Conventional laboratory experiments are laborious. Subjects have to be acquired individually or in groups; they have to show up at the laboratory at an arranged point of time; if computers are needed for stimulus presentation and/or subject inputs, each participant needs access to one, etc. Many experimental settings involving stimuli and measurements that can be displayed on a computer can also be conducted as virtual experiments on a website (→ Experimental Design).

The basic advantages are: (1) no investigator is needed; (2) participants can use their own computer at home or in the office; and (3) they can perform the experiments whenever and wherever they want to. These characteristics in sum result in a comparatively natural exposure situation. Finally, virtual experiments often exhibit extraordinarily large samples. There are major disadvantages as well: as indicated for online surveys, the sample quality may be poor and experimental groups may differ significantly. Participants have to administer the experiment on their own, and the researcher has poor control over the execution. If the prepared experimental procedure does not work at some stage or if the participant does not understand the instructions and requirements, the execution may be canceled and/or the received data may be corrupt.

Thus, virtual experiments only work if they can be taken easily and rapidly, and if participants are highly involved and keep to the rules. Experiments involving measures of personality may serve as an example here: many personality tests comprise simple stimuli and only a few questions and item batteries, and most individuals are highly interested in learning about their own personality (e.g., “how good am I in coping with crises?”) (→ Test Theory). Another area of application uses tests of websites and other online media (usability, user selection and navigation, etc.). After random allocation, site visitors are presented with different stimulus versions of media content. Navigation behavior can be measured by log-file analysis and afterwards an online questionnaire can be administered.

### **Observations**

Online research provides a rough, yet completely unobtrusive, method of observing human behavior – as far as it refers to the Internet: log-file analysis measures which page or document website visitors opened at what time, what part of the screen they looked at, whether they scrolled up and down the page, and other kinds of overt behavior that cannot be observed. Log-file analysis is the online variant of TV metering (→ Audience Research; Nielsen Ratings; People-Meter; Rating Methods). The difference between the

techniques is that people-meter systems are restricted to a sample while log-file analysis measures *all* visitors' actions on a website. With the help of cookies (little files stored on a visitor's computer by a web server), separate visits to a website can be recognized and connected to other data sources (e.g., online questionnaires answered on the same computer). There also exists (client-based) software that protocols all email and web activities of a person. Like TV metering, this method requires the participants' permission and active software installation on their computers.

### **Data Mining and Collaborative Work**

The Internet is a worldwide network of computers containing all kinds of mass media content, personal messages, → interpersonal communication, → group communication, and other information interconnected by hyperlinks and retrievable by search engines. Accordingly, it can be used as an endless source of social data and documents, which can be gathered unobtrusively with the help of search engines, robots, and other kinds of automatic data mining. An example may illustrate the potential: public opinion toward a politician, as publicly communicated on the net, can be sampled by searching for the politician's name with a standard search engine, saving all web pages, contributions on discussion forums, and comments on weblogs, and finally running a conventional content analysis (→ Content Analysis, Quantitative). The Internet not only offers new capabilities for gathering empirical data, but also facilitates and enhances traditional methods of literature research, expanding the availability of research literature beyond countries, disciplines, and scientific communities. This kind of online data mining can yield research data for extended → meta-analyses, which would not have been possible in former times. The same applies to Internet-based tools for collaborative work.

### **SOCIAL RESEARCH OF ONLINE PHENOMENA**

The Internet is a virtual world in which almost all real-world phenomena exist too. This especially applies to social and communication phenomena. Some real-world phenomena have changed dramatically in the virtual condition (e.g., accessibility of pornographic and extremely violent material to children; anonymous online communities; → Sex and Pornography as Media Content, Effects of; Violence as Media Content; Violence as Media Content, Effects on Children of); others still are quite comparable in both "worlds" (e.g., mainstream media content or → journalism). As it is impossible to draw a complete picture of all analyzed online phenomena, some examples might give an impression of the field.

Social research on the Internet begins with descriptive *demographics of the Internet population* (i.e., the number and structure of online users). Another "classical" realm of online research is *website evaluation*, including usability tests (combining retrieval tasks and think-aloud technique in the usability lab; additionally applying eye tracking, screen recording, and video observation of participants), user surveys, clickstream analyses (log-file analysis), and focus-group discussions. In *advertising research*, content and effects analyses of banners and other forms of mass media and direct advertising on the Internet are of relevance (→ Advertising; Advertising Effectiveness, Measurement of). Research on

online *journalism* and → *public relations* (PR) looks at communicators' characteristics on the Internet and new forms of interactions between journalism and PR. Research in → *political communication* addresses political participation on the Internet, e-government as Internet-based organization of policymaking and administration, the impact of politicians', parties', and other institutions' online communication on public opinion, etc. Research in → *health communication* deals with the effectiveness of online campaigns, and recipients' use of and trust in online medical information (→ Health Communication and the Internet). *Audience research* discusses uses and gratifications of different media channels and audience acceptance of new media products. *Psychology* and *sociology* analyze processes of interpersonal and group interaction, and the emergence or development of online communities, while → *rhetorical studies* deal with → discourse strategies, codes, and styles on the Internet. One might easily figure out how this enumeration is to be continued.

It is important to note that social research of online phenomena often, but not always, applies online methods. The demographics of the Internet population, for example, cannot be addressed with an online survey. Such data inevitably have to be based on a random sample of a country's total population, which, in turn, calls for a traditional telephone or face-to-face survey. It is hard to forecast the future of online research: online methods, as well as online phenomena, change at such a dramatic pace, that today's detailed descriptions of the field will be at best of historical value tomorrow. But hopefully the basic methods and ideas that this article has sketched will remain of relevance in the nearer future.

# Open Access Journals

*Ian Rowlands*

*University College London*

*David Nicholas*

*University College London*

Open access (OA) refers to a publishing practice in which users are granted rights of free access to digital content. Anyone, regardless of their institutional or personal status, can read and download OA materials without charge. OA is an invention of the *digital era* and only feasible because of the Internet and the world wide web. These technologies make it possible to separate the fixed costs of producing an article from the marginal cost of its distribution, which is effectively zero. This separation is critical to understanding OA business models (→ Information and Communication Technology, Development of).

OA contrasts with traditional publishing practice, where the costs of bringing print or electronic products to market are offset by user-facing charges: purchasing, pay-per-use, and licensing or subscription charges borne by libraries or individuals (or membership dues, in the case of the journals published by many learned societies). As well as being granted rights of free access, OA users are normally licensed to copy, distribute, and display those materials publicly in any digital medium for any responsible purpose, subject to proper attribution.

Although use is free under an OA model, costs naturally arise in the production and quality assurance of content. A number of mechanisms are evolving to enable these costs to be defrayed. Under the currently dominant “author pays” model, upfront publication charges are met by the researcher’s funder or employer. Alternatively, OA journals may be created on a voluntary basis by scholars or librarians, who assume the publishing role for themselves. Publication costs might also be met from endowment income or from other sources, such as philanthropic or commercial sponsorship or advertising. Although the OA concept has become strongly associated with scholarly journals, there is no reason *in principle* why it should not apply to other digital content: books, monographs, or even broadcasting, film, and music.

OA in publishing taps into a broader set of social developments, including open source software, open licensing, and even freedom to roam, all of which seek to redraw the relationship between capital and the rights of the individual. OA has also coincided with an alleged affordability crisis on the part of many libraries, leading to a negative cycle of journal cancellations, reduced subscription bases, and higher prices.

A powerful OA advocacy movement comprising academics, research funders, librarians, and politicians has emerged in response, galvanized by major international statements (notably the *Budapest Open Access Initiative* and the *Berlin Declaration*). Two key principled arguments are frequently marshaled by OA advocates. The first is that toll restrictions limit the circulation of knowledge and thus act as a brake on research and new discoveries. The second is that taxpayers have a vested interest in the outputs of the research that they have funded and should therefore have rights of access. Other, more

tactical, arguments are deployed, often invoking research that demonstrates a positive relationship between OA and a higher citation impact (Lawrence 2001; Eysenbach 2006). Early research on usage does not show the same impact (Nicholas et al. 2007).

OA journals are a source of considerable confusion and misunderstanding. It follows from the definition above that OA is fundamentally a legal and economic construct, not a particular technology. Neither should the OA concept be confused with *peer review*, nor indeed with any other value-added publishing function. OA journals may be produced to the highest possible standards of peer review and attract high impact factors (some of the titles published by BioMed Central fall into this category), or they may not. They may invest considerable effort in copyediting, presentation, and site navigability, or they may not. In this respect, editorial standards are independent of the notion of OA, and these journals span the full quality range, from the lamentable to the indispensable, just as traditional titles do.

OA journals are generally assigned into two broad *categories*: “gold” and “green.” Gold journals normally undertake full peer review and in most respects are indistinguishable from traditional (toll access or “white”) journals, except that they grant free rights of access to their content. The green road to OA refers to a set of arrangements, running in parallel with tolled access journals, whereby researchers archive a copy of their article (but normally only a preprint, the pre-peer reviewed manuscript) in an OA institutional or subject repository, often maintained by professional librarians using open source software products like D-Space.

OA is a disruptive technology with very considerable potential to reshape the scholarly communication environment. It is not, therefore, surprising that many of the claims of the OA movement are not entirely accepted by learned society and commercial publishers (Robinson 2006). Central to their concerns are serious doubts about the long-term financial viability of OA and that the journals system may become fatally destabilized as a result.

## Open Meetings Law

Janet Kaye

Buffalo State College

Open meetings law is predicated on the belief that government derives its power from the people in order to act on their behalf. For the government to remain accountable to the people, its processes must remain accessible to them, and to the news media, the people's watchdog (→ Freedom of the Press, Concept of; Journalism: Normative Theories).

To narrow the gap between governmental practices and the democratic ideal of government transparency, open meetings law requires public bodies with decision-making authority, such as agencies and commissions, to conduct their discussions, deliberations, and determinations in meetings open to the public and with advance notice. Some laws also include advisory public bodies such as panels and committees; some require that minutes be taken and published.

Most open meetings laws, like most freedom of information laws, were *enacted over the past thirty-five years*, often in response to public calls for reform following revelations of egregious instances of government abuse. A global study found that 68 nations had enacted some form of freedom of information law during this time period. There appears to be no similar study of nations with open meetings laws but, in general, there are far fewer of them (→ Freedom of Information).

Open meetings law presumes that government meetings are open to the → public. The burden of proof therefore rests with the party seeking closure. However, the prerequisites for closure can be so vague that the government's burden of proof becomes a negligible one. For example, the Constitution of *Finland* (1999) requires that plenary sessions of Parliament "are open to the public, unless the Parliament for a very weighty reason decides otherwise for a given matter." In contrast, the Government in the Sunshine Act (US Congress 1976), which is the federal open meetings law of the *United States*, enumerates 10 circumstances that might justify an exemption. These range from national security matters to housekeeping materials. Nine of them also apply to determining whether the government will be exempt from producing particular documents sought under the 1966 US Freedom of Information Act.

Open meeting laws cover different levels and branches of government. The 1976 US federal law applies to about 50 federal public bodies whose members are appointed by the president with the advice and consent of the Senate. Each of the 50 states has also enacted a law that regulates meetings of its state bodies. The state statutes differ widely from each

other in their scope and severity, and in the extent to which they specify open meetings regulations applicable to local government.

It has proved difficult to *secure full compliance* with open meetings law regardless of the level or branch of government to which the law applies or the specificity of its provisions. Generally, a meeting of a public body refers to a quorum of that body, gathered to consider government business. Yet reaching a consensus as to whether the word “meeting” or “public body” applied to particular circumstances was sometimes a protracted process even before the existence of teleconferences, chat rooms and email.

There is also little inducement for a reluctant public body to comply with the provisions of open meetings laws many of which, like the Municipal Act of *Ontario, Canada*, lack meaningful penalties for noncompliance or contain penalties that have rarely been imposed.

The Municipal Act as amended in 2006 provides that from January 2008 municipalities are permitted but not required to appoint an investigator to explore allegations of open meetings law violations. The Act differs from Canadian federal law, which does not include open meetings law requirements. However, it is similar to many other open meetings laws in its failure to specify the process that will be used to determine whether there was noncompliance.

“Accessible transparent government goes far beyond just opening the doors to a meeting,” Ontario Information and Privacy Commissioner Ann Cavoukian and Assistant Commissioner Tom Mitchinson wrote of the deficiencies in Ontario’s Municipal Act. “The broader objective of transparency is to ensure that citizens understand how decisions are made and have an opportunity to participate in the decision-making process” (Cavoukian & Mitchinson 2003). To meet that objective, they say, a law must include an efficient, accessible system of oversight and enforcement, and a body to take and investigate public complaints and resolve disputes. In addition to requiring government to provide adequate advance notice of all meetings, government must be prohibited from conducting any business for which it did not provide such notice.

The short-term *prognosis* for a substantial increase in the number of nations with open meetings law is uncertain. International effort still appears focused on freedom of information laws – enacting them, strengthening them, and above all monitoring them and increasing compliance. Satisfactory implementation of freedom of information law is viewed as a prerequisite to promulgating open meetings law. For many of the 68 nations with freedom of information laws profiled in a global survey, satisfactory implementation appears a long way off. *Bulgaria*, for example, enacted the Access to Public Information Act in 2000. In 2004, an international monitoring body noted significant improvements in implementation over the prior year and recommended changes, including requiring open meetings of collective bodies. By June 2007, however, any thought of expanding access to proceedings had been supplanted by the need to rescue the 2000 statute from “the deliberate attempts to weaken a law that has operated for the benefit of its citizens.”

There may have been some movement toward open meetings law in the last several years. The Constitutional Court in *South Korea* ruled in 2000 that there was a constitutional right to attend plenary sessions of the National Assembly, and that the news media should be able to report on the sessions unimpeded. Prior to that ruling, statutory

law generally left the decision of whether to open a meeting to the discretion of the Assembly members. No open meetings law has yet followed from the court's 2000 ruling, but that does not preclude the possibility. It took nine years for a freedom of information statute (Act on Disclosure of Information by Public Agencies) to become effective after the Constitutional Court ruled in 1989 that the people of South Korea's new democracy had a constitutional right to information (→ South Korea: Media System).

Article 19 and other international human rights groups view open meetings as a vital part of freedom of information, which was declared to be a fundamental human right by the United Nations at its first session in 1946. In 2000, the UN Special Rapporteur and the Organization of American States (OAS) Special Rapporteur endorsed nine international standards established by Article 19 as underpinning freedom of information legislation. Standard 7 states that the law should establish a presumption that the public can attend all meetings of governing bodies.

## **Open Source**

*Evangelia Berdou*

*London School of Economics and Political Science*

Open source software (OSS) refers to software that can be freely used and modified. It is developed collaboratively over the → Internet by teams of globally distributed and

predominantly volunteer programmers (→ Network Organizations through Communication Technology; Virtual Communities). The OSS movement is a continuation of a long tradition of sharing and cooperation that started in the early days of the Internet. OSS is protected under copyright licenses that aim to ensure the availability and free (re)distribution of the source code, the set of instructions written by developers that make up a program.

The term “open source” is frequently used alternatively or in conjunction with the term “free software” (as in FLOSS – Free Libre Open Source Software). FLOSS is an evolving and ambiguous phenomenon. It encompasses a wide variety of projects and institutional frameworks, such as community-initiated and -led projects, initiatives introduced and controlled by corporations, restrictive copyleft licenses, as well as more permissive, non-copyleft licenses, depending on how strict the conditions for the use and redistribution of the source code are. Copyleft licenses ensure that all the freedoms in modifying, using, and distributing the source code, which are protected under their terms, are preserved in any of its subsequent versions, whereas noncopyleft licenses allow for various exceptions.

OSS has been regarded as emblematic of processes associated with the transformative socio-economic capabilities of the Internet and of information and communication technologies (→ Information and Communication Technology, Economics of; Information Society). In particular, FLOSS has been examined as a revolutionary software development methodology, the principal characteristics of which are the granularity and modularity of the source code, which allow individuals to become as involved as they wish depending on their time and level of expertise, and the intensive release schedule, which leverages user feedback to implement new features and to quickly detect and solve program errors (bugs) (Feller & Fitzgerald 2002). In addition, FLOSS has been regarded as representative of a new model of production, social or peer-to-peer production, which reduces the gap between consumers and producers of information and which provides an alternative to the rationality of the exchange economy. It is known as the “gift economy,” which expresses the essence of community and is based on the principle of anticipated reciprocity (Kollock 1999; Benkler 2006; → Media Production and Content). At the same time, FLOSS has been viewed as an engine of economic development that provides the means to correct the deficiencies of proprietary software, especially in cases where access and interoperability are of great importance, such as in the case of e-government services (Forge 2005; → Code as Law; Communication Technology and Development).

Most examinations of the OSS phenomenon rely on a combination of arguments, including the cultural, ideological perspective focusing on influential practitioners’ accounts (Raymond 2001) and emphasis on the role of ideology and the desire to participate in the gift economy; the socio-technical perspective, which views OSS projects as systems whose technical and social aspects are intricately connected through a dual, recursive process of technology and social shaping; and organizational studies, labor economics, and the economics of innovation, where a few studies adopt formal economic models, but many researchers frame their explanations by combining insights from a number of areas.

Issues concerning motivation, coordination and cooperation, scalability, conflict management, division of labor, governance, and integration are investigated in the literature, but the topic that has drawn most attention is the question of incentives. One line of research assumes the economic rationality of individual motives and is premised on the view of

open source communities as composed by atomized actors whose behavior is influenced by the aggregate behavior of others. This work tends to reduce the complexity of the relationship between the gift and exchange economies to a distinction between monetary and nonmonetary rewards (e.g., Lerner & Tirole 2002). They argue that the reputational benefits of successful OSS contributors often translate into better-paid positions and improved access to venture capital. OSS researchers tend to use quantitative methods, including large-scale developer surveys (David et al. 2003), data mining of concurrent version system (CVS) repositories (Koch & Schneider 2002) and social network analysis of email postings (Crowston & Howison 2005).

Empirical research has demonstrated that claims about the wide collective basis of OSS contributions need to be challenged and that research is needed to understand the viability and scalability of OSS from an internal OSS community perspective on issues of coordination and control, and with regard to the way OSS communities interface with commercial and public actors.

# Operationalization

*Stephanie Lee Sargent Weaver*

*Emory University*

Operationalization is the process of translating abstract things into concrete, measurable variables (→ Measurement Theory). It is one of those things that is more easily said than done. It is quite simple to explain to someone the purpose and importance of operational definitions for variables and even to describe how operationalization generally takes place. But a researcher will quickly appreciate some of the subtle difficulties involved when he or she attempts to operationalize a complex variable. Operationalization is how researchers define things by what they do. In other words, the “operations” are the procedures or steps one must go through in order to observe the concept being defined (Babbie 2001; Katzer et al. 1998). To get to this point in the research process, we must first look at how research begins.

## CONCEPTS, CONCEPTUALIZATION, AND OPERATIONALIZATION

The research process starts off with a concept that a researcher is interested in measuring or observing. A concept is a “mental image that summarizes a set of similar observations, feelings, or ideas” (Schutt 2004, 86) or a “term that expresses an abstract idea formed by generalizing from particulars and summarizing related observations” (Wimmer & Dominick 2003, 42). Concepts are important for two reasons: (1) they simplify the research process by combining characteristics, objects, or people into more general categories; and (2) they simplify communication among those who have a shared understanding of them (Wimmer & Dominick 2003).

It is easy to identify concepts; for example, a story which appeared in the *New York Times* reported that five US colleges were participating in a pilot program to ban alcohol in their fraternities. The article also claimed that “substance-free housing” would become the norm on US campuses. Some of the concepts used in the article, like alcohol, colleges, campuses, and pilot program, are widely understood and commonly used. We might use these terms in conversation and never realize that your colleague was visualizing something completely different from you. From reading this article we might be left with several questions. (1) Is a junior college included in the term “college”? (2) Does the concept of “on campus” extend to fraternity and sorority houses that are not physically on college property? (3) Does “substance free housing” mean banning tobacco as well as alcohol?

Some of the concepts from the *New York Times* article illustrate that oftentimes there are concepts used in everyday conversation where people do not share the same → definition. When this occurs, we need to explicitly define the concept so that all readers will share the same definition. This is what is known as conceptualization. It is the process of specifying what we mean by a term (Schutt 2004; Wimmer & Dominick 2003). In a similar vein, Babbie (2001) defines conceptualization as the mental process whereby fuzzy and imprecise notions are made more specific and precise. In addition, Schutt sees conceptualization differently based according to whether we are conducting inductive or

deductive research (→ Deduction vs Induction vs Abduction). “In deductive research, conceptualization helps to translate portions of an abstract theory into specific variables that can be used in testable hypotheses. In inductive research, conceptualization is an important part of the process used to make sense of related observations” (Schutt 2004, 87). For example, if a person were to go into a classroom of 25 people and ask “What is your favorite cake?” It’s likely that most of the students in the classroom will probably not think of the same type of cake. If a researcher wanted to measure this concept, he or she would need to define what is meant by the term “cake.”

After we define the concepts in a theory, we can then identify variables corresponding to the concepts. Let’s say that we are interested in measuring differences between males and females on binge drinking. Our concept is binge drinking and we conceptualize it as “heavy episodic drinking.” Once we have defined it so that all readers will share the same definition, we can decide how we can measure this variable. One way we can measure it is by asking both males and females how many drinks they consumed in succession during some period.

Once we have specified the variable we want to measure, we can proceed to the next step in the design of our study – deciding on our measurement procedures. The goal is to devise operations that actually measure the concepts we intend to measure. This is referred to as the “operationalization of variables” or an “operational definition” (Wimmer & Dominick 2003). During this process, there will probably be several possible operational definitions for a given concept; the researcher must make a choice which one is most suitable for his or her research study. For this example, we are interested in conducting a study measuring people’s incomes. To measure income, we conceptualize income as annual earnings and operationalize the variable by asking the question “What was your total income from all sources in 2006?” When looking at income there is a large range of variation, from some people earning millions of dollars to those earning less than \$5,000 per year. Depending on your sample, you as the researcher must decide what the highest and lowest income categories will be (Babbie 2001; → Coding; Scales; Scales and Indices).

A good illustration of this process takes us back to our cake example from earlier. The operationalization for white cake is the recipe. It makes public what someone means by “white cake.” Anyone who has the recipe will be able to replicate the “white cake.”

#### *White cake*

Preheat oven to 375 degrees.

Sift together  $3\frac{1}{2}$  cups of flour,  $\frac{1}{2}$  teaspoon of salt, and 4 teaspoons baking soda.

Blend together 1 cup of butter and 2 cups of sugar.

Add 1 teaspoon of vanilla to 1 cup of milk.

Slowly mix together in stages the flour mixture, the milk, and the creamed sugar.

Whip the whites of 7 eggs until stiff and fold them into the batter.

Bake in lightly greased pans for about 25 minutes.

The cake recipe above tells us what we need to do to make a white cake. Anyone with basic cooking skills could follow it and likely end up with something similar to what the author of the recipe had in mind, but it could differ in terms of taste, weight, height, and moistness. Even though the recipe appears specific, some aspects of it are still missing: the size of the eggs and the quality of butter are not specified; there is no adjustment specified in the recipe for higher altitudes. Each of these might affect the outcome of the cake, and

so the recipe could have included them. If we were to look in a different cookbook for white cake we would likely find a slightly different recipe. If we followed that recipe, we would probably produce a cake much like the first one. This example shows us that there is no one correct recipe for a white cake. Along the same lines, there is no one correct operational definition for a concept (Babbie 2001; Katzer et al. 1998).

## **TYPES OF OPERATIONAL DEFINITIONS**

An operational definition is a specification of the activities of the researcher in measuring or manipulating a variable. There are, in general, two kinds of operational definitions: (1) measured and (2) experimental (Kerlinger 1986).

A measured operational definition describes how a variable will be measured. For example, achievement may be defined by a standardized achievement test, by a teacher-made achievement test, or by grades. On the other hand, an experimental operational definition spells out the details of the investigator's manipulation of a variable. Reinforcement can be operationally defined by giving the details of how subjects are to be reinforced (rewarded) and not reinforced (not rewarded) for specific behaviors.

Whether it is a measured or an experimental operational definition, researchers cannot underestimate the importance of operational definitions. They are indispensable ingredients of scientific research because they allow researchers to measure variables and because they are bridges between the theory-hypothesis-construct level ( $\rightarrow$  Hypothesis) and the level of  $\rightarrow$  observation. There can be no scientific research without observations, and observations are impossible without clear and specific instructions on what and how to observe. Operational definitions are those instructions.

## **OPERATIONAL DEFINITION GOALS**

Most researchers try to create definitions that ensure publicness, replicability, and, if possible, fruitfulness. These goals are part of an attempt to create definitions that reduce error. First, when researchers talk about reality, one wants to know specifically what they mean. Thus one must look for *clear, unambiguous definitions* of terms. For example, if a researcher is studying "eating," he or she should specify whether drinking liquids and taking vitamin pills fall under the definition. In normal usage of the term "eating," lack of specificity is not very important, but if a physical education researcher is studying the effects of various diet programs you need to know precisely what is meant (Katzer et al. 1998).

Second, to generate factually accurate information, researchers must *check what they say against reality*, and this means they must do something to define what they are talking about. For example, a researcher who studies eating by asking subjects how many meals a day they eat is using a very different definition than if he or she follows them around recording everything they eat. The researcher may have had the same conceptual definition in mind but then chosen different methods to actually observe eating. An acceptable operational definition helps readers and researchers by linking words with reality and by being public, specific, and replicable. But this is not enough.

The major criterion for the evaluation of any definition is its fruitfulness and is usually the most difficult to assess. To be fruitful, the conceptual definition must *build on current*

*theories and prior research.* Fruitful definitions usually fit into the research traditions of a field. They build on what exists. There is occasionally justification for writers to construct new definitions, but they should not introduce new terminology into a field unless they are convinced that the existing set of concepts is inadequate.

In addition, the *operational definition should coincide with the conceptual definition* in a useful way. Since operational definitions usually do not include exactly what is of interest; several operational definitions that, taken together, encompass the conceptual definition completely are usually needed. This goal should be of particular concern to the researcher and to the reader or user of research. Having more than one operational definition increases the chances that at least one will be useful.

## **Opinion Leader**

*Gabriel Weimann*

*University of Haifa*

Decades of social science research have demonstrated that there is a group of people in any community to whom others look to help them to form opinions on various issues and matters. Whether called “opinion leaders” or “influentials,” these people literally lead the formation of attitudes, public knowledge, and opinions. In the classic book *Personal influence*, opinion leadership is defined as “leadership at its simplest: it is casually exercised, sometimes unwitting and unbeknown, within the smallest groupings of friends, family members, and neighbors. It is not leadership on the high level of Churchill, nor of a local politico; it is the almost invisible, certainly inconspicuous form of leadership at the person-to-person level of ordinary, intimate, informal, everyday contact” (Katz & Lazarsfeld 1955, 138).

Since the introduction of the opinion leadership conceptualization, both practitioners and academics have been keenly interested in its applicability in modern society. Hundreds of studies have been conducted to identify potential opinion leaders, learn of the characteristics distinguishing them from their “followers,” and understand how they exert their personal influence to change opinions and behaviors of the masses (for a review see Weimann 1994). Many of these studies have validated the view that opinion leaders do indeed exist and influence others, in various areas, ranging from fashion and consumer decisions to politics. Such opinion leaders are individuals regarded as having expertise and knowledge on a particular subject. These individuals often provide information and advice to “followers”; therefore, they are more likely to influence purchasing behavior through word-of-mouth communication (→ Group Communication and Social Influence).

Opinion leaders are seen as having *special advantages*: First, they are perceived as possessing “expert power” because they are technically competent and are convincing. Second, product opinion leaders have knowledge power because “they have prescreened, evaluated, and synthesized product information in an unbiased way” (Menzel 1981, quoted in Solomon 1994, 385). Third, social power is attributed to them because of their standing in the community. Fourth, their hands-on product experience makes opinion leaders more likely to give both positive and negative information about the product’s performance – unlike paid-for communication, which focuses exclusively on a product’s positive aspects. Finally, they have referent power since, in terms of education, social status, and beliefs, they usually tend to be homogeneous with, or at least similar to, their opinion-seeking counterparts. Therefore, it is imperative that companies conduct research to identify opinion leaders. The knowledge gained from these studies can then be utilized to properly target information at the appropriate settings and media.

### ORIGINS OF THE CONCEPT

Three major studies laid the groundwork for opinion leadership theory: the “*people’s choice*” study, the *Decatur study*, and the *drug study*. Each study led to a greater understanding of how opinion leaders disseminate information – from the more simplistic two-step flow of communication to the more elaborate model, the multi-step flow of communication. The *two-step flow theory* asserts that information from the media moves in two distinct stages – from the mass media to the opinion leaders and from the opinion leaders to their followers (→ Two-Step Flow of Communication). The two-step idea was first introduced by → Paul Lazarsfeld et al. (1944) in *The people’s choice*, based on a study that focused on the process of decision-making during a presidential election campaign. Despite a number of criticisms by subsequent researchers, the “people’s choice” study is considered one of the most prominent in mass communication research, due to its comparison between the mass media and personal flow of information and influence (→ Media Effects, History of).

Criticisms are directed at the oversimplification of the two-step flow of communication, which leads to an underestimation of the direct influence of the media. The process of influence is said to be more complex than a single group of opinion leaders listening to the mass media, then feeding their opinions to a group of passive followers.

Instead, people who influence others are themselves influenced *by* others in the same topic area, resulting in an exchange. Opinion leaders are thereby both disseminators and recipients of influence.

With this in mind, a more accurate portrayal of the communication flow would be a *multi-step process*, rather than simply a two-step process. The two-step flow of communication theory has, however, remained relevant throughout the years. Several recent studies have addressed issues arising from Lazarsfeld, Katz, and Merton's studies from the 1940s. For example, Weimann led a re-examination of the opinion leader conceptualization in modern studies (1991, 1994), attempting to spark a new interest in the old theory and modify the definition and measurement of opinion leaders. Weimann and Brosius (1994; Brosius & Weimann 1996) examined the process of agenda setting as a two-step flow of communication, highlighting the role of opinion leaders in mediating between media agendas and public agendas (→ Agenda-Setting Effects).

### WHO ARE THE OPINION LEADERS?

The early studies on personal influence and opinion leadership resulted in several attributes related to opinion leaders. The most important ones are that opinion leaders: (1) are found at every social level, and in most areas of decision-making influence people from the same social level; (2) are found in both sexes, all professions, all social classes, and all age groups; (3) tend to be more involved than non-leaders in various social activities and social organizations and occupy central positions in their personal networks; (4) are considered experts in their field, but this is informal recognition by close friends, relatives, co-workers, colleagues, and acquaintances; (5) are more exposed to the mass media than non-leaders; (6) are more interested, involved, and up-to-date in the field in which they are influential than non-leaders; (7) tend to be monomorphic, i.e., usually expert in one area but rarely in various areas; (8) manifest a specific communication behavior, i.e., are more involved in formal and informal personal communication than non-leaders; and (9) are usually well aware that they are sources of information and influence for others.

In his review of the opinion leadership concept after the early studies, → Elihu Katz (1957) suggested three *criteria that distinguish leaders from non-leaders*: (1) *who one is* – the personification of certain values in the figure of the opinion leader; (2) *what one knows* – the competence or knowledge leaders have; and (3) *whom one knows* – their strategic location in the social network. A more debatable characterization relied on the use of the mass media, or the two-step flow model.

### MEASURING OPINION LEADERSHIP

Despite the growing research on opinion leadership, the identification of appropriate opinion leaders continues to be a challenge. Several methods have been used (→ Research Methods). In the *positional approach*, persons in elected or appointed positions in the community are assumed to be opinion leaders. This approach is inexpensive, but it can be highly inaccurate because it assumes opinion leadership is based upon position, rather than respect. The *reputation approach* relies upon the nomination of selected individuals

as, for example, the ten most influential persons in a community regarding a certain issue. Using the reputation approach generally improves the accuracy of identification, because one is getting information from more than one source about the influence of others in the community. In the *self-designating method* individuals are asked to identify themselves as being influentials in certain issues. This approach has the advantage of getting input on influence from community members, and therefore is more accurate than the positional approach. A potential pitfall of the self-designating approach is that persons might over- or underestimate their influence on others.

*Sociometric methods* trace communication patterns among members of a group, which allows for the systematic mapping of member interactions. Data is typically obtained by interviewing participants and asking them to whom they go for advice and guidance. These methods are more expensive and difficult to administer. Sociometry works best in a closed, self-contained social setting, such as a hospital, prison, or army base. This mapping of contacts serves to locate persons who are at the center of communications about the issue area. Another method of data collection on opinion leadership and advice-giving is by *observing social action* within the community. Observation, because of costs related to its application and the length of time required, is the most expensive of the techniques described here, but it is often considered the most accurate.

The *key informant* approach involves first identifying a limited number of people assumed to be knowledgeable regarding the patterns of influence within a group, and then asking them to identify influentials in that group. Although key informants are selected subjectively as persons likely to have the ability to identify opinion leaders, this method is employed because it usually produces savings in terms of costs and time when compared to other methods. However, it should be noted this methodology is less applicable to sample designs in which only a portion of an audience is interviewed.

Finally, → Elisabeth Noelle-Neumann suggested a measure, the *strength of personality scale* (PS scale), which emerged from testing numerous questionnaire items related to self-perceived levels of personal influence (Noelle-Neumann 1983; Noelle-Neumann & Csikszentmihalyi 1992). These early → scales were tested and refined after years of pretests with a variety of samples (→ Scales and Indices). The final scale included 10 items that were later weighted according to their part-whole correlations with the total scale (Weimann 1991, 1994). The successful identification of the influentials by means of the PS scale, validating the identification by “external” criteria, and the relative ease of administering the scale led more researchers to explore its potential.

### **THE FUTURE: OPINION LEADERS IN CYBERSPACE**

The acknowledged significance of opinion leaders in general led recent attempts to explore their existence, attributes, and functions in the online environment. The widespread use of the → Internet has enabled huge audiences to easily access an abundance of information about a variety of issues, products, and services. Internet users have made cyberspace into a meaningful place of interaction, information-gathering, and consulting. Moreover, the advent of the Internet, with its constituent parts (the world wide web, forums and lists, chatrooms, email), has also irreparably blurred the classic distinction between interpersonal and mass communication.

Preliminary evidence that virtual contacts have been integrated into information-seeking habits is provided by the Pew Foundation studies (Pew Internet and American Life Project 2002). For example, they report that an estimated 52 million web surfers in the US have sought medical information on the web, and approximately half of these report that the information found influenced their decisions about treatment and care (→ Information Seeking). This information was often key in deciding where to go next (e.g., whether to go see a doctor, whether to get another opinion), rather than in final decision-making about treatment. More and more people turn to the Internet and its virtual communities to seek advice, information, and guidance. Within these communities *online opinion leaders* emerged, generating millions of personal recommendations sent to their virtual followers. Recent studies are revealing the existence of these online opinion leaders in chatrooms, forums, and personal weblogs (→ Online Media; Blogger). In seeking to extend the theory of opinion leadership to the online environment, future research will explore whether the established theories for the offline environment would also help us understand opinion leadership in the online world.

# Order of Presentation

*Michael Schenk*

*University of Hohenheim*

The effectiveness of a communication depends on a variety of factors. Among those concerning organization and procedure, order of presentation forms one of the major factors that influence the impact of communication on an → audience. It is to → Carl I. Hovland and team's credit that appropriate research questions and → experimental designs have been developed to test and acknowledge this effect (→ Persuasion; Media Effects). "Order" refers to two aspects of variation: "(1) the order of presenting a series of communications, and (2) the order of presenting the various elements within a single communication" (Hovland 1957; → Media Effects, History of).

## ORDER EFFECTS IN SUCCESSIVE COMMUNICATION

For order effects in successive communication, the issue of the most advantageous position is of pivotal concern. We need to consider on the one hand the effects of being in first position, in terms of presenting our own communication before opposing arguments have an opportunity to reach the audience, and on the other hand the effects of being in last position, i.e., having the "final say." Lund (1925) enunciated a *law of primacy*, stating that the side of an issue presented first will have greater effectiveness than the side presented afterwards. In a replication of the Lund experiment by Hovland & Mandell (1952), results indicated that only one of three groups showed a greater effectiveness for the side presented first (primacy), while two groups showed the second side to be more effective (recency).

In another experiment to test this phenomenon, Hovland & Mandell (1957) used topics of interest at the time. The order of presentation was counterbalanced. Half of the subjects received the affirmative arguments first and the other half the negative arguments first. Opinion questions were asked after the first and again after the second side had been presented. Three of four groups showed a recency effect and only one a primacy effect. The authors therefore concluded: "When two sides of an issue are presented successively by different communicators, the side presented first does not necessarily have the advantage." The results of Hovland & Mandell raised serious questions about the generality of the law of primacy in persuasion for communication situations in which two sides of a controversial issue are successively communicated.

Further research on primacy or recency effects was stimulated by considering *mediator variables* (→ Mediating Factors). Primacy is found to be advantageous, particularly during the first stages in → information processing. As attention wanes, however, the second side will increase its relative impact by prolonging attention (Tetlock 1981). *Space* as another moderating variable showed that shortening the interval between both sides favors primacy, while shortening the interval between the second side and the impact measurements favors recency. The spacing effects are more evident for recency and attitude change (Miller & Campbell 1959). Finally, if the communications are on a very controversial issue, the advantage of primacy is reduced. Summarizing, the primacy/

recency effects clearly depend on mediating variables that facilitate either a primacy or a recency effect (→ Schemas and Media Effects).

### ORDER EFFECTS IN A SINGLE COMMUNICATION

The *order of presentation within a single communication* includes a series of possible variations. Only two pivotal aspects are referred to here: (1) the effectiveness of one- and two-sided messages, and (2) the effectiveness of explicit and implicit conclusions in persuasive messages. When communicating a persuasive message the sender has to decide whether to consider opposing viewpoints. A *two-sided message* is a message that not only presents arguments in favor of a position but also considers opposing arguments. A one-sided message, on the other hand, presents only arguments in favor of a particular position.

Hovland et al. (1949) concluded from a series of experiments (→ Experiment, Laboratory) that two-sided messages show a greater effect for persons who reveal a personal opinion contrary to the one presented. For supporters of the position presented in the communication a one-sided message shows greater effects. The two-sided message is also more effective than the one-sided message when individuals subsequently are exposed to opposing propaganda. Two-sided messages provide an immunizing effect. Finally, intervening variables such as education and intelligence are found to moderate the effect. For an intelligent audience, two-sided messages are proven to be more effective.

Studies on persuasion continued to investigate the effect of one- and two-sided messages. Petty & Cacioppo (1981) find for → advertising messages that a one-sided message is superior to a two-sided message if the advertised product is “well-liked, widely consumed, has few competitors, and enjoys loyal customers.” A two-sided message is more persuasive when “the audience is well-informed about a product and its alternatives, the product is not widely preferred, or the audience is likely to be exposed to advertisements for competitive products” (→ Advertising Effectiveness).

More recent experimental studies differentiate between *two types of two-sided messages*: refutational and nonrefutational. Refutational messages mention counterarguments to the position advocated and then refute them. Nonrefutational messages only mention the counterargument, without offering a refutation (Lucas 1989; Allen 1991). These studies show that a two-sided message with refutation generates more favorable attitudes than a one-sided message. However, a one-sided message is more persuasive than a two-sided message with no refutation. The two-sided message with refutation generally appears to be more persuasive and independent of the favorability of the audience.

Studies have also addressed whether communicators may rely on implicit *conclusion drawing* by the audience rather than explicitly stating their own position. In an experiment on economic questions, Hovland & Mandell (1952) found supporting evidence for the relevance of explicitly stating conclusions: more than twice as many recipients are likely to agree with the opinion of the communicator when the message includes an explicit conclusion, compared with a message with an implicit conclusion. Audience members may require an explicit conclusion to understand a persuasive message. If the recipient of an implicit message reaches no conclusion, less attitude change occurs in the advocated direction. Conclusion comprehension is seen as a critical mediating variable between

conclusion drawing and attitude change. Implicit conclusion drawing affords comprehension of the message. Accordingly, for complex issues implicit messages are expected to be less persuasive than explicit ones.

Another mediating variable is found in a *recipient's involvement* (→ Involvement with Media Content). Implicit messages can yield a greater effect than explicit ones if recipients are highly involved (Kardes 1988; Sawyer & Howard 1991). The advantage of implicit messages for highly involved persons results from a greater comprehension of the conclusion and a greater persuasiveness of self-generated conclusions compared to conclusions offered by the communicator (“People don’t like to be told what to think”). But if recipients are involved only on a low level, stating explicit conclusions has an advantage. Explicit conclusions also seem to be more persuasive than implicit conclusions for recipients who initially are favorable to the message. For those who initially are unfavorable, no differences between explicit and implicit conclusions are observed (Thistlewaite et al. 1955; Fine 1957).

Concluding, explicit messages are found to be slightly more persuasive than implicit messages. But complexity of the message, and especially involvement, moderates the effects of explicit and implicit messages.

## Organization–Public Relationships

*Robert L. Heath*

*University of Houston*

Over the years, academics and practitioners have worked to define public relations by what it accomplishes, the role it plays in society. One attempt at positioning the practice, and research about the practice, features the impact public relations can have on the quality of the relationship between each organization and its key publics, a theme that is at least 55 years old (Cutlip & Center 1952). Monitoring this view, Scott Cutlip, Allen Center, and Glen Broom (2000) observed that the trend in the United States was for public relations to be less focused on one-way, self-interested persuasion and more on mutuality, reciprocation, and the idea of “between.” Based on this trend, these authors posed one of the most widely disseminated definitions: “Public relations is the management function that establishes and maintains mutually beneficial relationships between an organization and the publics on whom its success or failure depends” (2000, 6). Thus, organization–public relationships consist of qualitatively valuable and relevant factors that lead key publics to support or oppose the organization because they see the organization as being as interested in their interests as it is in its own. The organization sees its interests with its publics as a valuable aspect of its own interests. Perception of mutual benefit can lead to support rather than opposition, which could foster willingness to buy products, use services, or take issue positions on public policy actions to support rather than sanction the organization. In short, the quality of the relationship is an independent variable that predicts support or opposition. The quality of the relationship is the dependent or mediating variable that results from what the organization does to meet or exceed the expectations of its key publics, whose good will and support are important to its business plan.

### **MUTUALLY BENEFICIAL RELATIONSHIPS**

The ways in which relationships are built or harmed can result from careful strategic business planning that meets high standards of corporate responsibility, and public relations processes shared meaning, i.e., identification, which results rhetorically in shared sense-making joining the interests of the organization to those of key publics. A mutually beneficial relationship (MBR), a highly desirable outcome of effective and ethical public relations, occurs when the stakeholders of each organization believe that it works to achieve a condition where it and all its stakeholders benefit appropriately because of the quality of their relationships.

As a platitude, MBRs are asserted as the outcome goal of public relations, without much attention to how that end is achieved or what it entails. Some think, thereby leading to substantial criticism, that mutually beneficial relationships are the exclusive outcome of strategic communication rather than responsible and reflective management decisions. Such platitudes may mask the darker intent and ability of the focal organization to manipulate the relationship to seem more mutually beneficial than it truly is. Woe to the organization that fails to believe that such deceit can be detected and doubly harmful to relationships. The concept of MBR commits organizations to a process and → discourse that go beyond mere manufactured image or reputation by actually operating in ways that achieve mutual benefits.

The logic of MBR is that when people believe that organizations operate with their interests in mind, they support rather than oppose those organizations. Thus, people buy from businesses they believe give them full value for goods and services purchased. They support activist or other nonprofit groups that share their values and hold similar goal-oriented commitments, such as preventing or treating specific childhood diseases. They believe in and support governmental agencies that act in their interest, in what can be seen as the public interest, where they are the “public.” They support businesses that meet operating expectations such as paying fair wages, giving proper benefits, protecting the environment, and fostering the communities where they operate.

Critics of this line of thinking simply doubt that businesses, for instance, ever hold stakeholder interests equal to their own. Thus the logic of MBR challenges public relations practitioners to truly understand and be in a management position to help the organization to know the expectations of its stakeholders that define their best interests. For this reason, public relations practitioners need to be advocates for sound and effective measures that produce mutual benefits.

MBRs assume that stakeholders hold varying standards of how each organization should operate. These standards are forged through societal dialogue voiced by many points of influence: industry, activist, government, media reporter, and such. Disagreement and intolerance are part of the dispute over the definition of what is mutually beneficial and whether the organization truly operates to that end. Critics hold different standards. Some are more intolerant of the actions and ethical choices of organizations than others. Thus, MBR is a normative goal that cannot be totally satisfied for all parties in any relationship. Each organization, regardless of its type, has a wide array of stakeholders. Each may have different expectations for the quality of the relationship and whether it is satisfied by what the organization does and says. In any full discussion of MBR, the sense of community is a focal point. What any organization does and says needs to be judged by whether it truly advances the essence of community among all of the stakeholders.

By the same token, appeals to community can be used asymmetrically to the beneficial interest of the organization rather than those of its stakeholders. Thus, a government ostensibly fighting international terrorism can appeal to community to defend its policies against its critics. It may, in this rhetorical stance, argue that any critic of its battle against international terrorists is actually a supporter of terrorism because it does not immediately and completely agree with and support the government policies. This rhetorical stance would in fact be asymmetrical and not serve the mutual interest of the critics, whose ideas

may indeed ultimately add value to the fight against terrorism but do so in ways that disagree with the positions of the administration.

## HOW TO CREATE RELATIONSHIPS

### Practitioners' Views

Substantial discussion by various practitioners and academics earlier in the twentieth century sought to determine how organizations could create relationships. Both the International Association of Business Communicators (IABC) and the Public Relations Society of America (PRSA) have featured relationship building as a part of effective public relations and strategic business communication.

In its “vision, mission, and structure statement,” the IABC features relationships and says it specializes in helping people and organizations to make business sense of communication, think strategically about communication, measure and clarify the value of communication, and build better relationships with stakeholders (IABC 2007). The PRSA has been committed to meeting the challenge of relationship building since at least 1982: “Public relations helps our complex, pluralistic society to reach decisions and function more effectively by contributing to mutual understanding among groups and institutions. It serves to bring private and public policies into harmony.” Reviewing the wide array of institutions that require effective public relations, the PRSA publication *Public relations tactics: The blue book* noted that “these institutions must develop effective relationships with many different audiences or publics such as employees, members, customers, local communities, shareholders, and other institutions, and with society at large” (PRSA 2002, B2).

One of the leaders in the formation of public relations as a management discipline, John W. Hill, principal founder of Hill & Knowlton, featured the concept of relationship in his books published during the 1950s and 1960s. He credited public relations icon Ivy Lee with an even earlier discussion of the term: “Public relationships, he [Lee] wrote, involved not simply ‘saying’ but ‘doing’ – not just talk, but action” (Hill 1963, 16). Hill reasoned that organizations simply could not avoid considering and meeting the challenges of multiple relationships “because the corporation deals with employees, stockholders, customers, neighbors, government functionaries, and many others – with all of whom it has many relationships” (1958, 4). To build relationships, organizations must not only talk, but act in appropriate ways. They must be good as well as do good.

At one level, the effort to achieve MBR, Hill reasoned, was a matter of reputation management. Do the organization’s stakeholders believe the organization works in their interests? Does it have the reputation for such actions? If not, is the problem with its reputation one that could be corrected by communication, or does it also, or primarily, call for new and improved actions and policies? To this end, Hill asked managements to think about how strong their relationships were with all of their stakeholders. He was a practical counselor as well as one who sought high moral ground as the rationale for his profession and its profession. He reasoned, as advice to executive managements:

Business managements are concerned with the problems of conducting their corporate or industry affairs in ways that they may feel are contributive to public progress. They must arrive

at effective policies that go far beyond their economic and operating functions into the complex realms of social, governmental, and political relationships. The large majority push forward into these policy areas as a matter of choice. But in terms of the long-range survival of corporate enterprise, there is little choice involved; it is a matter of essentiality. (1963, 230)

A realist, Hill knew and counseled that organizations could not operate with autonomy as long as they merely operated in their own interest and expected others to tolerate that point of view.

### **Theory and Scholarship**

Relationship management theory discusses process variables that can foster or impede the creation of MBRs (Ledingham 2005). This line of analysis is far from finished, but key factors are emerging (Heath & Coombs 2006): *Openness* fosters two-way communication based on listening for and sharing valuable information and evaluative opinions, as well as being responsive, respectful, candid, and honest. One-way communication occurs when an organization “speaks” but does not listen to or acknowledge the merit in what other people and organizations “say.” *Trustworthiness* builds trust by being reliable, nonexploitative, and dependable. Trust relates as well to the ethical and balanced use of control to foster one’s interests in relationships with other interests. *Cooperativity* engages in collaborative decision-making that insures that the needs and wants of the organization and its stakeholders are met. *Alignment* shares interests, rewards, and goals with its stakeholders. *Compatible views and opinions* foster mutual understanding and agreement, co-creating meaning. *Commitment* supports community by being involved in it, investing in it, and displaying commitment to its quality.

The analysis of relationships has been explored from many points of view. *Systems theory* gives the rationale that no part of a system can operate forever imbalanced against the other parts of a system (→ Systems Theory). A *rhetorical perspective* (→ Rhetorical Studies; Rhetorical Theory of Public Relations) reasons that the effort to define interests assumes the co-creation of meaning. Many voices come together to define what constitutes a mutually beneficial relationship. *Social exchange theory* reasons that the quality of each relationship is based on give and take (→ Social Exchange). In such matters, publics must be allowed or assumed to define themselves and speak their mind. Theory does not adequately get at the essence of MBRs if it leads to the conclusion that the organization alone can know what is a public, whose ideas are best, and which discussants of an issue are legitimate.

## Organizational Assimilation

Vernon D. Miller

Michigan State University

Organizational assimilation refers to the process by which individuals move from “outsider” to full membership in an organization. Fredric Jablin (1982, 1987, 2001) developed a framework to consider the influence of communication on the social construction of role expectations and their enactments that considers the stages of vocational socialization, organizational entry, metamorphosis, and organizational exit.

From childhood, *vocational socialization messages* from family, school, peers, media, and part-time work experiences shape individuals’ beliefs regarding the nature of work, how to communicate with others at work, and appropriate vocations to pursue. Employment interviewing and pre-entry experiences then provide information which becomes the basis of job and occupational expectations (though incomplete and at times misguided) (Jablin 2001).

Organizational entry and the development of role and task competencies center on two related, ongoing experiences: role-taking and role-making. *Role-taking events* convey the expectations of members for unit and organization membership. Orienting, socializing, training, formal and informal mentoring, and information-giving and -seeking are the chief means of learning task priorities and preferred manner of role performance (Katz & Kahn 1978). *Role-making* involves newcomers’ attempts to change work assignments and environments to better suit their needs and goals (Graen & Scandura 1987; Jablin 1987). Upward influence attempts and role negotiation represent communicative forms of role-making. Disengagement/exit concludes the cycle and may include both leave-taking behaviors and developing expectations of another organizational role.

### VOCATIONAL SOCIALIZATION

From childhood into early adulthood, individuals receive occupational information from their environments, which they then compare against their self-concept, weighing the

options and choosing career directions (→ Communication Skills across the Life-Span). Some cues regarding technical preparation, prestige, social elements, and stresses are never questioned while others are reconstituted as career understanding matures.

*Family members*, especially parents, are primary influences on individuals' career choices and understanding of the nature of work. Children are exposed to anecdotes regarding the nature of parental work responsibilities, deadlines, accomplishments, and difficulties through dinner talk or occasional visits to the workplace. Direct and indirect parental comments on various occupations (from garbage collector to aerospace engineer) convey status, fulfillment, approval, and relations with others. When participating in task-oriented or organizing activities such as household chores, children receive training in coordinated behavior and learn to: respond to requests for work; create justifications or accounts in refusing to perform tasks; solicit the help of others to perform tasks; remark on the expertise of others; identify chores to be completed or delegated; accept or reject sex-role stereotypes; and interpret and use metaphors to describe their tasks or environment. Young people are frequently exposed to procedure-related communication, including "the possibilities and the methods for raising questions or negotiating a change, the forms of talk or silence that are expected to accompany the work one does, and the extent to which people make decisions for themselves or need to follow orders" (Bowes & Goodnow 1996, 308).

*Schools and formal education-related activities* socialize youth into society, introduce and reinforce hierarchical divisions of labor, and provide feedback on intellectual, physical, and social abilities. Children learn to obtain information required for the completion of assignments, to navigate improperly delegated assignments and dysfunctional group dynamics, and to impress individuals in positions of authority. Textbooks typically offer limited, and often stereotyped, views of work interactions. However, pre-professional programs reveal implicit vocational interaction norms and codes by which individuals can later construct interpretations of events and interactions.

*Peers* serve as significant others who confirm and disconfirm the desirability of occupations. Because children and teens spend over half of their time in the company of peers, the importance of peer approval of vocational decisions should not be underestimated. Individuals receive considerable guidance from friends on dealing with conflict, negotiating solutions, and problem-solving with regard to their peers, parents, and teachers.

Depictions of occupations in the *media*, particularly on television, are popular, emphasize sex-role stereotypes, and feature prestigious occupations (omitting important roles for those of lower prestige). Television and movies commonly emphasize the trivial (e.g., romantic interests, office gossip) or one-way communication behaviors such as ordering or advising others and verbally aggressive conflict behaviors. Depictions of employees ridiculing inept bosses and prevailing in conflicts with them are common.

Finally, through *part-time jobs*, high school and college students learn to follow orders, provide reports on work events, apply problem-solving behaviors, and develop work relationships. They also typically receive little training or socialization, are excluded from outside-of-work interactions with supervisors and co-workers, do not form close relationships with supervisors, and complete tasks solo (and unsupervised) as opposed to in collaboration with others.

## ANTICIPATORY SOCIALIZATION

Through job fairs and employment interviews, individuals develop expectations regarding the nature of work in a specific organization and their fit to the position/organization. On North American college campuses, the 30-minute “first” or *screening interview* assists employers in identifying prospects, is marked by information-giving vignettes by both parties about organizational or candidate qualifications (e.g., candidate strengths/weaknesses), and often evidences a 2:1 ratio of interviewer-to-candidate talk-time. Information sharing is often hampered by interviewers’ closed-ended or vague questions (necessitating re-asking of questions) and interviewees not discussing issues of substance until well into the interview. “Second” or selection interviews may extend from two hours to two days, and the interactions are characterized by multiple interviewers, few scripted interactions, specific screening criteria, and lengthy information exchanges. On occasion, screening, selection, and even placement (i.e., assigning position) may occur in a single interview episode.

*Interviewers favor* candidates who fit skill and aptitude criteria, engage in an informative and conversational manner, and display high levels of non-verbal immediacy. *Interviewees prefer* organizations where job attributes like salary and benefits are competitive; whose interviewers are interpersonally warm, well organized, and knowledgeable, and ask open-ended questions; and where recruiters’ information concurs with secondary sources. The interview process culminates with candidate/organization selection and the development of candidates’ more or less realistic job expectations. Most candidates have fairly accurate notions of job pay and benefits, but their expectations regarding the nature of job duties are often inflated, based on incomplete information from recruiters, others (e.g., peers), and vocational socialization. Those developing more realistic job previews, especially from verbal exchanges, report higher levels of job satisfaction and organizational commitment.

## ENTRY

While messages forecasting desired knowledge, values, or behaviors are likely conveyed during the interview process, socialization begins in earnest upon the first day of entry through, at times, deliberately constructed contexts, prepared training materials, and encounters with incumbents (Chao et al. 1994; Van Maanen & Schein 1979). New hires receive messages specifying the nature and importance of task elements, preferred manner of task performance, and patterns of order and status in the work unit. Newcomers look to supervisors to provide guidance in task completion, give feedback, and reward or sanction behavior. Co-workers have vested interests in socializing newcomers, provide vital emotional support, and contribute to newcomers’ social construction of work realities and attitudes.

Newcomers nevertheless report encountering *role surprise*, in cases of mild discrepancies between their expectations and realities, or “role shock,” where discrepancies are major and dire (Louis 1980). It is generally accepted that newcomers seek information to reduce uncertainty about the best way to complete tasks, the quality of their job performance, and their relationship with others (Miller & Jablin 1991; Morrison 1993, 2002). Newcomers vary their information-seeking tactics and sources depending upon the

source and perceived social cost of the information. While research remains ongoing, it appears that (1) perceptions of social costs lead new hires to seek performance and relational information through less direct means (indirect inquiry and observing) and (2) overt means will be used when seeking task or technical information (→ Information Seeking; Anxiety Uncertainty Management Theory).

During the entry process, newcomers' development of relationships with supervisors and co-workers is essential (→ Supervisor–Subordinate Relationships). While interactions with supervisors are initially marked by directives and explanations, at some point these exchanges gravitate to “high-quality” patterns, characterized by mutual support, give-and-take, informal ideation, and inside information, or to “low-quality” patterns displaying the opposite characteristics. The nature of these leader–member exchanges (Graen & Scandura 1987) portends the favorableness of assignments, performance reviews, and advancement opportunities. From entry, newcomers and co-workers tend to exchange information equally and express mutual support. Critical outcomes for newcomers during entry include reducing role ambiguity, resolving role conflicts, and gaining role competence. Task mastery may be a precursor of acceptance into the unit or may be required for acceptance.

### METAMORPHOSIS

Employees are thought to regularly seek to modify their role to suit their needs, abilities, and desires. New hires engage in role-making when they pursue competing expectations of their role's purpose, the manner in which the role is to be enacted, and how the role performance will be evaluated. Others' expectations may be altered by selectively neglecting assigned tasks, performing extra tasks in addition to assigned duties, and explicit role negotiations with the supervisor (and others at times) to create agreements about assignments and responsibilities.

During this phase of assimilation, newcomers move away from coping and role learning activities and toward *fine tuning and negotiating the role* with others. The manner and outcomes of role-making have considerable influence on participants' interpersonal trust and on unit innovation, coordination, and flexibility. Contexts for role negotiation include performance feedback interviews and daily upward influence attempts, and contribute to employee role development, extra-role behaviors, and job satisfaction (→ Feedback Processes in Organizations).

Voluntary transitions from organizations are usually gradual, following a pre-announcement, announcement, and *post-exit sequence*. Psychological factors such as withdrawal, good or hard feelings, perceptions of justice/injustice, and misgivings over leaving may be preceded or followed by overt/hidden conflict, celebrations, retirement symbols, leave-taking, exchanges of addresses, and/or abandonment. In particular, communication-related antecedents (e.g., closed communication climate, non-participation in decision making) of leaving for a different organization are well studied, leading to questions regarding the role of communication in the evolution of loss of commitment or allegiance.

## Organizational Change Processes

Theodore E. Zorn

University of Waikato

Change is fundamental to organizing. To organize, or structure human activity intentionally to achieve collective goals, is in itself a change process – a movement from one

state of being to another. A *change process* in the context of formal organizations may be defined as a sequence of events by which alteration occurs in the structure and/or functioning of an organization. Alternatively, it may be seen as the way in which difference(s) emerge between two (or more) successive conditions, states, or moments of time in an organization (Ford & Ford 1995).

As implied by these definitions, organizational change processes can be all-encompassing in scope, but scholarly attention is typically devoted to large-scale planned changes, such as restructuring, mergers, or implementation of major new management methods or information technology. Transcending the traditional concerns of innovation research, the study of change-related communication (CRC) considers how planned changes are adopted and implemented and how change-oriented discourse can infuse organizational interactions and messages.

### RESEARCH INTERESTS IN ORGANIZATIONAL CHANGE

Organizational change processes have been of interest to → organizational communication scholars from the early days of the discipline's formation. In a historical overview of organizational communication research, Redding (1988, 45) cited several early publications that in one way or another focus on the role of communication in organizational change processes. For example, he mentions the following titles: "Employee Magazines Build Morale (1950)," "Effective Communications – One Road to Productivity (1950)," and "How House Magazines Improve Industrial Relations (1953)." Each of these suggests that early organizational communication scholars considered that communication could play a key role in enhancing productivity, improving employee relations, or attaining other organizational change goals. Additionally, → Everett Rogers's classic work on diffusion of innovations also highlights the role of communication in change.

However, organizational change has not until recently been a significant focus of study for organizational communication researchers. For example, handbooks of organizational communication have given only brief mention of organizational change. This is surprising, as the 1980s were a time when the notion of → organizational culture was coming into vogue as a major organizing construct, and culture change has been a major focus of both practitioners and organization studies scholars. However, organizational communication theorists tended to be critical of *culture change initiatives*, resisting the notion that culture is something that can be reliably managed. Thus, while practitioners and organizational scholars both became enamored of the culture metaphor beginning in the 1980s, practitioners were much more likely to associate culture with organizational change than were scholars.

The 1990s brought more focus on organizational change processes by communication scholars, largely stimulated by the increased *emphasis on change in the contemporary workplace*. There is still a relatively small body of work within the communication discipline, and few self-identified organizational communication scholars whose work concentrates on organizational change processes. However, this literature is growing, as is the sense of importance attributed to organizational change-related communication. In fact, Jones et al. (2004, 722) identified one of the six major challenges for organizational communication scholarship as "understand[ing] the communication of organizational change."

## INTELLECTUAL AND SOCIAL CONTEXT

The intellectual context for organizational change scholarship is quite diverse. Communicative dimensions of organizational change processes have been addressed by scholars from multiple countries and disciplines. Among organizational communication scholars in the English-speaking world, the work of Laurie Lewis in the United States is particularly prominent, but there is also substantial work on the subject by organizational communication scholars in Australia (e.g., Victor Callan and colleagues at the University of Queensland), the United Kingdom (e.g., Dennis Tourish at the Aberdeen Business School), and mainland Europe (e.g., Wim Elving at the University of Amsterdam and Anne-Marie Søderberg at the Copenhagen Business School). Outside of organizational communication, numerous management scholars have investigated communication aspects of organizational change processes or discursive approaches to organizational change. In particular, Jeffrey Ford's work (e.g., Ford & Ford 1995) has been widely cited, and Loizos Heracleous has been prominent in researching discursive approaches to organizational change (Heracleous 2002).

The social context in which organizations operate has changed substantially in the past 30 years, and as a result of a number of converging factors, we have seen an intensified commitment to organizational change on the part of managers and executives. Among these factors are: the emergence of Asian economies as serious competitors to western businesses in high-profile industries such as manufacturing and electronics, creating a heightened sense of threat; revolutionary new technologies such as personal computers and the → Internet that enable rapid processing and transmission of information across boundaries; and the political-economic force of neo-liberalism, which has resulted in free-market principles being applied globally and in new domains of society (→ Globalization of Organizations).

Alongside these changes is the *global dissemination of management ideas*. Thus, we have seen waves of popular management models and methods, such as quality circles, total quality management (TQM), business process re-engineering (BPR), downsizing, outsourcing, lean manufacturing, e-business, knowledge management, enterprise resource planning, and sustainable or "green" business. The recommended response to these forces from so-called experts has been to organize for continuous change – to become a flexible organization that can adapt quickly to changes in the environment. This argument for change has been repeated by popular management "gurus," such as the late Peter Drucker, Tom Peters, and John Kotter, as well as by business schools, management consulting firms, and the business press, such that it has become the accepted wisdom for many managers and executives.

## MAJOR DIMENSIONS OF THE TOPIC

A number of key dimensions of organizational change processes can be discerned. One important dimension is the meta-theoretical perspective from which the topic is approached. At least two broad meta-theoretical perspectives can be identified.

*Managerialist perspectives*, including positivist, post-positivist, realist, normative, and behaviorist approaches, are prominent in both communication and organization studies,

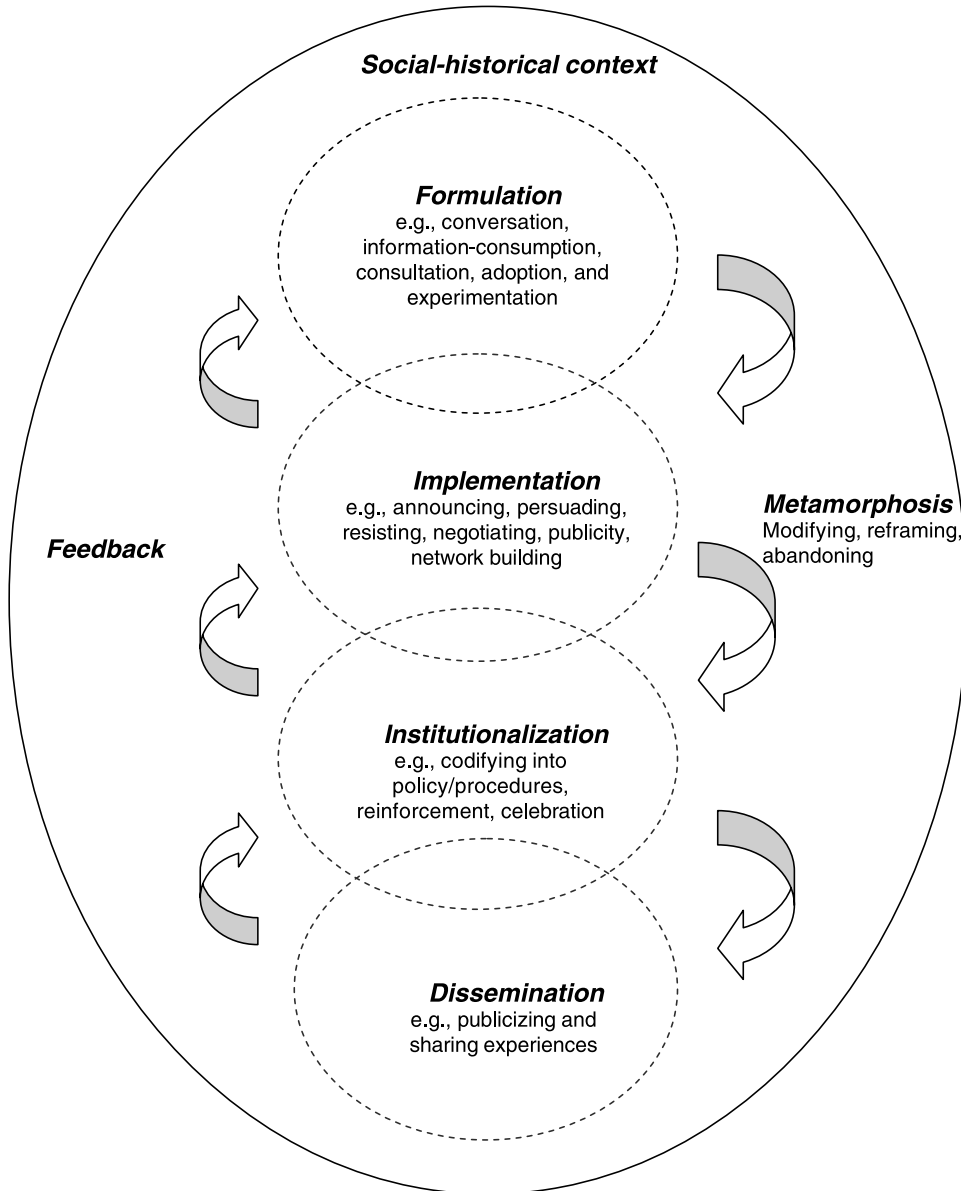

with scholars attempting to discern more or less effective means of communicating in the process of change. From this perspective, communication is seen as a tool or instrumental means to achieve organizational change, and change agents are seen to be attempting to align or adapt organizations to an objective reality (Ford & Ford 1995). For example, research has focused on effective ways to announce change (Smeltzer & Zener 1993), the relationship of communication frequency and participation to perceptions of success (Lewis 1999; Lewis 2006), the effectiveness of particular methods of employee participation in change (Kellett 1999), persuasion campaigns in the context of change programs (Garvin & Roberto 2005), and the effects of major change on communication patterns (Tourish et al. 2004).

A second group of perspectives, which might be referred to as *constructivist*, includes social constructionist, interpretive, critical, discourse, and postmodern approaches (→ Constructivism). This group tends to be more concerned with understanding and critiquing organizational change processes, and communication is viewed as a means by which change is constructed by organizational members. Interpretively oriented approaches tend to describe patterns of communication practices and meaning constructions. For example, researchers have investigated the means used to frame change initiatives (Fairhurst 1993), patterns of communication with external stakeholders (Lewis et al. 2001), and alternative constructions of a single change initiative (Zorn et al. 2000; → Framing Effects). Critically oriented constructivist approaches see communication as the arena in which organizational members struggle for preferred constructions of change-related phenomena. For example, researchers have demonstrated how certain communication practices serve a hegemonic function in change processes (Leonardi & Jackson 2004) and how tensions are reflected and constructed in CRC (Fairhurst et al. 2002).

#### FOUR PHASES OF ORGANIZATIONAL CHANGE

To understand the major dimensions of the topic of organizational change processes, it is helpful to consider a *model of the change process*, as shown in Figure 1. This model is essentially a communication-oriented reinterpretation of traditional phase models of change, the best known of which is Kurt Lewin's unfreezing–moving–refreezing model. The model in Figure 1, however, highlights the interaction of the organization with its discursive environment. That is, change programs do not take place in a vacuum; rather, social-historical trends influence the interpretation and choices made regarding changes in each phase.

Communication is implicated in each of the phases of change. In the first phase, the *formulation phase*, members of the organization become aware of the need for or possibility of change and decide upon a particular course of action, more or less well defined. In addition to identifying potential problems internally, members consume popular books, articles, seminars, and training videos – not to mention everyday talk with other managers – to learn of new programs and “best practices.” They may consult internal and outside experts (e.g., academics, consultants) as well as non-expert members of staff who may have insight or who may be affected by changes under consideration. Meetings will be held and memos, emails, and reports exchanged as discussion of a change develops. The organization may experiment with a change program on a small scale.

**Figure 1** Phases of organizational change-related communication

Communication processes in the formulation phase have been the focus of substantial theorizing and study, especially the processes by which popular management ideas are communicated and adopted. Guru theory, management fashion theory, and discourse theory make similar and mostly complementary claims. For example, Clark and Salaman (1998) theorized that management gurus construct an appealing identity for the manager as a heroic, transformational leader, thus encouraging managers to enact change to live up to the role. The management fashion perspective (e.g., Abrahamson 1996) suggests

that a management fashion industry, consisting of gurus, consultants, business schools, and the business press, identifies new developments in management practice and then represents these ideas as simple but radical departures from existing practice that are necessary to prevent impending disaster. The fashion industry employs a recognizable pattern of rhetorical conventions and principles to convince managers to adopt them in some form (Clark & Greatbatch 2004). Discourse theorists (e.g., Zorn et al. 2000) suggest that managers draw on the popular discourses from gurus and the fashion industry more broadly to legitimate their change initiatives, and that organizational members are prepared and disciplined by these same discourses in their interpretations of and responses to change initiatives.

The *implementation phase* is the most extensively researched in both the change management and communication literature. Communication processes in this phase include announcing changes, exchanging task-related information needed to enact planned changes (including training and coaching), persuading stakeholders (including employees) to accept and commit to changes, and resisting the changes. Given that many organizational changes today result in layoffs or decreased job security, winning employee commitment is no mean feat.

A number of aspects of implementation communication have been examined. A major focus has been identifying strategies that are likely to help managers introduce changes effectively. For example, Smeltzer and Zener (1993) modeled strategies for change announcements, and Lewis investigated both change agents' (1999) and receivers' (2006) perceptions of the relationship of implementation communication activities to the success of change. Timmerman (2003) investigated media choice during implementation and, while his work was predictive rather than prescriptive, it had clear implications for practitioners. In addition to these efforts, other research of a critical nature has focused on the political (e.g., Doolin 2003) and emotional (e.g., Zorn 2002) aspects of implementation communication, as well as resistance processes (e.g., Ford et al. 2002). Still other research has addressed variations in organizations' socialization activities in the context of change (Hart et al. 2003), how employees cope with the stress of change (Callan 1993), and how discourses are used instrumentally to drive change (Leonardi & Jackson 2004).

The *institutionalization phase* is analogous to Lewin's "refreezing" stage of change. Once changes have been introduced, efforts to make them part of the organization's routines are important. This is a key phase in an era of constant change, since one of the pitfalls of constant change is that management is tempted to move on to the next "fashion" before the current change program is successfully institutionalized. Institutionalization may involve a number of communication activities, such as textualizing new practices into policies and procedures, recognizing and celebrating achievements, providing ongoing training and other socialization practices, discussing failures, and reorienting efforts. Few studies explicitly focus on the institutionalization phase of change efforts, although there are exceptions (e.g., Fairhurst et al. 2002).

The *dissemination phase* draws attention to the fact that, as a change initiative plays out, messages about the change process and change results are conveyed, either formally or informally, to multiple audiences. The organization's reputation is influenced either intentionally or unintentionally by the dissemination of messages about the change process. Furthermore, these messages shape others' views not only of the organization, but also of

particular types of change initiatives. A management fashion perspective points to an interesting and practically important communication phenomenon in this phase. Because of managers' motivation to garner the praise and positive identity associated with successful programs, there is a temptation to publicize and overstate successes and hide failures. Zbaracki (1998), for example, reported that organizations that had had questionable success implementing TQM programs nonetheless publicized their use of and successes with these programs extensively. Such publicity may encourage the increasing positive appraisal and popularity of programs like TQM, even though such appraisals may be unwarranted.

### FUTURE DIRECTIONS IN RESEARCH AND THEORY

Despite a wide-ranging exploration of communication processes in the context of organizational change, theoretical development has been rather sparse. This is less true in the research on CRC in formulation and dissemination than in implementation and institutionalization. Regarding communication in formulation and dissemination, management fashion, guru, and discourse theories are prominent, as reviewed above. Institutional theory has been used extensively to explain change processes generally, but only recently has it been considered as a means to explain CRC (Lammers & Barbour 2006; → Institutional Theory).

Much research on communication in implementation and institutionalization has been atheoretical, for example focusing on variables that are related to perceptions of success or resistance. However, Lewis (2007) has recently begun to address this concern, developing a model of implementation communication around stakeholder theory. In addition, structuration theory (e.g., Fairhurst et al. 2002) and discourse theory (e.g., Heracleous 2002) have been drawn upon by some scholars in researching implementation and institutionalization. Surprisingly, the rich theoretical tradition in → persuasion research has rarely been brought to bear on organizational change processes. Since so much of CRC is a process of influence – in all four of the phases – organizational change would seem an appropriate context in which to apply the theory of reasoned action, the elaboration likelihood model, and other persuasion theories.

A recent development has been a *focus on "positive" approaches to CRC*. Building on developments in positive psychology, the gist of such approaches is to identify positive deviance – that is, what is working well in an organization – and build on it, as opposed to identifying problems – or negative deviance – to be solved. Methods such as appreciative inquiry and dialog have drawn particular attention (Barge & Oliver 2003; → Dialogic Perspectives).

Another future direction that seems particularly important is increasing research on *intercultural and trans-national organizational change*. While there are a few notable studies (e.g., Söderberg & Vaara 2003), these are rare. Given increasing globalization, an understanding of CRC practices in different parts of the world and, especially, in intercultural situations seems needed.

# Organizational Communication

*Katherine I. Miller*

*Texas A&M University*

Because investigations of organizational communication involve the intersection of two complex concepts – organization and communication – the discipline of organizational communication involves a number of diverse topical interests. Most scholars would agree that “organizations” are social collectives, embedded in a larger environment, in which activities are coordinated to achieve individual and collective goals. The study of organizational communication, then, is the consideration of “how the context of the organization influences communication processes and how the symbolic nature of communication differentiates it from other forms of organizational behavior” (Miller 2006, 1).

## EMERGENCE OF THE FIELD

As with many disciplines in communication, the study of organizational communication has been traced back many decades – even to antiquity (→ Communication: Definitions and Concepts; Communication: History of the Idea). For example, Clair (1999, 284) argues that the discipline “lean[s] on the shoulders of Smith and Ricardo or Marx and Engels . . . rel[ies] on the tomes of White and Russell or Levi-Strauss and Douglas . . . resurrect[s] Aristotle, Plato, or Heraclitus.” However, most historians of the field place the

beginning of the modern discipline of organizational communication in the middle of the twentieth century (→ Speech Communication, History of). The genesis of organizational communication can be traced to influences from traditional rhetorical theory, investigations of human relations and psychology, and theories from management and organizational studies. From their early years, organizational communication studies have been influenced both by theoretical frameworks from sociology, psychology, rhetoric, anthropology, and even the physical sciences, and by the ongoing practical concerns of those working in organizational settings. These cross-currents of theoretical and applied interest still influence organizational communication scholars in the twenty-first century.

Redding and Tompkins (1988) provide a typical recounting of the early history of organizational communication in their discussion of three overlapping formative phases. The *first* of these, occurring roughly between 1900 and 1950, is labeled the “era of preparation.” During this time period, concerns revolved around the need for prescriptive and skills-based training that would achieve “effective” communication within organizational settings. For example, researchers during this period looked at ways to structure messages, make appropriate media choices (e.g., written vs oral), and send messages to the “right person” at the “right time” for business effectiveness. Tompkins and Wanca-Thibault (2001, xxi) suggest that typical research questions during this era might include “What effects do downward directed mass media communications have on employees?” and “Is an informed employee a productive employee?”

The *second phase* (1940–1970) is labeled the “era of identification and consolidation.” During this time period, the discipline of organizational communication as a unique entity emerged, as seen through the development of graduate programs, the publication of seminal research articles, and recognition in professional associations such as the Speech Communication Association in the US (now the National Communication Association [NCA]) and the → International Communication Association (ICA). This time period was marked by attention both to prescriptive advice for practicing managers (what Redding and Tompkins call the “empirical-prescriptive” phase) and to an emphasis on the scientific method as central to the development of knowledge about organizational communication processes (what Redding and Tompkins call the “applied-scientific” phase). During this time period, empirical attention was focused on communication in supervisor–subordinate relationships, communication processes leading to employee satisfaction, communication networks such as “the grapevine,” and small group decision-making. These topic areas were investigated through straightforward → surveys of organizational members and through laboratory experiments of basic organizational communication processes (→ Experiment, Laboratory). Tompkins and Wanca-Thibault (2001, xxi) consider typical research questions from this time period such as, “What is the relationship between the attitudes and performance of workers and the feedback they receive?” and “How can communication networks in organizations be measured?”

Redding and Tompkins argue that organizational communication reached “*the era of maturity and innovation*” in the 1970s. At this point, organizational communication was recognized as an established discipline under the larger umbrella of communication studies, with important links to a wide range of allied disciplines including “administrative science, anthropology, business communication, corporate communication, industrial organizational psychology, management communication, organizational behavior, political

science, social psychology, sociolinguistics, sociology, rhetoric, and even literary criticism” (Taylor et al. 2001, 102).

The maturity of the organizational communication discipline is clear: organizational communication is among the largest divisions in both ICA and NCA, there are divisions or sections of organizational communication in organizations such as the Academy of Management, European Communication Research and Education Association (ECREA) and the Korean Society for Journalism and Communication Studies (KSJCS). Graduate degree programs have proliferated across the globe, and organizational communication scholarship is well represented in our discipline’s journals, in interdisciplinary journals, and in specialized journals such as *Management Communication Quarterly*. The publication of “handbooks” and summary edited books on organizational communication in the 1980s (Greenbaum et al. 1983; McPhee & Tompkins 1985; Jablin et al. 1987; Goldhaber & Barnett 1988) also points to the maturing and consolidation of the discipline.

The time since this “era of maturity and innovation” began has not been stagnant, of course. In recent decades, the discipline of organizational communication has been marked by a number of major intellectual shifts and conceptual debates. These developments have largely followed similar currents in other academic disciplines but have had specific implications for organizational communication in terms of theoretical commitments and research topics. Further, as scholars in organizational communication have worked through these theoretical and conceptual discussions, the “new” perspectives have not totally replaced the “old.” As a result, organizational communication is now a relatively eclectic discipline in terms of theoretical commitments, methodological approaches, and research topics. Three important, and somewhat overlapping, strands of work are now prevalent in organizational communication. Following Corman and Poole (2000), these strands are labeled “post-positivist,” “interpretive,” and “critical.”

## POST-POSITIVIST RESEARCH IN ORGANIZATIONAL COMMUNICATION

The first important strand of research in organizational communication is scholarship that has stemmed most directly from research conducted in the middle portion of the twentieth century and the phases of empirical-prescriptive research and applied scientific research discussed above. Various labels such as post-positivist, modernist, empirical, functional, or normative, this strand of research was clearly the dominant perspective as organizational communication reached “maturity” in the 1970s. The ontological focus of research during this time period was on a realist conception (→ Realism) of both “organization” and “communication.” That is, organizations were seen as “containers” within which people worked and within which goods and services were produced. These organizations were characterized by processes such as “input, throughput, and output” that emphasized both the boundaries of the organization and the definable processes of material and information management that occurred “within” those organizational boundaries. Further, communication was conceptualized in terms of mechanistic views of information flow that followed prescribed routes and included defined content.

Thus, communication and → information were conceptualized as discrete “things” that could be investigated within the discrete boundaries of the organizational container. Epistemological and methodological commitments were closely aligned with the scientific

method and a commitment to “objective” observation of communication behavior within organizational settings (→ Objectivity in Science; Quantitative Methodology). During this time period, the post-positivist perspective in organizational communication was often linked with managerial concerns such as increasing productivity, increasing efficiency, and enhancing the effectiveness of information flow within organizational systems.

Thus, early examples of post-positivist research in organizational communication included extensive attention to topics such as supervisor–subordinate communication, semantic information distance, information flow, upward and downward feedback in the organization, communication climate, and prescribed and emergent communication networks. During the 1970s and 1980s, “systems” perspectives on organizational communication became particularly prevalent, fueled by scholars interested in understanding the complexity of communication in organizations, the relationships among organizational subsystems, and the embedding of organizations in larger institutional environments (Farace et al. 1977; → Systems Theory).

In the final decades of the twentieth century and continuing into the twenty-first, organizational communication research with a post-positivist epistemological and methodological focus has continued, but has also been marked by important developments. First, many organizational communication scholars in this tradition now eschew a strictly realist ontological focus, with its emphasis on organizations as “containers” and on communication as mechanistic processes of information flow. Instead, scholars working from a post-positivist stance in organizational communication today tend to embrace modified realist stances or more complex ontologies of social constructionism (Miller 2000; → Constructivism). Second, post-positivist scholars in organizational communication today advocate and use much more sophisticated methodological choices, including over-time analysis (e.g., stochastic analysis, time-series analysis; → longitudinal analysis), complex analysis of communication networks (→ Network Analysis), and computer modeling of organizational communication systems. Third, post-positivist scholars in organizational communication today are engaged with crucial questions that face individuals and organizations in the late modern and postmodern world. These questions include issues of advanced communication and decision-making technologies, issues of globalization, alternative organizational structures and non-profit organizations, and self-organizing systems. As a result, post-positivist scholars are now generally less aligned with strictly managerial concerns than they were during the 1960s and 1970s and are less likely to consider questions of a strictly applied nature.

### **THE INTERPRETIVE TURN**

During the 1970s and 1980s, as in many fields of social and human research, organizational communication scholars began to question an allegiance to positivistic and functional approaches to scholarship. This questioning involved a rejection of realist conceptions of organizations and communication (e.g., the “machine” and “container” metaphors), together with a clear turn away from positivistic epistemological assumptions and research methods based on the scientific method and quantitative approaches. Within the discipline of organizational communication, several publications were particularly noteworthy during this time period. For example, Burrell and Morgan’s (1979) publication

of *Sociological paradigms and organizational analysis* caught the attention of many organizational communication scholars, as it systematized the study of organizations to include alternatives to the dominant paradigm of → functional analysis.

Within organizational communication, however, the “interpretive turn” is most often traced to a conference held in the summer of 1981 in Alta, Utah. Taylor et al. (2001, 108) recount that “during that summer a group of young communication scholars met in a mountain retreat just south of Salt Lake City to consider where the field had been and where it should now be going,” and Kuhn (2005, 619) argues that that gathering now “serves as a synecdoche for a movement occurring over many years, comprising a graduate shift in organizational communication from attention to information flow and the forces shaping members’ attitudes dominant before the conference . . . to an increased concern with meaning, interpretation, and power in organizing processes afterward.” The discussions from the 1981 Alta conference were published in a benchmark book, Putnam and Pacanowsky’s (1983) *Communication in organizations: An interpretive approach*.

The *intellectual roots of the interpretive turn* in organizational communication can be found in intellectual movements such as symbolic interactionism (→ Symbolic Interaction), → hermeneutics, → phenomenology, and → ethnomethodology. There are a number of important markers of the interpretive approach in organizational communication scholarship that developed from these founding perspectives. Ontologically, the interpretive approach is marked by a social constructionist view of the social world (e.g., Berger & Luckmann 1967). With this shift in ontology come changes in epistemology and methodology. Specifically, in the 1980s many organizational communication scholars turned to subjective epistemologies that emphasized the relationship between the knower and the known and the value of local and emergent forms of knowledge (→ Qualitative Methodology).

*Methodologically*, scholars began to emphasize research methods drawn from anthropology (e.g., organizational ethnographies), rhetoric (→ Rhetorical Studies), and other qualitative modes of inquiry (e.g., interviewing, narrative, discourse analysis). The interpretive turn also led to a shift in the conceptualization of “organization” and “communication.” Instead of following the container metaphor, which emphasized the flow of information within and between organizational structures, interpretive scholars considered the role of communication in processes of organizing and sense-making (Weick 1979). In other words, organizational scholars shifted from a mechanistic view of organizational communication to a constitutive view of organizing and communicating (Craig 1999). Finally, the interpretive turn marked a definitive turn away from the managerial concerns that were important to many organizational communication scholars working from a functional perspective. Instead, attention turned to the experiences and interactions of a variety of organizational actors.

The era of the “interpretive turn” in organizational communication was also marked by the emergence of interest in a number of research topics. Perhaps the most important of these in the 1980s was → “organizational culture.” Though early work in management and other applied areas emphasized a prescriptive approach to culture in which organizational leaders were urged to develop cultures that were “strong” (Deal & Kennedy 1982) or “excellent” (Peters & Waterman 1982), scholars in organizational communication followed the tenets of an interpretive approach in proposing models of culture that

emphasized the emergent and performative nature of culture (Pacanowsky & O'Donnell-Trujillo 1983), the existence of organizational sub-cultures, and the role of cultural understandings in processes such as organizational socialization, conflict, decision-making, and change. Other scholars during the early years of the interpretive turn focused attention on more macro issues of organizational identity and image, especially through the use of rhetorical approaches to organizational analysis (e.g., Cheney 1991). Many of these concerns are still active in organizational scholarship today, as scholars investigate the “lived experience” of organizational members through ethnographic, interview, and narrative methods.

### THE CRITICAL TURN

During the same time period as the “interpretive turn” in organizational communication studies, many scholars were also turning to a critical approach to organizational communication in which organizations were viewed as systems of power and control (→ *Organizational Communication: Critical Approaches*). Indeed, the watershed Alta conference in 1981 discussed above also marked a move in the discipline to an appreciation of critical approaches to scholarship, though the roots of that scholarship (like the roots of the interpretive approach) can be traced to many decades earlier (→ *Critical Theory*). In organizational communication research, critical scholarship can be traced to a *number of intellectual origins*, including Karl Marx’s attention to the commodification of labor and processes of alienation, Frankfurt School critics and their attention to cultural control, Louis Althusser’s attention to the political function of ideology, and Antonio Gramsci’s arguments regarding hegemony and control through consent. Organizational communication scholars also rely heavily on → Jürgen Habermas’s work on forms of rationality and communicative competence, Michel Foucault’s discursive approach to power, and Anthony Giddens’s structuralist conceptions of the relationship between agency and structure (→ *Structuration Theory*).

With these diverse and complex roots, the turn to critical organizational communication scholarship involved an analysis of *organizations as sites of oppression*, a consideration of the discursive construction of managerial interests, an examination of how workers are complicit in processes of alienation, and a consideration of processes of dissent and resistance in organizations (Mumby 2000; Deetz 2005). As Deetz (2005, 85) states regarding the critical approach in organizational communication, “of central concern have been efforts to understand the relations among power, language, social/cultural practices, and the treatment and/or suppression of important conflicts as they relate to the production of individual identities, social knowledge, and social and organizational decision making.” As organizational communication scholars interrogate these issues, there has been a consistent concern with praxis – the synthesis of theory and practice. In organizational communication, this concern often translates into considerations of alternative organizational forms, participatory practices in organizations, and opportunities for employee dissent (→ *Participative Processes in Organizations; Dissent in Organizations*).

With the critical turn in organizational communication scholarship also came a move to *feminist sensibilities and scholarship* (Ashcraft & Mumby 2004; → *Feminist and Gender*

Studies). Ashcraft (2005) argues that feminist research in organizational communication has roots in both the critical turn in social theory and research and the political activism that has served as the heart of feminism in all of its various waves. As Ashcraft (2005, 145) states, “whereas critical organizational scholars prioritized emancipation through ideology critique, feminists literally grounded their emancipatory interest in the trenches of practice.” Feminist scholarship did not gain a strong foothold in the organizational communication discipline until the 1990s, though there had been earlier studies of gender and biological sex in organizational communication processes, typically from a post-positivist perspective. However, in recent decades, feminist scholarship in organizational communication has included areas of research such as the public/private divide implicit in the distinction between work and home, feminist ways of organizing, emotionality in the workplace, and feminist approaches to conflict.

The critical turn in the discipline of organizational communication has also been associated in recent years with the emergence of *postmodern theorizing* (Taylor 2005; → Postmodernism and Communication). Postmodern approaches to organizational communication can be seen through two contrasting lenses (→ Organizational Communication: Postmodern Approaches). First, postmodern approaches differentiate organizations and communication in the modern epoch (e.g., centralized authority, mass markets, formalization, rationality, standardization, and stability) from the postmodern epoch (e.g., lateral relationships, fragmented and niche markets, consensus-based control, interactivity, and change; → Cultural Studies).

In this sense, it is possible to talk about a postmodern era or postmodern organizational forms. Perhaps more important, though, organizational communication scholars draw on postmodern theory to consider concepts such as intertextuality, the fragmentation of identity, the interrelationships of power, knowledge, and discourse, and the need for reflexive understanding. Taylor (2005, 120–130) provides five claims that are central to postmodern approaches to organizational communication. These are: (1) organizations are (inter-)texts; (2) organizational cultures and identities are fragmented and decentered; (3) organizational knowledge, power, and discourse are inseparable and their relations should be deconstructed; (4) organizational communication involves complex relations of power and resistance; and (5) knowledge of organizational communication is representational – thus, communication should be reflexive.

### **CONTEMPORARY FRAMES FOR CONSIDERING ORGANIZATIONAL COMMUNICATION**

There are a number of ways that current theory and research in organizational communication have been categorized. For example, Conrad and Haynes (2001) identify *five “clusters of scholarship”* within organizational communication in terms of their underlying concerns with aspects of the dualism between action and structure. Some research privileges structure over action, such as research on information exchange and supervisor–subordinate relationship. Other research privileges action over structure, such as work considering the emergence of culture, symbolism, or ambiguity. Conrad and Haynes also identify clusters of scholarship that attempt to integrate action and structure (e.g., work stemming from Giddens’s structuration theory, considerations of unobtrusive control

and identification, and critical theory), as well as research that crosses organizational boundaries and challenges traditional constructs from the 1980s and 1990s.

A second categorization structure for current organizational communication scholarship was proposed by Mumby and Stohl (1996), who identify *four central "problematics"* within the study of organizational communication. These are the problematics of voice, rationality, organization, and the organization–environment relationship. These problematics highlight the ways in which researchers question traditional ways of thinking about organizational communication and embed their interests in current concerns. For example, pressures toward globalization point to the fluid nature of the organization–environment relationship and the ways in which time and space are reconfigured through new technologies, new organizational forms, and the shifting needs of a global economy.

Putnam et al. (1996) provide a particularly insightful framework for considering contemporary theory and research in organizational communication. This framework considers the *metaphors of communication and organization* and highlights the varying ways the concepts of "organization" and "communication" are framed by theorists and researchers (→ Organizational Metaphors). The seven metaphors identified to categorize both historic and contemporary research in organizational communication are as follows. In the *conduit metaphor* approach to organizational communication, communication is seen as transmission that occurs within the container of the organization. Research in this tradition includes considerations of formal and informal communication flow, adoption of new communication technology, and considerations of information load in the workplace.

In the *lens metaphor* approach, communication is seen as a filtering process and the organization is seen as the eye. This metaphor highlights the possibility of distortion and the importance of message reception, and would include research on feedback in organizations, environmental scanning, and strategic ambiguity (Eisenberg 1984) in organizational communication. The *linkage metaphor* shifts the emphasis in theory and research to the connections among individuals and organizations. Thus, a primary focus of research within this metaphor is a consideration of communication networks, including network roles, patterns, and structures. Contemporary research in organizational communication considers these linkages both "within" organizations and in larger interorganizational systems. The *performance metaphor* marks a major break from the previous three, and interaction and meaning take the forefront. In the performance metaphor, "organizations emerge as *coordinated actions*, that is, organizations enact their own rules, structures, and environments through social interaction" (Putnam et al. 1996, 384). Organizational scholars working in this area rely on such frameworks as narrative theory and Weick's theory of organizing (Weick 1979; → Sense-Making) and consider processes including storytelling and symbolic convergence in groups at the micro-level (→ Symbolic Convergence Theory) and the rhetorical construction of organizational image and identity at the macro-level.

The *symbol metaphor* sees the organization as a complex system of texts and communication as a process of representation through which the organizational world is made meaningful. Many current studies of organizational culture, organizational socialization, and the role of narrative, rites, and rituals in constructing the commonplaces of organization could be seen as stemming from this metaphor. The *voice metaphor*, as Putnam et al. note, "entails focusing on communication as the *expression or suppression*

of the voices of organizational members” (1996, 389). Contemporary work from this metaphor could include considerations of ideology and naturalized knowledge (a consideration of *distorted voices*), considerations of hegemony and power (*voices of domination*), considerations of women and cultural groups in organizations (*different voices*), studies of hierarchy and participation (*access to voice*), and considerations of empowerment and democratization (*making a difference through voice*). In the *discourse metaphor* approach, finally, Putnam et al. consider theory and research in organizational communication that sees communication as a conversation, as collective action, and as dialogue. Scholarship stemming from this metaphor variously considers discourse as an artifact in organizational life, as structure and process, and as ongoing acts.

### CONTEMPORARY RESEARCH TOPICS IN ORGANIZATIONAL COMMUNICATION

The metaphors discussed above point to the disparate and enriching frameworks now used to consider organizational communication. However, it is important to emphasize the ongoing importance of the *metatheoretical and theoretical influences* discussed above, including post-positivism, interpretivism, critical approaches, postmodernism, and feminism. Organizational communication also continues to blend a concern with social theory with ongoing concerns with practice and with the experiences of organizational members. Further, the discipline of organizational communication continues to be marked by a consideration of various levels of analysis. Scholars are concerned with the individual experiences of organizational members (→ Psychology in Communication Processes); with the interaction of critical dyads in organizations, such as supervisors and subordinates (→ Supervisor–Subordinate Relationships); with interaction in task-related and social groups in the workplace (→ Group Communication); with the structure and function of various organizational types (→ Organizational Structure); and with larger systems of organizations across industries and nations (→ Interorganizational Communication).

There are a number of topic areas that would be considered “*enduring*” interests of *organizational communication scholars*. These include conflict processes in organizational systems and cultures (→ Organizational Conflict), issues of leadership (→ Leadership in Organizations; Feedback Processes in Organizations), and processes of individual and group decision-making (→ Decision-Making Processes in Organizations). However, the following outlines some of the more important contemporary interests of scholars in organizational communication. All of these topics are currently approached from a variety of theoretical perspectives and with a wide range of methodological approaches and analytical tools (e.g., ethnographic analysis, network analysis, survey and interview techniques, field experiments, comparative case analysis, rhetorical analysis, archival analysis, and historical analysis). It should, of course, be noted that these topic areas are not mutually exclusive and that this list is not intended as a comprehensive accounting of current organizational communication research.

Influenced largely by feminist theorizing, contemporary scholars in organizational communication have shifted from a traditional view of organizational processes as rational and logical to a consideration of *emotional experience in the workplace*. Such work includes studies of emotional labor, stress and burnout in the workplace, compassion,

humor, and workplace bullying (→ Emotion and Communication in Organizations). The concepts of *organizational identity and identification* have held a central role in organizational communication research in recent years, as scholars have considered the formation of identity and the influence of identification on issues such as organizational decision-making, commitment, and group interaction. Work in this area has important roots in rhetorical (especially Burkean) theory (→ Organizational Identification).

Not surprisingly, the role of *communication technology* in shifting organizational communication processes has been a central concern of scholars for the last several decades. This research is conducted largely within the auspices of post-positivist theoretical and methodological assumptions and has included considerations of decision-making technology, technology for information storage and retrieval, communication technology such as telephony and the Internet, and technology that allows for alternative organizational configurations such as → telework (→ Technology and Communication; Meeting Technologies; Mobility, Technology for; E-Commerce). Shifts in technology, travel, and politics have led organizational communication scholars to the critical consideration of *globalization processes*. Theoretical and research interests in this area include both global and economic concerns as well as considerations of ways in which processes of globalization affect the work lives and communication processes of individuals. Much work in this area remains theoretical – often with a critical or postmodern sensibility – but there are increasing forays into research that considers data from a variety of levels (e.g., economic, political, network, psychological) and a variety of methodological approaches (→ Globalization Theories; Globalization of Organizations; Technology and Globalization).

Traditional research in organizational communication considered profit-centered organizations and bureaucracies (→ Bureaucracy and Communication). However, organizational communication scholars have recently become more interested in considerations of *nonprofit organizations and alternative “flatter” forms of organizations* encouraged through feminist theorizing. Further, trends in technology and globalization have led to increased consideration of virtual workplaces, and concerns with → knowledge management have led organizational communication scholars to concepts of learning and dialogue in organizational processes (→ Learning Organizations; Dialogic Perspectives), and to continued considerations of participatory systems and organizational democracy.

Critical scholars in organizational communication initially gave a great deal of attention to the ways in which organizational processes such as managerialism, decision-making, organizational structure, identification, and gender and culture could lead to hegemonic processes of oppression and alienation in the workplace. In recent years, these scholars have also turned their attention to ways in which employees resist these processes and engage in *active dissent and resistance*. Given rapid developments in technology, globalization, organizational forms, and market concerns, scholars in organizational communication are concerned not just with the nature of organizational communication in the late modern and postmodern world, but also with the processes through which *organizations change and adapt* (→ Organizational Change Processes). Concerns with organizational change are particularly marked in considering the ways in which organizations navigate crises (→ Organizational Crises, Communication in; Crisis Communication), the management of organizational image (→ Image; Issue Management), and ethical considerations (→ Organizational Ethics).

# Organizational Communication: Critical Approaches

Dennis K. Mumby

University of North Carolina at Chapel Hill

The term “critical approach” refers to a broad, interdisciplinary body of theory and research that conceives of organizations as dynamic sites of control and resistance. “Critical studies” covers several distinct yet related intellectual traditions, each of which examines the communicative practices through which control and resistance are produced, reproduced, and transformed in the process of organizing. These traditions include: neo-Marxism, → critical theory, postmodernism, and feminism (→ Postmodernism and Communication; Feminist and Gender Studies). Each of these traditions shares the “post-linguistic turn” assumption that language and → discourse are central, constitutive elements of human meaning and reality formation.

In the context of organizational communication studies, this assumption translates into a view of communication and organization as co-constitutive. That is, communication is viewed as creating organizations as meaning-based, social constructions; organizations are conceived as both enabling and constraining the everyday communication processes of their members. Common to all traditions within the critical perspective, however, is the notion that such co-constitutive processes are not arbitrary or spontaneous, but rather occur within the context of complex relations of power. Thus, all perspectives in critical organizational communication studies view organizing as a fundamentally political process that gets played out in the dynamics of various competing interests (→ Control and Authority in Organizations).

Furthermore, critical perspectives share a praxis orientation toward theory and research. Simply put, praxis – the synthesis of theory and practice – invokes the possibility of social transformation. As Marx famously put it, “The philosophers have only described the world; the point is to change it.” In the context of organizational communication research, praxis translates into efforts to conceptualize and realize more democratic and participatory organizational forms (Deetz 1992). As such, all critical research invokes, whether implicitly or explicitly, the possibility of alternative organizing processes. In this sense, all critical research operates according to an emancipatory logic that recognizes the possibilities for self-reflection and social change.

## CONCEPTUAL FOUNDATIONS

The critical perspective came into its own in the early 1980s as part of a broader rise to prominence of an interpretive, meaning-based approach to the study of organizations. Both Putnam and Pacanowsky’s (1983) important edited volume, *Communication and organizations: An interpretive approach*, and a special issue of the *Western Journal of Speech Communication* edited by Putnam and Pacanowsky in 1982 featured essays by Conrad (1983), Deetz and Kersten (1983), and Deetz (1982) that together formed early efforts to define the conceptual terrain of critical studies, exploring the connections among communication, power, and organizing.

### Intellectual Origins

The *intellectual origins* of the critical perspective, however, are far older. Much is owed, of course, to Marx's rewriting of political economy and his groundbreaking analysis of the capitalist accumulation process. Despite its limitations, Marxist theory still resonates for critical organization scholars in its acute analysis of the expropriation, alienation, and commodification of labor. In this sense, critical organization studies has inherited from classic Marxist theory an understanding of the materiality of the capitalist labor process and the ways that workplace power and exploitation are structured into capitalist relations of production.

A much stronger influence on critical organizational communication studies has been exerted by efforts to reinterpret Marxism in the face of the changing character of capitalism and the workplace in the twentieth century. In particular, the work of the Frankfurt School and a number of western Marxist theorists, including Antonio Gramsci, Gyorgy Lukács, and Louis Althusser, have been instrumental in shaping critical studies of workplace "control through consent." This phrase captures the evolution of the capitalist workplace as it moved away from coercive, exploitative practices – described so vividly by Marx in *Capital* – toward forms of control that, paradoxically, relied more heavily on worker autonomy. For critical studies, then, theory and research have been centrally concerned with explaining the communicative dynamics through which apparent worker autonomy and consent to an exploitative labor process reside together.

Central to critical efforts to address this problematic have been the *concepts* of "ideology" and "hegemony." "*Ideology*," particularly as developed in the works of Althusser and Gramsci, refers not simply to a system of ideas, but rather to everyday discourses and practices which constitute the lived reality of social actors. From a critical perspective, ideology provides the interpretive mechanism through which certain social realities and interests are privileged over others. Furthermore, ideology does not simply reflect these dominant interests in a straightforward manner, but rather transforms and obscures these interests such that they are not immediately accessible to everyday experience. For example, Willis's (1977) classic study of a working-class sub-culture of "lads" in a British high school illustrates how their rejection of middle-class values of education, enterprise, and upward mobility and their embracing of a culture of violence and "having a laff" prepares them for insertion into the capitalist labor process in a way that reproduces their role as generalized, abstract labor. Thus, the lads' sub-culture functions ideologically to simultaneously secure and obscure their relationship to capitalist relations of production.

Gramsci's (1971) concept of "*hegemony*" is equally important in its conception of capitalism not as coercive, but as a structure of relations and institutions that creates a "collective will" among classes and interest groups with competing interests. A group or class that is hegemonic does not act in a coercive fashion (though coercion may be a control mechanism of last resort) but rather is able to articulate the beliefs, values, and interests of other groups and classes with its own. Hegemony therefore functions primarily in the ideological and cultural realms through the institutions of civil society such as the family, religion, education, and the mass media.

In the context of critical organization studies, Gramsci's concept is taken up to address the subjective experience of workers as they participate in the labor process. Burawoy

(1979), for example, shows how capitalist relations of production are hegemonic in part by virtue of the workers' construction of a culture of "making out" that functions ideologically to obscure the exploitative character of capitalist relations of production. Hegemonic relations, then, involve not passive consent to a system of beliefs, but rather the active appropriation and reproduction of those beliefs by subordinate groups.

The final neo-Marxist influence on critical organization studies comes out of the *Frankfurt School of critical theory* and, more specifically, the work of second-generation Frankfurt School philosopher → Jürgen Habermas. Habermas's work has been particularly influential on two related fronts. First, he argues that contemporary modernity has privileged technical forms of rationality over practical and emancipatory rationality, resulting in the dominance of instrumental, means–end forms of knowledge. This colonization and rationalization of the life-world lead to impoverished notions of human knowledge and community, and negate possibilities for critical reflection and social transformation. Second, Habermas posits the notion of "systematically distorted communication" to address the ways in which technical rationality functions ideologically, through discourse, to co-opt other forms of rationality. Critical organization scholars (e.g., Deetz 1992; Mumby 1988) have used Habermas's work to explore the central role of organizations in processes of the colonization of human identity formation. This not only includes research into the discursive mechanisms through which employees themselves are colonized by corporate ideologies and values, but extends also to larger corporate efforts to shape human identity, what counts as knowledge, definitions of excellence, and so forth.

### **Recent Developments in the Field**

Much of the critical organizational communication research conducted in the last 25 years has taken the form of extended "ideology critique," focusing on the discursive mechanisms through which organizations construct social realities that produce and reproduce the interests of "managerialism" (Deetz 1992). Early examples of such research include ideological analyses of organizational storytelling (Mumby 1988), work songs (Conrad 1988), and workplace rituals (Rosen 1985). In each instance, analyses focus on the intrinsic connection between ideology and discourse, examining how particular discursive practices "interpellate" social actors as organizational subjects in specific ways. Frequently repeated organizational stories, for example, "narrate" particular organizational realities into being and position members as subjects within those realities.

In the last 15 years the conceptual terrain of critical organization studies has broadened considerably, particularly with the emergence of research informed by postmodern theory and feminist theory. While *postmodernism* approaches are addressed in another entry (→ Organizational Communication: Postmodern Approaches), it is worth noting that there are certain continuities between critical theory proper and postmodern analytics. First, while both perspectives focus on power and its dynamics, postmodernism is concerned less with liberating truth from power and more with explicating the discursive mechanisms through which power and truth are articulated together in particular ways. Second, both focus on the discursive construction of social reality. However, while critical theory examines discourse through the lens of ideology critique, postmodern thought

examines discourse as a complex constellation of intertextual practices that construct subject positions in complex and often contradictory ways. Third, and related, while critical theory views the social actor as a rational, conscious – though linguistically mediated – subject, postmodernism views the subject as decentered, fragmented, and the effect of discourses.

Since the mid-1990s *feminist organization studies* has exercised increasing influence in critical organization studies (→ Gender and Discourse). Unlike earlier “gender as variable” research that examined, for example, differences in managerial leadership style between men and women, critical feminist studies take up Acker’s (1990) idea that organizations are “gendered” cultural forms, constituted around systems of difference that take “masculine” and “feminine” as the primary binary opposition. This reframing of the relationship between gender and organization has generated theory and research that examine the ongoing, communicative construction of masculine and feminine identities in the process of organizing. Of particular significance here is the shift away from an essentialist conception of gender, almost exclusively concerned with women’s roles in the workplace, to a much more nuanced exploration of the multiple and intersecting gendered identities that are socially constructed through everyday discursive practices. Consistent with other critical approaches, feminist scholarship focuses on the intersection of discourse, power, and organizing in everyday social practice; what differentiates it from other forms of critical research is its careful exploration of power as a gendered process.

Feminist theory and research in organizational communication have had three broad foci: (1) feminist deconstructions of the gendered underpinnings of mainstream organization theory (e.g., Mumby & Putnam 1992); (2) empirical analyses of everyday gendered organizing processes (e.g., Trethewey 1997); and (3) studies of feminist organizational structures and their possibilities for alternative means of democratic decision-making (e.g., Ashcraft 2001). It is important to note that while feminist organization studies can be placed under the broader umbrella of critical studies, this area also has a distinct and independent history, with much of early feminist thought and practice maintaining a skeptical posture in regard to the male-dominated theory work conducted in critical studies. Indeed, a strong case can be made that while many critical scholars were theorizing about the possibilities for alternative democratic institutional forms, many feminists were engaging such possibilities in a praxis-oriented manner through the creation of women-centered, collectivist organizations.

### **CURRENT RESEARCH FOCI**

While it is not possible to provide an exhaustive account of the current state of research informed by critical approaches, there are certain broadly identifiable empirical foci. These include: (1) professional identities; (2) knowledge-intensive organizations; (3) work-home relationships; (4) the body, sexuality, and emotion; and (5) employee resistance.

#### **Professional Identities**

The discursive construction of employee identities has become a central preoccupation of much critical scholarship (→ Organizational Identification; Identities and Discourse).

Such work takes a number of forms. For example, the European Labor Process Group of Knights, Willmott, and colleagues focuses on the ways in which employees maintain professional identities in the face of increasingly insecure work environments, where traditional conceptions of “job stability” and upward mobility have largely disappeared in the new, post-Fordist economy. In organizational communication studies proper, a number of scholars have shifted focus away from organizations as physical sites, within which members construct meanings and identities, and toward examination of the professional discourses that are both medium and outcome of organization members’ identities. In this context, organizations per se are less important than the constellation of discursive resources (e.g., race, class, gender, sexuality) that social actors draw upon in constructing such professional identities (→ Organizational Discourse).

### **Knowledge-Intensive Organizations**

The shift from the Fordist to the post-Fordist organizational form has led a number of critical researchers to examine the effects of this transformation on issues of power, control, and identity. For example, researchers have investigated the implications of flatter, more knowledge-intensive organizational hierarchies for issues of employee autonomy and decision-making.

One of the more interesting findings of this work is that greater decentralization of decision-making and control processes has actually led to increased, though more subtle and insidious, control over workers. This is particularly true in team-based organizations, where workers engage in “concertive control,” constructing their own collective value premises that act to internalize self-surveillance at the level of everyday work activities (Barker 1993).

### **Work–Home Relationships**

The critical focus on issues of “corporate colonization” and “managerialism” has led some scholars to investigate more closely the increasingly complex relations between work and others spheres of life, particularly home. Again, the advent of the post-Fordist organization and attendant phenomena, such as corporate campuses, telecommuting (→ Telework), flex-time, and so forth, has produced increased critical focus on the ways in which such structural shifts have changed employees’ relationships to work.

Perhaps most significantly, this research has drawn increased attention to the impact of these shifts on the construction of subject positions and the ability of social actors to even contemplate identities separate from work. If, indeed, distinctions between work and the private spheres of life are increasingly amorphous, then it is arguably increasingly difficult for social actors to articulate identities that are autonomous from corporate rationalization processes. In this context, critical organization research is particularly interested in the impact of such structural shifts on civil society; that is, to what extent corporate forms have subsumed other spheres of civil society such as family, education, and religion, thus constraining possibilities for the construction of meaning systems that function autonomously from corporate discourses including efficiency, rationality, and branding.

### **The Body, Sexuality, and Emotion**

The move in the last few years to studies of the body, sexuality, and emotion reflects increased critical attention to both the gendered and material character of organizing (→ Emotion and Communication in Organizations). In the latter case, this shift perhaps reflects the recognition that, in privileging the discursive/symbolic character of organizing, critical scholars have sometimes overlooked the flesh-and-blood social actors who people organizations.

Studies of the body and sexuality focus on how these issues are read through, and coded into, organizational discourses and practices. For example, Trethewey's (2001) study of mid-life professional women's experience of aging addresses their efforts to situate themselves and their bodies in relation to patriarchal/managerial discourses that interpellate such women within a "master narrative" of decline. In this sense, questions of the body, sexuality, and emotion are examined in terms of how they are structured into larger discourses of power, resistance, and identity. Emotion, for example, has been recognized by critical and feminist scholars as an important site of struggle in contemporary organizations; managerial control efforts aim at harnessing employee emotions as a way to enhance customer satisfaction, while employees struggle to maintain their right to express unmediated, genuine emotion.

### **Employee Resistance**

Finally, the last few years have seen a marked increase in critical studies that focus on employee efforts to resist organizational control mechanisms. This is in contrast to the early emphasis on control processes and the conceptual and empirical marginalization of resistance practices (→ Dissent in Organizations).

This recent effort to capture employee recalcitrance in the face of increasingly sophisticated managerial control efforts reflects greater sensitivity regarding the control–resistance dialectic in everyday organizing. Moreover, it suggests a greater recognition that, from a discursive, meaning-centered perspective, critical research is less about identifying and critiquing specific control (or resistance) practices, and more about explicating the – gendered, classed, raced, etc. – dialectical struggle between multiple interest groups over organizational meaning and identity. In this sense, critical organization studies at its most effective unpacks the ways that discourses, identities, control/resistance, and organizing get articulated together to create particular constellations of meaning. It is through understanding the political interests informing such articulation processes that alternative organizing practices become possible.

# **Organizational Communication: Postmodern Approaches**

*Shiv Ganesh*  
*University of Waikato*

Postmodern approaches to organizational communication elude easy description. Broadly speaking, they are diverse forms of inquiry that challenge and reconstruct systems of

power, identity, and representation (→ Control and Authority in Organizations). Since the 1980s, postmodern approaches, situated with reference to a larger critical tradition, have burgeoned in organizational communication studies. Under this rubric, many extant theories and methods in → organizational communication inquiry have been challenged and refashioned.

Yet scholars working in this tradition sometimes eschew the label “postmodern” and its attendant baggage, adopting other terms such as “dialogic” (Deetz 1996) or “discursive.” Inevitably then, the task of describing “postmodern approaches” is likely to be partial and fragmented – much like the approaches it seeks to describe. This entry thus proceeds tentatively, by examining the relationship between postmodernism and the critical tradition, and discusses some key tenets, trends, and futures of postmodern approaches to organizational communication studies.

### **MODERNITY AND ORGANIZATIONAL COMMUNICATION**

Postmodern thought has been a relatively new entrant in organizational communication studies due largely to the dominance of managerial perspectives and quantitative methodologies – approaches against which postmodern and critical approaches in part set themselves (Deetz 1992). As such, the emergence of postmodern thought in organizational communication studies has to be seen with reference to the critical turn in organizational studies (→ Organizational Communication: Critical Approaches), which began in the late 1970s when scholars began to consider issues of power and language as central to organizational life (Mumby 1988).

Like those in most disciplines that are engaged in investigations of “the social,” organizational communication scholars have wrestled with the central problematic of → *modernity*. The engagement with modernity both as a historical epoch and as an epistemological stance has been most overt in critical and postmodern approaches to organizational communication. Both approaches invoke a broad conception of power, and theorize issues of domination, control, and resistance. It is therefore a mistake to examine critical and postmodern approaches to organizational communication in oppositional terms. Indeed, there are important continuities between them in organizational communication studies, with many scholars combining both traditions (Cheney 1999).

A crucial difference between critical and postmodern approaches lies in their *respective critiques of modernity*. While critical approaches tend to offer an internal critique of modernity, endorsing some central Enlightenment ideals such as emancipation or progress, postmodern thought tends to take an external critique of modernity, sometimes rejecting it wholesale. Yet the relationship between postmodern thought and modernity is complex, and such complexity reflects the broad range of philosophical positions encapsulated in the term “postmodern.” For instance, Mumby (1997) argues that there are at least two major strands of postmodern thought: affirmative postmodernism and skeptical postmodernism (→ Postmodernism and Communication). The former maintains the viability of resistance, albeit fragmented, to dominant systems of power and is in some ways continuous with critical research in its belief in social transformation. In contrast, the latter eschews the possibility of any form of viable resistance to dominant control systems.

In addition to positioning their work as a critique of modernity, postmodern scholars in organizational communication examine postmodern organizational phenomena that arise from modernity itself. These include the replacement of structure with flux, the increasing fragmentation of labor, the emergence of bewildering arrays of difference and identity, the dominance of information and postcolonial economies, and so forth (Taylor 2005).

### **SOME TENETS OF POSTMODERN THOUGHT IN ORGANIZATIONAL COMMUNICATION**

First, postmodern approaches, drawing from Foucault, consider power in terms of diffuse and disciplinary networks, operating normatively and unobtrusively. Rather than power being conceptualized in terms of repression, it is thought of in terms of its ability to produce identities, languages, and realities. In particular, discourse is understood as the means through which power produces and reproduces (→ Organizational Discourse). Zoller's (2003) work, for example, examines occupational health and safety standards as a discourse that serves to produce a range of norms that construct work practices and identities.

Second, *embodied individual identities are seen as fragmented* (Tracy and Trethewey 2005). Postmodern thought is characterized by complex examinations of (the death of) individual subjectivity and the imposition of regulatory constructions upon categories such as pleasure and desire. Nadesan and Trethewey's (2000) analysis of women's popular success literature and the ways in which it constructs incomplete entrepreneurial identities among professional women exemplifies such research.

Third, issues of representation are *examined discursively*. Reality, for postmodern approaches, is a suspect category, never fully represented in discourse. Yet discourse and discursive formations remain our only means of accessing reality. Derrida's idea of "différance" points precisely to this: that which is referred to or signified in discourse is always deferred and set back. Postmodern approaches to organizational communication therefore often treat organizations themselves as discursive formations, a form of hyperreality, subsequently treating organizing and communicating as synonymous (Fairhurst & Putnam 2004).

Further, postmodern thought attempts to *move beyond the examinations of distinct economic, social, political, or cultural foundations* for explaining or understanding organizational life. Rather, postmodern scholars either consider their work as without foundations (the collapsing of categories such as economy or society) or as post-foundational proper (the construction of multiple foundations of organizational thought and practice).

Finally, postmodern scholars *theorize issues of resistance to disciplinary practices*. Here, resistance is conceived as a means of subverting or engaging in opposition to such practices. Research on resistance often characterizes organizations and communication as constituting systems of disciplinary practice, and examines fragmented and partial individual resistance in the context of such formations (Nadesan 1996).

### **POSTMODERN RESEARCH TRENDS IN ORGANIZATIONAL COMMUNICATION**

Organizational communication scholars emphasize some tenets of postmodern research over others, and in some respects the area is distinct from postmodern research in other

areas of communication inquiry. First, postmodern work in organizational communication studies often foregrounds questions of identity, resistance, and control, treating questions of reality, truth, and representation as larger, background issues. This is especially visible in studies of *concertive control* (Tompkins and Cheney 1985), which show how unobtrusive systems of normative power in organizations simultaneously shape individual identities and create possibilities for fragmented resistance (Larson & Tompkins 2005). Researchers have examined a wide range of phenomena under the rubric of concertive control, including social development programs, high-tech work teams, temporary labor, and fire-fighters (Cheney et al. 2003).

Second, postmodern research is friendly to *issues of voice and otherness*, emphasizing the study of difference, fragmentation, ethics, and politics (→ Organizations, Cultural Diversity in). Postmodern organizational communication studies is marked by a tendency toward inclusiveness, most clearly evidenced by emerging feminist scholarship on the subject (Ashcraft & Mumby 2003). While feminist thought itself is remarkably complex in its liberal, radical, Marxist, postmodern, and postcolonial manifestations (→ Feminist and Gender Studies), it contributes to postmodern thought in organizational communication studies the examination of gender as a key site of complex difference. Feminist thought and practice serves to deconstruct dominant organizational theory, enabling a constant engagement in the search for and the theorizing of difference. Such retheorizing is also evident in recent attempts, for example, to uncover the racial foundations of organizational communication thought (Ashcraft & Allen 2003). More recently, the emphasis on difference is turning into a productive engagement with issues of occupational and professional identity (Ashcraft 2006). Other organizational communication researchers have begun to examine organizational communication through postcolonial perspectives, which in turn are often informed by post-Foucauldian thought (Kurian & Munshi 2006). However, there is as yet no significant emerging corpus of research on postmodern difference informed by queer theory.

Third, postmodern approaches in organizational communication tend to be *more affirmative than skeptical*; this is evident in the emergence, since the early 1990s, of a significant body of work that examines various aspects of resistance. In many ways, the study of resistance can be said to constitute the central concern of postmodern organizational communication studies in the 1990s and the early part of this century. Such research often treats resistance in individualized, fragmented, and open-ended terms, although more recently scholars have also begun to call for attention to the more collective aspects of such resistance (Ganesh et al. 2005).

Finally, in the last few years postmodern approaches to organizational communication studies have begun to *play with the boundaries of what “counts” as organizational communication* itself. For instance, sparked by Cheney and Christensen’s (2000) work on how organizational identity issues coalesce both “internal” and “external” forms of communication, scholars have begun to examine the intersections between organizational communication and public relations scholarship (McKie et al. 2004).

## FUTURES

It is hard to predict any single direction for postmodern organizational communication research. However, it is safe to say that postmodern approaches will continue to explore

the dialectics of identity and difference, highlighting the contradictory and tension-laden character of organizational formations. Further, such approaches are likely to push collective understandings of the boundaries of organizational communication itself, as they continue to chart the shifting and dynamic interplay between internal and external forms of communication, and discursive and material realms. Finally, postmodern scholars are likely to continue working within the qualitative tradition, expanding their work to include both ethnographic and historical methods.

## Organizational Conflict

Linda L. Putnam

University of California, Santa Barbara

Organizational conflict is a frequent occurrence in most work settings. Whether rooted in interactions with co-workers, supervisors, or customers, conflict is an inevitable part of task and relational communication. Conflict refers to incompatibilities or perceptions of diametrically opposed goals and values that occur in the process of organizing. It includes disagreements about ideas, negotiations to obtain scarce resources, informal complaints about work issues, objections to corporate policies, and formal grievances filed against an organization. Hence, conflict is a pervasive feature of organizational life, but one that is often ignored. Unresolved and poorly managed organizational conflicts are very costly and lead to lower job satisfaction, lost work time, high costs of litigation, and the loss of valuable employees.

