on the behavior and indicate what was intended with a particular action.

*Different theories* may triangulate data in that they provide competing or complementary frames of interpretation. For example, observational data of television viewing in a family may be seen in the context of social cohesion, or in the context of identity. With this strategy, the researcher keeps an open mind about how to interpret the data, and compares the ability of different theories to explain a social situation, which ultimately serves a more profound theory development (Flick 2004).

Finally, triangulation with *different investigators* ensures that aspects of social reality are not dependent upon one researcher and his or her understanding of the social situation. The goal is to become aware of individual biases, to make an effort to find common ground among researchers about the interpretation of a social fact, and to increase the reliability of data collection.

While the original term “triangulation” implies that the object under investigation is fixed and can be uncovered validly and objectively by approaching it from several angles (→ Objectivity in Science; Validity), many social scientists have concluded in recent decades that methods do not uncover, but construct a social object (→ Constructivism). Accordingly, different methods might not capture the very same phenomenon; divergences in results might call for a truth criterion which does not exist. For the same reason, theoretical triangulation may after all have limited applicability in research: data cannot be collected in a theoretical way. Even if hypotheses and standardized instruments are not used, some previous knowledge about the phenomenon will guide method selection and perception in the field (Erzberger & Kelle 2003). Data collected for one purpose may not be useful in informing about a different theory. For these reasons, triangulation in social sciences is today conceived as a strategy to gain deeper and fuller understanding of a social

object rather than to provide a cross-validation of methods; it is a means of collecting the manifold facets of the social tableau rather than producing an objective picture (Flick 2004; → Realism).

Another strategy discussed in the context of triangulation consists of *combining qualitative and quantitative methods and data* (Erzberger & Kelle 2003). Qualitative methods may be used to explore the field in order to prepare for a quantitative study, but also to follow up results from quantitative studies that require more in-depth explanation (→ Qualitative Methodology). Also, parallel collection of both types of data may be used, either in a continuous and integrated way, or in such a way that the results from one method influence how the next step with the other method is executed (Miles & Huberman 1994). Even more than in method or theory triangulation, applying different methodological paradigms in the same study may result in divergent insights into the social issue, which is detrimental when one expects congruence in triangulation, but advantageous when one expects to get a fuller picture (Erzberger & Kelle 2003).

## **Trust of Publics**

*Günter Bentele*

*University of Leipzig*

The “trust of publics” or “public trust” can be defined as a process and outcome of a publicly generated, communicative, complexity-reducing mechanism within which publicly perceptible individuals, organizations, and other social systems act as “trust objects.” Public trust is generated and subjected to change within a mediated, public communication process in which “trust subjects” have their future-oriented expectations shaped by past experiences (see Bentele 1994; Bentele & Seidenglanz 2005). “Trust” has been defined by a variety of disciplines in social studies (sociology, psychology, communication, political

science, etc.). The emphasis is put on interpersonal trust, hence, that obtaining between individuals. An important conception of trust is presented by the German sociologist Niklas Luhmann, who defines trust as a “complexity-reducing mechanism,” as a risky prior concession to future events (Luhmann 1973, 23ff). As “personal trust” it represents the basis of any social relationship. In information and communication societies it is mainly relevant as “public trust.”

Credibility (→ Credibility of Content) can be conceptualized as a sub-phenomenon of trust and can be defined as a feature attributed to individuals, institutions, or their communicative products (written or oral texts, audiovisual presentations) by somebody (recipients) with regard to something (event, factual matters, etc.; see Bentele 1988).

### **LOSSES OF TRUST IN MODERN SOCIETIES**

While in archaic societies and other social formations prior to the civil society, a population’s trust in their political leadership was often an unquestioned given, the civil society carries within itself institutional doubt. In the system of parliamentary democracy both parliament and government depend upon the temporally limited trust of the voters. Based upon fundamental distrust (e.g., regarding the abuse of power), this trust is implemented in the form of control systems. Thus, the political systems of many modern societies hold formal and legal procedures (e.g., asking for a “vote of confidence,” passing a “vote of no confidence”) whose purpose it is to regulate situations in which the trust shown by elections has crumbled. In totalitarian systems, distrust of the political leadership often tends to be particularly pronounced among broad levels of the population. Loyalty and conformity are controlled solely by state power and centralized, barely credible media organs.

However, western parliamentary democracies, too, have had to witness a general decrease in trust within the last 25 to 40 years regarding politics, many branches of the economy, and the media itself (see Reitze & Ridder 2006). On the face of it, crises of trust in politics and the economy are linked with the accumulation of scandals made public (→ Scandalization in the News). The possibilities of “trust maintenance” or of “trust rebuilding” by means of communication, that is, → public relations (PR) and → strategic communication management, are a vital challenge for publicly perceptible individuals and organizations, such as politicians, political parties, CEOs, companies, etc.

### **GENERAL THEORETICAL APPROACHES AND EMPIRICAL RESULTS**

Four important general approaches toward a theory of (interpersonal) trust can be distinguished: those of Luhmann (1973, 2000), Barber (1983), Coleman (1990), and Giddens (1990). More recent interpretations (see Misztal 1996; Sztompka 1999) add little new to the discussion. Both Luhmann and Giddens conceptualize the function of trust for the social system as a kind of “top-down approach,” in which trust is understood as an important “mechanism” and as a constituent component necessary for the functioning of a society. Coleman and Barber, on the other hand, start out from a “bottom-up approach,” that is, with the individual, specifying trust as an → attitude toward other human beings and organizations.

The majority of the approaches stemming from social psychology, as well as work done in the economic domain, especially business management, follow the latter path (see Petermann 1996; Ripperger 2003). Since the 1950s in the USA and since the 1960s in Germany and other European countries, survey institutes have collected data on the question of how far politicians and political and other organizations are met with trust by the population (see Listhaug & Miller 1990; Vercic 2000). Political institutions (parliament, federal government) enjoy more trust than do individual politicians and parties. With growing age, trust in political institutions increases. Party preference and political interest are crucial determinants of the attribution of trust. So far, little research has been done into the social mechanisms of trust attribution (building, loss, and crises of trust).

### A THEORY OF TRUST BY PUBLICS

For PR and, thus, communication studies, trust is mainly relevant as “public trust.” Trust has long been recognized as a vital goal of PR. Only since the beginning of the 1990s has PR studies begun to devote more serious attention to it (see Ronneberger & Rühl 1992). On the one hand and with regard to recipients of (individual) “acts of trust,” the term “public trust” refers to the attribution of different degrees of trust or distrust to publicly perceptible individuals and organizations, that is, agents and social systems (→ Attribution Processes). In this sense, trust is closely linked with the psychological term “attitude.” On the other hand, the possibility of observing publicly perceptible agents and systems in the first place is produced and controlled by actively organized communication (journalism, media, PR). Thus, in that sense, “public trust” refers to the social mechanisms of public communication by which the attitude of agents’ trust is generated. Trust building or processes of losing trust, however, rely on mediators and interpreters of information, i.e., on media and PR agents that, after all, produce and process the lion’s share of socially relevant (public) information. It is the purpose of a “theory of public trust” to describe and explain this nexus systematically and empirically.

Such a theory was for the first time sketched out by Bentele (1994) and has since been substantiated empirically. First of all, the theory of public trust differentiates various elements in the public trust process – a process understood as a sub-dimension of public communication: trust subjects, trust objects, trust mediators, facts, and events, as well as texts and messages. Usually, *trust subjects* (trusters) are individuals, but they can also be groups or organizations. *Trust objects* are individuals – in which case we call them trustees – and organizations. More extensive social systems (the health system of a society, the political system, the economic system, etc.) can be trust objects too (→ Corporate Reputation). Those agents that intentionally or unintentionally mediate trust to the trust subjects within the process of public communication are called *trust mediators*. They can be individuals taking key professional roles in the process of public communication, such as journalists and PR professionals. Usually, however, they act within an organizational context, that is, editorial offices or PR departments of organizations.

Thus, organizations, too, act as intermediaries of trust. The relationships between PR and → journalism itself depend on mutual attributions of trust (→ Intereffication Approach in Public Relations). Other important elements in this process, without which

these attributions would be beyond analysis, are events and factual matters and their semiotic equivalents in texts and themes. The theory distinguishes *four types of trust*: (interpersonal) basic, (public) personal, organizational, and system. It is presumed that there are various trust factors (e.g., problem-solving competencies, adequacy of communication, communicative consistency, transparency, etc.) that are capable of creating high, empirically measurable levels of trust if they appear to a very marked degree or jointly. Low-level occurrence or absence of these factors, however, generates low trust or even distrust. Since trust is always produced or damaged within a process, *dynamic mechanisms* can be observed: the trust-building process, for instance, takes longer and requires various positive reassurances until a high level of trust is achieved.

*Loss of trust*, however, can – often in association with other mechanisms such as generalizations – occur very rapidly and result from merely a single crisis. The most important cause of loss of trust is seen in the trust subjects' perception of discrepancies, such as between information and actual fact (e.g., lies), between verbal statements and actions, between diverging actions within the same institution, between norms and statements or actions, etc. Discrepancies are generated intentionally or unintentionally by the communication or the actions of agents, or have a latent existence in the (political, economic) system. In the process of public trust building these discrepancies are transported and picked out as topics by the journalistic system (→ News Factors), which corresponds to the critical function of the media (→ Functional Analyses). On the other hand, due to the adherence of journalists and the media to the logic of news value, the discrepancies can be reinforced (frequently the case), weakened (rarely the case), or produced in the first place by the media. While the last empirically occurs, it defies the norm of objective reporting (→ Objectivity in Reporting). Journalistic news factors (see Staab 1990) such as negativism, conflict, and controversy, as well as certain journalistic routines, are capable of fostering media construction and the perception of discrepancies at the reception end. Published conflicts are particularly prone to transport, reinforce, and generate discrepancies and, thus, to effect the public's loss of trust in agents from the economy, politics, and society.

Voters' support and, thus, political power as well as economic success depend on attributions of trust by various publics. With regard to the future, the relevance of the trust of publics is almost certain to increase in the context of the information and communication societies. This is due to the process of mediatization and the increased significance that the media, especially television and online media, have assumed in the transmission of any content. All information about the world is received indirectly through the media: thus, trust becomes a structural necessity of modern societies (→ Mediatization of Politics; Mediatization of Society).

# Truth and Media Content

Karin Wahl-Jorgensen

Cardiff University

Truth is a slippery concept, and philosophers since Aristotle have battled over its meaning. The most intuitive and widely adopted understanding of truth is that of correspondence theory – the idea that “true propositions tell it like it is;” that “for a proposition to be true is for it to correspond to the facts” (Blackburn & Simmons 1999, 1). The correspondence theory assumes that the “truth” about a particular event or object is constituted by a set of “facts.” The more skillfully a phenomenon is described, the closer the description gets to the “truth” of it. Such a conception imbues media content and its makers with phenomenal authority, and is central to arguments about the importance of media professions.

Along those lines, → Walter Lippmann (1991, 31) famously suggested that to create a correspondence between “the world outside” and the “pictures in our heads,” we need a battalion of responsible expert journalists to ensure proper “representation of the unseen facts.” Ettema and Glasser (1998) have pointed out that journalism’s belief in correspondence theories of the truth is captured in the extensive use of metaphors of glass to understand and describe news: When we refer to the news as a “mirror of reality” or a “window on the world,” we assume that media content is straightforwardly referential; that there is a one-to-one relationship between the “true facts” of an event and the reality represented in news stories.

As McNair (1998) suggested, the cultural authority of journalism derives from its *discursive status as truth* (→ Journalism: Normative Theories). This status, in turn, is underpinned by the belief that it is possible to separate facts from values and the observer from the observed; that journalism can capture the world in its entirety (→ Separation of News and Comments). Such a belief underlies the ideals of the journalism profession, and is closely tied to key journalistic “strategic rituals,” including ideals of objectivity, and the celebration of → accuracy, fairness, and → balance in reporting (→ News Ideologies; Objectivity in Reporting; News Routines). It provides media producers with a set of readymade justifications for their practices, but also grants them the privilege of being the masters of our collective truths.

The commitment to truth-telling remains a cornerstone of journalism *codes of ethics* in western liberal democracies, and a key defense against encroachments on freedom of speech (→ Ethics in Journalism). However, as Ekström (2002, 271) has pointed out, the presumptions about truth inherent in the epistemology of news reporting are problematic insofar as “truth is largely reduced to a matter of the accuracy of individual facts,” and journalists do not necessarily critically reflect on “how true or accurate the news story *as a whole* may be” (emphasis in original). That is to say, this epistemology does not take into account the problem, memorably described by the Commission on Freedom of the Press (1947), that it may not be sufficient to provide the fact, because we also need to know the truth *about* the fact.

### CONSTRUCTIVIST APPROACHES

Scholars in media studies and beyond have nudged at journalism's commitment to a correspondence theory. In particular, proponents of a constructivist perspective on truth in media content question the idea of a direct denotative relationship between language and reality (→ Constructivism). Instead, such an approach starts from the presumption that all truths are contingent because reality is ultimately socially constructed through our use of language. In communication studies, James Carey's work has been associated with a constructivist perspective on the truth. His position is encapsulated in the definition of communication as "a symbolic process whereby reality is produced, maintained, repaired, and transformed" (1992, 23).

Rather than assuming a fixed external reality that stands in a one-to-one relationship to accounts of that reality, Carey proposes that we actively make the world through the stories we tell about it. In today's mass societies, most of our store of knowledge about the world comes from mass media, rather than from personal experience. This means that media content plays a key role in shaping our views of reality and our notion of truth (→ Media and Perceptions of Reality). In this vein, Miller (1998, 5) described media forms as "technologies of truth" or "popular logics for establishing fact," suggesting that the multiplication of media, genres, and spaces of reception over the past century has seen the means and sites of truth production increase.

If truth is viewed as socially constructed through mass media content, we must also ask who gets to make our collective truths, and what the consequences are of these truth-making processes. As Gamson et al. (1992, 374) suggested, "the lens through which we receive [media-generated images of the world] is not neutral but evinces the power and point of view of the political and economic elites who operate and focus it." Similarly, scholars such as Herman and Chomsky (1995) have criticized the media for failing to seek out the truth, instead "manufacturing consent" by propagating an elite consensus through the selection of some facts and stories, and the neglect of others. As such, these scholars point to the idea that the truth of media content is essentially hegemonic. Hall et al., in their classic work on media coverage of mugging, *Policing the crisis*, substantiated this view in their influential description of primary and secondary definers. Primary definers – the accredited representatives of major social institutions – come to establish the primary interpretation of the event in question. This primary interpretation comes, over time, to be accepted as the "truth" of that event. Arguments against this primary interpretation put forth by secondary definers are then forced to insert themselves against this already-established framework (Hall et al. 1978, 58).

Constructivist perspectives also underpin the approach of cultivation theory, associated with the work of Gerbner et al. (2002; → Gerbner, George). Cultivation research has demonstrated that television, as the common storyteller of our age, cultivates shared conceptions of reality among viewers. Over time, through repeated exposure to television content that "define[s] the world and legitimize[s] the social order" (Gerbner et al. 2002, 194), heavy television viewers converge toward the dominant television image of everything from violence and crime to science. As a result, heavy viewers perceive the world as a "mean and dangerous" place, and experience a heightened sense of risk. They are therefore more likely to be socially conservative, and to give their consent to

institutional authority and accept its use of force (→ Cultivation Theory; Cultivation Effects; Reality and Media Reality).

Similarly, work on framing acknowledges that when media tell stories, they do not straightforwardly represent the facts, but rather promote particular ways of understanding these facts. To frame is “to select some aspects of a perceived reality and make them more salient in a communicating text, in such a way as to promote a particular problem definition, causal interpretation, moral evaluation, and/or treatment recommendation” (Entman 1993, 52). The framing of texts has been shown to influence the opinions of audiences on issues as varied as the rights of AIDS patients, affirmative action, and the interpretation of political news. By framing “the facts” in certain ways, media narratives privilege some truths over others (→ Framing Effects; Framing of the News). Concerns over the social construction of reality through mediated representations also surface in debates over the role of public relations practitioners and political consultants in shaping news stories, “spinning” the truth in ways that benefit special interests, rather than the common good. Deceptive or untruthful political communications, crafted by such hired guns, are seen to be at the heart of an increasingly negative, cynical, and manipulative political debate that might ultimately contribute to a decline in citizen participation.

### **TRUTH AND AUTHENTICITY**

Finally, communication scholarship has shown that consumers of media are often concerned with the truth of texts in a rather different sense: audiences judge whether content is authentic, or whether it is “thought to be true to the essence of something, to a revealed truth, a deeply felt sentiment, or the ways these are worded or otherwise expressed” (Leeuwen 2001, 393).

For example, in Hill’s study of viewers of reality television, she found that audiences looked for “‘moments of authenticity’ when the performance breaks down and people are ‘true’ to themselves” (2005, 176). In studies of broadcast talk, “authentic” forms of public discourse are ones in which “traces of performance are effected or suppressed” (Montgomery 2001, 398). The more fresh and spontaneous an appearance is judged, the more “truthful” it seems. Similarly, in audience participation genres, including television and radio talk shows and letters to the editor, media producers make decisions about what voices to include on the basis of judgments of authenticity. Such judgments often assume that people can only speak truthfully about matters about which they have personal experience (e.g., Livingstone & Lunt 1994). In the context of a variety of such participatory genres, such assessments form the basis for a valorization of the voices of “ordinary people” and a dismissal of experts and figures of authority, who are seen as less truthful.

Underlying these views is an apparent paradox: although the media are the key source of our collective truths, there is also a widely held belief that access to media power, and the wealth and fame that go along with it, corrupt individuals and groups, making their contributions less truthful. As McLeod (1999) demonstrated, African-American hip-hop discourses, faced with threats of assimilation from the white mainstream, have been centrally preoccupied with notions of authenticity. Artists insist that they are “keepin’ it real,” or staying true to their roots instead of “selling out.” When looking at the content of

media, then, truth and its attendant notions of fact, objectivity, and authenticity remain contested and nebulous ideas, used strategically by scholars, media workers, stars, and audiences alike.

# Two-Step Flow of Communication

Marcus Maurer

Johannes Gutenberg University of Mainz

The two-step flow of communication hypothesis was first formulated by → Paul F. Lazarsfeld and his colleagues in their classical study on the 1940 American presidential election (1944). It states that there is usually no direct influence of the mass media on the general public. Rather, “ideas often flow from radio and print to the opinion leaders and from them to the less active sections of the population” (Lazarsfeld et al. 1944, 151). This assumption, challenging the popular idea of strong direct media effects on the public (→ Stimulus–Response Model), turned out to be one of the most influential ideas in communication research from the 1940s to at least the 1960s. While recent research has contradicted the original hypothesis in its rigid form, many of its underlying ideas have stimulated fruitful further research. This holds especially true for the concept of opinion leadership and the analysis of social networks (→ Network Analysis; Opinion Leader).

## THEORETICAL FOUNDATIONS

In *The people’s choice*, Lazarsfeld and colleagues found that 17 percent of the voters had changed their voting intentions during the campaign. Two thirds of all voters mentioned radio and newspaper as a “helpful source” for making their voting decisions. From today’s point of view, these results seem to indicate relatively strong media effects. Nevertheless, the authors had expected to find much stronger effects – as had been found by several earlier studies. Consequently, they tried to explain why mass media may be less powerful than commonly assumed. In doing so, they found two explanations. First, voters prefer to be exposed to media content that confirms their own political ideas. Therefore, their opinions are rather reinforced than changed by the media (→ Cognitive Dissonance Theory; Selective Exposure). Second, the flow of ideas from the mass media to the general public is not direct but rather involves two steps: a first step from the media to so-called *opinion leaders*, and a second step from them to so-called followers. Opinion leaders can be found on every level of society and do not differ much in their characteristics from other people. But they are more often exposed to mass media and more often try to convince others of their political ideas. However, because the study was not designed to examine the flow of communication more closely, it remained unclear whether there really was a two-step flow.

In the *Rovere study*, Merton (1949) suggested that opinion leadership is not a general characteristic of a person but rather limited to specific issues. He developed several *typologies*, e.g., the distinction between local and cosmopolitan opinion leaders. Both differ in their media consumption as well as in their areas of influence. In the *Decatur study*, Katz and Lazarsfeld (1955) further developed this idea. They distinguished opinion leadership in four areas of decision-making: marketing, fashion, public affairs, and movie-going. Generally, the results confirmed the assumptions of the two earlier studies: opinion leadership was more or less restricted to one of the four areas, and opinion

leaders were more often exposed to mass media than followers. Respondents who changed their opinions or behavior reported more often that they had been convinced by interpersonal communication than by the mass media. In the *drug study*, Menzel and Katz (1955) established the method of *network analysis* by asking doctors to name the three colleagues they most often met, talked to, and got advice from. By mapping all contacts in a social network, authors identified opinion leaders and followers. Again, the study confirmed most results of earlier research. On the other hand, the idea of a two-step flow of communication was not clearly supported. Opinion leaders frequently mentioned other opinion leaders as sources of information. This finding suggested that the flow of communication might be rather multistep than two-step.

Taken the assumptions of the early studies together, the two-step flow of communication model consists of at least *five* more or less explicitly stated *hypotheses*. (1) Most people are not directly exposed to the mass media. They are rather informed via interpersonal communication by so-called opinion leaders. (2) Opinion leaders are much more exposed to mass media and much more engaged in active communication than the general public is. (3) Opinion leaders not only inform the followers, but also transmit the content of the mass media to them. Otherwise, instead of a two-step flow of communication, there was concurring information by interpersonal and mass communication. (4) The general public is not only informed but also influenced by opinion leaders. The information given by opinion leaders leads to changes in opinions or behavior (→ Attitudes, Values, and Beliefs, Media Effects on; Public Opinion, Media Effects on). (5) Opinion leaders are no passive gatekeepers of media information. They transmit media content biased through their own opinions. Otherwise, the two-step flow of communication hypothesis would not be challenging the idea of strong media effects. Just the opposite was the case: conveying media information to those who are not exposed to media themselves means *increasing media effects*.

## RECENT FINDINGS

In recent research these hypotheses have often been disentangled and studied separately. Generally, *three types of studies* can be distinguished. First, studies on the *diffusion of news* deal with the flow of information from the mass media to the general public without taking the concept of opinion leadership into account. Second, studies on *opinion leaders* deal with the question of how opinion leadership can be measured, the structure of social networks, and the characteristics of opinion leaders without taking media effects into account. Third, studies on the *sources of public opinion* compare the effects of interpersonal and mass communication without analyzing the flow of information.

### Diffusion of News

The assumption that most people are not directly exposed to mass media but rather informed by interpersonal communication has been proven to be wrong by several recent studies on news diffusion. Nowadays, in western democracies about 80–90 percent of adults are exposed to any kind of media news on an average weekday (→ Exposure to News; News Audience). Comparing the primary source of news in 34 countries worldwide,

Plasser & Plasser (2002) found that in almost all countries under examination, the primary source of news is television, followed by newspaper. On average, less than five percent of respondents say that they are primarily informed by interpersonal communication.

Besides these general findings, since 1945 several studies on the *diffusion of single news events* have been conducted (→ Diffusion of Information and Innovation). In those studies, respondents are asked when and from which source they first heard about an event. They show quite different results, depending on the salience of the events under examination. In the case of extremely *high-salience news events* like Kennedy's assassination or the Challenger explosion in 1986, information diffuses rapidly and is conveyed to a significant number of people via interpersonal communication. In the case of relatively *low-salience news events*, information reaches fewer people and is conveyed almost exclusively by mass media. The reason for that finding, probably, is that only in the case of high-salience news events is interpersonal communication stimulated. Indeed, several studies on news diffusion show that people start talking to others about an event after being informed about it by the mass media. Those discussions were much more likely when the event was highly salient. Consequently, sometimes a two-step flow in news diffusion is quite likely – but only under extreme conditions, which seldom occur.

### Role of Opinion Leaders

The idea of opinion leadership was revived during the 1980s and 1990s by developing new methods of measurement. Besides network analysis, the “strength of personality scale” has become a frequently used tool for measuring opinion leadership. Instead of directly asking people whether they influence others, ten less obvious items (e.g., “I like to assume responsibility”) are used to identify opinion leaders. As in the early studies, opinion leaders, classified by recently developed methods, turn out to be highly exposed to mass media and actively engaged in interpersonal communication. They are located in central positions in social networks and many others report that they are influenced by them.

On the other hand, recent studies on opinion leadership suggest that the concept of a two-step flow of communication is oversimplified. First, opinion leaders engage in interpersonal communication with followers as well as with other opinion leaders. This finding points to a multistep flow of communication. Second, in the communication flow regarding most issues, a clear majority is neither opinion leader nor follower. Instead, they do not engage in interpersonal communication at all. Consequently, they have to rely on media information.

### Sources of Influence

Today, there is clear evidence that mass media influence people's opinions and behavior in many ways (→ Media Effects). The same holds true for → interpersonal communication. The crucial question is how the effects of both sources are related. This question relates to both steps of the two-step flow model. Concerning the first step, the question is how adequately opinion leaders understand the information received from the mass media. Only in cases where they understand and remember media content correctly are they able to convey it to others.

Several studies on *learning from the news* suggest that most people tend to quickly forget at least the details presented by the media. In the event of this holding true for opinion leaders too, a two-step flow of communication is quite unlikely. Concerning the second step, the question is how opinion leaders transmit media content to others. While several studies on interpersonal communication show that people frequently talk about media content, it remains unclear whether they convey it neutrally or in a manner that is biased by their own opinions. Only in the latter case can interpersonal and mass communication be regarded as contrasting influences. If people convey media content in a more or less unbiased way to others, interpersonal communication is not an independent source of influence. Rather, its effects should be regarded as an expansion of media effects.

Thus far, only a few studies have dealt with these questions. By using aggregate data, Brosius and Weimann (1996) found evidence for several models of influence – in this case → agenda-setting effects. Under some conditions, the media agenda, first, influenced the agenda of early recognizers – in the authors' terms – or a sub-group of opinion leaders. In a second step, the early recognizers' agenda influenced the public's agenda. While this finding is in line with the two-step flow model, more often another flow of influence occurred. First, the agenda of early recognizers influenced the media agenda. Then, the media agenda influenced the agenda of the general public.

Still, there is no test of the complete two-step flow model on an individual basis. Such a test would require a complex research design, including detailed analyses of media content and interpersonal discussions as well as → surveys of individual media exposure, engagement in discussions, and opinion changes over time. Carrying out a complex study of this kind seems almost impossible. Nevertheless, more detailed research on the role of interpersonal communication as a mediator of media effects is needed.

# Typography

Robert L. Craig

University of St. Thomas

Typography is a process for reproducing text, figures, punctuation, characters, ornaments, and borders via a printing press or electronic communication. Typography is distinguished from calligraphy, by which single, handwritten copies are made. Manuscripts set into type may be printed or stored electronically, allowing an infinite number of exact replicas to be distributed widely. Early typeface designs were modeled after calligraphic letter-forms but book typefaces quickly moved away from writing as a model. In a development spurred by the Industrial Revolution, commercialization, and later the growth of digital typography, which made type design easier, hundreds of thousands of formal, informal, and decorative typestyles are in use today.

## HISTORY

Typography is technically prefigured in the stamping of seals and signets, a process found in many early civilizations. Starting in the third century CE, the Chinese carved letters into wood blocks for printing. Eventually whole books were carved in relief on wood slabs. The oldest surviving xylographic or woodblock → book is the Buddhist *Diamond sutra* printed in China in 868 CE. In 1045, Pi Sheng of China may have developed the first form of handset or movable type, the name given to processes where multiple copies of individual letters (called characters, sorts, or glyphs) are cast so they can be combined and printed with other characters, taken apart, and stored for reuse. A twelfth-century, nine-volume, Buddhist religious tract titled *Propitiousness has spread to everywhere in Kouhebenxu* was discovered in a pagoda in 1991, and Chinese scholars believe it was printed with wooden, movable type. Around 1443, the Korean scholar-king Sejong the Great developed a phonetic alphabet called Hangul, which made movable type more practical and expanded book printing in Korea.

In 1454, *Johannes Gutenberg* invented movable type in Mainz, Germany. Also called foundry type, its characters are cast in relief out of a lead, antimony, and copper alloy. The characters are stored in cases and the compositor retrieves one character at a time and sets it in a composing stick adjusted to the correct measure (column width). The type is then printed via letterpress, and the characters are redistributed into the case for reuse. Due to the type metal's weight, large letters were cut in wood. Foundry type is still employed today by arts and crafts typographer-printers of the private press movement, who publish limited editions of carefully crafted books (→ Printing, History of). Gutenberg modeled his type and book design after the conventions of manuscript books. He designed blackletter fonts to fit the decorative, gothic style popular in both writing and architecture throughout Europe.

On the Italian peninsula, however, Renaissance scribes had revived a humanistic letter-form they called *Roman*. This hand was, in fact, Carolingian (ninth-century), but nevertheless it had quickly become popular. Printers who moved south from Germany when Gutenberg fell into legal and financial difficulties adopted it, as did Roman and Venetian typographers and printers.

Fifteenth- and sixteenth-century typographer-printers like the Venetians Nicolas Jenson and Aldus Manutius and the French Simone de Colines, Robert Estienne, and Claude Garamond refined what is now called “*old style*” *type design*. It is characterized by contrasting thick and thin strokes that finish in bracketed serifs (a subtly drawn transition at the end of the letter strokes so they widen into the horizontal serifs). Manutius, with punch-cutter Francesco Griffo, created the first italic typeface, which he used to print the text of his most significant invention, the pocket-sized, portable book. Seventeenth- and eighteenth-century type designers created a refined type style called “transitional” with more finely drawn thin strokes. Transitional typefaces showed more contrast and matched the fine lines in etchings, engravings, and baroque and rococo penmanship. In 1692 Philip Grandjean designed the “romain du roi” exclusively for Louis XIV’s printing office. In 1757, English printer John Baskerville cut the model transitional roman and italic, which became popular throughout Europe and America.

Later in the century, Italian Giambattista Bodoni and the French François Ambroise and Firmin Didot moved further still from old style when they created rational, elegant “*modern*” *fonts* with even greater contrast between the thick and thin strokes. The fine-lined strokes were matched in weight with unbracketed serifs, drawn as straight, horizontal lines rather than swelling outward as part of the main strokes.

Typesetting was still done mainly by hand until the nineteenth century, when inventors tried to mechanize the process. First, they invented machines to set the old foundry-type characters. However, in 1886 Ottmar Mergenthaler invented the *Linotype machine*, which revolutionized typesetting. It was so named because it set and cast a “line of type” simultaneously. The Linotype stores matrices (molds) for the characters in interchangeable font magazines. Compositors set type by striking a keyboard character, causing the correct “mat” to move into the assembly area. When a full line of mats and spaces is set, the type is cast – a marvel of the Industrial Revolution. Linotype operators set type many times faster than handset compositors.

## INDUSTRIALIZATION OF TYPOGRAPHY

The industrialization of typography and printing is synonymous with the growth of consumerism. Businesses needed more powerful typography and illustrations in their posters and advertisements to attract customers (→ Advertising). So printers employed larger, bolder headlines and decorative typestyles (→ Visual Communication; Graphic Design). Types for reading and advertising became bolder with less contrast, the most extreme called “slab serif” for their heavy, blocky serifs, which could be either bracketed or unbracketed. Another radical style was William Caslon IV’s “sans serif” type. Type “without serifs” appeared early in the nineteenth century but was used sparingly until the twentieth.

In Victorian design, multiple typestyles were often employed in single layouts, making them stand out but also garish and cumbersome to read. (→ Advertisement, Visual Characteristics of). However, late in the century the work of William Morris at his Kelmscott Press and other Arts and Crafts movement typographer-printers spawned interest in reviving the fine qualities of traditional typography and printing. Eschewing the Linotype and other industrial processes, the Arts and Crafts craftsmen returned to

handicraft production. Morris himself researched the history of typography and designed his own typefaces based on blackletter and Nicolas Jenson's fifteenth-century Venetian old style type. Industry followed Morris's scholarly lead in the twentieth century. With the resources to research type history and hire expert type designers, industrial type-founders revived and adapted the classical typefaces of the great type designers, making them available to modern designers for machine production.

In the nineteenth century, → photography revolutionized printing plate-making. When stone lithography and zincography evolved into offset lithography, twentieth-century artists suddenly had more freedom to manipulate typography in design. Artists associated with modern movements like Futurism, Dadaism, De Stijl, Cubo-Futurism, Constructivism, and the Bauhaus School employed type in radical, asymmetric layouts (→ Art as Communication).

German typography visionary Jan Tschichold proclaimed that *sans serif type* was the appropriate type for the machine age. The spread of plain, undecorated typefaces like Futura, Twentieth Century, and Univers was the modernists' critical reaction to the overly decorative Victorian typography. Initially, sans serifs typefaces were monotone, with no variation in their stroke weights. Eventually some contrast was added, often where the bowls (the rounded parts of letters like b and d) attach to the main strokes, as in fonts like Franklin Gothic and Helvetica. Eventually, designers restored classical qualities in "humanistic sans serifs" like Hermann Zapf's popular Optima by adding contrasting stroke widths.

Although the rise of sans serif typography had a profound effect, it did not supplant other letter-forms. In fact, new typestyles like "script" (whose letters have tails that link) and "cursive" (whose letters look as though they should link but do not) became popular in the 1920s–1940s. In the 1960s and 1970s modernists discouraged their use, but they have been revived by retro designers of the postmodern period.

## PHOTOCOMPOSITION AND DIGITAL TYPOGRAPHY

At the start of the twentieth century, a new typographical process called *photocomposition* was developed. Herman Freud developed the first commercial phototypesetter, called Intertype Fotosetter, in 1946. In photocomposition typefaces are drawn, photographed, and stored as photographic negatives on film strips or disks. To set type, a high-intensity light is flashed through the clear, negative character, exposing it on photographic paper that is then developed like a photographic print. The photocomposed, paper type is not printed directly but pasted with graphics and images onto a keyline layout for photo-mechanical plate-making. Where metal type was rigid, paper type could be cut and pasted up in any way designers could imagine, opening the door to the experimental, creative typographic layouts of the 1970s and 1980s. Photocomposition blossomed in the 1950s and 1960s when inventors added screens (CRTs) for viewing and editing type and computers to automate hyphenation and set type. The faster, computerized photocomposition quickly replaced the Linotype-style casting machines and made offset lithography the dominant commercial printing process.

Adding computers to photocomposition laid the foundation for *digital typography* and desktop publishing in the 1980s. The first digital screen and print fonts were bitmapped,

ASCII letter-forms that appeared as jagged dots on the screen and in dot-matrix printer output, which did not meet professional typographic standards. In 1984, to improve the appearance of type on the screen and in print, John Warnock and Chuck Geschke of Adobe Systems developed PostScript, which became the standard page description and programming language for desktop and electronic publishing.

The year 1985 was a watershed in the history of typography. Altsys Corporation released Fontographer, the first Bézier-curve-based type-design software. It allowed digital designers to create smooth, digital fonts. Aldus Corporation's PageMaker, a PostScript page-layout program, was also released, enabling designers to mix type, graphics, and images in a WYSIWYG (what you see is what you get) format. In 1987, QuarkXPress, a superior page-layout program, came on the market. It gave typographers and designers more control over type and its spacing, even permitting characters to be superimposed. It remained the pre-eminent professional page-layout program until challenged by Adobe's InDesign in 1999.

*Page-layout programs* had a profound impact on typography and graphic design when Apple produced its LaserWriter in 1985. Its raster image processor (RIP) contained an Adobe PostScript interpreter that combined high-resolution fonts, graphics, and illustrations in page layouts. Laser scanning resulted in higher-resolution output. For professionals, the German firm Mergenthaler developed the Linotronic image-setter, which set digital type at 2540 dots per inch (dpi), effectively killing photocomposition. Software like FontLab Studio and Fontographer put digital type design in the public's hands, resulting in an explosion of tens of thousands of new, individualistic typefaces associated with postmodern typography. Digital type's impact has been profound. Where earlier type technologies were expensive and thus unavailable to the public, digital type came free on personal computers. Ironically, typefaces like Zapf's digital script Zapfino have brought typography almost full circle. Zapfino is literally calligraphic, with over 1,425 character variations (e.g., over 50 variations of the lower case a), which can be substituted depending on how they look with the nearby characters just as calligraphers did their letters as they wrote. This practice was impractical in foundry or photocomposition. But with the computer able to quickly make character substitutions, Zapfino has been released as a standard font with Mac's System X. Today most typefaces can be found and downloaded from the web, often free of charge, making typography a democratic art.

# Ubiquitous Computing

*Jean-Claude Burgelman*

*Institute for Prospective Technological Studies*

*Yves Punie*

*Institute for Prospective Technological Studies*

Ubiquitous computing refers to a new era in which networking and computing technologies become so small, fast, interconnected, and cheap that they can be embedded seamlessly into the environment and everyday objects. It implies that computing becomes ubiquitous. User-friendly services are expected to be available anytime and anywhere and only when demanded by users. This implies computing becoming intelligent because it will need to understand human behavior in context. The term ubiquitous computing was coined by Mark Weiser (1952–1999), chief scientist at the Xerox Palo Alto Research Center (PARC) in California, in a seminal paper published in 1991.

The idea of ubiquitous computing or “ubicom” has been taken up and developed since then, in many different parts of the world under a *variety of terms*: pervasive computing, disappearing computing, proactive computing, sentient computing, affective computing, wearable computing, intelligent networks, and ambient intelligence. The use of these terms usually implies a different focus, such as augmenting everyday objects (e.g., a coffee cup) with sensors and/or activators in order for them to sense physical activity and, consequently, to act or communicate this information (e.g., coffee is hot). Others orient their work toward developing natural and intuitive user interfaces such as tangible ones where a person interacts with digital information through the physical environment.

But as a vision for a new era of computing in society, there is a need to encompass three *key technological areas*: invisible/ubiquitous computing, ubiquitous communication, and intelligent user-friendly interfaces. This means that everyday objects are augmented with computing capabilities and that these devices are able to interact with each other and with their users in a way that is natural and intuitive. In addition to technological progress, which is needed in each of the separate domains, the convergence and seamless interoperability between them is seen as a major challenge for research.

The differences in approaches to ubicom also are indicative of geographical preferences. Ubiquitous computing is the term most commonly used in the US and Japan, while in Europe, the term *ambient intelligence*, or AmI, is more prevalent. In Europe the concept

of AmI is raised as a future vision of the information society and is associated with the further development of information and communication technologies as a means of addressing the socio-economic challenges that Europe will face in the future.

AmI in Europe is being promoted by policymakers concerned with research, technology, and development (RTD) in the field of information and communication technologies. AmI was a priority area for research within the *European Commission's RTD Framework Programme 6* (2002–2006), which dealt with information society technologies (IST). The objective continues to be that research on IST should contribute to realizing European policies for the knowledge society as agreed at the Lisbon Council of 2000. At this time the strategic goal for Europe over the next decade was “to become the most competitive and dynamic knowledge-based economy in the world capable of sustainable economic growth with more and better jobs and greater social cohesion” (European Union 2000).

Major steps in developing the vision of AmI in Europe have been taken by the IST Advisory Group (ISTAG), a European group of high-level experts from industry and academia who are advising on the IST program. ISTAG has emphasized, from the start, the human and service aspects of AmI, and that its focus should be on serving people, not technologies (ISTAG 2001). The key ideas for AmI consist of human-centered computing, user friendliness, user empowerment, and the support of human interaction. These explicit human- and user-oriented claims about the future of AmI make the AmI vision different from earlier, more technologically deterministic, visions (Punie 2005).

Ubiquitous computing and ambient intelligence remain visions for the future as the key goals have yet to be realized, but they are based on the ongoing development of current and next-generation information and communication technologies and services. These terms suggest emergent properties that will take shape as they are developed. However, the scale, complexity, and ever-expanding scope of human activity will present enormous *technical and social challenges* to realizing the full potential of AmI. The huge amount of behavioral, personal, and even biological data that is needed to provide context-dependent, value-added, proactive services has major implications for → privacy, identity, and security. In addition, the growing autonomy and intelligence of devices and applications is expected to change the way people interact with technologies and services, and has implications for new business models, product liability, security, and service definition.

Ubiquitous computing has the potential to have major implications for the media and communications sector, as digitized information, communication, and transaction services become increasingly personalized, interconnected, and always available via broadband networks (wired and wireless). Important changes are occurring as new Internet players emerge and become established, such as Google, Yahoo! (→ search engines), and eBay (→ E-commerce). New services under the label of “Web 2.0,” such as social software, blogging, podcasting, and open source content, are also shaping the future of the Internet (→ Language and the Internet). These services seem to point to a trend whereby intelligence is with people and their networks rather than within the environment and with devices, as suggested by AmI and ubicomp. It remains to be seen how these developments will interact with breakthroughs in ubiquitous computing.

# **Uncertainty and Communication**

*Dale Brashers*

*University of Illinois at Urbana-Champaign*

Uncertainty has been an important concept in communication theory for many decades (→ Uncertainty Reduction Theory). Understanding how people respond to uncertainty in developing relationships (→ Relational Uncertainty) and in intercultural encounters (→ Anxiety Uncertainty Management Theory) has been the foundation of a large body of interpersonal communication research. This work has demonstrated complex relationships between communication, → information seeking, and the management of uncertainty (→ Uncertainty Management).

Recent theory building and testing have extended the concept into the social influence and behavioral change domain, primarily through → health communication research (→ Health Behavior Change, Transtheoretical Model of). Babrow et al. (1998) noted that uncertainty is a central feature of health and illness experiences, but that it had been conceptualized differently across various strands of research. These researchers integrated those definitions and explained that “uncertainty exists when details of situations are

ambiguous, complex, unpredictable, or probabilistic; when information is unavailable or inconsistent; and when people feel insecure in their own state of knowledge or the state of knowledge in general” (Brashers 2001, 478). Babrow et al. argued that this more complete description forms the basis for further theory building and practical applications in health-care and promotion.

Theories of communication and uncertainty management (Brashers 2001), motivated information management (Afifi & Weiner 2004), problematic integration (Babrow et al. 1998), and the risk perception attitude (Turner et al. 2006) are recent theoretical directions that recognize the complexity of uncertainty and information management in the health domain (→ Information Overload). For example, Brashers (2001) noted that people may want to reduce, increase, or maintain their uncertainty depending on how they appraise it (e.g., maintaining uncertainty about an illness can lead to hope or optimism), and that obtaining information does not necessarily lead to reducing uncertainty (e.g., information can lead to more uncertainty when it is inconsistent across sources or when it contradicts a person’s current beliefs).

Social influence researchers have used theories of → information processing and uncertainty management in recent research on health behavior change. For example, Rimal (2001) used Witte’s theory of fear appeals (→ Extended Parallel Process Model) to predict information-seeking behavior in response to health messages about cardiovascular disease. In a follow-up study, Turner et al. (2006) found that “avoidant” participants in their research (i.e., those with perceptions of high risk for a disease, but low self-efficacy to avoid it) were likely to seek information, but unlikely to retain it, perhaps suggesting that anxiety causes selective retention (→ Selective Perception and Selective Retention) or other psychological mechanisms to facilitate maintaining uncertainty. Other related areas of research have included tests of messages promoting HIV testing (using functional theory; see Hullett 2006; → Functional Analysis) and organ donation (using the theory of motivated information management; see Afifi et al. 2006).

One complexity that has received attention is the collaborative nature of uncertainty management. Afifi & Weiner (2004) argued that researchers need to account for the motivations, outcome assessments, and efficacy beliefs of both information seekers and information providers. For example, Dillard & Carson (2005) described how health-care providers and family members deal with uncertainty when a newborn has a positive screening test for cystic fibrosis. They found uncertainty management for the family was negotiated between providers and family members, which included family members seeking information about the illness to reduce uncertainty, health-care providers providing and highlighting information to help family members reduce uncertainty, a midwife recommending that family members avoid information to maintain their uncertainty and avoid anxiety about prognosis until diagnosis was confirmed, and medical technicians checking to see how much information family members wanted. Brashers et al. (2004) noted that supportive others can assist with uncertainty management by helping achieve information goals, but also by means such as facilitating skill development, providing acceptance or validation, or encouraging reappraisal or perspective shifts (→ Social Support in Health Communication; Social Support in Interpersonal Communication). They also noted that support attempts can be problematic, in that they sometimes included a lack of coordination of goals between the support provider and support recipient, the

addition of relational uncertainty to illness uncertainty, and the need for managing the uncertainty of both parties.

Future research in this area should focus on developing our understanding of what makes uncertainty management processes more or less effective. Goldsmith (2001) suggested that this involves asking research questions about the meaning and function of behaviors, with a focus on determining (1) what challenges there are in a particular social context for achieving a communicative goal, (2) what discursive resources are available for addressing those challenges, and (3) how efforts for achieving the goal will be evaluated as effective and appropriate.

# Uncertainty Management

Walid A. Afifi

*University of California, Santa Barbara*

Given that the experience of uncertainty, in some form, is a part of nearly every interaction, it should come as no surprise that new theoretical efforts to understand it are foundational to the study of interpersonal communication and continue unabated today. Uncertainty reduction theory (URT; Berger & Calabrese 1975) served as the field's initial, and most influential, examination of uncertainty in interpersonal contexts, and the theory of motivated information management (TMIM; Afifi & Weiner 2004) represents the most recent effort. Interestingly, the range of theories also reflects an over-twenty-year struggle over the basic assumptions and perspectives that guide our understanding of people's experience of, and response to, uncertainty.

A broad approach to uncertainty defines it as a lack of confidence in the predictive utility of information that one has about a topic (Brashers 2001; → Relational Dialectics; Uncertainty and Communication; Uncertainty Reduction Theory). In other words, high uncertainty translates to a perceived inability to predict or explain a person, interaction outcome, or issue with confidence. The theoretical debates about uncertainty have mostly revolved around two issues. First, how do people experience uncertainty? Second, how do people respond to that experience?

## THE EXPERIENCE OF UNCERTAINTY

URT argued that individuals have an innate motivation to predict and explain people and events (at least up to a certain point). As such, uncertainty is almost inevitably experienced as a negative physiological and psychological state. In fact, the theory's primary author has argued that the motivation to reduce uncertainty can be traced back to evolutionary needs (Berger 1987). Specifically, those who do not make efforts to reduce uncertainty about others are unprepared to defend themselves from the threats they may pose. Others have disagreed. Two communication scholars, in particular, have offered alternative viewpoints. Babrow (1992), in articulating problematic integration theory, and Brashers (2001), in advancing uncertainty management theory, have argued that people's experience of uncertainty differs dramatically according to the context and culture in question. In some cases, uncertainty is experienced as a positive state and, in others, as a negative one.

In support of this position, they have focused on people's experience of illness. For example, Brashers et al. (2000) have shown that people living with HIV often see uncertainty as hope – the otherwise certain outcome of death is less assured. Babrow has found similar positive experiences of uncertainty in patients with cancer, among others (Babrow and Kline 2000). Finally, some studies have suggested that uncertainty is more commonplace in certain cultures than in others, making inhabitants of those cultures less susceptible to aversive reactions to uncertainty (Goldsmith 2001). In an effort to account for this controversy, Afifi and Weiner (2004) recently advanced the notion of *uncertainty*

*discrepancy*. They claimed that uncertainty is an anxiety-producing state only when the actual and desired levels of uncertainty in a specific circumstance do not match. Such a discrepancy could reflect cases in which individuals want less uncertainty than they have, or those in which they want more. While so doing, they also acknowledged that the more common situation is the former. Indeed, their studies have shown just that – most people want less uncertainty, but there is a subset of individuals who report wanting more uncertainty than they have on an issue (Afifi & Weiner 2006).

Unfortunately, this uncertainty paradigm has offered very little in the way of predictive specificity about individuals' experience of uncertainty – only that uncertainty will be psychologically distressing for some, but not for others. One as yet untested possibility that marries the two theoretical camps is that uncertainty is experienced as positive *only* when individuals do not believe that its reduction would perform the preparedness/protective function that the evolutionary explanation otherwise assumes it does. In other words, if people believe that the HIV diagnosis equals inevitable death (something that they cannot prevent or protect against), then the evolutionary utility of uncertainty reduction disappears and another evolutionary tool – maintaining emotional (vs physical) well-being – takes over. Such an explanation would account for most of the empirical discrepancies in this research area and deserves to be tested.

## RESPONSES TO UNCERTAINTY

Closely tied to the debate about the experience of uncertainty is the one that challenges the way people respond to uncertainty. Not surprisingly, given the supposed evolutionary disadvantage of uncertainty, Berger and Kellermann (1983) argue that individuals respond to uncertainty with immediate efforts at uncertainty reduction – attempts that wane once uncertainty is adequately reduced. They also offered three general ways in which people seek information to reduce uncertainty: (1) passive (i.e., through observation), (2) active (i.e., through third parties or by altering the environment and watching the target's reaction), or (3) interactive (i.e., direct communication with the target) (for review, see Berger & Kellermann 1994). Several studies have confirmed that people prefer to start their uncertainty reduction efforts with passive strategies (a less efficient but more socially appropriate tactic), but inundate their targets with questions once in interactions (→ Initial Interaction). Investigations into uncertainty reduction in close relationships also show a preference for more indirect, socially appropriate strategies in these contexts (→ Relational Uncertainty).

Those scholars who see uncertainty as sometimes beneficial do not predict consistent efforts at its reduction. Individuals *may* make efforts to reduce it (when uncertainty is experienced as negative), but might instead choose to avoid information altogether (to prevent the reduction of uncertainty), cognitively re-assess the state of uncertainty, or even bask in its presence. Moreover, low levels of uncertainty do not always translate to a reduction in information-seeking efforts. In some cases they may lead to more vigorous efforts at information seeking – when uncertainty reduction means a loss of hope. Proponents of this model have produced considerable evidence supporting these possibilities. Examples include the avoidance of information when the expected outcome is negative or the search for third or fourth opinions in response to undesirable medical diagnoses.

Personality theorists have also argued that individuals differ systematically in their response to uncertainty. Some (e.g., blunterners) avoid potentially threatening information at all costs while others (e.g., monitors) are voracious information seekers (Miller 1987).

### **THEORY OF MOTIVATED INFORMATION MANAGEMENT**

Afifi and Weiner (2004) recently advanced TMIM as a way to address some of the inconsistencies in the literature and more fully capture the complexity of uncertainty management decisions within interpersonal encounters. The process starts with awareness of an uncertainty discrepancy about an important issue. That discrepancy then produces anxiety. In response, people ask themselves two general questions: “What are the costs and benefits of information seeking?” (labeled *outcome expectancy*), and “Am I able to seek and cope with the information?” (labeled *efficacy*). Three specific efficacy assessments are made: communication efficacy (i.e., can they skillfully seek the information from this person?), coping efficacy (i.e., can they cope with the outcome they expect?), and target efficacy (i.e., does the target have the information being sought and are they likely to provide it?).

Based on their perception of outcome expectancies and efficacy, individuals take one of three information-management routes: seek information (varying from direct to indirect methods), avoid information (varying from active avoidance to passive avoidance), or cognitively re-assess the level of actual or desired uncertainty. The theory proposes that individuals are increasingly likely to seek information directly to the extent that outcome expectancies are positive and the efficacy assessments all high. Afifi and Weiner (2004) argue that information providers go through similar assessments in determining what information to give and how to do it. They assess the costs and benefits of information provision and whether they are able to provide it. The end result of this process depends on the seeker’s strategy and the provider’s response. Studies of the theory have shown promise, although to date only the information seeker has been examined.

### **METHODOLOGICAL PROBLEMS AND FUTURE DIRECTIONS**

The literature on uncertainty in interpersonal encounters has been mostly dominated by quasi-experimental or → experimental designs. The typical paradigm in the first few studies was to have two strangers interact in a lab (sometimes with varying instructions, sometimes not), then code the interactions for evidence of information-seeking efforts (e.g., questions asked).

Participants were also typically asked to rate their level of uncertainty about the target other. One of the most commonly used measures of self-reported uncertainty is the short version of Clatterbuck’s (1979) attributional confidence scale (CLUES). The measure is intended to capture general uncertainty about a target person and has consistently shown strong psychometric properties. Other measures of uncertainty have emerged since then, some with alternative foci such as relational uncertainty (Knobloch & Solomon 1999), but the question kernels used in these measures are generally adopted from the original CLUES scale. Given the individualized, contextualized, and shifting nature of uncertainty’s

meaning in Babrow's and Brashers' uncertainty management frameworks, it is not surprising that qualitative methods (e.g., interviews) rose to prominence in the mid- to late-1990s as a means of capturing uncertainty and related processes. Still, the dominant methodological paradigm in the area remains quantitative.

Much has changed in the uncertainty landscape since Berger and Calabrese's uncertainty reduction theory was first introduced. Yet there remain many unanswered questions. Perhaps foremost among these is the explanatory mechanism that might lead to greater predictive precision regarding individuals' experience of uncertainty. In addition, despite a large corpus of knowledge about behavior during initial interactions, there is still relatively little known about the fluidity of uncertainty states within and across interactions, or interactants' shifting roles as provider and seeker. These limitations are in part due to an increasing reliance on one-shot survey designs and a noted absence of micro-coding of interactants in conversation and of longitudinal data. Finally, work by Babrow and Brashers has highlighted the need to attend more closely to the influence of emotion on the uncertainty management process, while research on TMIM has revealed the need to study more closely the role played by efficacy perceptions in the management of uncertainty.

## Uncertainty Reduction Theory

*Denise Haunani Solomon*

*Pennsylvania State University*

Uncertainty reduction theory explains both how interpersonal communication is affected by a lack of knowledge and how people use communication to gather information (→ Uncertainty and Communication). This theory was founded on the observation that → initial interactions between strangers routinely involve an exchange of demographic and public information, and these interactions change in predictable ways as they progress (Berger 1997a). Rather than simply label these patterns as normative, the theory elaborates on the mechanisms that drive interpersonal communication behaviors. Interpersonal communication plays two roles within uncertainty reduction theory: (1) communication is among the behaviors that people seek to predict or explain, and (2) communication is a tool people use to gather information or form predictions and explanations (→ Information Seeking). Over the 30 years since its inception, uncertainty reduction theory has been applied to numerous communication contexts, and it has given rise to several alternative perspectives on uncertainty and communication. Thus, uncertainty reduction theory has had a major impact on the communication discipline.

### THEORETICAL CLAIMS

A core assumption of uncertainty reduction theory is that people are driven to increase the predictability of their own and their communication partner's behavior. Uncertainty reduction can be *proactive*, focused on predicting future behaviors, or *retroactive*, focused on explaining past experiences. The theory also distinguishes between *behavioral uncertainty*, which is a lack of knowledge about the behaviors that are appropriate or expected, and

*cognitive uncertainty*, which involves questions about a communication partner's personal qualities.

Berger and Calabrese (1975) advanced uncertainty reduction theory as a *set of axioms* concerning the association between uncertainty and facets of interpersonal communication within initial interaction between strangers. The axioms specified in that initial formulation were as follows: (1) As the amount of verbal communication between strangers increases, uncertainty decreases; as uncertainty is reduced, verbal communication increases; (2) As the amount of nonverbal warmth expressed between strangers increases, uncertainty decreases; as uncertainty is reduced, nonverbal expressions of warmth increase; (3) When uncertainty is high, information-seeking behavior is frequent; as uncertainty decreases, information-seeking behavior decreases; (4) When uncertainty is high, the intimacy level of communication content is low; as uncertainty decreases, the intimacy level of communication content increases; (5) When uncertainty is high, partners are more likely to reciprocate each other's communication behaviors; as uncertainty decreases, the rate of reciprocity decreases; (6) Similarities between communication partners decrease uncertainty; dissimilarities between communication partners increase uncertainty; and (7) When uncertainty is high, liking for a communication partner is low; as uncertainty decreases, liking increases.

By considering all possible pairwise combinations of these 7 axioms, Berger and Calabrese also offered 21 *specific theorems* linking uncertainty to interpersonal communication variables and outcomes. For example, considering the first two axioms in tandem generates the prediction that amount of verbal communication and expressions of nonverbal warmth are positively correlated.

Although uncertainty reduction is taken as a necessary priority because it enables communication, Berger (1979) identified three conditions likely to increase a person's desire to reduce uncertainty. When future interaction with a communication partner is likely or expected, people should be especially motivated to gather information about that partner. In addition, the drive to reduce uncertainty should be increased if a communication partner has the ability to control the experience of rewards or costs. A communication partner who behaves in an unusual or deviant manner may also motivate uncertainty reduction, especially if that unpredictable partner cannot be avoided (→ Expectancy Violation).

Berger and Bradac (1982) elaborated on the methods people use to gather information about a target person. *Passive strategies* involve observing a person, preferably within situations where that person must be active or respond to the environment. *Active strategies* involve altering the physical or social context and observing a person's responses to that environment; this category also includes asking third parties for information about a target person. *Interactive strategies* involve gathering information by communicating directly with the target person.

## EMPIRICAL TESTS

Tests of uncertainty reduction theory have addressed three general issues. One line of inquiry is focused on *uncertainty reduction over the course of developing relationships* (→ Relationship Development). In general, people's confidence in their ability to predict a communication partner's attitudes and behaviors is positively correlated with various

measures of attraction (Berger 1987). Research summarized by Berger (1988) also indicates that the nature of uncertainty and uncertainty reduction changes as interactions and relationships progress. Within initial interactions, partners exchange demographic information that allows them to locate each other within social and cultural realms. Whereas the questions strangers ask each other focus on acquiring demographic background details, friends ask questions that elicit more evaluative and attitudinal information. Within romantic relationships, people might employ *secret tests* or covert activities that are designed to acquire information about the state of the relationship. In these ways, uncertainty is reduced about different issues as relationships develop.

Another line of inquiry has focused on the *factors that prompt uncertainty reduction*. A summary of this work highlights conflicting patterns of results (Berger 1997a). In studies that focused on behaviors after an initial real or hypothetical interaction, people did not increase their information-seeking efforts when they anticipated future interaction, had outcomes dependent on a partner, or the partner behaved in an unusual way. Other studies have shown that people communicating with a stranger engaged in more information seeking during the interaction when they expected future contact with that partner.

A third program of research has focused more closely on the *communication behaviors that people use to gather information during face-to-face interactions*. As summarized in Berger and Kellermann (1994), the first few moments of initial interactions are dominated by questions, the majority of which solicit information about the communication partner (→ Questions and Questioning). Another common information-gathering strategy is disclosing information to prompt a partner to make reciprocal disclosures (→ Disclosure in Interpersonal Communication). A third option involves putting the partner at ease to encourage him or her to share personal information. These information-seeking behaviors represent a tradeoff between the efficiency and appropriateness of uncertainty reduction efforts. At one extreme, interrogation offers an intrusive but efficient method of soliciting information from a target person. Self-disclosure is less efficient than question asking, because communication partners have to infer that reciprocal disclosures are desirable; however, the freedom afforded to the communication target makes this strategy more socially appropriate. Finally, relaxing a conversational partner involves highly appropriate behaviors, but it is an inefficient method of gathering specific information.

## THEORETICAL DEVELOPMENTS

Since its debut, uncertainty reduction theory has been the subject of considerable scholarly debate. One critical question focuses on uncertainty reduction as a motivating force in interpersonal interactions. For example, Sunnafrank (1986) argued that communication in initial interactions is motivated by a desire to predict the potential rewards and costs of continued interaction, rather than a desire to reduce uncertainty. Brashers (2001) argued that people may prefer to maintain uncertainty if the information they might gain is threatening (→ Uncertainty Management). Similarly, Baxter and Montgomery (1996) suggested that uncertainty is both desirable and undesirable in the context of ongoing personal relationships (→ Relational Dialectics).

The central role of uncertainty in interpersonal interactions was elaborated by locating uncertainty within a plan-based model of strategic communication (→ Message Production).

In particular, Berger (1997a, b) suggested that communication unfolds as people enact plans, which are mental representations of the steps required to achieve a goal (→ Goals, Cognitive Aspects of). Plans are hierarchically organized, such that an overall strategy is broken into more specific steps that, in turn, identify specific actions (→ Schemas, Knowledge Structures, and Social Interaction).

Berger (1997a) highlighted how making sense of a communication partner's behavior requires inferences about that person's beliefs, affective states, goals, and plans. Every interaction involves incomplete knowledge about a partner's state of mind; therefore, uncertainty is always relevant to interpersonal communication. Accordingly, people cope with uncertainty by seeking to reduce it and by creating communication plans that accommodate these unknowns. As noted by Berger (1997b), uncertainty complicates planning because people lack necessary information about the context for interaction, their partner's behavior, and their own actions. By this logic, uncertainty reduction is a necessary part of forming and executing communication plans.

## APPLICATIONS AND EXTENSIONS

Although uncertainty reduction theory was initially formulated and tested within the context of initial interactions between strangers, it has been widely applied to various communication situations. For example, uncertainty reduction theory has been used to illuminate the experiences of new employees (→ Organizational Assimilation), doctors and patients (→ Doctor–Patient Talk), students in a classroom setting, television viewers (→ Parasocial Interactions and Relationships), computer-mediated communication partners, and members of newly formed stepfamilies. The theory has also contributed to alternative perspectives on uncertainty and communication, such as predicted outcome value theory (Sunnafrank 1986) and uncertainty management theory (Brashers 2001).

One extension of uncertainty reduction is focused on *explaining intercultural communication experiences* (→ Anxiety Uncertainty Management Theory). According to Gudykunst (2005), people have a maximum and a minimum threshold for uncertainty and anxiety during interpersonal exchanges. When uncertainty is between the two thresholds, people feel comfortable because they have confidence in their predictions about the other person's attitudes and beliefs, but they are not overconfident. Similarly, a moderate level of anxiety keeps people engaged in an interaction, but not overwhelmed by fear.

Another extension of the theory has focused on the doubts and questions people experience within *romantic relationships* (→ Relational Uncertainty). The *relational turbulence model* specifies that changes in intimacy within romantic relationships spark relational uncertainty, defined as questions or doubts about the nature of involvement in a relationship (Solomon & Knobloch 2004). Although relational uncertainty polarizes emotional, cognitive, and communicative reactions to relationship events, reducing uncertainty and managing those events promote intimacy between relationship partners.

## **Underdog Effect**

*Rüdiger Schmitt-Beck*

*University of Duisburg-Essen*

The underdog effect is a phenomenon of → public opinion impinging upon itself: when at an election voters perceive a particular party or candidate to be the likely winner, they tend to support a competitor who is expected to lose – an “underdog” in the race. This

implies that apparent success may undermine itself. The origin of the term is unclear, although it is sometimes claimed that it was first used at the 1948 US presidential election. Simon (1954) was the first to use it in a scientific analysis.

The underdog effect is one of several hypothesized manifestations of “impersonal influence” – effects on individuals’ attitudes, beliefs, or behaviors that derive from these persons’ impressions about the attitudes, beliefs, or behaviors of collectives of anonymous others outside the realm of their personal contacts (Mutz 1998; → Social Perception: Impersonal Impact). Other examples are the → “bandwagon effect,” complementing the underdog effect by assuming a positive impact of perceived majority opinion, and the notion of “strategic” or “tactical” voting, which expects electors to refrain from choosing their candidate or party of first preference if they perceive it to be only weakly supported by others, in order not to waste their vote (→ Perceived Reality as a Communication Process).

In the literature, the underdog effect is typically treated as a companion to the bandwagon effect, emerging from the same cause, but leading to a contrary consequence: “If persons are more likely to vote for a candidate when they expect him to win than when they expect him to lose, we have a ‘bandwagon’ effect; if the opposite holds, we have an ‘underdog’ effect” (Simon 1954, 246). However, the implications of this understanding are only clear in the case of two-party systems: turning away from the likely winner automatically implies supporting its sole, apparently losing competitor, as there are no other alternatives left. In multiparty systems it is somewhat ambiguous what the underdog effect might consist in, as voters are faced with several “underdogs” of which not necessarily all are getting weaker if the likely winner is surging, and from which they can only choose one. Under these more complex circumstances, the notion implies the expectation that the anticipated winner of an election will lose votes, but entails no assumption about who will profit from this. It therefore appears appropriate to characterize the underdog effect as an “anti-bandwagon effect” (Irwin & Van Holsteyn 2000).

The media are the main source of information on preference distributions among the citizenry at large (Mutz 1998). Published findings from public opinion polls are an important type of such mass feedback, although not the only one (→ Election Polls and Forecasts; Polls and the Media; Public Opinion Polling). Because of the pervasive trend toward “horse-race journalism,” the question of who is ahead and who is trailing behind is ascribed high → news value in modern election coverage (→ Horse Race Coverage; Election Campaign Communication). Accordingly, journalists and politicians have also become key sources of mediated statements about the mass public’s political sympathies (→ Political Persuasion). Stylistic devices like exemplars or man-in-the-street interviews help journalists to convey impressions of where the public stands regarding candidates or parties prior to elections (→ Exemplification and Exemplars, Effects of).

As reporting on public opinion is thus a multifaceted phenomenon, the quality of the information on which citizens base their impressions is critically relevant. Many studies indicate that media audiences are not sufficiently capable to distinguish between sources of valid information, such as well-conducted polls, and sources of dubious significance. Audiences may thus fall victim to → “pluralistic ignorance,” deriving preferences from impressions about the opinions of their fellow citizens that are actually wrong.

Among social scientists, the underdog effect has attracted less interest than its complement, the bandwagon effect. The empirical evidence indicating that underdog effects are real is far weaker. Few studies were so far able to present findings that suggest the operation of underdog effects (Fleitas 1971; Ceci & Kain 1982; Lavrakas et al. 1991). Matching this rather unsatisfactory state of research is the weak theoretical underpinning that has been developed to make the notion of underdog effects plausible. Sometimes they are depicted as rather irrational emotional responses to a party's or candidate's seeming dominance, emerging out of feelings of pity or compassion for apparent losers or of defiance toward apparent winners (→ Emotion). More rational interpretations propose a dislike of large majorities or an anti-establishment bias on the part of voters as motives for supporting minority competitors. More convincing and less ad hoc is a model offered by Mutz (1998), which also accounts for the reasons why the same distribution of public opinion may lead to an underdog effect among some voters, and to a bandwagon effect among others. According to this view, the former is the likely response of voters who are politically involved and strongly committed to a party or candidate that seems to be losing. Among such individuals, the observation of a disadvantageous distribution of support may trigger a "cognitive response mechanism," stimulating them to think up counterarguments, and making them thus highly aware of the necessity of supporting their own camp.

# Underground Press

Chris Atton

Napier University

The “underground press” typically refers to those → newspapers and → magazines produced by the counterculture that emerged in the mid-1960s and continued until the early 1970s. The counterculture was concerned with establishing an alternative society in direct opposition to mainstream society. The underground press became a vehicle for the elaboration of this ideal, along with social issues such as women’s rights, ecology, and racial equality, and was politicized primarily by the US involvement in the Vietnam War. The aim of the underground press was to build a society where “culture and society were regarded as one” (Nelson 1989, 49), and to propose norms and values that broke with “straight” society absolutely. Interventions by the state were of particular concern, especially in areas of sexual freedom, drugs, and press → censorship (→ Activist Media).

Precursors of the underground press include independent papers such as the New York-based *Village Voice* (founded in 1955) and Paul Krassner’s the *Realist* (1958). However, three other US titles – the *Los Angeles Free Press* (1964), the *Berkeley Barb* (1964), and the *East Village Other* (1965) – began the underground press of the 1960s. The first underground paper in the UK was *International Times* (founded in 1966 and known as *IT* after the threat of legal action by the *London Times*), followed by *Oz* in 1967. The underground press was typified by its metropolitan locations, which restricted its geographical range; none had regional correspondents; foreign correspondents were absent. Its writers came from the counterculture itself; they were resolutely anti-professional, autodidacts of journalism and of methods of production.

Examples also come from other countries. Western Europe boasted titles in such cities as Amsterdam (*Real Free Press*), Brussels (*Amenophis*), and Paris (*Actuel*). There was a thriving underground press in Canada and in parts of Latin America, such as Argentina (*Contracultura*), Cuba (*Direct from Cuba*), Mexico (*Bohemia*), and Uruguay (*Huevas del Plata*).

While the underground press prided itself on its independence and individualism, it equally valued solidarity and cooperation. In 1967 the *Underground Press Syndicate* was established in the US to promote the underground press; meetings and conferences were held to discuss strategy, fundraising, and distribution. The Liberation News Service was intended as an underground, international press agency, which at least enabled local papers to access content from other cities. The underground press was in general less interested in hard → news; it preferred comment and opinion, theory and strategy, to objectivity and investigation (→ Objectivity in Reporting). Its writers and readers treated it as a “fifth estate,” directly challenging the → fourth estate of the mass media in its content, style, and organization.

The primary *method of finance* was through voluntary, “self-exploited” labor. This extended to technical skills such as typesetting and layout, and accounts in part for the visual experimentation found in many titles. Perhaps the most significant innovation in the underground press was the use of offset litho printing. A paper could be laid out and

pasted up by amateurs; typesetting could be done on a typewriter. It would be many years before the mass newspaper industry moved from hot metal to offset; for the underground press, this new method gave it the freedom to experiment creatively and to be independent of at least one part of the printing industry.

The underground press had little or no presence in high-street shops; its appearance and content made it almost impossible to find commercial distribution. Though limited largely to independent retailers and university campuses, circulation for the more established titles was very healthy. There are *no independent audits of circulation*, but claims from the papers themselves suggest significant peaks among established titles in the US of up to 95,000. The Underground Press Syndicate estimated a peak total circulation in the US of 4.5 million copies across 500 titles (Peck 1985, 183). In the UK, *Oz* claimed a circulation of 40,000 in 1970.

The independence of the underground press manifested itself in experiments with internal organization. Richard Neville, founding editor of *Oz*, emphasized the individualism of its contributors: “each reporter is, in a sense, his own editorialist” (cited in Nelson 1989, 47). The absence of editorial direction led to democratic participation in the organization of the underground press: many established workers’ cooperatives; some experimented with collective organization and with anarchist decision-making.

By the early 1970s the counterculture was in disarray. In the US, an underground press conference in Colorado in 1973 formally declared the renaming of the Underground Press Syndicate as the Alternative Press Syndicate. The underground press was formally at an end. Its music writers were the source of “what became the dominant ideology of rock” (Frith 1983, 169) and became crucial in the development of rock journalism (→ Popular Music). The vision of a “fifth estate” has been developed through an international alternative media and in struggles for media democracy through grassroots publications (→ Alternative Journalism; Grassroots Media; Media Democracy).

# UNESCO

*Andrew Calabrese*

*University of Colorado at Boulder*

UNESCO – the United Nations Educational, Scientific, and Cultural Organization – is a specialized UN agency, founded in 1945, and composed of 192 member states. Its headquarters are in Paris, where member states maintain delegations headed by a person with diplomatic status, typically with the rank of ambassador. UNESCO also has more than 50 field offices around the world. The preamble to the UNESCO constitution emphasizes the importance of the organization’s mission of peace through intellectual and cultural development and exchange, stating that “since wars begin in the minds of men, it is in the minds of men that the defences of peace must be constructed” (UNESCO 1945). The UNESCO constitution further states that the organization’s purpose is “to contribute to peace and security by promoting collaboration among the nations through education, science and culture in order to further universal respect for justice, for the rule of law and for the human rights and fundamental freedoms which are affirmed for the peoples of the world, without distinction of race, sex, language or religion, by the Charter of the United Nations.” For the 2006–2007 biennium, UNESCO had a budget appropriation of US\$610 million, with an additional US\$409 million in “extra-budgetary resources” (additional funds from sources other than member states’ assessed contributions), for a total budget of US\$1.02 billion for the two-year period.

## RELEVANCE FOR COMMUNICATION

The main program sectors of UNESCO are Education, Natural Sciences, Social and Human Sciences, Culture, and Communication and Information. As well, UNESCO has a variety of “mainstreaming” themes, which promote particular goals, including gender equality, youth action and integration, meeting special needs in Africa, dialogue among civilizations, and a worldwide culture of peace; and it also has “cross-cutting” themes, namely the eradication of extreme poverty, and the uses of information and communication technologies for the advancement of education, science, culture, and communication. UNESCO has programs that focus on promoting universal education and literacy, exploring the long-term impact of global climate change and ways to mitigate negative impacts on the world’s water resources, promoting sustainable global resource development, addressing ethical issues in scientific research and technological development, and working to promote and sustain worldwide cultural diversity.

UNESCO has special significance for communication scholars, particularly through the Culture sector and that on Communication and Information. In 2005, under the leadership of the Culture sector, the organization adopted a “*Convention on the Protection and Promotion of the Diversity of Cultural Expressions*,” which had been ratified by 52 countries and the European Union by March 2007, when it entered into force. The convention aims “to protect and promote the diversity of cultural expressions,” and it emphasizes the unique nature of cultural goods and services as “vehicles of identity,

values and meaning” (UNESCO 2005). Another function of the Culture sector is to identify “cultural and natural properties,” both tangible (specific sites and artifacts) and intangible (e.g., languages, oral histories, “living human treasures”), that are “of outstanding universal value,” place them on the “World Heritage List,” monitor their conservation, and respond to requests for assistance. The Culture sector also works to promote cultural exchange through modern → “culture industries,” including publishing, music, audiovisual technology, electronics, → video games and the → Internet, focusing particularly on freedom of expression (→ Freedom of Communication), cultural diversity, and economic development. UNESCO emphasizes the significant imbalances between cultural exports from the global north and south, and seeks to assist the latter by aiding in the development of local capacities and access to global markets. The Culture sector also emphasizes indigenous art and → design, literature and poetry, art education, → museum preservation and exhibition, and cultural tourism that is respectful of the physical environment and the cultures of others (→ Culture: Definitions and Concepts).

## STRUCTURE

The current structure of the Communication and Information (CI) sector, consisting of the Communication and Development Division, the Division for Freedom of Expression, Democracy and Peace, and the Information Society Division, was established in 1990. The CI sector’s strategic objectives are to promote the free flow of ideas and universal access to information (→ Freedom of Information), promote pluralism (→ Plurality) and cultural diversity through the means of communication, and promote universal access to information and communication technologies (→ Communication Technology and Democracy). Through extra-budgetary funding, the CI sector pursues interregional, regional, and national projects in Africa, the Arab states, Asia, the Pacific, Latin America, and the Caribbean.

The CI sector collaborates with other UN and bilateral agencies and with various non-governmental organizations, and it provides secretariats for the International Programme for the Development of Communication (IPDC) and the Information for All Programme (IFAP). Included among the general initiatives led by the CI sector are efforts to remove barriers to women’s access to information and communication technologies (ICTs) and explore ways in which ICTs can be used to address gender issues, the promotion of linguistic diversity on the Internet, projects to preserve cultural memory and heritage, support for libraries and archives, support for programs aimed at HIV/AIDS awareness and prevention, projects that encourage uses of ICTs for the production of cultural content by indigenous groups, and various other programs aimed at capacity building, advancing literacy, and working to eradicate a north–south → digital divide.

In monitoring these activities and many others that UNESCO does not directly influence, the CI sector hosts an “*Observatory on the Information Society*,” established in 1997. The Observatory provides reports, statistical data, and other resources in fulfillment of its mandate to operate a “permanent international monitoring mechanism” (UNESCO 2007) that focuses on ethical, legal, socio-cultural, and policy challenges in advancing a global information society. The CI sector also is active in promoting freedom of expression

through its annual World Press Freedom Day and its annual Guillermo Cano Press Freedom Prize.

## POLITICAL CONTROVERSIES

For many years, UNESCO was at the center of tense relations between the United States and the UN system. In the early 1980s, US-based critics of UNESCO, particularly members of such conservative US think tanks as the Heritage Foundation, advocated US withdrawal if UNESCO did not comply with US demands. Among the most significant criticisms were that UNESCO was mismanaged and top-heavy with a highly paid administrative staff. More importantly, the US critics of UNESCO considered the organization to be heavily “politicized,” i.e., anti-western and anti-American. Among the issues highlighted were the organization’s positions on US foreign policy. US-based critics took offense at UNESCO’s condemnation of Israeli archaeological excavations in occupied Palestinian territories, and of Israeli education and cultural policies in the occupied territories.

There also was significant criticism by several countries about the majority call by UNESCO members for a → “new world information and communication order” (NWICO), which was articulated in Belgrade in 1980 at the twenty-first UNESCO general conference. In that same year, UNESCO’s International Commission for the Study of Communication Problems published a report, titled *Many voices, one world* (see MacBride Commission 2004), more commonly known as the MacBride Report after the commission’s president Nobel Peace Prize laureate, Sean MacBride. The postcolonial and Cold War context of these developments placed UNESCO in the awkward position of having to negotiate among ideological and material differences between east and west, and between north and south.

Both the NWICO resolution and the MacBride Report highlighted many issues that continue to define the north–south divide related to communication and information. The fact that the causes of some of the most serious media-related problems had been identified with practices by US transnational media institutions and policies (→ Media Conglomerates; Globalization of the Media) led to a defensive posture by the US government and US media corporations. In December of 1983, Reagan administration secretary of state George Schultz explained in a letter to UNESCO director-general Amadou-Mahtar M’Bow the reasons for the US withdrawal. Equal emphasis was given to issues of mismanagement and “the injection of political goals beyond the scope of the cooperative enterprise” (Schultz 1984, 84).

## REFORMS

The effects on UNESCO of the US withdrawal were significant, as the US was a major financial contributor to its budget. The withdrawal appeared to critics to send a message to the UN system as a whole regarding official US distaste for multilateralism as a way of resolving its disputed foreign policies. The US withdrawal was soon followed by the withdrawal of the United Kingdom and Singapore, which further eroded the budget.

In 1997, the UK rejoined UNESCO, and the organization underwent significant reforms under director-general Koïchiro Matsuura, whose term began in 1999. Administrative

costs were cut by US\$10 million, the number of high-level posts was halved, and an “Internal Oversight Service” was created to perform audits, investigations, program management, and evaluations of headquarters and field offices. In 2003, in response, the US rejoined UNESCO. However, there remained tensions, evident in the 2005 conflict over the adoption of the above-mentioned “Convention on the Protection and Promotion of the Diversity of Cultural Expressions.” The agreement obligated the states ratifying it “to give recognition to the distinctive nature of cultural activities, goods and services as vehicles of identity, values and meaning,” and “to reaffirm the sovereign rights of States to maintain, adopt and implement policies and measures that they deem appropriate for the protection and promotion of the diversity of cultural expressions on their territory” (UNESCO 2005, Article 1).

This language, which upholds the idea of a “cultural exception” (→ Cultural Products as Tradable Services), ran counter to the US position, which favored placing the culture industries under the discipline of global trade agreements, like other goods and services. Critics of the US position noted that the US government once favored a cultural exception within UNESCO and pointed to the fact that the US is a signatory to the 1950 “Florence Agreement,” which explicitly enables contracting states “to prohibit or limit the importation, or the circulation after importation,” of cultural materials “on grounds relating directly to national security, public order or public morals” (UNESCO 1950, Article V). Of course, what constitutes “national security, public order or public morals” is subject to wide interpretation, but in fact the official rationale for establishing the US National Endowment for the Arts was expressed in terms of national interest.

UNESCO is not the only UN agency addressing communication and cultural issues. Some of UNESCO’s activities overlap with or complement the work of the United Nations Development Programme (UNDP) and the International Telecommunications Union (ITU). The ITU, a UN agency that has mainly served to recommend technical standards, allocate broadcasting frequencies, and coordinate the geostationary positions for communications satellites, came into much higher prominence when it was resolved at the 2002 UN general assembly that the ITU would host the UN World Summit on the Information Society (WSIS). The UN resolution emphasized “the urgent need to harness the potential of knowledge and technology for promoting the goals of the United Nations Millennium Declaration and to find effective and innovative ways to put this potential at the service of development for all” (UN 2001). The UN general assembly’s choice to assign this role to the ITU rather than UNESCO seemed inconsistent with the fact that a primary focus of the discourse at the summit was on social and cultural matters that fall more closely within the UNESCO sphere. Nevertheless, the summit proceeded and was convened in two phases, in Geneva in 2003 and in Tunis in 2005. UNESCO and other UN agencies became parties to the WSIS and led in implementing various “action lines” that resulted from the WSIS. Based on the Geneva “Plan of Action,” UNESCO’s WSIS follow-up responsibilities include developing programs and projects aimed at access to information and knowledge, “e-learning,” “e-science,” cultural and linguistic diversity, various goals related to mass media (in industries, policies, technologies, and content), reinforcing ethical dimensions of the information society, and participating in UN efforts to foster international and regional cooperation through the uses of ICTs.

## **United Kingdom: Media System**

*Dominic Wring*

*Loughborough University*

The United Kingdom of Great Britain and Northern Ireland (population 58.8 million; 2001 census) dates from the treaty that ceded an independent Irish Free State in 1921. This had followed on from the 1918 general elections, the first under near-universal suffrage, which had seen a rise in support for separatists in Ireland and the youthful Labour party in other parts of the country. Within a generation, Labour had replaced the Liberals as the principal opposition to the Conservatives. The immediate post-World War

If Labour government embarked on a major program of social reform, but changes to the famously unwritten Britain constitution were less forthcoming.

Significant modifications did, however, take place at the end of the twentieth century with the devolution of powers from London to a new Scottish Parliament and Welsh Assembly, and the re-establishment of a Northern Irish government. The UK's entry into the European Union has also brought significant change. Although the monarch remains the head of state, the hereditary principle has been challenged through the removal of several peers from the House of Lords, the upper chamber of the Westminster Parliament. England, the UK's most populous country, dominates the Union's politics and culture: though regional press and broadcasting flourished during the twentieth century, the most influential agenda-setting media are still those based in London.

### LEGAL FRAMEWORK

England was the first European country to abolish → censorship, conceding press freedom as early as 1695, when Parliament did not renew the Printing Act (→ Censorship, History of; Freedom of the Press, Concept of; Freedom of Communication). The media system is based on a hybrid model of ownership and control. Whereas the newspaper industry has long been dominated by privately owned firms, broadcasting operates on a more complex basis and under considerable influence from both state and market forces. For the half century before the introduction of near-universal suffrage in 1918, politicians appeared reluctant to challenge the power of the so-called “free press” and, more especially, the high-profile proprietors or “barons,” whose influence and circulations grew considerably during this period. Subsequent leaders have proved similarly disinclined to act in any way that might be seen to threaten or otherwise antagonize successive generations of print media owners. However, by the time broadcasting, in the form of → radio and then → television, was introduced, the now popularly elected governments felt more empowered to intervene and regulate what they viewed as a potentially more powerful form of media communication.

For much of the twentieth century the government's supervisory function was discharged by the Home Office (i.e., the interior ministry). Periodically this led to tensions between the state and broadcast media, notably over the often fraught and violent politics of Northern Ireland. In 1988, for instance, the Home Secretary actually banned the voice of a separatist party's Member of Parliament from the airwaves; the restrictions were eventually lifted in 1994 following political progress. It should be noted that the last two decades have seen a significant shift of policy emphasis from enforcing domestic regulations toward encouraging global competitiveness. Consequently government responsibility for the sector has been progressively assigned to the departments of state responsible for culture and trade. Much has been said about the importance and contribution of the so-called creative and media industries to the economy and status of the UK.

The government's 2003 Communication Bill created the current regulator Ofcom through the merger of several existing bodies responsible for supervising a range of media including most broadcasting. The early years of the twenty-first century also saw significant reform of the peculiar governance of the *British Broadcasting Corporation* (→ BBC), with the introduction of a new Trust to monitor the work of the Corporation in place of the

Board of Governors. The Board's ambiguous and potentially conflicting responsibility for both championing and overseeing its charge was highlighted during the notoriously fraught aftermath of the government-sanctioned Hutton report in 2004. The document sharply rebuked the Corporation for defending a journalist who had challenged the integrity of the prime minister's claims in support of the hugely contentious invasion of Iraq in 2003. This led to the unprecedented resignations of both the BBC chairman and director-general, and an apology to the government from the Corporation's temporary management team. The broadcasters' new leadership subsequently embarked on a successful mission to assure the BBC Charter was renewed. They did not, however, achieve their desired goal of convincing the government to raise their income stream by increasing the UK license fee (approximately 200 euros payable annually, at 2007 prices), which every household with a television must pay regardless of whether they use BBC services.

Aside from its statutory influence over the BBC and the similarly chartered Channel 4, the state exerts considerable influence over the commercial side of the market through a licensing system that permits broadcasters to operate. By contrast, the print media are free from similar impositions on their right to exist, not to mention what they publish. Newspapers do, however, face pressures of other kinds, including market forces and a requirement to observe common laws governing libel and defamation that apply to every organization and individual. Press proprietors have long campaigned against statutory government controls, notably through the Press Council, which was relaunched as the Press Complaints Commission in 1990 (→ Accountability of the Media). The PPC is a self-regulatory body made up of senior industry figures that adjudicates on cases brought to it by various aggrieved parties. Its perceived reluctance to censure journalists has led critics to call for government legislation to protect the public, particularly over alleged invasions of privacy by press reporters.

## PRINTED PRESS

Though *The Times* dates back to 1788, the modern newspaper industry only began to develop rapidly during the mid-nineteenth century, an era when politicians appeared willing and able to move against what they regarded as subversive outlets such as the *Red Republican* and *Black Dwarf* (→ Penny Press). The sustainability of these and other popular anti-establishment titles was challenged by the introduction of taxes and duties. Monetary levies of this kind encouraged the increased commercialization of the sector by more conventionally minded businessmen. The space for radical journalism rapidly diminished, to be replaced by other content including more advertising (Curran & Seaton 2003). Marketing revenues were reinforced by the growth of mass literacy in the late nineteenth century, which enabled "press barons" such as the Harmsworth brothers to exert considerable public influence based on their newspaper's growing sales and popularity. The close relationship between the media and political elites was graphically illustrated during World War I when two of the major newspaper proprietors actually worked for the government as propaganda ministers.

The early twentieth century saw considerable "vertical" integration within the print media sector, with smaller family-owned publishers closing, merging, or being taken over by larger firms. Consequently a small group of proprietors consolidated their position

and made it increasingly difficult for new entrants into the newspaper market. These press barons promoted a largely conservative if not Conservative agenda through vehicles like the *Daily Express* and *Daily Mail* and were hostile toward the growing Labour party, whose only reliable mass media support came from the *Daily Herald*. Despite its massive circulation of 2 million by 1933, the *Herald* was not as financially secure as its main rivals because, by comparison, it never attracted sufficient middle-class readers and the advertising revenues that came with them. Consequently the press barons' political and commercial strategies mutually reinforced one another, whereas the healthy sales generated among its largely working-class audience were insufficient to prevent the eventual closure of the *Daily Herald* and its reinvention as the *Sun* in 1964.

By the end of the 1960s the *Sun* had been acquired and relaunched by Rupert Murdoch, an owner destined to become the most influential proprietor over the next three decades through what would become the bestselling daily newspaper and its Sunday sister, the *News of the World* (→ Media Conglomerates; News Corporation). Both papers became leading exponents of an irreverent, bombastic, and intrusive "tabloid" media culture that became increasingly dominant. Murdoch's vociferous support for Conservative (Tory) prime minister Margaret Thatcher eased his potentially controversial takeover of *The Times* and *Sunday Times* in the early 1980s, and all four of his titles became a cornerstone of the so-called "Tory press" (i.e., *Daily Express*, *Financial Times*, *Daily Mail*, *Daily Star*, *Daily Telegraph*, *The Times*, *Sun*, and their Sunday equivalents). The proprietor was keen to maintain his reputation as a major political actor in Britain, and in the mid-1990s his newspapers abandoned their once vociferous denunciation of Labour and thereby prepared the way for the *Sun* and then *The Times* to switch allegiance to Labour leader Tony Blair. That said, Murdoch's titles have remained more consistent in their support for a socially and morally right-wing agenda that is often indistinguishable from the stance of still Conservative newspapers like the *Daily Telegraph*, *Daily Mail*, and *Daily Express*.

Advertising continues to play a major role in shaping the print media market and insuring the profitability of newspapers, particularly those belonging to the so-called "quality" press (*Daily Telegraph*, *Financial Times*, *Guardian*, *Independent*, and *The Times*). These titles usually sell fewer copies than their populist, tabloid rivals, but their appeal to an audience largely comprised of more formally educated and wealthy opinion formers has ensured their marketing space remains a lucrative source of revenue (→ Tabloid Press). Fierce competition for sales and advertising has meant an already declining UK print media market remains highly competitive, with 10 national daily newspapers and serious barriers to new entrants. The total daily circulation of the national press was 11.1 million in 2004. The Sunday papers have a strong position with a total circulation of 12.8 million, with the *News of the World* leading with 3.5 million. With a circulation of 330 copies per 1,000 inhabitants, the UK is by international comparison a well-saturated press market.

Nevertheless press circulation is diminishing, particularly that of the tabloids, a trend exacerbated by major growth in rival news sources such as celebrity magazines, digital television, and the Internet. The best-selling *Sun*, for instance, now sells 3 million rather than the 4 million copies it did 20 years ago, and this is one of the more modest losses. Over the longer term this arguably weakens the perceived political influence of major national newspapers. It is also a reason why the industry has witnessed so much "horizontal"

integration, with newspaper owners seeking to expand their businesses into other areas including the new media sector.

Some national proprietors, such as Associated Press, have also maintained a significant shareholding interest in local newspapers, which continue to command significant and loyal readerships (e.g., *Liverpool Echo*, *Leicester Mercury*, *Eastern Daily Press*, *Yorkshire Post*, *Birmingham Mail*, and various Scottish titles). While the London market has seen a decline in titles serving particular boroughs, two new capital-wide freesheets, the *London Paper* and *London Lite*, have recently appeared in an aggressive battle for advertising revenue between News International and Daily Mail and General Trust (DMGT), which also owns the city's long-established *Evening Standard*, now under pressure.

### RADIO AND TELEVISION

The BBC was originally set up as a private company in 1922 but by 1927 it had been brought under government supervision and turned into a public corporation (→ Public Broadcasting, History of; Public Broadcasting Systems). The BBC was granted a license to operate courtesy of a periodically renewable contract, the Charter, and was overseen by a government-appointed Board of Governors. The new Corporation's radio broadcasting adhered to a so-called "public service model" that promoted the virtues of impartial reporting, especially in partisan matters; as the Corporation's hugely influential first director-general, John Reith, put it, his BBC would and should seek "to inform, educate and entertain" (Curran & Seaton 2003). Limited experimentation with television began the following decade, but it was not until the 1950s that television superseded radio as the most popular medium. The coronation of Queen Elizabeth II in 1953 promoted the BBC service, as did the introduction of an advertising-funded *Independent Television* channel (ITV) in 1955 (→ Privatization of the Media). By the end of the decade over 70 percent of British households had a set, on which they were able to enjoy the more explicitly entertainment-based ITV.

Though ITV was a wholly commercially funded venture, the government's regulatory authority required the channel to adhere to certain public service expectations. Significantly, the independent network consisted of 15 franchisees, each based in one of the UK regions, and this originally gave it a distinctive, more localized identity. The BBC too became more consciously diverse, developing a strong network of regional radio stations and television news production facilities. Challenges also came in other guises, notably from illegal broadcasters, among them the hugely popular music channels such as Radio Caroline that operated from ships situated outside of the UK jurisdiction. In response the BBC launched the youth-oriented Radio 1 in 1967, and, like the more middle-aged BBC Radio 2 launched in the same year, it became a huge success. These and other Corporation stations devoted to sport, talk, and the regions continue to shape and dominate the market, with 57 percent audience share in early 2007 (RAJAR 2007; → Radio Broadcasting, Regulation of).

The 1970s saw the introduction of largely locally based commercial radio broadcasters, and this has since been supplemented by national operations including *Virgin*, *TalkSport*, and *Classic FM*. Non-BBC radio stations account for just over 42 percent audience share (RAJAR 2007). Television also expanded in response to social change with the launch of

the more experimental BBC 2 in 1964. The sector gained a further outlet with the setting up of the publicly owned but wholly self-funded *Channel 4* in 1982. By the time the commercial *Channel 5*, a station owned by the RTL group and highly reliant on US imports, was introduced in 1997, attention and audiences were increasingly switching away from traditional terrestrial broadcasters to new digitally based channels. The former market leader, ITV, has found it particularly difficult to compete in the new environment and has suffered a loss of advertising revenue. A consequence has been the merger of the various companies holding its franchises into two groups, Carlton and Granada, by 2001 before the eventual unification of the company into a single ITV plc in 2004 (→ Television Broadcasting, Regulation of).

### NEW MEDIA AND THE INTERNET

Non-terrestrial television began during the 1980s with the launch of the rival British Satellite Broadcasting and Sky services (→ Satellite Television). The former was dogged by problems and was eventually acquired by Rupert Murdoch, the latter's owner, after Margaret Thatcher's government had signaled it would not intervene to prevent the merger on competition grounds. The merged B SkyB consolidated and exploited its monopoly position by launching an audacious, expensive, and ultimately successful bid for the exclusive rights to broadcast English premiership football matches and major → Hollywood films. The gamble paid off as demand for the satellite service rapidly grew. Rival non-terrestrial networks have struggled to compete and have only begun to challenge in anticipation of the nationwide switchover to digital planned by the government for 2012.

The non-subscription Freeview digital service has proved particularly effective in promoting the traditional broadcasters' expansion into multichannel television since it began in 2002. Prior to that, ITV Digital had tried to challenge B SkyB's virtual monopoly of this market, but problems with content and technology caused the spectacular collapse of the venture. By contrast, the relatively inexpensive Freeview set-top box needed to access the digital service helped launch channels BBC 3 and 4, ITV 3 and 4, More4, and 5Life, alongside a huge range of other interactive services. The market remains in flux, the latest change at the time of writing being B SkyB's audacious purchase of a sizable minority stake of 17.9 percent in ITV. Broadcast content as well as ownership is also likely to continue to dramatically change in this fast-moving environment. Since its inception, the 24-hour Sky News channel has been obliged to adhere to strict public service guidelines on balance and impartiality. Officials belonging to regulator Ofcom have begun to speculate whether these regulations could or should be relaxed, giving rise to the possibility of News Corporation's British service developing a more distinctively partisan approach in the style of its US sister Fox News.

Alongside the take-up of digital television by 65 percent of UK households (in 2005/6), there has also been a rapid expansion in access to the Internet. In 1998, less than 10 percent of households had online access, by 2006, this had risen to 57 percent. Traditional media organizations have been particularly proactive in developing their online presence, and the BBC and Guardian Unlimited boast two of the most visited news sites, attracting significant traffic from outside as well as within the UK. Here it should be borne in mind that the total retail revenue value of the UK communications market was 85 billion euros

in 2005, and that television's share of this reached 17.8 billion and radio's 2 billion. The lucrative telecommunications sector accounted for the rest. This is partly explained by the rapid uptake of mobile telephones, to the extent that by 2006 they accounted for 31 percent of all call minutes, compared with 20 percent in 2001 (Ofcom 2007).

It is clear from the above sketch that the British media market has undergone considerable change during the last two decades. The fragmentation of UK audiences has been encouraged by the more ready availability of the Internet, DVDs, MP3 players, and computer games, not to mention the myriad of new digital channels. However, it is important to state that while traditional newspapers and broadcasters have lost audiences, they nevertheless remain at the center of debate and even of the national psyche. For the foreseeable future, the current major providers will continue to shape and influence developments in the UK, although it remains to be seen how and whether the aggressive media empire headed by Rupert Murdoch and his son James will undermine the position of the BBC as the "voice of the nation."

# United Nations, Communication Policies of

*Emmanuel Derieux*

*University of Paris II*

Although great importance is not always attached to the political, economical, social, or cultural role of communication activities, their influence on international relations certainly has not escaped the concern of the United Nations (UN). No matter what its limitations are, international law is not only formal but also symbolic. Further, it has a moral or diplomatic value and, albeit weak, a legal value through international conventions. The UN draws up certain essential general principles for communication. It also provides a framework on which specialized institutions are established to formulate various global communication policies.

## GENERAL PRINCIPLES

The general principles of the UN communication policies are found in the Charter of the United Nations, although the Charter does not explicitly refer to them. They are enumerated in the Universal Declaration of Human Rights and in the International Covenants on Civil and Political Rights and on Economic, Social, and Cultural Rights.

### Universal Declaration of Human Rights

The Universal Declaration of Human Rights (UDHR) was adopted on December 10, 1948, as a “resolution” by the UN General Assembly. It recognizes the classic idea of freedom of expression, with both its necessary limits and, in a positive and concrete manner, certain rights including the possibility of demanding those rights, which constitutes, as it were, the basis or inspiration of national communication laws.

Freedom of expression is set forth in Article 19 of the UDHR: “Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media, regardless of frontiers” (→ Freedom of Communication; Freedom of Information). This Article does not mention necessary limits to freedom of speech and the press; the *limitations on free expression* are in Article 12, which states “No one shall be subjected to arbitrary interference with his privacy, family, home or correspondence, nor to attacks upon his honour and reputation. Everyone has the right to the protection of the law against such interference or attacks.” Its limiting impact on freedom of expression is bolstered by Article 29 of the UDHR. “In the exercise of his rights and freedoms,” Article 29 provides, “everyone shall only be subject to such limitations as determined by law and solely for the purpose of securing due recognition and respect for the rights and freedoms of others and of meeting the just requirements of morality, public order and general welfare in a democratic society.”

From a positive perspective on freedom of expression, the UDHR sets forth the right to information. Article 22 is illustrative: "Everyone . . . is entitled to the realisation . . . of the economic, social and cultural rights indispensable for his dignity and the free development of his personality." Article 27-1 is more specific: "everyone has the right to freely participate in the cultural life of the community." The UDHR guarantees → copyright and related rights by declaring that everyone has the right to protect "the moral and material interests" that are derived from their scientific, literary, or artistic production. As the UDHR has no true legal value as an instrument of enforcement, however, these human rights elements of freedom of expression are set out in two 1966 international covenants.

### **International Covenants on Civil and Political Rights and on Economic, Social, and Cultural Rights**

The differences between western Europe's individualistic idea of freedom, based on the idea of the state's abstention, and the more collective and interventionist approach to human rights of the eastern block led, in December 1966, to the establishment of two international covenants in order to strengthen the UDHR principles: one on civil and political rights, and the other on economic, social, and cultural rights.

Article 19 of the *International Covenant on Civil and Political Rights (ICCPR)* states that "everyone shall have the right to freedom of expression; this right shall include freedom to seek, receive and impart information and ideas of all kinds, regardless of frontiers." This freedom of expression under the ICCPR is not absolute but qualified. Article 19 notes that "the exercise of rights to freedom entails special duties and responsibilities." Hence, freedom of expression may be subject to certain restrictions, which "shall only be such as are provided by law and are necessary: (a) for respect of the rights or reputations of others; (b) for the protection of national security or of public order (ordre public), or of public health or morals." Freedom of expression is further balanced by various other competing interests such as right to privacy and reputational interests. The ICCPR recognizes individuals' right to protection against unlawful invasion of their privacy and against injury to their reputations. The ICCPR forbids → war propaganda. It further proscribes hate speech that incites national, racial, or religious animosity against others (→ Hate Speech and Ethnophaulisms).

The *International Covenant on Economic, Social, and Cultural Rights (ICESCR)* stands in sharp contrast to the ICCPR in that it provides for a more positive and collective framework of human rights to communication. Article 15 stipulates that "the States party to the present Covenant recognise every individual's right: (a) to take part in cultural life . . . (b) to benefit from the protection of moral and material interests resulting from any scientific, literary or artistic production of which he is the author." It lists what member states must do in helping individuals to fully realize their right to free expression. The states must take actions to conserve, develop, and diffuse science while "respecting the freedom which is indispensable for scientific research and creative activity." This positive role of the government in making freedom of expression part of an individual's self-actualization for the good of society as a whole is intertwined with "the benefits to be derived from the encouragement and development of international contacts and co-operation in the scientific and cultural fields." Meanwhile, such international cooperation in the field

of communication among the nations is one of the main aims of specialized UN institutions.

## **SPECIALIZED INSTITUTIONS**

Several specialized UN institutions determine and implement a wide range of international communication policies. Among the most important and visible UN institutions relating to communication law and policy are the UN Educational, Scientific, and Cultural Organization (→ UNESCO) and the World Intellectual Property Organization (WIPO).

### **UNESCO**

UNESCO aims to promote peace and security by facilitating collaboration among the nations through education, science, and culture (→ Culture: Definitions and Concepts). It envisions its role in expanding the mutual knowledge and understanding of all peoples, through mass communication and by presenting “such international agreements as may be necessary to promote the free flow of ideas.” It was within the communication assistance framework of UNESCO that, in the 1970s, many “third world” countries, criticizing the one-way movement of information and TV programs from north to south, demanded, but did not succeed in obtaining, a → new world information and communication order (NWICO; → International Communication).

The UNESCO General Conference adopted, in October 2005, the *Convention on the Protection and Promotion of the Diversity of Cultural Expression*, hoping to give strength and legal value to the principles and aims underlying the Universal Declaration of Cultural Diversity. While emphasizing the importance of culture in providing social cohesion, UNESCO’s 2005 convention connected cultural diversity with the free flow of ideas. The Convention stressed that cultural diversity is “nurtured by constant exchanges and interaction between cultures” and that “freedom of thought, expression and information, as well as the diversity of the media, enables cultural expression to flourish within societies.” However, UNESCO’s cultural diversity convention pointed out that whereas globalization, through the rapidly developing information and communication technologies, creates unprecedented conditions for enhanced cultural interactions, it also poses a challenge for cultural diversity, associated with the real or imagined imbalance between the rich and poor countries (→ Communication Technology and Development).

In an effort to implement cultural diversity in information and communication, the 2005 UNESCO Convention recognizes the sovereign right of the states “to formulate and implement their cultural policies and to adopt measures to protect and promote the diversity of cultural expressions and to strengthen international cooperation. These national regulatory measures aim to encourage diversity of cultural expressions; allow domestic cultural industries genuine access to the means of production, dissemination and distribution of cultural activities, goods and services,” provide public financial assistance, and support public institutions.

Nevertheless, some are doubtful about the practical value of the UNESCO Convention on Cultural Diversity, even for the states which have ratified or will ratify it, when they are confronted with international economic agreements like those passed by the *World Trade*

*Organization (WTO)*. The WTO agreements are based on the principles of the free movement of goods and services and on guarantees of competition. Hence, albeit temporarily, they include a principle of “cultural exemption” to place various cultural activities outside the Convention’s application. In order to address this obvious conflict, the Convention characterizes cultural activities, goods, and services as being both economic and cultural because they convey identities, values, and meanings, and thus cannot be treated solely as commercial products or services.

Meanwhile, this UNESCO Convention recognizes the importance of intellectual property rights in protecting those who engage in cultural creativity (→ Intellectual Property Law). Intellectual property is one of UNESCO’s preferred domains. Indeed, it is UNESCO that, in 1952, adopted the Universal Copyright Convention, for which another UN institution has been set up.