### SOCIAL INTERACTION AND CONFLICT

Organizational conflict also entails social interactions between two or more interdependent parties that adjust to each other’s moves and countermoves. It includes what the parties say to each other (→ Language and Social Interaction), the → information that they exchange, their nonverbal behaviors (→ Facial Expressions; Gestures and Kinesics; Paralanguage), and the → meanings or interpretations of their messages. Moreover, in conflict interactions, parties react to each other’s influence attempts and anticipate each other’s actions.

Communication in conflict situations draws on sequences of statements and responses that develop into patterns. These patterns, then, can lead to repetitive cycles or conflict spirals. For example, if one party makes a threat and the other party responds with another threat, followed by a counter-threat, the conflict interaction begins to develop a competitive spiral that increases in intensity. Parties often have difficulty breaking a conflict spiral and avoiding these cyclical patterns in present and future interactions (Folger et al. 2005).

Because the parties in organizations are interdependent, they need each other to accomplish tasks and develop working relationships. Hence, they cannot easily walk away

from disagreements without the problems recurring at another point in time. Interdependence also means that each person has the potential to block the other party from attaining organizational goals. Therefore, parties must cooperate with each other to work together, yet they simultaneously compete with each other to attain their own goals; hence, parties mix both cooperation and competition to manage organizational conflicts (Putnam 2006).

This mix of cooperation and competition contributes to the tensions that parties feel in organizational conflicts. Because they are competing with each other, they may withhold information, feel distrustful, and fear exploitation. However, the need to cooperate pushes the parties to share information, develop trust, and avoid escalation. Folger et al. (2005) describe these tensions that result from cooperating and competing as a balancing act. Like tacking a sailboat that is moving upstream, parties need to capture the force and energy of the wind and steer the boat to avoid rampant escalation or easy exploitation. Parties need to confront the other disputant about the issues, develop mutual understanding of the underlying concerns, and avoid giving in prematurely.

In effect, conflict interaction develops into processes that move in either a destructive or a constructive direction. Destructive conflicts become inflexible over time; lead to uncontrolled escalation; and increase in the number of issues, parties, and costs that participants experience (Deutsch 1973). Disputants in destructive conflicts typically lose sight of their original goals, blur issues together, and aim to hurt or annihilate the other person. Thus, destructive conflicts often end up in a win-lose or lose-lose situation for both parties. In contrast, conflicts that move in a constructive direction lead to added flexibility, broaden participants' insights about situations, and foster personal development. Constructive conflict management focuses on discovering options to expand the pie and to produce a win-win situation for all parties. Because conflict can lead to destructive outcomes, most people avoid it or see it as a necessary evil. Organizational conflict, however, when handled in a constructive way, promotes change through preventing stagnation and enabling adaptability. It also functions as a safety valve, exposing problems and improving group cohesiveness.

To enhance effective conflict management, most people believe that parties must engage in rational decision-making and remove emotions from their interactions. Yet conflicts by definition are emotional (→ *Emotion and Communication in Organizations; Emotion*). Emotions are triggered because participants perceive an interruption in their plans or see a discrepancy between their goals and the likelihood of achieving them (Jones 2001). Emotions also enter into conflicts through seeing a course of action as good or bad, right or wrong. This value framing evokes frustration, anger, and contempt as well as feelings of pride and defensiveness. Emotions enter into conflicts because participants want to look good rather than be viewed as a wrongdoer. Thus, conflicts need to be approached with rational procedures, but with ones that recognize the personal and emotional involvement that employees have in work situations.

## **THEORETICAL PERSPECTIVES**

The role of communication in organizational conflict is clearly complex. Scholars have adopted different perspectives to examine the role of communication in organizational

conflicts, especially ones that treat communication as a variable, as an interaction process, as interpretations or meaning, or as a dialectic.

When scholars position communication as a *variable*, they combine it with other factors, like gender, culture (→ Culture: Definitions and Concepts), or → cognitions, to test for the effects of interaction on conflict outcomes. Communication surfaces as a variable when it is treated as a type of media, a strategy or tactic, a style or orientation to conflict, or information that affects an individual's judgments about a situation (Wilson et al. 2001). As a process, communication becomes the *interaction patterns* of participants that unfold over time. This approach focuses on the combinations of actions and reactions and how they result in constructive or destructive outcomes.

Treating communication as *meaning* highlights the language that participants use, the stories that they tell, and the ways that they make sense of situations. For example, formal negotiation between labor and management signifies efforts to work out differences between parties who have competing interests. This routine has symbolic meanings for the parties who have a stake in this process.

Finally, scholars adopt a *dialectical perspective* to the study of communication and conflict (→ Dialogic Perspectives). A dialectic perspective focuses on the tensions that arise through the simultaneous connection of opposites, such as cooperating and competing, or withholding and sharing information. Communication helps parties manage the tensions that arise from the oppositions that are inevitable in organizational conflicts. In this approach, communication and organizational conflict define each other as disputes surface through both formal and informal means, become fused with public and private activities, and are worked out through rational and emotional interactions.

## **ARENAS OF ORGANIZATIONAL CONFLICT**

These perspectives for studying communication and organizational conflict surface in research findings on conflict styles, communication media, negotiation and bargaining, work/life conflicts, and dispute system designs.

### **Conflict Styles**

Individuals typically approach an organizational conflict with a predisposition to manage the dispute in a particular way (→ Conflict Resolution). This orientation influences the verbal and nonverbal behaviors that members choose. In the 1960s and 1970s, Blake and Mouton (1964) identified five styles that are common ways of managing conflicts: problem-solving, competing, accommodating, avoiding, and compromise. With problem-solving, individuals confront a conflict directly through exploring causes and possible solutions. Competing relies on coercion or position power to pressure the other party to comply. Individuals who accommodate tend to smooth over a conflict and yield to others, while those who avoid withdraw from the scene or fail to confront. Compromise refers to meeting the other party half-way or settling for a 50–50 split. This approach is regarded as a half-hearted effort and often fails to meet the needs of both parties (Olekalns et al. 2007).

Choosing a conflict style depends on the importance of one's own and the other party's goals. Employees who develop a repertoire of approaches are typically more effective at

managing conflicts than are people who rely on only one or two styles. If both parties regard their relationship and their respective goals as important, they should use problem-solving or compromise. However, if organizational members need to reach a decision quickly or if only one party's goals are critical, competing, accommodating, or avoiding are appropriate. Managers who are optimistic about resolving a conflict typically begin with problem-solving and then shift to competing if subordinates do not comply. This combination of problem-solving and competing promotes the information search necessary for resolution and leads to the best substantive and relational outcomes (Olekalns et al. 2007). Choice of conflict style also influences levels of stress at work. Specifically, problem-solving and accommodating lower the amount of stress while the use of competing and avoiding may increase anxiety.

Research in the 1980s and 1990s revealed that the effects of using conflict styles differed across cultures. For example, managers from China, Korea, and the Middle East scored higher on avoiding as a preferred conflict style than did managers in the United States and Australia. However, younger Asian workers preferred problem-solving to manage organizational conflicts (→ Intercultural Conflict Styles and Facework; Communication Modes, Asian; Communication Modes, Western).

As a whole, research on conflict styles treats communication as a variable and relies heavily on questionnaires (→ Survey; Interview) that measure organizational members' preferences. These questionnaires are sometimes inaccurate predictors of actual behaviors in conflict situations and fail to recognize that preferences are fluid; hence, styles are only one indicator of verbal and nonverbal messages that parties use in organizational conflicts.

### **Conflict and Communication Media**

Another way that communication functions as a variable in organizational conflicts is the type of media or channel that parties use. "Communication media" refers to telephones, memos, computers, or face-to-face interactions. Early research in this arena revealed that disputants were more likely to cooperate when conflicts were managed through face-to-face interactions than when individuals used telephones or written messages. Recent studies on the use of emails reaffirmed these findings. In particular, disputants were more likely to use negative strategies, reduce information sharing, and receive lower joint profits in conflicts managed through email than in face-to-face interactions. Organizational conflicts handled via the computer led to fewer explanations, informal tones, and a tendency to bundle disparate arguments. The loss of social cues, such as vocal overtones or facial expressions in computer messages, may make it difficult to infer the other party's intentions (Olekalns et al. 2007). The effects of communication media on conflicts, however, are not direct or simple. Thus, if parties know each other well, interact regularly, or use multiple media to manage a conflict, these negative effects may not occur.

### **Communication and Negotiation Processes**

Research on negotiation process focuses on what bargainers say and how they respond to each other while searching for mutually satisfactory agreements (→ Negotiation and Bargaining). Negotiation is a form of conflict management in which parties exchange

offers and counteroffers in search of a settlement. In the 1980s and 1990s, researchers coded communication into categories of negotiation talk, such as a threats, offers, or information giving. Thus, this line of research treats communication as an interaction process.

Scholars have examined the relationship between categories of talk and distributive and integrative bargaining. Distributive bargaining treats organizational conflict as a fixed pie in which parties employ a win-lose approach to get the most from a pool of scarce resources. This approach is suitable when a person is buying a car or negotiating for the cost of a house. Integrative bargaining, in contrast, engages in a win-win process in which participants strive to meet the needs and interests of both parties. This model is most effective in workplace negotiations that depend on relationships and routine interactions. The two models, however, are tightly interrelated and any one negotiation is rarely a pure process. Bargainers who mix the two approaches rather than keep them distinct are more likely to reach agreements (Olekalns et al. 2007).

Research on communication and negotiation also reveals that bargainers reciprocate both cooperative and competitive tactics. That is, they match each other's tactics, such as arguments, threats, and demands, and they reciprocate offers and trade problem-solving tactics. To buffer against conflict spirals, bargainers use complementary tactics, such as following a demand with information giving or discussing procedures. Communication tactics also emerge at different stages in a negotiation. For example, bargainers who shift from → persuasion in the early stages of interaction to clarifying priorities later in the negotiation are likely to receive high joint gains.

Language use also aids in developing bargaining relationships. Specifically, studies find that negotiators who use first person pronouns, speak with short utterances, and avoid excessive interruptions convey closeness to the other party. Language use also facilitates making sense of a negotiation through the stories and symbols that parties share. For example, stories about outsiders as impeding the negotiation can unite opposing teams in reaching agreements.

### **Work/Life Conflicts**

Work/life conflict, also known as incompatibilities between work/family and home/work, refers to the tensions and role strain that occur from dividing time and energy to attend to both domains. Organizational expectations often compete with family and personal life for these scarce resources.

As a new arena of organizational conflict work, this topic embraces a dialectical perspective to examine the pushes and pulls between these domains. It also draws from the tensions between the public and the private domains, ones rooted in assumptions about the proper roles of men and women in society. These roles typically cast men in the work domain and expect women to attend to the private realm. In like manner, these assumptions perpetuate the myth of a separation between home and work, when, in actuality, the boundaries are very blurred. Effective management of work/family conflict improves organizational morale for both men and women (Kirby et al. 2006).

Research reveals that the critical factors for effective conflict management include having supervisors who recognize and are supportive of both domains, enacting and administering fair work/family policies, developing an organizational culture that fosters

flexibility, and having co-workers who value personal lives as well as organizational agendas. Organizations need to guard against sending mixed messages, such as having supportive policies but requiring excessive overtime and weekend work.

### **Designing Dispute Systems**

All organizations, large or small, have some type of conflict management system. Most of these systems are informal norms or sets of procedures for filing grievances. In the past 10 years, however, organizations have focused on designing formal dispute systems that are proactive and aimed at preventing, managing, and resolving conflicts (Lipsky & Seeber 2006). These systems contain steps and procedures for processing conflicts, build in alternative approaches for handling disputes, and integrate the system into the daily organizational routines. Alternatives for managing a conflict include hiring a neutral facilitator to lead discussions, voting on issues, assigning employees to serve as neutral third parties, or arranging for a mock trial with a jury of peers. Dispute systems typically offer conflict management training for employees, multiple points of entry for registering complaints, and approaches that focus on the needs and desires of parties rather than on who was right or wrong (Ury et al. 1988).

Communication plays a pivotal role in integrating dispute systems into the daily operations of organizations. The most effective systems are responsive, encourage employees to address conflicts at the lowest organizational level and as early as possible, and develop an organizational culture that supports dissent. Thus, employees feel able to voice complaints without fear of retaliation or reprisal.

### **NEW DIRECTIONS IN CONFLICT RESOLUTION**

Organizational conflicts differ from disputes in other arenas because they often reappear in different forms. Scarce resources and power differences often lead to fighting the same battles over and over again. Thus, scholars have moved away from resolving conflicts and, in turn, recommend ways to make decisions fairly and moving forward. When conflicts become opportunities to redefine situations, new directions emerge for managing conflicts. Dialogue is a form of communication that promotes attending to the other party's stance and creating new frames to locate conflict in alternative contexts. This approach differs from using the traditional options of conflict styles, negotiation, and dispute systems and brings multiple voices to the scene, transcends polarized positions, and develops new possibilities for meaning and action.

## **Organizational Crises, Communication in**

*Timothy L. Sellnow*

*North Dakota State University*

Advancing technology, global connectivity, and ethical lapses have resulted in an escalation in the frequency and intensity of organizational crises over the past two decades. Commensurate with the increase in crisis events, academic research in crisis communication has expanded, focusing predominantly on the role of communication in predicting, managing, and resolving crisis events (→ Disasters and Communication).

### **DEFINITION OF CRISIS**

Common types of crises are natural disasters, malevolence, product failure, human error, terrorism, financial loss, ethical violations, and widespread rumors. Hermann (1963) established that, to reach the level of a crisis, a negative event must have *three essential components*: surprise, threat, and short response time. *Surprise* indicates that the organization could not or did not prepare adequately for the magnitude of the crisis. *Threat* suggests that the organization's future is at risk. *Short response time* requires an

organization to take immediate action to avoid further intensification of the crisis. Coombs (1999, 2) addresses the interconnectivity of these three elements in his working definition: "A crisis can be defined as an event that is an unpredictable, major threat that can have a negative effect on the organization, industry, or stakeholders if handled improperly."

Crises evolve in *three general stages*: pre-crisis, crisis, and post-crisis (Seeger et al. 2003). In the pre-crisis stage, competent organizations scan their environment and attempt to prepare for potential crises. Warning signs typically occur in the *pre-crisis stage* that, if recognized by the organization, can be addressed to prevent a crisis. If the organization fails to recognize these warning signs, the situation may escalate into a crisis event. The *crisis stage* begins when a trigger event occurs. Typically, the trigger event makes apparent the warning signs that were not heeded during the pre-crisis state. In the case of a product failure, for example, reports of serious injury or extensive customer frustration are possible triggering events. During the crisis stage, the organization's reputation or survival is threatened. Communication during the crisis stage is hampered by the inherent uncertainty of the crisis and the public's demand for an expeditious response. The *post-crisis stage* begins when the danger of the crisis has passed. Post-crisis communication focuses on determining responsibility for the crisis, apologizing when appropriate, and taking corrective action to avoid similar crises in the future (Benoit 1995). Lawsuits and public outrage may cause the post-crisis stage to continue for years. For example, the 1989 *Exxon Valdez* crisis has yet to be fully resolved.

## EARLY RESEARCH

Early work in crisis communication focused primarily on *apologia*. Ware and Linkugel (1973) introduced apologetic rhetoric as a genre. The genre of apologetic discourse focused on the image-related crises of individuals and organizations. Ware and Linkugel identified *four strategies* commonly found in the rhetoric of self-defense: denial, differentiation, bolstering, and transcendence. Denial refers to a disavowal of guilt or responsibility. Claims of differentiation seek to separate the actions of the speaker from the general context of the accusations. Bolstering is an attempt by the speaker to distract the audience from the negative accusations by emphasizing admirable achievements of the individual or organization. Finally, speakers use transcendence to reinterpret the actions for which they are criticized in a broader and more positive context that is appealing to the audience.

Benoit (1995) extended Ware and Linkugel's work by developing a synthetic *typology of image restoration strategies* that is widely applied in the crisis communication literature. Benoit isolated four general categories for image restoration: denial, evading responsibility, reducing the offensiveness of the event, and corrective action. Denial involves either simply stating that the organization is not responsible or shifting the blame for a crisis event to a source outside the organization. When evading responsibility, organizations can claim that the crisis occurred because of provocation, defeasibility (an incapacity to respond), or an accident, or in spite of good intentions. Reducing the offensiveness of a crisis is achieved through bolstering the organization's reputation, minimizing the perceived impact of the crisis, differentiating between accusations and reality, making statements that transcend to a higher value, attacking the accuser, or offering compensation to victims. Corrective action requires organizations to make notable changes in their

management and operations to avoid future crises. Mortification occurs when the organization accepts responsibility and asks for forgiveness. Although apology has been a central focus of crisis communication research, the perspective is limited largely to considerations of reputation (→ Organizational Image).

## THEORETICAL CONCEPTS

Research in crisis communication has expanded from apology to advance theoretical concepts focusing on the comprehension of complex crisis situations, organizational learning in the wake of crisis events, and the development of best practices for mitigating and managing crises.

Fully comprehending a crisis situation is difficult due to the inherent elements of a crisis: shock, urgency, and uncertainty. In the midst of a crisis, the available information is highly *equivocal*. This means that multiple interpretations can be made from the same data. The short response time is a constraint that denies individuals and organizations the luxury of an extended analysis or debate. In order to manage a crisis effectively, organizational leaders must make sense of the situation and respond quickly.

Weick's (1979, 1995) theory of → *sense-making*, applied extensively in the organizational communication literature, has emerged as a flexible and enlightening approach to understanding how individuals and organizations comprehend warning signs and crises. Weick (1988, 306) links sense-making to crisis communication through what he calls "the enactment perspective." Weick explains, "People often do not know what 'appropriate action' is until they take some action and see what happens." Weick contends that, during crisis situations, individuals are limited in their sense-making by their commitment, capacity, and expectations. Commitment refers to the tenacity with which individuals hold to established procedures or opinions. Excessive commitment may result in defending established ideas and procedures even after they have contributed to a crisis. Capacity is the degree of influence individuals perceive they have on their environment. Limitations on capacity simultaneously diminish an individual's perceived ability and willingness to act in crisis situations. Finally, the expectations individuals have about vulnerability and priorities influence crisis planning and willingness to respond. Prior to a crisis, inappropriate commitment, limited capacity, and disempowering expectations can impede an organization's ability to recognize signs that a crisis is imminent. During a crisis, these factors can slow the comprehension process. Weick's sense-making approach has been applied to crises such as Union Carbide's deadly gas leak in Bhopal, India; natural disasters such as floods, hurricanes, and fires; and the 2001 attacks on the World Trade Center and the Pentagon.

*Chaos theory* serves as a means for viewing crises from a broad systematic perspective (Murphy 1996). Traditional notions of causality are replaced by an attempt to understand general trends and patterns across a system using broad scales and wide time frames. Crisis communication scholars have applied chaos theory to observe how complex systems are dismantled by crisis and reconstituted through post-crisis communication. Crises are initiated by drastic system changes referred to as *bifurcation* points. Order re-emerges through the self-organization process. Communication is a central feature in the *self-organization* process. Through self-organization, hierarchical structures, policies,

procedures, and interpretations are established (Seeger et al. 2003). In many cases, self-organization results in a new and improved system that is less vulnerable to the form of bifurcation that instigated the crisis and subsequent evolution of the system. Chaos theory is particularly relevant to crisis communication in catastrophic natural disasters such as floods, hurricanes, and tsunamis.

Ideally, organizations learn from mistakes made prior to or during the crises. Sitkin (1996) argues that failure is actually essential to the organizational learning process (→ Learning Organizations). Crises, which constitute a major failure, can inspire and validate *positive change* in organizations. Resilient organizations learn to take corrective action following a crisis so that similar crises do not reoccur. These corrective actions are maintained through organizational memory. The loss of this memory through employee turnover or a changing organizational culture can increase the organization's vulnerability to crisis. Organizations need not experience crises directly in order to learn from them. *Vicarious learning* occurs when organizations observe the crisis responses of similar organizations. Organizations can increase their resilience by adopting successful strategies from comparable organizations that have experienced crisis. Elements of organizational learning appear in crisis communication studies where corrective action is a featured element.

In the best circumstances, organizations emerge from crisis with a sense of *renewal* (Ulmer et al. 2007). Renewal occurs when the organization has a fresh sense of purpose and a renewed commitment to its stakeholders. Leaders in the organization communicate in ways that embrace a new normal, and employees feel a commitment to rebuild, move beyond the crisis, and rededicate themselves to serving their stakeholders. Renewal is prevalent in crisis communication research that focuses on communication ethics. Malden Mills' recovery from a devastating fire and Cantor Fitzgerald's response to losing 658 employees in the World Trade Center on September 11 are examples of crisis studies focusing on renewal.

Three *primary methods* are used to conduct crisis communication research. Case studies comprise the most common research method (→ Case Studies). Most frequently, theoretical frameworks are evaluated on the basis of outcomes of actual crises (Hearit 2006). Survey research methods are also prevalent in crisis communication research (→ Survey). Victims of crises, first responders, or organizational employees who have faced a crisis are often surveyed to build a better understanding of the impact crisis has on individuals in a variety of positions (Greenberg 2002). Finally, message testing research is often done prior to a crisis in hopes of predetermining effective communication strategies (Heath 1997; Reynolds 2002; → Test Theory). Crisis planners share a variety of message types with subjects in an attempt to predict how various messages would be interpreted in an actual crisis situation.

Crisis communication research has expanded and evolved considerably since the initial work in apologia. The increasing complexity of organizations and the expanding threat of terrorism portend an increase in the frequency and intensity of crises in the future. Crisis communication scholars must continue to adapt their theoretical concepts and research methods to match this evolving threat. The considerable expansion of crisis communication theory in the past three decades suggests that scholars will succeed in meeting this challenge.

## **Organizational Culture**

*Joann Keyton*

*North Carolina State University*

Organizational culture is the “set(s) of artifacts, values, and assumptions that emerge from the interactions of organizational members” (Keyton 2005, 1). These interactions create a social order or a communication construction of the organization. Thus, symbols, messages, and meaning create a continuous communication performance at work (→ Culture: Definitions and Concepts; Meaning). This is why it is frequently stated that an organization *is* culture rather than an organization *has* a culture (Smircich 1983). While the popular view of organizational culture is often that it is comprised of organizational members’ shared assumptions, communication scholars have demonstrated that

multiple shared patterns of organizational artifacts, values, and assumptions exist and are constantly being created and recreated through member interactions (→ Organizational Communication).

### ARTIFACTS, VALUES, AND ASSUMPTIONS

Artifacts are visible or tangible in themselves or in their manifestations, such as *norms* about politeness or dress, organizational customs such as new employee orientation, or physical representations such as organizational logos. Artifacts are easy to observe, but can be difficult to decipher. For example, an organizational logo can be easily identified, but why or how the logo or artifact represents the organization is not always direct or clear. Because an analysis of an organization's artifacts is only partial, a valid interpretation of an organization's culture cannot be constructed from artifacts alone (Schein 1992).

*Values* shared by organizational members and manifested in their behavior are also a component of organizational culture. Values are strategies, goals, principles, or qualities that are considered ideal or desirable, and, as a result, create guidelines for organizational behavior. Organizational cultures are comprised of many values that are interdependent; one set may support one another (e.g., values for independence and personal achievement), whereas others again may conflict (e.g., values for autonomy and teamwork). Values that are shared inevitably become transformed into *assumptions*, taken-for-granted beliefs that are so deeply entrenched that organizational members no longer discuss them. These tacit assumptions are subtle, abstract, and implicit, making them difficult to articulate. Despite these features, basic assumptions are acted on with such little variation that organizational members consider any other action inconceivable.

Organizational members seldom talk directly about artifacts, values, and assumptions. Rather, the meaning held in these elements is revealed through day-to-day conversations with other organizational insiders and outsiders. Organizational culture is both created and revealed through the creation and enactment of rites, rituals, and ceremonies; the practice of norms or procedures; the use of specialized language; and the telling of stories or use of metaphors. No one artifact, value, or assumption can create or represent an organization's culture. Rather, organizational culture emerges from the complex interplay of these elements in the organizational communication of all members, all at levels, in all job functions. As a result, culture is nearly impossible to see in its totality.

### CHARACTERISTICS OF ORGANIZATIONAL CULTURE

Using a communicative perspective, organizational culture has *five important characteristics* (Keyton 2005). *First*, organizational culture is inextricably linked to organizational members, who participate in the organization symbolically and socially construct and sustain the culture. *Second*, organizational culture is dynamic, not static. *Third*, organizational culture consists of competing assumptions and values, as organizational members create sub-cultures with both overlapping and distinguishing elements. *Fourth*, organizational culture is emotionally charged, as meanings associated with artifacts, values, and assumptions are deeply connected to the feelings and relationships of organizational members. *Finally*, organizational culture operates in both the foreground and background

of organizational life. Organizational members make sense of their current interactions (the foreground) on the basis of their understanding of the existing culture (the background). This cycle of culture creation is continuous and never complete. As a result, organizational culture is a representation of the social order of an organization (→ Control and Authority in Organizations).

### **Relationships of Sub-Cultures to Culture**

A consensus view of organizational culture is based on the congruence of assumptions, values, and artifacts jointly held or shared by organizational members. The more unity there is among members, the more consensual the view of organizational culture. Often referred to as integration, mutually consistent interpretations are abundant and so deeply held that little variation occurs. Generally, a strong leader shapes this integration by initially generating the value and beliefs and then strategically publicizing and propagating them.

Six factors *limit* the degree to which a *consensual view of culture* can be achieved. Employees are often members of occupational or professional communities and bring pre-existing shared values and practices into the workplace. Employees also belong to specific functions (e.g., manufacturing, human resources, engineering, sales) or work groups. Because the work of these groups is central to the organizational mission, these individuals are likely to bond together as they work to control their collective destiny in the organization. Hierarchy can also create sub-cultures. Organizational members at the same level will share similar organizational treatment, and thus sub-cultures develop. Sub-cultures can also develop based on the social needs and interpersonal interactions among employees across work groups or work functions. When groups exist in an organization they distinguish themselves from members of others groups. This ingroup/outgroup distinction often results in intergroup conflict that strengthens differences between groups and the sub-culture of each. Finally, all employees have individual value systems, and core values are often difficult to change. Thus, it is common for sub-cultures with different sets of artifacts, values, and assumptions to develop in organizations.

Regardless of their basis, sub-cultures are revealed in the *language patterns* of organizational members as they segment themselves into groups. Sub-cultures may be distinguished by clear and systematic differences. This type of segmentation, known as differentiation, reveals oppositional thinking, with each sub-culture concerned about the power it holds relative to others. Within each sub-culture, there is consistency and clarity that makes it distinct from others. In contrast, fragmentation of organizational culture occurs when ambiguity is prevalent. Here, organizational members are part of shifting coalitions, forming and reforming on the basis of shared identities, issues, and circumstances. Sub-cultures appear briefly, but with boundaries that are permeable and fluctuating, making it difficult for a sub-culture to sustain itself. Fragmentation tensions are irreconcilable, and are often described as ironies, paradoxes, or contradictions, as employees may belong to sub-cultures that are in agreement on some issues and simultaneously belong to other sub-cultures that are not. In this view, ambiguity is a normal and persistent organizing condition.

The broadest view of cultural consensus and division is that integration, differentiation, and fragmentation *coexist*. Using all three perspectives allows consistency, distinction, and ambiguity to be revealed as important characteristics of an organization's culture. One perspective is not more correct than another, as each offers an incomplete view of an organization's culture, and all three are needed to offer a multifocal view. Described as a nexus approach to the study of organizational culture (Martin 2002), this serves as a resource for communication researchers. However, the ontological and analytical claims associated with it have been challenged (Taylor et al. 2006).

## HISTORY

Viewing organizations through a cultural lens – rather than as legal entities, hierarchies, or functional operations – reveals the rich symbolism that exists in all aspects of organizational life. A cultural lens also shifts the focus in organizational studies from that of managers, leaders, and executives to all organizational members (→ Leadership in Organizations). Through a cultural perspective, researchers can explore an organization's way of life, how that reality is created and interpreted by various organizational stakeholders, and the influence of those interpretations on organizational activities.

From early anthropological studies, culture was viewed holistically and was synonymous with societal boundaries. More recently, the study of culture has focused on meaning systems that distinguish members of one group or category from another. The primary contribution of anthropologists to the study of culture has been their integrated and detailed accounts of cultural phenomena. The study of organizational culture also draws from sociologists who focus on sub-groups within a society (e.g., blue-collar workers, working mothers) and the ideas, themes and values they express.

Although not labeled as organizational culture, Elton Mayo's human relations studies (Mayo 1975; 1st pub. 1949) concluded that informal interactions among organizational members created expectations and constraints that could not be otherwise explained, and that beliefs, attitudes, and values brought by employees into the work setting influence how the employees view themselves, the organization, and their roles. By 1969, organizational culture was inextricably linked to organizational change, as management scholar Warren Bennis proclaimed that the only way to change an organization was to change its culture.

Since the 1970s, communication scholars have worked to explore and explain the ways in which messages, meanings, and symbols are central to an organization's existence. This early symbolic interaction approach has been replaced with an interpretive approach that focuses on the complexity of meanings in social interaction, treats organizations as social constructions, and views the processes of organizing and communicating as inextricably linked (→ Organizational Discourse). Most recently, a critical communication perspective of organizational culture (→ Organizational Communication: Critical Approaches) has generated insight about cultural processes by revealing the complexity of the work environment, the variety of stakeholders, and their competing interests and power relationships (Deetz 1988).

Communication scholars have contributed to the growth and development of the study of organizational culture in five ways (Eisenberg & Riley 2001). First, a communication perspective has demonstrated the symbolic nature of day-to-day conversations and

routine practices, emphasizing that culture is present in all organizational communication. Second, a communication perspective emphasizes the way in which both interpretation and action exist within communication practice. Third, the communication perspective on organizational culture recognizes how societal patterns and norms facilitate or constrain the practices of individuals within an organizational culture. Fourth, the communication perspective honors a variety of researcher–organization relationships. The researcher can be within, close to, or more removed from the culture being studied. Finally, the communication perspective acknowledges all motives as legitimate for the study of organizational culture. These five contributions underscore the role of the study of organizational culture in moving the broader study of organizations, particularly, organizational communication, from a rational, objective, and abstract perspective to one that produces deep, rich, and realistic understandings of organizations and the experiences of people within them.

### **APPROACHES FOR ORGANIZATIONAL CULTURE RESEARCH**

Communication scholars have taken several approaches to the study of organizational culture. Four are described here: symbolic performance, narrative, textual reproduction, and power and political.

The *symbolic performance perspective* examines the way in which a set of artifacts, values, and assumptions reveals cultural meaning as well as how the performance itself is developed, maintained, and changed. Organizational performances have four characteristics (Pacanowsky & O'Donnell-Trujillo 1982, 1983). They are interactive and contextual, as organizational members create and participate in them together situated within a larger set of organizational events. Organizational performances are episodic – each with a beginning and ending – creating regularity and a routine for the flow of work, as well as a framework for interpretation. Finally, organizational performances are improvisational. While an organization's culture can provide some structure for a performance, a performance is never fully scripted. Witmer's (1997) study of Alcoholics Anonymous illustrates these characteristics.

A second approach sees organizational culture as a *narrative reproduction*. A narrative is a story, and a common way for people to make sense of their organizational experiences (Boje 1991; → Storytelling and Narration). Because organizational stories are about particular actors and particular events, they serve as artifacts to provide information about an organization's values and assumptions. The telling and retelling of a narrative reproduces the culture and provides insight into what the culture values. Stories also reveal logics or rationales for understanding the complexity of organizational life, and create bonds that hold organizational members together. If others in the organization tell the same or a similar story, the narrative will gain legitimacy and be seen as the way things really are. Legitimacy in this case is not located in *truth*, but depends on the plausibility of the story. Most important, stories are never neutral, and often represent the interests of dominant groups. Because stories reinforce what is and what is not valued, they both produce and reproduce the organization's power structure. As an example, Zoller's (2003) interviews with employees at an automobile manufacturing plant demonstrate how stories reveal their values and assumptions and the way in which those values and assumptions align with those of management.

A third approach conceptualizes organizational culture as *textual reproduction*. Written texts, such as formal communication in the form of newsletters, mission statements, procedures, handbooks, reports, and slogans, are widely used and available in organizations, providing a fixed view of organizational culture (→ Text and Intertextuality). Typically these texts represent managerial perspectives because of their permanence and ability to be controlled. Textual reproductions of organizational culture are especially useful for exploring espoused versus enacted elements of culture. Formal documentation represents the espoused view and explains the culture from a managerial perspective. Alternately, informal texts, such as emails or blogs, are better representations of the enacted culture. An example of the latter is Gossett and Kilker's (2006) examination of a counter-institutional (i.e., not organizationally sponsored) website that reveals employees' and former employees' alternative interpretations of organizational events.

In a fourth view, *power and politics* are manifested in many ways in organizations; four are central to the study of organizational culture (Ragins 1995). Power can exist in an organizational member's ability or others' perceptions of that ability. Power can exist in interactions among organizational members. Structural or legitimate power can be derived from the design of the organization, most commonly based on a job title or job function. Finally, socio-political power – such as racism, sexism, and classism – can be imported from an organization's larger social environment. Thus, it is impossible for an organization's culture not to carry symbolic meaning about who is powerful and who is not. For example, Smith and Keyton's (2001) study of the production of a television sitcom demonstrates how interactions among organizational members both affirm and contest hierarchal power.

The *critical perspective* views the communication of an organization as an index of its ideology. Critical cultural studies explore forms of organizational domination and control as well as the ways organizational members perpetuate or resist these forms. Organizations are sites of hierarchy, dominance, and power, and, as a result, organizational members have varying degrees of power and status, and of control over message creation and message meaning. Powerful organizational members, when they can get others to accept their views about the organization, are in a position to create the normative practices of the organization's culture. Moreover, these members can establish a culture that is more favorable to them and less favorable to the less powerful. While norms and values are sometimes obvious, this imbalance can also be presented in such a way that less powerful organizational members accept the views and values of the powerful without question.

## METHODOLOGICAL ISSUES

The value of a communicative approach to the study of organizational culture rests within a researcher's intimate knowledge of an organization's interaction environment. While early functional and prescriptive studies were largely based on → surveys or questionnaires (→ Interview), the interpretive and critical perspectives rely on participation → observation, group and individual interviews (→ Interview, Qualitative), ethnography (→ Ethnography of Communication), and textual analysis.

These methods allow the researcher to capture informal and formal textual artifacts of the organization, and organizational members' interactions as they occur as well as their

reactions to the communication of others. These methods also allow a researcher to examine the texts, interactions, and interpretations of communication within the context in which they were generated.

# Organizational Discourse

Gail T. Fairhurst

University of Cincinnati

Organizational discourse is a burgeoning area of study featuring the role of discourse and communication in organizational dynamics. While its rhetorical and literary roots date back to the ancient Greeks (→ Rhetorical Studies), a more recent impetus has been the analysis of professional talk in institutional settings, beginning in the 1970s, and the role of slogans, creeds, jokes, and stories as reflections of organizational culture in the 1980s (Putnam & Fairhurst 2001). From these early beginnings, organizational discourse analyses have taken on a number of forms.

## DEFINITIONS

Discourse and communication are not synonymous; communication is conceived as a related but broader construct that goes beyond the language and meaning-centered concerns of organizational discourse. Although discourse can be defined in a number of ways, Alvesson and Kärreman (2000) generally distinguish between *discourse* and *Discourse*. Specifically, *discourse* is the study of talk and text in social practices. *Talk-in-interaction* represents sociality, the processes of messaging and conversing. It is the “doing” of organizational discourse, while *text* is the “done” or material representation of discourse in spoken or recorded forms. Texts can include both written documentation and verbal routines, such as performance appraisals and job interviews that are reconfigured through continued use. The details of language and interaction are the central concerns of *discourse* analysts. Following Michel Foucault, *Discourse* refers to general and enduring systems of thought rooted in history and culture. Power/knowledge relations are established in culturally standardized Discourses, formed by constellations of ideas, logics, assumptions, and language that come to constitute objects and subjects. These Discourses order and naturalize the world in particular ways and serve as linguistic resources for communicating actors. *Discourse* analysts interpret Discourses either as standalone systems of thought or the ways in which these systems of thought become dialogically grounded in social practices (→ Discourse Analysis).

## DISCOURSE–ORGANIZATION RELATIONSHIP

Organizational discourse analysts often refer to organizations as discursive constructions because the combined forces of *discourse* and *Discourse* are the foundations upon which organizational life is built. However, there are at least three interpretations of the discourse–organization relationship (Fairhurst and Putnam 2004). When the organization is cast as an *already formed object*, the organization exists prior to discourse, remains stable over time, and has specific features or components that shape language use. In this tradition, language can be an interesting artifact, reflect the boundaries of one or more speech communities, or become a product of some feature of the organization. When the organization

is depicted in a *state of becoming*, discourse exists prior to the organization because the properties of language and interaction produce organizing. For example, language use can signal relational differences, align group members into categories, legitimate actions, and enact asymmetric or distributed power relationships. This tradition explicitly rejects language as artifact to focus on the ways in which discourse constitutes micro- and macro-aspects of organizations. Finally, in the *grounded-in-action* relationship, action and structure are mutually constitutive. Drawing from → ethnomethodology, → structuration theory, or actor-network theory, the organization is anchored at the level of discursive practice. Rejecting the macro–micro distinction for organizational processes, analysts instead emphasize the ways in which structure is found in action, history is captured in the present, and the global exists within the local; for example, see concepts such as lamination (Boden 1994), structuration (Giddens 1984), and association (Latour, 1996). Because the object, becoming, and grounded-in-action perspectives all possess a certain veridicality, holding them in tension with one another can produce more complex understandings of the discursive foundations of organizational life.

### TYPES OF ORGANIZATIONAL DISCOURSE ANALYSES

There are a number of typologies for organizational discourse. This discussion follows Putnam and Fairhurst (2001) with a few exceptions. Accordingly, there are eight types of organizational discourse analyses: sociolinguistics, conversation analysis, cognitive linguistics (including discursive psychology), pragmatics (including speech acts, ethnography of speaking, and interaction analysis), semiotics, literary and rhetorical analyses, critical discourse analysis, and postmodern discourse analysis.

In *sociolinguistics*, language is a product of social categories such as class, education, or geographic differences; the analytic focus is on the meanings and linguistic repertoires of these social groupings. In the organizational arena, sociolinguistics examines language differences among blue- and white-collar workers, geographically separate units, occupations, roles, or sub-cultures. Language and lexicons are the artifacts of organizations whose structures are static forms rather than dynamic processes (→ Linguistics; Interactional Sociolinguistics).

*Conversation analysis* focuses on the detailed organization of talk-in-interaction (→ Conversation Analysis). Its goal is to discern how people use various interactional methods and procedures to produce their activities and make sense of their worlds. Conversation analysis captures the inherent richness and complexity of social interaction by analyzing turn-taking, membership categorization, adjacency pairs, insertion sequences, accounting practices, topic shifts, conversational openings and closings, agenda setting, decision-making, and many other forms of talk-in-interaction. The interpretive practices and competencies of actors found through conversation analysis also reveal how the organization is literally “talked into being” (Heritage 1997). As such, the macro–micro distinction dissolves because of an emphasis on social practices, the primacy of text, and the absence of researcher-imposed “levels” of analysis (Boden 1994).

*Cognitive linguistics* is the study of discourse processes that arise from mental processes such as → scripts, → schemas, and frames. It includes *discursive psychology*, in which psychological phenomena such as attitudes, categories, scripts, memory, attributions, and

so on are examined for the ways in which they surface in talk-in-interaction. For example, while scripts refer to mental representations or stereotyped sets of events, *script formulations* occur in ordinary conversation as verbalized event sequences. Scripts formulated in talk can be depicted as more or less routine; script violation or *breach* occurs in conversation when some problematic event is contrasted with a routine. Both script and breach formulations are rhetorical moves deployed for some interactional goal (Edwards 1997). In organizational discourse studies, script and breach formulations function as linguistic resources in organizational change, performance management, or organizational conflict. Other forms of cognitive linguistics include *cognitive mapping* of shared interpretations through linguistic phrasing, and *semantic networks* emerging from similar interpretations of organizational concepts and words.

*Pragmatics* emphasizes language in context (→ Linguistic Pragmatics) and forms three distinct schools. First, *speech acts* treat language as action, emphasizing the actions performed, such as promising, requesting, baptizing, and so on. Organizational studies focus on politeness, accounting, and common speech acts such as directives, declaratives, expressives, and so on as well as their ordering within specific episodes of interaction (*speech act schematics*). Second, *ethnography of speaking* focuses on actors' expectations and typifications associated with the context and its routines. Organizational studies emphasize the language of specific speech communities and communication rules, conversational performances of organizational roles, storytelling performances, and symbolic interaction through negotiated social orders. Finally, *interaction analysis* focuses on the coding of behavior according to a predefined set of codes. It includes a host of quantitative approaches that draw from studies of message functions and language structures to assess the frequency and types of coded verbal behavior in organizational interaction. Interaction analysis highlights the sequences and stages of interaction, their redundancy and predictability, and the link between interactional structures and the organizational context.

*Semiotics* examines the interpretive role played by → signs and sign systems (→ Semiotics). It includes nonverbal codes, images, actions, and objects, in addition to discourse. The analytic focus may be individual signs or sign systems, termed codes. Two semiotic schools have emerged in the organizational discourse literature: *structuralism*, which casts language as a system of differences in which deep structures of meaning and control produce surface-level signs and sign systems; and *semiosis*, which emphasizes the interplay of meaning between signs, referents in the material world, and mental images, such as that found between organizational identity, corporate image, and marketing communications.

*Literary and rhetorical analyses* focus on the interrelationships between language, → meaning, function, and context. *Literary* approaches focus on classic tropes such as metaphor, metonymy, synecdoche, and irony, but also other rhetorical forms including alliteration, icons, euphemisms, and clichés. *Rhetorical* approaches draw from classical methods of argumentation to analyze corporate messages and advocacy in crises, organizational decision-making, identification, and conflict management. Analysts studying literary and rhetorical forms infer meanings through discursive subtexts rooted in organizational conditions and contexts.

*Critical discourse analysis* examines the often opaque relationships between discursive practices, events, and texts and wider social structures and processes to discern the hidden

influence of ideology, hegemony, and struggles over power (Fairclough 1995; → Organizational Communication: Critical Approaches; Critical Theory). Discourse functions strictly to produce, maintain, or resist systems of power and control; thus, analysts critique organizational narratives for their political bias and organizational rituals, routines, and texts for privileged interests. As power relationships are actively constructed through the routines of everyday organizational life, ironies, contradictions, and paradoxes emerge, revealing struggles over power and opportunities to resist.

*Postmodern discourse analysis* also focuses on power and resistance, but analysts reject grand narratives, challenge representationalist views of language, and focus on the instability of meaning (→ Organizational Communication: Postmodern Approaches; Postmodernism and Communication). Foucault's Discourse and disciplinary power are central to this perspective. However, many analysts add to Foucault's work by adopting poststructuralist moorings, which cast Discourses of power as attempting to fix meanings in a struggle where several competing Discourses are always in play. In the organizational context, masculine, feminine, entrepreneurial, and managerialist Discourses are frequent examples. Discussions of agency are cast amid the fragmentation and ambiguity or irony and paradox wrought by multiple Discourses. In postmodern discourse analyses, text is also viewed as a metaphor for organizing; thus analysts privilege intertextuality or the ways a given text intersects with or embodies other texts. Deconstruction and exploring text–conversation tensions pose two analytic options.

## **CRITICISMS AND FUTURE DIRECTIONS**

Generally speaking, organizational discourse analysts argue for the social construction of reality through discourse and communication. Several discursive approaches have been charged with *relativism*, such that reality is just what actors define it to be; and *discoursism*, in which the organization collapses into discourse (Conrad 2004; Gergen 2003). In both instances, the putative lack of attention to pre-existing institutional forms and material conditions results in an exaggerated sense of agency and an insufficient account of coercive structural forces (Reed 2000), or how acts of organizing beget the complex form “organization” (McPhee & Zaugg 2000). For a critique of specific organizational discourse analyses, see Putnam and Fairhurst (2001).

Organizational discourse analysts increasingly look for ways to tackle the “levels” issue associated with *discourse* and *Discourse*. For example, Fairclough's (1995) critical discourse analysis preserves the macro–micro distinction between the two; Taylor and Van Every (2000) theorize hybrid agency between human and nonhuman objects (including texts), the latter of which carries the institutional traces of past organizing; and discursive psychologists like Wetherell (1998) reformulate *Discourse* as the display of one or more linguistic repertoires in *discourse*. Organizational discourse analysts increasingly apply a complex levels approach to specific phenomena such as leadership (Fairhurst 2007), organizational succession and board meetings (Cooren 2007), and the self (Holstein & Gubrium 2000). Finally, as organizational discourse analyses continue to open up the processes of social construction through more meaning-centered models of communication, new implications for praxis are emerging (Barge & Craig in press).

# Organizational Ethics

Stanley Deetz

*University of Colorado at Boulder*

Organizational ethics includes the consideration of a wide number of issues of rights, responsibilities, values, and proper conduct in contemporary organizations and in organizations' relations to host societies. Conceptions and studies of organizational ethics have focused on both internal practices and social consequences and have been descriptive as well as normative. Unsurprisingly, questions of organizational ethics are especially prominent today in the wake of widespread scandals such as those at Enron and WorldCom and the almost incredible global social, economic, and environmental effects of large organizations. While many organizational ethics studies still focus on individual behavior and issues primarily linked to compliance with organizational policies, communication scholars have become increasingly interested in ethical issues focusing on values, governance, and → corporate social responsibility, drawing on concepts developed from critical communication theory (Deetz, in press; → *Organizational Communication: Critical Approaches*).

Organizational ethics discussions focusing on descriptions of internal organizational practices and individual conduct (often also called business ethics) have emphasized accountability, employee rights and responsibilities, and dissent and whistle-blowing (e.g. Seeger 1997; → *Dissent in Organizations*). Most research has described various *business ethics programs*, formal codes of ethics, what division houses the ethics program within an organization, ethics violation reporting, how culture influences ethics, and the role of leadership with respect to ethics. These studies investigate ethical decision-making, moral recognition, judgment, cognitive moral development, religion, and the role of emotion (Treviño and Weaver 2003). Most studies have used fairly simple self-report and behavioral measures. Jackell's (1988) work is an important exception in his ethnography of moral decision-making in organizations. His in-depth analysis provided an understanding of concrete moral dilemmas confronted by employees and the complex processes of making choices in actual work contexts.

A second line of work has been more *philosophical and normative*. Following MacIntyre's (1984) influential work, organizational managers were said to have developed a "character" problem. Character here is not meant in a sense of individual psychological lack, but as arising from the decline of a robust social discussion of values and shared guiding principles. Managerial "stewardship" was described as giving way to a rather raw instrumental reasoning process in which ethics was relegated to a private emotive realm and weakened. Value conflicts and debates gave way to calculations in presumed value-free representational codes, and procedural values like due process replaced end-state values based on conceptions of quality of life and morality. These works tried to reinstate value discussion in the organizational context. The complexity of multiple communities with multiple standards makes such discussions important but difficult.

A third line of work argues that the primary issue is neither individual conduct nor shared values but instead *organizational governance and decision-making processes* (→ *Decision-Making Processes in Organizations*). In this work, the consequences for the

environment and larger society are central, and issues of ethics and social responsibility merge. The concern ranges through important issues such as human rights, environmental protection, equal opportunity and pay for women and various disadvantaged minorities, and fair competition. Such broad issues are instantiated in activities such as using prisoners as workers, moving operations to environmentally less restrictive communities, offering and taking bribes and payoffs, creating environmentally unsound or wasteful products, closing economically viable plants in takeover and merger games, growing income disparity, declining social safety-nets, malingering harassment, maintaining unnecessary and unhealthy controls on employees, and advocating consumerism.

From such a perspective governance and decision-making processes are flawed from an ethical standpoint because, while the processes of organizational decision-making are heavily value-laden, they do not include a sufficiently representative set of values to make responsible decisions for the community or to make the most productive use of resources. The call for greater responsibility is less the application of a new social standard than a transformation of organizations to allow more decisional voices and value debate and negotiation (→ Participative Processes in Organizations). Ethics and responsibility rest in more free and open communication rather than in moral standards. Most of this work has focused on reforming → stakeholder theory by providing a richer conception and more robust applications drawing from critical communication theory, especially following the work of → Jürgen Habermas (Kuhn & Deetz in press; Palazzo & Scherer 2006; Scherer et al. 2006).

# Organizational Identification

Timothy Kuhn

*University of Colorado at Boulder*

For organizational communication scholars, identification provides a key to understanding organizing practices, the individual–organization relationship, and the construction of selves. “Organizational identification” refers to the creation, maintenance, and modification of linkages between individuals and organizations, whereas “identity” refers to the conception of the self that defines the person’s position in the social order (Cheney 1983a; Scott et al. 1998). Identification scholarship builds on a conception of personal identity in which we create selves, as well as distinctions from others, in social settings comprised by a variety of social groups. Identification, then, is the process by which an identity is constructed, but the linkages actors form are simultaneously guided by their pre-existing personal and social identities.

Conceptions of these individual–organization “linkages” mark an important distinction between *three versions of identification theorizing*. A first view emphasizes *cognitive processes*, drawing on → social identity theory and its claims that individuals seek to attain distinctiveness for their mental representations of ingroups and competing groups. In this perspective, identification is the perception of belongingness to a group, and it occurs when one integrates beliefs, attitudes, and emotions regarding an organization into one’s own identity (Pratt 1998).

The majority of organizational communication research on identification falls into a second perspective, one that foregrounds *communicative practice* in understanding individual–organization linkages. This approach draws on the dramatism of Kenneth Burke (1950), → symbolic interactionism, and → structuration theory to assert that one’s personal identity is made up of the myriad identifications with groups comprising social life and that identities tend to be “grouped” such that some identifications logically occur together (Scott et al. 1998; Kuhn 2006). Identification here is fundamentally communicative because the individual–organization linkages are manifest both in organizational activity and in the messages proffered by organizations.

A third approach sees identification as *subject to organizational discourses*, both within and beyond a given organization, which place us in “subject positions” that regulate thought and action. Usually drawing from poststructuralist theorizing, this third view provides an alternative communicative conception of identification that emphasizes the active power of discourse in comprising individuals’ identities (→ Organizational Discourse; Identities and Discourse).

Running across these perspectives is the assumption that individuals identify with organizations because doing so is necessary in the construction of a personal identity. Burke, for instance, argued that contemporary social life creates new divisions between people, and that individuals secure a sense of self against these divisions through attachments with various social groups. We identify with organizations because we recognize some congruence between our personal identities (or perhaps our desired selves) and the identities projected by organizations. In other words, organizations – and particularly workplaces – are attractive *resources for identification* because individuals can derive

several benefits through identification, including satisfying desires for affiliation with others, alleviating feelings of uncertainty or vulnerability, raising aspirations about performance, developing a positive self-image, and providing a sense of purpose.

Organizations benefit from member identification as well. Highly identified workers display more motivation, satisfaction, and pro-social behaviors; they are superior performers who are less likely to leave (Cheney 1983b; Elsbach 1999). More generally, highly identified members place the concerns of the organization above their own self-interest, so coordination with, and control of, these members tends to be relatively simple. Drawing on the work of Herbert Simon, scholars see organizational efforts to induce identification as part of a strategy to exert *unobtrusive control* over members (Tompkins & Cheney 1985; → Control and Authority in Organizations).

Public relations messages, socialization tactics, characterizations of competitors, and contact with charismatic leaders lead members to internalize decision premises in ways that guide their action toward the organizational interest, and away from personal interests, in the absence of overt commands. Thus, identification is generally encouraged by organizations, but high levels of identification can be damaging for both individuals and organizations if it generates unquestioning conformity, decreased creativity, and a lack of personal autonomy (Mael & Ashforth 2001). Moreover, some organizations, such as agencies for temporary workers, may actually seek to discourage identification because the attachments it creates are not beneficial for organizational action (Gossett 2002).

The presence of a *multiplicity* of identity resources complicates the outcomes for individuals and organizations. The most commonly studied identity resources are the work group, the organization, and the occupation, and scholars often examine the compatibilities or conflicts between these identifications in situated activity (e.g., Scott 1997; Glynn 2000). This research shows that differences in professional practices, the nature of the (often tacit) employment contract, communication structures, and organizational strategies lead some identity resources to have a stronger influence on identification than others. Recent work also suggests that identifications may shift over time in response to important organizational events or as actors perceive changes in the nature of the identity resources (e.g., Kuhn & Nelson 2002; Larson & Pepper 2003).

## Organizational Image

*Craig E. Carroll*

*University of North Carolina at Chapel Hill*

Organizational image is a useful concept for understanding the impressions individuals have of organizations or that organizations want to convey to individuals. The term refers to an → image that encapsulates the likeness of an organization. Organizational images can have a strong influence on most aspects of members' organizational experiences. From an individual perspective, organizational image helps to explain how people: (1) seek membership in organizations, (2) identify with organizations, (3) make sense of and compare organizations, (4) align their decisions and behavior with others serving the same organizational cause, and (5) understand themselves and their roles in organizations. From an organizational perspective, organizational image helps the dominant coalition to establish or position the organization, its goals, and its views in the minds of its employees, customers, or other stakeholders. For employees, organizational image helps envision what types of activities are appropriate; for external constituencies, the image helps place the organization into a category of similar organizations while simultaneously differentiating the organization from others (→ Organizational Communication).

The concept of organizational image is closely related to the term “corporate image,” used by management consultants and public relations practitioners. The concept was broadened to capture a wider range of uses. Most people immediately understand organizational image

and acknowledge its influences on organizational life. Most scholars and practitioners recognize its value as a concept and as an organizational “intangible.” Yet there has been little systematic research on this concept within communication studies because of the term’s early association with marketing and manipulation.

## HISTORY

Much of the popular press writing about image from management consultants and public relations practitioners coincided with scholarly writings on image in the first place. The earliest scholarly writings on organizational image came in the early 1960s from the economist Kenneth Boulding and the historian Daniel Boorstin; each had his own influences. Boulding (1956) offered “the image” as a device undergirding much of society. Boorstin (1961) used the term as a signification of the “graphical revolution,” whereby much of what the public knows becomes mediated through the graphical interfaces, such as advertising, the news media, or other third parties. While Boulding noted that his view shares much with George Herbert Mead’s symbolic interactionism (→ Symbolic Interaction), he assigned Barnard’s *Functions of the executive* (1968, 1st pub. 1938), Wiener’s *Cybernetics* (1948), and Shannon and Weaver’s *The mathematical theory of communication* (1998, 1st pub. 1949) as the sources for his formulations of the image concept. Boorstin attributed his source of inspiration to Walter Lippmann, who used “image” to describe the “pictures in our heads” of the world outside of our direct experience.

The first use of “organizational image” in communication studies was by Harris and Cronin (1979, 13), who used the term to mean the “construed beliefs and goals that define a collectivity.” According to Harris and Cronin, an organizational image is composed of three analytical levels: constructs used to define the organization, beliefs about the organization, and ideal goal states for the organization. Based on this “image,” organization members negotiate rules that define appropriate behavior within the context.

## DIMENSIONS OF ORGANIZATIONAL IMAGE

There is considerable debate about whether all organizations even have an image. Using such terminology usually suggests a question about the degree of familiarity stakeholders have with the organization or whether they have sufficient clarity to make an estimation of what the organization is about. Erving Goffman (1963) suggested that if an image is not clear or discernible, people will fill the blank screen with images of their own (→ Goffman, Erving). Often, these images are not favorable, which suggests that organizations are better off creating their own images as a way of establishing desirable ones.

A second way that image is described is purely in terms of affect, sentiment, or status, such as when it is said that an organization has a positive or negative image. Organizational images are used as frames in which organizations attempt to attach themselves to a category of similar organizations, and then distinguish themselves from the pack with which they associate. In this sense, individuals are able to locate an organization within a particular category, while still being able to differentiate the organization from others sharing the same label. Particular types of categories include market positions, industries,

or even organizational forms. In more cynical views, “organizational image” is used to connote a facade or a public face that contrasts with reality. According to Baudrillard (Merrin 2005), an image can function as (1) the reflection of a basic reality, (2) a mask or perversion of a basic reality, or (3) a mask for the absence of a basic reality, or (4) the image becomes its own reality.

### CATEGORIES AND DEFINITIONS OF ORGANIZATIONAL IMAGE

Many use the term → “corporate reputation” as a substitute for organizational image because of the “negative image” the latter term often has. That is, the term can often pejoratively refer to the illusory or superficial nature of images that may or may not reflect reality. There are *four general types of organizational images* in the communication literature. They are projected images, perceived images, refracted images, and defining images. Each of these four general types overlaps with the others in different ways depending upon whether one is adopting the viewpoint of senders or receivers, organizational members or individuals outside the organization, or simply comparing the messages designed to represent the organization with those from individuals who have their own opinions, speaking as authorized agents, highly identified or disenchanted individuals, or self-appointed experts.

The *projected image* refers to the image emitted by the organization. This is the view that came from management consultants and public relations practitioners in the 1950s and 1960s, and the view associated with management and marketing orientations. From this view, the projected image is the corporate image embodied in visual icons, corporate logos, tag lines, and message points. It also refers to the desired image that the dominant coalition projects through mission and vision statements, credos, speeches, and expressions of organizational identity and core values. This image can also be used by founders or entrepreneurs to help create, constitute, and guide the organization before the organization has any sense of history or precedence upon which to rely.

The second major view of organizational image is the *perceived image*. Here, the emphasis is on a general impression or perceptions held by insiders or outsiders. This category includes the organization’s public image, perceived organizational identity (members’ answers to the question “Who are we?” as an organization), construed external image (what insiders think outsiders believe), and corporate reputation (what outsiders actually think about the organization). This view also includes what those outside the organization hear coming from the organization. This view, too, is sometimes referred to as corporate image, but from the perspective of the external members’ perceptions of the organization. This view of image is different from corporate reputation in the sense that external audiences are comparing what they see the organization doing with what the organization says.

Another general view that is emerging is the view of *refracted images*; that is, organizational images passed on by third parties such as the news media, advertising agencies, government regulators, analysts, and pundits through some form of medium. These groups will often take the images passed on by organizations and add their own interpretations, which may or may not match or align completely with what the organization projects or says itself, but become part of the symbolic environment. Refracted images

gain an air of objectivity because they come from sources generally regarded as authoritative, they are publicly available, and they are widely distributed. The general public has access to these images and they interact or combine with what is seen coming from the organization itself.

The last view of organizational image comes from scholars who study organizations. This category of organizational image, *defining images*, simply refers to central images in organizations, such as root metaphors and archetypes. These images are used as heuristic devices to capture the general nature or definition of organizations or the worldviews that are at work within them. For example, Ruth Smith and Eric Eisenberg (1987) used root metaphors as organizational images to illuminate conflict in worldviews between management and labor at Disneyland. Gareth Morgan (1997) used images to help shed light on underlying organizational structures.

### MEASURING ORGANIZATIONAL IMAGES

Organizational images have been assessed and measured in a variety of ways, including participant observation, in-depth interviews (→ Interview, Qualitative), focus groups, → surveys, Q methodology (→ Statistics, Descriptive), and content analysis (→ Content Analysis, Quantitative; Content Analysis, Qualitative). There are no standardized questionnaires for assessing the contents of organizational images (→ Interview, Standardized). Don Treadwell and Teresa Harrison (1994) studied organizational images using personal interviews, Q-sort, and questionnaires. Another large-scale example of the study of organizational images comes from Mary Mohan (1993).

Most Q methodology studies and surveys usually begin with in-depth interviews or focus groups to determine what images are applicable. The conditions of instruction for assessing organizational images have seen more systemization. Respondents are often asked to identify what their perceptions of the organizational image is, which images they find attractive or unattractive, which images they agree or disagree with, which images conform to their experiences with the organization, even their perceptions of what top management (or the organization) is attempting to convey. Content analysis has been used for examining organizational image in CEO speeches, vision and mission statements, annual reports, and published news reports. One concern with assessing organizational images through the use of respondents is their idiosyncratic nature. An individual's personal image of the organization may not even exist prior to the person's being asked to provide it.

### IMPLICATIONS OF ORGANIZATIONAL IMAGE

There is considerable potential for organizational image as a construct within communication research. Communication scholars can combine these approaches in order to more fully illuminate conflict in communication policies and practices both within and across organizations. Using co-orientation theory from interpersonal communication research, researchers and organizational practitioners can use organizational image as a way of helping organizations understand the degree of accuracy, agreement, and perceived agreement between the different forms of organizational images described here.

For example, → public relations practitioners can compare the images that the general public sees coming from the organization with the images the organization is trying to project, or the perceptions that organizational members have of their organization's reputation with the reputation their organization actually has. Further still, the projected image of the organization can be compared with the reputation that the organization actually has with the general public or members of any one stakeholder group. Comparing these different perceptions and projects may enable organizations to identify areas of consensus and conflict that may suggest whether policy changes are needed or are sustainable.

# Organizational Metaphors

Kathleen J. Krone

University of Nebraska-Lincoln

Metaphors have played an important role in shaping the study of organizations and organizational communication since the 1980s. Various principles of metaphor have been used to conceptualize the abstract and complex domains of organizations and organizational communication; to imagine new constructs, theoretical insights, and perspectives; to analyze and understand organizational culture; and to facilitate organizational change (Lakoff 1993).

An early and influential consideration of metaphorical → images analyzed organizational theory through a set of eight metaphors as diverse as “machines,” “cultures,” “psychic prisons,” and “instruments of domination” (Morgan 1986, 1997). This analysis highlighted the partiality of each metaphor, illustrating the idea that organizations are too complex to be understood completely as any one. In addition, multiple and overlapping metaphors have been used to characterize organizational communication research, including those of conduit, lens, linkage, performance, symbol, multiple voices, and discursive forms (→ Organizational Communication). This analysis also implies that the complexity of organizational communication requires the use of multiple metaphors in research and illustrates how the relationship between organization and communication shifts within and across metaphors, between those of containment, co-production, and equivalency (Putnam et al. 1996).

A range of *organizational constructs* have been reconceptualized through the use of metaphor, including the organizing process itself (Eisenberg 1990), career models (Buzanell & Goldzwig 1991), negotiation (Stutman & Putnam 1994), organizational socialization (Smith & Turner 1995), emotion management (Krone & Morgan 2000), international teamwork (Shockley-Zalabak 2002), and employee cynicism and resistance (Fleming 2005). In the process, these studies have illustrated the limits of traditional constructs and opened up space for the development of new knowledge and insights.

In addition, metaphors have played a role in the analysis of → organizational culture. Scholars have examined the external and internal coherence of metaphor clusters to understand the social construction of organizational reality (Koch & Deetz 1981), and the use of metaphor to better understand power relations and the processes by which systems of consensual meaning are constructed and challenged (Deetz & Mumby 1985; → Constructivism). Through an analysis of root metaphors, scholars have also demonstrated how the images of *drama* and *family* embedded in organizational culture help explain conflict and change in Disneyland (Smith & Eisenberg 1987).

Because metaphorical expressions both reflect and construct an organization’s system of → meanings, their use can both facilitate and block change (→ Organizational Change Processes). The skillful use of metaphorical language is considered important for leaders and others who wish to manage innovation and change in organizations (→ Leadership in Organizations). Organizational development consultants work with metaphor in a variety of ways as a tool to diagnose problems and design appropriate interventions (see Oswick & Grant 1996 for examples). Some of this work is noteworthy in its attempt to

acknowledge and creatively work with the inherent ambiguity and potential unmanageability of organizational metaphor (Barrett & Cooperrider 1990).

Future research on organizational metaphors supports the turn toward discourse in organizational studies and organizational communication research (→ Organizational Discourse). The greatest contributions to understanding will come from the continued study of metaphors in use among organizational members (Oswick & Grant 1996). Such language-centered research will continue to inform understandings of the discursive production and reproduction of organizations (Deetz 1986), and the ways in which some metaphorical expressions become dominant while others are suppressed (Inns 2002). The study of metaphors in use also will continue as a complement to the study of other forms of organizational discourse such as irony (Oswick et al. 2004).

## Organizational Structure

*Robert D. McPhee*

*Arizona State University*

*Heather Canary*

*Arizona State University*

Organizational structure is the set of formally stipulated rules and regulations that regulate and legitimate the organization's work processes, communication, and other activities. An organization's structure constrains interaction processes and biases the style and content of interaction; also, since organizational structure is the framework of any organization, it is the focus of → discourse about organizational change.

Organizational structure includes features such as an organization's hierarchy, divisional and departmental pattern, arrangements for surveillance and record keeping, and explicit operating procedures and policies. It is generally spelled out in writing in a typical organization's legal documents, personnel and payroll records, strategic plan, and operating procedures manuals. Explicit, planned structural features make organizations distinct from other social forms such as communities and families, and are in large part responsible for the power organizations have in our world today. Organizational structure has long been important to → organizational communication, because it is a managerial tool establishing authority allocations, mandatory information flows, work allocation and workflow patterns, and grouping arrangements for employees. Early studies reflected this managerial perspective by identifying structural patterns useful for efficient communication. More recently, scholars have conceptualized an organization's structure as itself created and conveyed in a communication process that reflects cultural norms and the organization's environment and history.

### HISTORY

Formal structure is focal in even the earliest writings about organizations, which involve records of resources and plans for personnel use in building cities and pyramids. Early

analysis of organizational communication prescribed communication along lines of formally authorized relationships, within organizations viewed as containers of communication processes. Early analysts of bureaucracy and scientific management emphasized written communication, the regular flow of files from official to official, the importance of clear oral instructions about behavior, all supported by a formal managerial apparatus designed to maximize the efficiency of information flow (→ Bureaucracy and Communication). Bureaucracy, beyond its controlling tendencies, also manifested norms of transparency, fairness, and workplace justice, both to limit worker resistance and to harness worker loyalty and initiative. The tendency of human relations theorists was to take a managerial perspective emphasizing supervisor leadership through vertical communication to shape informal group norms. That tendency was echoed in the emphasis in early business communication literature on appropriate channel and style selection in vertical communication.

In the 1960s, strategic contingency and → systems theories led researchers and consultants to pay more attention to communication issues. They reasoned that as organizations faced more complex, unclear, and dynamic environments, structures had to change to allow similarly complex information processing. Abstract structural syndromes such as centralization, formalization, and standardization were reconceived as variables; both concrete and abstract structural features were seen as potentially simplifying or helping to perform the vital functions of coordination and information processing. In complex environments, organizations were supposed to: (1) develop flatter, more decentralized structures, (2) create ways to facilitate interdepartmental communication by appointing liaison managers and setting up regular integrating relationships and task forces, (3) share information and power more fully, and (4) engage in collaborative decision-making.

The documents stipulating organizational structure automatically mandate and constrain other organizational communication processes; moreover, they serve as a foundation for a managerial and financial logic that could overpower other bases of organizational decision-making. In addition, these documents create a fundamental division or “distanciation” in the organization, between managers empowered to create or write structural documents and approve them, professionals who have access to and can influence implementation of the structure, and workers who rarely have access to the documents and can seldom understand them.

Differences among documents such as hierarchy charts, mission statements, and policies lead to important differences in the implementation of, or dissemination of information about, structural change. Some important changes may be subject to brief announcement only, while others involve extensive consultation during planning, elaborate announcement ceremonies, and extensive training or development programs to deal with cultural and other consequences of the structural changes (→ Organizational Change Processes).

Since the height of influence for contingency theory, attention of researchers has swung away from general issues of organizational structure, for several reasons. First, global competition, technological advances, and greater complexity of outputs have led organizations to adopt very flexible structural arrangements across the board; today’s “machine bureaucracy” is rarer and very different from that of old. Second, growing understanding of nonformal factors such as information channeling, → organizational culture, and peer group pressure

have led to increased concentration on their use for organizational control, replacing standard structural features. Third, communication technology has revolutionized organizations, facilitating the development of novel forms, and augmenting or substituting for standard structural features (→ Technology and Communication; Information and Communication Technology, Development of). As a result of these developments, research on organizational structure has turned to analysis of specific structural features and types.

## IMPORTANT STRUCTURAL FEATURES TODAY

### Communication Technology (CT)

Though communication technology is not really a structural feature, its power as a communication and control medium has enabled it to supplant other structural features and change basic properties of organizations. CT has affected organizational structure foremost by allowing the creation of “new organizational forms,” discussed below. Other impacts include the fact that *computerized communication replaces direct interaction* for orders and standard rules as a coordination mechanism, allowing for more transparent coordination apart from control. CT also allows *both synchronous and delayed communication*, enabling coordinated work over global distances without regard to time differences. CT *crosses traditional organizational boundaries* and geographic distances easily, allowing the distancing effects of rank, occupation, and even organizational membership to be bypassed, so that organizations and their alliances can have truly global reach (→ Globalization of Organizations). CT allows the *transition to → knowledge management* as an important value-adding process, with information and ideas rapidly disseminated and applied in new ways.

With these empowering changes come some *constraints*. CT replaces work rules with communication access rules: there are some databases and message threads that employees cannot read or affect. CT also allows greatly expanded surveillance of employee work and communication, in a way that can defeat decentralization. For instance, optimal empowerment of battlefield commanders is undermined if distant superiors use CT to micro-manage combat decisions. Further, CT rules and surveillance are often less transparent than traditional structural features. Both these constraints and the empowering effects may depend on the structural context of the units using CT.

### Organizational Policy

Policies created and implemented within organizations are material features of organizational structure. Policies both reflect and create structure by mediating between structure and action and by formally prescribing how activities and procedures transpire.

Developing policy research has made links among structure, policy, and action clearer. Critical approaches focus on ways that structure influences whether an issue becomes policy-relevant and how policies reproduce existing organizational power distributions. Interpretive approaches focus on how organizational caseworkers interpret and use policies to negotiate activities within contested contexts, often in ways that thwart the

original intent involved in the policy. Decision-makers, implementers, and policy stakeholders engage in continuous negotiations of meaning and purpose throughout issue identification, policy construction, implementation, evaluation, and revision.

Because they are publicly available and subject to adjudication, policies – especially public policies – are often developed and disseminated in elaborate processes of investigation, publication, review, implementation, and staff training. Such processes help mediate between levels of organizational hierarchy.

### **Nonstandard Employment Relations**

More organizations employ workers under nonstandard arrangements such as independent contracting, temporary firm placements, daywork, and at-home work. Implications of these new relations vary by contract type, with workers who desire temporary status having better work experiences, greater flexibility, and more benefits, while involuntarily nonstandard workers suffer economic disadvantage. Other sources of success for temporary workers are the socio-emotional and informational supports from the client organization. Workers from “temp” firms often fall under a dual-control system, by both temporary agency and client organization, and experience looser control.

Organizations receive economic and knowledge benefits from nonstandard workers. Contingent workers also learn (so organizations risk proprietary knowledge), especially if they are successfully integrated with the core workforce. But integration can be challenging. Presence of temporary workers can lead core workers to be more conscious of the threat (and benefits) of greater insecurity in their own job arrangements, and also of (perceived) injustice, overwork, and reduced promotion opportunities for core workers.

## **IMPORTANT STRUCTURAL TYPES TODAY**

### **“New Organizational Forms”**

These are also called network organizations and post-Fordist organizations. Noteworthy features include: (1) *flexible production*, with skilled workers using computerized technology to do intelligent work responding to differentiated markets; (2) *team organization*; (3) *dense CT nets* within and between teams; (4) *flat vertical structure* with little middle management but dynamic self-organization of team alliances; (5) *control by top management* through surveillance, peer pressure, and result-based allocation of capital; and (6) *technology* allowing global distribution of such teams and networks. This complex of features is strikingly different from the “machine bureaucracy” that characterized many organizations a half-century ago; it is closer to the “organic community” form of craft shops and research labs, but lacks the social stability and worker power of those institutions.

New organizational forms have proliferated due to low-cost communication technology and more educated workforces; they are encouraged by hypercompetition and mobile global capital. They allow invisible, dynamic control, making worker organization and resistance harder. They also present communication challenges to workers: problems of successful team self-management in an externally controlled environment,

problems of surveillance and autonomy, and difficulties in developing trust and team commitment.

### **Organizational Democracy**

Another research focus, going beyond decentralization aimed at interactive coordination, is democratic participation by stakeholders in the resolution of basic structural issues for organizations. Democratic organizations develop due to top-level corporate desires to motivate workers, as well as from worker efforts inspired by democratic ideals. They are facilitated by an educated, empowered workforce valuing democratic initiative and voice, but constrained by post-Fordist developments, such as politically powerful free-flowing capital and new surveillance or control media.

Organizational democracy is a mixed structural type, with varied arrangements for member voice through ownership, voice, and representation, about varying issue types. Democratic organizations face special challenges, stemming both from the need for bureaucratic elements in performance-oriented social systems, and from today's hypercapitalistic environment (→ Participative Processes in Organizations).

### **FUTURE DIRECTIONS**

As new media of control, nontraditional work forms, and global workforces proliferate, research must explore how management and work design, in conjunction with new structuring practices, lead to organizational control and/or emancipation. Future studies of structure and policy will benefit by focusing on micro-processual connections to macro-organizational and broader societal structures, using → structuration and activity theory. Investigations also will benefit from longitudinal studies and qualitative data reflecting critical, interpretive, and practice theory approaches.

## Organizations, Cultural Diversity in

Mary M. Meares

Washington State University

Cultural diversity is an increasingly salient issue for many organizations due to greater geographic mobility among potential members (including migration; → Migration and Immigration) and a decrease in barriers to participation in many countries. “Cultural diversity” is defined as the presence of members with different systems of understanding based on cultural or group affiliation (Cox 1993; → Diversity in the Workplace). These systems of understanding may be based on identities of gender, age, ethnicity, socioeconomic status, sexual orientation, religion, educational background, or other identity groups (→ Culture: Definitions and Concepts). Loden and Rosner (1991) divide dimensions of diversity into those that are relatively fixed as primary (e. g., age, ethnicity, gender, physical abilities, race, and sexual orientation) and those that are more mutable as secondary (e. g., educational background, geographic location, income, marital status, etc.). Although demographic differences in a group often reflect differences in experiences and patterns of behavior, it is the differences in worldview, values, and ways of understanding based on cultural differences that often prove challenging in understanding diversity in organizations. When members of a work, social, or educational organization come from different cultural backgrounds, there is both increased potential for conflict and misunderstanding and the potential for greater creativity and resources, resulting in productivity (→ Intercultural Conflict Styles and Facework; Organizational Conflict).

Cultural diversity has been framed by organizations in various ways (Cox 1993; Ely & Thomas 2001). Cultural diversity has long been seen as an issue of civil rights, social justice, and morality in some organizations, where providing access and fair treatment to people from different cultural backgrounds is the “right thing to do.” Cultural diversity, especially in the US, has also been framed as a legal issue, with a focus on avoiding charges of discrimination (e.g., lawsuits) and meeting governmental requirements (e.g., affirmative action). Many workplace organizations also frame cultural diversity as an economic issue (i.e., the “business case” for diversity), linking diverse membership to better creativity and innovation, legitimacy, the ability to attract talented new members, and, ultimately, productivity. A focus on cultural diversity may also be seen as part of the organization’s mission (particularly with educational or nonprofit organizations) or their identity. Often these diversity frames overlap, with organizations citing multiple reasons for focusing on cultural diversity issues.

## RESEARCH ON CULTURAL DIVERSITY IN ORGANIZATIONS

Research on cultural diversity in organizations has been approached from a variety of *meta-theoretical perspectives*. While much of the early research addressed cultural differences from a functional or social scientific perspective, many researchers today utilize interpretive and critical approaches to examine diversity in organizational life.

From a functional perspective (→ Functional Analysis), researchers (e.g., Hofstede 1991) have examined cultural-level factors that influence organizational behavior and affective outcomes (e.g., satisfaction), focusing on the influence of national culture and other easily measured dimensions (sex, ethnicity, age, etc.). The focus of these studies is predicting behavior on the basis of knowledge of cultural norms. These approaches have been criticized for oversimplifying cultural identity and minimizing the influence of multiple cultures and individual differences (Jackson et al. 2003).

From an *interpretive perspective*, research on cultural diversity in organizations has examined organizations via ethnographic case studies (e.g., Ely & Thomas 2001; → Ethnography of Communication) and in-depth interviews (→ Interview, Qualitative), for example asking minorities in organizations about their experiences and perceptions of behavioral choices (e.g., Orbe 1998). These studies try to make sense of the experiences of diverse members in specific organizational contexts. While they examine members' perceptions of life in the organization with recognition of the complexity of organizational realities, these studies rarely suggest ways to improve cultural relations beyond increasing understanding of the experience of those being studied.

A growing area of current research on diversity in organizations takes more of a *critical approach*, examining issues of dominant cultural power and privilege in organizations (→ Organizational Communication: Critical Approaches). The goal from this perspective is to critique the ways in which organizations are sites of power and control, and the roles that cultural identity and dominant group membership play in this control (→ Control and Authority in Organizations). This perspective is exemplified by Munshi (2005), who uses postcolonial and feminist perspectives to critique the ways in which discourse about diversity serves to control those outside of the dominant group. While critical research highlights the structural changes that are necessary for equality of members, critics note that such opportunities for radical change are rarely accessible to organizational members.

## CULTURAL DIVERSITY AT DIFFERENT LEVELS OF ORGANIZATIONAL ANALYSIS

Within the organizational context, cultural diversity can also be addressed at individual, interpersonal, group, organizational, and societal levels (Jackson et al. 2003). Both the theoretical and the applied literatures address topics at these levels, while recognizing some concerns may be present on multiple levels.

At the *individual level*, the focus is on the influence of cultural diversity and the diversity climate on members' individual perceptions, attitudes, and performance. The emotional toll associated with being culturally different may be a salient issue for individuals who are not part of the dominant group (e.g., Allen 1998), as are issues of ethnocentrism and cultural sensitivity. Attitudes toward the organization and the subsequent level of

involvement and identification (Cox 1993) are examined at the individual level. However, most communication scholars examine these factors in tandem with communication behaviors at the interpersonal, group, or organizational level.

At the *interpersonal level*, interactions between members from different cultural backgrounds are the focus. Interpersonal conflicts, often due to different expectations or cultural norms, are manifest at this level, including issues of stereotyping, prejudice, and mistreatment. Members from diverse cultural backgrounds may also experience less access to interpersonal relationships with mentors who can help them within the organization. Training is often designed to address interaction between members at an interpersonal level, rather than examining structural issues that privilege one cultural group over others (Hafen 2005; → Intercultural Communication Training).

At the *group level*, the interactions between members working together in a team, committee, or departmental context are central (Oetzel et al. 2001). At this level, issues of inclusion/exclusion and tokenism become salient for members who are different from the majority or dominant group. Intergroup conflict may also be an issue (→ Organizational Conflict; Group Communication and Problem-Solving).

At the *organizational level*, the focus for cultural diversity is on the diversity climate. The diversity climate is influenced by communication at the other levels, but also includes issues of formal and informal structures, patterns of minority individual outcomes (opportunities for advancement, equity in compensation and job assignment, and fair assessment of performance), the value placed on diversity, the level of knowledge about and acceptance of cultural difference, and evaluations of institutional bias in human resource systems and other policies and procedures (Cox 1993). Both structural and informal access are important for members of nondominant groups. The level of structural integration of members from different cultural groups can be measured from their representation both at different levels of status within the organization and in specific units. Lack of opportunities for advancement to higher-level positions results in a “glass ceiling” (Morrison & Von Glinow 1990). However, the integration into informal networks, providing access to information and the ability to build relationships with others, is also vital. Voice, representation, and access to participation in organizational decision-making are often concerns for nondominant groups (→ Participative Processes in Organizations).

At the *societal level*, organizational representatives’ interactions with potential members and with others outside of the organization (e.g., clients and customers) can be influenced by cultural diversity as well. Representatives of organizations may also reflect perceptions about the cultural diversity of the organization and the diversity climate as they interact in their community. Public perceptions, which may be influenced by publicity about positive or negative events or climate evaluation, also influence the success of the organization in attracting members.

## **METHODOLOGICAL ISSUES AND FUTURE RESEARCH**

*Methodological concerns* in studying cultural diversity in organizations center on the complexity of cultural identity and identity development, as well as power issues in the research process. Cultural influences are difficult to conceptualize and measure, as much

of culture is based on tacit understanding that may be difficult to articulate. Different aspects of one's identity may be salient depending on the organizational context, and personality and life experiences may influence the individual's level of cultural self-awareness. Dominant culture members and those who are assimilated into the dominant culture may not consider culture to be very important, but those who are exploring their nondominant identity and resisting assimilation may be more cognizant of their own cultural group's norms and expectations (Phinney 1993). Cultures are also in constant change, increasing the complexity of cultural dynamics.

Access issues can also prove challenging for researchers. Even willing and open participants' level of candor may be influenced by the cultural background of the researchers. An interviewee may choose to share less with a dominant-culture interviewer, for example, or frame information shared in ways that create or maintain a positive (face-saving) image of the cultural group. Organizations may also choose to limit access to researchers so as to not highlight potential problems or encourage members to focus on differences related to cultural diversity.

There are a number of *new and continuing directions for research* on cultural diversity in organizations, including studying the resources and skills necessary for diversity "competence" at multiple organizational levels, dimensions of culture that have been overlooked or underexamined in previous studies (e.g., religion), evolving contexts (e.g., virtual groups), and organizational processes from the perspective of members of nondominant cultural groups (e.g., emotional labor, leadership, change). Much of the research on diversity in organizations has been conducted within business and educational contexts in the United States; however, with increased globalization and worldwide demographic shifts, further analysis should be conducted in different countries and contexts.

## Ownership in the Media

*Gerald Sussman*

*Portland State University*

Structures of media ownership take the form of either public or private enterprises. “Public” refers to those media funded at least partially out of general public revenues, whereas in the general sense “private” means media whose financing is provided by individuals, families, or groups. Public media can be state-owned (as in the former Soviet Union; → Russia: Media System) or state-managed, controlled by the government in power (such as China’s ruling Communist Party newspaper, *Renmin Ribao*; → China: Media System), or can have a charter making them relatively independent of the state or governing power (such as Britain’s → BBC; → United Kingdom: Media System). The type of structure, public or private, does not necessarily correspond either to the degree of professional freedom enjoyed by the media organ or to its quality. Some African broadcast media are modeled on the BBC but operate with far less openness and with frequent political interference (→ Africa: Media Systems). Community media, such as community newspapers and radio stations, which typically rely on listener sponsorship and grants and receive little if any government financial support, are generally much smaller in scope and reach but often exercise considerably more freedom than their public-media counterparts and often transmit a broader range of political, social, and cultural programming (→ Community Media).

Privately controlled media, especially of the publicly traded stockholder type (→ Media Corporations, Forms of), have become more prevalent worldwide during the past 25 years. In the United States and other market economies, media industries have been

permitted wide latitude to engage in mega-mergers of the various industries within the sector, a trend that accelerated in the US following the FCC's elimination of the "Fin/Syn" rules in 1995, which had previously prohibited in-house production and syndication ownership (→ United States of America: Media System; Communication Law and Policy: North America; Federal Communications Commission [FCC]). The 1996 Telecommunications Act relaxed restrictions on station ownership, enabling media owners such as the Sinclair Broadcast Group to expand their reach to more than a quarter of American homes. Even before the Act, non-media businesses, such as General Electric and Westinghouse, were allowed to purchase multimedia enterprises, including two of the major television networks, RCA and CBS. Two radio networks, Clear Channel and Viacom's Infinity Broadcasting, together now control more than a third of all radio advertising revenue and as much as 90 percent in some markets (→ Advertising). There still remains, however, a large number of private newspapers and a smaller number of television stations that are owned independently or by families. With the breakup of stockholder media groups such as Knight Ridder (US) and the Tribune Company (US), more have been added. Among the largest corporate → media conglomerates in the world, the German → Bertelsmann Corporation is of the "private" type (i.e., not traded), as is Cox Communications in the US. An exceptional media type, the *St. Petersburg Times*, a Florida newspaper, is run as a nonprofit institution.

Media conglomerates, headquartered in Japan, Western Europe, and North America, typically are vertically integrated firms cutting across a number of different media and other industries. The → Sony Corporation (Japan; → Japan: Media System), for example, manufactures numerous media and communication devices (televisions, radios, DVDs, CDs, VCRs, computers, camcorders, microwave telecommunication systems, digital radio and satellite systems, and other equipment) and also owns all or part of major film production and distribution outlets (Sony Pictures, Columbia Pictures, TriStar Pictures, MGM, United Artists, and others) as well as the Sony/Loews Theaters Group (some 3,000 screens in North America), plus various companies for games, music, and television production and distribution, and various television interests in Asia, Europe, Latin America, and Australia. Vivendi (France; → France: Media System) owns the Canal + Group of television and cinema studios, theme parks, and cable channels, almost 40 record labels, a video games division, a telecommunications group, and still other businesses. The largest media corporation, → Time Warner Inc. (US), owns AOL and other computer-based enterprises, one of the biggest cable operations in the United States together with the Turner Broadcasting System (→ CNN and other cable broadcasting companies and the Atlanta Braves baseball franchise), New Line Cinema, Warner Bros. Pictures and the Warner Bros. Television Group, Home Box Office operations, dozens of Time Inc. magazines, comic books, and still other media holdings (Greenwald et al. 2006).

### OWNERSHIP PATTERNS IN THE US

In the US, one of the prevailing patterns of broadcast ownership is control by major banking and financial institutions. The major stockholders and board members of leading broadcasting networks include such banks as BankAmerica, Citigroup, Chase

Manhattan, Bankers Trust, Washington Mutual, and Morgan Guaranty Trust, which interlock not only with the media and other major industries but also among themselves; they are thereby able to exercise significant influence over fiduciary functions and management hiring in the media. Major media organizations also interlock with Fortune 500 corporations, including airline, energy, nuclear power, insurance, telecommunications, and weapons industries. Ford Motor Company has enjoyed interlocking directorships on the boards of the *New York Times*, *Washington Post*, and *Los Angeles Times*. A simpler ownership structure is that of Bertelsmann AG (Germany; → Germany: Media System), whose majority stockholder and founder is an individual, Reinhard Mohn. With his family and foundation, Mohn until recently held 75 percent of stock voting rights in the company until forced to open share ownership (25.1 percent) to the Belgian–Canadian financial holding company GBL. In 2005, the Sony Corporation, which as shown above is widely diversified in product lines and ownership, and has a number of foreign stockholders, appointed an American, Harry Stringer, to be its first foreign chairman and chief executive officer. A recent trend is that Wall Street investment houses are bypassing film studios and making deals directly with successful producers to finance their projects.

The biggest issue in media ownership is industry *concentration*, both at the national and international level (→ Concentration in Media Systems; Competition in Media Systems). In the US, there is no dispute about the high media concentration ratios (number of companies controlling each segment of the industry), but not all agree that this condition violates the public interest. Although media concentration is high in most countries, it is a particularly contentious issue in the US, where ownership of media and communication systems has historically been private, commercially driven, and, until a wave of consolidation began to accelerate during the past 25 years, quite competitive. Many intellectuals and other leaders around the world complain that these monopolistic tendencies have intensified American media and cultural domination in their societies. Indeed, media content in most countries bears the heavy imprint of → “Hollywood” and “Madison Avenue.” Robert McChesney (1999) listed eight global corporations that owned 79 percent of the American mass media: → television, → newspapers, → magazines, → radio, satellite systems, cable (→ Cable Television), book publishing (→ Book), → film production and distribution, movie theater chains (→ Cinema), the core elements of the → Internet, billboards, and theme parks. Two bookstore chains, Borders/Walden and Barnes and Noble, accounted for a third of all retail book sales in the country. Worldwide, McChesney found that the mass media are controlled by between 70 and 80 first- and second-tier corporations.

### OWNERSHIP PATTERNS WORLDWIDE

Media policy in Australia, New Zealand, Canada, and Western Europe (→ Communication Law and Policy: Europe) has followed a similar pattern of consolidation. The very high concentration of media ownership in *Australia* (→ Australia: Media System) is led by Rupert Murdoch’s New York-based → News Corporation (which formerly had its headquarters in Adelaide), which alone controls some 70 percent of the country’s newspapers. News Corporation, along with John Fairfax Holdings, the Harris Group, and West Australian Newspapers, make up the Australian Associated Press, which dominates

national news distribution in the print and broadcast media (Given 2001). Similarly, New Zealand is dominated by four foreign-owned giant media corporations. Only 9 percent of the country's readership is tied to domestically controlled newspapers. In radio, the concentration ratio is even higher, with 97 percent of the country's stations controlled by a single joint Australian (ANM)–United States (Clear Channel) group. In television broadcasting, the state-owned but commercial TVNZ (TV1 and TV2) competes with the Canadian-owned (Canwest) stations TV3 and TV4. Pay TV is controlled by the foreign-controlled (formerly by Murdoch, now Fairfax) Independent News Ltd., comprising 80 newspaper and magazine titles in New Zealand (New Zealand 2003).

In *Canada*, media ownership patterns did not significantly change until the mid-1990s, when the government's Canadian Radio-Television and Telecommunications Commission (CRTC) liberalized ownership rules to permit companies to own multiple television stations in the larger markets (→ Canada: Media System). Currently, nearly all of Canada's commercial stations are owned by national conglomerates. Mergers have brought about a tight consolidation of television station ownership across the country. With waivers given by the CRTC, some of the same conglomerates also took over major newspapers, and by 2001 all but one of the major urban newspapers were owned by a conglomerate. At the same time, ownership has been somewhat fluid, as major newspapers have passed from one chain to another in the last decade. Canada restricts foreign ownership of media companies to 20 percent. Although Canadian stations are required to air a majority of domestically produced content, most Canadians have access to American television, especially during prime time; it is easily accessible over the air, by cable, and via satellite. Canada is one of the most heavily foreign-penetrated media markets in the world.

In most of *Western Europe*, as in Canada and other leading industrial states, public service requirements are more established, and publicly funded broadcasting is more competitive with the commercial sector than in the United States. In *Britain*, for example, the BBC, publicly funded through license fees, is the country's largest broadcaster, with two national television channels (with national and regional sub-divisions), five national radio stations, cable and digital TV channels, and more than 40 local radio stations. However, Western Europe is also experiencing an expansion of commercial broadcasting and the mass media overall. *Italian broadcasting* (→ Italy: Media System), for example, is dominated by Fininvest, a company owned by former prime minister Berlusconi, who also has interests in France's TF1, Germany's Tele 5, Spain's TeleCinco, stations in the former Yugoslavia, and other countries. French and British print media have also been consolidated over the past decade by major transnational corporations (European Federation of Journalists 2005).

*France's* print media consolidation has been underway since the end of the World War II. The country's 175 regional newspapers in 1946 were reduced to 55 in 2004, most of which were owned by major media groups. In 2004, the print media were further consolidated with the purchase of the Socpresse publishing group, including *Le Figaro* and many other titles, by the aeronautics corporation, Dassault. Its main competitors are the Lagardère Group, which owns several major French publishing firms, and the Filipacchi Médias Group, the largest magazine publisher in the world. The bailing out of the left-wing *Libération* newspaper by Baron Edouard de Rothschild in 2005 signaled the near-finale of the independent press in France.

*Britain* too has a high concentration in print media, which are dominated by four major groups that control about 85 percent of the national market, though the government maintains relatively strong cross-ownership restrictions. The most powerful media group in the country is Murdoch's News International (NI), whose five newspapers, including *The Times* and the *Sunday Times*, have about 37 percent of the daily share and 39 percent of Sunday sales. NI also controls 75 percent of connected homes through its satellite BSkyB system. US companies also dominate Britain's digital and broadband sections of the media.

## MEDIA DIVERSITY

Currently, most American television stations are either owned by or affiliated to the large networks (ABC, CBS, NBC, Fox, Viacom, and Time Warner; → Television Networks), both in over-the-air broadcasting and cable, constituting an oligopoly. The UPN network was taken over by a joint project of CBS and Warner Bros. Entertainment (CW) in 2006. It is sometimes argued that these companies actually operate as a *functional* monopoly, inasmuch as they share generic (often copycat) formats in programming, in both news and public affairs and in entertainment, and thereby cater to and present viewers with a narrow range of content, style, opinion, debate, and consumer tastes and preferences, and effectively censor that which is not profitable (→ Consonance of Media Content). Others argue, however, that the existence, depending on tiers of service, of potentially hundreds of stations via broadcasting, cable, satellite, and computer provides audiences with a high degree of diversity in programming, especially when one adds the countless number of Internet websites now available to most people. Still others insist that the number of broadcast outlets is not altogether relevant because their products are almost entirely, often crassly, commercial in character and thereby offer little of a public service remit, especially given the possibilities of earning a large share of their profits from overseas distribution.

From an international perspective, the capacity of vertically integrated media conglomerates to reach worldwide audiences raises the specter of cultural imperialism (→ Cultural Imperialism Theories). The counter-thesis to this argument is that significant media industries exist in other parts of the world, such as → Bollywood, Televisa, and the Chinese-language film and TV industry, which offset the influence of American-produced media. Non-US media conglomerates, such as Sony (Japan), Bertelsmann (Germany), News Corporation (Australia), and Vivendi (France), offer competition to US media even in the United States itself. Whether the number of competing entities or the provision of publicly funded media is the best measure of media service will remain a significant debate for the foreseeable future.

## P2P Networking

*Paolo Dini*

*London School of Economics and Political Science*

*Paul Krause*

*University of Surrey*

The emergence of peer-to-peer (P2P) networking shows that technological determinism can be turned on its head: rather than socio-economic systems being determined by technological developments, sometimes technology can be determined by its users. Although in general the coupling goes both ways, P2P networking culminates the progression in computer architectures from mainframes through minicomputers, workstations, PCs, and client–server (master–slave) architectures, as information and communication technology (ICT), over a 50-year span, gradually adapted to the needs and behavior of its users (→ Communication Networks). In contrast to the master–slave or client–server architecture, in a peer-to-peer network each node has the same status and can issue requests to or respond to requests from any other node. Centralized management of network traffic becomes functionally unnecessary, with implications of increased local autonomy and lack of centralized control of the content carried by such traffic.

At the research level, P2P networks benefit from a constructive tension between two completely different disciplinary domains. While P2P networks research is increasingly drawn toward biology and physics in response to ever-increasing demands on the performance of such networks, it is also drawn toward social science as the development of P2P applications is increasingly influenced by a convergence between social science and design, known also as “social computing” (→ Social Networks; Technology, Social Construction of). Because this entry is centered on P2P networks rather than on applications, the focus is on their technological, physical, and mathematical aspects.

Although P2P technology is still making waves as a “disruptive technology” in ICT (Subramanian & Goodman 2004), its potential has not been fully realized, primarily because none of the implementations that underpin all the major P2P applications fully meets the requirements of a “true” P2P architecture. The *key vision of P2P* is to move away from any centralization of services and a single point of failure/control, to a truly distributed environment that enables two or more individuals to collaborate to achieve a goal that is of value to at least one of them. To meet this vision, a P2P network must have a number of

organizational as well as technological characteristics. While the provision of the resources and services that constitute the P2P network should ideally be shared by its community of users, the autonomy of individual users must be respected. P2P networks must be open to dynamic membership and connection topology, secure, scalable, robust to failures, and “autonomic” (self-configuring/self-optimizing/self-healing) (→ Communication Infrastructure).

All instances of P2P applications meet the vision better in some respects and worse in others. For example, in *Gnutella* all peers have equal rights, but the search algorithm is extremely expensive in network traffic. *Napster* has a much faster search mechanism, but at the cost of using a centralized directory. *Freenet* removes the dependence on either centralized directories or single points of failure for file storage, but its search mechanism is even more complex than *Gnutella*'s (→ Search Engines).

Current research addressing the performance of P2P networks as their size increases to millions of nodes has led to the investigation of their underlying topological structure in terms of graph theory concepts. Until relatively recently the modeling of physical and nonphysical systems and processes has been performed under an implicit assumption that the interaction patterns among the components could be embedded onto a regular Euclidean lattice. Two mathematicians, Erdős and Rényi (1960), made a breakthrough in *graph theory* by describing a network with a complex topology by a random graph. Fundamentally, *Gnutella* uses this model. Many real-life complex networks are neither completely regular nor completely random, and in P2P networks, even just in file-sharing systems, implementations based on these two models have encountered significant problems.

An important model for several P2P networks (especially discovery systems) is the “*small-world*” model (Watts & Strogatz 1998), based on the discovery that any two people on the planet can be connected by acquaintance relationships between six intermediate people, on average. A prominent common feature of the random graph and the small-world models is that their node connectivity distribution peaks at an average value and decays exponentially on either side. Such networks are called “exponential networks” or “homogeneous networks” because each node has roughly the same number of link connections (the sharp peak in the distribution). Because this most frequent number of links depends on the size of the network, it provides a measure of its “scale.” Work by Barabasi (2002) has shown, however, that most networks in a wide range of contexts – from physics, to biology, to social science, to the Internet (→ Internet, Technology of) – exhibit a “scale-free” distribution of node connectivity, i.e., uniformly varying from a maximum to a minimum, without intermediate peaks and independent of network scale. Scale-free networks are inhomogeneous: most nodes have very few connections but a few nodes have many connections. These “aristocratic” nodes organize the network so that it too can exhibit a small-world effect, but with a very different topology to the Watts and Strogatz small-world model.

Existing examples of P2P networks show limited achievement of the goals of P2P mainly because none of them exploits the scale-free properties that arise so often in natural and social networks. In a scale-free network a search can succeed in a very small number of steps if it is directed through one or two relevant and well-connected hubs. The introduction of “super-peers” is one way to begin to introduce scale-free aspects into P2P networks. However, such attempts to date have been of limited success as most “natural” scale-free networks have a hierarchy of super-peers, not just one additional layer. In addition, to remain true to the P2P philosophy, super-peer networks must be

avoided where the super-peers are static and physically reside on (clusters of) servers owned by a single organization. Somewhat paradoxically, although naturally occurring scale-free networks demonstrate highly efficient communication and stability against fragmentation, they are also extremely vulnerable to organized attack on the super-connected few. Counters to this threat involve carefully monitoring the hubs and either repairing them or delegating their responsibilities if their key role is jeopardized. Thus, the environment supported by a P2P network ideally should be truly dynamic as well as distributed. Research indicates that P2P networks are becoming ever more relevant to social computing and are performing in ways ever closer to how social systems actually work.

## **Painting**

*Leslie Cunliffe*

*University of Exeter*

Understanding the historical practices of painting is significant for communication studies because in nearly all cultures these practices embody the origins and establishment of subsequent genres of picture-making.

Humans have made paintings for at least 30,000 years using *three material components*: pigment suspended in a medium; a surface to which the paint is applied; and tools like brushes, sticks, fingers, and hands by which the paint is transferred to the ground. In prehistoric times, paintings were applied to readymade grounds of rock surfaces. In other cases paintings have been made on grounds laid on a support, like canvas on a stretcher.

Grounds can be rough or smooth, resistant or absorbent, a choice that goes hand in hand with the type of tool, usually a brush, used to apply the relative transparency, opacity, and viscosity of the paint. Brushes can be small or large, fine or coarse, features that allow for the manipulation of techniques and visual symbolic codes for the wider purpose of projecting → meaning.

The autographic or hand-held painting processes that create unique → artifacts are always made against a broader intentional field of cultural expectations (→ Cultural Studies). The operation of background pressures explains why paintings vary from culture to culture, from one historical period to the next within the same tradition, and between two artists working in the same cultural context (→ Culture: Definitions and Concepts). The background circumstances influence both the materials for executing paintings and the way line, tone, color, texture, rhythm, form, space, scale, and figurative references formally structure compositions for communicating perceptual, expressive, and conceptual meanings (→ Visual Communication). These variables determine style in painting.

*Style* allows someone both to make paintings that have meaning, and to distinguish, say, a Chinese watercolor from an Egyptian mural, a baroque from a Renaissance painting, a Matisse from a Picasso. Styles used to represent and conserve shared, symbolic understandings of the world have dominated non-European, ancient, and older European practices of painting (→ Sign). By contrast, paintings done in Europe since the late eighteenth century have aimed to critique dominant cultural expectations, a corollary of which has been the proliferation of styles that emphasize self-expression, a practice not found in other cultural contexts.

Painting styles vary on a spectrum from the pictographic to the highly realistic, the abstract to the figurative. Pictographic methods are arranged parallel to the picture plane rather than modeled in receding space, as in western painting aimed at evoking the real world on a flat surface, a function that picture frames reinforce (→ Perspective, Pictorial). The practice of twentieth-century painting moved away from creating such a window on the world in favor of emphasizing the inherent flatness of the picture plane, which had the effect of creating the twofold, potential space associated with psychoanalytic approaches to painting (→ Psychology in Communication Processes).

When paintings perform a ritual function, style changes only if the underlying beliefs wane, or if a representational innovation brings further prestige and purpose to the way paintings serve their prescribed role (→ Rituals in Popular Communication). Such an innovation happened when a new preaching style influenced late fourteenth- and early fifteenth-century Italian artists to move away from the schematic Byzantine style toward the invention of naturalism, in which the artist paints not only what happens in the sacred story but how this happens in a moment of time from an eyewitness point of view that the congregation shares (→ Art as Communication). Foreshortening is the representational master key for unlocking this innovation, as it eliminates inconsistencies in the projection of the visual field, a corollary of which is the way halos evolved from flat, gold circles into thin, linear ellipses.

Paintings can be made by the *process of accretion* associated with the accumulated revisions made in oil paintings, in which new applications of opaque or transparent paint obfuscate or modify previous layers, or by the alternative *process of omission*, in which brush strokes follow the mark-making tradition of calligraphy common to China and Japan. Both accretion and omission require a sophisticated knowledge of the medium.

An example of how a painting style develops in *response to technological innovation* can be found in the way the production of tube paints facilitated mobility when the Impressionists recorded everyday life. The Impressionists' coarse, grainy visual codes and improvised cropping techniques are also indebted to the invention of → photography (→ Realism; Realism in Film and Photography).

To understand the symbolic content of paintings requires knowledge of their context. An example would be the symbols used in Aboriginal Australian tribal art that do not resemble the phenomenal reality of the things they represent. In order to read such text-analog paintings the visual code, like the alphabet and its many combinations, has to be learned. Paintings in the western tradition that approximate more to phenomenal reality can also carry indirect, text-analog meanings. An example is a painting by Dürer that shows a man holding a large sword in one hand and a book in the other. To understand that this is a representation of St. Paul would require familiarity with his comment about scripture being like a two-edged sword, which became Paul's attributes (→ Iconography). Wittgenstein (1953) describes the ability to see one thing as something else as "aspect seeing," which he distinguished from the ordinary "seeing" of phenomenal reality.

Other examples of aspect seeing are the way visual elements are used to create synesthetic metaphors of value on the basis of equivalences across sensory modes. The preference of neo-classical artists for composing paintings with "honest," clear outlines is an example of a style being given the sensory equivalence of integrity (→ Visual Representation). This judgment about the symbolic potency of visual expression emerged as a reaction to the previous, "corrupt" rococo painterly style. Understanding the potency of expression of visual codes in painting requires such web-like registers from which conscious and unconscious comparisons are made.

# Paperback Fiction

Ken Gelder

University of Melbourne

There have been several “paperback revolutions” in fiction publishing, the first of which unfolded during the first half of the nineteenth century in the United Kingdom, Europe, and the United States (→ Fiction; Fictional Media Content). Cheap bulk postal costs encouraged American publishers to print royalty-free foreign novels (those of Charles Dickens, for example) in lightweight large quarto or newspaper formats, offering cheap installments to subscribers. They could thus be claimed as periodicals, gaining access to third-class postal rates and railroad distribution across the country. Schurman (1996, 63) notes that by the mid-1840s in the United States, “paperback novels could be had through the mails at six cents each or sixteen for one dollar.” Park Benjamin had in fact issued what is generally taken to be the first paperbound full-length novel in June 1840, Charles Lever’s *Charles O’Malley*, a military romance. Smaller paperback quarto-sized books followed, usually as part of an ongoing series of publications, like the Beadle Dime Novels of the 1860s and 1870s, with their sewn spines and woodcut cover illustrations.

The first *dime novel*, published by Irwin P. Beadle in June 1860, was a story first serialized twenty years earlier in 1839, Ann S. Stephens’ *Malaeska, the Indian wife of the white hunter* – reflecting the ongoing taste for frontier adventure fiction. In the United Kingdom, George Routledge reprinted the famous frontier American novelist James Fenimore Cooper’s naval adventure *The red rover* in a new pocketsize paperback form in December 1848. Routledge’s Railway Library – easily identified through their yellow covers (known as “yellowbacks”) – ran alongside a number of other publishers’ Library or Standard series and lasted for around fifty years until 1899. By the 1860s, the first paperback revolution was in full swing, with publishers such as Routledge and Chapman and Hall investing in long-running series of new works and reprints, selling for a shilling or less each: hack writing in some cases, recycled literary classics in others.

In the later part of the nineteenth century, a new novel might go through *several phases*: serialization in a periodical or newspaper, then publication as a relatively expensive “three-decker” or three-volume hardcover novel (a typical format for literary fiction), followed by various reprints at ever cheaper prices depending on its popularity and longevity (Eliot 2000). The decline of the three-decker novel in the 1890s coincided with another paperback boom, although this was somewhat curtailed in the United States in 1891 when Congress’s Platt-Simonds Bill forced publishers to pay royalties to foreign authors. Genre fiction, however, began to flourish. Detective stories, westerns, and adventure fiction were printed on the cheapest kind of “pulp” paper and were closely tied to the rapidly growing pulp magazine market. But the various Library series – like J. M. Dent’s Everyman Library series, founded in 1906 – continued to reprint the literary classics in cheap paperback form well into the early twentieth century.

Mass-market paperback publishing – the third paperback revolution – properly began in *Germany* with Albatross Books, founded in 1932. Size was standardized (181 × 111

mm) and the books were color-coded: orange for fiction, for example. The company's success and format was noticed by Allan Lane, who at the time was director of Bodley Head in London, a prestigious publisher. Lane bought up publication rights to a range of novels and established a new publishing house in Britain devoted exclusively to paperbacks, Penguin. The first 10 titles, released in 1935, included novels by Ernest Hemingway and Agatha Christie. Again, the books were color-coded: orange and white for fiction, green for crime fiction, and so on. In 1945 Penguin began its Penguin Classics series, securing the paperback's affiliation to quality works of literature. Penguin's main British competitor was Pan – Ian Fleming's publisher – which, by contrast, embraced the lower popular genres such as horror and showcased a more lurid kind of cover illustration. In the United States, Penguin's success was replicated in 1939 by Fair de Graff's Pocket Books, with its kangaroo logo. The first 10 paperback titles here were led by James Hilton's *Lost horizon*, but again included a novel by Agatha Christie as well as a paperback volume of five of Shakespeare's tragedies.

The paperback novel has always accommodated both quality literature – pirated or reprinted literary classics – and genre fiction, and little seems to have changed, even today. The paperback publishers most commonly associated with mass-market genre fiction are Harlequin (founded in 1949) and Mills and Boon (founded in 1908, and initially specializing in hardcover novels). These two publishers merged in 1972, rapidly extending the range of their category romance fiction for which they are best known and selling around 30 million romance novels in the following year (Dixon 1999) – but also venturing into literary fiction through the MIRA imprint. Most literary fiction is now published in paperback only; on the other hand, many genre novelists are published first in hardcover, with paperback reprints following some time later on. Mass-market paperbacks are distinguished from trade paperbacks: the former remain small, pulp-like, and relatively cheap, while the latter are usually the same size as hardcover novels and are an overt sign of the paperback novel's continued ties to quality fiction.

# Paradigm

James A. Anderson

University of Utah

“Paradigm” refers to a fundamental set of assumptions about reality and the appropriate ways of studying it. A discipline is said to be paradigmatic when there is general agreement within it as to basic statements of fact, background knowledge, research practices, warrants for claims and evidence, and criteria for accepting new knowledge.

Applied originally to natural sciences, and later extended to all forms of scholarship, the concept of paradigm is directly traceable to Thomas Kuhn’s (1962) *The structure of scientific revolutions*. That book was part of a sociology of science movement that went on to include Berger and Luckmann’s *The social construction of reality: A treatise in the sociology of knowledge* (1966) and Latour and Woolgar’s (1979) *Laboratory life: The social construction of scientific facts* (→ Constructivism). In Kuhn’s formulation, a paradigm was first an achievement by a scientist or group of scientists that was both extraordinary and anticipated, and then sufficiently open-ended that it attracted other scientists and provided for their work. Watson and Crick’s double-spiral helix model of DNA is a good example of a paradigmatic achievement. It organized scientific thinking and practice in the field of genetics and certainly has provided work for geneticists for more than 50 years. Initially a proposed solution, it has become the received view (or accepted explanation) for how cell replication works. It is this widespread acceptance and nearly total absence of dissent by any qualified scientist that nominate the model as a paradigm. The science associated with the achievement becomes paradigmatic and normalized and the principles that accorded the achievement become foundational and incontrovertible.

In a *normalized science*, the daily work involves the accretion of expected results using hypotheses that develop from the implications of the theory and highly conventionalized methods that are appropriate to the theory. The process of this daily work builds a mosaic of where the theory works (the research hypothesis was supported) and where the experiment failed. The shift in attribution is important to note. Successful experiments (→ Experimental Design) demonstrate the efficacy of the theory; unsuccessful experiments demonstrate a failure of the experimenter. In this manner, normalized science preserves its theory despite the appearance of contradictory evidence or anomalies. Over the course of time, however, contradictions and anomalies can build to where the exploration of alternatives becomes possible or even encouraged and the potential for a new paradigmatic achievement rises. As these alternatives are explored, rival explanations develop that vie with one another and the normalized view. With sufficient competition the field loses its normalized status and becomes pre-paradigmatic, with multiple explanations available and none capable of commanding it. Some practitioners adhere to the old, some to one of the new; and others float among those available as they position themselves in the field.

Importantly, Kuhn’s argument is not about truth but about the *human practice of science*. A theory is paradigmatic not because it is true but because it attracts practitioners

who can accomplish their goals with it. The double helix indeed may not be true, but, no matter, it provides the mainstream for the current science of genetics.

If we use that last sentence as the criterion, we would have to conclude that communication science is not normalized. There is no mainstream. There are certainly pretenders to the crown, and there are major theoretical families that attract a number of practitioners, but none has achieved a command of the field. Communication, therefore, can be described as a *pre-paradigmatic science* with multiple constellations of theories, each making its bid as the best available. This is not to say that each constellation is equally distributed (→ Communication as a Field and Discipline).

A particular practitioner could easily spend her entire career interacting with like-minded colleagues, crafting normalized studies, publishing in favorable journals, and teaching the principles of her received view. She would, of course, encounter and respect dissent, but such dissent would be considered wrong or more likely simply irrelevant. From this standpoint, the practitioner could easily argue that the practice in which she participates is the normalized science of the discipline and that the theories she supports are both foundational and incontrovertible. It is clear evidence of the pre-paradigmatic status of communication that such arguments appear regularly in our journals, in association meetings, in our classrooms, at the bar, and over coffee. Claims in these arguments to be the paradigm or even a paradigm are part of the political activity for ascension that are hallmarks of a pre-paradigmatic science. We will recognize communication as a normalized science when those arguments are as rare as the arguments against the double helix.

Kuhn's formulation of paradigm and normalized science works quite well across all forms of scholarship. For example, Stuart Hall (1980) argued for the then presence of two opposing formulations for → cultural studies, one experiential, the other structural. He went on in that article to propose a third, selecting elements from his opposing forces and adding elements of his own. It does not appear that Hall settled anything, as multiple authors have proposed other formulations since 1980 (cultural resistance, community, hybridity, postcolonialism [→ Postcolonial Theory], transnationalism, etc.). It is arguable, of course, but none of these appears to be paradigmatic in stature.

A paradigm can also be conceived, outside Kuhn's original formulation, as a descriptor for a community of scholarship with the background knowledge, research practices, and emblematic claims that are the signature of that community. Each such community has its rules of membership, requirements for good practice, warrants for claim and evidence, criteria of excellence, and increasingly its own divisional home in the associations and journal outlets of communication. Within a given community's boundaries, paradigmatic characteristics can appear, but they do not reach across the discipline.

## Paralanguage

*Thomas O. Meservy*

*University of Memphis*

*Judee K. Burgoon*

*University of Arizona*

Paralanguage refers to the nonverbal elements of speech – such as vocal pitch, intonation, and speaking tempo – that can be used to communicate attitudes, convey emotion, or modify meaning. In simple terms, paralanguage can be thought of as how something is said rather than what is said.

The study of paralanguage is known as “paralinguistics.” Early work on paralanguage emerged in the 1950s with the pioneering research of George Trager and Henry Lee Smith (Hall & Trager 1953; Trager 1958), who noted that kinesics (body movements) and vocalics (voice quality and other aspects of the voice) are part of the language system. Building on their work, other researchers focused on vocal pauses (hems, ahs, coughs), speaking rate, volume, and quality (Pittenger et al. 1960). Since that time, paralanguage has been studied and applied to numerous domains including psychiatry, child development, courtship (→ Interpersonal Attraction), and deception (→ Deceptive Message Production).

The idea that how one says something may impact the meaning of what is said is a familiar concept. Most often, humans use paralanguage purposefully, though perhaps subconsciously, as many of these patterns have been learned since infancy. For example, when something is said sarcastically, the voice may take on a negative tone to accompany a positive word or phrase, or particular intonations may modify the meaning of the words that are spoken. The voice may also send messages and reveal information apart from the words. For example, → emotions are signaled through the voice. When someone is aroused, the pitch and resonance of the individual’s voice change due to physiological changes in the vocal cords. Loudness may convey boisterous emotions; falling intonation may convey sadness or distress.

### **FACTORS AFFECTING PARALANGUAGE**

There are many different factors (e.g., biological, physiological, socio-economic, cultural) that can affect the paralanguage an individual employs. For instance, biological factors such as gender, age, and anatomical features heavily influence the physical ability to

produce certain sounds or ranges of sounds. Pitch usually deepens as one enters into adolescence and into adulthood and then elevates again in senior years. Additionally, the anatomy of the male vocal tract typically produces deeper-pitched sounds than the anatomy of the female tract.

Many paralinguistic cues are affected by cultural or regional factors. Individuals who live in the southeast United States, for instance, employ a slowed speech tempo with lasting emphasis on certain syllables, resulting in what is sometimes referred to as a drawl. Residents of the US state of Indiana are known for their nasality. Dialects the world over include vocal as well as verbal features that distinguish them.

Voices also differ from individual to individual. A voice style consists of numerous paralinguistic elements or cues. Paralinguistic cues refer to elements such as pitch, tempo, loudness, voice quality, and others. Each person's vocal cavity, tongue, and nasal cavities produce voice qualities that are so individual that law enforcement can use them to develop voiceprints that are analogous to fingerprints. Humans detect these differences as distinctive voice styles such as breathy, tense, raspy, or resonant (→ Communicator Style). For example, celebrities and media personalities are quite often recognized by their distinctive voice qualities or styles.

## PARALINGUISTIC CUES

Paralinguistic cues can be roughly subdivided into five general categories – frequency, intensity, fluency, voice quality, and timing. Figure 1 shows several cues in each of these categories. A description of each category and its cues follows.

### Frequency and Intensity

Any paralinguistic cue that deals with pitch is grouped under the frequency category. Of all paralinguistic cues, pitch (which is the perceptual label for fundamental frequency) is perhaps the most versatile in conveying different messages. In many languages, such as English, Spanish, and German, pitch, in conjunction with emphasis on specific words (e.g., “Well”), can convey a change in meaning (e.g., surprise, contempt, anger, disappointment) even though the word is the same. However, in certain other languages, such as Chinese, Thai, and Vietnamese, pitch inflections may actually convey a different word (Poyatos 2002). Changing pitch at junctures such as the end of sentence boundaries can

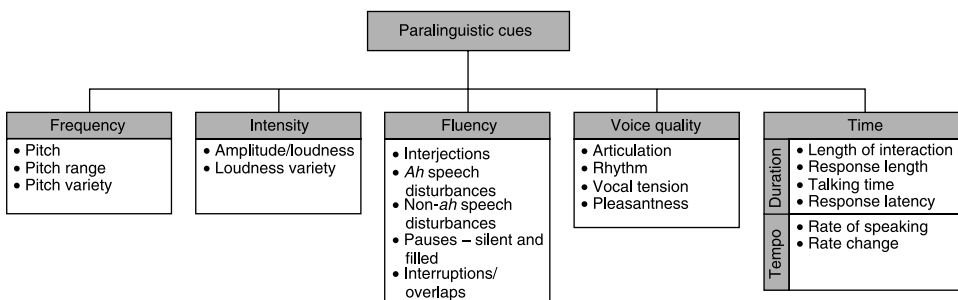

Figure 1 Paralinguistic cues and categories

also change meaning. In English, when a question is posed, even if not in correct grammatical structure, the voice pitch is typically elevated at the end of a sentence.

Pitch and its variability have been linked to physiological changes due to arousal and certain types of emotion. Researchers suggest that low pitch levels (in association with other paralinguistic cues) may be associated with boredom, anger, and disappointment, whereas elevated pitch levels may be associated with happiness, surprise, and anger again (Davitz & Davitz 1964; Scherer & Ekman 1982). Some emotions (e.g., anger) may either increase or decrease pitch level, requiring an observer to rely on other cues to infer the emotion. In general, pitch levels rise when an individual is trying to communicate praise or sincerity, or to appear less rigid.

Vocal cues dealing with the loudness of the voice are grouped under the intensity category. Emotions such as joy and anger may be conveyed using increased volume, whereas sadness and empathy are often conveyed using decreased volume (→ Comforting Communication). Research also suggests that loudness may reveal a speaker's sincerity or confidence (Rockwell et al. 1997). Certain emotions typically employ a greater variation in loudness than others. For example, someone who is angry often exhibits larger variation in volume than someone who is calm. Additionally, the intensity of voice may be used strategically to assert power or dominance in an interaction (→ Power, Dominance, and Social Interaction).

### Fluency

Any paralinguistic cue that deals with the general flow of the speech belongs to the fluency category (→ Speech Fluency and Speech Errors). This category can be further divided into interjections, checkbacks, interruptions, and silent pauses.

Interjections, also known as vocal segregates, include words that interrupt the smooth flow of speech. *Ah* speech disturbances are a common type of interjection. Examples of *ah* speech disturbances include words such as *um* and *ah*. Interjections are common in speech, but are typically omitted in written text. Non-*ah* speech disturbances include other filler words that are not in the *ah* speech disturbances sub-category. Examples include *like*, *I mean*, and *whatever*. Also included are other forms of dysfluency such as repetitions, stutters, garbled sounds, hesitations, and halting speech.

Another interruption to the smooth flow of speech occurs when an individual interjects a question that requires a response from the conversational partner. These questions are often used to assess whether or not there is shared understanding of what is being communicated, but they also can be used by the person speaking to allow for more time to gather his or her thoughts. These questions are known as checkbacks. Examples of checkbacks include questions such as *Know what I mean?* *Ya know?* *Right?* *OK?* and *Got it?* (Buchholz 2000). Another type of interruption is overlap in speech of the subject and the interviewer. Often such overlap results in a change of turns.

Not all speech disturbances are filled with audible sounds. Like other disturbances, silent pauses may allow individuals to assess understanding or prepare for upcoming speech. A certain amount of silence exists in most speech. A silent pause is considered a speech disturbance when the amount of silence in the pause exceeds the amount of silence expected. The tempo, rhythm, and silent pauses of earlier speech impact the amount of silence that is expected.

### Voice Quality

Paralinguistic cues that deal with articulation, rhythm, and tenseness or pleasantness of the voice are grouped under the voice quality category (→ Voice, Prosody, and Laughter). *Articulation* may be associated with conveying different emotions. Researchers have observed that emotions such as pleasure, happiness, and surprise exhibit more clipped articulation than boredom, disgust, or sadness (Rockwell et al. 1997). Other researchers suggest that clipped articulation is often used “for addressing someone in a harsh or impatient tone (‘Com’n, get out’f here!’); warning against impending danger (‘Watch out!’); remembering suddenly (‘Wait!’)” (Poyatos 2002).

*Rhythm of speech* involves the combination of pitch, loudness, syllabic duration, and overall tempo (Poyatos 2002). Other paralinguistic cues, such as nonfluencies and response latency, also impact the perception of the rhythm of a conversation. Rhythm can be viewed on a scale from staccato-like, clipped articulation at one end to smooth, drawn-out speech at the other. *Vocal tension* or stress in the voice can be caused by a physiological change due to arousal. When a person is under stress, micro-muscle tremors in the vocal tract are transmitted through speech. These micro-muscle tremors are generated by the vocal cords that vibrate in the 8–12 Hz range.

Other attributes of voice quality related to vocal pleasantness – such as resonance, breathiness, and nasality – may also change when an individual experiences different emotions. Researchers have found that individuals often deem utterances false when there is a switch in the speaker’s voice quality. For more detailed descriptions of voice styles and qualities – such as breathy, laryngealized, nasal, falsetto, harsh, squeaking, screeching, squealing, squawking, hollow, whining, whimpering, twangy, and moaning – see Poyatos (2002).

### Timing

Paralinguistic cues related to the duration or the speed of an utterance are grouped under the timing category. The duration sub-category includes cues for overall length of an interaction, response length, total amount of talk time, and response latency. Length of interaction refers to the total duration of an interaction between conversational partners. Response length refers to the total length of an individual’s response to a question. Speaking duration refers to the proportion of the total time of the interaction that the subject spends talking or interacting. *Response latency* refers to the amount of time between when a question ends and when the subject begins a response. A response latency that is too long or too short interrupts the overall flow of the conversation. Many people attribute prolonged response latency to increased cognitive effort and a short response latency to anticipation, impatience, or wanting to get the next word in.