## WIPO

WIPO is a UN agency which primarily concerns intellectual property issues, especially copyright and related rights. WIPO is responsible for enforcing the 1886 Berne Convention for the Protection of Literary and Artistic Works. This was the first international convention on copyright. In 1961, WIPO set up the International Convention for the Protection for Performers, Producers of Phonograms, and Broadcasting Organizations.

Two treaties were adopted to implement WIPO’s conventions in 1996: the WIPO Copyright Treaty and the WIPO Performances and Phonograms Treaty. Their purpose was to ensure the adaptation of rules to technical evolution in communication. The impact of the treaties on copyright protection as an issue, especially in the Internet era, is open to question.

## United States of America: Media System

†*Robert L. Stevenson*

*University of North Carolina at Chapel Hill*

*Glenn Scott*

*Elon University*

*Donald L. Shaw*

*University of North Carolina at Chapel Hill*

The United States of America, located in the northern hemisphere of the American continent, is a federal republic that consists of 50 states and the District of Columbia (capital: Washington). The population comprises 250.6 million people. The USA was created in 1776 out of 13 British colonies. The head of state is the president, and responsible for the legislation are two chambers, the House of Representatives and the Senate. The political system is dominated by two parties, the Democrats and the Republicans.

### HISTORICAL DEVELOPMENT

The first → newspaper published in the British North American colonies was *Publick Occurrences, Both Forreign and Domestick*. One issue appeared in 1690 in Boston. It was soon closed down by the colonial government. The first continuously published newspaper was the *Boston News-Letter*, which began publication in 1704 and continued for several decades. The oldest daily paper still publishing is the *Hartford Courant*, which was founded in 1764. Newspapers and especially pamphlets such as Thomas Paine's *Common Sense* played an active role in the movement for independence. Although it was ignored by many, the Stamp Act of 1765 required tax stamps to be purchased for a wide

range of documents, including newspapers. The controversy surrounding the act provided a rallying point for both supporters and opponents of independence and reinforced a style of → journalism that infused ideology into the news. After the war, newspapers grew rapidly along with the nation and became entwined with the political system (→ Newspaper, History of).

Partisan journalism (→ Partisan Press) remained the standard for most of the nineteenth century. The latter years of the century introduced two trends that are still visible in newspapers in many countries. Excessive competition between William Randolph Hearst and Joseph Pulitzer for dominance of the New York market led to → “yellow journalism” – named for a popular cartoon character – that resembles the current tabloid or popular press style (→ Tabloid Press). In contrast was the sober, non-partisan coverage pioneered by the *New York Times*. Adolph Ochs took over the financially ailing *Times* in 1896 and declared that it would publish “All the News That’s Fit to Print,” a slogan that still appears on the nameplate on page one. When Ochs died in 1935, the *Times* had become one of the most prestigious newspapers in the United States and one of the most influential in the world. Its reputation was founded on careful, fact-based reporting and a strong sense of social responsibility. According to scholar Joseph Campbell (2006), a third model of journalism, complementing the popular press of Hearst and Pulitzer and the nonpartisan professional *Times*, was a literary journalism promoted by Lincoln Steffens in the New York *Commercial Advertiser* that anticipated the intellectual emphasis still found in some elite publications.

## LEGAL FRAMEWORK

The simple statement guaranteeing press freedom in the First Amendment to the US Constitution is one of the oldest and surely the most famous legal formulation of what is now considered a universal right (→ Freedom of the Press, Concept of; Freedom of Communication). It is also misleading since the guarantee is written as an absolute – “Congress shall make no law . . . abridging the freedom of speech, or of the press” – but in fact several exceptions are recognized. They include defamation, obscenity, and sedition and extend to derivative topics such as privacy, restrictions on access to information, and other laws that act to limit publication of information that is embarrassing or damaging to governments, corporations, or individuals. Criticism of public officials received special protection in 1964 when the Supreme Court ruled that they must prove “actual malice” – defined as knowing that defamatory information was false or had been published with a reckless disregard for its truth or falsehood – in any civil suit for defamation. As a result, lawsuits by public officials against critical media are virtually unknown (→ Libel and Slander).

The American approach to press freedom is minimalist. It is mostly a set of restraints on government, as the First Amendment specifies. At its core is the principle that government cannot prevent publication of information but can hold journalists responsible after publication. The Freedom House Report 2006 ranked the United States seventeenth among 73 “free press” countries. The report expressed concern for government policies linked to its war on terrorism but concluded that “media coverage of political affairs is aggressive and often polarized” (Karlekar 2006, 256).

More controversial is an annual report by the France-based Reporters Sans Frontières (RSF), which ranked the United States fifty-third among 168 countries in 2006. This represented a drop of nine places from the previous report.

Relations between the media and the Bush administration sharply deteriorated after President George W. Bush used the concern over national security to regard as suspicious any journalist who questioned what he called a “war on terrorism.”

## PRINTED PRESS

Daily newspaper → circulation reached a peak in 1985 when 1,676 daily newspapers produced 62.8 million copies. Since then, circulation – along with the number of daily newspapers – has declined steadily. In 2005, 1,452 daily papers printed 53.3 million copies. Most affected by the declining circulation were afternoon dailies and newspapers published in large urban areas. In addition, 6,659 weekly papers published 49.5 million copies, averaging 7,319 copies. The United States has three daily newspapers that circulate nationally: the popular *USA Today*, which was founded in 1982 as a national newspaper (circulation in 2005 was 2.28 million); the business-oriented *Wall Street Journal* (circulation 2.07 million); and the general news-oriented *New York Times* (circulation 1.14 million). Most daily papers are small and oriented toward local communities (→ Local News). In 2005, 86 percent of all dailies had circulations of fewer than 50,000 copies; only 2 percent circulated more than 250,000 copies.

Circulation figures mask the full impact of newspaper decline because they omit reference to the rapid population growth of the United States. A more telling statistic is daily newspaper sales per 1,000 population, which permits cross-national comparisons and comparisons across time. In 1985, the 62 million copies represented 264 copies per 1,000 population; the 53 million copies in 2005 represented 178 copies per 1,000 people, a drop in two decades of 33 percent.

Readership studies (→ Readership Research) reinforce the gloomy circulation statistics. In the 1972 national General Social Survey, 69 percent of respondents said they read a newspaper every day. In 2004, the comparable figure was 41 percent. The Pew Research Center (2006, 3) reported that the percentage of Americans who had read a newspaper “yesterday” dropped from 58 percent in 1993 to 40 percent in 2006.

## RADIO AND TELEVISION

Terrestrial broadcasting in the United States is regulated by the → Federal Communications Commission (FCC), which grants broadcast licenses and maintains limited oversight under a “trusteeship” model of broadcasting represented by the phrase “public interest, convenience, and necessity.” The phrase was contained in the Broadcast Act of 1927 and included in the Broadcast Act of 1934, which provides the basic structure of broadcasting. From the beginning, fixed-term licenses were granted to mostly commercial organizations to broadcast on preset frequencies to local markets. Public broadcasting evolved from early licenses granted to universities, with the involvement, in many cases, of the federal Agricultural Extension Service. Local stations could affiliate to national networks to achieve an approximation of national services.

As of March 2006, the FCC had granted active licenses to 11,002 commercial radio stations and 2,746 educational or public radio stations, and to 1,371 commercial TV stations and 381 public TV stations. Additional licenses, mostly for translators and boosters and for low-power licenses operated by universities and a few communities, brought the number of terrestrial broadcasters licensed in the United States to 27,556.

Most commercial TV stations are affiliated to one of the three traditional networks – CBS, ABC, or NBC – that provide news and prime-time entertainment programming, or to one of the new limited networks, such as Fox and the CW network, which is aimed at young adults (→ Television Networks). Locally produced programming is typically limited to several hours of news that is heavy on coverage of crime, fires, and accidents along with local weather and sports.

Although the big three networks own radio stations, “network radio” in its traditional mix of entertainment and news has disappeared (→ Radio Networks). Within each of the 210 designated market areas (DMAs), individual stations aim for a narrow segment of listeners with a specific format of music – top 40, contemporary adult, country, and rhythm and blues, among others. Stations are programmed and sometimes remotely controlled from a regional or corporate headquarters, with the result that stations broadcasting in a particular format are nearly identical in content across the country. It is not unusual for a single company to own several stations with different formats in the same market. The largest player in the industry was Clear Channel, which, until it announced the sale of more than 400 stations outside the 100 largest markets in 2006, owned more than 1,100 local stations.

## **INTERNET, CABLE, AND SATELLITE TELEVISION**

### **Internet**

The → Internet emerged as a mass medium in the 1970s and remained a communications platform used mostly by educated, elite users until the development of the world wide web in the early 1990s. The net grew quickly in popularity as developers created web browsers that simplified the process of connecting via personal computers. Media organizations soon began to recognize the web’s value as a medium capable of transmitting information instantly and in greater depth and clarity than was possible through traditional forms. Over time, media groups increased their reliance on the web, building more sophisticated sites to exploit its interactive features and to converge traditional forms of → video, audio, print, → photography, and graphics in multimedia offerings. A dominant characteristic of media websites has been change, as professionals have adjusted, often fitfully, to the shifting patterns of innovation and consumer use in the early stages of the digital era.

Almost three-quarters of all US adults, or 73 percent, enjoyed a connection to the Internet in 2006, according to survey results from the respected Pew Internet and American Life Project (Horrigan 2006, 2). The recent growth has occurred in the accelerating adoption of high-speed Internet service. More than four in ten, or 42 percent, of American adults had broadband connections in 2006, a remarkable 40 percent increase in broadband use from a year earlier.

The arrival of digitization posed new techniques and worries for the delivery of entertainment. File-sharing techniques quickened consumers' abilities to obtain copies of popular music and software, for example. Such practices also forced debate and revisions of laws protecting → copyrights, which in turn have spawned movements toward maintaining a democratic use of the web.

News organizations moved warily onto the web as some journalists cautioned against a loss of control, and perhaps function, in a more fluid, interactive environment. The need to change, however, trumped the status quo. For traditional print and broadcast organizations especially, the continued fragmentation and decline of mass audiences has prompted a greater willingness to embrace digital forms.

The surge of independent publishing on the web, popularly labeled → citizen journalism, has awakened the established media to the revolutionary possibilities of digital networking through blogs (→ Blogger), podcasts, video sites, and popular social networking sites. Scholars and professionals continue to explore the implications of the new digital landscape, debating issues such as whether news and advertising will continue to be presented in bundled forms via branded websites, or more commonly delivered through personalized channels and services via feeds to PCs and other, more portable devices such as mobile telephones.

### **Cable**

Most American households can receive six or more terrestrial TV stations with a simple roof-top antenna. However, → cable television is the standard delivery system, providing, in some cases, more than 200 programs as well as high-speed Internet access and even telephone service. In 2005, 85 percent of all TV households were cable subscribers. Private commercial cable companies operate as monopolies with franchises granted by local governments. In 2003, there were more than 9,000 cable systems, although most were owned by a handful of large corporations such as Comcast, Time-Warner, and Cox. Federal regulations require cable providers to carry all local terrestrial stations, which is important to small stations with weak signals in the upper UHF band, and local governments usually require that cable channels be set aside for use by local government and for public access (→ Access to the Media; Public Access Television). Otherwise, content decisions are made by the providers themselves. Since the federal government's authority to regulate content does not apply to cable or satellite broadcasting, cable content on pay services such as Home Box Office (HBO) often includes nudity, rough language, and graphic violence that are prohibited on traditional channels. Some companies even offer "adult" channels that show mild pornography.

### **Satellite**

Direct broadcast satellite (DBS) is available in the United States but relatively limited (→ Satellite Television). Two private companies offer program packages similar to those available on cable TV and serve mainly rural areas that cable does not reach. The small "pizza-dish" antennas are not as much a part of the landscape as they are in many other countries. In 2006, the two companies had about 27 million subscribers. One provider,

Dish Network, specialized in packages of foreign programming, offering 20 different regional and language packages in 2006. Most cable systems and the two DBS systems provide two or more channels in Spanish, including the two US-based Spanish networks, Univision and Telemundo, Spanish versions of national news and sports services, and channels imported from Latin America.

Terrestrial digital radio is undeveloped in the United States, although the FCC does grant licenses, and some stations broadcast a digital signal version of their traditional terrestrial program. The advantages of a digital signal are both the CD-like quality of the sound and the compression, which allows up to five separate signals to be transmitted in the bandwidth used by one analog signal. Receivers, however, are expensive and not readily available and little pressure to develop the system is apparent, either from the government, the public, or the broadcast industry.

Up until now, a source of irritation to long-distance motorists, radio signals fade rapidly as one travels along the interstate highway system. Since the stations are local, it is not always easy to find another signal that offers similar programming. However, satellite radio that reaches coast to coast is available through two commercial companies that began operation in 2001 and 2002. The main market is automobile and truck drivers, although the service is also available for in-home and even portable receivers. As of mid-2006, the two services – XM Radio and Sirius Radio – had from 12 million to 13 million subscribers. Both services offered a mix of channels including 60+ commercial free music programs, 35–40 news/talk programs, and 20+ local traffic/weather and local sports programs that allowed listeners to follow a favorite college or professional team regardless of where they lived. As with DBS television, satellite radio is in the early stages of development, and its future direction is uncertain.

## **HIGH-DEFINITION TELEVISION**

In the 1990s, the US government began moving toward an advanced system of fully digital high-definition television (HD-TV), replacing the half-century-old National Television Standards Committee (NTSC) analog system. To implement the new standard, each terrestrial TV broadcaster would be given a temporary second frequency. During a transition period, it would introduce HD-TV on one frequency while continuing to broadcast in NTSC on the other. At a specified time, the analog service would stop. Broadcasters were happy to receive a second frequency but some wanted to use it for nonbroadcast services; others balked at the expense of converting to the new standard. Broadcasters were reluctant to introduce high-definition programming because so few households could receive it; consumers hesitated to buy the new, relatively expensive HD-TV sets as long as programming was limited.

At some point in the last half of the 2000–2010 decade, HD-TV is likely to reach the takeoff point in the traditional S-curve of adoption of new technology. Households in most markets could receive limited local high-definition signals with a special rooftop antenna, although most consumers are so far opting for a set of HD channels available on cable or satellite. The commercial networks have begun making prime-time programming available in HD to local stations, which have fed the signals to local cable companies before they have begun over-the-air transmission of network programming or converted

local programming to the new standard. The deadline for shutting down the old analog system has remained flexible, although a principle agreed upon early in the debate still seems to apply: when 85 percent of households has access to HD-TV, dismantling of the old analog system will begin. A tentative date, postponed at least once, was 2009.

# Uses and Gratifications

*John L. Sherry*

*Michigan State University*

*Andy Boyan*

*Michigan State University*

Dating back to work done in Columbia's Bureau of Applied Social Research in the 1940s, media uses and gratifications (U&G) research represents one of the oldest and largest continuous programs of research in the field of communication. The tradition represents hundreds of research projects since the 1940s examining the reasons why people use mass media including → radio, → television, film (→ Cinema), print media, and the → Internet. U&G has consistently been one of the most frequently published mass communication theoretical perspectives in communication journals over the past 50 years. The product of this massive research effort has been a large set of taxonomies of media use motives; research linking those motives to antecedent variables (e.g., social factors, personality) and media use, along with some consequences (effects) of that use; and an extensive theoretical discussion and critique. Many scholars hold that U&G represents a research perspective that is separate from the → media effects tradition (→ Communication as a Field and Discipline; Exposure to Communication Content; Media Effects, History of).

## MAJOR DIMENSIONS OF USES AND GRATIFICATIONS

In their 1974 collection, → Katz and Blumler, along with Gurevitch, provided the germinal theoretical description of the U&G → paradigm, stating that U&G research is concerned with “the social and psychological origins of needs, which generate expectations of the mass media or other sources, which lead to differential patterns of media exposure (or engagement in other activities), resulting in need gratifications and other consequences, perhaps mostly unintended ones” (Katz et al. 1974, 20). From these first theoretical musings, U&G stood in contrast to many contemporary effects theories by positing an active → audience that uses media to satisfy felt needs, rather than a passive media audience that is affected by media messages.

Rubin, one of the most prolific U&G researchers of the 1980s and 1990s, specified five a priori *assumptions about the relationship between people and media* embodied in U&G research. The first assumption is that media use is motivated, goal-directed, and purposive behavior. Second, individuals initiate media use in response to felt needs. Third, a variety of individual differences and social factors guide and filter media use behavior. Fourth, media use is just one of many alternatives people have; thus media competes with other communication to best satisfy needs and motives. Finally, U&G research assumes that people are a more powerful influence than media in most cases.

In 1961, → Schramm et al. specified three motives for television use among children: entertainment, social interaction, and learning. As other taxonomies were specified with the emergence of new media and genres, these three core motives expanded, but remained

fairly consistent with the original formulation. Typically, television use motives include those for entertainment (e.g., to pass time, diversion, arousal, relaxation), social interaction (e.g., → co-viewing, parasocial interaction, cultural currency), and learning (e.g., information about the environment, → socialization by the media). Print media motivations also include entertainment (→ escapism), social interaction (prestige; → Interactivity, Concept of), and learning (interpreting public affairs, surveillance). New media often introduce different motives. For example, → video game motives include entertainment (diversion, arousal, fantasy) and social interaction, but not learning (Sherry et al. 2006; → Fantasy/Imagination). Instead, unique motives of gaming include the challenge of beating the game and the competition of beating others.

### CHANGES OVER TIME IN THE TOPIC AND ITS TREATMENT

According to Rosengren et al., U&G research proceeded in three major phases up until the writing of their collection, *Media gratifications research: Current perspectives* in 1985. The first phase began in the 1940s and lasted until the late 1950s. This era was characterized by descriptive research focusing on the reasons individuals use media, starkly contrasting with the mass society powerful effects beliefs of the time. The second phase, which Rosengren et al. called the → operationalization period, focused on developing typologies of media use during the 1960s. The working philosophy of the time is best summed up by Schramm et al., who wrote, “In order to understand television’s impact and effect on children, we have first to get away from the unrealistic concept of what television does to children and substitute the concept of what children do with television” (1961, 169). The second era efforts culminated in the early paradigm models proffered by Katz et al. and by Rosengren in Blumler & Katz’s classic 1974 collection *The uses of mass communications: Current perspectives of gratifications research*.

Of these perspectives, the model advanced by Rosengren (1974) best encapsulates the core concepts and theoretical linkages of U&G. Rosengren’s model stated that basic needs, individual differences, and social pressures combine to result in a variety of perceived problems and motivations to which gratifications are sought from the media and elsewhere, leading to differential patterns of media effects on both the individual and societal levels. Thus, in the 1970s U&G became consistent with the emerging emphasis on functionalism found in many other disciplines at the time (→ Models of Communication).

After the publication of the Blumler and Katz collection, researchers continued to expand empirical data in support of the Rosengren model. This effort resulted in the emergence of several core concepts and debates. Some scholars attempted to reduce existing taxonomies into clearer theoretical distinctions, dividing motivations for media use into those that represent media uses (to satisfy anticipated pragmatic goals) and those that satisfy media gratifications (transitory mental or emotional responses). Rubin continued this work, further specifying *instrumental use motives* (seeking exciting or entertaining information) and *ritualistic use motives* (habitual). Instrumental uses were associated with more purposeful, limited, and selective media use, while ritualistic motives were associated with generalized medium or genre use that was more time-consuming.

Another focus emerged from the debate as to whether media audiences were *active or passive*. Though the paradigm had always posited an active audience, this notion was

difficult to sustain as research into habitual or ritualistic motives continued to emerge. Researchers came to understand that media users exhibited varying levels of selectivity and attention before, during, and after the media use process. Recently research has shown that unconscious selection of media and → genres may be driven by biological states that are either transitory or relatively stable across the life-span (Sherry 2001). Thus, media use is likely both active and passive; conscious and unconscious (→ Communibiology).

Rosengren's theoretical explication notes that media use does not guarantee that an individual's perceived problems will always be solved by the media. Researchers therefore began to investigate the differences between media gratifications sought and media gratifications obtained. Further, they developed an approach to media satisfaction based on an → expectancy value model. In this model, media satisfaction resulted from beliefs about gratifications attributes possessed by the media and affective evaluation of those attributes. This model was more successful than a straightforward comparison of the gratifications obtained to the gratifications sought (Palmgreen & Rayburn 1985).

### CRITICISM OF THE USES AND GRATIFICATIONS APPROACH

Several scholars have criticized U&G as non-theoretical and lacking in conceptual clarity and explanatory mechanisms. In particular, critics claim that many of the key concepts, particularly motives, needs, gratifications, and uses, are not conceptually distinct from one another. Recently, however, scholars have begun to clarify the concepts implicated in reasons for media use by borrowing concepts from psychology like intrinsic, implicit, and explicit motives, as well as intrinsic motivations (→ Intrinsic and Extrinsic Motivation and Volition). Another problem is that the taxonomic tendencies in the literature are too compartmentalized to support the notion of a unified theory of media use. Careful consideration of the guiding model suggests that this conclusion is more due to the research that has been undertaken than to any deficit in the potential explanatory power of the U&G model. In order for the model to reach its explanatory potential, it must address the question of the etiology of media use motivations theorized in it (Vorderer et al. 2006).

As pointed out above, the approach's key assumption, namely that media users are active in the selection of media and can articulate the reasons for media use, has also been criticized. In response, some researchers have attempted to address the *etiology of use motivation*. For example, researchers have examined the relationship between media use and the "Big Five" personality factors (neuroticism, extraversion, openness to experience, agreeableness, and conscientiousness), other personality factors, chronic loneliness, self-esteem, → sensation seeking, and need for arousal. To date, media researchers have not demonstrated a strong link between personality traits and media use (Finn 1997). Typically, the results are mixed, with few personality variables associated with media use variables. However, research on biological drivers such as temperament may go a long way toward solving this problem (→ Personality and Exposure to Communication).

Finally, critics have complained that U&G research is narrowly focused on individuals and does not acknowledge the impact of societal factors and societal-level changes. While this has certainly been the case with the empirical research, scholars have begun to *call for*

*cross-level theorizing* in media research. U&G is a good candidate for cross-level thinking; Rosengren's (1974) model clearly articulates the importance of both individual- and societal-level variables as a part of the media selection process.

### **FUTURE DIRECTIONS IN RESEARCH, THEORY, AND METHODOLOGY**

One of the advantages of the U&G approach is the ease with which it applies to new media and new technologies. In fact, interactive technologies such as the Internet and video games have breathed new life into U&G research because of its emphasis on active audiences. Online users and games must make frequent content or response choices while engaged with these new media. With the advent of wikis and personal web page sites such as Facebook and MySpace, media users are getting more actively involved in both creating and consuming media. Taxonomies of Internet usage motivations parallel earlier media in some ways (e.g., interpersonal utility, pastime, information seeking, convenience, and entertainment), but also provide a place to communicate with family and friends. This difference marks one of the major distinctions in this new medium.

Recent work on new media highlight *two broad types of gratifications* users can expect: process gratifications and content gratifications. Song et al. (2004) argue that the Internet is different from traditional media because it provides not only an activity to engage in (process motivations such as surfing the net or playing games) and information (e.g., → news stories, product information, online movies), but also a new social aspect that traditional media lack (e.g., instant messaging, chatting with customer service, talking over the Internet while gaming). Further, the Internet puts more information in the hands of users more quickly and easily than any other medium. Users do not need to wait for a newscaster or journalist to provide game scores and analysis – it is all instantly available. It will be interesting to see the gratifications that people will develop with these new media and the extent to which these media will create dependency or replace other forms of human communication (→ Media System Dependency Theory; Addiction and Exposure).

For now, growing numbers of young scholars are focusing attention in two directions. First, they are creating taxonomies of use of emerging media as scholars did in the past. More importantly, they are more closely examining the experience of media use through an array of entertainment media theories and concepts including hedonic theory, → selective exposure, flow, → presence, and transportation (Bryant & Vorderer 2006; → Transportation Theory). These scholars are interested in the phenomenological experience of media entertainment, as well as in clarifying the psychological and neurophysiological systems implicated in media use (→ Phenomenology). Like the U&G scholars that preceded them, they are addressing the weaknesses of the paradigm through continuing empirical and theoretical advances. Thus the oldest and largest research domain in mass communication continues to grow and evolve with each new generation of researchers.

# V

## Validity

*Klaus Krippendorff*

*University of Pennsylvania*

In logic, validity is an attribute of the form of an argument that cannot lead from true premises to false conclusions. For example, “all A are B; some A are C; therefore some B are C” is a valid form. A common way to evaluate the validity of arguments is by treating it as a function of truth values – true or false – making sure that of all combinations of truth values, no false conclusions follow from true premises. In everyday life, the word “validity” is used similarly to “logic,” but more loosely and with qualifications. Near-synonyms of validity are “soundness,” as in sound or unquestionable arguments; “plausibility,” as in conclusions that make sense and are accepted as most likely true; or “persuasiveness,” as in a convincing, believable, or credible account. Claims of validity are always built on a sense of authority, usually scientific, but also legal and popular. These synonyms can shift the burden of proof from the quality of arguments (soundness) to a community of reasonable people (persuasiveness), or to individual judgments (plausibility).

*In the social sciences*, and in empirical research in particular, researchers go out of their way to justify their findings in terms of how they came to them. The analytical methods they employ to proceed from data to findings are analogous to the arguments by which logicians proceed from premises to conclusions. By definition, data are unquestionable facts, hence true – save for the possibility of being unreliable. Scientific methods are designed to preserve the truths of the original data in the findings to which they lead (→ Research Methods). Because social research – unlike logic – theorizes diverse and often statistical phenomena, validity must here embrace probabilities and contexts. In the social sciences, therefore, validity refers to the quality of research leading to conclusions that are true to a degree better than chance and in the context in which they are claimed to be true. In the particular case of measurement, the validity of a test (→ Test Theory) is the degree to which it measures what it claims it measures (→ Measurement Theory). Reference to chance and degrees of truth implicates probabilistic considerations, and references to claims contextualize the research process.

It is important not to confuse validity and → reliability. Reliability concerns the trustworthiness of data. Data should represent only the phenomena of interest to the researchers. They should not be tainted by the irrelevant circumstances in which they were obtained, by interests in the research results, or by carelessly recording observations

and measurements. Unreliability introduces uncertainty about what the data represent. It acknowledges that there is an above-zero probability of containing falsehoods. Because a method of analysis may well be invalid, perfectly reliable data do not guarantee valid conclusions. However, unreliable data always limit the chance for a valid method to produce valid findings. Just as it is important for logicians to know whether their premises are true, so it is important for researchers to know the extent to which their data are reliable.

### **BRIEF HISTORY OF VALIDITY**

Most social scientists use ways to demonstrate the validity of their research. At least since the 1940s, writers have proposed classifications of these practices and investigated their conclusiveness. Efforts to legitimize particular research methods culminated in a special scientific sub-discipline called “methodology.” The first effort to codify the terminology of validation efforts was undertaken by the American Psychological Association (APA; 1954), concerned with the validity of the then growing practice of psychological testing. This report defined four kinds of validity: content, construct, concurrent, and predictive validity.

Subsequently, the APA’s effort was joined by the American Educational Research Association (AERA) and the National Council on Measurement in Education (NCME; 1985). In a series of joint publications by these associations, terminologies emerged and were abandoned, showing no clear consensus. In 1999, the effort to standardize turned toward distinguishing the evidence that researchers use to support their findings (American Educational Research Association et al. 1999). Although some terms of earlier typologies migrated into sociology, political science, and economics, generalizations from psychological testing to truly social research proved difficult. For example, content analysis, a research technique for making valid and reliable inferences from texts to their contexts, bears little resemblance to aptitude tests for individuals (→ Content Analysis, Quantitative).

### **KINDS OF VALIDITY**

There are three kinds of validity to start with: face validity, social validity, and empirical validity. They justify the acceptance of research findings on different grounds.

*Face validity* is obvious or common truth. Researchers rely on face validity when they accept methods and results because they make sense, are plausible, or are persuasive, without feeling the need to give reasons for their judgment. Face validity is omnipresent in many decisions concerning scientific research. For example, findings that seem wrong or counterintuitive are not as likely published as findings that make sense. Face validity can be misleading, however. For example, it makes a lot of sense to take the relative frequency of mentioning a certain issue in the news as an indicator of how important that issue is to members of the public. Yet correlations between the two are notoriously weak. Face validity often overrides other forms of validity. Face validity results from individual judgments, although the cultural root of sense-making cannot be ignored.

*Social validity*, also called pragmatic validity, is that quality of research methods and findings that leads one to accept them for their contribution to public debates or the resolution of important social issues: crime, terrorism, the antisocial behavior of juveniles,

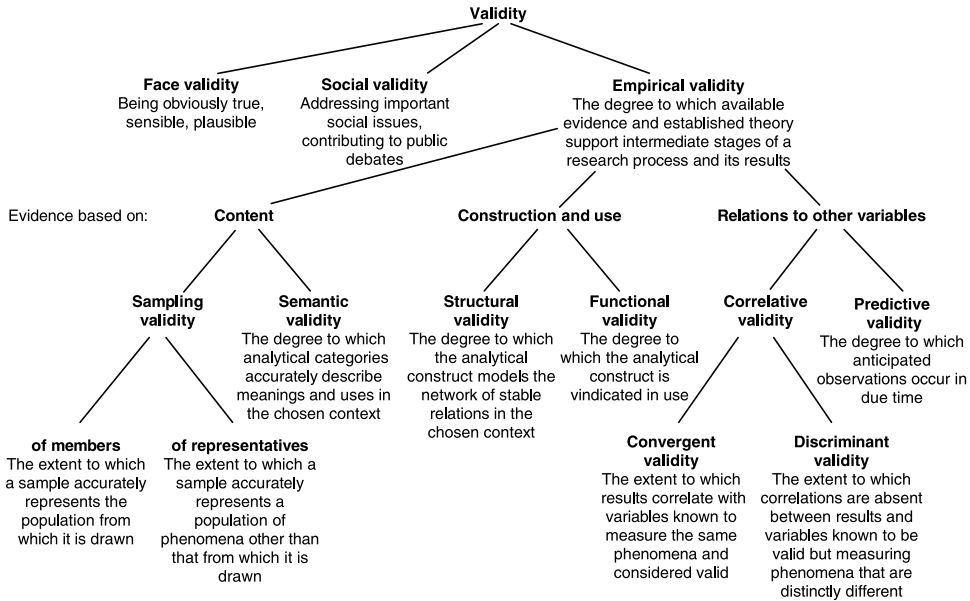

Figure 1 A typology of validity

racism, lack in civility during political campaigns, etc. (Riffe et al. 1998). Justifying a particular research project almost always relies on social validity. Whether one evaluates its contribution to a group of scholars in pursuit of a theory, to a commercial sponsor, or to a research foundation, the criteria usually turn toward its usefulness, relevance, social significance, or impact. Scientific researchers may not acclaim social validity, but it generates valued public or peer-group support.

*Empirical validity* is the cherished concern of the sciences. It is the degree to which available evidence supports various stages of the research process, and the degree to which scientific conclusions withstand the challenges of additional data, other research efforts, and theory based on observations, experiments, or measurements. Campbell and Stanley (1963) call empirical validity “internal validity” and define it somewhat more loosely as the basic requirements for an experiment to be interpretable. Empirical validity cannot deny intuition (face validity), nor can it divorce itself entirely from social, political, and cultural factors (social validity) – after all, researchers are human and their work is reviewed by others, who may have their own theoretical commitments and personal alliances and are, hence, hardly immune to non-empirical concerns. However, the following typology, summarized in Figure 1, separates empirical validity from face and social validity by focusing on how empirical evidence is woven into the research process or brought to bear on its results.

## FORMS AND PROBLEMS OF EMPIRICAL VALIDITY

As already mentioned, most efforts to standardize validity concerns are rooted in experiences with psychological tests, only marginally addressing validity issues arising in content analysis,

public opinion polling, communication research, and other social science methods. The following takes this point to heart and builds its typology on the distinctions among the kind of evidence used to support empirical research: content, construction and use, and relations to other variables.

*Content* refers to evidence that must be read or interpreted by individuals or organizations in order to be considered data. In the domain of psychological testing, Anastasi and Urbina (1997, 114) define content validity as “the systematic examination of the test content to determine whether it covers a representative sample of the behaviour domain to be measured.” It acknowledges the qualitative nature of written test items, text. Indeed, texts, which constitute most of the data in social research, cannot be treated in the same manner as meter readings. Even crime statistics, expressed in seemingly objective numbers, are developed primarily from narratives of people’s experiences or communications. To become a crime statistic, accounts of crimes tend to come in everyday terms that must be, first, understood and, second, analyzed, categorized, and counted. Evidence based on content naturally divides into two types: sampling validity and semantic validity.

*Sampling validity* is the degree to which a sample accurately represents the population of phenomena in whose place the sample is to be analyzed. One can sample from the members of a population, or from representatives of that population. Sampling theory provides various strategies to assure that the *members of a population* have an equal chance to be part of the sample (→ Sampling, Random). If a valid sampling plan is followed, the only uncertainty that remains is how large a sample must be to be representative of the population of interest. Unable to know the population in relevant variables without studying it, sampling theory relies on the law of large numbers, which suggests that the larger the size of a sample, the more likely it is that averages in the sample resemble those of the population. The law serves as validating evidence for a sample being representative of a population. The measure of statistical significance used in statistical tests plays the same role.

Sampling theory fails to address situations in which researchers are forced to select units for analysis from a source that hides, filters, or distorts the phenomena of the researcher’s interest. Therapeutic interviews, for instance, are conducted to aid a therapist’s treatment, not to uncover uncontaminated truths. They have to be interpreted accordingly. Similarly, unless mass communication researchers are interested in purely syntactical features of the media, they may have to be sensitive to the fact that its audiences, at least in the US, are not presented with what the outside world is like, but with what is easily obtainable and communicable, fits the editorial policies of the channel, attracts sponsoring advertisers, and holds audience attention (→ Media Production and Content).

Without direct access to the population of phenomena that they wish to study, researchers must treat the units they can sample for analysis no longer as members of a population but as representatives of that population. The method of selecting among such representatives must take into account how their source represents these phenomena and makes them available for analysis. Under such conditions, validating evidence concerns a data source’s selectivity, how these phenomena are presented. It justifies sampling methods that reverse the statistical biases of the source and guarantee that the sample actually analyzed represents the statistical properties of phenomena to be studied.

*Semantic validity* is the extent to which the categories of an analysis are commensurate with the categories of the object of inquiry. Kenneth Pike’s distinction between emic and

etic categories is important here (Headland et al. 1990). The anthropological preference for emic or indigenous rather than etic or researcher-imposed categories of analysis demonstrates a concern for semantic validity. And ethnographers' attempt to adjust their own accounts to their informers' perceptions is an effort to gather evidence for the semantic validity of their findings. Traditional preference in psychology and sociology for abstract theory may not care about semantic validity. However, in public opinion research – asking questions that are relevant in the life of interviewees – and in content analysis – acknowledging how audiences interpret the texts being analyzed – lack of semantic validity spells trouble for the research results. They may say more about the researcher than about people's opinions and audience receptions. Internet browsers are largely insensitive to the meanings of words and, lacking semantic validity, they often retrieve much irrelevant text.

*Construction and use* refers to evidence about the model characteristics that underlie a method of analysis – its algorithms and networks of analytical steps, or any parts of it. Earlier typologies defined construct validity as the degree to which a common pattern or theory underlies several measurements, until methodologists realized that all valid tests possess implicative structures – systems of relationships that imply each other – and are saturated with theoretical commitments. Evidence about the internal makeup or use of a method leads to two kinds of validity.

*Structural validity* is the degree to which a research method possesses implicit structures that demonstrably correspond to structures in the object of an analysis. Simulations, for example, will be structurally valid if it can be shown that they model the essential features of what they simulate. Psychological tests are structurally valid if they operationalize the psychological processes of the individuals tested. Evidence for structural validity may be obtained in the form of data about the composition and causal connections underlying the object of study, or previously substantiated theories about how the parts of that object work together.

*Functional validity* is the degree to which a method of analysis is vindicated by successful uses rather than validated by structural correspondences (Janis 1965). Because functions may be materialized variously, a research method may be functionally valid without being structurally valid. Demonstrating the functional validity of a method requires evidence in the form of a history of its successes and relative absence of failures – regardless of how that method came to its results. Taking a method's successful and widespread use as a validity criterion can easily lead to self-fulfilling prophecies. For example, the use of college entrance tests, when instituted in a university's admission process, becomes functionally validated by making it difficult for those who fail the test to prove themselves worthy of advanced education. In use, such a test creates its own truth.

Relating other variables to the results of a method of analysis has, again, two forms. *Correlative validity* is established by correlating the research results with variables that are concurrent with and extraneous to the way these results were obtained. The purpose of correlating research results with other variables is to confer validity on the otherwise uncertain research results. This transfer, however, can be accomplished only when the variables with which the research results correlate are known to be of unquestionable truth.

An important systematization of correlative validity is the multitrait-multimethod technique (Campbell & Fiske 1959). It calls for constructing a matrix of all correlations

between variables that are related to measures of the phenomena of interest, including the research results to be validated, and a number of variables that concern unrelated phenomena. Comparisons among these correlations give rise to two kinds of validity, convergent and discriminant. For research findings to be correlationally valid, they must satisfy both.

*Convergent validity* is the degree to which research results correlate with other variables known to measure the same or closely related phenomena.

*Discriminant validity* is the degree to which research results are distinct from or unresponsive to unrelated phenomena and hence do not correlate with variables known to measure the latter.

For example, human intelligence is conceived of as underlying many extraordinary accomplishments in life. To have convergent validity, an intelligence test must correlate highly with all measures of phenomena that involve intelligence. To have discriminant validity, that test must be demonstrably independent of measures of phenomena that do not involve intelligence. If research results correlate with nearly everything, which easily happens when concepts are as pervasive as human intelligence is, correlational validity fails for lack of discrimination.

*Predictive validity* is the degree to which statements made about anticipated but unobserved and uncertain phenomena at one point in time are supported by evidence about their accuracy at later point in time. Prediction, literally “before saying,” is not limited to forecast, and not to be confused with generalizations from a sample to the population from which it was drawn. Moreover, correlations might suggest the predictability of recurrent phenomena, but they do not lend themselves to predictions. Predictions are validated by specifics, for example, by naming the actual author of an anonymously written text, correctly predicting a planned terrorist attack in at least some of its dimensions – perpetrators, time, place, target, and means of attack, or accurately forecasting stock market movements. When predictions are acted upon, their validity may surface in successes, for example in preventing a terrorist attack or gaining in the stock market.

## Vatican Radio

*Cinzia Padovani*

*Southern Illinois University Carbondale*

Established in 1931, Vatican Radio (VR) is one of the world's oldest international broadcasting services. Its birth can be traced back to the *Lateran Treaty*, signed in 1929 by Benito Mussolini and the secretary of the Vatican State, Cardinal Gasparri. Aimed at resolving 59 years of tense relationships between the kingdom of Italy and the Holy See, the treaty was intended to compensate the Holy See for what it had lost when Rome, previously under the control of the pontiff, was annexed to the Italian kingdom in 1870. In addition to establishing the Vatican's own borders, jurisdiction, currency, and even stamps, the treaty made it Italy's responsibility to ensure the "necessary link, directly also with other States, of the [Vatican's] telegraph, telephone, and radio and postal services," thereby paving the way for the Vatican to establish its own broadcast media. As a further endorsement of the legitimacy of the pontiff's previous control over Rome, Mussolini agreed to pay more than one billion Italian lira in compensation. This was of great ideological significance: the dictator would now be able to count upon the Catholic elites, who welcomed his generosity and the new "harmony" established between the Italian state and the Vatican. For the then pope, Pius XI, Mussolini was the "man of Providence."

Guglielmo Marconi was commissioned to assist with the creation of the new → radio station, which the pope inaugurated with a speech in Latin on February 12, 1931. From the start, though not without recurrent internal struggles for power, representatives of the Jesuit Order were called upon to head the station's operations. Together with the newspaper *L'Osservatore Romano*, founded in 1861, and the weekly magazine *Civiltà Cattolica*, founded in 1880, VR became an integral part of the broader plan to propagate church doctrine. Whereas the print media targeted the Italian political and intellectual elites, VR was, from the onset, a shortwave radio broadcaster, aimed at reaching people all over the world; a truly "universal" medium, perfect for the mission of a "universal" church (→ International Radio).

It is not surprising, therefore, that the history of VR, like that of the Catholic church, is one dense with contradictions. As a child of the Lateran Treaty and therefore of the problematic alliance between the Vatican and fascist Italy, VR found itself in the midst of

controversies from the beginning. Although the relationship between the regime and the pontiff began deteriorating only a few years after the signing of the treaty, the church and its radio were criticized for their positions at the onset of the Holocaust and throughout World War II. Pius XII (Pius XI's successor) was accused of not being vociferous enough against Nazi Germany, and of failing to use the radio station to denounce the Holocaust more forcefully (→ Propaganda in World War II). At the same time, some have defended the radio service and the pope, presenting evidence that even the Allies would use the reports from VR to get invaluable information about what was going on in Italy, and that the station was one of the first to announce to the world that the extermination of Jews had begun (Adler 2004).

Beginning in the year 2000, VR found itself at the center of allegations that its million-watt towers were causing severe *environmental pollution*. According to citizens' groups and environmental organizations, the electromagnetic pollution generated by these emissions was responsible for the high prevalence of leukemia cases, especially in children, in areas surrounding VR's towers in a small town northeast of Rome (Michelozzi et al. 2002). After lengthy legal battles, in the spring of 2006 an Italian court found VR guilty of not respecting the limits imposed by the legislation on the emission of electromagnetic waves. Although fines and time in prison were imposed on those in charge of the station's main operations, the prison sentences were ultimately suspended. National newspapers avidly followed the case as it exemplified the continuation of an uneasy relationship between the Vatican and Italy.

VR is owned by Vatican City. The station is not allowed to carry → advertising, and its annual budget is between 20 million and 25 million euros. Given that the radio station does not generate revenues, its worth is judged in terms of its role in spreading the doctrine of the church and its position on world affairs. VR broadcasts programs in *47 languages in 40 countries*. With more than 42,000 hours of broadcasting and 200 journalists working in different parts of the world, its programs include international news, religious celebrations, and music. The initial acumen that characterized the Vatican's use of the mass media and new technologies continues. In fact, VR is at the forefront of technological developments with its podcasting, videos and audios on demand, streaming broadcasts on the world wide web (→ Internet), and satellite transmission (→ Satellite Communication, Global). Traditionally, however, the core service of VR has been its shortwave transmissions. This bandwidth can be utilized by anybody who wants to broadcast internationally, and its clear reception makes it a strategic choice for a church whose main target, and hope for survival in the third millennium, is to reach millions of people, particularly in sub-Saharan Africa, Asia, and South America.

Due to new technologies, however, the distribution of VR's programs continues to evolve and might slowly change in new directions. With the help of satellite delivery, a network of FM radio stations is developing with a mission to distribute religious messages, including VR's programs, to local audiences. Among those radio stations, there is *Radio Maria* (headquartered in Italy) and *Radio Chrétienness* (based in France). The first is a truly international network of FM radio stations spanning the globe from Argentina to Austria, Burkina Faso, Chile, Croatia, Mozambique, Paraguay, Poland, Perú, Russia, and Uganda. Radio Chrétienness, instead, targets Francophone countries on the African continent. This transition to satellite and FM distribution is significant in that stations such as Radio

Maria and Radio Chrétien, and ultimately VR, might become a notable force in the competition with local stations for the allocation of bandwidth.

# **Verbal Aggressiveness**

*Dale Hample*

*University of Maryland*

Verbal aggressiveness and argumentativeness are distinct but closely related concepts that apply to conflictual interpersonal interaction (→ Argumentative Discourse; Conflict Resolution; Interpersonal Communication; Interpersonal Conflict). Verbal aggressiveness is the inclination to attack the other person’s feelings or identity. Argumentativeness is the motivation to attack the other person’s position, arguments, or statements. Both are types of aggressive communication, which can be subdivided into two categories: constructive and destructive. Constructive aggressive communication can be assertive or argumentative. Destructive aggressive communication also has two subdivisions: hostility and verbal aggressiveness. Assertiveness and hostility have received little research attention. Verbal aggressiveness and argumentativeness are often assessed together in empirical investigations. Males generally score higher than females on both measures, and cultural differences have been explored (though without a simple generalized conclusion to this point). Dominic Infante is the originator of the current work on these two topics.

Both verbal aggressiveness and argumentativeness are personality predispositions, although most researchers prefer to call them communication traits (Rancer & Avtgis 2006). While most research treats them as enduring inclinations, they have from the beginning been theorized to have a situation-specific nature as well. Their character as traits is far more studied than their state aspects.

A substantial empirical literature has grown up around these two concepts. The most detailed review of that work is Rancer and Avtgis (2006), which now supplants the earlier summary of Infante and Rancer (1996).

## INSTRUMENTATION

Each of these variables is normally measured with 20-item, self-report Likert scales. The original versions continue to be well regarded and are the standard instrumentation choices (Infante & Rancer 1982; Infante & Wigley 1986). Shorter 10-item versions have been used, and other adaptations have been made for use with adolescents (Rancer & Avtgis 2006). All versions of the  $\rightarrow$  scales are reliable.

Questions have arisen about the unidimensionality of the two scales. Both are composed of two 10-item groups. In the case of argumentativeness, 10 items express approach motivations (e.g., "I enjoy defending my point of view on an issue") and 10 represent avoidance impulses (e.g., "I enjoy avoiding arguments"). The standard verbal aggressiveness scale is composed of 10 negatively worded items (e.g., "If individuals I am trying to influence really deserve it, I attack their character"), and 10 positively worded ones (e.g., "I try very hard to avoid having other people feel bad about themselves when I try to influence them"). In both cases, the composite score is calculated by subtracting the sum of one set of items (avoiding or being pro-social) from that of the other set (approaching or being verbally aggressive).

Hamilton and Mineo (2002) report that the approach and avoidance subsets of the argumentativeness scale are negatively correlated and both are reliable. The composite scale is both internally and externally consistent. Some researchers report separate results for the two subscales Hamilton and Mineo (2002) have reported acceptable reliabilities for the verbal aggressiveness scale. Several researchers have generated evidence that the scale is actually two-dimensional, with the aggressive and pro-social items falling into different (and negatively correlated) factors. Levine et al. (2004) show that a two-factor model should be preferred. The two factors consist of the 10 aggressive items and the 10 pro-social ones. In addition, Levine et al. report that the aggressive subscale is more predictive of other antisocial communicative behaviors and inclinations than is the pro-social subscale, and the reverse seems to be true when benevolent measures are correlated to the two subscales. The two subscales are substantially correlated, and have reasonable levels of reliability. Researchers should begin reporting subscale results as well as composite ones.

## ASSOCIATIONS WITH BASIC PERSONALITY TRAITS

Scholars have explored the connections between various communication traits and general personality factors, factors that have been shown to be heritable. This work is called  $\rightarrow$  *communibiology*, because the main interest is to determine the degree to which genetics controls key traits, such as anxiety about communicating ( $\rightarrow$  Communication Apprehension). The biological claims are controversial, but the empirical evidence is straightforward, and serves to locate both verbal aggressiveness and argumentativeness in the general context of personality research.

The usual method in these studies is to test respondents on the *big three personality measures* (extraversion, neuroticism, and psychoticism) as well as on various communication traits. Argumentativeness is positively associated with extraversion and psychoticism, but has no apparent connection to neuroticism. Verbal aggression correlates only with

psychoticism. Research shows a positive relationship between psychoticism and peer ratings of verbal aggressiveness, and a negative relationship between extraversion and peer ratings of verbal aggressiveness. A → meta-analysis of studies involving twins deals with aggressiveness in general, rather than our two specific communication traits or the big three. Beatty et al. (2002) report that aggressiveness is 58 percent heritable.

Taken together, these results suggest that both argumentativeness and verbal aggressiveness are positively associated with psychoticism, which refers to emotional independence (perhaps hostility or a lack of empathy toward others). This common result may trace back to both traits' connection to overall aggressiveness. Our two traits seem particularly distinct when associated with extraversion. Argumentativeness is characteristic of extraverted people, while verbal aggressiveness is higher among introverts. These findings are based on only a few studies, however, and further work will need to be done before conclusions are secure.

### **ASSOCIATIONS WITH OTHER PERSONALITY TRAITS**

Personality measures other than the big three have also been extensively compared to scores on both verbal aggressiveness and argumentativeness. This material has been conveniently reviewed by Rancer and Avtgis (2006). In line with theoretical expectations, the profile of a person high in verbal aggressiveness suggests limited social skills. Such people score high in defensiveness, self-handicapping, and external locus of control. They are low on laudativeness, cognitive flexibility, and need for cognition. A variety of findings suggest that people high in verbal aggressiveness are oblivious to the interpersonal damage they do, and believe that their behaviors are acceptable or even positive (Infante & Rancer 1996; Hample 2005; Rancer & Avtgis 2006).

Those high in argumentativeness, in contrast, have a profile that predicts active social engagement characterized by interpersonal competence. Argumentative people are noticeably low in any sort of communication apprehension. They are extraverted, and high in cognitive flexibility, need for cognition, and the personal power dimension of self-esteem. They rate themselves as being highly competent communicators. Those high in argumentativeness are less likely to be defensive during interpersonal conflicts. However, they are also more likely to self-report that they are compulsive communicators.

### **ATTRIBUTIONS OF PEOPLE HIGH ON VERBAL AGGRESSIVENESS AND ARGUMENTATIVENESS**

Personality traits are both self- and other-attributed. Up to this point, we have been examining self-reports and their correlates. Here, however, we consider what additional things others attribute to people high in verbal aggressiveness and argumentativeness (→ Attribution Processes). Self- and peer ratings of verbal aggressiveness are positively correlated, and the same is true of self- and friend ratings of argumentativeness. Both of these traits seem to be clearly exhibited to others. Attributions about verbally aggressive people are generally negative. Verbal aggressiveness is associated with lower relational satisfaction. Verbal aggression in parents is directly connected to *authoritarian parenting styles*, which have been in turn associated with a number of negative results for children

(→ Family Communication Patterns). In organizational settings, verbally aggressive supervisors are seen as damaging one's self-concept, and they are rated as less relaxed, friendly, and attentive (→ Organizational Communication). Finally, verbal aggressiveness reduces one's credibility. Results for people high in argumentativeness are essentially the mirror image of these findings. Such people participate in more satisfying relationships, and engage in more reason-exchanging parenting. At work, such supervisors are more affirming and better liked. They are rated as being more credible.

### **BEHAVIORAL CONSEQUENCES OF VERBAL AGGRESSIVENESS AND ARGUMENTATIVENESS**

The original impulse that led to this research was the everyday observation that some people attack others while some attack positions. This is a robust result, whether evidenced by the face validity of the instruments, peer ratings, or actual behavioral observation.

Perhaps the most interesting behavioral issue connected to verbal aggressiveness is its relationship to *domestic violence* (→ Frustration Aggression Theory). Infante et al. (1989) introduced the concept of an argument skill deficiency, and provided the first of several pieces of evidence for it. The idea is that as a domestic dispute begins, participants deal with it verbally. If they have arguing skills, they reason and have a good chance of resolving things peaceably, but without such skills, frustration sets in. The person believes that he or she is right, but cannot say why, cannot answer the other's remarks properly, and cannot reach the other persuasively. Aggression increases, possibly culminating in physical violence. Verbal aggressiveness is not held to be a direct cause of the violence, but it is seen as a triggering element and a nearly inevitable stage in the sequence leading to violence.

In the case of argumentativeness, a recurring research topic has been whether those high in argumentativeness actually cause more arguments while interacting. If it were necessary to offer a simple conclusion, we would say that they do; however, the work shows several interactions between own and partner's argumentativeness. This is an expected outcome. Each remark by the other constitutes an instantaneous change in the situation, and the situational character of argumentativeness reasserts itself differently from instant to instant. Several investigations have shown that own arguing behavior is more responsive to other's behavior than to own predispositions (Hample 2005).

### **INTERVENTIONS**

Researchers in the area are committed to the proposition that people are better off if they are argumentative and worse off if they are verbally aggressive. Consequently, interventions have been designed to increase people's argumentativeness and depress their verbally aggressive impulses (Rancer & Avtgis 2006). Researchers have applied a system originally designed by Infante to adults, high school students, and middle school children. While the length and content of the interventions vary, they generally include both conceptual instruction and guided practice in conflictive interaction. Immediate and long-term (up to a year after the intervention) results show that argumentativeness can be increased; however, some of the programs also generated a rise in verbal aggressiveness. These

efforts are very hopeful and generally valuable, but perhaps improved handling of verbal aggressiveness will be developed.

## **Verstehen vs Erklären**

*Thomas R. Lindlof*

*University of Kentucky*

During much of the twentieth century, the dichotomy between *verstehen* (interpretive understanding) and *erklären* (causal explanation) helped frame the debates about the epistemological foundations, purposes, and methods of the social sciences (→ Research Methods). Similar in many respects to the nomothetic/idiographic controversy (→ Idiographic vs Nomothetic Science), the key issue was whether it is possible – or desirable –

to achieve unity between the natural and social sciences. The concept of *verstehen*, in particular, posed a challenge to this idea of unification. By the end of the twentieth century, the coexistence of multiple forms of inquiry had become an accepted state of affairs in all of the social sciences, including communication research, and dampened the urgency of this issue. However, the legacy of the *verstehen/erklären* dichotomy lives on in the worldviews and practical activities of scholars. In such realms as the methods they use, the theoretical traditions they uphold, and the curricula they teach, there can still be found the imprint of the split between interpretive inquiry and causal explanation.

### ORIGINS OF THE CONCEPTS

The *verstehen/erklären* debate originated during the rise of positivist social science in the nineteenth century. Informed by the empiricist philosophies of John Locke and Francis Bacon, and especially by David Hume's arguments about causation and the importance of sensory experience, sociology made its appearance as a fledgling science of "social physics." Sociology, as Auguste Comte conceived it, would achieve scientific legitimacy only by adopting the deterministic, quantitative model of research that was proving so successful in the natural sciences (→ Quantitative Methodology). By the latter decades of the nineteenth century, sociology and the nascent fields of anthropology, political science, psychology, and economics were rapidly usurping the subject matter of history and the other humanistic disciplines. Also in full retreat from the positivists' influence was the use of methods like introspection and textual analysis for studying social and moral problems.

In the midst of these changes, the German historian and philosopher Wilhelm Dilthey argued in a series of works that the subject matter and methods of the *Geisteswissenschaften*, or "human sciences," were of a different order from those of the natural sciences like physics and chemistry. Dilthey included among the human sciences of that era not only the social and psychological sciences, but also history, moral theory, legal and political studies, and literary criticism. All of these fields had in common the study of processes of human understanding and expression. By claiming these processes to be the special province of a science of man, Dilthey rejected the model derived from the natural sciences. His viewpoint is distilled in the famous saying, "Nature we explain, psychic life we understand" (Dilthey 1914).

The German verb *erklären* refers to the process of explaining by citing the antecedent causes of events. Applied to the natural world in the context of Newtonian physics, this statement is unexceptional. However, applying *erklären* to the study of human conduct, as advocated by the nineteenth-century philosophers and social scientists John Stuart Mill, Herbert Spencer, and August Comte, was far more controversial. Human nature, in the positivists' view, is little different from physical nature. By reducing the action of human beings to a limited number of purely physiological functions (such as "stimulus," "response," and "drive"), and analyzing how these functions interrelate in terms of chains of cause and effect, the science that Dilthey labeled *erklärende Psychologie* ("explanatory psychology") hoped to achieve the same level of certainty as physics and chemistry. Thus, *erklären* science engages in the search for laws of causation that would cover animate as well as inanimate matter. The physical sciences also supplied the nomological-deductive logic (→ Deduction

vs Induction vs Abduction) and experimental methodology that could be used to test hypotheses about human behavior. Meanings (→ Meaning) and intentions were left out of the *erklären* conception of science. Only sensory objects that could be directly observed were deemed suitable for empirical investigation.

*Verstehen*, on the other hand, arose out of Dilthey's belief that "[a]n empiricism which renounces the attempt to ground what happens in the mind on an understanding of the system of mental life is necessarily sterile" (Dilthey 1974, 15). It was self-evident to Dilthey that human beings express themselves in complex ways precisely because they ascribe meaning to things. Moreover, human consciousness is constantly evolving and reshaping objects into outward signs of these meaning ascriptions. Only by "reliving" a person's line of action can scholars gain knowledge of the contents and qualities of meaningful experience. The methodology of natural science, he declared, was ill-suited to this task. The verb *verstehen* (to understand) refers to a method especially suited for the human sciences: empathetic understanding. According to Dilthey, one practices a science of understanding by studying psychic life from the inside. The investigator enters the life-world of the subject by whatever means available – for example, texts, conversation, and social participation – and tries to reconstruct the totality of what the subject believes, values, and desires (→ Emic vs Etic Research). This subjective knowledge is broadened and enriched by relating it to relevant contexts of history, politics, religion, and so on. The method of *verstehen*, then, is closely aligned with that of → *hermeneutics*, in which the meaning of one text is grasped (tentatively) by relating it to an array of related texts.

Although Dilthey thought that empathetic understanding was far more pertinent to the human sciences, he also recognized that *erklären* and *verstehen* are not inimical kinds of inquiry (Harrington 2000). Dilthey claimed that the natural and human sciences do not differ so much in the objects studied as in how each considers the "facts" of an object. For example, the sensory data of a public speech can be analyzed either as a purely physiological event, requiring little or no recognition of the human being as a purposeful subject, or as a communicative event in which evidence of the speaker's motives, expectations, and constructions of meaning becomes relevant. Dilthey also maintained that the subjective understanding of human action always depends on knowledge of material facts. For example, if we wish to learn about the meanings the Internet has for people, we must first possess knowledge of the Internet's structure and physical properties. Finally, Dilthey realized that interpretation and human interests suffuse even the most objective-seeming inquiry. Not only do natural scientists engage in "interpretations" of their own constructs; the historical and discursive circumstances of scientific explanation can also be treated as "facts" in hermeneutic investigations of science.

### CRITICISMS AND REFINEMENTS OF VERSTEHEN

The concept of *verstehen* – and more generally, the notion of a special methodological approach for the social sciences – has come under critical scrutiny since it was introduced. Initially, defenders of *erklären* science argued that if an explanatory psychology had not yet produced the same impressive accomplishments as the physical sciences, it was not due to failures of the experimental method itself, but rather because the appropriate research tools had yet to be developed (Harrington 2000, 440). Later, mid-century logical

empiricists like Ernest Nagel (1961) and Theodore Abel (1948) mounted attacks on the scientific adequacy of *verstehen*. Empathetic understanding, they argued, cannot produce real insights into another person's subjective states because it depends on verification from a social actor (the researcher) who already possesses similar knowledge. Without going the additional steps to engage in controlled observation and verification of behavior, the *verstehen* method can only offer "hunches" about the possible meanings of someone's experience. Therefore, if *verstehen* has a role to play at all in social research, it is as a heuristic tool for generating hypotheses. Similar arguments against interpretivism continue to be voiced by logical empiricists today.

In spite of these criticisms, the *verstehen* view of human action attracted many adherents over the course of the twentieth century, especially in the emerging schools of social → phenomenology, *symbolic interactionism* (→ Symbolic Interaction), and social → constructivism. These "creative sociologies" (Morris 1977) have a common interest in describing action from the social actor's point of view. Another reason why *verstehen* gained wide appeal is that the concept itself was given new meaning. Max Weber (1947), for example, considered the analysis of subjective meanings of action to be an essential step in the construction of ideal social types. Others sought to improve upon Dilthey's version of *verstehen*, which was often considered too metaphysical or "introspective" for empirical application. Trying to resolve confusion about what the concept meant, Alfred Schütz (1970) asserted that it had nothing to do with introspection. Instead, he identified three distinctive uses for *verstehen* – as a form of commonsense experience; as an epistemological problem; and as a research method unique to the social sciences. More recently, such philosophers as Hans-Georg Gadamer (1989, 1st pub. 1960) and Charles Taylor (1971) refigured *verstehen* as a fundamentally intersubjective phenomenon, one which requires the sharing of discourse traditions within a living community.

Although the concept of *verstehen* as such does not play a large role in theoretical discourse in communication research, it loomed large as a foundational idea for the growth of interpretive communication studies from the 1970s onward. The study of organizational cultures, relational management, and media audience interpretation, to name just a few areas, owe a significant intellectual debt to *verstehen* and its varied articulations in the social sciences. Theories of intersubjective understanding also proved very important to nearly all of the varieties of qualitative research methods used in communication studies (Lindlof & Taylor 2002; → Qualitative Methodology).

In recent years, the interpretivist research program in communication, and the method of *verstehen* on which it is largely based, has faced skepticism about its capacity to render the inner realities of individuals, groups, and organizations. *Critical theory*, in particular, suggests that people's modes of understanding are constituted and organized in large part through the governing ideological structures in society and the institutional forces that serve to reproduce these structures (→ Critical Theory). Because power is left out of the usual definition of *verstehen*, the role of dominant discourses in shaping people's understandings of their lived experience can be seriously underestimated or ignored (see Deetz 2001; Giddens 1993). Other theoretical positions, such as standpoint epistemology (Harding 1998), seem to complicate the ability of anyone other than members of the group being studied to get "inside" their perspective. In addition, postmodernist conceptualizations of communication suggest that personal agency is so fluid and subject to

multiple, contradictory interpretations that “subjective understanding” lacks any stable point of reference (→ Postmodernism and Communication). Although *verstehen* is not a lost or discredited idea, there may be a need to rethink its assumptions in a changed epistemological terrain.

Conversely, the term *erklären* is seldom cited in the English-speaking communication literature. It has been replaced by other terms – e.g., objective empiricism (Anderson 1996) – that convey the same defining characteristics, especially that of causal determinism (→ Objectivity in Science). Probably the majority of empirical scientific research on communication today follows some form of causal logic. However, the materialist unity of science that the supremacy of *erklären* science was supposed to usher in has never happened. Multiple domains of epistemology and methodology now thrive in communication research, a circumstance that is largely due to the “interpretivist turn” that occurred in the last two decades of the twentieth century (Anderson 1996).

# Victimization, Secondary

Michael Kunczik

Johannes Gutenberg University of Mainz

An aspect of mass media violence largely ignored in mass communication research and criminology is the effect news coverage has on victims of reported crimes (→ Crime Reporting). Few studies address the reaction of the social environment to the victims after a crime (→ Reciprocal Effects). “Secondary victimization” is defined as the victimization of the crime victim due to media coverage. It must also be taken into account that coverage of the crime can benefit the victim reported about, in that it helps them to deal with the fact of having become a crime victim.

Several authors have investigated the influence of media coverage on the outcome of trials (Bruschke & Loges 1999). There is only one study published about secondary victimization in the print media (Kunczik & Bleh 1995). The study investigated reports about the crime victims’ experiences with media coverage and assessed the influence newspaper reporting had on how the victims coped with the crime. The particular quality of the experience of becoming a victim of crime had to be considered in many ways. Because of the differences between the crimes studied and the different social backgrounds of the victims, experiences with the media vary greatly and show a broad spectrum of positive and negative experiences.

Secondary victimization can occur in the most varied ways and very frequently concerns aspects of reidentification. This implies fears of either becoming the victim of reidentification in the social environment or of being the target of a new crime, for whatever reason (→ Fear Induction through Media Content). Victims of different crimes show *different reactions to reports* about the crimes. Victims of sexual assaults (and to a lesser extent of robbery and physical injury) mostly complained about the distribution of intimate information. They did not want that information about the crime and about their person to be made public. In contrast, victims of crimes against property did not oppose media coverage. However, the results within each category showed a wide variance. Some crime victims under certain circumstances agreed to become an object of journalistic interest while others strongly rejected this.

Very often the victims criticized the *insensitive and/or sometimes inaccurate reporting* by journalists about the crime (→ Reality and Media Reality; Accuracy). Many victims were afraid of stigmatization due to the fact that they could be identified, especially in the case of victims of rape. Reporting about crime victims can, however, also have a positive, therapeutic effect (cf. Otto 2002). It is often hard for the victims to talk about what they have gone through. Here the media can assume an important role because they can make it easier for victims to make themselves understood in their social environment. The results of Kunczik and Bleh’s study show that the effects of reporting about crimes on victims are not independent from personality, type of crime, the consequences of the crime, and the results of the criminal case (whether the culprit was sentenced and whether the conviction was regarded as adequate).

On the whole, the victims’ assessment of mass media coverage turned up a surprise: the majority found it positive that their case was reported, and many felt the reporting to be

neutral and appropriate and said they would agree to publication again. The cases of the victims questioned in this study show that reporting crime has more functions than informing the public. In many cases, it is an important element in the psychological working-over of the experiences and may help victims to reintegrate into the social environments from which the events catapulted them. But great sensitivity is required of journalists to avoid victims being damaged further (→ Ethics in Journalism).

## **Video**

*Karen A. Ritzenhoff*

*Central Connecticut State University*

Video began as a technological innovation and changed the media landscape of mainstream network television around the globe forever (→ Television Networks). As the technology became more accessible to the consumer market, it developed a greater impact on independent filmmaking: “media arts centers” emerged in the 1970s and 1980s, as well as → community media with the advent of community video centers and programs. By the 1980s video had become a revolutionizing force worldwide, changing the way audiovisual media as part of TV and film culture were produced and consumed in everyday life (→ Television; Cinema).

Programming diversified and paved the way to today's transnational media systems, which profoundly impact the way we conduct our public and private lives. Nowadays, average citizens, for example, can upload privately recorded questions to presidential candidates and expect to have direct access to their political realm. The TV news coverage of the Virginia Tech shootings in 2007 privileged amateur footage over the images shot by

professional TV crews, and the footage was distributed via *YouTube* to a national audience (→ Amateur Photography and Movies). The actual perpetrator of the shootings sent his video message post-mortem to NBC television as a video manifesto, similar to the recordings of terrorist suicide bombers or even the tapes circulated by Osama Bin Laden (→ Terrorism and Communication Technologies; Mediated Terrorism). Individually produced media messages have gained validity and authenticity as a discursive device and an acceptable form of public speaking. In this way, the current standard of digital video recording has realized what analog technology was originally meant to be: a form of assembling electronic images, captured on tape, that can be easily distributed.

## DEVELOPMENT

Video is seemingly an outdated technology, but one can also regard it as an umbrella term to capture both analog and digital technologies. As an analog recording and distribution system it is currently being phased out of public and private use. Once a welcome medium of information, used by professional television journalists, cable-casters, independent filmmakers, underground video guerillas, visual artists, educators, therapists, researchers, lawyers, and business executives to record and tape, analog video is now a technological dinosaur. VCRs (video cassette recorders) as playback devices as well as video camcorders are being discontinued in public higher education.

*Video tape* when it was first introduced was a recording device that allowed a new aesthetic of representation. It changed the nature of television programming, expanded access to media production, and altered the way audiovisual material could be viewed and used. Because it facilitated pre-recording and editing, its introduction c. 1960 moved television from a largely live broadcast format, with live commercial pitches incorporated into the programs themselves, to pre-recorded and edited presentations, with advertisements spliced in “magazine style” (→ Advertising). Cheaper than film, video democratized amateur access, eventually making home video nearly as ubiquitous as snapshot photography. This marketing of VCRs made it possible for producers and consumers to quickly wind video tape forward and backward and to review content repeatedly. As Johnson (2005) points out, the VCR was a “repetition engine,” a tool to rewind, replay, repeat. In its opening decades television was a “present-tense medium,” but video tape and the VCR allowed for delayed viewing, limitless repetition of content, and seemingly limitless distribution and syndication (Wasser 2001). It anticipated, and set the stage for, the current explosion of individualized media consumption with its descendant technologies: podcasting, digital recording, → Internet downloads, and hand-held devices.

By the late 1970s, average consumers in industrialized countries could acquire video technology and pursue *amateur video production*. By the 1980s, public service community programming on most European state television systems, and newly established public cable access TV stations in the US, provided venues to exhibit professional and community-based video production (→ Community Video). However, in most US cities participation in community cable access never lived up to early expectations. A variety of factors contributed to this, including tepid support from cable operators, a general lack of publicity for and public awareness of video production opportunities, and the reluctance of many people to invest time or energy in video training and nonprofit media production.

The fact that much of the amateur programming on public cable access does not match the polished look of commercial media also seems to inhibit recruitment of new participants, often limiting producers to small and consistent circles of community activists and media enthusiasts. Still, new television channels for nonprofit, community-based video production have successfully expanded, and some of the earliest attempts to take advantage of these new channels, such as Paper Tiger Television and Deep Dish Television, have become legendary examples of the possibilities for low-budget video.

## HISTORY OF THE VIDEO TAPE

The basic technology for analog audiovisual recording is the *magnetic tape*, the video cassette. This recording technology was developed more than 100 years ago by the Danish telephone engineer Valdemar Poulsen of the Copenhagen Telegraph Company, who attempted to record telephone messages onto magnetic film. The first magnetic recording device received a patent in 1898 as the “telegraphone.” The first “*magnetophone*” was introduced by the German company AEG Telefunken in 1935 during the Radio Fair in Berlin. The first stage of video-tape technology is linked to the 1956 Ampex machine, a stationary device that used a 2-inch video tape. The technology advanced, became more mobile and lightweight, and led to different formats, such as the reel-to-reel format of the 1960s and 1970s (3/4-inch U-matic and then 1/2-inch tape cassette, sold by Sony in 1975). Narrower tape brought with it lower cost and increased portability. It allowed the VCR to become a global mass medium. It became the standard to record media messages in broadcast companies throughout the world and was also introduced to the domestic consumer home market. The introduction of *audio cassettes* in 1963 by Philips led to the opportunity to do sound recordings and voice dictation. What was initially conceived as a dictation device became a technology that allowed for individualized recordings to listen to music or to interviews by journalists, as well as the recording of classroom lectures.

A primary advantage of *digital technology* over analog recording is that sound and video quality do not suffer from reproduction. In the tape-to-tape format of the analog medium, each time a tape is copied (that is, each generation of tape in the post-production process) the sound and picture quality are diminished. Digital recording also allows for fast access to materials, precluding the need for tedious forwarding and rewinding when editing, although losing a quality of video that has been used by filmmakers and videomakers over the years as a stylistic trope.

For example, the Canadian-Armenian director Atom Egoyan uses the qualities of video tape to suggest shifting memory and the erasure of the past, as when he erases recordings by taping over them in his early film *Family Viewing* (1987). Egoyan also questions the notion that video can project reality faithfully, a concept that is at the core of the advent of → reality TV, and continues his work in films such as *Speaking Parts* (1989). In *sex, lies, and videotape* (1989) independent filmmaker Steven Soderbergh uses the look of home video to mimic the voyeurism of the amateur pornography market. Other examples where video plays an integral part in the narrative are David Cronenberg’s *Videodrome* (1982), a science fiction where viewers of video tapes develop violent hallucinations, and the Spanish production *Tesis* (1997) by Alejandro Amenabar, which engages with snuff

videos and murder. Gore Verbinski's US production *The Ring* (2002) belongs to the horror film genre and uses video as a key storytelling device. An independent film from France, *Cachée* ("Hidden," 2005), by German-Austrian director Michael Haneke, represents video tapes as carriers of meaning and access to the past. Earlier examples of Haneke's films, such as *Der Siebente Kontinent* ("The Seventh Continent," 1988) and *Benny's Video* (1992), already engage with the mass media as social criticism: television and video, according to Haneke, lead to the collapse of interpersonal communication and to violence.

Video as a *democratic art form and a means of self-expression* continues to be powerful. It facilitates the recording of content in remote areas of the world and helps to bring marginalized voices into the mainstream. One such example is *Afghanistan Unveiled* (2003), a video collection by Brigitte Brault and the Aina Women Filming Group, distributed by *Women Make Movies* (WMM) in New York. The documentary was shot by 14 young women journalists in Afghanistan who had been trained in the context of the post-US-invasion détente to represent life in their villages. The video was shown in international film festivals and on public television in the United States, and has been distributed by WMM. It effectively illustrates the impact of easy access to video production technology.

## VIDEO DIARIES

Another such example emerged in the early 1990s in the United Kingdom. The British Broadcasting Corporation (→ BBC) launched an experiment to empower individual subjects to record so-called "video diaries" as first-person, subjective video statements – glorified home videos. The domestic camcorder and home access to technology allowed for a reinvention of the video medium by providing personal, visual narratives for television. This movement preceded reality TV. The voyeurism and scopophilia entailed in watching somebody's recordings of their private lives and thoughts were tapped into by this innovative strategy of using a well-established institution to support the representation of the voiceless (→ Voyeurism). A team of producers and camera men would assist and accompany a chosen subject over the course of a year and help record his or her diaries. The ratio between recordings and post-production edited content was 150:1. The sheer amount of recordings that had to be edited and selected in post-production posed a major commitment of time and staff for the BBC. Tony Steyger was one of the producers on the show. He describes the BBC Community Programme Unit in London as being part of the fringes of the organization (Steyger 2006). Access television was considered to be different from cable access in the United States and Canada. The topics were suggested by viewers and campaigning organizations, featured social issues, and reflected a social conscience.

What facilitated the occurrence of this form of programming was the invention of the lightweight domestic video camcorder. While the BBC producers trained subjects in recording their lives, and coached them to represent their own stories on tape, at times speaking directly into the camera in the privacy of their own bedroom, the idea was that "real" stories would emerge, unfiltered by the institutional context of the broadcast establishment: "TV made for the public by the public" (Steyger 2006). A key development

in this movement for self-expression has been a change in the visual language: amateur videographers have changed the norms of representation. The genre of the video diary has revolutionized the visual aesthetic by introducing new forms such as innovative angles, point-of-view shots, longer interview bites, spontaneous-looking interactions between subjects on the screen, jump cuts, and open-ended formats of storytelling. The main code of interviews, where subjects are supposed to look off camera, was transformed by the direct address of the diarists (used by Errol Morris in his documentary projects through the device of the *Interrotron*).

This new wave of reality TV has also triggered a set of new mainstream formats, such as *Big Brother* in England and the US *Wife Swap*. The video revolution facilitated the digital explosion of self-expression that one can witness on the web, where “reality” is packaged by techno-savvy individuals who do not need institutional support to express themselves, and who upload their versions of reality onto YouTube and MySpace or stream a program via podcasting onto computer screens.

# Video Games

Kimberly Gregson

Ithaca College

A game is a voluntary activity with rules and some sought-after outcome. A video game is a game played on some electronic device. Playing video games is not necessarily fun all the time. However, succeeding at the challenge of learning the skills to master a game is rewarding.

The computer game industry developed quickly and flourished. Computer or video games have been around since at least 1962 when MIT student Steve Russell programmed *Spacewar!* There was no keyboard, no joystick, and no sound; instead you toggled built-in switches to move the rocket ships. Ten years later, Nolan Bushnell, Atari founder, successfully introduced a version of Pong (electronic Ping-Pong). The first home console units were introduced in the 1970s and the well-known arcade game *PacMan* was introduced in 1980, followed by *Donkey Kong* in 1981 (→ Digital Media, History of). In 2005, the industry saw more than US\$7 billion in sales. Almost 85 percent of the games sold were rated T for Teen or E for Everyone. Puzzle, board, card, or trivia games are played most often. The typical player is no longer a teenage boy playing violent shooter games. In 2005, the average age of video game players was 33; almost 40 percent are women and 25 percent of game players were 50 or older.

Cable television is a good place to start looking for examples of how video games have become a part of our culture. G4, a channel launched in 2002 and available in 53 million US homes, is devoted to video games and the gamer lifestyle, at least the part of the lifestyle represented by males aged 18–24 (→ Cable Television). SpikeTV, another channel targeting young men, hosts the Video Game Awards show annually. And USA Network announced that they would air the Professional Gaming League competition, with announcers and commentators in the style of professional sports.

Video games have influenced movies, too (→ Cinema). One of the earliest movies based on a video game was *Super Mario Brothers*; based on Nintendo's games, it made more than US\$20 million at the box office. Five Pokemon movies have been released in the United States; the first one made US\$85 million at the box office. The two Lara Croft movies grossed approximately US\$200 million. In 2005, three of the top ten bestselling games were based on the *Star Wars* movie franchise. There is even a video game called *The Movies*, in which players become producer and director of their own animated movies. Not all video game movie productions have been successful. The debacle that was the 1982 video game based on *ET: The Extra-Terrestrial* is legendary, with hundreds of thousands of unsold copies of the game cartridge being dumped secretly at night into a landfill. Most video game historians mark the release of the *ET* game as the beginning of the crash in sales from 1982 to 1984.

The amount of attention paid to video games as a part of → popular culture is mirrored by the attention paid by academics to video games and the effects they have on the people who play games (→ Youth Culture). Academic research suggests that video game use leads to less pro-social behavior and more physiological arousal, hostility, anxiety, and aggressive thoughts, as well as increased aggressive behavior after playing

violent video games. There have been several unsuccessful state government efforts to limit sale of violent video games to minors.

However, there is a lack of real evidence that playing violent video games causes harm to minors, and some studies point out that in the United States youth violence has been going down steadily while use of video games has been increasing, suggesting that there is no connection between playing violent video games and violent behavior. Experimental research is criticized, especially when using children, because unnatural settings tend to lead to unnatural results; studies using more natural surroundings have found few violent effects from playing violent video games. Other studies suggest that children need opportunities to experience fantasy violence to distinguish between real and fictional violence and to deal with the real violence in their own lives (→ Computer Games and Reality Perception). Some games are associated with enhanced learning. They engage students and reinforce curricular content. Serious games are being designed to teach emergency response skills, government budgeting, and city planning, as well as health and wellness topics such as biofeedback and asthma management (→ Media Effects; Computer Games and Child Development; Violence as Media Content, Effects of).

## **Video Malaise**

*Garrett J. O'Keefe*

*Colorado State University*

The term “video malaise” was coined by political scientist Michael Robinson in 1975 in reference to a hypothesis that viewership of televised public affairs programming results

in an increased sense of malaise, or vague cynicism or detachment, regarding political institutions, processes, and actors. The rationale was based on a discernible decrease in the 1960s and 1970s in political trust, confidence, and efficacy (→ Political Efficacy) among US citizens, coupled with the rise of → television news and related programming as their dominant source of political information (→ Political News). Various scholars and critics had previously claimed that television posed a unique presentation format and a perceived negative tilt against established political institutions and values. Similar views were voiced in other western democracies (→ Political Cynicism; Negativity).

Some empirical evidence at the time provided partial support for the proposition, but other data were contradictory, as is more the case recently. Nonetheless, the notion gained intellectual and popular currency in part as a result of ongoing conflicts over the role of mass media in western democracies, and the presumed influence of television in particular on political and social culture. More recent work has attempted to tie variations on video malaise, or more generally “*media malaise*,” to such phenomena as decreased credibility in both the media and political institutions, characteristics of political campaigns (especially negative advertising), and increased social and civic isolation resulting from media use. These arguments remain compelling to many, despite largely sketchy and conflicting research evidence.

### **ASSUMPTIONS ABOUT MEDIA INFLUENCE**

Reasoned speculation about the potential for mass media influence on political and social norms and values grew rapidly after World War II, especially in the US. Most of the scholarship emphasized reinforcement of existing norms and values rather than change. Lazarsfeld and Merton’s prescient 1948 essay, “Mass communication, popular taste, and organized social action,” defined several social functions of mass media as operating in that sense (→ Lazarsfeld, Paul F.). However, they noted one potential dysfunction: a “*narcotizing dysfunction*” view of media posed that increased public attendance to a rising “flood” of mediated information could lead to less social action, superficial involvement, and political apathy and inertness. Kurt and Gladys Lang suggested (1959) that television in particular could lead to more passive political activity (→ Attitudes, Values, and Beliefs, Media Effects on).

Empirical research of the era, however, worked against such arguments. The largely campaign-based media effects studies of the 1940s and 1950s supported the then-popular “minimal effects” view of media, including television, on voter knowledge, beliefs, and behaviors (→ Media Effects, History of). It was not until the late 1960s and early 1970s that research began taking a broader view of possible media influences on public opinion beyond voting, including political socialization, participation, and the shaping of attitudes and values. The first published research evidence linking television public affairs viewership with political malaise appeared in 1976 in an *American Political Science Review* article by Michael Robinson. Robinson combined a series of experiments with re-analyses of several → survey datasets, impressively making an “equivocal” case that television news viewership was linked to indicators of political malaise in national population samples of US adults, and giving experimental evidence (→ Experimental Design) that exposure to a televised negative portrayal of the Pentagon resulted in less positive beliefs about the military.

## COINING THE TERM

The specific rationale Robinson initially offered for the video malaise proposition is intriguing. As noted above, television had become by far the major source of political news for most of the public, and, equally if not more important, much of that viewing audience was less politically involved to begin with (→ Political Media Use). Robinson termed this portion of the audience “inadvertent”: they were likely watching television for other reasons, and inadvertently came across political information they would likely not have gotten otherwise, e.g., from newspapers or interpersonal sources. With television in many cases as their only source of political news, the effect became magnified for them. News audiences also uniformly ascribed high credibility to the programming, high trust in television news anchors, and belief in the accuracy of information being provided; hence, television news had more persuasive capability (→ Credibility of Content).

Insofar as the medium itself is concerned, Robinson pointed to considerable evidence that television news, unlike print, almost inherently plays up a more dramatic or thematic portrayal of events, following storylines to maintain audience interest. It tends to be more interpretive, which Robinson concluded lends itself to more negativism, contentiousness, and anti-institutionalism than would the same event reported in print (→ Negativity). Rather than an inherent bias against one political party or faction or another (→ Bias in the News), one can argue that television news took a more negative tone against one and all traditional establishments. Moreover, taking a historical view, in the US this research was evolving within the time frame of the debilitating departure of US armed forces from Southeast Asia, with all of the cleavages in American society and culture that spanned that era, not to mention the hard-to-imagine ongoing political drama of Watergate (→ Watergate Scandal). Whatever the merits of arguing that television was more negativistic than other media, the raw material for such coverage was present.

## EVIDENCE FROM SUBSEQUENT STUDIES

The inadvertent audience rationale behind video malaise was specifically tested in a study of the 1999 European elections, and found wanting. Schoenbach and Lauf (2002) posited that less politically interested citizens were “trapped” into viewership of televised campaign information by heightened coverage of the election on fewer available channels, and would thus be more influenced by television than other sources. However, less interested voters were largely able to tune out election coverage, and even for those who did not little television influence was found.

An extensive analysis of several American and European datasets by Norris (2000) found little if any evidence of media or video malaise, and in fact most of the findings flowed in the *opposite direction*: greater attention to news media including television correlated with higher levels of trust, confidence, and engagement in the political system (→ Attending to the Mass Media). Norris carefully posits a case for “a virtuous circle,” in which positive political dispositions lead to greater attention to political public affairs content, which in turn reinforces engagement in civic matters. While the data presented are post hoc and correlational at best, they do work against the malaise contention, and Norris’s rationale is a compelling one that takes into account changes in media systems

over recent decades. For example, in explaining why the views of the less or more negatively politically involved are not reinforced by media, Norris points to the more recent multimedia, multichannel information and entertainment environment, in which it is far easier for the disinterested or dismissive to tune out political content and choose more pleasing alternatives (→ Entertainment; Entertainment Content and Reality Perception). Further, to the extent that the disengaged are exposed to news media, they may see it as less credible, given considerable evidence that trust in government and the news media are well correlated.

More recent findings indicate a *reciprocal downward trend in trust* in both political institutions and the media, with general political malaise more likely to pull down the stature of the news media (Jones 2004). Other work has suggested that attacks and counterattacks between news media and government officials can contribute to the diminished credibility of both.

### CONDITIONS FOR MEDIA MALAISE EFFECTS

Norris also suggests that media malaise is more likely to exist with respect to specific kinds of political issues and content. Cappella and Jamieson (1997) and others offer extensive research on “*strategic*” news coverage of politics that emphasizes the contest-related or competitive aspects of politics, as well as candidate style, candidate tactics, and media depictions, as opposed to presumably more substantive coverage of political issues, candidate and party values, and the like. The argument goes that more strategic coverage leads to more citizen cynicism regarding politics and less engagement. While the link between strategic news and cynicism has been reasonably well established, the relationship to political engagement is less clear (→ Social Capital, Media Effects on). More recent research focused on European Union and integration issues indicates that impact on cynicism is a matter of degree and type of strategic news (De Vreese 2005). Further, the case is made that several studies have been unable to clearly link moderate levels of cynicism to political participation, and that perhaps a modicum of cynicism generated by strategic news or other means is not unhealthy for the politically more active.

Even more to the point regarding television, recent evidence points to *incivility* in political discourse as adversely affecting trust in government (Mutz and Reeves 2005). Televised, heated political arguments that transcend social norms for discussion and debate appear to reduce such trust, while stated differences of opinion in themselves do not (→ Deliberativeness in Political Communication; Political Discourse). Unfortunately, greater incivility in political discussions appears to promote greater viewership and interest, while more polite and reasoned discourse may have trouble finding an audience. Arguably, written debates or reports of them, no matter how acrid, are unlikely to depict to audiences the same emotional fervor as the more intimate televised experience. Yet other evidence appears to consistently suggest that negative political campaigning can be an effective strategy, perhaps particularly in mobilizing voter participation (Martin 2004).

Research focusing on media malaise propositions over the past three decades has largely lacked coherency and cohesion. Theoretic perspectives, operationalizations of the concepts involved, and frames of analysis have greatly varied from study to study. Part of the problem may be the typical intellectual drift that can occur when more emphasis is

placed on demonstrating the impact of an independent variable, e.g., television news, than on explaining the likely multitude of influences on a dependent variable such as political malaise, no matter how specifically defined. One suspects it may now be even harder to clarify linkages between mass media and political dispositions given the converging of media channels, the computer-driven personalization of media sources, and their more interactive nature.

# Violence against Journalists

John Nerone

*University of Illinois at Urbana-Champaign*

Violence against journalists is universal, found everywhere there is journalism. But the level and type of violence vary according to a series of factors, involving the general level of violence in a society or political system, the level of professionalism in the news media, and the extent to which violent action is useful in representing public opinion. Violence against journalists almost always includes a symbolic dimension; in some cases, the violence is primarily symbolic.

## EVIDENCE ON VIOLENCE AGAINST JOURNALISTS

Several organizations track violence against journalists worldwide. *Reporters without Borders* reports the number of journalists killed each year: 2006 (82), 2005 (63), 2004 (53), 2003 (40), 2002 (25). The *Committee to Protect Journalists* has been issuing an annual report, "Attacks on the press," for more than a decade (the reports from 1996 on are available online). The *International News Safety Institute*, a clearinghouse for a variety of journalism and human rights groups, reported in 2007 that more than 1,000 men and women had been killed in the previous 10 years while on the job. Their report lists 167 deaths for 2006, more than double the figure from *Reporters without Borders*, probably because the *News Safety Institute* included auxiliary personnel, like translators. The deadliest locations were in Iraq, Russia, and Colombia, countries that all had high levels of crime and civil unrest or both. These organizations note that, especially in conflict zones, journalists are increasingly subject to violent attack.

Wartime and social upheaval have always produced violence against journalists. The dangers of covering a war are integral to the mystique of the → war correspondent and especially the photojournalist, who want to get "Capa close" to the action, a term that refers to Robert Capa's iconic photographs of military action, from the Spanish Civil War through Vietnam (→ Photojournalism). And in social transitions, specific journalists become engaged and targeted through either partisanship or a determination to expose powerful interests. Autocracies use violence to stifle criticism (→ Freedom of the Press, Concept of), and → crime reporting can also be glamorously dangerous.

But the largest number of fatalities appeared in local reporting of crime and corruption. According to the *Committee to Protect Journalists*, the *most common cause of death* among journalists who have suffered violence is murder, and the most common perpetrators are political groups (26.7 percent), government officials (20.1), criminal groups (12.0), paramilitaries (8.4), and militaries (6.8), with the civilians outnumbering the military by a hefty margin. In China, for instance, a rapidly expanding media system at the beginning of the twenty-first century produced a wave of exposés of local corruption, and the targets of the exposés frequently became violent. In 2005, "dozens of uniformed traffic officers" attacked Wu Xianghu, deputy editor of a newspaper in coastal Taizhou, Zhejiang province, a day after his paper reported corruption in granting vehicle licenses. Senior officer Li

Xiaoguo was removed from his post for his role in the attack, *Xinhua* reported in October. Wu later died from his injuries (→ China: Media System).

Journalism is dangerous, but less dangerous than allied endeavors. To be a soldier is more dangerous than to be a war correspondent, to be a cop more than to be a crime reporter, and to be a labor organizer more than a sympathetic journalist (→ Labor in the Media). Nevertheless, throughout its history and always in its mythology, journalism has always courted danger.

## PATTERNS OF VIOLENCE

Beyond extraordinary events linked to war and social upheaval, patterns of violence are systemic to the operation of a press system and are evident in the histories of most societies. Violence operates at the boundaries of the → public sphere and can be a form of policing. Violence marks the limits of the legitimate operation of the press. In any political system, the media are involved in the representation of → public opinion. Historically, political forces attempt to capture the representation of public opinion through various means: making news, exerting political or economic pressure, winning elections. When peaceful means fail, violence becomes useful (→ Freedom of Communication).

Violence has been used to try to exclude ideas and groups from public discussion. Such exclusionary violence often appears to be a surrogate for government censorship (→ Censorship, History of). In US history, during the build-up to the Revolutionary War, patriots used crowd actions to target printers who published loyalist pamphlets, both to intimidate them and, acting as “the people out of doors,” to symbolically declare loyalism as outside of the sphere of acceptable public expression (→ Printer-Editors). In the nineteenth century, *antislavery organizations* were similarly targeted. The first antislavery publication in any particular locality was highly likely to be the target of a mob, usually one organized by local party leaders who wanted to show the national party that they were “sound” on the slavery issue. Throughout US history, minority and foreign-language publications were targets at moments of tension, also as a way of symbolically defining the limits of legitimate membership in the public (→ Ethnic Journalism; Minority Journalism). The *World War I period*, a watershed for the history of civil liberties generally in the United States, saw a rash of violent attacks against the publications of the large German-speaking minority group (which then experienced a net out-migration following the war) as well as against radical groups like the Industrial Workers of the World.

Violence against the press is a common feature in many countries whose populations are diverse. Communal media in India, for instance, have experienced violence similar to that visited upon African-Americans in the US south at the end of the nineteenth century. Such actions often look like spontaneous popular outbursts (→ Mediated Populism); they are usually carefully scripted to do so. When violence runs along ethnic or religious fault lines, its spontaneity becomes a matter of political contest. In the case of the international wave of violent unrest that greeted the publication of cartoons of the prophet Muhammad in the Danish *Jyllands Posten*, critics of protesters argued that the violence was staged as a way of delegitimizing the newspaper.

The line between public and private has also been a site of violence (→ Privacy). The subjects of personal criticism in the press, whether private or public figures, have often

struck back. Journalists and editors have at times assumed a certain level of combat to be part of the job. Mark Twain's satirical account of "Journalism in Tennessee" is testimony to the ordinariness of this sort of violence in the nineteenth-century United States; the same has been true of highly partisan media in other developing nations (→ Partisan Press). Although generally too low in social stature to merit the ritual, journalists have also *engaged in dueling*. The expectation that a public insult would occasion an opportunity for "satisfaction" by dueling was common. In France, Émile de Girardin, founding editor of the cheap popular Conservative newspaper *La Presse*, killed Armand Carrel, editor of the more established *Le National*, in a duel in 1836. Incidents of personal violence like these have often been primarily political in nature, although they have been choreographed to look like affairs of honor. In recent years, personal violence has been directed more often at journalists covering celebrities, so-called *paparazzi*, for instance, who intrude too closely on what their subjects want to be a protected personal space. This is a depoliticized version of personal violence.

Another common pattern of violence against the press involves *labor issues*. The publicists for labor movements have been targets of violence, though not as often as on-the-ground organizers. Labor activists have also targeted anti-labor newspapers, the most famous case being the bombing of the *Los Angeles Times* in 1910. Within news organizations, too, tensions between workers and management have occasionally produced violence, especially during strikes (→ News Workers). In the United States, the most famous incidents occurred during the 1912 strike in Chicago, during which the newspapers formed a united front and secured the services of Max Annenberg to provide muscle to intimidate newsboys into accepting an offer. Annenberg had honed his techniques during the frequently violent circulation wars of the previous decade, when he had hired out his services first to Hearst's *Chicago Journal* and then to other Chicago newspapers.

A final form of violence that has become more common as the media have become more concentrated in ownership and management is inclusionary. *Movements that feel themselves neglected* by the news media will sometimes commit acts of spectacular violence to claim coverage for themselves. During the 1980s in Peru, for instance, Shining Path operatives attacked the press as well as bombing banks, electrical towers, and other establishment symbols to gain public attention (Barnhurst 1991). In a sense, most terrorism is a form of inclusionary violence. On a more mundane level, acts of vandalism, like inserting fake wraparounds in newspapers in newsboxes, can also be called inclusionary.

## VIOLENCE AND PROFESSIONALIZATION

Because violence is an effective means of intervening in the process of representing public opinion, it is always present in some measure in a press system. In most developed democracies, however, the level of violence is quite low. This might be a result of ownership patterns and market conditions, which discourage the kind of ideological competition that previously nurtured violence. It might also be tied to the → professionalization of journalism, which tends to insulate newswriters from the more personal forms of attack.

Because violence has occurred wherever the press is seen to be an agent of real or potential political transformation, the diminution of violence in a national system might appear as a sad commentary on the power of the press. In the most professionalized press systems,

there is very little violence. But often there is a perception that work is becoming more dangerous. Why? Perhaps the muckraker ideology that pervades the professional press also invites a *myth of violent retribution* (→ Muckraking). It is also possible that the professionalization of the press gives greater visibility to violence. The more “white-collar” journalists become, the less reasonable violent attacks seem. A blue-collar reporter might expect to be slugged occasionally, but a white-collar journalist: that is man-bites-dog territory.

## **Violence as Media Content**

*Nancy Signorielli*

*University of Delaware*

Most of what we know about violence in the media has explored violence on → television. While some studies of television violence were conducted during the 1950s and 1960s, most of the information about the amount of violence on television in the US comes from the long-term research conducted as part of the Cultural Indicators (CI) Project’s analysis of samples of prime-time network programs (1967 to 2002; → Cultivation Theory; Gerbner, George) and the National Television Violence Study’s (NTVS) short-term analysis of a larger sample of network and cable channels from the mid-1990s (→ Television Networks; Cable Television). In the UK, information about television violence comes from an analysis of samples of programs from the mid-1990s. Knowledge about television violence in other countries (Japan or the Netherlands, for example)

comes from studies looking at violence in samples of programs taken at one point in time. Most of these studies, whether conducted in the US or in other countries, focus on physical violence (hurting or killing) because emotional violence is extremely difficult to define and isolate in a consistent way.

### **AMOUNT OF VIOLENCE IN TELEVISION PROGRAMMING**

The CI studies examine and measure the amount of physical violence on television by monitoring network broadcast television programming. These analyses show that the levels of violence on television are quite high and have been relatively stable for the past 30 years. Gerbner et al. (1994) found, for samples of prime-time network programs broadcast between 1973 and 1992 (N = 1,306), that violence appeared in 7 out of 10 programs at the rate of 4.6 incidents per program, and that half of the major characters in these programs were involved in violence. Signorielli (2003) found in samples of prime-time programs broadcast between 1993 and 2002 (N = 1,127) that violence appeared in 6 out of 10 programs at an average rate of 4.5 acts of violence per program.

The NTVS (Federman 1998) examined physical violence in three samples (1994–1995, 1995–1996, and 1996–1997) of composite weeks of programming across 23e channels operating between 6:00 a.m. and 11:00 p.m. each day. The sample (N = 8,200) included broadcast (commercial networks, independent stations, and public television) and cable channels (basic and premium channels such as HBO). This sample presents a broader picture of violence on television than the CI perspective. In all of the programming sampled, the NTVS found no change in the prevalence of violence from the 1994–1995 to the 1996–1997 television seasons. Moreover, roughly 60 percent of the programs in each sample contained violence, findings very similar to those of the CI researchers.

In the UK, Gunter et al. (2003) sampled programming for 20 days in both 1994–1995 (N = 5,607) and 1995–1996 (N = 7,237). In both samples, the percentage of programs with violence was considerably smaller than in the US studies. In the 1994–1995 sample, 37 percent of the programs were violent, whereas in the 1995–1996 sample, 45 percent were violent. The increase was due to inclusion of programs on the satellite channels as well as the addition of two satellite channels (TNT/Cartoon network and Sky Sports; → Satellite Television) in the second year of the study. Both the NTVS and the UK study found that premium movie channels (e.g., HBO) had the most violence – more than 8 out of 10 of the programs in these samples contained violence.

There have been several studies of television violence in other countries. *Japanese* television programs, for example, are considerably more violent than programs in most other countries but quite similar to US programming (Iwao et al. 1981). Japanese television violence, however, tends to be more graphic than violence seen in other countries. Interestingly, many recent → cartoon programs now seen in the US (*Pokémon*, *Dragon Ball Z*, *Digimon*, etc.) are Japanese → animation that are specifically translated for the US market (→ Anime; Rutenburg 2001). Violence in the programming seen in the *Netherlands* is similar in level to that seen in the US (Bouwman & Signorielli 1985). *Canadian* television is considerably less violent than US programming. Nevertheless, because most Canadians can easily see a considerable amount of US television, audiences would see less violence only if they watched primarily Canadian-produced programs (Gosselin et al.

1997). *Finnish* programming is also less violent than US television, although imported programs tend to be more violent (Mustonen & Pulkkinen 1993). Likewise, *Korean* television is less violent than US programming (Kapoor et al. 1994).

Overall, the US studies, particularly those conducted in the 1990s, show stability in the amount of violence on television: violence appears in roughly 6 out of 10 programs in the US. Consequently, whether viewers watch network broadcast channels or cable channels, it is relatively difficult to avoid violence. From an international perspective, countries that import considerable amounts of programming from the US have levels of violence on television similar to those seen in the US, whereas those that do not import many programs have lower levels of violence. One of the reasons for the high level of violence in imported (typically US) programs is that violence transcends language barriers – it is relatively easy to translate because pictures are self-explanatory.

### THE CONTEXT OF VIOLENCE

The way violence is presented on television (i.e., the context in which it appears) is an important consideration. The NTVS advanced understanding of the way violence is presented on television, particularly its contextual elements, by examining the consequences of violence, whether humor was involved, the graphic nature of the violence (→ Television, Visual Characteristics of), whether weapons were used, and the degree of → realism in the violence. The analysis of data from 1994 to 1995 found that the context in which violence is presented poses risks for viewers. In particular, three-quarters of the violent scenes were committed by characters who were not punished, negative consequences of violence were rarely presented, one-quarter of the violence incidents involved the use of a handgun, and less than 1 in 20 programs emphasized anti-violence themes.

Yet television violence was not particularly graphic (bloody or gory). Even though broadcast network programs had less violence than cable channels, the context of violence on both broadcast and cable was similar. Prime-time broadcast network programming and basic cable programming were less likely than premium cable programming to include violent interactions that depicted pain or harm. Consequently, prime-time network broadcast programs show relatively low levels of pain and suffering. Similarly, CI research also found that violence tends to lack context and that most programs do not show any long-term consequences of violence, such as remorse, regret, or sanctions. The lack of contextual elements is not limited to US programming. The UK study found that programming does not show violence that is particularly harmful and that there was little evidence of blood, gore, and pain. Most of the motives for violence in UK television were related to evil and destruction. The major situations in which violence occurred were interpersonal disputes and crime, followed by scenes focusing on power and self-preservation.

### WHO IS INVOLVED?

Any discussion of the amount of violence on television must examine the characters who do the hurting and killing or are hurt and killed. CI studies show that television violence illustrates and provides lessons about power. Violence illustrates who is on top and who is on the bottom, who gets hurt and who does the hurting, and who wins and who loses.

These studies consistently find a power structure related to character demographics, with earlier studies finding women and minorities more likely to be hurt than to hurt others. In addition, during prime time, men are more likely than women to be hurt (victimized) or hurt others (commit violence).

In the programs of the 1980s, men were slightly less likely to be involved in violence than in the programs of the 1970s. Fewer characters still were involved in violence between 1993 and 2002. Whites and minorities were equal likely to be victimized or commit violence (about a quarter of both whites and minorities). During the 1990s, the ratios of hurting to being hurt changed from the patterns seen in the 1970s and 1980s for women but not for men. Today, for every 10 male characters who hurt or kill, 11 are victimized, the same ratio found in the earlier samples. For women, however, instead of 16 women being victimized for each woman who hurts or kills, the odds are even – women are equally likely to hurt or kill and to be hurt or killed. Moreover, although whites are a little more likely to be victimized than to hurt others, the odds for minority characters are even (→ Sex Role Stereotypes in the Media; Stereotypes).

Although the NTVS did not generate a profile of characters on television, it did examine the demographic characteristics of perpetrators (those who commit) and targets (victims) of violence. Most of the perpetrators (close to three-quarters) were men; only 1 in 10 was a woman. Few perpetrators were categorized as heroes, and most were white. Similarly, most of the targets were men and most were white. Potter and colleagues (1995), in looking at a composite week of evening programming (6 p.m. to midnight) on four networks, also found that television typically presents an unrealistic picture of serious aggression in regard to the race of those who commit the acts as well as of those who are victimized. In short, television over-represents both white perpetrators and white victims of aggression. Overall the research shows that more men than women and more whites than minorities are involved in violence. Similarly, studies conducted in the UK found that women were much less likely to be involved in violence.

### **THE MESSAGE OF VIOLENT CONTENT**

Overall, the consensus of findings from studies of media content indicated that contemporary television programs and video games may not adequately support or reinforce the lesson that “crime does not pay.” On television, the lack of adequate contexts for violent behaviors may transmit the lesson that violence is “sanitary,” that it is not necessarily immoral, and that those characters who commit violence are not sorry for their actions and may not be punished for their transgressions – in short, there are few, if any, consequences of committing violence.

Thus, the environment of violent entertainment in which many people, including children, spend most of their free time may be potentially harmful. Last, the lack of realistic contexts for violence on television may signal that aggression and violence are acceptable modes of behavior (→ Violence as Media Content, Effects of; Violence as Media Content, Effects on Children of).

## **Violence as Media Content, Effects of**

*Michael Kunczik*

*Johannes Gutenberg University of Mainz*

*Astrid Zipfel*

*Heinrich Heine University of Düsseldorf*

Discussion of the harmful effects of media violence is as old as the media themselves. There is no medium that has not been suspected of stimulating real-world aggression. Spectacular violent acts such as those in Littleton, Colorado (where in 1999 two teenagers murdered 13 people before committing suicide), or Erfurt, Germany (where in 2002 a 19 year old killed 16 people and himself), regularly instigate public interest on this topic. Although there is a huge body of research on the effects of media violence, public discussion

rarely reflects scientific knowledge (→ Entertainment, Effects of). This may be due to the fact that the results are complex, sometimes contradictory, and do not allow for simple conclusions. However, on the basis of this research some widely accepted assertions about the effects of violence in the media are possible.