The *tempo* sub-category includes cues that gauge the rate of an individual’s speaking and the change in that rate. Rate of speaking refers to the “relative speed or slowness in the sequential delivery of words, sentences and the whole of a person’s speech” (Poyatos 2002, 8). Nonfluencies such as interjections and filled pauses affect the tempo of a person’s speech. Tempo has been formally calculated by researchers by taking the number of words or syllables spoken divided by the total time of a response or by the proportion

Table 1 Sample emotions and corresponding cues

Emotion	Pitch	Pitch contour	Pitch variation	Loudness	Rate	Enunciation
Anger	High	Up	Small	Loud	Fast	Clipped
Happiness	High	Up	Large	Loud	Fast	Somewhat clipped
Sadness	Low	Down	Small	Soft	Slow	Slurred

Source: Adapted from Scherer and Oshinsky (1977)

of voiced segments to total voiced and silence segments. Tempo is a major component of an individual's basic voice style, but it can be influenced by a number of factors. Certain grammatical elements, such as a parenthetical comment, are often conveyed with a change in tempo. Additionally, when someone misspeaks, stutters, or introduces errant information, often the subsequent repairing sentence is said with increased tempo. Tempo may also be tied to certain emotions or states of arousal. For instance, someone who is angry may have very slow, deliberate, tense speech. Someone who is confident may speak at a faster tempo. Researchers have studied tempo in a variety of contexts, including differences in the rate of speaking throughout a conversation or interview.

## PARALANGUAGE TO CONVEY EMOTIONS AND PERSONALITY TRAITS

An individual can convey emotions through a variety of paralinguistic cues. For example, one may convey sincerity about an opinion by using a softer but firm voice. Table 1 provides sample emotions and a few of their corresponding cues. For a more comprehensive analysis of the association between paralanguage characteristics and different emotions see Scherer (2003).

Paralinguistic cues can also be used to infer personality traits. For instance, people who are animated or extraverted often have a faster rate of speaking than those who aren't. Conversely, people who are withdrawn tend to have a "flatter" tone of voice. While paralinguistic cues such as these can be broadly associated with personality traits, it would be incorrect to conclude that these associations are consistent all of the time.

Paralanguage is an integral part of our communication toolset that allows us to convey emotion, modify meaning, or communicate an attitude. Most paralanguage occurs in a face-to-face environment. However, with the development and increased use of technology in recent years, conveying paralanguage through other communication media is becoming more popular. For instance, individuals using text-only communication channels might use font size, coloring, capitalization, or non-alphabetic characters as a proxy for traditional paralinguistic cues. Instant messaging programs have implemented emoticons that can substitute for paralinguistic cues not available in text-based communication media (→ Mediated Social Interaction). Even with the increased availability and understanding of substitutes, however, the use of paralanguage in text is relatively limited.

## **Parasocial Interactions and Relationships**

*Holger Schramm*

*University of Zurich*

The term “parasocial interaction” (PSI) was first used by Horton and Wohl (1956) to describe viewers’ responses to media characters (called “personae” in PSI research; singular: “persona”) during media consumption. Horton and Strauss (1957) set down the first systematic descriptions and observations of PSI as well as of more long-term responses to personae, known as parasocial relationships (PSR). These two articles can be regarded as the beginnings of theorizing about PSI and PSR, as empirical data were still nonexistent.

In the following decades, many communication scholars picked up the idea of PSI and PSR and investigated various aspects of the concepts. Uses-and-gratifications researchers, for example (→ Uses and Gratifications), have regarded PSI and PSR primarily as motivators for → selective exposure or as a special type of interpersonal involvement that combines different phenomena like → interaction, → identification, and long-term relationships with media personae (Rubin et al. 1985; → Relationship Development). Culturally diverse scientific communities, especially Anglo-American, German, and Scandinavian researchers, have worked on PSI and PSR. Additionally, distinct scientific

disciplines, such as communication, social psychology, media psychology, film studies, and the arts have applied PSI and PSR research. Since all of these researchers have implemented and interpreted the concept on the basis of their preferred research → paradigm, it is not surprising that even today, a coherent and broadly accepted concept of PSI and PSR does not exist. PSI and PSR have been used to explain an extensive spectrum of media exposure phenomena, where a recollection and revival of the primary idea as well as a theoretical foundation and a meta-theoretical discussion are now seen as necessary (Giles, 2002; Schramm et al. 2002).

## CONCEPT

Horton and Wohl (1956) considered the illusion of interaction and interactivity between media users and personae (→ Interactivity in Reception) as one of the most central attributes of mass media consumption. Television as an audiovisual medium ought to be especially able to constitute an *illusion of face-to-face interaction*. Nevertheless, this mediated form of communication and social interaction is one-sided because the persona's action can reach the media user, while the media user's reaction cannot reach the persona. Second-order reactions of the personae comparable to those of real interpersonal interaction drop out. Thus, PSI shows similarities to forms of *asymmetrical* interactions in → interpersonal communication.

A notable characteristic of PSI is that in spite of the missing feedback, channel viewers often feel addressed by the personae. Referring to this, PSI research has shown that the same key impulses that play an important role in social interactions are relevant for the constitution of PSI. *Key impulses* are, for example, the mediated spatial distance between the personae and the viewers (obtrusiveness), the duration of exposure to these personae (persistence), the personae's attractiveness, and especially their nonverbal and verbal addressing performance. By responding to these addressing cues, media users give up their passive roles of being observers and become "actors."

This activity manifests itself in different forms, like rising interest, intensive thoughts and deliberations, tense body movements, agile facial expressions and gestures, and/or speaking to the TV screen. The *two-level model of PSI* (Hartmann et al. 2004) conceptualizes those viewer responses to media personae as being composed of different cognitive, emotional, and/or behavioral processes. These processes are seen as following up on initial impression formation (or persona recognition), after which they emerge into different interaction patterns, change dynamically within the course of media exposure, and are strongly influenced by factors relating to both personae and viewers. Due to a wide range of concurring processes, PSI can be classified – similar to involvement (→ Involvement with Media Content) – as a kind of *meta-concept* composed of narrower concepts such as → attention, comprehension, knowledge activation, evaluation, social comparison (→ Social Comparison Theory), sympathy, empathy (→ Empathy Theory), emotional contagion, and physical activity (Klimmt et al. 2006).

In contrast to the notion of PSI and PSR held by uses-and-gratifications research in the 1970s and 1980s, most research conducted during the last 15 years argues for a *clear distinction between PSI and PSR*. PSI, in this sense, specifically means the one-sided process of perception of the media person during media exposure. In contrast, PSR

stands for a cross-situational relationship that a viewer or user holds with a media person, which includes specific cognitive and affective components. While PSI is restricted to the duration of media exposure, PSR can endure beyond the single exposure sequence – like a friendship that exists between two persons beyond their face-to-face communication sequences. As a consequence, a first PSI sequence between a viewer and a persona is able to constitute a PSR after media exposure, while this PSR in turn is able to influence future motivations and selection processes as well as PSI processes in subsequent media exposure sequences (Gleich 1997).

### EMPIRICAL EVIDENCE

PSI and PSR have been investigated in relation to diverse personae such as politicians, → news anchormen, → soap opera and film characters, TV talk show characters (→ Broadcast Talk; Celebrity Journalists), comedians, radio hosts, virtual avatars in computer games (→ Video Games; Avatars and Agents) or on the → Internet, comic figures (→ Comics), and characters in audio stories. In spite of the heterogeneity in the evolution of PSI and PSR research and the focus on positively evaluated PSI/PSR, the existing empirical findings provide some fundamental insight into the phenomenon. Most studies have used the terms PSI and PSR interchangeably, so most findings cannot be attributed exclusively to one of the two concepts. Therefore the following extract of key findings will not differentiate between PSI and PSR.

Both the attractiveness (physical, social, and task attractiveness) and perceived similarity of the media character seem to be important antecedents (Rubin & McHugh 1987; Turner 1993). Personae often exhibit character traits that receivers admire and would like to have (Caughey 1986). *Gender* also plays a role in this respect (→ Personality and Exposure to Communication). Vorderer (1996), for example, found that female viewers tend to admire the attractiveness of personae more than male viewers and thus tend to hold stronger PSR in the sense of worshipping personae. Interactions and relationships with female TV characters are often more intense than with their male counterparts. However, females display greater admiration for male characters and vice versa, which again points to the importance of cross-gender attractiveness for the formation of PSI/PSR (Vorderer & Knobloch 1996).

Findings regarding the effects of *age and education* are mixed. Vorderer (1996) found that PSI/PSR with stars of TV series is intense among older, less educated individuals who frequently watch television, but is also intense among adolescent fans of TV series, in contrast to middle-aged groups. Gleich (1997) and Levy (1979) found that strong PSI/PSR is associated with the age of the onlookers. In turn, Giles and Maltby (2004) pointed out the important role of PSI/PSR among adolescents. Nordlund (1978) reported that the intensity of PSI/PSR increases as the variety and number of spare-time alternatives decrease, which is a typical process as people get older. The intensity of media use seems to be positively associated with strong PSI/PSR in various investigations (Nordlund 1978; Levy 1979; Rubin et al. 1985; Vorderer 1996; Gleich 1997).

Accordingly, Rubin and Perse (1987) reported that PSI/PSR with *soap characters* increases with the strength of affinity to soaps and the intensity of exposure to them. Therefore, the frequency of selective exposure might be crucial; the effect that older

people tend to report stronger PSI/PSR might be diminished if the amount of television usage were controlled. It is not loneliness that makes individuals more prone to turn to media characters. Rather, individuals with high *social abilities* tend to report strong PSI/PSR (Cole & Leets 1999). However, shyness (a perceived lack of social competency) might hinder individuals in fulfilling their need for interpersonal interactions. Consequently, Vorderer and Knobloch (1996) found that PSI/PSR is highest among individuals who are shy, but feel a greater need for social interactions. Additionally, strong PSI during media reception can result in more intense post-viewing discussions and cognitions that influence the constitution and development of PSR (Rubin & Perse 1987).

In summary, findings suggest that “social and parasocial interaction are complementary, perhaps because they require similar social skills” (Cohen 2004, 192). Analogously, research shows that PSR develops quite similarly to real-life relationships (Rubin & McHugh 1987; Perse & Rubin 1989; Cohen 2004) and that the “typical” PSR is comparable to the relationship someone has with his/her neighbor (Gleich 1997).

## METHODOLOGY

The main problem with the previous findings is the nonstandardized measurement used across the studies (→ Measurement Theory; Hartmann & Schramm 2006). Most PSI/PSR research is based on the parasocial-interaction scale (Rubin et al. 1985) or variations/adaptations of that scale (→ Scales; Scales and Indices). Whereas Rubin et al. (1985) found a one-dimensional structure, Gleich (1997) and other researchers explored three underlying dimensions of the PSI scale, from (1) empathy and involvement in the reception process, through (2) emotional relationships in the post-viewing phase, to (3) previewing activities and selection processes.

The PSI scale was initially developed “to measure feelings of audience relationship with local television news personalities” (Rubin et al. 1985, 176). Therefore, in every other context besides television news the scale has to be modified and supplemented. The scale’s heterogeneity has constricted comparisons of PSI/PSR findings across different media genres, media personae, and media audiences for the last two decades (Hartmann & Schramm 2006). Some other measurement tools have now evolved, such as the “audience persona interaction scale” (Auter & Palmgreen 2000) or a seven-dimensional PSR scale (Gleich 1997). The “parasocial breakup scale” (Cohen 2003) consists of 13 items measuring the anticipated feelings and coping strategies of someone whose favorite TV person has been dropped. This scale primarily measures the intensity of the anticipated loss and is therefore an indirect measurement of PSR’s intensity. Schramm and Hartmann (in press) developed a PSI questionnaire based on the two-level model of PSI that can be applied directly after TV exposure. It contains 14 scales (one scale for each of the cognitive, affective, and behavioral dimensions), measures positive as well as negative and neutral PSI, is suitable for all TV personae and genres without modifying the items, and allows for comparisons of findings across different studies.

Although research on PSI/PSR can look back over 50 years of tradition, the measurements and findings in use are still very heterogeneous. The challenge for future research is to provide measurement standards and to build up standards of PSI/PSR findings that are generated, confirmed, and validated across several studies using the same measurements.

## Parental Mediation Strategies

Amy I. Nathanson

Ohio State University

“Parental mediation” refers to the interactions that parents have with children about their media use. The majority of the research has focused on interactions involving children’s television viewing. Most scholars believe that parental mediation is comprised of three dimensions.

The first dimension refers to parent–child *communication about television* (→ Media Messages and Family Communication). This dimension has been given numerous labels, including active mediation, instructive mediation, and evaluative guidance. There can be great variation in the content of parent–child communication about television. Parents might express negative attitudes about programs and content (e.g., “I don’t like this program”), encourage children to view the material more critically (e.g., “do you think this would happen in real life?”), provide supplemental information (e.g., “this show is filmed in Los Angeles, California”), or endorse the material or the characters’ behaviors (e.g., “she is my favorite character”).

The second dimension refers to the *rules and regulations* that parents impose on their children's television viewing. Most researchers call this type of interaction "restrictive mediation," although some use the term "restrictive guidance." Parents may create daily rules about the number or type of programs that are acceptable, what time of day television may be viewed, or the location where viewing can occur. Parents may vary in whether and how they negotiate viewing rules with their children and how strict they are in enforcing those rules.

The third dimension is called → "*co-viewing*," or "social co-viewing," and is defined as parents and children viewing television together. Parents might co-view because they wish to protect their children from harmful content or help them benefit from educational or positive content. In this case, parents are said to engage in "intentional co-viewing." Other times, however, parents simply wish to view the same programs as their children because of shared interests or as a function of them being in the same place at the same time. The latter type of co-viewing can be thought of as "passive co-viewing" (Bybee et al. 1982; Nathanson 2001; Valkenburg et al. 1999).

Of the three types of parental mediation, co-viewing occurs most frequently and parent-child communication occurs least commonly. Parents who co-view usually have positive attitudes toward television and enjoy watching programs. Parent-child communication and restrictive mediation are more likely to occur among parents who have more negative attitudes toward television, especially regarding their children's viewing. Mothers are most likely to engage in all types of parental mediation.

Each of the three types of parental mediation has been linked with a variety of *effects among children* (→ Educational Television, Children's Responses to; Socialization by the Media; Violence as Media Content, Effects on Children of). Most research has been conducted on parent-child communication. This work shows that parent-child discussion about television is related to less aggression, better television plot comprehension, and more critical viewing among children (Austin 1993; Desmond et al. 1985; Nathanson 1999). When experiments (→ Experimental Design) are conducted in which researchers instead of parents deliver mediation message to children while they view television in a laboratory, the results suggest that active mediation also can reduce sex-role stereotypes, enhance learning from educational material, and diminish fright responses to scary content (Cantor 1994; Corder-Bolz 1980). The effects of parent-child communication about television may be strongest for younger children, such as those who are still in elementary school. Studies of adolescents sometimes fail to find effects or observe unintended outcomes. In some cases, for instance, parent-adolescent communication is linked with problematic outcomes among adolescents (Nathanson & Botta 2003). It is likely that parents need to adapt their communication to find a style that is persuasive to this age group.

*Restrictive mediation* is associated with positive outcomes, such as less aggression and better comprehension of television plots. However, restrictive mediation also is prone to backfiring effects, especially among adolescents. Research has found that parents who are very strict have children who are more aggressive (Nathanson 1999). In addition, rules may lead adolescents to search for the forbidden content elsewhere, such as at their friends' houses. On the other hand, children who receive both restrictive and active mediation are less likely to experience this kind of outcome (Nathanson 2002).

Co-viewing seems to enhance the effects of the co-viewed material (Salomon 1977). In the case of educational material, this effect is desirable. That is, children whose parents co-view educational content learn more from the material than do children whose parents do not co-view. However, the same type of effect has been observed when parents co-view antisocial content. For example, parental co-viewing also has been associated with increased aggression and more sex-role stereotypes among children (Nathanson 2001; Rothschild & Morgan 1987). Researchers speculate that the presence of parents leads children to pay greater attention to the co-viewed content and attach more importance to it, thereby making media effects more likely.

# Participative Processes in Organizations

Teresa M. Harrison

University at Albany

A core concept in organizational communication, participative processes refer to a wide range of efforts aimed at initiating or enhancing the involvement of employees in decision-making activities to which they would otherwise not have access by virtue of their positioning within an organizational hierarchy (→ Organizational Communication). Participative processes are generally discussed in opposition to or as a way to ameliorate problems associated with the routine functioning of bureaucratic hierarchy, that is, traditional top-down organizational structures (→ Bureaucracy and Communication; Organizational Structure). Top-down hierarchies allocate tasks, responsibility, and authority across positions in an organization in ways that control and coordinate organizational processes (→ Control and Authority in Organizations), but that may also inhibit flows of information and expertise, alienate employees, and, in so doing, diminish the organization's abilities to solve problems.

Participative processes take a *variety of forms*. In early formulations as practiced in the US and other industrial contexts, participation was conceived as essentially managerially driven, a prerogative managers exercised at their discretion. The manager's choice to consult with employees, to whatever degree and on selected issues, was a strategic one, made in response to the demands of a particular decision-making situation, and without accompanying changes in the organization's formal distribution of responsibility and authority. In other contexts, participation is practiced in formal programmatic initiatives, frequently organized around the creation of contexts for communication that function as alternative or parallel structures within the organization. These programs include programs for quality of work life, quality circles, Scanlon plans and other profit-sharing arrangements, and, more recently, employee involvement programs and autonomous or self-directed work teams. In Europe, participation has been strongly linked to national political processes and historically incorporated through legislative demands and union contracts into the formal functioning of organizations, such as in Swedish and German models of employee–employer co-determination. In other contexts, participation is practiced in ways chosen by employees who are organizational owners, as in employee stock ownership plans, worker cooperatives, and other alternatively structured organizations.

This variety suggests considerable diversity in the *philosophies underlying forms of participation*, the objectives that are sought, and the levels of power attributed to management and employees. Generally, informal participation practices and participation programs, particularly in the US, have functioned as ways to elicit employee commitment and increase the subjective involvement of employees in addressing organizational needs. Organizations have tended to alternate between cycles of focus on participation practices and on managerial control, depending on the state of the labor market or other economic or technological conditions. In legally mandated co-determination systems, in contrast, employees are viewed as roughly equal stakeholders in decision-making carried out in structures with employee representation. Such systems reflect political party philosophies,

the strength of union membership, and the influence of unions in government. Finally, in cooperatives and employee-owned organizations, participation is conceived as a fundamental right within the democratic or ownership ideologies upon which such organizations are based.

Researchers assessing the effects of participation generally ask whether participation processes are related to instrumental outcomes, chiefly job satisfaction and increased productivity, and assess the validity of models explaining how such effects are realized. In the *affective model*, participation is thought to enhance job satisfaction because employees find value in being involved in decision-making processes. The mere act of participation achieves benefits because participation enhances individuals' self-esteem and their feelings of control, trust, and identification with the organization, and reduces employees' resistance to decisions that are made. In the *cognitive model*, participation is thought to improve productivity by increasing the amount of information available within the organization for problem-solving. This makes it further possible to increase the effectiveness and efficiency of organizational processes.

Research has found support for both the affective and cognitive models, with somewhat stronger support for the former. However, it is difficult to determine the reliability of these findings because studies generally do not distinguish rigorously between the forms of participation used and the dimensions upon which these forms differ, such as the degree of participation and the range of issues discussed. There is similar diversity in the conditions under which participation takes place. Essentially, there is so much variety in participation processes that it is difficult to know what aspects are critical in achieving particular effects.

Interest in participation perseveres due to the continuing need to draw on the knowledge, expertise, and problem-solving capacities of employees in increasingly global, knowledge-intensive, and team-oriented work. Researchers have more recently focused on the communicative and collaborative dimensions of participation, since it is through communication networks that team members are brought together and through their interaction that problem-solving takes place (→ Communication Networks). But the authenticity of motives for participation programs has been a perennial question, as commitment on the part of organizational leaders ebbs and flows with economic and political conditions. Even with contemporary interest in creating flexible teams and collaborative communities, critics compare what companies say about the importance of participation with what they do in restricting employee voice, exercising arbitrary interference, and constraining employees' abilities to develop knowledge. Even more frustrating is the recognition that efforts to promote participation, regardless of their success, can produce a range of paradoxical effects that undermine desired outcomes. This is because participation is simultaneously a perceptual, political, structural, and ultimately interactional phenomenon, a complex process that is most frequently initiated by managers, but that requires the active engagement of employees to give it life and meaning.

## Participatory Action Research

Thomas Jacobson

Temple University

Participatory action research (PAR) is a methodological approach to research that breaks with standard social scientific practice in a number of ways (→ Research Methods). In standard practice, research into the behavior of social groups is conducted by university-trained scientists, while in PAR research is conducted by the social groups themselves with the assistance of university-trained scientists. In standard practice, research into the behavior of social groups is conducted with an attitude of scientific objectivity (→ Objectivity in Science), while in PAR research processes are conducted with a less objectivist attitude. Finally, in standard social scientific practice, the primary aim of research is the accumulation of knowledge, while in PAR the primary aim of research is improvement of social conditions, or social change (→ Communication Strategies for Empowerment; Social Mobilization). Given the aim of improving social conditions, much of PAR is conducted in the conditions of developing countries (→ Development Communication). However, action research approaches have been found useful worldwide in a broad range of contexts including education, urban planning, environmental conservation, and others. Journals, handbooks, and collected works on the subject are readily available.

PAR is not really a single method, but rather one of a *family of research approaches* (→ Communication and Social Change: Research Methods). One approach derives from John Dewey through Kurt Lewin, who is often considered the father of American-styled *action research*. Lewin sought both knowledge production and beneficial social change through social experiments. He proposed “a type of action-research, a comparative research on the conditions and effects of various forms of social action, and research leading to social action” (Lewin 1946, 38). This research involved a spiral of steps, “each of which is composed of a circle of planning, action and fact-finding about the result of the action” (1946, 38). *Action science* is a school of thought developed by Chris Argyris. Argyris’s

work is dedicated to improving community and organizational conditions, working largely in the context of industrial and corporate organizations and focusing specifically on the study of change and resistance to change. This research includes the study of “defensive routines” that manifest in organizations challenged with change, “dispositional” attributions of the form “My supervisor believes in such and such,” and theories of “causal responsibility” that concern the effects of decision *a* on outcome *b*. And she uses field experimental methods that meet “the rigorous tests of disconfirmability” (Argyris et al. 1985, xii).

Another approach to action research has a praxiological, or critical, orientation deriving from Karl Marx and Frederick Engels through Antonio Gramsci. Fals Borda’s (1985) promotion of *participatory action research* aims to foster community awareness within the perspective of historical materialism, addressing socio-political barriers to third world development efforts. William Foote Whyte has developed an approach to PAR that is different from that of Fals Borda. Whyte’s is more indicative of approaches to action research that focus on community participation. His characterization of the approach may therefore serve as a working definition of PAR: “In participatory action research (PAR), some of the people in the organization or community under study participate actively with the professional researcher throughout the research process from the initial design to the final presentation of results and discussion of their action implications” (Whyte 1991, 20). Despite its preoccupation with social change, Whyte believes that PAR should be recognized as an approach providing unique opportunities for academic research. It should be incorporated “into the tool kit of the social sciences” (1991, 19).

From the perspective of epistemology, PAR breaks quite deliberately with the tenet of scientific objectivity based in the fact–value dichotomy. Sometimes identified with British empiricist philosopher David Hume, the fact–value dichotomy refers to a distinction between scientific data, which are facts that can be proven, and social opinions, which are based on values and are matters of mere preference (→ Critical Rationalism). The attitude of scientific objectivity follows from the priority assigned to the pursuit of factual knowledge. PAR’s epistemology must therefore include knowledge gained from action that is guided by values.

For researchers interested in contributing to the well-functioning of social groups, or society as a whole, alternatives to scientific research have traditionally included policy research and applied research (→ Communication Research and Politics). Both policy and applied research aim to support or to change social processes. Policy research is concerned more specifically with informing decisions required of policymaking in large-scale societies or settings. While applied research focuses on the actual business of implementing social action, policy research, strictly speaking, may not be required or may have already been conducted (Etzioni 1971). Following such a classification, PAR would belong to the category of applied research, though not all researchers would agree with assumptions underlying distinctions between these forms.

Modern philosophical trends have largely undermined, or at least complicated, assumptions underlying the fact–value dichotomy and the idea of factual objectivity. Social theorists as divergent as Pierre Bourdieu, Jürgen Habermas, Michel Foucault, and Seyla Benhabib identify an element of practice in the conduct of most, if not all, inquiry. The relationship between PAR and contemporary philosophy of social science remains yet to be thoroughly articulated.

## **Participatory Communication**

*Jan Servaes*

*University of Massachusetts Amherst*

Participatory communication stresses the importance of cultural identity of local communities and of democratization and participation at all levels – international, national, local, and individual. However, the point of departure must be the community. It is at the community level that the problems of living conditions are discussed, and interactions with other communities are elicited (Servaes 1999; 2003). It points to a strategy, not merely inclusive of, but largely emanating from, the traditional “receivers” (→ Models of Communication). Paulo Freire (1983, 76) refers to this as the right of all people to individually and collectively speak their word: “This is not the privilege of some few men, but the right of every (wo)man. Consequently, no one can say a true word alone – nor can he say it for another, in a prescriptive act which robs others of their words” (→ Freedom of Communication).

In order to share → information, knowledge, trust, commitment, and a right attitude, participatory communication is very important. The International Commission

for the Study of Communication Problems, chaired by Sean MacBride, argued that “this calls for a new attitude for overcoming stereotyped thinking and to promote more understanding of diversity and plurality, with full respect for the dignity and equality of peoples living in different conditions and acting in different ways” (MacBride 1980, 254).

The most developed form of participation is self-management of communication media. This principle implies the right to participation in the planning and production of media content (→ Media Production and Content). However, not everyone wants to or must be involved in its practical implementation. More important is that participation is made possible in the decision-making regarding the subjects treated in the messages and regarding the selection procedures. One of the fundamental hindrances to the decision to adopt the participation strategy is that it threatens existing hierarchies. Nevertheless, participation does not imply that there is no longer a role for specialists, planners, and institutional leaders. It only means that the viewpoint of the local groups of the public is considered before the resources for projects are allocated and distributed, and that suggestions for changes in the policy are taken into consideration.

## **TWO MAJOR APPROACHES TO PARTICIPATORY COMMUNICATION**

There are two major approaches to participatory communication. The first is the dialogical pedagogy of Paulo Freire (1970; 1973; 1983; 1994), and the second involves the ideas of access, participation, and self-management articulated in the UNESCO debates of the 1970s (Berrigan 1977; 1979). In spite of wide acceptance of these principles of democratic communication in participatory communication projects, there exists today a wide variety of practical experiences and intentions.

### **Freire’s Dialogical Pedagogy**

The Freirean argument works by a dual theoretical strategy. He insists that subjugated peoples must be treated as fully human subjects in any political process. This implies dialogical communication. Although inspired to some extent by Sartre’s existentialism, a respect for the autonomous personhood of each human being, the more important source is a theology that demands respect for otherness – in this case that of another human being. The second strategy is a moment of utopian hope, derived from the early Marx, that the human species has a destiny that offers a life more than the fulfillment of material needs. Also from Marx is an insistence on collective solutions. Individual opportunity, Freire stresses, is no solution to general situations of poverty and cultural subjugation.

These ideas are deeply unpopular with elites, including elites in the third world, but there is nonetheless widespread acceptance of Freire’s notion of dialogical communication as a normative theory of participatory communication. One problem with Freire is that his theory of dialogical communication is based on group dialogue rather than such amplifying media as → radio, print, and → television. Freire also gives little attention to the language or form of communication, devoting most of his discussion to the intentions of communication actions.

### Access, Participation, and Self-Management in UNESCO Discourse

The second discourse about participatory communication is the → UNESCO language about access, participation, and self-management from the 1977 meeting in Belgrade. The final report of that meeting defines the terms in the following way. *First*, “access” refers to the use of media for public service. It may be defined in terms of the opportunities available to the public to choose varied and relevant programs and to have a means of feedback to transmit its reactions and demands to production organizations (→ Access to the Media; Public Access Television). *Second*, “participation” implies a higher level of public involvement in communication systems than mere access. It includes the involvement of the public in the production process, and also in the management and planning of communication systems. Participation may be no more than representation and consultation of the public in decision-making. *Third*, “self-management” is the most advanced form of participation. In this case, the public exercises the power of decision-making within communication enterprises and is also fully involved in the formulation of communication policies and plans.

Access by the community and participation of the community are to be considered key defining factors, as Berrigan eloquently summarizes: “[Community media] are media to which members of the community have access, for information, education, entertainment, when they want access. They are media in which the community participates, as planners, producers, and performers. They are the means of expression of the community, rather than for the community” (Berrigan 1979, 8). Referring to the 1977 meeting in Belgrade, Berrigan (1979, 18) partially links access to the reception of information, education, and entertainment considered relevant by/for the community: “[Access] may be defined in terms of the opportunities available to the public to choose varied and relevant programs, and to have a means of feedback to transmit its reactions and demands to production organizations.”

Others limit access to mass media and see it as “the processes that permit users to provide relatively open and unedited input to the mass media” (Lewis 1993, 12) or as “the relation to the public and the established broadcasting institutions” (Prehn 1991, 259). Both the production and reception approaches of “access” can be considered relevant for an understanding of → community media (→ Citizens’ Media; Citizen Journalism; Media Democracy Movement).

These ideas are important and widely accepted as a normative theory of participatory communication: it must involve access and participation (Pateman 1972). However, we should note some differences from Freire. The UNESCO discourse includes the idea of a gradual progression. Some amount of access may be allowed, but self-management may be postponed until some time in the future. Freire’s theory allows for no such compromise. We either respect the culture of the other or we fall back into domination and the “banking” mode of imposed education. The UNESCO discourse talks in neutral terms about “the public.” Freire talked about “the oppressed.” Finally, the UNESCO discourse puts the main focus on the institution, for which participatory or community radio means a radio station that is self-managed by those participating in it.

## PARTICIPATORY COMMUNICATION FOR SOCIAL CHANGE

Participation involves the more equitable sharing of both political and economic power, which often decreases the advantage of certain groups. Structural change involves the redistribution of power. In mass communication areas, many communication experts agree that structural change should occur first in order to establish participatory communication policies. Mowlana & Wilson (1987, 143), for instance, state: "Communications policies are basically derivatives of the political, cultural, and economic conditions and institutions under which they operate. They tend to legitimize the existing power relations in society, and therefore, they cannot be substantially changed unless there are fundamental structural changes in society that can alter these power relationships themselves."

Therefore, the development of a participatory communication model has to take place in relation to overall societal emancipation processes at local, national, as well as international levels. Several authors have been trying to summarize the criteria for such a communication model. The Latin American scholar Juan Somavia (1977; 1981) sums up the following (slightly adapted) components as essential:

- 1 *Communication is a human need.* The satisfaction of the need for communication is just as important for a society as the concern for health, nutrition, housing, education, and labor. Together with all the other social needs, communication must enable the citizens to emancipate themselves completely. The right to inform and to be informed, and the right to communicate, are thus essential human rights, and this both individually and collectively (→ Freedom of Information).
- 2 *Communication is a delegated human right.* Within its own cultural, political, economic, and historical context, each society has to be able to define independently the concrete form in which it wants to organize its social communication process (→ Communication and Law). Because there are a variety of cultures, there can therefore also arise various organizational structures. But whatever the form in which the social communication function is embodied, priority must be given to the principles of participation and accessibility.
- 3 *Communication is a facet of the societal conscientization, emancipation, and liberation process.* The social responsibility of the media in the process of social change is considerable. Indeed, after the period of formal education, the media are the most important educational and socialization agents. They are capable of informing or disinforming, exposing or concealing important facts, interpreting events positively or negatively, and so on.
- 4 *The communication task involves rights as well as responsibilities or obligations.* Since the media in fact provide a public service, they must carry it out in a framework of social and juridical responsibility that reflects the social consensus of society. In other words, there are no rights without obligations.

The freedom and right to communicate, therefore, must be approached from a threefold perspective: *first*, it is necessary for the public to participate effectively in the communication field; *second*, there is the design of a framework in which this can take place; and, *third*, the media must enjoy professional autonomy, free of economic, political, or whatever pressure.

In sum, participatory communication for social change sees people as the nucleus of development (Jacobson & Servaes 1998). Development means lifting the spirit of a local community to take pride in its own culture, intellect, and environment. Development aims to educate and stimulate people to be active in self- and communal improvements while maintaining a balanced ecology. Authentic participation, though widely espoused in the literature, is not in everyone's interest. Due to their local concentration, participatory programs are in fact not easily implemented, nor are they highly predictable or readily controlled.

# Partisan Press

*Jordan Stalker*

*University of Illinois at Chicago*

The term “partisan press” commonly describes a pattern of organizing competing journalism outlets along party lines, but may also represent a period in emerging national journalism systems. In creating and distributing news, publishers and editors may work within or make arrangements with parties, resulting in reportage that openly espouses the positions of leaders or factions (→ Party–Press Parallelism; Political Communication). In most countries, from France to Japan to the United States, Indonesia, and Senegal, some form of partisan or party-run press played a critical role in national political development. The partisan press, in both senses of the term, provides guidance to the general public and contributes to a country’s political consciousness (→ Public Opinion).

*Historically*, partisan presses appeared in the process of national emergence. In 1766 in India, for example, a merchant displeased with the way the colonial powers regulated business attempted to establish the country’s first newspaper, though the government quashed it before inaugural publication (→ Printer-Editors). A few decades later, the bilingual *Calcutta Gazette* and the *Bombay Gazette* appeared, but acting as official voices of their respective governments (Karkhanis 1981). In other countries, such as Norway, newspapers would combat government intervention and oppression by taking such simple measures as renaming the same paper after the national government outlawed the original one (→ Censorship, History of). Continental European newspapers of the late 1700s exhibited varying degrees of resistance or bending to the will of the ruling courts. In an example of international partisanship, the French-language *Gazette de Leyde*, based in the Netherlands, was responsible for promoting the successes of the newly independent United States to the rest of Europe (Popkin 1989).

Partisanship became a key principle for organizing the popular journalism of some countries in the nineteenth century. The 1830s saw the founding of Telugu- and Tamil-language newspapers in Madras, India (Karkhanis 1981). Horace Greeley’s *New York Tribune* served as a tool of the Whig party in its bid against Jackson in 1824. Political debates went beyond editorial pages to appear prominently on the front pages of Republican and Federalist newspapers (→ Penny Press). Exuberant partisan news coverage was also a progenitor of → sensationalism in journalism, prevalent in the last quarter of the nineteenth century and continuing today.

In the period before the press secretary, politicians used newspapers to act as their sounding boards and official scribes (→ Party Political Communication). The Japanese government was quick to put restrictions on its national press following the Meiji Restoration of 1868, setting a precedent for government regulation of speech rights in the country. Political dependence on newspapers to broadcast party messages lessened considerably after Theodore Roosevelt held the first → press conference in 1908.

Journalists have often made the leap from reporting to partisan policymaking. After their favorable coverage of his policies, American president Andrew Jackson appointed nearly 60 journalists to federal posts following his 1832 election (Baldasty 1984), a

process called the “spoils system.” After the Hungarian revolution in 1848, Mihály Táncsics, an editor of a popular paper, was entrusted with explaining legislative issues and earning public trust and support (Kosáry 1986).

European publishers in the Victorian era commonly remained married to the political system, which provided their papers with subsidies and exclusive news reports. A partisan pattern of press organization in Europe blossomed before World War I and depended on the existence of more than one party. Newspapers linked themselves to the politics of one competing party and tended at times to sacrifice the ideal of → objectivity in reporting to that political position.

Other forms of press organization may supplant a partisan press. For instance, some scholars indicate that Progressive Era ideals in the United States prompted journalists to eschew deliberate political affiliations. Newspaper editors came to think of such activities as conflicts of interest or barriers to making the craft more professional (→ Professionalization of Journalism). In other countries, journalists also formed associations and press unions that served the dual functions of protecting smaller enterprises from government oppression and delineating what qualified as journalism (→ Journalists: Professional Associations).

It remains unclear whether the professional project in fact removes journalism from partisan involvement. For example, some scholars criticize the Japanese press for anti-government bias, though others contend that the existence of press clubs – national professional organizations the government affords preferential access – reinforces the point that the press remains a government tool in Japan (Pharr & Krauss 1996).

In most Southeast Asian and African nations, press systems took shape after independence movements, most of which occurred in the middle of the twentieth century. To succeed, they needed to ally themselves with a political party or other special interest. Partisanship may take a darker form in one-party political systems. In 1940s and 1950s Liberia, the government was quick to employ sedition laws and other acts of oppression, culminating in the imprisonment of C. Frederick Taylor, the editor of the *African National* (Burrowes 2004).

Many nations developed in the context of the political leanings and activities of the press. In countries with a literate population throughout the world, some form of partisan press played a role in shaping political life and in forming journalism itself.

## Party Political Communication

Sharon E. Jarvis

University of Texas at Austin

Political parties are groups that organize to gain political office, control the governing process, mobilize majorities, organize dissent and opposition, and socialize voters. In democratic political systems parties have emerged as the natural evolution of like-minded interests organizing for political influence. Election campaigns are one major battleground on which political parties compete for influence through political communication (→ Election Campaign Communication). Many election studies have compared the messages, advertisements, debate performances, issue preferences, and web pages of partisan candidates as well as the overall strategies of the parties themselves (→ Negative Campaigning; Political Advertising; Political Marketing; Issue Management in Politics; Televised Debates). In systems with primary elections, it is generally observed that campaign messages are more partisan in the intra-party primary contest (featuring just candidates from one party) and more centrist during the general election campaign (featuring candidates from several parties).

Beyond the election situation, research on party political communication has largely examined the roles and functions of party labels and the styles of partisan leaders. *Party labels* have been defined as cues that provide simple, direct, and consequential information in shaping individuals' perceptions and evaluations. Party labels are considered by many to be the chief cue for individuals as they make decisions about candidates or issues. Findings from survey and experimental research suggest that labels help people make sense of their political worlds in at least five ways (→ Political Language; Political Symbols).

First, partisan labels are *broadly understood*. Research has noted that citizens recognize the predominant party labels in their political systems, that citizens and elites often agree on the broad meanings connected to party labels, and that citizens have an easier time discussing the differences between party labels than the individual candidates within a party.

Second, party labels *help citizens make decisions*. Party labels are argued to serve as short cuts (or heuristics) for making sense of political life. Experimental research has shown that voters are more likely to choose a candidate when partisan information is provided. This finding holds for voters who report both high and low levels of political sophistication. Even though individuals with fewer political resources are the most dependent on party labels to help them make political decisions, citizens of all levels of sophistication are found to make decisions more efficiently when labels are present.

Third, party labels are understood through *partisan screens*. Research shows that individuals who have an ideological view of political parties are more likely to see differences between party labels and consistently prefer their party label to the opposition's (→ Perception; Image). A similar pattern appears for the way individuals regard ideological labels (such as left, right, liberal, or conservative). At times, preferences for partisan or ideological labels can move from the group label to a leader nominated or elected by the party; indeed, studies have shown that attitudes toward party labels affect attitudes toward party nominees and that reactions to party nominees can, in turn, influence attitudes toward parties and party labels.

Fourth, party labels *influence how citizens think about candidates*. While the research mentioned immediately above acknowledges how individual cues can influence the way citizens regard party labels, other experimental studies have shown the opposite is true as well: when party images have been activated, citizens may not individuate political candidates (Rahn 1993). Specifically, experimental work suggests that party stereotypes (1) can function heuristically for voters when they are confronted with political information processing tasks, and (2) appear to be quite robust cognitive categories with considerable influence in many political information-processing tasks (→ Candidate Image).

Fifth, party labels are regarded as *dynamic*. Rhetorical and public opinion research has pointed to how the visibility and favorableness of labels can change over time. Studies have noted how labels can expand or contract over time, gaining or losing emotional, ideological, or stereotypical associations that influence how individuals regard these cues as well as the parties they represent.

Political strategists and academics have explored how the parties, partisan candidates, and party issues positions can be made more attractive. In the United States, visible wordsmiths include strategists Frank Luntz and academic George Lakoff. Working for the Republican side, Luntz has employed focus groups and public opinion → surveys to test phrases to help conservatives get elected, frame public policy debates, and garner more flattering news coverage (→ Election Polls and Forecasts; Political Consultant). In his research as a linguist, Lakoff (2002) has offered advice as to how Democratic and left-leaning voices could begin to respond to the long-term linguistic efforts of the right. He recommends (1) creating framing devices that benefit a leftist perspective and (2) building counter-narratives to recast many of the ways in which contemporary politics are being discussed (→ Strategic Framing; Framing Effects). In Europe, scholarly attention has focused on the branding practices of political parties, including such processes as rebranding (e.g., the Labour Party emerging as the “New Labour Party”) and brand management (see Newman 1999; → Brands).

Scholars have also compared the *rhetorical and cognitive styles* of partisans from the left and the right. Rhetorician Richard Weaver observed that conservatives argue from

definition (basing their positions on fundamental principles) and liberals from circumstance (basing their cases on conditions and contingencies). Political communication research has offered empirical support for Weaver’s claim, documenting distinct partisan styles in politicians from the left and the right (Jarvis 2005). Psychologist Philip Tetlock has found conservatives (Republicans in the United States) and liberals (Democrats) display differing cognitive styles. Specifically, research on US senators and Supreme Court justices has shown that Republicans are more cognitively simple than Democrats. These findings do not mean that Republicans are less intelligent than Democrats. Instead, conservatives are more parsimonious in their thinking and arguments than their liberal peers, whereas advocates of centrist and moderate to left-wing causes tend to interpret and express issues in more complex and multidimensional ways (Tetlock 1983).

## **Party–Press Parallelism**

*Paolo Mancini*

*University of Perugia*

Colin Seymour-Ure (1974) was the first scholar to speak of a “parallelism” between parties and newspapers. In his view this refers to three main features: the ownership of the mass media by political parties, the editorial choices of the news organizations, and the party affiliation of the readers (→ Ownership in the Media). Jay Blumler and Michael Gurevitch (1995) further developed this concept, slightly changing it (→ Freedom of the Press, Concept of). In their view, party parallelism – or partisanship – includes “any organizational connections to political parties, the stability and intensity of editorial

commitments and presence or absence of legal restraints on the rights of the media to back individual parties” (Blumler & Gurevitch 1995, 65). Even in the absence of organizational links, party parallelism in Blumler and Gurevitch’s view may include also all those situations in which a news organization backs in a more or less stable condition a political party, either because of a historical tradition or because of contingent decisions (→ Balance; Commentary; Editorial; Endorsement; Neutrality; Partisan Press).

While in Seymour-Ure’s definition, the main feature of party parallelism was essentially the ownership of the news organization by the political parties determining a media content marked by a strong advocacy slant, Blumler and Gurevitch see party parallelism as a somewhat more general framework of links and connections between mass media and political parties, not necessarily descending from direct party ownership.

It is from this last interpretation that the definition of *political parallelism* descends. It refers to “media content – the extent to which the different media reflect distinct political orientations in their news and current affairs reporting, and sometimes also their entertainment content” (Hallin & Mancini 2004, 28; → Media as Political Actors).

Beyond content, political parallelism is reflected also in the organizational connections that, as in Seymour-Ure’s and Blumler and Gurevitch’s definitions, may exist between political organizations, parties, unions, social movements, and the like on the one side, and media organizations on the other (→ Social Movements and Communication). These links may involve the property of the media but also just the fact that mass media and news organizations are linked through a common ground of organizational connections and symbolic affiliations. Political parallelism exists when media personnel show a tendency to be active in political life: reporters take sides not just in their professional work but also by being active in party organizations and political life. Thus, political parallelism exists also when the careers of journalists and politicians overlap, when the shift from one position to another is easy and frequent (→ Advocacy Journalism; Journalists’ Role Perception; Bias in the News).

The move from the notion of *party parallelism* toward *political parallelism* highlights a very important, and, in some countries, very recent change of the political system. Political parallelism tends to substitute party parallelism as political parties are losing the importance they had in previous years. Their role as agents of socialization is losing ground. Party membership is going down while political participation is no longer limited to involvement with political parties, but can be related to a number of different political organizations, such as social movements, cause-related groups, environmentalist groups, feminist groups, and the like.

The weakening of political parties has determined the disappearance of many party newspapers in the Scandinavian countries, France, Italy and many other western democracies. However, it has not meant the disappearance of either political/ideological links existing between political organizations and mass media, or the political orientation of many newspapers and broadcasting organizations. In other words, even in a more secularized social life in which the → commercialization of the media has undermined their role as agents of political socialization (→ Political Socialization through the Media; Socialization by the Media), the concept of political parallelism indicates that the framework of organizational and symbolic links still exists between the mass media system and different social organizations, and is still reflected in the content of mass media. The fact

that these links may be of some stable nature differentiates the concept of political parallelism from that of *advocacy*, which may indicate a temporary “taking sides” for a cause by the mass media, and a less structured and stable framework of connections with different organizations of society.

## **Pathos and Rhetoric**

*Daniel M. Gross*

*University of California, Irvine*

Derived from the Greek verb *paskhein*, meaning to be in a certain condition, to experience, or to suffer, pathos is one of the three principal sources of rhetorical proof along with ethos and logos (→ Ethos and Rhetoric; Logos and Rhetoric). Typically translated into English as → “emotion,” pathos is a key term in the ancient debate between philosophy and rhetoric because it tracks basic attitudes about human nature and civil society.

In the western canon, emotions have long been treated with caution by those who would hail the virtues of rational discourse aimed at truth. And since Plato (c. 428–c. 347 BCE), such caution is the symptom of a divisive political philosophy separating experts from non-experts. As Socrates suggests in the *Gorgias* – Plato’s famous diatribe against rhetorical art – the rhetorician might have luck arguing to the ignorant about something like the causes of health and sickness, but among experts, the diagnosis of a trained doctor will carry more weight. In contrast to the expert, a sophistic rhetorician working in either an expert domain or in a practical domain such as politics has no need to know the truth about things. Instead, according to Plato, the rhetorician merely hits upon techniques of persuasion that achieve the desired ends (459c). First among these techniques, as the Roman rhetoricians would later reiterate, is the appeal to popular emotion.

In typical Roman fashion, Marcus Tullius Cicero (106–43 BCE) acknowledges that civic leaders must give emotions voice, but only in order to make proofs exciting to those who might otherwise remain apathetic. As Cicero laments in *De oratore*, intellectual understanding might have a direct line to the truth, but that line will usually remain untapped unless some external motivating force is applied. With some reluctance, then, the eloquent civic leader must embody the vivid language and delivery that speaks to the emotions of a popular audience (2.214).

Lurking in this Roman defense of eloquence is the fear that emotional appeals threaten civil society because they naturally cater to special interests without inherent consideration for the general good (*De Oratore* 2.186–187). For instance, the educator Marcus Fabius Quintilianus (c. 35–c. 100 CE) takes seriously the stoic philosopher’s fundamental suspicion of emotion when he condemns emotional appeals that distract a judge from the truth (*Institutio oratoria* 6.1.7). So again for the Romans, logical reason by itself escapes a popular audience, while a thoughtless appeal to the emotions is considered profoundly unethical. The Roman solution to this dilemma was to add pathos to logos, to *join* reason and eloquence, and this by sheer fiat. The most influential formulation is furnished by Cicero in the opening pages of *De inventione*: since wisdom in itself is silent and powerless to speak, wisdom in the absence of eloquence is useless. What is needed if a commonwealth is to thrive is *ratio atque oratio*, powerful reasoning allied with powerful speech.

In his radical 1924 reintroduction to the concept of pathos, Martin Heidegger explicitly rejects this Roman compromise with its manipulative psychology that ties emotions to the untrained mind. Instead, Heidegger considers pathos in the tradition running from Aristotle’s *Rhetoric* through Augustine and the theology of Martin Luther, where a basic emotion such as fear makes our collective existence concrete and moves us in our fundamental belief (*doxa*). For Heidegger, the fact that we are subject to movement in our belief is precisely what makes us part of the human community and grounds all sorts of civic discourse, including discourse that seems essentially logical. Without pathos, according to Heidegger, we would lack the sympathies and antipathies that define community and shape social discourse down to its concrete propositions.

We might consider, for instance, the US logic for war against Iraq, as it was outlined by Colin Powell to the United Nations General Assembly in February 2003. In this case “wisdom” depended not just upon a deductive argument for correct action grounded in the truth of an immanent Iraqi threat; US action in this case followed a complex, mediated orchestration of the hopes and fears that defined friend and enemy around the key term “terror.” As Heidegger might remark in this case and similar, logos is grounded in pathos, not the other way around.

Repulsed by images such as an impassioned Josef Goebbels at Nuremberg, some postwar communication theorists like → Jürgen Habermas returned to philosophical theories of civic discourse grounded in reason. However, Heidegger’s revitalization of Aristotelian pathos now finds resonance in a range of contemporary rhetorical theory that starts from our more messy, and irrational being-in-the-world, including theories that engage cultural studies and psychoanalysis. Prominent examples of this latter camp include Judith Butler, who is interested in hate speech and the passionate attachments that mark the contours of social discourse, and Michel Meyer, who analyzes in detail how

real-world propositions necessarily implicate emotion. Finally, and ironically, this more radical rhetorical perspective prioritizing pathos has recently found a dubious ally in anti-Cartesian philosophy and brain science, which grounds cognition in emotion understood physiologically, not socially.

## **Patient–Provider Communication**

*Rebecca J. W. Cline*

*Wayne State University*

Patient–provider communication, interaction between patients and professional and familial caregivers in formal health-care contexts, has significant influences on health-care outcomes. During health-care, patients interact with numerous health-care professionals (e.g., primary providers, specialists, nurses) and familial providers (e.g., elderly adults' children, spouses, young children's parents). Familial providers interact with health-care professionals on behalf of patients (Eggly et al. 2006), patients behave differently in family members' presence (Greene et al. 1987), and patient–provider communication affects health outcomes (e.g., pain and distress) (Cline et al. 2006). However, the majority of patient–provider communication research has investigated physician–patient dyads (→ Health Communication; Doctor–Patient Talk).

### **HEALTH-CARE RELATIONSHIPS**

The type of physician–patient relationship that develops varies with → relational control (Beisecker & Beisecker 1993). Relational control refers to the process of establishing who

has the right to define and direct a dyad's actions. In *paternalism*, physicians take control while patients yield control (e.g., unquestioningly accept physician judgments). *Participatory models* (e.g., mutual participation, participative decision-making, therapeutic alliance) imply both parties' active involvement and relatively equal control (interdependence, information exchange, and listening). In *consumerism*, patients take charge of their health-care, seek information independently, sometimes request treatments, and, if dissatisfied, seek other physicians.

Equal relational control is an ideal unlikely to be achieved in practice, but active patient involvement is assumed desirable. Due to differences in conceptual and methodological approaches, critics disagree about whether patient-centered interaction (which theoretically privileges patients over providers) leads to improved outcomes (Mead & Bower 2000). However, a participatory model and/or patient-centeredness typically are assumed desirable by researchers and medical educators. Evidence generally associates active patient participation, with positive health-care outcomes.

## OUTCOMES

Patient–provider communication affects health outcomes (Brown et al. 2003). Abundant research has found that patient satisfaction with health-care is related to patient–provider communication. Early observational research found patient satisfaction to be predicted more by quality than quantity of communication; later research showed communication length and quality to be unrelated. Physician communication behaviors associated with patient satisfaction include: providing information, discussing psychosocial and quality-of-life issues, offering emotional support, empathy, including families, and listening (Thompson & Parrott 2002).

Substantial evidence links patient satisfaction to adherence (compliance) to treatment regimens, and thus to health and medical outcomes (→ Compliance Gaining). Communication variables that influence patient satisfaction generally affect adherence. Additional patient outcomes affected by communication include: psychological (e.g., anxiety, distress) and physiological responses (e.g., blood pressure, heart rate, pain), health-care needed (e.g., hospitalization length, medication taking), problem/symptom resolution, health status, and quality of life. Better communication quality leads to improved provider outcomes: reduced malpractice claims, consultation length, doctor shopping, and marginal physician use; as well as increased appointment keeping (Brown et al. 2003) and clinical trial enrollment (Albrecht et al. 2003).

## MICRO-LEVEL PATIENT–PROVIDER COMMUNICATION RESEARCH

Research has been conducted in two general ways: (1) obtaining patient/provider self-reports regarding perceptions of communication, and (2) observing actual communication. Although patient–provider communication was long assumed important, observational investigations did not begin until the 1960s. State-of-the art research observes micro-level communication patterns (e.g., who talks, forms and functions of talk, specific nonverbal behavior).

Depending on theoretical or practical interest, researchers may focus only on physicians' or patients' communication behavior or on relationships between their communication

behaviors. Researchers generally distinguish between *two dimensions of messages*: informational and relational. Informational-level messages typically contain medical content (e.g., symptoms, diagnosis, treatment, side-effects, prognosis). Relational-level messages include explicit relational content (e.g., “I like having you as my doctor”), as well as implicit messages (e.g., interruptions, closed versus open questions, empathy, friendliness, gaze) that influence affiliativeness (i.e., closeness, liking) and relational control (i.e., dominance, conversational control).

Over time, for *observation and measurement*, investigators have most relied on audio-recording patient–provider interaction for subsequent analysis. State-of-the art research relies on unobtrusive video-recording systems, which permit subsequent coding of complex nonverbal and verbal behavior, precise time assessments (e.g., length of talk, silence, touch time), and real-time coding of patient, family member, and provider communication behavior (Penner et al. 2007; → Coding).

Various observational coding systems have been used to analyze transcripts, audio tapes, and video tapes of interactions. (See 2001 special issue of *Health Communication* for applications of numerous coding systems to a common sample.) The typical unit of analysis is an utterance (speaking turn) or thought unit (oral equivalent to a simple sentence). Seminal research applied Bales’s interaction process analysis (IPA) to provider–patient communication. Designed to study small group interaction, the IPA categorizes verbal interaction into task and socio-emotional categories. Subsequent coding systems were designed specifically for medical interaction. Depending on theoretical interest (e.g., relational control, communication competence), additional interpersonal communication coding systems have been applied to physician–patient communication (→ Interview, Qualitative).

*Roter’s interaction analysis system* (RIAS), the most widely used coding system, focuses on physician–patient social exchange of resources and incorporates task and socio-emotional categories similar to Bales’s IPA, such as information giving/gathering in psychosocial and medical content areas and relational talk (social/emotional talk, agreements/disagreements, and partnering talk). Other coding systems focus on areas of theoretical or practical interest. The *measure of patient-centered communication* (MPCC) assesses patient-centeredness, including physician exploration of patient’s disease or illness experience, physician understanding of patient’s psychosocial context, and “finding common ground” (physician–patient agreement regarding problems, goals, and roles). The *Karmanos accrual assessment system* (KAAS) was designed to observe conversations about clinical trials, and includes global communication ratings applicable to medical interaction in general. The global assessments are relatively unique in making assessments at the dyadic rather than individual (patient or physician) level (e.g., connectedness, closeness, dominance; Egly et al. 2006).

## NATURE OF RESEARCH

Physician–patient communication research reflects *several trends*: (1) much early research was descriptive and qualitative; (2) most research has occurred in primary care but increasingly researchers are investigating specialized care, particularly cancer care (Arora 2003); (3) research has focused far more on physicians than patients; (4) research has focused predominantly on verbal communication.

Several research topics have received substantial attention. Studies of effects of patient social characteristics generally indicate that physician communication behavior varies based on patient gender, age, and socio-economic status (Cooper & Roter 2003). Females, elderly patients, and patients of lower socio-economic status generally fare worse than their counterparts with regard to informational and relational communication quality.

Research investigating communication competence and communication skills training has attended far more to physicians than patients. Reviews conclude that communication skills are “teachable,” but little agreement exists regarding what skills should be taught and what framework should guide training (Thompson & Parrott 2002). Although little research has focused on patient communication training, and that training typically has been limited to information-seeking skills, evidence generally supports its value for health outcomes (e.g., reduced blood pressure; Cegala 2006; → Interpersonal Communication Competence and Social Skills).

A significant communication challenge for physicians is discussing “bad news” with patients, including terminality and other sensitive issues (e.g., diagnosis of serious health problems, poor prognosis, and difficult treatment regimens). Cultural expectations influence physicians’ disclosure of “bad news.” Although medical education and training often includes “bad news delivery,” little evidence exists for the efficacy of commonly advocated approaches (→ Bad News in Medicine, Communicating).

Evidence is growing that macro-level phenomena (the → Internet; → direct-to-consumer advertising of prescription drugs, and more recently of genetic testing; complementary and alternative medicine; social support groups) affect micro-level patient–provider communication (Cline 2003). Exposure to these phenomena may enhance patients’ actual or perceived knowledge and empower them to communicate more actively with providers. Typical research involves content analyses to identify potential influential factors (→ Content Analysis, Quantitative; Content Analysis, Qualitative). Investigations of actual effects on physician–patient communication (e.g., patients bringing information to visits, time consumption, relational impact) generally have been limited to self-report data. Critics agree that these phenomena encourage patient participation, but debate whether specific effects benefit or harm physician–patient relationships and health-care outcomes. More investigation is needed. Email is a largely uninvestigated technological advance that directly influences physician–patient communication; its impact on health-care is debated. If macro-level phenomena ultimately improve health-care, differences in access to them may enhance health-care disparities.

Perhaps the *most important contemporary issue* is the impact of patient–provider communication on racial and ethnic health-care disparities (Cooper & Roter 2003; → Health Disparities, Communication in). Patient–provider communication may contribute to disparities, given the importance of communication for health-care outcomes and evidence regarding effects of social characteristics (i.e., gender, age, social class) on that communication. Little research has addressed this issue. However, patients rate race-discordant (versus race-concordant) physician–patient interactions as less satisfying and participatory. Whether these differences are rooted in stereotypes and expectations, or actual micro-level interaction patterns differ on the basis of race concordance, is not clear. Future research needs to identify disparity-enhancing patient–provider communication processes and develop efficacious interventions.

# Peace Journalism

Nancy L. Roberts

State University of New York at Albany

Peace journalism is an attempt at persuasive communication, usually by a social movement, to advocate in favor of ending war and violence. Journalism that advocates reforms such as social justice, the abolition of slavery, woman suffrage, and, most centrally, international peace has flourished in the United States, partly because of the press freedom the First Amendment of the US Constitution affords (→ Freedom of the Press, Concept of). Perhaps not surprisingly, most of the research to date on peace journalism has focused on US subjects and concerns (Roberts 1991, 1995).

Underpinning the scholarship is a rich history of international peace movements. Several scholars have emphasized the vigor and continuity of Anglo-American efforts originating early in the nineteenth century (Brock 1968; Chatfield 1971; Curti 1936; DeBenedetti & Chatfield 1990; Phelps 1930; Wittner 1969). Recent studies focus on modern, international peace efforts such as the post-World War II nuclear disarmament movement (Wittner 2003). The research usually notes the important role of the advocacy press in promulgating ideas about peace (→ Advocacy Journalism).

Some scholarship views peace journalism as a tool of peace societies, first organized in the United States early in the nineteenth century. The Massachusetts Peace Society and the New York Peace Society formed in 1815 and the American Peace Society (APS) in 1828. These nonsectarian, Christian organizations sponsored periodicals such as the *Advocate of Peace*, *Calumet*, and *Harbinger of Peace* (APS), *Friend of Peace* (Massachusetts Peace Society), and *American Advocate of Peace* (Connecticut Peace Society). Another example, the New England Non-Resistance Society, published the *Liberator* and other titles. The League of Universal Brotherhood (founded 1846) and the Universal Peace Union (founded 1866) also published several periodicals.

Besides these comparatively nonsectarian, sponsored periodicals (Stewart et al. 2006), peace journalism also emerged in religious institutions, within the communication strategies of historical peace churches: Quakers (Society of Friends), Mennonites, and Church of the Brethren. All have proselytized for peace as a religious tenet. In the nineteenth century at least, the nonsectarian peace publications greatly overshadowed the religious ones, which thus received less scholarly scrutiny.

A third category of nineteenth-century peace journalism came from religious communitarians who advanced peace as a key principle of their vision to remake society. The Oneida Community in upstate New York published *American Socialist*, *Oneida Circular*, and *Witness* (Roberts 2005). The Shakers issued *Shaker Manifesto* and other publications, and the Owenite New Harmony group published *New Harmony Gazette*. Also in this category are the Adventists (*Review and Herald* and *World's Crisis*) and the Disciples of Christ (*American Christian Review*, *Christian Baptist*, and *Millennial Harbinger*).

After the nineteenth century, peace journalism grew along with the number of peace organizations. Examples of the publications from religious institutions (including the historical peace churches) are *Brethren Life and Thought*, *Friends Journal*, *Mennonite Life*,

*Fellowship* (Fellowship of Reconciliation), and *Catholic Worker*. Examples from secular organizations include *Liberation*, *International Conciliation*, and *Bulletin of the Atomic Scientists*, as well as *WIN*, from the War Resisters' League.

Beginning in the early twenty-first century, individuals and groups turned to new media technologies such as the → Internet to proselytize for peace. For instance, most peace organizations today take advantage of computer networking and email to help organize their international members' activities, including the production of media messages. Many peace periodicals have either developed an auxiliary website or are primarily web-based, such as *Peace Journalism* ([www.peacejournalism.com](http://www.peacejournalism.com)), an international e-magazine.

The best-developed scholarship on peace journalism grows out of the field of peace history, especially institutional histories. Some scholars have focused on influential practitioners of journalism for peace advocacy, such as Dorothy Day and her *Catholic Worker* (Roberts 1984) and I. F. Stone, editor of *I. F. Stone's Weekly* (Cottrell 1992). Such research demonstrates that some practitioners such as Day focused almost equally on content and journalistic craftsmanship.

Research on peace advocacy journalism and new media technologies is still in its infancy. Other areas that demand study include peace advocates' uses of communication, economic aspects of peace journalism, audiences peace journalists reach, the social and cultural context, and the journalists' background and training, especially compared to mainstream professionals.

# Pedagogy, Communication in

*Philip M. Backlund*

*Central Washington University*

Pedagogy is commonly defined as the principles and methods of instruction. Instructional pedagogy, at all levels, is mediated through the communication process. Successful pedagogy is thus dependent on successful communication among teachers and students. However, all teachers do not effectively use communication to support instruction. A teacher's thorough knowledge of content does not mean that she or he can communicate it to students.

Much of student learning success and teacher satisfaction with the process is derived from the quality of the student-teacher relationship. All teachers are faced with the challenges of classroom communication, of communicating content to students, and of engaging students in the learning process. When the communication process works well, learning takes place and relationships are developed. But the process does not always work. Some students feel course content is worthless, some are unresponsive, others fear talking in class, and still others struggle with the English language. These issues, in part, are affected by how a teacher communicates with students. An effective teacher is a content expert, and many teachers believe that is all they need to be. However, teachers who also focus on *how* to support students and learning through effective communication increase learning, student liking for learning, and teacher satisfaction.

## ROLE OF STUDENT TALK

The strategies outlined below focus both on student talk and on teacher talk (→ Classroom Student–Teacher Interaction). The primary objective of developing student talk is to provide opportunities for student engagement in content. For example, studies have shown that the lecture method is not universally effective in helping students learn because they are not actively involved in the learning process. On the other hand, an old dictum states, “If you want to learn something, teach it.” There is truth there, truth that points to helping students communicate what they have learned. “If you can't communicate about it, you probably don't know it.”

Yet many teachers and students do not see the value of student talk. Barbara Wood (1981) made the point that many students see a negative relationship between talk and grades. It is the quiet student that just does his or her work who seems to get a positive evaluation. This isn't always the case, but it happens with regularity. Wood described four beliefs that guide many teachers' approaches to student talk in the classroom:

- I must retain the floor as much as possible.
- I must insist on complete quiet from my students in order to retain control.
- Students cannot gain access to the floor without first getting my invitation (I call on them).
- Students should not ask questions or make comments about the topic until the proper time (such time is rarely provided).

These beliefs invite passive behaviors from students. Alternatively, an effective focus on communication in classroom pedagogy can improve student ability to relate effectively to others, improve social system understanding, build confidence in influencing that social system, and most importantly, build confidence in content (→ Student Communication Competence).

### **COMMUNICATION STRATEGIES FOR THE CLASSROOM**

Once the decision is made to focus on the role of communication in pedagogy, the question becomes one of implementation. However, choosing the appropriate teaching strategy for a course or an individual class session is not easy. An instructor can choose from an increasingly wide range of methods including lecture, discussion, guided discussion (→ Classroom Questioning), small groups, peer instruction, computer-assisted instruction, podcasting, online chat groups, experiential games and activities, and the like (→ Classroom Instructional Technology). All strategies work, but not equally well for every learning objective. Cooper & Simonds (2003) developed a set of guidelines applicable to choosing an appropriate instructional strategy.

- The *teacher*: what is the teacher's teaching style (→ Teacher Communication Style)? What is he or she comfortable with?
- The *students*: what is the student's background, interest level, knowledge level, attention span, etc.?
- *Objective of the lesson*: what is the learning outcome? Different outcomes (such as information acquisition or skill development) require different learning strategies.
- The *environment*: factors such as class size, amount of time devoted to the lesson, classroom physical arrangement, and other environmental considerations impact learning strategy selection.

Using these guidelines, a teacher can select the most appropriate strategy. The remainder of this entry focuses on three commonly used strategies.

#### **Lecture Method**

The lecture method is generic across subjects and education levels. It is well documented as a strategy for communicating ideas to others, and it has also been known to put many a student to sleep. It has survived because it is efficient, familiar, and necessary. No teacher escapes giving directions, specifying procedures, and providing demonstrations (Cooper & Simonds 2003). In recent decades, the lecture has received a great deal of criticism for misuse and unskilled applications. Research studies link the lecture method

to reduced motivation (Spaulding 1992), lower long-term memory retention, and passive learning (Freiberg & Driscoll 2005). The implication of these findings is that the lecture should more strongly engage students in the content (Freiberg & Driscoll 2005).

How does an instructor accomplish this? The teacher can develop an effective lecture by focusing on the student, the content, the organization, and the delivery (→ Teacher Clarity). Lecturing is a form of public speaking, and the principles of a good public speech apply. Preparation begins with audience analysis. Understanding who the students are and how they can be prepared to listen lays the groundwork for tailoring the lecture to meet their needs. Variables that should be considered include: students' learning styles and the instructor's teaching style, students' information processing ability, their attitudes and beliefs about the topic, their previous knowledge, feelings about the instructor, and the range of cultures represented in the classroom.

Some instructors, unfortunately, take the point of view that "It is my job to give the lecture, their job to listen." These instructors believe that no adaptation is necessary, and some would even say adaptation is pandering to students. This issue does bring up the necessary question of student responsibilities during a lecture. If we view the lecture as a communication event, then we know that whatever the outcome, both interactants (instructor and students) have an impact. Students do need to actively participate in this communication event to make it successful, but what is their responsibility? A very useful idea is for the instructor to talk with the students about lectures, about expectations, and ask the students for their opinions on how course lectures can be made most beneficial. In this way, adaptations are made on both sides for everyone's benefit.

A key factor in lecturing success is explicitly stating learning outcome(s) for the content. All lectures should have a clear instructional outcome, and the teacher needs to make the determination that a lecture is the best strategy to accomplish this objective. The identified learning objective becomes the main point for the lecture and guides the content of the lecture.

Once the main idea is determined, the teacher can develop the lecture's organization. A clear organization has many benefits. It helps students listen more effectively as it allows them to follow the development of the content; it helps the lecturer stay on track; and it aids in information retention. Good organization begins with an introduction that gains the attention of the students, introduces the main points, describes the relevance of the information, and previews the content. The body of the lecture needs to have clearly identified sections, with obvious transitions. Depending on the attention span of the students, a lecture can sometimes use the transitions between points to give the students a moment to talk with each other about the content. This breaks up the lecture's flow and more actively involves students. The conclusion should summarize the primary ideas of the lecture and restate the significance of the material.

Once the lecture is prepared, the instructor needs to consider delivery. Good delivery enhances listener attention. Delivering the lecture with animation, energy, and enthusiasm will help maintain interest. Watch student response during the lecture and if it appears that attention is waning, it may be time for a break, for the students to interact with each other, or for a refocusing activity.

Lectures will continue to be used in education because they are an effective strategy for certain purposes, such as introducing students to new information and concepts and

clarifying material perhaps already read in the course textbook. Becoming adept in the use of this classroom strategy is a necessary part of the teaching profession, just as important as leading in-class discussions.

### **Classroom Discussions**

A goal of this pedagogy is developing the student's ability to engage actively in the course content. Classroom discussions are one of the most efficacious strategies for accomplishing this goal. Cooper & Simonds (2003) noted that discussions are both exciting and messy. Discussion does not always follow a specific organizational pattern, teachers are not always in control, and students do not always discuss what the instructor thinks are the right ideas. However, the discussion method has no peer as a means to encourage students to participate actively and to ask more questions of the teacher and each other, and to find out how well the students can verbalize the content.

Hyman (1987) described five different reasons to hold class discussions: (1) explaining – analyzing causes, reasons, background, etc. for a given topic; (2) problem-solving – exploring options for tackling an issue; (3) debriefing – reflecting on the meaning of a shared activity; (4) predicting – speculating on consequences of a particular action or forecasting future events; and (5) policy deciding – coming to group consensus on lines of action. These five goals cannot easily be accomplished by other strategies.

An effective discussion should have a specific plan and structure. Like lectures, the discussion needs an introduction that captures the interest of the student, increases their motivation to participate, describes the purpose of the discussion, and describes the potential outcome. In addition, the teacher should briefly describe ground rules for the discussion. These rules might include suggestions on turn-taking, length of comments, listening behavior, disagreement resolution, decision-making strategy, etc. Next, the teacher should plot the body of the discussion out. What topics should be covered? What questions will generate the best student response? How will the decision be moved from one topic to the next? Either the discussion plan can be teacher developed or the teacher can develop it with the students. Last, the conclusion ties the discussion together, reinforces the outcomes, and may link the outcome of the discussion to the next lesson.

Questioning is one of the most important aspects of the discussion strategy (→ Questions and Questioning). Without good probes, the discussion will not succeed. Bloom's *Taxonomy of education objectives* is an excellent source for questions that increase critical thinking and support the lesson (Bloom 1956). Following this taxonomy will help develop questions that allow students to explore knowledge, develop comprehension, apply concepts, analyze situations, synthesize various points of view, and evaluate ideas based on specific criteria.

The final consideration when implementing this strategy is teacher response to student comments. As the goal is to develop student comments, the teacher should refrain from overt evaluation of student comments. Even positive responses can have a limiting effect on the discussion. Instead, the teacher should focus on building on student contributions, accepting and developing feelings, listening and reflecting student thoughts, developing further detail, and guiding student thinking toward deeper understanding of the topic (→ Teacher Feedback). The teacher also needs to act as an effective moderator of the

discussion. This includes encouraging comments from the reticent (→ Reticence), discouraging monopolizers, pacing the discussion so that the necessary topics are covered, providing summaries and transitions between topics, and bringing the discussion to a close.

### **Small Group Communication**

Some students, generally the brighter ones, do not like small group activities in the classroom. Complaints about groups in class are, unfortunately, frequently well founded. Many teachers do use small groups as a teaching strategy, but do so badly. Merely “getting them into groups” will not guarantee that a teacher will reach the goal of increased interaction and increased learning. Rather, classroom groups need to be constructed and implemented effectively.

Small groups ought to be used with two purposes in mind: helping the students acquire and better understand the content, and helping students learn to work in groups. If the class in question is a communication course, then the second purpose is likely built into the class structure. Given these two purposes, the usual rationale for using small groups is collaborative learning. The focus of collaboration fits the overarching theme of this entry – teaching communication. Collaborative learning is an attempt to take advantage of differing viewpoints held by students as they focus on a single project. Differing viewpoints can be a group’s greatest disadvantage as well. If students are not properly prepared to participate, chaos can result.

To set the stage for effective small groups, the teacher needs to consider process variables (how the group accomplishes its task) and content variables (how the content is managed). Students are frequently unaware of the importance of process variables. The teacher needs to help the groups develop procedures on leadership, participation, decision-making, group norms, individual roles and responsibilities, and logistics. The teacher also needs to help the group determine how it will tackle the content. Used well, the classroom small group can be an effective strategy to enhance learning.

### **ASSESSMENT**

Students need feedback on their communication efforts, and the teacher needs to effectively guide the classroom communication process. This cannot be accomplished without evaluation and assessment. Handled well, evaluation can increase skill, develop confidence, and promote effectiveness. An effective evaluation system can increase both the quantity and quality of classroom communication. Guidelines for this system are as follows.

- 1 Early in the class, at the beginning of the year or term, promote interaction between teacher and students and among the students. Use activities that require, in a nonthreatening way, every student to say at least two things the first few days of class (→ Teacher Confirmation; Teacher Immediacy). The goal is to develop the pattern of students contributing, orally, to the class. The longer it takes for a student to contribute, the more difficult it becomes. Developing student expectations for communication is important groundwork for later success.

- 2 The students' efforts at talking early in class should have minimal feedback or evaluation. The best approach is to develop outside boundaries such as specific time frames for their comments and interactions, with other time periods devoted to specific instruction. "Time" is a convenient beginning boundary, followed by the boundaries of topic, channel (who can talk to whom), and similar boundaries.
- 3 After the students have realized that talking in class isn't necessarily wrong, and after they have gotten used to the idea of boundaries, the teacher will be ready to move to descriptive feedback on their communication efforts. Descriptive feedback focuses on message effects. This evaluation technique asks the student to describe, with perhaps some probing from the teacher, the original intent for the conversation, the communicative acts used, and the subsequent effect. Through students' describing those three things (either orally or in writing), the teacher can probe and suggest alternatives in each area. This model is a powerful tool in getting the student to see options in communicative behavior.
- 4 The previous point focused on after-the-fact evaluation. This point focuses on before-the-act evaluation. This follows a more traditional teaching model in that the teacher sets up a specific objective to work on using a communication behavior. The teacher develops the objective, models the behavior, helps students practice, and then helps them to try it out in as real a situation as possible. Evaluation is done afterwards in the sense of "did it work?"

Evaluation is difficult, but necessary. It takes working with students on an individual basis frequently, but it is an educationally powerful method. If it follows the model described above, and focuses on description of behaviors, then evaluation can be a powerful learning tool that helps students see the connection between their communicative efforts and results in the real world.

Communication in pedagogy is frequently overlooked by content area instructors. However, a concentrated focus on communication in the classroom can do much to improve learning, increase student participation, and develop a more satisfying learning environment for all concerned.

## Penny Press

John Nerone

University of Illinois at Urbana-Champaign

In the early to mid-nineteenth century, in most western countries but especially those with press freedom, a cheap popular press appeared. The term “penny press” is associated with a famous generation of US newspapers that appeared in the 1830s, but the notion of penny publications has a longer lineage. The penny papers of the 1830s and their British counterparts have been credited with effecting a revolution in journalism, and in fact with the invention of journalism itself as well as of neutrality or objectivity (→ Journalism, History of; Objectivity in Reporting). This famous generation of penny papers also had successors that were spectacular in their own day but have escaped the attention of journalism historians. Echoes of the penny press formula – particularly the combination of sensational news with mass market appeal, large-scale industrial production, and economies of scale – have continued to appear. The relationships between popular journalism and populism, on the one hand, and journalism, on the other, remain controversial.

## PREHISTORY

Cheap publication has surfaced periodically since the advent of printing (→ Printing, History of). In most western countries, a ballad literature commenting on novelties and current events came to be printed up in the sixteenth century. Each one of these ephemera, often single-page broadsides, had to find its own audience, and so looked to the most sensational content, including marvels and disasters, and frequently crime and punishment (→ Sensationalism). Over time, these novelties developed into more substantial publications. In seventeenth-century England, cheap, short pamphlets (“chapbooks”) of 8, 12, or 24 pages appeared, priced at a penny and featuring tales of the supernatural, romances, heroes and villains, and some history and news. These were irreverent in tone and definitely plebeian, and were viewed with suspicion by the authorities and polite society.

These *penny pamphlets* survived taxation and moral uplift to remain vibrant through the eighteenth century. Reformers competed with them by producing more acceptable cheap publications. The pathbreaker was Hannah More, whose *Cheap Repository for Moral and Religious Tracts* issued monthly penny publications from 1795 to 1798, intending to counter both the plebeian sensational pamphlets and the radical political press inspired by the French Revolution and native thinkers like Tom Paine. Penny → magazines began circulating successfully in Britain in the 1810s, the most famous being the *Penny Magazine* published by the Society for the Diffusion of Useful Knowledge, but, because of taxes and censorship, penny newspapers did not appear there until the 1850s (→ Magazine, History of; Censorship, History of).

British cheap publication evidently inspired *French experiments*. One key pioneer was Émile de Girardin, whose initial cheap publication, the *Journal des Connaissances Utiles*, had 120,000 subscribers. In 1836 he established *La Presse*, which cost 40 francs a year and was dedicated to conservative politics. De Girardin was a vigorous partisan, and France’s cheap press, like French journalism generally, remained committed to politics (→ Partisan Press).

In other countries, the appearance of a cheap mass circulation press was delayed until later in the nineteenth century. In many countries, censorship prevented popular publication. In others, market conditions, and especially the availability of plentiful advertising revenue, were slow to develop. By the end of the nineteenth century, most western countries had some version of a cheap popular press.

## US 1830S PENNY PRESS

In the US, the absence of censorship, the ready availability of government and party patronage, and the generous policies of the national postal system had encouraged a rapid growth of the newspaper system, until by the 1830s US Americans could claim to have more newspaper readers than any other country. Still, most of the newspapers produced were weeklies; daily newspapers remained expensive and targeted toward the business class.

Beginning with the publication of the *New York Sun* in 1833, a new genre of daily newspapers emerged. Priced at a penny, targeted toward a mass readership, drawing on manifold roots in working-class culture, intentionally wary of party politics, focused on crime news (→ Crime Reporting) and other sensational matter, the *Sun* and its imitators

opened a new market niche. The large popular readerships of these papers led to expanded advertising revenue (→ Advertising, Economics of). Some became immensely successful, and, after investing revenue in the latest communication and production technologies, became the elite organs of a new mass media system. Others continued to operate in the margins, producing plebeian matter on the cheap for ephemeral audiences.

This generation of penny papers has drawn a good deal of scholarly attention. Because it coincided with many other remarkable developments – a “market revolution,” a quickening of working-class activism, and a burst of reformism across the political spectrum – it has prompted arguments about the connections among them. Some point to *connections between the penny press and class tensions* evident in popular culture generally (→ Popular Culture and the News Media). Others argue that the penny press served a middling class coming into more intense contact with urbanization and market forces. The most ambitious arguments see the penny press as a driving cultural force behind the creation of a modern culture of news that included objectivity, political → neutrality, commercialization, the adoption of new technologies, the deployment of reporters, and the rise of “news,” by which is meant a combination of crime news and human interest stories (→ Commercialization of the Media). There is some truth in all these arguments, though a more responsible perspective sees the developments in both the general society and news culture as coming out of diverse sources and having deeper roots in a longer history.

The apparently distinctive content of the penny papers – politically neutral ephemeral matter – had been honed by predecessors. Since the turn of the century, gossip newspapers, often with names like *Wasp* or *Microscope*, had exposed the hypocrisies and vices of “dandies” and others. At first, these newspapers had a partisan bent. Later, under the threat of lawsuits, they turned more toward crime reporting. Meanwhile, the Workingman’s Party and the Anti-Masons had used republican language to criticize the corruptions of “partyism,” and claimed a stance above party. The Workingman’s Party especially adopted a plebeian tone. Most of these newspapers were weeklies, and not especially urban. Meanwhile, urban dailies were commercial, focusing on business news, meant to be read by the business class, and investing resources in news gathering. These were sometimes very political and sometimes neutral *Advertisers*.

The penny press merged the culture of the marginal weeklies with some of the habits of the commercial dailies to find an expansive audience of daily readers that could in turn be effectively sold to advertisers. This may at first have been a working-class audience, but in the course of the 1830s the successful entrepreneurs managed to move upscale, a history that can be told in capsule form by recounting the founding of the most important of the New York City penny dailies. The *Sun* and its producers, headed by Benjamin Day, were rooted in the same artisanal culture in New York City that had nurtured the Workingman’s Party and radical sheets like the *Free Enquirer*. In 1835, James Gordon Bennett established the *New York Herald*, which quickly surpassed the *Sun* in circulation. Bennett had been a Washington correspondent for the commercial daily *Courier and Enquirer*, and had sharpened his editorial voice in the party press; he won middle-class readers with his regular “money article,” which reported business news coming out of Wall Street, even while keeping downscale readers with crime news and show-business gossip. He also raised his price to two cents. In 1841, New York’s Whigs, led by former Anti-Mason publisher Thurlow Weed, selected Horace Greeley to edit the *New York*

*Tribune*, a Whig counterpart to a penny press establishment that they considered thoroughly Democratic. And in 1851, Henry J. Raymond, a committed Republican politico, founded the *New York Times* as a penny paper. The *Times* had no working-class accent to it, was consistently partisan and upscale, and cost the then-immense sum of \$100,000 to establish. Other famous papers – the *Baltimore Sun*, *Philadelphia Public Ledger*, and *Cincinnati Commercial*, for instance – followed a similar trajectory, beginning as rebellious upstarts and becoming their cities’ elite newspapers.

The penny press of the 1830s happened for a time to give expression to the demotic energy of *working-class culture*. By the 1840s, news culture and working-class culture had again separated. A vibrant popular culture continued in “yellow” literature – cheap books featuring genre fiction, often sold with a yellow paper cover – and radical and reformist politics continued in a weekly newspaper culture sponsored by reformists and evangelicals, but these were increasingly remote from commercialized news culture, which had again become partisan and would remain so until the end of the nineteenth century.

## POST-HISTORY

Something similar happened later in other countries and again in the US. In other western countries, the penny press waited upon the abolition of censorship and newspaper taxes – so, for instance, in Britain in the 1850s. There, mass popular dailies at first courted and then rinsed themselves of the radical political culture of the “unstamped” and Chartist press. In the US, the 1870s and the 1890s saw similar eruptions of cheap new newspapers, sparked by combinations of cheap paper (the result of new wood-pulp processes), newly abundant advertising (especially from department stores), and economies of scale coming from new production technologies (stereotyping, the linotype, and so forth). In the 1920s, “tabloids” appeared, emphasizing a shorter, more popular, decontextualized verbal reporting style combined with “candid” photography (→ Tabloidization). In the 1930s and the 1950s, broadcast media produced somewhat similar bursts of popular journalism, and in the last decades of the twentieth century, talk radio (→ Broadcast Talk), → cable television, and the → Internet provided new openings for news with a populist accent. Each of these moments seems to share important elements of the penny press, and there is a tendency among historians to view the penny press through the lens of subsequent “tabloid” or “boulevard” newspapers.

But these later mass popular journalisms are *historically and analytically distinct*. They appear as alternatives to a dominant daily news culture already well established. The first moment of the penny press arose before the appearance of a dominant daily news culture. Reacting against a politicized press, the successful penny papers themselves became the dominant daily news culture. Later eruptions of popular journalism found their markets alongside established and (by the twentieth century) professionalized news as the disreputable “other” journalism. Because the penny press produced a commercialized mass circulation newspaper establishment, it created the space for subsequent eruptions of popular journalism even while keeping them in their place.

## **People-Meter**

*James G. Webster*

*Northwestern University*

A people-meter is an electronic device that records when media are being used and who is using them. It is the preferred method of audience ratings companies that provide “third-party” estimates of audience size and composition to various clients (→ Audience Research; Rating Methods), and the principle means of national television audience measurement around the world. People-meters are constantly being enhanced and adapted to capture other forms of media use.

People-meters, like the German “Teleskopie” system, were first developed in Europe during the 1970s. They improved on earlier household meters that recorded set use but failed to capture information about who was actually watching the set. In 1987, the A. C. Nielsen Company adopted people-meters as the standard method for measuring national television network audiences in the United States (→ Nielsen Ratings). Advertisers, who were increasingly interested in reaching specific target markets, found reliable, quickly gathered demographic information to be desirable. For the media, people-meters were a mixed blessing. Older networks that had sold time to advertisers based primarily on audience size found no advantage in the technology. Newer cable networks that catered to smaller, more demographically homogeneous audiences benefited from a measurement technology that better demonstrated their value to advertisers. People-meters of various designs are now in use in dozens of countries.

## TECHNOLOGY AND APPLICATION

In their most common incarnation, people-meters are small boxes that attach to each television set in a sample household. They record when the set is on and what is being watched. They also feature a set-top box with a series of lights that serve as prompts and person-specific buttons that allow individuals to indicate they are watching. To encourage viewers to “log in,” the lights flash when the set is turned on, when the channel is changed, or when there is no button-pushing activity for an extended period of time. Most people-meters offer respondents a remote hand-held device so they can press their button without walking to the set. The data collected by the people-meters are retrieved via telephone lines on a daily basis, combined with other previously gathered viewer information (e.g., age, gender, etc.), and turned into audience ratings that can be accessed the next day.

People-meter data are typically gathered from a panel of television-equipped households selected through some form of probability sampling. As such they suffer from the same kinds of sampling and nonresponse errors that occur in all → survey research (→ Sampling, Random; Sampling, Nonrandom). People-meter measurement, however, presents some novel problems and solutions.

Button-pushing requires the active participation of audience members. It is, therefore, a relatively obtrusive form of measurement that is subject to respondent fatigue. Further, some types of viewers, like children, are not particularly vigilant button-pushers. Ratings firms combat these problems by training respondents and offering various incentives for cooperation. They will also limit how long a household can be in the ratings panel – in the US, it is a maximum of two years. Ideally, more “passive” technologies would identify who within the household was watching. To that end, ratings firms have experimented with facial recognition software, or having respondents wear small “tags” that would signal if they are in the room.

Newer video technologies that offer an abundance of choice and the ability to time-shift consumption present the challenge of accurately identifying what is being watched. The problem is addressed in one of two ways. Ideally, the companies that provide media content will embed inaudible codes or “watermarks” into the audio portion of their offerings. Detecting these codes allows meters to record what content and delivery platform is being used, as well as calculate the extent of time-shifting. Media that are not encoded can still be identified by capturing an audio “signature” that is later matched to a library of material.

Conventional people-meters are expensive to manufacture, install, and maintain. This places a limit on the size of the market that can be economically measured. Local broadcasters in small cities simply do not generate enough revenue to justify adequately sized people-meter samples. Newer, less expensive technologies are being developed. These might involve smaller, lightweight meters that could be mailed to respondents, installed simply without hard-wiring, and returned to the ratings company.

## PORTABLE PEOPLE-METERS

Other forms of portable electronic media, like radio, are ever more commonplace. The diary-based measures that are still the principal means for measuring radio audiences, however, are problematic, and conventional people-meters that are anchored to a particular

location are ill-suited to the task. This has given rise to newer, portable people-meters (PPM) that are carried by respondents and are capable of capturing exposure to multiple sources of media.

At this writing, the most fully developed PPM technology is being deployed by the Arbitron Company, the major supplier of radio ratings in the US. It is being introduced in major American markets, and is being used in several countries, either as the “currency” for buying and selling media, or as a supplement to more conventional metering.

Arbitron’s PPM requires a sample of respondents to carry or wear a pager-sized device that is capable of detecting inaudible watermarks embedded in the audio signal of either radio or television. Thus, the PPM can capture information on exposure to either or both media. Portable media using earphones can be measured using special adapters. In the future, it might also be possible to measure proximity to print media by seeding them with tiny RFID chips, or outdoor advertising by building in some sort of GPS technology. At the end of the day, respondents are instructed to place their PPM in a docking station that recharges the meter and retrieves the data. PPMs are designed with motion-detectors to determine whether they are being carried. If they are not, the ratings company can contact the respondent.

Though they are less expensive and more easily deployed than conventional hard-wired people-meters, PPM technology is not cheap. Having PPMs accomplish both radio and television measurement would greatly improve the economics of deployment. However, in the US Nielsen has shown qualified interest, in part, because optimizing the device for “hearing” a radio receiver (e.g., in a car with the windows open), may make it too sensitive for television measurement (e.g., picking up a TV set in another room).

An alternative to PPMs that might further drive down costs and encourage greater compliance is under development. This approach takes advantage of “smart phones” already being carried by prospective respondents. Such phones have an operating system that can be programmed to take audio “snapshots” at 30-second intervals, recording an audio watermark or signature. At various times during the day, the phone transmits its data via GPRS to a data center, where it is interpreted, cleaned, edited, and aggregated into audience estimates that could be reported in near real time.

The thought is that since many people already use mobile phones, they would be more likely to carry them than a dedicated device. This strategy might enhance compliance among difficult-to-measure demographics like young males or minorities. For those who did not have the requisite smart phone, one could be provided. Investing less in collection technology might permit bigger sample sizes, or measurement of smaller markets. It remains to be seen whether people who may view their mobile phones as a repository of personal information will make them readily available to a research company, whether giving someone a powerful new phone will alter their behavior, and whether it is feasible to develop and test the software needed for each new kind of smart phone that reaches the market.

## **THE POLITICAL ECONOMY OF PEOPLE-METERS**

Beyond the technical attributes of people-meter measurement, there are economic and political forces that affect their deployment. Though there is variation in the hardware

used to create people-meters, they are all relatively expensive. Large national markets usually generate enough advertising revenue to justify the cost. Unfortunately, sampling error is independent of population size, so even the smallest local market needs a sample of roughly 500 people-meter households to estimate audiences with acceptable accuracy. To finesse this limitation, it is possible to have people-meter households do double duty in both national and local markets. As long as household data are properly weighted, this has the dual benefit of increasing the size of the national panel and extending measurement to smaller markets. This is one reason Nielsen is replacing household meters and diaries with “local people-meters” (LPM) in the US.

All forms of audience measurement have potential biases. Audience ratings, however, constitute a currency worth billions of dollars in the US alone. Any change, even an improvement, in the underlying measurement technology is likely to benefit some and disadvantage others in nontrivial ways. Hence, Nielsen’s introduction of well-established people-meter technology into local markets was met with fierce opposition by some broadcasters and public interest groups who claimed it would undercount minorities. This, in turn, triggered hearings in the US Congress. One can only imagine the difficulties in introducing more radical changes in audience measurement.

## **Perceived Realism as a Decision Process**

*Michael A. Shapiro*

*Cornell University*

What do we mean when we say a story is realistic? At first, that may seem simple. One possibility is that realism is a characteristic of the genre – news is real and a → soap opera is not. That explanation may work in many cases, but → fiction is intended to capture aspects of reality that are not easily depicted in the news. A soap-opera depiction of a

sexual infidelity may capture the emotional reality of that betrayal better than a documentary on the topic. Another possibility is that people think if something looks real, it is real. Certainly, appearance is a cue to realism. For example, each new generation of → video game uses increased computer power to make the games look more realistic. But appearance of a video game or television show does not provide a complete picture of the problem. While young children tend to think that what looks real is real, adults know that what something looks like does not always reflect its true nature. No matter how realistic a dragon may look, an adult knows that dragons do not exist.

Such changes in realism judgments as people mature indicate that people use knowledge of the world to judge the realism of stories. For example, police dramas judged highly realistic by many people may seem comical to law enforcement professionals. But even a person's knowledge about the world cannot be a complete answer. Just comparing a story to what we know falls short even for shows strongly embedded in everyday life. Few viewers of the US television series *The West Wing* have had real-life experiences working for the president. For most of us, comparing a story to our own experience is totally inadequate for judging the realism of stories about drug dealing in Miami, life as a Jewish merchant in late sixteenth-century Venice, or life on a twenty-fourth-century starship. Yet we seem to be able to make realism judgments about all of those situations.

Scholars now appreciate that judgments about realism result from a complex, often moment-to-moment interaction between a story and the mental processes of the reader, viewer, or player. As we will see, our judgments about realism seem to be linked to both what we know and what we can imagine. Adult judgments of realism depend on sensory information such as the look and sound of a story, as well as on inferential, conceptual, and imaginative judgments about a story.

Finally, realism is not a binary judgment. Stories are not real or unreal. Instead, stories vary in how realistic they are in a variety of ways. Special effects in a fantasy story can make things that cannot happen look extremely realistic (→ Special Effects). On the other hand, a few words printed on a page about the death of a friend can be devastatingly real. To understand these complexities, we need to understand something about research on realism and how realism judgments change as we mature from child to adult.

### **WHY IS REALISM IMPORTANT?**

Many of the media messages we see are in the form of a story, including → news, → advertising, entertainment, and most recently computer games (Shapiro et al. 2006). Some modern scholars claim that stories are fundamentally the way we understand the world, ourselves, and our social relationships, and are the way we transmit culture (→ Culture: Definitions and Concepts).

The notion that realism is an important element of stories is ancient. Realism undoubtedly plays a role in making many stories more compelling. For example, more realistic dramas appear to be more enjoyable (Shapiro & Chock 2003). Realism may also influence mental processing, beliefs, attitudes, and behavior, forming parasocial relationships with media characters, aggressiveness, and the effectiveness of health messages. A recent study indicates that realism mediates the relationship between exposure to sexually explicit Internet material and recreational attitudes toward sex. Video-game players

consider a high degree of realism one of the most important characteristics of a video game. However, the influence of realism can be very complex.

Some of the earliest modern social science studies on media realism manipulated realism by telling participants that a particular film or video clip was either real or fictional. Almost all find that presentations labeled as “real” encourage aggressiveness more than fictional presentations.

Another set of studies measured a variable called “perceived reality” as a global characteristic of television. Using factor-analytic techniques, three dimensions of perceived reality were often identified in studies: (1) magic window, (2) instruction or utility, and (3) identity. The “magic window” dimension of perceived reality, once seen as characteristic of children’s judgments about TV, has evolved into the semantic component, or “a belief in the reality embodied in the meaning or substance of the message” (Potter 1988). That is, realism is the degree of perceived similarity between mediated characters or situations and real-life characters or situations (→ Perceived Reality as a Communication Process).

### **DEVELOPMENTAL TRENDS IN REALISM JUDGMENT**

How children make realism judgments changes in systematic ways with maturity. Young children tend to judge realism based on concrete physical perceptions. What looks real is real, even if it is a dragon. As children mature, they gain experience with the physical and social world, and they learn to use abstract, conceptual, and even hypothetical thinking. What scares children reveals something interesting about how realism judgments change as children mature (Cantor 2001). First, as children get older they are less likely to be frightened by what looks scary but is actually harmless. By middle childhood, most children know that a dragon does not exist even if it is scary-looking. Second, as children mature they are more frightened by real dangers and less by fantasy dangers. However, as children age they become more able to be frightened by depictions of abstract concepts or hypotheticals, such as nuclear war. Children’s ability to distinguish between real and unreal depictions varies with the child’s experience with a particular topic. Even at a young age, children often use their real-world and television experiences to make complex realism judgments, for example about depictions of family life.

Knowledge of other less physically obvious aspects of television (acting, scripting, and rehearsal) become more important for older children. By middle childhood, children start to add more sophisticated categorizations about what is real in addition to judgments about physical characteristics and genre. One distinction seems to be on the basis of factuality – the distinction between events that really happened outside of TV and those that were made up for TV. Another distinction is between fabricated but possible and fabricated but probable or representative. During the passage from middle to late childhood, more and more children define real as probable or plausible, not just possible.

By adulthood a person’s understanding of realism is complex. What a person can imagine or infer about a story contributes as much or more to a sense of realism as what is explicitly presented (Shapiro & McDonald 1992). It is not surprising that people usually rate news as more real than drama. However, adolescents know that television news presents events as less complex, more intense, and more solvable than people know them

to be in real life. Adult realism judgments appear to be multidimensional, including plausibility, typicality, factuality, emotional involvement, narrative consistency, and perceptual persuasiveness (Hall 2003). This offers an interesting explanation for some complex realism judgments. For example, science fiction may be judged as not factual or plausible, but may look real and have high involvement and narrative consistency (→ Developmental Communication).

### **OTHER MEANINGS OF REAL**

Recent research indicates that people make judgments about realism in at least two ways. One way is similar to the semantic component defined earlier. A person can judge the absolute likelihood that a depicted event could happen in the real world. By that standard, much of what we see in the media is rare and thus would seem unreal. But people do not seem to do that. That raises another possibility – that people judge how real an event is based on imagining what that event would be like if it were to happen. Thus, earthquakes are absolutely rare. But if an earthquake were to happen, we can judge depicted behaviors and events as more or less realistic in that circumstance. This enables people to judge the realism of unfamiliar contexts and events – a story about prison life, for example. This also allows us to judge the realism of fiction and fantasy. People appear to make both absolute and relative judgments about realism across a wide variety of stories, including advertising, news, drama, and comedy.

Related to relative judgments of realism is the possibility that we make those relative judgments differently for ourselves than for others. This may parallel the → “third-person” effect. In general, events seem more realistic for others than for ourselves. This reality-person effect appears to be robust and has been detected for a variety of news, entertainment, and commercial messages. Psychologically, the effect appears to be an implicit comparison between self and other.

### **REALISM, TYPICALITY, AND EXPECTATIONS**

Several recent studies have explored realism judgments for specific narratives. The more typical the people and events in a story, the more realistic the story seems, but that effect is not as strong when the story appears to come from an unfamiliar culture (Shapiro & Chock 2003, 2004). While realism appears to be strongly tied to our judgments about typicality, the link to expectations about how characters act appears to be more complex. For example, people tend to spontaneously generate dispositional explanations when something bad happens to a character and situational explanations when something good happens. Also, items identified as atypical often contain incongruent emotional reactions.

One possibility is that stories containing information congruent with spontaneously generated attributions or with expected emotions will be judged more realistic. That seems to be true for → emotions, i.e., stories with expected emotions are judged more real than stories with unexpected emotions. However, the opposite seems true for attribution. Stories containing information contrary to what is spontaneously generated are judged more realistic than stories containing information congruent with what is spontaneously generated. However, even for emotion, our expectations about emotion vary in complex

ways that can influence our perceptions of realism. For example, extreme happiness in an interpersonal situation is more realistic than in a professional situation. It seems likely that research in the near future will find that many social judgments influence judgments about realism.

## **Perceived Reality as a Communication Process**

*Gerald Kosicki*

*Ohio State University*

Beyond one's own direct experiences of the world, humans rely on communication to form impressions about the rest of reality. This fact makes communication a key to how people form their perceptions of reality. There is a rich literature grounded in communication dealing with the role of mass communication in forming individual-level judgments as well as public opinion about conditions in the world (→ Media and Perceptions of Reality; Social Perception). This literature, which ranges over the areas of

entertainment, news media, media effects, and various social indicators, is impressive in its breadth and depth (e.g., Bryant & Zillmann 2002).

The main models employed in research on perceived reality typically focus on inaccurate or misleading perceptions of social reality. Studies usually involve various attributions about the world that are known, relatively uncontroversial, and normatively useful for citizens to remember accurately, such as the proportion of people working in law enforcement, or the incidence of violent crime. People's answers about these matters are then compared to media portrayals of these phenomena and the differences are calculated and explained, often with reference to media-use preferences and habits. Studies done in real-world settings will introduce various controls through multivariate equations in which the effects of demographics, education, and sometimes other variables are removed before the media variables of interest are considered. Experimental studies often rely on short-term changes in perceptions introduced by some manipulated media stimuli (→ Perceived Reality: Meta-Analyses).

In the realm of *nonfiction* → news and public affairs information, the basic approach is often similar, with dependent variables such as political or public affairs knowledge (→ Political Knowledge), perceptions of political figures or candidates for office (→ Candidate Image), or perceptions of the importance or relevance of various public issues (→ Agenda-Setting Effects). Sometimes the studies involve the extent to which issue opinions are shown to have consistency with one another or with some elite construction of ideology (e.g., Converse 1964). Much of this work has been influenced by various normative theories of what is expected of citizens and of media (e.g., Donsbach 2004; McLeod et al. 1994). The bulk of work in the area has also been focused on the effects of media on citizens or society.

The most useful early mass communication process model was created by Westley and McLean (1957), who captured several essential elements of mass mediated information. The model focuses attention on information advocates such as politicians, advertisers, or other news sources. These sources help choose and subsidize information from the world and make it available to news organizations and individual journalists (→ Models of Communication). News organizations communicate with the public directly, but are active in selecting and shaping messages that flow to audience members. The model is notable because of its emphasis on selectivity at various stages of the communication process, and also for its incorporation of various feedback loops. Various shortcomings have been voiced over the years, but the model has had tremendous heuristic value (McQuail & Windahl 1993).

Over the years a vast literature has been created regarding perceptions and mainly misperceptions of social reality (→ Pluralistic Ignorance). The *spiral of silence* is one model that tries to explain reactions to public opinion trends, which people receive from other people and from mass communication. Mass communication, according to → Elisabeth Noelle-Neumann, are consonant, ubiquitous, and cumulative, and so resistant to the effects of selective exposure and attention (Noelle-Neumann 1993). In the model, media convey information that includes the norms of society, various representations of the opinions of others, and clues about the extent to which these are acceptable or not (→ Spiral of Silence).

Significant research interest has also been demonstrated in models that examine misperceptions of media content and their impact. One of the best known of these is the → third-person effects model. As it is articulated by Davison (1983), people tend to

perceive greater media impact on others than on themselves. The literature on public opinion has been a rich source, inspiring studies connecting media to perceptions of social reality for more than 100 years (Glynn 2005).

*Pluralistic ignorance* is a broad concept associated with general inaccuracy about the distributions of opinions in society. This can be shown to have a number of dimensions, including false consensus, social projection, and so-called “looking-glass perceptions.” It can also involve overestimates or even false estimates of the degree of consensus. Cultivation is another major perspective explaining media effects on perceptions of social reality. The model includes message systems analysis that examines the content of television and finds it full of violence. Institutional analysis examines the role of media corporations and their links to the power structures of society for clues about why television portrays reality as it does. Cultivation analysis links television content to public perceptions and distortions of social reality in a causal manner (→ Cultivation Effects; Gerbner, George).

Framing has emerged in recent years as a major focus of research activity aimed at understanding how people construct reality. One advantage of this perspective is its focus on defining reality, not merely selecting some aspect of perceived reality and making it more salient in a given situation. Framing can be seen as providing causal explanations for events, as well as moral interpretations. It has been described as having two sides – internal structures of the mind and devices embedded in political discourse (Kinder & Sanders 1990; Pan & Kosicki 1993). Communication, whether conceived in terms of individual talk or in terms of the larger infrastructure of public deliberation, is central to the process of collective sense-making about public policy issues (Pan & Kosicki 2001; → Framing Effects; Framing of the News).

## Perceived Reality: Meta-Analyses

*Andrew F. Hayes*

*Ohio State University*

*Jason B. Reineke*

*Ohio State University*

Meta-analyses have been conducted within the last twenty years in four areas in the field of perceived social reality (→ Meta-Analysis; Perceived Reality as a Social Process; Perceived Reality as a Communication Process). Their results will be summarized here. It has to be noted from the start, though, that any meta-analysis summarizes only the existing literature at the time. The findings reported here should not be taken to reflect current knowledge or thinking in the area, but instead, only the state of knowledge as of the respective dates of publication of the meta-analyses.

### **META-ANALYSIS OF THE FALSE CONSENSUS EFFECT**

The earliest meta-analysis in the area of perceptions of social reality was undertaken on the corpus of literature on the *false consensus effect* (→ False Consensus). The false consensus effect refers to our tendency to perceive our own behaviors, attitudes, and opinions as relatively more common than those of people who behave differently or have alternative opinions or beliefs. As such, it is a *relative* phenomenon, not an absolute one. We do not necessarily believe our own opinions or behaviors are in the majority but, rather, we tend to overestimate how common our opinions and behaviors are. Many explanations for this phenomenon have been offered, ranging from → selective exposure to people who are similar to ourselves to motivation to believe that our behaviors, choices, and → attitudes are normal and good (see, e.g., Marks & Miller 1987).

In the typical false consensus study, participants are asked to provide information about their own beliefs or behavior or the extent to which they exhibit certain characteristics, and they are also asked parallel questions about some other group or the population

at large. Mullen et al. (1985) published the first meta-analysis of existing false consensus studies. For inclusion in this meta-analysis, studies had to meet three criteria: (1) they had to report some statistical test of false consensus, (2) the outcome measure of interest had to be free-response, self-generated percentage estimates of the prevalence of a particular characteristic, opinion, or behavior in some population, and (3) the statistical tests of the false consensus effect had to be derived from original data gathered to assess the phenomenon. These criteria yielded 23 studies containing 115 tests. The results indicated statistically significant support for the existence of a false consensus effect that is, on average, moderate in magnitude. Furthermore, they found that the effect was larger when participants were asked to respond to fewer questions about the behavior and beliefs of others, or when participants were first asked to provide reports of the behavior or beliefs of others prior to reporting their own, compared to when the questions were asked in the opposite order.

Robbins and Krueger (2005) published a subsequent meta-analysis of studies of the false consensus effect focused on whether such false consensus or “projection” effects are larger for perceptions of ingroups relative to outgroups. Examining 19 studies yielding 48 hypothesis tests based on over 5,000 participants, Robbins and Krueger report that, indeed, people tend to believe members of their ingroups are more similar to themselves in a variety of ways than are members of outgroups. However, ingroup false consensus effects tended to be larger in perceptions of laboratory-contrived ingroups than real ingroups existing in the participant’s world outside of the laboratory context.

### **META-ANALYSIS OF CULTIVATION EFFECTS**

Perceptions of false consensus are driven at least in part by selective exposure to people who are similar to ourselves. Through our daily interactions with like others, we come to see our world as populated by people who share many of our own characteristics, attitudes, and values. The advent of television, however, gave people a new lens through which to view the world. Of course, people differ in how much time they spend watching television. According to → cultivation theory, cumulative long-term exposure to television cultivates a worldview that is consistent with television portrayals (→ Cultivation Effects; Entertainment Content and Reality Perception; Gerbner, George). In other words, light and heavy television viewers will come, over time, to perceive the world in a very different way. Namely, the perceptions of heavier viewers will tend to become more consistent with the “reality” of the television world – as one that is relatively violent, hostile, and unfriendly – more so than will those of lighter viewers.

Shanahan and Morgan (1999) published the first meta-analysis of cultivation studies, examining the relationship between television-viewing frequency and perceptions of the world on such dimensions as the prevalence of violence, likelihood of being a victim of crime, and so forth. In 58 independent tests of the cultivation hypothesis, they report an average effect of around 0.10 in correlation terms, an effect that they admit is small but statistically significant, thus supporting cultivation theory predictions (→ Correlation Analysis). In general, heavy television viewers report perceptions that are more consistent with the television world than light viewers. However, Shanahan and Morgan also found evidence that the effect sizes were heterogeneous across studies. They found no evidence

that the magnitude of the cultivation effect varies across “perceptual domains” – the effect size was around 0.10 regardless of whether participants were asked about crime, sex roles, the “meanness” of the world, or a variety of other domains. They also report no evidence that the magnitude of the effect differs between men and women. However, they did find weak evidence that political liberals seem more susceptible to cultivation than conservatives, and white participants may show greater cultivation effects than other ethnic groups. On the whole, given the number of moderators they looked for and the relatively small differences between studies varying on potential moderator variables examined, their conclusion was that important moderators of the cultivation effect remain “at large” (Shanahan & Morgan 1999, 132).

### **META-ANALYSIS OF THE SPIRAL OF SILENCE**

The remaining two meta-analyses described here are less concerned with studies on perceptions of reality but instead on the potential *effects* of perceptions of reality. According to → spiral of silence theory (→ Noelle-Neumann 1974; 1993; → Climate of Opinion), our perceptions of the beliefs of others influence our willingness to express our own beliefs publicly. When we perceive our own opinion to be popular or gaining in strength with the public, we are more likely to express that opinion publicly than when we think our opinion is in the minority or becoming less popular. Because our own behavior serves as input into others’ perceptions of reality, this theory describes one mechanism by which our own perceptions of reality can affect the perceptions of others’ reality.

Glynn et al. (1997) conducted a meta-analysis of research on the spiral of silence by focusing on studies that met four selection criteria: (1) the study had to assess participants’ perceptions of opinion distribution, and compare that perception to the participants’ own opinion, (2) the investigator could not have experimentally manipulated perceptions of the → climate of opinion, (3) the study had to measure perceptions of the climate of opinion rather than which opinion in the distribution was in reality more or less common, (4) the study had to include a measure of how willing the participant was to express the opinion publicly. A total of 17 studies met these criteria, some of which were published, some unpublished, allowing Glynn et al. to compute 123 separate effect sizes.

This meta-analysis revealed a weak but positive and statistically significant relationship between perceived support for our opinion and willingness to speak our opinion publicly. Tests of heterogeneity revealed evidence of significant variation in effect size across studies. Glynn et al. considered several potential moderators of effect size, including whether the study was published, whether respondents were asked about willingness to express an opinion or just about engaging in a conversation on the topic, whether the audience for the opinion expression was presumed to agree or disagree with the respondent, whether the audience for the opinion expression was a stranger to the respondent or a member of the respondent’s community, and whether the opinion expression was directed to a media representative (e.g., a newspaper reporter) or someone else. However, none of these potential moderators of the effect size were statistically significant, leaving unanswered the question of what accounts for between-study variation in the size of the relationship between perceptions of the opinion distribution and willingness to express one’s opinion.

## META-ANALYSIS OF THE THIRD-PERSON EFFECT

People often fail to recognize or are unwilling to admit that the messages they receive through the mass media can affect their own thoughts, feelings, and behavior in negative ways. Yet there is reason to believe that, by contrast, people are quite aware of and comfortable acknowledging the detrimental effects that mass media can have on others or on society as a whole. This tendency to perceive mass media as having a bigger effect on others than on oneself has been dubbed the → “third-person effect” (Davison 1983). In the typical third-person effect study, participants are asked to indicate how probable it is that others (e.g., friends, members of the participant’s community, or people in general) will be affected by certain mediated messages (e.g., pornography, advertising, etc.). Participants also indicate how likely they are themselves to be affected by such messages. Like the false consensus effect, explanations for the third-person effect are numerous, such as biased attribution or self-esteem enhancement or maintenance.

Paul et al. (2000) conducted a meta-analysis to determine whether a third-person effect exists and what determines its size, restricting analysis to studies that (1) explicitly included a measure of perceived effects of certain media messages on others and the self, and (2) reported results in a format that could be converted to a common metric. This selection process resulted in 32 studies representing 121 separate effect sizes. Paul et al. found support for the third-person effect hypothesis in the corpus of literature, with an average effect size that was moderate in strength. People do indeed perceive media content as having a greater effect on others than on themselves. However, the size of the effect was heterogeneous across studies, suggesting the presence of one or more moderators.

An examination of sampling method, respondent (student or not), and message content (e.g., pornography, violence, political ads, etc.) revealed them to be significant moderators (→ Sampling, Random; Sampling, Nonrandom; Sex and Pornography as Media Content, Effects of; Sexual Violence in the Media; Violence as Media Content; Violence as Media Content, Effects of; Political Advertising). Third-person effects were larger when sample collection was nonrandom rather than random. But this difference may have been the result of the fact that effects based on nonrandom samples are typically calculated from college student participants, whereas random samples usually include members of the general population. Indeed, third-person effects were generally larger in studies that used college students than in studies that relied on samples from the general population. Importantly, the meta-analysis revealed no statistically significant evidence that the third-person effect is larger when participants are asked about the effects of socially desirable media messages (e.g., wearing seatbelts, behaving nicely to others) compared to undesirable messages (e.g., pornography, television violence, political scandals), a distinction that has itself motivated substantial third-person effects research.

The Paul et al. meta-analysis tells the research community that there is a systematic tendency for people to overestimate the effects of media on others compared to themselves. But this meta-analysis does not provide information about the potential effects of such perceptions. The third-person effect is considered important because, presumably, differential perceptions of the effect of media themselves have certain effects. For instance, studies suggest that such perceptions are related to a willingness to censor objectionable media messages, presumably out of a desire to protect a naïve public from negative effects

(→ Censorship). To date, no meta-analysis of the literature on the correlates of third-person perceptions has yet been conducted, and one is certainly warranted, given the large number of studies on the topic that currently exist.

# Perceived Reality as a Social Process

Lyn Van Swol

University of Wisconsin-Madison

Research on small group communication has a long history of examining how participation in groups affects perceived reality. Groups often create a *shared reality* in which to work, interact, and complete their tasks. As Herbert J. Simon (1976, 23) states, "A man does not live for months or years in a particular position in an organization, exposed to some streams of communication, shielded from others, without the most profound effects upon what he knows, believes, attends to, hopes, wishes, emphasizes, fears, and proposes." There are three major approaches that address how the perception of reality is a social process within groups: social comparison theory, social proof, and shared mental models (→ Social Perception).

Research on *social comparison* examines how people check their perceptions of reality against similar others in order to establish a social consensus of the correct interpretation of an event or opinion (→ Festinger 1954; → Social Comparison Theory). Many issues people face do not have an objective or correct answer. Therefore, perceptions of the correct view often will be based on communicating with others to learn their positions. Social corroboration from one's group often increases one's confidence in one's view of reality. However, lack of validation from the group often leads people to abandon their view and conform to the majority opinion. The desire for social corroboration and a shared social reality often leads to groups rejecting or punishing dissenters and minority opinion members who may upset group consensus (Schachter 1951).

Similar to research on social comparison, research on *social proof* explores how others' behaviors may shape a person's social reality through informational social influence because one assumes that what most people are doing or believing must be true and correct. With social proof, people rely on the behavior of others to form opinions or gain information, and fail to rely on their own internal collection of knowledge or information. Social proof becomes more compelling as more and more people engage in a specific behavior or espouse a certain viewpoint. At some point social proof can cause what is known as a "social cascade." In a social cascade, many people behave or think in a certain way because of the weight of a few influential people, who early on influence subsequent opinion. As more and more people follow the opinion of these few influential people, the viewpoint becomes more compelling because of greater social proof, and may turn into a social movement (Sunstein 2003).

Finally, research on *shared mental models* and → sense-making examines how group members create a shared view of group processes, norms, and roles that helps coordination and performance. Through a process of sense-making, group members come to share subjective meaning of ambiguous stimuli and uncertain environments. Communication is the vehicle by which collective sense-making occurs. Through communication of opinions, information, and individual perceptions, group members can discuss their view of the situation or learn about norms or roles that others hold. This helps them influence one another and build and maintain a shared mental model of the situation and

group processes (Roberson 2006). Shared mental models are the common understandings that individuals in the group have of the environment, norms, task, and one another's responsibilities. Researchers have found that groups with stronger shared mental models often have improved performance on tasks (Cannon-Bowers et al. 1993). Not only do groups influence a shared social reality, but shared cognition plays a significant role in group processes and influences a group's performance and decision-making. Having shared cognition in the group allows for coordination of movement, facilitates communication and consensus, and promotes the maintenance of the group.

# Perception

L. J. Shrum

*University of Texas at San Antonio*

Perception is an ambiguous term and is used in many different ways, at least in the field of communication. Perhaps this is understandable given that communication is a diverse field that draws on concepts from a number of disciplines. Thus, in reading communication literature, one might encounter terms such as precept, perceptual field, or perceptual fluency (terms basic to cognitive psychology), → social perception and selective perception (terms basic to social psychology; → Selective Perception and Selective Retention), and perception of social reality (a term almost unique to communication; → Media and Perceptions of Reality). In fact, each set can be thought of as representing particular stages of information processing, and each is fundamentally important to communication processes (Shrum 2006).

## PERCEPTION AS CATEGORIZATION

Perception is essentially a process of categorization. In order to initially comprehend something, we take the surface features of the stimulus we encounter (e.g., color, shape, sound) and use them to place the stimulus into some semantic category. These categories can vary in their level of abstractness, from broader categories such as “plant” to more specific categories such as “fruit” or “apple.”

How a stimulus gets categorized is a function of a variety of factors, and psychology’s understanding of the factors that influence perception has changed dramatically over the last century. For many years, perception was considered a locus, or unitary event, that occurred prior to → comprehension and → memory storage (and retrieval). However, new formulations, inspired by the work of Jerome Bruner and his colleagues, dramatically changed the way scientists view perception. These formulations, often referred to as the “New Look” and “New Look 2” in perception research, now view perception as a “vast processing region” rather than a single point in information processing (Erdelyi 1974, 12). This new perspective on perception had profound effects on both cognitive and social psychology, as well as allied fields such as communication, laying the foundation for the information-processing and social cognition models that are currently dominating the respective fields.

## THE “NEW LOOK” OF PERCEPTION

For many years, research on perception took a positivist perspective that held that there was an objective reality, or “pure percept,” that could be perceived, comprehended, and stored in memory. Moreover, these precepts by definition were thought to be influenced by external factors such as intensity or novelty, but for the most part uninfluenced by internal factors of the perceiver. In other words, the mind of the perceiver was considered to be a *tabula rasa*, or blank slate, that came to the perception situation with no preconceived notions.

The research by Bruner and colleagues (for reviews, see Bruner 1957; Erdelyi 1974) challenged these assumptions. In a series of experiments, Bruner and colleagues showed that perception could in fact be influenced by internal constructs such as the expectancies and motivations of the perceiver. These expectancies and motivations can affect “perceptual readiness” (Bruner 1957), that is, the readiness with which individuals are prepared to categorize things as they are encountered. Here is an example. Consider a picture of a man that is presented to you. This man has no particular identifying characteristics other than that he is bending over. What is the man doing? Clearly, there are a number of possible answers. In other words, the man’s actions can be categorized, or perceived, in a number of ways: He may be working, praying, playing, and so forth. Prior to the work of Bruner and colleagues, scientists generally thought that only external factors (e.g., the frequency with which a category word such as work, play, or pray occurs in language) could explain deviations from chance categorization. Bruner showed, however, that categorization differed from random chance in predictable ways (Bruner 1951). In particular, categorization depended in part on the personal values held by the perceiver. People who tended to hold strong religious values were more likely to categorize the man

as praying than were those who did not hold strong religious values, and those who held strong economic values were more likely to describe the man as working than were those who did not hold strong economic values.

What Bruner's research showed was that various internal constructs affect the readiness with which we can categorize objects. In any particular situation, many concepts may be used to categorize an object. Which one is used is a function of the accessibility ( $\rightarrow$  Attitude Accessibility) of that concept (i.e., the ease with which it comes to mind): the more easily that concept comes to mind, the more likely it is to be used to categorize an object. Hence, the concepts that we think about often (e.g., the personal values we hold in high regard) are more likely to be used to categorize an ambiguous stimulus than are those that we do not think about as often. This explains why the participants in Bruner's experiment differed in their categorization of a man bending over as a function of their personal values. Indeed, Bruner and colleagues showed that the simple speed with which people could recognize words denoting particular concepts was similarly related to their personal values. When participants were presented with words from the Allport-Vernon values list (a list of values used to determine which ones are most important to a person), the participants were quicker to recognize values that were more important to them than they were values that were less important to them (Postman et al. 1948).

Values are not the only constructs that can influence perception. Past experience also plays a role. To demonstrate this, Bruner and Postman (1949) devised a clever experiment in which they presented participants with pictures of playing cards (i.e., the ace of diamonds, queen of spades, etc.). These cards were presented tachistoscopically (a procedure in which the picture of the playing card is shown on a screen but is masked or blurred; over a very short period of time, the masking is gradually removed and the word becomes more recognizable), and the speed with which participants could recognize or identify the card was recorded. However, the cards that were presented differed. Some were "normal" cards (e.g., a red queen of diamonds) and others were "anomalous" cards (e.g., a black queen of diamonds). Bruner and Postman found that participants were much quicker to recognize the normal cards than the anomalous cards, presumably because of past experience (the queen of diamonds is always red). The researchers provided further support for this reasoning by showing that participants became faster at recognizing the anomalous cards the more they encountered them, but they never reached the recognition speeds of the normal cards.

What the research by Bruner and colleagues shows is that the probability of categorizing a concept is a function of how frequently certain categorization concepts are activated. When we frequently encounter certain things (e.g., playing cards of a certain color) or frequently think about certain things (the values we hold dear), we are more likely to think of them first (and thus more likely to use them first) when we attempt to categorize an ambiguous stimulus. As the experiment with the man bending over implies, this laboratory research translates very obviously to real-world perception. Thus, we might expect that people would categorize the reasons for a person of a certain race sitting on a park bench (lazy, tired) based on their  $\rightarrow$  attitudes toward and  $\rightarrow$  stereotypes of people of that race, even though there are many possible reasons for the very innocuous behavior ( $\rightarrow$  Information Processing: Stereotypes).

## **SOCIAL PERCEPTION**

Perception as a categorization process occurs very early on in the information-processing stream. As such, it has important implications for downstream processes. One of these is the process of forming impressions of others. In the research just described, Bruner and colleagues showed that the accessibility of particular constructs in memory affected the recognition and categorization of various things (e.g., playing cards), and also affected the interpretations of ambiguous behaviors (e.g., man bending over). This general line of reasoning can also be extended to the construction of social perceptions, or attitudes and beliefs about others (→ Climate of Opinion; Pluralistic Ignorance, Third-Person Effects), and the implications are straightforward. A set of behaviors can often be interpreted in terms of quite a number of different trait concepts. For example, providing homework answers to a friend might be considered either dishonest or helpful; people who rarely change their minds may be considered either stubborn or persistent. Bruner and colleagues' work suggest that the impressions we form of people based on such ambiguous information will be interpreted in terms of the concepts that come most readily to mind. Thus, the accessibility of certain concepts (which may occur for reasons unknown to the perceiver) may potentially affect the interpretations of behaviors, which in turn may affect attitudes toward the people performing them.