Research has mainly focused on the effects of fictional television violence. Recently, however, there has been much interest in violent content in music and music videos (e.g., Smith & Boyson 2002; Anderson et al. 2003), the Internet (e.g., Slater 2003), and especially in computer games (e.g., Carnagey & Anderson 2004; Sherry 2007). Typically, research examines the media depictions of personal violence (i.e., intended physical and/or psychic damaging of a person, living beings, and inanimate objects by another person).

### THEORIES OF PRO- AND ANTI-SOCIAL EFFECTS

Research on the effects of mediated violence has been conducted within several theoretical frameworks. The roots of → *catharsis theory*, which was very popular for a long time, can be tracked back to Aristotle, for whom catharsis meant “the homeopathic cleansing of affects” through compassion and fear aroused by tragic theatre. According to modern catharsis theory (Feshbach 1961), the viewing of media violence would lead to an engagement in fantasy aggression that permits the purging of one’s feelings and the discharge of aggressive tendencies such that the viewer is less inclined to behave aggressively after viewing violent media content. Catharsis theory could not be confirmed by research and has been abandoned by the scientific community, although it is still very popular in non-scientific discussions.

An alternative explanation for sporadic findings of aggression reduction is *inhibition theory*, which assumes a deterrent effect of media violence that causes fear and inhibits aggressive behavior. Grimm (1999) assumes a process of “negative learning” by which the overt depiction of horrible consequences for the victim leads to a critical reflection of the violent perpetrator’s behavior – unless empathy with the victim is so intense that it triggers an aggressive impulse of revenge (the “Robespierre effect”).

The simple assumption that media violence is imitated directly through a *suggestion process* has been clearly refuted. However, there may be special conditions that allow imitation of violent acts. Contagious effects of media violence have been studied concerning homicide, running amok, and suicide. The imitation of suicides is also labeled the “Werther effect” because Goethe’s *The Sorrows of Young Werther* (published in 1774) allegedly led so many people to commit suicide that in some countries the book was banned. Phillips (1974) showed that after intense coverage of suicides (e.g., Marilyn Monroe’s) the suicide rate rose in the USA and in Great Britain. In Germany, statistical proof for imitations of suicide was provided by a study on a television film in the early 1980s in which a 19-year-old high school student committed suicide by throwing himself in front of a train (Schmidtke & Häfner 1988). Imitations of this type of suicide could most clearly be proved for people most similar to the model, male youths aged 15 to 19 in this case. However, media content seems to be only one of many more important causes or the final trigger for an action planned long before. In any case, the details of the media content and the attributes of the recipient must be considered.

Although the simple suggestion mechanism has been refuted by research, public discussion on the contagious effects of violent media depiction is ongoing, and this discussion on the risks of media violence holds a risk in itself: Aggressors often tend to justify their behavior by referring to role models on television. This rationalization of one's own behavior can happen both before an offense (thus facilitating violent behavior) and after it. Denying responsibility by blaming it on the media is so popular because the delinquents can present and/or see themselves as led by external forces. The *habituation theory* emphasizes cumulative, long-term effects (→ Media Effects Duration). It assumes that media violence causes emotional blunting and desensitization. As some followers of the habituation theory maintain, this not only reduces emotional and physiological reactions to violent media content and increases the need for stronger stimuli, but also affects attitudes toward violence in real life. It reduces empathy with the victims of violence, increases tolerance for violent behavior in others, and reduces the inhibition threshold for one's own aggressive behavior. Although some studies seem to back it, habituation is not yet scientifically proven.

Another approach that deals with long-term effects of media violence is *cultivation theory*. It assumes that heavy television viewers suffer from a distorted view of social reality. Viewing violence thus may cultivate fear of crime and the belief that the world is a mean and scary place (→ Cultivation Effects; Gerbner, George). Research is currently concentrating on intervening variables in that process such as the experience of victimization, exploring the effects of special media content (e.g., crime movies), and seeking to explain information processing leading to cultivation in more detail. Additionally it has to be clarified to what extent fear is not the result but the cause of heavy television viewing (escapism).

According to → *excitation transfer theory* different types of media content (violence, but also eroticism, humor, sports, etc.) cause a state of unspecific arousal that intensifies subsequent actions. The behavior being intensified depends on the particular situation and does not relate to the content of the media stimulus. For example, erotic media stimuli may intensify aggression while media violence may foster caring behavior.

The state of arousal and the current situation also are important factors in *stimulation theory*, which is based on → *frustration aggression theory*. According to Berkowitz (1970), certain types of media violence (e.g., violence that is presented as justified) enhance violent behavior under circumstances in which the viewer is emotionally aroused (e.g., due to frustration; → Excitation and Arousal) and meets situational cues that are associated with the actual feeling of anger or with past experiences, or that generally instigate aggression (e.g., weapons). A state of emotional arousal brought about by frustration leads to an aggressive disposition and can result in violent behavior if watching media violence bears a resemblance to the real situation.

Later, Berkowitz (1984) focused on the possibility that media violence could prime thoughts of aggression, making actual violent behavior more likely. The concept of *priming* (→ Priming Theory) is based on "cognitive neo-association theory" and means that in brain cognition, emotions and behavioral tendencies are connected via associative pathways or neuronal networks. If a stimulus (e.g., media violence) activates a node inside this network (priming), activation spreads to related nodes, activating associatively connected thoughts, emotions, and behavior. This process happens automatically and

unconsciously, and it influences the interpretation of new stimuli and makes aggressive behavior more probable in the near future. However, priming theory also assumes that through repeated stimulation, activation may become chronic, resulting in long-term effects. Scientific results support priming theory but priming processes still have to be described more precisely.

Priming is closely connected to *script theory*. Scripts are mental routines that are stored in memory and applied to guide behavior and to solve problems (→ Scripts; Schemas and Media Effects). Scripts contain information about the typical course of an event (e.g., consultation of a doctor, dealing with provocation), people's behavior, and the outcome of actions. It is assumed that children who watch much media violence will develop scripts concentrating on violent solutions to a problem. Situational cues will activate the matching scripts. Scripts that are frequently repeated can be accessed more easily. Media content can help to develop new scripts and to activate existing ones.

### SHORT- AND LONG-TERM EFFECTS

Bandura's *theory of social learning* seems to be the most appropriate approach to explain the quite heterogeneous results of medium-to-long-term studies on media violence (→ Observational Learning; Bandura, Albert). It postulates that people adopt patterns of behavior by observing other people's actions (in reality or in the media). However, these patterns do not necessarily have to be acted out. Normally, they remain latent. Violent actions usually underlie inhibiting conditions (e.g., social norms, fear of punishment or revenge, sense of guilt). Violent patterns of behavior only transfer into manifest action under adequate conditions. This may happen if the person encounters a situation that resembles one observed before and if he or she has the means necessary for imitation (e.g., special weapons).

The most important factor, however, is the consequence of a certain behavior (success or failure, reward or punishment) experienced by the role model and/or experienced or expected by the observers themselves. Factors considered by the theory of social learning comprise the attributes of media contents (e.g., importance, explicitness, comprehensibility, efficiency, justification, rewards for violence) and of the observer (e.g., character, cognitive abilities, state of arousal, interests, former experiences with a certain behavior) and social conditions (e.g., socialization, norms and values in family and peer group). Social learning theory takes into account that different observers perceive the same contents differently and derive different consequences for their own actions (→ Selective Perception and Selective Retention). Against this background, the finding that children who possess no preference for violent media contents will not show any tendency toward violent behavior, even after long contact with it, does not contradict the theory.

From the perspective of social learning theory, the *general patterns of television violence* facilitate learning and implementation of violent patterns of behavior (→ Violence as Media Content). As a rule, the plot is suspenseful and exciting, assuring the necessary attention. Violent acts normally are simple (i.e., easy to perceive and just as easy to imitate). Since the "good" heroes also massively use violence to achieve their aims (e.g., justice), they are suited for identification. Furthermore, violence almost always pays off. Hence, observer can conclude that he or she only needs to be careful enough to avoid the

punishment most of the “baddies” suffer at the end of a plot, although up to then they have successfully used violence in many sequences. Overall, violence is shown as a normal, everyday behavior. Although the acts of violence as such are highly unrealistic (hardly any wounds, injuries, etc.), the models themselves are depicted realistically.

New results indicate that in judging the harmful effects of media violence, it is important not only to consider the attributes of violent role models. The results rather suggest that the recipient often identifies with the *victim* of media violence, resulting in a deterrent effect on violent actions (Grimm 1999).

### AN INTEGRATIVE MODEL

The latest theoretical development in media violence research is the *general aggression model* (Carnagey & Anderson 2004), which tries to integrate different concepts such as learning theory, priming, script theory, and excitation transfer theory. The model suggests that behavior is the result of two input variables: the person (including character, attitudes, values, scripts, current state) and the situation (environmental factors like aggressive cues, rewards, provocation, etc.).

These input variables influence the appraisal of a situation and the subsequent impulsive or thoughtful choice of behavior by influencing the current internal state of a person. This happens through three main routes of impact that may interact: cognition (aggressive constructs become more accessible), affect (evoking of hostility), and increase of arousal. The person's behavior results in reactions in the environment that may influence the input variables and lead to reinforcement or inhibition of the chosen behavior in the future.

Based on this cyclical process, the general aggression model also posits long-term effects, because repeated exposure to violent stimuli helps to develop easily accessible aggression-related knowledge structures that may be reinforced by successful application and that become increasingly complex, automatized, and resistant to change. Together with desensitization effects, this may lead to the development of an aggressive personality.

### EFFECTS STRENGTH AND FUTURE RESEARCH

Most researchers agree that media violence may cause negative effects. However, these effects have to be considered in a differentiated way. Correlations found in empirical studies on television violence are usually quite small (between  $r = 0.1$  and  $r = 0.31$ , which means that at most 9 percent of aggression is explained by media violence; Comstock & Scharrer 2003). Although it is assumed that violence in computer games ( $\rightarrow$  Computer Games and Reality Perception; Computer Games and Child Development) should be far more dangerous (because of the player's active role, the current repetition of violent acts that are rewarded immediately, etc.), and research indicates negative cognitive, emotional, and behavioral effects, particularly strong effects of computer game violence have not been found up to now.

These small effects point to the fact that media violence is only one factor within a complex network of causes for real-world aggression. However, a small correlation between media violence and violent behavior that holds true for the average of recipients

does not mean that strong effects for particular forms of media contents and for particular recipients cannot be found.

*Future research* should concentrate on the conditions for negative effects to emerge. In doing so, three main factors of influence must be considered (Kunczik & Zipfel 2006): quality of media content, attributes of the recipient, and his or her social environment. According to the present state of knowledge, negative effects of media violence are most likely to occur to young, male, socially deprived heavy viewers who already possess a violent personality, grow up in violent families with high media (violence) usage, experience much violence from their parents and in school, and belong to aggressive and/or delinquent peer groups. The last point means that they are exposed to a “double dose” of violent role models.

Violent media contents and their own violent experiences interact and reinforce each other; violent media models are much more interesting and “useful” for children growing up in a violent environment, and additionally, the violent behavior of media models seems to be quite normal to them. These recipients are even more at risk if the media content they perceive presents violence in a realistic and/or humorous context, if violent behavior seems justified and is committed by attractive, successful protagonists with whom the recipient can identify (e.g., also because of the resemblance between them), and especially if violence is not punished and does not harm the victim in a visible way. These factors are not independent of each other, but the interaction patterns are not yet described in detail. This remains an important scientific task to be fulfilled.

## Violence as Media Content, Effects on Children of

*Brad J. Bushman*

*University of Michigan and Free University Amsterdam*

*L. Rowell Huesmann*

*University of Michigan*

Many children today spend more time consuming media than they spend attending school, or in any other activity except for sleeping. By “media” we mean any form of mass communication such as → television, → Internet, video and computer games (→ Video Games), comic books (→ Comics), and → radio. Violence is a dominant theme in most forms of media. For example, content analyses show that about 60 percent of television programs in the USA contain violence, and so do about 70–90 percent of the top-selling video games. By “violence” we mean an extreme act of physical aggression, such as assaulting another person (→ Violence as Media Content).

### EFFECT TYPES

For decades researchers have investigated the short- and long-term effects of media violence (→ Media Effects, History of). These researchers have found evidence for at least two important short-term effects and three important long-term ones. The *short-term effects* are “priming effect” (→ Priming Theory), i.e., exposure to media violence immediately stimulates aggressive thoughts and ideas, and “mimicry effect”, i.e., children immediately

mimic whatever they see, including violent behaviors they see in the mass media. The *long-term effects* are the “mean-world effect” (→ Cultivation Effects), i.e., the more violent media children consume, the more they think the world is a mean and hostile place and the more afraid they are likely to become; the → “observational learning effect,” i.e., the more violent media children consume, the more likely they are to think and act like the aggressors they observe, even long afterward; and the → “desensitization effect,” i.e., the more violent media children consume, the more tolerant and accepting they become of violence (→ Media Effects; Media Effects Duration; Violence as Media Content, Effects of).

### Short-Term Effects

Experimental studies on *priming effects* have shown that exposing participants of any age to violent media for relatively short amounts of time (e.g., 20 minutes) causes increases in their aggressive thoughts, angry feelings, and aggressive behaviors (for a review see Anderson et al. 2003; → Experimental Design). For example, laboratory experiments have shown that exposure to violent media makes people more willing to shock others or blast others with loud noise (→ Experiment, Laboratory). The exposure to violent media activates these aggressive ideas and thoughts in the mind (primes them), which in turn makes aggressive behavior more likely.

Experiments on *mimicry effects* have shown that even very young children will immediately mimic violent or nonviolent behaviors they see being done in the mass media. Bandura et al. (1963) first showed this for nursery school kids hitting “Bobo” dolls, but others have shown the same effect with nursery school kids hitting other kids (Bjorkqvist 1985; → Bandura, Albert). The propensity to mimic facial expressions and simple observed behaviors seems to be a “hard-wired” process that emerges in infancy. It is differentiated from “imitation,” which is a longer-term process requiring encoding of a script, its retention in memory, and its use at a later time.

Heavy TV viewers (defined as viewing for 4 hours per day or more) are more fearful about becoming victims of violence, are more distrustful of others, and are more likely to perceive the world as a dangerous, mean, and hostile place. The description of this as *mean-world syndrome* is derived from → cultivation theory (Gerbner 1969; → Gerbner, George), which claims that repeated exposure to television has small but cumulative effects on people’s beliefs about what the real world is like. This process seems to begin early in childhood, with even 7–11 year olds displaying this pattern (Peterson & Zill 1981). In general, the mean-world syndrome only seems to apply to appraisals of environments with which people have relatively little experience. Although violent media makes people more afraid of crime in their city, exposure to violent media has relatively little impact on people’s feelings of safety in their own neighborhood.

### Long-Term Effects

Although Bandura first included both short-term and long-term copying of observed behaviors under the rubric of “imitation” or “observational learning,” more recent theoretical approaches to imitation have distinguished immediate copying of observed behaviors (called *mimicry*) from delayed copying (called *imitation or observational learning*). Often

what is acquired in observational learning is not a simple behavior but behavioral → scripts, beliefs, → attitudes, and other → cognitions that make a class of behaviors (e.g., aggressive behaviors) more likely. A number of longitudinal studies have now shown that exposure to media violence in childhood has a significant impact on children's real-world aggression and violence when they grow up (Anderson et al. 2003; → Longitudinal Analysis).

For example, in one study children exposed to violent media were significantly more aggressive 15 years later (Huesmann et al. 2003). Importantly, this study also found that aggression as a child was unrelated to exposure to violent media as a young adult, effectively ruling out the possibility that this relationship is merely a result of more aggressive children consuming more violent media. The effects of violent video games on children's attitudes toward violence are of particular concern. Feeling empathy requires taking the perspective of the victim, whereas violent video games encourage players to take the perspective of the perpetrator. Exposure to violent TV programs and films increases people's pro-violence attitudes, but exposure to violent video games has the additional consequence of teaching decreased empathy for victims (Funk et al. 2004; → Computer Games and Child Development).

In part, this impact occurs because exposure to violent media desensitizes people emotionally to violence and makes them more tolerant of their own aggression (see below). However, a more important process is likely that violent media teaches children that violent behavior is an appropriate means of solving problems, the violent scripts they can use to solve social problems, and that good consequences can come from behaving violently. As adults children do not recall exactly the violent behaviors they saw in the media as children but they do imitate those behaviors, because they learned lasting beliefs that make those behaviors likely.

People who consume a lot of violent media become less sympathetic to victims of violence. For example, research has shown that after exposure to violent media people show more sympathy for perpetrators of violence and less empathy toward their victims. The reduced empathy for victims of violence can cause people to become less willing to help violence victims in the real world and more likely to accept violent behavior in themselves and others. In one such study, children who saw a violent movie were then less willing to intervene when they saw two younger children fighting (Drabman & Thomas 1974). One reason why people may become more tolerant of violence and less empathic toward victims is that they become emotionally desensitized to it over time (*desensitization effect*). Research has shown that after consuming violent media, people are less physiologically aroused by real depictions of violence (e.g., Carnagey et al. in press; → Habituation).

### **MODERATORS AND SIZE OF VIOLENT MEDIA EFFECTS**

Although it is clear that violent media make people more aggressive, more tolerant of violence, and more fearful of crime, not all forms of violence are alike. Media that glamorize violence and feature attractive role models (e.g., "good guys") may have a particularly strong influence, especially when the model's behaviors are reinforced. Whether someone is more likely to become an aggressor or a victim may also depend on whom they identify with, the perpetrators of violence, or their victims. However, for practical purposes, the sheer amount and variety of violence children are exposed to makes it likely that all children

are vulnerable to these effects in varying degrees. Both boys and girls are affected. Both more and less intelligent children are affected. Both aggressive and nonaggressive children are affected. The long-term effects are greater for children than for adults (Bushman & Huesmann 2006).

The effect of violent media on aggression is not trivial, either, ranging from a significance of 0.2 to 0.3 on the average. For example, exposure to violent media is a larger risk factor for youth violence than other well-known risk factors such as low IQ, being from a broken home, having abusive parents, and having antisocial peers (U.S. Department of Health and Human Services 2001, Table 4-1).

Smoking cigarettes provides a good analogy for violent media effects (Bushman & Anderson 2001). Not everyone who smokes gets lung cancer, and not everyone who has lung cancer smokes, but smoking is an important risk factor for lung cancer. Similarly, not everyone who consumes violent media becomes aggressive, and not every aggressive person consumes violent media, but violent media is an important risk factor for aggression. Smoking one cigarette probably will not give a person lung cancer, but repeated smoking over time greatly increases the risk. Watching one violent program or playing one violent video game probably will not make a person more aggressive, but repeated exposure over time greatly increases the risk.

## **Violence and the Media, History of**

*Karen Boyle*

*University of Glasgow*

For over a century violence in the media has been framed as a “problem” by social commentators. The arrival of a new medium (from the early tabloids to comic books, from → cinema to the → Internet) has typically been accompanied by a wave of concern about its potential for “exposing” an audience to representations considered undesirable by policymakers and moral guardians (→ Tabloid Press; Comics; Morality and Taste in Media Content). It is no accident that it is the mass availability of these texts that has typically been of concern: the “mass” audience being conceived as endangered and dangerous, vulnerable and victimizing (→ Violence as Media Content, Effects of). These concerns have also shaped academic debate. As a result, work on violence in the media has been concentrated in social science disciplines, particularly in the US, and the work of arts and humanities scholars has been marginalized in public debate and policymaking.

### **DEFINING VIOLENCE**

One of the difficulties of summarizing this work is that there is no clear consensus as to what violence is. Much work in the field has defined violence as a physical action (a punch, a slap, a shooting). One of the benefits of such a definition is that it makes it relatively easy to determine how much violence there is in a text or group of texts. Content analysis has been a key method for analyzing violence in the media (→ Content Analysis, Quantitative; Content Analysis, Qualitative), particularly on television (although “television” has itself become more difficult to define, and hence sample, as channels and modes of delivery have multiplied). Such studies have measured violence and tracked changes in the amount and nature of violence on television over fixed periods. The most influential of these studies in the US is the Cultural Indicators Project begun by → George Gerbner and his colleagues in the 1960s (Gerbner et al. 1994).

The findings of these studies are easily extracted by policymakers – typically in sensationalist terms – but such statistics cannot shed light on the *meaning of violence*, with the emphasis on action and the inevitably limited sample period diminishing important differences in generic context. For example, it is difficult to quantifiably differentiate between the shooting of an abusive husband by his wife in a long-running soap opera, and the shooting of an incidental “bad guy” by the hero in an action movie. Clearly, viewer engagement with these acts may be very different, however: in the first instance a viewer may have spent years in the company of these characters, whereas in the second they may know (and care) little about them. Broadening the definition of violence to include explicit verbal threats and talk about violence has given a more complete picture (Seawall 1997). However, less explicit behaviors such as stalking, a staple of the horror genre, and nonphysical injuries (e.g., social alienation or fear) remain difficult to account for in this way (Parks 2003).

Research that has considered *viewers' own definitions of violence* is a newer development. This work has suggested that viewers are more likely to define as “violent” situations that they consider unjust or socially undesirable, while sometimes failing to recognize as “violent” (and hence socially undesirable) texts they enjoy (Morrison et al. 1999). This draws attention to the fact that all definitions of violence, including those used by researchers, are ideological. This is only a problem when the ideological assumptions are not made explicit and a consensus is assumed as to how “violence” is defined and for what purpose.

## EFFECTS?

Gerbner's work also sought to investigate whether people who watched more television “cultivated” a television worldview in relation to violence (→ Cultivation Effects; Cultivation Theory). This exemplifies a broader trend in thinking about violence in the media as a social problem, namely a concern with the putative effects or impacts of these representations. Empirical research on the effects of media violence has a long history, dating back more than 70 years to the Payne Fund Studies, conducted between 1929 and 1932, which investigated the influence of movies on children's emotions, attitudes, and behaviors (Jowett et al. 1996). Effects research is based on the assumption that the effects of the media can be isolated, measured, and/or predicted. Such research is typically conducted in a laboratory environment where media consumers are “exposed” to a media text in controlled conditions, and the consumers' subsequent behavior is measured. Notably, the research participants are rarely questioned directly about their experiences and understandings of the text: rather, the model relies on disguising the nature of the experiment from the participants (→ Experimental Design).

Research conducted by → Albert Bandura and associates in the early 1960s provides a prototype for research in the field (e.g., Bandura et al. 1963). Bandura's work investigated the possibility of imitative aggression, focusing specifically on children. The typical design involved showing a child a film of adults behaving violently, most famously by hitting a doll. The children would then be placed in a room with a similar doll and their behavior would be monitored to see if they too would behave aggressively (e.g., by hitting the doll). Bandura, and others who followed him, also considered whether the mood of the child

before the play session would impact on the likelihood of their behaving aggressively: for example, if the child had been angered or frustrated by an adult beforehand, would they be more or less likely to hit the doll (→ Violence as Media Content, Effects on Children of)?

Experimental research of this kind has been widely criticized. Key criticisms are, e.g., that sanctioned behavior in a laboratory setting is no indicator of people's willingness to behave violently in the real world (→ Experiment, Laboratory); that the research pays little attention to the media texts studied, using clips or even material generated for the experiment rather than the commercial media; that it removes consumers from context and offers little choice about consumption practices; that it conceives of audiences as inadequate and fundamentally "different" than the researchers; and that it uses unrepresentative audiences. The effects paradigm has nevertheless retained a hold in US scholarship. Although the media have changed, altering the modes of engagement for consumers (e.g., with developments in gaming technologies; → Video Games; Computer Games and Child Development), the question for effects researchers has remained broadly the same: does  $x$  cause, or increase the likelihood of,  $y$ ? Yet even if we accept the premise of this research, there is a striking lack of consensus as to the sum of its findings, with the evidence often being marshaled to prove opposing viewpoints (compare Freedman's 2002 meta-analysis of the literature with Kirsch's 2006 account).

The enduring influence of the effects paradigm can in part be explained by its continuing high profile within news media, policy reviews, and even courtrooms wherever a simple answer is sought to the question, "Do representations *cause* violence in the real world?" This question is frequently posed in the aftermath of otherwise apparently inexplicable acts of *real-world violence*: the murder of 2-year-old James Bulger by two 10-year-old boys in 1993 is perhaps the most notorious example in the UK; the 1999 massacre at Columbine High School has a similar status in the US. Scrutiny of the evidence in these cases typically concludes that a causal link cannot be proven (Buckingham 1996; Barker & Petley 2001; Boyle 2005).

This has led critics outside the effects tradition to a further question, namely, what is to be gained by making this link? Feminists, noting that the vast majority of alleged copycat cases involve male perpetrators, have offered one explanation: blaming the media is a way of not blaming men, of ignoring the connections between violent men and ideals of masculinity that permeate the culture more broadly. Such an approach makes it more difficult to isolate, as "problems," individual media texts, as it establishes continuities in cultural representations from the Bible to competitive sports and fairytales as well as the usual suspects of horror, pornography, and violent video games (Boyle 2005; → Feminist and Gender Studies).

## AUDIENCES

Moving beyond the effects tradition, researchers – primarily, though not exclusively, in arts and humanities traditions – have begun to examine how people make sense of these contentious texts in the context of their day-to-day lives. Research on the audiences for a wide variety of texts – from controversial films such as Cronenberg's *Crash* (Barker et al. 2001) to children's television dramas (Buckingham 1996) and reality-crime shows (Schlesinger et al. 1992) – has pointed to diverse understandings and interactions. For example, Barker

et al.'s work on *Crash* highlighted the extent to which viewers' responses were shaped by another media text: a daily newspaper's moral crusade against the film. This research demonstrated that viewers understand that individual representations of violence are embedded in a wider cultural context, that they make informed choices about their media consumption, and that they are engaged in an active process of making → meaning from what they see.

Investigating media in the context of complex lived experiences, including personal experiences of violence, adds a further dimension. Research by Schlesinger et al. (1992) and by Jenny Kitzinger (2004) has identified the importance of media representations of domestic and sexual violence against women and children in allowing victims/survivors to recognize their own experiences and so to escape violent situations or seek support, challenging the assumption that violence in the media is necessarily undesirable. In a very different context, scholars of the Rwandan genocide have identified how radio (a hitherto rather neglected medium in violence research) was used to incite Hutu violence (Kellow & Steeves 2006). Indeed, close textual analyses of news media and their portrayals of violence are increasingly central to the violence debates, demanding an attention to the specificity of both textual practice and socio-historical context (Weaver & Carter 2006). Clearly, just as violence in the real world is multifaceted and complex, so, media researchers are coming to understand, are the ways in which media consumers make sense of, use, and interact with media discourses of violence. One size does not fit all.

It is not possible to prove, conclusively, that a media text *causes* a human being to behave in a particular way, although this question has dominated the first century of debate on violence in the mass media. As the debate moves forward, not only are the media texts and modes of delivery different but the types of violence of most concern to social commentators in the west are changing in response to the post-9/11 socio-political context. Questions about how and why we use, make sense of, and produce violence in the media at this historical juncture require an attention to the specificity of both text and viewing context.

## Virtual Communities

W. Edward Steinmueller

University of Sussex

Largely due to Rheingold (1993), the term “virtual communities” has become the most popular way to identify interpersonal and Internet-based communication networks to form, maintain, or extend social relationships. In 1993, Rheingold was writing ethnographies (→ Ethnography of Communication) of the communities anticipated by pioneers such as Licklider (1968), who imagined the → Internet as the source of new meeting places and as a revolutionary advance in communication capability. For social scientists, virtual communities represent a new platform for the observation and testing of theories of interpersonal communication behavior (Sproull & Kiesler 1986), structuration (Orlikoski 1992; DeSanctis 1994), and identity (Turkle 1995; → Personal Communication by CMC). A distinctive literature employing various combinations of underlying theories has emerged (e.g., Kollock & Smith 1999; Wellman & Gulia 1999).

### DEFINING VIRTUAL COMMUNITIES

Efforts to sharpen the definition of virtual communities such as the one by Wellman and Gulia (1999) illustrate the difficulty of distinguishing between a network of communicating

individuals and the various concepts of “community” – a term that brings with it many connotations of mutuality, trust, and identity. It is reasonable, however, to exclude some communication modalities as having no relation to the idea of “virtual community.” For example, the websites of broadcast media (one-to-many forms of communication), such as those of many major news services, fail to provide a direct way for readers to communicate with one another and therefore do not, themselves, provide a foundation for building virtual communities of interest about their content. It is possible to reach the same conclusion concerning many locations maintained by commercial, governmental, or nonprofit actors that are accessible using the world wide web and that have been designed using the broadcast model of information dissemination, or that seriously constrain persistent interaction between their users (→ Human–Computer Interaction).

A somewhat more ambiguous case exists in communication capacities that were initially designed to facilitate direct interpersonal communication such as email. Because these capacities can be used, through the capture and reuse of addresses, to establish numerous dyadic or more complex network communication linkages, it is difficult to rule out the possibility of email-based virtual communities. At the same time, however, mailing list servers that permit only replies to the entire group or bar replies are essentially forms of information broadcasting, and the same may be said for most discussion forums and weblogs (blogs; → Blogger). Defining virtual communities in terms of network formation possibilities and enactments is one, minimalist approach. It has the advantage of not requiring the assessment of the nature or depth of social relationships or sense of “community” among participants (→ Social Networks).

This network-based definition of virtual communities is broadly compatible with those of authors, such as Mitchell (1996), who focus upon the architectural features of communication spaces. Likening some Internet spaces to the Italian piazza, a paved pedestrian area central to many Italian towns and villages, Mitchell observes that social norms evolve in relation to the nature of the space. Mitchell’s architectural metaphor can be applied to many different features of the Internet, including the hundreds of channels of Internet relay chat (IRC) servers or explicit efforts to build “cyberspaces” or massively multi-player online role-playing games (MMORPGs). While it is undeniable that these examples are frequented by large numbers of individuals, applying the term “virtual community” to them is controversial, even offensive (Werry 1999), to those who take the view that communities are more than networks – that they necessarily involve elements of mutuality and democracy (→ Communication Technology and Democracy), including some sort of collective definition of identity or democratic control of resources. These features are largely absent in either IRC channels or MMORPG sites, which are controlled by and dependent upon their sponsors within explicit or implicit terms of service (even though some may allow users to co-produce content).

## **BEYOND NETWORKS TO COMMUNITIES**

Extending either the definition or the analysis of virtual community to encompass other aspect of “community” inevitably creates complexity. One way to manage this complexity is to explicitly consider how authority concerning belonging and purpose is constituted in specific communities (Kollock & Smith 1996; Steinmueller 2001). Considering the

rules or norms governing *organizational authority* – who is recognized as a part of the community and how they might participate – and *procedural authority* – how and for what purpose collective purposes and actions are taken – makes it straightforward to distinguish voluntary and open virtual communities from those embedded within organizations or professional associations. For example computer supported cooperative work (CSCW), which often involves flexibility in the configuration of communication networks, may be implemented within organizations where organizational and procedural authority is an extension of the organizational hierarchy or line management. Where organizational and procedural authority is concentrated in the hands of the sponsor, this distinguishes these communities (Hagel & Armstrong 1997) from more “open” structures where belonging and purpose are based upon individual choice and democratic decision-making.

When there is not a sponsor exercising organizational and procedural authority, there is some evidence that these roles emerge from the social learning of community participants (Tuomi 2002). Alternatively, they may have to be created by the community through collective decision (Kim 2000). Not surprisingly, the variety of ways in which this may be done largely replicates the ways in which nonvirtual communities form. The approach that currently dominates discussion of the “emergent” properties of virtual communities is derived from the “communities of practice” framework proposed by Lave and Wenger (1991) and exemplified in Brown and Duguid (2000). This framework combines elements of “social learning” and structuration in which “novices” are, in essence, tested by those more experienced as they develop skills in the context of the practice of the community, creating an emergent form of hierarchy based upon mutual regard. The communities of practice framework is most relevant in contexts involving a gathering of expertise or where a collective effort with common purpose is a factor motivating the interaction.

There are, however, virtual communities where simple association and mutual support are the aims, and these include patient, parenting, and other types of mutual support groups (→ Social Support in Health Communication; Support Talk; Social Support in Interpersonal Communication). Many of these communities are “sponsored” by charities or individuals who are themselves part of the community of interest, and a large number are hosted by web services companies such as Yahoo! and Google. There may be fewer problems with procedural authority in these groups due to their aim of simply being “spaces” where those of similar interest might gather. However, such groups may face significant problems with regard to organizational authority resulting from unwanted participation or interaction (Smith 1999).

The need for some form of authority in virtual communities is an ongoing tension because of the direct financial and, even more important, time commitments required to exercise this authority. A consequence is that many communities that originated in looser collective management or were organized by single individuals have moved toward either commercial or charity-based forms of organization. The nature of sponsorship has a number of implications for the future development of virtual communities, and several models have emerged. The most prevalent model involves maintaining the virtual community using *tools provided by a platform provider*, which is often an Internet service company such as Yahoo! or Google (→ Search Engines). Although generally permissive of a broad range of content, a few virtual communities on these platforms have come into

conflict with national governments intent on removing content deemed to be offensive. Perhaps of greater significance, the use of these platforms creates ambiguities regarding the ownership of content and the leadership of any specific community.

A second model, typified by Wikipedia, involves a “*social contract*” with participants that assures a continuing right to access and use information and resources that are collectively produced. A variant of this model is “virtual world” sites employing MMORPG-type technologies and offering explicit rules granting property rights for individual developers, such as Linden Lab, the sponsor of Second Life.

A third type of model is identified with communities that have a particular purpose, such as the creation of → *open source software*. These communities best illustrate the communities of practice form of governance, with the emergence of hierarchies based upon reputation for expertise and effective contribution to the collective purpose of the community. A mix of sponsorship models can be observed in these purpose-directed communities along with the emergence of “paid participation,” i.e., individuals participating as the result of company sponsorship with the aim of helping to create a collective good that can be of benefit to the sponsoring organization. The ways in which virtual communities are organized and the purpose they serve in their participants’ interests seem sure to expand with the growth in Internet usage, skills, and capabilities.

### FURTHER RESEARCH

The expansion of sponsorship models has brought with it a growing professionalism in the role of community manager and a proliferation of ideas and literature (e.g., Kim 2000), which provide the basis for future research on effectiveness and value creation. Due to the wide variety of motivations for establishing virtual communities, the creation of a comprehensive census of virtual communities is likely to require new approaches to social science research. While the current research focus is largely case-study oriented, comparative and quantitative studies in this area of human endeavor would provide greater understanding of the variety and level of virtual community initiatives. Better research on factors limiting community size and shaping interactions within communities would provide useful knowledge to managers and policymakers concerned with promoting such initiatives.

## Virtual Reality

Sean Cubitt

University of Melbourne

Virtual reality (VR) has at least three dominant meanings in communications. Though the distinctions blur in some analyses, these largely discrete areas are: (1) immersive audiovisual technologies; (2) technologies that achieve a similar effect through their ubiquity and apparent removal from mundane reality; and (3) technologies, architectures, and social processes that in some degree resemble immersive technologies, and the thesis that social life in the contemporary world is itself virtual. A fourth usage of the term “virtual” to denote a philosophy of becoming is also emergent.

## HISTORY

Immersive VR emerged from NASA as a scientific tool. During the later 1980s and early 1990s, there was much excitement about the possibility of immersive entertainment, particularly in the arcade games industry and among artists. The typical interface comprised a mask-and-glove wearable device, that provided stereo sound and stereoscopic screens mounted in front of each eye, and a glove whose spatial movement could be tracked to provide navigation and in some cases the ability to manipulate digital objects. Many significant artworks were produced, perhaps the most famous being Char Davies's *Osmose* which used a mask that was sensitive to head movements and a chest belt that responded to the expansion of the lungs, in order to move up and down in the virtual environment, in an experience analogous to diving. Other experimental artworks created the possibility of bringing two or more people into a shared environment.

Despite hopes for tumbling prices in the mask-and-glove interface, other pioneers opted for less expensive and less individualistic interfaces, among them Dan Sandin of UIUC who developed the widely used *CAVE system*, in which users equipped with 3D glasses and motion-sensor gloves enter a three- or four-walled stereoscopic projection space. Similar experimental systems have been developed by NHK in Japan and at Jeffrey Shaw's *iCinema* project in Sydney. However, the largest use of immersive environments today is in science and technology and in the training of pilots, soldiers, and ships' captains and pilots.

The term "virtual reality" was rapidly generalized to include all digital environments, especially their visual attractions (→ Digital Media, History of; Digital Imagery). The arrival of the world wide web as a consumer medium with the launch of the Mosaic browser in 1993 led to a host of utopian and apocalyptic visions of network societies as variants of Huxley's *Brave new world* (→ Internet). Movies like *Lawnmower Man* made little distinction between immersive and network technologies, a blurring that was fostered by the assertion, most famously in the Electronic Freedom Foundation's "Declaration of the Independence of Cyberspace," that the environment opened up by the web to public interaction was no longer subject to the normal laws of states any more than it was to the law of gravity.

In the early twenty-first century, the term *second life*, derived from an online game environment, has become closely synonymous with the sense of virtual reality as an alternative to "first life," the ordinary world experienced away from the computer (→ Video Games). Two variant terms have arisen from this new perception of a pair of human environments, one actual, the other virtual. The term "mixed reality" is applied to devices and techniques that are intended to meld elements of each into a single experience. Examples include enhanced wearable computers that, for example, stream data, maps, or images over otherwise normally transparent eyeglasses. The second is becoming widely known as "locative media," characterized by the use of ubiquitous computing and cheap consumer technologies, notably mobile phones (→ Mobility, Technology for). In projects like *Urban Tapestries*, users navigate the real city of London, locating via their mobiles a wealth of memories, histories, artifacts, and inventions left at particular locations by other users. Commercial applications are close at hand, including various value-added GPS (global positioning systems) software and web technologies increasingly available for

handheld devices such as *Google Earth* and the various hacks based on it. Such enhanced or blended forms of immersion lead to particularly interesting questions about the relations between actual and virtual realities (Tuters & Varnelis 2006).

## UTOPIA AND APOCALYPSE

The arrival of both enthusiastic and apocalyptic accounts of immersive VR (for example, Rheingold 1991) sparked an interest among postmodernist media scholars and sociologists, especially those influenced by Debord's (1977) theory of the society of the spectacle (→ Postmodernism and Communication). For such theorists, immersive VR was not the logical outcome of Wagner's total artwork (*Gesamtkunstwerk*) but a technological response to the changing urban environment. For these critics, virtual reality described a mode of experience rather than a technology. The new architecture of malls, the ubiquity of screens, even the windscreens of automobiles (Virilio 1995), produced an experience analogous to immersive VR by mediating the environment to the exclusion of any unmediated sensation.

Virilio also pointed to the militarization of society as a *self- or endocolonization*, arguing that the increasing distance between weapon and target in modern warfare, the post-human speed of decision-making, and the arts of camouflage had become hallmarks of contemporary political and cultural life. The massive expansion in Internet and mobile participation and the promise of ubiquitous computing in the industrial economies has led to a decreasing visibility of computers, and a lowering of both utopian and apocalyptic discourses about them. The arrival of mixed-reality genres indicates a shift toward a sense of the virtual as an immanent element of any urban space, invisible without the aid of technology, but omnipresent. The notion of perpetual connectedness has overtaken that of immersion, although there remains the sense that specialized immersive installations are only a more intense form of a generalized immersion in the informational city, the knowledge economy, and the mediated world which is now indistinguishable from first-life, mundane reality (→ Computer Games and Reality Perception).

In an extreme form, this phenomenon has produced the *philosophical nihilism* of Jean Baudrillard (1996), for whom the over-writing of the world by ubiquitous media has resulted in the elimination of reality itself. It is ironic then that the most significant uses of the most powerful engines of virtual reality occur in areas such as the manipulation of large molecules in biosciences and in centers in which, for example, harbor pilots learn to handle supertankers. In the former instance, the connection between the representations and the actual molecules is provable through the physical results of the manipulations afforded by immersive interfaces. In the latter, the effectiveness of the training depends on its provision of the chance to make a mistake without causing actual environmental damage, such that the preservation of the marine environment is an actual outcome of a virtual activity. Moreover, the failure of the consumer market for immersive wearable VR devices (a trend paralleled by the decline in cinema attendances), in parallel with the huge take-up for interactive technologies, including online game environments, texting, and Internet relay chat, suggest that the loss of self in fictional worlds has become less attractive than new modes of mediated socialization. While the degree of social integration consequent on such mediated intercourse is widely debated, it is clear that individualistic interfaces are less popular than social ones.

Nonetheless, virtual reality discourses continue to generate interest in a number of areas in communications. The rise of → Disney studies in the 1990s pointed toward the theme park as a *model for immersion in entertainment*. A number of authors (Klein 2004; Ndalianis 2004) flagged the parallels between contemporary physical environments like the Disney parks and the cornucopias of architecture, painting, and ritual of the baroque. Indeed a number of immersive and installation artworks directly referenced the baroque, especially the trompe l'oeil architecture and ceilings of Counter-Reformation churches, as precursors for the creation of fictive spaces and overwhelming experiences in virtual environments, both digital and architectural. While there is little iconographic connection between such spaces, the creation of architectural environments that are radically separate from the external world, that provide heightened experiences, that may be understood as narratives, and that are designed to trick the senses is a common theme. The theme park ride has proved an especially rich vein for analysis of this comparison, and for extending the definition of immersive virtual reality to incorporate physical movement on specially designed vehicles based on fairground rides. In this analysis, many other precursor technologies have been mentioned, notably the phantasmagorias of the eighteenth century, the panoramas of the nineteenth century, and the cinematic railway rides of the early twentieth century (Huhtamo 1995). One interesting element common to these precursor media is that they are rarely individualized, which may help explain the lack of success of immersive mask-and-glove systems.

## VIRTUALITY

The fourth emergent concept of virtuality may derive some of its impetus from the significance ascribed to immersion as a factor both in technological media and in social life. Where for Baudrillard the virtual threatened to annihilate the direct experience of existing in the real world, critics following the lead of Gilles Deleuze argued that virtuality was a state of potential, and as such was immanent in all living creatures and all historical process. Where theorists influenced by Heidegger emphasized the lack of being, Deleuzeans emphasized the process of becoming. Thus a body in motion is never entirely actual, but instead exists as perpetual variation (Massumi 2002). Given this definition, it may be argued that all moving images are virtual. Despite the film strip's composition as a series of still images, it is not the images that constitute movement, but the spaces in between them, a truth that is even more true of the interlaced screens of television and the arrays of digitally compressed/decompressed images, where the image never exists as a completed whole at any given moment. This argument may be extended to the production of virtual space in perspective construction, still or moving. Where apparatus theory, grounded in Heideggerian nostalgia for the loss of being, saw only ideologically loaded vanishing points, a theory of virtuality describes the construction of space through points of becoming.

Such analyses have proved both productive and controversial in fields as diverse as politics, photography, geography, phenomenology, art history, architecture, and engineering. With relations to possible worlds theory in philosophy, to the psychology of perception, to analyses of power and ideology, and closely allied to critics and supporters of computer simulation as a predictive tool, for example in the science of global climate change, the discussion of virtuality produces a number of critical disturbances (→ Simulation).

On the one hand, the term “virtual reality” is applied to such phenomena as the baroque cathedral and the contemporary theme park, spaces marked by their cultural intensity, even totalitarianism; while on the other it is applied to the unmarked spaces of anonymous passage: the airline terminal, the waiting room, or the interiors of public transport.

The fading distinctiveness of computer technology, its gradual passage into the general background of life in the same way that writing is now rarely observed to be writing, only what it communicates, is a phenomenon observed historically of other technologies by Don Ihde (1990) and now clearly apparent in the daily life of the industrial world. On the one hand, this suggests that either the nature or the experience of reality is indeed changing and becoming more virtual. On the other, it suggests that where such technological mediation does not obtain, reality persists. If so, then reality is the state in which there is a minimum of technological mediation, in other words, the poorest areas of the world. Given the choice between living in the manner of the world’s poorest inhabitants or of inhabiting a virtual or at least a mixed reality, most people, including most economic migrants, would choose the latter. This implies of course that the “fourth” sense of virtuality, that of the potential to become other than what one is, is restricted to the wealthiest populations of the planet.

# Visual Communication

*Michael Griffin*

*Carleton College*

The study of visual communication comprises such wide-reaching and voluminous literatures as art history, the philosophy of art and → aesthetics, → semiotics, → cinema studies, → television and mass media studies, the history and theory of → photography, the history and theory of → graphic design and → typography, the study of word–image relationships in literary, aesthetic, and rhetorical theory (→ Rhetorical Studies), the development and use of charts, diagrams, → cartography and questions of geographic visualization (images of place and space), the physiology and psychology of visual → perception, the impact of new visual technologies (including the impact of digitalization and the construction of “virtual realities”; → Digital Imagery), growing concerns with the concept and/or acquisition of “visual literacy,” and the boundless social and cultural issues embedded in practices of → visual representation.

Amid such an eclectic field no consensus has emerged regarding canonical texts. Even the concept of “imagery” itself seems to have no clear boundaries, encompassing concepts of the image that extend from the perceptual process, through the mental reproduction of perceptions in eidetic imagery, dreams, and memory, to the realms of abstract symbols and ideas by which we mentally map experience, and the physical creation of pictures and visual media. Consequently, the study of imagery is as integral to the study of language, cognition, psychoanalysis, and ethology as it is to the study of pictorial or graphic representation.

## **SOCIAL RELEVANCE OF THE FIELD**

This entry notes key themes and theories in this cross-disciplinary area of study. For purposes of manageability the focus is on *pictures* rather than the broader concept of *the visual*, and with a bent toward the study of twentieth-century mass communication media rather than the larger history of art and visual representation. The term “picture” is used here in a sense that is similar to the Albertian definition of a picture noted by Alpers: “a framed surface or pane situated at a certain distance from a viewer who looks through it at a second or substitute world” (1983, xix). I do not, however, wish to limit my definition to a strictly Renaissance model of picture-making but rather would include all types of visual image-making that address viewers in a picture-like manner. The choice to concentrate on the pictorial directs the emphasis toward the production and interpretation of communication media and avoids the insurmountable problem of addressing a diffuse and boundless range of the visual. The focus on recent history reflects the concern for contemporary media and cultural environments that is such a prominent part of communication studies.

In this context the study of visual communication as an institutional interest area has grown primarily in response to perceived gaps in the more widely established field of mass communication research. The relationship to mass communication may not be

readily apparent, for visual communication study did not emerge within established traditions of mass communication research, nor was it bound by the same theoretical or methodological paradigms (→ Communication as a Field and Discipline). Yet the study of visual communication (as opposed to the study of art, art history, design, or architecture) has been defined in relation to the mechanical reproduction of imagery that has characterized modern mass media (Ivins 1953; Benjamin 1969; Berger 1972).

Those intrigued by the role and influence of visual imagery in mass circulation publications, television, and the entire range of commercial → advertising have often been disappointed by the lack of attention given to pictures in established traditions of mass communication research. Prominent strains of mass communication research – → public opinion and → attitude research, social psychological studies of behavior and → cognition, experimental studies of media exposure (→ Exposure to Communication Content), → marketing research, correlational studies of → media effects, content analysis (→ Content Analysis, Qualitative; Content Analysis, Quantitative), studies of media → uses and gratifications, agenda-setting research (→ Agenda-Setting Effects), or sociologies of media organizations and media production (→ Media Production and Content) – have only sparsely and inconsistently incorporated the analysis of visual forms and their role in communication processes. For years content studies of television news were conducted solely from verbal transcripts, and audience studies often documented viewer responses to program stories and characters without attending to the nature of the specific visual presentations of those programs (Griffin 1992b).

Even *studies of* → *political communication*, where one might expect a keen interest in the role of visual images, focus overwhelmingly on rhetorical strategies, issue framing (→ Issue Management in Politics), and a concern for the tactical effect of linguistic symbols and slogans, and lack a sustained attention to the contributions of the visual. A 1990 survey of political communication literature, for example, found that only five out of more than 600 articles and studies actually examined the concrete visual components of televised election coverage and advertising, and that when the term “image” *was* used it most often referred to conceptual interpretations of the public ethos of political candidates rather than specific concrete visual attributes of media presentations (Johnston 1990). Consciousness of the importance of visual images in political communication expanded greatly in the wake of the Reagan presidency, when such Reagan advisers as Michael Deaver averred that the control and manipulation of images overpowered anything that the public heard or read (Deaver 1987). Following the 1988 campaign, prominent political rhetoricians, such as Kathleen Hall Jamieson, began for the first time to explicitly call for the visual analysis of political spots and contemporary political discourse (Jamieson 1992).

Against this background the *growing interest in visual communication throughout the 1970s and 1980s* was often perceived as a corrective response. The increasingly ubiquitous visual appeals of advertising, both commercial and political, and the alarming number of hours most people spent watching television, had certainly made media researchers aware of the potential impact of images and triggered interest in some to include visual analysis in their work. Yet, few examples of research specifically focused on the visual mode could be found in the mass communication literature, and those hoping to pursue such research needed to look beyond the boundaries of communication scholarship for theories, templates, and inspiration.

Often, this meant foraging purposefully among literatures institutionally separated from communications: aesthetics, anthropology, art history, graphic design, electronic and video arts, → film theory and history, the philosophy of perception and knowledge, literary theory, linguistics, semiology. Sometimes it meant opening the door to the developments within communications that were more attentive to the impact of images: to feminist scholars, and others, interested in gender portrayals; to those concerned with representations of homosexuality; and to those concerned with the stereotyping of various racial, cultural, and social groups (→ Social Stereotyping and Communication; Stereotyping and the Media). And sometimes it meant reframing or redefining entrenched areas of professional and technical training: in film and video production, photography and photojournalism, broadcast journalism, typography and publication design.

By the 1980s this trend led to movements within academic communication associations to provide *expanded forums for visual communication research* presentations. In the → International Communication Association (ICA) nondivisional paper sessions were organized around visual communication themes, eventually leading to the establishment of a Visual Communication Interest Group. In the Association for Education in Journalism and Mass Communication (AEJMC) attempts were made to encourage the presentation of scholarly research in the Visual Communication Division, a division previously focused almost exclusively on professional training in graphic design and photojournalism, and seen largely as an area of technical support for the primary work of writing and editing. In the Speech Communication Association (SCA) in the US, an interest group on “visual literacy” was formed. These developments have continued to have a bearing on the place of visual communication studies within the larger field of communication research. However, primary sources of new theory and new research have continued to originate from outside these institutional parameters. In the rest of this entry I shall attempt to chart some of the major influences in the intellectual history of visual communication studies that led it to be identified as a distinct sub-field within communications.

## HISTORY AND THEORY

The rise of contemporary visual communication studies was, of course, preceded by centuries of thought and writing concerning the arts and the visual image. Yet the last decades of the twentieth century have seen a renewed philosophical concern with the visual that Mitchell (1994), following Rorty’s (1979) notion of “the linguistic turn,” has called “the pictorial turn.” In *Picture theory* (1994) Mitchell argues, “The simplest way to put this is to say that, in what is often characterized as an age of ‘spectacle’ (Debord), ‘surveillance’ (Foucault), and all-pervasive image-making, we still do not know exactly what pictures are, what their relation to language is, how they operate on observers and on the world, how their history is to be understood, and what is to be done with or about them” (1994, 13). He adds, “while the problem of pictorial representation has always been with us, it presses inescapably now, and with an unprecedented force, on every level of culture, from the most refined philosophical speculations to the most vulgar productions of the mass media” (1994, 16). In this, Mitchell echoes the challenge described by Worth in the early 1970s (Worth 1981). An extensive body of literature explores the *ontology and epistemology of photography and the cinema*, the foundations of contemporary lens-based

media. Writings on photography since the middle of the nineteenth century have continually explored, and revisited, the nature of the photographic image as art vs science, pictorial expression vs mechanical record, trace vs transformation. Meanwhile, the practice of photography has been dogged by the ongoing contradictions between the craft of picture-making and the status of photographs as “reflections of the real” (Sekula 1975; Brennen & Hardt 1999). Similarly, the extensive *literature of film theory*, going back at least to the treatises of Lindsay, Munsterberg, Arnheim, and Balazs, has struggled with the nature of cinema and its proper aesthetic and communicational development (Andrew 1976). A wellspring of analytic concepts regarding the composition and juxtaposition of images have been applied to sophisticated analyses of *mise-en-scène* (the construction of the shot) and montage (the structuring of sequences of shots through editing). The synthesis of realist theories of *mise-en-scène*, formalist theories of montage, and structural theories of narrative in the work of Jean Mitry (1963–1965), and the subsequent application of linguistically based semiotic theory to cinema by Christian Metz (1974) pushed film analysis into new territories of narrative and syntactical exegesis in the attempt to identify a “language of film.” We are still looking.

### Film Studies

An important foundation for the development of visual communication studies, film theory comprises a body of concepts and tools borrowed from the study of art, psychology, sociology, language, and literature. Work in visual communication has often returned to these various sources for new applications to photography, design, electronic imaging, or virtual reality. A central theoretical parameter of debate has involved the distinction between formative and realist theories (Andrew 1976; 1984), but has also involved questions concerning the scope and centrality of narrative, an issue that has preoccupied the philosophy of representation across numerous fields.

*Formative film theories* treat cinematic presentations as wholly constructed visual expressions, or rhetoric, and seek to build schematic explanations for the semantic and syntactic capacity and operation of the medium (→ Rhetoric and Visuality). *Realist theories* argue that there is a natural relationship between life and image (→ Realism). They assert that photographic motion pictures inherently mirror everyday perception and moreover that the goal for filmmakers should be to employ that essential capacity to create the most realistic possible simulations of actual experience (→ Realism in Film and Photography; Reality and Media Reality). All film students learn about the concepts of film art posited by early formalists such as Munsterberg, Arnheim, Kuleshov, Pudovkin, Eisenstein, and Balazs, and countered by realists such as Bazin and Kracauer. Many aspects of this theoretical opposition have re-emerged repeatedly as visual communication studies have come to encompass parallel issues in television, photojournalism, news, advertising, and most recently digital image creation and manipulation.

The heart of the matter, and arguably the central question of all visual communication study, is the *precise status of the image as a copy or analogue*. As Andrew writes of the work of Bazin and Mitry, “Bazin spent his life discussing the importance of the ‘snugness’ with which the filmic analogue fits the world, whereas Mitry has spent his life investigating the crucial differences which keep this asymptote forever distinct from the world it runs

beside and so faithfully mirrors” (1976, 190). Historically, film and photographic theory and criticism were absorbed with these questions as they pertained to the properties of the image-text itself. As will be discussed at a later point, visual communication studies turned the question toward the manner in which images were utilized and interpreted by media production institutions and viewing audiences.

The key point here, to be revisited throughout this entry, is that the study of pictures brought into even greater relief questions of reflection and construction in human representation. And although these issues are not confined to modern visual media, and perhaps are questions that cannot be asked of pictures as if they were a purely visual medium, somehow outside of intertextual contexts, they have become defining issues for visual communication study in an era of constant photographic reproduction when it is so often taken for granted that visual media technologically mimic reality. These issues relate as well to spatial and temporal constructs in literature and the earlier plastic arts, and were raised by writers at least as early as the eighteenth century (Mitchell 1986).

Various *technical advances* have seemed to provide an inexorable progression toward ever more convincing recreations of the “real world” and have consistently raised the ante on illusion and simulation. Yet film theory has persistently directed attention toward the processes of constructing visual representations, constantly reminding us of the inherent tension between the craft of picture-making and the perception of pictures as records. Against the commonsense assumptions so often made that visual media give us a window on the world with which to witness “reality,” film theory from the beginning has interrogated the ways in which such “windows” are created and structured to shape our view. Even in the practice of documentary film, theorists such as Nichols (1991) identify patterns or “modes” of representational strategy that make each documentary a formal and rhetorical articulation. Writers on still photography, perhaps ironically, followed the development of film theory in fully theorizing the ontology of the photograph, but in the last 50 years have also contributed an extensive literature on the relationship of photo images to their subjects.

The fact that film studies provided an important stock of conceptual tools for the study of pictorial communication of all types was not lost on communication scholars who hoped to better understand the growing prominence of visual mass media in late industrial society. British cultural studies also borrowed freely from film studies (much of it centered around the British Film Institute and its sponsored book and journal publications) and the resulting sensitivity to the culturally constructed nature of visual representation in much cultural studies work made it attractive to visual communication scholars in America. Writings on visual media by British and Australian cultural critics and scholars such as John Berger (1972); Raymond Williams (1974), Laura Mulvey (1989), Judith Williamson (1978), and John Fiske and John Hartley (1978) drew the attention of those tuned into what the British increasingly called “lens theory.”

The *influence of this brand of cultural studies* on the American scene fueled a nascent interest in semiotic analysis and the interpretation of media texts, and it was not a far leap to imagine the incorporation of visual analysis into studies of representation, meaning, and ideology. An early example of the incorporation of visual analysis in the study of representation and ideology is Stuart Hall’s essay “The determination of news photographs” (1973). In this essay he attempts to apply the cultural and ideological analysis derived

from Birmingham Center studies of popular culture to news photographs in order to demonstrate how pictures enhance and frame the ideological positions of accompanying linguistic text. In the mid 1970s the Glasgow University Media Group (1976; 1980) carried out some of the first detailed visual analyses of television news footage in order to expose the ideological nature of BBC reporting on industrial labor disputes. Moreover, the fast-growing popularity of cultural studies often helped to open up additional curricular space for addressing the nature of visual symbol systems and processes of meaning construction. A convergence of interest in the study of photographically mediated culture was building from several directions, including anthropology, sociology, and the psychology of art.

### **The Psychology of the Visual: Language and Image**

The work of E. H. Gombrich serves to represent the essential themes of this tradition, although its roots lie in the earlier work of Panofsky (1991; 1st pub. 1924) and others. In his highly influential book *Art and illusion* (1960) Gombrich makes a powerful case for the conventionality of schemes for visual representation. With an art historian's knowledge of the traditions of western art, and particularly the development of linear perspective, he argues that picture forms of all kinds are conventionally constructed according to learned schemata, not copied from nature (→ Perspective, Pictorial; Art as Communication). Building from the idea that perceptual gestalts are not necessarily innate but often learned (a concept fully developed in the perceptual research of R. L. Gregory [1970]), Gombrich argued that perceptions of visual representations in art operate by means of gestalts that are culturally based and that, in this sense, pictures are *read* on the basis of prior knowledge of cultural conventions.

Gombrich develops the metaphor of “reading images” in his article, “The visual image,” written for *Scientific American* (1972). Here he reiterates the ways in which images are intertwined within cultural systems of language and function and depend upon “code, caption, and context” for understanding. Pictures rarely stand alone, and rarely communicate unambiguously when they do. The mutual support of language and image facilitates memory and interpretation, making visual communication (as separate from artistic expression) possible. Without using the same structuralist paradigm or terminology, Gombrich comes very close to reproducing the semiological notions of icon, index, and symbol in his analysis. Most images seem to combine all three qualities of signification in some measure, although it is most often the iconic prevalence and/or limits of images that preoccupies scholars of the visual, the iconic being that which most clearly distinguishes visual signs from lexical, mathematical, musical, and socio-gestural (Gross 1974).

Although a substantial body of research by perceptual psychologists contradicts Gombrich's suggestion that visual apprehension is culturally learned – providing evidence instead that many aspects of visual perception derive from a natural, hard-wired set of sensory, neurological, and perceptual processes – the impact of Gombrich's analysis has still been enormous. His writings provide a strong case against the equation of art and communication, and help to lay a basis for the study of visual communication as distinct from the study of art. They also demonstrate the need to understand the history of art, and the various traditions of depiction and symbolization that have influenced visual practices, before we can hope to explain the role of visual communication in modern media systems.

Together with film theory, semiotics, the social history of art, and anthropological concerns with art and visual representation, the psychology of visual representation has contributed to an eclectic body of theory and research on which communications scholars began to draw for conceptualizing approaches to visual communication analysis.

Other strains in the history of art and aesthetics that have contributed much to contemporary thinking about visual communication include the *social history of art and aesthetic theories* regarding the relationship between pictures and language. The social history of art, particularly in the work of writers such as Michael Baxandall (1972) and Svetlana Alpers (1983), offers models for investigating relationships between the production of images and the social contexts of their sponsorship, use, and interpretation. Alpers has explored the relation between picture-making and description, from the ekphrastic tradition of the Sophists in which they used the subject matter of paintings as jumping-off points for discursive monologues and storytelling, a model, she argues, for Vasari's famous descriptions of Renaissance paintings (Alpers 1960), to the seventeenth-century tradition of Dutch painting, when northern European painters broke with the narrative tradition of Italian painting to create a new "descriptive pictorial mode."

Baxandall's (1972) study of painting and experience in fifteenth-century Italy provides an example of what reviewer Larry Gross (1974) called a historical "ethnography of visual communication," demonstrating how patronage and contractual obligations, on the one hand, and viewer expectations and understandings of convention, on the other, combined to make of painting a currency of social communication (→ *Ethnography of Communication*). Becker's *Art worlds* (1982) applies a similar approach to twentieth-century social worlds of artistic production with specific attention paid to painting and photography, among other arts. Gross's *On the margin of art worlds* (1995) follows in this vein with a collection of studies explicitly devoted to the social definitions and boundaries that have emerged among worlds of visual art and communication.

Related to these extra-textual studies of visual communication practice and meaning is a long history of attention to the *intertextual relationships between word and image*. Whether in studies of the relationship between religious painting and scripture, pictures and narrative, or in attempts to pursue the study of *iconology* (the general field of images and their relation to discourse), the existence of pictures within larger multi-textual contexts has led to several rich traditions of scholarship (Panofsky 1939; Mitchell 1986; 1994; → *Iconography*). Here the dispersed boundaries of visual communication studies become especially apparent. Its coherence as a field diffuses into myriad strains of philosophy, literary theory, linguistics, cultural theory, art history, and media studies – the concerns with the subject/spectator (the look, the gaze, the glance, observation, surveillance, and visual pleasure) and with the interpreter/reader (decipherment, decoding, visual experience, "visual literacy," or "visual culture") running through numerous disciplines and theories (→ *Visual Culture*).

### **The Sociology and Anthropology of Visual Communication**

This tradition of research emerged in the 1960s and 1970s in the US largely in association with the work of Sol Worth, Jay Ruby, Richard Chalfen, Larry Gross, Howard S. Becker, and their students. It was carried forward by scholars particularly interested in the *cultural*

*codes and social contexts of image-making* within particular communities, sub-cultures, and social groups. This movement was influenced by work in the psychology of art and representation, film theory, semiotics, and the social history of art. For example, attempts to assess and compare the types of psychological schemata suggested by Gombrich in image-making and image interpretation across different cultures suggested that processes of visual communication were not universal and needed to be explored within specific socio-cultural settings.

The anthropology of visual communication was also heavily influenced by new approaches to the study of linguistics, not only by structuralist tendencies and the semiological theories and methods that structural linguistics engendered, but in particular by the rise of sociolinguistics (Hymes 1964). *Sociolinguists* had begun to examine the differing uses of language across sub-cultures, social classes, and ethnic groups, and provided exemplars for the similar study of visual “languages” in varying social contexts. A key figure in adapting these influences to the study of visual communication was Sol Worth. The collection of his writings, *Studying visual communication* (1981), edited posthumously by his colleague and co-author Larry Gross, is perhaps the best starting point for those interested in gaining a sense of the origins of the field of visual communication research. “The central thread that runs through Worth’s research and writings is the question of how meaning is communicated through visual images” (Gross 1981).

This interest led to the landmark Navajo Filmmakers Project, in which Worth collaborated with anthropologist John Adair and graduate assistant Richard Chalfen to study film made not as records *about* Navajo culture, but as examples *of* Navajo culture, reflecting the value systems, coding patterns, and cognitive processes of the maker (Worth & Adair 1972). The Navajo films (now in the collection of the Museum of Modern Art in New York), and the published results of the project, were praised by such commentators as Margaret Mead as a “breakthrough in cross-cultural communications” (Mead 1977, 67).

The critique of documentary practice led Worth to propose “a shift from visual anthropology to the anthropology of visual communication” (1981) suggesting the need to abandon taken-for-granted assumptions about the capacity of film and photography to portray culture from the outside. Instead, he suggested, it would be better to study the forms and uses given to visual media by the members of different cultures and social groups themselves. Worth vigorously distinguished this work from traditional “visual anthropology,” much of which he considered naïve and unreflective in its reliance on photographic records *about* culture, and increasingly became identified with the alternative of studying all forms of visual communication as examples *of* culture, to be analyzed for the patterns of culture that they reveal.

## INTERDISCIPLINARY CROSS-CURRENTS

Worth’s idea of an “anthropology of visual communication” dovetailed with the work of numerous students, colleagues, and scholars working along cognate trajectories, leaving a fruitful legacy. These included, among others: ground-breaking studies of family photography and home moviemaking (Chalfen 1987; → Amateur Photography and Movies); explorations of the nature and limits of documentary representation (Ruby 2000; → Documentary Film; Ethnographic Film); the study of pictorial perception, learning, and interpretation

(Worth & Gross 1974; Messaris & Gross 1977); children's socialization to visual forms (Griffin 1985; → Socialization by the Media); the nature of visual rhetoric and persuasion and questions of visual literacy (Messaris 1994; 1997); institutionalized standards and practices in picture-making and use; the study of social worlds of visual production and legitimization – from art to advertising, to news (Tuchman 1978; Rosenblum 1978; Schwartz & Griffin, 1987; → Television, Visual Characteristics of; Television News, Visual Components of; Photojournalism; Advertisement, Visual Characteristics of); and the ethics of visual representation (Gross et al. 1988; 2003; → Image Ethics).

It also led to the establishment of the *first scholarly journal* in the US devoted specifically to visual communication research, *Studies in Visual Communication*. The journal published contributions from a wide range of disciplinary sources, representing the new critical histories of photography, work on the visual languages of science and cartography, research on caricature and political cartoons, essays on public art, new interpretations of the documentary tradition in photography and film, and a greater emphasis on television and media events. The pioneering study *Gender advertisements* (1976) by Erving Goffman was first published as a special issue of *Studies in Visual Communication*, and for a time the journal provided impressive evidence that scholarly attention to visual imagery was growing across the social sciences and humanities. An attempt to extend this attention led directly to the organization of a Visual Communication Interest Group in the International Communication Association, which in 2004 became the Visual Communication Studies Division of the ICA.

By the 1980s traditional notions of visual media were being re-evaluated across programs of art, communications, and journalism. A few journalism schools attempted to recast their photojournalism and publication graphics tracks into more integrated and multi-disciplinary visual communication curricula. Communication scholars increasingly pointed out that, given the pervasively visual nature of contemporary mass media, it was no longer tenable to study mass communication separately from visual communication (Griffin 1992a), and that even a medium such as the newspaper needs to be understood as an inherently visual phenomenon (Barnhurst 1994; → Newspaper, Visual Design of).

### KEY ISSUES AND CURRENT TRENDS

The key issues for visual communication in the new millennium are surprisingly similar to those of 30 years ago. The major difference is that greater attention is being paid to these issues within communications scholarship itself, and the application of these ideas is being made across an even greater diversity of media forms and technologies, including digital ones. Recent attempts to examine the state of visual research, and its application to new media, remind us that the kinds of questions asked by Sol Worth decades ago have not been settled (Manovich 2001; Elkins 2003). We are still exploring “how, and what kinds of things, pictures mean.” And “how the way that pictures mean differs from the way such things as ‘words’ or ‘languages’ mean” (Worth 1981, 162). Barthes wrote that photography, “by virtue of its absolutely analogical nature, seems to constitute a message without a code” (1977, 42–43). This quality not only lends itself to the proliferation of pseudo-events, and the ever new developments and consequences of virtual realities, but makes of images a kind of automatic evidence that is rarely questioned. Therefore, the

ontological questions regarding the status of images as simulated reality blur together with epistemological questions concerning the validity of images as evidence.

These compounded theoretical issues continually re-emerge in nearly every area of visual communication studies. A great, but still largely unmet challenge for visual communication scholars is to scan, chart, and interrogate the various levels at which images seem to operate: as evidence in visual rhetoric, as simulated reality bolstering and legitimizing the presence and status of media operations themselves, as abstract symbols and textual indices, and as “stylistic excess” – the self-conscious performance of style (Caldwell 1995). Visual style itself, apart from content-related denotation, connotation, and allusion, can be a powerful index of culture – sub-cultures, professional cultures, political cultures, commercial fashion. Initial forays suggest that scrutinizing visual forms of simulated “reality” tell us a great deal about the nature of media rhetoric, the limits of veridical representation, and the self-conscious performance of style in entertainment, advertising, and news. These issues are perhaps more significant than ever for the processes of “remediation” that characterize “new” digital media and the emphases on “transparent immediacy” and “hypermediacy” that distinguish digital visualization (Bolter & Grusin 1999; → Digitization and Media Convergence).

Visual communication research, more than anything else, has been a path into the examination of the specific forms of our increasingly visual media surround. In the early stages of mass communication research Lang & Lang reported on “The unique perspective of television and its effect” (1953). The heart of the study was their comparison of the televised coverage of Chicago’s MacArthur Day parade with the reported observations and experiences of informants on the scene, a comparison that found the representation of the parade on television, the “TV screen reality,” to be very different from, even contradictory of, the “reality” seen and experienced by those attending the event. They concluded that television’s need to create a coherent presentational structure from separate, fragmented, and often only indirectly related scenes and activities resulted in a “televisual perspective” or *televisual form* specific to the nature and workings of that medium. Visual communication research is often distinctive precisely for its attention to forms of representation, forms created by the intersection of aesthetic and pictorial traditions, shifting industrial uses of visual media, and evolving media technologies. To many it seemed that the movement toward visual communication studies in fact best fulfilled cultural studies pioneer Raymond Williams’s exhortation to focus attention on the *forms and practices* of media production and representation (Williams 1974; → Cultural Studies).

This is not a return to a McLuhanesque essentialism regarding media technology. Rather it is a recognition (following Raymond Williams) that the historically and culturally specific forms of representation that have evolved in particular industrial and commercial systems inexorably shape and delimit the nature of media discourse. This is an issue of particular concern to visual communication researchers as we proceed into an era of increasingly convincing virtual realism on the one hand, and an increasingly systemic textualization of images in cyberspace on the other. More and more visual practices are moving away from the ideal that visual media can and should explore and reveal our social and natural environment and toward self-contained visual lexicons that reduce all visual elements to characters in digital texts. For both economic and technological reasons

digital designers and television producers increasingly create “virtual worlds of excessive videographics” in place of the realist style of conventional production techniques (Caldwell 1995). It is as if we seek to follow French structuralist philosophy to its logical conclusion, taming the potential autonomy and power of images and making them subservient to structural linguistic interpretation (Jay 1993). It is not just what we *can* do with new digital technologies of manipulation but to what purposes we seek to use the production of images in a “post-photographic age.”

Finally, in that emerging condition often referred to as the “global media environment” visual images have become a new sort of transnational cultural currency. Not the “universal language” that promoters such as Eastman Kodak Company claimed for photography earlier in the century, but a currency of media control and power, indices of the predominant cultural visions of predominant media industries.

## Visual Culture

*Lisa Cartwright*

*University of California, San Diego*

Visual culture is an area of study focused on practices of looking and the role of visual representations in the arts, popular and alternative media cultures, institutional and professional contexts, and everyday life. Art history, film and media studies, → cultural studies, sociology, and anthropology are some of the fields in which visual culture study is conducted. Forms of → visual representation studied include → museum display, fine art, film and → television, old and new media, computer and → video games, digital culture, medical images such as X-rays and sonograms, and advertising (→ Art as Communication; Painting; Cinema; Film as Popular Culture; Television, Visual Characteristics of; Video; Digital Imagery; Advertisement, Visual Characteristics of).

The study of visual culture emphasizes the relationship of looking and visual representation to forms of knowledge, power, experience, and ideology in everyday life and culture in

different historical periods. Emphasis is placed on looking as a social practice and the place of visual texts and artifacts in relationships of power, pleasure, and knowledge within and among social groups including nations, communities, workplaces, audiences, and members of institutions such as schools, churches, and cultural organizations. Research in visual culture tends toward qualitative and interdisciplinary methods informed by post-structural critical theory and cultural studies (→ Structuralism in Visual Communication).

The majority of work on visual culture considers the postwar period during which electronic and digital media became pervasive components of industrialized cultures. During this period previously distinct media forms such as painting, photography, the → Internet, and video converged (→ Digitization and Media Convergence). Just as individual works of fine art were subject to more pervasive reproduction and circulation with the rise of digital imaging and the world wide web, changing the status of the original work of art, so mechanical forms of reproduction like photographic and motion picture film converged with digital media in production and exhibition processes. With this increased and enhanced presence of visual media forms in everyday life, the visual became a more crucial area of research among humanists and social scientists studying postwar culture. However, the field also includes significant research in the visual cultures of earlier historical periods and the place of the visual in cultures that have not known the same accelerated advances in electronic and digital media forms experienced by those with access to new technologies in the industrialized west (Baxandall 1972; Worth & Adair 1972).

The parallel and overlapping traditions of cultural studies, visual culture, and visual studies are reviewed and critiqued in Elkins (2003). The study of “visual culture” is usually distinguished from the study of “visual communication,” which is more often associated with popular and commercial forms of mass media and the efficient communication of information (→ Popular Culture; Popular Communication; Popular Culture and the News Media; News; Photojournalism; Infographics).

Visual culture became a formalized area of study in the early 1990s with the founding of PhD programs at institutions including the University of Rochester (New York) and the University of California at Irvine. These entities grew out of the efforts of individuals whose original training was in art history, film studies, sociology, and comparative literature. The field was strongly influenced by literary and film theorists who forged their methodology out of the writings of the French psychoanalyst Jacques Lacan on the gaze (→ Spectator Gaze); Ferdinand de Saussure on semiotics (→ Semiotics); and the Marxist theory of power elaborated by the French philosopher Louis Althusser.

A strong foundational influence was the writing on culture, myth, and photography by the French philosopher → Roland Barthes. Early work in visual culture study, before the term itself came into conventional use, was introduced by art historians such as Michael Baxandall. The British sociologist Stuart Hall was a leading author and teacher in visual culture study in the UK and globally by the 1970s. Literary and art historical writing on the semiotics of the gaze by Mieke Bal, Michael Ann Holly, and Norman Bryson; and British and North American feminist film studies scholars, art historians, and artists John Berger, Jacqueline Rose, Mary Kelley, Victor Bergin, Mary Ann Doane, Kaja Silverman, Constance Penley, D. N. Rodowick, Jackie Stacey, Douglas Crimp, and Griselda Pollack contributed an important theoretical foundation for the emergence of self-conscious

programs of visual culture research. Other key influences included Laura Mulvey's essay on the male gaze and visual pleasure in western art and film, Janet Wolff's work on the social production of art, and Martin Jay and Jonathan Crary's conceptions of → scopic regimes.

Also movements to study the social use and role of pictures and visual artifacts in anthropology and social communication, largely in the US, provided important pioneering contributions to the rise of visual culture study (Worth 1981).

Since the early 2000s, visual culture study has solidified into a field of study in its own right, marked by the inauguration of the interdisciplinary and international *Journal of Visual Culture* in 2002. Rather than emerging merely as a field in its own right, visual culture has achieved recognition as a viable approach in many of the traditional disciplines including literature, history, art history, film and media studies, and communication studies. One of its major innovations in academic study has been the integration of visual practice and critical theory; and a sustained interest in feminism, queer theory, and critical race studies as strong components of the field's work.

# Visual Representation

Carey Jewitt

University of London

The study and conceptualization of visual representation were primarily associated with art and art history prior to the twentieth century, and drew on the analytical tools of iconology with a focus on the artist's intention and perception (→ Iconography). With the advent of → semiotics, followed by other theories of the visual, the twentieth century marked a broadening in conceptions of visual representation from the realm of art to the realm of the everyday. Studies of visual representation have expanded to include the images that surround people everyday. This includes studies of images in film (Metz 1990), the use of photography (Sontag 1979), advertising (Goffman 1979), scientific imagery (Latour & Woolgar 1986), learning and development (Kress 1996), and the representation of social identities (Hall 1997). This expansion of the domain of the visual has influenced how visual representation is theorized and approached, including a shift in focus from the image to contexts of production and viewers. Today a range of theories is applied to understanding the visual, including theories drawn from anthropology, art history, cognitive psychology, cultural studies, linguistics, psychoanalytical theories, and sociology.

Studies of visual representation have shown that the visual is central to the cultural construction of social life. People's everyday experience of the world, socially, physically, and psychologically, and their production of meaning are mediated by the visual. Visual representation is not only a matter of how people experience the world; it is also crucial in how the world itself is constructed. The twenty-first century is marked by a plethora of imaging and visual technologies, and in contemporary western society everyday life is saturated with the images that these technologies make available. Studies of late twentieth-century culture have noted a *turn to the visual* (Mitchell 1995; Mirzoeff 1999) in which the modern world has become a visual phenomenon; a world that conflates looking, seeing, and knowing (Jenks 1995) to become a "vision machine" created through new visualizing technologies in which people are all caught (Virilio 1994).

Visual representation is a complex concept that connects with fundamental questions of "reality," ideology and power, agency, as well as signification and the procedures and potentials for interpreting meaning. There is, however, a general agreement that the meaning of an image is "made" at three sites: (1) the site of the image, (2) the site of production, and (3) the viewer interaction. The meaning of visual representation is realized in the interplay across these three sites or factors.

## THE IMAGE

The concept of visual codes and conventions (socially agreed ways of doing something) is often employed in the analysis of visual representations. Semiotics proposes that there is a wide range of visual, pictorial, material, and symbolic → signs that are conventional in the way that they simplify, and yet bear some kind of resemblance to, an object or quality

in the “real” world that they signify. This includes abstract signs that become associated through agreement into convention with the object or quality represented. These conventions are extended to a semiotic → “code” to form an extended system of semiotic signs. Social semiotics uses the concept of “semiotic resource” rather than code. This serves to foreground the work of the sign-maker in interpreting and assembling semiotic resources.

What is depicted in an image and how it is represented are an obvious starting point for understanding the process of visual representation. Visual codes can, for example, be designed to realize visual narratives or conceptual categories, each of which serves to connect or disconnect depicted elements in different ways. That is, the way these relationships are represented marks (and establishes) what belongs and does not belong together, who acts on what, and so on. These *represented relations* are realized through a range of codes, including the representation of depicted elements, compositional arrangements, and analytical structures. Visual representations also work by using and representing many of the visual codes that are employed in lived rather than textual forms of communication. In this way visual representations can carry all the sign systems and codes (dress, style, body language, and so on) that can “make” the lived world meaningful. For instance, Goffman’s *Gender advertisements* (1979) offers a classic exemplar of how depicted elements, compositional structures, posture, and gaze contribute to the production and regulation of gendered identities.

In addition to their “content,” visual representations position the viewer to look in particular ways. In this way an image can be understood as “telling” viewers who they are and where they are. In doing so the image realizes the ideological design of the viewer’s relationship with the depicted object, person, or event. The viewer can refuse to adopt the viewing position offered by an image, but nonetheless it is present.

## PRODUCTION

In order to get at the meaning of an image, the ways in which the meanings and uses of images are regulated by institutions of production, distribution, and consumption need to be considered. The economics, motives, and intentions of those who produce and disseminate visual representations are aspects of the site of production. That is, visual representations need to be understood in context because these social factors and experiences are not separate from the signifying systems of the visual; they do not exist in an abstract realm – they actually structure it (→ Sign Systems).

The production of an image is therefore integral to its use and meaning. Technologies of production, in particular new technologies, are key to the question of the relationship between visual representation and “reality.” Technologies have changed what it is possible to see and how these entities are seen, through the magnification of detail, slow motion, capturing images that escape “natural” vision, and the changing context of viewing.

## VIEWER AND GAZE

The viewer, looking, and subjectivity are key themes in theorizing and understanding visual representation (→ Spectator Gaze). Understanding the agency of the viewer demands a shift of analytical emphasis away from the image or text to the social identities and

experiences of the viewer. This necessarily connects with the context of viewing as part of the production of meaning. From this perspective, meaning is understood as constituted in the articulation between the viewer and the viewed, between the power of the image to signify and the viewer's capacity to interpret meaning. Visual representations work (mean) by producing effects each time they are looked at. However, the image also depends for its effects on a certain way of seeing.

Asking who the viewer is raises the question of the alignment and identification of their points of view and perspective with those of the maker of the image (→ Visual Communication). In other words, both the maker and the reader of a visual representation are involved in the process of making sense (*designing meaning*). Seeing the viewer as agentive means that the power of a visual sign remains a potential until the viewer engages with it. The parameters within which interpretations are made are shaped by the viewer's social position and subjective capacity in conjunction with the conventions and codes of a visual representation.

The mediating effect of contexts of viewing is especially relevant for visual representation in the twenty-first century, when images are mobile across different media and contexts (→ Digitization and Media Convergence). For example, reading a magazine at home, driving by a billboard on the road, and watching an advert at home on television or with friends in the cinema all call forth different practices of viewing. The context of viewing contributes to realizing different practices of looking and interpreting.

In summary, visual representation can be understood as a *cycle of production*, circulation, and consumption, a cycle in which visual representations become a site of struggle over what something means.

## VISUAL REPRESENTATION AND SIGNIFICATION

Signification and how to theorize the relationship between referent, signifier, and signified are central to the way visual representation is conceptualized. Current theories of → perception, → structuralism, poststructuralism, and postmodernism theorize their relationship in different ways (→ Postmodernism and Communication). This influences how the power of visual representation is understood to shape people's experience of the world, what the world is, and what it can be.

### Perception

Models of perception are concerned with image-making as an internal psychological process, that is, with the perceptions and sensations in the mind of the image-maker and the viewer. Here the goal is the perfect reproduction of reality. This places reality as external to representation, in which the referent "exists" and the signifier reflects it.

From this perspective an image is a *transparent window* through which the viewer can connect directly (via the signifier) to an original object or presence (the referent). This presents a notion of the image as autonomous and as containing within itself an inherent meaning. This conception of visual signification and image-making as cognition, perception, and a kind of optical truth severs the connection between image and society and fails to account for the relationship between image and power.

## Structuralism

In the twentieth century semiotics began to interrogate the elements and structures of systems of representation, language, and the visual. Traditional semiotics (e.g., Saussure 1986) views → meaning as consisting of two parts: the signifier and the signified. On the one hand, the signifier denotes a sign's literal meaning: that is, who or what is depicted. On the other hand, the signified connotes a sign's associated meanings: that is, the cultural ideas and values associated with the objects depicted. Structuralism asserts that although we depend on the relationship between these two parts to produce meaning, it is an arbitrary relationship established through cultural convention. This presents language and other systems of meaning as self-contained structures, a system of arbitrary and differential signs that do not name or reflect thoughts or concepts that pre-exist it, but rather actively construct them.

Structuralism attempts to understand the social and cultural forces that motivate representation, rather than accepting representation as given or natural. This brings the relationship between referent, signifier, and signified into a social relationship. Viewing is repositioned as a social process that involves the unfolding of meaning through the “activation” of visual codes of recognition, codes learnt through the viewer's interaction in the social cultural world, rather than an individual physiological and cognitive process.

Locating visual representation in the social domain in this way opens up the necessity of thinking of visual representation as discursive work, work that produces society. This reconnects images with the social and in doing so locates image in relation to power. However, structuralism has been criticized for being *ahistorical* and for being *deterministic* in the way that it privileges structure over individual human agency. In this way it is inadequate in theorizing the potential of human agency to resist, challenge, and change systems of representation. Peirce (1991) brought human agency into semiosis by his assertion that sign-making involves the cooperation of a sign, its object, and its interpretant. In other words, for Peirce signs cannot exist independently of a subject to interpret them. This shifts attention from the idea of meaning as embedded in text to a concern for the interactive process of *meaning-making*.

## Poststructuralism

Poststructuralism developed in the 1960s as a critical response to the assumptions of structuralism. Poststructuralism rejects the structuralist notion that there is a consistent structure to a text and argues instead that these structures and systems that underlie a text are themselves a cultural product. Poststructuralism argues that the systems of knowledge that produce it, as well as the text itself, need to be analyzed in order to understand the meaning of a text. In other words, poststructuralism can be seen as the study of the production of knowledge (Worth 1981).

Poststructuralism argues that the author is not the primary source of the meaning of a text (Barthes 1977) and that there is a *multiplicity of meanings* to any text. Decentering the authority of the author in this way serves to open up the meaning of a text to the work of the reader and other sources for meaning, such as cultural norms and historical context. Placing the reader at the center of meaning-making in this way asserts that no text has one

meaning, purpose, or existence. In addition to demanding a rethinking of texts and representations, poststructuralism also destabilizes the notion of the “self.” From this perspective the concept of the self as a single and coherent entity is a fictional construct.

*Social semiotics* rejects the concept of code as too rigid and static and instead uses the concept of semiotic resource (Hodge & Kress 1988). A focus on semiotic resources serves to recognize the social, historical, and cultural character of visual codes and the ideological work of signs. From a poststructuralist perspective the act of reading a sign is repositioned as the act of sign-making, of giving meaning to a signified. That is, the reader is the sign-maker and signs are constantly remade and transformed through people’s engagement with them. In this way, the denotative (the signified) can be seen as always connotative, no matter how literal its relationship to the “real” world.

The relationship of the referent with the signifier and signified is significantly “loosened” in poststructuralism- and the term “signifier” is preferred to “sign” to indicate that no single meaning is secured to a word, and that the possibility of a full and secure meaning is always deferred (Derrida 1978). In other words, meaning is never as fully “fixed” as structuralism appears to suggest. This attempts to move away from the linking of representation with the idea of reconstituting the missing “presence,” the original source “content” of the empirical form of a representation.

### Postmodernism

Postmodernism argues that the economic and social conditions of late capitalism, in particular globalization and new technologies, have led to a decentralized, fragmented, and media-dominated society saturated with images (→ Globalization Theories; Technology and Communication). Postmodernism rejects the idea of “representation” in favor of “*simulation*” to emphasize the constructed character of signs. Simulations are understood as simulacra of the “real” that presuppose and precede the “real.” These hyperreal symbols and signs do not have an original, stable referent or a source of meaning. In this way postmodernism breaks the relationship between seeing and knowing. Baudrillard (1983) argues that society has replaced all reality and meaning with symbols and signs, and that what people understand as “reality” is actually a simulation of reality. From this perspective, images are to be fundamentally mistrusted because they claim to signal a referent that they have become detached or severed from.

Postmodernism is a contested term. Whether or not it is a distinct historical period or an extension of modernism remains a matter of debate. There is agreement, however, that the conditions of late capitalism have realized some of the aspects encompassed in postmodernist theory, such as the breakdown of traditional structures (e.g., genre and other stylistic forms) and classificatory categories. This conceptualization of visual representation refutes the possibility of representation as a mimetic reflection of “reality.”

### VISUAL REPRESENTATION, IDENTITY, AND POSTCOLONIALISM

The visual produces as well as represents culture, constituting (and constituted by) its relations of power and difference, so that cultures of everyday life are entwined with practices of representation. The continuous circulation and repetition of images presented

as the norm or reality in visual media actively define social and cultural norms as fixed and natural. In the ways that people are depicted, vision is complicit with power and discipline through surveillance. Understanding visual representation as embodying and constituting ideologies (the system of thoughts and beliefs that determine the subjects action and behavior) shows how ways of investing meaning in the world are realized in visual representations.

The theorization and study of identities (→ Social Identity Theory) is one example of a significant area that has shown the potential of visual representation in understanding social and cultural phenomena (e.g., Hall 1997). Work has shown how racial, gendered, and other identities are visually represented, recycled, and contested. Visual discourses work to govern and empower particular understandings of a subject through their representation. Building on the work of Foucault (1977), identity theorists have examined visual representation as a part of the regulatory force of culture (sets of practices, cultural norms, meanings, and values) as they apply to the production of identities.

The cultural practices of looking and seeing are (like other social practices) organized around the founding principles of the *articulation of difference*. Looking at how representations attempt to fix difference offers a way of conceptualizing the complex relationship of power and representation. The practices of representation can be employed, for instance, to mark gender and racial difference. The “visible” signifiers of race and gender on the body can be called on to make these differences seem real and therefore true. The differences we can “see” appear to ground their “truth” beyond the social and historical construction of race and gender into nature and therefore to be unchangeable. The question of how the “other” is produced and reproduced through visual representation is central to postcolonial theories. The idea that discipline and control can be achieved through relations of looking and the knowledge and power that vision allows over what is seen is central to Foucault’s work and postcolonial theories.

Visual representations are, then, a discursive means by which a dominant group works to establish and maintain hegemonic power within a culture in which meaning is constantly reproduced and remade as signs are articulated and rearticulated. Images are thus a site of *struggle for meaning*, a site of power, and constitutive of society. Cultural production therefore has real political and ideological effects (→ Cultural Studies). As a result, visual representation has also been taken up as a potential tool for resistance and the remaking – reimagining – of society (→ Art as Communication).

## Visuals, Cognitive Processing of

*Jeremy N. Bailenson*

*Stanford University*

*Sun Joo Ahn*

*Stanford University*

Visual perception is a seemingly effortless process for most people. However, it is not the case that the human brain receives information just as it exists in the environment. Vision is an *active process*, and while information from the outside world becomes transformed into information sent to the visual cortex, there are a number of decisions the visual system makes in order to solve inherent ambiguities (→ Information Processing). For example, objects in the physical world are three-dimensional, while images stored on the retina are represented in only two dimensions. Consequently, it is almost impossible to resolve the information about size and distance with complete accuracy. Consider the case of a scuba diver with limited visual cues – the shark in her visual field could be seen as a very large fish 10 meters away, or as a very small fish just 1 meter away. Much research in psychology has focused on how people resolve ambiguous information using various visual cues including object size, motion, color, segregation (i.e., determining when one object begins and another one ends), and the distance of the object from the perceiver.

A separate line of research seeks to understand *how people form and process mental images internally*. Evidence suggests that the manner in which people store and utilize

visual memories is different than that for verbal memories (→ Dual Coding Theory), because the former are largely contingent on spatial principles, while the latter are stored in a propositional format. Researchers have utilized various → paradigms to study the manner in which people store and use images. For example, work by Shepard and colleagues in the early 1970s established a paradigm of mental rotation (e.g., Shepard & Metzler 1971). By having experimental subjects rotate objects in their mind (e.g., rotate the letter “K” 90 degrees counterclockwise) and comparing the imagined results to the actual results, researchers learned about the accuracy and malleability of mental representations. In addition, by running experiments in which subjects scanned mental maps and recalled features of imagined images, Kosslyn and colleagues demonstrated that people used mental imagery often and accurately (e.g., Kosslyn 1973). Moreover, certain types of visualization are qualitatively different from others in terms of richness of representation; evidence suggests that people process human faces more substantially than other images.

When people communicate with others, either face-to-face or through some mediated context, vision usually plays a major role. Of course, how substantial that role is obviously depends on context – watching → television relies more on vision than listening to the → radio. However, communication scholars have relied on theories and methodologies created by cognitive and perceptual psychologists to guide their work (see Smith et al. 2005 for a review; → Psychology in Communication Processes).

One fruitful area of work has been examining the manner in which visual information *interacts with verbal information*. The now classic “McGurk effect” had demonstrated that people rely on visual information when listening to another person speak. McGurk and McDonald (1976) created a video clip with the speaker mouthing the sound “pa-pa” but coupled with the sound “na-na”. People watching the clip integrate the two conflicting cues and hear the phoneme “ma-ma.” In other words, visual information changes the way a communicator hears information.

Many communication scholars have studied the *effect that visualization has on verbal processing*, when the two channels are either redundant (i.e., consistent) or inconsistent. For example, Edell and Staelin (1983) have provided support for a model in which the degree to which visual information improves or detracts from a verbal advertisement depends on the type of message presented in the advertisement and on the congruence of the verbal and visual information. Subsequent work has examined the degree to which visual information augments verbal information in newscasts, political flyers, and many other forms of mediated messages with visual information.

The effect of visual processing is significant enough that people may be unknowingly influenced in various important decisions made in society. The realm of politics serves as a good example. Modern politics depends heavily on the development of communication media, which heighten the visual aspect of political campaigns (→ Candidate Image). Work has demonstrated that in low-information situations people often turn to *visual affective cues* and base their electoral choices on the appearance of the candidate. One study demonstrated that manipulating images to increase the facial similarity of the candidates to the voters’ own facial features increased the likelihood the voter would support that candidate (Bailenson et al. 2006). Of course, well-informed voters have the ability to filter such intuitive attractions out of their decision-making processes, but the influence of the visual information above and beyond substantive issues is significant.

Infinite possibilities for visual processing await discovery in the field of communication. In the future, it will become increasingly important for scholars and the public alike to constantly question the ethics of innovative methods to influence the human mind through visual manipulation (→ Image Ethics).

## **Voice of America**

*Nicholas J. Cull*

*University of Southern California*

Voice of America (VOA) is a multilingual international broadcasting service funded by the US government, which, since its creation in 1942, has played an important role in projecting American news, culture, and policy to the world (→ International Radio; News; Culture: Definitions and Concepts).

The US government was slow to begin international broadcasting. While Soviet Russia had been transmitting to the world since 1927, the United States left such activity to a few religious stations. The outbreak of World War II changed this. In February 1942 federally funded broadcasts began from New York in German, French, and Italian under the collective name of Voice of America. More languages soon followed. The first VOA broadcast set the tone with the announcer declaring in German: “The news may be good or bad. We shall tell you the truth.” Overseen by the Office of War Information, VOA sparked controversy when it repeated criticism of US foreign policy, but it was considered effective enough to survive into the postwar period as an adjunct of the State Department.

While postwar funding was initially hard to come by, the ubiquity of Soviet → propaganda soon convinced Capitol Hill that the US needed a permanent international information machine including shortwave radio. The authorizing legislation came in 1948. In 1953 the Eisenhower administration placed VOA within the United States Information Agency (USIA) a new agency for what would eventually be dubbed “public diplomacy.” At the same time VOA moved from New York to Washington, DC to quiet McCarthyite claims that the station was running a radical foreign policy of its own.

From the outset VOA’s output was strongly influenced by the ethics of domestic American journalism. The station’s broadcasters worked to present the news in a balanced way (→ Balance). The Eisenhower administration recognized the prime value of credibility and in 1960 authorized a Voice of America charter to require the Voice both to reflect American policy and broadcast all sides of a story. VOA was helped in its journalistic mission by the existence of a parallel network of ostensibly independent stations broadcasting to the Eastern bloc, known as Radio Free Europe and Radio Liberty and actually funded by the CIA (→ Radio Free Europe/Radio Liberty). VOA took the role of the good cop while RFE/RL played propaganda hardball. Had VOA been America’s only voice it is likely that the pressure on them to transmit propaganda would have been even more intense than they were. Even so, while the charter strengthened the hand of the journalists at VOA it was not enough by itself to deter politically motivated attempts to skew the Voice’s output. Political pressure during the → Watergate scandal and the closing years of the Vietnam War prompted a bipartisan move to write the VOA charter into law in 1976.

Besides news, VOA output always included cultural programming. Its most famous program was the *Music USA Jazz Hour*, hosted by Willis Conover, which ran from 1956 to Conover’s death in 1996. The show was an immense hit with audiences in eastern Europe. Conover saw jazz as a musical expression of American democracy. VOA also carried features, drama, commentary and broadcast some of its English-language programming as “Special English,” a system that used a limited vocabulary delivered at dictation speed for those with only a beginner’s grasp of the language.

As the Cold War progressed the Voice pulled back from its European languages and added more *Asian and African content*, typically maintaining 46 or so different languages. VOA built an audience generally reckoned in excess of 100,000 per week. Refugees from the communist world consistently affirmed its value while further evidence of its effectiveness could be found in the counter-measures deployed by its enemies, including jamming across the Soviet bloc and China.

In the 1980s VOA entered a period of *modernization and controversy*. While some Reagan administration appointees sought to increase the political content of the Voice and expand the use of editorials on the air, journalists fought a rearguard action to protect their charter. VOA began to move away from shortwave, seeking out FM affiliates to rebroadcast its material. In the 1990s the Voice redoubled its quest for FM affiliates and began broadcasting television programs, starting with its Mandarin and Farsi services. Under the leadership of director Geoffrey Cowan, the VOA greatly expanded its use of call-in formats, a shift characterized by Cowan as “from monologue to dialogue.” The Voice swiftly recognized the value of the Internet and launched language streams in all its broadcast languages. As post-Cold War budget cuts bit, some of these replaced the on-air version.

The 1990s saw two major *bureaucratic shifts*. First, in 1994, VOA came into the same stable as RFE/RL – the International Broadcasting Bureau (IBB) – which required a pooling of engineering resources. Then, in 1999, as USIA disappeared into an expanded State Department, VOA and the wider IBB became subject to a new Broadcasting Board of Governors (BBG). While the BBG was designed to keep out political influence, VOA managers soon complained that the structure had actually locked in the influence of particular board members.

The global “war on terror” sparked familiar tussles over alleged attempts to skew VOA. The Voice embraced new technology (including feeds in several languages to personal data devices), and increasingly used → television, but resources remained scarce (→ International Television). The BBG launched several major initiatives, including new radio and TV services in Arabic, outside the VOA structure. The Voice paid the price in budget cuts, culminating in a budget for fiscal year 2008 that eliminated most English-language programming. At the time of writing the future of the Voice seems increasingly in doubt.

## **Voice, Prosody, and Laughter**

*Phillip Glenn*

*Emerson College*

The terms “voice,” “prosody,” and “laughter” refer primarily to vocal, nonlinguistic aspects of communication. Human communication is rich with meaning conveyed through multiple channels, often divided into verbal (language, words, and symbols) and nonverbal. It may be tempting to think of nonverbal communication as primarily visual, but speakers convey much meaning vocally, too. Considering prosody, voice, and laughter together may promote a misleading view that spoken language operates somewhat independently from such paralinguistic indicators (also called supra-segmentals in linguistics). This view has its origins in scholarly traditions that begin with studying the

printed word. A different starting point is interaction, where all features of message production work integrally to contribute to meaning, which participants negotiate moment by moment. The French linguist Ferdinand de Saussure captured this distinction between studying *langue*, the abstract system that a particular group of people internalizes, and *parole*, actual speaking practices.

*Prosody* and *voice* features such as pitch, intonation, emphasis, volume, rhythm, timing, and tempo contribute to the emergent meaning of utterances. For example, intonation at a possible transition point (where change from one speaker to another is relevant) helps mark an utterance as a completed question (upward intonation) or declarative statement (downward intonation) or as still in progress (continuing intonation). In this and various other ways prosodic features help shape turn-construction and turn-taking. They also play a role in action design and sequence organization matters that arise routinely in interaction (→ Conversation Analysis). Prosodic features indicate perceived confidence and attractiveness and mark aspects of individual identity such as gender, race, and class (→ Interactional Sociolinguistics).

Under some circumstances speakers will tend to adjust prosodic features to be more convergent with or divergent from those of their interlocutors. These changes may reflect rapport or status. Prosody and vocal patterns make up different accents and dialects of spoken languages (→ Language Varieties). Prosody and voice also mark attitude and affect in interaction (→ Emotion). Such features have long been of interest to teachers and scholars of performance, both for the stage and professions that rely on effective vocal performance and for culturally grounded studies of performance genres around the world. Studies of speech play and verbal art pay attention to performance elements that give spoken language heightened drama, involvement, ritual value, aesthetic value, or emotional impact (for example, rhyme, repetition, and rhythm).

*Laughter* has long drawn attention for its distinctive place in the human communicative repertoire. Philosophers from the time of Plato and Aristotle to the present have sought to understand why people laugh, although such investigations often reveal ultimate concern with what makes something funny. However, much laughter in interaction does not respond to humor or anything particularly funny but serves other social functions, such as showing friendliness or affiliation. Ethological researchers have studied how human laughter resembles and differs from similar behaviors exhibited by other higher primates. Chimpanzees and baboons, for example, show a relaxed, open-mouthed face and make a reiterated uh-uh-uh sound when playing. Human laughter differs physiologically (enabled in part by our upright, bipedal posture and breathing apparatus) and shows a greater variety and subtlety of social functions. Researchers in psychologically grounded traditions have sought to understand the mental mechanisms that underlie laughter and some of the social variable that may prompt someone to laugh in certain contexts.

Although laughs have no semantic content, they routinely occur closely intertwined with talk and help shape overall meaning. Social interactional researchers document laughter's placement, production features, and workings within all kinds of talk, ranging from casual conversation to meetings, medical interviews, and televised political debates. Laughter is finely organized, precisely placed, and subject to interpretation based on its acoustic properties and sequential location. People often laugh together, and such shared

laughter routinely begins with one person inviting another to laugh along (Jefferson 1979). Whether one is the first to laugh or joins in both shapes and reflects issues of local relationship and role (e.g., whether one is the butt of a tease, or is affiliating with someone else). Researchers in nearly all traditions have found fascination with laughter's dual nature: it may signal alignment and bring people together, but it may also display hostility and be used mockingly or derisively. Whether someone is *laughing at* or *laughing with* another in interaction gets worked out according to specific cues. Laughter itself may be ambiguous in the extent to which it displays going along with what is happening or resisting it. This makes laughter a valuable social tool for negotiating identities and relationships (Glenn 2003). Laughter conveys meaning visually as well as aurally, but most social interactional studies have attended primarily to its aural features.

Different systems for transcribing prosody, voice, and laughter (→ Transcribing and Transcription) carry different assumptions about what is important to notice and how features interrelate with each other. The conversation analytic transcription system developed by Gail Jefferson (see Atkinson & Heritage 1984) uses symbols on the keyboard to note prosodic features such as changes in pitch and intonation, volume, emphasis, and tempo. Laughter is not merely noted but actually transcribed. This allows analysis of how variations in the acoustic structure of laughter – for example, a closed-mouth “hmh” contrasted to an open-mouthed “hah” – contribute to what it is doing at a moment in interaction.

# Voyeurism

*Pamela Church Gibson*

*University of the Arts London*

*Neil Kirkham*

*University of the Arts London*

Voyeurism (from the French *voir* – to see) is a term used to describe the act of observing the actions of other people in order to provoke sexual arousal. Although all-encompassing, it is often associated specifically with the behavior of adolescent males, who frequently engage in voyeuristic activities in the period leading up to sexual maturity.

In Robert Zemeckis's *Back to the Future* (1985), the time-traveling teenager Marty McFly watches a teenage incarnation of his own father (George) in the act of spying on his own future mother (Lorraine), herself still a nubile girl. While she is happily undressing in what she believes to be the safe haven of her own bedroom, her future husband is perched on the branch of a tree, peering at her through binoculars. Here George conforms exactly to the popular idea of a "voyeur," someone whose primary sexual gratification derives from the unseen, hidden act of looking. Although Lorraine is unaware of being watched, the horrified Marty, who can see everything, groans, "Oh my God, he's a peeping tom." Marty's disgust is understandable. Described as a "perversion" by Freud, the act of voyeurism is seen as a violation of the victim's privacy, something that, conversely, also applies to the voyeur – for whom gratification is often dependent on not being seen to look.