These possibilities were confirmed in a series of independent experiments by Higgins et al. (1977) and Srull and Wyer (1979, 1980). In those studies, certain trait concepts were made more accessible via priming methodologies (→ Priming Theory). For example, Higgins et al. primed either "stubborn" or "persistent" via a Stroop task, and Srull and Wyer primed either "kind" or "hostile" by having participants unscramble sentences, a majority of which had implications for one of the two trait concepts. Later, participants read a description of a situation or a list of behaviors that were ambiguous with respect to the trait concepts they could imply. The results confirmed that the situationally induced accessibility of the trait concepts affected person perceptions. Participants in the studies interpreted the behaviors in terms of the trait concepts that were activated through the priming procedures, which in turn affected liking for the target person. Thus, attitudes were more favorable toward the target person when the trait concepts that were activated were positive (kind, persistent) than when they were negative (hostile, stubborn), even though participants were provided with the exact same information about the target person.

## **COMMUNICATION, ACCESSIBILITY, AND SOCIAL PERCEPTION**

The research on the effects of construct accessibility on social perceptions has important implications for the influence of various types of communication on social perception. One in particular is the effect of mass media on construct accessibility, and its consequent influence on social perceptions. Construct accessibility has a number of determinants. In terms of media effects, two are particularly germane: frequency of activation and vividness. The more frequently a construct is activated, the more accessible it becomes, and the more vivid a construct, the greater its accessibility (Higgins 1996). Thus, for example, heavy television viewers are likely to have certain constructs more accessible

than light viewers, because of both the frequency of viewing and the fact that television portrayals tend to be very vivid.

These possibilities were confirmed in a study by Busselle and Shrum (2003). Participants were asked to recall certain exemplars, some of which are frequently portrayed in television programs (e.g., murder, courtroom trial). The results showed that ease of recall was positively correlated with the frequency with which examples were portrayed in television programs (but only when direct experience with the examples was low). Other research has shown that not only does the frequency of television viewing affect construct accessibility, but, as in the studies reviewed earlier, this increase in construct accessibility has predictable consequences. In a series of studies by Shrum and colleagues, television viewing was shown to be positively related to the accessibility of certain constructs (e.g., violence, expensive products, marital discord), and this heightened accessibility was positively related to perceptions of the prevalence with which these constructs occur in everyday life. Thus, heavy viewers estimated a greater level of constructs such as societal violence, affluence, and marital discord than did light viewers, and this effect was mediated by the accessibility of these constructs (for a review, see Shrum 2006; → Attitudes, Values, and Beliefs, Media Effects on).

The examples just provided pertained to the frequency of television viewing and its affect on social perceptions. However, it should be clear that the effects should pertain to any media, particularly when their content tends to overrepresent particular constructs. For example, like → television, → newspapers and → magazines often focus on sensationalistic events (e.g., murders, rapes, kidnappings; → Media Logic; News Values). Frequent consumption of such content should increase the accessibility of these constructs, just as it has been shown to do for television. However, it is also worth noting that it is not only the frequency of portrayals that may affect accessibility, but also the consistency of the portrayals. Thus, for example, if certain personal characteristics (e.g., length of hair, color of skin) are consistently paired with certain outcomes (e.g., drug use, violence), then the mere observance of these characteristics may activate the concepts with which they are consistently paired. In this way, the frequency and consistency of portrayals may lead to increased stereotyping, and as noted in the research reported earlier, these effects may occur outside of the perceiver's awareness.

## Personal Communication by CMC

*Joseph B. Walther*

*Michigan State University*

Computer-mediated communication (CMC) includes electronic mail, group discussion systems, and real-time chat systems through which people send messages to others, either to a defined individual or set of recipients, or to a messaging space where many people may read and reply to others' messages. Much CMC is used for professional work and to facilitate commerce; within this application, much CMC that accompanies professional pursuits features personalizing features that help users relate to one another, which may enhance both the instrumental and interpersonal aspects of such communication. In addition, a great deal of CMC is used specifically for personal goals and activities. In some ways CMC is a simple alternative to other forms of communication (→ Online Media), with some socio-technical features that alter communication dynamics (→ Human–Computer Interaction). In other ways CMC offers significant opportunities that enhance communication in personal settings by allowing users to contact a large field of potential communication partners, reducing aspects of human interaction that impede communication effectiveness in conventional interaction. CMC can enhance personal communication by allowing users to enhance messaging in ways that conventional interaction does not as readily afford, facilitating new relationships and relational maintenance.

## HISTORICAL DEVELOPMENT

CMC developed in several *domains*: in the development of government and industrially sponsored inter-computer information relay systems such as those that became the Internet, through interest-based discussions that traversed such networks (such as Usenet), and through individually or organizationally sponsored electronic bulletin board systems (→ Internet, Technology of). In all cases, accompanying the ability to send messages to other users about instrumental aspects related to file-sharing or about users' topic-related experiences, communication about off-topic interpersonal information often accompanied the use of ostensibly instrumentally focused systems. Research focusing on the ability of CMC to foster personal information became popular in the 1980s, driven by concerns that written communication transmitted via computer networks could not foster social and interpersonal cues, predicting and often demonstrating that CMC would feature impersonal interactions. Further, without nonverbal cues with which to emit and detect personal characteristics such as charisma or personality, interpersonal dominance or professional status, or the ability to manage conversations and facilitate turn-taking, CMC was often expected to be ineffective for instrumental group discussions or interpersonal functions.

This view was predominant in much research in the fields of social psychology, management, and communication, and was largely based on experimental research using ad hoc groups. However, less frequent reports from other domains depicted successful, personal exchanges using similar systems in situ, such as cross-sectional studies in organizations and hospitals where CMC was used over long periods, as well as from hobbyists and non-professional bulletin board discussions, reflecting variation in the task vs social nature of CMC, or depicting organic, emergent communities of users whose information-sharing online led to deeply personal and emotional associations. The 1993 publication of journalist Howard Rheingold's *The virtual community: Homesteading on the electronic frontier*, describing relational, social, and psychological dynamics observed in amateur networks, did much to bring the personal use of CMC to the public's attention, despite the limited network access and awareness that the public had at that time (→ Virtual Communities).

The 1990s fostered further applications and new understanding of CMC and its personal applications. The early years of the decade saw the increased popularity of proprietary CMC networks such as Prodigy, CompuServe, and America Online, which were used for both professional applications and semi-anonymous chatrooms, in which communicators could exchange help and support, or make friends or flirt with people whom they did not see and could either involve in their personal lives or easily keep away. The removal of funding by the US National Science Foundation for the major educational and scientific network cleared the way for commercial activity over the Internet. This rapidly propelled activity via for-profit Internet access providers, including the existing and new proprietary networks. The Internet evolved into a social space for worldwide discussions of any topic, personal relationship seeking or support, even anonymous, virtual-only flirtation, relationships, virtual marriage, and sexual simulation. One researcher whose 1980s work depicted CMC as negatively impacting interpersonal dynamics came to characterize the 1990s Internet as a field of "atheism, sex, and databases" (Sproull & Faraj 1997; → Sex and Pornography Online).

## NEW PERSPECTIVES

As it became clear that CMC was being used effectively for personal as well as task communication, new theories were developed that accounted for such use. Social influence theory (Fulk et al. 1990) argued that the expressive potential of a medium like email was not a deterministic result of specific technological attributes alone. Rather, people use media in accordance with their perception of the media's capabilities, which is shaped, in turn, through the media perceptions and uses of the individuals in one's communication network. Social information-processing theory held that CMC users may have the same relational goals as those who communicate offline, but must adapt to the characteristics of CMC in order to affect the level of impressions and interpersonal relations. Rather than relying on nonverbal cues for the expression of affective and social messages, as do face-to-face communicators, CMC users translate such meanings into verbal behaviors (→ Language and the Internet).

Several studies established that this *translation* takes place fluidly, but requires more time and/or message exchanges to reach the level of development that face-to-face communicators achieve more readily. Further research has shown that the timing of messages and responses interacts with verbal cues in determining the social meanings of text-based messages in CMC. It has been well established that communicators use language and paralinguistic cues other than the nonverbal cues conveyed by space, voice, and body in CMC so that, even in task-oriented as well as personal contexts, personal impressions are made and managed; the alternative forms of meta-communication CMC allows facilitate impressions and relational communication (for review see Walther 2006).

As the Internet became more pervasive, news media, → advertising, schools, and word of mouth led to great *diffusion and public awareness of the commercial and personal uses* to which it was being put. Anecdotal accounts of people making friends online, or having closer friends online than in offline contexts, were met with skepticism. More disconcerting were accounts of romantic relationships that began as meetings in CMC chatrooms. Research followed such trends, charting the course of successful romantic couples who had met and courted via CMC, or describing how friendships began in public, topically based online discussion groups, evolved to dyadic electronic media, traversed telephone contact, and culminated in face-to-face meetings a significant proportion of the time. Both sets of research found that relationships quite simply began in online venues that facilitated the meeting of and conversation among individuals who held common interests, as often or more than in chatting venues specifically oriented toward partner seeking per se. Toward the start of the twenty-first century, deliberate online dating and matchmaking systems provided another CMC venue for initiating relationships (Gibbs et al. 2006).

New research and theoretical models emerged that attempted to account for conflicting predictions and findings that had been accruing in the burgeoning CMC research literature in the 1990s. While many experiments and research accounts continued to show social deficits from CMC, others showed more normal relational states, while other accounts again documented superior or more intimate encounters online than in comparable offline contexts. A 1996 article attempted to summarize the extant findings as well as to introduce a new model: "Computer-mediated communication: Impersonal,

interpersonal, and hyperpersonal interaction” (Walther 1996). This model offered contingencies with which to understand how each type of interaction could be fostered by CMC.

*Impersonal CMC* seemed to be most likely when interaction time and/or interpersonal familiarity were restricted, either by the demands of an experiment, by the organic short-term context in which some (but not all) CMC exchanges take place, or by the imposition of software such as group decision support systems that are designed to enhance anonymity and minimize interpersonal effects in online interaction. *Interpersonal CMC* is facilitated by sufficient time for ongoing exchanges and by conditions such as anticipated relational longevity that prompt interpersonal interest, with users then deploying CMC in ways described by social information-processing theory to effect these goals.

*Hyperpersonal communication* represents more intimate, satisfying communication and interpersonal evaluations than are typical in comparable offline settings, and was hypothesized to arise due to systematic variations in basic communication processes that are facilitated by CMC. (1) Selective self-presentation, exploitation of the editing and timing capacities of the medium, and the ability to reallocate cognitive activity from ambient surveillance and physical self-monitoring to message construction all facilitate the construction of highly intentional, deliberate, and self-serving expressions of self, attitudes, and emotion in CMC messages. (2) The receiver is idealized through exaggerated interpretation of messages with respect to the person’s similarity or complementarity of social category memberships or personal characteristics. (3) CMC removes the time that is allocated to message construction and editing from the real-time flow of traditional conversational demands. (4) Reciprocal interaction involves the previous elements, which escalate positive perceptions of senders and receivers. The intentional breadth of the hyperpersonal model has allowed it to be applied to a variety of CMC field settings, from collaborative work groups and distance education settings to online social support systems and self-presentation in online dating systems, among others. Many elements of the framework have been supported in experimental research as well (see Walther 2007).

### **MAINSTREAM USE AND SPECIAL ADVANTAGES**

CMC has by this point become a mainstay of the maintenance of personal relationships, although less research has focused specifically on maintenance than on relationship initiation and formation. Several surveys of American Internet users report that people – women in particular – frequently use email for staying in touch with friends and family members. Beyond the convenient capacity of email to send messages any time and store them for retrieval, the written nature of CMC appears to lend itself to facilitating more delicate and frank exchanges among family members than they may feel comfortable undertaking by other media, such as telephone or face-to-face conversations (→ Self-Presentation). Research has found that CMC facilitates more, and less superficial, self-disclosure and personal question-asking than does face-to-face communication. Although a recent hybrid form of CMC – Internet blogs, or web logs – have become better known for fostering political commentary and citizen journalism, surveys show that blogs most often take the form of individuals’ personal diaries describing life events and observations (→ Personal Publishing). When there is an intended audience for blogs, it is usually the

blogger's friends and family (Lenhart & Fox 2006), reinforcing the role of CMC in relational maintenance processes.

The abilities provided by CMC for users to compose messages carefully, and to maintain physical and psychological distance while still offering potentially immediate exchange, in combination with the potential of the Internet to connect to vastly greater social networks than previously possible, have also been connected to CMC's utility in fostering social support, facilitating relationships for individuals with social skill deficits, and reducing threats to self-esteem from rejections in online mate-seeking. Online social support networks have arisen spontaneously and purposefully in a variety of Internet venues (→ Social Support in Health Communication; Social Support in Interpersonal Communication).

In these *virtual settings*, groups ranging in size from teens to thousands exchange information, emotional support, sympathy, and coping strategies with members experiencing various illnesses, psychological issues, legal problems, or other personal problems. The Internet allows and invites people with similar concerns to connect around a topic, and its potential global reach and weak tie facilitation provide the means for people to find others who share similar experience and first-hand expertise with respect to the issue of focus. Users of online social support systems often report that the mere discovery of so many other individuals with experiences and feelings like their own, often not the case in their offline personal networks, provides strong emotional benefit. Similarity of experience lends particular credibility to the information and personal advice exchanged in these venues. In addition, online social support users value the social distance, anonymity, message management, and discretionary access that online support provides.

Although the Internet opens numerous possibilities for forming relationships, those individuals with skill deficits affecting face-to-face communication appear to find particular *gratification* (→ Uses and Gratifications) or *further deterioration* in conducting personal relationships online. Depression, loneliness, shyness, or other similar syndromes (→ Communication Apprehension and Social Anxiety) lead some individuals to withdraw from face-to-face social interaction, preferring instead the message management and distance that CMC interaction allows in the conduct of meeting and chatting online. In some cases, awareness of the capabilities of CMC to foster self-disclosure and friendship development can lead to interpersonal success online. In other cases, Caplan (2003) demonstrated that problematic Internet use, comprised of online interaction durations exceeding a user's intention, accompanied by guilt over apparent inability to control such use, reinforces and exacerbates psychosocial problems.

The same properties of distance and message management that reduce the anxiety and risk of meeting and initiating relationships with others appear to have made *online mate-seeking* a valuable CMC process. Several aspects of commercial online dating sites such as Match.com seem to routinize and depersonalize a communication process otherwise fraught with anxiety, uncertainty, and risk of rejection (→ Dating Relationships). Online dating sites typically collect demographic, preference, and personality information from users, in order to allow other users to screen their databases of candidates and select among a subset of potential mates that meet desired criteria; this replaces the discovery process that might otherwise necessitate a good deal of interactive communication with a stranger in order to make preliminary compatibility judgments. There may be system-

enabled, impersonal ways to signal prospective interest in conversing with another individual, such as the communication of words and graphics depicting a wink, but obviously doing so in a generic, stylized manner that is the same across the many users who wish to initiate this signal of interest. A recipient may then accept the symbolic token and initiate a CMC conversation, or select to reply with an automated “no thank you,” an impersonal, generic, stock reply that may be less deflating to receive than an individual rejection. Research on online dating services has focused primarily on the presentation of self online and on how individuals idealize their online profiles; future research will undoubtedly focus on communication using a range of new, system-provided symbols indicating interest/disinterest, availability/receptivity, and particularly authenticity, which is at this writing the primary concern of online daters.

CMC is also a mainstay of personal communication among individuals who use any number of *text messaging systems*. Such systems include short message service (SMS), a method of “texting” or sending alphanumeric messages to other users who have mobile phones that are equipped for this purpose. Likewise, instant messaging using AOL Instant Messenger, ICQ, and other systems providing real-time, dyadic chat are popular, particularly among individuals in their teens and twenties, but increasingly in professional settings as well. These systems are useful in maintaining a feeling of presence, or connectedness, among individuals. The ad hoc messages common to these systems tend to be informal, and they are often intended to be amusing or humorous; they facilitate banter. Most such messaging takes place among people who have personal relationships offline, although a significant proportion of teens report meeting online someone they did not previously know, by using such systems. Interaction using instant messaging may be less stressful than face-to-face interaction, and meeting strangers via such systems has been found to induce greater happiness than meeting strangers face to face, possibly because individuals need not worry about their appearance or awkward pausing, and because such systems are associated with socializing and fun (Green et al. 2005). Communication stress may also be reduced as individuals commonly segregate their personal relationships from familial or fraternal audiences by the use of different pseudonyms and accounts by which they represent themselves online.

Other research concerning personal CMC has examined the implications of CMC in the *presentation of the self online*, with respect to language and identities. These studies include whether deception is facilitated or better detected in online, verbal-only discourse, and what linguistic markers are associated with lying in CMC environments (typically, real-time chat; → Deception Detection Accuracy). The study of linguistics and identity in CMC has also focused on gendered language, alternatively finding that individuals’ online discourse reinforces offline gender stereotypes, or that people accommodate to the linguistic patterns of desirable CMC interaction partners as they communicate online. Concern over online self-presentations also encompasses the potential for individuals to enact alternative identities online. These efforts may include minor distortions in age and status, as well as performance as a fictitious person of the gender opposite to one’s own in certain Internet spaces that occlude discovery of participants’ offline characteristics. Research has suggested that such radical behavior occurs less frequently than popular accounts suggest; that it is most often driven by simple curiosity rather than pathology or malicious intent, and that its duration is fleeting. Others have suggested that identity play

in CMC provides therapeutic opportunities to enhance perspective-taking abilities (Herring & Martinson 2004).

# Personal Publishing

David Brake

London School of Economics and Political Science

Personal publishing by an individual or small group – generally not for profit and generally not aimed at a mass audience or utilizing mainstream publishers – has occurred for centuries. In its early years it took the form of, e.g., small-scale pamphleteering, the circulation of diaries within faith-based or friendship communities, or the publication of books of family history or autobiography using the “vanity” press (publishers whose income comes primarily from authors). Because of the economics of publishing, however, these practices tended to be marginal. With the advent of the personal computer and inexpensive desktop publishing tools, small-scale personal publication became easier and a variety of small-scale magazines sprang up (→ Zines). It has been the diffusion of access to the Internet in recent years across much of the world (→ Digital Divide), however, that has enabled a flourishing of online personal publishing and inspired a greater academic focus on this area. This started with personal Internet home pages in the mid-1990s and has continued in the form of the “weblog” (a site consisting of items published in reverse chronological order) and, most recently, of profiles on social networking services like MySpace and Facebook.

Self-publishing has taken a great *diversity of forms* and therefore attracted interest from academics across a number of disciplines. Zines and personal home pages, e.g., are important means of recirculating fan-created fiction and criticism (→ Fandom). Much of the attention paid to weblogs in the press and academic literature has focused on those who use them as a form of alternative or → citizen journalism (→ Blogger). There has also been some attention paid to weblogs as tools for the creation and maintenance of virtual communities of practice through the sharing of topic-centered information and inter-linking between such sites by their authors (Efimova 2004; Mortensen and Walker 2002). These are not the most popular reasons that people choose to self-publish online, however.

A survey of US bloggers (Lenhart and Fox 2006) – echoing earlier, smaller-scale surveys – indicates that the most important *uses for weblogs* by a considerable margin are as a means of creative expression and as documentation of the writer’s life and experiences. Diaries, both traditional and online, have been studied as part of a broader literary and sociological interest in biography and autobiography – written, oral, and now online (e.g., the journals *Auto/Biography* and *Biography*; → Storytelling and Narration). Such studies reveal the manner in which a medium of supposedly “free” expression can be constrained or at least influenced both by internalized expectations of what “belongs” in a diary (Stanley 1992) and by the constraints of the medium itself (Harrison 2001). Studies of home pages and weblogs also focus on how they may be used to construct, present, explore, or play with identities (Cheung 2004; Miller and Arnold 2001; → Self-Presentation).

Because the newer forms of online diary make *interaction between readers and the author* easy, social psychologists have examined the weblog as a novel form of computer-mediated communication and potentially as a form of virtual community (→ Personal Communication by CMC; Virtual Communities). The assumed importance to their

authors of a readership for online diaries has been called into question by a number of interview-based studies that reveal a more complex and sometimes distanced relationship between the writer and his or her desired and actual readers (Gumbrecht 2004; Menchen Trevino 2005; Nardi et al. 2004). Even when desired, interaction is not necessarily forthcoming: one analysis of patterns of online responses posted on weblogs (Mishne and Glance 2006) found that while 80 percent of sampled weblogs allowed or enabled comments, only 28 percent had actually received any.

Many diaristic personal publishers – particularly the young – appear to be migrating from individual weblogs and home pages toward “profiles” in social networking services that encourage them to make explicit their personal and professional ties to others in that network. With the increased diffusion of broadband Internet connections and the availability of inexpensive portable digital cameras (including those in mobile phones), weblogs and “profiles” increasingly include pictures, audio, and video as well as text (→ Amateur Photography and Movies). The implications of these shifts will become the subjects of research in the future.

# Personality Development and Communication

James B. Weaver, III

Emory University

The idea that an individual's personality is "inherently intertwined" with how they communicate has intrigued scholars since the late 1920s (Daly 2002). Indeed, many have observed that through our social interactions we drop clues about the essence of our personality and, in turn, learn about others. Everyday parlance is, in fact, filled with terms and phrases categorizing individuals' personalities. Across essentially every human culture, for example, colloquial expressions like "He's so quiet," "She's very assertive and to the point," and "They just love to talk," illustrate how attention to communicative perceptions and behaviors punctuates personality discernment in daily life (Weaver 1998).

## PERSONALITY DEVELOPMENT

This fundamental link between personality development and communicative perceptions and behaviors was first demonstrated in the pioneering work of Gordon Allport (1937). Recognizing the unique heuristic value of natural language terms, Allport employed a lexical approach to identify more than 18,000 words that described common personality dispositions or traits. Approximately a quarter of these terms, because they concerned distinctive human behavior (e.g., friendliness, shyness, talkativeness) were deemed particularly important. And, of these, a substantial portion involved some aspect of communicative perceptions and/or behaviors.

Reflecting this dispositional foundation, personality is broadly defined in contemporary theories as a dynamic and organized set of characteristics or personality dimensions, each incorporating an array of dispositions or traits, which uniquely influence an individual's → cognitions, motivations, and behaviors in various situations. *Personality dimensions*, which can differ among individuals, develop through the ongoing interaction between an individual's unique genetic history and the variety of physical, social, and cultural environmental factors encountered throughout the life-span. Specifically, as individuals respond to personal, social, and cultural demands, personality dimensions emerge as relatively stable and enduring patterns of perceiving, relating to, and thinking about themselves and their environment.

Although there is considerable evidence for *personality stability and continuity* across the adult life-span, much less is understood about the complex interplay of constitutional and environmental factors during childhood from which personality develops. Research findings increasingly highlight the role of genetic influences in shaping virtually every aspect of personality functioning. Overall, the current heritability estimate for personality overall is approximately 40 percent, with some specific aspects of personality (e.g., temperament, social composure, and wit) evidencing substantial biological heritability (→ Communibiology). However, genetic influences, while powerful determinants of

personality development, are not environmentally immutable. Environmental influences, such as culture, family, and parental characteristics, acting as social regulators, continually interact with genetic influences (i.e., biological regulators) to mediate both the enactment of behaviors and the emergence of individual differences (→ Culture: Definitions and Concepts; Family Communication Patterns).

Against this backdrop, it is now generally accepted that personality development during infancy and early childhood is shaped by a range of *environmental factors*. A stable child–caregiver relationship, for instance, that provides nurturing support appears crucial for normal personality development. Family dynamics are also significant, with several aspects – including cohesion, adaptability, and disciplinary practices – potentially affecting a child’s self-esteem, → emotion regulation, and cognitive, intellectual, and social growth and, consequently, personality development. By middle childhood (6–11 years old) most children display considerable personality development continuity, with parental descriptions of their personality characteristics reflecting the same traits and dimensions commonly applied to adults (Halverson et al. 2003).

During adolescence, however, personality seems to involve some *malleability*, particularly in western cultures. Apparently instigated by an array of biological, environmental, and psychological determinants, adolescents often exhibit elevated aggressiveness, distractibility, impulsivity, public self-consciousness, and restlessness. These dispositional shifts, often corresponding with strong developmental spurts (i.e., pubertal onset), are seen as adolescence-limited differences that obscure, but do not significantly alter, stable personality characteristics. From young adulthood onward, personality development can continue and typically involves normative adjustments, reflecting increased self-control, pleasantness, and coping skills, that correspond with age-related biological, systemic, and social factors. Such adjustment does not occur evenly throughout adulthood, however, and is not evident in all individuals.

## PERSONALITY DIMENSIONALITY

While modern theorists generally agree on these core aspects of personality development, there is considerable divergence in both the name (e.g., central dispositions, primary factors, supertraits, and types) and number (ranging from 3 to 16) of personality dimensions across modern personality theories (Ryckman 2008). Increasingly, communication theorists have adopted the *psychobiological theory of personality* developed by Hans J. Eysenck (1990) as a conceptual framework for delineating relationships between personality dimensions and communicative perceptions and behaviors. Several distinctive aspects of the psychobiological theory appear to underlie its broad application in communication research. Particularly prominent are: (1) a strong emphasis on inherited neurobiological and psychological determinants as primary in personality development; (2) utilization of large, culturally diverse samples in development and validation of key theoretical concepts; and (3) advancement of a parsimonious typology involving three essentially orthogonal behaviorally defined personality dimensions.

Two dimensions of Eysenck’s psychobiological typology are consistent with those identified in essentially all contemporary personality theories. The *extraversion* personality dimension is conceptualized as tapping traits such as an individual’s level of sociability,

social adaptability and activity, and positive self-esteem. The *neuroticism* personality dimension, on the other hand, involves traits such as anxiety, emotionality, and a negative self-image. Unique to Eysenck's typology, *psychoticism* is conceptualized as involving traits such as egocentricity, social autonomy and deviance, impulsivity, and callousness. The fact that many of the traits exemplifying each personality dimension are manifestations of communicative behaviors has not been overlooked by communication scholars.

## PERSONALITY AND INTERPERSONAL COMMUNICATION

Indeed, for many communication theorists, the three personality dimensions of the psychobiological typology are conceptualized as central components within the nexus of affective, cognitive, and physiological mechanisms guiding an individual's daily interactions with their social environment (Weaver 1998, 2000). And, consistent with this expectation, there is a growing body of research evidence suggesting that the extent to which individuals exhibit psychoticism, extraversion, or neuroticism greatly facilitates explanation and prediction of their self-perceptions about communicating.

Drawing from the findings of several studies, for instance, it is possible to sketch out distinctive interpersonal communication profiles for each personality dimension. Individuals evidencing *extraversion* as their predominant personality dimension consistently perceive themselves as confident, patient, and skilled communicators (→ Interpersonal Communication Competence and Social Skills). Extraverts tend to freely express sympathy for others, are perceptive and attentive, experience essentially no → communication apprehension, and endorse a people-oriented approach to listening that reflects patience with and interest in others.

In stark contrast, individuals reporting *neuroticism* as their predominant personality dimension tend to be extremely apprehensive, imperceptive, and defensive during social interactions. Lacking both patience and finesse when communicating, neurotics often ardently filter both verbal and nonverbal conversation content and seem susceptible to information overload and confusion. Consequently, neurotics frequently display a unique "social shyness," appearing, on the one hand, as acquiescent and demure communicators who prefer minimal contact with others, but, on the other hand, reporting considerable hostility and frustration during social interactions (→ Communication Apprehension and Social Anxiety).

Reflecting considerable callousness toward others, individuals reporting *psychoticism* as their predominant personality dimension tend to be unsupportive, unresponsive, and verbally aggressive during social interactions (→ Verbal Aggressiveness). Reporting moderate communication apprehension, psychotics appear to lack empathy and sympathy for others, seem imperceptive and inattentive in interpersonal settings, and endorse an approach to listening defined by impatience with and indifference toward others. Psychotics frequently seek to dominate or control interpersonal interactions through rudeness and/or by infusing conversations with culturally avant-garde or marginalized jargon.

The findings of a recent study on → *communicator style* illustrate how the three distinctively different personality dimensions moderate perceptions about interpersonal communication (Weaver 2005). Specifically, three aspects of communicator style – the way individuals perceive themselves communicating and interacting with others (Norton &

Brenders 1996) – and the three dimensions of personality were assessed in a large sample. The three aspects of communicator style are: (1) a nondirective style typical of an attentive communicator who encourages, accommodates, and acknowledges others; (2) a directive style characteristic of a dominating communicator who talks frequently, comes on strong, and takes control in social situations; and (3) an illusive style assumed by a communicator who is acquiescent yet deceptive in interpersonal interactions.

The investigation revealed considerable correspondence between the personality dimensions and the communicator styles. Individuals evidencing the extraversion personality dimension endorsed the nondirective communicator style; those evidencing the psychoticism personality dimension endorsed the directive communicator style; and those evidencing the neuroticism personality dimension endorsed the illusive communicator style. Further, within each personality dimension, the alternative communicator styles were essentially rejected.

### **PERSONALITY AND MASS MEDIA USE**

Consideration of the personality characteristics of media audiences has long been recognized as a key component to understanding both the uses and effects of the mass media (Weaver 2000). Early research, for example, identified numerous unique individual characteristics – such as emotional insecurity, social isolation, intellectual ability, and predispositions and personality patterns – that influence media content preferences and the consequences of exposure (→ Personality and Exposure to Communication; Selective Exposure).

To this end, the psychobiological theory of personality has also provided an effective theoretical framework. However, application of the three personality dimensions to problems concerning media uses and effects involves a different conceptual orientation. Recognizing that few, if any, media use behaviors share the imminent centrality to personality manifest through interpersonal communication behaviors, media scholars have focused principal attention on segmentation of the mass media → audience across the three personality dimensions (→ Audience Segmentation).

Traditionally, segmentation strategies based on demographic characteristics such as age, gender, and race have dominated and remain the standard practice of many media and marketing researchers. Although strategies employing psychographics, which involve “fuzzier” concepts such as lifestyle and/or psychological profiles, have been developed, evidence of their effectiveness is limited.

A growing body of research suggests, however, that Eysenck’s personality dimensions may more effectively segment individuals into *three distinct subsets* that project fairly homogeneous media use attitudes, needs, and behaviors. Individuals displaying the neuroticism personality dimension, for example, express a strong preference for informative/news television content (→ News; Television News) and “downbeat” music, and tend to avoid lighthearted comedy and action/adventure fare. Content facilitating sociability, such as “club” or “party” music, and content promoting social activities, such as party-themed movies, are strongly preferred by individuals exhibiting extroversion. Individuals presenting the psychoticism personality dimension evidenced a strong preference for socially deviant content such as graphically violent horror movies and “hard” or “rebellious”

rock → music videos (Weaver 2000). Significantly, similar patterns of congruency between the personality dimensions and media content preferences have been observed among children and adolescents (Weaver 2006).

The explanatory utility of the tripartite psychobiological typology as a segmentation tool has also been demonstrated in research on self-reported motives for television viewing (Weaver 2003). Individuals evidencing the neuroticism personality dimension, compared with those in the extraversion and psychoticism groups, strongly endorse using television as a replacement for social companionship, to pass the time, and for both relaxation and stimulation. And, consistent with expectations, individuals exhibiting the socially outgoing extraversion personality dimension strongly rejected the notion of using television as a functional alternative to interpersonal companionship (→ Parasocial Interactions and Relationships; Uses and Gratifications). Personality dimension segmentation has also been successfully applied to understanding → Internet preferences and use (Amiel & Sargent 2004).

## **FUTURE DIRECTIONS**

Evidence from diverse programs of research summarized here leaves little doubt that personality development and communication are entwined and that crucial work to untangle and clarify the conceptual linkages binding these two theoretical domains is under way. One prominent outcome of this inquiry has been the articulation of a “communibiological perspective” by Michael Beatty and his associates. A derivative of Eysenck’s psychobiological model, the communibiological perspective emphasizes the influence of genetic and neurobiological mechanisms on communication behavior.

The developing research literature points to other conceptualizations that should provide fruitful avenues for future research and theory. Application of → Albert Bandura’s (1997) self-efficacy notion to social interactions, for example, could prove provocative. Specifically, the concept of social self-efficacy, reflecting an individual’s assessment of engaging in social interactions, could provide a theoretical framework highlighting individual differences in cognition and affect as casual predictor communicative behaviors. Finally, addressing the interesting question of whether similar interrelationships between personality and communication are reliably evident across a variety of cultures demands empirical attention. Some evidence suggests we can answer with a qualified “yes” so long as we recognize that culturally grounded communication practices vary considerably, even across cultures sharing common heritages.

## **Personality and Exposure to Communication**

*Mary Beth Oliver*

*Pennsylvania State University*

Variations in preferences for media content highlight the importance of how the diversity of the viewing audience affects exposure and responses to media content. Among the

limitless ways in which audience members may differ, the personality characteristics of the viewer provide a vast and diverse means of predicting individuals' uses of, preferences for, and reactions to media content.

## **PERSONALITY AS A CONCEPT IN COMMUNICATION RESEARCH**

Although the term "personality" has been used in a variety of ways, it is generally understood to refer to traits or dispositions that are relatively enduring and stable. Whereas demographic characteristics such as race and gender could be included under this definition, personality is typically understood to represent traits, outlooks, and behavioral tendencies that are relatively consistent and enduring within individuals.

Because the concept has been explored extensively in a variety of disciplines and because it provides a broad framework for conceptualizing individual difference variables, it has enjoyed a wealth of scholarly attention among media researchers interested in examining a host of related questions (→ Individual Differences and Information Processing). Among these questions are how personality serves as a useful predictor of preference and enjoyment of content, how personality functions as a predictor of selective exposure and perception, and how personality may serve as an important moderator in explaining differential effects of media content on viewers (→ Selective Attention; Selective Exposure; Selective Perception and Selective Retention).

## **PERSONALITY AND MEDIA USE AND ENJOYMENT**

Media use is not uniform across populations, nor is media content homogeneous. Some individuals spend a great deal of time viewing → television; others refuse to have a television in their homes. Some people have an affinity with action films and horror; others prefer romance, tear-jerkers, and melodrama (→ Film Genres). Variations in use and preferences may reflect a host of audience characteristics, including gender, historical or social context, or mood, among others. However, the personality of the viewer undoubtedly plays an important role in media use, as personality is thought to be relatively stable across temporal variations.

Research from a → uses-and-gratifications perspective conceptualizes media use as goal-directed, purposive, and fulfilling needs for individuals (Palmgreen et al. 1985; Rubin 2002). Following from this assumption, research generally supports the proposition that personality tends to be associated with using media for the fulfillment of various goals. For example, Weaver (2003) reported that neurotic personality types tended to watch television more frequently for purposes of passing the time and stimulation, whereas extroverts (who presumably had greater social contact) were less likely to watch television for purposes of companionship (→ Parasocial Interactions and Relationships). Similarly, emerging research on → Internet use suggests that individual-difference variables such as social skills and shyness may be useful in predicting uses of and preferences for online communication over face-to-face interactions.

Research also suggests that personality variables are useful in predicting many preferences for different *types* of content or media portrayals. In this regard, media associated with potentially harmful behavioral or attitudinal reactions have garnered the greatest share of

scholarly attention. For media violence specifically, research generally suggests that personality variables indicating greater hostility or aggression on the part of the viewer are predictive of greater interest and enjoyment (→ Violence as Media Content). For example, research has reported that traits such as callousness, rebelliousness, tough-mindedness, psychoticism, and aggression are associated with greater viewing and enjoyment of a host of different genres, including horror films, defiant rock music, and television violence, among others. Similar patterns have also been obtained for research on erotica or pornography, with higher levels of sexual permissiveness associated with enjoyment of sexually explicit materials per se, and with higher levels of aggressive or sexually callous traits associated with enjoyment of sexual materials featuring violence or unconventional behaviors (for reviews, see Oliver 2002; Oliver et al. 2006; → Sex and Pornography as Media Content, Effects of).

Although existing research suggests that viewers appear to be attracted to entertainment that mirrors or complements their existing dispositions, unambiguous explanations for these preferences have yet to be identified. For example, these preferences may reflect how individuals have been affected by media consumption, with heavier viewers of violent content developing dispositions that reflect their media diets. On the other hand, these preferences may reflect a preoccupation with violent or sexual cognitions that serves to make such media content particularly salient or meaningful. The latter interpretation is consistent with Reiss and Wiltz's (2004) recent argument that individuals are motivated by a finite number of basic desires (e.g., power, status, vengeance, honor, etc.), with the actualization of these desires (including vicarious actualization) resulting in feelings of joy or fulfillment. This line of research implies that existing research on personality and media preferences may illustrate more general patterns of media consumption that reflect the means by which individuals use media content to satisfy basic desires, albeit vicariously.

### **PERSONALITY AND SELECTIVE PERCEPTION, EXPOSURE, AND AVOIDANCE**

In addition to predicting individuals' enjoyment of media content, research on individual differences suggests that personality likely plays an important role in terms of media consumers' selectivity – including selective exposure, avoidance, and perception. Although this research has generally examined individual differences in terms of attitudes, many researchers conceptualize enduring attitudes as part of a subset of related constellations of traits that make up what is commonly understood to be the building blocks of personality.

Research in audience selectivity is often broadly influenced by theories of cognitive dissonance (Festinger 1957; → Cognitive Dissonance Theory). This perspective generally suggests that individuals tend to expose themselves to media messages that are consistent with existing attitudes and avoid inconsistent messages as a way of avoiding dissonant feelings. Further, when incongruent messages are encountered, they are often perceived and remembered in ways that are supportive of existing beliefs. Although scholarship on the role of cognitive dissonance and media use has revealed numerous nuanced caveats to this basic prediction (Cotton 1985), research in a host of domains supports the prediction. In

particular, research pertaining to social and political media content generally shows that individuals tend to select and perceive messages in ways that are supportive of existing beliefs. However, similar research also curiously suggests that under some circumstances, partisan individuals tend to perceive news reports on salient, related issues as hostile to their position (Vallone et al. 1985; → Hostile Media Phenomenon). The seeming disconnection between viewers' assimilation of messages and their perceptions of a hostile media is difficult to resolve, though it may reflect the extent to which individuals are cognizant of how messages may affect other viewers. That is, perceptions of powerful media influence on others may serve to exacerbate hostile-media perceptions (Gunther & Schmitt 2004).

### **PERSONALITY AS A MODERATOR OF MEDIA INFLUENCE**

In addition to predicting enjoyment and selection of media messages, personality variables can also serve as important moderators of both the strength and direction of → media effects. In many respects, research demonstrating this moderating effect may reflect differences in interpretation of media content. For example, individuals who are sensation seekers may find frightening media content exciting and gratifying, whereas individuals low in sensation seeking may experience dread or anxiety (→ Sensation Seeking). These differences in resultant affect may manifest themselves in further differences in behaviors, arousal levels, cognitions, or related emotional responses.

Related to the notion of interpretation, personality characteristics may also play consequential roles in individuals' processing of media messages, with variations in processing resulting in variations in the extent to which messages may result in attitude change. For example, individuals who score high on need for cognition (NFC) are typically more likely to carefully scrutinize and elaborate upon message arguments than are those who are low in NFC. According to the → elaboration likelihood model, this individual difference may imply different paths to attitude change, with message quality having a stronger influence than peripheral cues for individuals high in NFC, and the reverse true for individuals low in NFC (for a review of this literature, see Petty & Wegener 1998).

In addition to suggesting that individual differences play important roles in moderating the effects of persuasion, studies employing priming models also demonstrate that personality can moderate the extent to which media content may activate concepts, emotions, or action tendencies that, in turn, affect subsequent behavior. In general, research from this perspective argues that for a concept or mental model to be primed or activated, the concept must be present in an individual's cognitive structure (→ Priming Theory). Applied to issues of personality, this reasoning suggests that certain personality traits may signify a given cognitive structure for a viewer, making the viewer more susceptible to priming effects resulting from exposure to different types of media content. For example, research on media violence and priming has demonstrated that individuals with certain personality characteristics, such as trait hostility, psychoticism, or hyper-masculinity, are more vulnerable to priming influences than are individuals who do not harbor high levels of these traits (see, e.g., Bushman 1998; Scharrer 2001; → Violence as Media Content, Effects of).

## PERSONALITY AS A CONSEQUENCE OF MEDIA SELECTION AND EXPOSURE

Arguably, the bulk of social scientific research on personality and media has conceptualized personality variables as independent variables in terms of predicting media selection and response, or as moderator variables in terms of specifying the types of individuals who may be more susceptible to media influence. Because personality is understood to be stable and enduring, this focus is understandable. However, given that media consumption (and its accompanying messages and portrayals) begins at a very early age and comprises the bulk of individuals' leisure activities, future researchers may profitably examine how long-term and cumulative media use may play important roles in the formation of personality traits and dispositions (→ Personality Development and Communication).

## Personalization of Campaigning

Frank Brettschneider

University of Hohenheim

Election campaigning is considered to be personalized if it focuses on the top candidates and their personal qualities more than on political issues. The personalization of campaigning is part of the personalization of politics as a whole (→ Political Personality in Media Democracy). Moreover, the personalization of voting behavior and that of media coverage play an important role (Brettschneider 2002). Yet the personalization of election campaigns receives the bulk of criticism. Some observers see in it a dangerous trend toward depolitization. Politics, according to them, is increasingly meaningless, issues are marginalized, and elections are turned into mere beauty contests, designed by → spin doctors who are practically “packaging” their candidates for the media (Franklin 2004).

The *reasons for personalized election campaigning* include the increasing importance of the top candidates compared to their parties, decoupling of parties and candidates, and the focus on apolitical candidate characteristics (human interest). The increasing importance of top candidates in many countries is also considered to be a part of the “Americanization” of election campaigns (→ Election Campaign Communication). Since the American president is essentially elected by the people, the candidates of the Republicans and Democrats are obviously the main protagonists. In parliamentary democracies, however, the head of government is elected by the parliament. The population votes for the candidates of their electoral districts or parties. The importance of the top candidates varies depending on the political starting point (topical agenda) and the constellation of candidates. Nevertheless, the personalization of election campaigns is not an entirely new phenomenon in parliamentary democracies. “Political leaders have always been embodying political ideals and goals as representatives of political movements and parties. The personalization of politics is as old as politics itself” (Radunski 1980, 15).

According to many observers, however, more and more top candidates tend to distance themselves from their parties these days. The top candidate, they say, is not necessarily and primarily a representative of his party any more, but faces the voters in his own right, occasionally taking positions that oppose those of his own party. Again, this tendency was first noticed in the US. The American procedure for selecting party candidates – that is, the broad diffusion of primaries since the 1970s – favors such a decoupling (Patterson 1993). Jimmy Carter, for instance, was the first American president who successfully ran as a counter pole to his own party’s establishment in Washington.

Bill Clinton also ran as an “outsider” at first. His TV spots during the 1992 presidential elections and his speech at the Democratic convention rarely mentioned the Democratic Party. Instead of presenting himself as a party politician, he ran as a pragmatist. Tony Blair followed a similar strategy in his 1997 election campaign for the House of Commons, as did Gerhard Schröder in the 1998 German parliamentary elections. The decoupling is particularly obvious in → political advertising. A clearly visible party logo on the candidate’s campaign posters and flyers is much less common now than it used to be.

Most observers also claim that the focus on private issues in election campaigns is a new phenomenon. While the candidates in the US have always been showing their private side – for example in campaign ads – this has been less common in parliamentary democracies. Instead, the focus used to be on the candidates’ political role. By making the tour of popular TV shows, as well as marketing their personal background stories to the media, some politicians now want to collect sympathy points and reach those voters who have only little interest in politics (→ Political Marketing). Still, most candidates seem to prefer talking about their political ideas and leadership qualities than their biography, family situation, looks, and hobbies.

Changes in voting behavior, parties, and the mass media are considered to be the cause of increasing personalization. Voters tend to be less loyal to their parties. This in turn leads to stronger fluctuations in voting behavior and a growing importance for the top candidates (→ Issue Voting). At the same time, parties have changed from being doctrinal parties to catch-all parties, concentrating less on their political ideology and more on their short-term success in the elections. Top candidates are seen as a means to achieve this electoral success (Wattenberg 1991).

But more than anything, personalization is due to the development of the media system – in particular, the diffusion of commercial → television (→ Commercialization: Impact on Media Content). This holds true for the US as well as other western democracies (Mazzoleni & Schulz 1999; → Mediatization of Politics). Television’s focus on prominent politicians appears to be part of a → politainment trend. Campaign professionals adapt to this → media logic in order to increase public attention. Key elements in this strategy are → televised debates. “The modern campaign strategy which dominates all others and best fits media logic is personalization, concentrating on telegenic leaders while programs and policy proposals remain in the background” (Swanson & Mancini 1996, 272).

However, the assessment of the personalization of campaigns is beginning to change. The top candidates’ prominent position in the campaign is no longer considered to be detrimental as such. It rather depends on the type of image aspects that are focused on (→ Candidate Image). If nonpolitical image components predominate and replace political issues, this will indeed be problematic. But if personalization in election campaigns is used to transmit political issues, personalization is not then the same as depolitization. Rather, personalization can be an adequate strategy in order to communicate complex content: politicians then lend their party’s policies a face and a voice.

## Perspective, Pictorial

Eduardo Neiva

University of Alabama at Birmingham

Perspective refers to the graphic representation on a flat surface of an optical sense of depth associated with natural stereoscopic vision (→ Visual Representation). This translation of three-dimensional visual perception onto a two-dimensional picture plane is accomplished through a variety of techniques for composing the pictorial space, including: (1) diminishing scale, (2) the occlusion of figures and shapes, (3) atmospheric blurring or color variation from foreground to background, and (4) the converging of parallel lines at vanishing points along an imaginary horizon line. From the fifteenth century in Europe, artists increasingly used a combination of such techniques to create formal systems of perspective designed to present the picture plane as a kind of window, through which one views a visible world implied beyond the plane of the picture frame (→ Painting). Tied to the notion that a picture could, and should, imitate natural appearances, European drawing, painting, and print-making (→ Prints; Printing, History of) following the Renaissance conventionally organized the lines, shapes, and colors of the picture plane to appear to proceed outward from an observer's unique point of view. The viewer sees depicted objects and space from the single *perspective* of the viewer's unique position, as if the visible world was unified along the sight lines of this imagined observer. The representation of vision is stable and monocular. The point of view of the painter coincides with the beholder. Although recent polemical analyses have suggested that mirrors and lenses could have been used to produce the impression of perspective, Renaissance treatises advanced a conception of vision that followed mathematical projections and geometrical deductions, as illustrated in Dürer's engraving of a man drawing a lute (Fig. 1; Hockney 2001; Hockney & Falco 2003; Neiva 2005).

**Figure 1** Engraving of a man drawing a lute. Albrecht Dürer, 1525  
 Source: Beinecke Rare Book and Manuscript Library, Yale University

Perspective does not represent human vision per se, but it represents one of the potential modes of representing vision. While Damisch (1987, 37) has criticized the temptation to consider the idea of perspective as a pictorial code, its self-referential visual nature as well as its regulative presence across western art may indicate otherwise (→ Code). Goodman (1976) argues that the notational system of perspective relates closely to human language, constituting a conventional and symbolic code that requires cultural training to decipher. Some scholars of → visual culture therefore contend that cultural learning is necessary to visual comprehension (Bryson et al. 1994).

**PERSPECTIVE – MORE THAN A CONVENTIONAL CODE?**

The notion that perspective is little more than a culturally conventionalized pictorial code, a kind of visual morphology or grammar of image-making, *perspectiva artificialis*

(Goodman 1976), contrasts with the idea that renderings of linear and aerial perspective in art successfully mimic the perspective of natural perception, *perspectiva naturalis* (Messaris 1994). Humans as a species may experience natural perspective in routine vision, but pictorial techniques for rendering visual depth have not always been available to artists, painters, and architects, and the particular conventions of linear perspective that emerged in the western tradition of picture-making have not characterized the picture-making of numerous other cultures.

It is something of a paradox, then, that perspective be considered the pre-eminent device of realistic visual representation. In the process of seeing the natural world in perspective, the observer knows that the railway is constructed of parallel tracks, and that they remain parallel even when vision indicates that the parallels converge to a vanishing point on the horizon. Yet in attempting to represent this visual experience on a flat picture surface, the artist consciously plots lines that actually do converge, artificially foreshortening depth within practiced and self-contained schemes that have become, not only accepted norms, but demonstrations of competence. Depiction in perspective translates the properties of objects in terms of a canonical pictorial procedure. The pictorial rule of perspective demands that every object reflected in the picture surface should not suffer distortion, but that the orthogonal lines receding in the distance converge to a point vanishing in infinity whose position depends upon the spectator's viewpoint: "A pyramid of visual rays joins the objects that are seen to beholder's eyes" (White 1967, 121). Alberti's *Della pittura* (1973, 1st pub. 1436) defines the picture as the planar section of the visual pyramid. The sense of depth is obtained because the objects diminish in direct proportion to the individual's gaze.

While foreshortening of objects amounts to a pictorial technique not unknown in antiquity, in fact familiar to the ancient Greeks, it was only during the Renaissance in Europe that perspective, as a completely homogeneous conception of space, came to full realization. Furthermore, the knowledge of representing in perspective supplies the pictorial ground of modern → photography. This, in turn, leads to the assertion that perspective dominates the visual canon not only in western art, but in the use of pictorial material in various mass media, extending its global reach.

Even if foreshortening is *not* the most natural and inevitable mode of spatial representation (Waisanen 2002), perspective is now everywhere: in the cinema, on television, in the pictures found in publications that we read, and even in the design of → magazine pages, → posters and websites. We carry mobile phones that photograph and transmit scenes according to conventions of perspective (→ Digital Imagery). The relative universality of the → Internet confirms, through use of photographs, that perspective is a mode of representation transcending cultural barriers.

### **PICTORIAL REPRESENTATION, CLASSICAL CULTURE, RHETORIC, AND TRUTH**

More than a mere technique of pictorial representation, perspective must be seen as a rhetorical device (→ Rhetorical Studies). In both perspective and rhetoric, representations disregard objective and absolute truth. In perspective, the viewer never perceives things as they are, but instead as they seem to be, in the same way that in a persuasive speech

(→ Persuasion; Rhetoric, Argument, and Persuasion) what matters is not truth but truth-likeness, at best the surface appearance of truth. As Gombrich (1993) asserts, the world may never look like an image, but an image can be made to look like the world.

Among ancient authors, Plato (c.427–347 BCE) not only noticed but also assessed negatively the *mimesis* of the painter, who makes pictures that comply with the compositional method of perspective, comparing the artist to the rhetorical sophist. In the *Republic* (X, 595 b–c), Plato states most clearly what he considers the correct moral and logical stand: “we must not honor a man above truth.” Objective and eternal truth, on the one hand, and persuasion and perspective, on the other, are irreconcilable. Consider their contrast: perspective and rhetoric represent the transitory, while absolute truth is averse to change, since what changes is not yet true. As illusionists, conjurers, and producers of simulacra, painters and sophists disseminate phantasms of truth (*Republic* X, 538 b–c; → Rhetoric, Greek).

Despite Plato’s disapproval, apocryphal anecdotes reveal the endurance and the lure of illusionary pictorial techniques. In his *Historia Naturalis* [*Natural History*], Pliny describes the outcome of a competition between the most skilled painters of the time: Zeuxis and Parrhasius. Zeuxis depicts grapes so real that birds come to peck at them, while Parrhasius paints curtains so perfect that Zeuxis asks his competitor to open the drapes. Parrhasius wins the dispute, having duped a fellow artist. Vasari (1980, 1st pub. 1550) records another tale: Paolo Uccello stays months without leaving the house, probing into the secrets of perspective. When his wife urges him to go to bed, Uccello makes it intimate: “*Che dolce cosa è questa prospettiva!*” (“What a sweet thing is this perspective!”)

## **PERSPECTIVE AND PICTORIAL REPRESENTATION IN CULTURE AND NATURE**

Although a naïve conception of perspective might describe it as a simple reflection of human vision, perspective is a visual construction of an essentially mental nature. An image in perspective embodies a system of cultural meanings, being much more than the joint work of the hand and the eye. This is Panofsky’s position in *Perspective as symbolic form* (1991, 1st pub. 1927). Panofsky contends that perspective, like any symbolic construction, is the linking of a mental concept, *the signified*, with a material mode of pictorial representation, *the signifier*, within a system of diacritical distinctions (→ Sign; Sign Systems). Before choosing a geometrical or optical strategy of representation, the image-maker has to have prior conceptual guidance. To represent in perspective, the artist must accept that the natural space of the world is not a quilt of isolated scenes, but rather one unified space.

Developing Panofsky’s ideas further, Francastel (1951) points out that perspective is the dominant factor in the cultural creation of a new type of pictorial space. To raise the apse of the church of Santa Maria de Fiori, Brunelleschi (1377–1446) came to the conclusion that he could not use the traditional medieval methods of construction. Brunelleschi’s solution relied heavily on geometrical and mathematical planning; but in doing so, he also gave birth to a culturally revolutionary conception of space, both uniform and measurable. Brunelleschi’s final plan derives from the application of perspective. It was more than a novel architectural solution: the transformation of natural space into a

geometric representation constituted an intellectual anticipation of modern scientific conceptions of nature, in which the material qualities of the natural world are rephrased in a geometrical and mathematical language. Brunelleschi's artistic achievement forecasted Galileo's *Dialogo sopra i due massimi sistemi del mondo* (1953, 1st pub. 1632).

Although it is quite accurate that the origin and the discovery of the pictorial method of depicting in perspective is the product of specific historical developments, and therefore a cultural invention, this does not mean that perspective is purely and solely cultural. Cultural systems of perspective should be seen as historically specific manifestations of our biological legacy. Depth information results from *stereopsis*, in other words, from the fact that the eyes produce slightly different views of the natural world. After receiving such data, the brain assesses the perceptual disparities, interpreting them and thus producing *inferentially* the sense of depth. As brain cells are binocularly driven, and as this indicates a prior cerebral categorization, the conclusion should be that both perceptual and pictorial perspective are inferential processes. And if differences in retinal information are the basic anatomical condition for vision in depth, then the cultural invention of perspective can be seen as an attempt to reproduce similar inferential processes (→ Information Processing).

# Persuasion

*Daniel J. O'Keefe*

*Northwestern University*

Persuasion is a communicative function that can be pursued in many different settings, ranging from face-to-face interaction to mass communication. Mass media persuasion takes three primary overt forms: commercial advertising (of consumer products and services), pro-social advertising, and political advertising. On each of these subjects, there is extensive empirical research and theorizing (→ Strategic Communication).

Studies of *consumer advertising* have examined such questions as the effectiveness of different advertising strategies, the role of endorsements in consumer advertising, effects of varying the frequency and timing of advertisements, the role of visual elements, and so on (e.g., Kardes et al. 2005; → Advertising; Advertising as Persuasion; Advertising, Endorsement in; Advertisement, Visual Characteristics of). Advertising is commonly one part of a larger marketing effort involving decisions about pricing, product distribution, market segmentation, sales force management, and so forth (→ Marketing).

*Pro-social communication campaigns* (sometimes termed “social marketing,” because such campaigns apply familiar marketing tools to pro-social ends) aim to forward environmental or charitable causes or to advance health-related ends such as encouraging people to exercise, quit smoking, and so forth (→ Environmental Communication; Health Campaigns, Communication in; Social Marketing; Planned Social Change through Communication). Research on health promotion communication has been informed by such theoretical approaches as the → health belief model, the → stages of change (transtheoretical) model of health behavior change, and the → extended parallel process model (→ Health Communication; for collections of studies of pro-social campaigns, see Rice & Atkin 2001; Hornik 2002).

Studies of *political persuasion* (especially, but not exclusively, in the context of election campaign advertising) have examined such subjects as the effects of negative advertising and the role of televised political debates in elections (see, e.g., Mutz et al. 1996; → Election Campaign Communication; Negative Campaigning; Political Advertising; Political Persuasion; Televised Debates). This research is linked with broader work concerned with mass media influences on public opinion generally (see Glynn et al. 1999), including such topics as → propaganda and the interplay of interpersonal interaction and mass media as influences on the public (e.g., the → “two-step flow of communication”; → Public Opinion).

Beyond these three overt forms of mass media persuasion, advocates can also pursue persuasion through two other kinds of media content: news (by means of media advocacy) and entertainment (especially through entertainment education). “Media advocacy” refers to the strategic use of news media coverage to influence opinions on social or public policy questions (→ Media Advocacy in Health Communication). For example, in addition to using paid advertising, a health campaign might supply relevant news stories to local media outlets, or an advocacy group might seek to influence the framing of news stories concerning its particular issue. (For a practical guide to media advocacy, see Wallack et al. 1999).

Especially in the *developing world*, the use of entertainment programming to carry persuasive messages (e.g., about population control or disease prevention) has been particularly notable. For example, a recurring television → soap opera can be used to convey information about HIV/AIDS prevention. A number of these → “entertainment education” campaigns have been especially effective vehicles for persuasion. (For a useful overview, see Singhal et al. 2004.)

In addition to research and theorizing focused on specific contexts of persuasion (e.g., political advertising or changing health behavior), a number of more general theoretical perspectives on persuasion have been developed (for broad treatments of such work, see Dillard & Pfau 2002; O’Keefe 2002; Perloff 2003). Among the more prominent and promising are the → elaboration likelihood model (ELM), → social judgment theory, and → transportation theory. And persuasion has also been illuminated by the application of general models of psychological processes such as → cognitive dissonance theory (often invoked to explain selective exposure to messages) and the theories of planned behavior and reasoned action (two related approaches to understanding the bases of voluntary action; → Planned Behavior, Theory of; Reasoned Action, Theory of).

# Persuasion and Resistance

*Robin L. Nabi*

*University of California, Santa Barbara*

In → persuasion research, the concept of resistance generally refers to → audiences withstanding attempts to change their beliefs, → attitudes, or behaviors. Resistance, however, can actually be conceptualized in multiple ways. For example, it can be thought of as simply an *outcome* of a persuasive attempt (i.e., no change in attitude in the face of a persuasive message). It might also be considered a *motivation*, or goal of the audience (e.g., to maintain or protect their initial beliefs). Resistance might also reflect the *process* through which persuasive attempts are thwarted (e.g., disagreement with a message position or denigration of a message source). Finally, resistance might be reflected by the qualities of either attitudes (e.g., attitude strength) or people (e.g., dogmatic personalities) that limit persuasive effect (see Knowles & Linn 2004).

Regardless of how resistance itself is conceptualized, its role in persuasion is often considered from two different perspectives. First, resistance as the natural, and perhaps unintentional, result of exposure to a persuasive message is examined with the intent of determining how best to minimize this blockage to persuasive effect. Second, given there are persuasive situations in which the intended goal is to reinforce attitudes, or promote resistance to future persuasive attempts that the audiences might face (e.g., messages that might encourage teenagers to start smoking), much attention has focused on how to *generate* resistance to persuasion. Thus, to understand resistance, it is important to consider the factors that might generate resistance to persuasion, means of overcoming those sources of resistance, and the conditions under which resistance might be intentionally induced.

## SOURCES OF RESISTANCE

Although resistance to persuasion has been a consistent theme in persuasion research for over 50 years, there does not exist, as yet, a clear typology of the sources of resistance or the means of overcoming them. Still, there are a number of sources that have been examined, some of which focus more on motivational or process orientations to resistance, like reactance, scrutiny, distrust, inertia, and invulnerability, whereas others relate more to the nature of individuals and attitudes themselves (Knowles & Linn 2004).

### Sources Relating to Motivational or Process Orientations

One of the most commonly cited sources of resistance is a motivational force known as *reactance* (Brehm 1966). According to reactance theory, when people perceive a request as

unjustly restricting their freedom to choose or act as they want, they experience a motivation state in which they attempt to reassert their freedom by rejecting the request. This rejection might appear as holding onto their initial attitudes more strongly or as a desire to engage in the very act they were cautioned against. The more direct and demanding the request, or the more important the threatened freedom, the greater the reactance is likely to be. Individual differences in the tendency to be reactant have been examined, and though teenagers – teenage males in particular – are viewed as prototypically reactant and thus challenging targets for persuasive attempts, any group predisposed to feeling restricted might be likely to evidence this form of resistance.

A second very common source of resistance to persuasion is *scrutiny*, which refers to the critical processing of persuasive messages. The more carefully people process a persuasive appeal, the more likely they are to come up with arguments (→ Argumentative Discourse; Rhetoric, Argument, and Persuasion) that may counter or undermine the positions asserted in that message. To the extent that message scrutiny reveals weaknesses in a message's arguments, the message is more likely to be resisted. Scrutiny is more likely to occur when people are both motivated and able to process information. Thus, messages that are seen as personally relevant are particularly likely to undergo careful examination.

Three other process-related sources of resistance have received less attention yet still put up significant barriers to persuasive impact. *Distrust*, or the general guardedness against proposals for change, suggests that audiences process persuasive messages with skepticism, which biases the outcomes against change. *Inertia*, which focuses on people's tendency to stay just as they are to avoid the effort involved in enacting change in what they think or how they act, implies less active resistance in favor of the more benign motivation to maintain the status quo. Finally, *invulnerability*, which is perhaps most applicable in health-related contexts, suggests resistance is likely when audiences perceive whatever negative consequences might arise if the message is not accepted as not likely to happen to them (→ Social Perception: Unrealistic Optimism). Particularly likely in adolescent audiences, perceptions of invulnerability suggest resistance stems from a lack of perceived need to change.

### Sources Relating to the Nature of Individuals and Attitudes

In addition to the motivational and process variables, there are also a number of sources of resistance to persuasion that stem from the nature of attitudes as well as the people who hold them. Considering the nature of attitudes, several characteristics of attitudes are associated with resistance to persuasive influence. Perhaps the most notable is that of *attitude strength*, which is in part defined by the ability to withstand attacks and to persist over time. Factors that contribute to attitude strength include, among other things, → attitude accessibility (i.e., attitudes that come to mind quickly), attitudes based on direct experience or attitude-relevant knowledge, and attitudes on issues that are personally relevant or in which a persona has some vested interest. Along related lines, *attitude certainty*, which refers to a person's own perception of the validity of his or her own attitude, suggests that those certain of their own attitudes are likely to more readily resist persuasive attempts.

As to personality factors, the trait of dogmatism, or the tendency to have closed belief systems, is associated with greater resistance to persuasion. In contrast, research on authoritarian personalities indicated such traits associate with greater openness to fascist

ideology. More recently, measures that tap into individual differences related to the motivational forces and process variables associated with resistance (e.g., reactance, preference for consistency, need for cognition) have received increasing attention, though these lines of research are still in their nascent stages.

### **STRATEGIES TO OVERCOME RESISTANCE**

Given the many and varied sources that pose resistance to persuasive attempts, it is not surprising that a number of strategies have been considered to try to overcome these barriers to persuasion. There are two basic categories of strategies to overcome resistance processes. The first set focuses on how to enhance the persuasiveness of the compliance attempt, or encourage message acceptance. These efforts include attempts to increase message vividness and emotional effect; the use of incentives; boosting argument strength; the use of positively framed arguments; and the inclusion of positive message acceptance cues, such as credible, attractive, or likeable sources, social consensus cues, boosts of self-affirmation, and others (Knowles & Linn 2004; → Credibility Effects).

A second set of strategies focuses on minimizing the sources of resistance. For example, one could side-step resistance by redefining an interaction as not involving an influence attempt (e.g., as a conversation rather than a sales pitch). One could directly address the sources of resistance by offering counterarguments or other forms of assurance. Conversely, one could distract from resistance by disrupting message scrutiny. One might even reframe a situation so as to harness resistance processes to promote change (e.g., through reverse psychology).

Perhaps the most studied form of reducing resistance, and the currently most popular, focuses on the use of narratives, or stories, as persuasive vehicles (see Green et al. 2002). Narratives are believed to reduce resistance for two main reasons. First, given that audiences generally approach stories with the expectation of being entertained, not persuaded, any natural barrier posed by the perception of persuasive intent is avoided. Second, the dramatic and suspenseful nature of stories may capture viewers' attention such that their focus is on following the plot of the story and the fate of the characters (→ Storytelling and Narration), which serves to distract them from scrutinizing the message content. Further, if audiences identify with story characters, it is likely that, given their resistance is down, they may be more likely to adopt the views and behaviors of the characters they admire. This approach has been the foundation of the entertainment-education movement, in which persuasive messages are intentionally embedded in entertainment programming with the expressed purpose of increasing audience knowledge, attitudes, and behaviors regarding pro-social issues, like safer sex and family planning (see Singhal & Rogers 1999; → Entertainment, Effects of).

### **STRATEGIES TO PROMOTE RESISTANCE**

To this point the focus has been on sources of resistance and how to overcome them. However, a significant amount of attention has been paid to how to promote resistance to persuasion; that is, to encourage audiences to continue to hold onto their current attitudes. Efforts to promote resistance to persuasion have focused on two strategies: forewarning and inoculation. Forewarning simply refers to alerting people that they are

about to be exposed to a persuasive attempt. Under this circumstance, it appears that audiences generally perceive the impending persuasive attempt as a threat to their current beliefs, thus motivating them to defend their original attitudes.

Inoculation theory offers more systematic and theoretically developed insight into how to promote resistance to persuasion. On the basis of a biological model of inoculating against disease, William McGuire suggested that giving small doses of the opposition's viewpoint, followed by refutations of those arguments, would bolster resistance to future persuasive attempts. Currently, inoculation messages are designed to have three components: threat to belief, which appears not simply to forewarn audiences of a future persuasive attempt but also to motivate defense of the current attitude; counterattitudinal arguments, or opposing viewpoints that the audience might hear at some point in the future; and refutations of those counterarguments. Evidence consistently demonstrates that audiences exposed to inoculation messages are more resistant to future persuasive attacks, whether they contain the same counterattitudinal arguments as included in the inoculation message or different ones. Research over the last 50 years has consistently found support for the inoculation effect in such varied domains as political campaigns, social policy initiatives, and health behaviors (see Compton & Pfau 2005).

# Phenomenology

*Richard Leo Lanigan, Jr.*

*Southern Illinois University*

Phenomenology is a movement in philosophy associated with the human sciences as a qualitative approach to the study of human conscious experience. Research → validity and → reliability are assessed as functions of logic, not mathematics or statistics (→ Qualitative Methodology; Research Methods).

Consciousness refers to the unique human ability (1) to have an awareness of self, others, and the world, i.e., iconic codes of awareness, (2) to be aware of that awareness, i.e., indexical codes of signification, and (3) to displace that awareness of awareness in space and time, i.e., symbolic codes of meaning. The conjunction of these codes in expression and perception is the function of discourse. Following Merleau-Ponty, these three semiotic phenomenological stages of defining human communication (→ Semiotics) are known as the phenomenological method of (1) description, entailing the iconic principle of *reversibility*, where expression and perception are interchangeable; (2) reduction, entailing the indexical principle of *reflexivity*, where expression structures perception; and (3) interpretation, entailing the symbolic principle of *reflection*, in which expression and perception represent one another. As a contemporary human science, phenomenology is the name for, and method of, the study of discourse as a logic of discovery.

There is both a European and a US *tradition* in phenomenology, beginning in eighteenth-century Europe with Johann Heinrich Lambert, who first used the term “phenomenology.” The name was then taken by Kant to describe awareness of awareness, in distinction from initial awareness. Hegel turned phenomenology in a historical direction by focusing on the evolution of self-consciousness. By the nineteenth century, the European forerunner of phenomenology was Franz Brentano. He divided phenomena of consciousness into (1) *representations*, (2) *judgments*, and (3) *emotive acts*. A philosopher, he had several famous students at the University of Vienna. First was the psychoanalyst Sigmund Freud, who stressed the relationship of representation and emotive acts in his famous “talking cure” for neurosis. Second, there was the logician Edmund Husserl, who focused upon the relation between representation and judgment in consciousness, i.e., “intentionality.” Both Freud’s applied work and Husserl’s theoretical analysis founded phenomenology in its modern sense within the domain of human communication. In his 1922 London lectures, Husserl defined his methodology as centered on the “manifest multiplicity of conscious subjects communicating with one another.”

Within discourse, Husserl specifies the meaning of conscious experience as having four domains of reference, as elaborated in → communicology (→ Meaning). First, *meaning* signifies (the signifier expression) while *manifestation* refers (the signified perception). Second, meaning has *objects*. Third, *symbolic meanings* in perception contrast with *intuitive meanings* in expression. Fourth, all *acts of meaning* have a common *ideal meaning*. Thus, a phenomenon is the object-referent (*noema*) of the constituting act directed toward it (*noesis*). The whole process is called *intentionality*, whereby a person is “conscious of . . . [experience].” Karl Bühler in Europe and Vilém Flusser in South America provided major applications of Husserl’s work to communication theory and practice (→ Photography).

Also among Husserl’s interpreters are the French philosopher and psychologist Maurice Merleau-Ponty and his student Michel Foucault. Both focused on the *embodied discourse* domain of consciousness where self, other, and the lived-world blend together. Merleau-Ponty suggested there are two levels of communication: (1) *existential discourse*, in which a person expresses his or her speaking in an original and perceptive speech – that is, a “speech speaking”; and (2) *empirical discourse*, which merely expresses what has already been said by others – that is, a “speech spoken.” Heidegger made the same distinction with his “talk” (*Rede*) and “idle talk” (*Gerede*). Foucault argued that the

empirical social level of discourse hides the existential level. This contested process of discourse forms a “rupture” or ongoing discontinuity of levels. He engages his third level, *critical methodology* (interpretation), by using the first-level (description) method of *archaeology* (“knowledge” as the *experience of consciousness*) and the second-level (reduction) method of *genealogy* (“understanding” as the *consciousness of experience*) (→ Critical Theory; Structuralism). Thus, for Merleau-Ponty and Foucault, the conjunctions of both consciousness and experience in discourse are reversible icons, reflexive indices, and reflective symbols. While Merleau-Ponty examines the place of *personal perception* in public expression, Foucault critically studies the reverse – that is, the place of *public expression* in personal perception.

The central personality in American phenomenology is Charles Sanders Peirce, also known for his combination of semiotics and phenomenology with an existential focus: “man is a sign . . . my language is the sum total of myself; for the man is the thought” (Peirce 1931–1958, vol. 5, para. 314). Like Husserl, whom he studied (Peirce 1931–1958, vol. 4, para. 7), Peirce defined his phenomenology by “communication: the recognition by one person of another’s personality takes place by means to some extent identical with the means by which he is conscious of his own personality” (Peirce 1931–1958, vol. 6, para. 159).

# Photography

Jan-Christopher Horak

University of California, Los Angeles

The word photography comes from the Greek *φωτός* (photos) and *γράφειν* (graphein), meaning to write with light. From its invention in the early 1800s to the beginning of the twenty-first century, photography referred to a photo-chemically based system of analog and indexical still image production that resulted in an optical reproduction of the space in front of the lens. In the first five years of the new millennium analog photography was almost completely supplanted by electronically based digital systems that calibrate light intensities in terms of logarithms. For most of the nineteenth century, photographs were produced by specialists, using a variety of chemical formulae to make and develop light-sensitive surfaces. As artist-technicians, their primary concern was to document the world of appearances, although aesthetic manipulation of reality became an ever-growing trend.

By the early twentieth century, photographic processes had become standardized and their production industrialized, allowing a growing number of amateurs, as well as professionals, to document various aspects of everyday life, and create photographic art in all kinds of genres and styles, including abstract and camera-less photography, architectural, → advertising, fashion, documentary, nature, nude, → photojournalism, → portraiture, and surrealist. With the invention of half-tone printing in the 1880s, photography became all-pervasive in journalism and other forms of publishing, whether to capture objectively the news of the day or to express the subjectivity of the photographer (→ Journalism, History of; Objectivity in Reporting). At the beginning of the twenty-first century, digital photographs began circulating in geometrically expanding numbers through the Internet. With the inflation of prices in the art market in the latter half of the twentieth century, all forms of photography became collectible in the art market, whether its well-known practitioners had intended them to be art or not.

## EARLY HISTORY

First used as a working tool by painters wishing to measure perspectives, the *camera obscura* was invented in the sixteenth century (→ Painting). Artists soon began searching for a method of capturing its framed image on a light-sensitive surface. Joseph Nicéphore Niépce produced the first known surviving photograph in France in 1827, calling it a heliograph, although documents suggest he made his first successful photographic image as early as 1816. Having no method to permanently fix the image, however, Niépce signed a contract in 1829 with Louis Jacques Mandé Daguerre, who was also experimenting with chemically produced images. After Niépce died in 1833, Daguerre successfully invented a photographic process in 1837, called *daguerreotype*, which fixed the image on a silver-plated sheet of copper, using iodine and mercury fumes. Daguerre published his findings in 1839, leading one French newspaper to write: “It upsets all scientific theories of light and optics, and it will revolutionize the art of drawing” (*Gazette de France*, January 6,

1839). Over the next 20 years, daguerrotypes became an extremely popular form of photography, especially for landscapes and, later, portraits, once exposure times had been reduced to under a minute.

Among the best-known daguerrotypists were Baron Jean Baptiste Louis Gros and Joseph Girault de Pranguey, who documented architecture and cityscapes in their travels to Greece and the Middle East. The Americans Albert Southworth and Josiah Hawes were portrait photographers whose images of the Boston elite revealed startling details of character. By 1853 there were 86 daguerrotype galleries in New York City alone. However, the fact that a daguerrotype image could not be reproduced, as well as the daguerrotype's expense, led photographers to search for other methods of photographic image making. Utilizing different chemicals, but essentially the same limited technology, *ambrotypes* and *tintypes* were briefly an extremely popular low-cost alternative that allowed hundreds of thousands of individuals to have themselves photographed.

At virtually the same time as Daguerre was experimenting, Henry William Fox Talbot began (1835) sensitizing paper with silver chlorides and nitrates to produce a photographic image on paper, but he, too, was not able to fix the image permanently. It was Sir John F. W. Herschel who, after reading Daguerre's and Talbot's papers in 1840, successfully fixed his photographic images with a solution of hyposulfite; he also coined the terms "photography," "positive," and "negative." However, these first paper photographs lacked the sharpness of detail found in daguerrotypes. In 1841, Fox Talbot announced the invention of *calotypes*, which not only greatly improved image quality, but also involved the production of a negative from which multiple prints could be produced. Between 1844 and 1846, Talbot published *The pencil of nature*, a collection of 24 calotypes, which constituted the first photographic book. Among the most important practitioners of calotypy were David Octavius Hill and Robert Adamson, two Scotsmen whose outdoor portraits of common people between 1843 and 1848 revealed a strong painterly quality. In France in the early 1850s, Henri Le Secq and Charles Marville used calotypes to photograph the country's historic buildings and monuments for the Historic Monuments Committee of the Ministry of the Interior.

However, the invention of the wet-plate *collodion* process by Frederick Scott Archer in 1851 soon made both daguerrotypes and calotypes obsolete. Archer's glass-plate negatives produced much sharper images than calotypes and were infinitely reproducible. Coating glass with a viscous solution of nitrocellulose in alcohol and ether, mixed with potassium iodide, the photographer had to expose and develop his images while the coating was still wet, forcing him to carry a portable darkroom when working in the field. Photographic prints were made on albumen paper, which had been coated with potassium bromide and acetic acid dissolved in egg whites, then sensitized prior to exposure with silver nitrate. While albumen paper gave way to superior collodium paper in 1864 (invented by George Wharton Simpson), wet-plate negatives remained the standard until the 1880s, when gelatin dry plates came into general use.

With these improved tools, photography became both a mass medium for portraiture and a high art. Oscar Gustave Rejlander and Henry Peach Robinson, for example, used photo-montage techniques to produce complex, allegorical images that mimicked classical painting. The work of Roger Fenton, Julia Margaret Cameron, and Nadar (Gaspard Félix Tournachon) was less stylized but also had high art pretensions. Mathew Brady, famed

for his photographic work in the American Civil War, focused more on documentary aspects.

The invention of *dry-plate photographs* involved a long and complex process over 20 years of fits and starts. While Richard Hill Norris produced the first commercially available collodian dry plates in 1856, Richard Leach Maddox is credited with the invention of gelatin dry plates, although his published paper in 1871 in the *British Journal of Photography* initially failed to attract any attention. Maddox formed an emulsion of gelatin, containing nitric acid, cadmium bromide, and silver nitrate, which he coated onto glass plates and paper, then developed in a solution of pyrogallol. Unfortunately, ill health prevented Maddox from further experiments. The experiments of several other inventors were necessary before reliable and very light-sensitive dry plates became commercially available in 1878. By the early 1880s, large-scale production of dry plates had commenced and collodion wet-plate photography was phased out. Meanwhile, albumen paper had been succeeded by gelatin bromide and chloro-bromide paper for printing.

With the invention of the Kodak camera and acetate roll film in 1888, photography entered a new era, allowing large numbers of amateur photographers the opportunity to produce photographic images for the first time. The introduction of the Kodak “Brownie” in 1900 further democratized the production of photographic images by making it possible for completely untrained amateurs to “point and shoot” successfully (→ Amateur Photography and Movies).

### PHOTOGRAPHY ENTERS THE MODERN AGE

While photography evolved toward ever easier usage, some photographers continued to attempt painterly effects. Under the banner of Pictorialism, photographers utilized gum prints on heavy stock paper, producing soft-focus images that resembled paintings. Photogravure printing technology also created soft photographic images, which could be mass produced in a printing press. Peter Henry Emerson, e.g., advocated reproducing human vision by blurring the edges of the image and leaving the camera focus slightly soft. Pictorialist photographers, such as Frederick H. Evans, George Davison, Robert Demachy, Heinrich Kühn, Hugo Erfurth, Eduard Steichen, and Alvin Langdon Coburn, created images that consciously attempted to elevate photography to an art; e.g., Demachy’s *Behind the Scenes* (1897) resembled Edgar Degas’s portraits of ballerinas. Their portraits, landscapes, and nudes thus mimicked genre paintings in terms of both composition and texture.

Heinrich Kühn was among the first to experiment with *color photographs*. In 1907, after years of preparation, the Brothers Lumière in Lyon (the same inventors who had introduced motion pictures in 1895) marketed “autochrome” plates, which would reproduce living color. While previous generations of photographers had to rely on hand coloring their black-and-white prints, the Lumières’ autochromes placed a layer of starch, dyed orange, green, and violet, under a black-and-white emulsion, which was then developed as a color transparency. Autochromes proved extremely popular, but it was not until the invention of the Kodachrome dye coupling process (available in 1937), which placed three layers of color film emulsion on 35 mm photographic film, that an easy and effective color negative process became commercially available.

After 1900, art photography slowly began freeing itself from the strictures of Pictorialism. A new generation gathered together under the banner of the “Photo-Secession” to advocate “*straight photography*.” They demanded a return to sharply focused images that highlighted the characteristics of the medium itself, rather than attempting to copy other art forms. Among the first champions of straight photography was Alfred Stieglitz, who had earlier been aligned with the Pictorialists. Stieglitz co-founded the Photo-Secession in 1902, and its New York gallery “291.” He also became founding editor of *Camera Work* (1903–1917), the primary publication of the new style, while continuing to make his own straight photographs, *The Steerage* (1907) being one of his acknowledged masterpieces. Stieglitz published the work of Gertrud Käsebier, Clarence H. White, Steichen, Coburn, and a young photographer, Paul Strand.

In 1917, Strand won first prize in the prestigious Wanamaker competition, the Twelfth Annual Exhibition of Photography, with his photograph *Wall Street* (1916), which was typical of straight photography’s concern for capturing scenes from everyday life, while simultaneously abstracting the image through composition and light values, thereby constructing deeper meanings. Strand also exemplified a new generation of professional photographers who took on commercial assignments to support their own artistic work in the medium. Strand bought an Akeley 35 mm movie camera and worked as a newsreel and documentary cinematographer. White became a professor at Columbia University and directed his own photography school in Maine, while Steichen supported himself with fashion and advertising photography. Today, Steichen’s commercial photography is just as highly prized in the art market as his more private work.

Value is, in fact, more dependent on original condition, age, uniqueness, and reputation of the photographer than on the original context of production. As is the case with other arts, a photographer’s reputation is subject to fashion and critical academic debate. A constant in photography’s history over the last century is that photographers have chosen to work in a wide variety of genres, whether as private artists on fellowships, private patronage, or foundation grants, or as employees for hire of private companies, government agencies, or communications media.

## FORMS AND SUBJECTS OF MODERN PHOTOGRAPHY

In the 1920s European modernist artists began experimenting with exposing photographic paper to light without a camera, resulting in purely abstract images, parallel to painting’s evolution toward abstraction (*abstract or camera-less photography*). Both Man Ray and László Moholy-Nagy placed objects directly on photographic paper and exposed them to light in a darkroom for their rayograph and photogram series, respectively. Christian Schad and Francis Brugière used cut paper to produce abstract shadows in a multitude of black, white, and gray tones. Meanwhile, Alfred Stieglitz’s *Equivalents* series depicted clouds as pure light and shade. In the 1940s, Harold Edgerton and Gjon Mili utilized strobe lights to create abstract multiple exposures of moving objects or persons, again producing abstract designs. In the 1960s, Harry Callahan and Aaron Siskind photographed the real world, but framing their images so that objects were abstracted and no longer recognizable as anything but pure form (→ Art as Communication).

In the nineteenth century, a major impetus for photography was the *documentation of architecture*, especially historic buildings. In the early twentieth century, photographers became fascinated by cityscapes with skyscrapers as the epitome of modernity. Eugene Atget's images of deserted Paris streets and buildings prior to World War I had a great influence, especially on the surrealists. The city demanded new ways of seeing, whether looking down from high buildings or looking up at them, as exemplified by Alvin Coburn's view down on Central Park, *The Octopus* (1916), and Alexander Rodchenko's images of Moscow balconies. In mid-century New York, Bernice Abbott followed in Atget's footsteps, while Eric de Maré became the most prominent architecture photographer of the 1960s–1990s.

With the expansion of mass print media, photography evolved into the most important tool for *advertising consumer goods*. In the 1920s, German photographer Albert Rengé-Patsch produced advertising photos for Hag Coffee, strongly influenced by the Bauhaus concept of graphic design, while Ralph Steiner's American *Eight O'Clock Coffee* likewise highlighted the product through eye-catching composition. Given the huge popularity of fashion magazines, it is not surprising that fashion photography soon became big business. Some of the most successful fashion photographers also established artistic reputations, include Irving Penn, Cecil Beaton, David Bailey, Sarah Moon, William Klein, and Bruce Weber.

One of photography's foremost goals was to *document real-world conditions*. Utilizing the camera as a tool for social criticism, Lewis Hine's images of children in New York sweatshops helped pass child labor laws in many states. August Sander's frontal portraits of farmers, workers, and tradesmen created a complex social portrait of Weimar Germany. In Depression-ridden America, the photographs of Walker Evans, Arthur Rothstein, Dorothy Lange, and Ben Shahn documented economic hardship and the New Deal. Roman Vischniac's photos of Jewish ghettos in 1930s Poland captured a way of life that would disappear with the Holocaust. In the last 50 years, Robert Frank, Lee Friedlander, Danny Lyon, and Mary Ellen Mark, among others, have documented both the middle class and social outcasts (→ Documentary Film).

Just as *nature* has always been a primary subject matter for art, so too has it continued to fascinate photographers. Edward Weston's, Imogen Cunningham's, and Karl Blossfeldt's early twentieth-century images tended to abstract nature, finding formal patterns in natural environments. In mid-century, Ansel Adams and Eliot Porter sought to capture the grandeur and power of the natural landscape, while Jean Dieuzade's and Joan Fontcuberta's nature images function as abstracted still lifes.

An important subject from classical art, *nude photography* runs the gamut from the pornographic to the highly aesthetic. Paul Outerbridge's nudes in the 1930s broke new ground by mixing classical naïveté with taboo-breaking fetishisms. Frantisek Drtikol and Bill Brandt abstracted the human body, making it an element of photographic design. Helmut Newton and H. F. Heineken have trodden a narrow line between pornography and fashion photography, while Robert Mapplethorpe's large-format homoerotic images of male nudes caused intense political controversy in the 1980s.

With the rise of illustrated news magazines, e.g., the *Berliner Illustrierte Zeitung*, *Picture Post*, and *Life*, as well as the development of the 35 mm Leica camera, *modern photo-journalism* was born (→ Picture Magazines). Capturing news events of the day, whether

diplomatic conferences or images from a war front, photographers such as Erich Solomon, Alfred Eisenstedt, Umbo (Otto Umbehr), and Margaret Bourke-White traveled the globe to get their scoops. More in the vein of today's paparazzi, Weegee photographed the underbelly of 1950s New York and Los Angeles, his snapshots of murders, homeless drunks, and prostitutes displaying the immediacy of news torn from the headlines. At the same time, W. Eugene Smith created a series of intense photo essays, including one on the Japanese victims of industrial pollution.

From the time of the earliest daguerrotypes, *portrait photography* has been central to the medium. The photograph was thought to capture not only the outward appearance of the subject, but also a sense of the person inside. In the 1920s, Nicholas Murray photographed the artistic and intellectual community of his day, including many film stars. Hollywood, in fact, engendered a sub-genre, the star portrait, produced for studio publicity purposes by George Hurrell, Clarence Sinclair Bull, and Ruth Harriet Louise. After 1950, Chargesheimer (Karl Heinz Hargesheimer) and Richard Avedon represent celebrity photographers working for illustrated magazines. In the 1960s, Diane Arbus's portraits of freaks and other physically or emotionally deformed persons took on a surrealist quality. In the 1990s, Cindy Sherman invoked the conventions of portraiture to create fictionalized self-portraits in gallery-sized formats that have commanded prices akin to painting.

The twentieth and early twenty-first centuries have seen a large number of photographers manipulating the medium to create *surrealist fantasies*, juxtaposing photography's ability to reproduce reality iconically with its capability of creating fictions. Utilizing a variety of techniques, including multiple exposure, photo-montage, and solarization, photographers in the 1920s, like Jaromir Funke and Herbert Beyer, created surrealist images. In the 1950s, it was Philippe Halsman and Jerry Uelsmann who sought to visualize their inner subjectivities, while in the 1970s Paul de Nooijer and Duane Michaels were prominent.

## DIGITAL CONVERGENCE

In the early years of the twenty-first century, photography has become both more prevalent, retaining its status as a mass medium through → Internet distribution, and also subject to the critical and aesthetic winds of postmodernism (→ Postmodernism and Communication). Photographers, such as Marco Breuer, Carl Carienza, Rimma Gerlovina, Richard Misrach, Julie Moos, Sebastiao Salgado, Gary Schneider, and Krzysztof Wodiczko are as diverse as the genres they work in.

In the new millennium, photography has morphed from a chemical-based medium to digital forms, with images stored digitally on hard discs in cameras or computers (→ Digital Imagery). While it is still too early to tell what aesthetic consequences the digital revolution will have for photography, it is already clear that both amateurs and professionals have embraced the medium almost instantaneously. Furthermore, distribution of digital images has been revolutionized, allowing consumers to take pictures with their phones and send them to their computers, while professionals can email extremely large image files from almost anywhere on the planet to their editors. However, digitality has also entailed convergence, meaning that film, photography, and other forms of image production have lost much of their media specificity (→ Digitization and Media Convergence).

# Photojournalism

*Julianne H. Newton*

*University of Oregon*

Photojournalism means reporting visually. Yet this simple definition belies the complexity of a professional media practice whose mission remains constant, while the means of fulfilling that mission and the degree to which one believes it can be fulfilled shift along with technology, culture, and perception.

The defining characteristic of photojournalism is visual portrayal, with contextualizing verbal information, of an *event* – an observable occurrence that can be as simple as the fleeting moment of a child's smile or as complex as a country's struggle to rebuild after war. Henri Cartier-Bresson, often described as the greatest photojournalist of the twentieth century, defined *the decisive moment* as “one moment at which the elements in motion are in balance” (1952): “Photography must seize upon . . . and hold immobile the equilibrium of” that moment. A founding member of the great picture agency Magnum, Cartier-Bresson believed effective picture stories required engaging the heart, mind, and eye: through “recognition of a rhythm in the world of real things,” the eye finds and focuses “on the particular subject within the mass of reality” and the camera registers “the decision made by the eye.”

## GENRES

Photojournalism images fall into five categories: *spot news* (significant, unplanned events); *general news* (ongoing issues and activities); *features* (interpretative essays about lives, activities, and issues); *illustrations* (staged or digitally created images communicating concepts); and *documentary* (long-form picture/word narratives). Subject matter addresses political, cultural, economic, or natural concerns ranging from a single incident (such as the

moment when a screaming, burned girl ran from a napalm bombing in Vietnam) to a family's long-term experiences with the ongoing illness and subsequent death of a grandparent. Serious photojournalism, practiced with the goal of *witnessing* (or showing the world to itself) should be distinguished from *paparazzi* photography, with its goal of capturing celebrity life. However, the line between the socially responsible “watchdog” for the public interest and sensationalist voyeur-satisfying insatiable curiosity is as difficult to establish in professional media practice as it is in everyday life (→ Journalism: Normative Theories).

## HISTORY

Discussions of photojournalism's origins underlie scholarship about visual ways of knowing: the role of the seer versus the role of the seeing technology (→ Photography). Newton (2001), for example, roots visual reportage in the evolution of consciousness through the human need to survey the environment in order to survive. In that case, the medium of reportage is the eye/brain, which mediates stimuli gathered through perception into meaningful information (→ Media and Perceptions of Reality). Such technologies as sketch pads and cameras developed as extensions of the body. Pioneer photojournalism educator Cliff Edom (1976) maintained that cave art was a form of visual reportage, that the “illustrated press” dated back to illuminated Egyptian manuscripts, and that even fine art sometimes portrayed significant events (→ Art as Communication). As early as the 1830s, British and US print publishers relied on field artists to draw scenes for conversion to woodcuts and engravings. In 1842 the *Illustrated London News* began a 16-page weekly containing 32 woodcuts.

Photographic historians date the beginning of actual *photographic reportage* to 1826, when the first image was created by means other than the action of a human hand and tool. Joseph Nicéphore Niépce's eight-hour exposure (a heliograph) at LeGras recorded the changing patterns of highlights and shadows across the turrets of his estate, making permanent the first light-written image. The oldest extant light recording of a human figure is Jacques Louis Daguerre's 1838 image of a man having his shoes shined on a Paris street. The daguerreotype, with 20- to 30-minute exposures, captured fine detail for portraiture, as well as such newsworthy events as battle scenes, fires, earthquakes, and uprisings. A daguerreotype of the 1853 train wreck near Pawtucket, Rhode Island, for example, was used as the basis of an engraving published in the *New York Illustrated News* (Carlbach 1997). Although William Henry Fox Talbot patented his paper negative process in 1841, making possible multiple reproductions of the same “pencil of nature” image, the more durable and detail-sharp wet collodion, glass negative process, introduced in 1851, led to the mass reproduction of photographs in print.

Seeking to record new views of the world, such nineteenth-century enterprisers as Nadar photographed Paris from a hot-air balloon and Frances Frith documented foreign lands. In 1873–1874, John Thompson published a four-volume documentary of life in China and teamed with radical journalist Adolphe Smith on the monthly publication *Street Life of London*, laying the groundwork for such (now classic) photojournalistic publications as *National Geographic* magazine, founded in 1888.

Scholars often correlate photojournalism history with technological advances. One benchmark was the development of half-tone techniques for converting continuous

photographic tones into dot patterns for letterpress printing (→ Printing, History of). The first newspaper half-tone, *A Scene in Shantytown*, was published in 1880 in the *New York Daily Graphic*. Other late nineteenth-century benchmarks included rotogravure, which made possible the reproduction of multiple high-quality copies of text and pictures from a single plate; flash power; roll film; and moving images. Key twentieth-century developments included the 35 mm camera, wire transmission, color printing, stroboscopic flash, offset printing, and digital imaging (→ Digital Imagery).

Scholars also cite the critical roles of aesthetic, cultural, and economic forces in photojournalism's development: artistic and scientific drives toward realistic portrayal of the material world, surveillance and propaganda functions of governments and institutions, economic imperatives of mass distribution systems, public fascination with visual media, experimentation in advertising media, and the rise of modernism (→ Aesthetics; Propaganda, Visual Communication of). Popular opinion linking photographic realism with the assumption of accurate and transparent representation fostered its use by news publications, as well as natural scientists, and supported growth of the social and behavioral sciences. Social reform highlights were Jacob Riis's late nineteenth-century visual documentation of New York City slums and Lewis Hines's early twentieth-century investigation of child labor.

Institutional forces played a key role in the professionalization of photojournalism. This can be seen in the creation of cooperative → news agencies such as the Agency France Presse (founded in 1835 as Agence Havas), the Associated Press, Reuters, and United Press International; of organizations such as the Danish Union of Press Photographers (founded in 1912) and the National Press Photographers Association (1946); and of international picture agencies, such as Black Star and Magnum. The great picture magazines, such as the *Arbeiter-Illustrierten Zeitung* (1921), *Münchener Illustrierte Presse* (1924), *Life* (1936), and *Look* (1937), used high-quality printing techniques in black and white and eventually color to build mass appeal (→ Picture Magazines). The magazines were particularly influential in developing the picture story, or photo essay, a carefully designed layout of pictures, captions, and text. Influential *Life* editor Wilson Hicks (1952) believed word-picture combinations communicated better than either could alone. The picture magazines were largely responsible for the rise of such photographic stars as Margaret Bourke-White, W. Eugene Smith, and Robert Capa.

For much of the twentieth century, the term "photojournalism," attributed to University of Missouri journalism dean Frank Luther Mott, referred to reproducing still photographs in combination with words in print publications to report subject matter of immediate and significant interest to the public. Although the major picture magazines lasted only about four decades (except for *National Geographic*), specialty magazines and → books continued to publish photo-documentaries. As the twentieth century progressed and video journalism, information graphics, and digital media developed, they came to be grouped under the inclusive term *visual journalism*, which can also include editorial cartoons and multimedia packages with both still and moving images, graphics, and audio (→ Documentary Film; Television News, Visual Components of). This relatively new form, sometimes called *new media storytelling*, is characteristic of visual news dissemination on Internet sites, particularly as → newspapers commit resources to online versions (→ Internet News).

Increasingly, the twenty-first-century visual journalist must be skilled not only in making excellent digital photographs but also in combining both still and moving images with text and sound for electronic dissemination via media ranging from home computers to personal display devices. Print publications of visual reportage come and go, while → Internet sites such as digitaljournalist.com demonstrate the ease and cost-effectiveness of publishing full-color picture packages for worldwide distribution.

In some ways, this is a return to the “generalist” journalist of the mid-twentieth century, when word journalists were often expected to carry cameras to collect images for their stories (→ Journalism, History of). Although specialization prevails, those who can write, shoot, edit, and design have an advantage, especially during times of shifting economies, technologies, and audiences.

### KEY ISSUES

Despite, or perhaps because of, the ubiquity of images in mass media, photojournalists still find themselves asserting the reportorial power of authentic photographs over the misperception that pictures are best used to illustrate text and enhance layout. Contemporary analysis of the appropriate role of photography in news reporting founders on issues of truth and privacy under the general term *photojournalism ethics* (→ Image Ethics). On one end of the ideological continuum are those who argue that all photographs misrepresent reality because they are necessarily “mind driven,” human-motivated, minute slices of time, place, and action. Exacerbating those arguments are abuses of digital manipulation techniques. On the other end are those who argue, as did Andre Bazin (1961), that, because a photograph records the energy of light rays reflected from real-world subjects, photographs hold a referential trace (→ Realism in Film and Photography). Film scholar Laura Marks (1999) argues that “electronic images, like all of us, owe their material being to electrons and their associated waveforms,” continuing an interconnectedness with the physically real into virtual space. A related argument is that photographs – whether “straight” (not overtly manipulated) or purposefully altered – provide evidence of something: point of view, editorial judgments, or even the imagination of the image-maker or subject. Defenders of photographic truth also point to the ease with which ideas can be manipulated with words as a general argument for the need for journalism ethics.

Researchers approach the complexity of *visual truth* by examining both methodological and epistemological characteristics of a particular image or set of images. *Methodological* refers to technological and behavioral means of image production. Technologies include tools (cameras, lenses, means of recording light, and means of production and dissemination). Behaviors include not only events that garner visual attention (ranging from the subtlety of gesture through the complexity of war) but also the effects of individual differences on interaction between photographers and those observed, and on subsequent preparation of images for publication. *Epistemological* refers to content issues: what we say an image means. Image content is created, altered, and disseminated (behavior) with technology (→ Ethics in Journalism). Yet the meaning of that content is ultimately created, perceived, altered, disseminated, and forgotten or remembered by viewer minds influenced by the full range of contexts and human differences (→ Ethics of Media Content).

Of particular significance is the issue of the public's → right to know versus the right to → privacy. Here again, method and epistemology are interconnected. One methodological shift, for example, is toward professional use of images taken by nonprofessionals (the photos of prisoner abuse taken in Abu Ghraib, for example), whose images and videos are either picked up after major events and distributed via international agencies, or are posted on the Internet (→ Amateur Photography and Movies). A related shift is toward the use of images of lower technical quality – in part because of the ease of producing digital images with low-tech cameras and in part because lower-quality images may be perceived by an increasingly skeptical public as more authentic than images produced through technical expertise.

Another important shift is the effect of digital imaging on visual archives; film made archiving a matter of storing negatives and prints for later retrieval by fact checkers and historians. Digital images involve decisions to erase files and on how best to protect authenticity. Increased digital storage capacity and pixel-examination software are improving archival practices and image authentication routines. The growing use of → stock photography, fueled by digitization and online accessibility of image collections, such as the US Library of Congress and the British Museum, are systematizing image use.

Legal trends throughout the world vary. US courts, for example, increasingly demand that photojournalists turn over their recorded visual evidence, while courts in Japan increasingly honor journalists' rights to protect their sources. Organizational codes of ethics governing truth and privacy issues continue to be strengthened.

What has not shifted, however, is the commitment of the serious photojournalist to recording history in as authentic a manner as humanly possible. One need only recall the Holocaust to understand the consequences of not having reliable visual evidence readily at hand. Attempts to deny the occurrence and/or extent of the Holocaust eerily echo Orwellian prophesies of vested interests altering truth by erasing and rewriting – or repicturing – history (Brennen & Hardt 1999).

## Physical Effects of Media Content

Jürgen Grimm

University of Vienna

The physical effects of media content are understood as the direct influence of the media on the organism. This includes mainly processes of physiological arousal as well as emotional effects evoking joy or fear, a pleasant mood or stress.

Early one-dimensional arousal theories (Lindsley 1951; Duffy 1962) stated that physiological arousal comprises unspecific activation on which degrees of alertness of the organism are dependent. Schachter used this assumption for a *two-factor model of emotion* according to which → emotion results from the combination of arousal and → cognition (Schachter 1964). For Schachter, positive and negative emotion are identical on a physiological level and can be differentiated only by cognitive evaluation and causal attributions (→ Excitation and Arousal).

This concept left its mark on communication research and inspired a great deal of research on media reception (→ Exposure to Communication Content). Sturm et al. (1982) used a combination of physiological and cognitive measuring to explore the emotional involvement of children while watching TV. They found that the breathing amplitude while watching a filmic story varies systematically with the dramatic course the story takes and its evaluation as “pleasant” or “unpleasant.” This parallelism of physiological indicator (Physiological Measurement) and cognitive evaluation can be seen as a solid arousal–appraisal conjunction according to Schachter (→ Physiological Measurement; Appraisal Theory). The authors also found inconsistent results: the skin conductance level (SCL) rose continually without a clear connection to cognitive evaluation.

Zillmann used the Schachter concept as a basis for his excitation transfer model which plays an important part in media violence research (Zillmann 1971). The model states that residual arousal caused by an earlier filmic event leads to cognitive re-evaluation in a new situation and thereby to reinforcement of existing behavior (→ Emotional Arousal

Theory; Excitation Transfer Theory). For instance, hostile attitudes can be reinforced by highly arousing erotic content if the surrounding conditions (e.g., frustrating or annoying factors) stimulate aggressive behavior. On the other hand, it is possible to enhance helpfulness by showing frightening filmic material if the situation inspires pro-social behavior.

One problem of Schachter's theory and its practical applications in communication studies is that the variability of cognitive interpretation of arousal tends to be overestimated and there is often not enough distinction between different arousal indicators. Film reception experiments by Lazarus and his colleagues (1962) show that the skin conductance level indicates stressful film events. Heart rate and blood pressure, however, indicate motor activation or pleasant arousal. According to the two-arousal hypothesis by Routtenberg (1968) and further developments by Gray (1982). Gray argues for at least two different arousal systems that can, depending on the surrounding conditions for the individual, either enhance or obstruct each other. The *behavioral activation system* (BAS) prepares the organism for motor activities, e.g., in the context of fight or flight, and easily reacts to rewarding cues. The *behavioral inhibition system* (BIS) is stimulated by fear, and usually interrupts motor action and promotes cognitive activities (Fowles 1980). Both types of arousal can be influenced by cognition, but cannot be modified at will in any way.

With this concept in mind, the dissociation between the SCL (indicator for BIS) and heart rate (indicator for BAS) during the course of a dramatic filmic chase can be explained. In a viewer experiment (Grimm 1999), both arousal indicators ran parallel as long as a woman on the run (and with her the viewers) saw a chance of escaping several aggressive men (→ Experimental Design). When a few scenes later the men finally caught up with the woman and she realized the situation was hopeless, the viewers', and also presumably the victim's, BAS activities suddenly dropped while BIS arousal continued to rise. BIS thereby developed an obstructing function for BAS in order to protect the organism from useless and potentially damaging arousal and to make further cognitive operations possible (→ Emotions, Media Effects on).

Today, empirical research has shown that cognition does not only function as a subsequent attribute of arousal states, but also actively creates them. Zillmann (1988) proved that intentional exposure to media content can interrupt adverse moods and aggressive feelings. In dealing with frightening media content, the viewers use techniques of self-appeasement such as the affirmation "It's only a movie." In this way, unpleasantly high arousal levels can be regulated cognitively. On the other hand, people strive for arousal-inducing experiences to a certain extent in order to reach the arousal level that is suitable for them (Zuckerman 1979). "High sensation seekers" therefore prefer horror movies and pornography whereas "low sensation seekers" avoid intensively arousing movies (Zuckerman & Litle 1986). Buchsbaum & Silverman (1968) showed that a high level of arousal (BIS and BAS) is accompanied by higher cortical activity. According to this, "high sensation seekers" increase their cognitive arousal regulation together with the desired arousal intensity (→ Sensation Seeking). This leads to the assumption that the gratification of arousal-inducing media use is not only generated by the BIS–BAS activation itself, but also by the regulation of arousal. This view is consistent with the *emotion management concept* (Vitouch 1993; Grimm 2006) according to which frightening media stimuli are sought out to enhance fear control. This usually implies a strengthening of BIS in relation to BAS.

As a BIS-dominated activity, *television use* can have damaging effects on a long-term basis. Hill et al. (2003) showed in a longitudinal study that the intensive use of television correlates with lack of exercise (weak BAS) and obesity. The so-called “couch potato” effect can be seen as unwanted long-term effect of an otherwise efficient activity of excitement monitoring from a physiological point of view (→ Media Effects Duration).

Another rather underrated effect is the impact of heavy media use on the ability to concentrate. There is evidence that the continuous reception of fast shots and jump cuts in a movie may contribute to a state of enjoyable distraction, but will interfere with the ability to concentrate on something for a longer period of time (Christakis et al. 2004). Others, however, argue that television increases the speed of perception and thereby cognitive abilities.

# Physiological Measurement

*Andreas Fahr*

*Ludwig Maximilian University of Munich*

Psychophysiology is concerned with the physiological bases of psychological processes. For example, where psychologists are interested in why we like a certain TV program, physiologists are interested in the input–output of the cardiovascular system. A psychophysiologicalist attempts to link the two approaches. The study of the interface of mind and body is what makes psychophysiology most distinct.

Physiological processes here designate physical and/or chemical reactions or accompanying symptoms of human behavior, such as (changes in) cardiovascular activity (e.g., heart rate, blood pressure, peripheral blood volume), electrodermal activity (EDA, like skin conductance), neuroelectric activity (electroencephalography [EEG], such as alpha waves), muscle activity (electromyography [EMG]), body temperature, breathing, eye movements (electrooculography [EOG]), pupillary reflexes, reflexes (such as the blink of an eye), and many more similar processes.

Psychological reactions designate aspects of human behavior that can be expressed in the language of psychology. Here, the focus is primarily on the description, explanation, and prognosis of → information processing (cognitive aspect), experience (affective aspect), and behavior dispositions (conative aspect) of individuals (→ Cognition; Emotion; Affects and Media Exposure). The physiological reactions indicating reaching or leaving a psychological state are therefore described as psychophysiological indicators. Psychophysiological research identifies or manipulates behavioral, cognitive, or emotional states of subjects as the independent variable (for example, through instructions, picture or movie presentations, sensory irritations, etc.) and observes events on the physiological level as the dependent variable. Psychophysiological measurements must therefore be added to the method of → observation in most cases.

## THE NATURE OF PSYCHOPHYSIOLOGICAL MEASUREMENT

In contrast to data collection techniques such as → interviews, → surveys, or observation, psychophysiological data collection is considered more direct, immediate, and objective.

While other measuring procedures that accompany the reception – such as real-time response measurement (→ Real-Time Ratings [RTR]) – can influence the reception experience and information processing itself, psychophysiological processes are considered to be less reactive; they do not require the memory and/or the verbal abilities of the subjects. Hence, they do not interfere with message processing. At the same time, the reactions are scarcely controllable by the observed person. Psychophysiological measurement should therefore enable researchers to gain empirical access to the processing, experiencing, and responding of people that they cannot or will not voice or that is not accessible by other methods.

Emotional experience, for example, is for many people not easy to describe, and is frequently something we are not even conscious of. In addition, emotions are very volatile reactions, that later (for example, in a post hoc interview) are no longer remembered or cannot be described, or are remembered or described incorrectly or altered. Furthermore, the expression of attitudes toward people, advertising, topics, or other matters of opinion are frequently subject to the problem of social desirability or the distorting effects of impression management. Psychophysiological measurement helps to address these problems. These kind of measuring processes finally produce very scattered time-series data that allow the reproduction of the *process* of media reception and not only its consolidated result. In addition, they provide an excellent database for powerful time-series analysis.

### QUESTIONS OF VALIDITY

The main problem of psychophysiology, however, is how far physiological reactions can serve as valid indicators for the psychological concepts in question. Emotions should serve as a good example here because they represent an integrative concept of cognitive, affective, and motivational perspective on human behavior. For example, strong emotional reactions, such as anger or enthusiasm, routinely correspond with increased physiological arousal, which can be measured by changes of electrodermal activity. The valence of the reaction, however, cannot be read from the intensity of the activation, that is whether it designates a positive (happiness) or a negative (anger) emotion. Both emotions are connected with high activation.

Whether a stimulus is evaluated as pleasant or unpleasant depends on the cognitive evaluation or appraisal of that stimulus. Therefore one psychophysiological parameter alone is seldom a sufficient indicator for a complex psychological phenomenon. Newer findings of psychophysiology stipulate that emotion-specific reactions be indicated by the combined collection and evaluation of several physiological parameters. For example, against the background of circumplex models of emotions, the simultaneous recording of arousal *and* valence can serve as a clue for experienced emotions. While arousal is measured by means of electrodermal activity, valence can be collected via real-time response (RTR) systems, electromyography, or facial expressions.

The insufficient external → validity of psychophysiological examination is often considered a problem. Since the test subjects are closely monitored using numerous sensors and cables, the context is a highly artificial one and not comparable to normal media environments. In the mean time it has been shown that people adapt quickly to the

artificial situation and to most sensors in laboratory surroundings. The use of → television and the → Internet, especially, can be simulated comparably realistically in modern laboratories. Technical development has also contributed to the measuring instruments becoming smaller, more precise, more portable, and more robust. The measurement process therefore has become less intrusive, distracting, and irritating for test subjects.

## APPLICATIONS

In psychophysiology physiological phenomena are arranged, summarized, and interpreted in the context of psychological questions, and the complex empirical results integrated with our understanding of anatomy and physiology using a series of concepts. Activation concepts, → habituation models, stress reactions, and emotion theories are of especial significance in communication research. In communication studies psychophysiological concepts can be applied to attention and information processing, learning, emotional experience, (sexual) excitement, attitude (change) and persuasion, adaptation research, social cognition, and sleep research.

For example, within the scope of the *limited capacity paradigm* it can be shown that an average activation level supports information processing optimally and therefore results in the best learning performances (→ Limited Capacity Model). Activation concepts in communication are referred to in → *mood management theory* and → *excitation transfer theory*. Psychophysiological indicators such as excitement here serve as indicators or causes of media selection and effects of media reception. People therefore generally appear to strive for an average excitation level (→ Excitation and Arousal). In these contexts electrodermal activity is a very reliable measure of activation or arousal. It is widely used as an indicator for psychological concepts like attention, task significance, or affective intensity of stimuli experienced by the subjects. Studies have shown that EDA is also highly correlated with self-reported emotional arousal.

Beyond activation, there are several more physiological indicators for different kinds of psychological processes. Orientation reactions are reactions that prepare an organism for reaction to a new stimulus. These *orienting responses* correspond with a reduction of heart rate, an increase in skin conductance, an increase in muscle tension, pupil dilation, constriction of peripheral blood vessels, expansion of the blood vessels in the brain, as well as alpha blockage (short blockage of the alpha brain waves). However, when a stimulus becomes too intensive, a *defense response* is triggered, which represents a complementary reaction to the orienting response and is supposed to protect the organism from excessive stimulation.

The pattern of psychophysiological reaction also complements the orienting reaction. It is linked to cognitive avoidance reactions. The so-called *fear response* appears at sudden appearances of stimuli and is displayed physiologically by an increased blinking reflex, an increase in the heart rate, an expansion of the brain blood cells, and an increase in skin conductance. A similar theoretical systematization differentiates between physiological systems of response activation (behavioral activation system), behavioral inhibition (behavioral inhibition system), and emergency reaction (fight/flight system). Behavioural activation is caused by fulfilled expectations and positive feelings; behavioral inhibitions are caused and accompanied by dissonance experiences, which also evoke information

collecting processes (→ Cognitive Dissonance Theory). Selective attention or the blocking of nonrelevant stimuli is accompanied by an increase in heartbeat frequency and higher heartbeat variation. Active stimuli absorption, however, can be accompanied by a decrease in heartbeat frequency. Coordination performances involve frequent changes between heartbeat acceleration and delay. These concepts and measuring processes are applied primarily in media information processing in reception research (selection, exposure, retention), and adaptation research in media use and media education (→ Selective Exposure; Selective Perception and Selective Retention; Exposure to Communication Content).

Within the scope of the *research on social cognition*, → attitudes, or → persuasion it can be shown that electrical activations of certain facial muscles (facial EMG, especially movements of the *corrugator supercilii* [brow] muscles and *zygomaticus major* [cheek] muscles) co-vary with evaluations of actors shown on television. These individual vegetative accompanying reactions are instinctively perceived as emotion of a certain color by observers and again form the foundation for the evaluation of the persons shown (compare facial feedback theory of emotions). Facial EMG can therefore identify subtle reactions to emotional media that are not perceptible using the facial expression coding methodology (e.g., the *facial action coding system* (FACS) developed by Paul Ekman and Wallace Friesen (Ekman et al. 2001)).

Furthermore, the magnitude of the blinking reflex – which can also be measured via facial EMG – varies linearly with affective valence: blinking is more pronounced in response to unpleasant stimuli, compared to pleasant stimuli. In addition, the activity of the *oricularis oculi* muscle is elevated for arousing versus neutral sounds. It must be noted that facial EMG is not able to discriminate between very subtle differences in emotional valence that are often present in media messages. Compared to self-report, however, facial EMG measures discriminate more effectively between emotional responses, e.g., in television advertising. Furthermore, there are indicators within the context of the psychology of emotion that clear and distinct cardiovascular reactions can be shown for discrete emotions, such as anger, fear, and sadness (→ Facial Expressions; Nonverbal Signals, Effects of).

There are currently very promising developments in the field of *brain imaging techniques*, including positron emission tomography (PET) and functional magnetic resonance imaging (fMRI). These (very expensive and complex) measures use the diversity of the signal intensity in brain tissue in psychophysiological communication research. Through fMRI, it is possible to make visible metabolic processes that accompany brain activities. Since the activity of certain brain regions corresponds with certain psychological correlatives (such as emotions), emotions experienced by a test subject when observing medial stimuli can be identified. There are pilot studies especially in the area of advertising, violence research, video game studies, etc.

In general, perhaps the most important aspect of the psychophysiological approach to psychological phenomena is the attempt to understand the physiological mechanisms that mediate between cognitive and emotional events. There are currently four main trends in psychophysiological communication research: (1) Measuring processes are becoming more precise and can increasingly be used in mobile settings. (2) Various psychophysiological parameters can be measured simultaneously and submitted to pattern recognition. In addition to the increased accuracy of measurements, advanced statistical analysis of recorded data is becoming more and more important. (3) The

significance of the analysis of media content processing allows for data to be collected over time which leads to more accurate study of time processes. (4) Continuing use of the three systems approach to brain behavioral relations, i.e., the integration of physiological data with verbal reports and overt behavior study.

## **Picture Magazines**

*Hanno Hardt*

*University of Iowa*

The development of picture magazines is a twentieth-century phenomenon, aided by print technologies that offered quality reproduction of photographs in large numbers and in a short time, like rotogravure, which had yielded high quality reproduction using a single plate for type and photo since 1910 (→ Magazine, History of). Earlier, photographs had been used for wood-engraved illustrations in many magazines, including the *Leipziger Illustrirte* (Germany, 1843), *L'Illustration* (France, 1843), *Illustrated London News* (UK, 1842), *L'Ilustracion* (Spain, 1849), the *Saturday Evening Post* (USA, 1821), *Frank Leslie's Illustrated Newspaper* (USA, 1855), *Harper's Weekly* (USA, 1857), and the *Weekly Illustrated of India* (India, 1880). The *Canadian Illustrated News* (1869) featured a half-tone on its first cover, only a few years after the *Illustrated London News* (1842) had been launched with 32 woodcuts on 16 pages.

Picture magazines constituted windows to the world for millions of readers in all parts of the world, who became eyewitnesses to human and natural tragedies, visitors to foreign places, and participants in the explorations of the universe. The heyday of modern picture magazines was the 1920s and 1930s, when they emerged – accompanied by the success of moving pictures – as important global manifestations of an expanding visual culture (→ Cinema). Picture magazines are the result of an enterprising worldwide use of photographs as a means of public communication (→ Photojournalism). Large circulation figures – from 300,000 copies a week for the *Illustrated London News* (UK) in 1863 to 6.2 million copies a week for the *Saturday Evening Post* (USA) in 1959 – document the rising popularity of the picture magazine over a 100-year period. Beginning in the late 1950s, advertising expenditures and reader attention shifted to television and brought about an identity crisis among picture magazines. Argentina, for instance, lost half of its magazine circulation between 1998 and 2004. The result was a new focus on specialized interests, like fashion or sports, e.g., *Sports Illustrated* (USA) was launched in 1954 and the *Sunday Times Magazine* (USA) has appeared since 1962.

When picture magazines emerged fully in the 1920s, they relied on the aesthetics of innovative photographic practices, which were the product of cultural and political processes in Europe, Latin America, and Asia, where photography had captured the imagination as a new language of public conversation (→ Photography).

## EUROPE AND THE US

In Europe, for instance, the art movements *Neue Sachlichkeit* and social realism, particularly, helped shape magazine photography as an expressive documentary tool, demonstrated in the Soviet Union and Germany by the rise of a radical aesthetic and by the recognition of the factual as a central professional interest. Thus, photographers associated with *Novyj Lef* (Left Front of the Arts) magazine and *USSR in Construction* (USSR, 1930) recognized that the new challenges of daily life required a new form of representation. Their work appeared in political magazines, like *Molodaia Gvardiia* (Young Guard) or *Vestnik Truda* (Herald of Labor) to cater to the working class, thus suggesting a merger of avant-garde photography into mass culture, resulting in a sophisticated, expressive visual coverage of events. In Germany, the connection between art and photography resulted sometimes in a complex, new way of looking at familiar objects, like in *Der Querschnitt* (Germany, 1921), where photographs with different meanings were reproduced for effect.

Innovative layouts contributed to the new look of picture magazines, not unlike in *La Vie au Grand Air* (France, 1898), a sports magazine, which was known for its unique layouts, photomontage, and inset images. *Vogue* (USA, 1892) published the first bleed edged photo in 1930, a style common in Japanese magazines, and featured the first full color photograph on its cover in 1932. While sizes have varied greatly among picture magazines over the years, an innovative, small (A5) format, known as the handbag or travel format, was introduced by *Glamour* (1939) in 2001, followed by *Cosmopolitan* (1885) and *Elle* (1985) in 2004. *Vu* (France, 1928) dedicated much of its content to photojournalism, made use of art photography, and used montage effectively, challenging the traditional *L'Illustration* (1843); the latter became *Paris-Match* after 1949 and is

known for its photographic scoops. In addition, single images were fashioned into longer narratives with the development of the picture story – a sequencing of images not unlike a film clip – claimed and popularized in the late 1930s as the photo essay by *LIFE* magazine (USA, 1936). However, German picture magazines, like the *Berliner Illustrierte Zeitung* (1892), the *Münchener Illustrierte Presse* (1924), and the *Arbeiter-Illustrierten Zeitung* (1921), had developed this genre since the mid-1920s as a regular feature. Their visual narratives competed with the visual attraction of movie house offerings and replaced the use of photographs as mere illustrations of texts (→ Newsreel).

Picture magazines responded generously to public demands with a steady stream of pictures and texts, providing the modern context for societies driven by the desire to understand the world through the consumption of photographic images. Picture magazines produced national identities as they became a major source of visual evidence – next to film – until the advent of television. They depicted the familiar and the exotic, realizing the potential accessibility, diversity, and durability of their representations of reality. The impact of picture magazines, with their emphasis on photographic reportage, coincides with the crisis of the word in Europe. Considerations of language as signs of class, authority, or expert knowledge become suspect, until abandoned for the alternative of the image and its inherent claims of objectivity. Yet, the result was always an ideologically charged visual reproduction of the world, which fit the respective editorial visions of reality.

The emerging strategy among European and US publishers to reinforce the dependence on the picture as explanation included the use of a single image on the front page of the magazine, the inclusion of a serialized novel, and a low price (→ Magazine, Visual Design of). Also, the availability of photographs encouraged the production of glossy weekly newspaper supplements, which offered a visual interpretation of culture and politics in competition with picture magazines for advertising and readership. With the establishment of picture magazines and weekly supplements came the rise of professional staff photographers, who complemented or replaced the work of photo agencies (→ News Agencies). The latter, like Mauritius, Dephot, and Weltrundschau in Weimar Germany, or Black Star in the United States, initially had accounted for much of the magazine content, e.g., when *LIFE* magazine was launched in 1936, followed by *Look* a year later, Black Star was a major supplier of photographs. Earlier, the Associated Press (USA) had also become a distributor of photographic material – in Germany it had absorbed Pacific and Atlantic Photos in 1931. At the same time, picture magazines reached across cultural and political borders for photographic material – photographs have been sent by wire since 1923. *The Graphic* (UK, 1870), and later on the *Picture Post* (UK, 1938), used German photographers on a regular basis. Likewise, many contributors to Black Star were German émigré photographers, whose work would subsequently appear in *LIFE* magazine, demonstrating the cross-cultural appeal of topics or styles of photographic representation. In 1947, the picture agency Magnum (Paris) was founded, serving publications worldwide while protecting the rights of photographers to their work.

## LATIN AMERICA

In Latin America, where most readers buy their magazines at newsstands, picture magazines are popular sites of fotonovelas, fictional versions of the traditional photo

essay as storytelling, or a variation on movies, which appear serialized each week. In addition, celebrity magazines like *Caras* (Brazil, 1994) and the current affairs magazine *Veja* (Brazil, 1968) boasted large circulation figures. Photography had been well established early on in most Latin American societies and played a major role in the identification and definition of nation and peoples as documentary photography went beyond magazine coverage. *Revolución* (Cuba, 1959) became the picture magazine of the Cuban revolution; similarly, the picture coverage of *Drum* (South Africa, 1961) served black readers to help anticipate freedom from an apartheid system. In Mexico, the short-lived *Rotofoto* (1938), a provocative picture magazine, was highly popular with its coverage of politics; later on, *Hoy* (1937) and *Mañana* (1942), joined by *Siempre!* (1953), dictated the performance of the illustrated press until the advent of television in the 1950s, when newspapers began to replace picture magazines as print sources of visual information.

## ASIA

In Asia, the beginning of picture magazines coincides with the influence of European and American photographic practices. In Japan the publication of *The Far East* (1870) was followed by *Datsuei Yawa* (1874), later known as *Shashin Zasshi*, which featured hand-mounted photographic prints; the oldest illustrated women's magazine, *Fujin-Gaho* (1905), reproduced photographs, and *Asahi Graphic* (1921) was the first rotogravure-produced magazine. Korean photographers had published *Hankook-sajin-hoebo* in Seoul and Incheon since 1904; about 40 years later, the first picture magazine after the liberation from Japanese colonial rule was *Kookje-bodo*. In China, the first picture magazine, *Dianshi zhai Huabao*, appeared in 1884 in Shanghai, established by Ernest and Frederick Major, while in India, the *Illustrated Weekly of India*, a *Times of India* weekly edition, appeared in 1880. After the 1980s period of reforms in China, documentary photography has found a home in glossy, illustrated magazines, which have begun experimenting with the popularity of pictures and topics dealing with human conditions and the urban landscape. *People's Photography* (1983) became the first professional magazine addressing the potential of photography as a language of enlightenment in China.