If this kind of voyeuristic activity may appear dangerous (in the United Kingdom it was criminalized under the 2003 Sexual Offences Act), then the visual arts offer considerable respite. The act of looking is essential to the construction of → meaning in → painting, → photography, → television, → cinema, and online (→ Internet). All present the opportunity to peer into an oft-denied space, regardless of whether it provides intellectual or sexual stimulation.

An example of voyeurism as "intellectual" stimulus is provided by the history of the *female nude in western art*. Fundamental to the type of voyeuristic pleasure gained through the study of these paintings is the question of whether or not the women represented return the gaze of the, presumably male, spectator (→ Spectator Gaze). Typically, the gaze of the female protagonist is turned away from the voyeur, possibly toward an unseen lover (→ Gaze in Interaction). However, from the early nineteenth century onward this tradition is undermined. Certain painters deliberately challenge this convention by depicting a traditional reclining nude who stares defiantly out of the canvas to meet the eye of the male spectator; the most controversial example is possibly Manet's *Olympia* (→ Art as Communication). Berger (1972) examines the tradition of the nude in western art and suggests that at this ruptural moment the conventional distinction between images on canvas and mass-produced soft-core pornography disappears (→ Sexualization in the Media).

Voyeurism is, of course, often confused with *scopophilia* (the pleasure derived from gazing at another body). Mulvey (1975) used this latter term in her deconstruction of the

voyeuristic gaze of → Hollywood cinema, arguing that the pleasure of “looking,” within classic narrative cinema, is constructed, quite specifically, for a male viewer. Yet, interestingly, the male gaze is never directly returned – the film spectator subjectively identifies himself with either the male protagonist or the camera. The cinema offers three potential *examples of voyeuristic participation*: that of the camera, of the character, and of the spectator. As the very process of watching a film – in the dark, separated spatially from other members of the audience – appears to offer audiences the unseen, individual pleasure of the “peeping tom,” the importance of such “looking” is intensified, particularly in relation to the communal, visible-to-others viewing traditional with, say, television (→ Film Theory). Certainly, the term “voyeur” often appears to suggest a male viewer. Kaplan (1991) describes how very few reported cases of sexual voyeurism involve a woman as perpetrator (→ Women in the Media, Images of; Audiences, Female). In relation to pornography, the most voyeuristic of all the visual arts and one primarily “consumed” by men, this would certainly appear to be the case (→ Pornography Use across the Life-Span; Pornography, Feminist Debates on). Freud described how such pleasure in looking becomes perverse when it supplants the desire to engage in intercourse (→ Fetishization). While all the visual arts offer a pleasure of sorts, pornography (which has as its eventual aim the sexual gratification of the voyeur) perfectly exemplifies this idea. It is perhaps for this reason that the Internet, the one great extension to the possibilities offered for voyeurism in the last two decades, contains such a vast array of pornographic material (→ Sex and Pornography Online). The widespread use of the webcam allows the voyeur to interact with his or her chosen target while remaining unseen and anonymous.

## War Correspondents

*Michael Pfau*

*University of Oklahoma*

War correspondents provide first-hand accounts of military conflict for dissemination to the public. The literature of war correspondents manifests a decidedly western focus. War correspondents originated during the imperial age, when British newspapers sought first-hand accounts of distant continental and colonial wars, and became an institution during major nineteenth- and twentieth-century wars. Newspapers originated the role of war correspondent. *The Times* of London hired barrister Henry Crabb Robinson to cover Napoleon's campaign in Spain and later employed William Howard Russell to cover the Crimean and Franco-Prussian wars. Scholarship about conflicts and journalism practices in general focuses disproportionately on western sources.

### ORIGINS AND TECHNOLOGY

Before the nineteenth century, reports from the front lines depended on accounts from travelers or letters from troops, who were untrained and poorly educated. Accounts of war in newspapers often served simply to promote nationalism. Two factors that influenced the role and function of war correspondents are social and ideological (→ News Ideologies). Social changes, especially those involving technology, shortened the time required to get news from the front lines to the public, and ideological pressures created tension over whether war reports are independent accounts or government propaganda (→ Technology and Communication).

Early on, correspondents wrote their reports by hand and transmitted them to newspapers by horse or ship. Sometimes weeks or months passed before the public read about battles. The pattern began to change in the late nineteenth century. During the Mexican-American War, correspondents sent their reports first by steamship to New Orleans, then via telegraph to the east coast or by pony express to the US heartland (→ Telegraphic News). War reporting changed again when the US and European networks of telegraph lines expanded. The telegraph sped movement of news reports from the front lines. The number of war correspondents increased during the US Civil War: more than 500 from the north alone covered the early battles in Virginia and Maryland. Although coverage became more immediate, reports were often inaccurate, fabricated, partisan (→ Partisan

Press), and incendiary (Knightley 1975), largely because correspondents lacked education and training (→ Journalism Education).

The Atlantic cable laid in 1866 meant that news of war on one continent no longer took weeks to reach readers on another. At first the flow of news was largely one-sided, with the US press depending heavily on foreign reports, especially from Britain. During the last half of the nineteenth century, British war correspondents dominated coverage. Europeans and Americans read news reports of the Crimean and Franco-Prussian wars by William Howard Russell of *The Times* of London and accounts of the Franco-Prussian, Russo-Turkish, and Zulu wars by Archibald Forbes of the *London Daily News*. During the Spanish–American War, US correspondents dominated, including Richard Harding Davis of the *New York Journal* and Stephen Crane of the *New York World*, and the Associated Press emerged as a major source of war news.

The sharp rise in literacy and the development of *economical printing* increased the number of mass circulation → newspapers and → magazines in the late nineteenth century, enlarging audiences for war news. The expanding audience for news between the US Civil War and World War I produced a *golden age* for US and European war correspondents (Knightley 1975).

The next significant development was the dissemination of war news over the → *radio*, which spread with mass production of radio receivers following World War I. The first radio networks formed in Great Britain and the United States in the 1920s. By the late 1930s, almost all urban (and a majority of rural) US residents relied on radio as their primary news source. On the eve of the outbreak of World War II in Europe, correspondents in London and Prague could narrate events for a widening audience. Radio remained a primary source of news during the Korean conflict. Following the outbreak of war, radio ratings jumped by more than half.

In the United States, only one in six homes had → *television* when the Korean War began, but nine out of ten had TV sets by 1960, and most had a color TV by mid-decade. The Vietnam War was the first to enter US homes by television (Hallin 1989). The color film and video images were graphic and powerful (Allan & Zelizer 2004), but not live, because → television news divisions had to transport film canisters from the front. Television war reporting shifted the structure of news reports from thematic frames, which include background and context, to episodic frames, which communicate stories in piecemeal fashion without context (Iyengar 1991).

Starting with the Gulf conflict in 1991, *satellite transmission* eliminated the lag from the time correspondents covered events in war to the time audiences witnessed those events in news reports (→ Satellite Television). After → CNN broadcast the US bombing of Baghdad live in January 1991, instantaneous coverage of war was dubbed the *CNN effect*. When an audience thousands of miles away can experience words and images from a war zone as they occur, journalists have less time to exercise news judgment (→ News Values).

## TENSIONS

War correspondents face tension because of their several roles in wartime (→ Journalists' Role Perception). They may see themselves as a mirror, providing largely objective accounts of war with little or no interpretation; as a watchdog, counterbalancing the power of

political and military officials; or as a cheerleader, serving as a conduit to disseminate government positions. Which role prevails depends, in part, on three factors: the attitudes of news publishers, editors, and reporters; whether the public is unified or divided in its support of war; and the access to the front lines that political and military officials permit.

Early war reports served more as → *propaganda* (→ War Propaganda). Before World War I, war correspondents were more likely to provide what audiences wanted to read, mainly patriotic accounts that contributed to the illusion of war as an adventure or thrilling story (Knightley 1975). Governments did not necessarily interfere. For example, during the US Civil War, the government in Washington made little effort to control correspondents, in part because President Abraham Lincoln valued a free press and in part because of the difficulty of enforcing restrictions.

Competition between news outlets in reporting war news has been present since the mid-nineteenth century, when *The Times* and *Daily News* of London sent their own war correspondents to cover the Crimean, Franco-Prussian, and Russo-Turkish wars. In time, however, competition spurred overzealous newspaper owners to use sensational coverage to build circulation. That motive helped trigger US entry into the Spanish–American War, as William Randolph Hearst’s *New York Journal* and Joseph Pulitzer’s *New York World* competed for readers.

### GOVERNMENT CONTROLS

In war, the first casualty is truth. At the start of the twentieth century, Great Britain in the Boer War and Japan during the Russo-Japanese War were the first governments to censor war correspondents (→ Censorship; Censorship, History of). All major belligerents during World War I employed strict censorship of war news. Government and military officials reasoned that total war requires sacrifices, not just from soldiers but also from civilians.

Governments used two approaches to foment hatred of the enemy in order to sustain public support for war. First, they controlled press access to the front. The military provided reports of battles and subjected any correspondents found on the battlefield to arrest and expulsion. Second, governments created vehicles for their own propaganda by manipulating information. When these efforts were revealed following World War I, the press experienced a sharp decline in credibility.

During World War II the degree of censorship ranged from moderate control of the press among democratic nations to total control among totalitarian nations. US president Franklin Roosevelt sought to balance the conflicting goals of secrecy and candor, first through the Office of Censorship, formed after the Japanese attack on Pearl Harbor, and then through the Office of War Information, under Elmer Davis, formed in June 1942. US officials rationed pictures of American dead on the basis of public relations needs. They banned photographs of casualties early in the war but encouraged them later, fearing that US battlefield successes might result in overconfidence and reduce willingness to accept domestic hardships. Military officials in Britain and France intended to treat the press much as they had in World War I, but were instead more relaxed toward the press during World War II. US and British militaries considered correspondents part of the armed forces, a view that many correspondents shared (Knightley 1975; → Propaganda in World

War II). The press–military relationship, often contentious in previous wars, was cooperative during World War II, the Korean War, and the start of the Vietnam War.

At the outset of the latter two wars, news reports from the front were highly supportive. Occasional tension with the military arose over personalities or over the requirement to send stories from Korea through controls in Tokyo. By contrast, US journalists operated in Vietnam with complete freedom. After the Tet offensive in 1968, some political and military officials claimed that negative war coverage influenced public opinion. They blamed press access to the front lines for the reporting of casualties and atrocities. The reporting on bad news coverage would remain contentious in future wars.

In Korea and Vietnam, the US press was supportive of war early on, relying heavily on political and military officials for reports about progress. Later, as elite and public opinion began to divide, news reports reflected the divisions, and public support for limited war fell as casualties rose (Hallin 1989). News coverage tends to be critical in the late stages of longer wars.

Some political and military officials, believing that the news media undermined → public opinion during Vietnam, devised strategies to control press access during combat. The US invasion of Granada occurred in secret, absent press coverage. By the time of the invasion of Panama and the Gulf War, the US military employed a pool system that restricted battlefield access to a few reporters. Initial pools in the Gulf War consisted of 150 journalists out of more than 1,400 located in the region. The press corps strongly opposed the pool system.

During the Falklands War against Argentina, the British → *embedded* journalists in combat units, which fostered an *esprit de corps* between press and military that, some claim, slanted coverage toward the military. The US Department of Defense adopted a policy of embedding journalists in combat units during the Iraq War, partly in response to criticism of the pool system. The US government also wanted to showcase American military forces and simultaneously pre-empt misinformation anticipated from the Iraqi regime. The more than 600 journalists embedded in combat units during the Iraq War produced newspaper and television news reports that were structurally different from unilateral (non-embedded) reports. Embedded reports in the first two years featured greater episodic framing and, as a result, greater affect, and embedded reports were more favorable toward the military (Pfau et al. 2005).

Governments also continued creating new vehicles to influence war coverage. Following World War II, the US military used its own public affairs (once called “public information”) practitioners to work with civilian journalists covering war news. Since the Gulf conflict, governments also have used multinational public relations firms to influence public opinion. For example, the Hill and Knowlton firm represented the government of Kuwait at the time Iraq invaded the country. The firm helped shape US public opinion in favor of military intervention, in part by using the longstanding technique of claiming atrocities. During the Iraq War, the US government turned to public relations agencies to influence world opinion.

## **War Propaganda**

*Robin Andersen*

*Fordham University*

War propaganda fuses international and domestic processes in communicating one or more nations as the “Other,” as worthy en masse of death and mutilation. During the twentieth century, as examples from Britain, Germany, and the US indicate, domestic as well as international media → propaganda became essential for planning and engaging effectively in combat against other countries. In World War I, governments employed verbal and visual strategies that effectively influenced mass public opinion in favor of war. Since then, technological media developments and advances in communication design have been employed to promote positive attitudes toward war, albeit with varying effectiveness. Terms such as public diplomacy, media campaign, information management, “stagecraft,” spin, and even “militainment” have also been deployed to characterize ever-evolving propaganda strategies. War propaganda to boost “Us” and dehumanize “Them” is also, however, the target of ongoing public scrutiny and challenge.

### **LANGUAGE, THE USES OF HISTORY, AND THE UNAVOIDABILITY OF VIOLENCE**

Over the decades, even in the face of significant public opposition, elected officials and military planners have called for and waged war. Convincing the public that war is

necessary, that all diplomatic means have been exhausted, and that the call to military action justifies the inevitable loss of life in its wake requires well-planned media campaigns. And during war, problems with battlefield logistics, military misconduct, and casualty figures can all corrode what has been referred to since World War I as “home-front morale.”

Wartime rhetoric includes linguistic and visual strategies that either obscure the human costs or present the loss of human life as acceptable (→ Linguistics; Propaganda, Visual Communication of). Phrases such as “smart bombs” assure that only military targets will be destroyed; the identification of images of dead and wounded civilians as “enemy propaganda” denies their reality; and “collateral damage” presents human destruction as a legitimate and inevitable by-product.

When *historical frameworks* are used to shape news of war, certain war events may be turned, very questionably, into transferable reference points, yet others may stay untouched, almost untouchable. Many US news media equated the 9/11 terrorist attacks with the 1941 Pearl Harbor attack that drove the US into World War II (→ Propaganda in World War II). Historical references to the danger of appeasing Hitler (in the renowned 1938 Munich summit) placed Afghanistan, Iraq, even Iran, within the context of the “Good Fight” of World War II. Yet during the build-up to the Afghanistan and Iraq wars, no mention was made in US news media of the standard brutalities of actual military interventions, to well-documented massacres by US troops such as No Gun Ri in the Korean War and My Lai in the Vietnam War, or to the fact the US was forced to withdraw from Vietnam.

War rhetoric *nurtures fear and hatred*, rendering reasoned discussion less compelling. Society generally punishes unlawful violent behavior, so that mobilizing collective hatred of an enemy requires blocking out peacetime inhibitions. In promoting state-sanctioned violence the enemy’s actions must be defined as so far outside the bounds of tolerance that negotiation is absurd. War must appear to be the only defense against a menacing, murderous aggressor. The demonized enemy is no longer recognizably human, and can be killed with impunity. Such narratives of exclusion provide the necessary psychopolitical context for war.

## **WORLD WAR I AND THE BIRTH OF MODERN WAR PROPAGANDA**

The cognitive, linguistic, and visual communication strategies that fueled World War I were designed in a variety of ways. In conjunction with → censorship, the repetition of carefully designed messages helped fuel the public’s fear and hatred, and to drag out the conflict over four years, with many millions of dead and maimed (→ Message Design Logics).

The linguistic and conceptual devices used almost a century ago are still recognizable today. Ambiguity must be eliminated, replaced by definitive assertions. The world is divided between “our civilized way of life” and “their barbarism.” A simple *binary of good and evil* facilitates mass consensus. War propaganda asserts that conflict is caused by the inherent evil of the enemy, not by historical injustices, failed diplomacy, competition for economic resources, or global inequities.

During World War I, stories of the brutality of the German “Hun” predominated in Britain and France. Official documents featured atrocity narratives of malevolent German soldiers carting away young women and bayoneting babies. Posters selling war bonds and recruiting troops, first in the UK and then in the US, depicted German soldiers as brutes,

with ape-like stature, often hunched over the defenseless and innocent victims who lay at their feet. The visceral fury evoked by this sub-human, club-wielding image became indispensable in overcoming much of the public's strong resistance to war.

In the years between World Wars I and II, many researchers became interested in the nature of information, as opposed to propaganda. As Europe lay devastated in the wake of a death toll of 8 million, the values of skepticism and independent thought were rearticulated. American scholars and many in the media industries were troubled by propaganda's efficacy. Even some of its practitioners would later question its damaging legacy for the democratic process.

War propaganda, some proposed, challenges the foundations of democratic governance by substituting government secrecy, and the repetition of officially sanctioned points of view, for accurate information and uninhibited public dialogue. Under these discursive controls, citizens cannot freely determine their own policies. If a public could be so uniformly swayed, held under a totalizing atmosphere, convinced to accept a conflict that most were privately convinced should stop, how could democracy remain a historical force for good? How would governments be kept accountable?

As these debates continued, the Third Reich emerged from the ashes of World War I. The Nazis now became the masters of war propaganda, evident in films such as *Triumph of the Will* by Leni Riefenstahl. Her film depicted a God-like Hitler descending from the heavens, and images of mass enthusiasm for authoritarian rule at the Nuremberg rallies. The 1939 invasion of Poland was shown in Nazi → documentary film as justified by provocations to the then German population of Poland and by the genetic inferiority of Slavs, and was to have concluded in a mere three weeks with tiny loss of German lives. War propaganda facilitated the acquiescence of the German population in Hitler's regime. In the US meanwhile, the experience of World War I made the public skeptical about backing another war, so that there propaganda creation became institutionalized in the US military (and continued to evolve with each new war).

### **NEW WAR PROPAGANDA FORMATS: "MILITAINMENT," STAGECRAFT, AND VIDEO GAMES**

Recently a hybrid format that blurs the boundaries between fiction and nonfiction, referred to as "*militainment*," has been employed by the US media and military to represent war. Militainment and "stagecraft" are attempts to control the meanings of war through fictional formatting, information management, and media choreography.

After September 11, 2001, Pentagon officials met with Hollywood producers and directors and requested they join the fight against terrorism. They collaborated on such films as *Behind Enemy Lines*, a story validating unilateral US military action, and ABC's *Profiles from the Front Lines*, a "reality show" about the Afghanistan war. Producer Jerry Bruckheimer made *Profiles* for ABC's entertainment division with full US military cooperation, even while news reporters were denied independent battlefield access. Media coverage of Iraq's invasion was largely foreshadowed by *Profiles*. Iraq also became the first war to be televised in real time with → embedded journalists providing live video-phone dispatches. These compelling images featured brave soldiers fighting, but almost no images of death, injury, or bereavement.

By the twenty-first century, the defining moments in the reporting of war in the US were increasingly *stage-managed* by Pentagon and White House public relations professionals. A leading illustration was when President George W. Bush declared an end to “major combat operations” in Iraq. Dressed in a military flight suit in a fighter jet cockpit, the president landed on aircraft carrier *USS Lincoln*, and in front of a banner proclaiming “Mission Accomplished,” announced the Iraq invasion over.

The White House said the jet fighter was necessary because the carrier was too far out to sea to be reached by helicopter. In fact, a few columnists and alternative news sources reported that the ship was so close to land that it had to be turned around to prevent television cameras from catching the San Diego coastline in the background. More importantly, the invasion of Iraq only began a long and devastating occupation.

Newer technologies also tie the media industries to the Pentagon in what has been called by a number of scholars the “military–entertainment complex.” During the 1990s, new-media designers joined with US Department of Defense engineers to trade expertise in cutting-edge digital technologies. These multipurpose protocols have been used to create news graphics and → video games, are used as components of military weaponry, and are also key training and recruiting tools. On July 4, 2002, America’s Army, the first video game created by the military, was offered free to download off the Internet. Players are positioned as first-person shooters, and after basic training, the advanced “marksmanship” was so realistic that the computer screen moved in time to the digital soldier’s breathing under fire. The online actors were patterned after the actions of real soldiers. “From a propaganda perspective the Army has seemingly hit the jackpot. (And the Army readily admits the games are a propaganda device)” (Morris 2002).

The ongoing merger between the entertainment industry and the military, together with the use of sophisticated media stagecraft by the government, has raised serious issues for the media’s wartime role. People rely on news media to report war’s impact, but the shift to turning war into entertainment may well lessen their ability to feel alarm, or compassion for those who die in wars carried out in their name.

### **WAR PROPAGANDA UNDER SCRUTINY**

There are countless examples, however, of opposition to war propaganda over the past century and beyond. Two twenty-first-century US examples follow. Patrick Tillman, an iconic football player who had enlisted in the US Army after the 9/11 massacres, was a 2004 “friendly fire” victim in Afghanistan. The army, however, claimed Tillman was killed by enemy gunfire as he strove to help some ambushed soldiers, and awarded him a Silver Star. Only an agonizingly slow army investigation finally revealed that military officials had systematically misled Tillman’s family and the public.

Private Jessica Lynch, injured and briefly separated from her unit, was helped back to safety by Iraqi medical personnel. Military press releases claimed that on capture, she fought bravely but was shot and stabbed by enemy forces, and was only saved by a crack commando unit storming the hospital. Mainstream US media trumpeted the daring raid, but a BBC report concluded the rescue had been staged, with the green night-footage produced by the military’s own combat camera. The BBC noted the raid’s fictional aspects, and the influence of both reality and action movies, not least Jerry Bruckheimer’s *Profiles*.

In both cases, the military fabricated exciting stories at difficult points during the wars in Afghanistan and Iraq to garner public support for war. The stories illustrate the ways in which fictional narratives are now embedded within military practice, as the representations of war become central to war itself. But the cases also illustrate increasing public awareness of propaganda strategies. US Representative Henry Waxman's 2007 Congressional hearing, entitled "Misleading Information on the Battlefield," invited Jessica Lynch and Kevin Tillman, Patrick Tillman's brother, to provide evidence to legislators investigating the reach of Pentagon information management. Their critical testimonies drew considerable mainstream media attention.

As researchers, First Amendment scholars, Congressional investigators, and journalists probe the war propaganda strategies employed during the early years of the twenty-first century, more will be understood about the trend to merge military and media operations. While perception management and conflict operations have become more closely united, the loss of public support for the American war in Iraq shows the limits of even the most powerful propaganda. It remains to be seen whether the US public, or other publics in similar situations, will benefit from media support to help remember the painful counter-narratives of constructing the Other before belligerencies are allowed to begin; and further, to understand that while entertainment and fictions facilitate the prosecution of war, they offer no exit strategy from the bitter realities of escalating violence.

# Watergate Scandal

*Russ Witcher*

*Tennessee Tech University*

Watergate was more than a break-in at Democratic national headquarters. It reflected a larger struggle over US foreign policy between an increasingly powerful executive branch and a resurgent legislative branch. The precursor to this struggle was US involvement in the war in Indochina.

The Watergate crisis grew directly out of this war. As was usual with President Richard Nixon's public crises, the press played a major role in the beginnings of Watergate (→ Fourth Estate; Historic Key Events and the Media). In June 1971 the *New York Times* began publishing a series of articles that chronicled American involvement in the Vietnam War. The documents, which had been leaked to the *Times* by former Pentagon employee Daniel Ellsberg who had become disillusioned with the war, were basically a historical account of American participation in the conflict. They dealt with mishandling of the war by the previous Democratic administration and were first thought by Nixon to be embarrassing only to his political opponents. However, Nixon's national security advisor Henry Kissinger convinced the president that to allow the leakage of such classified information without retaliation on his part would be harmful to ongoing secret negotiations with the North Vietnamese, the Chinese, and the Soviet Union. The United States might be viewed by these countries as being unable to keep a secret.

The Nixon Justice Department sought and obtained an injunction against the *New York Times* and other papers that were running the series of articles. A US district judge in New York granted a temporary injunction against the newspapers and, for the first time in the history of the country, the press was ordered by the government to stop publication of a story (→ Censorship; Censorship, History of). The conflict between freedom of the press and national security during wartime was such a momentous issue that the US Supreme Court agreed to hear the appeal on an expedited basis. The high court ruled in a 6–3 decision that the government had not met the heavy burden of proof that continued publication of these Pentagon Papers would cause a direct and immediate threat to national security.

It was after the Supreme Court ruling that Nixon made the politically fatal decision to order the creation of a White House investigative unit that would search for and stop further damaging leaks to the press by government employees. This unit, later known as the Plumbers because its purpose was to stop leaks, eventually broke into Ellsberg's psychiatrist's office in California in search of material that might reveal whether Ellsberg had more information that could be used to discredit the government and influence foreign policy (Ambrose 1989).

To this day, it is not clear whether Nixon knew beforehand of the break-in at the psychiatrist's office, but he later admitted that his concern about damaging leaks to the press had created a climate in which such operations grew (Frost 1978). He also said that he would not have stopped the operation if he had known about it because he believed it was important in protecting national security during wartime.

Although the Plumbers unit soon disbanded, intelligence-gathering operations continued to be conducted from the White House. One such operation was the break-in at the Democratic national headquarters in the Watergate complex in Washington, DC during June 1972, where five burglars were arrested by the police. The incident eventually led to the exposure of White House complicity in the break-in and Nixon's own involvement in the cover-up (Aitken 1993). The early reporting of Bob Woodward and Carl Bernstein of the *Washington Post* was an important factor in keeping the Watergate story alive when other media outlets viewed it as what it initially appeared to be: a nonsensical attempted third-rate burglary (→ Investigative Reporting; Journalism, History of).

The US Senate conducted an inquiry in 1973 into the Watergate break-in and alleged improprieties during Nixon's re-election campaign the previous year. Nixon aide Alexander Butterfield testified before the Senate committee that Nixon had secretly recorded conversations between himself and others at the White House and other offices he used as president. After a year-long legal battle, the US Supreme Court ruled without dissent that the president had to turn over to the special prosecutor investigating Watergate the audio-tapes of discussions he had had with aides concerning Watergate. The reason for this decision was that the audiotapes were needed as evidence in the criminal trials of Nixon's aides who had been accused of the Watergate break-in. Ironically, the smoking-gun tape that led to Nixon's resignation was caused by his attempt at implicating an agency that he bypassed with the creation of his own intelligence-gathering operations. This was the June 23, 1972 tape in which Nixon told his chief of staff Bob Haldeman (1978) to tell the CIA leadership to tell acting FBI director Patrick Gray to stop the investigation that was tracing the money supplied to the Watergate burglars because it might expose CIA assets in Mexico. In reality, it would have revealed that the money had been supplied by the Committee to Re-Elect the President. There was no national security reason to order the investigation to be halted, as Nixon later maintained in his defense. The real reason was the political one of protecting the names of political donors whose money had been laundered through a bank in Mexico.

The significance of the Watergate story today is related to the power struggle between the executive and legislative branches of US government, particularly during times of war. To what extent can secrets in wartime be maintained in a democratic society? That question has to be resolved ultimately, with the help of an independent press, by the third branch of government, the judicial branch.

## West Asia: Media Systems

*Katharina Nötzold*

*University of Westminster*

The media landscape of West Asia includes countries and media systems as diverse as Turkey, with big media conglomerate holdings; Lebanon, whose media strongly influence developments in the Arab media sector, state-controlled Syrian media, partly controlled media under the Palestinian National Authority (PNA); and pro-government media in the Hashemite Kingdom of Jordan.

The media market of *Turkey* (population estimate 68 million) has changed from family-owned media enterprises to large media empires that have additional stakes in construction, banking, and other industries (→ Media Conglomerates). This applies not only to the press but also to → radio and → television, so that the majority of national dailies and television stations are owned by a few media holdings. The largest is Doğan Group, which owns influential dailies *Hürriyet*, *Milliyet*, *Radikal*, *Posta*, and numerous other publications, several publishing houses, three TV channels (*CNN Türk*, *Kanal D*, *Star TV*), and radio stations, followed by the Merkez Group and smaller media holdings (→ Cross-Ownership; Ownership in the Media). The popular private television stations offer a diet of entertainment, sports and news, and locally produced dramas, but there are also several thematic channels for news (*CNN Türk*, *NTV*, *Habertürk*) and music (*Kral TV*, *Number One TV*) alongside Islamic TV stations (*Mesaj TV*, *Kanal 7*). Public *TRT* television, with seven channels ranging from general to thematic programs, is faced with political interference and strong competition with successful private channels (→ Public Broadcasting Systems). Of around 1,100 private radio channels, 36 stations broadcast nationally, and TRT has four national radio channels with different themes.

*Lebanon* is a small country (population approximately 4 million) but known throughout the Arab world for a vibrant and free, privately owned press. Different political opinions are published in the biggest dailies, *An-Nahar*, *As-Safir*, and *Ad-Diyar*, and numerous other dailies and periodicals. Government-run *Télé Liban* has never recovered from its division during the civil war (1975–1990) and suffers from political interference and financial neglect. The state also owns *Radio Liban*. In 1985, *LBC* was founded as the first private television in Lebanon and the Arab world. By the early 1990s a plethora of illegal television and radio stations existed in Lebanon. As a result, the government wanted to control private television and radio through the audiovisual media law of 1994 (→ Communication Law and Policy: Middle East). After many protests, only a few stations were licensed to broadcast news and political programs, and they had to represent the major sects and political leaders: *LBCITV/Sawt Lubnan Radio* (Maronite), *MTV/Radio Mont Liban* (Greek Orthodox), *Future TV/Radio Orient* (owned by Sunni ex-prime minister Hariri), *NBN TV/Radio* (representing Shiite parliamentary speaker Berri), and *Al-Manar TV/Al-Nour Radio* (affiliated to the Shiite militia and party Hizbullah). *New TV/ Sawt as-Shaab Radio* (Sunni) received a license in 1998.

The political and sectarian affiliations of the stations are visible in the news and political programs (→ Partisan Press). Those who criticized Syrian policies in Lebanon had to

bear the consequences: *MTV/Radio Mont Liban* was closed down in 2002, and parliament reversed the decision only in 2005. Lebanese entertainment and game shows attract large audiences and are transmitted also by the satellite channels *LBC*, *Future*, and *New TV* to the Arab Gulf. The transmission of international formats such as *Superstar* and *Star Academy* on *FutureSat* and *LBCSat* was highly successful throughout the Arab world. *Al-Manar* broadcasts family series adapted to the Islamic moral code of Hizbullah, with political programs praising the Islamic resistance, interrupted by advertisements for Hizbullah-affiliated organizations. Its satellite operations, which include English and French newscasts, have earned *Al-Manar* a worldwide Muslim audience. *LBC*'s cooperation with pan-Arab daily *Al-Hayat* gives *LBCSat* competence in news reporting throughout the Arab world (→ Arab Satellite TV News). Lebanon's media will continue to play a significant role in the development of Arab media and many journalists have been trained in Lebanese stations and universities before joining pan-Arab channels (→ Communication as an Academic Field: Middle East, Arab World).

The media sector of *Syria* (population estimate 18.5 million) is controlled by the Baath party and the government under Bashar al-Assad. Criticism of the president and his family is not permitted and domestic and foreign press are censored (→ Censorship). There are three official newspapers: *Al-Baath*, *Al-Thawra*, and *Tishreen*. The licensing of private publications characterized a short period in the "Damascus spring" after Bashar al-Assad's ascension to power in 2000, but a subsequent press law of 2001 imposed restrictions. Syrian radio and television are government owned. Syrian TV operates two domestic channels and a satellite service, and there are two national radio channels. Because the use of satellite receivers is permitted, many Syrians have access to foreign television programs. The → Internet is censored by the Syrian state and various websites are blocked.

The *Palestinian* media have to operate between Israeli occupation and the control of the PNA (population 3.7 million) The public Palestinian Broadcasting Corporation and Voice of Palestine radio have been the mouthpiece of the PNA. Numerous private television stations, such as *Al-Watan* or *Al-Alam*, exist but they are often restricted to certain regions. Expressing opinions differing from those of the PNA has led repeatedly to the punishment of several media outlets. *Al-Quds* and *Al-Ayyam* dailies are privately owned, whereas *Al-Hayat Al-Jadida* is partially owned by the Palestinian authority, but all are considered supporters of the PNA.

With approximately the same size population as Lebanon, *Jordan's* media sector does not come close to the vibrant Lebanese media market. *Ar-Rai* and the *Jordan Times* are published by the Jordanian Press Foundation, whereas *Ad-Dustour* is owned by the Sherif family. All papers, including the formerly independent *Arab al-Yawm*, are considered pro-government. After restructuring in 2001, Jordanian Television comprises of three terrestrial channels (one full program, a movie channel, and a sports channel) and a satellite channel (→ Satellite Television). Radio Jordan has three national radio stations, broadcasting in Arabic, English, and French. Television and radio are state run and the news reports mainly about the activities of the king and his government. With the Press and Publication Law of 1999, censorship of journalists was to be diminished, but security services still interfere in media content and a climate of self-censorship prevails. The concentration of Internet cafés is high, especially in cities near universities, but the Internet is mainly used for chat.

## **Woman as Sign**

*Carolyn M. Byerly*

*Howard University*

Woman as → sign is a → semiotic construct developed by feminist scholars trying to explain the ways in which women's status in patriarchal society is understood, communicated, and acted on through institutional practices. Film scholar Laura Mulvey's (1975) application of psychoanalysis to → film theory was foundational to the construct's development. Mulvey argued that woman stands in patriarchal culture "as signifier for the male other" within a symbolic system in which men are permitted to live out their fantasies of domination both linguistically and through images they create (1975, 7). Feminist anthropologist Elizabeth Cowie (1978) coined the term "woman as sign" on the basis of her work with Claude Lévi-Strauss on kinship systems that featured the exchange of women (e.g., a bride leaves her father's house to live in her husband's house). Woman's status in such systems, she said, is economic but also that of a sign, which conveys an understanding of subordination and enables her to be exchanged physically among men. Cowie advocated a revolution in kinship systems to create more egalitarian *sex roles* and the meanings associated with them.

Feminist communication scholars Lana F. Rakow and Kimberlie Kranich (1991) are credited with giving the construct "woman as sign" a place in more recent feminist media theory. These scholars placed the construct at the center of their study of → television news in the late 1980s. Like other critical scholars (e.g., Molotsch 1978; Hartley 1982) Rakow & Kranich recognized the news as an essentially masculine narrative in which women function as a sign in men's → discourse (→ Masculinity and the Media; Discourse

Analysis; Narrative News Story). To investigate more specific ways in which women function as sign in television news, Rakow & Kranich conducted a two-part study. First, they examined 1,203 news stories contained in one month's news programs aired on NBC, ABC, and CBS networks in the United States. They found that women were largely absent from newscasts, with only 15 percent of all stories containing any women as on-camera sources. Second, they examined six months' news transcripts in which women were more likely to be important to the story (and thereby more able to be examined as signs in news). They found that women were most likely to appear as private (not public) individuals, serving as signs of the times "to make a connection between the private sphere of home, family, emotions, neighborhood, and personal experience and the public world of politics, policy and authority" (1991, 16; → Public Sphere). In their association with the private realm, women were also allowed to serve as signs of support, endorsing an action or policy, often through institutional affiliations that do not represent women.

Conversely, the study showed, women were much less likely to appear as experts, politicians, or political activists or in other public roles. Even stories that might logically have a woman speak to the issues – e.g., a story about men's battering or killing of women – generally did not. In order to speak for women, they found, a woman must signify as feminist, and in six months of stories examined, they found a feminist source only seven times. In addition, they found that only white women were allowed to signify as "woman," another way that news homogenized all women's experiences, except in cases where a news item specifically involved race or ethnicity. They found a few stories in which women became news by disrupting the social order, and in these, women were often pitted against each other, arguing different positions. Like Cowie, Rakow and Kranich leaned toward a radical solution to women's disregard and misrepresentation in television news, one that would require feminizing the masculine news narrative (→ Feminization of Media Content) and altering the symbolic system (→ Sign Systems; Symbolic Annihilation) positing woman as objects of men's exchange.

# Women in the Media, Images of

Lana F. Rakow

University of North Dakota

Images of women in the media have presented a serious problem and challenge to feminist activists and scholars concerned about women's status in society. In the US in particular, but also in other parts of the world, the type, quality, and number of → images of women in various fictional and nonfictional → genres (in film, television, and magazines especially) have been well documented since the 1970s. Consistently, such research documents women's subordinate status to men, demonstrated by their key absences (such as in → news) and attention to physical appearance or domesticity (such as in commercial advertising). While documenting problematic visualizations of women has been a dominant approach to assessing women's relationship to the mass media, other approaches have raised challenges about the theoretical and political shortcomings of a focus on "images." Consequently, more sophisticated understandings of the relationship between mass media, reality, and political and economic structures have taken hold in feminist communication scholarship (→ Reality and Media Reality; Media and Perceptions of Reality).

Nonetheless, analysis of women's media images in countries around the world has been important in efforts to make changes for women. The International Women's Media Foundation ([www.iwmf.org/resources/stats.php](http://www.iwmf.org/resources/stats.php)) compiles study results showing, for example, how few women in southern African countries are news sources in political stories, the state of images of women in the European Union, the coverage of women's rights in Arab countries, and the small percentage of women's appearances in Canadian newspapers. While there are notable similarities in women's images in many countries, there also are important differences related to religious, political, and cultural contexts, as demonstrated in a study of sexual advertising content (Nelson and Paek 2005). These differences dispel the assumption there is a universal image and meaning of "woman" across countries as well as within them (for examples, see Hill & Ly 2004; Woodward & Mastin 2005).

## MEDIA AND WOMEN'S MOVEMENTS

The scholarly and systematic documentation of women's media images got its impetus from what is now called the second wave of feminism in the US (→ Women's Movement and the Media). The *second wave of feminism*, as compared to the first wave beginning in the nineteenth century and fading with the passage of the Nineteenth Amendment granting women the right to vote in 1920, was concerned more with the legal and economic rights of women in the home and the workplace. It is often criticized as a movement that focused on the issues of white, middle-class women. Indeed, journalist Betty Friedan's landmark book *The feminine mystique*, published in 1963, identified the "problem that has no name" of primarily white, middle-class women dissatisfied with their lives, which were focused on domestic and family responsibilities, despite the way in which women's magazines at the time idealized such a life.

Second wave feminism, like the first wave, rested on two different *theoretical positions*, now identified as liberal feminism and radical feminism. *Liberal feminism* accepts many of the features of US liberal social theory, including the notion of the autonomous individual with inherent rights to the equal chance to compete on the basis of merit in a democratic and capitalistic society. Hence liberal feminists typically have argued for equal opportunities for women, insisting that the country's fundamental principles of citizenship should be extended to all, advocating that women be treated the same as men. While women and men may be biologically different, liberal feminists hold, their social roles can be adapted and even interchanged, if we can overcome stereotypes of appropriate behavior and activities.

*Radical feminism*, on the other hand, views women and men as distinctly and importantly different, with women's attention to relationships, nurturing, and cooperation to be valued over men's competition, hierarchy, and aggression. Overcoming men's domination of women requires, from a radical feminist perspective, resistance to oppressive structures and relationships and a critique of patriarchy as one if not the most significant feature of US society.

Given its theoretical basis, which matched that underlying most US academic institutions, especially in journalism and mass communication programs, it is no surprise that liberal feminism was able to make the greatest headway in establishing a research agenda for issues about women and media. Women researchers, often in contexts in which their work was not rewarded and their own positions as faculty were tenuous or isolated, began accumulating empirical evidence that women were absent, denigrated, and devalued throughout much of the mass media. An important step in the process of documenting and theorizing these images occurred with the publication of a book in 1978 edited by Gaye Tuchman, Arlene Kaplan Daniels, and James Benet, *Hearth and homes: Images of women in the mass media*. Tuchman's concept of → "symbolic annihilation" to describe how women were invisible and devalued in much mass media content is still used today.

Research results consistently demonstrated that in programming aimed at women, particularly in → soap operas on television and in → magazines directed at women, storylines and commercial advertisers took the cue of radio soap operas sponsored by manufacturers of soap and other domestic products, making women's domestic responsibilities as primary caregivers of families and homes seem their natural fulfillment. On the one hand, media content directed at men, including news, fictional action narratives, and pornography, displayed women as sexual enhancements of male power. The *sexualization of women's images* began in mainstream mass media in the 1960s, in what many feminists considered a co-optation of the women's movement and its attention to reproductive rights and freeing women from oppressive restrictions on sexuality (→ Sexualization in the Media; Sex Role Stereotypes in the Media). Media-created and media-perpetuated myths of feminist bra-burning and "free love" in the 1960s era of the student and peace movements made women's sexuality a new sales tool for advertisers, who began draping bikini-clad women on cars, and for television and filmmakers, who seized the opportunity for increasing audiences through increasingly escalated sexual and violent content.

Sexual and violent content became a concern not only of researchers on images of women but also of public policymakers and conservative social commentators (→ Sexual Violence in the Media). Feminist activists and scholars, reflecting liberal and radical

feminist positions as well as others such as postmodern feminism, remain divided about how to understand and change such images, especially given the political consequences. At issue, on the one hand, have been concerns that attacking pornography will lead to restrictions on free speech, including sexual content created by women for women (→ Pornography, Feminist Debates on). On the other hand, there have been concerns that women as performers, models, and the objects of men's fantasies are harmed by images that make women men's (apparently) willing and unwilling sexual objects (see Russo 1992; Wackwitz 2001).

### FROM IMAGES TO REPRESENTATIONS

While images research has been criticized as undertheorizing both gender and media, the analysis of women's images became more theoretically and ideologically complex through feminist analysis of film. Of particular importance was the work of Laura Mulvey, who in 1975 published a piece on "*the male gaze*" in cinema that, although much refined and critiqued since its original publication, reverberates in feminist work today (→ Spectator Gaze). Mulvey's work ushered in psychoanalytic feminism to the task of understanding women's images in media. She argued that the camera is a male eye with women as its object. Men look; women are to be looked at. Contemporary manifestations of the problem are revealed by the alarming rise of eating disorders in girls and young women, suggesting that men's surveillance of women results in women's self-surveillance in order to achieve a particular shape and look.

A further advance was made when images research was scrutinized for differences among media images of women along *racial lines*. It became clear that images of white women were different from those of women of other racial and ethnic groups. While white women often were portrayed as madonnas or whores (Kuhn 1985), Native American women were shown as beautiful Indian princesses or unattractive squaws (Bird 1999), African-American women as mammies or matriarchs (Collins 1990), Chicana/Latina women as Spanish noblewomen or beautiful cantina girls (Fellner 2002), and Asian/Asian-American women as sexually servile geishas or powerful dragon ladies (Kim 1986; → Black Feminist Media Studies; Feminist Media Studies, Transnational; Latina Feminist Media Studies). The differences in images among women of different "races" illustrate the need for the larger meaning systems within which the images appear to be examined.

### CRITICAL INTERVENTIONS

More recent images research has taken on changes in women's portrayal, such as the phenomenon of the "tough chick" image of women in some television programs and movies, producing feminist discussion of whether or not these images represent an advance by showing powerful women, despite exaggerated physical characteristics emphasizing sexuality (Inness 2004). Even if an argument can be made that some images have changed, the limited ability of an images research approach to yield substantive social change has been pointed out on a number of fronts.

First, the approach has been wedded to a liberal social theory that accepts the current *commercial media system* while arguing for only limited reforms (i.e., making representations

of women “more realistic”). Socialist feminists have pointed out that the economic system and the power of ownership and production must be accounted for to produce a sufficient critique of the media. It has been noted that even if some changes are made in women’s images in the mass media, little else changes, including the concentration of media ownership in a few corporate hands and the commercialization and commodification of not only news and entertainment but also much of contemporary life (→ Political Economy of the Media). Meanwhile, the material conditions of the lives of women who are not middle-class continue unexamined and unchanged (Steeves 1987; Ferguson 1990). Other feminists push for changes that would give women access to the means of production and representation, following from the analysis that the media represent men’s interests and experiences that must be countered by the stories and experiences of women (→ Gender: Representation in the Media). Consequently, these feminists have attended to women’s alternative media as an antidote to mainstream mass media images of women (Ross & Byerly 2004).

Second, the critique has been made that images research based on a liberal feminist paradigm is unlikely to lead to substantial change because of its connection to the *dominant “effects” paradigm* of much mass media research (→ Media Effects). Documenting limited and negative images of women is usually insufficient for making a case to policymakers that change is required. Demonstrating audience effects has been a less than straightforward task for media researchers, despite almost a century of attempting to do so. It is not clear what would be done if negative effects of any media phenomenon were unequivocally proven, since the First Amendment rights of media owners, at least in the US, precludes all but minor policy adjustments to the current media system.

Third, images research based on a liberal feminist paradigm has been critiqued for its *narrow theoretical understanding of both media and gender*. Its epistemological foundation of realism, following from an ontological position giving reality the status of an objective phenomenon existing outside of human meaning, results in a reliance on a mirror-image relationship between reality and media texts. Media texts not only *can* present veridical accounts of reality, they *should*, from this theoretical position. In the case of gender, a realist position adheres to an understanding of gender as a condition of difference that pre-exists the social roles, malleable as they are, that women and men occupy. Hence, a realist position on the media supposes that “real” women and men exist outside of cultural texts that should accurately represent them. Postmodern feminists, often working outside of the field of journalism and mass communication, have challenged the position with a constructivist rendering of both social reality and gender. Teresa de Lauretis (1987), for example, showed how gender is both a product and process of representation, not something that exists outside of representation. Even one’s own identity must be represented to oneself. If representations cannot logically be thought of as accurate or inaccurate, it makes little sense to press for accurate representations of women, and more to argue for different meanings about gender.

### INTERNATIONALIZING FEMINIST MEDIA RESEARCH

While research on images of women has been primarily a US liberal feminist project, women around the world have found political and theoretical value in examining and

challenging women's images in media systems. In fact, the United Nations Fourth World Conference on Women, held in Beijing in September 1995, identified two strategic objectives in its platform for action regarding media. These were to "increase the participation and access of women to expression and decision-making in and through the media and new technologies of communication" and to "promote a balanced and non-stereotyped portrayal of women in the media" (UNESCO 1995, 94–95).

By attending to the larger political, economic, and ideological meaning systems within which images arise and function, scholars and activists can elucidate significant issues affecting women and suggest how change might and does occur in gender systems. Myra Macdonald's reading of media images of veiled Muslim women leads to challenges to western feminist assumptions about sexuality (Macdonald 2006), for example. Barbara Sato's interpretation of the "the new woman" that emerged in Japan between the two world wars, confronting previous notions of women as gentleness and meekness with a new urban femininity, shows how images of women can be used to explain and manage periods of social change (Sato 2003). These more sophisticated notions of both "images" and "women" have extended and enriched the important work begun by liberal feminist scholars.

## Women's Communication and Language

*Kandi L. Walker*

*University of Louisville*

With the general growth of gender research across multiple disciplines, it is not surprising that issues surrounding women's language and communication have become a popular area of study (→ Feminist and Gender Studies). Research in this area has been traced back to a 1664 report that cited differences in speech forms of “Carib” women and men (Jespersen 1922). This research was the beginning of a fruitful area of study looking at language use, speech styles, and communication strategies associated with women.

Early research on women's language and communication focused on linguistic aspects of language, mainly concentrating on sounds (e.g., phonetics) and syntax (→ Linguistics). The more systematic interest and dichotomy of sex-role- and gender-related aspects of language and communication came much later (→ Rhetoric and Gender). With the influence of the feminist movement in some parts of the world, a serious interest in women's language and communication research materialized. Thus, in these countries

research concerning women's language and communication became apparent from the 1970s.

### **EARLY RESEARCH ON WOMEN'S COMMUNICATION AND LANGUAGE**

One of the first books to look at women's language and communication was Robin Lakoff's (1975) *Language and woman's place*, in which the author investigated the structure of women's speech. This pioneering work was later revised and expanded with the 2004 publication of *Language and woman's place: Text and commentaries*. These books outline what has often been deemed the foundational work of describing feminine speech style, illustrating the significant relationship between language and gender. Lakoff identified a number of characteristics in women's speech patterns (hedges, super-polite speech, tag questions, speaking with intonation emphasis, empty adjectives, hypercorrect grammar and pronunciation, lack of sense of humor, direct quotations, special lexicon, rising intonation in declarative statements). Although criticized for labeling women's language as varying from the norm, Lakoff's research has had great heuristic value in current communication, linguistic, and gender studies.

From the work of Lakoff many lines of research emerged in regards to women's language and communication. In particular, *three influential perspectives* underpin the research on women's language and communication: first, research that emanates from a sex-role perspective; second, that which utilizes feminist frameworks; and, finally, an approach which employs gender as culture viewpoint. These perspectives help shape what is known about women's language and communication styles and patterns.

In short, researchers from a sex-role perspective believe there are innate similarities and differences between women's and men's language and communication. For feminist researchers, women's language and communication are analyzed in relation to issues of power (or lack thereof; → Gender and Discourse). Researchers from the gender-as-culture perspective argue that similarities and/or differences found between women's and men's language are a creation of performing gender. A further summary of the three perspectives as they relate to women's language and communication follows.

### **SEX-ROLE, FEMINIST, AND GENDER-AS-CULTURE RESEARCH AGENDAS**

In the early 1960s and 1970s, many scholars considered *biological sex* as a dominant indicator of language and communication use. Researchers from this perspective contend that notable differences are apparent between women's and men's brains, especially surrounding issues of language and communication. For example, it has been found that women are better able to process information simultaneously in both of the brain's frontal lobes, resulting in higher scores associated with language → comprehension and vocabulary (→ Information Processing).

It has also been noted that *women's brains* are smaller than men's brains and that women have more gray matter than men do. This may help explain why women perform better on verbal tasks than men. In addition, other studies show that women's language and communication differ from men's due to how the brain is stimulated when listening and interpreting communication. It has been found that during passive listening, a

woman stimulates both sides of her brain. This is different than a man, who activates neurons on only one side of his brain. Similarly, when asked to interpret certain aspects of communication (whole sentences), women use both sides of their brains while men use one side. In short, this perspective assumes natural differences exist between women and men that result in the two sexes often communicating differently.

In the 1970s and 1980s, research about women's language and communication saw an increased number of publications from feminist and gender-as-culture perspectives (→ Culture: Definitions and Concepts). These scholars consider women to be at a disadvantage to men due to *power imbalances*. Mainstream feminist researchers point to studies that have found language and communication differences between men and women as an indication of men's power over women. For example, various studies report different talking time given to women, different types of interactional interruptions, and different uses of silence in current communication practices (→ Language and Social Interaction). Further, these researchers argue that women's language and communication perpetuate the subordinate role of women. As a result, many feminists have pushed for the creation of a new woman's language which does not reflect a male-dominated worldview (e.g., *chairman* of the board). This new language would emphasize community, affect, and equality in order to neutralize the patriarchy that dominates current language and communication practices (→ Power and Discourse).

The *gender-as-culture perspective* takes a different approach to women's language and communication. Scholars posit that men and women inhabit different linguistic cultures due to being socialized to enact gender in specific ways. In 1990, US linguistics researcher Deborah Tannen published *You just don't understand: Women and men in conversation*, attracting extensive attention in popular culture. One of Tannen's central arguments in this book, and in later books, contends that women and men are socialized to use communication differently, thus forming unique cultures of communication. She further states that communication styles of men and women are best explained as "cross-cultural communication" (→ Intercultural and Intergroup Communication), meaning that women's communication promotes connection and intimacy while men's communication promotes status and autonomy. In other words, women's communication indicates a concern for solidarity, using language to build connections and intimacy. Men's communication indicates a concern for power, using language to disseminate information.