Culturally distinct and ideologically varied in their approach, contemporary picture magazines continue to construct visions of reality, but unlike during the 1920s and 1930s, they rarely use the work of avant-garde photographers or feature experimental work to reflect on the world (with occasional exceptions in advertising.) Instead, form and style in photojournalism tend to create a universally shared view of people and events, reinforced by the use of international picture agencies or the widespread circulation of some western magazines (→ Stock Photography). Finally, with art books and museums recovering documentary and/or journalistic work, picture magazines have also become conduits of photojournalism as art (→ Art as Communication).

## **Piracy**

*Ronald V. Bettig*

*Pennsylvania State University*

The origin of the term “piracy” dates back to the thirteenth century when rogue seamen who intercepted merchant and military vessels to rob them of their cargo were known as “pirates.” In the early eighteenth century, the term took on a new meaning, referring to the unauthorized use of intellectual property. Images of the swashbuckling pirate are still reproduced in → popular culture today: in movies (→ Film as Popular Culture), → television programs, romance novels, and theme parks. By the late 1900s, the term had been loosened from its original meaning and become the primary descriptor of the unauthorized use of copyrighted works, patents, and trademarks (→ Trademarks in the Media; Copyright). By the early years of the twenty-first century, the most common usage of the term piracy had come to signify unauthorized uses of intellectual property via the → Internet and sale of CDs, DVDs, and computer software on the black market. While seafaring pirates pilfered material property to keep or resell, piracy of intellectual property involves the infringing appropriation of immaterial goods, including creative and intellectual works.

The distinction between piracy of material goods and that of intellectual property is essential to the understanding of the term “piracy” and its actual practice. The theft of material goods deprived the owner of cargo or land that could not be recovered without force. However, the distinctive feature of the theft of immaterial goods, such as intellectual and artistic creativity, is inherent in the nature of the product, which is easy and cheap to reproduce. Copyright law created a dichotomy between an “idea” and its “expression,” the former being unprotected by → intellectual property law and the latter protected by its

embodiment in tangible form. Thomas Jefferson wrote of ideas and informational goods as eminently sharable, comparable to lighting another person's candle from one's own, giving the other light but not leaving oneself in the dark. Jefferson was referring to what economists now call "public goods," which allow joint or nonrival consumption by all potential consumers. The costs of producing a → book, film, or recording are primarily incurred during the production of an original text. After that, the costs of reproducing copies drops significantly and the text becomes prone to piracy. This is why, under capitalism, state intervention to protect intellectual property became essential.

The *function of intellectual property law* therefore is to protect artistic and intellectual creativity from those who make unauthorized copies at the expense of both the actual creators and the owners of the means of communication and production. The latter ultimately decide what gets produced, and this involves the transfer of intellectual and artistic works to capitalists who control the systems of production and distribution. In Marxian terms, the labor of the artist, intellectual, or inventor is appropriated for the purpose of making a profit, and the actual creators end up being exploited by the appropriation of their work. Like factory workers, intellectual and artistic workers are not compensated for the value of their work; the factory worker puts in eight hours of labor but is paid for only six. The remainder is profit for the capitalist, meaning that piracy actually begins at the level of production and then moves to the level of unauthorized reproduction.

*Media piracy* began with the rise of the book publishing industry after the invention of movable type. European governments sought to control book piracy through the licensing of printers to help promote the development of an infant industry (→ Printer-Editors). In return, printers and publishers agreed not to publish seditious or heretical works. However, the monopoly prices and profits earned by licensed book publishers inspired literary piracy by unlicensed entrepreneurs seeking a share of the industry's fortunes. This began a trend rooted in the structure of capitalism involving conflicts between big and small capital over unauthorized use of intellectual property, battles waged primarily at the industrial level. In addition to books, small capital pirated vaudeville acts, motion pictures, and musical recordings on a regular basis. At the same time, the United States sought to protect copyrights and patents held by national industries while refusing to grant protection to foreign works and inventions until the late nineteenth century.

The infringement of intellectual property protected by copyrights and patents grew more intense as the means of communication evolved. Struggles over the control of copyrights and patents at the industrial level were waged between oligopolies and peripheral firms engaged in various forms of intellectual property. By the mid-twentieth century, *new communications technologies* opened the doors to unauthorized reproduction of copyrighted works in the home and the office (→ Technology and Communication). Starting with the introduction of reel-to-reel tape recording and photocopying, intellectual property owners began to lose control over the uses and users of their works. The trend accelerated with the development of music cassette tapes and then the introduction of the VCR in the mid-1970s. While new home and office technologies generated piracy on a mass scale, industrial piracy of music and movies became a problem for intellectual

property owners on a global scale. At the start of the twenty-first century, the unauthorized reproduction of copyrighted works – computer software, recorded music and movies – became rampant, especially in China and Russia. As the major exporter of intellectual property, the US turned to international forums such as the World Trade Organization to combat global piracy.

In the late 1990s intellectual property owners faced a new front in controlling their works – the *Internet*. The → music industry was the first to face infringing uses of its property. First, central servers such as Napster made the piracy of music cheap and easy. The music industry was successful in shutting down Napster, but by then Internet users had begun to use peer-to-peer systems to share music files to engage in copyright infringement. The copyright industries (software producers, music companies, and movie studios) fought piracy using litigation, legislation, digital rights management, and marketing to protect their intellectual property. Their efforts have begun to pay off with services such as iTunes and video on demand. The logic of capital and the logic of intellectual property go hand in hand, despite Jefferson's reminder that the sharing of information and culture could spread light (→ P2P Networking; Communication Law and Policy: North America).

## **Planned Behavior, Theory of**

*Joseph N. Cappella*

*University of Pennsylvania*

The theory of planned behavior (TPB) is one of a class of related theories of behavior change. The theory was developed by Icek Ajzen (1985, 1991) as an extension of the theory of reasoned action (TRA; Fishbein & Ajzen 1975; → Reasoned Action, Theory of), itself a model of behavior change. The TRA originated as a solution to the problem of attitude–behavior correspondence (→ Attitude–Behavior Consistency). In brief, the problem is the commonly observed fact that people can have attitudes toward a behavior that are favorable or unfavorable but not act on those attitudes in a consistent way.

## **FORERUNNER: THE THEORY OF REASONED ACTION**

To understand the importance of the TPB requires understanding of how the TRA solves the problem of attitude–behavior correspondence. As part of the solution, Martin Fishbein and Icek Ajzen introduced the concept of intention as a mediator of attitudes and behavior. When a behavior is under volitional control – that is, when a person can readily enact a behavior or not – then the intention to carry out such a (volitional) action will lead to that behavior under certain circumstances. The TRA initially is restricted to volitional behaviors with behavioral intentions mediating attitudes and behavioral response.

To insure correspondence among attitudes, behavioral intention, and behavior requires behaviors that are carefully defined and that there is correspondence across the three. The behavior must first be well defined. For example, losing weight is not a behavior – it is, instead, a goal. The goal of losing weight might be achieved in many different ways, such as “my exercising vigorously at the gym for 30 minutes three times per week starting this week.” Definitional correspondence requires matching in time, action, context, and target. The action is exercising vigorously for 30 minutes three times per week; the time is this week; the context is “at the gym”; the target is my behavior, not the value of people exercising more generally. By defining behaviors precisely and not confusing behavior with general goals, intentions can be defined precisely. When matched in this level of specificity, behavior and intention will tend to correlate strongly.

This fundamental development in the conceptualization and measurement of behavior along with the introduction of a corresponding conceptualization of behavioral intention sets the stage for the solution of the problem of attitude–behavior correspondence by inserting behavioral intention between attitude and behavior. The TRA then turns its attention to accounting for behavior by accounting for behavioral intention.

In the TRA, behavioral intention is determined by two broad factors – cognitive and social. Cognitive factors are → attitudes toward the behavior, again carefully matched in level of specificity to maximize the association with intentions to carry out the behavior (→ Cognition; Cognitive Science). Social normative factors are the perceived pressures that a person feels from significant others to engage in the behavior. These two classes of predictors are the attitudinal and social normative routes to the formation of intention.

The chief conclusion from the TRA, the core for the more general TPB, is that attitudes toward the behavior and social normative pressure will predict behavioral intention and ultimately behavior when the behavior is well defined and when the theory’s concepts are matched in level of specificity. Cumulative studies of the associations between attitudes and behavioral intention and between behavioral intention and behavior show considerable consistency when there is a match in level across concepts (Kim & Hunter 1992).

The attitudinal and social normative routes to intention in turn employ subjective expected utility functions from economics and the psychology of decision-making (Arrow 1951) to account for attitude toward the behavior and for social normative pressure. Specifically, attitudes, and perceived → social norms are, themselves, functions of underlying beliefs – about the outcomes of performing the behavior in question, and about the normative expectations of specific referent groups. Thus, for example, the more one believes that performing the behavior in question will lead to “good” outcomes and prevent “bad” outcomes, the more favorable is one’s attitude toward performing the behavior.

Similarly, the more one believes that specific others think one should (or should not) perform the behavior in question, and the more one is motivated to comply with those specific others, the more social pressure one will feel (or the stronger the subjective norm) with respect to performing (or not performing) the behavior.

## **DEVELOPING INTO THE THEORY OF PLANNED BEHAVIOR**

### **The New Element**

The core of the TPB is the TRA. The TRA assumes that behavior is the result of the information people have – correct or incorrect – about good and bad consequences of the behavior for themselves and what others think they should do.

As a theory of volitional behavior, the TRA focuses on behaviors that are under the control of actors through their own agency. For example, exercising at the gym tonight is generally under a person's control and so is volitional. However, if the person requires transportation to the gym and their car is in the mechanic's shop, then the intention to go to the gym depends on factors outside of the person's immediate control. Although walking and mass transit are possibilities, they erect barriers to the realization of intention. The behavior is no longer completely under volitional control but depends in part on the perception of how controllable the behavior is.

The TPB holds to the core of the TRA but extends it to include *perceived behavioral control* as a predictor of behavioral intention parallel to the attitudinal and social normative routes. Perceived behavioral control is how easy or difficult the performance of the behavior is perceived to be. Perceived behavioral control is related to the concept of self-efficacy introduced by → Bandura (1977) and is also a measure of the available resources, opportunities, and skills necessary to undertake a behavior. Perceived behavioral control functions as a predictor of both intention and behavior within the TPB and, like attitudes and subjective norms in the TRA, is itself a function of control beliefs and the perceived power of those beliefs to affect the outcome. So, even if I believe that going to the gym regularly and exercising will improve my physical appearance and believe that my significant others want me to go to the gym regularly, perceived difficulties with mass transit may lead me to avoid the gym, marking this behavior as less under volitional control. Research summaries in various contexts have shown that perceived behavioral control adds substantial explanatory power to the prediction of behavioral intention (Ajzen & Albarracín 2007).

### **Empirical Value**

Two characteristics of a consequential theory are its ability to predict and its generative capacity. The TPB and its variants – including the TRA and the integrated model of behavior change (Fishbein 2000) – have generated thousands of published studies in their 35-year history. These studies have focused on topics as diverse as politics, consumer behavior, exercise, safe sex practices, smoking, → video games, and shoplifting, among many others (Eagley & Chaiken 1993; Ajzen & Fishbein 2005). The TPB has been a rich theory for researchers, having wide applicability in diverse contexts.

The theory has also been powerful in its ability to predict behavior. As Ajzen noted in a reflection on the theory's origins (Ajzen & Albarracin 2007), it was designed in part to move beyond the weak predictive capacity of dispositional theories in psychology. When the theory is implemented appropriately, substantial variation in intention is explained by the three routes to behavioral intention even in special populations (e.g., adolescents) and with socially undesirable behaviors (e.g., drug use intention).

### **Applicability in Communication**

The TPB and its variants are theories of behavior change but have considerable influence in research problems in communication and persuasion. They help campaign designers answer the question: "What approaches, topics, and beliefs should my campaign messages target?" (→ Development Communication Campaigns; Election Campaign Communication; Health Campaigns, Communication in; Population Campaigns). The three routes to behavioral intention identify three different ways that → persuasion can occur – by manipulating attitudes, social norms, or perceived behavioral control. In turn, these components are based on underlying behavioral beliefs, normative beliefs, and control beliefs that can be targeted in the design of persuasive messages. Which route to choose in a particular case and which beliefs to target depend on conducting formative research with the behavior and with the target population.

In addition to locating the possible routes to persuasion for the given behavior and target population, the TPB also suggests that specific beliefs or particular routes to persuasion can be made more salient by communication campaigns that target those beliefs (Cappella et al. 2003; Fishbein & Yzer 2003). The TPB does not assume that the three routes to persuasion are equally strong. Communication campaigns can emphasize one route to intention rather than another or one behavioral belief rather than another in order to make it more salient. If a campaign primes a route or belief, then that component could play a stronger role in subsequent behavioral intention by having a greater weight during decision-making (Fishbein & Yzer 2003). Thus, the TPB guides communication campaigns and persuasion in two important but complementary ways – persuasion that changes a belief and priming, which makes a belief more cognitively salient (→ Priming Theory).

The TPB and its variants guide researchers to routes to persuasion and to beliefs to target in persuasive efforts but they do not tell us how to design messages or other interventions to achieve these changes. Other theories complementary to the TPB need to be consulted in the message design phase (Cappella 2006). In this sense, the TPB does not compete with theories of attitude change (e.g., the → elaboration likelihood model) or with → information processing theories but answers questions about behavior change that these theories are not able to ask.

### **Criticism**

A theory as productive and time-tested as the TPB is not without its criticisms. These have included the role of affect, causality, sufficiency, habit and past behavior, the nature of the routes to intention, and rationality. These issues are summarized in Eagley and

Chaiken (1993) and considered in several other places (Ajzen & Fishbein 2005; Fishbein 2007). Even if one acknowledges some theoretical challenges, the TPB and its cousins have had profound effects on the study of human behavior and on the design of communication campaigns and interventions. Few theories have had the staying power, influence, and predictive success of the TPB.

# Planned Social Change through Communication

*Douglas M. McLeod*

*University of Wisconsin-Madison*

Planned social change is the result of an intervention by a change agent (an individual or organization that seeks to induce change) in order to transform the nature of human communities, most often as a response to some perceived problem such as health risks, environmental crises, political instability, economic hardships, underdeveloped infrastructures, and recovery from natural disasters. Thus, there are a variety of contexts in which planned social change is practiced including → health communication, political transformation, crisis management (→ Crisis Communication), technological innovation, and → modernization. Across each of these areas, the predominant goal is to improve the quality of life and the standard of living within a given social system. Ostensibly, the goal of planned social change is the betterment of society, though there may be no consensus on which goals of the campaign are most important and indeed whether they are socially desirable at all.

Most planned social change campaigns can be divided into *three basic phases*. First, there is a planning stage in which all relevant situational information is assessed and strategies are formulated. Second, there is an implementation phase in which campaign strategies are put into action. Finally, there is an evaluation phase in which the performance of the campaign is assessed so that future campaigns can benefit from lessons learned. Successful campaigns rely on extensive research during each of these stages.

The mass media are often a crucial tool in the hands of change agents by transmitting information, setting the public agenda, and mobilizing the public (→ Agenda-Setting Effects; Agenda Building; Social Mobilization). A major issue in the research literature on social change campaigns is how to maximize the effectiveness of mass media in the change process. Among the keys to the successful use of mass media are creating messages that resonate with the intended → audience, and placing messages efficiently by targeting the most likely prospects for inducing change, and avoiding the already converted and change-resistant members of the audience.

Evaluations of past social change campaigns indicate that significant long-term, desired change is extremely difficult to achieve. Moreover, variance in effectiveness across different campaigns suggests that the complex situational constraints that regulate success make each case unique. The effectiveness of planned social change campaigns depends on a variety of factors including the cultural compatibility of the goals, strategies, and tactics of the campaign, the quality of research and planning, the availability of necessary resources, the salience and efficacy of campaign messages in the media environment, and the lack of resistance from community institutions, opinion leaders and the public at large (→ Population Campaigns; Health Campaigns, Communication in; Development Communication Campaigns).

## **INTELLECTUAL AND SOCIAL CONTEXT OF PLANNED SOCIAL CHANGE**

Perhaps more so than any other area of communication research, planned social change research represents a dramatic mix of basic and applied research (→ Applied Communication

Research). It also brings together researchers interested in the psychological processes involved in regulating social change in individuals and those interested in more macro-sociological processes related to improving society such as patterns in the distribution of information, knowledge, resources, and power.

At the heart of the planned social change process are such basic theoretical concerns as education, motivation, and → persuasion. Each of these processes has been used by planned social change campaigns as both antecedents and consequences. For example, campaigns may target learning, motivation, and attitude/behavior change outcomes. Alternatively, learning and motivation may be key antecedents (mediators) to producing changes in attitudes and behaviors. In turn, changes in individual attitudes and behaviors may be key milestones on the path to the betterment of communities. Driven by the desire to maximize the power and positive outcomes of social change programs, practitioners have traditionally been very concerned with developing and testing underlying theories. By the same token, social change campaigns are concerned with applied outcomes, testing actual effects in real-world settings. In other words, planned social change projects tend to be *theory-driven and research-evaluated*.

Another characteristic of planned social change is an *implicit assumption about the pro-social benefits* of potential campaign effects. That is, in most cases, those involved in planned social change campaigns often assume that if the campaign is successful, society and the individuals that comprise it will be better off. There are value-laden decisions involved in the design and implementation of planned social change. The degree to which the larger community is in consensus regarding the social desirability of the goals and decisions of the campaign is likely to vary widely.

Research on planned social change is by nature an *interdisciplinary endeavor*, both historically and contemporaneously. First, historical contributions to knowledge in planned social change have come in virtually all social science disciplines (as discussed below). Second, contemporary research evaluating the effects of large-scale, planned social change campaigns often involves researchers from multiple disciplines, for example, the Minnesota Heart Health Project (MHHP), which was a community-based campaign designed to promote heart-healthy behaviors among citizens in three experimental Minnesota communities. The project, which ran from 1980 to 1993, brought together researchers from communication, psychology, sociology, social work, marketing, biostatistics, epidemiology, and medicine.

Strategic campaigns for social change are likely to be extremely *resource-intensive* in terms of the staffing, research, and media costs of developing, implementing, and evaluating the campaign. As such, most large-scale campaigns are dependent on government and private foundation funding. This means that such campaigns are more likely to be top-down and to reflect interests consistent with these institutions. Though such campaigns are likely to espouse elite values, many of the problems they address have the most adverse effects on the poor who may often be the beneficiaries of social change. Moreover, not all campaigns are conducted by organizations with access to copious resources. Grassroots organizations can be successful in engaging in planned social change; however, it is likely that the scope, objectives, and tactics will have to be more modest in order to reflect their relatively limited resources.

In response to these concerns, more recently, some have argued for a different approach, community-based participatory research (CBPR) where, ideally, the community is an equal

partner with the researchers from the defining the problem to the execution of the study, interpretation of the data and dissemination of the research. Whether CPBR, in practice, produces more sustainable outcomes requires more empirical work (→ Participatory Action Research).

## MAJOR DIMENSIONS

The important dimensions of planned social change can be organized according to Lasswell's (1948) model of the communication process: "Who says what to whom through what channel with what effect" (→ Models of Communication; Lasswell, Harold D.)

### Who? The Change Agents

Those who initiate planned social change campaigns are known as change agents, which most frequently consist of government agencies, political parties, businesses, academic researchers, health communication professionals, interest groups, nonprofit organizations, and social movements.

When change agents and the communication messages that they produce come in contact with the target audience, campaign effectiveness may be reduced if the audience perceives them to be external to the culture they are trying to change. As such, most campaigns engage local change agents for points of contact with the target audience.

### What? The Content

This dimension focuses on the messages of the campaign. Understanding the important components of successful messages involves invoking bodies of knowledge drawn from applied academic research and professional experiences from the fields of advertising and public relations. For instance, campaign messages must be both attention-grabbing and memorable to cut through the clutter of the thousands of persuasive messages to which targeted individuals are exposed on a daily basis (→ Attention; Selective Attention). There are other content choices as well that must be made on the basis of a thorough situation analysis. Should the campaign use rational, information-based appeals or more evocative emotional appeals? In part this depends on such factors as the amount of information that the audience needs in order to make decisions, the difficulty of gaining the attention of the audience, and the degree to which targeted audience members are motivated to process information.

Advertising also contributes different templates for the types of messages that might be successful in different situations such as humor, guilt, fear appeals, narratives, exemplars, and frames among others (→ Advertising; Advertisement Campaign Management). Fear appeals are likely to be particularly useful in social change campaigns, as they often communicate negative sanctions for not complying with the recommended attitude and/or behavior change. A variety of models have been proposed to account for the *effectiveness of fear appeals* (e.g., the fear drive paradigm, the protection motivation model, the threat control model). Among the factors that these models contribute are the believability of

the fear appeal, the perceived likelihood that failure to follow the recommended behavior will lead to negative consequences, the perceived likelihood that the recommended behavior will prevent negative outcomes, and the perceived personal efficacy of following the recommended course of action. There is also a general consensus regarding the appropriate level of fear used in messages – it should not be so weak that it has no effect, but not so strong that it overwhelms the target audience or motivates counterarguing and other discounting strategies.

The practice of → *public relations* has contributed knowledge on how to extend campaign resources by using strategies to engage the news media to cover stories that will advance campaign goals. Not only does good news coverage contribute free publicity, but it may also add credibility to the message. For example, campaigns to ban smoking in public places may benefit from news stories about the potential harms of second-hand smoke. To get news media attention, events and messages must be constructed to conform to the demands of → news values and practices (→ News Routines; News). For instance, they must fit media definitions of what constitutes a good story and must be packaged to fit media conventions in terms of content and timing.

Not only can news content be used to reinforce a campaign, but *entertainment programming* may be engaged as well. An “entertainment-education strategy” may be used to embed messages in entertainment programs for transmitting information to stimulate change through storytelling (→ Entertainment Education). For example, Mexican → soap operas have been used to transmit messages about the importance of family planning, responsible parenting, and literacy. Entertainment programming has many advantages over traditional media for inducing change. Entertainment media are ubiquitous and emotionally evocative; they are valued, if not revered, by their audience. They are vivid and demonstrative. Finally, their intentions are less likely to be recognized and discounted by the audience (Brown & Singhal 1999). Unfortunately, we know little about the effectiveness of using entertainment media as part of social change campaigns. Clearly more research is needed to guide the application of nontraditional campaign media, as well as to evaluate their effectiveness.

### **To Whom? The Target Group**

Most planned social change campaigns target individuals with messages tailored to change individual attitudes and behaviors. Successful campaigns know that it is important to target some individuals more than others, specifically, individuals who are most likely to respond to the messages, which may include those who are likely to be motivated to receive, process, and yield to campaign messages, as well as those who are likely to influence the opinions and behaviors of others. Exploratory research may be used to identify the characteristics of individuals who are likely to be persuaded and those who are likely to persuade others. Such research may also be useful in making decisions about what types of messages to create for them as well as where to place those messages as part of a cost-efficient media plan.

Researchers may not only be concerned with the characteristics of the potential target audience, but also with differences in the way that different types of individuals process these messages. For example, dual-process models (i.e., the → elaboration likelihood model

and the heuristic systematic model) emphasize the message receiver's level of *involvement as a moderator of message effects*. High-involvement individuals tend to have greater motivation and ability to thoroughly process the crucial information in the message. On other hand, low-involvement individuals tend to look for heuristic shortcuts to message processing by focusing on peripheral information such as communicator attractiveness or the number of arguments presented (→ Involvement with Media Content). Insights from these models have a number of implications for planned social change campaigns including the production of different messages targeting high- and low-involvement audiences.

Researchers have known for many years that certain individuals (i.e., opinion leaders) among the target population are likely to have disproportionate influence. As such, many campaigns seek to capitalize on influence flows within community networks by identifying and engaging → *opinion leaders* directly as part of the campaign. Moreover, media expenditures may be more efficient by targeting opinion leaders to take advantage of the “two-step flow” of information, as messages are filtered through highly influential individuals. Research has shown that opinion leaders differ from one context to another, so campaigns must identify the context-specific characteristics of opinion leaders. Moreover, opinion leaders may be part of community networks or part of the mediated world, such as the case of celebrity or expert endorsements.

### Through What Channel? The Choice of Media

Most campaigns create messages that are disseminated through various mass media. The particular media mix (i.e., choices about which media to use to carry campaign messages) depends on the campaign goals, media goals, target audiences, and resources of the campaign. For example, the campaign goal of spreading knowledge requires media that carry credible information that can be processed and reprocessed by the target audience (e.g., print media), whereas changing attitudes and behaviors is likely to require media that carry emotional appeals, allow for the modeling of appropriate behavior, demonstrate negative consequences of not following recommended changes, and permit repetition without redundancy (e.g., television).

Media goals specify the relative emphasis of widecasting (an emphasis on reaching as many people as possible using such media as → newspapers and → television) or narrow-casting (targeting specific audience members using media like → magazines and → radio). Media choices are also dictated by the choice of target audiences as campaign planners seek media vehicles that have relatively high concentrations of target audiences for efficient message placement. Finally, choices are guided by the more pragmatic constraint of available resources (e.g., radio is very inexpensive and magazines are very expensive; television has high absolute costs, but relatively low cost per thousand persons reached).

The → *Internet* is a growing part of the media mix for most campaigns. As a tool to disseminate campaign information, the Internet offers many advantages over traditional mass media. It is relatively low-cost, permits the transmission of large amounts of information, and is driven by the needs and interests of the audience. The Internet also permits interactive, two-way communication. Moreover, and surprisingly, a high degree of credibility is accorded to the Internet as a source of information. Still, concerns about the → “digital divide” in terms of access to online information mute this optimism

(→ Exposure to the Internet). Beyond mass media, *interpersonal message channels* are important to engage because they are very influential: messages can be personalized and reinforced through the influence of primary groups, social ties, and opinion leaders. Many small business owners can attest to the effectiveness and cost-efficiency of word-of-mouth advertising. For these reasons and the fact that they represent two-way, interactive communication, interpersonal channels are particularly effective in most social change campaigns (→ Interpersonal Communication).

There has been much recent interest in buzz/viral marketing, the nonlinear spread of information throughout → *social networks*. It may take the form of information spread from person to person, or the form of campaign messages (e.g., humorous video clips) that are passed on through digital networks. In part, the success of such techniques stems from their relatively low cost and the positive attitude of the target audience toward such messages, though whether they are effective or not requires more research.

### **What Effect? Potential Outcomes of Campaigns**

Finally, there are the potential outcomes of a campaign. Some campaigns may promote radical social transformation, some minor incremental change, while others may seek to prevent change altogether. Regardless of the nature of social change sought, there are a variety of different perspectives on the nature of that change. More specifically, some campaigns may focus on inducing micro-level change in the form of altering the knowledge, attitudes, and behaviors of individuals. Other campaigns may focus on macro-level changes including shaping social values and norms, while yet others may focus on changing institutional policies.

Scholars have been interested in the dissemination of knowledge and the use of persuasion to change attitudes and behaviors for quite some time, such that the literature is truly voluminous. Perhaps the most influential program for studying *persuasion* was laid out by researchers from Yale University in the 1950s (Hovland et al. 1953; → Hovland, Carl I.). Their influential research explored such message-related characteristics as source credibility, message appeals, substantiating arguments, incentives/sanctions, and the structure of argument presentation (i.e., one-sided vs two-sided messages; → Message Design Logics). Their research contributed copious evidence on message effectiveness such as the findings that messages attributed to high-credibility sources are more persuasive, but that the credibility effect wears off over time in the absence of repetition, and that conclusive two-sided messages are better than messages that present only one point of view (→ Credibility of Content; Credibility Effects). They helped propagate the notion that one important key to promoting change in attitudes and behaviors is to present information that provides incentives for following recommended behaviors and sanctions for doing otherwise, something that is at the heart of most planned social change campaigns. Most importantly, their research set the agenda for decades for persuasion researchers from psychology and communication.

Research also suggests the importance of *targeting social norms* as part of social change campaigns. Social norms are opinions, attitudes, and behaviors that are considered widely shared within a given social system. In any system, there are incentives for conformity to → social norms and sanctions for violating those norms. Such normative pressures exert

a powerful influence on the public. Campaigns may take advantage of such pressures by invoking and reinforcing existing norms. They occasionally seek to create or change existing norms (e.g., the “5 a Day” campaign to increase fruit and vegetable consumption in the UK). While such campaigns ultimately seek to influence individuals, they focus on influencing norms (and the perception of norms) as key mediating factors. This type of orientation is reflected by Fishbein & Ajzen’s (1975) theory of reasoned action, which incorporates social norms into the relationship between attitudes and behaviors (→ Reasoned Action, Theory of). Conceptualizing the influence of social norms, as well as attempting to influence norms as part of the campaign, is complicated by the fact that individuals are part of overlapping social networks, each of which may have its own set of norms.

The *presumed influence model* (Gunther & Storey 2003) provides a perspective on campaign effects that combines the influence of social networks and perceptions of social norms. In this model, when individuals encounter multiple campaign messages, they may make the assumption that other members of their social network are going to be affected by this campaign and thus make inferences about potential changes to social norms, which then has an effect on the individual’s attitudes and behaviors. For example, a teenager may witness anti-smoking ads and infer that other teenagers are going to be affected by the campaign and become less likely to smoke. Alternatively, this inference may be matched by another inference that such campaigns wouldn’t be necessary if smoking wasn’t prevalent among teens. This example points out a precarious position for campaigns with regard to the communication of social norms – competing inferences about the normative acceptability of the behavior in question. Which inference is more influential is likely to be moderated by perceived smoking prevalence among the individual’s immediate peer network.

While social networks and social norms can be powerful tools in social change campaigns, *operationalizing* them is inherently difficult. A more direct approach is to actually change organizational, community, and social policies. For example, social problems may be curtailed through public policy initiatives that include the application of incentives, sanctions, and usage impediments. Examples of such incentives would include tax breaks for hybrid cars and public financing for the development of alternative energy sources. Sanctions might include usage taxes and laws with fines for noncompliance. Examples of usage impediments would include indoor smoking bans, fuel efficiency standards, and licensing/regulation. While such policies are no doubt effective in regulating the behaviors of individuals and larger collectives, they also require complicity from within the power structure of any given system.

## **A MULTIDISCIPLINARY HISTORY OF PLANNED SOCIAL CHANGE**

The history of planned social change in the social sciences is relatively long and variegated. A number of disciplines have made important contributions to the growth of knowledge in planned social change including psychology, sociology, economics, political science, and communication. Each of these disciplines has at some point also touched on mass media’s role in affecting social change.

The largest contributions of *psychologists* have been in the area of the role of motivation and persuasion in changing knowledge, attitudes, and behaviors at the individual level. In

addition, psychologists were influential in early studies of the role of communication and mass media in producing such change. While the media have long played an important role in bringing about social change from religious reformations to revolutions, social science researchers have been studying the role of mass media in bringing about social change only since the middle of the last century.

One of the first *systematic studies of mass persuasion* was conducted during World War II in a series of research projects investigating the effect of the *Why We Fight* films that were designed to mobilize soldiers to fight against the Germans and Japanese. General George Marshall, who was the Chief of Staff of the US Army, engaged renowned Hollywood director Frank Capra to create a seven-film series designed to motivate American soldiers. Evaluation research conducted by a prestigious group of persuasion researchers hired by the government showed that the films were powerful in increasing soldiers' factual knowledge, but that they had little effect on motivations and attitudes. Ultimately, this was an early study that provided evidence that campaigns designed to promote planned social change have an easier time influencing knowledge than they do shaping attitudes and behaviors. After the war, researchers involved in this project went on to conduct a long series of studies (known as the Yale Program of Research on Communication and Attitude Change) investigating factors related to using mediated message to promote attitude change (→ Stimulus–Response Model).

For *sociologists and economists*, the aftermath of World War II was also a fruitful era for researchers studying planned social change, particularly in the area of promoting national development in developing countries. Researchers operating from the “modernization perspective” assumed that developing the economies of third world nations was a key to world stability. From this perspective, the mass media were seen as the “magic multiplier” in bringing information and motivation in order to mobilize individuals in developing countries in the process of modernization (→ Lerner 1958). In the development model, government and mass media were envisioned as a partnership in promoting the social good. The argument that media should play a central and coordinated role in promoting national development has often been used to justify government ownership (as opposed to private ownership) of the media. By the 1960s, the modernization perspective on national development began to draw criticism on a variety of fronts. Its assumptions were challenged as being ethnocentric and its conclusions were questioned by dependency theory (Cardoso & Faletto 1979), which argued that the developed nations through economic ties have engaged developing nations in exploitative relationships that leave them in a perpetual state of underdevelopment.

Sociologists have contributed knowledge regarding a key component in most conceptions of planned social change – *social control*. Most campaigns aimed at shaping individuals and their communities implicitly or explicitly recognize forces of social control. These forces operate through a combination of incentives that reward norm conformity and sanctions that punish deviance. These forces may be informal as in the case of public opinion and peer pressure, or they may be formalized in terms of laws and public policy. Many sociologists view the mass media, as primary sources of communication of social norms and the attendant incentives and sanctions that induce conformity, as social control agents. These ideas have implications for planned social change such that change agents often use media in the course of a campaign to do more than carry

information and persuasive messages. The media can be used to convey or change social norms as well as to model rewards and punishments associated with them.

Another historical tradition in planned social change focuses on *social engineering*, a concept that comes from the political science discipline. Social engineering focuses on large-scale change (typically at the national level) in public opinions, attitudes, and behaviors. Most often, this perspective focuses on the role of government as the primary change agent. Under this perspective, public policy, laws, and other governance strategies are considered primary directives of social engineering. There is a heavy emphasis on the incentives and sanctions that induce change, adopting the social control framework from sociology. Social engineering is facilitated by the tools of social science, which provide formative and evaluative research that guides the process of social change. Such change is promoted by the use of mass communication technologies, which convey policies and rules, and shape opinions, attitudes, and behaviors. The term “social engineering” has taken on negative connotations through its associations with various historical social engineering campaigns such as the propaganda campaigns and final solution from Nazi Germany and the Cultural Revolution and Great Leap Forward campaigns in China.

*Political science* also provided early research on the *role of propaganda* as mass persuasion. Originally, the term was socially acceptable and used to describe attempts by government agencies (such as the Office of War Information, 1942–1945, and the Voice of America, founded in 1942) to influence the opinions and behavior of the public (→ Propaganda in World War II). Concerns about the negative effects of other countries’ use of propaganda during World War I, in communist revolutions, and the rise of Nazism motivated government interest in engaging political scientists in the study of propaganda effects (Lasswell et al. 1979). In the best-known example of propaganda research, Lee and Lee (1939) identified common techniques used by propagandists engaged in mass persuasion, which included such devices as glittering generalities, card-stacking, and name-calling. Like social engineering, propaganda has increasingly assumed negative connotations because of its association with brainwashing, indoctrination, disinformation, and psychological warfare, as well as its historical association with enemies of the United States. In reality, propaganda campaigns are simply a special case of planned social change for which the benefits and detriments of effects are in the eye of the beholder.

More recently, *communication researchers* have picked up the ball to advance research on planned social change. One of the earliest examples of research on social change by a communication researcher was a perspective on planned social change that was initiated in 1962 when → Everett Rogers published his book *Diffusion of innovations* (Rogers 1962). The book helped launch a research tradition that examined the processes and influential factors that regulate the adoption of new technologies and practices in a given society. Rogers characterized the process of social change as a bell curve, in which innovations are in turn adopted by innovators, early adopters, early majority, majority, and laggards over a period of time. The theory viewed the process of innovation adoption as occurring through a series of stages including awareness, interest, evaluation, trial, and adoption. The mass media may play a key role in each of these stages (→ Diffusion of Information and Innovation).

Many of the research traditions discussed in this section produced a considerable amount of social science research in their day, but at some point fell dormant. For many

of these traditions, their decline was precipitated by the gradual recognition and resentment of ethnocentric assumptions implicit in their model of planned social change, that is, they are predicated on assumptions such as: if only other societies were more like us, they would be better off; or, our view of social change is right and their view of social change is wrong.

### CONTEMPORARY ISSUES IN PLANNED SOCIAL CHANGE

Current campaigns designed to foster planned social change are likely to employ a combination of mass, interpersonal, and interactive communication to achieve objectives, adopting many of the concepts and tools of advertising and public relations campaigns. Such campaigns revolve around defining objectives and situational constraints, creating strategic solutions, and executing them with an integrated campaign (→ Strategic Communication).

Campaign goals vary in terms of the degree of change sought from incremental modifications to revolutionary change. If objectives are overly ambitious, the campaign is likely to fall short of its goals and be deemed a failure. If the objectives are too modest, the agency footing the bill for the campaign may not feel that the campaign is worth the investment. Whether objectives are achieved depends on support from within the power structure, available resources, the degree to which incentives and sanctions can be invoked, and the cultural compatibility of the campaign.

Strategic decisions must be made about who to target, and how and when to target them with change efforts. Strategies may vary in the extent to which they emphasize *coercion* or merely seek the *consent* of the targets of change. Zaltman and Duncan (1977) provide a typology that organizes strategic approaches into four categories. First, *power* strategies, which are on the coercive side of the continuum, involve changing laws, policies, economic incentives, and other relatively direct forms of control. *Persuasion* strategies tend to utilize communication media using a variety of different types of appeals to change audience knowledge, attitudes, behaviors, and motivations. *Normative re-educational* strategies are based on a more rational model of spreading information. *Facilitation* strategies rely on providing resources and opportunities to the public. Most campaigns opt for a mix of these strategies, the composition of which is based on a variety of factors including available time and resources, and the nature and degree of change sought.

The *tactics* used in a campaign depend in large part on the amount of resources that are available to the campaign. The use of mass-mediated advertising has the advantage of maximizing the change agent's control over the campaign messages, but paid advertising is very expensive, and may not be a viable option for other than the well-endowed campaign. Some campaigns may seek to use public service announcements (PSAs), but PSAs have been on the decline lately as media outlets have become less concerned about demonstrating social responsibility. Organizations that seek to effect social change but don't have the resources to pay for advertising may often resort to engaging news media through the use of press releases, events, or rallies. Reliance on news media involves risks, in part because the organization can't control whether the media will show up to publicize the story, nor can they control the nature of the message. As many protest groups that seek to change the system have discovered, getting the attention of the news media can be very difficult. Often, such groups resort to the use of dramatic tactics (such as street theater and confrontations) to attract media attention. Unfortunately, for these groups the resultant coverage is often

negative and their tactics can be used as criticism against them and their cause. This has led to the realization that any publicity may not be better than no publicity at all.

## METHODOLOGICAL ISSUES AND FUTURE DIRECTIONS

Many of the *methodological issues* and problems associated with attempts to study the effects of planned social change campaigns are common to research on media effects in general. It is difficult to isolate cause and effect. How do we know that the effects are the results of the campaign and not something else? At the individual level, it is difficult to manipulate exposure to the campaign or to measure the degree of exposure to the campaign. Some campaigns have tried to set up experimental and control communities to assess change in response to the campaign, but again it is difficult to isolate campaign effects (see Hornik 2002; → Experimental Design).

One limitation of most planned social change campaigns is that they are essentially *pilot campaigns* designed to test the viability of a given campaign approach. They may be limited in scope and in time frame, and as such never achieve systemic change. These campaign projects may show positive campaign effects, but implementing the campaign on a system-wide basis may not be feasible. Thus, such campaigns may not have a wide or a lasting impact.

The most promising areas for the *future of research and practice* in planned social change are how to most effectively apply the methods of strategic communication honed by advertising and public relations practitioners, and how to harness and evaluate the power of the Internet and other new media. As the tools of strategic communication and media message production become more widely available, it may be more feasible for organizations such as social movements to engage in social change campaigns. As they go forward with these initiatives, there are a few important lessons to bear in mind. The acceptability of social change goals is in the eye of the beholder. It is far easier to spread knowledge than it is to change attitudes and behaviors. Mass-mediated messages are more effective when combined with Internet support and interpersonal communication that utilizes existing communication networks and opinion leaders. And finally, change is most likely to occur among individuals who are motivated to process information and when it is consistent with personal values and social norms.

## **Playing**

*Peter Ohler*

*Chemnitz University of Technology*

Playing is always communication. It does not matter whether a child interacts in solitary play with a pretend object, whether a group of children is engaged in role-play, or whether an online community meets at a virtual playground, as in the massively multi-player online games (MMOGs). Each form of playing is communication. Some fields of communication and media sciences can profit from the view that forms of computer-

mediated communication should be analyzed not only from the perspective of media communication but also from that of play. The analysis of interactive media entertainment especially can be based on a play frame (e.g., Vorderer 2001; Ohler & Nieding 2006). Play research can contribute to various fields of the communication sciences; therefore it is necessary to take playfulness seriously.

Play researchers of numerous disciplines agree that an unambiguous *definition of play* has not been offered in the history of play research. The term “play” contains a wide range of behaviors. Till now play research has not been able to extract the behavioral or functional features that are applicable to every play form and different playful behavior pattern. It is not even possible yet to distinguish playful from non-playful behavior precisely. The concept of play is a genuine fuzzy concept. Sutton-Smith (1997) even assumes that its ambiguity is the peculiar quality of play.

More recent approaches to play differ from classical ones with respect to their broadness. Compared to early speculations on and theories of play (e.g. Groos 1899, 1901), which tried to explain the entire phenomenon, twentieth-century approaches focus on only specific aspects, e.g., play and cognitive development (Piaget 1962), or play and the modulation of arousal (Shultz 1979).

One main difference from other communicative behavior systems is that it is not only (young) individuals of the species *Homo sapiens* that show play behavior, but also those of other species. All mammals, some birds, and perhaps even non-avian reptiles play. This means that the behavior system “play” is much older than modern humans; it is even much older than the entire hominid line. The essential contrast between animals and humans arises from the fact that the latter develop more elaborate play forms in the course of their ontogenesis.

Several authors assume that play is a *functionless or even purposeless behavior*, but mostly it has been suggested that it serves some adaptive function. The most prominent approaches in animal play suppose that it is physical exercise (or pre-exercise; Groos 1901) yielding payoffs for later adult sensorimotor skills. For the human species play should be more focused on cognitive exercise, resulting in improved cognitive competencies later on. Other approaches agree that the evolutionary function of animal play is based not in the opportunity for improved practice but in behavioral adaptation to changing niches (behavioral flexibility; → Evolutionary Theory; Communibiology). Individuals of a species that show playful behavior are able to retrieve a repertoire of behaviors more effectively than others of the species. This results in a higher rate of reproductive success. Over many generations the behavioral feature will manifest itself in the genetic pool of that species. All members of the population will show playful behavior (Ohler & Nieding 2006).

Every child older than 1 year enacts different play forms simultaneously or consecutively. But in the course of development – in specific age ranges – certain play forms are more frequent than others (→ Developmental Communication). Most scholars agree that the development of children, with minor deviations, can be characterized by the emergence of the following *sequence of play forms* (approximate starting ages in brackets): sensorimotor play (6 months), experimental play (1 year), early pretense play (1 year), constructive play (2–3 years), role-play or elaborate pretend play (3–4 years), games with rules and other symbolic games (5–6 years).

Video and computer games are games with rules (→ Video Games). In the history of computer games, classic games like chess or checkers were the first to be computerized. Later on new games were developed that can only be played interactively with electronic devices. Video games can be taxonomically subdivided into the following main categories: hit, jump, and run games; action games (first person and third person shooters); adventures; simulations; and strategy games (turn-for-turn and real-time). Modern video games often appear to be hybrid forms. For almost all these types of video games there exist not only single player versions but also the option for multiplayer use.

MMOGs represent the latest generation of computer games (at least up to the time of writing). Massively multi-player role-playing games (MMORPGs) especially require the participants to collaborate in accomplishing certain tasks (quests). In the more popular MMORPGs, such as World of Warcraft, participants can establish long-lasting player associations (guilds,) and many of the users' activities are not aimed at game-specific goals (e.g., reaching the next level). Instead, mediated via their avatars, participants show a high frequency of communicative acts that are typically performed in real "third places" like pubs or clubs. MMOGs are not only games but virtual meeting places (→ Virtual Communities). The attractiveness of these virtual environments is amplified by the rewards of being integrated into a social network and the opportunity to gain a reputation within it (Ducheneaut et al. 2006). As games with rules, MMOGs are able to produce flow in their players. Furthermore, in their function as virtual social places they are able to induce (virtual) social co-presence (→ Computer Games and Child Development; Presence).

An important compendium concerning different aspects of playing video games is Vorderer and Bryant (2006).

# Pluralistic Ignorance

Gregor Daschmann

Johannes Gutenberg University of Mainz

There are several definitions of pluralistic ignorance – in the fields of psychology, sociology, and communications the term is not used uniformly. But despite the differences in details, they all share a focus on the same phenomenon: the inaccuracy with which most people perceive or judge → public opinion or at least the distribution of opinions in social groups (→ Social Perception).

## ORIGIN

The term was first coined by Allport & Katz in 1931 to describe situations where individuals make unfounded assumptions (and act on the basis of these assumptions) as to how others in their peer group will think, feel, or act (Allport & Katz 1931, 152). Later, Allport (1933) used the term to describe a situation in which members of a group who believed themselves to be in the minority were actually in the majority. Allport did not emphasize the relationship of the term to the concept of public opinion; he focused much more on social groups and the behavioral component of the idea. He argued that members of a social group usually perceive the norms of the group by observing the public behavior of others. If this behavior is discrepant to the individual norms or attitudes of the observing group member, he or she tends to believe that the norm discrepancy is his or her individual problem whereas he or she believes that nearly all other group members show this behavior because it is in line with their own social norms and attitudes.

As a consequence, the group member conforms to the norm to avoid embarrassing situations and displays the respective behavior, which again could be misperceived by the other group members as the usual and intended behavior of the majority. If the individual discrepancy between norms and behavior is widespread and holds true for most of the group members, this may lead to the paradox that a social group may follow some norms or show some behavior that most group members actually do not accept. This concrete phenomenon of the *majority believing itself to be in the minority*, including its behavioral consequences, is what Allport originally termed pluralistic ignorance. It includes the attribution of identical actions of self and other to different internal states (Miller & McFarland 1987). Up to now, the original meaning of pluralistic ignorance is still a line of research in social psychology (e.g., in studies on the causes and motives for the (ab)use of drugs or alcohol among college students).

Allport's definition of pluralistic ignorance originally served as a concept for the discrepancy between private beliefs and public behavior. Researchers who followed broadened the definition. Breed & Ktsanes (1961), for instance, defined pluralistic ignorance as an *inaccuracy in estimates of public opinion*. Other scholars described pluralistic ignorance simply as the situation when *the majority is wrong about the majority* (which holds true for Allport's original definition, but not for later definitions of pluralistic ignorance,

because salient effects can occur even if only a minority shows misperceptions), while O’Gorman defined it briefly as “false social knowledge of other people” (1988, 145).

While some researchers labeled only one of the two possible directions of misperception as pluralistic ignorance, Taylor included both, suggesting that the term be used to describe a “situation when a minority position in public opinion is incorrectly perceived to be the majority position and vice versa” (Taylor 1982, 312). In communication science, this definition seems to be the most accepted in the recent literature. The crucial change to Allport’s definition is not only its link to the concept of public opinion, but the loss of the behavioral component in the original definition – in the field of public opinion, pluralistic ignorance is usually concerned with perceptual accuracy.

All the definitions above have in common that they describe pluralistic ignorance as a characteristic of a social group that has its cause in the average perceptions of the social reality by the members of the group. Therefore, the term can be seen as somewhat of a misnomer since the outcome is not truly pluralistic. Instead, it is a misperception each individual may or may not have in judging the attitudes, sentiments, or behavior of the plurality. Accordingly, the term “pluralistic ignorance” is not undisputed and there are several other terms in the literature that focus on the same phenomenon described by “pluralistic ignorance” above. For example, in 1932 Schank, one of Allport’s students, discovered a similar relationship between personal attitudes and group norms in a small New York community, but labeled the phenomenon “misperceived sharing,” or “misperceived consensus.” Sometimes, especially in the context of the → spiral of silence, pluralistic ignorance is also referred to as “social optical delusion of the public about the public” (→ Noelle-Neumann, Elisabeth).

## RELEVANCE

Though pluralistic ignorance has its tradition and its explanatory roots in the tradition of general social perception, the salience and relevance accorded to the concept is due to its *behavioral consequences*. The relationship between perceived public opinion and an individual’s behavior corresponds to the logic of the Thomas theorem: “If men define situations as real, they’re real in their consequences” (Thomas & Thomas 1928, 572). In the case of pluralistic ignorance, this means that each individual’s subjective perception of public opinion defines the individual social circumstances under which he or she is speaking or acting in public. Both correct and false perceptions of the public’s opinion may have the same impact upon the subject’s behavior – as long as he or she believes (even if erroneously) the perception to be “true.” The consequences may be serious: an incorrect perception of the political → climate of opinion during an election campaign, for example, may lead to inappropriate voting decisions of single voters, for persuasive as well as for strategic reasons.

As a social psychological phenomenon, pluralistic ignorance is an *important concept in communication research* for various reasons. First, communication research is interested in public opinion in general, which naturally includes the social perception of public opinion. Second, the perception of public opinion is one of its own components – public opinion about public opinion. Third, most people’s actions are based not only on their own attitudes or opinions; frequently they are based on their perceptions of the opinions

of others. Therefore, pluralistic ignorance concerns the behavioral consequences of public opinion. Furthermore, the measurement of people's "real" opinions is difficult and frequently biased. In such cases, the measurement of perceived opinions can serve as an indicator not for "true" public opinion, but for underlying personal attitudes, and for this reason pluralistic ignorance is relevant to the measurement of public opinion. Additionally, in respect of its causes, the question arises as to whether the distortion of the perception of public opinion is caused at least partly by media coverage.

### METHODOLOGICAL ASPECTS

Pluralistic ignorance occurs only when individuals underestimate or overestimate the proportion of others having the same opinion as they have themselves. This inaccuracy or error in estimation can be tested only by comparing the actual distribution of opinions on an issue within a social group or representative sample with the distribution of opinions as it is perceived by the members of the group or sample. Therefore, pluralistic ignorance implies *two different levels of observation*: the aggregate level and the individual level.

The aggregate level is used to observe whether there is any discrepancy between actual and perceived public opinion; the individual level is used to observe which of the individuals belonging to this aggregate have an incorrect perception of the aggregate's characteristics and what the cause of the distortion might be. In most investigations, actual public opinion is usually operationalized as the aggregation of all single opinions within the group or sample. To measure the perceived public opinion additionally, each member of the group must provide his or her estimations about the opinions of others. There are different *operationalizations of perceived public opinion*: some studies ask simply for minorities and majorities, which is a dichotomous measurement; others ask subjects to rate the percentage of the different proportions, which allows for more complex analysis. Since both kinds of data, perceived and actual public opinion, are usually collected within the same survey, some caution in questionnaire design is necessary to avoid halo effects.

With respect to methodological aspects, it is important to consider that pluralistic ignorance is, as Glynn et al. (1995) point out, a product, not a process: it describes the state of misperception at one arbitrarily chosen point of time. Since public opinion changes at least slightly from day to day, measured differences between actual and perceived public opinion are no surprise at all, since one can safely assume that the perception of public opinion follows the development of public opinion with a delay. Therefore, the discrepancies could be considered as just an artificial effect, depending on the time of measurement, which will vanish as soon as the perception of public opinion catches up with public opinion. However, research in general shows that this argument is untenable, since pluralistic ignorance can be observed for issues with stable distribution of public opinion as well as for issues with changing majorities. In addition, there is evidence for constant misperceptions within the same issue over decades.

### EXPLANATIONS OF MISPERCEPTIONS

Early research on pluralistic ignorance has focused on one crucial question: why do people perceive the opinions of others incorrectly? Pluralistic ignorance has been found

in different countries, different cultural settings, and on a large number of different issues. Therefore, explanations for the occurrence of misperceptions based on specific cultural conditions are limited and insufficient. Accordingly, recent research has focused on the pattern of the perceptions of opinion and on the psychological and social factors influencing the accuracy of these perceptions. Within this research, one can identify different approaches or phenomena that can be summed up under the term “pluralistic ignorance”: → false consensus effect, looking glass perception, and false idiosyncrasy. The connections of the different concepts to pluralistic ignorance are outlined below.

*False consensus* can serve as an explanation for findings in pluralistic ignorance where minorities perceive themselves erroneously to be in the majority. False consensus means that most people tend to consider their own opinions as common and appropriate and therefore expect them to be shared by a larger proportion of others, whilst alternative opinions are perceived as deviant and inappropriate (Ross et al. 1977). Research identified biased information availability, as well as the need for self-enhancement and social support, as possible explanations for the phenomenon. Within this line of research, the overestimation of consensus (the tendency of an individual to overestimate the group of people who share his or her opinion) is relevant. It is in contrast to Allport’s original definition, which focused on the pattern that people tend to believe their felt norm discrepancies to be an exception. However, it serves as an explanation for the overestimation of minorities within the newer tradition of linking pluralistic ignorance to public opinion.

Similar to false consensus is what is called *looking glass perception* (Fields & Schumann 1976), sometimes also termed “egocentric bias” or “social projection.” This term describes people’s tendency to assume that others have the same opinions on issues as they themselves. It is assumed that this effect is independent of the actual distribution of opinion and is relatively widespread. However, for some issues with ideological aspects, an ideological bias may prevent looking glass perception.

False consensus and looking glass perception describe situations in which people do not agree but think they do – when a minority perceives itself as in the majority. The opposite (and original) pattern of pluralistic ignorance is when people agree, but do not realize it – when a majority perceives itself as in the minority. This has been coined “false idiosyncrasy” or “silent majority” effect (Eveland 2002). It may occur if people believe their own position to be not in line with public norms and therefore overestimate the position of public opinion that is in contrast to their own. It is possible that this is also the reason for the ideological bias mentioned above (→ Perceived Reality: Meta-Analyses).

## PLURALISTIC IGNORANCE AND THE MEDIA

Many studies in pluralistic ignorance try to explain the misperceptions underlying the concept by examining psychological and/or social influences on perception but do not discuss media effects as a possible cause. This is surprising, for Allport had in 1924 mentioned three sources of information for inferences about the opinion of others: rumors, social projection, and the press (Allport 1924, 308). Nevertheless, there are a few approaches in media effects research that can be usefully linked to the phenomenon: the hostile media effect, the → third-person effect, the spiral of silence, cultivation research,

and exemplification effects (→ Cultivation Theory; Cultivation Effects; Exemplification and Exemplars, Effects of; Media Effects).

The → *hostile media phenomenon* (Vallone et al. 1985) postulates that many with a partisan view on an issue tend to misperceive relatively neutral news content as biased against their own position. Since this perception can be found for partisans on different sides of an issue, at least one of the partisan sides must be misperceiving the bias in media coverage. Because of this misperception and because of common assumptions about the power of mass media, people assume an influence of the perceived bias on public opinion and therefore estimate public opinion incorrectly.

This effect may be amplified by the *third-person effect* (Davison 1983), which postulates that most people believe that the media have a greater impact on others than on themselves. Because of this misperception, people assume the surrounding society to be strongly influenced by media coverage that may lead to changing estimations of public opinion. Since they are founded upon exaggerated assumptions of media impact, these perceptions of the climate of opinion may be misperceptions.

The *spiral of silence* (Noelle-Neumann 1974), a dynamic theory of public opinion, postulates that most people fear isolation and therefore tend to express their opinion in public only if it is in line with the opinion they perceive as being in the majority, otherwise they remain silent. The spiral of silence assumes that people have a “quasi-statistical sense” that makes them able to estimate public opinion and to identify majority and minority positions. Hence, a person’s willingness to express (or not to express) his or her opinions in public is perceived by others and influences their inferences on the climate of opinion. Nevertheless, according to the theory, the quasi-statistical sense can be distorted by media coverage due to its consonant, ubiquitous, and cumulative character. This may lead to misperceptions of the climate of opinion and inappropriate behavior in public as a consequence.

The *cultivation approach* (Gerbner et al. 1980) suggests that in the course of the last few decades television has become the most important cultural factor in society. Therefore, television – and particularly its entertainment programs – is shaping viewers’ conceptions of social reality (“mainstreaming”). Since the TV world differs from the real world, the conceptions of heavy viewers established by television may be incorrect and, with regard to public opinion, these conceptions may result in pluralistic ignorance. Exemplification effects (Zillmann & Brosius 2000) describe the impact of examples selected and covered by the media upon the recipients’ conceptions and especially on their perceived climate of opinion. Many investigations showed that abstract statistical data, for example poll results, hardly have an impact on these conceptions, whereas a few personal statements as examples of public opinion can have a strong impact upon the perceived climate of opinion which may of course lead to pluralistic ignorance.

Today, the spiral of silence is the only theory that attempts to combine predictions of different patterns of pluralistic ignorance as well as explanations for their occurrence in a larger theoretical framework. Though there has been much progress, up to now the research and findings on pluralistic ignorance are still very heterogeneous. There are many different approaches and concepts, but successful attempts at theoretical and/or interdisciplinary integration are still lacking. The explanation of social misperceptions remains a challenge for future communication research.

# Pluralistic Ignorance and Ideological Biases

S. Robert Lichter

George Mason University

An ideology is a consistent set of related ideas about the nature and goals of society, such as liberalism, conservatism, or socialism. Ideological bias refers to the skewed thoughts and perceptions that such perspectives can produce. One such misperception is → pluralistic ignorance, an inaccurate perception of how a group member's own opinions relate to those of the larger group. The communications media are widely believed to produce biases in → public opinion, but the extent and direction of media content and effects are still contested by both scholars and political actors (→ Social Perception).

The behavioral sciences treat political ideologies as internal maps or → scripts that we all make use of to interpret social and political behavior (→ Schemas; Schemas, Knowledge Structures, and Social Interaction). An ideological perspective is not necessarily biased or prejudiced. Individuals with a high degree of ideological consistency tend to be well informed and to vote for candidates whose views match their own. In this sense, ideologues are the most “rational” citizens (Zaller 1992). Recent research in cognitive psychology treats ideological bias as a failure of → information processing. It consists of stereotyped thinking in which new information is distorted in order to make it conform to existing beliefs (Kinder 1998; → Stereotypes). Social psychologists find that adherence to ideologies of both the far left and far right is associated with intolerance and closed-mindedness.

Ideological bias can produce pluralistic ignorance, a mistaken perception of the relationship between one's own opinions and those of the majority. In mass publics, pluralistic ignorance represents a misreading of public opinion vis-à-vis one's own opinion. Thus, an individual may be in the majority but inaccurately believe she is in the minority, or vice versa (Berkowitz 2004). Paradoxically, such erroneous perceptions of majority opinion can become self-fulfilling prophecies. If those who incorrectly feel they are a minority become afraid to speak out, their opponents may dominate public debate and form a new majority. This process is known as the → “spiral of silence” (→ Noelle-Neumann, Elisabeth; Climate of Opinion).

The *results of pluralistic ignorance* may favor either side of the political spectrum. For example, in the 1970s, a time of highly publicized racial strife in the United States, white citizens incorrectly believed that most whites opposed racial integration in housing in their community (→ Civil Rights Movement and the Media). Conversely, a more recent study found that a desire to appear “politically correct” led white college students to overestimate on-campus support for affirmative action. In both cases, a → “false consensus” favors vocal minorities over silent majorities, since being in the majority confers normative advantages in public debate – *vox populi, vox dei*.

Pluralistic ignorance and ideological bias are products as well as carriers of misinformation. Thus, the *quality of information in public* → discourse is central to understanding both phenomena (→ Political Discourse; Quality of the News). The effects

of → television viewing have attracted the most attention from researchers (Comstock and Scharrer 2005). For example, → cultivation theory argues that television creates a surrogate reality for heavy viewers, whose perceptions of the social environment are clouded by the fantasy versions they experience on television, especially in entertainment programming (→ Cultivation Effects). Similarly, the theory of → video malaise argues that a negativistic bias in television news gives viewers an unduly jaundiced view of their social environment (→ Negativity). Both theories remain controversial, and video malaise is now seen as a particular case of more general media negativism.

The most controversial issue, however, is *whether news media content favors one side of the political spectrum*. Particularly in the United States and Europe, the debate over media bias has been joined by political elites and the general public (→ Bias in the News). On one hand, critics on the left indict for media for “manufacturing consent” for ruling elites, by reinforcing and legitimizing their perspectives. Conversely, political conservatives portray the news as the instrument of leftist journalists whose coverage undermines traditional social values and institutions. The question is whether the news reflects the ideological assumptions of left-leaning journalists or the economic interests of their more conservative bosses, or whether these and other influences cancel each other out. All three positions have vocal proponents (Lichter et al. 1990; → Instrumental Actualization). Moreover, the debate over media bias is itself colored by pluralistic ignorance. For example, partisans tend to regard neutral news content as favoring their opponents (the → hostile media phenomenon), and there is a widespread tendency to believe that the media influence other people more than ourselves (the → third-person effect).

Communications scholars increasingly rely on content analyses to sort out such competing claims (→ Content Analysis, Quantitative; Content Analysis, Qualitative). However, this literature has produced *mixed results*. In the United States, for example, Democratic presidential candidates tend to get more favorable coverage than Republicans, but presidents from both parties get highly unfavorable coverage while in office. However, some *broad trends* can be identified. The news media do frequently ignore or denigrate marginal groups and radical voices calling for fundamental social change, as critics on the left argue. But news coverage also tends to be critical of hegemonic social institutions such as government, business, and the military, as right-wing critics contend. More generally, the media frequently draw attention to society’s problems and failures, stimulating social reform. This watchdog role can be interpreted as either a threat to traditional values and institutions or a safety valve that marginalizes dissent. Thus, despite their quite different perspectives, critics on the left and right can both claim some support for their allegations of ideological bias in the news.

*University of Tampere*

Plurality refers to the existence of a multiplicity of identities and perspectives from which different groups and people experience social reality. A belief that this diversity should be a criterion for judging how power is distributed in society is termed pluralism; transferred to debates about the media, pluralism is an ideal that calls for versatile media contents and diffuse distribution of power to control the media. In this form, pluralism and plurality are core elements of the legitimization rhetoric of twentieth-century liberal democracies. As such, they are also a contested part of political and social theory and, consequently, of the role of media in society. Evidence of the actual existence of different kinds of plurality in society and in the media, as well as views about the value of the concept itself, remain contradictory. This is due to both the conceptual range over which pluralism has been stretched and the political interests this covers.

### **EMERGENCE OF THE CONCEPT**

The term “pluralism” is derived from Latin through (thirteenth-century) French. During the early nineteenth century it is often used in a pejorative sense to refer to people holding more than one official ecclesiastical position at the same time, enjoying the benefits of an office without actually being in residence. In *nineteenth-century philosophy*, pluralism comes to refer to a belief that the world is made of multiple substances and differing views on matters. Here the belief in plurality is juxtaposed with “monism,” a belief in the underlying unity of reality, implying one ultimate opinion binding to all. In *political theory*, pluralism appears as a shorthand term for a key belief in twentieth-century liberalism (Laski 1919), according to which power in democracies should be spread between many economic and political pressure groups. To a large degree, then, pluralism takes the actual institutional forms of modern western democracies as an ideal model, implying that these societies are an embodiment of the principle of pluralism. Pluralism thus celebrates western democracies’ forms of institutional systemic differentiation, cultural diversification, and democratization, and implies that the media has been a successful part of this process.

Historically, pluralism *as an ideology* can be regarded as a reaction to the political challenges of modernity. If the modern scientific revolution challenged the knowledge monopoly (and monism) of the church, other facets of modernity (the market economy, political and religious diversity, secularization) gradually challenged the idea of a simple, hierarchical, and stable social order and power. As one key element in this socio-cultural process of change, modern media – from the printing press to digital broadcasting networks – was from the beginning caught in the middle of this process and debates about it (Thompson 1995; Briggs & Burke 2005; → Printing; History of; Media History). From John Milton’s *Areopagitica* (1644) on there is an evolving tradition of the idea of free speech (Peters 2005), in which the call for pluralistic and diverse media content plays an important role (→ Freedom of the Press, Concept of).

In the liberal *theory of the press* (and its later versions on the social responsibility of the media; → Accountability of the Media), the media is given the task of reflecting the constituent groups and identities of a given society. By the 1940s this ideal of pluralism of opinions is well established in the dominant western thinking about the mass media: plurality of media content (opinion and views) comes to serve as the twin of the scientific method (news based on facts; → Objectivity in Science; Precision Journalism). The media is given the tasks of distributing verified and objective information and reflecting relevant group opinions (cf. Commission on Freedom of the Press 1947; Royal Commission on the Press 1950, 1st pub. 1947–1949). More than coincidentally, thus, pluralism as an ideal in general social and political theory as well as in media theory is articulated during the same twentieth-century conjuncture of → modernity as two other key concepts of liberal media theory, namely *objectivity* as a core value of news journalism (cf. Schudson 1978; → Objectivity in Reporting) and the notion of “the market-place of ideas” (Peters 2004).

## THEORETICAL TENSIONS

As part of a functionalist and affirmative theory of modern society, pluralism has also been challenged in the field of media research.

*Critical theory* (or *Marxism*) from the late 1960s on has pointed out some key limitations of pluralism’s explanatory power. Critics claim that social diversity and its manifestations in modern societies are from the start framed by uneven social conditions. Hence, the starting point of liberal pluralism – that it suffices to allow recognizable groups to take part in public life – is flawed. Since media institutions in modern western societies are linked to economic and political power, working toward genuine pluralism in the media has to deal with structural inequalities related to both general social conditions and the media. Critical political economists (Murdoch & Golding 2005) of this strand have challenged the liberal media policy of western governments. Their thinking has also informed practical political attempts (ranging from ideas of public service broadcasting to public media subsidies; → Public Service Broadcasting: Law and Policy; Subsidies for the Media) to secure a plurality of representation in the media (→ Political Economy of the Media). Epistemologically, critical theorists and liberal pluralists share the legacy of modernity, i.e., the idea that the media can be judged on how well it *reflects* the constituent groups and identities of a given society. Both positions view truth mainly as a matter of correspondence to reality, and a pluralistic debate is seen as a

method for finding out the truth or consensus (→ Realism). The fundamental disagreement concerns the performance of the market-driven media system to provide for this: liberal pluralists believe it does; critical theorists think the market forces need to be at least counterbalanced with other logics (Curran 2002).

Another critique of pluralism emerges – somewhat ironically – from *multiculturalism*, i.e., the growing recognition of the plurality of identities, experiences, and ways of knowing in late modern societies. This shift of perspective is rooted in a broader epistemological turn in social theory and media research, arguing that all representations of social reality are ultimately constructions (→ Constructivism). Hence, to call for a correspondence between pluralist media contents and the plurality of reality (and thus to call for a reflecting role for the media; → Neutrality), is to misplace the question. From a constructivist point of view, the media is always part of the process of how groups and interests are constituted. Therefore there cannot be a “common” or “neutral” vocabulary of representing the “constituent” groups of society, and any claim for such impartiality is in itself a form of power and ideology.

On the one hand, multiculturalism offers a stinging criticism of the pluralist notion of diversity as such as a way of seriously ethically limiting the role of the media, i.e., media theory of this kind effectively denies us the responsibility for asking what is right (→ Ethics in Journalism). Here multiculturalism criticizes pluralism for not taking new identities, groups, and their representations of reality seriously as part of the public democratic dialogue. Such *dialogically grounded multiculturalism* points out that identities are constructed in communication, and that this communicative potential of language and communication (→ Habermas, Jürgen) leads to a media theory which will not celebrate the postponing of ethical judgment in the name of pluralism and free speech. On the other hand, some constructivists also abandon this belief in dialogue and deliberation. For them (Mouffe 1999) society is comprehensively seen as a site of a power struggle between groups and identities, and democracy as a constant struggle of identities with clashes between positions, show of power, and influence, and conversions (instead of consensus) from one belief to another (→ Social Identity Theory). Here, constructivism is connected to a view of communication and language as ultimately strategic and instrumental. Thus the media can be evaluated on how well it performs the act of recognition of new and constantly emerging plurality groups, identities, and interests in late modern societies, but not (even in theory) on how it is able to provide a site for deliberation and negotiation between diverse positions.

## EMPIRICAL DIMENSIONS

All the theoretical disagreements aside, pluralism sets an important normative goal in evaluating media policy and performance. This opens up the difficult terrain of operationalizing plurality: where and how can it be measured?

On the *level of media structures and institutions*, a call for pluralism translates into a need for a diverse and diffused pattern of control of media organizations. In liberal democracies this means measuring the concentration of power by media ownership and other forms of economic control, such as advertising and sponsorships (→ Concentration in Media Systems; Media Economics). At this level media systems have had a tendency to

develop increasing ownership concentration. This anti-pluralist trend has manifested itself in the development of chain-ownership of one media, such as newspapers from the late nineteenth century onward; in the emergence of multimedia companies, combining various media activities such as television, magazines, and newspapers; or as conglomeration, when media companies are part of wider industrial corporative structures (Doyle 2002; → Media Conglomerates). The effects of ownership concentration on the diversity of media content are complex: in some current contexts (such as multi-title magazine publishers and multi-channel television corporations) concentration can contribute to diversity (Van der Wurff 2005, Van Cuilenberg 2005), although in others (such as syndicated or corporately shared newspaper material) it can clearly add to the homogenization of media content.

Another focus for measuring media plurality is to look at the *diversity of the media workforce*. During recent decades, media companies have begun to pay growing attention to the cultural diversity of their employees, who by and large are still mostly disproportionately white, male, and upper middle-class, and thus not representative of the plurality of their respective publics. There is a historical liberal pluralist counterargument for this critique: that journalism is a profession (→ Professionalization of Journalism) and that this enables journalists to act as neutral mediators of social reality. However, a question remains whether calls for professionalism and its particular set of values compromise the ideals of pluralism or diversity in the first place (Glasser 1992; Zelizer 2004). Empirically, there are also some clear indications of international homogenization related to professional journalism and its practices (Hallin & Mancini 2004).

Focusing on the *diversity of media content*, one way of judging pluralism is to evaluate the access of various groups and their representatives to the media (→ Access to the Media). Research has consistently emphasized that the media in general and journalism in particular reproduce the existing knowledge and power structures of society by offering the “primary definers” and legitimate representatives of routine institutional sources a dominant position in the public (Hall et al. 1978). Through this privileged access these actors also exercise control of the agenda of issues that the media system deems noteworthy (→ Agenda Building; Agenda-Setting Effects). Powerful countries, institutions, and their elite representatives are also able to control the frames of representation in which the media depict the world (→ Framing of the News; Framing Effects). Indeed, there is clear evidence of a structural correspondence between the plurality of opinion in the media and the plurality of opinion in the political power elite: mainstream media content is an “index” of the range of legitimate internal disagreements of the power elite (Bennett 1990). However, without contradicting this long-term functionality for the status quo, one should bear in mind that professional → news values and presentation techniques cannot be totally reduced to structural power: “the journalistic field” of news production practices also sets conditions for the performance of the powerful actors (Benson & Neveu 2005; McNair 2000; → News Routines). Finally, in terms of media content, plurality of views is also closely tied to the actual theme in question: there are domains of social life (such as art) that can enjoy a much more diverse debate than others (such as foreign policy or national security).

Measuring plurality can also mean considering the *points of view of the audience* and its choices. It is one thing to measure the diversity that a whole (national) media system

provides but sometimes quite another thing to look at what is available as actual choice for the audience (Hellman 2001). Thus, for instance, television programming as a whole can be very diverse but in a given prime-time moment the channel competition can create a stream of very homogeneous content. Indeed, the question of what constitutes the relevant media opinion market (or audience) within which plurality is measured will become all the more complex and important (Van Cuilenberg 2005). It is crucial whether the relevant market is defined geographically as a local, national, or even transnational one, and whether pluralism is measured across media output or inside particular → genres of content (news, entertainment, special interests, etc.).

In judging all this and other, similar empirical evidence, obviously a lot depends on the theoretical positions outlined above. Liberal pluralism can, for instance, celebrate enhanced professionalism of media production, while more constructivist accounts would point to the shortcomings of professional routines in either facilitating dialogue or allowing visibility to new, emerging identities and groups. Similar differences of interpretation apply at the structural level. For instance, on the one hand the link to advertising and audience lifestyles has driven the media to create new kinds of profiled content, which increases quantitative diversity (→ Commercialization: Impact on Media Content). On the other hand this connection equates the market value of social groups with their possibility of being publicly and democratically represented. Thus the logic not only reproduces but also increases social power differences.

### NEW QUESTIONS

Since plurality and pluralism emerge as an essential and essentially positive part of modern western social imaginaries (→ Deliberativeness in Political Communication), it is likely that this vocabulary will remain a prominent part of discussions about the role of the media and journalism in society, about how well the media actually perform this role, and about what kind of → media policy would enhance pluralism best. However, at least two recent trends pose questions for its usefulness as a framing notion of media performance.

A first set of challenges emerges from the *rapid development of media technology*. In a digitalized and interactive network environment, many traditional boundaries become blurred. Questions like “Who is a journalist?” or “Is this journalism (or entertainment or advertising)?” are becoming much more complex than in traditional media outlets. Thus the role of the idea of professionalism in debates about media performance is likely to change. Also, since the threshold for being able to broadcast (webcast) your message has dropped dramatically, some believe this will potentially solve some of the structural problems of earlier mass media arrangements. There are also partly legitimate hopes that some audiences will become active and critical partners in surveying both the media’s performance and the news, providing alternative content and exposure (with the help of light media production technology such as mobile phone cameras) and changing “hot spots” of attention and criticism (Benkler 2006).

To be sure, the early twenty-first century has witnessed some interesting and impressive experiments where *new media forms* enable new kind of organizational patterns for media production: despite all their problems, such phenomena as “wikis,” → open source

journalism sites, and blogging (→ Blogger) are evidence of a changing landscape. Since pluralism is a historical construction, it will be affected by all this. For instance, in its most dramatic form, open source ideology suggests that the “collective intelligence” of wiki-based sites does away with the role of experts – and even actually synthesizes opinions and evidence (the very modern distinction of which gives rise to pluralism). Whether pluralism continues to have a central bearing on our evaluation of such media practices is a good question. But for the moment, it is not at all clear that the *theoretical* strands of debate would become obsolete in the near future. It is, after all, telling that many of the problems the new technology promises to solve are the same ones that the debate around pluralism has attempted to come to terms with.

A second notable set of challenges emerges from outside the media. Despite differences of opinion about timing and depth, there is a broad consensus that modernization has been lately reshaped into a process of *globalization* (→ Globalization Theories). This is a major shift in the economic, political, social, and cultural conditions of the media. Since pluralism was invented during the emergence of the modern nation-state, it tends to look at society as a nation-state. It also situates media in the service of such a unit and in cooperation with particularly national political and economic structures, institutions, and identities. In a world of globalized economy, weak translational political structures, and diverse, diasporic identities, a call for a pluralistic media is perhaps not enough. In the contemporary world, media itself has become such an obvious part of political communication that the agenda for a pluralist media theory – the media to inform about reality and reflect the variety of opinions – might not be plausible any more.

## Poland: Media System

*Katharina Hadamik*

*Ghent University*

The Republic of Poland is one of the largest countries in central Europe, and in size of population (38.7 million people) ranks eighth in Europe. Of that population, 98 percent are of Polish ethnic origin, and over 90 percent are Roman Catholics. Politics in Poland takes place in the framework of a parliamentary representative democratic republic.

Poland’s history is characterized by a long-lasting struggle for independence and a late democratization. In 1795 the country was partitioned by its neighbors and erased from the map of Europe until its reconstitution in 1918. After a short period of democracy (until 1926), Poland was ruled by an authoritarian government. The Second Republic was destroyed by the German invasion in 1939. After World War II, the *People’s Republic of Poland* was created, a satellite state of the Soviet Union.

By the late 1980s the workers' and intellectuals' reform movement *Solidarnosc* ("Solidarity") was able to enforce a peaceful systemic transition. The era of communism ended in 1989, and Poland underwent a process of far-reaching political and socio-economic transformation. It is regarded as a consolidated democracy and one of the most successful transition countries of the former Eastern bloc. In May 2004 Poland became a member of the European Union. The country has a rather polarized multi-party system, which especially in the early 1990s was characterized by an extreme fragmentation. After the 2005 elections, six parties entered Parliament. Poland has since then been ruled by a centre-right minority government.

### **TRANSITION AND LEGAL FRAMEWORK**

The Polish media system under communist rule was regarded as one of the most consistently open in the Eastern bloc. Its press landscape especially was much less uniform than conventionally anticipated in a communist state. Nonetheless, for more than four decades its main characteristics consisted of state control, communist ideology, and centralistic structures. The systemic transition toward democracy and market economy facilitated fundamental changes in the media sphere. Old monopolistic structures have been dismantled and replaced by pluralistic ones, censorship and barriers to information have been abolished, and new players have been admitted to the media market.

Press freedom started to exist as early as mid-1989. In 1997 it was anchored in the new constitution. Article 14 states: "The Republic of Poland shall ensure the freedom of the press and other means of social communication." In addition, Article 54 guarantees freedom of expression and prohibits censorship. Media communication is regulated mainly by three statutory acts: the Press Law of 1984 (amended in 1990 and 1991), the Broadcasting Act of 1992 (with later amendments), and the Intellectual Property Law of 1994.

### **PRINTED PRESS**

Since 1989 the press landscape has become noticeably more differentiated. From 1990 until 1991 the Workers' Publishing Cooperative (RSW), a gigantic press combine established by the communist ruling elite, was wound up and its publications privatized. Thereafter, the press market developed with practically no restrictions. With very few exceptions, all publications available on the Polish press market are privately owned and do not receive any state subsidies. The government basically has no means of exerting influence over the printed press.

The range of print publications is diverse and extensive. In 2004 there was a total of 6,502 publications, including 58 dailies, 396 weeklies, 226 fortnightlies, 1,815 monthlies, 2,153 bimonthlies and quarterlies, and 1,854 others (i.e., sub-local publications, distributed in one or more districts of a city, but not in the entire city). The written press has always had a strong tradition in Poland. Nonetheless, newspaper readership has been declining in the last two decades. In 2006, the average total single circulation of paid daily newspapers amounted to 4,369,000 copies (free daily newspapers 597,000). Newspaper sales per 1,000 adult population amount to 137. The market for national dailies has expanded in recent

years with the successful launch of new paid and free newspapers. The regional daily press, however, has been in decline. Since 1999 eight regional dailies have ceased to exist.

In 2006, there were 12 *national dailies* on the Polish market, including seven dailies of general interest (five quality papers and two tabloids) and five specialized dailies (one focusing on sports and four focusing on economical and legal issues). For more than a decade *Gazeta Wyborcza* (“Election Newspaper”), the first independent daily in the Eastern bloc, set up in May 1989 by former dissidents, kept its leading position. A market shake-up occurred in 2003 with the introduction of the tabloid *Fakt* (“Fact”) by the German publishing company Axel Springer. Within a short time, the newcomer succeeded in attracting many Polish readers, and reached a circulation of 529,000 copies in 2006. *Gazeta Wyborcza* has been relegated to second place (423,000 copies). Besides national titles, there were 27 regional dailies and four free newspapers in the Polish market in 2006. External pluralism can be observed in the national press especially. Whereas *regional dailies* keep their profile rather neutral, national dailies represent a variety of political orientations and worldviews. National dailies are owned by Polish and foreign companies or Polish–foreign joint ventures. The regional market is dominated by two foreign companies: the Norwegian Orkla and the German Passauer Neue Presse.

The *magazine* market has changed significantly since 1989. It was mainly foreign companies that identified many market deficits in this area and that filled the gaps successfully with the introduction of new offerings (women’s magazines, young people’s magazines, TV guides, and popular color magazines). The magazine market is characterized by a high concentration. The 14 biggest magazine publishers publish more than 100 titles with a total circulation of 30 million copies. The major magazines are owned by foreign companies: Bertelsmann, Axel Springer, Heinrich Bauer, and Hachette Filipacci.

## BROADCASTING

The process of restructuring the broadcasting sector was accompanied by numerous controversial discussions. It lasted until March 1993, when a new broadcasting law came into force and a dual system was introduced. State broadcasting was broken down into 18 separate stock corporations of *Polskie Radio* (Polish Radio) and *Telewizja Polska* (Polish Television [TVP]), which serve as public broadcasters. Public broadcasting de facto remained under state control because the state is the 100 percent stockholder of all of the stock corporations. Also in 1993, the first licenses for private broadcasters were awarded.

The Broadcasting Act of 1992 established a new controlling body: the National Broadcasting Council (KRRiT). Inter alia, its responsibilities include the allocation of licenses to private operators, the supervision of public and private stations, the nomination of the supervisory boards of the public media, and the distribution of the broadcasting fees. Although in the initial concept it was foreseen as a group of independent experts, the National Broadcasting Council has always had strong links to politics. Its members are nominated by Parliament (*Sejm* and *Senat*) and the president. Right from the start, each president and each government has attempted to name people close to them as candidates to the Council and to exert influence over the body in various ways. However, because individual council members could not be dismissed during their period of office, direct governmental control was not always possible. It often happened

that the majority of the political powers in the Council represented the opposite of the ruling government's views. Major changes occurred after the Act of December 29, 2005, became law: the term of office of the previous Council expired and a new board was established. All its members, who in spring 2006 nominated new supervisory boards for the public media, have political allegiances with the ruling center-right government. Furthermore, the Act has reduced the number of board members from nine to five: two are appointed by the Sejm, one by the Senat, and two by the president. The term of office of each of the members is six years. Before this, a rotating system ensured that every two years one third of the Council members were changed.

The market for audiovisual media has expanded significantly since 1993. Polish radio listeners and TV viewers have a wide and varied choice. Polish public radio provides four national programs. Its independent regional stations provide 17 regional and four local programs. Nationwide programs are also offered by three private operators: the commercial stations *RMF FM Radio* and *Radio Zet* and the Catholic station *Radio Maryja*. Furthermore, there are three stations that broadcast supra-regionally and 168 local stations. In terms of listeners reached, the private commercial stations are leading: *RMF FM* with 21.4 percent, and *Radio Zet* with 18.8 percent. The most popular public programs are *PR 1* (14.9 percent) and *PR 3* (6.1 percent). Most of the nonreligious radio operators with national or regional transmission range have foreign partners.

Regarding the TV market, it is crucial to distinguish between broadcasters whose programs can be received terrestrially (via the analog signal) and those whose programs can be received via satellite, cable, and digital TV platforms. To the first group belong Polish public television (TVP), which broadcasts two nationwide programs and one regional program (produced by 16 regional departments), as well as the private operators that received a license to broadcast (*POLSAT*, *TVN*, *TV 4*, and *Telewizja Puls*). In terms of viewers reached, the public channels have kept their leading position: *TVP 1* (25.4 percent) and *TVP 2* (20.8 percent), followed by *POLSAT* (15.9 percent) and *TVN* (15.1 percent). *POLSAT* and *Telewizja Puls* have remained Polish in their ownership structure, while *TVN* and *TV 4* have foreign partners.

Via satellite, cable networks, or digital TV platforms more than 400 TV programs (foreign programs, thematic channels) can be received in Poland. Of these, 50 are Polish-language broadcasts. They are produced by foreign operators as well as by Polish public television and the licensed commercial stations. In 2006, 30 percent of all Polish households subscribed to cable TV, 20 percent possessed a satellite antenna, and 8 percent took advantage of the services provided by the two digital TV platforms *Canal+ Cyfrowy* and *Cyfrowy Polsat*. It is planned to introduce terrestrial digital TV before 2015.

The importance of the *Internet* has been growing continuously since the 1990s. In 2006, 30 percent of all Polish households and 87 percent of all companies had access to the Internet. About 10 million Poles are regular users, spending an average of 22 hours per month on the web. The two most important Internet portals in Poland are *Wirtualna Polska* and *Onet*. Almost all important Polish media outlets have developed their own websites, too. In the media market, the observable tendency is that the boundaries between telecommunication operators and cable TV operators are disappearing. Companies possessing the corresponding infrastructure are able to provide access to television, telephone, and Internet at the same time.

The development of the Polish media since 1989 has been influenced by two crucial factors: structural transformation following the systemic change, and a far-reaching technological transformation. In both respects, Polish media have followed “western” standards and global trends. The Polish media system shows characteristics of diverse western models. As in Mediterranean countries, a political culture prevails that aims to exert influence over the public media. This is especially true for public television, which is often instrumentalized by politicians. The degree of regulation (of commercial time, violent content, and ownership) in the broadcast sector is rather high. In this respect, Poland resembles countries in northern Europe. Communication policy toward print media, however, is particularly liberal.

## **Politainment**

*Jörg-Uwe Nieland*

*University of Bochum*

Politainment refers to the blending of politics and entertainment into a new type of political communication. The portmanteau word is composed of “politics” and “entertainment,” analogously to the term → infotainment. As well as infotainment, which is used as a label for a specific television program type, the term “politainment” denotes, in a broader sense, the entangling of political actors, topics, and processes with the entertainment culture. According to Dörner (2001), two different, though interrelated forms (or levels) of politainment may be distinguished: entertaining politics and political entertainment. Both take advantage of the mass media’s potential to attract wide

audiences and to create celebrity (→ Celebrity Culture). Politainment may be seen as resulting from an increasing mediatization and professionalization of politics that characterize modern democracies (→ Mediatization of Politics; Political Consultant; Spin Doctor). Governments, parties, and politicians cope with these developments by adapting to the → media logic, particularly to the selection criteria and presentation formats of → television (→ Television News; Television News, Visual Components of).

*Entertaining politics* serves political actors to get media access in order to enhance their public images and to promote political issues. This is quite obvious during election campaigns (→ Election Campaign Communication), when, for example, party conventions are staged by movie directors mimicking the dramaturgy of pop concerts, and when political candidates appear on popular television talk shows. Politicians presenting themselves in an entertainment setting, exposing their personal characteristics and private lives, are catering especially to voters with little interest in politics.

A certain type of politainment exploits for political purposes the popularity of showbiz celebrities. This is the case when pop stars engage in politics, endorse political candidates, or even move into political offices. For example, well-known singers such as Pete Seeger, Bob Dylan, Bob Marley, and Bruce Springsteen, as well as bands such as the Clash, Rage Against the Machine, and Public Enemy, are known for expressing political viewpoints. Others, like Bono and Bob Geldof, seek publicity in the context of world economic forums or G8 summits in order to advocate political goals. Famous movie stars like Ronald Reagan and Arnold Schwarzenegger gained top political office in the United States and thus succeeded in transmuting popularity into political influence. Silvio Berlusconi's career took him from solo entertainer to Italian prime minister, after having been successful in the television business. The Berlusconi case exemplifies how commanding television entertainment can be transformed into political power.

*Political entertainment*, a somewhat different type of politainment, refers to political topics in various entertainment formats of → popular music, film (→ Film as Popular Culture), and television. The entertainment industry tends to exploit the world of politics with its sometimes interesting personalities, prestigious figures, and exciting scandals (→ Scandalization in the News). Movies and television plays take up political matters as raw material for drama or satire plots, as illustrated by movies such as *Wag the Dog* and *Primary Colors*, and by serials like *West Wing* and *Yes, Prime Minister*. Late-night television, following the model of NBC's *Tonight Show* (made famous by Johnny Carson) and now well established in many countries, presents political issues and celebrities in an entertaining format mixed with showbiz and comedy. It is assumed that Jay Leno's *Tonight Show* had a decisive role in promoting Schwarzenegger's candidacy for governorate of California.

This example illustrates quite well the symbiotic relationship between politics and entertainment. Politainment offers political actors effective means for reaching the public and pursuing political goals and, in exchange, provides the entertainment industry with celebrity figures and exciting stories. As a result, politics appears entertaining while public affairs enter popular media, so that the distinction between fact and fiction erodes. The Clinton–Lewinsky scandal and its media coverage are perhaps the best-known example of the blurring line between hard news and tabloid-style entertainment (Carpini & Williams 2001).

Politainment seems to serve political functions, as it brings political actors and issues to the attention of a wide and partly apolitical audience and may thus stimulate political participation and contribute to agenda-setting processes. The legendary Live Aid and Live 8 concerts reached millions of people worldwide and directed public attention to famine and poverty in the third world. The Live Earth concerts in 2007 followed this model to promote the issue of global warming. There is empirical evidence that the strategy of using entertainment as a vehicle for political matters is successful, particularly in media environments such as the US, dominated by entertainment formats and → soft news (Baum & Jamison 2006). Van Zoonen (2005) draws a parallel between engaged citizens and the behavior of fans of popular music, claiming that entertainment makes citizenship pleasurable. Politainment may stimulate interpersonal communication and Internet interaction, give an emotional access to the world of politics, and thus strengthen political values.

More often, however, politainment is regarded as a problematic development, criticized for downgrading civic culture and for contributing to → political cynicism. Politainment as a communication strategy designed by political marketing specialists is suspected of leading to excessive personalization, even “celebritization,” of politics and of fostering political populism (→ Mediated Populism; Political Marketing). Staging political events as spectacles and presenting politics through the art forms of popular culture may create a fake picture of the political reality, a political “fantasyland” (Nimmo & Combs 1983), impeding rather than advancing citizens’ understanding and deliberation of politics.

# Politeness Theory

Susanne M. Jones

University of Minnesota

Politeness theory is a sociolinguistic theory in the pragmatic tradition that was developed by Brown and Levinson, who extended Goffman's dramaturgical approach. Using Durkheim's work on social rituals, Goffman examined how people manage their public identities, which he labeled *face*. When in the presence of others, one's face is always on display and others will form impressions and respond to these impressions (→ Impression Management; Self-Presentation). Face, then, becomes a situated social identity that is not owned, but rather resides in the flow of human interaction. To have one's face invalidated by others means to lose face; to have it sanctioned is to have face. Face must therefore be maintained and is subject to constant threats. The process by which people maintain face is called *facework*. Because people are mutually concerned with maintaining each other's face, facework becomes a necessary social ritual that provides the cooperative mechanism for interaction order as opposed to interaction chaos. Considerable research in interpersonal communication has used politeness theory and facework to examine the communicative strategies people use to enact, support, or challenge face.

Brown and Levinson extended Goffman's analysis by refining the concept of face, and by proposing a heuristic of politeness strategies people use to manage *face-threatening acts* (FTAs). Face was defined in terms of two opposing human needs: *negative face* (the need for autonomy) and *positive face* (the need for validation). The struggle to balance positive and negative face points to a fundamental conflict involved in human interaction: on the one hand, people strive to cooperatively manage each other's face, and on the other hand, they tend to unintentionally commit acts that are inherently face threatening. It is this presumably universal conflict that permeates all social interaction and that subsequently motivates the use of politeness strategies. The severity of an FTA is determined by (1) the social distance of the speaker to the hearer (e.g., status, closeness), (2) the power of the speaker relative to the hearer, and (3) the rank of the FTA (i.e., a cultural and personal assessment of the threat magnitude).

Drawing from Grice's *conversational maxims*, Brown and Levinson proposed a hierarchy of five mutually exclusive politeness strategies that balance two opposing goals: the goal to communicate the content of the message in an efficient way, and the goal to preserve one's own and the other's positive/negative face. The most polite strategy is to entirely *avoid the FTA*, which maximizes face saving at the expense of communicating content. The least polite strategy is to relinquish all efforts at face saving and to go *bald-on-record* without redress, a strategy that prioritizes the content of the message at the expense of face. In between are three strategies that vary in degree of politeness. People might choose to do an FTA *off record* through innuendos. When speakers use *positive politeness* FTAs, they show regard for the recipient's positive attributes (e.g., claiming common ground), whereas *negative politeness* FTAs minimize imposition on the listener's autonomy (e.g., incurring a debt). According to Brown and Levinson (1987), negative politeness strategies are more polite than positive politeness strategies, because they mark the speaker's self-effacement.

Politeness theory and facework have been tested not only cross-culturally (Holtgraves 2001) and nonverbally, but also in face-threatening social contexts, such as the provision of advice and requests, sexual resistance, social influence, phone calls to a 911 emergency center, and doctor–patient conversations (MacMartin et al. 2001; Metts & Grohskopf 2003). Empirical research on politeness theory has used two different methodologies to examine politeness and facework. First, the extent to which certain strategies are more or less face threatening has been examined most frequently with a message perception method, which requires participants to read hypothetical scenarios or dialogues that vary in face threat. Participants then evaluate strategies that vary in politeness on the basis of their perceived attention to positive or negative face. Second, by far the greatest amount of research has tested how politeness is enacted in everyday conversations by using discourse analysis, an interpretive method that attempts to bridge the gap between sentence meaning and speaker meaning by examining the functions of specific speech acts. So far, results are mixed, which might partially be a function of the different methodologies that have been used to examine politeness and facework. For example, scholars in the message perception tradition argue that speakers view positive politeness as more positive than negative-politeness strategies, and use various politeness strategies within the same utterance, even though these strategies were conceived initially as linearly arrayed and mutually exclusive (Metts & Grohskopf 2003). Brown and Levinson (1987), however, contend that politeness theory needs to be examined with interpretive, rather than deterministic, methodologies in order to capture subtle speaker–hearer relationships in speech acts in everyday interactions.

Face, faceless and facework, have entered the common vernacular in a relatively short period of time, indicating their immense relevance and heuristic value. Future research will focus on several issues. For instance, initial work has begun to uncover individual differences in face needs and facework competence. In addition, the relative importance of positive face compared to negative face appears to be an important distinction between personal and social relationships. Yet, we know little about how people avoid threats to positive face in close relationships. Scenario studies might not reveal the conversational nuances relational partners use to manage positive face. Rather, a detailed analysis of couples' conversation is necessary.

# Political Advertising

*Lynda Lee Kaid*

*University of Florida*

Political advertising is a form of political communication that uses the mass media to promote political candidates, parties, policy issues, and/or ideas. Advertising messages are generally controlled messages allowing for direct communication with the public and voters without interpretation or filtering by news media or other sources.

In the United States, where political advertising is the dominant form of communication between political candidates and voters, political advertising is a paid media form, and candidates and parties purchase airtime or space for their advertising messages directly from commercial media outlets. Since political advertising enjoys strong protection as a form of free speech/free expression under the US Constitution, there are very few regulations or restrictions on the amount of advertising that can be purchased or the content of advertising messages. In other countries political advertising, particularly on radio and television, is either prohibited or tightly controlled. Some countries allow more freedom for print advertising, and, since purchase of broadcast advertising is prohibited, candidates or parties are given free time for promotional messages. The UK and France are examples of such systems. Other countries (e.g., Germany) have a dual system, providing free time on public broadcasting outlets and allowing purchase of time on private stations (→ Political Communication Systems).

## ISSUES OF FORM AND CONTENT

Early forms of political advertising were printed, and generally took the form of → posters, signs, mailers, flyers, and brochures. Newspapers and magazines also offer important mass distribution channels. In the first half of the twentieth century, radio developed into an important advertising medium, but it was the development of television that led to the current popularity and significance of political advertising. Beginning in the United States with the first presidential campaign of Dwight D. Eisenhower in 1952, candidates and parties began to purchase time for political advertising on television. Since that time, televised political advertising in the United States has been an increasingly important part of every presidential campaign, and dominates the communication at almost all election levels, including state and local elections (see Jamieson 1996 for an overview of the historical evolution of political advertising in the United States).

In democracies around the world political advertising has also evolved into an important form of communication. In many countries printed forms of political advertising, such as posters and newspaper advertising, remain the most important forms of electoral communication. Some observers suggest that “American-style” televised political advertising has been spreading to other countries, but there is also evidence that these trends are more the result of professionalization and modernization of campaign techniques (Kaid & Holtz-Bacha 1995; Kaid 2006a).

*Criticisms* of political advertising have become a recurring aspect of politics in many democracies. In addition to complaints about the accuracy or truth of specific political ads, the most common criticisms are (1) that political spots are too short to contain meaningful information, (2) that television ads focus too much attention on the candidate's image at the expense of issues, and (3) that political ads are too negative. Certainly political spots in the United States are quite short: the average length is now around 30 seconds, and some are surely superficial and lacking in substance. Many spots, however, can convey simple viewpoints of the candidate in 30 seconds. In most other countries, the prescribed format is somewhat longer, up to 5 minutes or longer. Research has not supported the second concern. In their analysis of the video style of presidential spots in the US, Kaid and Johnston (2001) verified that television spots focus much more heavily on issues than on image or candidate qualities. This is also true of most electoral advertising and party broadcasts in other countries (Kaid & Holtz-Bacha 1995; Kaid 2006a).

The concern about the increase in negative or attack advertising may be a valid one (→ Negative Campaigning). Negative advertising is usually defined as advertising that attacks the opponent or opposing idea, rather than discussing the positive attributes of the sponsoring candidate, party, or issue. In the United States the amount of such negative advertising has been increasing over the past two decades, and in some recent presidential campaigns the percentage of negative ads was higher than that of positive ads. This trend toward negativity has also increased as a result of new campaign finance laws in the United States, which greatly expanded the involvement of independent groups as sponsors of political advertising. In the 2004 presidential campaign, for instance, independent groups such as the Media Fund, MoveOn.org, Swift Boat Veterans for Truth, and the Progress for America Voter Fund spent millions of dollars on negative political advertising.

While these trends toward negativity in US presidential elections continue, there is no evidence that the majority of electoral advertising at state and local levels is negative. There are certainly notorious examples of attack ads in races for senator, governor, or Congress, but the majority of ads are positive. This is also true of political advertising in other countries. While many countries do have some examples of attack advertising, and trends suggest that this may be increasing, most political advertising outside the United States focuses more on the positive attributes and issue positions of the sponsoring candidate or party.

## **EFFECTS OF POLITICAL ADVERTISING**

The effects of political advertising are less easily and clearly documented, but some conclusions are clear. One of televised political advertising's great advantages is that it is capable of overcoming selective exposure. Many voters only choose to expose themselves to political messages that are in line with their predispositions, making them less likely to see persuasive messages with opposing viewpoints. However, in the US political spots come in the middle of television programs, leaving voters less able to avoid those that have messages counter to their beliefs. Television ads also reach voters when their other defenses against opposing messages may be down, when they are focused on other concerns and more open to persuasion. Thus, political advertising tends to work best with voters who are uninvolved or even undecided (→ Advertising Effectiveness).

Overall, there is a large body of research that provides convincing evidence that political television advertising can be effective in *changing a candidate's image* and/or in affecting *voting decisions* about the candidate (Kaid 2004). The former effect, changes in → candidate image, may go in either direction. That is, the changed effect may be an increase in positive opinions or a negative effect decreasing the image. Similar effects have been observed in many countries around the world. Some research has also tied exposure to political television ads directly to voting behaviors and electoral outcomes (→ Political Persuasion).

Political advertising is particularly effective in communicating *issue information* to voters. Exposure to political advertising often leads to increased voter knowledge. In fact, studies have shown that political advertising can be more effective at eliciting voter recall of issues than can exposure to television news (Patterson & McClure 1976) or even televised debates (Just et al. 1990).

Because *negative advertising* has been increasing, considerable research has been dedicated to determining the conditions under which it is effective. Some candidates and parties fear a backlash from negative advertising that might harm, instead of help, the sponsoring candidate. While a few researchers have observed such effects, the overwhelming evidence suggests that negative advertising is quite effective, with limited backlash potential. One of the reasons for this effectiveness is that the public tends to remember negative information more than positive information. Negative ads also tend to be more effective when they criticize the issue positions of the opposing candidate, rather than the personal qualities or image of the opponent.

Research also offers some good advice about how to offset the effects of negative advertising. First, it is helpful to inoculate voters against possible negative attacks. By providing counterevidence or positive candidate information first, a candidate or party decreases the possibility that later attacks will be credible. Second, once an attack has been made in a negative advertisement, the target must provide a rebuttal to the charges. If a candidate is attacked and does not respond, the public tends to believe the attack is true. American presidential campaigns provide many good examples of the dangers in letting attacks go un rebutted. In 1988 Michael Dukakis's campaign was damaged by his failure to respond quickly to George H. W. Bush's advertising attacks criticizing Dukakis's record on crime. More recently, in 2004 John Kerry failed to take seriously the attacks of the Swift Boat Veterans for Truth group on his Vietnam War record. Rebuttals must come quickly, and they must be direct responses, not couched in vague or ambiguous terms.

There is also a concern that increased negative advertising may lead to lessened participation in the political process by voters. Ansolabehere and Iyengar (1995) have proposed that exposure to negative advertisements can decrease election turnout by turning voters off and making them cynical about politics. Most other researchers, however, have not found this to be the case, and some research even suggests that heightened negativity may increase political interest and stimulate turnout (Kaid 2006a).

## NEW DIRECTIONS IN POLITICAL ADVERTISING

Criticisms of political advertising have led to the desire on the part of news journalists to scrutinize political ads and to attempt to circumvent the candidate's desire for a controlled message unfiltered by the media. Print and broadcast journalists have begun to offer

“adwatches” as a way of exposing inaccurate or distorted advertising messages. In an adwatch, a journalist analyzes the advertisement, researches the claims made in it, and attempts to evaluate the truth and accuracy of the ad. While journalists hoped adwatches would mediate the effects of ads on the public by pointing out untruthful or distorted claims, studies have shown that this is often not the case. Frequently, despite journalistic efforts, adwatches have served to enhance the ad, making its visual and verbal claims more salient to viewers.

Political advertising has taken new directions recently with the increased importance of the → Internet (Kaid 2006b). Candidates are using websites as a form of direct political advertising, and they are also using them to host copies of their political television ads, making it possible for viewers to play and replay the ads. In addition, some candidates and third-party interest groups are using their own websites to distribute unique video ads produced only for distribution on the web. Some of these formats take advantage of the interactivity possible on the web, thus providing more opportunity for direct voter involvement in the ads. Web publishing tools have also made it possible for ordinary citizens to produce their own ads. These are all trends that will grow and take new directions in the future.

# Political Cognitions

*Doris A. Graber*

*University of Illinois at Chicago*

*Gregory G. Holyk*

*University of Illinois at Chicago*

“Political cognitions” refers to the ability of human beings to acquire and possess → political knowledge through perception, reasoning, or intuition. Citizens’ cognitions about politics come mainly from information supplied by the mass media – television, newspapers, magazines, or the Internet – because most political happenings are beyond the day-to-day experiences of citizens. Dependence on mass media has consequences for peoples’ cognitions about politics and makes it important to investigate what kinds of information mass media produce.

## **MEDIA AS SOURCES OF COGNITIONS**

Despite news professionals’ claims of balanced reporting, information provided by the mass media is biased (→ Balance; Bias in the News). Indeed, complete → neutrality is impossible. Media personnel must choose what political stories to report, whom to use as story sources, and how to present the narrative of political events. By highlighting certain issues, people, and details, and framing them to reflect particular perspectives, the media affect how people interpret information and use it for political decisions (→ Framing Effects). For instance, Clinton’s approval ratings rose during the Lewinsky sex scandal when news media framed the event as a conservative war waged against a liberal president rather than focusing on the ethical issues concerning the sexual behavior of the president.

The news media are often blamed by democratic theorists for the public’s lack of civic participation and knowledge. These theorists charge that the media provide insufficient political information for effective participation in public life. However, other theorists absolve the media of blame, noting that the number of important issues under consideration at any one time is so great that citizens cannot possibly be fully informed about all of them. Even if people know the details of an event initially, they soon forget them and retain only the gist of the story and their reactions to it. Nonetheless, citizens can make sound political decisions without knowing most of the facts about which social scientists quiz them when judging their civic competence.

The media do deserve blame for often failing to present political information in ways that citizens can easily process and remember. Political events are frequently presented as discrete happenings, unconnected to any political history and narrative. Political stories rarely focus on the aspects that the majority of citizens find most interesting and memorable. That makes it difficult for people to commit these stories to long-term memory, and exacerbates the already considerable negative effects of inattention and apathy.

Distinguishing media impact on citizens’ attitudes from the impact of multiple other information sources is difficult. Experiments have been useful in isolating mass media

effects but raise questions about the validity of the findings in real-world settings. Experiments have revealed ample evidence of profound → media effects on citizens' political attitudes. Citizens tend to adopt the dominant frames that are offered by the mass media. Consequently, their political attitudes conform to the mainstream opinions featured by the media, which in turn reflect the views of those political elites on which the media rely heavily as information sources (→ News Sources). Not only do media messages affect the tenor of political attitudes, but media selection of issues has an → agenda-setting effect. The emphasis of media coverage, especially if stories are prominently placed, indicates to citizens which issues are significant and which can be safely ignored. Political issues that are emphasized in media stories are much more likely to be described as one of the “most important” issues than are issues receiving lesser attention (Iyengar 1991).

Though political messages in the media unquestionably affect the political attitudes of citizens, the process involves more than a simple transfer of information (→ Attitudes). People are not blank political slates and their political cognitions are not completely determined by media information (→ Information Processing). People combine their own experiences, biases, motivations, and stereotypes with the political information they consume (→ Information Processing; Stereotypes; Stereotypes). Their built-up expectations and beliefs about political issues and events provide a lens through which they view and interpret new political messages. Political cognitions thus represent a melding of content and framing of political messages with citizens' existing political attitudes and biases. Because existing attitudes and biases guide citizens' opinion formation, this process has been dubbed “motivated reasoning” (Lundgren & Prislín 1998).

### **COGNITIVE PROCESSING NEEDS AND CAPABILITIES**

Political scientists have different conceptions of how much breadth and depth of political knowledge average citizens need in a democracy to perform their civic duties. While most deem a well-informed and active public essential, they disagree about the standards that should be applied. Judged by idealistic standards about citizens' roles in a democracy (the “ideal” citizen), average citizens are woefully uninformed about current and historical political facts. They know too little about their current government officials and political institutions, current domestic and international political issues, political geography, and political history.

Political realists concede that citizens have neither the cognitive capabilities nor the motivation to process the vast amounts of political data necessary to fully understand the major political issues requiring attention at various times. Still, people do pay attention to news stories, but they concentrate their attention on the limited amount of information that they find interesting and relevant to their own lives and essential for fulfilling their civic obligations (→ News Processing and Retention). They participate only selectively in the political process. Although democratic idealists are disturbed by limited learning, economic theories suggest that it constitutes rational behavior because it is a waste of intellectual resources to obtain detailed political knowledge about matters that do not appear to be of immediate concern (Downs 1957). Motivation to learn political information peaks at times of crisis when citizens may have to take action but it tends to be low at other times.

Citizens are “active information processors and meaning constructors” rather than passive consumers of political messages (Gamson et al. 1992). However, they tend to choose political messages that provide information with which they already agree. Selective exposure then reinforces existing beliefs. Information that conflicts with established beliefs is avoided because it can produce cognitive dissonance, which is an uncomfortable mental state (Festinger & Carlsmith 1959; → Cognitive Dissonance Theory).

Citizens use cognitive shortcuts in order to simplify and efficiently process political information. They are also unsystematic cognitive processors who do not search their entire memory for relevant political information when expressing political opinions; instead, they tend to use information that is readily available from memory and made salient by the media. For instance, when the media routinely frame politics in terms of politicians’ personalities instead of political issues, personality factors become paramount in people’s thinking and behavior (i.e., voting).

### **SOCIAL INFLUENCES**

Although cognitive political processing is an individual activity and a major part of human identity, it also has social components. For instance, people monitor their social environment and alter their political communication to conform to the political norms of their society. People also alter their search of political information and their own political communication based on what they believe to be the majority or consensus political opinion (Mutz 1998; → Climate of Opinion; Pluralistic Ignorance; Social Perception; Third-Person Effects).

Just as the media act as major sources of information and influence on political cognitions, social factors heavily influence political thinking. Ethnicity, nationality, age, socio-economic status, education, religion, and gender are all social factors that strongly influence political thinking and attitudes. In fact, these social factors are often the central focus of political issues that are important to people, and form the core of their political identities. For example, political attitudes about the role of women in society cannot help but be affected by a person’s nationality, religion, and, of course, gender.

### **EMOTIONS AND POLITICAL INFORMATION PROCESSING**

Many political topics are dramatic and apt to arouse citizens’ → emotions. In fact, political rhetoric is deliberately constructed to appeal to feelings like pride, love of country, anxiety, or fear. Despite the pervasiveness of emotion-arousing appeals, emotional influences on thinking have been condemned in the past as irrational and harmful, and contrary to the prized canons of rationality.

Advances in neuroscience demonstrate that earlier views were mistaken. Emotional arousal releases hormones that enhance human perceptions, speed reactions, and deepen and sharpen memories. In fact, emotional arousal provides the spark that sets off human thinking processes. The emotional arousal produced by many political messages therefore has a major impact on rational political thinking and on the conduct of politics (→ Emotional Arousal Theory). This is especially true during stirring political events like fiercely contested elections, revolutions, or civil and international wars.

## **Political Communication**

*Winfried Schulz*

*University of Erlangen-Nuremberg*

Communication is considered to be *political* if it relates to the exchange of messages among political actors. For example, most of what politicians do is political communication. Likewise, citizens communicate politics when they discuss political issues with friends or family members, phone in to political radio talks shows, or participate in political chats on the Internet. Demonstrations and other forms of protest are more

expressive, sometimes even violent, forms of political communication. However, only few people engage in such forms of communicative activity. Most citizens confine themselves to the role of passive spectators of politics that is presented by mass media. Nevertheless, the consumption of political media reports is a form of political communication too.

In abstract terms, the category of political actors includes all groups, organizations, and individuals who are participating in the process of collectively binding decision-making on the distribution of scarce resources in society. Some of these actions – and the corresponding communications – take place backstage, i.e., in the arcane spheres of party assemblies, parliamentary commissions, diplomatic negotiations, and meetings in government offices. But a major part is performed in public, for example when politicians give public speeches, debate in a parliamentary plenum, or present statements in front of television cameras.

Communication research focuses on political communications taking place *in public*, whereas political science is more interested in decision-making processes inside political institutions. But the research topics of both disciplines overlap considerably.

### CHANGING POLITICAL COMMUNICATION

While politics is becoming more dependent, in its central functions, on mass media, questions relating to the → mediatization of politics are assuming higher ranks on the research agenda. Concepts such as → “media democracy” and “electronic democracy” (→ E-Democracy) have been introduced in order to characterize the transformation of politics brought about by the evolution of mass media. The changes are part of a far-reaching → mediatization of society, which involves all spheres of society and social life (→ Information Society).

According to a model proposed by Blumler and Kavanagh (1999), we are now witnessing the emergence of a “third age” of political communication. This new era is characterized by media abundance, the growth of → political marketing, intensified professionalization of political publicity, and strong currents of populism entering both politics and the media (→ Mediated Populism; Populism and Responsiveness). Politics is adapting to the → “media logic” and is thus continuously shaped by the interactions with mass media. The redistribution of power that comes along with the evolution of mass media is affecting the orientations and norms that regulate the behavior of political actors and journalists. In addition, the manner in which political actors and the media communicate vis-à-vis the general public is assuming new modes and formats.

Blumler and Gurevitch (1995) suggested conceptualizing the interface of the realms of politics and journalism in terms of a → political communication system in which politicians and journalists interact in order to produce political news and comments for a mass audience. The interactions of politicians and media professionals are shaped by a specific → *political communication culture*, which varies across countries according to system-specific role definitions and behavioral norms. Moreover, different regulatory conditions determine the audience orientations and content outputs of political communication systems. They may vary depending on the structure and development of media markets, the degree and form of → professionalization of journalism, the degree of → party–press parallelism, and the degree and nature of state intervention in the media

system (Blumler & Gurevitch 1995; Hallin & Mancini 2004). For example, if there are close party ties with media systems, more biased political content can be expected and also more conflicts over issue priorities. By contrast, a high degree of autonomy of the media system may activate citizens to seek information and guidance about political matters.

Following up on these ideas, Hallin and Mancini (2004) present a cross-country comparative analysis which distinguishes European political communication systems according to three different models: (1) the polarized pluralist model, which applies to Mediterranean countries such as France, Greece, Italy, Portugal, and Spain; (2) the democratic corporatist model, which characterizes the situation in northern and central European countries; and (3) the liberal model, which prevails in the UK, the United States, Canada, and Ireland.

### **THE COMMUNICATION OF POLITICS**

In spite of impressive modernization trends, including, for example, the growing importance of → visual communication, most of the discourse among political actors is still language based. Political elites use language for strategic purposes such as building a positive image, winning public support, or establishing specific perspectives for evaluation (→ Political Language; Strategic Communication). Language labels are instrumental in defining particular groups as friends or foes, and labels indicate that certain problems are relevant for political discussion (→ Symbolic Politics). On the other hand, language serves citizens to make sense of politics, form opinions, and take political decisions (→ Sense-Making). For example, party labels are cues that help voters to make decisions about political candidates or issues (→ Party Political Communication).

The empirical study of language and → political symbols was inaugurated by → Lasswell and associates with their seminal analyses of → propaganda during both twentieth-century World Wars (see, e.g., Lasswell et al. 1949). Analyses of the structure and functions of political rhetoric are now intensely covered fields of research (→ Rhetoric and Politics; Rhetoric and Social Protest). In recent times, normative discourse theories, particularly the “deliberative model” emphasizing the formation of considered opinions through argumentative exchange, as proposed by → Habermas and others, attracted considerable attention (→ Deliberative Polls; Deliberativeness in Political Communication). Deliberation refers to a process in which individuals discuss and weigh arguments from various points of view.

The mass media play a pivotal role in making the political discourse open to the public. Mass media select, process, and transmit → political news and current affairs content (→ Media Production and Content). For ordinary citizens and even for political decision-makers, the media coverage of politics is the most relevant and quite often the only source of information about current events. The picture of politics as presented by the media, whether it is accurate or flawed, neutral or partisan, is for most people a major orientation base. Because most political events elude direct personal experience, mediated information serves to form individuals’ perceptions of the political reality, including the predominating opinion climate (→ Climate of Opinion; Media and Perceptions of Reality). Moreover, when political actors anticipate the media reporting and behave according to what they think the media want, the mediated political reality becomes self-fulfilling.

Thus, political news creates the events that it seems to represent (→ Media Events and Pseudo-Events).

The indispensable functions of mass media for the newsmaking and publicity of political actors has turned the media into a “political institution” serving particularly actors of the political center to accomplish political and policy goals (Cook 2005). There is a growing demand of governments, political parties, and various interest groups for professionalizing their political communications (Negrine et al. 2007). A number of newly emerged professions provide expertise specific to publicity and political advocacy, as, for example, public opinion analysts, → public relations experts, and a variety of → political consultants. Professionalization tendencies are most obvious and most advanced in modern election campaigning, which makes use of the theory and practice of political marketing. The “marketing colonization” of politics, as critics have termed it, includes an increased use of public opinion polls for campaign planning and also for newsmaking and spin doctoring (→ Election Surveys; Polls and the Media). Spin doctoring involves, among other things, rapid rebuttals, attacking opponents, and explaining campaign strategy to journalists (→ Spin Doctor).

By providing a platform for the public debate of political issues, the media construct a → *public sphere*, that is, an open realm for the exchange of information and opinions among diverse political actors. The media-constructed public sphere has a *reflexive* character, allowing political actors to “revisit perceived public opinions and respond to them after reconsideration” (Habermas 2006). In principle, this is conducive to the public sphere as a filtering mechanism that serves to generate “considered” public opinions. However, according to Habermas, the dynamics of public communication may be impaired by dominating powerful actors of the political center and by deficiencies of the media system, namely commercialization tendencies and connections with special-interest groups.

Rather than confining their role to functioning as intermediaries, i.e., serving the information and publication needs of all groups in society, the media themselves have become powerful political actors, sometimes referred to as the → fourth estate. Media organizations pursue policy objectives, for example, by expressing specific partisan opinions, by endorsing the interests of certain societal groups, or by legitimizing the views of those in power (→ Media as Political Actors). This may have consequences for the balance of power among the classical political estates – legislative, executive, and judiciary – and thus raises questions concerning the definition of media freedom and mechanisms of media control (→ Media Policy).

## **POLITICAL COMMUNICATION CONTENT**

The evolution of mass media brought about contradictory results as to citizens’ exposure to political information. On the one hand, due to a number of 24-hour news networks on radio and television and, in addition, a plethora of Internet news pages, the sheer volume of available political information proliferated immensely (→ Internet News; Newscast, 24-Hour). On the other hand, many mainstream broadcasters and newspapers have reduced their hard news coverage, especially foreign affairs reporting, and have instead extended the supply of entertaining content, → soft news, and → infotainment formats. This goes along with shrinking audiences of serious newspapers and public affairs

programs in many countries. While politically attentive citizens benefit enormously from the enriched political media menu, particularly of the Internet, the audience majority seems to be content with being informed just about the most salient issues.

Corresponding to the key role of mass media in spreading news, much research attention is paid to the volume and structure of political content available in the press, on radio and television, and on the Internet. The focus of most analyses is on mass media's coverage of political events and issues in the news (→ Content Analysis, Quantitative; News as Discourse). As political news is the most important and often the only source available to citizens and other political actors for forming an impression of current events, questions of → media performance, particularly with reference to democratic citizenship, are of central relevance.

Hence, a growing field of research is devoted to assessing the quality of journalistic reporting and testing political news for its → accuracy and objectivity. These and other criteria are derived from considerations of the → public interest, from professional standards or from theories of democracy (→ Political Media Content, Quality Criteria in; Standards of News). A recent review of predominantly US research concludes that the quantity and quality of news supplied by mass media is adequate for citizens' needs if one takes into account the practical realities of a commercial media system (Graber 2004). The answer might be different for a system with a strong media sector committed to a public service mission, as is still the case in some European countries.

By contrast, there is also ample empirical evidence confirming → Walter Lippmann's (1922, 358) dictum that "news and truth are not the same thing and must be clearly distinguished." But only part of the reporting that does not meet the expectations of concerned observers is flawed by deliberate attempts at slanting the news. More often structural factors that are inherent to the news production process are responsible for differences between the political reality and its media representation. A large number of studies have documented that the news media's picture of the political reality is characterized by elite actions, proximity, negativity, and other → news values that help to select among an abundance of events entering the editors' desks day after day.

Political actors' attempts at influencing the journalistic selection mechanisms affect the news media's endeavor to present a fairly accurate picture of the political reality. Several strategies serve this purpose; for example, staging newsworthy pseudo-events or tailoring political events to the needs of news production. Professional → issue management, based on communication theories and research results, is deployed not only by political parties and powerful interest groups, but also by grassroots organizations and social movements (→ Issue Management in Politics). Nation-states and governments also engage in → media diplomacy as a strategy to back up or even substitute for traditional means of managing international relations. And political terrorists too are exploiting the Internet and other mass media for the diffusion of violent and subversive messages and for blackmailing political authorities (→ Mediated Terrorism).

## **CITIZENS' COMMUNICATING**

Although democracies rest on the will of the people, most citizens do not actively participate in politics other than casting a vote on election day. Even political talk plays a

minor role in the everyday life of most people. Much more common is passive consumption of the political spectacle as delivered by mass media. Television is still the main source of information about politics for the average citizen, though the Internet is gaining ground, particularly among the younger generation, at least in some countries (→ Political Media Use). A high correlation of political media use with certain demographic factors is responsible for large differences in the reach of political news and in citizens' acquisition of political information (→ Knowledge Gap Effects). In all countries those who have a higher income, who are better educated, and who are more strongly interested in politics are the most attentive to political information. However, due to blurring lines between hard news, soft news, and light entertainment in some mass media, there is also a chance that politically inattentive citizens are unwittingly exposed to mediated politics (→ Politainment).

Media use can be expected to increase → political knowledge, and indeed many studies show that this is actually the case. Newspaper reading seems to be most effective in this respect, though it is not quite clear how much of the effect has to be attributed especially to media exposure and how much is due to the distinct motivational predispositions of newspaper readers (→ Exposure to Print Media). People with lower levels of education and little interest in politics may, under certain conditions, gain some political knowledge from television news. Internet use, at least among young adults in some countries, was found to contribute to political knowledge too (→ Political Socialization through the Media). In general, intensive news use is correlated with political reflection and issue discussion. This indicates a mutual reinforcement among political media use, political deliberation, and civic participation, according to the pattern of a "virtuous circle" (Norris 2000).

Normally media audiences follow political news highly selectively, directed by their personal interests and political predispositions. Moreover, people have a quite limited processing and storage capacity, particularly for complex and unfamiliar topics, which constitute the bulk of hard news stories. This explains why most political news offered by the media is not recognized, and even stories that audience members attend to are processed only cursorily, hardly stored, or quickly forgotten (→ News Processing and Retention; Selective Perception and Selective Retention). Hence, studies testing political learning from the news show disappointing results, particularly if they apply standardized survey measures.

Whether the media's supply of political content and the audience's political learning from the media meet the requirements of democratic citizenship is a contested question. The answer depends essentially on how "good citizenship" is defined. If the ideal of the fully informed, participatory citizen serves as a starting point, content analyses and studies testing audience's political knowledge inevitably come to a sobering conclusion (for reviews of the pertinent literature, see Delli Carpini 2004; Graber 2004). However, the answer is different if the reality of political communication is measured on a more modest standard such as the "monitorial citizen" standard. Monitorial citizens, according to Schudson's (1998) understanding, need not be fully informed; they only have to scan the media for major political threats to themselves or their communities. The average monitorial citizen may rely on attentive publics who follow the political scene quite closely and who share their information with the less informed sections of the population.

“The media’s role in informing monitorial citizens may thus be a two-step process” (Graber 2004).

Relationships between mass media use and interpersonal communication were observed as early as 1940, in the seminal “Erie County study” of the US presidential election led by → Lazarsfeld et al. (1944). The researchers coined the concept of a → “two-step flow of communication,” which states that ideas often flow from the mass media to → opinion leaders and from them to population sections that are less attentive to the public discourse. The concept implies a role differentiation between opinion leaders on one side and their “followers” on the other. This notion, however, has been challenged by more recent research and substituted by the model of a social network among a number of different communication roles and positions (→ Media Content and Social Networks; Network Analysis; Social Networks).

### **CHANGING ELECTION CAMPAIGNS**

By far the most research activity is concentrating on → election campaign communication – for at least three different reasons. First, elections usually have far-reaching consequences for the distribution of power in society and the priorities of political decision-making. Second, election campaigning is essentially aimed at influencing citizens’ political beliefs and attitudes by communication means (→ Political Persuasion). Consequently, the impact of the campaign and its various elements on the voters’ minds and ultimately on their electoral behavior is the crucial question not only researchers are interested in, but first and foremost, those who are running for office or managing the campaign. Third, the election battlefield usually serves to deploy new tools of mass persuasion and new ways of instrumentalizing communication media for political purposes. In this respect the arrival of the Internet and other new media provided parties and candidates with new powerful tools to organize the campaign, to solicit funding, to mobilize supporters, and to reach the electorate. At the same time, the new media environment enlarged citizens’ opportunities of accessing relevant campaign information, expressing their personal opinions, and organizing collective actions through the networking capacity of the world wide web.

Communication researchers take advantage of election campaigns as a testing ground for advancing theories and methodologies. Several of the keywords that are in use to denote the change processes constituting the mediatization of politics originate from election campaign research. For a certain time period, it was common to regard the changes as signs of “Americanization,” in the sense that advanced American campaign practices are exported to other countries, or adopted by campaigners outside the United States. The critical overtone that was often associated with the Americanization concept derived from → cultural imperialism theories, which had their followers particularly during the late Cold War period (→ Americanization of the Media). As an alternative, some scholars suggested to conceive of the changes in election campaigning as a process of “modernization” (Swanson & Mancini 1996) or “postmodernization” (Norris 2000).

However, there are more precise characterizations of the transformation of election campaigning. For example, parties and candidates tend to extend their activities over the whole legislative period so that pre-election campaigns have been turned into permanent campaigns. Quite often hidden campaigning through means such as newsmaking and

issue management remains unnoticed by the average voter since it is interwoven with everyday politics. Targeting as a campaign strategy to reach specialized audiences benefits from the increasing diversification of mass media and from the emergence of new personalized media, particularly emails and mobile phones. The importance of television as an information source for voters as well as the persuasive power of visual communication have boosted the tendency to personalize election campaigning, i.e., to organize the strategy around the leading candidates and to emphasize their personal characteristics (→ Personalization of Campaigning). As a result, → candidate images and the “horse race,” that is, who is leading in the polls, may get more public attention than political issues and the parties’ political programs (→ Horse Race Coverage).

The extensive use of → election polls and forecasts, which are quite often commissioned by the media in order to enhance their campaign reporting, regularly gives rise to speculation about potential → “bandwagon effects,” implying that voters tend to follow what they perceive to be the majority opinion. On the other hand, the → “underdog effect” hypothesis states that voters may tend to support a competitor who is expected to lose. The research evidence speaks for a weak bandwagon effect rather than for an underdog effect.

A critical issue, particularly in the United States, though in some other countries too, is the practice of → negative campaigning, especially the growing number of negative political advertisements (→ Political Advertising). While there is clear evidence that negative ads do affect voting preferences, the consequences for voter turnout, → political efficacy, and political trust seem to be negligible, as studies in the United States show.

## **POLITICAL MEDIA EFFECTS**

As the study of mass communication is generally based on the premise of → media effects (McQuail 2005, 456), it is also a central presumption of political communication research that the media have a significant impact on politics (Graber 2005). A large number of key communication concepts and theoretical hypotheses in general relate to → political cognitions or political behavior. These include, for example, agenda-setting theory and related concepts, which have inspired very much research activity in recent decades (Bryant & Miron 2004; → Agenda Building; Agenda-Setting Effects; Framing Effects; Priming Theory). In almost all cases, the studies deal with the agenda of *political* issues.

From the perspective of certain political actors – namely politicians, political parties, government officials, and interest groups – the media are often seen as an instrument of political persuasion, i.e., for exerting purposive influence on → public opinion or on specific target groups. Traditionally, this type of communication was labeled “propaganda.” But the central role of propaganda in the fascist and communist regimes of the twentieth century brought the term into discredit. Nowadays more neutral terms such as information policy, public relations, or strategic communication are preferred to denote deliberate persuasive communication aimed at specific goals.

A broad field of communication research is devoted to examining the effectiveness of persuasive influence attempts. Part of this research is focused on the persuasion of individuals under experimental conditions, an approach that was introduced on a broad scale by → Hovland and his research team during World War II (Hovland et al. 1949; → Experimental Design). The tested messages include variously structured messages,

different kinds of media formats, and also advertisements (→ Advertising Effectiveness). Another strand of research looks at influence processes in campaign contexts, for example, in health campaigns, in political information campaigns, in → social marketing campaigns, and most often in election campaigns.

In the early days of systematic experimental study of → persuasion, media effects were conceptualized primarily in terms of attitude change. As empirical research showed that mass media quite often do not bring about the presumed attitudinal effects, or the effects are conditional on contextual or situational factors, increasingly complex models of persuasion were developed. More recent models are trying to take moderating conditions into consideration. For instance, the O-S-O-R model suggested by Markus and Zajonc (1985) and McLeod et al. (1994) stresses the importance of individual differences (“O”) – demographic, cultural, cognitive, or motivational – and of intervening reactions of recipients while they process a message. Another example is the → “elaboration likelihood model” by Petty and Cacioppo (1986), which posits a dual route to persuasion. Message involvement or importance decides on whether audience members apply a central or peripheral route of message processing (→ Attitudes, Values, and Beliefs, Media Effects on; Media Effects Models: Elaborated Models).

As distinct from such rather pragmatic approaches to media effectiveness, there is a broad field of political communication research with a critical or pessimistic orientation that starts from the more or less explicit assumption that mass communication may have negative implications for democratic citizenship and for the political system as a whole. Among the harmful media effects that have been hypothesized are eroding trust in political institutions, loss of social capital, and declining political efficacy (→ Social Capital, Media Effects on). The empirical evidence for these and other problematic media effects is mixed and obviously dependent on the specific political context, the historical situation, and the media environment under study. By and large, more detrimental political effects have been observed for the United States than for other countries, which may be due, at least to some degree, to the large number of studies undertaken in the US context. A typical example is research on → political cynicism. Studies in the US context have shown that exposure to news stories that frame politics as a strategic game rather than an endeavor to solve social problems does activate corrosive cynicism among citizens. Yet studies in the European context have provided evidence of the contrary, namely positive connections between cynicism and political sophistication.

## **POLITICAL COMMUNICATION AND RESEARCH IN FLUX**

Evidently, the context of political communication is rapidly changing due to societal trends such as globalization, economization, individualization, and, above all, the rapid proliferation and diversification of mass media. The advent of the Internet and other new media has removed some of the constraints that traditional media have imposed on communication processes. Due to the enormous increase in content diversity, citizens can choose according to their individual political interests among an excessive variety of outlets and media products. While audience members can select more freely, the traditional media are losing some of their gatekeeping and filtering functions. Messages filtered according to journalistic routines and conventional news value criteria can be sufficiently

compensated for. Political actors can bypass the mass media and use their own channels for directly addressing the public or specific target groups. Thanks to the availability of convenient software, citizens can easily disseminate messages via weblogs or Internet platforms such as *YouTube*, or in direct person-to-person networking (→ Blogger; Online Media; P2P Networking). The new media seem to enhance both mediated expressions of political opinion and direct political interaction.

Research is trying to keep pace with these developments, though not with fully satisfying results. On the one hand, there is the interest of a well-established field – such as political communication research – in the continuity of theories and methods. On the other hand, this may also impede a commensurate adaptation to environmental changes.

The systematic study of political communication is a relatively young field that developed gradually during the twentieth century, though reflections on political communication, especially on strategies of political rhetoric, have been quite common in political philosophy and can be found in the ancient Greek works of Plato and Aristotle (→ Rhetoric, Greek). As a field of academic study and teaching, political communication was formally institutionalized only in the 1970s with the foundation of special divisions within scholarly organizations such as the → International Communication Association (ICA). Yet there are clear signs of maturity, as demonstrated by a considerable number of textbooks and handbooks that have appeared in recent decades in many countries and languages (e.g., Chaffee 1975; Mazzoleni 1998; Kaid 2004; Schulz 2007) as well as specialized scholarly journals (e.g., *Comunicazione Politica*, *Harvard International Journal of Press/Politics*, *Political Communication*). Signs of maturity notwithstanding, the field is characterized by a fragmented intellectual structure due to the fact that political communication researchers are either based in neighboring disciplines or have different disciplinary backgrounds, such as political science, psychology, journalism, or speech communication (Lin & Kaid 2000). And many relevant articles are still scattered through various journals of several related disciplines, predominantly mass communication and political science.

An analysis of professional journals that appeared at the beginning of the twenty-first century (Graber 2005) may convey the impression that only a minor part of the relevant research follows closely the fundamental changes of political communication arising from the evolution of mass media. Most well-covered research themes have been on the agenda for decades. By far the most attention is paid to election campaigns. Other familiar topics on the list are international relations, information processing, public opinion, and campaign advertising. Studies of new media rank second, though. This signals that at least the transformation of media systems by new media has drawn extensive attention.

Another somewhat novel theme near the top of the list is *civic engagement*. The label refers to research that tests the presumed (mal)functioning of mass media for political participation. While this category of studies continues the critical strand of research mentioned above, it also represents a trend in political communication research that was already emerging, according to McLeod et al. (1994), at the end of the last century and has been rapidly growing since. Research on civic engagement includes studies with an explicit orientation to normative criteria, especially to standards derived from theories of democracy.

Still underdeveloped, but showing hopeful signs of growth, is *international comparative research* (see, e.g., Esser & Pfetsch 2004). Even though many countries around the world are catching up with political communication research, there is a great preponderance of

studies conducted in the United States. A growing body of international comparative research may serve to prevent a premature generalization of results pertaining to a specific political and media context or, as Blumler & Gurevitch (1995, 75–76) have put it, may act as an “antidote” to “naïve universalism” and “unwitting parochialism.”

# Political Communication Culture

*Barbara Pfetsch*

*University of Hohenheim*

How does the way people think about politics influence the way and the means by which politics is communicated? And how does the communication of politics impact on political orientations and symbols? These questions are at the core of political communication culture, which refers to the forms of expression and the attitudinal milieu in which politics and media interact. The study of the interaction of media and politics with regard to the cultural roots of political communication was introduced by Gurevitch and Blumler (1977). Their aim was to identify and to analyze key dimensions along which political culture impacts on the processes and outcomes of political communication. Political culture refers to the → meanings attributed to politics. The study of political communication cultures has turned out to be most fruitful as a comparative framework. The investigation of political communication cultures across countries, social segments, or time may provide us with a better understanding of the processes of encoding and decoding political messages, the vocabulary of politics, the culture of journalism, the interrelationships between media and politics, and the relations between citizens and political elites (→ Political Communication).

## PREMISES OF POLITICAL COMMUNICATION

The idea of political communication culture rests on three premises. First, political communication in western democracies is to be understood as a process of → interaction between political actors and media actors.

Second, this interaction is based on a specific set of cultural expressions or actors' orientations and takes place in the institutional and societal contexts of the political system and of the media system (→ Culture: Definitions and Concepts). As an upshot of these considerations, political communication is to be regarded as a two-dimensional social system. It involves a structural dimension that refers to the institutional settings of the political system (e.g., the mechanisms of government, the electoral system, the role of political parties, the cleavage structure, etc.) and the media system (e.g., the degree of politicization or commercialization of media). It also involves a cultural dimension that includes the orientations of actors in political communication roles and/or the expressions of political messages. It is supposed then that we may be able to describe empirically the specific patterns of interaction between political actors and journalists by researching their orientations and the institutional contexts.

Third, the political communication culture approach gains significance first and foremost as a comparative framework. It calls for comparing across national political communication cultures, that is to say, between various dimensions of the media–politics interface across countries. It is also possible, however, to apply the framework to comparing smaller segments within a country, for instance to compare the media–politics interface on regional or local levels or within certain cultural segments, such as ethnic or cultural groups in a society.

### BASIC NOTIONS AND DIMENSIONS

In the current literature there are basically two conceptions of political communication culture, which vary in their emphasis and qualification of the relevant dimensions. In an updated version of their original approach, Gurevitch and Blumler (2004) point out that political communication culture comprises *three dimensions*: (1) the relationship between the media and political systems, which might be captured on a continuum from autonomy to subordination; (2) the norms that define the roles and functions of media for society, ranging from an essentially critical/watchdog function to a nation-building or state-supporting role; (3) the relationship between citizens and their political system that is expressed in the notion of citizenship, which may range from alienation or apathy to political engagement.

While Blumler and Gurevitch's concept provides a general, macro-analytical perspective on the impact of the political culture on various forms of political communication, there is a narrower notion formulated by Pfetsch (2004). This concept draws on the political culture model of Almond and Verba (1963) and applies it to the *politics–media relationship*. It claims that the exchanges between political actors and journalists are regulated by a set of orientations and norms that can be measured empirically on the individual actor's level. In this approach, political communication culture is defined as the actor's orientations toward specific objects of political communication, which determine the manner in which political actors and the media communicate vis-à-vis the general public.

Following this definition, political communication culture consists of attitudes toward (1) the institutions of exchange relations between politics and the media; (2) the input side of political communication, such as → public opinion, (3) the output side of political communication, such as the agenda-setting processes that are triggered by political → public relations or PR (→ Agenda-Setting Effects; Strategic Communication; Political Marketing); and (4) the role allocations and norms of professional behavior. The specific orientation patterns of political actors and their spokespersons on the one hand and of journalists on the other hand make up a national political communication culture. It is important to note that the self-image of the two groups of actors is characterized by tensions resulting from the conflicting interests of their institutions of origin. Thus, politicians view communication as an instrument with which to gain or retain political power, while journalists see it as a duty (and a business) to inform the public about what is at stake (→ Journalists' Role Perception).

The *emphasis of current research* on political communication culture is clearly on applying the framework to the empirical study of the communication forms and political processes of modern western democracies. One trajectory of this approach is to classify the interface between media and politics in various countries using a typology of four types of political communication cultures (two main types and two subtypes), which was put forward by Pfetsch (2004). In this heuristic a "media-oriented political communication culture" is to be distinguished from a "party-oriented type." While in the former, the milieu between media and politics is dominated by the media logic, political power calculations determine communication relationships in the latter. The third type, a "PR-oriented political communication culture," depends primarily on the close relationship

between journalism and political PR (→ Public Relations Roles). Finally, the “strategic type” is defined by the dominance of political logic, which is deployed by the strategic use of political PR to anticipate → media logic (Manheim 1998). Although this typology is a heuristic tool, it allows for differentiating national and sectoral milieus of political communication, and reflects on their potential impact on political forms and discourses in modern democracies.

## INTELLECTUAL CONTEXT AND METHODOLOGICAL CHALLENGES

Research on political communication culture became pertinent as an approach to studying the significance and meaning of political communication processes at a time when scholars felt it was not sufficient to describe only isolated phenomena in the outward manifestations of political communication, such as electoral campaigns (→ Election Campaign Communication), television formats and the personalization of politics, the contents of → news, or the practices of political public relations. Gurevitch and Blumler (2004) argued that, at a point when scholarship on political communication was rather dispersed and fragmented, it was necessary to understand the underlying processes of political communication and the public forms it takes in a larger framework, such as political culture.

The political communication culture approach thus can be located at the *crossroads of different strands of research* in communication science and political science. The core concept of the normative underpinning of the politics–media relationship and its outcome is related to studies on professional orientations of journalists and media culture (e.g., Donsbach & Patterson 2004). Regarding the consequences of the political communication culture for modern democracies, the research can be linked to studies on the nature and development of political communication at large.

The perspective of political communication culture gains its meaning as a *comparative framework* (→ Comparative Research). Only comparative analyses can help answer the question whether the types of political communication culture are empirically valid. In order to pursue a research agenda on political communication culture, there are a number of challenges that current scholarship faces. First, students of political communication need to develop adequate research designs and measures for assessing the type of political communication culture that prevails in a country or a cultural segment of a society.

Second, the link between the institutional contexts of political communication and the given dominant constellations of actor orientations still needs to be determined in empirical studies. One trajectory of research that is suited to tackling this question is provided by Hallin and Mancini (2004). They discuss a “polarized pluralist model,” a “democratic corporatist model,” and a “liberal model of the media system,” and relate each of them to political system variables (→ Political Communication Systems). Further research may link these types to the types of political communication culture.

A third point in the contemporary research agenda is to establish knowledge about patterns of changing political communication cultures over time. So far, there are many general theories about the development of political communication at large, such as → modernization or → Americanization of the Media. Yet systematic, data-based, longitudinal empirical studies on the specific milieus at the interface between media and politics are still missing.

Political communication culture is key to understanding the public representation of political issues and politics in national public arenas, as well as the interaction between political actors and journalists and its implications for the democratic process. Ascertaining the dominant political communication culture in a country can help explain the mode and quality of → political discourse, and, not least, may influence the quality of the democratic political process. Hence, the contribution of this approach to the study of political communication lies in its relevance for modern democracy. As the quality of political communication is directly related to a rational understanding of public affairs among citizens, the political communication culture is an important precondition of democratic development. It is therefore a test of every political communication culture whether it permits or generates discourses that enhance a rational understanding of political processes on the part of the public. By the same token, a political communication culture is dysfunctional for the democratic process if it impairs the quality and rationality of the political discourse.

# Political Communication Systems

Barbara Pfetsch

University of Hohenheim

Looking at political communication phenomena in a systems framework is a common approach in this field of study. The term “system,” in its general meaning, denotes a multitude of component parts, depending on each other, and functioning as a whole (→ Systems Theory). The nature of the political communication system is thought of as a structure of producing, processing, and communicating political messages. As Blumler and Gurevitch (1977) point out, adapting the systems approach to political communication processes implies the assumption that variation in one of its component parts would be associated with variation in other components.

## ELEMENTS OF A POLITICAL COMMUNICATION SYSTEM

By analogy with the political culture research (Almond & Verba 1963), a political communication system can be mapped out along *four dimensions*. First, it implies an institutional structure that depicts the space in the media and politics in which politicians and journalists interact to produce messages. This structure is directly influenced by the set-up of the media and political system. Second, the political communication system implies an input side of → public opinion that reflects the reactions of the public and, third, it implies an output side that depicts the messages that are produced at the interface between media and politics with regard to the public. The fourth dimension of the political communication system implies the role definitions and norms of the actors such as politicians and journalists. Their interactions are subject to behavioral norms and other system constraints (→ Political Communication Culture; Journalists’ Role Perception).

The political communication system is composed of *elements from two other social systems*: politics and the mass media. According to theoretical considerations, integration of two social systems comes about if the exchange processes between them are institutionalized. Hence, the political communication system can be regarded as such an institutionalization, as it carries and regulates the ongoing cross-border communication between politics and the media. Eventually, it develops its own language and the more contacts are maintained, the more it develops an identity of its own.

The common *unit of reference for professional roles* in political communication is the → public. The preferences and demands of the media audience with certain information needs, and the preferences and demands of the electorate with specific political needs, converge in the construct of public opinion. Hence, the social construction of public opinion on the part of political communication actors can be understood as the input side of the political communication system. The output side is concerned with the production, processing, and communication of political messages. Managing political issues is a major function of the politics–media interface (→ Issue Management in Politics). Since the choice of issues has an impact on the image of the actors involved,

agenda setting influences public opinion about organizations and actors, and does so with persuasive intent, i.e., with the aim of generating consent (→ Agenda-Setting Effects).

## INTELLECTUAL ROOTS

The notion of political communication systems reflects the adaptation of political systems analysis to a theoretical framework of political communication. Perceiving political communication through the lens of a systems perspective coincides with the insight that it is not sufficient to capture the interface between politics and media through indicators of the media system or the political system only. At the same time, the investigation of political communication would fall short if it were studied only in terms of the short-term, issue-related behaviors of actors in areas such as election campaigns, political → public relations, newsmaking, or public opinion. If political communication refers to “an interactive process concerning the transmission of information among politicians, the news media, and the public” that includes top-down, bottom-up, and horizontal flows of messages (Norris 2001, 11631), then students of political communication must understand the general nature of this interaction rather than concentrate on particular situations or singular issues or events. The attempt to develop a broader framework of analysis for political communication that focuses on the whole system rather than on single aspects also reflects the need for a more abstract formulation of processes of political communication that lends itself to comparative analysis. Hence, the political communication systems perspective allows for conceiving processes of political communication as an ordered system, which consists of actors and structures that can be related to each other and their environment in systematic terms.

The conception of political communication as a system is inspired by *Easton's (1965) political systems analysis* and the notion of “political culture,” which was introduced by Almond (1956). The specific patterns of citizens’ beliefs and orientations to the political system and its dimensions are called political culture. A basic assumption of systems analysis is that a political system can be stable only if the citizens’ fundamental values and orientations are compatible with the socio-political and institutional structure of the society. The notion of political communication systems refers to both the institutional setting of the political and the media systems and the subjective orientations of political communication actors. These → attitudes determine the interaction and the flow of messages between political actors and media. According to Pfetsch (2004) the match of the actors’ attitudes and the structures of message production is a decisive criterion for the stability of the political communication system of a given country.

The essential value of the concept of political communication systems lies in its potential as a *heuristic basis for the comparative study of political communication*. If political communication processes are seen as interplay between communication roles and structural conditions, the comparative approach offers considerable potential for analyzing these processes. Comparison enables us to make out which structural conditions correspond with specific constellations of actor orientations. Moreover, only comparative research can reveal the variety of political communication systems as well as the systematic link between the political system and the media system (Pfetsch & Esser 2004).

## CHALLENGES OF FUTURE RESEARCH

The interplay between structural conditions and attitudinal and behavioral aspects has not yet been researched systematically. To date, we lack encompassing studies that reveal the variety of national political communication systems and their internal and external conditions. Current research on the interface of media and politics largely follows the path of neo-institutionalism, which has its precursor in formulations such as the *Four theories of the press* by Siebert and Schramm (1956; → Journalism: Normative Theories). While this study has been heavily criticized for its ideological bias, recent work by Hallin and Mancini (2004) on media systems and their political aspects constitutes a meaningful point of departure for the comparative analysis of political communication systems. Hallin and Mancini develop a typology of three ideal types of media systems: the “liberal model,” the “democratic corporatist model,” and the “polarized pluralist model.” Moreover, the researchers link these types to a set of variables to describe the structural conditions in the media and the political system. These environmental conditions are associated with specific expectations vis-à-vis media organizations on the part of politics, and with political mechanisms and opportunities for exerting influence on the media. On the other hand, the setting of the media system influences how media organizations position themselves in a national media system and in the public sphere.

On the side of the media, Hallin and Mancini propose that *four dimensions constitute important environmental conditions* for media systems: (1) the development of media markets (strong or weak development of mass circulation press); (2) political parallelism (extent to which the media system reflects major political divisions in terms of links between media and political parties; → Party–Press Parallelism); (3) strong or weak journalistic professionalism; and (4) the degree and nature of state intervention in the media system. Arguably, the four dimensions converge in the *dichotomy between commercialization and politicization* of the media system, which has wide-ranging implications for political communication. With regard to the structural context conditions on the side of the political system, Hallin and Mancini refer to the general relationship of state and society, especially the state’s role as owner, regulator, and founder of media organizations, the makeup of the government including the party system, and the intensity of political cleavages and interest mediation.

Although this framework reflects some of the basic ideas of political communication systems analysis as proposed here, it still reveals some shortcomings and methodological problems that emerge if the systems approach to political communication is applied in empirical designs of cross country comparison. Yet future research must solve the problem of bringing together different levels of analysis and different types of data, such as attitudinal measures of individuals’ orientations and their aggregation to the macro-level of analysis, as well as measures of the structural makeup of the media–politics interface. Eventually, it will also be necessary to formulate a set of hypotheses about the political communication system with its environment and specify them in empirical research designs. Current research has only begun to travel this route.

## **Political Consultant**

*Fritz Plasser*

*University of Innsbruck*

A political consultant is a paid, outside advisor to candidates, political parties, or interest groups. The rise of political consultants started in the United States when Whitaker and Baxter formed Campaign Inc. in the mid-1930s, which is considered the first political consulting firm. But while in the late 1950s only roughly thirty or forty individuals acted as professional political consultants, the industry has seen tremendous overall growth since the late 1960s. Three developments contributed to this rise of the political consultancy business.

The first development is the advent of nationwide *television* as the dominant medium of political communication. In order to cope with the structural demands of a visual and fast-paced medium, candidates and parties had to adopt the standards of a new media

logic, centered on the communication skills of personalities, impression management, and the delivery of camera-ready pictures and visuals. In these days a new entrepreneurial profession entered the political marketplace: the political consultant, specialized in strategic communication, image-building, and crafting television commercials based on extensive survey research and focus groups.

Second, as party loyalties have eroded and electoral volatility has risen, the traditional style of party campaigning and voter mobilization has been gradually replaced by a *political marketing approach*, where the priority is to identify voter needs and to target special voter groups. This approach relies on the expertise of external consultants specialized in careful segmentation of the electoral market, survey-based development of micro-messages, strict message discipline, instant rebuttal units, opposition research and the use of focus groups, mall intercepts, and extensive survey research to craft arguments, framing the issues and producing effective television commercials.

Third, the ongoing *fragmentation of channels and audiences*, a multiplicity of news outlets, the advent of the Internet, and the transformation of broadcasting into narrowcast micro-messages addressed to carefully targeted voter segments increased the demand for professional media and communication consultants, experienced in advanced techniques of news management, scripted events, spin control, and → negative campaigning (→ Spin Doctor). In the United States currently 8,000 professional political consultants and 1,500 political consultancy firms offer services in the fields of general strategy, media and communication consulting, polling and survey research, fund raising, field operations and organization, initiative and referendum consulting, and Internet services and web campaigning. Political consultancy has become a growing branch since the 1980s in Latin America, Australia, and western Europe, and – with some delay – also in eastern Europe. The development in the United States – the gradual replacement of traditional party managers by professional media and strategy consultants – can now be observed on a worldwide basis. Foreign political parties and candidates invite American top consultants to perform highly specialized functions that domestic experts cannot fulfill or are just learning to accomplish in a professional manner.

The *internationalization* and *globalization* of political consultancy is further fostered by transnational platforms, like the International Association of Political Consultants (IAPC), founded by Joseph Napolitan in 1968, or the European Association of Political Consultants (EAPC), organizing conferences and workshops and serving as meeting platforms and professional networks. In the meantime, similar associations have been established in the United States, where political consultancy is considered as a one-billion-dollar market, Latin America, western Europe, and Russia. Also Australia and New Zealand have a flourishing political consultancy scene, whereas the political consultancy market in Asia and Africa is still in its infancy.

The data of the Global Political Consultancy Survey, a worldwide survey of political consultants and campaign managers from 45 countries conducted between 1998 and 2000, permit insights into the *professional role definitions* of political consultants, and show two different consultancy approaches (Plasser & Plasser 2002). Political consultants of the first type have been characterized as “party-driven sellers,” while those belonging to the second type have been defined as “message-driven marketers.” *Party-driven sellers* concentrate in their consulting activities on a strong and efficient party organization and

programmatic positions of parties, while at the same time they stress the importance of the candidates' personalities. Party-driven sellers consider the secret of a successful campaign to be the product of party-related factors.

By comparison, the *message-driven marketers* concentrate on the strategic positioning of their candidates and the development of messages which appeal to the expectations of special target groups, and place much more importance upon the central message of the election campaign. Message-driven marketers clearly tend to define campaigns as political marketing operations in which the strategic positioning and addressing of target groups represent essential conditions of success. Message-driven marketers also concentrate more strongly on the availability of financial resources and evaluate the role of external advisors and campaign experts as much more important than party- and organization-centered campaigners. Sixty percent of the political consultants who were interviewed in the survey operate as party-centered "politics-sellers." Forty percent correspond more strongly with the message-driven marketers and their political marketing logic. American political consultants mostly correspond to the type of the message-driven marketers (→ Political Marketing).

The data of the Global Political Consultancy Survey indicate that the focus of modern campaign strategies also moves in the direction of candidate- and message-centered factors among political consultants from the traditionally party-centered competitive cultures of Germany, Sweden, or Italy. This change of orientation appears to be even more explicit among political consultants with a strong affinity with the US role model of modern campaigning.

Yet, the data also indicate the existence of a combination of traditional and modern styles of political communication in most of the regions examined. Western European political consultants clearly differ from the modus operandi of American political consultants. Two-thirds could be classified as TV fixated, who appeal to the mass public and try to optimize the reach of their campaign messages. American political consultants, on the other hand, prefer a postmodern strategic logic of communication. Three out of four US political consultants interviewed could be defined as target-group marketers. Confronted with a multitude of news channels, "media clutter," and the declining marginal value of extensive advertising campaigns in the large national networks, they changed their focus in the direction of segmented advertising campaigns in the local cable channels, targeted direct marketing activities, and the potential of the Internet.

## Political Cynicism

*Claes H. de Vreese*

*University of Amsterdam*

Political cynicism is recognized as an important political sentiment. However, there is little agreement about the nature, measurement, and consequences of political cynicism. *Webster's Dictionary* defines a cynic as “one who believes that human conduct is motivated wholly by self-interest. A person who expects nothing but the worst of human conduct and motives.” Cappella and Jamieson (1997, 166) defined *political cynicism* as “mistrust generalized from particular leaders or political groups to the political process as a whole – a process perceived to corrupt the persons who participate in it and that draws corrupt persons as participants.” Cynicism has been defined as oppositional to → political efficacy (e.g., Niemi et al. 1991) and as inversely related to trust in different social, economic, and political institutions.

Political cynicism has different dimensions and can be considered in relation to various objects. Cynicism as absence of trust has been treated at the level of the institutions of government and the regime as a whole (e.g., Miller 1974). It has also been conceptualized as negativism and disapproval at the level of candidates and incumbent political leaders (e.g., Citrin 1974). Erber and Lau (1990) also stress a distinction between political cynicism directed toward persons on the one hand and toward issues and institutions on the other. An additional dimension of political cynicism can be seen as directed toward a specific context such as a campaign (De Vreese & Semetko 2002; → Election Campaign Communication).

Political cynicism has been linked directly to news coverage of politics. Most notably, the link has been demonstrated between cynicism and exposure to strategic news – that is, news covering politics as a strategic arena, focusing on politicians' motivations and concern with → public opinion rather than their policies. This relationship was investigated in a seminal series of experiments conducted by Joseph Cappella and Kathleen Hall Jamieson (1997). First, they found that participants exposed to strategic news remembered more strategy-based information about candidates compared with those who were exposed to issue-based news. Second, they found that strategic news enhanced political cynicism.

The studies by Cappella and Jamieson (1997) and others compellingly linked exposure to strategic news coverage to political cynicism in experimental studies in the US. Outside

the US, several studies have also tested the relationship between strategic news reporting and political cynicism. Kleinnijenhuis and colleagues (2006) demonstrated that negative news media coverage discourages trust in political leaders (→ Negativity). De Vreese (2004) tested the effects of repeated exposure to strategic news and found that when participants were not subsequently exposed to strategically framed news, the effect on cynicism that was established in the immediate post-test vanished (→ Framing Effects). This implies that repeated exposure is a necessary condition for a longer-lasting effect. De Vreese and Semetko (2002) found that exposure to strategic news media reporting about a national political issue contributed to citizens' levels of cynicism, even when controlling for the initial level of cynicism in the campaign. De Vreese (2005) further specified this dynamic by demonstrating, using two-wave panel surveys and media content data from two countries, that the relationship requires a certain level of strategic reporting in order to affect political cynicism.

The *consequences* of political cynicism are important. While news coverage of politics is a relevant antecedent for understanding change in political cynicism, the consequences and implications of cynicism and distrust have also been considered. Cynicism (media-induced or not) has been used to explain declining turnout in established democracies, most notably in the US (Cappella & Jamieson 1997; Patterson 2002). Indeed, cynicism has also been suggested as the cause for citizen apathy and general dislike of public administration and government (Nye et al. 1997).

The direct consequences of cynicism have, however, not often been subjected to empirical analyses. Other studies have provided evidence of the contrary, namely that there is no relationship between cynicism and voter apathy (De Vreese & Semetko 2002). In fact, some studies have yielded positive connections between cynicism and political sophistication, thereby suggesting that political cynicism is perhaps little more than a healthy expression of critical reflections about the political system and politicians (De Vreese 2004, 2005).

Our understanding of political cynicism in communication and politics is work in progress. Future work should be aimed at getting a more detailed understanding of the different dimensions of political cynicism, the conditional relationship with news exposure as a function of news content and audience characteristics, and the different consequences of cynicism, e.g., for public engagement in politics.

## Political Discourse

Hartmut Wessler

University of Mannheim

In general usage, political discourse comprises all forms of communication in and by political institutions or actors and all communication with reference to political matters. Thus, political public relations, both internal and external, news, commentary, film, talk shows, citizens' everyday talk about politics etc. are all sites of political discourse. Different sites follow different rules of selection and construction of political reality, including, for example, news management techniques, news values, frames of interpretation, and heuristics of political judgment. General usage also acknowledges the fact that political discourse is often thematically structured, as in reference to “globalization discourse,” “abortion discourse,” and so on.

In addition to such general usage, there are two prominent, and opposing, strands of theorizing that feature more specific concepts of political discourse: the normative discourse theory of democracy and public communication associated with, among others, German philosopher → Jürgen Habermas on the one hand, and, on the other hand, a broad field of theoretical approaches originating in French philosophy and sociology that center around social and political functions of discursive practices (→ Discourse Analysis).

In the first, *normative*, tradition, political discourse is characterized by the attempt to convince others through rational exchange of arguments about political matters. In the background of this understanding is the model of an ideal speech situation in which interlocutors cannot but make the following four counterfactual presuppositions about each other: (1) that their utterances are comprehensible, (2) that their claims about

elements of objective reality are true, (3) that their utterances reflect their real intentions (truthfulness, sincerity), and (4) that their actions and norms are morally defensible (rightness) (Habermas 1984, 23). While most instances of (political) communication deviate from this ideal in one way or the other, such deviations can be “repaired” in discourse by problematizing and justifying the respective validity claims of comprehensibility, truth, and rightness. Only truthfulness cannot be argued but only demonstrated through corresponding action.

Political discourse in this normative understanding thus entails that political actors should explicitly justify their validity claims so that they can be debated by others in the → public sphere – a process called public deliberation or public discourse (see Peters 2008; → Deliberativeness in Political Communication). In his later writings, Habermas (1998) argues that civil society actors should put power-holders in the center of the political system “under siege” with their communication and that they can acquire communicative power to the degree that their opinions influence legislative deliberation and law-making. In this view, political legitimacy is procured not only by electing representatives (as is posited in most theories of democracy) but also by the communicative power generated bottom-up in political discourse. In empirical political communication research, this normative model has sometimes been used to evaluate the discursive quality of political media content, parliamentary debate, and citizen deliberation but a comprehensive empirical investigation of the interlocking stages and elements of political discourse from this perspective is lacking.

The second *tradition of theorizing political discourse* has a completely different starting point and draws from a number of different disciplines, including political science, sociology, linguistics, and literary and → cultural studies (for an overview, see Apter 2001). Here discourse is understood as a way of organizing human experience in both texts and social practices following the insight that all human activity is built on a constant process of interpreting and giving meaning to the world. Usually, a relativist epistemology is advocated in this tradition, lacking a systematic distinction between scientific and other (e.g., professional, popular, sub-cultural) forms of discourse and not privileging the former over the latter. The boundaries of discourse as opposed to nondiscursive elements of the social world are often somewhat vague, and the idea of a causal relationship between discursive and nondiscursive elements is usually abandoned or ignored. Discourse analysis in this tradition is often concerned with exposing mechanisms or functions of domination in discourse and, conversely, the links between particular discourses and the ability of social and political actors to claim and realize agency.

Thus, political discourse has been studied from critical and feminist perspectives through in-depth interpretations of media texts (→ Text and Intertextuality). But everything can become the object of political discourse analysis in this sense: political rituals and public speeches, but also dress, architecture, anthems, flags, and other insignia of power and authority. One example relevant to political communication is the *analysis of media events*, deliberately staged and globally televised celebrations, contests, or “conquests” (Dayan & Katz 1994; → Media Events and Pseudo-Events). Examples of the latter type are political events that mark transgressions such as Egyptian president Sadat’s first visit to Israel or Pope John Paul II’s first visit to communist Poland. Conquests, due

to their strong propensity to command emotional participation and their particular performative qualities, can mark the coming of a new era and contribute to constructing the reality of that era. It is this emphasis on the reality-constituting capacity of discursive texts and practices that unites the divergent field of political discourse analysis in the second tradition.

## **Political Economy of the Media**

*Vincent Mosco*

*Queen's University*

Political economy is the study of the social relations, particularly the power relations, that mutually constitute the production, distribution, and consumption of resources, including communication resources (→ Media Economics). This formulation has a certain practical value because it calls attention to how the communication business operates, for example, how communications products move through a chain of producers such as a → Hollywood film studio, to wholesalers, retailers, and, finally consumers, whose purchases, rentals, and attention are fed back into new processes of production.

A more general and ambitious definition of political economy is the study of control and survival in social life. “Control” refers specifically to the internal organization of social group members and the process of adapting to change. “Survival” means how people produce what is needed for social reproduction and continuity. Control processes are broadly political, in that they constitute the social organization of relationships within a community, and survival processes are mainly economic, because they concern processes of production and reproduction.

### TRADITIONS IN POLITICAL ECONOMY

Political economy has consistently placed in the foreground the goal of understanding social change and *historical* transformation. For classical political economists of the eighteenth and early nineteenth centuries, such as Adam Smith, David Ricardo, and John Stuart Mill, this meant comprehending the great capitalist revolution, the vast social upheaval that transformed societies based primarily on agricultural labor into commercial, manufacturing, and, eventually, industrial societies. For Karl Marx, it meant examining the dynamic forces within capitalism and the relationship between capitalism and other forms of political economic organization, in order to understand the processes of social change that would, he contended, ultimately lead from capitalism to socialism.

*Orthodox economics*, which began to coalesce against political economy in the late nineteenth century, tended to set aside this concern for the dynamics of history and social change, in order to transform political economy into the science of economics, which, like the science of physics, would provide general, if static, explanations. According to this view, economics would be able to explain precisely how buyers and sellers come together to set prices in the marketplace, but would not address those broad processes of social and economic change that create the conditions for setting prices. Contemporary political economists, occupying various heterodox positions distinct from what has become the economic mainstream, continue the tradition of classical political economy to take up social change and transformation, focusing now on such areas as the transition from an industrial to a service or information economy. The study of the mass media and communication technology plays an important role in this research because the industries encompassed by these fields of study are major forces in the creation of today's economy.

Political economy is also characterized by an interest in examining the social whole or the *totality of social relations* that make up the economic, political, social, and cultural areas of life. From the time of Adam Smith, whose interest in understanding social life was not constrained by the disciplinary boundaries that mark academic life today, through Marx, and on to contemporary institutional, conservative, and neo-Marxian theorists, political economy has consistently aimed to build on the unity of the political and the economic by accounting for their mutual influence and for their relationship to wider social and symbolic spheres of activity. The political economist asks: How are power and wealth related? How do these influence our systems of mass media, information, and entertainment?

Political economy is also noted for its commitment to *moral philosophy*, understood as both an interest in the values that help to create social behavior and in the moral principles that ought to guide efforts to change it. For Adam Smith, as evidenced in his *Theory of Moral Sentiments*, a book he favored more than the popular *Wealth of Nations*, this meant understanding values like self-interest, materialism, and individual freedom, that were contributing to the rise of commercial capitalism. Whereas for Karl Marx, moral philosophy meant the ongoing struggle between the drive to realize individual and social value in human labor and the push to reduce labor to a marketable commodity. Contemporary political economy tends to favor moral philosophical standpoints that promote the extension of democracy to all aspects of social life. This goes beyond the political

realm, which guarantees rights to participate in government, to the economic, social, and cultural domains where supporters of democracy call for income equality, access to education, and full public participation in cultural production and a guarantee of the right to communicate freely.

Following from this view, *social praxis*, or the fundamental unity of thinking and doing, also occupies a central place in political economy. Specifically, against traditional academic positions which separate the sphere of research from that of social intervention, political economists, in a tradition tracing its roots to ancient practices of providing advice and counsel to leaders, have consistently viewed intellectual life as a form of social transformation and social intervention as a form of knowledge. Although they differ fundamentally on what should characterize intervention, from Thomas Malthus who supported open sewers as a form of population control, to Marx, who called on labor to realize itself in revolution, political economists are united in the view that the division between research and action is artificial and must be overturned.

The political economy approach is also distinguished by the many schools of thought that guarantee significant *variety of viewpoints* and vigorous internal debate. Arguably the most important divide emerged in responses to the classical political economy of Adam Smith and his followers. One set, which eventually established the contemporary discipline of economics, focused on the individual as the primary unit of analysis and the market as the principle structure, both coming together through the individual's decision to register wants or demands in the marketplace. Over time, this approach progressively eliminated classical political economy's concerns for history, the social totality, moral philosophy, and praxis, and transformed political economy into the science of economics founded on empirical investigation of marketplace behavior conceptualized in the language of mathematics. Broadly understood as *neo-classical economics* or simply, in recognition of its dominant position as today's orthodoxy, *economics*, it is a perspective that reduces labor to just one among the factors of production, which, along with land and capital, is valued solely for its productivity, or the ability to enhance the market value of a final product.

A second set of responses to the classic political economy of Adam Smith opposed this tendency by retaining the concern for history, the social whole, moral philosophy, and praxis, even if that meant giving up the goal of creating the science of economics. This set constitutes the wide variety of approaches to political economy. A first wave was led by a number of groups including *conservatives* who sought to replace marketplace individualism with the collective authority of tradition, *utopian socialists* who accepted the classical faith in social intervention but urged putting community ahead of the market, and by *Marxian* thinkers who returned labor and the struggle between social classes to the center of political economy. Subsequent formulations built on these perspectives leaving us with a wide range of contemporary formulations.

Although economics occupies the center and center right of the academic political spectrum, a *neo-conservative political economy* thrives in the work of people like George J. Stigler, James M. Buchanan, and Ronald Coase, all recipients of the Nobel Prize in economics, who apply the categories of neo-classical economics to all social behavior with the aim of expanding individual freedom. *Institutional political economy* occupies a slightly left of center view, arguing, for example in the work of Galbraith, who drew principally on Veblen, that institutional and technological constraints shape markets to

the advantage of those corporations and governments large enough and powerful enough to control them. Institutionalists created the framework for studies (described below) documenting how large media companies can control the production and distribution of mass media products to restrict diversity of content, specifically by keeping out work that challenges pro-business views. *Neo-Marxian* approaches, including those of the French Regulation School, world systems theory, and others engaged in the debate over globalization, continue to place social class at the center of analysis, and are principally responsible for debates on the relationship between monopoly capitalism, the automation and de-skilling of work, and the growth of an international division of labor. Finally, social movements have spawned their own schools of political economy, principally *feminist political economy* which addresses the persistence of patriarchy and the dearth of attention to household labor, *environmental political economy* which concentrates on the links between social behavior and the wider organic environment, and a political economy that melds the analysis of social movements with the Italian *autonomous Marxist* theoretical tradition.

## RESEARCH ON THE POLITICAL ECONOMY OF THE MEDIA

### Regional Emphases

North American *research* has been extensively influenced by the contributions of two founding figures, Dallas Smythe and Herbert Schiller. Smythe taught the first course in the political economy of communication at the University of Illinois and is the first of four generations of scholars linked together in this research tradition. Schiller, who followed Smythe at the University of Illinois, similarly influenced several generations of political economists.

Their approach to communication studies drew on both the *institutional* and *Marxian* traditions. A concern about the growing size and power of transnational communication businesses places them squarely in the institutional school, but their interest in social class and in media imperialism gives their work a definite Marxian focus (→ Globalization of the Media; Media Conglomerates). However, they were less interested than, for example, European scholars, in providing an explicit theoretical account of communication. Rather, their work and, through their influence, a great deal of the research in this region have been driven more explicitly by a sense of injustice that the communication industry has become an integral part of a wider corporate order which is in their view both exploitative and undemocratic. Although Smythe (1981) and Schiller (1989) were concerned with the impact within their respective national bases, they both developed a research program that charts the growth in power and influence of transnational media companies throughout the world.

Partly owing to their influence, North American research has produced a large literature on industry and class-specific manifestations of transnational corporate and state power, distinguished by its concern to participate in ongoing social movements and oppositional struggles to change the dominant media and to create alternatives (McChesney 1999; Mosco 1996; Schiller 1999; Wasko 2003). A major objective of this work is to advance → public interest concerns before government regulatory and policy organs. This

includes support for movements that have taken an active role before international organizations, in defense of a new international economic, information, and communication order (Mosco & Schiller 2001).

*European research* is less clearly linked to specific founding figures and, although it is also connected to movements for social change, particularly in defense of public service media systems, the leading work in this region has been more concerned to integrate communication research within various neo-marxian and institutional theoretical traditions. Of the two principal directions this research has taken, one, most prominent in the work of Garnham (2000) and of Murdock & Golding (2000), has emphasized *class power*. Building on the Frankfurt School tradition, as well as on the work of Raymond Williams, it documents the integration of communication institutions, mainly business and state policy authorities, within the wider capitalist economy, and the resistance of subaltern classes and movements reflected mainly in opposition to neo-conservative state practices promoting liberalization, commercialization, and privatization of the communication industries.

A second stream of research foregrounds *class struggle* and is most prominent in the work of Armand Mattelart (2000; Mattelart & Siegelau 1983). Mattelart has drawn from a range of traditions including dependency theory, western Marxism, and the worldwide experience of national liberation movements to understand communication as one among the principal sources of *resistance* to power. His work has demonstrated how peoples of the third world, particularly in Latin America where Mattelart was an advisor to the government of Chile before it was overthrown in a 1973 military coup, used the mass media to oppose western control and create indigenous news and entertainment media (→ Development Communication; Development Communication, Planning of).

*Third world research* on the political economy of communication has covered a wide area of interests, although a major stream has grown in response to the modernization or developmentalist theory that originated in western, particularly US, attempts to incorporate communication into an explanatory perspective on development congenial to mainstream academic and political interests. The developmentalist thesis held that the media were resources that, along with urbanization, education, and other social forces, would mutually stimulate economic, social, and cultural modernization in the third world. As a result, media growth was viewed as an index of development. Drawing on several streams of international neo-Marxian political economy, including world systems and dependency theory, third world political economists challenged the fundamental premises of the developmentalist model, particularly its technological determinism and the omission of practically any interest in the power relations that shape the terms of relationships between first and third world nations and the multilayered class relations between and within them (Zhao 1998; Pendakur 2003).

The failure of development schemes incorporating media investment sent modernization theorists in search of revised models that have tended to include telecommunication and new computer technologies in the mix. Political economists have responded principally by addressing the power of these new technologies to integrate a global division of labor. A first wave of research saw the division largely in territorial terms: unskilled labor concentrated in the poorest nations, semi-skilled and more complex assembly labor in semi-peripheral societies, and research, development, and strategic planning limited to

first world corporate headquarters where the bulk of profit would flow. More recent research acknowledges that class divisions cut across territorial lines and maintains that what is central to the evolving international division of labor is the growth in flexibility for firms that control the range of technologies that overcome traditional time and space constraints (Sussman & Lent 1998; Pellow & Park 2002).

### **Central Coordinates: Commodification, Spatialization, Structuration**

One can also map the political economy of communication through key coordinates or the three social processes that are central to the field: commodification, spatialization, and structuration.

#### *Commodification*

Commodification has long been understood as the process of taking goods and services that are valued for their use, e.g., food to satisfy hunger, stories for communication, and transforming them into commodities that are valued for what they can earn in the marketplace, e.g., farming to sell food, producing drama for commercial television (→ Commodification of the Media). The process of commodification holds a dual significance for communication research. First, communication practices and technologies contribute to the *general commodification process throughout society*. For example, the introduction of computer communication gives all companies, not just communication companies, greater control over the entire process of production, distribution, and exchange, permitting retailers to monitor sales and inventory levels with ever greater precision. This enables firms to produce and ship only what they know is likely to sell quickly, thereby reducing inventory requirements and unnecessary merchandise. Second, commodification is an entry point to *understanding specific communication institutions and practices*. For example, the general, worldwide expansion of commodification in the 1980s, responding in part to global declines in economic growth, led to the increased commercialization of media programming (→ Commercialization of the Media), the privatization of once public media and telecommunications institutions, and the liberalization of communication markets.

The political economy of communication has been notable for its emphasis on describing and examining the *significance of institutions*, especially businesses and governments, responsible for the production, distribution, and exchange of communication commodities and for the regulation of the communication marketplace. Although it has not neglected the commodity itself and the process of commodification, the tendency has been to foreground corporate and government institutions. When it has treated the commodity, political economy has tended to concentrate on media *content* and less on media audiences and the labor involved in media production. The emphasis on media structures and content is understandable in light of the importance of global media companies and the growth in value of media content. Tightly integrated transnational businesses, such as → Time Warner Inc., → News Corporation, and → Sony Corporation, create media products with a multiplier effect embodied, for example, in the *tiered release* which might start with a Hollywood film exhibited in theaters, followed by a DVD, shortly thereafter by a version for pay-per-view, pay-cable, and, finally, perhaps aired on broadcast television.

Political economy has paid some attention to *audiences*, particularly to understand the common practice whereby advertisers pay for the size and quality (propensity to consume) of an audience that a newspaper, magazine, radio or television program can deliver. This generated a vigorous debate about whether audiences, in fact, labor, i.e., sell their labor power, in effect, their → attention, in return for whatever content is produced (Smythe 1981; → Audience Commodity). The debate has been useful because it broadened the discussion beyond content and included all businesses, and not just media companies, in the core of communication research. Recent political economy research has advanced the analysis of → audience research by examining audience history and the complex relationship of audiences to the producers of commercial culture. It has also extended the debate over audience labor to the Internet where the process of building websites, modifying software, and participating in online communities both resembles and differs from the labor of audiences that Smythe described (Terranova 2004).

In addition to examining the process of commodifying media content and audiences, it is important to consider the *commodification of media labor*. Harry Braverman's now classic work directly confronted the transformation of the labor process in capitalism. According to him, general labor is constituted out of the unity of *conception*, the power to envision, imagine, and design work, and *execution*, the power to carry it out. In the process of commodification, capital acts to *separate* conception from execution, skill from the raw ability to carry out a task, to *concentrate* conceptual power in a managerial class that is either a part of capital or represents its interests, and to reconstitute the labor process with this new distribution of skill and power at the point of production. In the extreme, and with considerable labor resistance, this involved the application of detailed and intrusive "scientific management" practices, pioneered by Frederick Winslow Taylor. Braverman documented the process of labor transformation in the rise of large-scale industry, but he is particularly recognized for demonstrating the extension of this process into the service and information sectors. His work gave rise to an enormous body of empirical research and theoretical debate, the latter focusing principally on the need to address the contested nature of the process, the active agency of workers, and the trade union movement and, finally, on how the transformation of the labor process was experienced differently according to industry, occupation, class, gender, and race.

The labor of communication workers is also being commodified as wage labor has grown in significance throughout the media workplace. In order to cut the labor bill and expand revenue, managers replaced mechanical with electronic systems to eliminate thousands of jobs in the printing industry as electronic typesetting did away with the jobs of linotype operators. Today's digital systems allow companies to expand this process. Print reporters increasingly serve in the combined roles of editor and page producer. They not only report on a story, they also put it into a form for transmission to the printed and, increasingly, electronic page. Companies generally retain the rights to the multiplicity of repackaged forms and thereby profit from each use. Broadcast journalists carry cameras and edit tape for delivery over television or computer networks. The film industry is delivering digital copies of movies to theaters in multiple locations over communication satellite, thereby eliminating the distribution of celluloid copies for exhibition by projectionists. Companies now sell software well before it has been debugged on the understanding that customers will report errors, download and install updates, and figure out

how to work around problems. This ability to eliminate labor, combine it to perform multiple tasks, and shift labor to unpaid consumers further expands the revenue potential (Sussman & Lent 1998). Workers have responded to this by bringing together people from different media, including journalists, broadcast professionals, technical specialists in the film, video, telecommunications, and computer services sectors, into trade unions that represent large segments of the communications workforce.

### *Spatialization*

The second starting point for the political economy of communication is spatialization, or the process of overcoming the constraints of space and time in social life. Classical political economists like Adam Smith and David Ricardo found it necessary to devote considerable attention to the problems of how to value the spaces taken up by land and our built environment. Furthermore, their development of a labor theory of value was bound up with the problem of how to define and measure labor time. Marx came closer to spatialization when he noted that capitalism “annihilates space with time.” By this he meant that business makes use of the means of transportation and communication to diminish the time it takes to move goods, people, and messages over space. Today, political economists conclude that rather than annihilate space, business, aided by developments in communication and information technology, transforms space. People, products, and messages have to be located somewhere and it is this location that is undergoing significant transformation, evidenced in, for example, upheavals in the international division of labor that has seen millions of jobs relocated to low-wage regions of the world, especially China and India (→ Markets of the Media; Consumers in Media Markets).

Spatialization builds upon ideas offered by geographers and sociologists to address structural changes brought about by shifting uses of space and time. Anthony Giddens refers to the centrality of *time-space distanciation* in order to examine the decline of our dependency on time and space. He suggests that this process expands the availability of time and space as resources for those who can make use of them. David Harvey identifies *time-space compression* to suggest how the effective map of the world is shrinking, again for those who can take advantage of it. Manuel Castells calls our attention to the declining importance of physical space, the space of places, and the rising significance of *the space of flows* to suggest that the world map is being redrawn according to boundaries established by flows of people, goods, services, and messages creating what Doreen Massey refers to as a transformed “power-geometry.”

Communication is central to spatialization because communication and information processes and technologies promote flexibility and control throughout industry, but particularly within the communication and information sectors. Spatialization encompasses the process of *globalization*, the worldwide restructuring of industries and firms (→ Globalization Theories). Restructuring at the industry level is exemplified by the development of integrated markets based on digital technologies and, at the firm level, by the growth of the flexible or “virtual” company, which makes use of communication and information systems to continuously change structure, product line, marketing, and relationships to other companies, suppliers, its own workforce, and customers.

The political economy of communication has traditionally addressed spatialization as the institutional extension of corporate power in the communication industry. This is

manifested in the sheer growth in size of media firms, measured by assets, revenues, profit, employees, and stock share values. For example, communications systems in the United States are now shaped by a handful of companies including US-based firms General Electric (NBC), Viacom (CBS), the Walt Disney Company (ABC; → Disney), and Time Warner Inc. (→ CNN). There are others including non-US-based firms such as the News Corporation (Fox), → Bertelsmann, and Sony. Political economy has specifically examined growth by taking up different forms of corporate concentration (Herman & Chomsky 1988; Kunz 2006). *Horizontal concentration* takes place when a firm in one line of media buys a major interest in another media operation that is not directly related to the original business.

The typical form of this is *cross-media concentration* or the purchase by a firm in an older line of media, say a newspaper, of a firm in a newer line, such as a radio or television station. But horizontal concentration also takes place when a media company buys all or part of a business entirely outside of the media (e.g., when a broadcaster buys a hotel chain). *Vertical integration* describes the amalgamation of firms within a line of business that extend a company's control over the process of production as when a major Hollywood film production studio purchases a distributor of film. This is also referred to as forward integration because it expands a firm further along the production and distribution processes. Backward vertical integration took place when the New York Times Company purchased paper mills in Quebec, thereby expanding the company down the production process. In addition to demonstrating how media firms have developed into transnational conglomerates that now rival, in size and power, firms in any industry, political economists are addressing the development of flexible forms of corporate power evidenced in the *joint ventures*, *strategic alliances*, and other short-term and project-specific arrangements that bring together companies or parts of companies, including competitors. These take advantage of more flexible means of communication to unite and separate for mutual interest (Wasko 2003; → Concentration in Media Systems).

### *Structuration*

The third entry point for the political economy of communication is structuration, a process given prominence in the sociologist Anthony Giddens's work. Structuration amounts to a contemporary rendering of Marx's view that people make history, but not under conditions of their own making. Specifically, research based on structuration helps to balance a tendency in political economic analysis to concentrate on structures, typically business and governmental institutions, by incorporating the ideas of agency, social process, and social practice. Concretely, this means broadening the conception of social class from its structural or *categorical* sense, which defines it in terms of what some have and others do not, to incorporate both a relational and a constitutional sense of the term.

A *relational* view of social class foregrounds the connections, for example, between business and labor, and the ways in which labor constitutes itself within the relationship and as an independent force in its own right. This takes nothing away from the value of seeing class, in part, as a designation for the differences between the "haves" and the "have nots." The political economy of communication has addressed class in these terms by producing research that documents persistent inequities in communication systems,

particularly in access to the means of communication, and the reproduction of these inequities in social institutions (McChesney 1999; Murdock & Golding 2000). This has been applied to labor, particularly in research on how communication and information technology has been used to automate and de-skill work, including work in the media industries. It has also been used to show how the means of communication are used to measure and monitor work activity in systems of surveillance that extend managerial control over the entire labor process in precise detail.

A relational view of social class that defines it according to the practices and processes that link social class categories means, for example, that the working class is not defined simply by lack of access to the means of communication, but by its relationships of harmony, dependency, and conflict to the capitalist class. Moreover, a *constitutional* conception of class views the working class as producer of its own, however tenuous, volatile, and conflicted, identity, in relation to capital and independently of it. This research aims to demonstrate how classes constitute themselves, how they make history, in the face of well-researched analysis of the conditions that constrain this history-making activity.

When political economy has given attention to agency, process, and social practice, it tends to focus on social class. There are good reasons for this emphasis. Class structuration is a central entry point for comprehending social life, and numerous studies have documented the persistence of class divisions in the political economy of communication. Nevertheless, there are other dimensions to structuration that complement and conflict with class structuration, including *gender*, *race*, and the broadly defined *social movements* that, along with class, make up much of the social relations of communication. Political economy has made important strides in addressing the intersection of feminist studies and the political economy of the media (Meehan & Riordan 2002). It has also taken major steps in research on information technology, gender, and the international division of labor, which addresses the double oppression that women workers face in industries like microelectronics, where they experience the lowest wages and the most brutalizing working conditions (Pellow & Park 2002). Communication studies has addressed *imperialism* extensively, principally by examining the role of the media and information technology in the maintenance of control by richer over poorer societies (→ Cultural Imperialism Theories). Race figures significantly in this analysis and more generally in the social process of structuration, as Gandy (1998) takes up in his multi-perspectival assessment of race and the media. Racial divisions are a principal constituent of the multiple hierarchies of the contemporary global political economy, and race, as both category and social relationship, helps to explain access to national and global resources, including communication, media, and information technology (Pellow & Park 2002).

One of the major activities in structuration is the process of constructing *hegemony*, defined as what comes to be incorporated and contested as the taken-for-granted, commonsense, natural way of thinking about the world, including everything from cosmology through ethics to everyday social practices. Hegemony is a lived network of mutually constituting meanings and values that, as they are experienced as practices, appear to be mutually confirming. Out of the tensions and clashes within various structuration processes, the media come to be organized in full mainstream, oppositional, and alternative forms.

### Relationship to Cultural Studies and Policy Studies

Understanding the political economy of communication also requires one to look outward, at the relationship between the discipline and those on its borders. Although one can map the universe of academic disciplines in numerous ways, it is useful to situate the political economy of communication opposite cultural studies on the one side, and policy science on the other.

The → cultural studies approach is a broad-based intellectual movement that focuses on the constitution of meaning in texts, defined broadly to include all forms of social communication. The approach contains numerous currents and fissures that provide for considerable ferment from within. Nevertheless, it can contribute to the understanding of political economy in several ways. Cultural studies has been open to a broad-based critique of positivism (the view that sensory observation is the only source of knowledge). Moreover, it has defended a more open philosophical approach that concentrates on subjectivity or how people interpret their world, as well as on the social creation of knowledge. Cultural studies has also broadened the meaning of cultural analysis by starting from the premise that culture is ordinary, produced by all social actors rather than primarily by a privileged elite, and that the social is organized around gender and nationality divisions and identities as much as by social class.

Although political economy can learn from these departures, it can contribute equally to richer cultural studies. Even as it takes on a philosophical approach that is open to subjectivity and is more broadly inclusive, political economy insists on a realist epistemology that maintains the value of historical research, of thinking in terms of concrete social totalities, with a well-grounded moral philosophy, and a commitment to overcome the distinction between social research and social practice. Political economy departs from the tendency in cultural studies to exaggerate the importance of subjectivity, as well as the inclination to reject thinking in terms of historical practices and social wholes. Political economy also departs from the tendency for proponents of cultural studies to use obscure language that belies the original vision of the approach, that cultural analysis be accessible to the ordinary people who are responsible for creating culture. Finally, it eschews the propensity in cultural studies to reject studies of labor and the labor process in favor of examining the social “production” of consumption and the ensuing tendency among some in the cultural studies school to deny labor any value in contemporary movements for social change.

Political economy can also learn from the development of a *policy studies perspective* whose political wing has tended to place the state at the center of analysis, and whose economic wing aims to extend the application of primarily neo-classical economic theory over a wide range of political, social, and cultural life. Political economy has tended to regard government as overly dependent on and determined by the specific configuration of capital dominant at the time and therefore benefits from an approach that takes seriously the active role of the state. Moreover, political economy shares with policy science the interest in extending analysis over the entire social totality, with an eye to social transformation. Nevertheless, political economy departs fundamentally from the policy science tendency to a pluralist political analysis that views the state as the independent arbiter of a wide balance of social forces, none of which has enough power

to dominate society. Against this, political economy insists on the power of business and the process of commodification as the starting point of social analysis. Furthermore, political economy rejects the tendency of policy science to build its analysis of the social totality, and of the values that should guide its transformation, on individualism and market rationality. Against this, it insists on social processes, starting from social class and labor, and on setting community and public life against the market and a rationality that, from a political economy perspective, actually reproduces class power.

## Political Efficacy

Patricia Moy

University of Washington

A multidimensional concept that links political → cognitions, → attitudes, and behaviors, political efficacy refers generally to citizens' beliefs in their ability to influence the political system. In the half-century since its emergence, research on political efficacy has focused much on its conceptualization and → operationalization. In communication research, however, scholarship has emphasized defining its antecedents and outcomes.

### DEFINING AND MEASURING POLITICAL EFFICACY

According to its initial formulation (Campbell et al. 1954), political efficacy referred to the feeling that political actions taken by individuals can have an impact on the political process. Early perspectives on the concept saw it not only as a psychological disposition, but also as a norm and as a behavior. In other words, if citizens are politically efficacious, they will be more likely to support a given political regime, be more trusting of that system, and be less likely to engage in activities that challenge the system. If political efficacy is a disposition and a norm, then politically efficacious citizens believe that they can and should participate in politics. Contemporary views have reverted to the original emphasis on feelings, and conceptualize political efficacy as having two dimensions: internal efficacy, which reflects a personal sense of political competence, and external efficacy, the belief that the political system is democratic and will respond to actions taken by its citizens.

Although scholars concur on the existence of these two constructs, the items used to measure them have been less consistent (Balch 1974; Morrell 2003). Grounded in large part in work in the American National Election Studies, most operationalizations of *internal efficacy* are based on one or more of the following Likert-scale items (→ Scales; Scales and Indices):

"I consider myself to be well qualified to participate in politics."

"I feel that I have a pretty good understanding of the important political issues facing our country."

"I feel that I could as good a job in public office as most other people."

"I think that I am better informed about politics and government than most people."

“Sometimes politics and government seem so complicated that a person like me can’t really understand what’s going on”

*External efficacy*, on the other hand, tends to be measured by items that include the following:

“People like me do not have any say about what the government does.”  
“I don’t think public officials care much what people like me think.”

Although internal efficacy and external efficacy have been shown to be empirically related, this relationship is not always constant, and the presence of one does not necessarily imply the presence of the other. There are individuals who believe they can influence the system, yet perceive some politicians or elected officials to be unresponsive to efforts geared toward social change. Similarly, other individuals may perceive elected officials to be receptive to input, yet do not believe they themselves possess the knowledge or ability to take action to influence governmental policies.

Regardless, political efficacy is highly correlated with other cognitions and behaviors (→ Attitude–Behavior Consistency), and has played a key role in political theorizing. For example, a combination of efficacy and political trust can generate social or political change. According to William Gamson (1968), a combination of high internal efficacy and low political trust (linked to external efficacy) can motivate citizens to take action. However, the relationship between efficacy and action is reciprocal (Finkel 1985): Feelings of self-competence and system responsiveness can encourage political participation, and engaging in such activities can increase levels of internal and external efficacy.

## **POLITICAL EFFICACY AND COMMUNICATION**

The relationship between communication and political efficacy is not clear-cut; issues of causality and direction of effects remain unclear. A few trends have emerged from this front, however.

First, various studies have illustrated how *newspaper reading* increases knowledge, and with increased knowledge, enhances feelings of self-efficacy. Understandably, citizens who know more about politics will feel more self-confident and be more likely to perceive themselves as being able to take action. The fact that newspapers can physically devote more space to providing mobilizing information – information that allows readers to know how to take action (e.g., where a town-hall meeting will convene) – also can stimulate levels of self-efficacy. Whereas newspaper reading can enhance internal efficacy, *television viewing* is generally negatively associated with it, presumably due to how television news viewing decreases political knowledge. In other words, because television news focuses less on issues of substance, opting instead for coverage of personalities, places, and events, audience members relying primarily on television news will tend to experience lower levels of knowledge gain than newspaper readers. Despite this general trend, the view that newspapers are more effective than television news at imparting political knowledge has come under attack as researchers have begun to scrutinize the conceptualization and measurement of political knowledge and media use (→ Political Knowledge, Political Socialization through the Media).

Second, when examining the *effects of media content* on feelings of efficacy, research illustrates that these effects are primarily negative. Numerous studies conducted over the past three decades have drawn the same conclusion: media → negativity undermines political trust, a very close correlate of external efficacy. In their milestone study linking newspaper coverage with → political cynicism and (external) efficacy, Miller et al. (1979) found that in a sea of primarily neutral or positive newspaper coverage, consumption of critical coverage led to greater distrust of the federal government, which in turn fueled feelings of system unresponsiveness. Over the years, television news coverage of politics has been more negative than newspaper coverage, and has grown increasingly so (→ Political News). Negatively valenced stories of Congress, presidential candidates, and democratic institutions regularly punctuate television news coverage, and more so in network news than local television news (Moy & Pfau 2000). Moreover, television production practices have evolved such that viewers regularly see close-ups of individuals engaged in politically contentious discussions (e.g., in a roundtable on a news talk show) or split screens in political debates (Mutz & Reeves 2005). These formats, which become more prominent as political discourse grows increasingly uncivil, can reduce trust in government, which in turn can decrease levels of external efficacy.

Newspapers and television news notwithstanding, negative portrayals of politicians and the political process appear in scores of other outlets. Political *campaign advertisements* are rife with negative messages designed to undermine the opposing candidate; viewers exposed to these negative advertisements can shift to voting for the sponsoring candidate or choose to disengage from the political process and abstain from voting (→ Political Advertising). Television news magazines present 15-minute segments in which investigative reporters expose the truth behind a host of scandals, and illustrate the failings and foibles of politicians and others. Presented in a highly accessible and dramatic fashion, the conveying of such backstage information indicates to viewers that the system is not to be trusted. In even shorter segments, political talk radio hosts in the United States have taken to lambasting politicians and policies, employing forms of speech previously unheard over the airwaves. And with the fusing of political and popular communication, negative messages about the political system and those who occupy various offices can be found in late-night talk shows and entertainment content (→ Infotainment; Politainment). Late-night talk-show hosts devote the beginning of their shows to a monologue in which politicians and political incidents provide the fodder for most of their jokes. Shows like *Saturday Night Live* and *The Daily Show*, which have been adapted in several countries outside the US, satirize politicians, distort their personal traits, and deride their policies. For those who rely primarily on these non-news outlets, negative portrayals of politicians and the political system can shape perceptions; these anti-institutional themes communicate to audience members that the system cannot be relied upon and is intractable.

Third, the emergence of the → *Internet* on the media landscape has changed how scholars view media effects on efficacy. There is no convergence of views on this front, and the differences map easily onto a spectrum anchored by optimism and pessimism. At one end, optimists believe new media technology can lower the costs of communicating with elected officials, expressing their views with others, and participating in public affairs. In addition, the wealth of information available on the Internet has the potential to increase knowledge about political issues. Together these factors can enhance perceptions

that one can take effective political action. Pessimists, however, offer another view, contending that the Internet helps only to erode political efficacy. Specifically, the same wealth of political information online that would generate political knowledge could overwhelm a user and reduce his or her sense of self-efficacy. Also, increased levels of communication (e.g., emails) with elected officials may not necessarily mean increased responses from these individuals; this disjuncture would nurture perceptions of system unresponsiveness. Empirically, the data linking Internet use to political efficacy have generated inconsistent results. These inconsistencies derive in part from the context and time period in which the data were collected as well as the items used to measure Internet use. Some scholars prefer to operationalize the concept as access to the Internet, whereas others opt to employ measures of exposure to information about a campaign (or a given issue) or active seeking of such information (Kenski & Stroud 2006).

Fourth, communication effects on political efficacy include those of *interpersonal communication* (→ Two-Step Flow of Communication). Much like mass-mediated content, discussion with others affords citizens the opportunity to gain knowledge about politics, learn about differing views and experiences, and understand how action can be taken. Perhaps more importantly, discussion about an issue allows citizens to learn that others feel the same way they do about an issue; the mere knowledge that others share one's views may increase one's feeling that effective action can be taken.

### **EFFICACY MAY INFLUENCE COMMUNICATION**

Thus far, the aforementioned trends reflect those that situate political efficacy as causally subsequent to communication, not surprisingly given communication scholars' focus on effects research (→ Media Effects). A smaller corpus of literature provides evidence for arguing causality in the other direction, i.e., that efficacy (particularly internal efficacy) influences communication.

In general, more self-efficacious individuals will tend to follow public affairs content, believing that additional information gleaned from the media will help them better understand the world around them and take action. This finding resonates with the → uses-and-gratifications literature, which posits a menu of motivations as to why individuals use the media. Also, those who believe they possess some level of political self-competence will be more likely to express their opinions and communicate with others. This communication can take various forms, perhaps the easiest and most common ones being interpersonal discussion, particularly with like-minded others, and expression of views in an online setting (one that may or may not allow for anonymity). This communication may stem from a desire to rally support for a given cause or to take collective action. Finally, those with higher levels of internal efficacy also have a greater tendency to engage with media that allows for some level of interactivity, such as call-in radio and television talk shows.

In sum, it is clear that mass and interpersonal communication can shape one's feelings of efficacy. However, as media outlets and genres proliferate, and as they attempt to attract different segments of the population, each with different orientations and motivations and dispositions, the relationships between communication and efficacy will need to be analyzed more closely.

## **Political Journalists**

*Thomas Hanitzsch*

*University of Zurich*

Political journalists, viewed through the lens of the editorial organization, are those who report on political affairs or work on the *political desk*. This perspective foregrounds organizational factors in news production, particularly the division of labor in the editorial process. Typical Anglo-American newsrooms make a functional distinction between news gatherers (reporters) and news processors (editors), but in continental Europe many news cultures have implemented divisions among subject-related editorial departments (such as politics, business, or sports), where journalists function as professional all-rounders with tasks involving reporting, editing, and commenting (→ News Routines; Political News).

Organizational pressures, especially the cutbacks in financial resources allotted to editorial processes, have left journalists limited, if not inadequate, time to produce a balanced, comprehensive, and contextualized account. Other limitations emanate from the textual constraints of most news formats and from the increased speed of news production through new communication technologies. Consequently, reactive modes of

political journalism have gained ground as more proactive approaches have receded (→ Muckraking; Investigative Reporting). Reliance upon official sources is particularly pervasive in, but not limited to, news cultures with an authoritative press system (→ News Sources). Even in liberal media systems, journalists commonly recognize government information as credible and authoritative, which makes it much easier for political advertisers and public relations executives to get their messages into the news (McChesney 2004). Because politicians have long recognized the impact of media and public opinion on the processes of political decision-making, journalists operate permanently under pressure from lobbyists and so-called political handlers (→ Spin Doctor), who strive to control and manipulate information. As political communication has relied more on strategic information management, media coverage has turned cynical and negative in tone (Patterson 1993; → Strategic Communication; Negativity; Bias in the News).

Political journalists also work under normative expectations that often conflict (→ Journalists' Role Perception). In an era of mediated politics, they play a vital role in informing the electorate. They are expected to act in the public interest, as gatekeepers who identify the relevant political news of the day for citizens, and also as watchdogs who monitor the legislative, executive, and judicial estates to safeguard democracy (→ Fourth Estate). Tensions arise between the demands of covering the revival of local cultural identities and the processes of globalization, as societies look to political journalists to serve as a cohesive force contributing to social integration.

In contrast to normative expectations, however, some scholars argue that political journalism in fact causes alienation, induces cynicism, and has a narcotic influence that continues to erode public engagement in civic life (McNair 2000). As media organizations have become subject to marketing, commercializing, and commodifying processes, political journalism has tended to highlight the popular and spectacular over the relevant. This tendency, along with a decline in voter participation, has helped give rise to a reform movement (→ Public Journalism) that endeavors to reconstruct public life by reconnecting journalists with the communities they cover. Other efforts attempt to furnish political journalists with a more assertive role in national development and nonviolent conflict resolution (→ Development Journalism; Peace Journalism), especially in poor and war-torn societies of Asia and Africa.

Consistent evidence shows that journalists come primarily from the middle and upper middle classes. Some media critics (e.g. Paletz & Entman 1981) argue that their elite background prevents many political journalists from challenging the political status quo. They are thus seen as preserving the legitimacy of the prevailing political, economic, and social system.

Finally, journalists are also political actors. The strategic ritual of objectivity dominates the professional ideology of journalists around the world (Weaver 1998; → News Ideologies), but interpretive and interventionist practices still exist in political reporting. In the United States after the September 11 attacks, prominent political journalists positioned themselves as Americans first, journalists second, in a stance that may have contributed to the biased coverage of the war on Iraq in the mainstream US media. In a similar vein, leading media figures in Europe (including France, Germany, and Great Britain) and Asia (especially in the Islamic context) spoke out against the war.

Politically active journalists perceive themselves as participants in the debate, as advocates of and missionaries for a particular political cause. They may act on behalf of the socially

disadvantaged or as the mouthpiece of a party or other group whose interests are at stake in a political process. As advocates, their impulse is not to stand outside the flow of events, but to participate, intervene, and get involved to promote change (→ Advocacy Journalism). The interventionist impulse also motivates public, development, and peace journalism.

Historically, politically assertive journalism has a rich tradition in Latin America and also in Europe, where the media tend to have distinct political orientations (Hallin & Mancini 2004; → Party–Press Parallelism). Surveys of journalists have shown that the degree of their partisanship is higher in the political cultures of Germany and Italy than among their colleagues in the United States (Donsbach & Patterson 2004). Although the majority of news workers lean to the liberal side of the political spectrum, most media organizations, as a result of their integration into the economic system, lean to the conservative side.

## **Political Knowledge**

*William P. Eveland, Jr.*

*Ohio State University*

*Myiah Hutchens Hively*

*Ohio State University*

One of the foundational assumptions of democratic theory is that the public must be sufficiently informed about public matters in order to be capable of fulfilling their roles

in making collective decisions. The centrality of an informed public in democratic theory has made the study of political knowledge integral to the study of political communication. Much of the research on political knowledge addresses one of two main questions: Is the public sufficiently politically knowledgeable to sustain an effective democracy? and: What role does communication play in the creation and maintenance of an informed citizenry? (→ Deliberativeness in Political Communication; Public; Public Opinion; Public Sphere). But to begin, it is important to define political knowledge.

Various terms are used to address the *concept of political knowledge*. For instance, the term “political sophistication” often includes knowledge or awareness of political matters as a central component. Some also incorporate political interest, political participation, political discussion, and news media use in definitions of political sophistication. However, a number of scholars have noted that, at its core, political sophistication is about knowledge of the political realm. Thus, political sophistication is a concept very closely related to political knowledge.

Another commonly employed term that shares much with political knowledge is *political expertise*. Political expertise is difficult to differentiate from political sophistication, as it also has been claimed to include factual political knowledge as well as political interest and experience in political activities. Again, given the central role of knowledge in the definition of expertise, political expertise is closely related to – or heavily overlapping with – political knowledge.

## **DIMENSIONS AND LEVELS OF POLITICAL KNOWLEDGE**

Political knowledge is often divided into two components. Some researchers refer to “differentiation” – the number of political facts or concepts held by an individual – and “integration” – the ability to connect and relate these facts or concepts – as the two components of political knowledge or thinking. Others make a very similar distinction between factual knowledge and structural knowledge.

*Factual political knowledge* is probably the most commonly investigated aspect of political knowledge. It refers to the ability to remember or recognize bits of information that can be determined by observers to be true or false. For instance, knowing the names of one’s representatives – or alternatively, knowing the length of a representative’s term of office – is a form of factual political knowledge. Other forms of factual political knowledge include knowledge of officials and their positions in the political system, knowledge of political process, and knowledge of candidate characteristics and issue positions.

The second dimension of political knowledge, often ignored by researchers but considered vitally important by theorists, is *structural knowledge*. Structural knowledge is the way in which factual information is organized by an individual. For instance, political ideologies are one way in which attitudes are structured. Various terms have been employed to refer to political knowledge structures, including → schemas, ideologies, and knowledge structure density. What each of these terms shares is the notion that it is not merely a group of disconnected facts about politics that make up political knowledge. Instead, the manner in which facts are organized in memory, and the ways in which individuals see connections between the facts, can be vitally important. However, it is difficult to explicitly say that any given organization or structure of political information

in memory is accurate or correct. For instance, some consider hierarchically organized structures to be the most sophisticated or expert, whereas others believe that knowledge structures need only be highly interconnected to reflect higher levels of sophistication or expertise.

A different method of dividing up the concept of political knowledge is by considering *knowledge across various political domains*. For instance, one might distinguish knowledge of gun-control policy from knowledge of health-care policy from knowledge of fiscal policy. Some argue that individuals who have high levels of knowledge or expertise in one domain do not necessarily have high levels of knowledge in other domains. Issue publics – groups of individuals who care a great deal about an issue and pay high levels of attention to governmental activity surrounding it – are informed about their own issues but not necessarily about the issues of others. One might also distinguish between knowledge of politics at the national level and knowledge of politics at the local level.

There is considerable debate regarding the *level of political knowledge* of the general public and what level of knowledge is necessary for the effective practice of democracy. Research on factual knowledge suggests that levels of political knowledge in the US have been low and stable since the mid-twentieth century. Comparative work suggests that levels of foreign affairs knowledge differ by country, with people from North America being relatively less informed than their European counterparts (Bennett et al. 1996).

Some argue that research showing a lack of knowledge of fundamental rules of government, an inability to correctly identify the names of one's political representatives, and the lack of a consistent ideological framework employed in reasoning and decision-making raise serious questions about the ability of democratic forms of government to work effectively and in the interests of their citizens. Others counter that even citizens with minimal levels of knowledge of the sort described above can use simple heuristics – based on party identification or even visual characteristics (e.g., race, gender) of candidates or supporters of various issues – to make satisfactory choices in the majority of cases. Still others question the ability of scientists to specify what kinds of knowledge and what levels of knowledge are in fact necessary and sufficient for effective decision-making in a democracy.

## **MEDIA USE AND KNOWLEDGE ACQUISITION**

While it is important to understand what political knowledge is, it is also important to understand how communication is related to knowledge. Political knowledge has been consistently linked to news media use, with the strength of the relationship often varying from one medium to another (→ Exposure to Communication Content; Political Media Use). Communication researchers have determined that individuals' first introduction to politics, and most of their contact with politics, comes from the media. Therefore, it makes sense that using news media would lead to increased political knowledge. While there is some debate as to how best to measure media use, the medium that has demonstrated the strongest relationship to political knowledge is the newspaper.

The *newspaper use/knowledge relationship* has been found using a variety of measures, such as amount of attention paid to political stories while reading a newspaper and how many days an individual reads a newspaper. This relationship is fairly robust because it is

replicated across time, countries, and measures of newspaper use, although political learning is typically less from tabloid newspapers than from broadsheets. Researchers have theorized several reasons for why newspaper reading tends to be the best predictor of political knowledge. Two common reasons found are the content provided in newspapers and the structure of newspapers. Researchers conclude that newspapers have space in which to provide more background on issues and they allow readers to absorb the information at their own pace, both of which facilitate learning.

*Television news* is also positively related to knowledge, especially among those who have generally lower levels of education (→ Knowledge Gap Effects). In countries such as the United States where most individuals watch commercial network news, the relationship between television and knowledge is not as strong or consistent as the relationship that exists between newspaper use and political knowledge. This could be due to either content differences across media or the ways in which individuals use different media. For instance, television news often presents visuals that are inconsistent with the verbal message, which can reduce learning. Moreover, television news generally has less space to devote to political news (24-hour cable networks being the exception) than print media and thus it carries less political information overall. It also could be that individuals are more easily distracted by alternative behaviors (e.g., eating, talking) while watching television news than while reading a newspaper. These distractions can reduce attention and thus reduce learning.

The newest form of mass media, the → *Internet*, can also be a source of political information and learning (→ Internet News). Although examining the political uses of the Internet is still a relatively new area of research, research has shown that online news use is positively related to political knowledge. Younger individuals have generally been found to have lower levels of political knowledge, but young individuals who use the Internet for political purposes have been found to have higher levels of political knowledge than their non-Internet-using counterparts. Key to the relationship between knowledge and Internet use is being aware of what individuals are searching for when using the Internet. Using the Internet for leisure activities, such as playing games, is negatively related to knowledge; however, using the Internet to search for political information is positively related to knowledge.

## **DISCUSSING AND PROCESSING POLITICS**

Discussing politics with others has also been tied to an increase in political knowledge (→ Two-Step Flow of Communication). Whether it is the discussion that fosters knowledge, or whether it is information seeking in preparation for discussing politics that creates the relationship is a matter of some debate (Eveland 2004). The people whom individuals talk to about politics are typically referred to as an individual's "discussion network." There are several features of the network that are considered when examining discussion effects. The most commonly analyzed features are the frequency of discussion – how often politics is discussed – and the size of the discussion network – the number of people with whom an individual talks about politics.

*Frequency of political discussion* has one of the most consistent relationships with political knowledge; that is, the more you talk about politics, the more you know about it.

Researchers have determined that this relationship exists because the more often you talk about politics, the more chances you have to be exposed to other points of view and come across new information. In addition, the size of the discussion network is also positively related to political knowledge for similar reasons. The third variable that is often considered when examining the influence of discussion networks is the heterogeneity of discussion partners, which is the variety of political views and other characteristics represented in an individual's discussion network. This variable's relationship to knowledge is not examined as often, but has generally demonstrated a positive relationship to at least some forms of political knowledge.

For both types of communication – mass mediated and interpersonal – an individual's motivation plays a role in what information is selected and how it is processed (→ Information Seeking; Uses and Gratifications), and this will have a large impact on how knowledge is affected by that communication. Selecting news-related mediated content and talking frequently to a variety of individuals about politics are communication behaviors associated with political knowledge. When processing information, elaborative processing – making connections between new information and prior knowledge and experience – is associated with increased knowledge.

# Political Language

Sharon E. Jarvis

*University of Texas at Austin*

Political language has been studied by sociolinguists, communication scholars, political scientists, historians, sociologists, anthropologists, psychologists, and marketing professionals (→ Language and Social Interaction; Political Communication). Shared assumptions across these fields are that (1) citizens come to know their political worlds through messages and symbols, and (2) political words do not have → meaning in themselves; rather their meanings are a function of contexts, speakers, audiences, and predispositions. Beyond these shared assumptions, specific fields have made unique contributions to what is known about political language.

Fundamental contributions to this topic have been provided by sociolinguists. Widely accepted claims from this area include those that naming is critical to communication (for only entities that are named can be shared among people; Kress & Hodge 1981); that language helps individuals to understand situations (as the structure of any language helps to shape the perceptual and conceptual discriminations available to individuals; Fowler 1974); and that political language is not static (indeed, political terms can change with time as the meanings of words can expand, contract, or shift from their original meanings; Fromkin & Rodman 1974).

Key scholarship in communication and → cultural studies has also focused on the power of names and naming. Three key works from these fields link shifts in word use to broader ideological concerns. British theorist Raymond Williams's *Keywords* (1976) took a longitudinal approach to show how important social and historical processes occur within language. Williams observed from a Marxist perspective how certain meanings emerged (e.g., capitalism), older meanings became reversed (e.g., society, individual), and still others were extended (e.g., interest) over time in language. In doing so, he underscored how cultural and ideological shifts can be witnessed in the meanings ascribed to words. Rhetorician Kenneth Burke (1950, 1966) also discussed the capacity of language to shape people's thoughts, particularly subconscious thoughts (→ Rhetorics: New Rhetorics). Burke introduced the notion of a "terministic screen" that serves as a set of symbols through which individuals can interpret and make sense of their worlds. These screens present a means of studying the intersection between language and ideology, for individuals can only see the world as their symbol systems allow them to do so. Rhetorician Richard Weaver (1953) pointed out how certain words are politically loaded in a society when he developed the concepts of "god" terms (words that have an automatic positive meaning) and "devil" terms (words that trigger negative associations). Weaver detailed how such terms have considerable persuasive – and propagandistic – force. He urged individuals to use such words with caution and to consider carefully when these words are employed by others.

The most powerful work in political science on political language has been advanced by Murray Edelman. Two of his seminal books, *Symbolic uses of politics* (1964) and *Political language* (1977), drew on foundational understandings from sociolinguistics and

imported them into political settings. In both of these books, Edelman asserted that individuals are far more likely to experience the language surrounding politics than actual political events themselves. For this reason, he regarded language as the central factor in social relations and action. In *Symbolic uses of politics*, Edelman argued that it is imperative to study how language shapes people's realities and how it establishes specific perspectives for evaluation (while distracting individuals from considering alternative perspectives). Notably, he discussed how elites use language to shape citizen expectations of government and of leadership, as well as perceptions of the past and the future. A key theme of his discussion was that the constructions provided by elites do not have to mirror empirical realities. He maintained that the language and symbols used to describe a leader, government, or issue do not have to be accurate, but they do describe how elites have guided conversations and how individuals have been encouraged to think and feel about themselves and their systems (→ Political Symbols; Symbolic Politics).

In *Political language*, Edelman focused specifically on how language is used to classify people, to define groups, and to justify actions and policies. Specifically, he described how labeling can (1) cast individual persons as deserving of state assistance or support, (2) define particular groups as allies or enemies, and (3) signal that certain issues are appropriate for political discussion. Edelman maintained that all of these processes have important consequences in political life. To politicize a person, a group, or an issue, in his mind, is to define it as appropriate for decision-making. In contrast, to ignore a person, to define a group as an enemy, or to regard an issue as nonpolitical often serves to win general acceptance for elite values (→ Marginality, Stigma, and Communication; Symbolic Annihilation). Political labels not only designate certain people and topics as political, but also contribute to the identity of a society. When citizens accept particular constructions, they help to create their own realities and collective identities. Edelman discussed how there are considerable incentives to accept the labels and the constructed understandings that are offered by political elites and promoted in media programming. Accepting these allows citizens to accept dominant and reassuring perspectives on public affairs rather than having to challenge understandings of themselves, their institutions, and their society.

Historical analyses of political language point to the intersection of words, traditions, and public life. From this perspective, scholars examine the ability of words to inspire, enrage, mobilize, and make mass actions possible. Sociological analyses of political language attend to how groups discuss politics, how groups are encouraged to enter public debates (and public life) and dissuaded from doing so, and what types of group interactions might lead to greater political participation (as well as what types of group dynamics make individuals want to avoid politics entirely). Psychological analyses explore how various linguistic framing techniques shape the way individuals interpret messages and make judgments (→ Framing Effects; Framing of the News).

The study of political language in marketing and business schools has forwarded important observations on psychological short cuts, brand identification, and brand loyalty (→ Brands). As political campaign environments become increasingly professionalized and tied to the best business practices of marketing and advertising, valuable contributions to the understanding of political language have emerged from business schools (→ Political Marketing). European scholars, particularly, have focused on the

marketing and branding practices of political parties and other groups in political life (Newman 1999).

A variety of methodologies has been employed to study political language. Content analytic research has tracked trends in word use, documented shifts over time, and made connections between patterns in word use and → public opinion, public policy, and electoral outcomes (→ Content Analysis, Quantitative). Computerized content analysis has examined large corpuses of texts to search for macro-patterns over time, across speaker type, and across various types of political messages. Stylistic analyses point to more nuanced differences in language use between speakers, message types, and political circumstances (→ Style and Rhetoric). Rhetorical analyses of historical texts have addressed how language has functioned in prior political contexts (→ Rhetorical Studies). Experimental and focus group research capture how language and framing techniques influence attitudes and behaviors (→ Experimental Design).

# Political Marketing

*Philippe J. Maarek*

*University Paris XII*

Political marketing arose when, in the middle of the twentieth century, the methods developed by commercial marketing specialists were adopted for political campaigning. Political marketing replaced unilateral → propaganda exactly as commercial → advertising has become a plain subsidiary of commercial → marketing. Political marketing is considered as one of the most demanding applications of political communication research. It stands at the crossroads of several distinct fields of social sciences engaging in the study or practice of deliberate and purposive communication to reach set goals (Maarek 1995, 2007; → Political Communication; Public Relations; Strategic Communication).

## THE EMERGENCE OF POLITICAL MARKETING

It is generally accepted that political marketing started to become a cornerstone of political campaigns when, in the 1952 presidential election, the American Republican Party hired a first-rate marketing consultant, Thomas Rosser Reeves Jr., who managed Dwight D. Eisenhower's successful transformation from an army general to a civilian commander in chief (McNair 1995; → Election Campaign Communication). The two main methods then used by Reeves in two successive steps are representative of the two main stages of a political marketing strategy. First, direct marketing by mail was extensively used in order to define Eisenhower's main campaigning themes, simplifying them according to the "unique selling proposition" method, which Reeves had previously devised for commercial products. Then 49 short televised spots (one for each US state) were aired, strictly following the precise targeting rules also previously developed for commercial marketing (Diamond and Bates 1984).

This shows clearly the two-dimensional aspect of political marketing with its two successive steps: not only does it grant new and modernized communication tools to the politicians, but also it precedes the campaign and influences its strategy considerably, notably in the targeting process. Political marketing does not arrive after the main campaigning decisions are made but comes in from the start as an aid to campaign decision-making.

This also means that political marketing influences and modifies the contents of politics itself. While the political propaganda of a premodern campaign plainly influenced the message and its transmission, modern political communication usually intervenes in the core of the political campaign. This may be advantageous to the development of a campaign strategy for addressing volatile voters. But this also means that rather than presenting a fully organized and focused political program, politicians are pushed to transform it in order to reach and convince the so-called "swing voters" who are commonly considered as being the most susceptible targets of the campaign. Swing voters may decide who will win the election (Maarek 1995, 2007).

Eisenhower's success in reaching the presidency in 1952 indicated clearly that political marketing, able to find him a strategy for winning the White House, was key to modern

political campaigning. In the following years, this led to the exponential development of political marketing in the United States (see, e.g., Sabato 1989; Kaid & McCubbins 1992).

### THE EXPANSION OF POLITICAL MARKETING

Nowadays, as a consequence, political marketing consultants are helping would-be politicians to campaign all over the world and sometimes for the smallest electoral offices in the tiniest constituencies (→ Political Consultant). This expansion also led to a systematic attempt to reach any media potentially helpful to political communication, in what constitutes the *second stage in the development of political marketing*. From audiovisual mass media to the → Internet, and including old-fashioned mail, all media have been employed by political marketing, following the reasoning that a single extra vote thus won might be useful. Even electoral meetings are now staged like rock concerts, and negative advertising is flourishing, not to mention innumerable direct marketing mailings and email spamming. For instance, in France, while campaigning for the presidential office in 2007, Nicolas Sarkozy sent unsolicited emails to more than a million mailboxes (Maarek 2007; → Electronic Mail).

While political marketing initially emerged in the United States, it has progressed very quickly to most of the countries where free elections are held (see, e.g., Franklin 1994; Kavanagh 1995; Scammell 1995). Politicians in many countries started to hire American political marketing consultants who had been successfully managing US presidential campaigns, from Joe Napolitano to James Carville and Dick Morris – to mention just a few prominent figures. Sometimes considered as an “Americanization” of political communication processes, this penetration by modern political marketing techniques is now understood as being a sign of plain *professionalized modernization*, and a reaction to similar media environments and similar electoral circumstances (Negrine 1996; Negrine et al. 2007). Modern political marketing knows no borders, and French or British political marketing consultants are now traveling around the world as much as their American counterparts (→ Professionalization of Public Relations).

### FROM CAMPAIGNING TO GOVERNMENTAL SPIN

Initially positioned within electoral campaigns, political marketing was bound to expand its borders to political communication at large.

In the 1970s, after the example set by John F. Kennedy, who reorganized the White House according to media management practices, only public opinion polls specialists were hired by governing politicians (Valéry Giscard d’Estaing in France, for instance, created a “public opinion cell” in the presidential staff in 1974). Then, in the 1980s, when polls increasingly dictated government public relations, many countries’ governments reorganized accordingly. Some, like France or Italy, also renamed the offices in charge of the government’s public communication (“Communication Publique” and “Comunicazione Pubblica” respectively).

This *generalization of political marketing* to government public communication is not only motivated by incumbent politicians’ wish to control their messages and to be re-elected more easily. Political marketing also became the counterpart of new media

developments, especially of the Internet and its widespread possibilities of extending citizens' free, fast expression (Davis 1999) – with Internet petitioning and blogging as a more recent transformation of that medium (Maarek 2007; → Blogger). Any new announcement in policymaking has now to face the new liberty given to citizens to denounce it instantly and efficiently, thus leading to more carefully planned communication campaigns by marketing specialists. As a consequence, government communication to the public has become more and more dependent on political marketing methods and on newly appointed communication officers and → spin doctors, who are eagerly trying to control the government's media relationships (Jones 1995).

This change was blatant in the United Kingdom when Tony Blair became prime minister after his landslide victory in the 1997 parliamentary election. He established as “director of communication and strategy” his campaign spokesman, former journalist Alastair Campbell, who proceeded to control government communication to the public in every way, thanks to his extended job definition (Wring 2004).

Tony Blair's success in controlling the media, at least during his first two governments, led to a clear breakthrough of political marketing practices as a policy enforcement tool, even if the media became aware of the political “spin,” which resulted in neutralizing it to some degree. In many countries, this was seen as an example to follow. In France, for example, the two main contenders for the presidential office in 2007, Segolène Royal and Nicolas Sarkozy, both equally claimed Blair's legacy.

## CONSEQUENCES OF POLITICAL MARKETING INFLUENCE

Two consequences of an increasing political marketing influence are discussed quite often in the scholarly literature: depolitization of politics and excessive personalization.

*Depolitization of politics* seems to be a paradoxical result of targeting swing voters in election campaigns, who are considered to have a crucial influence on the election outcome. By addressing swing voters through more and more differentiated and elaborate means, political marketing has considerably narrowed the scope of political campaigns and has rendered communication to the public more difficult. By catering to swing voters who have little interest in politics, parties and candidates have toned down the political core of their campaigns and often resorted to plain populism (→ Populism and Responsiveness; Mediated Populism). Likewise, governing politicians have been led to drastically change or withdraw from decisions deemed unpopular, following the results of opinion polls and the advice of public relations consultants. Addressing issues of citizens' everyday life, or of security and comfort, is considered as more profitable than campaigning or governing on the basis of a political program that people with little interest in politics might find less concrete and unattractive.

The way of addressing the public has also changed. In order to reach a wide audience and particularly citizens with little political interest, politicians are appearing on media entertainment programs and present themselves like show-business celebrities (→ Infotainment; Politainment). Bill Clinton playing the saxophone on Arsenio Hall's show is a legendary example. Discussing entertaining topics and private affairs has become a prime means of accessing the apolitical citizen. This is supposed to have led to a paradoxical depolitization of political communication. Politicians who rely too much on marketing advisors, however, often find their basic capacity questioned.

An increasing *personalization of political communication* is also seen as a consequence of political marketing. Personalization is connected to underplaying issues and focusing instead on politicians' personal charisma, and even their looks and private lives, particularly in election campaigns (→ Personalization of Campaigning). The marketing strategy of reaching undecided voters by nonpolitical arguments contributes to personalization, as does the predominance of television in election campaigning. In addition, negative advertising attacking the opponent, a growing phenomenon particularly in American presidential campaigns, directs voters' attention to the personal characteristics of the top candidates (Ansolabehere & Iyengar 1995; → Candidate Image; Negative Campaigning; Political Advertising). Therefore the personalities of the front runners become the main reason for casting votes, rather than their political programs or their campaigning themes, and this is assumed to result in a personalization of voting behavior.

Personalization is even having, as a rather dubious side-effect, the *celebritization of politics* (or "peopolisation," a *franglais* word derived from "people"). Politicians assume the status of celebrities, like prominent actors and pop stars, and are treated by the mass media accordingly. For instance, during the run-up to the French presidency campaign of 2007 a celebrity magazine published, as part of a survey of "50 stars at the beach," suggestive paparazzi photos of a scantily bikini-clad Ségolène Royal, the Socialist presidential candidate. This phenomenon points to the seamy side of political marketing: politicians taking advantage of the sophistication and branding potential of marketing methods have to face situations where the media dictate the rules of the game. Such politicians may not only lose control over their personal image, but also contribute to depolitization tendencies and even growing cynicism among the population (→ Political Cynicism).

## Political Media Content, Quality Criteria in

Lutz M. Hagen

Dresden University of Technology

Media content is usually considered “political” if it refers to current events and issues, to political institutions or actors, as well as to the public discourse among these actors (→ Political Discourse). If the term “quality” is used to speak of more than just a trait, it refers to a trait that is desired according to some standard or norm. In this sense, the quality of political media content refers to the degree to which this content fulfills normative requirements.

There are many sources of norms or standards for media content, resulting in a broad variety of criteria by which content may be assessed. Standards mostly pertain to the media's function of providing information and orientation and to news content (→ News; Political News; Uses and Gratifications). The core of those standards is formed by professional theory and practice of journalism (→ Ethics in Journalism; Fairness Doctrine; Standards of News). Many quality criteria are derived from the intention to best serve media consumers' individual orientation needs. Others, possibly coinciding, are derived from the notion of a → public interest that the media should serve. A particular field of empirical media research has established itself, which aims at assessing the quality of → media performance.

Serving the public interest may in itself be considered a political quality since it involves debate or other forms of democratic decision-making to determine what lies in the public interest. Serving the individual orientation interests of users may too be considered a politically relevant quality, since it is a prerequisite for rational political opinion formation and decision-making. From this one can conclude that the core quality criteria of professional journalism must also pertain to political media content: *objectivity*, *diversity*, and *readability* (→ Accuracy; Objectivity in Reporting; Plurality).

Above and beyond that, further norms can be derived from the notion that the media should foster the desired outcome of the political process according to the norms of the respective political systems. Such specific quality criteria for political media content mainly

originate from theories of democracy as far as they define the functions that the media system is expected to perform for political systems (→ Functional Analysis).

### **INTERDEPENDENCIES BETWEEN MEDIA SYSTEM AND POLITICAL SYSTEM**

No matter which form political systems take, in mass societies their functioning is dependent on the mass media. After all, politics can be conceived of as largely, or even solely, consisting of communication acts (Meadow 1980), and in modern states, unlike ancient city states, there is no alternative to involving citizens and societal groups in politics through the mode of mass communication. On the other hand, the structure of a mass media system is determined by the structure of the political system (→ Political Communication; Political Communication Systems).

Thus, the development of mainly market-based media systems in the western tradition is rather parallel to the development of democracy in the United States and Britain, whereas the development of monopolized and state-controlled mass media systems in other countries went along with the rise of fascist, communist, and other totalitarian states of the twentieth century.

The norms prescribing how the media should function can thus diverge widely, depending on the respective structure and values of a political system. What is functional for one system may be dysfunctional for another. For example, in totalitarian systems, diversity of media content will typically be dysfunctional, whereas it counts as a core quality in the context of democratic systems. Siebert, Peterson, and → Schramm's classical *Four theories of the press* (1956) discusses the norms of political systems as a major shaping force of media systems, and accordingly categorizes media systems as "libertarian," "social responsibility," "communist," or "authoritarian," with the first two models describing democratic media systems (→ Journalism: Normative Theories). A strong impact of political systems on media systems is confirmed by a recent and analytically more detailed study by Hallin and Mancini (2004).

In principle, media functions as defined by nondemocratic press theories – like, for example, Lenin's theory of the press as an agitator, propagandist, and organizer – might be interpreted as "quality" criteria in a totalitarian sense. Yet, the vast majority of the pertinent literature deals with quality criteria of media content in the *context of democracies*, for two reasons. First, independent and public scientific research on media and communication is not functional for totalitarian systems and thus remains an enterprise limited to the boundaries of democracies. Second, the spread of democracy to many countries in the world has caught the attention of scholars. This goes in line with an increased need for explaining the character of democratic regimes and the role of mass media therein.

This development has also fostered research that aims at defining and measuring the dimensions and degrees of democratic quality and at comparing them between different political systems. According to the most influential work of Dahl (1989), the degree to which countries meet the *ideals of democracy* can be assessed by measuring to what degree they meet the following five criteria: voting equality at the decisive stage; enlightened understanding; control of the agenda; inclusiveness; and effective participation. Whereas the first criterion is not dependent on the performance of the media, all other criteria are:

enlightened understanding refers to the ability of citizens to make informed and rational decisions. The third criterion states that citizens have the opportunity to place their issues on the agenda of the political system. The fourth and fifth criteria demand that all citizens have an equal chance to take part in and influence the democratic process.

From this it is not yet clear which content traits would contribute to Dahl's criteria being met. Indeed, research assessing democratic quality does not deal with this issue. Rather, some of the manifold indexes that have been developed to measure the quality of democracy in democratic audit projects utilize freedom of the press as an indicator of democratic performance (see, e.g., [www.democraticaudit.com](http://www.democraticaudit.com); Munck & Verkuilen 2002).

### QUALITY CRITERIA AS POSITED BY DEMOCRATIC THEORY

That freedom of the press alone will assure the beneficial effects of mediated communication for democracy is a tenet of libertarian democratic theory, which has its roots in classical texts originating from the era of Enlightenment and later on the era of utilitarianism. The first is closely associated with John Milton's tract *Areopagitica*, which introduced the notion that freedom of the press can be deduced from the right of the individual to defend him or herself against the state on grounds of natural law. The second is closely associated with the liberal thinkers of the eighteenth and nineteenth centuries, John Stuart Mill above all, whose central argument held that individuals are capable of using reason and distinguishing right from wrong as long as they may access the ideas of others (→ Freedom of the Press, Concept of). According to this theory, human ideas and opinions prove themselves only in a process of mutual challenge, an adjustment which calls for an open marketplace of ideas.

Already from this early version of libertarian theory, *three quality criteria* may be derived. First, as a correlate to press freedom, the mass media have to realize *diversity*, for the sake of guaranteeing a marketplace of the broadest possible range of ideas. Second, they have to report *objectively*, in the sense of neutrally trying to reproduce the many claims and opinions that society holds. Third, one might see the duty of the press to serve as a "watchdog," i.e., to scrutinize government and to *criticize* all attempts of abuse of power by the government that might restrict the citizens' freedom of opinion (given by law of nature) or freedom of the press (derived from utilitarian reasoning; Voltmer 1998; → Fourth Estate).

The changes brought about by flourishing capitalism in western democracies during the nineteenth and twentieth centuries led to a revision of the original libertarian theory of the press. The virtually autopoietic mechanism of truth revelation posited by libertarian theory was challenged by empirical data collected by the US Commission on the Freedom of the Press (Hutchins Commission). These findings in particular showed that practices of the yellow press – → sensationalism, neglect of relevant and substantial issues (→ Soft News) – had come to dominate and that the press in general did not supply equal access to different voices but rather was a forum for the powerful (→ Bias in the News). As a reaction to this, the Hutchins Commission provided a set of criteria against which to judge contemporary media performance, which detailed the norms of

Table 1 Normative criteria in democratic theory

Theory type	Criteria for a good democratic public discourse			
	Who participates	In what sort of process	How ideas should be presented	Outcome of relation between discourse and decision-making
Representative liberal	<i>Elite dominance, expertise, proportionality</i>	Free marketplace of ideas, transparency	Detachment, civility	Closure
Participatory liberal	Popular inclusion	<i>Empowerment</i>	Range of styles	Avoidance of imposed closure
Discursive	Popular inclusion	Deliberative	<i>Dialogue, mutual respect, civility</i>	Avoidance of premature, non-consensus-based closure
Constructionist	Popular inclusion	Empowerment, recognition	Narrative creativity	<i>Avoidance of exclusionary closure, expansion of the political community</i>

Note: The priority concern is italicized.

Source: Ferree et al. (2002, 316)

objectivity and diversity and extended the duty of the press to not only check on government but to scrutinize powerful particular interests too.

Further variations of liberal democratic theory and corresponding inferences for quality criteria during the twentieth century can be observed. Ferree et al. (2002) differentiate between a representative and a participatory strand of liberal democratic theory, which have both developed further, partly conflicting quality criteria (Table 1). The *representative liberal strand* holds it necessary that for the free marketplace of ideas to function it has to be supplemented by the criteria of elite dominance, expertise, proportionality, and transparency. Thus, the core idea of representative liberal theory holds that democracy will actually function better if average (i.e., under-qualified) citizens rather stay out of the account that media give of reasoning, debate, and action, and that media should focus rather on elites and experts. Correspondingly, the focus on these actors has to be proportional to the distribution of interests they represent and their actions must be made transparent to the public for the sake of accountability.

Quite the opposite, *participatory democratic* theory requires *empowerment* as the most important responsibility of media discourse, which means to engage as many citizens as possible in public life. This goes along with a need for giving ordinary citizens a chance to be heard (popular inclusion; → Politics in Popular Communication).

A still more recently developed normative democratic theory, which otherwise appears to be quite close to participatory liberal theory, holds *deliberativeness* to be the most important quality criterion (→ Deliberativeness in Political Communication). This means a “process in which one provides fully developed arguments for one’s own position and takes seriously and responds to the arguments of others. It involves recognizing, incorporating,

and rebutting the arguments of others” (Ferree et al. 2002, 306). This view mainly originates from → Jürgen Habermas’s (1998) deliberative model of democracy, which also considers it crucial that actors from the periphery of the political system too should be offered opportunities to join in political discourse by the media (→ Public Sphere).

The last theoretical tradition identified by the authors is the *constructionist theory*. Scholars from this tradition have a critical approach in common and tend to focus on hidden inequalities in public → discourse. Thus, they focus on narrative patterns and deem recognition of the distinctive standpoints of actors an important criterion.

Apart from criteria concerning the participants and the sort of process that is supposed to mediate their communication, two further dimensions of quality criteria can be distinguished by which the different types of theory are characterized. The first one focuses on the different communication styles that are considered to be functional. Except for representative liberal theory, all theories have a preference for specific styles because of their potential to include the largest possible fraction of citizens. The second dimension, closure, concerns the time at which everybody can agree that the matter has been decided and attention may be dedicated to other issues. Again, depending on which theory one adheres to, closure is considered either a positive or a negative trait.

## **NORMATIVE CLAIMS AND EMPIRICAL KNOWLEDGE**

Scholars in the field of political communication have concentrated much of their research on issues related to creating and maintaining high-quality democratic governance (Graber & Smith 2005). The most frequent application of the diverse quality criteria derived from different strands of democratic theory lies in serving as frameworks for devising content analytical categories (→ Content Analysis, Quantitative). A great many content analyses try to assess media performance using such criteria. Among the rather consistent findings are those showing that in many western democracies, content and style of media have undergone → tabloidization in one form or another during recent decades (Esser 1999). Other important findings point to the fact that in international comparison, high quality criteria will be realized greatly depends on the respective nature of political cultures and polities (Wessler, submitted; → Political Communication Culture).

Obviously, quite different normative notions exist among pundits as to which features of media discourse foster the quality of democracy. For example, little agreement may be found among scholars either about the requirements of democratic citizenship and the implications of empirical findings about citizens’ → political knowledge, or about the way that political messages should best be constructed for voters to make sense of them (Graber & Smith 2005, 483). Whereas the majority of scholars so far see tabloidization and → infotainment rather as a threat to democracy, some would argue that, on the contrary, infotainment might contribute to boosting the reach of political messages and also might contribute to a better understanding among those shunning complex messages (Zaller 2003).

Thus, it is a big desideratum for research to establish more proof concerning the causal connection between content features and democratic performance. This, of course, is a demanding task calling for long-term cross-sectional and cross-cultural research on the micro and macro levels.

# Political Media Use

Wolfram Peiser

Ludwig Maximilian University of Munich

To take part in the democratic process, citizens should be well informed about politics, which implies they should keep up with current affairs through the news media. Given this essential role of the media for democracy, it seems important to know to what extent and why citizens actually use political media content. While comparatively few empirical studies have focused exclusively on these questions, exposure or attention to political content is often measured in studies of political → media *effects*. Indeed, political media use is considered important because what people see or hear in the news media can influence their knowledge, attitudes and opinions, and political participation.

## CONCEPTUAL ISSUES AND RESEARCH PROBLEMS

Political media use refers to people's usage of both political media (such as newspapers or news magazines) and political content in all kinds of mass media, including the Internet. Political content normally means nonfictional content dealing with political events, issues, institutions, etc. (e.g., political news, commentary, round tables).

Research on political media use is fraught with problems, and common approaches have been increasingly criticized in recent years. Inaccuracies are highly probable because "political information" or "news" can mean different things (to respondents), including short or in-depth, accessible or demanding, or even nonpolitical material. While usually counted as "political information," newspapers, radio, and television news cover not only domestic politics, foreign affairs, and economic news (often referred to as "hard news") but also sports, culture, and human-interest themes (→ Soft News).

Recipients' contact with politics in the mass media can take very different forms, varying in terms of motivation, attention, and regularity. People seek information about specific themes purposively, they follow current affairs habitually, and they encounter political content incidentally. Hence, just measuring quantitative exposure seems of limited utility, at least if research interest is in news processing and learning (→ Learning and Communication; News Processing and Retention). Finally, self-reported exposure probably overestimates political media use not only because of inaccuracies but also due to → social desirability.

This overview mainly relies on data from a large number of studies and countries (western Europe and the US) and focuses on general patterns and relationships that are fairly stable over time and across media-use measures (measures mostly pertain to frequency of use; time spent using political information has been measured in rather few studies).

## GENERAL PATTERNS OF EXPOSURE

Most adults are at least somewhat interested in current affairs, and regularly use the mass media to keep up. Compared to entertainment media use, however, political information

seems relatively unimportant to most of the audience. But it is hard to tell exactly how much of the time people spend with media is devoted to political content. Schulz (2007) estimates that share conservatively at about 10 percent.

Television continues to be the most important source of current affairs information if judged by audience size, frequency of use, or people's impression as to where they get most of their news. Television tends to present politics in a particularly vivid, emotional, personalized, entertaining way, and is thus more accessible and attractive. Daily newspapers and the radio remain important, but in some countries the Internet has already passed these media as a source of political news (at least among younger people).

News or politics is often integrated with other types of content that are more attractive to many citizens (e.g., music on the radio). In this way, even less politicized media users may encounter politics quite regularly. In one form or another, this phenomenon appears to hold for all media (including the Internet) although the discussion so far has centered on television (→ Trap Effect).

However, most of this incidental exposure is not exposure to in-depth political information but to news designed to appeal to a broad audience. The same applies to political content available in public places (e.g., in bars). On the other hand, cable TV and the web have expanded citizens' possibilities to get political information far beyond typical news coverage, including easy access to parliamentary debates, parties' news releases, and much more (with accordingly small audiences).

### **CORRELATES OF POLITICAL MEDIA USE**

While there is no specific theory of political media use, research suggests a variety of explanatory factors. Researchers have measured exposure or attention to news or other political content and examined their relations to demographics and an increasing number of other variables. This overview is based on studies that have taken the correlations between at least some of these explanatory factors into account.

*Motives or gratifications:* people mainly turn to political media content to keep informed about current affairs (→ Uses and Gratifications). Even if information-oriented motivation dominates, people also use news for diversion and entertainment. News use helps structure the day and often becomes a routine or habit, even a ritual. Social motivation also appears to be important: news and other political content provide us with themes and arguments for discussions. In general, citizens tend to prefer sources that reflect and confirm their own political views.

*Interest in politics:* quite strongly related to education, this is probably the most important factor linked with political media use. Interest in politics may almost be equated with interest in political media content. Those who are more interested in politics tend to use news media (especially hard news) more extensively, purposefully, and actively.

*Social environment:* political media use is shaped by socialization influences, specifically parental information habits. Discussions with family members, friends, and colleagues motivate people to keep up with current affairs. Citizens' political media use tends to be higher if they are well integrated into discussion networks (→ Social Networks), and if these networks are large, active, and heterogeneous (increasing the likelihood of citizens' being confronted with different opinions).

*Education:* studies usually find a positive relation between level of education (which indicates cognitive abilities and information processing capabilities) and newspaper reading, in particular for quality papers. A similar pattern holds for in-depth political information in other media, including television (but not for TV news). The effects of education on political media use are in part mediated by interest in politics.

*Income:* there is also a fairly consistent relationship between (household) income and political media use, particularly often found for newspaper reading. Besides financial resources, lifestyle and occupation-related motives could play some role here.

*Age and/or cohort membership:* political media use increases markedly during youth and adolescence, along with political interest. In old age, it may decline again due to deteriorating cognitive abilities and changing information needs. In the adult population, age has positive correlations with newspaper reading and television news viewing, while Internet news use tends to be higher among younger people. Older persons generally appear to be more interested in current affairs information. However, such differences between age groups may reflect not only processes of aging (called age effects) but also cohort effects, meaning stable differences between birth cohorts (i.e., people born in the 1930s, the 1940s, etc., who have been shaped differently by the changing times). In particular, cohort effects have been found for newspaper reading (→ Readership Research).

*Gender:* known differences between men and women are largely confined to newspaper use, with men reading more frequently. Women also appear to be somewhat less interested in politics, probably to a large part because of gender-related socialization and role patterns (education, employment, occupation, etc.). This gender gap is larger in the older cohorts of the population, and it has narrowed in recent decades, a trend likely to continue.

Further correlates of political media use that have been examined less frequently include personality factors such as need for cognition, desire for control, and opinion leadership (→ Opinion Leader), values (postmaterialism), attitudes (identification with a civic duty to keep informed), and exposure to other news media (e.g., TV news may prompt viewers to seek further information in newspapers). Finally, there are differences between countries: in Europe, political media use – most clearly, newspaper reading – tends to be higher in the north and below average in the south. The US also shows rather low levels of political media use.

## LONG-TERM TRENDS

In times of war or political crisis, interest in and exposure to news rise considerably, and television's role as the favorite news source is further strengthened. More interesting are long-term trends. In the past five decades, new media have greatly expanded the range of political content available to a broader audience, even if politics' share of total media content has declined. Political media use expanded as well in the postwar decades (in absolute terms), probably in part due to rises in educational attainment, women's employment, and political interest.

It appears that in postwar western Europe, political media use increased up to the 1970s (and in part also in the 1980s) but has declined somewhat since. In the US, an even more marked decline in news use has occurred, particularly during the past 10 or 15

years. Trends reported in the literature differ, however, which may be explained by the time periods, countries, and measures of media use they are based on.

In the US, young people in particular seem to have reduced their news use (at least in the old media), a trend that has received much attention lately. Traditional news sources are facing hard times as the younger cohorts increasingly turn to online news and weblogs, and even to news content available on mobile devices such as cell phones or PDAs (→ Online Journalism; Blogger).

Although it is not clear how far this downward trend extends to Europe, there is ample evidence that newspaper reading has declined not only in the US but also in many western European countries, particularly strongly among young people. A considerable part of the overall decline seems to be due to a cohort effect, meaning that newspaper use will drop further as the older cohorts are successively replaced by younger people who are reading less frequently.

In economic terms, the gap between news supply and news demand has widened. Facing stronger competition, news media have made efforts to keep or expand their audiences by more entertaining presentation and by emphasizing soft news. If these more popular forms serve to attract politically less interested people to news, they may not be as bad for democracy as many critics say (Norris 2000). On the other hand, hard news and in-depth political information could get increasingly marginalized – if not displaced – and more difficult to find.

Undoubtedly, an ever-increasing amount and variety of political information is available today. Expanded choice (of both news and entertainment content) facilitates but also forces selectivity, thus creating further potential to avoid news. At the same time, new distribution avenues generate new chances of exposure (in public places, on the web, etc.), and at least top news seems to be nearly omnipresent today. Scanning and monitoring the news (often while engaged in other activities) is becoming more common. The evolving political media use apparently no longer corresponds to the ideal of the “informed citizen.” But “monitorial citizenship” – a concept advanced in 1998 by Schudson in his book *The good citizen* – may be more realistic anyway, given the growing complexity of our societies, politics, and media systems.

## Political News

Winfried Schulz

University of Erlangen-Nuremberg

Political news was published in leaflets and early → newspapers in the fifteenth and sixteenth centuries, shortly after the advent of printing (→ Printing, History of). However, only the cheap, mass circulation press in the nineteenth century and, most notably, → radio and → television about a century later made political news available to a general audience (→ Media History). Today, regular newscasts on many radio and television programs, 24-hour news networks, and a multitude of websites on the Internet make political news continuously available and pervasive in society (→ Internet News; Newscast, 24-Hour). The deployment of global news logistics – → foreign correspondents, → news agencies, and news pools around the world – as well as advances in cable, satellite, and other transmission technologies, have brought about an enormous expansion of the political news supply.

In addition to studying the historical, technological, and organizational aspects of news production, communication research concentrates on three questions when examining political news: how does political news portray political reality? What kind of political knowledge does the audience get from political news? What are the functions of news for the political system?

### CONTENT AND STRUCTURE OF POLITICAL NEWS

According to common understanding, political news is a representation of current events and relevant issues, of individual politicians, and collective actors (such as states, international organizations, national governments, parties, interest groups, social movements, and citizens), and of their actions as well as the public → discourse among these actors. At a closer look it becomes apparent that most political news relates to verbal behavior, i.e., statements, political claims, declarations of intent, accusations, denials, etc.

News analyses typically focus on characterizing the content and structure of the political reporting of newspapers, → magazines, radio and television channels, news

agencies, and → Internet websites. Content analyses applying more or less elaborate coding schemes measure the topical substance and formal features of news; for example, the respective shares of reporting on international and domestic affairs, on different policies (e.g., economic policy, defense, education), on political issues, on the representation of political organizations and personalities, and on how such actors are portrayed and evaluated (→ Content Analysis, Quantitative; Content Analysis, Qualitative). News analyses also examine the published statements and opinions of political actors, and the style and rhetoric of public discourses (→ News as Discourse; Political Discourse).

Content analyses of political news provide a description of politics, or as one should rather say: of scientific perceptions and interpretations of politics. However, content analyses quite often pursue goals beyond a mere description of reporting. Instead, researchers are interested in the relationships between the news and the reported political occurrences, or between the news and the media audience, or between the news and the political system as a whole. Such relationships are either inferred from content analyses results, or studied directly, with research designs including observational, survey, or experimental methods.

### NEWS AND THE POLITICAL REALITY

It was Walter Lippmann (1965, 226) who set the theme for generations of researchers when questioning the news–reality relationship, by stating “that news and truth are not the same thing, and must be clearly distinguished.” Among the deficits research has diagnosed are, for instance, too much reliance on the elite, particularly on government officials and their news management (→ Issue Management in Politics; Spin Doctor; Public Relations); an excessive personalization and dramatization of politics; a preference for negativism (“bad news”; → Negativity); and a shortsighted presentation of isolated happenings, resulting in a fragmented picture of reality (Bennett 2001; Patterson in press).

News analyses may be roughly categorized into two types. Studies of “news bias” try to disclose journalistic malpractice, which is often attributed to the ideological motives of the journalists or the commercial interests of media owners (→ Bias in the News). Studies of “news mediation,” on the other hand, try to identify and explain the structural factors determining the selection and construction of news (→ Construction of Reality through the News; News Factors). Both types of studies contrast real events and their media representation, at least in principle, but sometimes also operationally by comparing the news with the reality or, more precisely, intra-media data with extra-media data (→ Extra-Media Data; Reality and Media Reality).

For several reasons, both types of studies mostly focus on *political* news. First, the political reporting of the mass media is, for the ordinary citizen – but quite often for political decision-makers as well – the only information source about relevant political events. This is generally the case for international and national politics, and even for most political events on the community level. Second, it is well established that the picture of political reality as presented by the media, whether it is true or false, accurate or distorted, neutral or biased, influences the political behavior of individual citizens, societal groups, political leaders, and nation-states (→ Media Effects). Third, political news has → reciprocal effects on reality and sometimes even creates the events that it seems to

represent (→ Media Events and Pseudo-Events). Repercussions may occur, for example, when politicians anticipate media reporting and behave according to what they think the media want. Thus mediated political realities may be self-fulfilling (Nimmo & Combs 1983). Fourth, the content of political news is to some degree the result of the strategic news management of policymakers. In international politics, for instance, the news media are used for addressing foreign governments and publics or as a substitute for diplomacy (→ Media Diplomacy). Hence analyses of international communication and propaganda as well as of election campaign communication quite often serve to discover the political intentions, goals, and strategies of political actors.