Another approach to the gender-as-culture perspective is the gender-as-a-result-of-culture perspective. In *Gendered lives* (2005), US communication scholar Julia Wood argues that gender is socially learned through communication. She considers language and communication differences between women and men to be more about socialization than innate traits. By using the concepts of feminine and masculine speech, she explains how men and women are socialized to have characteristics of feminine speech styles and masculine speech styles. From this perspective, feminine speech is about creating interconnectedness and relationships (→ Femininity and Feminine Values). *Feminine speech styles* include more details in conversation, not because of their importance to the content of the message but because the details help with the relational level of the interaction. Feminine speech is also concerned with involving others in the conversation and promoting connections between people. Thus, feminine speech is related to socio-emotional aspects of interactions (→ Emotion and Discourse). In contrast, masculine speech is less about

building connections and is more direct and instrumental. Masculine speech is concerned with independence, enhancing status, and autonomy. Scholars from this perspective claim women can be socialized to have characteristics of both feminine and masculine speech styles.

### **ASSESSING WOMEN'S COMMUNICATION AND LANGUAGE RESEARCH**

As with many prolific areas of study, there is a discrepancy among research findings. A number of scholars assert that most differences found between women's and men's language are based on conventional perceptions of gender rather than any real evidence, in that, despite research findings indicating that women are more similar than different to men in their language and communication, women are perceived to be more talkative than men are. Women are believed to use more circuitous and elaborate language than men do. For example, in one study women were rated as speaking more than men in spite of the fact they read the same amount of information. It is believed that the stereotype that women talk more is the cause for women being perceived differently than men. Similarly, a commonly held belief is that women self-disclose more than their male counterparts. In a review of 205 studies involving over 23,000 participants, researchers found mixed results (Dindia & Allen 1992). They found that women disclose more when in same-sex interactions but did not disclose more than men in cross-sex interactions (→ Disclosure in Interpersonal Communication). It is the predisposition to believe gender differences occur that some researchers believe perpetuates the notion that women's and men's language and communication are different.

Opposing this line of research, other scholars report that → stereotypes of women's language and communication are consistent with research findings. Researchers have found distinct language features in women's and men's language use. In a review of over 30 studies, Mulac et al. (2001) found men and women use language differently. They report 16 language characteristics found consistently in research that demonstrate men and women communicate differently.

Distinct research findings are apparent in each perspective, reinforcing the idea that the perspectives are often viewed as mutually exclusive. Current studies, however, tend to show intersections of similarities underlying the three perspectives. For example, many feminist scholars believe gender is socially learned, and many gender-as-culture scholars believe power may in fact be a factor in language and communication differences between men and women. Some scholars argue that the three perspectives build a stronger framework for understanding women's language and communication when combined. In all three approaches, it is interesting to note that research highlights the notion that the structure and use of language and communication by women and men may result in different life experiences.

### **RESEARCH FUTURES**

Beyond the three perspectives' similarities and differences, there has been a rise in research concerning women's language and communication in different contexts. For example, examinations of women's language and communication regarding *computer-mediated communication* have been shown to mirror face-to-face communication (→ Language

and the Internet; Human–Computer Interaction), in that women appear to emphasize supportiveness, apologize more, hedge, and use more emoticons than men. Women's language use online has also been shown to include more exclamation points and capitalization when writing emails than men's. Another example of research concerning women's language and communication in context is the increase in publications exploring women's communicative influence in family relations. This line of inquiry has established the intense impact a mother's language and communication have on her children, especially daughters.

*International advances* in women's language and communication are also on the rise. An interest concerning women's language and communication has been seen worldwide. To name a few, researchers from New Zealand have been studying women's use of compliments and apologies, noting that women compliment and apologize more than men. In Japan, scholars have made comparisons between Japanese women's language and women's language from the United States, remarking upon the ways in which culture may influence the perception of the power or powerlessness of women's language. Researchers in Morocco have reported on the linguistic practices of women and the influence of gender on women's language and communication. Global interest in women's language and communication is now gaining momentum. As a result, the insights to be gained from international studies and cross-cultural investigation are set to make important contributions to the knowledge base of information surrounding women's language and communication worldwide.

## Women's Media Genres

*Joke Hermes*

*INHOLLAND University*

Women's media genres include women's → magazines and romances in print media, the → soap opera on → television, and romantic comedy in film (→ Film Genres). They are not generally the corollary of men's media but defined in contrast to general audience media such as newspapers or "family genres," including situation comedies, quiz shows, and action series on television. In some cases, they are specifically made for female audiences. In other cases, they have, over time, come to be identified as "women's genres" due to their consumption by largely female audiences. For instance, the classic detective novel has long been typical reading for middle-class women and as such has come to be known as a women's genre. Western women's movements, notably second wave feminism from the 1960s onward, pointed to women's media genres as sources of women's oppression (→ Women's Movement and the Media). They criticized the assumed effect on readers of these genres (→ Media Effects) because of the traditional gender definitions in them. To be referred to as a "women's media genre" is not particularly a mark of distinction for a media form. It is sometimes used as an indication of (overly) high emotional or sentimental content (→ Emotions, Media Effects on). Audience reasons for using women's media genres include widely divergent arguments ranging from the everyday usefulness of traditional women's magazines (Winship 1987; Hermes 1995; Currie 1999; Gough-Yates 2002), via recognition of real-life dilemmas in soap opera, to the guilty pleasures afforded by romantic fiction.

Feminist critical attention started a tradition of research in women's genres and women as readers (known as feminist media studies, also part of the new audience research in → cultural studies in the early 1980s; → Feminist and Gender Studies; Cultural Studies: Feminist Popular Culture). Over the years, a nuanced view emerged based on recognition of the triple role of these genres. First, the label *women's* media genres and their existence confirm a traditional definition of gender that defines femininity and masculinity as opposites. Second, they disseminate traditional gender roles, and third, they afford a unique pleasure to readers. Readers' pleasure in these genres may well also include subversive resistance to traditional coding of gender roles. It has been generally accepted that feminism has become a presence in all types of audiovisual and print texts made for women. Sometimes this is an absent presence, forcing conservative portrayal of gendered identities to relate to a wider range of roles, responsibilities, or options for women and for men (→ Gender: Representation in the Media). More commonly, storylines in women's media genres

reference emancipatory or feminist arguments or introduce emancipated characters, even if the overall message favors a traditional view of gender. Although minor, lesbian film, detective novels, romances, and magazines form recognizable women's sub-genres.

In terms of content, women's genres tend to deal with private rather than public life. They generally address the reader in an intimate manner. Their subject matter is not found elsewhere. Women's media genres do not often prioritize the analysis of fact or arguments (→ Argumentative Discourse). Rather, facts are presented as part of a worldview that also recognizes intuition and → emotions as acceptable components of a reflexive knowledge of the world. Part of the private-life orientation of women's media genres is their focus on relationships. In some women's genres, the maintenance relationships require takes precedence, in others their coming into being. Not surprisingly, use of these media can be seen as voluntary training for the role of emotional and practical caretaker of households and family relationships. The fantasy today's mainstream women's media offer is that of a woman capable of doing a job well while raising children and maintaining a fulfilling relationship with a male partner. Glossy magazines and girls' magazines especially present slim and young-looking women with no physical handicaps as an ideal, hard to imitate, example. Most though not all of the women portrayed in ads, in fashion spreads, or as main characters in narratives in western media forms are white.

### EARLY CRITICISM OF WOMEN'S MEDIA GENRES

US feminist author Betty Friedan's *The feminine mystique*, published in 1963, is generally regarded as the start of western feminist criticism of women's media genres (→ Feminine Mystique). In this book, she describes women's magazine content as convincing audiences that they could find identity and meaning in their lives through their husbands and children. Such a "false belief" system would cause women to lose their identity in that of their family. Friedan referred to the problem of gender roles as "the problem without a name." Others used terms such as "the happy housewife myth." In empirical communications research, the content of women's magazines and daytime television was further indicted for producing a gender gap in society. Available images did not prepare young women well for their future roles as wage earners and professionals. In a famous large-scale study conducted in the US in the early 1970s, Gaye Tuchman (Tuchman et al. 1978) showed that women made up a significant part of the North American workforce. The media, and especially women's media genres, however, depicted them solely in domestic roles and in relation to men: their husbands, fathers, brothers. Tuchman suggested that women were "symbolically annihilated" by the media (→ Symbolic Annihilation; Reality and Media Reality). While general audience media rarely portrayed women, women's media genres relegated them to the home. In turn, she felt this would provide young women with an entirely skewed notion of what society needed from them when they grew up.

Underlying the symbolic annihilation thesis is the idea that the media provide "role models." Given the right role models, girls would behave less "girlishly" and stop under-achieving in order to do well in the marriage market. Gender, argued second wave and earlier feminists such as Ursula Scheu, a German researcher, and Simone de Beauvoir, a French philosopher and novelist, was not imprinted on one's genes. It was Simone de Beauvoir who famously remarked "On ne naît pas femme: on le devient" ("One is not

born a woman: one becomes one:) in her 1949 book *Le deuxième sexe* (*The second sex*). Scheu and many others echoed this observation in books that after 30 years are still in print; for example, Scheu's *Wir werden nicht als Mädchen geboren, wir werden dazu gemacht* (*We are not born as girls, we are made into them*), first published in 1977. Apart from the expectations of parents, the media in this view are mostly to blame for disseminating skewed images of women. Although the role model theory is seen as somewhat less than adequate by academic critics today, it is still an important part of common wisdom about the media. It does fit with academic discussion today that suggests that gender is a social construction that is built and rebuilt, in different situations and contexts (social → constructivism; → Sex Role Stereotypes in the Media).

Women's media genres have continued to be debated over the last half century. Cultural criticism, empirical research on texts and representations, and → audience research (→ Audience; Nielsen Ratings) form the three types of intervention in academic and public debate. Cultural criticism is both a part of reports on empirical findings and a contribution to public debate in its own right. Betty Friedan's *The feminine mystique* fits this category, as does Australian feminist Germaine Greer's equally well-known *The female eunuch* (1970). In this book, Greer discusses women's popular culture, including women's media genres, as part of the production of "femininity" that forces women to adjust to particular roles and rigorous work on their bodies (→ Body Images in the Media) and self-presentation (see also Coward 1984). The book's main thesis is that the traditional, suburban, consumerist, nuclear family represses women sexually, and that this devalues them, rendering them "eunuchs."

Humorous and witty, Greer found a wide audience. By the mid-1970s, men and women readers and nonreaders alike denounced women's media genres. Although women's magazines themselves changed significantly, their reputation as a "women's genre" had been carved in stone. In that same period, the Dutch women's weekly *Margriet* supported women's right to abortion and significantly widened the scope of its questions and answers rubric. Feminist etiquette and sexist denigration of women and women's media were in serious danger of becoming bedfellows.

It took 10 more years for a new kind of feminist criticism to put the record straight by seriously addressing the qualities of women's media genres. In all this time, up to today, there has been little research on women's media genres other than by women, who often hold a women's studies perspective. Research in the early 1980s suggested that although these genres were clearly and exclusively aimed at the private sphere and excluded the → public sphere, thus narrowing the reader's view of the world significantly, it was possible that there was more to women's media genres than met the eye. A number of publications, usually counted as cultural studies' rewriting of audience research, were in fact feminist studies of women's genres. The best known of these are Janice Radway's (1984) extensive US study of romance reading and Ien Ang's (1985) Dutch study of the prime-time soap opera *Dallas* (→ Audiences, Female).

### THE "OTHER" SIDE TO WOMEN'S MEDIA GENRES

By the early 1980s, the low status of popular culture had become a cause of disagreement for the thriving new discipline of cultural studies. From the outset – a general argument

against the reproduction of class society via such distinctions as the one between “art and high culture” on the one hand and “mass culture” on the other – cultural studies soon turned to a reevaluation of popular forms. Women’s media genres easily counted as forms of culture that had not been considered seriously. Radway’s and Ang’s key studies were preceded by Tania Modleski’s US study of Harlequin romances, gothic novels for women and soap opera. In *Loving with a vengeance: Mass-produced fantasies for women*, Modleski (1982) shows how using literary analysis, popular culture may be shown to be far more complex than assumed. She uncovers, for example, the psychological mechanisms needed for readers to identify with the heroines and thus for Harlequins to be written in the third person. Most interestingly, she shows how soap opera is a unique form of storytelling. Rather than a backward and slow example of television drama, Modleski argues that soap opera’s open-ended, multi-threaded structure suited the viewers for whom it was made. She points to soap opera’s cyclical logic as the formal counterpart to household chores. Likewise, the serials’ point of departure – that families may experience all kinds of upheaval but never really fall apart – would suit women taking care of their families in an age of increased divorce rates. Soap opera, in her discussion, is no less than a vanguard form of television drama. Not only does it provide never-ending stories, it also turns television’s weakness as a “talking heads” medium into strength. The close-ups of facial expressions so typical of daytime soap opera, suggests Modleski, is nothing less than the privileged gaze of the mother, appealing to and sharpening especially women’s dexterity in managing the relations and emotions of their loved ones.

Although revolutionary in its suggestion that women’s popular genres merited serious attention and should be treated as literature, Modleski followed earlier feminist criticism. Her basic contention was that while women’s genres provided a way out for women’s rage at their social oppression, women’s media genres reworked that rage in such a way that the social order was never threatened. On the contrary, Harlequins as much as gothic novels strengthen the ideological notion that a good man is the only thing a woman really needs. Soap opera likewise underwrites the value of being able to read and interpret the emotions of those around you in order to manage family relations. While Modleski made it clear that women’s media genres were far more complex than they had been assumed to be, her work also confirmed that these were anti-feminist “fantasies” standing in the way of women’s liberation.

Although often read as criticism of Modleski’s text-based analysis, Janice Radway’s (1984) major study of Harlequin romances confirms Modleski’s conclusion. Radway based her study on a questionnaire and extensive interviews with popular romance fiction readers in a small US town. For contacts with readers, Radway relied on “Dot,” a bookseller who wrote a newsletter for her customers in which she rated all romances as they were published. It becomes immediately clear from *Reading the romance* that readers have a strong emotional investment in their novels. Popular genres are rescued from being seen as uniform trash. Rather, readers uphold the view that there are huge quality differences between writers and between different sub-genres in romances.

Interestingly, Radway asked her readers to name excellent as well as very bad romances. Reading these, she reconstructs viewer pleasure to be mostly dependent on portrayal of the hero. A good hero is sensitive and masculine at the same time. He knows how to “mother” without losing his heterosexual attraction. A bad hero is not very sensitive and

may come close to crossing the line between ardent lover and rapist. Radway concludes that the ideal hero is a rewritten version of contemporary masculinity (→ Heterosexism and the Media; Masculinity and the Media). Such rewriting and the activity of romance reading itself as claiming time away from family and household chores suggest to her that romance reading is a crypto-feminist activity. At the end of her book, she laments that romances are still needed, suggesting that in a post-patriarchal world such diversion would not be wanted.

This point of view is challenged by studies such as Ien Ang's *Watching "Dallas"* (1985). Ang placed a small ad in a Dutch women's magazine asking readers whether they received "strange reactions" when people learnt that they liked watching *Dallas*. More than 30 viewers, most of them women, responded. In the study, Ang positioned herself as a viewer, part of the audience she wishes to research. The earlier view that women's media would divert a viewer from becoming a feminist was thus falsified. Other feminist critics too have written about their favorites in (traditional) women's media genres. Among them are Cora Kaplan (1986), who wrote about television melodrama (*The Thorn Birds*); Helen Taylor (1989), who shared the enthusiasm of the *Gone with the Wind* fans whose letters she analyzed; and Janice Winship (1987), who selected a feminist, a traditional, and a glossy women's magazine she liked to read herself for a study of their content and ideology. The combination of an academic and a fan perspective proved highly fruitful (→ Fandom). Ang's study of *Dallas*, for example, laid bare how the "tragic structure of feeling" in the soap opera text produced a melodramatic imagination of the world for readers, who recognized and validated the soap's view of the world. Although readers were aware that soaps such as *Dallas* are not factual representations, they translated the insight of soaps to another level. "Emotional realism," the term Ang coined for this, has since been used widely beyond analysis of women's media genres.

## DEVELOPMENTS

While discussion of women's media genres has changed considerably over time, opening up to a more even-handed view of their social and cultural value, so did the market. Although second wave feminism has in many ways become part of commonsense views of the world, women's media genres have continued to hold sizable market shares (→ Markets of the Media). The strength of women's media genres in some cases has traveled to other genres. "Soapification" can be recognized in most types of television drama and notably in crime serials. While earlier these genres would not include much information about the personal lives of detectives, most of them in the 1990s started providing background storylines for their key characters, thus adding depth and emotional complexity.

Another significant development regarding women's media genres is the growth of men's genres as their corollary. While "men's magazines" used to denote pornographic content, and all general interest magazines were in fact aimed at what were perceived to be "male" interests, there are now women's magazines for men. Men's lifestyle magazines differ from their female counterpart. They are less intimate in address and content matter and often rely on hard forms of humor. However, they do portray men as equally interested in fashion, gadgets, and other men's lives. Their coming into being in the late 1980s and 1990s coincides with the marketing of new ranges of consumer products specifically at

men, such as cosmetics. Clearly, men are now faced with perfect male bodies and the implicit pressure to conform to high beauty standards in terms of musculature and body fat percentage (Benwell 2003).

Women's media genres meanwhile continue to go through cyclic changes in content. Sometimes there is overall more (post)feminist content, stressing women as autonomous agents in the world; sometimes there is a return to traditional definitions. Humor and reflexivity often soften the narrative impact of outspoken gender roles. Women's media genres have not yet extended far into the world of the → Internet and gaming (→ Video Games). Although sizable numbers of women and girls are gamers, gaming is often either a male domain or a not heavily gendered field.

## Women's Movement and the Media

*Patricia Bradley*

*Temple University*

In the US, as in many other western countries, the link between the media and organized feminism goes back to the establishment of what in the west has been called "first wave feminism" in the nineteenth century. At the famous 1848 Women's Rights Convention in Seneca Falls, NY the organizer Elizabeth Cady Stanton sought to raise public awareness about women's rights by composing a Declaration of Sentiments modeled after the already sacrosanct US Declaration of Independence. Her Declaration elicited denunciatory press editorials. While she was unhappy about the misrepresentation of her ideas, Stanton understood the value of press attention. Subsequent waves of feminism continued to make use of media attention to achieve their ends, contributing to the discussion of the role of mass media in social movements, especially when messages are framed according to media practices contrary to the intent of the social movement (Barker-Plummer 1995; → Feminist and Gender Studies).

By the turn of the twentieth century, as mass newspapers became entrenched in everyday life in North America and many parts of Europe, *organized feminism* had become expert in utilizing media strategies. Alice Paul, founder and head of the National Women's Party (NWP), 1915, heavily relied upon the publicity techniques of confrontation and hunger strikes she had learned from British suffragist Emmeline Pankhurst. For example, in 1917 over 1,000 NWP women picketed the White House day and night for 18 weeks in order to put pressure on the federal government to pass the Susan B. Anthony Amendment (for women's suffrage). Paul was arrested in October and sentenced to seven months in jail. After being placed in solitary confinement, she began a hunger strike. Newspapers across the country ran articles about the suffragists' jail terms and forced feedings, which increased public support for the case for women's suffrage.

From the 1970s, *second wave feminists*, as they have come to be called in many western countries, were strongly influenced by the publicity techniques of various new social movements (student antiwar, gay rights, civil rights). This was also true of burgeoning feminist movements in Japan (Muto 1997), West Germany (Lewis 1995), and many other democratic countries. In India, however, the emergence of feminism during this period was more closely related to the independence movement and its aftermath, tied up with profound changes in thinking about social class, religion, culture, and colonialism (Kumar 1993).

In the US, feminists in leadership positions, notably Betty Friedan (co-founder and first leader of the National Organization for Women) and Gloria Steinem (co-founder of the feminist magazine *Ms.*), were media practitioners who believed in the value of mass media in advancing feminist goals (→ Gender and Journalism). The media savvy that characterized the new wave of feminism helped put feminist voices on the national news agenda. Early attention came by way of articles written by feminists in agenda-setting publications, such as the *New York Times* (Brownmiller 1970). “Agit-prop” (agitation propaganda) techniques soon dominated the movement’s activities. Both the reformist and the radical wings of the movement mounted events specifically designed to attract television coverage, from the Friedan-inspired sit-in at New York’s Plaza Hotel in 1967 to the famous protest at the Miss American Contest a year later (Bradley 2004).

As the women’s movement found a place on the news agenda, activist women were increasingly the subject of media coverage, none more sought out than Steinem, whose attractiveness comported with the demands of television. Steinem used her celebrity as a launch pad for the founding of *Ms.* in 1972, which aimed to take feminist issues to a mass media audience. Although critics of the magazine argued that the emphasis on sisterhood weakened the political message, the slick and well-produced magazine, which resembled mainstream domestic magazines for women, introduced subjects such as abortion, lesbianism, infanticide, and domestic abuse which had never before been broached in the mass media (Farrell 1998; → Women in the Media, Images of). For the rest of the twentieth century, discourses around feminism were influenced by a *largely unsympathetic media* (Faludi 1991). Mass media focused on traditional messages of beauty and fashion, as well as the concerns of working women. More than ever the emphasis was on the individual and on personal solutions to gender problems rather than on the structural discrimination that confronted women as a group.

Since the beginning of the twenty-first century, there have been notable developments within feminism that have led to a resurgence of feminist political action around the world (→ Feminist Media Studies, Transnational). There has been a steadily growing number of feminist Internet sites and blogs (→ Blogger). As Youngs (2007) notes, “feminism is alive and well, evolving and changing in these cyber times. Women’s online voices and activities expand day by day across the world, as does their diversity.” In global terms, feminism is enjoying renewed public and media interest. Issues including the plight of Afghan women, girls’ education, domestic violence, the feminization of poverty, abortion rights, women’s health, and HIV/AIDS have been brought to the attention of global audiences (Sarikakis & Shade 2007).

## Yellow Journalism

*Richard L. Kaplan*

*University of California, Santa Barbara*

The term “yellow journalism” first emerged in the United States as a pejorative to characterize the news produced by publishers William Randolph Hearst and Joseph Pulitzer in their competition for New York City readers during the late 1890s. Their success in achieving daily circulations surpassing one million helped spread their innovations, including → sensationalism, to other newspapers. With Pulitzer and Hearst, the US news industry joined that of other industrialized democracies at the turn of the century, including Sweden, Germany, Canada, and England (with the Northcliffe revolution), in evolving from a limited “class” press to a “mass” medium. These mass newspapers adopted varying proportions of sensationalism, populism, and socialism to address the interests of new, urban, working-class, and immigrant readers. In response, the established upper-class journals fought back on matters of taste and politics, in part by disputing the legitimacy of the new journalism and castigating it as yellow (→ Newspaper, History of).

During the late 1800s, two factors altered the economic strategies of US news publishers. First, the cost of paper stock continued a long-term fall from approximately 12 cents a pound in 1860 to 2 cents in 1900. Second, advertising revenues rose drastically, first from display ads for department stores and later from name brands. US census data reports that advertising constituted 44 percent of gross revenue for periodicals (including newspapers) in 1879, but reached 54.5 percent in 1899 and 65.5 percent in 1919 (→ Cost and Revenue Structures in the Media; Advertising, Economics of). *Falling costs and rising revenues* allowed publishers to lower the price for each copy and simultaneously increase the quantity of material published in the daily paper, thus attracting the growing audiences that advertisers desired. The US news industry, following Pulitzer, began to focus on the marginal customer, who previously possessed neither the means nor the desire to purchase newspapers. A pursuit of readers led papers out of limited market niches into general competition.

Pulitzer bought the moribund *New York World*, with 15,000 readers, in 1883 and quickly experimented with new techniques to attract readers. He expanded headlines from one-column stacked decks to full-page banners, splashed illustrations and photos across page one, introduced comic strips, and added pages for women and sports, among other innovations (→ Newspaper, Visual Design of). The *World* quickly surpassed the

city's circulation leader, the *Sun*, with 130,000 readers. By 1887, Pulitzer's distribution hit 250,000 – the country's largest – and at the peak of the 1898 Spanish–American War, Pulitzer and Hearst each amassed a circulation of 1.2 million. With the impetus from yellow journalism, newspapers had achieved almost universal readership. In 1880, the daily papers in New York City printed only four copies for every ten inhabitants, but by 1900 the rate had doubled, to eight copies for ten inhabitants.

The “yellow” label refers to how journalists handled news content. Pulitzer, and in his footsteps the competitive acolyte Hearst, emphasized reporting on crime and scandal (→ Scandalization in the News) and launched populist crusades against governmental corruption and corporate power. Sensational journalism in the *World* and the *Journal* violated the tastes and social understandings of the American upper and middle classes (→ Morality and Taste in Media Content). In response, competitors from the genteel press condemned the focus on crime, scandal, and reform, saying that Hearst and Pulitzer were pandering to the tastes of the masses.

The *New York Press* coined the term “yellow journalism” in 1897 to denote the sensationalist coloring of the news. In fact, in western Europe “yellow” had long been a depreciating expression for cheap, popular, sensationalist fiction. In New York City, however, yellow had a more specific referent in one of the *World's* and *Journal's* most prominent features: comic strips (→ Comics) and, in particular, Richard Outcault's brightly colored Yellow Kid, a gap-toothed ragamuffin from the city slums. Conflicts over the correct conduct of journalism and proper public discourse (→ Standards of News) produced a movement aimed at chastising the two New York publishing magnates. Elite papers joined with upper-class magazines, reforming social scientists, and political leaders in criticizing the yellow press and calling for the banning of sensational sheets from libraries and clubs.

The *hunt for readers* heightened Hearst's and Pulitzer's demand for news. The pursuit of scoops and scandalous stories, however, tied yellow papers to mainstream ones in a general turn from past traditions of interpretive, literary, and partisan reporting. The shift toward unadorned facts redefined and temporarily lowered the reporters' place in the news organization, as well as their general social status in public life (→ Journalists, Credibility of). The number of reporters multiplied, but they lost independent authority. They became increasingly subject to a hierarchy of rewrite men, copy editors, and editors. With the adoption of the telephone during the 1890s, reporters often called in the story to a rewrite man, who seized upon salient details and wove them into a snappy narrative. Reflecting their lack of workplace power, turn-of-the-century news workers endured long working hours, low pay, and uncertain tenure. These working conditions, along with low standards for journalism, reinforced the sensationalism of the news as reporters padded, altered, and even fabricated their stories to boost their pay.

The manipulation and, indeed, *creation of news* by yellow journalism reached its apogee in the 1898 Spanish–American War. Critics, led by such anti-imperialists as E. L. Godkin, blamed the yellow press for drumming up public opinion against Spanish colonial rule and pressuring US president William McKinley to enter the war, but historians later discounted the power of the yellow press. In any case, a corrupt circuit of information emerged. Starting in 1895, Cuban exiles in New York City provided the press with exaggerated or fabricated reports, detailing the attacks of Cuban rebels and reprisals of the Spanish government. The yellow journals seized on the information and twisted it

to fit their own jingoistic, republican plots. Their stories described Cubans longing for freedom but subject to vicious Spanish masters. Once the war began, the yellow journals offered up patriotic tales of American heroism in the face of war. In Godkin's 1898 analysis, an unholy collusion united the publishers' desire for circulation, a public roused to nationalism, and the propaganda interests of the national government.

In the end, what vanquished yellow journalism were not the attacks of genteel critics but Pulitzer himself, deciding to end his race to the gutter with Hearst. In the early 1900s, Pulitzer pursued a veneer of respectability, engaging in such ventures as founding the Columbia University School of Journalism and the Pulitzer Prizes. Although centered on US history, yellow journalism was a precursor to sensationalism elsewhere in the media.

## **Youth Culture**

*Richard Kahn*

*University of North Dakota*

*Douglas Kellner*

*University of California, Los Angeles*

As the social historian Philippe Aries reminds us (1962), “childhood” and “youth” are socially constructed conceptions of age and not biological givens. Indeed, the idea that a transitional period of youth occurs between childhood and adulthood is a relatively recent invention, beginning with Rousseau's *Emile* in mid-eighteenth-century Europe, which celebrated childhood and delineated stages of youth. Generational terms referring to the “lost generation” of the 1920s, or the “silent generation” post-World War II (1950s), began emerging in the twentieth century. During the post-World War II period, “youth culture” was widely used to describe the growing music and rock culture and consumer and fashion styles of the era that quickly mutated into the counterculture of the 1960s.

Since then there has been a flourishing industry in sociology, → cultural studies, and popular media designing terms like “baby-boomers” – who were born in the mid-1940s and the postwar period and came of age during the affluence of the 1950s and 1960s

(Strauss & Howe 1991; Gillon 2004; → Popular Communication; Popular Culture). This generation were the beneficiaries of an unprecedented economic expansion and a highly self-conscious sense of generation, having gone through the turbulent 1960s together and emerged in many cases to prosperity and success in corporate, academic, and political life in the 1970s and beyond.

### ORIGINS OF THE CONCEPT

The category of “youth culture” can be traced back to theorists associated with and influenced by the Centre for Contemporary Cultural Studies in Britain who emphasized its counter-hegemonic and “generational” qualities and examined the ways in which working-class youth sub-cultures resisted subordination through the production of their own culturally subversive styles (Hall & Jefferson 1976). From this perspective, youth of the 1950s celebrated beatniks, teddy boys, and the styles associated with American rhythm and blues music. A decade later, when these became appropriated by the mainstream, 1960s youth turned to the mods on the one hand, and hippy and countercultural styles of sex, drugs, and rock and roll on the other. After the commercialization and appropriation of the counterculture in the 1970s, youth turned to new movements like punk and, with the rise in global popularity of hip-hop culture from the 1980s onward, youth have turned increasingly to more urban and underprivileged “gangsta” styles of violent rap sub-culture (Kellner 1995).

While there have been attempts to present baby-boomers and “post-boomers” as coherent generations (Howe & Strauss 1993; 2000), in fact contemporary youth embrace a wide array of young people and its youth culture is equally heterogeneous. Post-boomers include those who helped create the Internet and the culture of video-gaming; the latchkey kids who are home alone and the mallrats quaffing fast food in the palaces of consumption; the young activists who helped generate the anti-globalization and emerging peace and antiwar movements; the cafe slackers, klub kidz, computer nerds, and sales clerks; a generation committed to health, exercise, sustainability, ethical dietary practices, and animal rights, as well as anorexics and bulimics in thrall to the ideals of the beauty and fashion industries. Today’s youth also include creators of exciting zines and diverse multimedia such as can be found on sites like MySpace, Facebook, and YouTube; the bike ponies, valley girls, and skinheads; skaters, gangstas, low-riders, riot grrls, and hip-hoppers; all accompanied by a diverse and heterogeneous grouping of multicultural, racial, and hybridized individuals seeking a viable identity.

### POSTMODERNISM

By the 1990s, new forms of “postmodern culture” became a central part of youth culture (see Best & Kellner 1997; 2001; → Postmodernism and Communication). Originating during this period, the style of MTV has come to influence postmodern media culture on the whole – normalizing a cultural style that seeks to absorb and pastiche anything and everything, while it turns oppositional cultural forms such as hip hop and grunge into seductive hooks for fashion and advertising. The postmodern media and consumer culture is alluring, fragmented, and superficial, inviting its audiences to enter the postmodern

game of consumption, style, and identity through the construction of look and image. Postmodern cultural forms are becoming dominant – at least for youth – with genre implosion a recurrent feature of contemporary film and TV, as are pastiche, sampling, hyper-irony, and other features of postmodern culture. Novel forms of electronic music such as techno and rave clubs also produce cultural artifacts where youth can experience postmodern culture intensely as they indulge in designer drugs, chemical and herbal ecstasy, and psychotropic drinks. Thus, for contemporary youth, postmodernism is not merely an avant-garde aesthetic, or an academic topic, but the form and texture of their everyday lives.

Most crucially perhaps, experiences of the → Internet have brought postmodern culture into the homes and lives of contemporary youth (→ Internet and Popular Culture). Hooking into the world wide web, individuals can access myriad forms of culture, engage in discussions, create their own cultural forums and sites, establish relationships, and create novel identities and social relations in a unique cyberspace (see Turkle 1995). Internet culture is on the whole more fragmented, diverse, and interactive than previous media culture and as sight and sound increasingly become integral parts of the Internet experience individuals will live more and more in a space significantly different from previous print and media culture. Being propelled into a new cultural matrix is thus an integral part of the postmodern adventure with unforeseen results. Contemporary youth constitutes the first cybergeneration, the first group enculturated into media and computer culture from the beginning, playing computer and video games, accessing a wealth of TV channels, plugging into the Internet, and creating communities, social relations, artifacts, and identities in an entirely original cultural space for which the term “postmodern” stands as a semiotic marker (→ Media Production and Content).

Youth culture is thus today intersected by media and computer technologies, and the current generation has grown up in postmodern culture. Media culture has indeed extended and prolonged youth culture as 1960s rockers like Mick Jagger, Tina Turner, and Bob Dylan continue to strut their stuff, and youth becomes an ever more obsessive ideal in US culture with the mass marketing of plastic surgery and medicines like Viagra supporting a highly sexualized mass culture that appears to idealize the youthful libido as a satisfying state of being ideally obtainable by every person. Yet in opposition to the dominant media and consumer culture, resistant youth sub-cultures have emerged that provide autonomous spaces where they can define themselves and create their own identities and communities (Kahn & Kellner 2003). Youth sub-cultures can be merely cultures of consumption where young people come together to consume cultural products, like rock music, that binds them together as a community. Yet youth sub-cultures can also be countercultures in which youth define themselves against the dominant culture, such as in punk, goth, grrrl, or hip-hop culture (see Epstein 1998).

## WORLDVIEW

“Global youth culture” is the transdisciplinary category by which theorists and policy analysts attempt to understand the emergence of the complex forms of hybrid culture and identity that increasingly occur among youth throughout the world due to the proliferation of media like film, television, popular music, the Internet, and other information and communication technologies (ICTs) in their everyday lives (for a global range of forms of

contemporary youth culture see SPoKK 1997; Dolby & Rizvi 2007). “Youth,” defined alternatively as post-adolescent and pre-adult groups, or by the United Nations as the over 1.1 billion young people between the ages of 15 and 24, are perceived as a primary engine for the growth of global media culture (→ Globalization of the Media). Youth generally comprise the most media- and technologically literate sector of their societies and the multinational corporations that trade in global media commodities actively target young people as a consumer class now believed to be worth more than US\$2 trillion in potential sales.

The potential for global media to enlist youth as agents for the cultural logic of advanced capitalist culture and economy has led some theorists to criticize global youth culture as dangerously ethnocentric and imperialist (see Gidley & Inayatullah 2002). Others see global popular culture as promoting a progressive postmodern diversity, hybridized cosmopolitanism, and proliferation of voices, cultural forms, and styles (see Dolby & Rizvi 2007). In this view, youth are being empowered by new cultural opportunities to question reactionary and regressive cultural and political attitudes in their respective societies. Therefore, while global youth culture is mistakenly characterized as being simply homogeneous and imperialistic, it also cannot be separated from a rigorous critique of its political economy. In this respect, there are ways in which global youth culture is undergoing a “McDonaldization” and represents a form of “McWorld” that seeks to replace local and traditional cultures with universal liberal and egalitarian values that surreptitiously support the geopolitical aims of countries like the United States and the profits of primary multinational media conglomerates like News Corporation, AOL/Time Warner, Vivendi Universal, Viacom, Bertelsmann, Sony, and the Walt Disney Company (→ Media Conglomerates; Disney; Time Warner Inc.).

But either condemning youth culture as homogenizing, or celebrating it as hybridized and creative, may miss the potential resistant elements in youth culture. Youth sub-cultures can comprise an entire way of life, involving clothes, styles, attitudes, and practices. Youth sub-cultures contain potential spaces of resistance, though these can take various forms ranging from narcissistic and apolitical to anarchist and punk cultures, from environmental and social justice activist cultures promoting progressive vegan lifestyles to right-wing skinheads and Islamic jihadists promoting startlingly reactionary ideas and values. Thus, although there might be elements of opposition and resistance to mainstream culture in youth sub-cultures, such counterculture might not be progressive and must be interrogated in specific cases concerning their politics and effects.

## **GLOBALIZATION AND YOUTH CULTURE**

Though there are undeniably a plethora of contemporary youth sub-cultures, the thoroughly mediated aspects of today’s youth culture, with technology like the Internet able to provide youth the world over with instant access to a wide diversity of cultural styles and artifacts, has led recent theorists to question the applicability of the concept of “sub-culture” in a global context. Proposing “post-subcultural studies” which emphasize the complexity, multiplicity, diversity, and syncretistic aspects of youth cultures as they localize global media influences and globalize local lifestyles, postmodern cultural theories are attempting to account for the ways in which global youth negotiate individualism amid market-based tribalism and strive for political agency within a world of media

spectacles. In this perspective, one would trace the international appeal of a rapper like Eminem, but also observe how local forms of hip hop have taken root from New York to Tokyo and Berlin to Sao Paulo, with global music channels and websites broadcasting not only these performances, but also hybridized forms of club music that mix rap styles with a *mélange* of cultural sounds and ideas. Further, whereas it was once believed youth culture was little more than a symbolic political gesture of defiance, today's youth have utilized new media to mobilize and coordinate global political expressions like the anti-corporate globalization movement which voices the desire of youths for a progressive world based upon alternative globalizations.

While → television and → radio remain the most powerful and pervasive media in the lives of most global youth, the Internet often supplant them as a primary influence and will continue to do so under institutional frameworks that push for the further development of a wired world that is both global village and global mall. While western corporations like Microsoft, Yahoo!, Google, eBay, ESPN, and Electronic Arts maintain top websites for global youth, Asian sites from China, Japan, Hong Kong, Korea, and Singapore also represent some of the most fashionable domains. As Asian countries are estimated to comprise 60 percent of the world's youth, evidence suggests that Asian website popularity may still be regional in large part. But the Japanese → anime-style Internet phenomenon of the Neopets site, where over 70 million global youth have created virtual pets that they care for and compete with for real prizes, demonstrates the manner in which online global youth culture can be hybridic and complex.

The continued growth of the Internet throughout Asia, Latin America, and Europe, as well as in parts of Africa, means that material on the global Internet will continue to become more diverse. Still, the hundreds of millions of global youth who live in abject poverty, fight in wars, and continue to be forced into slavery must serve as reminders that theories of global youth culture that celebrate its urbanity, cosmopolitanism, and mediated qualities can be misleading and may not be applicable to the cultural experiences of the downtrodden whose "youth" itself has become a political question.

Contemporary global youth culture is thus defined today by products and usages of mass media and information technologies and a common social and political environment. Today's youth are not the first TV generation (their boomer parents had that honor), but their media experience is far more intensive and extensive. Where boomers were introduced to a TV world with limited channels in black and white, post-boomers experienced the cornucopia of 100-plus channels in living color transmitted by cable and satellite television, a wealth of video cassettes, remote control and wireless devices, massively multi-player online games (MMOGs), DVDs, BitTorrent, MySpace, and YouTube. Whereas much boomer TV-watching was rigorously supervised and circumscribed by concerned parents, post-boomers, often with both parents at work, were parked in front of the TV as a pacifier and indulged themselves in a media orgy supplemented by video and computer games.

### **A MULTIMEDIA ENVIRONMENT**

Post-boomers have therefore watched much more TV than boomers, the time competing with that they spend in school and with other forms of media consumption. The shows

post-boomers watch are of a very different nature, often filled with images of sex and violence the likes of which were not seen in the 1950s and early 1960s, replacing shows like *Ozzie and Harriet*, *Dobie Gillis*, and *Lassie* with *Law and Order*, the *CSI* series, and *The Sopranos*. Since the late 1990s younger viewers have watched shows like *The OC* and *Grey's Anatomy* (teens), *SpongeBob SquarePants* and *The Fairly OddParents* (pre-teens), compared to the likes of *The Howdy Doody Show*, *The Mickey Mouse Club*, and *Mr. Ed*, which had entertained young boomers. While for young boomers the nightly news was iconic, post-boomers prefer the comedic critique of *The Daily Show*, and follow the superficial antics of *American Idol* and the dramas of celebs like Paris Hilton and Lindsay Lohan.

The current wave of → “reality TV” shows feature young contestants struggling for survival, prizes, and celebrity against older players in *Survivor*, locked up in a panopticon of surveillance in *Big Brother*, and subject to the degradations of sexual and social rejection in the highly competitive personality/sex contests of *Temptation Island*, *The Bachelor*, *The Bachelorette*, *Joe Millionaire*, and MTV's *The Real World*. These latter shows generally feature narcissism and sadism, depicting a highly Darwinist neo-liberal struggle for survival of the fittest and sexiest, while losers are rejected and cast aside as unworthy.

But post-boomers are also the first generation to grow up with personal computers, CD-Roms, the Internet, the world wide web, and iPods, which provide for exciting adventures in cyberspace and proliferating technological skills, making this generation the most technologically literate in history and offering unprecedented opportunities for them to become politically engaged and to create their *own* culture. Peer-to-peer (P2P) sharing of music, video, computer programs, and other digitized products represents more communal and social sharing than is evident in the reality TV shows, and programs like BitTorrent, MySpace, Facebook, and YouTube represent social technologies designed by youth to create a participatory and shared digital youth culture, one currently at war against the adult world of copyright litigation and the net police (→ Fandom).

Of course, one needs to distinguish between a youth culture produced by youth themselves that articulates their own visions, passions, and anxieties, and media culture produced by adults to be consumed by youth. One also needs to distinguish between youth cultures that are lived and involve immediate, participatory experience as opposed to mediated cultural experience and consumption, and to be aware that youth cultures involve both poles. Moreover, one should resist both reducing youth culture merely to a culture of consumption and glorifying it as a force of resistance. It is best instead to ferret out the contradictions and both the way in which youth cultures are constructed by media and consumer culture and the way in which youth in turn construct their own communities.

## Zapping and Switching

*Helena Bilandzic*

*University of Erfurt*

Zapping is the selective avoidance of television commercials, either by changing the channel with the remote control or by leaving the room during the commercial break. Sometimes the term “zapping” is used as a synonym for changing channels, or switching, but more often it is connected to advertising avoidance. Analog or digital video recorders can be used for “zipping,” fast-forwarding past the commercials (Bellamy & Walker 1996). The opposite of zapping – watching the commercials – is often referred to as “sticking” (Ottler 1998).

Zapping has economic significance as it challenges the value of → advertising in → television and threatens the basic income of commercial television (→ Advertising Effectiveness; Advertising Effectiveness, Measurement of; Advertising, Economics of). This makes empirical research especially sensitive to external interests, even more so as the amount of zapping reported strongly depends on the → operationalization (→ Audience Research). The self-reported zapping rate may be biased by a negative attitude toward advertising if respondents answer according to their attitude rather than their actual behavior (→ Interview). Also, → social desirability might lead to increased zapping rates in self-report. Electronic counting devices make up for this shortcoming by measuring actual behavior (Danaher 1995).

Even though the exact amount of zapping is difficult to establish, there is some agreement in research about the characteristics of the zappers: mostly, young and male viewers tend to avoid commercials (Bellamy & Walker 1996).

Television planners employ various *strategies to prevent zapping*. Increasing the appeal and likeability of commercial spots is one strategy (Woltman Elpers et al. 2003). Commercials between shows are more likely to drive away viewers than commercials that interrupt a show (van Meurs 1998). Thus, a strategy for limiting zapping is to announce the next show while the credits for the previous show are still on, using a split-screen. Eliminating commercials between shows altogether might be another strategy; instead, the commercial break may be inserted before the previous show ends or after the next has started. In a common effort to prevent zapping, channels may schedule their commercial breaks in parallel time slots (“roadblocking”; Ottler 1998). Also, announcing the short duration of the break or the small number of spots until a show starts is a strategy for decreasing zapping behavior. In the digital future, receiving devices may block channel changes

during commercials or, if a show has been recorded, block the fast-forwarding of commercials. Viewers might then be given the option to either watch the commercials or pay for viewing the show. A patent application for such a device by Philips exists; however, there is no intention to actually develop the device (yet; Snyder Bulik 2006).

Zapping represents a widespread reason for changing channel (→ Channel/Program Loyalty). There are many other *reasons for switching* (Heeter & Greenberg 1988; Walker & Bellamy 1993; Bellamy & Walker 1996). Channel changes may be motivated by the intent to avoid certain content, like boring shows or certain actors. Changes also may serve to look for certain content, like → news or → music videos, or, in an unspecific orienting search, to see what programs are on (often described as “scanning” the programs or “flipping” through the channels; → Selective Exposure). Both uses are instrumental in that they enable the viewer to make the optimal viewing decision. In contrast, there is a more playful way of switching: without having a specific goal of finding or avoiding content in mind, viewers take a stroll in the television world and experience pleasure in picking up snippets of different shows and not respecting traditional entities. Changing the channels with the remote control also enables viewers to watch two or more shows at the same time, switching back and forth between the shows (“hopping”). Also, a number of psychological traits, e.g., novelty seeking or locus of control (Bellamy & Walker 1996), and waning involvement (Vorderer 1993; → Involvement with Media Content) are connected to channel changing.

Apart from these television-related reasons for changing the channel, switching has also a social implication for the viewing group, as the person holding the remote control exerts a certain power over his or her co-viewers (Bellamy & Walker 1996).

As in zapping, there is little agreement between studies concerning the exact amount of switching. Self-report is a common *method for measuring channel changes*, being relatively cheap compared to electronic counting devices, and convenient for collecting data on other constructs like viewing motivations, personality traits, etc. in the same sample. However, switching is a mundane and repetitive behavior that viewers do not remember easily (Ferguson 1994). Moreover, self-report measures that ask for switching rate per hour might go beyond the respondents' capacity. Finally, there may be an effect of social desirability when respondents try to embellish their true switching frequency. Comparisons of self-report and electronic counter data show that actual switching frequency is underestimated by viewers (Kaye & Sapolsky 1997). More valid data can be expected from → observation, either through observers who sit in during a television session, or by recording channel changes with a video camera or a video recorder. Either way, the effort for the respondents is reduced, and validity is increased, because actual channel changes are recorded. However, the method is reactive, putting the viewers in an experimental situation that may alter their usual behavior. Moreover, preparing observational recordings for data analysis is costly and limits the number of respondents. Finally, electronic counting devices work without the presence of an observer, and offer exact data on each channel change. Such devices are used in commercial ratings measurement (→ Nielsen Ratings). While exact and less obtrusive than observation, this method is quite expensive, and commercial data are not easily available for academic use. Moreover, ratings data represent behavior, but not a viewer's intentions like searching or avoiding content. Mixed method designs combining self-report and observation or electronic counting devices are useful to get more complete information.

Again as for zapping, the socio-demographic characteristics of heavy switchers are similar across studies (Heeter & Greenberg 1988; Bellamy & Walker 1996): young male viewers change channels to a greater extent. Also, the presence of many channels promotes channel changing. The frequency of switching increases when new shows begin, e.g., on the hour or the half hour.

## **Zines**

*Jennifer Rauch*

*Long Island University*

A *zine* is an independent publication produced by an individual or collective on a low budget and distributed on a small scale primarily for personal, artistic, or social aims rather than for profit. Because zine communities arise outside of mainstream media systems, they represent ways in which people understand and engage with media that diverge from consumer capitalism. While there is some question as to whether modern

self-publishing can foster social change, scholars (as well as zine producers themselves) have observed that many common practices of zine culture are guided by democratic ideals of expression, inclusion, and participation.

The term “zine,” an abbreviation of *fanzine* (itself a contraction of *fan* → *magazine*), refers to printed work typified by idiosyncratic themes and noncommercial motives. Individual zines might cover a wide range of subjects – music, politics, culture, sex, travel, work – or focus on an esoteric topic such as thrift shopping, baseball nostalgia, conspicuous consumption, or eight-track tapes. Popular articles often discuss publishers’ daily lives and comment seriously or humorously on social trends, offering perspectives from anarchists, obese women, feminists, HIV-positive men, senior citizens, and other underrepresented groups. Well-known zine titles include *Ben is Dead*, *Bunnyhop*, *Chickfactor*, *Cometbus*, *Dishwasher*, *Fifth Estate*, *Giant Robot*, *Hip Mama*, *Maximumrocknroll*, the *Realist*, *Rollerderby*, and *Temp Slave*.

Some zine creators are accomplished writers and designers with a professional attitude toward publishing, while others take an amateur approach. Zine production techniques range from low-tech (hand-writing, typewriters, cut-and-paste, office paper) to sophisticated (desktop publishing, offset printing, binding, specialty stock). Many zines are photocopied, folded, and saddle-stapled as a booklet. Titles such as the *Baffler* and *Bust*, rooted in the zine movement, physically resemble traditional journals and magazines. With a few exceptions, zines are made in small quantities on an irregular schedule, sold and traded through local venues and mail order, and publicized through word of mouth and independent publications.

Zine producers situate themselves in the tradition of American revolutionaries who printed *Common Sense* and *Poor Richard’s Almanack*, of Dada and surreal artists who self-published manifestoes in the early twentieth century, and of the countercultural press that developed in the 1960s. The first zines appeared in the United States in the 1930s when science-fiction enthusiasts mimeographed original stories along with readers’ letters and addresses, which encouraged fan networks to develop (→ Fandom). Several influential, long-running zines grew out of the 1970s punk-rock scene that glorified do-it-yourself, or “DIY,” culture.

In the early 1990s, zines emerged in the United States, Canada, and Great Britain as a distinct cultural form. Their presence and popularity exploded due to the convergence of several favorable factors. Production became cheaper and easier as desktop computers and copy machines proliferated. Many young people unfulfilled by temporary or part-time employment devoted time and energy to such projects. The Riot Grrrl movement linking feminism, music, and politics also encouraged DIY publishing as a means of empowerment (→ Youth Culture). Zine editors and readers (often the same people) connected with each other through *Factsheet Five*, a comprehensive guide that reviewed and promoted zines through the 1980s and 1990s. Book retailers became interested in distributing zine titles, and national news media spotlighted them. While underground circulation is difficult to determine, estimates place the number of zines being published in the United States between 10,000 and 50,000, with a total audience in the millions.

The print phenomenon of zines boomed prior to mass adoption of the Internet in the late 1990s, when *e-zines* (electronic magazines, a format akin to web pages and blogs) emerged. Some online publications – for example, *BoingBoing.net* or *Pitchfork.com* – sprang from the same underground community that produces print zines. The term

“e-zine” denotes the technological form of a publication and does not necessarily connote the independent context of production associated with zines.

Communication scholars have explored the roles zines play in sub-cultural communities and the reasons for which people publish their own social messages. For instance, Duncombe (1997) describes how zines fostered oppositional identities, utopian goals, and alternative practices without challenging or changing mainstream culture. Other work shows how gay men published zines that celebrated their lifestyle and marginal status during the early AIDS crisis (Long 2000; Brouwer 2005).

Several studies focused on how self-publishers responded to the Internet’s emergence as a medium for producing and distributing zines. Smith (1999) argued that online fanzines can build and maintain sub-cultural communities, transcending geography. Cresser et al. (2001) discussed how female authors of e-zines created a space for political discussion online that neither marginalizes nor liberates women and girls. Rauch (2004) concluded that many editors of printed and handmade zines are ambivalent toward web publishing because they derive pleasure from the social interaction inherent in physical circulation (→ Virtual Communities; Personal Publishing).

A sign of zines’ enduring significance is that major institutions such as Barnard College Library, the New York State Library, and the Salt Lake City Library have built diverse zine collections to secure these primary source materials and document popular culture (Bartel 2004).