### **POLITICAL NEWS AND THE MEDIA AUDIENCE**

As → audience research shows, a large majority of the population in modern democracies follows public affairs in the mass media day in, day out. However, the intensity of news usage as well as the amount of information people extract from the news vary considerably, depending mainly on the recipients' age, education, political interest, and previous political knowledge. Television is still the main source of political information, yet the younger generation is increasingly turning to the Internet for news (→ Political Media Use).

A key concern of communication research is to specify the mass media's contribution to citizens' → political knowledge and understanding. There is ample evidence of a positive association of political knowledge with public affairs media use, although less with watching television news than reading broadsheet newspapers. This relationship seems to be transactional rather than causal, following a "virtuous circle": people with higher political interest and previous political knowledge are more likely to attend to news reporting, and in turn, benefit from the news exposure (Norris 2000). However, long-term studies in the US spanning five decades do not show a considerable increase in the population's political knowledge, in spite of the enormous increase in both news supply and media exposure over the years (Delli Carpini & Keeter 1996).

The conventional approach to studying the media's contribution to information gain by testing people's factual political knowledge has been criticized as a "civics fallacy" (Norris 2000, see also Graber 1994). Citizens may not need to acquire encyclopedic information to participate in politics, e.g., to make reasoned electoral choices. More importantly, "civics" tests hardly correspond to the way people make sense of the news. Usually people process political information selectively and parsimoniously, investing just as much effort as is needed to get an impression of the salient events and relevant issues of the day (Graber 2001; → Political Cognitions). Moreover, news use quite often is a form of entertainment. Against this backdrop some authors suggest that the normative standards for citizens' role in politics as well as for the mass media's news reporting should be reconsidered.

### **NEWS AND THE POLITICAL SYSTEM**

Theories modeling the role of the mass media in politics, explicitly or implicitly, postulate that the news serves specific political functions for the adaptation, integration, and operation of a democratic system (→ Functional Analysis). For example, political news, in addition to recording the events of the day, is expected to reflect → public opinion, act

as a “watchdog” to disclose political misbehavior, facilitate public discourse, and foster citizens’ political participation. Such normative requirements are, according to common understanding, best performed under press freedom, a condition which is defined by the absence of → censorship, the availability of a plurality of sources and information, and open → access to the media for all citizens. Although the worldwide expansion of news channels and of political news supply has been conducive to these requirements, there are still large differences in press freedom in different countries, so that the news media can perform their positive political functions much better in some countries than in others (→ Freedom of the Press, Concept of). Press freedom is relatively high in central and northern Europe, but low in most third world countries (Reporters without Borders n.d.).

Further, the positive functions of political news depend on the organization of news production and on the newsmaking behavior of journalists. In democratic societies these conditions are regulated by media law (→ Journalism: Legal Situation), by media market and ownership arrangements (e.g., private versus public ownership; → Ownership in the Media), and by more or less formal communication norms and journalistic standards (see, e.g., Graber 2002). Conventional standards of newsmaking, such as → accuracy, objectivity (→ Objectivity in Reporting), independence, plurality, or → balance, are rooted in fundamental democratic principles (McQuail 1992). Hence empirical studies examining how far these standards are met indicate to some degree the democratic quality of a given political system (→ Political Media Content, Quality Criteria in).

Nevertheless, there are arguments in favor of lowering the conventional norms of journalistic performance. According to the “burglar alarm standard” proposed by Zaller (2003, 122) as an alternative to the “full news standard,” journalists should concentrate on important issues “by means of coverage that is intensely focused, dramatic, and entertaining,” and thus take into account citizens’ limited capacities to process political news, as well as recent changes in news style.

## CHANGING POLITICAL NEWS

The “full news standard” requires, among other things, a clear separation of → news from → commentary (→ Separation of News and Comments), as well as of public affairs (“hard”) news from entertaining → “soft” news. Both distinctions seem to be eroding, resulting in a changing news style. While the lines between news and entertainment are blurring, there seems to be an increasing tendency among journalists to intermix factual reporting with interpretations. New media formats and channels for publicizing public affairs have emerged, and the scope of political reporting has been expanding with the growth of strategic communication and mediated politics (see, e.g., Graber et al. 1998; → Mediatization of Politics). These changes may be attributed to several developments.

Since the mid-twentieth century, the range and conception of politics have been changing dramatically, and so has the media’s definition of politics. Most notably, processes of globalization and international cooperation have resulted in an increasing media attention to foreign affairs, particularly from mainstream elite media and specialized news channels. At the same time, the extension of state influence – through legislation, regulation, taxation, subsidization – has led to a growing politicization of major parts of society, including the economy, arts, sports, even the private lives of

citizens. Correspondingly, myriad interest groups engage in articulating their interests through public relations activities, issues management, protest action, even terrorism (→ Mediated Terrorism), leading to an ever-increasing stream of politically relevant information and forcing the media to focus on the most noisy and dramatic events.

Second, the expansion and commercialization of media markets (→ Commercialization of the Media) have brought about fierce competition for audiences, including audiences for news. Some media are trying to extend their market shares by softening up the news with human interest, mixing political information with entertaining elements, or presenting political issues in entertainment formats (→ Infotainment; Politainment).

Third, due to the emergence of the Internet, mediated political information abounds more than ever. Internet users do not only have at their disposal online news produced by offline media; the web also carries a vast quantity of information offered by various political stakeholders, including ordinary citizens. Search engines and web-based companies provide links – sometimes categorized and annotated – helping the user to find a path through the information bazaar. In addition, a plethora of blogs, podcasts, and other kinds of politically relevant information is available from various share and discussion sites (→ Blogger). These developments blur the lines not only between different genres and formats of political news, but also between producers and consumers of news.

## Political Personality in Media Democracy

Astrid Schütz

Chemnitz University of Technology

With the advent of → television the public appearance of political processes has changed fundamentally. Television makes visual impressions of political events easily available and provides politicians with the opportunity to project an → image of themselves to the general public (→ Media Democracy). This is assumed to have been contributing to a personalization of politics in general, and particularly to the change from issue-centered to candidate-centered election campaigning (→ Personalization of Campaigning). When the political parties and the mass media focus on the leading politicians, their public images become important factors in shaping and changing political opinions (→ Attitudes, Values, and Beliefs, Media Effects on; Candidate Image). As people lend themselves more readily to a mediated presentation of politics, the personality of political representatives plays an important role in citizens' thinking and behavior (→ Political Cognitions).

Personality can be defined as the intra-individual consistent pattern of reactions to different situations. With respect to the concept of political personality three different meanings may be distinguished: (1) the politician's private or "true" personality; (2) the persona a politician publicly presents (→ Impression Management; Self-Presentation); and (3) the image the media present of a politician. The politician's self-presentation and the image conveyed by the media may or may not correspond to the politician's private personality. The relationship between the different aspects of the political personality and people's reactions can be understood as dynamic interaction, in which people's perceptions influence public self-presentations and images, which in turn influence people's perceptions.

Lasswell's (1930) classic analysis of politicians' personalities distinguishes the agitator, the administrator, and the theorist. In recent research the emphasis has been on specific motives, predispositions, and interaction and decision styles (e.g., Winter 2005). As politicians rarely subject themselves to direct assessment procedures, indirect methods have become important in political psychology.

With the *personality assessment at a distance (PAD)* approach (Hermann 1999), the frequency of certain words or phrases during interviews is used to draw conclusions about a politician's personality. PAD is used to compare profiles of political leaders across countries and to predict future political behavior. It is to be remembered, however, that only spontaneous statements are informative about a speaker's private personality. Planned responses may be inspired by media coaches, and aim at a specific public image.

Schütz (1993, 1998) used content analysis to study politicians' public self-presentation behavior during election campaigns and scandals (→ Content Analysis, Quantitative; Content Analysis, Qualitative). The resulting *taxonomy* distinguishes aggressive, assertive, and defensive self-presentation. Aggressive self-presentation is characterized by efforts to convey images of superiority or strength by devaluing opponents or attacking journalists. Assertive self-presentation means presenting favorable images without attacking others. Defensive behavior is aimed at protecting and re-establishing threatened identities. There is a critical balance between positivity and credibility in self-presentation. The effective self-presenter chooses the maximum level of positivity that can be conveyed to a specific audience in a specific situation without being perceived as insincere.

Selective broadcasting, journalists' comments, camera perspective, etc. add to creating a public image (→ Media Effects). The impact of *media features* on a candidate's image is examined in experimental studies on agenda setting (→ Agenda-Setting Effects). Participants typically rate newspaper articles about competing candidates or watch TV shows in which the setting or background information is manipulated. It has been shown that information on certain personality traits (e.g., corruptness) receives more attention than information on others (e.g., educational background; see Kioussis et al. 1999), a finding that fits in well with the general trends that "bad news is good news" or "bad is stronger than good" (Baumeister et al. 2001; → Negativity).

Recent studies have analyzed politicians' personalities by means of personality inventories. Italian politicians' self-descriptions proved to be on higher levels than the general population with respect to agreeableness, extraversion, and social desirability, though there were congruencies between politicians and their voters on all personality dimensions (Caprara et al. 2003). These findings suggest that the politicians' self-presentations match voters' preferences.

Past research focused on political personalities in the press, on the radio, and on television. Today the → Internet is receiving increasing attention as a medium of → political communication. Personal websites, emails, and weblogs are prominent in political campaigning. Political candidates' websites aim at improving the candidates' image. The advantage of emails is the chance of addressing someone personally and tailoring messages to specific audiences. Weblogs are a medium of increasing importance (→ Blogger). They enhance the options of the public to actively participate in the political discourse and are often perceived as authentic, but there is of course also the possibility of selective posting and manipulating. A large area for future research on the personality in politics is opening up here.

## **Political Persuasion**

*Richard M. Perloff*

*Cleveland State University*

*Edward Horowitz*

*Cleveland State University*

*Gary Pettey*

*Cleveland State University*

Persuasion is an integral part of politics and a necessary component of the pursuit and exercise of power. Political persuasion is a process in which communicators try to convince other people to change their attitudes or behavior regarding a political issue through messages, in an atmosphere of free choice (Perloff 2003, 34). As the field of political communication has grown, so too has the number of studies exploring the processes and effects of political persuasive communication (→ Persuasion). Political persuasion involves the application of persuasion principles to a context in which most individuals possess the seemingly incompatible characteristics of harboring strong feelings about a host of issues, yet caring precious little about the context in which these issues are played out.

## COGNITIVE PROCESSING

In order to understand political persuasion impact, one must appreciate the processes by which messages achieve their effects (→ Media Effects). Cognitive processing models such as the → elaboration likelihood model (see Petty et al. 2003) emphasize that under *low political motivation or ability*, voters base decisions on *heuristics* and are susceptible to cues peripheral to the main message, such as candidate attractiveness, political party labels, endorsements, and even the degree to which political names are repeated or are smooth-sounding (→ Information Processing). Some researchers argue that in these low-involvement situations, individuals lack political attitudes altogether and therefore can be swayed by factors that are momentarily salient in the political environment, variables that may be of such a transient nature they are devoid of any substantive meaning (Bishop 2005).

By contrast, when individuals are *motivated* or able to consider political issues, they centrally process message arguments, recalling arguments they perceive to be personally important and thinking through issues, although such thinking is invariably biased by strongly held values or self-interest. In politics, where attitudes and prejudices are formed at an early age, much highly involved processing is biased processing. Consequently, the political persuasion that occurs through debates, advertising, news, and blogs frequently falls under the category of reinforcement, attitude strengthening, or converting attitudes into voting behavior (→ Attitudes, Values, and Beliefs, Media Effects on). The vast array of political communications also can change attitudes, frequently subtly and indirectly, as when messages access deeply held values, prime standards for candidate evaluation, and influence the salience of political issues (West 2005).

## LEVELS OF INFLUENCE

While researchers generally focus on specific types of political persuasion, we can understand this process more clearly by examining both the direction of influence and the various levels at which this persuasive influence occurs.

If a democratic system is to function efficiently, political persuasion occurs in both directions, bottom-up and top-down. The → public must be able to persuade politicians to enact public policies that reflect the will of the people. This persuasion can be expressed by the will of the majority, such as by a mandate in a winning election, but it can also be expressed by the minority, such as in the influence of special interests and lobbyists. Alternatively, the direction of influence can go from political leaders to the public. Politicians must be able to persuade the public to support their agenda of foreign policy, domestic, and legislative initiatives. For example, the government uses various means of political persuasion to persuade the people to support foreign military action, or support new domestic initiatives such as sweeping health-care reform or the privatization of pension provision.

Ultimately, it is the media that are the critical links in this process – regardless of direction – as they transmit carefully crafted messages by government agencies (for example White House propaganda in the war on Iraq; Kellner 2004), convey the strength of public support of policies by reporting public opinion polls (Mutz & Soss 1997), and act as gatekeepers and framers of the daily flow of political news (Williams & Deli Carpini 2000).

Along with direction of influence, we must understand the practice of political persuasion across levels. At the *interpersonal level* there is ongoing political persuasion occurring within the halls of legislative bodies, where law-makers engage in endless arm-twisting of their colleagues while seeking support and votes for legislation. The so-called “Johnson treatment” is a case in point. As a senator in the 1950s, the former US president Lyndon Johnson was particularly effective in gaining the support of his Democratic colleagues by exploiting tactics of persuasive interpersonal communication. In more recent years Johnson’s techniques have been refined through the use of non-stop opinion polls, made famous during the presidencies of Reagan and Clinton.

Political persuasion at the interpersonal level also occurs among individuals, dyads, and groups within the public. This is most apparent during political campaigns as supporters attempt to convert the undecided as well as rally the faithful. The persuasiveness of interpersonal political communication has become more apparent in recent elections as the use of the Internet, including emails and blogs (→ Blogger), has been found to be an important means of rallying political support and fundraising (e.g., the Howard Dean 2004 and Barack Obama 2008 presidential campaigns; → Election Campaign Communication). Internet campaigns by special interest groups have also been found to be effective in spurring letter-writing, phone calls, and emails to members of parliaments to persuade them to vote for particular legislation. In addition, at the intergroup level members of the public participate in political rallies, marches, and protests that can often be effective means of persuading politicians to pay greater attention to specific social causes or legislative issues.

Most research in the area of political persuasion occurs within the context of elections. At the *societal level*, political advertising has been found to influence the voting decisions and affect the political knowledge of voters in the US (Just et al. 1990; → Advertising as Persuasion; Political Advertising). Although derided by critics, negative political ads have been shown to be effective (Perloff 1998; → Negative Campaigning). Tactics of persuasion during elections have been practiced and perfected by political consultants (Thurber & Nelson 2000; → Political Consultant). As inordinate amounts of money are becoming increasingly important in successful political campaigns, candidates and party leaders must persuade donors to make financial contributions. Lastly, throughout the campaign candidates make promises to voters as a means of winning their votes, although means of accountability for broken promises are much less clear.

Converging across levels, attempts at political persuasion by interest groups must continually battle for legitimization from the greater public at large, public officials, and the media. Even as some interest groups find great success in persuading both public and politicians of their message, many other “fringe” groups (e.g., proponents of a 9/11 cover-up) may never find their message well received, despite their persuasive attempts.

## **MEDIA FORMS AND FRAMES**

Like other forms of political communication, politically persuasive messages are not always truthful and honest, and it is up to media watchdogs and the public to sort out fact from fiction. Politically persuasive messages also take different forms across various media. The goal of films like Michael Moore’s *Fahrenheit 9/11* and Al Gore’s *An Inconvenient*

*Truth* is to persuade individuals to support a particular set of political beliefs. In addition, both TV talk shows and talk radio have continued to become more pervasive in the US and other countries, and a myriad of talk-show hosts both entertain and try to persuade their audience that their opinions are right, while also inducing reinforcement effects (→ Broadcast Talk). Thus, the mediated campaign environment represents the battleground in the fight for the “hearts and minds” of public and elites. Legitimation of message is a crucial aspect of persuasion, and the media are primary sources of political information, whether about candidates or about issues (→ Political Cognitions). But the media are not simple conduits for information. Journalistic routines influence what and how news is presented (→ News Routines).

How information is framed also affects how it is processed, with what elements it is stored and related in the public’s mind, and ultimately how persuasive it may be. Framing provides the audience with a workable model to interpret complex and often confusing information (→ Framing Effects). In this sense, framing is an extension of agenda setting. Agenda setting was seen as the outcome of journalists’ roles, activities, and values. Hence the media tell us what to think about, if not specifically what to think (→ Agenda-Setting Effects). Traditionally, this was viewed as a *laissez-faire* phenomenon, but more recently the setting of the media agenda (and through that the public’s agenda) has been seen as the result of an intention to create the media’s own effects (Lakoff 2004; → Strategic Framing).

But framing is a multilevel phenomenon. Elites and special interest groups attempt to create – or manipulate, depending on your perspective – the public agenda by providing poll-tested linguistic constructions of highly charged political issues. Media, using their own norms and values, select and present information about these issues. The public itself interprets mediated information through its own preconceptions and attitudes.

Initially, framing may be more effective in low-involvement situations, providing simple explanations for events, in line with peripheral processing. Once the frame is set, it can be activated for processing other persuasive messages. Kosicki (2002) argued that framing is consistent with schematic information processing (→ Schemas).

Framing operates at both a sociological and a psychological level. When the media present themes that explain basic episodic news (persons and events), there are inherent ideologies, values, and symbols that help to shape context. When individuals use these themes to assess cause and effect, heroes and villains, and right and wrong, the psychological processes are in full play (Iyengar & Simon 1993).

## AMBIGUITY OF POLITICAL PERSUASION

Ultimately, political persuasion can be best viewed along a *continuum* – one end anchored in the harmful effects of propaganda, the other in the positive effects of marches and demonstrations leading to civil rights legislation, with a great deal in between. Back in 1922 → Walter Lippmann said that the media create a pseudo-reality (Lippmann 1922), but in the age of corporate news media, the “mediation of reality,” in which persuasive messages are delivered by the media, is frequently guided more by purposes such as gaining revenue or influence than by journalistic standards (→ Media and Perceptions of Reality).

Political persuasion remains an ambiguous phenomenon, raising time-honored questions that date back to ancient Greek philosophy. Do political persuasive messages

enhance or debase democracy? Do advertisements inform voters about candidates' positions or mislead them by presenting vacuous statements and feel-good pictures? As campaigns move to the Internet, new questions are emerging, such as whether campaigns will enhance direct communication between leaders and citizens or increase the potential for deception in a milieu unchecked by nonpartisan news media. Theory and research suggest that technology will bring benefits, but also offer new gimmicks in an old game.

# Political Socialization through the Media

*Dhavan V. Shah*

*University of Wisconsin-Madison*

There is a great deal of controversy concerning the effects of mass communication on political socialization, in terms of both its size and direction (→ Media Effects). Political socialization can be understood as the processes through which democratic societies instill the proper norms among their members to maintain social institutions and practices. Most research on this topic focuses on how individuals engage in political development and learn basic civic skills, with family, schooling, peer groups, and media serving as the major factors involved in this dynamic. Early studies focused on adolescence as a critical period for political socialization, though this has given way to lifelong learning models, attention to generational differences, and consideration of civic modes of participation alongside the political (Sears & Levy 2003; Sapiro 2004).

Media consumption (→ Exposure to Communication Content) and → social networks are increasingly central to models of political socialization that extend beyond adolescence to life stages when parental and educational influence is comparatively reduced. The relationships between these variables are not always viewed as complementary, with electronic media often considered the source of declining rates of social interaction. Some scholars even argue that television viewing and → Internet use erode engagement in public life and demobilize citizens (Putnam 2000; → Exposure to the Internet; Social Capital, Media Effects on). Young people, as heavy users of such media, are thought to experience these negative influences to a disproportionate degree, as a consequence of the displacement of time from social interaction, the promotion of antisocial perceptions, and the generation of cynicism toward politics and public affairs (→ Political Cynicism).

However, these assessments of the adverse influence of television on civic and political participation have been called into question by research revealing little evidence of time-displacement effects and demonstrating the benefits of → news, documentary, and dramatic television viewing on civic attitudes and behaviors (→ Documentary Film; Drama in Media Content). Recent work has also observed that online news consumption and social messaging have positive effects on engagement in public life, providing some evidence of the pro-civic and pro-democratic potential of digital media for younger generations (Eveland et al. 1999; Shah et al. 2001).

## THE DECLINE IN YOUTH PARTICIPATION

Evidence shows that the gap in civic engagement between young and older adults has grown in recent years in most western democracies. For example, the gap in voter turnout between 18-to-24-year-olds and older adults has grown over the last two decades. Young people have less → political knowledge and pay less attention to the news than their parents did at their age. They are less trusting of their fellow citizens, and even when they do vote, their action is not as likely to be accompanied by other civic actions. By and large, young people today are comparatively disengaged from and uninformed about politics,

and less active in civic life than the rising rate of educational attainment among their generational cohort would predict.

Although conventional newspaper reading is viewed as the one positive exception to the negative effects of the media on participation and democratic legitimacy, traditional print media have seen their youth audience, and thus their influence, displaced by the rise of television during the latter half of the twentieth century and the ascendance of digital media in the last decade (→ Media Use across the Life-Span; Political Media Use). Among these, television use (→ Exposure to Television) has become a prime suspect when scholars began searching for causes of the four-decade decline in civic participation (Putnam 2000). Indeed, heavy television viewing as measured by hours of use is associated with lower political activity among both adolescents and younger adults, seemingly confirming this suspicion.

This finding should be interpreted tentatively. First, it only holds for formal political activity and discussion, but not for less formal civic activities and learning. Second, time displacement may not be the key mechanism. A focus on time spent with television may mask important differences in the effects of various forms of television *content*. Watching → situation comedies appears to deter civic action, while news and documentary viewing tends to show positive effects. This focus on television has also led many in the academic community to ignore the positive effects of the print media, such as newspapers and news magazines. Indeed, the decade's long decline in participation is more likely a direct result of the erosion of print news readership rather than an effect of the rise of television. The Internet, especially when used as a source of public affairs information and a sphere for political expression, shows signs of salutary effects rivaling TV and newspapers (Shah et al. 2005).

## COMMUNICATION AND SOCIALIZATION

As a result of these changes, traditional models of political socialization have been radically altered over the last 40 years to account for the shifting effects of communication factors. The early focus on political *outcomes* came at the expense of ignoring *processes* that are vital to democracy. The idea of an active audience has important implications for political socialization research. As mentioned earlier, time-spent media measures are insensitive to the differing effects of specific types of content. Moreover, television viewers often combine watching with other activities. Today's youth typically spend seven hours a day using media, most of which involves using two or more media simultaneously (Roberts 2000). It is therefore important to obtain self-reported information about the person's consumption of particular types of media content and the context of this consumption.

To more fully understand media effects, communication research has gone beyond simply questions of *how much* an individual uses various media to consider the questions of *how* content is consumed, and beyond *what* media are used to examine *why* certain media are selected (→ Media Effects, History of). The *how* question is answered by focusing on exposure and attention to various types of media content and by attending to potentially differential effects across a range of media. For example, among televised entertainment media, social drama viewing has been linked to civic engagement, whereas reality show viewing has been linked with civic disengagement. The *why* question is addressed by

examining the *gratifications* sought from content and their association with patterns of media consumption. For example, informational motivations increase attention to hard news and facilitate learning, whereas seeking escape or diversion motivations lessens attention and learning from news.

Further, the socializing influences of the mass media on youth are often complemented and reinforced by communication with parents and peers. How parents communicate with their adolescent children has been found to be particularly important to civic socialization (Chaffee et al. 1973). In particular, children who are encouraged to freely express their ideas even if they are at odds with those of their parents tend to be more politically engaged, whereas those who are raised in communication contexts where conformity is emphasized are less so. In a similar vein, political discussion issues with family, friends, co-workers, and others in one's social network have been found to play a key role in the development of civic identity (Huckfeldt & Sprague 1995). These factors have been found to influence adolescent and early adult socialization, complementing and channeling the effects of media on civic outcomes.

## ADOLESCENT SOCIALIZATION THROUGH MEDIA

To understand the effect of media use and political talk on adolescent socialization, we must consider both the *level* of activity and strength of *effect*. Adolescent news consumption from traditional print and broadcast media is small in comparison to their consumption of entertainment content in the form of television programs, films, and video games. Still, there is a significant gain in news consumption, political talk with peers, and civic engagement from early to late adolescence. Family communication patterns also change during the adolescent years, with parents reducing demands for conformity and instead favoring greater openness to the expression of controversial positions. These changes contribute to adolescent political learning and activity.

### Effects on Adolescents

Newspaper hard news reading has the strongest media effect on indicators of youth socialization, after demographic and other controls, in conveying knowledge, stimulating discussion, and shaping attitudes among adolescents. The strength of its effects remains as strong in the late 1990s as it was in the early 1970s (Chaffee et al. 1973). Attentive television news viewing has positive though weaker impact, while television entertainment viewing has both positive and negative effects (→ Entertainment, Effects of). Mental elaboration or “reflection” – reflecting on issues seen in the news and connecting them with existing beliefs – has a strong effect on engagement beyond exposure to the news. Indeed, reflection and issue discussion are seen as both conduits and consequences of news consumption. That is, news consumption encourages these outcomes, but also has its effects on participation channeled through these internal and external forms of deliberation (McLeod 2000; Yoon et al. 2005).

Recent studies counter early speculation that the effect of adolescent Internet use, overall, on civic activism is negative (→ Internet Use across the Life-Span). Although “time-spent-online” measures have been negatively related to psychological well-being,

social trust, and real-world ties, recent research focused on adolescents finds positive linkages between certain forms of use and civic engagement. Research on young adults, which focuses on online news consumption, political messaging over email, and other online communication tools, suggests even more optimistic outcomes for adolescents.

### **YOUNG ADULT SOCIALIZATION THROUGH MEDIA**

Early adulthood is a period of rapid identity change. The social support provided by parents, school, and church is removed and new civic allegiances and identities must be formed. Young adults tend to have high rates of residential mobility, typically anticipating a move within the next five years. For this reason, they are less likely to feel a strong sense of belonging to their new social context, especially if they are no longer in the same community in which they attended high school. There are also substantial life-course differences between the college-bound, trade-school students, and those who directly enter the workforce or armed services. Nonetheless, social interactions with friends and co-workers play a critical role in all young adults' lives, including the development of their civic identity. For many young adults, the media also take on a larger role as a means of connecting socially with others and for maintaining contact with others through email and social networking.

Although younger adults are generally less active than older adults, the extent of difference varies across indices of civic engagement. Differences are largest for voting, political/public affairs interest, and knowledge. More moderate differences are shown for trust in people and efficacy (→ Political Efficacy). Volunteering and other forms of civic participation are more similar for younger and older adults. Newspaper reading remains low for those under age 40. Television news viewing is similarly skewed, though young adults approach older adult levels by the mid-thirties (McLeod 2000). Prior to the rise of the Internet, news reached young adults mainly through television, with young people consuming at lower rates than older citizens during election campaign periods. Internet use, writ large, displays an opposite pattern. Younger adults are the heaviest users, with amount of use declining across increasingly older adults. For example, more than 40 percent of young adults read a political story from the Internet in the 2000 US election campaign – almost double the proportion for those 50 and older. That percentage rose dramatically for both groups by 2004, though the gap remained in place (Yoon et al. 2005).

### **Effects on Young Adults**

Albeit in decline, newspaper reading, which has the strongest impact on learning and participation for adults generally, is among the strongest positive influences on civic engagement among young adults (Sotirovic & McLeod 2001). Still, it is unlikely that conventional newspaper reading is a way to spur young adult activism, due to its low use. The Internet, because of its very heavy use among younger adults, may provide a more potent opportunity. Internet use, measured in crude hours of use per day, was found to have a positive influence on knowledge, interest, volunteering, and civic participation on American adults aged 18–22. Internet effects for the youngest adults tend to be stronger than for adults over 35 years old. Internet use for search and exchange of information was

most strongly related to trust both in people and in civic participation among the youngest adult cohorts (Shah et al. 2001).

## PROSPECTS FOR SOCIALIZATION THROUGH THE MEDIA

The prospects for civic renewal and future civic socialization through the media clearly deserve more attention. As noted above, newspaper reading among adolescents has dropped markedly over the last three decades, particularly in the United States. Consumption of → television news has also dropped, leading some to suggest that young people are no longer exposed to or attentive to public affairs content. With the rise of the Internet, patterns of news consumption are shifting, especially among adolescents, with some recent studies suggesting that young people are mainly encountering conventional hard news content through online channels such as customized home pages, blogs, and news indices. Thus, use of the Internet by the most recent cohorts may partly offset the loss in conventional news consumption via newspapers and television. Notably, adolescent access to computers, the Internet, and broadband connections in schools and at home has grown rapidly.

## Political Symbols

Sharon E. Jarvis

University of Texas at Austin

Political symbols are entities that stand for things other than themselves, elicit responses, and assume meaning in relation to the objects, beliefs, values, or attitudes to which they refer.

In the field of political science, symbols have been studied from two key approaches. Behavioralist scholars have examined the functions of symbols, tracked their appearance across political messages and situations, and made connections between symbol use and attitudinal or behavioral effects. This perspective often regards symbols as separate from the world of politics, or as entities that mask the realities of political life. Interpretivist scholars, in contrast, have studied how symbols are open to interpretation, how individuals use – and are used by – them, and how symbols may not reflect empirical realities (and yet their constructed meanings are powerful, nonetheless). This perspective contends that because citizens rarely have the opportunity to experience political phenomena (e.g., campaign speeches, governmental meetings, policy debates, and other elite activities), they come to know their worlds through symbols and language.

Symbols have also been studied from processual, structuralist, and postmodern approaches in neighboring disciplines such as communication, anthropology, and sociology (→ Structuralism; Postmodernism and Communication). Most contemporary research on political symbols comes from the interpretivist perspective.

Political scientist Murray Edelman authored the seminal works on political symbols. Four of his books are particularly influential, and his own scholarship can be viewed as moving from the functional to the interpretivist perspective. Indeed, Edelman's *Symbolic uses of politics* (1964) and *Politics as symbolic action* (1971) bear markers of the functional approach, while *Political language: Words that succeed and policies that fail* (1977) and *Constructing the political spectacle* (1988) are clearly driven by an interpretivist view. Edelman was not the first to theorize about → symbolism and constructed meanings in politics. His theorizing was inspired by scholars including → Harold Lasswell, → Walter Lippmann, George Herbert Mead, Kenneth Burke, and Jacques Derrida. The breadth and richness of Edelman's work inspired a set of understandings, and research trajectories, about the roles of symbols in political life.

A key point for Edelman is that citizens come to know their roles, political leaders, governmental structures, and issue options through symbols and language (→ Political Language). Symbols, then, demand scholarly inquiry, as individuals cannot understand

their political lives outside of them. Perhaps responding to the functionalist perspective, Edelman and others claim that symbols do not need to be accurate to be influential. Instead, the symbols that leaders and societies use often tell a more powerful story about what those leaders and societies want to believe rather than that which can be empirically verified. Symbols are not regarded as meaningful in and of themselves. They become powerful only when individuals and groups grant them meaning, and they become most influential in constructing political realities when they (1) are supported by many smaller symbols (so that they are difficult to question), (2) shape public thought and dialog (so much so that people forget they are constructions), and (3) displace alternative constructions (so that other ways of thinking about political situations are left unimagined; → Political Discourse).

Political symbols can feature cognitive and emotional components. Edelman advanced two types of symbols that are widely cited in subsequent research. *Referential symbols* are abbreviations for the objective aspects of objects or situations. These symbols can be identified similarly by different types of people and refer to a situation as statistics might summarize an event. *Condensation symbols* are abbreviations of emotions connected to an object or situation. Condensation symbols may feature singular or multiple emotions and need not be based on accurate information. Edelman observed that no object could be purely a referential or a condensation symbol. Nevertheless, most controversial topics emerge to serve as condensation symbols, for the threats surrounding the controversy become meaningful through the emotions, not the objective consequences, of the situation.

Political symbols are also connected to political power. In Edelman's work, he explains how elites use symbols, myths, rituals, and political language to (1) shape the wants and preferences of citizens and (2) make certain solutions appear to be sensible responses to the symbolic framing of problems. Emotional symbols are particularly influential in creating incentives for individuals to accept the dominant constructions of problems and solutions. Media reports amplify these symbolic constructions, and, by doing so, conserve and preserve the power of political elites. Sociologist and theorist Pierre Bourdieu, too, examined the connection between symbols and power. His construct of *symbolic capital* offers an economic metaphor to assess the value of having prestige or being recognized.

Rhetorician Kenneth Burke defined symbols as a verbal parallel to a pattern of experience (→ Rhetorical Studies). In a way akin to political scientists working in the interpretivist approach, Burke regarded humans as symbol using, making, and misusing animals and argued that people's largest problems result from symbols using humans rather than humans using symbols. Burke's notion of *secular prayer* has been influential in the research of Edelman and others. There, Burke noted that political communicators often add dramatic properties to common matters and soften the impact of controversial ones to create influential political symbols.

Common critiques of research on political symbols include concerns with imprecise conceptualization and measurement and a lack of systematic and empirical methods. Interpretivist scholars respond to such critiques by noting that their aim is to offer a multidimensional approach and richer understandings of symbols in social, cultural, and historical contexts. Research on political symbols is most commonly praised for attending to the constructions of meanings of political and policy debates and for questioning and explaining puzzles in → public opinion research.

## **Politics in Popular Communication**

*Deborah A. Macey*

*University of Oregon*

Political communication is an interdisciplinary field with roots stretching back to Aristotle and Plato, who debated the meaning of democracy and society (→ Political Communication; Rhetoric, Greek). Modern political communication research incorporates not only the field of communication, including → journalism and rhetoric, but also political science, sociology, history, psychology, geography, and others (→ Rhetorical Studies).

Political communication can mean many things. Put simply, it is the “role of communication in the political process” (→ Chaffee 1975, 15). A more precise description, used by the Political Communication section of the American Political Science Association ([www.apsanet.org](http://www.apsanet.org)), offers that political communication is “the creation, shaping, dissemination, processing and effects of information within the political system – both domestic and international – whether by governments, other institutions, groups or individuals.” Furthermore, political communication scholars explore media in the political process, new media technologies, and societal- and individual-level effects on political processes. For example, Tekwani (2006) examined gaudy billboards as political communication in India, and Hanna (1992) explored the role of rock music in the political disintegration of East Germany.

The term “popular” has both positive and negative connotations. Negatively, it evokes notions of subordinate class position, dominance over the masses, and manipulation by the ruling class and/or culture industries. Adorno might have deemed “popular political communication” an oxymoron, believing that these popular cultural products serve only to control the masses and maintain status quo power relations (→ Critical Theory). In this context, however, it means of, by, for, and about the people. Popular political communication incorporates complex local, national, and international political and media systems.

## **POPULAR POLITICAL COMMUNICATION AND THE PUBLIC SPHERE**

Transparent and accessible popular political communication is necessary to have an informed public to facilitate dialogue and thriving governmental systems. As the world continues to expand into an electronic culture, heavily influenced by visual media such as → television and the → Internet, shifts in consciousness also occur (→ Medium Theory). Each new communication technology, whether written or printed, televised or web-based, influences the way information is received and processed (→ Information Processing). Shorter attention spans, a focus on visuals, and a trend toward entertainment are just some of the outcomes from this shift to a more electronic culture. In some cases, popular political communication has been reduced to slogans and sound bites, due mostly to the economies of the media industry and advancements in media technology (→ Media Economics; Technology and Communication).

Political communication is both communication by a formal political organization and the freedom to criticize that system on the part of the general public, including journalists. What constitutes political communication varies with every political structure. The concepts of the → public sphere and press freedoms are central concerns of popular political communication in western industrialized countries (→ Freedom of the Press, Concept of). In general, the public sphere is an ideal arena where ideas are generated, knowledge is shared, and opinions are freely debated and discussed. This forum is open and accessible for all to assemble and participate. Press freedom involves not only freedom from government control, but also freedom from commercial influence. While this might be a desirable model for other political structures, it is not always available. Where there is little individual press freedom, little to no private media ownership, and much government control of the media, as is the case in countries such as China, Laos, and Cuba (→ Censorship; China: Media System; Cuba: Media System), popular political communication often serves as a hegemonic tool for state → propaganda. Annually, the nongovernmental organization Reporters without Borders publishes a Worldwide Press Freedom Index. In 2006, for example, the top three countries enjoying the most press freedom were Finland, Iceland, and Ireland. The bottom three, with the least press freedom, were North Korea, Turkmenistan, and Eritrea.

In global society, the media serve as a type of public sphere where information is exchanged, debated, and distributed to the masses, although the exchange is mostly one-directional – media to the masses (→ Globalization of the Media; Globalization Theories). While the public may not have much production input with commercial media, particularly with newspaper and television, there still exists a social responsibility function of the media to serve the public interest in a democracy. The → BBC is a good example of public service broadcasting in the UK. The idea of a European public sphere and linking citizens across Europe has developed along with the rise of the European Union and has prompted the establishment, for example, of the German political education system (Segert 2005). Scholars who explore the cultural influences on popular communication in Africa, for example, point to the difficulties in establishing an exchange due to frequent breakdowns of government and leadership, as well as military intervention in the political communication process (Nnaemeka 1990).

Given the freedoms and the commercial nature of media, particularly in the US, sensationalization of → political discourse for entertainment value is permitted (→ Sensationalism).

Parody and satire are common formats used in western industrialized nations to critique the system. The *Daily Show* and the *Colbert Report* are examples of television programs used for this purpose. Political economic media scholars critique the strong commercial influence on the media. They insist more regulation is needed and the capitalist “free market” media model is inherently flawed at creating a true public sphere (→ Political Economy of the Media).

### MULTIMEDIA FORMS

Most recently, *radio* as a vehicle for popular political communication has seen a surge of influence and availability in Latin American countries. In countries such as Peru, Colombia, and Brazil, *comunicación popular* (“communication of the people”) occurs through community radio, which is a tool used by the people in social and political struggles. Radio Sutatenza of Colombia and Radio Huayacocotla in Mexico focus on education and community organization (Gumucio Dagron 2001). In the US, popular political communication on radio often serves niche partisan audiences. Hosts such as Rush Limbaugh and Dr Laura Schlessinger gained popularity among conservatives frustrated with the perceived mainstream media’s liberal bias (→ Bias in the News; Hostile Media Phenomenon). Air America radio targets more liberal, left-leaning listeners.

*Television*, arguably the most mainstream of all the media, takes a broad and diverse approach in its production of political discourse (→ Television: Social History). With the development of cable, television tries to reach large audiences through broadcast stations, while specialized cable networks focus on fragmented or niche markets (→ Cable Television). In the US and many other countries, broadcast stations generally host national presidential debates and air → political advertising (→ Televised Debates). Debates are not only seen as contests with winners and losers, but also a game in punditry, where popular political pundits from the left and right critique their opponents’ success. Political communication through advertising can be as diverse and simple as painting candidate names on roadside boulders, airplanes streaming banners, and vans or cars blasting boastful campaign messages from megaphones, to straightforward television, radio, newspaper, and outdoor advertisements. Recent popular communication scholarship examines political discourse in popular late-night programs, as well as newer venues such as YouTube and blogs (Tessler 2006).

### INTERNET

The newest medium with the greatest potential to provide in-depth (and almost unlimited) information, as well as the opportunity for individual citizens to contribute to political dialogue, is the Internet (→ Internet News; Online Journalism). While there are access and technical expertise inequities that even the most optimistic media reformers cannot deny, in many countries this medium offers the greatest opportunity to engage in political discourse even if governments regulate other forms of media. While many have only begun to incorporate this new technology, a few savvy bloggers and web page designers have been able to scoop mainstream news outlets (→ Blogger). In the broader context, the Internet is relatively new, and individual users and corporations are trying to

determine how to make the most of this medium as scholars monitor the progress and recommend democratic uses for this seemingly limitless new medium.

Many scholars believe a healthy democracy depends on a thriving public sphere, where political discussions are in-depth and free from fear of government retaliation. Providing journalists access to government officials and organizations and citizens the opportunity and freedom to participate in political debate are major challenges in many parts of the world. Even in countries where this relationship is claimed to exist, a close examination often reveals little transparency of process. Some of the biggest obstacles to popular political communication include consolidation of media ownership, and commercialization or profits being favored over public service, which includes the trend toward infotainment. Fraser suggests that the singular public sphere is unrealistic and citizens should seek out a “multiplicity of publics” (1992, 127) to participate actively in the popular political discourse.

# Polls and the Media

*Michael W. Traugott*

*University of Michigan*

Election polls have a long history of a symbiotic relationship with the media, dating back to the nineteenth century (Converse 1987; Frankovic 2008). However, it was not until the 1920s that polls insinuated themselves into the news operations of election coverage on a regular basis. Before the advent of the modern polling period, the major political poll operating in the United States was conducted by a leading circulation magazine, the *Literary Digest*. Based upon its subscriber lists, eventually supplemented by information from telephone directories and automobile registrations, the *Literary Digest* conducted large mail surveys to produce estimates of the outcome of presidential elections. While the magazine made good estimates from its data in 1928 and 1932, its 1936 estimate that predicted a Landon win over Roosevelt was a disaster (Squire 1988). Of greater significance, George Gallup had started a new public polling operation and promised his first major news client, the *Washington Post*, that his methods could outperform the *Literary Digest*. When he did, a new era of public polling for news organizations was born (→ Public Opinion Polling; Survey).

## SYMBIOTIC RELATIONSHIP

The nature of the symbiotic relationship was, and remains, that public polling organizations needed the news media to publicize the work they did during elections in order to promote their availability for private work for commercial clients, where they made their money. And the news organizations were attracted to the ability of polls to generate news content based upon their election forecasts which coincided with their natural inclination to cover elections with “horse race” journalism which focuses on who is ahead and by how much (→ Election Polls and Forecasts; Horse Race Coverage). At the same time as Gallup began his relationship with a series of newspapers that carried his syndicated column from the American Institute for Public Opinion, Elmo Roper established a similar relationship with *Fortune* magazine (Zetterberg 2008). And as American campaign techniques have been transported to overseas political systems, so has the use of polls in the news coverage of them (see, e.g., Worcester 1980; Weimann 1990; Brettschneider 1997; 2008).

These partnerships still exist today, although changes in technology and the structure of the news business have altered them. In the 1970s, a number of forces converged to move news organizations into independent data collection rather than continuing their reliance on syndicated data gatherers like Gallup, Roper, or Harris (→ Precision Journalism). This was the period when network television news was competing with newspapers for pre-eminent coverage of elections, including live on-the-air coverage on election night (→ Television News). In the polling industry, telephone surveys were replacing face-to-face interviewing techniques, and the advent of low-cost personal computers and supporting software coincided with the development of computer-assisted telephone interviewing

(CATI) operations and the design of random digit dialed (RDD) sampling (→ Sampling, Random).

Major partnerships developed in the US between CBS News and the *New York Times*, ABC News and the *Washington Post*, and NBC News and the *Wall Street Journal*. Each of these partnerships involved a major morning newspaper and a significant television news operation that coincidentally shared the same effective deadline early in the evening of the same day. Similar joint polling operations have sprung up in a number of other countries, including in Germany between the Allensbach Institute and the *Frankfurter Allgemeine Zeitung*, for example, and in the United Kingdom between the British Broadcasting Corporation (→ BBC) and Globescan, as well as a variety of research institutes. The television news operations get to produce a brief version of a polling story first for broadcast, while the newspaper operations produce longer stories, typically with more analysis, for the next morning's paper. By the late 1990s, these news organizations were also independently producing web-based content for simultaneous release as well.

In the beginning, the partnerships were justified on the basis of newsworthiness criteria (→ News Values). Why should a pre-eminent collection of journalists have to rely upon editorial decisions made by someone at the Gallup Organization (or Harris or Roper for that matter) about which questions should be included in a poll and when it should be fielded? When the paired news organizations set up their operations, there were shared resources each committed to the operation (like the phone banks in the advertising operations of the newspapers that were not being used in the evenings), and they contributed jointly to the development of the questionnaires. Each poll generated a dataset that could be analyzed separately by each organization, and it often produced different lead stories based upon different assessments of the most newsworthy content from the poll.

In 1992, the Gallup Organization entered into a joint agreement with → CNN and *USA Today* to produce poll content. In addition to work on analysis, Gallup editors eventually began to appear in brief video segments on the cable network. In 2006, in what might be described as business coming full circle across 70 years of work, Gallup announced it was severing its relationship with CNN because of declining cable ratings for their segments and an interest in establishing its own e-broadcasting presence, including with AOL. It maintains its partnership with *USA Today* because of its large readership in the United States and its worldwide presence. We are waiting to see whether similar “divorces” occur with other pairings of media and polling organizations in other parts of the world.

## POLITICAL POLLS IN ELECTION CAMPAIGNS

Campaigns and elections are of special interest to news organizations because they share many features that make them ideally suited to coverage (→ Election Campaign Communication). They are high-impact events that affect many readers and viewers; in the case of presidential elections or even statewide elections, they affect everyone in the circulation or broadcast area. They usually involve known figures who are eager to be news sources and willing to be quoted. They involve conflict and drama, and they occur on a schedule. And election day provides a clear end to the event with a declared winner and loser.

All of these features provide a clear and well-understood storyline for news organizations, and they enable them to carefully plan their coverage in terms of the allocation of

resources (including reporters), the partitioning of the news hole, and the organization around key events in the political calendar, including the announcement of candidacies, primary elections or nominating conventions, debates between the candidates, and major policy addresses (Weaver 2008). Every one of these events is also amenable to different forms of polling that assesses the relative standing of the candidates at each stage of the campaign, especially in terms of the “horse race” measure of who is ahead and by how much; who won a debate; and the impact of significant campaign events like planned speeches or inadvertent slip-ups.

The polls also played a central role in the capture of election coverage by electronic broadcast media from newspapers. While news organizations sometimes shared the content of pre-election polls and analyzed them carefully for trends, the early television coverage of election night results was based upon the tabulation of raw votes from across the country. These votes came in very slowly and were relatively meaningless unless the news organization had detailed information about the geographical locations where they came from and the historical voting patterns there. It was quite common in this period for newspaper coverage of elections not to contain any significant results and analysis of them until the one or two days following the election. In order to overcome this problem and gain a reporting advantage, the US television networks developed new polling techniques to assist with election night coverage. At first they simply applied sampling theory to select “key precincts” where the raw votes could be tabulated on a representative basis. But they quickly saw the limits of such techniques for extended analysis of such factors as gender or attitudinal patterns underlying voter preferences. So exit polls were developed as a method to add a significant explanatory note to the understanding of social and political forces at work in the electorate. This technique added depth and immediacy to television coverage of elections, as well as an overall immediacy to counting votes more quickly.

The exit poll phenomenon has taken off in other countries as well, assisting electronic news organizations, especially television networks, in capturing election night coverage (→ Election Surveys). Depending upon the nature of the electoral system, these exit poll operations focus less on the division of the popular vote and more on the control of the national legislature or parliament. In the United Kingdom, one set of exit polls is designed to capture the winners of the marginal or competitive seats and hence the control of the House of Commons. In other countries, different interviewing procedures are employed, including the use of telephone surveys of those who have already voted, as in the Philippines. But in each case, the goal is the rapid reporting of the outcome of elections in as close to real time as possible and before newspapers can report the same results.

### **PROBLEMS WITH MEDIA USE OF POLLS**

The problems with the media’s use of polls derive from their reliance on “trial heat” or “horse race” polls that measure who is ahead and behind in a political contest (Patterson 2005). Polls could contribute in a number of significant ways to election coverage if they were used in a more varied set of ways that gave the voters a stronger voice in the coverage. They can be used at the start of the campaign to provide information about which issues the public thinks are most important and their sense of how much attention

the candidates are devoting to them. They can be used during the campaign to assess how much the voters are learning about the candidates and the issues they are discussing. And they can be used at the end of the campaign to measure voters' satisfaction with the content and tone of the candidates' speeches, ads, and debate performances, as well as with the media coverage of the campaign.

In the standard news story about the campaign that does not include such polling information, journalists search out party leaders, candidates, and campaign staff members for assessments of the campaign. These are all strategists of one kind or another who have a vested interest in the outcome of the campaign and will "spin" a story to their side's advantage (→ Spin Doctor). This often involves statements about what the voters are learning or how they are reacting to the candidates and events of the campaign. Why not use polls to give the voters their own voice in this coverage rather than providing partisan or self-interested interpretations of what is going on in the public's mind?

One of the realities that contemporary news organizations face is that their audience sizes and shares have been declining (→ Exposure to News; Exposure to Print Media). This has produced a number of associated trends in news coverage. One is a relative decline in hard news coverage, supplanted by an increasing amount of soft coverage (→ Political News; Soft News). Furthermore, news organizations have turned to a number of techniques to try to engage their remaining audience members and provide some interaction with the production of news. Both of these trends are complemented with the increased use of polling data, although not always of the highest quality. Polls enable news organizations to report on what their readers and viewers are thinking, their patterns of behavior, and their attitudes and preferences. The hope is that this will forge a closer tie between the news organizations and the audience.

At the same time, news organizations are some of the most profitable corporations in the business world, and they are under continuous pressure to maintain these high profit margins for their shareholders and investors. One consequence is that often they resort to inexpensive data collection that includes dial-in or web polls that involve self-selected samples of viewers and readers who are sometimes asked to respond to simple single-question surveys. The emphasis is on the sheer number of responses, for the purpose of engaging as many audience members as possible, rather than the representative nature of them. These features make → Internet polls especially attractive to news organizations, although significant questions about their methods remain.

## Popular Communication

*Debra Merskin*

*University of Oregon*

Popular communication is an interdisciplinary, multi-theoretical, multi-methodological philosophy of media and audiences. It has evolved as a nonhierarchical perspective that emphasizes the value of objects, behaviors, attitudes, and beliefs associated with everyday life. Gunn and Brummett (2004, 705) ask provocative questions about popular communication that capture the difficulty of defining the term: “Whose child is it, and who invented it? What sort of side dish did it contribute to the feast?” In many ways, the term defies definition because of the resistance to categorization inherent in a postmodern vision, which values all products of human endeavor (→ Postmodernism and Communication). Popular communication research is often critical of systems of power. A philosophy behind popular communication research is a “skepticism toward dominant institutions (including the university), ideologies, and social relations and an implicit commitment to a more democratic, egalitarian, and humane social order” (McChesney 1994, 340).

It is the ideology inherent in mass communicated messages that is of the utmost importance to popular communication scholars (→ Critical Theory). Through three related processes, “domination, contradiction, and struggle,” the global arena of popular communication research focuses on the role of media and the construction of meaning in capitalist and postcapitalist society (Lembo 1986, 390). Mosco (1983, 244–245) elaborates: “research offers an alternative way of seeing the place of communications in society by focusing on the transformation of social relations . . . [however] the critical view does not end with a description or even an explanation of existing reality, but is guided by an explicit value: to free people for self-determination. As such the growing area of popular

communication research reflects the ideological struggle over who does and will control media and information in global society. The emphasis is on media power and knowledge.”

Hence, one approach reveals the power of dominant institutions, such as the mass media, through examination of the messages and their potential impact on audiences (→ Media Effects). Another key interest of the field is the way(s) people make → meaning from the media (visual and verbal) texts they consume. This view holds that the mass media are ideological tools with which dominant society maintains power and controls resources by presenting assumed mainstream attitudes, beliefs, and behaviors. Meaning is thereby both an “agency of influence” and “the goal of influence” (Gunn & Brummett 2004, 710).

Much popular communication content is produced in the United States (films, television programs, recorded music). The reach and effects, however, are global (→ Global Media, History of; Globalization of the Media; Globalization Theories). Many nations are, however, developing media production facilities. There is a sizable film industry in India, for example (→ Bollywood). In addition to traditional means of production, the → Internet and the world wide web extend the reach of content producers and providers, whereas distribution might have been too expensive or too regulated in the past (→ Internet and Popular Culture). Reclamation of indigenous culture in postcolonial nations such as Africa, India, Bhutan, and the Cook Islands, and producing content by and for local people, is a positive aspect of new media technologies (→ Africa: Media Systems).

Entries in this section of the encyclopedia encompass the three Cs of popular communication research: (1) *corporations* are explored, as well as the relationship between popular culture and media and media-related industries (television, music, Internet, consumer culture, tourism); (2) *content* includes examinations of specific genres and forms, such as → anime, drama, → fashion, news, → popular culture, → reality TV, → situation comedies, → sports as popular communication, → video games, and → zines; and (3) *consumers* are discussed in entries such as those about → girl culture, celebrities, fans, subaltern communities, youth, and social class. In addition, more theoretical entries include → reification, ritual, mythology, → symbolic annihilation, politics, and the developing area of → media ecology.

In order to understand what popular communication is and does, it is necessary to consider how the term evolved and the context within which it developed. Popular communication as a component of everyday life is an area of concern and interest to scholars. Therefore, the following sections first define the terms “communication” and “popular,” demonstrate how and where these ideas came together, and discuss the history of popular communication as a philosophy and field of study. This is followed by a brief look at typical theories and methodologies, illustrated by examples of research. This entry concludes by speaking to the future of the field.

### WHAT IS “POPULAR”?

It was in relation to folk culture and folklore that widely understood, accepted, and enjoyed (as in “the people”) culture became thought of as culture of the masses, a vast, undifferentiated body of people with common tastes. Traditionally, the term “popular” was used to express favorability, high regard, and appreciation by the general public (as opposed to small, elite segments). Popular “culture” is culture of the people by the people

and for the people (→ Culture: Definitions and Concepts). At one time popular culture was thought of as the product of something made by hand, but it can also mean widespread fame, popularity, and commercialism, as well as the idea of a shared culture. Sometimes viewed as the opposite of high cultural art forms (ballet, classical music, and opera), popular culture is a shared set of practices as well as the product of those interactions. It includes television programs, comic books, → popular music (jazz, hip hop, rock), fashion magazines, sports, → advertising, food ways, festivals, and rituals. Whereas the high/low culture distinction views culture hierarchically, the “pop comm” approach is a linear, non-evaluative perspective. Thus, the idea of “mass culture” is intimately connected with valuations of popular culture.

*Mass society theory* views audiences as essentially passive, easily entertained, malleable sops for consumerism and advertising, predetermined to have bad taste, and devoted to repetitive formulaic forms of culture (→ Audience; Audience Commodity). Mass society theory presents a view of citizens as audiences for mass media products that are a homogeneous grouping of people, whose only connections to one another are through that which they find in common, that which is popular. Related to this is a belief in the decline of what is regarded as authentic, traditional, more personal forms of relating.

The theory of mass audiences can be traced to the early development of American consumer society and mass production around the turn of the twentieth century through the 1920s and 1930s, with the rise of the market economy. While industrialization, urbanization, and modernization originated in Europe, mass production and selling imperatives exploded in the US. What was identified as popular was not necessarily identified as such by the people it appealed to, but rather by those who produced it. In advanced capitalist societies, the popular is typically tied to the commercial and, given that, the term generally means the culture of ordinary people, i.e., working class, non-elite members of society, or that which is left over after what is elite is defined – hence the hierarchical, elitist view of the popular as inferior.

Cultural theorist Raymond Williams (1976, 199) points out that two characteristics identified early popular culture products – “inferior kinds of work” (popular press versus literature) and “work deliberately setting out to win favor” (pop celebrity or popular journalism versus serious, democratic work). Furthermore, Williams (1976, 90–91) articulates four meanings for the word “popular” in relation to culture and communication. (1) “A pejorative meaning referring to objects or practices deemed lesser than or inferior to elite culture,” i.e., appeal to a mass audience; for example, popular → Hollywood movies versus independently produced films; *Telenovelas* versus → BBC or PBS programs. (2) “Objects or practices well liked by many people,” i.e., not the small groups of elite or wealthy. Examples include rock and country music concerts versus attending the ballet or opera. (3) “Work designed with the intention of appealing to a great number of people,” i.e., commercial culture meant to be widely consumed. Popular press magazines, cable and network television programs, and other advertising-supported media are examples. (4) “Things people make for themselves,” for example, knitted scarves, community theatre, or musical performances.

The expression “popular culture” is, unfortunately, often used as a *pejorative term*, viewed as lesser than so-called high-culture pursuits because it originates among and is widely available to a vast majority of everyday people, and is deeply embedded in daily

life. Traditionally thought of as the product of something made by hand, popular can also mean widespread fame, popularity, and commercialism as well as the idea of a shared culture. Popular culture's definitional fluidity is made clear by remembering that, in their time, Shakespeare's plays were the popular culture of their day. During the 1960s, the music of the Beatles, for example, was considered vulgar. Parents worried that their children would be corrupted citizens and sexual deviants as a result of listening to the band. Today, however, songs such as "Love me do" and "Strawberry Fields" are played on oldies and soft rock radio stations.

The contents of popular culture are perpetuated through a nation's vernacular (spoken, written), i.e., visual or verbal language. The quality of and value placed upon the products are socially constructed. Popular culture carries and articulates social class and social group distinctions. Horkheimer and Adorno's classic work *Dialectic of enlightenment* posits that the production and distribution of popular culture constitutes a → "culture industry" (1997, 120). This argument holds that cultural products such as art become commodities that reflect dominant ideology and in fact convey norms. Fashion is an example of this process, which not only has the power to democratize but also to establish and affirm borders. The popular, therefore, is that which is representative of larger social conditions and opposition between authenticity and commercialization/globalization. Expressions such as "high art" and "low art," for example, have immediate associations with social class. High art can feature nude bodies, while low art is pornographic. While Gans (1975) orders the products of popular culture in a hierarchical manner (from classical to kitsch), the intent was to de-privilege forms of cultural narrative from their economic foundations (→ Taste Culture).

### WHAT IS "COMMUNICATION"?

Communication is a theoretical field as well as praxis that includes mediated and nonmediated forms (→ Communication Theory and Philosophy). Communication is also a process, a product, and a discipline (→ Communication: Definitions and Concepts). As a process, communication includes gestures, signs, symbols, sounds, painting, speaking, writing, facial expressions, and the transmission of these through a form of human and electronic technology (such as books, television, film, and radio). It is "interaction by means of mutually recognized signals" (Hartley 2002, 32). Communication includes what is known as a speech act, an example of which is dialogue. Interpersonal communication has the advantage of immediate feedback between sender and receiver, as in a frown, a nod, or a shrug (→ Interpersonal Communication). This type of nonverbal response is not as immediate in mass mediated communication; however, this is rapidly changing. Email, web-based polls, and audience/user ratings are examples of interactions that viewers, readers, and listeners can have with content providers. YouTube, a website where users post videos, film clips, and other material is an example of audiences creating content. In the case of television programs such as *American Idol*, viewers vote for their favorite performer by telephone and learn the results during the next episode.

As a product, mass (simultaneously, widely available) media contain the symbolic products of human communication – language, music, images, signs, and symbols – as well as the technologies that send them. Thus, communication is the transmission of

these products by way of books, television, film, the Internet, newspapers, magazines, and radio. An example is the BBC television series *Hex*, the plot of which revolves around the perennial battle between good versus evil. The program contains dialogue, plot, and story lines emphasizing love and hate, but also significant alchemical pagan symbolism. Thus, the program is coded in ways that those familiar with magic and mystery understand, but is also accessible to new viewers.

As a discipline, or area of academic study, the field of communication includes speech communication, organizational communication, interpersonal communication, intercultural communication, performance studies, and mass communication (→ Communication as a Field and Discipline). The study of popular communication is also part of this array and, as described below, includes an emphasis on identifying sources of media control and power, analyses of visual and verbal texts, and appreciation of the role audiences play in the give and take relationship with content.

### WHAT IS “POPULAR COMMUNICATION”?

If communication is a process, product, and discipline involving the exchange of signs and symbols and the popular consists of objects or practices that appeal to a wide audience, then it follows that popular communication is the transmission of signs and symbols, via written and visual rhetoric, widely available to audiences. At the same time, the popular communication perspective recognizes that people are capable of making their own meaning from content, resisting and transgressing messages of expected behaviors and roles. Audiences often participate in the creation of content as well, such as on Internet fan sites.

Scholars in the field of popular communication resist fixing the meaning of the term by narrowly defining it. Gunn and Brummett (2004, 708) suggest a definition as “the study of objects that are widely circulated by means of mass media. These objects are studied with a view toward explaining their meaning, structure, and impact.” These areas have in common a concern with a particular set of problems; they ordinarily focus on mass media, specifically the interrelated “three Cs” – content (text), corporations (producers), and consumers (audiences) – have a predilection to use specific methods, and share similar political views.

Some popular communication scholars *examine the context* within which dominant social, political, and economic institutions use the media to retain power. Others focus on structures that contribute to the maintenance of boundaries between those with and without power and resources. Hegemony is control of people through use of ideas (instead of physical force), which requires their consent. Agreement is accomplished through an interwoven structure of mainstreamed attitudes, beliefs, and behaviors constructed as “normal” and reinforced through institutions such as family, education, religion, politics, and government. Ideology, a term that refers to a set of ideas or a vision, can be presented symbolically in media content through signification (meaning making) and articulated in representations (or lack thereof). Individual and social identity and belonging are thereby reinforced by the existing hierarchical power structure. Thus, through subordination, domination, oppression, and repression, a structured, predictable social order is maintained.

In a foundational essay exploring popular communication, Zelizer (2000, 303) described characteristics of popular communication scholarship that provided a framework for unpacking key ideas. As such, popular communication is: (1) interdisciplinary; (2) eclectic in its “theoretical focus, methodological perspective, and focus of inquiry”; and (3) connected to the academy and daily life.

### INTERDISCIPLINARY

Popular communication research is a product of merger or, as Geertz (1980, 167) points out, “blurred genres” between sciences and the humanities. The humanities and social sciences have been in dialogue for hundreds of years. However, in the early part of the nineteenth century, the humanities dominated European thought and enveloped a broader range of disciplines than today. During the late nineteenth and early twentieth centuries, the social sciences institutionally broke away from the humanities. Since that time, these areas have been in dialogue but seek answers to questions in different ways using distinct methodologies. Geertz (1980, 167) identified this as a kind of freedom in which scholars from seemingly different disciplines became “free to shape their work in terms of its necessities rather than received ideas as to what they ought or ought not to be doing.” Popular communication research enjoys this exchange or flow of ideas back and forth between disciplines.

What is regarded as the production of knowledge in science is the *production of meaning* in mediated communication, both of which rely on intersubjectivity – ways in which shared understandings of phenomena are created. While traditional science argued for an objective unified reality, communication and popular communications argue that all meaning is socially constructed, the interpretation of which is individual (→ Constructivism; Objectivity in Science). Symbols are an example of the fluidity of meaning in a particular time and place. After the tragic events of September 11, 2001, with the bombing of New York City’s World Trade Center towers and the Washington, DC, Pentagon building, the American flag came to have much more solidified meaning to many Americans. Where at one time the meaning of patriotism was fluid, and many definitions of allegiances accepted, after America’s retaliation, meaning became fixed. The emblem recognized as the Nazi swastika has ancient origins, but was appropriated by this ruling party as a sign. Thus, the philosophical underpinnings of communication, particularly popular communication, are traced through a series of linguistic, anthropological, historical, psychological, and social science disciplines. Popular communication studies bridge these areas with interdisciplinary philosophy, methods, and theories. It is this amalgamation that fuels debate on whether or not communication can be considered a discipline separate from other forms of social science and humanities.

The humanities further influence the trajectory of popular communication research through four interdisciplinary theoretical traditions that, in particular, inform philosophy and method in the field: → hermeneutics, → phenomenology, rhetoric (→ Rhetorical Studies), and → semiotics. These *ways of knowing* about the production, consumption, and content of communication are the foundation on which popular communication research is built. Hermeneutics, a reading of texts and/or understanding a culture from the perspective of that culture in order to understand how meaning is made and

changes, is considered by many to be a philosophy, theory, and method of analysis. A phenomenological approach considers and values everyday life and ways of being in the world, i.e., lived experiences. A rhetorical analysis examines the power of language to describe and persuade, including nonverbal forms of communication such as symbols. It is a philosophy, a skill, a method, and a technique that recognizes the power of communication.

*Discourse (language) analysis* adds the dimension of questioning taken-for-granted meanings and deconstructing them in ways that reveal sources of power by revealing hidden motivations (→ Discourse). For example, a discourse analysis of the contents of a political speech might reveal motivations around the topic of war. A → discourse analysis of advertising copy might examine the use of nature-based references as ways of constructing wholesomeness around products. Film narratives often examine the construction of masculinity, femininity, and sexuality. Associated theorists who have looked at the power of language, metaphor, and the relationship with power include Michael Foucault, George Lakoff, and Mark Turner.

*Semiotics*, another tool for examining visual and verbal representations in media content, is the study of signs and symbols and the way meaning is constructed and understood. Semiotics is also used in architecture and art. For example, a semiotic analysis of perfume ads could reveal social class biases, techniques of → branding, and status conferral by examining product packaging, naming, use of color, typography, and models. Associated scholars include Charles Sanders Peirce, Ferdinand de Saussure, → Roland Barthes, Jean Baudrillard, and Umberto Eco.

Scholarship is organized according to *three broad areas*: (1) the content of communication, (2) control of distribution, and (3) consumers/audience members who view or read the content. Examples of content-focused research include studies of television programs, Internet sites, and music lyrics, and visual analyses of news photography, portrayals of women and girls in advertising, and the male body in popular culture.

Examples of studies that examine corporations and control of the production of media products, and thereby construct meaning for society, include the related area of political economy. Political economy, defined as the production and distribution of power and resources in society, is concerned with the internalization of attitudes, beliefs, and behaviors of dominant culture (→ Political Economy of the Media). This perspective is particularly global in nature. For example, studies have examined media ownership in Scandinavian countries, the production of film in India, and the film industry in Taiwan. A more extended example of research includes the subject of daytime television. Media corporations that own broadcast television operations produce programming to attract advertisers, which want to attract audiences to see their commercials. All parties – the media corporations, the television stations, the advertising agencies, and the companies whose products are for sale – are interested in making a profit. The programs generally reflect aspirational values of upper-class, high-consumption lifestyles. Thus, the programs echo the goals of media and marketing to encourage people to buy products and emulate the lifestyles seen on television, even if doing so is out of the financial reach of most viewers. Associated scholars include Karl Marx, Oliver Boyd-Barrett, and Dallas Smythe.

Communication studies are credited with bringing attention to the *importance of what audiences think about*, feel about, and do with mass media content. In traditional media

research, the idea of audience is an abstraction. Audience research, while conducted by corporations to ascertain the size and demographic characteristics of a group, in this case is about the experience of viewing, reading, and hearing and interpreting media content. One of the earliest applications of this perspective came from the Centre for Contemporary Cultural Studies at the University of Birmingham (UK). In the 1970s, researchers began studying the relationship between media texts and audiences. Stuart Hall is closely associated with work on the idea of encoding/decoding discussed earlier in this entry (→ Cultural Studies). David Morley and Charlotte Brundson conducted the *Nationwide Project* in the late 1970s and early 1980s. This audience and reception theory study examined the BBC program *Nationwide* using encoding and decoding. Their concern was with “the programme’s distinctive ideological themes and with the particular ways in which *Nationwide* addressed the viewer” (Moore 1993, 19). Interviewing viewers from a variety of socio-economic backgrounds, the researchers found that even within particular social class groups there were individual differences in the way media content is read.

### **ECCLECTIC IN THEORETICAL FOCUS, METHODOLOGY, AND FOCUS OF INQUIRY**

Grossberg (1994, 332) identifies three characteristics of communication scholars that are reflected not only in what becomes the topic of research but in the theory and method used: researchers are (1) committed to the fact that reality is continually socially constructed, (2) drawn to the “popular” as the terrain of everyday life and cultural practices, and (3) committed “to a radical contextualism” of power and culture. My own review for this entry of the 60 article titles published in the four-year-old journal *Popular Communication* found an eclectic blend of theory, methodology, and disciplines.

Critical studies, genre studies, image and characterization research, cultural studies, cultural history, and audience-focused consumption research are examples of theoretically driven areas. Topics include analyses of postmodernism, blackness, and art; telenovelas; the cultural politics of race; television makeover programs; political culture jamming and the *Daily Show*; hip-hop culture; the Israeli song contest and men; television shopping; gender transgression; boys’ and girls’ responses to and interactions with the *X-Files*; and Japanese popular culture. Scholars used a variety of methods, such as historical, textual analysis, critical analysis, and semiotics.

### **Eclectic in Theoretical Approaches**

Communication research has developed through a long history of scientific, empirical ways of knowing and, more recently, qualitative inquiry (→ Qualitative Methodology; Research Methods). The theories, methods, and objects of study contained within the domain of popular communication include critical studies, cultural studies, media criticism, and feminist, queer, and game theories (→ Feminist Media Studies, Transnational).

As discussed previously, popular communication scholars view audiences as active participants in the reception and decoding process of mediated messages. As such, there are individual differences in interpretation and understanding, therefore “media content is always polysemic, or open to interpretation” (Morley 1994, 255). Whereas traditional,

Figure 1 Hall's circuit of culture

linear theories of the flow of communication support the high/low culture distinction and view culture hierarchically, popular communication studies' nonlinear, non-evaluative perspective is illustrated by Stuart Hall's (1981) *circuit of culture model* (Fig. 1). Hall's work came out of the 1960s British cultural studies movement from the Birmingham Centre for Contemporary Cultural Studies. This early work, based on the writings of Italian revolutionary Antonio Gramsci, emphasizes the role of hegemonic consensus in maintaining institutionalized power and the ways mass media serve as tools that communicate dominant ideologies of industrialized, western democratic states.

In this view, power resides both with the sender and in the transmission process, but once the message is received, audience members make decisions about how it will be interpreted. Hall (1981) posited that both sender and receiver at different sites produce meaning, which is circulated through products and practices. Mass media content is viewed as text to be read, the meaning of which changes over time just as language and symbols do. Whether this content is the lighting, camera angles, and actors in a film, the pose and position of a model in an advertisement, or the language used in a televised presidential speech, the entire product or elements within a television program, film, web page, or book are viewed as encoded elements in the construction of the product. The power of the media, as an "ideological state apparatus" (Althusser 1977), reinforces and circulates beliefs about values, beliefs, and behaviors that are constructed as normal and desirable.

### **Eclectic in Methodology**

According to this perspective, there are *three primary lenses through which the audience decodes messages*: preferred (as the sender intended with little to no critical evaluation of content) or "structured polysemy" (Morley 1994, 255), negotiated (audience is aware of

the intent of the message, but goes along with it anyway), and resistant (audience awareness is high regarding the persuasive intent of the message and the audience actively works to decode the denotative and connotative meanings within and behind the text). Fiske (1987) added that audiences at times modify and even deflect senders' intentions. An important consideration is that ideologies are not necessarily static and, in fact, "hegemonic discourse is always insecure and incomplete" (Morley 1994, 256). This view suggests a lower level of effects and higher level of audience choice making. Budd et al. (1990, 170) point out, "Whatever the message encoded, decoding comes to the rescue." In this view, making and remaking of culture by audiences can work to resist commercial imperatives.

James Carey (1989, 15) identified the *transmission view* of communication as "a process whereby messages are transmitted and distributed in space for the control of distance and people." Furthermore, he posited a ritual model of communication (versus the traditional transmission model) that provides the context within which much popular communication research develops. The traditional transmission model emphasizes a linear sender-receiver model (→ Models of Communication). This social scientific concept is based on → Lasswell's (1966) classic questions: "who/says what/in which channel/to whom/with what effect?" Similarly, Shannon and Weaver's (1949) mathematical model of communication views communication as engineered as a series of signals. These models only minimally consider the audience as active in the reception process. Early theories of media effects shared the view of media having uniform, immediate, and long-term effects on audiences. The ritual model, however, emphasizes the social construction of texts and the creation and transformation of shared meaning. First articulated by James Carey, the ritual view sees culture and communication as inseparable, and communicating as reinforcing shared values and beliefs. Gunn and Brummett (2004, 712) take this further by declaring that communication brings "reality" into existence and affirms and maintains this established, constructed way of being as "normal." Communication, then, is the deliberate construction, with hegemonic origins and ideological goals, of information, as well as "the terrain upon which symbolic action takes place."

Therefore, studying communication through the lens of cultural theory and popular communication is to examine the sources and content of mass media messages and the responses to them by audiences. In order to do so, according to this perspective, quantitative research methods, while useful and important, are not sufficient ways of getting deeper into material and human understanding or accessing lived experience. Qualitative methods commonly used include in-depth personal interviews, participant observation, production research, ethnography, textual analysis, discourse analysis, and audience studies, with, as discussed above, theoretical bases in hermeneutics, phenomenology, semiotics, rhetoric (visual, verbal), → aesthetics, and texts (→ Rhetoric and Media Studies).

### **Eclectic in Focus of Inquiry**

Objects of inquiry for popular communication research include sports; sub-culture/ritual; music; communication symbols, forms, and phenomena; analyses of youth culture; representations of race, gender, age, and social class; fandom; media as text, film, and spectacles; the digital revolution; sexuality; television, radio, and magazines; and advertising/consumer culture.

A developing focus of inquiry that touches all areas of popular communication is identified by scholars such as McAllister (2003), who asks the question, “Is commercial culture popular culture?” (→ Consumer Culture). Certainly, in western countries, *commercialism* is a defining characteristic of mass culture that is exported globally. Whether that exportation is exploitation or simply opportunistic, commercial culture is far-reaching, and does not necessarily require the integration of advertising and entertainment. According to Mosco (1996, 144), commercialization is “a process that specifically refers to the creation of a relationship between an audience and advertisers.” This suggests an overlap with consumer culture. Ads are commercial culture, as are other objects, such as films. They become commercialized particular when they involve product placement and merchandising. Fowles (1996, 11) asserts, “advertising, while sharing many attributes with popular culture, is a categorically different sort of symbolic content.” By its very nature, advertising is self-serving and therefore pleasure oriented, eagerly appropriated by audiences. These approaches to media content call for new techniques, theories, and methods with which scholars can study both the popular and the people in a culture.

### CONNECTED TO THE ACADEMY AND DAILY LIFE

Two conceptual binaries describe the anxiety associated with defining the term “popular communication” and stimulate debate and tensions within the academy: (1) the low culture/high culture binary, and (2) the notion that texts that attract the masses are insignificant and therefore not worth serious scholarly attention (Gunn & Brummett 2004). What is viewed within the academic world as the everyday world contains a general tendency to dismiss what is widely available and popular as not worthy of serious academic study. For example, how can studying something as mundane and everyday as television, for example, be valuable? Popular communication scholars address this dismissal by emphasizing the importance of what is within people’s everyday lived experience as perhaps the most important aspect of culture.

An associated tension involves assumptions about audiences for popular communication – if the product is widely available, wildly popular, and easy to access and understand, the common assumption is that audiences for it must not be very smart and part of the “unwashed popular” (Gunn & Brummett 2004, 706). An example is the lack of communication research on *National Geographic* magazine, most notably the magazine’s lack of focus on gender and race and its role as a middlebrow source of colonial discourse. This oversight suggests a kind of blindness to these institutionalized values, even within the field (Parameswaran 2005). It was anthropologists Lutz and Collins (1993) who first identified the “special cultural niche occupied by the *Geographic*” and the notable absence of scholarship among media scholars. Today, many popular communication scholars have addressed this lack by making connections to the importance of popular engagement as reflected in economic, cultural, and social contributions to society.

While popular communication studies scholars could be viewed as engaged in a disproportionate amount of navel gazing, it is this reflexive practice that lends itself to ongoing questioning of premises of research as well as ways to refine and clarify methods.

## FUTURE DIRECTIONS

In the early 1980s, the editor of the *Journal of Communication (JOC)*, → George Gerbner, challenged scholars to review the field of communication. The seminal 1983 special issue of *JOC*, *Ferment in the field*, contains 35 original essays from 10 countries responding to the question of the state of the field of communications research. Collectively, the essays converged around three processes surrounding the social relations of communication: domination, contradiction, and struggle. Mosco (1983) posited that the growth in critical research is reflective of the developing (at the time) information society and the control of it. Gerbner (1983, 358) noted that “common consciousness” had become a “largely manufactured product . . . and the concept of class or any other authentic public consciousness may be obsolete.” The scholars predicted a convergence between disciplinary perspectives (humanities and social sciences) as well as methodologies (quantitative and qualitative). There was also increased recognition not only of the growing convergence in mass media technology and production, but also between quantitative and qualitative research in the field. Gerbner’s (1983, 348) epilogue noted, “If Marx were alive today, his principal work would be entitled Communications rather than Capital” – a bit bold, even arrogant, perhaps, but the statement certainly addresses the importance of keeping the relationship between knowledge and media power always in sight.

Not only has there been a coming together of humanities and social sciences evident in popular communication research in the past few years, but also cross-pollination of media studies areas. Challenges to the field have come from postmodernism, cognitivism, and feminism in particular. Parameswaran (2005) examines engagement between feminist cultural studies and media studies in regard to issues of political voice, citizenship, and gender with those of mediated culture. If, as Appadurai and Breckenridge (1995) note, public culture is a “shifting array of texts and experiences, which constitute evolving contexts for one another,” then certainly popular culture as part of popular communication is similarly fluid. While many popular communication scholars study artifacts from popular communication, journalistic media, such as CNN, the *Wall Street Journal*, the *New York Times*, and other news organizations and content, also fall under this purview. Zelizer (2004, 114) challenges the field to reposition “journalism at the forefront of inquiry.”

Deetz and Putnam (2001) challenge communication studies scholars to consider less the obviously popular (as in entertaining) and more the pragmatic projects that address “significant problems of our times,” such as the democratic process and joint decision-making with governmental authorities. Funding initiatives and grant opportunities are likely to come from global concerns, health communication interests, and emphases on technology. They argue for more of a balance between pragmatic interests (of which popular communication scholars tend to be critical) and too much emphasis on trendy, popular topics. In addition, outreach to and activism within human communities, a basic tenet of communication and cultural studies research, offers promising possibilities for social change.

A decade after “Ferment in the field,” the follow-up report, *Defining media studies* (Levy & Gurevitch 1994), cautioned communication studies scholars to be mindful of the possible pitfalls and prejudices inherent in researching from positions of privilege while arguing for equity and other socially constructed differences. Furthermore, the field is so eclectic and interdisciplinary it would be easy to get lost in the mire of definitional fluidity,

or what Nordenstreng (2004, 13) calls “surfing syndrome” by studying only fashionable topics.

## Popular Communication and Social Class

Rob Drew

Saginaw Valley State University

During the Industrial Revolution, the English word "class" morphed from a general term for a division or group to a specific term for a position of rank within a social system based on economic wealth. Around the same time, the word "popular" began to be applied

to communication and culture with meanings ranging from “liked by many people” to “created by many people.” Thus, social class and “the popular” simultaneously arose as objects of intellectual interest. Indeed, the very question of what counts as → popular culture or → popular communication has always led to questions of class. In the late eighteenth century, when J. G. Herder coined the term “popular culture,” he had in mind the peasant culture that, for him, represented a more authentic alternative to Europe’s elite, classical culture (→ Culture: Definitions and Concepts).

By the late nineteenth century, when Matthew Arnold wrote *Culture and anarchy*, he understood popular communication as the culture of the “masses,” the culture of cheap novels and melodrama that was crowding out the high cultural tradition of “the best that has been thought and said” (Arnold 1960, 6). Though neither Herder’s romanticism nor Arnold’s elitism made explicit reference to social class, the issue of class and its contested role in defining culture, communication, and “the popular” lay just below the surface for both.

### MASS VERSUS CLASS CULTURE

In the early twentieth century, as the field of popular communication came into focus, so did debate about the role of social class. One key debate pitted a European-influenced mass culture approach against an American-influenced class culture approach. The former approach was represented by the group of German émigré intellectuals known as the *Frankfurt School* (→ Critical Theory). Horkheimer and Adorno (1972, 1st pub. 1944), for instance, blamed the ideological influence of mass culture for forestalling revolutionary social change. The → culture industry cranked out nearly identical forms of entertainment that lulled the masses into a false consciousness of mindless consumerism. The Frankfurt School thus shared the animosity of elitists such as Arnold to the popular culture of their time, yet they saw popular culture as an imposition from above rather than a contamination from below.

*Within US* communication research, the Frankfurt School was opposed by a more sanguine *class culture approach*. This pluralist perspective viewed social classes as having their own autonomous and equally valuable cultures. In → Katz and → Lazarsfeld’s (1955) research on communication flows among a sample of women, social class is treated as just another influence (along with social contacts and position in the life cycle) on individuals’ lifestyle choices regarding public affairs, movies, fashion, and household products (→ Media Effects; Media Effects, History of). Gans (1974) later solidified the American approach, arguing that the cultural affinities of different class and educational groups should be viewed not as a hierarchy but as a collection of diverse → “taste cultures.” In Gans’s view, so-called mass culture was just as valid for its less wealthy, educated public as high culture was for its public, and those critics on the left and right who derided mass culture were mere elitists who feared that the popularity of mass culture would erode their own privileged status.

The lines drawn within these mid-century debates have remained fairly resilient. While positivist researchers are accused of underemphasizing the determining role of social class in popular communication, critical scholars are faulted for overstating the influence of class. A rapprochement of sorts took form within the Centre for Contemporary Cultural

Studies in Birmingham, England (→ Cultural Studies). The *Birmingham School* originated with scholars who became disenchanted with classical Marxism's economic determinism. They built a model of scholarship that was rooted in Marxist notions of class conflict but showed an engagement with the culture of working-class people. In contrast to the Frankfurt view of the working class as victims of a totalitarian mass culture, the Birmingham scholars made the case that progressive social change remained possible and would be made by working-class culture.

### THE BIRMINGHAM SCHOOL

Inheritors of this tradition were among the first scholars to grapple with modern practices of popular communication in ways that did not merely condemn them. Under the direction of Stuart Hall, work within the Birmingham center turned to ethnographic studies of working-class sub-cultures (→ Ethnography of Communication). Birmingham scholars decoded the complex sign systems that lay below the surface of the music and style of sub-cultures like the Teddy boys, mods, and punks (→ Youth Culture). Much of this work took its lead from Raymond Williams's (1973) argument that cultural practices could be divided into dominant, residual, and emergent formations. While dominant formations wielded the majority of power and residual formations were remnants of the past, emergent formations created lines of resistance and pointed the way to new social structures. By Birmingham scholars' accounts, then, youth sub-cultures were not mere curiosities but potentially a kind of vanguard.

On another front, Birmingham scholars looked beyond the Frankfurt School's grim view of media culture by giving new attention to media reception (→ Audience Research). Hall (1980) forged a model of reception by integrating Birmingham-style cultural analysis with → semiotics. Media texts constitute a "structured polysemy." They are open to interpretation while usually favoring interpretations consonant with dominant ideology. The ways audience members interpret such texts are influenced by their position in the social structure; thus dominant readings will tend to be produced by those whose social position aligns them with dominant ideology (i.e., upper-class people), while oppositional readings will be produced by those whose position places them in opposition to dominant ideology (i.e., working-class people).

The world conjured by Birmingham theorists proved alluring to media scholars. It put a neo-Marxist spin on popular communication research and thereby lent such research a new political urgency. As studies accumulated of symbolically rich sub-cultures and resistant audiences, however, *three criticisms* arose of the Birmingham model. First, the narrative of dominance and resistance that underlay such work often reduced it to a trite Manichaeism. As Meaghan Morris (1988, 15) quipped, "I get the feeling that somewhere in some English publisher's vault there is a master-disk from which thousands of versions of the same article about pleasure, resistance, and the politics of consumption are being run off under different names with minor variations." Second, despite the Marxist origins of cultural studies, its focus on audiences and relative disregard for economic and textual analysis opened it to charges of political complacency.

Third, empirical research contradicted the assumptions of cultural studies. David Morley (1980) tested Hall's model of audience readings by showing a → television news

show to viewers of different social classes (→ Television News). He then interviewed them about the program and classified their readings. Contrary to Hall's predictions, Morley found that the working-class apprentice engineers tended to produce dominant readings of the program while the upper-class university students produced oppositional readings. Such results pointed to problems in cultural studies' attempt to reconcile audience analysis and class analysis. Social class is a multivalent concept whose influence on media interpretation is complex and changeable. As far back as the 1940s, American media research indicated that audience members' critical or uncritical reception of mediated messages depends on education. Given the covariance of education and social class, it is as likely that it was education that accounted for Morley's university students' oppositional readings as anything directly to do with class.

Despite their differences, Frankfurt and Birmingham scholars shared a common theoretical trajectory, agreeing on a Marxist ideological critique while disagreeing on the potential for resistance. A more coolly analytical line of theorizing on popular communication and class can be traced to Weber's "Class, status, and party" (1958). While class is determined by control over production, status is rooted in consumption and lifestyle. Whereas Marx understood the economic base as the driving force behind status, Weber saw class and status as autonomous and mutually influential. A similar emphasis on status and consumption appeared in Veblen's *The theory of the leisure class* (1994), which portrayed social life as a contest in which people assert status through conspicuous consumption and conspicuous leisure; that is, the ostentatious waste of money and time (→ Consumer Culture).

### **BOURDIEU'S NOTION OF CONSUMPTION AS COMMUNICATION**

The notion of consumption as a communicative system of status is elaborated in Pierre Bourdieu's (1984) work *Distinction*. For Bourdieu, the cultural field stands alongside the social and economic fields as avenues through which class divisions are reproduced. "Cultural capital" includes tastes, abilities, and habits of consumption that social actors employ to achieve a higher status. Like Veblen, Bourdieu sees economic capital as translatable into cultural capital, yet for Bourdieu, the reverse is also true: habits of consumption can influence economic capital. The interpenetration of wealth and culture occurs through the subtle mediation of "habitus," an unconscious system of dispositions ingrained through socialization. In an analysis of French survey data, Bourdieu finds class variations not only in tastes, but in the very bases of taste. For instance, he argues that the upper class's distance from necessity leads them to employ an "aesthetic disposition," observing objects of culture with a disinterested eye for formal beauty untainted by moral, practical, or sensual considerations.

Bourdieu's field theory forms a counterpoint to mainstream ideologies of social mobility and pluralism, pointing to the symbolic boundaries cultivated by differences in taste and conduct. His work has provided the terms for an analysis that forgoes both the Frankfurt School's ideological monoculture and the Birmingham School's dualistic struggle of dominance and resistance. Like these other paradigms, Bourdieu's work has led to valuable research in popular communication, yet it too has its critics. In his response to idealist notions of culture handed down from Kant, Bourdieu subjects culture to a cynical reductionism. As sociologist David Gartman (1991, 422) writes, Bourdieu

“reduces cultural choices to passive reproduction of structural necessities.” As a result, there is no room for agency in Bourdieu’s conception of culture, no possibility of changing rather than reproducing the class system.

To the degree that trends in theory follow politics, it is not surprising that Bourdieu’s Weberian realism has gained ground. His vision of an aesthetic elite set against a moral and practical working class resonates at a time when conservatives have appropriated populist rhetoric through appeals to so-called “values issues.” At the same time, the conservative political environment seems ripe for a resurgence of Frankfurt-style critical theory. Evidence of such resurgence in the US can be found in Thomas Frank’s (2005) recent work, which traces conservatives’ success in convincing working-class voters to vote against their own economic interests. Hence criticism of popular communication and class may come full circle, to renewed cries of mystification and false consciousness.

# Popular Culture

*Debra Merskin*

*University of Oregon*

“Culture” is “one of the two or three most complicated words in the English language” according to Williams (1976, 87; → Culture: Definitions and Concepts). Originally used to describe the process of tending, culture evolved as metaphor, as noun, and as a reference to a physical object. Today, culture is regarded as a unifying system, a worldview, a civilization, and as a psychology encompassing behavior, attitudes, and values as well as the symbolic structure of these activities (→ Cultural Patterns and Communication). Music is one of the most globally ubiquitous forms of culture. Four elements are typically included in definitions of culture: institutions, norms, values, and artifacts. “Popular” is a term used to express favorability, high regard, and appreciation by the general → public, as in the popular vote or to distinguish the popular from the academic press. Thus, “culture” used in this sense is political rather than aesthetic (→ Political Communication Culture). Storey (1996) points out that culture is not a narrow sense of aesthetic nor only an intellectual product but rather a domain of contestation, reflection, resistance, and reconstruction.

*Popular* culture is culture of the people by the people and for the people. Traditionally, popular culture was thought of as the product of something made by hand, but it can also mean widespread fame, popularity, and commercialism as well as the idea of a shared culture. Sometimes viewed as the opposite of high cultural art forms (ballet, classical music, and opera), popular culture is a shared set of practices as well as the product of those interactions. It includes → television programs (→ Television as Popular Culture), comic books (→ Comics), → popular music (jazz, hip hop, rock; → Music Industry), → fashion, → magazines, sports (→ Sports as Popular Communication), → advertising, food ways, and rituals (→ Rituals in Popular Communication). Whereas the high/low culture distinction views culture hierarchically, the second is a linear, non-evaluative perspective.

Cultural theorist Raymond Williams (1976, 90–91) articulates *four meanings for the word “popular” in relation to culture*: (1) a pejorative meaning referring to objects or practices deemed lesser than or inferior to elite culture, i.e., appeal to a mass audience; (2) objects or practices well liked by many people, i.e., not the small groups of elite or wealthy; (3) work designed with the intention of appealing to a great number of people, i.e., commercial culture meant to be widely consumed; and (4) things people make for themselves.

## HISTORY OF POPULAR CULTURE

One of the first bringing together of the words “popular” and “culture” was in the culture of the folk. Johann Gottfried Herder (1744–1803) is credited with coining the term “popular culture” as a way of describing authentic culture. Fiske (1992, 25) states: “popular culture is formed always in reaction to, and never as part of, the forces of domination.” Some scholars argue that popular culture emerged as the result of industrialization,

urbanization, and modernization when the work day was divided between time spent working and leisure time.

It was in relation to folk culture and folklore that a widely understood, accepted, and enjoyed culture became thought of as culture of the masses, a vast, undifferentiated body of people with common tastes. The idea of *mass culture* is intimately connected with valuations of popular culture. This theory views the → audience as essentially passive, malleable, sops for consumerism and advertising, predetermined to have bad taste, and devoted to repetitive formulaic forms of culture.

The theory of mass audiences for the mass media can be traced to the early constructions of consumerism and mass production in the US in the 1920s and 1930s and the rise of the market economy (→ Consumer Culture). What was identified as popular was not necessarily identified as such by the people it appealed to, but by those who produced it for them. Raymond Williams (1976, 199) points out that two characteristics identified early popular culture products – “inferior kinds of work” (popular press vs literature) and “work deliberately setting out to win favor” (pop celebrity or popular journalism vs serious, democratic work; → Celebrity Culture). Mass society theory presents a view of citizens as audiences for mass media products that are a homogeneous grouping of people, whose only connections to one another are through that which they find in common, that which is popular. Related to this is a belief in the decline of what is regarded as authentic, traditional, more personal forms of relating.

In advanced capitalist societies the popular is typically tied to the commercial and, given that, the term generally means the culture of ordinary people, i.e., working-class, non-elite members of society, or that which is left over after what is elite is defined (→ Popular Communication and Social Class). Horkheimer and Adorno’s classic work *Dialectic of enlightenment*, posits that the production and distribution of popular culture constitutes a “culture industry” (1997, 120; → Culture Industries). This argument holds that cultural products such as art become commodities that reflect dominant ideology, that in fact convey norms. Fashion is an example of this process that not only has the power to democratize but also to establish and affirm borders. Global popular culture includes fashion, imported and exported from country to country, as well as Japanese → anime, → Bollywood films, and spectacles such as the Superbowl and World Cup soccer.

## CULTURE AND PUBLICS

Unfortunately, the expression “popular culture” is often used as a pejorative term, viewed as lesser than so-called high culture pursuits because it originates among a wide variety of everyday people and is deeply embedded in daily life. The contents of popular culture are perpetuated through a particular country’s vernacular (spoken, written), i.e., visual or verbal language. The objects, practices, and products that comprise popular culture are widely shared among a population. The quality and value placed upon the products are, however, socially constructed. Sociologist Herbert Gans is among the early scholars of popular culture and communication who studied the function of television in American society, the production of → television news, and the composition and perspectives of audiences (→ Television: Social History). One of his best-known books, *Popular culture and high culture* (1975), explores the place of fine art, popular art, mass media, and

audiences and hierarchical rankings, based on social class distinctions, perceived scarcity, and social construction of value.

Gans examined *criticisms of popular culture* and perceived negative effects under four areas: (1) negative effects on high culture, (2) negative character of popular culture creation, (3) negative effects on the popular culture audience, and (4) negative effects on society. Gans also studied popular taste and the products of popular culture, identifying five “taste publics” which differ in terms of the “diversity of and disagreement about aesthetic standards and values”: age, class, religion, ethnicity, regional origin, and education, each of which helps determine cultural choices. Thus, popular culture carries and articulates social class and social group distinctions. Expressions such as “high art” and “low art,” for example, have immediate associations with social class. High art can feature nude bodies, while low art is pornographic. While Gans orders the products of popular culture in a hierarchical manner (from classical to kitsch), the intent was to de-privilege forms of cultural narrative from their economic foundations. A characteristic of popular culture is its definitional fluidity. For example, in its time, Shakespeare’s plays were the popular culture of their day. Jazz, for example, during its early days was considered vulgar and audiences were thought to fall “trancelike into vulgar and wanton behavior” (Lopes 2006, 387). Today, jazz is often played to sophisticated audiences in trendy clubs and nightclubs.

One of the goals of the leading popular culture journal in the field, the *Journal of Popular Culture*, is to “break down the barriers between so-called ‘low’ and ‘high’ culture” and focus “on filling in the gaps a neglect of popular culture has left in our understanding of the workings of society.” Recent studies covered “Barbie dolls in Mexico,” Canadian superhero comics, Harry Potter, “Tricksters and the marketing of breakfast cereals,” and *The Simpsons*.

## POSTMODERNIST PERSPECTIVES

Postmodernism moves away from a singular gaze or perspective and argues for the value of a multiplicity of meanings (→ Postmodernism and Communication; Text and Intertextuality). Popular culture is replete with multiple perspectives and interlocking parts, or what is known as self-referentiality, that is, where one form of popular culture refers to another form. Intertextuality is apparent, for example, on the television program *The Simpsons*, which often refers to or parodies mainstream media and contemporary issues. In the television comedy *Seinfeld*, the lead character’s name is the name of the actor who plays that role.

One of the most famous examples of intertextuality and popular culture is the famous Andy Warhol (1928–1987) painting of Campbell’s soup cans. This form of expression, known as “Pop Art,” was part of a movement in 1960s America that illustrated the mixed messages and complexity of popular culture with characteristic energy. Huyssen (1984, 16) argues that it was within the realm of “pop” that postmodernism took root, and “the most significant trend within postmodernism has challenged modernism’s relentless hostility to mass culture.” The intertextuality implicit and complicit with a postmodern approach to cultural text separates the perspective from the narrow, unidirectional, individualistic approach characteristic of modernism. This hierarchical approach to

valuations of “high art” and “low art” then gives way under a postmodern view to valuing the popular as a body of work. The result is a rupture in a single identity, instead placing that which is high above that which is popular.

McRobbie (1994, 14) observes that postmodernism “implicitly challenges the narrowness of structuralist vision, by taking the deep interrogation of every breathing aspect of lived experience by media imagery as a starting point” (→ Structuralism). Thus, no one moment, no one *thing*, is privileged in the examination of the pastiche of the present. Popular culture theory recognizes the value of the everyday, arguing that objects and activities of everyday life, such as fashion, cosmetics, music, style, and dress, can be subject to the same analyses as topics considered worthy of “serious” scholarship.

### POPULAR CULTURE THEORY

Many forms of popular culture carry a stigma through association. Stigma is defined by sociologist Erving Goffman (1963) not as a particular attribute, but instead as a “spoiled identity,” as perceived lack of quality and a form of labeling (→ Marginality, Stigma, and Communication). *Comic books*, for example, have been stigmatized since their introduction in the mid-1930s. The famous comic book scare of the 1950s attributed juvenile delinquency to youth reading, in particular, crime comic books. Particular forms of music or bands have also been accused of destroying young minds, for example, jazz, in the 1920s, the Beatles in the 1960s, and the Grateful Dead, whose fans were regarded as “directionless, drug-addled nomads with no link to reality” (Lopes 2006, 388). *Fashion* is an example of a form of cultural expression appropriated up (torn jeans) or down (designer knock-offs). Simmel (1971, 302) points out that the “very character of fashion demands that it should be exercised at one time only by a portion of the given group . . . as soon as anything that was originally done only by a few has really come to be practiced by all . . . we no longer speak of fashion.”

Lopes (2006) argues that *stigma* works in and through popular culture by association with particular objects, forms, practitioners, genres, and roles, and can effect the development of cultural forms. For example, the stigma associated with → graffiti limits opportunities for creating and expression within the art form. A stigma associated with romance novel readers and writers both encourages a subculture of fans and authors who come together around their shared interest and a view of frivolity by those outside this culture (→ Fandom). Various forms of social → dance once stigmatized, such as tango and flamenco, have now gained widespread appreciation and participants. Popular culture producers, for example, hip-hop and rap artists, bear the burden of associations of violence, misogyny, and racism found in some of the music. Audiences and fans are also stigmatized for their appreciation and enthusiasm for particular forms of popular culture deemed banal or low-class during a particular time in a particular place. Opera lovers, classical music devotees, jazz fans, and antique collectors, who are regarded as of a higher social class and hence not stigmatized today, have different social experiences from heavy metal fans, motorcycle club members, or body builders. All participate in widely distributed mass cultural products, yet the focus on social class distinctions, often expressed in terms of stigmas associated with race, gender, or

sexuality, overshadows the qualities of the actual art form, which becomes labeled as “bad taste.”

Popular culture carries an ideological imperative. In a Gramscian sense, popularity evokes conformity, operating as a site for the production and reproduction of political hegemony (→ Critical Theory; Cultural Studies). This is why “popular culture” matters. It establishes, reifies, and contests established categories. Stuart Hall describes popular culture as “an arena of consent and resistance. It is partly where hegemony arises, and where it is secured” (quoted in Storey 1996, 466). When Spivak (1988) asks, “can the subaltern speak?” of global popular culture, she articulates concerns that western popular culture so dominates the world that nations of culturally and economically oppressed peoples lose the voice of their own culture (→ Subaltern Communities, Communication in). The study of popular culture offers a window onto the world of the everyday, a compelling view not only of individual groups and cultures, but also of social and cultural worlds generally.

## Popular Culture and the News Media

Carl R. Bybee

University of Oregon

While there may be some debate over whether Russia's or Canada's version of "Naked News" came first, for many social observers the beginning of serious news delivered by naked women or women in the act of stripping indicates a crisis in the practice of journalism. To say that the boundary between → journalism and entertainment has been breached, if not swept away, is for many not a debate at all. It is a simple observation of the dramatic transformations in the practice of journalism that have taken place in the so-called "modern" western industrial democracies (→ Infotainment; Quality of the News).

More interesting is the debate over whether there ever existed a wall between journalism and entertainment, journalism and → popular culture, or journalism and ideology, for that matter. Conservative commentators, particularly in the United States, bemoan the loss of objectivity and → balance to a rise of a press dominated by liberal ideology (→ Objectivity in Reporting). Liberals challenge the idea of a liberal press as a myth propagated by conservative ideologues, counterclaiming that journalism in the United States and increasingly other countries that have come to embrace the ideology of free market capitalism (increasingly known as neo-liberalism), applied to more and more aspects of social, political, and economic life, has curtailed the democratic functions of the press and is moving the United States and other "free market" countries to a new and dangerous form of corporate–government partnership (→ Bias in the News; Commercialization: Impact on Media Content).

### RECONSIDERING THE CATEGORIES OF "NEWS" AND "POPULAR CULTURE"

This may seem like creating much ado about the simple juxtaposition of the two terms "news" and "popular culture," but both terms have complex histories that are ideologically informed and deeply intertwined. Examining the idea of "news" in relationship to the idea of "popular culture" highlights a number of critical issues. The *first* is that the two terms have often been used as contrasts, "news" referring to the serious side of mass-mediated culture while "popular culture" has often been evoked to identify the softer, chaotic, and entertaining dimension of mass-mediated communication. This opens up questions regarding the historical claim of news to a quasi-scientific form of objective

truth, and as to whether the “popular” in “popular culture” refers to media of and from “the people” or to mass-manufactured cultural products designed for a consumer society (→ Semiotics; Truth and Media Content).

A *second and related issue* concerns the common roots of both “modern” mass-produced news and popular culture. Both are communication products that came into existence in the rise of the “modern” era of expanding industrialization, democratization, and transformation of communication and culture into commodity forms (→ Commodification of the Media; Culture: Definitions and Concepts). The irony in the contrast between news and popular culture, in this sense, is that while both are popular forms of communication in the sense of being mass-produced, news was forced, particularly in the United States, to hide its commercial foundation for fear of being perceived as a vehicle of → propaganda for the industrial/corporate sector of society. Another irony was that news, particularly by the 1920s in the United States, was being framed as a value-neutral form of information aligned with a scientific worldview, which was generally accepted as a positive outcome of a union between liberalism and technology. The irony was that news at this time was also both claiming and attempting to serve an ideological position, promoting democracy by contributing to the formation of an active public capable of self-government, particularly as contrasted with the idea of the → public as a dangerous mob capable of destroying society, say, in sense of the Russian revolution and the revolutionary uprisings taking place across Europe.

So the news in the US in the early part of the twentieth century, founded on capitalist economics, legitimized as value-neutral by its commitment to scientism and progressive professionalism, was promoting a vision of an active public capable of democratic self-government (→ Public Sphere; Political Discourse). At the same time within the commercial sphere, the potentially dangerous public, the public as dangerous mob, was being engineered through → marketing and → public relations to view itself as committed to the “popular,” in the sense of desiring mass-produced culture and material goods as the means by which it would see itself as a unified culture with common, increasingly commercial goals. The echo of the mass society debates engaging social thinkers such as Émile Durkheim, Ortega y Gasset, and members of the Frankfurt School, can still be heard in this intersection of the news and popular culture in the debate over the viability of participatory democracy (Calhoun 1992; Bybee 1999).

A *third issue* concerning the link between news and popular culture, again related, but not as theoretical or central to those above, examines the representations of news, journalism, journalists, and reporters, in the popular cultural forms of the novel (→ Book), film (→ Cinema), and → television. These examinations shed light on the changing nature of the commodified vision of the press as it was represented in the public imagination throughout the twentieth century and into the twenty-first century (see, e.g., Image of the Journalist in Popular Culture (IJPC) website at <http://ijpc.org/>).

A *fourth issue* that is brought into visibility when news and popular culture are considered in relationship is how news, as the serious form of popular, corporate culture frames reality in a way that complements or challenges softer corporate popular culture representations. It is in this sense that media observers such as John Fiske, Peter Dahlgren, Barbie Zelizer, John Fowler, S. Elizabeth Bird, Colin Sparks, and Gunther Kress view news as joining a cultural battle with other forms of popular culture over which reinforcing

web of representations will emerge as the dominant frame for constructing reality; or, in the view of philosopher Michel Foucault, which discourse will emerge as dominant (→ Power and Discourse). Cultural studies theorist Stuart Hall defines Foucault's idea of discourse as "a group of statements which provide a language for talking about . . . a particular topic at a particular historical moment . . . discourse, Foucault argues, constructs the topic. It defines and produces the objects of our knowledge. It governs the way that a topic can be meaningfully talked about and reasoned about" (Hall 1997, 47; → Cultural Studies).

Certainly agenda-setting research (→ Agenda-Setting Effects), the way in which news media can set the agenda for what is to be considered important and talked about, coming from the mainstream of US and European media studies, could be understood as sympathetic to this view. However, it failed to situate this observation within a more encompassing system of interrelationships between culture as a system of → meaning and the social, political, and economic institutions that held in place a particular worldview; from the most humble elements of daily living to the most concrete institutional embodiments, not of a reality, but of a naturalized view of what constituted reality. This is, of course, the power of coupling news with popular culture, because in the domain of popular culture, the observer, whether academic, professional, or amateur, is more willing to follow the idea of → constructivism: that "pop" culture is a series of artificially constructed fads and diversions.

To apply this same constructivist thinking to serious "political information" requires a theoretical step that most, not having followed the disciplines of epistemology, hermeneutics, structuralism, and political theory as necessary domains of understanding to make sense of media as a cultural phenomenon, are unwilling to follow. It is here, of course, that the insights of viewing news as not distinct from popular (commercial) culture, but as another genre of it, begin to provide the groundwork for understanding such current popular culture media fare as "reality television" where the stakes are pitched at the very level of what constitutes "reality" and from whose point of view (→ Reality TV).

*Finally*, but not exhaustively, another related critical issue raised by the juxtaposition of news and popular culture is the complex dynamics running through the whole modern period and continuing into the late capitalist or postmodern era of commercially produced culture, labeled "serious" or "light," "soft" or "hard," or "news" vs "entertainment," "news" vs "fiction," or "news" in the dialectic domain of the "popular" as simultaneously a corporate production *and* an expression of the "popular" view/will of the people which has been excluded from access to corporate media production and distribution (→ Postmodernism and Communication).

In this issue we find discussions of the potential for popular resistance, challenge, and reform to a corporate media worldview. One might call this, following Brazilian educator Paulo Freire, a "liberatory" view of popular culture (Freire 1972): as a culture for and of the people, capable of not only seeing through the mystifications of power, but also of understanding and acting on the democratic principles of inclusion, dialog, and participation in the process of achieving social justice. This view of a liberatory popular culture has been expressed through the news form taken to excess (as in tabloid journalism), the parody of news and journalistic practice (consider the popularity in the US of Jon Stewart's parody of network news called *The Daily Show*), and the phenomenal rise of

alternative/radical media forms (consider the rise of IndyMedia, or more formally the Independent Media Center (2007), which operates in eight languages). These approaches, more horizontal (people-to-people) in form, and involving both “information,” “entertainment,” and imaginative blends of the “information/entertainment” divide, challenge the dominant categories and re-engage a growing number of people as citizens rather than simply as consumers.

This growing ideological war over the health of the media and the political state can be seen in individual countries as well as in the more general challenges to free-market globalization (→ Globalization Theories). A particularly dramatic example of a moment when commercial news, liberatory popular culture, and spectacle were united is arguably illustrated by the speech of Venezuelan president Hugo Chavez as he stepped to the same UN podium in September 2006 after President George W. Bush had delivered his own address there the day before. President Chavez remarked that “the devil” had been at the spot the day before and that it “smells of sulfur still today” (CNN 2006). Chavez then went on with an enthusiastic and detailed endorsement of a new book by noted US left-wing intellectual Noam Chomsky, *Hegemony or survival: America’s quest for global dominance*. Critical of US foreign policy and strongly endorsed by Chavez, the book hit the number one spot on Amazon’s US bestseller list two days later (Rich 2006).

### **NEWS IN THE SERVICE OF DEMOCRATIC CULTURE? POPULAR CULTURE IN THE SERVICE OF AN ENLIGHTENED AND ENGAGED PUBLIC?**

It is in this light, the territory of the news as popular culture, that a phenomenon like “Naked News” can be regarded as revealing more than flesh. What it reveals is the nakedness of the emperor and the empire-builders in their control over defining the political, economic, and social situation. Perhaps most notable in such parodies of the news, or in the resistance or liberatory news, is a reflection of how widespread are the market failures of global capitalism unleashed.

Commercially produced news itself appears to be one of the more significant examples of market failure. Commercially produced news, particularly in the arena of broadcast news in the US, was once viewed as a necessary money-losing proposition, required to demonstrate good faith and the commitment to the general public interest of the corporations who made their profits from the use of public airwaves. However, to stay with the US as an example, in the mid-1970s it was found that broadcast news programming did not have to be a money loser. As demonstrated by the popularity and growing audience size of the CBS Network’s *60 Minutes* series, a weekly investigative news magazine program, news could be a new and valuable profit center. With this realization, television news in the later decades of the twentieth century underwent a radical transformation, and began pushing whatever contributed to the market value of what was now reconceived as a new commodity, branded “news” or “information,” or even “infotainment.”

The outcome, both in the United States and in other nations, has been deeply injurious to the supposed democratic function of news as the vehicle for both contributing to the constitution of an active, engaged citizenry and to the public debate on issues of critical importance, not just to the corporations, to citizens as consumers, but also also to citizens as members of a democratic culture that goes beyond the formal institutions and roles of

politics to all places where power is exercised. The audience for what is increasingly viewed as news as corporate-speak is tuning out in record numbers (Mindich 2005). Morale among journalists has been plummeting as the corporate bottom line has become the operative rule as to what gets covered, how it gets covered, and what gets left out. In June 2007 even Britain's prime minister, Tony Blair, in a speech hosted by the Reuters Institute for the Study of Journalism, compared the hyper-competitive, profit-driven news media to "a feral beast, just tearing people and reputations to bits" (Sullivan 2007).

The juxtaposition of news and popular culture has been and can continue to be an enormously productive area of research and understanding of the dynamics of twenty-first-century cultural politics and power, particularly if the relationship is viewed with the complexity it requires, holistically, and with the commitment to go beyond isolated, reductionist economic analyses that simply reify "infotainment" and the outcome of market forces and call for a return to a simpler cultural past that never was. Perhaps the most critical new direction the news/popular culture contrast suggests is investigation of the deteriorating stock of public meaning which provides the foundation for democratic culture.

## Popular Music

*Robert Burnett*

*Karlstad University*

Music in various functions plays an increasingly important role both as an indicator of and as a medium for changes in society. Popular music is with us constantly; it is part of our everyday environment, and increasingly part of the aural or sonic soundscape that surrounds us. Not only do we listen to music in our homes and at concerts, but also as a background in cars, bars, airplanes, restaurants, and shopping malls. Our brains are constantly registering, monitoring, and decoding popular music. Popular music is one of the more powerful expressions of the → “culture industry” worldwide. Some would claim that popular music is the only truly universal “mass medium.” Certainly most people would agree that music speaks a universal language of → emotions. Popular music is now the lingua franca for a large segment of the world’s youth population. It is probably fair to say that music is the most universal means of communication we now have, instantly traversing language and other cultural barriers (→ Popular Communication).

Whereas consumption of other media products is often limited by geographic availability and consumer income, almost anyone anywhere can listen to popular music, often regardless of whether they want to or not. Most of us at one time or another have felt pursued by music itself. In this respect, popular music is certainly the most global aspect of our “global village” (→ McLuhan, Marshall). The evolution of technology and the proliferation of global cultural products have had many effects, not the least of which is the fact that the stars of the contemporary music industry are increasingly catering to

an international audience that is constantly growing. Today, we are all listening to the “global jukebox” (Burnett 1996; → Globalization of the Media).

There is no precise, straightforward *definition of popular music* but rather a commonsense understanding placing an emphasis on “popular” and based on the commercial nature of music, and embracing genres perceived as commercially oriented. As soon as there were media technically able to transmit sound, and communities economically able to use these media, there was mass communication of music. This occurred first with the development of the record industry, and was later followed by the development of → radio, sound film, → television, → music videos, and the → Internet.

### MUSIC AND GLOBALIZATION

In recent years, the international music companies have begun to stress that they are global organizations. Globalization in their case, and as reflected in company annual reports, means the organization of production, distribution, and consumption of cultural goods on a world scale market (→ Commodification of the Media). The flow of information, ideas, and cultural artifacts on a global scale has greatly increased in recent decades, due in part to the many developments of new communication technology (→ Globalization Theories). It is no longer fruitful to try to understand the new global cultural economy by using old models of conflict that contrast the center versus the periphery. In most of these models of “cultural imperialism,” an underlying concern or fear of “cultural homogenization” is expressed in the wake of growing Americanization and commodification (→ Americanization of the Media; Cultural Imperialism Theories). What is clear is that in the contemporary context, the international media environment is far more complex than that suggested by earlier models of media imperialism.

The study of *transnational music production* should be able to tell us something about the ways in which international capital works in the field of → popular culture and specifically in the entertainment industry. For example, a question that is always raised is: are we experiencing the rise of a global homogeneous world culture, and if so, will this process still allow for smaller heterogeneous local cultural traditions? One effect of media globalization and commercialization is the almost instantaneous dissemination of popular music developed by the major transnationals to an increasingly global audience spread to the far corners of the world. One can argue that the universal acceptance of popular music indicates that a widely felt need and demand are being met, and its global reach enables greater understanding and the emergence of some sort of global music culture.

There is also an increasing musical flow towards the cultural centers, and cross-flows within particular geographical and cultural regions as well, which may open up musical understanding between peoples. A controversial effect of the globalization of the music industry is the spread of music and the carrying across borders of some of the *values of the west*, such as human rights, individualism, and questioning of authority. These values embedded in popular music lyrics and music videos, whether explicit or implicit, can lead to controversy in nonwestern cultures (Shuker 2001).

However, as noted above, it is really no longer fruitful to talk about American “cultural imperialism” at the level of ownership in the entertainment industry. European and Asian companies have proved to be at least as successful as their American counterparts. It makes

more sense to discuss the few transnational companies that dominate today's world market. The transnationals certainly see themselves as players on a world scale. Advances in communications technology have weakened the nature of traditional national boundaries.

It used to be the case that → Hollywood film, television, and record producers saw foreign distribution as a lucrative by-product, money to be made after earning back costs and hopefully turning a profit in the domestic American market. In recent years, it is increasingly the case that producers, distributors, and investors target the international market from the very beginning of every new project (→ Markets of the Media). Still, it is important to remember that much of the information and entertainment material owned by non-American companies is still created by Americans, for the simple reason that Los Angeles is still the film, music, and television production capital of the global entertainment industry (Negus 1999).

The ownership of major entertainment enterprises has become increasingly internationalized, reflecting the economic interdependence among nations. In the entertainment industries it goes beyond internationalization of ownership. American film, television, video, record, and music publishing companies now derive at least 50 percent of their *revenues from foreign markets*, and must therefore consider the tastes of consumers in other countries as well as those of American consumers. One of the reasons why music companies pay million-dollar fees to stars such as Madonna, Britney Spears, and Michael Jackson is the simple fact that with a big selling album, enormous financial returns can be derived outside the United States. Escalating production and → marketing costs have made thinking about the foreign market crucial. The same logic is at work in the film, television, and book industries as well. The vertical and horizontal integration of the music, film, and television production and publishing industries, an alignment of technology development and ownership that is coupled to production and distribution control, has never been more closely linked to the power centers of the media and electronics industries in America, Europe, and Japan (Hesmondhalgh 2002).

## MUSIC AND DIGITIZATION

Deregulation and the emerging digital technologies changed the mission of the music business (→ Digital Media, History of). The multiplication of media channels combined with cheaper, more flexible means of producing, manipulating, and integrating musical material into new contexts (such as music TV, video games, and advertising) led to a *shift in revenues* from physical distribution to immaterial performance rights. A wider, simultaneous presence in global markets imposed further constraints to find instant “synergies” across the activities of a media group. The ideal product would sell on any channel, anywhere (Burnett & Marshall 2003).

Music, and its production, distribution, regulation, and reception, are now essential features of the → “information society.” The music industry is a key financial asset. The agent of change in the world of music in recent years is the Internet and the capabilities that it provides. There are two constants in the music industry. On the one hand, there are the artists and the music they create; on the other hand, there are the fans who are eager to hear the music (→ Fandom). All the other pieces between the artists and their fans are subject to change. What the Internet has provided is a mechanism and a technology with

the capability to bring the artist and the fans together, so closely in every possible way that it is going to change the mechanics and the dynamics of the business.

The *future of the music industry* in many ways coincides with developments in digital media. We are witnessing an important *transition period* in the music industry. Historically, intellectual property has been defined by physical boundaries, like the movie, video cassette, CD, or book. Now, because of advances in information technology, this physical boundary has been broken. The best example of this transformation is the music industry, where the music, which is the purest digital format, has left the CD, left the physical product, and spread rapidly across new technologies and networks and in different ways found its way back to consumers. Specific digital technologies such as mp3 sound files and peer-to-peer (P2P) networks have facilitated this process.

Due to these developments, music companies will need to embrace new technologies much faster and much more aggressively than they have in the past. Today we see new technologies and high consumer demand and use of these new technologies. The problem is that currently there are no proper business models in place, where the value of the intellectual property being produced is maintained. With the concentration of control in the music industry, the transnational corporations will continue to play a strong role in shaping global rules for trade policies and for the protection of intellectual property rights.

The globalization of the music industry has both an economic and a cultural dimension, which are closely linked. Certainly, the almost total dominance of the popular music industry by the transnational corporations, and the globalization of popular music styles are clear examples of the forces of globalization. The transnational majors' market share of the global production, manufacture, and distribution of recorded popular music is estimated at between 80 and 90 percent. Figures from the International Federation of the Phonographic Industry also show that the dominance of the transnationals is around 90 percent across Europe, and growing in Asia. Since the 1980s, the transnationals have concentrated on buying up local and national record labels around the world in their search for increased market shares (Burnett 1996).

Myth comes from the Greek word *mythos* meaning “speech” or “story.” Contrary to popular parlance that says a myth is something untrue, false, or fake, *mythology* is in fact true stories and timeless tales passed down from generation to generation. Myths provide answers and explanations for the big questions of life, such as: where did we come from? What is love? Where do we go once we die? What is the role of nature? And so forth. They are the stories we tell ourselves about ourselves. They are truthful, inasmuch as they reflect a belief (even if erroneous or hegemonic).

Early on, Joseph Campbell (1949) established that every society has what are called the Big Myths – stories about love, life, origins, and death. How these myths are articulated varies enormously from culture to culture. In early times, myths focused on immediate needs such as personal safety, finding food, and understanding weather. Today, however, many myths focus on and construct femininity and masculinity. The concept of beauty, for example, has always existed and varies greatly between cultures. In industrialized countries such as the US the ideal female beauty is a tall, thin, big-busted woman (→ Body Images in the Media). In others, she is plump and short. It is the nature of human beings to believe in the stories we hear and see, regardless of whether they are factually provable or not. The real meanings behind myths are timeless, adaptable, and resilient.

All societies have deep and ancient roots. Psychologist Carl Jung (1968) referred to a kind of groupthink that develops what he called the collective unconscious. This is the psychological container within each person’s head in which ideas about morality, authority, and religiosity reside. It contains ideas that we somehow seem naturally to hold but in fact have learned as we grew up. While the collective unconscious is below conscious-level thinking, it holds a collection of cognitive (thinking), affective (feeling), and behavioral (doing) characteristics that are passed down to all members of a society, generation after generation. Mythologies are not, however, found only in the past because myths are essentially about the meanings people make – a key concept in communication studies (→ Meaning; Communication Theory and Philosophy). Cultures form around the meanings people construct, which occur within a system of other meanings from which ideology emerges. Meanings, for example for a word, change over time. Thus, the articulation of a myth, perhaps one about how a person finds true love, changes to keep current with the times.

A typical myth involves the hero’s journey. This is a tale, often told from the perspective of the hero, in which a young (usually) man must go out into the world and achieve, rescue, or locate something which he brings back to his community. On this journey, he experiences usually three challenges, accomplishes them, and brings back the boon. It is not only a tale of individual accomplishment but a timeless story that energizes cultures today through its familiarity and its sense of good prevailing over evil. Movies such as *Star Wars*, police and detective shows, and American Westerns all use this traditional storytelling

format, which simultaneously reveals and conceals its ideological foundation (→ Cinema; Visual Communication; Storytelling and Narration).

For a myth to remain relevant, credible, viable, and believable, it must reflect people's present-day realities. While the underpinnings of a myth remain true throughout time, popular culture portrayals help to define, reproduce, and distribute the stories. Once upon a time we got our stories by sitting around campfires, within sweat lodges, or in community situations, whereas today, the primary storytellers for most of the news and social instruction, in industrialized nations, come from the mass media.

Social changes such as the women's and civil rights movements as well as technological advancements in the mass media affect a culture's telling, remembering, and passing on of its most important tales.

A mythic perspective on → popular communication is interdisciplinary, incorporating religious studies, → linguistics, sociology, psychology, → semiotics, literary and narrative theories, and psychoanalysis. Methodologies that facilitate this kind of inquiry include → hermeneutics, → phenomenology, semiotics (→ Rhetorical Studies), psychoanalysis, and the history of the imaginary, as well as the use of conceptual tools from → aesthetics and art. Mass culture has a mythological dimension, which has been investigated from the perspectives of narrative theory and mythic analyses in films, television programs, sports, → advertising (→ Advertisement, Visual Characteristics of), and other forms of communication.

French semiologist → Roland Barthes regarded myths as not only classical fables about gods, goddesses, and heroes. To him, myths reflect the dominant ideologies of our times and take on the appearance of naturalness, everyday-ness. Furthermore, myths function as metaphors that help us comprehend our experiences not only in our own culture but also in comparison to those in the world around us. Myths make socially constructed laws, rules, regulations, social relationships, sexual relationships, beliefs, and values seem normal and natural – simply how things are and have forever been. This is accomplished through language, narrative structures, images, and sounds.

Narrative patterns such as those found in the Western film genre articulate a form of social order, present a classic plot of good versus evil, and provide a mechanism through which social tensions can be released. As a genre, the Western has several clear themes and elements that make it quickly identifiable: it takes place in the American West and has cowboys, Indians, horses, and gunfights (→ Film Genres). Newspaper stories also perform this way by framing reality, by telling readers what is important to know in ways that support dominant, mainstream beliefs of a society (→ Framing of the News; Media Production and Content). Myths inform our everyday lives and play a powerful role in shaping individual and collective identities.

## **Population Campaigns**

*Tara M. Sullivan*

*Johns Hopkins Bloomberg School of Public Health*

Communication campaigns have become a central component of family planning programs designed to shape social norms and individual behavior related to fertility. Communication at multiple levels (individual, family, community and mass media) has been used to heighten awareness of family planning, change attitudes toward contraceptive use, and shape norms surrounding family planning. Communication campaigns play a key role in providing people with access to accurate information in order to promote informed choice and to dispel rumors and myths about family planning. They also help improve service quality by enhancing the interpersonal skills of providers (Robey et al. 1994).

Campaigns have an important, complementary function that supports service delivery efforts, the policy environment, and community-based programs. Because population campaigns create demand for services, they are typically coordinated with improvements in service delivery infrastructure, service provider skill, and contraceptive supplies to meet the expectations generated through the campaign. Communication campaigns, in concert with other family planning program components, have promoted informed choice, improved the quality of services, assisted couples to achieve their ideal family size, saved the lives of women and children, and curbed population growth (→ Planned Social Change through Communication; Communication and Social Change: Research Methods; Development Communication; Health Communication).

### **EVOLUTION OF POPULATION CAMPAIGNS**

Once characterized as relying on clinic-based, passive approaches, campaigns today are increasingly complex, using multiple channels and participatory techniques. Early programs, starting with the “*clinic era*,” relied on a medical model in which communication efforts were limited and family planning clients were expected seek services simply because they were available – reflecting a “build it and they will come” philosophy (Rogers 1973; Piotrow et al. 1997). Once at the clinic, clients primarily listened as providers

communicated family planning messages. While this model worked for highly motivated clients, it did not address the needs of those who did not feel comfortable discussing such private issues in public clinics.

The late 1960s marked the beginning of the “*field era*,” when the largely passive, one-way communication model was replaced by active dialogue. At the same time, while clinics continued to be an important component of family planning programs, their activities were complemented by outreach efforts undertaken by family planning field workers. Field workers, armed with posters, leaflets, radio broadcasts, and more, attracted new clients to clinics and also provided information and limited family planning services (Rogers 1973; Piotrow et al. 1997).

Over the past 20 years, population campaigns have grown in sophistication and reach. Today population campaigns are strategic, following a systematic approach with a focus on key behavior change objectives. In this “*strategic era*,” campaigns are results-oriented and designed, implemented, and evaluated on the basis of the latest behavioral science models and with the active participation of stakeholders and beneficiaries (Piotrow et al. 1997). Communication has moved beyond dialogue to convergence; an iterative process in which participants create and share information in order to achieve mutual understanding (Kincaid 1979; Rogers & Kincaid 1981). No longer focused on distributing a high volume of materials, campaigns now rely on multiple, mutually reinforcing channels that may include a mix of mass media, community mobilization, client-centered counseling, social network interventions, social marketing, TV or radio spots, dramas and music, public policy advocacy, and more. Entertainment education, an approach that capitalizes on the persuasive power of promoting educational messages through entertainment formats such as songs, dramas, and soap operas, has transformed communication and expanded the reach of family planning messages (→ Entertainment Education). Today’s campaigns also make use of positioning to determine how to best motivate audiences to adopt a specific behavior, and they benefit from more sophisticated audience segmentation, which differentiates audiences according to their family planning attitudes, needs, or concerns rather than just on basic demographic characteristics such as age, marital status, and socio-economic status (Piotrow et al. 1997).

## CONTEXT SURROUNDING POPULATION CAMPAIGNS

The environment in which population campaigns operate has been shaped by *international population conferences* held every 10 years. At the 1974 World Population Conference at Bucharest, participants addressed population in relation to development. While more developed countries were in favor of controlling population growth with the idea that reduced population leads to improved development, a sub-group of attendees resisted the idea of demographic targets and argued that investments in development would promote fertility decline. Despite this disagreement, attendees created the World Population Plan of Action, a document on population policy and programs that was the first of its kind (Ashford 1995). The next population conference, convened in Mexico in 1984, is best known for the United States’ declaration that it would withdraw funds from programs that promoted or provided abortion. Though this so-called Mexico City Policy was rescinded in 1993, it was reinstated in 2001 and continues to shape family planning

efforts worldwide, forcing some organizations to shift operations in the face of losing funds (→ Gag Orders).

One positive outcome from this conference was the call to make *family planning services universally available* (Ashford 1995). The 1994 conference in Cairo marked a major paradigm shift for international family planning programs. The landmark conference shifted the focus of family planning programs away from demographic objectives to an emphasis on the rights and needs of women and encouragement of a more comprehensive reproductive health approach. The Program of Action called for expanded family planning programs that promoted informed choice, increased access to contraception, and included programs aimed at men and young people.

One common thread of each of the conferences is that each country has the sovereign right to develop its *own population policy* in ways that are consistent with national laws, development priorities, and cultural values (→ Culture: Definitions and Concepts; Culture and Health Communication). Consequently, while the latest program of action, adopted at the 1994 Cairo Conference, advocated a couple's right to choose from a variety of contraceptive methods in order to achieve their fertility desires, some national population policies and related campaigns, undermine a couple's human right to choose the number and timing of their children, rather than promoting voluntary use of contraception. China's "One Child Policy," which restricts couples living in urban areas to one child, is an often-cited example of a national policy that goes against the spirit of the program of action adopted in Cairo in 1994.

## THEORY AND PRACTICE

Fertility decline was once primarily explained by the demographic transition theory, a model attributing fertility decline to decreased mortality and to socio-economic factors such as urbanization and industrialization, which resulted in the rising cost and declining economic value of children (Notestein 1953). However, as more evidence has become available, scholars have come to acknowledge the critical and complementary role of the diffusion of new attitudes, behaviors, and technology through social interaction (→ Diffusion of Information and Innovation). This "ideational model" attributes fertility decline to the spread of ideas and innovation through mass media, social networks, and interpersonal communication. As these new ideas take root, social norms change, making contraceptive use and the small family norm more acceptable, eventually resulting in fertility decline (Cleland & Wilson 1987).

In practice, population campaigns are guided by behavior change communication theories, particularly *stage or step theories* that describe the process that individuals undergo to change their behavior. The specific objectives of population campaigns are often related to the maturity of organized family planning programs. Less mature programs with relatively low modern contraceptive prevalence rates (CPR) may focus on developing a supportive environment by increasing public awareness of the benefits of family planning, whereas a more mature program with relatively high CPR may direct its efforts to improving provider interpersonal communication skills to insure informed choice and contraceptive continuity. Campaigns often operate at one or more levels including the social and political environment, the service delivery system, the community, the family, the couple, and the individual. Elements of mass media, primarily used to create aware-

ness and influence attitudes and beliefs about family planning, are often complemented with interventions aimed at improving interpersonal communication between providers and clients, husbands and wives, and family and community members, which help to motivate behavior change.

## CHALLENGES AND OPPORTUNITIES

Proving that changes in social norms and contraceptive behavior can be attributed to population campaigns has been a challenge, particularly since it is nearly impossible to use the “gold standard” (an experimental design using pre- and post-tests, a control group, and randomized participants) to measure the impact of programs with a mass media component (Figueroa et al. 2002). The very nature of mass media interventions using radio or television precludes this, since it is almost impossible to create a control group with no exposure to campaign messages. Consequently, evaluators have been challenged to develop better methods to demonstrate that change can be attributed to population campaigns (→ Communication Evaluation Research).

The Program of Action developed at the 1994 conference in Cairo provided an opportunity for communication campaigns to *reach new audiences segments* by specifically calling for the expansion of family planning programs to provide information, counseling, and services for young people and men. Young people often have an unmet need for family planning. While young people are sexually active and young women do not want to become pregnant, many do not know about or have access to contraceptives. However, creating communication campaigns that satisfy young people’s need for information and help them make healthy decisions, while at the same time making them acceptable to adults and sensitive to cultural norms, is a challenge. Men have also been increasingly recognized as having an important role in improving family planning and reproductive health following the 1994 conference. Men who have been exposed to information about family planning are more likely to support their partner’s family planning decisions, and communication campaigns aimed at men can improve spousal communication about family planning, which is positively associated with contraceptive use.

Expanded access and *new channels of communication* also present opportunities and challenges for family planning campaigns. Today, people worldwide not only enjoy greater access to television and radio, but also have the opportunity to use new communication technologies (→ Communication Technology and Development). For example, the → Internet has expanded access to health information and facilitated information sharing in a way once inconceivable. Throughout the world, health professionals and consumers can retrieve the latest health information at the touch of a button. Internet technologies provide access to health-related databases and documents and can facilitate information sharing through listservs, discussion forums, chatrooms, and the like. While the Internet provides new opportunities for reaching audiences with family planning messages, it also has its drawbacks. As more and more channels of communication become available, population communication programs will have to work harder and be more creative in attracting audience attention. Furthermore, traditionally underserved populations will have unequal access to technology such as the Internet. Consequently, health communicators will need to address barriers that create a → “digital divide” occurring at country, community, and individual levels (Maxfield 2004).

## **Populism and Responsiveness**

*Sibylle Hardmeier*

*PiCABiA*

Populism and responsiveness are rather broad and messy concepts. They are not only used for scientific analysis but for political allegations as well. A simple and general definition of the two terms shows what holds the two concepts together: *responsive* refers to politics that are open to the electorate and respond to what the people want (Latin: *responsum* = response); *populist* refers to politics that attach great importance to people's opinions (Latin: *populus* = people). The two terms operationalize the sovereignty of the

people, albeit with different connotations. Responsiveness, at least to some degree, is considered an essential element of representation, and thus of democracy. By contrast, interpretations of populism are in most cases not only highly charged but also negative. Only some authors find the sources of populist protest in the heart of the “democratic project” (Canovan 2002, 33) or treat the populist principle as an institutionalist feature which mainly determines direct democracy and therefore stands for a broader plebiscitarian transformation of politics. The proponents of responsiveness hold that this concept makes politics *more representative*, whereas populists criticize the *nonrepresentativeness* of politics.

## POPULISM

Populism is both a political catchword as well as an ambiguous construct in social sciences. Populism has an “awkward conceptual slipperiness” (Taggart 2000, 1). The definition of the term and the phenomenology of populism, as well as explanations for it and its impact, are far from clear. As a result, studies on populism are quite fragmented despite a reasonably long tradition.

In the beginning populism was studied in very contextual terms and based on → case studies and/or historical approaches. Among these historical populisms, the so-called agrarian populism and especially the commodity farmer movement of the US *People's Party* or *Populist Party* should be mentioned, which is also where the term derives from (Canovan 1981). Today, various populist movements are observed, most of them in the right wing of the political spectrum (“neo-populist”).

So, in short, the historical perspective already provides an idea of populism's core feature: populism reacts to and mobilizes against political elites and institutions of representation. Since the nature of these varies, populism varies as well. This is also the reason why populist parties or politicians are regarded as opportunistic (Mudde 2004; Decker 2006). The fact that, contrary to many people's expectations, populism has turned into a permanent phenomenon and populists nowadays also form governments has advanced research. Here Canovan's (1981) taxonomy of different types of populism laid an important cornerstone. More recent publications discuss, in particular, causes and effects of populism (Taggart 2000; Mény & Surel 2002; Decker 2006).

In regard to the definitional characteristics of populism, we can identify some agreement or concurrence among scholars. Populism is considered to be “a thin-centred” ideology “that considers society to be ultimately separated into two homogeneous and antagonistic groups” (Mudde 2004, 543): the people and the elite. Populists fuel this antagonism. They are hostile to representative politics and they construct “the people,” or the “heartland,” as Taggart (2002, 66f.) would call it: the place “in which, in the populist imagination, a virtuous and unified population resides.” This may be described as the vertical axis. However, the rhetoric of the people implies a horizontal axis, too. On the horizontal level, populism dissociates itself from persons or groups whose affiliation to the people is disputed. Among right-wing populists, these → identity politics easily converge with nationalist, racist, or xenophobic issues (→ Rhetoric and Race).

Furthermore, two other aspects are sometimes considered to be characteristic: the organization, i.e., charismatic leadership on the one hand, and the style on the other hand. According to the style argument, populism can only be treated as a → discourse, a

kind of rhetoric (→ Political Language; Rhetoric and Politics; Rhetorical Studies). Populism emerges when “he” becomes “them” or “I” becomes “we”; when adjectives like “distant,” “faceless,” or “invidious” portray the elite and when denominations such as “Eurocrats” or “party hacks” are used for the political personnel (Taggart 2002).

A large share of the literature on populism is concerned with the debate about the causes, and many scholars argue that populism is a phenomenon of social or political crisis or crisis-prone perception. Among explanations regarding the rise of right-wing populism, Kitschelt’s (1995) thesis is very well known. The author argues that the transition from industrial to postindustrial economies established a new cleavage, with left-wing libertarian positions on one side and right-wing authoritarian positions on the other. Thus, the background of this thesis also points to an actual or perceived effect of globalization or European integration and governance structures (instead of government), which all mounts a critique of the systems of politics. Others point to more precise changes, such as the process of cartelization within (European) party systems, which reinforces anti-elite sentiments, or the process of depoliticization, which is very pronounced among former consociational democracies such as Austria or Switzerland, and thus implies a populist call for repoliticization of the → public sphere.

## RESPONSIVENESS

Responsiveness and the study of linkages between the rulers and the ruled are of great relevance to democratic regimes. Keeping representation and government democratic requires ensuring that citizens are to some degree linked to political elites and their actions. In this, normative theory discusses the justifiability, desirability, or degree of this linkage, and is situated between an elitist and a participatory position. The elitist position demands leadership of the rulers rather than responsiveness and thus advocates a trustee model. The participatory position calls for a high level of responsiveness and more strongly favors a delegate model, on the other hand.

Empirical researchers illustratively discuss some typical instruments of linkage (e.g., elections, interest groups, opinion polls). Based on this, some authors argue that there is a broad diversity of linkage mechanisms (Kitschelt 2000) – such as charismatic linkage (responsiveness because of preferences, grand gestures, and personal styles) or clientelist linkage (responsiveness through material advantages). The distinction is implicitly relying on the classical, four-fold typology of responsiveness presented by Eulau and Karpis (1977): the rulers give the ruled the feeling of being represented by public gestures (symbolic); the rulers fight for the interests of their electorate through pork barrel exchanges (allocation); or the rulers try to secure particularized benefits for individuals or groups in their constituencies (service). The focus of most studies, however, is on the fourth and special linkage mechanism: policy responsiveness or the programmatic linkage, i.e., the relationship between public opinion and public policy (→ Public Opinion; Symbolic Politics).

Using different approaches, these studies of substantive representation generally begin with citizen issue preferences and link these to the positions of their representatives, following the design of the seminal Miller–Stokes study analyzing how constituencies influenced roll call behavior (Miller & Stokes 1963). This congruence model was further

adapted to the European political system with comparatively strong parties (responsible party model; Thomassen 1991), and tested for other causal orderings between public opinion and policies.

## POPULISM IN POLITICAL COMMUNICATION

Communication studies dealing with populism are rather scarce, but at least two broad fields of interest are still discernible.

The first highlights the fairly close *link between populism in the media and politics* (Mazzoleni et al. 2003). Since many characteristics of populism – such as prominence, timeliness, conflict, etc. – converge with → news values, populist phenomena and actions are very likely to be reported by the mass media. Populism serves both the → media logic of selection and the logic of presentation. Thus, populists may easily exploit the media for their purposes (→ Mediated Populism). Yet comparative analyses also reveal that the mediated (neo-)populism still has different patterns, depending on the life cycle of the parties, the media type, and the overall context. Furthermore, while using a broad concept of populism which highlights the inclusive function, Mazzoleni (2006) rightly stresses that the media industry tends to be populist as well. Not only the imperative of the market in journalism and media (→ Markets of the Media) but also the civic journalism movement promote “populist formats” and give the people a voice by using phone-ins, town meetings, etc. (→ Citizen Journalism; Citizen Journalism, History of; Public Journalism). Here a new performance of style is identified, which incorporates “the people’s voice” into programming via new communication technologies (Jones 2003). As newsroom journalism lacks distinctive analytical tools, it is sometimes not very distinct from horse race journalism or from market-oriented journalism (→ Horse Race Coverage). But, in contrast to many authors, Mazzoleni (2006) holds that media populism is not necessarily an enemy of the democratic process but may bring the people back to politics.

The second field takes a more detailed look at the *discursive forms of populist messages* – techniques of mobilization, rhetoric, and strategies of → persuasion (Decker 2006, 11). Thus, they analyze typical patterns of argumentation, such as friend and foe schema, preferences for radical and alleged clear solutions, and of course the linguistics of “the people” (→ Rhetoric, Argument, and Persuasion). However, these types of interpretative-hermeneutic studies are still scarce (→ Linguistics; Hermeneutics). And regarding the field of populism and media in general, some authors rightly discuss the lack of research and theory and point in particular to the unreflected use of the term among scholars as well as journalists.

## RESPONSIVENESS IN POLITICAL COMMUNICATION

Typical responsiveness studies treat the mechanism of linkage between rulers and ruled as a black box. Consequently, the “chain of responsiveness” (Powell 2004) does not include a close look at aspects of political communication, mechanisms of linkage, or information processing of policymakers more precisely. Most of these responsiveness studies follow the Miller and Stokes (1963) dyadic approach (Burstein 2003) and look at the impact of

public opinion (citizen as respondent or constituency) on policymaking (politicians and legislative behavior; see, e.g., Brettschneider 1995).

Primarily, communication scholars take up the thesis of mediated politics (→ Mediatization of Politics). They analyze the media–policy connection more closely and highlight the media’s role in this connection. For example, this research looks at the emergence of the media agenda and the contribution of media in the processes of → agenda building and agenda setting (→ Agenda-Setting Effects). Research about the use of (published) polls fits into this domain, too (→ Polls and the Media). Still, only few scholars take a closer look at the responsiveness of policymakers to media news and analyze their attention and following actions in the context of information processing and persuasion theories (Yanovitzky 2002, → Information Processing; Political Persuasion). Furthermore, qualitative studies which analyze the rhetoric of responsiveness are still scarce, and therefore that which applies in general remains true at the level of content-analytical studies: if Mudde’s (2004) allegation states that populism’s electorate first and foremost wants leadership, we need to include theories of representation (leadership versus responsiveness) in the analysis of populism in order to get a sound understanding of the challenges of representation in modern → media democracies.

## **Pornography, Feminist Debates on**

*Gail Dines*

*Wheelock College*

*Robert Jensen*

*University of Texas at Austin*

The feminist pornography debates, known as the “porn wars” or the “sex wars,” began in the US, the UK, and many other countries around the world in the early 1980s. These struggles have raised questions about the nature and effects of not only pornography but also prostitution and stripping, highlighting crucial debates about women’s agency and the role of structural forms of inequality in shaping women’s lives in patriarchy.

### **HISTORY OF DEBATES**

There have been three *major philosophical/political positions* within feminism during these debates: (1) anti-pornography feminists, typically identified as “radical feminists”; (2) anti-censorship feminists who are critical of misogynistic pornography but reject the legal approach radical feminists proposed; and (3) a pro-pornography group valorizing pornography as a discourse that subverts traditional gender norms and has liberatory potential for women’s sexuality. The growing strength of the postmodernism (→ Postmodernism and Communication) underlying this third position is representative of a larger trend away from the activist-oriented second wave of feminism toward a more academic-based theorizing. Since the 1980s, these debates have caused major divisions in the global

feminist movement and continue to split feminists into anti- and pro-pornography camps (→ Women's Movement and the Media).

The second wave of western feminism, beginning in the 1960s, gave rise to a *radical feminist movement* that argued male violence against women was one of the central patriarchal methods of control over women. The other major strand of second wave thinking, liberal feminism, focused on women's subordinate social and legal status in the home and workplace, and tended not to highlight physical violence and sexual exploitation. For radical feminists, violence against women was theorized as a method of sexual terrorism, central to men's economic and cultural control of women. Radical feminists argued that until women were free from violence and the fear of violence – in private and in public – legal or economic gains would not liberate women (→ Sexual Violence in the Media).

A *grassroots anti-violence movement* argued that sexual assault was an expression of, rather than an exception to, patriarchy's sexual norms, and in response women created rape crisis centers, battered women's shelters, and support groups for survivors of child sexual assault. Radical feminists exploring reasons for this violence looked at popular culture and pornography, given that in a mass-mediated society images help shape attitudes and behavior (i.e., in advertising, news, and entertainment media). Radical feminists criticized misogynistic images in all these media, as well as the underlying ideology that legitimized or celebrated violence against women (→ Women in the Media, Images of).

This led to activist groups in the US, most prominently Women against Pornography (WAP) in New York, educating and protesting the harms of the pornography industry. Anti-pornography slide shows were distributed to local feminist groups and presented in private homes, local community groups, and colleges to help build a grassroots movement of women to organize against the pornography industry. WAP also gave guided tours of the shops in New York's infamous Times Square pornography district to raise public awareness about the sexist nature of pornography. In March 1979, WAP organized a Times Square march that drew several thousand and generated national coverage that publicized the movement.

The first major radical feminist publication was *Take back the night: Women on pornography* (Lederer 1980), in which key researchers of violence such as Diana Russell and prominent feminists such as Alice Walker and Robin Morgan set out a framework for understanding pornography as a form of violence against women in both its production and use by men. This was followed a year later by *Pornography: Men possessing women*, which established Andrea Dworkin as the best-known anti-pornography feminist in the US and then increasingly around the world. Dworkin argued that pornography was one of the major ways patriarchy disseminated woman-hating propaganda.

### **DIVISIONS OVER THE ORDINANCE**

Although there was a flurry of this kind of anti-pornography critique and activism in the US in the late 1970s and early 1980s, radical feminists did not face organized opposition from other feminists until an anti-pornography legal strategy was developed by Dworkin and lawyer/law professor Catharine MacKinnon. Rejecting traditional criminal obscenity law, in 1983 they drafted for Minneapolis a civil rights ordinance that would allow women to pursue damages against producers and consumers. Passed by the City Council

but vetoed twice by the mayor in Minneapolis, it was then passed and signed into law in Indianapolis in 1984. That ordinance, and the theory behind it, were rejected on constitutional grounds in the federal courts in 1986, though organizing efforts to pass the law in other jurisdictions continued through the early 1990s.

The ordinance proposed a shift in existing law, away from a moral framework about what kind of sex is consistent with the dominant sexual mores and toward a political one, focused on patriarchal power. Rooting the move in the radical feminist argument that women are oppressed in part through sexual subordination, Dworkin and MacKinnon identified pornography as a means of sexualizing inequality and a practice of sex discrimination. The ordinance created five causes of action women could pursue: coercion into making pornography; the forcing of pornography on unwilling people; assault resulting from pornography; defamation through pornography; and trafficking in pornography. The trafficking clause, allowing any woman to bring a case against any pornographer, was the broadest and hardest to square with contemporary interpretations of the First Amendment. The assault cause of action raised complex questions about pornography's effects on not just attitudes but behavior.

Anti-censorship feminists were skeptical about state intervention in sexual matters, even under the umbrella of civil law that empowered women, and rejected the ordinance as a threat to women's freedom and autonomy. The Feminist Anti-Censorship Task Force produced an argument – known as the FACT brief – that became a focus of debate between the two camps. Some of the women in FACT also articulated a pro-pornography position that became more prominent in the 1990s and 2000s, as the liberal rejection of the radical critique increasingly leaned toward the postmodern.

Much of the debate about pornography has concerned the question of effects (→ Media Effects; Sex and Pornography as Media Content, Effects of). Does pornography, particularly material that eroticizes violence and/or domination, lead to increased sexual violence against women, children, and other vulnerable people? Pro-pornography feminists and some researchers argue there is no conclusive evidence. Others find evidence for effects with some groups of men. No one argues that pornography is the sole causal factor in rape; the question is whether use of pornography can be considered a sufficient condition for triggering a sexual assault in some men, and whether repeated exposure to pornography can contribute to the normalization of sex that is coercive, violent, and degrading.

Radical feminists argue that attention to the experiences of men and women – those who use pornography and against whom pornography is used – makes the connection clear. Such accounts, in light of laboratory work from social psychology, have led radical feminists to argue that, at a minimum, pornography (1) is one important factor in shaping a male-dominant view of sexuality; (2) can contribute to a user's difficulty in separating sexual fantasy and reality; (3) is sometimes used to initiate victims and break down resistance to sexual activity; and (4) sometimes provides a training manual for men who sexually abuse women and children.

## CONTEMPORARY DEBATES

These camps are also divided on the *nature of the pornography industry*. For radical feminists, the production of pornography in patriarchy exploits women. While not denying

the ability of women in the industry to make choices, the feminist anti-pornography movement focuses on the economic, social, and cultural factors that influence women's choices to perform in pornography, such as histories of sexual abuse in childhood, the violence of pimps, and control by boyfriends and other men. Pro-pornography feminists counter this argument by insisting that women are making rational choices given the reality of employment opportunities and that some women prosper in the industry.

This is part of a much larger debate regarding the nature of work in the sex industry. Pro-pornography feminists describe prostitutes, strippers, and women in pornography as sex workers who sell their labor, much like other workers, and argue that any problems should be addressed through union organizing and/or health regulations. Radical feminists reject the term "sex worker," arguing that women in the sex industry do not perform work as it is typically understood. Most radical feminists are anti-capitalist and supportive of labor organizing, but see pornography as a practice central to the subordination of women and as a form of violence. Radical feminists point to the rates of post-traumatic stress disorder in women who are prostituted, as well as high levels of physical abuse and sexually transmitted diseases, evidence of the exploitative conditions of these women's lives. Pro-pornography feminists argue that women in the sex industry freely enter into contractual agreements to sell their labor.

While most of the early arguments against the radical position focused on issues of free speech and the dangers of censorship in the 1980s and 1990s, such writing increasingly argues that pornography can be a subversive and liberatory text, or indeed, that it has been controlled and domesticated for women's pleasure (Juffer 1998). Many of these concepts have their origins in postmodernist theory, especially as developed by literary, art, and film scholars such as Linda Williams (2004) and Laura Kipnis (1996), focusing on the text and the power of readers to interpret meaning. The postmodern turn in the academy – a focus on the fluidity of meaning of texts with multiple meanings, depending on the subject position of the reader – has influenced feminist analysis that constructs the pornographic image as a complex text open to interpretation. This conflicts with the radical feminist argument that examines the meaning of the pornographic text in the context of the lives of the women who are used in the making and the women who will interact with the men who are the primary consumers. While pro-pornography feminists do not minimize the harm of men's violence against women, they reject the idea that pornography is a central practice in patriarchal control of women.

One area of agreement concerns the making of *child pornography*, which is understood by virtually all as exploitation and an inherent violation of children. Yet while pro-pornography feminists make a sharp distinction between sexually explicit material made with children and with adults, radical feminists make connections. While not arguing that adults in pornography have the status of children, radical feminists point to how pornography using adults also eroticizes subordination. Radical feminists point to common genres of pornography such as Hustler's "Barely Legal" films, in which the adult women performing are dressed and posed in ways that suggest a younger age.

Although the pro-porn and radical feminists continue to disagree on key issues, there was little direct political engagement between the two camps in the late 1990s and early 2000s. That is in part because there have been no legal issues to focus the debate, and also because pro-porn feminists tend to concentrate more on writing for an academic audience and radical feminists focus on activism outside the academy.

## **Pornography, Media Law on**

*Jeremy Harris Lipschultz*

*University of Nebraska at Omaha*

Pornography or “porn,” is a socially defined class of sexual communication, which may or may not be protected under national laws. The term may be distinguishable from legal definitions of obscenity or indecency. Pornography is generally considered the depiction of graphic sexual behavior usually designed to promote sexual arousal. Pornographic material may be either legal erotica or illegal obscenity. Many have questioned the validity of the distinction between erotica and pornography, the latter being a pejorative and subjective term.

Regulation of sexual expression varies from society to society. As the Statement on Freedom of Expression for the Commonwealth notes, “The law with respect to obscenity and pornography must arise from, and respect the value of, the society in which it operates. States have a special responsibility for eliminating child pornography” (→ *Morality and Taste in Media Content*).

## HISTORICAL REFERENCES

Pornography has been in existence for centuries. Some of the earliest cave paintings, sculpture, and pottery discovered by archaeologists contain sexual references. “Pornography” is a word first found in the writing of the Greeks in relation to discussion about *porne*, or prostitute. Around 1650, some of the first pornography appears to have been published using printing presses.

“Pornography” is considered a general term that is distinct from its legal definitions addressed under a wide range of obscenity laws. Sex was first a legal issue in England in 1663 with the conviction in London of Sir Charles Sedley for breach of peace by becoming drunk, removing his clothes, uttering profane remarks, and pouring urine on a crowd below a tavern balcony. This indecency was not blasphemous, as was the case with previous convictions. Common law courts in England did not tend to be faced with pornography cases. Still, in 1727 Edmund Curll was convicted for corrupting public morals through publication of *Venus in the cloister, or The nun in her smock*. A few years later, John Cleland’s *Fanny Hill, or Memoirs of a woman of pleasure* was widely translated, yet later judged to be illegal in the United States.

Technological development of → photography and → video expanded the distribution of pornography. Much of what we consider pornography today has its roots in Scandinavia and the United States, where there was a dramatic increase in production in the 1960s and 1970s. Movies such as *Last Tango in Paris* and *Deep Throat* brought pornographic images into the mainstream. During this period, child pornography surfaced from Europe, Africa, and Asia. Japanese pornography, which began to mingle sex with violence, has flourished using a variety of realistic and animated approaches (→ *Animation*).

Twentieth-century → magazines and adult → books found a global market. When the → Internet world wide web exploded on the scene in the mid-1990s, pornography could be easily distributed internationally and became the first profitable online industry. In the absence of international pornography laws, national laws prevail that are designed to curb or prohibit the production, distribution, and sale of sexual materials. Current enforcement typically involves attempts to identify sexual predators in the online environment and prosecute them (→ *Sex and Pornography Online*).

Sexual media depictions are often unsolicited. Therefore, concerns have been expressed about the proliferation of Internet spam. Unwanted emails often make offers of a sexual or pornographic nature, and attempts to use email filters have been frequently defeated by the marketers of porn (→ *Electronic Mail*). Pornography is sometimes related to prostitution. Depending on perspective, legal scholars have treated the sale of sexual conduct as either a modern form of slavery or a legal right of work. An extension of prostitution is the depiction of sexual behavior in multimedia forms. These portrayals may be distributed for sale or not. Clearly, such behavior raises international human rights issues.

## **CHILD PORNOGRAPHY**

While laws vary widely from nation to nation, a general international agreement exists on the need to prevent child pornography, although the age of sexual consent is not standardized worldwide. In Japan, soliciting prostitution from a child (under age 18) is punishable under the Law for Punishing Acts related to Child Prostitution and Child Pornography, and for Protecting Children. Prior to 2005, no law existed to prohibit sex trafficking.

The typical legal concern involves sexual depictions of people under 18 years of age, such as the case in the Canadian Penal Code. Nevertheless, this is not universal. The age of concern drops to 16 under Australian law, and 15 in some US states. However, US federal child pornography statutes that make illegal the creation and distribution of photographs or videos limit such sexual behavior between an adult and a teen. In Europe, “audiovisual material which uses children in a sexual context” is restricted under the Council of Europe definition. The International Criminal Police Organization’s (INTERPOL) definition of child pornography goes beyond visual representation to include a “child’s sexual behaviour or genitals.”

## **EXAMPLES OF LEGAL REGULATIONS**

### **United States of America**

The US Supreme Court in *Miller v. California* (1973) has formulated a three-part test to judge whether content is obscene and, thus, not protected speech under the First Amendment: (1) whether the average person, applying contemporary community standards, would find the work, taken as a whole, appeals to prurient interests; (2) whether the work depicts or describes, in a patently offensive way, sexual conduct specifically defined by applicable state law; (3) whether the work, taken as a whole, lacks serious literary, artistic, political, or scientific value.

A local jury might be asked to determine whether the pornographic material appeals to prurient interests based upon local community standards. State law is applied to the question of patent offensiveness. However, a large loophole is the third prong of the obscenity test, which allows sexual material to be legal where serious LAPS value is found.

As a general rule, print media have the most freedom to publish sexual material. This is because it is easiest to restrict access to children by zoning, for example, adult bookstores and businesses away from schools and other locations where children may be present. In broadcasting, the → Federal Communications Commission (FCC) has restricted indecent speech to a late evening hours “safe harbor” when children are not likely to be present in the audience. Broadcast indecency, which blurs the definition between indecent and obscene, is defined, under the broadcasting community standards, as sexual or excretory activities or organs in material that panders or titillates without value. Profanity, which generally is considered indecent, may not be so in certain serious contexts. The FCC applies a national contemporary community standard for the broadcast medium. Generally, cable systems are either free from indecency regulation or have more freedom than their broadcast brethren. The Internet is similar to print media

when it comes to its right to disseminate pornographic content. It is more broadly protected than broadcasting.

### Canada

The Criminal Code proscribes obscenity. It provides that it is an offense to publish, import, export, or advertise “anything that depicts a child performing a sexual act or assuming a sexually suggestive pose while in a state of undress.” In reporting court proceedings, the Code prohibits news media from including “any indecent matter or indecent medical, surgical or physiological details . . . that if published, are calculated to injure public morals.”

In *R. v. Butler*, the Supreme Court of Canada, ruling on the obscenity statute, adopted the feminist position that men who are exposed to pornography are induced to commit violence to women. The Court divided sexual expression into three distinct types: (1) explicit sex with violence, (2) explicit sex without violence but which subjects people to treatment that is degrading or dehumanizing, and (3) explicit sex without violence.” The third category is presumptive legal unless it involves child pornography, but the first and second categories are usually unprotected. As the Canadian Supreme Court reasoned, “the portrayal of sex with violence will almost always constitute the undue exploitation of sex,” while “explicit sex which is degrading or dehumanizing may be undue if the risk of harm is substantial” (→ Communication Law and Policy: North America).

### Europe

Article 10 of the European Convention on Human Rights balances freedom of expression with the protection of morals. Compared to the US Supreme Court, the → European Court of Human Rights (ECHR) has rarely struggled with the definitional quandary over obscenity as an *unprotected* expression because it is, in general, protected. Nonetheless, its few obscenity cases recognize a reality surrounding obscenity as an ambiguous issue in the legal, socio-political, and cultural arenas. The 1976 ECHR obscenity case, *Handyside v. United Kingdom*, is illuminating.

*Handyside* started with the police seizure of copies of *The Little Red Schoolbook*, a reference book for children. Published by Richard Handyside in London, the book dealt with the early sexual experiences of children. In considering whether the English government’s interference with Handyside’s freedom of expression was acceptable, the ECHR found that English judges had authority, in the exercise of their discretion, to conclude that the book would harm the morals of many of the children who would read it. The seizure of the copies of the book by the authorities had the aim to protect the morals of the young – a legitimate purpose under English law.

Widespread concern about the actual or perceived harm of sexual material to children led the European Union in 1989 to declare that member states should take appropriate regulatory steps to prohibit television programs that “might seriously impair the physical, mental or moral development of minors, in particular that involve pornography and violence.” In late 1996, the EU Commission, addressing the issue of illegal and harmful Internet content, made clear that all cyber child pornography falls under the existing legal framework.

European nations were some of the first to restrict Internet distribution. For example, Germany prosecuted and sentenced a manager of a subsidiary of CompuServe in 1998 for distribution of newsgroup online pornography. The case was later reversed when a court found that a subordinate was not in a position to limit illegal content access. Under German law, pornography is grouped with racist, violent, and other speech that is considered harmful (→ Communication Law and Policy: Europe).

### **Japan**

Japan has been strongly influenced by the United States in its free speech jurisprudence since the end of World War II. Nonetheless, its obscenity law showcases how Japanese cultural values guide its application. The public distribution or sale of obscene material is a crime in Japan. It is regulated under the Criminal Code, the Custom Standards Law, and various mass media laws. Meanwhile, the Japanese Supreme Court has recognized governmental authority to restrict sexual expression, even when it has significant artistic or literary value. The Supreme Court has held obscene materials to be outside the protection of the Constitution of Japan on freedom of speech and the press. As the Court stated, “When writings of artistic and intellectual merit are obscene, then to make them the object of penalties in order to uphold order and healthy customs in sexual life is of benefit to the life of the whole nation.”

### **South Korea**

Obscenity in traditional media is prohibited as a criminal violation of the Criminal Code and other laws. The judicial interpretations of obscenity law in South Korea borrow heavily from American law. A case in point is the obscenity test drawn up by the Korean Supreme Court:

Whether a document is obscene should be determined by considering the explicit and graphic depiction of sex, the amount and substantiality of the sexual description in relation to the document as a whole, the ideas expressed in the document and their relationship to the sexual portrayal, the lessening impact of the document’s artistic and theoretical values on its sexual titillation. Further, examination should be made of whether the document, taken as a whole, primarily appeals to readers’ prurient interest.

Pornography definitions frequently run into difficulty because the line between porn and art is not clear. Digital artists commonly depict sex, and multimedia materials may blur the age of actors. The use of home computers, digital cameras, and video-recording equipment has created a revolution in the production and distribution of pornography. Inexpensive and available equipment allows individuals to create their own erotic or pornographic materials. Enforcement of laws generally halts at one’s front door, unless the sexual content involves illegal behavior or distribution.

## **Pornography Use across the Life-Span**

*Jochen Peter*

*University of Amsterdam*

Throughout the years, intense legal, political, and academic discussions have centered upon the use of pornography and its implications (→ Pornography, Media Law on; Sex and Pornography as Media Content: Feminist Perspectives). Currently, these discussions have been revived because the → Internet provides not only adults but also adolescents and children with free and anonymous access to pornography (→ Sex and Pornography Online). The easy availability of pornographic material for all age groups has raised questions about the extent to which people of different age groups are exposed to such material.

Although research on the issue is scarce, the existing studies suggest that younger people use pornography more often than older people (Buzzell 2005; Janghorbani et al.

2003; Traeen et al. 2004). This particularly applies to males – exposure to pornography is generally much more common among males than among females (Laumann et al. 1994). Young male adults and, with the advent of the Internet, also male adolescents seem to be the most frequent users of pornography. Exposure to pornography declines somewhat among people older than 30 years. People who are older than 60 are the least frequent users of pornographic materials. This *age gap* also shows in the fact that people older than 60 years are less likely than young adults to have ever been exposed to pornographic material (Traeen et al. 2004). Recent research from Scandinavian countries suggests that typically more than 80 percent of young adults have consumed some type of pornographic material sometime in their life (Haeggstroem-Nordin et al. 2005). For young male adults, this figure reaches nearly 100 percent. In contrast, only 63 percent of people older than 60 years have ever been exposed to pornography (Traeen et al. 2004). A study conducted in Asia suggests slightly lower figures, but still shows that the majority of young adults use pornographic material at some point in their life (Janghorbani et al. 2003).

Pornography is basically *targeted at adults*. However, the free and anonymous availability of pornography on the Internet has enabled adolescents to use such material. Studies from two culturally diverse countries – Taiwan and the Netherlands – have recently found that 50–70 percent of male adolescents and more than 20 percent of female adolescents have accessed different types of pornographic material on the Internet (Lo & Wei 2005; Peter & Valkenburg 2006). The respective figures for older people are generally lower, with less than 10 percent of women and less than 40 percent of men ever having been exposed to pornography on the Internet (Traeen et al. 2004). However, the diverging figures for adolescents and adults may also result from different investigation periods and different operationalizations of exposure to pornography on the Internet (→ Audience Research; Research Methods; Exposure to the Internet).

Generally, the comparability of research on the use of pornographic material is impeded by conceptual and methodological differences in the studies. The conceptual and operational definition of exposure to pornographic material (→ Operationalization) often differs across the studies as does the sampling technique, the target sample, and the interviewing mode (→ Survey). Moreover, research on sexual issues is affected by cultural contexts and technological change. For an encompassing understanding of the implications of exposure to pornography, cross-culturally comparative research is needed, preferably also with a longitudinal component.

## Portraiture

*Peter Burke*

*Emmanuel College, University of Cambridge*

There have been many disputes over the definition of portraits and some of them have ended up in court (in Alabama in 1863, for instance, and in New South Wales in 1944). A compromise definition is advisable, steering between the dangers of vacuousness, on the one side, and of excluding many images that are commonly taken to be portraits, on the other. For example: “a representation of one or more individuals that can be recognized by acquaintances as a likeness (despite possible elements of either idealization or caricature).” So defined, the portrait has a history, a geography, and a sociology.

Whether or not Egyptian images of pharaohs or their wives (Nefertiti, for example) were likenesses, many ancient Greek and Roman statues were (→ Realism). In the west, an interest in likenesses seems to have declined in the Middle Ages, reviving in the fourteenth century, spreading during the Renaissance, and remaining important ever since. Some 40 years ago, John Berger claimed that the painted portrait was obsolete, thanks not only to the rise of photography but also to the decline of belief in social roles and changes in conceptions of identity. This obituary appears to have been premature (→ Painting).

Portraits can be found in *many parts of the world*, but not with equal density. An interest in portraits, officially forbidden in Islamic culture, developed in court circles in the Ottoman Empire in the mid-fifteenth century and in Mughal India c.1600. In China, they became more important from 1600 onward (Vinograd 1992). Today, photographic portraits are as ubiquitous as globalization (→ Photography). Within Europe, they became fashionable in Florence and in the Netherlands before spreading elsewhere. The place of Britain is a paradoxical one. Sitters were dependent on foreign artists from Hans Holbein to Anthony Van Dyck, but in the eighteenth century, the age of Joshua Reynolds and Thomas Gainsborough, portraiture came to be seen as typically British.

Portraits were originally *confined to high-status social groups*, but for this very reason they became both the sign and the means of social mobility. Complaints about the democratization of the portrait go back at least as far as sixteenth-century Italy. As a means of distinction, portraits needed to emphasize social identities (gender, class, or occupation): the warrior with hand on sword, the mandarin in his robes of office, the

noblewoman in her fine clothes, etc., like “the scenic flats in photographers’ seaside studios with their empty face-holes waiting for the tourists to come and fill them in” (Brilliant 1991, 62; → Visual Representation; Symbolism). The rise of more informal types of portrait in eighteenth-century Europe may express a new culture of individualism, anticipated by Rembrandt in his self-portraits (Chapman 1990). In contemporary India, by contrast, a decentered view of the individual seems to underlie the current vogue for double images of the same person in photographs (Pinney 1997).

The varieties of portrait are so great that *typologies* are required, whether they are based on media or on → genres. The *media* of portraiture include not only painting (oil, watercolor, pastel) and sculpture (in marble, bronze, ceramics, wax) but also textiles, graphics (drawings, woodcuts, copperplates, mezzotints, etc.), and of course photographs, still or moving – not to mention mummification, producing the “auto-icon” recommended by the nineteenth-century radical Jeremy Bentham. The *genres* of portraiture are almost equally various: formal (the “state” portrait, for instance) or informal, contemporary or historical, public or private, realistic or idealized, as well as self-portraits, allegorical portraits, and various kinds of group portrait, from school or team photographs to conversation pieces or the traditional Chinese *yaji* (“elegant gatherings”).

Videos apart, the portrait may be analyzed as a *frozen act of communication* (→ Video). As in other analyses of communication, it is necessary to ask who is communicating what to whom, with what intentions, by what means, and with what effects (→ Art as Communication). In the case of the “who,” recent scholarship has presented the portrait as the product of an “encounter” or “transaction” between artist and sitter. The “what” is a likeness, sometimes an idealization, sometimes a → caricature, and often an expression of the sitter’s self-image. The public for portraits ranges from family and friends to large groups such as the nation. Their purposes include the commemoration of intimate occasions and of national heroes and heroines. The means and strategies employed are sometimes described as the “iconology” of the portrait, including clothes, gestures (more or less modest for women and men respectively), and “properties” such as classical columns, magnifying the importance of the sitter (→ Iconography; Sign). *References to other portraits*, like the “quotations” from Van Dyck by Reynolds, often had a similar purpose. The effects of these acts of communication are linked to the many different uses of these artifacts, hung on walls, collected into albums, or concealed in drawers or in locket, like English miniatures. In short, portraits come in many varieties. Rather than simply expressing individuality or presenting a social role, they reveal tensions between the individual and the social. These tensions are particularly visible in the case of a series of institutional portraits (bishops, or the heads of colleges), where formality in dress, for instance, coexists with increasing informality of posture.

## Portugal: Media System

Anabela Carvalho

University of Minho

Situated in southwestern Europe, Portugal covers an area of 92,152 sq km and has a population of 10.6 million (2006 estimate). The two biggest cities are Lisbon, the capital, and Oporto. The official language is Portuguese. The literacy rate is 93 percent, and 94 percent of the population are Roman Catholic. In 2005, the country's GDP was €147.3 billion (€13,972 per capita). Portugal is a parliamentary democracy. The Portuguese Constitution determines the complete separation of the four main organs: the president, the government, the parliament, and the courts.

Portugal has been an independent country since the twelfth century. The monarchy was overthrown in 1910, but the period of the First Republic ended in 1926 with a military coup d'état. From 1933 the nation was ruled by a repressive right-wing regime with close ties to the Catholic church, the Estado Novo. Democracy came with the 1974 leftist revolution, which also led to independence being granted to Portugal's colonies in Africa. Between 1985 and 1995, the ruling center-right Partido Social Democrático promoted the privatization of key sectors of the economy, including banking and telecommunications, a tendency that continued under subsequent Socialist Party governments. The country joined the European Union in 1986 and experienced a significant economic growth in the 1990s. However, the economy has struggled and unemployment has grown since 2001.

Following the 1974 revolution, the 1976 constitution – and its revised versions – granted *press freedom* and prohibited any forms of censorship (→ Freedom of the Press, Concept of; Freedom of Communication). Media laws currently in place (Press Law no. 2/99, Television Law no. 31-A/98, Radio Law no. 2/97) enshrine a pluralist view of the media (→ Plurality) and establish a number of rights and guarantees for journalists and citizens. The Entidade Reguladora para a Comunicação Social (Mass Communication Regulatory Body) oversees the enforcement of such rules and regulations.

There are five daily generalist *newspapers* with national circulation. Two of these are “quality” papers: *Público*, owned by the Sonae business group, and *Diário de Notícias*, the property of the Global Notícias multimedia group. This group also owns the mid-market *Jornal de Notícias*, based in Oporto, and *24 Horas*, one of the two popular newspapers. The other is *Correio da Manhã*, property of the Cofina group. Traditionally, readership of dailies

is low, and it dropped further in 2005, when *Público* had a circulation of 50,701 copies, *Diário de Notícias* 37,909, and *Correio da Manhã* 118,254 (ICS 2006). With circulations of 128,168 and 99,683 respectively, *Expresso* and *Visão* are the most widely read *weekly newspaper* and *news magazine*. Both are the property of the Impresa multimedia group. There are 532 regional and local papers in the country with typical circulations of only a few thousand.

The Portuguese *radio system* is organized into three main groups: Rádiodifusão Portuguesa, Renascença, and Media Capital. Rádiodifusão Portuguesa, which is a public service station, had its origins in Emissora Nacional, funded in 1935 under the Estado Novo. Soon after, the Catholic church started Renascença. This group is the audience leader, with 38 percent of audience share in 2005, due especially to RFM, its hugely popular easy-listening music channel. Funded by a license fee and advertising, Rádiodifusão Portuguesa operates three main channels – Antena 1, Antena 2, and Antena 3 – which broadcast news and popular music, classical music, and new music targeted at young people, respectively. The Media Capital Group is the most commercial of the three with its Rádio Comercial, Cidade FM, and Rádio Clube Português taking 20 percent of audience share. Local stations were legalized in the 1980s and totaled 355 in 2005. In addition, TSF (part of Global Notícias), which features long news bulletins and documentaries, plays a key role in radio journalism in Portugal.

Four *television channels* are freely broadcast in Portugal. Two belong to the state-owned Radiotelevisão Portuguesa (funded in 1955): RTP1 and 2: (→ Public Broadcasting Systems). SIC is the property of Impresa, and TVI is owned by Media Capital. SIC and TVI started operating in 1992 and 1993 respectively. There is less diversity in the program mix of the two privately owned channels than in RTP1's, the public service operator, which is funded by the state and by advertising. RTP1 invests more in national production with cultural and/or historical relevance, and had an audience share of 23.6 percent in 2005. With an audience share of 27.2 percent, SIC devoted its prime time to Brazilian telenovelas, but was overtaken by TVI with nationally produced soap operas (30 percent share). A new project, 2: was launched in 2004 to replace RTP2. It is open to the independent productions of the so-called “civil society” and shows more knowledge-oriented programs (5 percent audience share). RTP transmits dedicated channels to the island territories of Portugal: RTP Açores and RTP Madeira.

There are 20 *cable and satellite channels* in Portugal. RTP and SIC own a cable news channel each and several entertainment ones. Lusomundo, of the (mainly state-owned) Portugal Telecom multimedia group, has a number of cinema channels. The Internet has grown to 100,000 registered sites, and 35 percent of Portuguese homes have access to it (ANACOM 2006). All the main national media and most of the regional and local ones have online editions. There are several digital news periodicals, such as *Portugal Diário* and *Diário Digital*. Blogging has become very popular and is also widely used by some conventional media, such as radio stations. The recent appearance of over 20 web TVs and the delivery of television programs to mobile phones are other examples of the convergence of various forms of communication (→ Satellite Television; Cable Television).

While the Portuguese media system was marked by censorship and oppression during the Estado Novo period, it radically changed in the following 30 years, when privatization and deregulation turned the market into the decisive factor (→ Censorship; Privatization of the Media). Although there is still some state intervention in the Portuguese media

system, it is becoming increasingly liberal (→ Media Policy). A history of low levels of literacy still means low newspaper readership and therefore a certain economic fragility. Excessive concentration of property is the main risk for press diversity in the future (→ Concentration in Media Systems). Digital and cable media (including regional television channels) offer the biggest prospects for growth, but there is a crucial need to foster computer ownership and Internet access.

## **Positioning Theory**

*Ansgar Zerfass*

*University of Leipzig*

Positioning is an essential concept in → communication management, → public relations, and → marketing communication. The process of positioning includes identifying, defining, and managing the → perception relevant audiences have of a particular organization, product, person, or idea. Three lines of thought relevant to communication theory have emerged during the last decades: strategic positioning, positioning strategies, and discursive positioning.

In line with the coalition and stakeholder theory of the firm (Freeman 1984), companies can be conceptualized as a “negotiated enactment of stakeholder interests” (Heath 1994, 147). Resulting from this ongoing process is the *strategic position of a company* in the market and in society. Theories of → corporate communication (van Riel & Fombrun 2007; Zerfass 2007) argue that this position has to serve as the starting point for developing communication programs. Strategic positioning thus constructs a frame of reference for public relations and marketing. For example, the website of Merrill Lynch

& Co, Inc., states: “Merrill Lynch has positioned itself to be the preeminent global investment bank, wealth management and advisory partner, an essential partner to its client.” This gives a clear orientation for the company’s communication management, which has to identify and facilitate different facets of this position in the minds of customers, prospects, employees, financial journalists, and other relevant stakeholders.

There is also a reverse relation between strategic positioning and communication. Professional communication helps to (re)position the company by gathering information and cultivating relationships (Steyn 2007), which might foster business routines (motivating employees, influencing customers’ preferences, securing the license to operate) and build immaterial capital (reputation, brands, trust, legitimacy). The need for integrating communication programs (→ Integrated Marketing Communications) and positioning goals stimulates the development of management tools like corporate communication scorecards, which try to map those interdependencies.

The second area of discussion is *positioning strategies*. Within marketing theory, the term “positioning” was coined by Jack Trout (1969) in a journal article. He expanded and deepened the concept together with Al Ries. Their popular book *Positioning: The battle for your mind* (Ries & Trout 1981) defines positioning as the ownership of a concept or word in the (potential) customer’s mind, relative to the position of the company’s competitors. In this narrow sense, positioning is part of the management process that plans, implements, and evaluates public relations and marketing strategies. Positioning begins with identifying the cognitive structures stakeholders use to define a product or service.

For example, automobiles are conceptualized as sportive, luxurious, reliable, powerful, safe, stylish, or comfortable. In a second step, companies have to concentrate on an auspicious segment and make people think that its own products or services are the best within this area. By doing so, Mercedes has succeeded in occupying the position “luxury and reliability” for decades. Volvo was the first to claim the category “safe car” with great success, but partly lost this position to Renault at the beginning of the twenty-first century. In a third step, communication measures have to be oriented toward the positioning goal. For example, Mercedes concentrates the majority of its advertisements and press campaigns on attributes that sustain its traditional perception. Renault, in contrast, implemented its new positioning strategy by visualizing the safety of its automobiles in a series of commercials and referring extensively to the high level of quality standards reached by its automobiles in media relations.

Finally, a quite distinctive, but nevertheless fruitful, understanding of positioning has been developed within speech philosophy and social psychology: *discursive positioning*. Positioning theory as conceptualized by Rom Harré (Harré & van Langenhove 1999) is an interactionist concept influenced by Wittgenstein, Vygotsky, and Goffman. It studies the nature and change of rights and duties in small-scale relationships. Harré criticizes role theory and theatrical metaphors of enactment for being too static and ontological.

Discursive positioning argues that social structure is rather immanent than real and arises from fluid patterns of positioning. In social interactions, people use communication to explain their own positions, defend them, and alter them. Often, they also try to position others as misinformed, wrong, or immoral. As a consequence, positions are dynamic and always linked to specific relationships where they are tested and legitimized. The concept of discursive positioning is instructive for a variety of fields within

communication studies, e.g. for studying interpersonal communication and organizational communication. It might also be used as a basic theory for communication management and marketing communication.

According to the rhetorical and interpretive paradigm of corporate communication (Heath 2001), companies strive to persuade others as well as themselves by positioning their self-concepts, cultures, brands, products, and services (→ Rhetorical Theory of Public Relations). This takes place within a wide variety of communicative settings, ranging from personal interactions to corporate media, online channels, and the mass media. As a consequence, the dynamic concept of discursive positioning has to take into account the rules and resources imposed by society and its particular communication system.

## **Postal Service, History of**

*Paul Arblaster*

*Catholic University of Leuven*

The use of couriers to bear written messages is presumably as old as the art of writing itself. The entrusting of messages to those traveling on other business (trade, pilgrimage, etc.) is attested from ancient times. States in many parts of the world and in many periods have instituted some sort of cadre of official messengers, sometimes maintaining an infrastructure of roads, inns, and relays to provide for the needs of those traveling on

official business. Ancient Persia, Egypt, China, and the Roman Empire all had sophisticated communications infrastructures of this nature. The oldest descriptions of such a postal service in operation come from ancient Greek commentators on Persian affairs.

The official transport system of the Roman Empire, the *cursus publicus*, was a relatively late development but in many ways typical of these ancient postal systems. It relied on a network of well-maintained roads and bridges, and a system of inns and relay stables, to facilitate the movement of imperial messengers and officials. The use of the posts as an instrument of state intelligence meant that there was little distinction between couriers, scouts, spies, and the secret police. The supplies, beasts of burden, and ancillary staff that relay stations required were exacted from local communities, which in return enjoyed exemptions from certain other taxes. Private messages and travelers were strictly banned from the public posts, and separate commercial services developed to serve such needs.

### DEVELOPMENT IN THE MIDDLE AGES AND EARLY MODERN TIMES

In medieval Europe the physical and legal infrastructure of the *cursus publicus* was lost, but royal messengers as holders of a privileged official function were known. They were able to commandeer animals or other resources in the fulfillment of their duties, and assaults, insults, or robberies committed against them were more severely punished than those committed on ordinary travelers. Besides the royal messengers of Spain, France, and England, the official messengers of the papal chancellery and of the governments of Milan and Venice are also well attested. By the end of the Middle Ages, if not before, a more obscure “carrier” trade, open to members of the general public, was conducted by riders, drivers of packhorses, and carters who had little or no connection with the official postal services. Influential institutions or groups, such as civic corporations, universities, and religious orders, might retain servants to carry messages, often with privileges analogous to those of the official posts.

The fifteenth and sixteenth centuries saw attempts to recreate something like the *cursus publicus* in many European states. The first international posts, linking the local Habsburg capitals of Innsbruck (in Austria) and Mechelen (in the Low Countries), were instituted in the late fifteenth century. By the end of the sixteenth century, interlocking services connected all the cities of western and central Europe to what was effectively a single communications network. Until around 1800, the trunk of this system was a service from Milan and Venice to Brussels, via Augsburg, Frankfurt, and Cologne, under the administration of hereditary imperial postmasters of the Tassis, or Taxis, family. With an increasing proliferation of civic, national, and international postal services connecting to this trunk, a great deal of redundancy was built into the system, so that failures of connections in one part could be compensated for in others.

The same period saw the growth and reform of postal infrastructure and organization in the Ottoman Empire, Russia, Persia, India, China, and Japan. In China, two parallel systems were maintained, one (dating from the seventh-century Tang dynasty) of regular couriers and courier stations and another (established by the Mongol rulers of the thirteenth-century Yuan dynasty) of express postal riders. Early seventeenth-century attempts to economize by closing down courier stations contributed to the social unrest

that precipitated the fall of the Ming dynasty in 1644. In early modern India and Japan, great roads were put in a state of repair and provided with inns and relay stations; some, such as the *Sarak-i-Azam* (the Grand Trunk Road) and the *Tokaido*, were of tremendous economic, administrative, and cultural importance. In all these places a variety of private commercial carrier services operated, benefiting from the maintenance of roads and bridges, and the building of caravanserais and posting inns, but still quite distinct from the official postal service.

The posts in seventeenth-century Europe, however, became “public” in a very different sense: the official posts were transformed from a part of the tax burden into a largely self-financing service competing with private and civic carriers for custom. The legal understanding of posts continued to derive from Roman law, so that control of postal services, and the location of posthouses, were seen as issues of sovereignty (→ Telecommunications: Law and Policy). International posts, even when purely commercial ventures, were regulated by treaties between states. Practical considerations, such as monitoring seditious or suspicious correspondence, or making the posts a financially attractive proposition for royal monopolists, gave national governments additional reasons to control the carriage of letters as tightly as possible. Sometimes in law, and often in fact, conveyance of letters became a state monopoly. This could lead to conflicts between the newer “public” posts and the existing practices of the older carriers. In the seventeenth and eighteenth centuries, cities and universities fought a long but ultimately losing battle for their carrying privileges.

The first treaties between European states to regulate international posts date from the seventeenth century: sometimes to guarantee the continuation of a regular postal service between belligerents, sometimes to agree new routes. Tampering with postbags, or interfering with postal messengers, could lead to crises in formal relations, and calculated retaliations. The profusion of bilateral treaties led eventually to a need for multilateral regulation at an international level, and relations between postal authorities are now regulated by the Universal Postal Union, founded in 1874 by the Treaty of Berne, and since 1948 an agency of the United Nations.

## **TRANSPORT TECHNOLOGY**

Until the late eighteenth century, postmen were still essentially post-riders, supplemented by short-distance packet boats within European waters, as later in the Caribbean and the coastal US. In the later eighteenth century, changing transport technology led to the appearance of stagecoaches, with attendant coaching inns and turnpike roads, and long-distance packet boats (and later still clippers), linking Europe and overseas colonies. The great merchant companies that dominated colonial trade and administration made tremendous efforts, not always profitably or successfully, to provide regular links to overseas colonies.

In the nineteenth and twentieth centuries, postal services were the biggest institutional customers for steam packets, for railways, and later for civil aviation. Postal contracts were important elements in financing new rail, shipping, and air services. Experiments with airmail began as early as 1911, and the first international airmail services were launched in 1919.

## **MODERNIZATION**

The nineteenth century saw a general overhaul of the working practices of the posts, first in the British Post Office and soon copied or adapted throughout the world. Rowland Hill's introduction of the adhesive penny stamp in 1840 provided a cheap and simple means of prepayment for conveyance of letters. The collection of prepaid mail from roadside postboxes, with near-universal delivery to the door, made the benefits of postal communication much more broadly available, but at the expense of the posts' earlier profitability. In subsequent decades Frank Scudamore spearheaded the introduction of parcel post, postal savings, and a post-office monopoly on the telegraph (later extended to the telephone; → *Telegraph, History of*). Like regular postal delivery itself, fixed-line telecoms were widely seen as a natural monopoly that could more usefully be run as a state agency than as a private business. In some countries the post office did not directly manage telecoms, but typically a Ministry of Posts and Telecommunications combined oversight of the posts with a regulation of telecoms that often came to include some degree of formal or informal → *censorship* (→ *Censorship, History of*) of → *radio* and → *television*. In twentieth-century welfare states, post offices were often the preferred point of payment for pensions and other disbursements to individual citizens. By the end of the twentieth century, the Japanese post office was the single largest financial operator in the world.

The US Postal Service eschewed or abandoned all these developments to an extent unusual among national post offices; although at its height, during the banking collapses of the 1930s, US postal savings were by far the largest guarantor of private savings. Since the late twentieth century, many postal regimes have retreated from the model of a nationalized monopoly combining wide fields of operation in different aspects of communication, administration, and finance, and have opened almost every aspect of post-office activity to privatization and competition.

## **SOCIAL IMPACT OF THE POSTAL SERVICE**

In seventeenth-century Europe, the institution of regular national and international posts open to the general public facilitated a massive expansion in correspondence. The working practices not only of diplomats and administrators, but also of merchants, scholars, the legal profession, scientists, and publishers, were all transformed by the advent of a regular service for the transmission of letters, → *newspapers*, and small packages. This was a necessary precondition for the beginnings of print → *journalism* in the first decades of the seventeenth century. The nineteenth-century reforms of Hill and Scudamore made the postal service an even more important lever of → *modernity*. The developmental potential of public postal services was recognized and promoted by the United Nations, through the agency of the Universal Postal Union, throughout the second half of the twentieth century.

The history of the posts is closely intertwined with the history not only of business but also of employment. In the industrial nations of the nineteenth century, post offices were typically the largest public sector employer. Their three-tier organization (postmaster general, postmaster, postman) was the model for middle management in the nineteenth-century development of railways (with station masters), retail chains (with store managers), and banking and insurance enterprises (with branch managers; → *Supervisor–Subordinate*

Relationships). The rationale for employing women in public service as sorting and counter clerks in post offices, and as telegraphists and telephonists, was purely to economize on wages, but had the side-effect of facilitating the social acceptability of working women. In a number of countries, the postal service produced test cases in equal opportunities (both sexual and racial) and in public sector unionization.

## POSTAGE STAMPS

The invention of the postage stamp opened a new area to forms of mass official communication. Written communication between private individuals came to use tokens bearing portraits of rulers, dynastic or national emblems, and other value-laden images of all sorts. Under highly ideologized regimes there was particular sensitivity to such iconography: during China's Cultural Revolution, for instance, philatelists might suffer for the hoarding of what could be considered reactionary or capitalist images. The collectibility of stamps has given rise to a philatelic sub-culture with its own literature, journalism, and economics. Old post offices, postage stamps and covers, postboxes and postal uniforms have all become elements of "heritage" nostalgia. Nevertheless, academic study of stamps is virtually nonexistent, and of postal history in a broader sense little better.

# Postcolonial Theory

Shanti Kumar

University of Texas at Austin

The emergence of postcolonial theory as an academic tradition, particularly in the United States, can be traced to the late 1970s with the publication of Edward Said's book *Orientalism* (1978). According to Said, Orientalism is a powerful body of knowledge – power/knowledge in Michel Foucault's sense (→ Structuralism) – produced by texts and institutional practices of western colonialism beginning with Napoleon's conquest of Egypt in 1798. Said finds three key elements in Orientalism: first, the power/knowledge of colonial institutions and texts to understand, control, and manipulate the "Orient" (or the east); second, the representation of "Oriental" societies as an unchanging cultural essence; and third, the fabrication of the "Orient" as an ahistorical space waiting to be transformed by historical progress and social development.

Orientalism, according to Said, was a European enterprise from the beginning. Its producers were European scholars and writers; its consumers were European students and readers; the non-European subjects of Orientalism figured only as inert objects. Since the "western self" of the European Orientalist made sense only in opposition to the "Oriental other," the traces of each in the other were systematically ignored or concealed. By positing that the east–west binary opposition predated colonialism, Orientalism also made Europe's colonial conquests seem legitimate. According to Said, although Orientalism underwent considerable changes over time, its basic structures and procedures have remained rather stable.

One of the most significant and sustained challenges to the Orientalist discourses of European colonialism (and later American imperialism) has come from theorists and practitioners of postcolonial nationalism, particularly in Asia, Africa, and Latin America. And yet, postcolonial nationalists stayed within the dominant frameworks of western power/knowledge to imagine a nation that is at once modern in its political statecraft and authentic in its cultural history and memory. In *Nationalist thought and the colonial world*, Partha Chatterjee (1986) demonstrates how Indian nationalists like Bankim, Gandhi, and Nehru struggled to create an authentic vision of an uncolonized nation, even as they were heavily influenced by western theories of modern statecraft and Orientalist representations of Indian history and culture. Following the European Orientalists who came before them, many Indian nationalists saw India as an essentialized unity; its historical progression was still seen in terms of the (ancient) Hindu, the (invading) Muslim, and the (modern) British periods.

Despite their complicity with Orientalism, the postcolonial nationalists did manage to break the Orientalist monopoly on power/knowledge, establishing the postcolonial subject as a sovereign, rational, and active agent of history. Therefore, as Gyan Prakash (1996) argues, postcolonial nationalism – notwithstanding its many contradictions – should be considered one of the most important ways in which the third world writes its own history.

If postcolonial nationalists accused Orientalism of deliberate ideological misrepresentations, Marxist critics of third world nationalism have argued that the idealized

notion of a unified postcolonial nation is itself an ideological category, not unlike Orientalist idealizations of the colonial world. Thus, one of the major contributions of Marxism in postcolonial theory has been to destabilize the illusion of an undivided nation and to point toward the heterogeneity of the nationalist subject – albeit only in the economic domain of class struggles between dominant elites and subordinated workers.

Moving the debate on postcolonial theory beyond the political-economic domain, some cultural anthropologists, sociologists, and structuralist historians have worked to reveal heterogeneity in the domains of race, gender, class, caste, age, religion, region, language, and so on. However, for a long time, many of these approaches, like Orientalism, remained “essentialist” in theorizing colonial and postcolonial discourses with reference to essences of either class, social deep structures, or native culture.

A crucial break from the essentialist legacy of Orientalism has come from a recent turn toward anti-essentialism, or what is also known as postfoundationalism or post-Orientalism. One of the most prominent and successful contributions is found in the works of the Subaltern Studies Group. This group, dispersed across North America, Latin America, Africa, Asia, Australia, and Europe, has come up with what Edward Said (1988, v) described as “massively detailed, and frankly revisionist . . . fiercely theoretical and intellectually insurrectionary accounts of marginalized subjects in the colonial and postcolonial worlds.” Ranajit Guha (1988, 35) writes that the word “subaltern” is used “as a name for the general attribute of subordination . . . whether this is expressed in terms of class, caste, age, gender, and office, or in any other way.”

Arguing that much writing on the history of the postcolonial world is teleological and essentialist, the Subaltern Studies Group has attempted to construct anti-essentialist histories from below – from subaltern perspectives. Some early writings relapsed into essentialist frameworks of Hegelian dialectics and Marxist ideology critiques to “recover” the subaltern from elite domination. However, the Group’s creative deployment of the subaltern as a heterogeneous, hybrid, and historically contingent subject has been theoretically refreshing and methodologically reinvigorating.

A sustained focus on historical contingency, marginality, heterogeneity, and hybridity in Subaltern Studies has been further emphasized by other leading postcolonial scholars, such as Homi Bhabha, Nestor Garcia Canclini, Stuart Hall, and Gayatri Spivak. Their scholarship has been particularly significant in contemporary debates because it situates postcolonial theory in a global context where it intersects productively with other anti-essentialist theories in postmodernism, poststructuralism, post-Marxism, and feminism.

## Postdevelopment

*Jan Nederveen Pieterse*

*University of Illinois at Urbana-Champaign*

Along with “anti-development,” postdevelopment is a radical reaction to the dilemmas of development. Perplexity and extreme dissatisfaction with business-as-usual and conventional development rhetoric and practice are keynotes of this perspective. This perspective emerges out of frustration with the seeming inability of development intervention to improve the lives of those in need. As a critical response to the development industry, this approach raises concerns with the imposition of science as power, cultural imperialism, and environmental destruction (→ Cultural Imperialism Theories; Sustainable Development).

Resistance to development involves the realization that attaining a middle-class lifestyle for the majority of the world population is impossible. There are different strands to resistance to development. “Anti-development” is inspired by anger with development business-as-usual. “Beyond development” combines this aversion with scanning the horizon. “Postdevelopment” adopts a methodology of → discourse analysis. These positions overlap with critiques of → modernity and technoscientific progress as in ecological movements (→ Modernization).

Development intervention requires the management of a promise – and what if the promise does not deliver? Living in Chiapas or other oppressed and poor areas, chances are that development is a bad joke. Postdevelopment is not alone in looking at the shadow of development; all critical approaches to development deal with its dark sides. *Dependency theory* raises the question of global inequality (→ Dependency Theories). Alternative development focuses on the lack of popular participation (→ Participatory Communication). Human development addresses the need to invest in people. Postdevelopment focuses on the underlying premises of development, and what sets it apart from other critical approaches is its rejection of development. Since the 1980s activists and intellectuals in Latin America, Asia, Africa, and Europe have taken up these views. They typically problematize poverty, view development as westernization, and critique modernism.

Economists in the field of development focus on issues of poverty. Yet one can distinguish between “frugality,” as in subsistence economies, “destitution,” which arises when subsistence economies are weakened through growth strategies, and “scarcity,” when the need for commodities takes over. Often development policies encourage the implementation of growth strategies with caution, building on frugal lifestyles with appropriate

technology and maximum use of local resources. "Poverty" may be seen as more than an economic deficit, though, as engaged through Frierean approaches such as conscientization and human-scale development.

### THE ANTI-DEVELOPMENT PARADIGM

Anti-development thinkers object to development as a form of westernization. With decolonization came critiques of cultural imperialism and "Coca-Colonization." Yet, this may deny the agency of the global south and the extent to which the south also owns development (→ Development, Geometry of). Development perspectives such as dependency theory, alternative development, and human development originate to a significant extent in the south. A more appropriate rejoinder to Eurocentrism is recognizing that multiple centers, also in the global south, shape development discourse.

Part of anti-western sentiments is *anti-modernism*. No doubt development suffers from "psychological modernism," through its focus on technological progress over human development. Social movement groups in the west have joined others in the south in their resistance to the privileging of science as power. "Science" here means Enlightenment thinking, positivism, and achieving mastery over nature. Yet the utility of science is more complex. Ecological movements use scientific methods to monitor energy use, pollution, and climate changes.

Like Orientalism, analyzed by Edward Said, → development discourse serves to produce and manage developing countries. Discourse analysis, scrutinizing language as a framework of structures of thought, has become a critical tool in development studies. This type of analysis permits broad critique of the development industry as a whole.

### PECULIARITIES OF THE POSTDEVELOPMENT

Postdevelopment critique differs from other alternative approaches in its rejection of the system of development, whereas some alternative strategies advocate working within the system. However, postdevelopment critics are not interested in alternative development, but in alternatives to development. Postdevelopment challenges the managerialist nature of development, when it attempts to shape and control economies and societies. So what to do? One response is nothing. However, doing nothing comes down to endorsing the status quo.

Postdevelopment thinking is uneven. In proposing to do away with development, postdevelopment essentializes "development." Essentializing "development" is necessary to arrive at the repudiation of development, and without the anti-development pathos, postdevelopment loses its foundation. Some postdevelopment claims misrepresent the history of development. The *Development dictionary* refers to the 1940s as the beginning of the development era (Sachs 1992). But the application of development to the south started with colonial economics and besides, development has an older history in the latecomers to industrialization in central and eastern Europe and in Soviet economic planning. Dichotomic thinking, pro- and anti-development, underrates the complexity of motives and motions in modernity and development. Postdevelopment's take on real existing development is narrow. Many reflections are general and do not discuss cases.

When cases are described, the experience of East Asia is ignored, despite its economic achievements.

In response to these concerns, postdevelopment opts for Gandhian frugality, grassroots movements, and indigenous knowledge. But none of these necessarily add up to rejecting development. If we read neo-liberal critiques of the developmental state side by side with postdevelopment critiques of development power, the parallels are striking. Both agree on state failure, though for different reasons. According to neo-liberal critics, states fail because of rent seeking; postdevelopment critics object to authoritarian social engineering and the faith in progress. Yet the net political effect is much the same and there is an elective affinity between the development agnosticism of neo-liberalism and postdevelopment.

Some argue that many social movements in the global south resist development. However, social movements in the south are too diverse to be captured under a single heading. Some are concerned with access to and inclusion in development programs, while others attempt alternative political action.

### **CRITICISM OF POSTDEVELOPMENT**

The politics of resistance to development is one of local struggles in the limited sense of Michel Foucault, rather than emancipation. Foucault's imagination of power is an imagination without exit. Accordingly, postdevelopment takes critique of development to the point of retreat. The imaginary of power that inspires postdevelopment leaves little room for forward politics. Instead, what postdevelopment offers is a cultural critique of development in which development is a substitute for modernity.

Postdevelopment is caught in rhetorical gridlock. Using discourse analysis as an ideological platform invites political quietism. In the end, postdevelopment offers no politics besides the self-organizing capacity of the poor, which lets the development responsibility of states and international institutions off the hook. Since most insights in postdevelopment sources are not specific to postdevelopment, what is distinctive is the rejection of development. Yet the rejection of development does not arise from postdevelopment insights as a necessary conclusion. Postdevelopment parallels postmodernism both in its acute intuitions and in being directionless in the end, because of the refusal to translate, or lack of interest in translating, critique into construction. It also matches the neo-traditionalist reaction to modernity with romantic and nostalgic strands.

Social movements, north and south, engage not merely in resistance but also in transformation and cannot be simply captured under the label "anti." Postdevelopment's strength is a hermeneutics of suspicion and an anti-authoritarian sensibility. But since it fails to translate this into a constructive position what remains is whistling in the dark. Postdevelopment adopts a wide angle in looking at development through the lens of modernity. Yet its optics is not sophisticated and its focus is blurred. Resistance to development and postdevelopment are based on flawed premises, flawed not as sensibilities but as positions.

The problem is not the critiques, but the accompanying rhetoric. "Alternatives to development" is a misnomer because no alternatives to development are offered. There is critique but no construction, resistance but no transformation. "Postdevelopment" is misconceived because it attributes to "development" a single and consistent meaning that does not match either theory or policy, and thus replicates the rhetoric of development

rather than penetrating its polysemic realities. It echoes the “myth of development” rather than leaving it behind. Postdevelopment makes engaging contributions to collective reflexivity about development and as such contributes to philosophies of change, but its contribution to politics of change is meager. (General sources are in Sachs 1992; Rahnema & Bawtree 1997; a wider treatment is in Nederveen Pieterse 2001.)

## **Poster**

*Marion G. Müller*

*Jacobs University Bremen*

Posters are visual means of communicating messages to large public audiences (→ Visual Communication). A poster is a printed mass media product (→ Printing, History of). Although → graffiti and murals are predecessors of posters, they do not qualify as posters, since one of the defining criteria for a poster is its mass reproducibility. While graffiti and murals exist only as single objects, attached to a specific place, posters are movable objects produced in large quantities to cover a wide geographical area.

The production of posters is typically event-related: political campaigns (→ Election Campaign Communication), advertising campaigns (→ Advertising Campaign Management), or simple announcements of cultural events count among the typical events leading to poster production (→ Media Events and Pseudo-Events). While posters in the context of an electoral or commercial campaign have to be considered as *paid media*, protest posters, produced for demonstrations or expressing clandestine opposition, are free media that have an end in itself and are not part of a larger, commercialized production process.

Historically, the poster or “placard” as a public announcement is linked with political upheaval and war. Already in the seventeenth century Netherlands, so-called *plakatten*, posted to walls and other public places, were used by the Dutch to protest Spanish domination. The twentieth century saw an increase in poster production and their public use. Both the German revolution of 1918 and World Wars I and II (e.g., Gregory 1993) were accompanied by heavy poster propaganda and counter-propaganda (→ Propaganda, Visual Communication of). US President F. D. Roosevelt’s New Deal policy enlisted poster artists like Ben Shahn in the Work Progress Administration (WPA), producing an

abundance of posters for all occasions, from tourism to theater and later on war-related topics (DeNoon 1987).

Two developments were prerequisite for modern posters to be used as means of mass communication. The first was the invention of lithography at the end of the eighteenth century, which enabled the reproduction of visual motifs in large quantities. Second, the political development of mass democracy in the nineteenth and twentieth centuries created an audience and a market for posters.

Posters are produced for the purpose of being displayed in public. In the US, during the 1960s and 1970s, printed posters and billboards were largely replaced by televised commercials (→ Advertising, History of). Contemporary political campaigns in the United States print posters, if at all, only in small numbers, mainly as collector's items. Outside the US, and particularly in Europe, posters maintain their role as a major communication tool, both in political campaigning and in commercial → advertising (→ Political Advertising).

### **POLITICAL CAMPAIGN POSTERS**

Today, the dominant usage of posters is in the political realm (→ Political Communication). Election posters, which are still widely used outside of the United States, possess a distinct → iconography. The most pervasive motif is a candidate's headshot in the context of a political election campaign. The majority of political posters feature portraits (→ Portraiture). Thus, the election campaign poster is a specific, and in quantitative terms dominant, sub-category of the political poster.

Lithography, a printing technique that uses the repulsion of water and grease for the reproduction of graphic images, was invented by the Bavarian printer Aloys Senefelder around 1796 (→ Prints). This cheap and relatively fast technique to reproduce visuals spread quickly in western Europe and was mainly used in art and in early forms of advertising. The political poster needed a second "fertilizer" – mass democracy – to flourish in the second half of the nineteenth century. This happened to be in the United States of America, the world's first mass democracy. The first publication of a lithograph in the US dates back to the year 1819, but it took another 20 years before this printing technique became popular. The political campaign poster emerged to become a characteristic feature, first of presidential campaigning, then of campaigning in general. Although posters were produced in France and Germany in the nineteenth century, these countries still lacked the mass audiences at which political posters were targeted. Thus, the origin of the modern printed election poster is the US presidential campaign. Four phases of the presidential campaign poster can be distinguished (Müller 1997): the experimental phase (1828–1840), the commercial poster period (1844–1880), the partisan mass-printing period (1884–1948), and the extinction of the poster and replacement by television ads (1952 to the present).

While nowadays political posters and other campaign items are usually commissioned by respective campaigns, and in Europe by the political parties running campaigns, the employment of candidate portraits in poster format owes much to the commercial genius of America's early lithographers. Lithography as a trade blossomed in the 1840s and 1850s and kept its momentum until the end of the century, when color lithography, or chromolithographs, were fashionable. Around 1860, a total of 60 firms operating in the United States were registered, employing 800 people. Twenty years later the census of

1880 showed an increase to 167 lithography firms, employing a total of 4,332 people and with a production volume worth US\$6,912,338. The business kept growing and toward the end of the nineteenth century 700 lithograph companies were registered, with a total labor force of about 8,000 and a turnover of about US\$20 million annually (Marzio 1979, 3). Given those figures it comes as no surprise that in the 1840s small lithographic firms like the New York-based Currier and Ives were also offering political posters.

From the perspective of twentieth-century campaigning, where the differentiation of candidates is crucial, the similarities of opposing candidates' posters is surprising. For example, the only differences between the posters for the Whig presidential candidate Henry Clay and the competing Democratic candidate James K. Polk are the portraits and the accompanying names and slogans. The rest of the poster, including an American eagle, flags, floral ornaments, and framing curtains are identical. This was typical for the commercial period of the electoral poster, since these posters were meant to be sold by peddlers at very low price. The most expensive part of the poster production was the original → design of the poster prepared by an artist (→ Graphic Design). In presidential campaigns, those designs could be used twice by just exchanging the medallion-shaped portraits of the candidates, and thus reducing production costs. These early campaign posters were meant to be posted indoors – in saloons, at the sheriff's office, and by the large partisan audience at home above the fireplace.

At the turn of the nineteenth century the printing trade had reached its peak. The professionalization of presidential campaigning had led to a reversal of the production structures of posters. Formerly offered as a news item by commercial lithographers, the posters became products that were commissioned and paid for by individual campaigns, with distinct Republican or Democratic party symbols. These colorful posters had a larger format and were no longer meant for private display, but for adorning party rallies, work spaces, public billboards, as well as street parades. The New Deal campaigns of Franklin D. Roosevelt employed artists like Ben Shahn (see above) to design posters and billboards for his campaign (DeNoon 1987; → Art as Communication).

With the introduction of television commercials for Dwight D. Eisenhower's first presidential bid in 1952 posters became first old-fashioned, then too costly, and finally obsolete in modern US campaigning (→ Advertisement, Visual Characteristics of). Television advertisements had many advantages (→ Television; Television, Visual Characteristics of). They provided a national reach at comparatively low cost, and they could convey more information in a short period of time. Still, the poster tradition lives on. Stereotypes of presidential candidates were long established in political posters before electronic communication was available. Thus, the US presidential campaign poster can be termed the legitimate predecessors of contemporary TV and → Internet commercials. The medium has changed, but the political messages vary only marginally, as can be demonstrated by the main types of visual campaign strategies, most of which are still applied in twenty-first-century campaigning.

### **CAMPAIGN POSTERS IN GERMANY AND FRANCE**

In Germany, to this day, publicly advertised billboards and posters signal the election campaign. Campaign posters still rank high in the mix of paid media used by German

parties to communicate with the electorate. Although a slight decline in the importance of posters can be observed when comparing the campaigns of 1998 and 2002 (Müller 2002), posters still ranked second on the list of most important campaign communication tools, surpassed only by party conventions in 1998 and by the then newly introduced → televised debates in 2002. Since in the German public broadcasting system, television commercials for parties running in the general election are limited according to party size, but have to be aired for free, TV advertising does not dominate German campaign communications and has not yet replaced the posters.

The colorful French tradition of political campaign posters (Benoit et al. 1986; Gervereau 1991) was abruptly curbed in 1990 by the Loi Rocard, a law titled after then French Prime Minister Michel Rocard that expressly banned all forms of political advertising within the three months preceding an election, including newspaper advertisements and commercial posters. Posters can now be displayed in public during election time only in designated poster areas in the immediate vicinity of polling stations. Elaborate billboard campaigns like the one that brought President Mitterrand to power in 1981 – “La force tranquille” (the tranquil force), drafted after the image of US actor John Wayne – belong to the past. Thus, in contemporary French campaigning, posters no longer play a significant role.

## PROPAGANDA AND PROTEST POSTERS

The twentieth century, and particularly the two World Wars and the following Cold War, were the heyday of political posters. Posters were a crucial strategic tool of war propaganda on all sides (Gregory 1993; → Propaganda). Communist regimes in the Soviet Union and in China perfected large billboard campaigns which were spread over vast territories to propagate the communist model of society.

Contemporary usage of political posters is, with few exceptions, concentrated outside of the western and the developed world. For example, the use of posters of religious leaders, of victims of violence, and of terrorist “martyrs” in public rallies and demonstrations in the Near and Middle East is a scarcely researched topic. Additionally, in many non-western countries election posters still play an important role that requires further investigation.

## Postfeminism

*Rosalind Gill*

*London School of Economics and Political Science*

Postfeminism is one of the most important and contested terms in the lexicon of western feminist cultural critique. The term signifies something that is either after or beyond feminism in some way, yet still maintains a distinctive relationship to it. The notion of postfeminism was first used in the 1920s to describe the reaction against women's activism in the early part of the twentieth century (Faludi 1992), but it is only since the early 1990s that it has come to prominence as a central term in the field of gender and media.

In recent years, debates within feminist media and communication studies about topics as diverse as the history and exclusions of feminism, the gender consciousness of young women, and the ideological nature of contemporary media have crystallized in disagreement about postfeminism. The term is used both to signal a theoretical orientation or approach, and to capture empirical changes in the way that gender is represented. Broadly speaking, it is possible to identify four major ways in which the term is used, each of which is considered below.

### POSTFEMINISM AS EPISTEMOLOGICAL BREAK

For a number of writers, postfeminism represents an epistemological break with second wave feminism and marks “the intersection of feminism with a number of other anti-

foundationalist movements including post-modernism, post structuralism and post colonialism” (Brooks 1997, 1). “Post,” as it is used in this sense, implies transformation and change and signals a critical engagement with earlier/other forms of feminism. It is alleged to have arisen partly as a result of critiques from black and third world feminists who destabilized dominant feminist theorizing and interrogated the right of (predominantly) white western (northern) women to speak on behalf of all others.

Combined with this were the critical challenges mounted by postmodernism and poststructuralism (→ Postmodernism and Communication; Structuralism), which called into question the ways in which feminist theory relied on dualistic thinking and upon totalizing concepts (such as “patriarchy”). Postfeminism in this sense marks a shift away from a focus on equality to a focus on debates about differences, and from structural analysis and meta-theorizing toward a more “pluralistic conception of the application of feminism” that “addresses the demands of marginalized, diasporic and colonized cultures for a non-hegemonic feminism capable of giving voice to local, indigenous and post-colonial feminisms” (Brooks 1997, 4; → Feminist Media Studies, Transnational).

In cultural and media analysis, postfeminism in this sense is mostly encountered as an *analytic perspective*, rather than a description of the nature of any particular cultural product. Its value is in stressing the manner in which gender is connected to other forms of marginalization and other axes of power such that it can never be examined separately from “race,” colonialism, sexuality, and class. Amanda Lotz (2001) has suggested that for a text to be considered postfeminist (in this rather positive sense) it should contain the following four features: narratives that explore women’s diverse relationships to power; depictions of varied feminist solutions; attempts to deconstruct the binaries of gender and sexuality; and illustrations of contemporary struggles.

### POSTFEMINISM AS HISTORICAL SHIFT

In this perspective, a historical rather than epistemological or theoretical shift is considered important. This approach attempts to periodize feminism and regards postfeminism as a period after (the height of) second wave feminism. Sometimes it is used synonymously with “third wave feminism” (particularly in the US context, where the notion of a third wave is more fully developed than elsewhere). It seeks to mark a time not after feminism per se, but after a particular moment of feminist activity and a particular set of feminist concerns. For Joanne Hollows (2000) postfeminism is not necessarily anti-feminism, but represents a *new kind of feminism* for a new context of debate. Hollows is angered by a type of feminist analysis that holds new writing and contemporary cultural texts (whether films or sitcoms or chick lit novels) up against a “1970s version” of feminism – only to find them wanting. The feminism in such popular texts is always said to have been “neutered” or “co-opted” or “emptied of its radical potential,” she argues, whereas it may in fact have simply changed – for a new moment. Such critique, Hollows suggests, serves to reify feminism, and works on a “recruitment” model, rather than thinking of feminism as dynamic, negotiated, and in a process of permanent, ongoing transformation.

Similarly, Rachel Moseley and Jacina Read (2002) argue that the polarization in feminist thought between feminism on the one hand and femininity on the other is a

product of the thinking of the mid-1970s. Discussing criticisms of the successful US television show *Ally McBeal* that attack it for wanting to “have it both ways” (with Ally as a mini-skirted male fantasy *and* a successful, professional woman), they ask: why *shouldn't* she have it all ways? She is, they suggest, a postfeminist heroine, a female protagonist for our times, who wants it all and does not observe (what may seem to her and to her audience) arbitrary boundaries around behavior, address, or aspiration.

This is a powerful argument and the critique of second wave ideas as the “one, true way” is an important one. The problem comes in specifying what, if anything, might constitute the *content of postfeminism*. It seems infinitely flexible. Critical observers might note also the way in which a politically sanitized, neo-liberal, and highly sexualized version of postfeminism circulates in the media, where girl bands like the Spice Girls, “babes” like Ally McBeal, and a collection of silicon-enhanced supermodels are among its most celebrated icons (→ Women’s Media Genres).

### POSTFEMINISM AND THE BACKLASH

A third way in which postfeminism is used is to refer to discourses that constitute part of a backlash against feminist achievements or goals – the “post” in postfeminism, here signaling a reaction against feminism (Faludi 1992). Backlash discourses take many contradictory forms. They often work by attributing all women’s unhappiness to feminism, but may also suggest that “all the battles have been won” or, conversely, that “you can’t have it all – something has to give;” that “political correctness” has become a new form of tyranny; that (white) men are the real victims, and so on.

Imelda Whelehan (2000) argues that contemporary postfeminist discourses are often characterized by “retrosexism,” premised on real fears about the collapse of masculine hegemony. She has explored the nostalgic quality of much contemporary television, which harks back to a time and place peopled by “real women” and humorous “cheeky chappies,” and argues that representations of women “from the banal to the downright offensive” are being “defensively reinvented against cultural changes in women’s lives” (Whelehan 2000, 11). Similarly, in her recent writing about → advertising, Judith Williamson (2003) argues that contemporary postfeminist sexism operates in two main ways: through the frame of a period style in which the retro styling offers an alibi for notions about men and women and gender relations that, if expressed in contemporary language or settings, would garner significant critique, and, alternatively, through increasingly fetishistic sexual imagery that “depicts power relations as about S&M sex rather than who washes up or chairs the board” (2003, 2).

These arguments are valuable for trying (unlike the other two approaches considered so far) to say something about the normative or ideological content of postfeminist discourses, but they do not tell the whole story. In particular, the focus on harking back may miss what is new about contemporary depictions of gender. Moreover, while notions of backlash and retro-sexism have been crucial in highlighting the reactive (as well as reactionary) nature of many contemporary representations, the elision of postfeminism with anti-feminism misses a crucial feature of current media discourses: namely the entanglement of feminist and anti-feminist ideas within them.

## POSTFEMINISM AS A SENSIBILITY

The notion of postfeminism as a sensibility is an attempt to fashion an understanding of the term that could be used analytically, but which would not be limited to studying media products that were obviously backlash texts. For scholars who use it in this way, postfeminism is the *critical object of analysis*, rather than a theoretical orientation or a new form of feminism. The approach does not require a static notion of one single, authentic feminism as a comparison point, but instead is informed by postmodernist and constructionist perspectives (→ Constructivism), and seeks to identify what is distinctive about contemporary articulations of gender within media and cultural texts.

The notion of postfeminism as a sensibility originated out of a dissatisfaction with other models of postfeminism – in particular, the difficulty of specifying with any rigor the features of postfeminism, and the problem of applying the notion to any particular cultural or media analysis. The notion of a sensibility aims to answer questions such as: what makes a text postfeminist? What features need to be present in order for any media scholar to label something postfeminist?

The notion emphasizes the contradictory nature of postfeminist discourses and the entanglement of postfeminist and anti-feminist themes within them (McRobbie 2004). It argues that postfeminism is best thought of as a sensibility that characterizes increasing numbers of films, television shows, adverts, and other media products. A number of relatively stable features that together constitute a postfeminist discourse characterize this sensibility. These include the notion that femininity is a bodily property; the shift from objectification to subjectification; an emphasis upon self-surveillance, monitoring, and discipline; a focus upon individualism, choice, and empowerment; the dominance of a “makeover paradigm”; a resurgence of ideas of natural sexual difference; the marked sexualization of culture; and an emphasis upon consumerism and the commodification of difference (→ Commodity Feminism). These themes coexist with and are structured by stark and continuing inequalities and exclusions that relate to race and ethnicity, class, age, sexuality, and disability – as well as gender (Gill 2007).

## DEBATES AND DILEMMAS

It should be clear that postfeminism is at once a central critical term within feminist media studies, and a term about which there is little consensus. Recent attempts to reconceptualize postfeminism as a sensibility go some way to beginning the process of attempting to “map” or chart the nature of postfeminism – but existing attempts are likely to produce further disagreement. In addition, the term may be challenged for its *northern-centrism* and its lack of applicability to the global south. It has emerged and been most contested in the Anglophone cultures of the US and the UK, and it is not clear that the notion would have much value in developing countries, where feminism itself takes such different forms. Linked to its lack of global applicability is the tendency to restrict analysis to a highly selective number of media texts. The principal ones are *Sex and the City*, *Ally McBeal*, and *Bridget Jones's Diary*. Each of these has been subjected to

extensive analysis, while most media output remains, as yet, entirely unanalyzed from this perspective. It is therefore difficult to draw any conclusions about the extent to which contemporary media are showing postfeminist tendencies. The white, middle-class homogeneity of most texts discussed as postfeminist is also worth noting. Finally, the term has been used almost exclusively in relation to media texts, and its relevance or usefulness for audience research or for organizational or political economy studies have yet to be explored.

## **Postmodernism and Communication**

*Jay David Bolter*

*Georgia Institute of Technology*

Postmodernism is one of a series of terms, including postmodernity and post-structuralism, that is applied to cultural production in western Europe and North America in the period from the 1960s to the present. Postmodernity is sometimes used to refer to the cultural history of this period. Poststructuralism was a critical practice directed toward literary, linguistic, and philosophical movements that flourished around

this time. The term “postmodernism” itself is defined in opposition to “modernism” in order to describe contemporary forms of art and architecture and their aesthetics.

Postmodernism began in the 1960s as a response to high modernism, particularly in architecture and the plastic arts (→ Art as Communication). The qualities of postmodern literature were less well defined (→ Fiction). The distinction between modernism and postmodernism was perhaps always clearer for critics than for cultural practitioners. High modernism’s most influential critic was Clement Greenberg, whose essays such as “Modernist painting” seemed to capture an aesthetic that was already passing. Greenberg’s notion of purity in artistic goals and his insistence on maintaining the distinction between high art and popular culture were being contradicted in practice by minimalists, pop artists such as Andy Warhol, and video artists such as Nam June Paik and Steina and Woody Vasulka. In “Art and objecthood,” the modernist critic Michael Fried attacked the minimalists for their “theatricality,” which he regarded as a betrayal of the modernist aesthetic (→ Aesthetics). Yet, the way in which these artists acknowledged the relationship between the work and the spectator helped to define postmodern installation and performance art. Greenberg’s and Fried’s modernism was subsequently challenged by other theorists such as Rosalind Krauss and Hal Foster in the pages of the journal *October*.

Poststructuralism specifically critiques the structuralist analysis of language, literature, and culture, including the work of Ferdinand de Saussure and Roman Jakobson in linguistics and Claude Levi-Strauss in anthropology (→ Structuralism). The most influential poststructuralists included Jacques Derrida, → Roland Barthes, Michel Foucault, and Paul de Man, each of whom had their own intellectual trajectories and never intended to found a coherent movement. To the extent that structuralism itself can be considered part of the modernist project, however, poststructuralism can be considered postmodernist.

Critical theorists also developed postmodernism into a general theoretical category (→ Critical Theory) – a development exemplified by two very different works: Jean-Francois Lyotard’s *The postmodern condition* (1984) and Fredric Jameson’s *Postmodernism* (1991).

Already in 1979, Lyotard’s brief but influential volume offered a more general view of postmodernism as a philosophical response, not only to modern art and the modernist movement of the twentieth century, but to what Lyotard and others came to define as the modern era in a broad sense, beginning in the eighteenth century or even earlier. Lyotard’s work did not focus on aesthetics, but instead offered a critique of the so-called grand or master narratives, which he identified in the ideologies and communicative practices of the modern period, advocating their replacement through multiple little narratives.

Jameson (1991), on the other hand, did take art and aesthetics as its starting point. He attempted to delineate various strands of postmodernism with specific analyses of architectural works, such as architect John Portman’s Westin Bonaventure Hotel in Los Angeles. Jameson’s guiding concern was to extend the discussion of postmodernism to cultural, ideological, and economic domains, as indicated in the subtitle: as “the cultural logic of late capitalism,” postmodernism’s aesthetic characteristics could not be separated from the economic conditions of postindustrial and global forms of economic organization now dominant throughout the developed world.

Jameson’s case for the inseparability of cultural forms and political ideologies has been accepted by a generation of cultural theorists in the humanities. The argument seemed

particularly relevant and convincing for popular cultural forms in the mass communication and entertainment industries, which were at this time becoming “global” to a degree not previously acknowledged (→ Globalization of the Media). While mergers in the communications industry were creating global “empires” in television and newspapers, at the same time the invention of the world wide web and its subsequent commercialization seemed to offer new venues to distribute popular entertainment (→ Commercialization of the Media). The video cassette and then the DVD emerged as new distribution methods for film and to some extent television. There was a growing concern that global companies would use these new distribution networks to promote the dominance of western and particularly American entertainment products throughout the developed and developing world.

If there is a common element in all of the “post-” terms and the work they represent, it might be that all of them are critical reactions to what are perceived as totalizing practices and rhetorics of the modern era. In each case, the reaction was an attempt to subvert claims to unity, simplicity, or universality. Those gestures of subversion constitute a legacy that remains influential today in the fields of art, art theory, and critical theory. Postmodernism also, arguably, has a legacy in → popular culture: music videos, social computing sites such as YouTube and myspace.com, and the products of remix culture (DJs and VJs) are postmodern in their rejection of single, simple representational practices.

## **Power and Discourse**

*Bernadette Vine*

*Victoria University of Wellington*

The concept of power, who holds it and how they use it has been of great interest to almost every field of social science. A crucial way in which power is expressed and resisted is through language. Ng and Bradac (1993) argue that language reveals power, language

creates power, language reflects power, and language obscures or depoliticizes power. It has even been claimed that there is no language situation, involving either public or private discourse, free from effects of power.

### TYPES OF POWER

Power can basically be defined as involving an unequal relationship between at least two people. Different types of power have been identified. French and Raven (1959) developed a framework of power which has been very influential. It contains five *main categories*: legitimate power (power due to position), referent power (power or ability to persuade and influence others), expert power (power derived from skills or expertise in an area), reward power (power that depends on the ability of the person in power to confer valued rewards), and coercive power (power that relies on using negative influence to get people to do things).

These types of power involve situations where one individual or group has power over another. Out of the five, coercive power is felt to be the least effective form, since it builds resentment and resistance. The overt marking of all five types of power has been decreasing in some societies over recent years, e.g., in Great Britain, making issues of *empowerment* and *consultative power* relevant (→ Communication Strategies for Empowerment). Consultative power involves someone, in, e.g., a position of legitimate power, seeking information from subordinates, considering their advice, and making plans with others rather than just telling them what to do.

### SOCIAL THEORIES OF POWER

Power is a complex and highly theorized phenomenon. Work in the 1950s and 1960s from a *behaviorist perspective* saw power as residing in individuals and as being observable through behavior. One major problem with this approach is that power is only understood to have been exerted if the recipient of the power acts in a way they would not otherwise have done. This approach also sees power as quantifiable. In contrast, the structural model of power developed by theorists such as Steven Lukes views power as more abstract, ideological, and hegemonic. All social action is seen to involve power because behind all language and action are ideas and values. Power is seen to shape people's perceptions and has the effect of making people accept things as they are and act in certain ways, even if it is not in their best interests to do so and even if they are not aware that they are doing it.

*Poststructuralist theories* of power include the work of Michel Foucault. Rather than viewing power in terms of dominance and ideology, Foucault proposes a concept of power as a complex and continuously evolving web of social and discursive relations. Language is acknowledged as having an important role to play here.

### CRITICAL DISCOURSE ANALYSIS

The structural view of power has been influential in the area of *critical discourse analysis* (CDA; → Discourse Analysis). One of the fundamental tasks of CDA is to account for the

relationships between discourse and social power. Power is seen as already accruing to some people and not to others. This power is determined by institutional role and socio-economic status, gender, or ethnic identity (Fairclough 1992; van Dijk 1993). In CDA, therefore, the role of power in discourse tends to be a question of examining how those members of society who possess it reflect, reinforce, and reproduce it through the language they use. The issue of access to discourse is an element of this, in terms of both private and public discourse.

The focus of CDA is ordinary, naturally occurring language. Fairclough (2001), e.g., illustrates power in discourse using data from newspapers as well as face-to-face spoken interaction. An example from face-to-face interaction involves the use of interruption by a doctor when interacting with medical students. The doctor interrupts a student several times. Fairclough interprets this as an indication of the doctor controlling the student's contributions, with interruptions here being seen as a device used to exercise and reinforce power.

Power may be exercised in different ways. Fairclough distinguishes between power through *coercion* and power through *consent*. As with French and Raven's "coercive power," "coercion" here refers to the use of negative influence to get people to comply. *Consent power* involves winning consent to, or at least acquiescence to, the possession and exercise of power.

### POWERFUL WAYS OF SPEAKING?

Early work in sociolinguistics on language and gender took the view that there are more or less powerful ways of speaking (→ Gender and Discourse). Women are seen to be in a more powerless position in relation to men, and the linguistic strategies they use are in turn felt to be less powerful than those typically evident in the speech of men. As shown by numerous empirical studies, however, it is not the linguistic form or strategy that is powerful. Rather, it is a question of who uses it and how. The same strategy can be used to exercise power or to show solidarity, or even to do both. Interruptions, e.g., may be used by a speaker to provide support for another speaker rather than as a device for directly controlling the other speaker's contributions. Furthermore, as Tannen (1994, 23–24) points out, "what appears as attempts to dominate conversation (an exercise of power) may actually be intended to establish rapport (an exercise of solidarity). This occurs because . . . power and solidarity are bought with the same currency: The same linguistic means can be used to create either or both."

The situation is further complicated by the fact that different speakers have different *norms*, or expectations. An example which clearly shows this is given by Tannen (1995) and involves two men, one from Detroit and one from New York City. The first man feels that the second man is pushy and uninterested in what he has to say because the man from New York City never leaves him the length of pause he expects in order to take a conversational turn. On the other hand, the second man feels that the man from Detroit has nothing to say. Not only are the two men unable to communicate effectively, but they also ascribe powerful and powerless intentions to each other that were not intended.

A further example provided by Tannen involves the use of questions. Gender has been seen to be a relevant factor when considering whether and when people ask questions.

Women have been found to ask more questions than men and do not see question-asking as a powerless strategy. Tannen argues that men are more aware of the potential face-losing aspect of question-asking. Men with this view do not ask questions because it might reflect negatively on them. They are also likely to have negative opinions of other people who do ask questions.

The use of language in *context* determines the function and effects of an utterance. Discursive power is a contextually sensitive phenomenon. Speakers draw on different linguistic devices more or less successfully depending on the people they are interacting with and the speech situation.

A recent area of sociolinguistic research which captures the idea of different norms involves the concept of → *communities of practice*. Under this model every community, be it a family, a company, or a country, has a culture of locally constructed values, relations, and ways of communicating and doing things. What counts as powerful or not in a situation therefore depends on the community of practice.

### THE NEGOTIATION OF POWER

The communities of practice framework has developed within a *social constructionist* approach to sociolinguistics. Social constructionism was adopted from sociology as a dynamic means of analyzing the relationship between aspects of language and social identity, initially by researchers interested in the relationship between language and gender. This approach is influenced by poststructuralist ideas and challenges the notion that power is held by some speakers and not by others. Attention is given to how power is constantly under negotiation by participants in an interaction and to how speakers “do power” (e.g., Holmes et al. 1999; Thornborrow 2002).

The social role of a person is a facet of a person’s identity that may be drawn on at different points in an interaction. Other aspects of their identity may be evident at other times; e.g., gender, ethnicity, or age. Identity in this view is something that speakers construct and maintain through discourse (→ Identities and Discourse). In this type of approach power may be resisted by people in positions of less power. At other times the building of solidarity and rapport may be more evident in the speech of a more powerful person than the overt expression of power.

The discourse of people at work has been the focus of much of this research (→ Business Discourse), and a range of qualitative approaches to analysis has been drawn on (→ Content Analysis, Qualitative). This is informed by approaches such as CDA but takes on elements of other approaches to language study as well (→ Politeness Theory; Conversation Analysis).

Unlike CDA, conversation analysis has not traditionally been concerned with issues of power. The idea that there are pre-ascribed roles is rejected, and contextual factors such as speaker status have only been seen to be relevant if there is evidence in the discourse that participants are orienting to these factors. The focus is on asymmetries that are made visible in the discourse. Context is of vital importance in this approach, but only at the level of surrounding talk. Hutchby (1996), however, argues that power can be analyzed using conversation analysis; interactional power being observable in small details such as the relationship between turns at talk.

## **Power, Dominance, and Social Interaction**

*Charles R. Berger*

*University of California, Davis*

When individuals engage in social interaction, regardless of the relationship they have with each other and the context within which it occurs (→ Classroom Power; Power in Intergroup Settings), power and dominance are fundamental dimensions that both shape and are shaped by communication (→ Power and Discourse). Studies of how people think about and judge their social relationships have consistently demonstrated the importance of a dominance dimension. People use this dimension to judge and experience their social relationships and the communication that occurs within them (Berger 1994; Ng & Bradac 1993). Judgments concerning who is dominant or submissive or who is “in control” easily come to mind, whether the judgments are made during or after a specific interaction episode or in an ongoing relationship consisting of multiple episodes.

These judgments may have substantial consequences. For example, people who consistently display dominant or submissive actions in their social commerce with others over time may be judged to have dominant or submissive personalities by those who interact with them. Not only are power and dominance fundamental features of social interaction among humans, dominance hierarchies are legion in the social behavior of

many animal species. Even when group members consciously strive to have “equal” amounts of power and “equal” status, dominance hierarchies emerge over time. Consequently, understanding how social interaction works requires attention to the role that social power and dominance play in its conduct.

## PERSPECTIVES ON POWER AND DOMINANCE

The concepts of power and dominance may be viewed from at least two perspectives: the individual and the relationship. Everyday parlance frequently reflects the *individual perspective*, as when people say, “She is an extremely powerful person” or “He is very controlling.” Such assertions imply that power is an attribute possessed by the individual and that one can have more or less of it. However, many power theorists have argued that power is more fruitfully viewed as a *characteristic of a relationship*. Individual A may indeed attempt to influence individual B during the course of a particular social encounter; however, individual B may resist individual A’s influence attempts to the point that A fails to influence B. Moreover, there is the possibility that individual B may exert counter-influence on individual A to the point that individual A is influenced. Consequently, social power is not simply a matter of attempting to influence others; it also involves social actors’ ability to overcome resistance from those they are attempting to influence (→ Relational Control). During the thrust and parry of social intercourse, control struggles may develop that eventuate in → interpersonal conflict (→ Social Exchange).

Although the relationship view of power is probably more useful than is the individual perspective for understanding how power dynamics play out during social interactions, considerable research has examined the degree to which individual personality dispositions such as dominance and power motivation influence individuals’ communicative conduct in social situations. In addition, a second research tradition has examined the ways in which communicative conduct in social situations influences observers’ attributions of power to individual social actors. This approach ignores the personality dispositions of individual social actors and focuses on the relationships between communication and perceptions of power and dominance. The question addressed in this research tradition concerns the relationships between specific features of verbal and nonverbal communication and observers’ judgments of the degree to which social actors are dominant. Each of these traditions is considered in turn.

## POWERFUL PERSONALITIES AND THEIR COMMUNICATION

A considerable amount of research has sought to understand the relationships between such *personality dispositions* as dominance and need for power and the behaviors individuals display while communicating with others. In the typical study, individuals first complete personality measures designed to assess their level of dominance or power motivation and are then placed in a group discussion situation. Video recordings of the discussion are analyzed to determine the frequency with which each group member participated in the discussion, the average length of time they spoke, how frequently they paused while speaking, the number of times they interrupted other group members, and how loudly they spoke. Each of these measures is a potential indicator of dominance. In

general, such studies have found that individuals who speak frequently and for longer times, pause less frequently when they speak, interrupt other group members more, and speak more loudly tend to score higher on personality measures of dominance than do people who score in the opposite direction on these communication parameters (Berger 1994). Thus, individual predispositions for dominance can be reflected in these nonverbal behaviors.

Related research on *power motivation* has produced similar findings (Winter 1973). Individuals with high power motivation levels seek to exercise influence over others. They define their social relationships in terms of power, and the successful exercise of power is their primary goal. Individuals with high power motivation gain power by making themselves visible to others and maintain power by surrounding themselves with loyal followers who are themselves not highly visible. Consistent with these power strategies, students with high power motivation were found to write more letters to their campus newspaper and be more likely to have their name posted on their dormitory room doors than their counterparts with low power motivation counterparts. Individuals with high power motivation also were more likely than those with low to seat themselves in visible positions during group discussions, and they displayed significantly more cantankerous behaviors during the discussions.

Findings like these provide support for the notion that individuals with high power needs seek to make themselves highly visible to others. Additional research found that in contrast to their counterparts with low power motivation, students with high power motivation tended to select as close friends students who were not well known to other students on campus. This finding provides support for the idea that those with high power motivation levels surround themselves with individuals who will not threaten their visibility.

### COMMUNICATION AND ATTRIBUTED POWER

Although the research just considered is predicated on the idea that relatively stable personality dispositions such as dominance and power motivation drive behavior, other research suggests that the behaviors social actors enact during social interaction episodes can promote *differential perceptions* of their power and influence among those who observe them. In the typical study, individuals engage in a group discussion that is video recorded and analyzed. At the conclusion of the discussion, each group member rates the degree to which every other group member was influential in the discussion. These judgments are then correlated with behaviors exhibited during the discussion to determine which behaviors are related to the influence judgments.

An analysis of 77 different experiments using this methodology showed an average correlation of .65 between the frequency with which group members verbally participated in the group and others' judgments of the degree to which they were influential in the discussion (→ Meta-Analysis). Those who spoke most often tended to be judged to be more influential than those who spoke little. Studies of this kind have revealed that individuals who interrupt others more, speak with greater vocal intensity, and pause little while speaking tend to be judged to be more influential than those who score the opposite on these speech parameters (Berger 1994). In addition to these *nonverbal indicators of*

*dominance*, some have broadened the list of relevant features to include verbal aspects of communication, under the heading of powerful versus powerless speech (Ng & Bradac 1993). Speech marked by the frequent use of qualifiers, hedges, and indirectness, in addition to nonverbal indicants of submissiveness such as a soft voice and frequent pauses, prompts judgments of powerlessness by observers.

Since the 1970s there has been considerable debate about how *sex differences in speech and language use* might influence people's judgments of women's and men's influence in social situations (→ Interpersonal Communication, Sex and Gender Differences in). Some have alleged, for example, that in contrast to men, women tend to display a characteristic speech style that creates perceptions of submissiveness and powerlessness, which may explain why women have tended not to rise to positions of power and influence in society (Lakoff 1975). Specifically, the claim is that more than men, women tend to: (1) use overly polite language when making requests; (2) employ tag questions when asserting opinions, for example, "It's a nice day, isn't it?"; and (3) use a rising vocal intonation when answering questions. The latter two of these forms were purported to make their users sound more uncertain and less confident about what it is they are saying and thus less influential in social situations. Contemporaneous studies of conversations between men and women revealed that men tended to interrupt women more often than women interrupted men, thus suggesting that men assume a dominant role in cross-sex interactions. Although some subsequent research has reported similar findings, there are a number of studies that have found either no sex differences in interruption rates or situations in which women interrupt men more than men do women (Berger 1994; Dindia & Canary 2006). Mixed results have also been reported for sex differences in the rates of tag questions and use of a rising vocal intonation in answering questions (Dindia & Canary 2006).

One explanation for these inconsistent results is the fact that interruptions, tag questions, and rising vocal intonation may serve a variety of functions during social encounters. For example, when a person says "It's a nice day, isn't it?" to someone, the tag question may serve as a friendly invitation to converse rather than a signal that the person is uncertain that it is "a nice day." Similarly, interruptions may serve a variety of functions other than bids for dominance. People may interrupt speakers to show support or agreement with what they are saying, or they may interrupt to seek clarification. The interrupter's primary goal is not to dominate the speaker, although observers of the interruption might infer that the interrupter is pursuing such a goal. Because such behaviors as interruptions, tag questions, and rising vocal intonations are multifunctional, merely counting their relative occurrence in conversations between men and women to determine who is more dominant cannot clearly reveal potential sex differences in the use of so-called "dominant forms" of communication.

Conversational topics might also determine whether women or men will dominate interactions between them. On average, women might dominate cross-sex conversations that happen to include time spent talking about women's fashions, while men might assume a dominant role when the topic is professional football. Of course, some men might dominate a discussion of women's fashions and some women could dominate a professional football discussion; however, in the aggregate such instances would probably be less frequent. In any case, some theories, such as status characteristics theory, suggest that individuals are accorded leadership (dominant) positions in groups when other group

members perceive that they possess certain status characteristics, such as education, leading perceivers to believe that such status characteristics are associated with special competencies (Berger et al. 1977). Dominance patterns in mixed-sex interactions may hinge in part on such competence inferences.

Most would agree that power and dominance are fundamental dimensions of social interaction. That verbal and nonverbal communication can both give expression to individual proclivities to exercise power and serve as grist for observers' inference mills when judging how dominant fellow social actors are is beyond dispute. However, the story that explains these complex relationships is still far from complete.

## **Power in Intergroup Settings**

*Sik Hung Ng*

*City University of Hong Kong*

Exercising power over others is a common human experience. Children override the better judgment of their parents, displaying temper tantrums or simply nagging them to exhaustion. Parents in turn control their children using reason mixed with bribes and brute force, or the threat of it. In seemingly equal relationships such as that between spouses, people nonetheless influence or cajole their peers to have their own way. The exercise of power relies partly on strategic communication, and even seemingly powerless individuals may triumph over the more powerful. Just as individuals exercise power over others, they also have the experience of being overpowered by others.

The examples cited above have one common theme – they all involve a person (the agent) exercising power over another person directly (the target) – with three contextual dimensions: interpersonal (in contrast to intergroup), direct (versus indirect), and power over (instead of power *to*, e.g., power to do good common to both the agent and the

target). Ng in *The social psychology of power* (1980) has provided an overall analysis of the contextual dimensions. Presently, only the interpersonal–intergroup dimension will concern us, with the emphasis on power in intergroup settings seen from the perspectives of social psychological and cognate academic disciplines such as language and communication (→ Language and Social Psychology).

### THE NATURE OF POWER

Philosopher and mathematician Bertrand Russell (1938, 35) defines “power as the production of intended effects.” This elegantly worded generic definition is echoed in Heider’s *The psychology of interpersonal relations* (1958). According to Heider, a person’s action is constrained by the environment but is also a function of personal factors, which include the person’s power, intention, and how hard he or she is exerting him- or herself. *Power is what a person can cause*. From this generic definition, Heider differentiates between personal and social power, referring respectively to personal capabilities and social positions.

Both Russell and Heider align power with its effects. On this important but controversial point, Lewin and his fellow field theorists take a different approach. In *Field theory in social science* (1952), Lewin separates power from its effects and restricts it to mean the possibility of inducing force to overcome resistance. When force exceeds resistance, power is in action as influence, otherwise it remains dormant as potential influence. The agent’s influence is seen from the target’s perspective: the latter’s dependence is the former’s power to influence. Specifically, the target’s dependence on the agent as a guide to reality, for uncertainty reduction and similar other cognitive needs, provides the agent with a base for exercising informational social influence (→ Uncertainty Reduction Theory). By the same token, the target’s dependence on the agent for social approval, social validation, and similar other social motivational needs gives the agent a basis for exercising normative social influence. According to Raven (2001), most forms of social influence stem from six power bases: reward, coercion, legitimacy, referent, expert, and information power. The power bases are not rigid entities, but can be reframed to reduce resistance, minimize cost, and amplify influence. For example, coercive power can be reframed into informational and referent power using strategic communication (→ Strategic Framing).

*Social exchange theory* views power in the context of the ongoing exchange of outcomes between interdependent individuals (→ Social Exchange). Thibaut & Kelley in *The social psychology of groups* (1959) argue that as long as the target has no better alternative for satisfying his or her expected outcome other than from the agent, he or she is dependent relationally on the agent, and consequently places him- or herself under the latter’s contact control. Within this (trapped) relationship, the agent’s power over the target varies with the *range* of the target’s outcomes that is under the agent’s control. For example, although a mother who always rewards her child but never uses punishment may be able to retain contact control, she has less behavior control than she would have if she withholds reward or supplements reward with punishment.

The classic definitions reviewed above serve to indicate the range of power definitions still current in social psychology. By and large, they are concerned with social behavior in interpersonal contexts, and up till the late 1960s the study of intergroup behavior was

conspicuous by its absence. Burgeoning intergroup research since has been successful in filling the lacuna.

### INTERPERSONAL AND INTERGROUP SETTINGS

There are occasions where we think, feel, and act in terms of our unique personal self and treat others as individuals rather than as representatives of particular groups. There are other occasions where group membership and identification take control of our consciousness and induce us to treat others as either “one of us” or “one of them,” rather than as unique individuals in their own right. These two contexts – the interpersonal and the intergroup – correspond to our dual existence as unique persons and as members of social groups. The more the social context shifts toward intergroup, the less interpersonal relations and interaction occur between groups.

An insight from intergroup research is that seemingly interpersonal encounters are in fact *intergroup*. For example, when we greet a woman in a wheelchair, the one who is in our minds is not a person but a member of a disability group, a disabled “other,” and we show this by addressing not her, but the person pushing the wheelchair (Fox & Giles 1996). Another insight is the ease with which discrimination against “them” (the outgroup) can be triggered in the absence of historical rivalry and even at personal cost to the discriminator, simply by dividing people into (cognitive) groups. By contrast, it is notoriously difficult to reduce or eliminate intergroup discrimination, as reviewed by Gaertner & Dovidio in *Reducing intergroup bias: The common ingroup identity model* (2000). World history of peace and war is a constant reminder of this fundamental asymmetry (→ Social Conflict and Communication). A third insight is the discovery of a discontinuity between interindividual and intergroup interactions. Intergroup interactions are generally more competitive than interpersonal interactions, suggesting greater “fear and greed” in the former than in the latter situation (Wildschut et al. 2003).

Collectively the three interrelated insights summarized above serve to establish the prevalence of intergroup contexts and their powerful effects on practical issues such as stereotyping, discrimination, competition, and conflict. These insights and other advance in intergroup research provide a basis for understanding power in intergroup settings. As the topic of power in intergroup settings is broad, the discussion below is necessarily selective and only two aspects will be highlighted. The first is a comparison of high- and low-power groups with respect to the perceptual and behavioral correlates of power. Here power is treated as a given and the question is what flows from it. The second aspect does not take power as a given but instead constitutes it as the subject of inquiry. Here the concern is with the formation and change of power relations with respect to leader emergence and the politicization of collective identities in intergroup settings (→ Intergroup Contact and Communication).

### HIGH- AND LOW-POWER GROUPS

Intergroup research in the main has treated power as a given variable to see its effects or correlates. An informative overview of the findings can be found in Brauer & Bourhis (2006), who also summarize a number of intergroup power theories. They lump together

intergroup and interpersonal power, but only the former will concern us here. Compared to members of low-power groups, members of high-power groups are more inclined to evaluate outgroups negatively, perceive them as more homogeneous, and prefer group-based over individuated information processing. In turn, they receive more positive and fewer negative evaluations. The specific combinations of positive and negative traits suggest that power is associated with *mixed stereotypes*: competent but cold for groups of high power, and incompetent but warm and pitiable for low-power groups. Regardless of trait valence, within-group variability is overestimated for high- and underestimated for low-power groups. On the basis of these and other correlates of high- and low-power groups, Brauer & Bourhis (2006) conclude that high-power groups are less susceptible to stereotyping than low-power groups (→ Stereotypes; Social Stereotyping and Communication).

The connection between high power and freedom from stereotyping extends Fiske's (1993) power analysis of stereotyping. She makes the insightful observation that stereotyping not only serves cognitive functions, but also controls people who are subjected to it. This enables her to argue from the power-as-control perspective that stereotyping is a tool for power. A corollary of this would be that high-power groups are better able to protect themselves from being stereotyped. In this sense, the empirical connection found between high power and freedom from stereotyping completes the logic of the dual relationships between stereotyping and power (control). The intriguing question is: how does high power free its holders from stereotyping and control?

The answer is complex and implicates ideology and social representations. At the social interactional level of analysis, the answer can be gleaned from what high- and low-power group members actually do. *Individuals in powerful positions* (including membership in high-power groups) are less inhibited and show this in their more open display of a wider range of emotions, greater risk-taking, and more readiness to act (Keltner et al. 2003). Their stronger power bases also enable them to act according to their individual wishes and in their idiosyncratic ways (Brauer & Bourhis 2006). Behavioral disinhibition and inner-directedness combine to produce individuals acting freely and differently from each other, maximizing variability and thus minimizing the objective base of being stereotyped as homogeneous. *Low-power individuals*, as shown by Mulder in *The daily power game* (1977), tend to orient toward, attend to more, and know more about high-power individuals in their attempt to reduce their power distance from the powerful. As a result, low-power individuals have an objective base to individuate rather than stereotype powerful others, thereby relinquishing their (potential) control via stereotyping over them.

It should be apparent by now that power is never static. One may view it as a given in a particular context at a particular point in time, and see what may flow from it. Yet what flows from it is rarely automatic or straightforward, but is caught up in dynamical processes of influence and control. Conversely, as we shall discuss next, power is created or mobilized in and through processes of influence and control, often mediated by what human beings are best at, namely, using language to influence and control (Ng & Bradac 1993).

## LEADER EMERGENCE AND POLITICIZATION

Any intergroup setting must by definition presuppose the existence of two (or more) groups although the groups may vary in their "groupness." At the very least, a sense of

shared identity, however shallow, is required for a collection of individuals to become a group. If nothing more, the group remains as a cognitive group without a power hierarchy among members. To understand how power relations are formed in groups, one has to extend the study beyond cognitive groups to real groups that involve members interacting with and talking to each other.

When previously unacquainted individuals interact, typically a power hierarchy emerges. The leader who has emerged does not require pre-existing high status, because even groups composed of similar individuals also form power hierarchies, as documented by Bales in *Personality and interpersonal behavior* (1970). Rather, members talk their way to power through active communication participation as shown by volume of talk or, more effective still, a high rate of speaking turns. The ability to penetrate the web of conversational turn-taking to obtain speaking turns holds the key to becoming leader, and this is facilitated by enacting (constructive) interruptions worded in assertive “proactive speech acts” and not in conciliatory “reactive speech acts” (Ng et al. 1995). With speaking turns in hand, the speaker is in a position to create conversational control by drawing attention to self, maintaining or changing the conversational agenda, and allocating the next turn to a preferred person (→ Conversation Analysis).

The studies cited above and similar others were carried out with groups in isolation rather than in interaction. In these *intra*-group contexts, conversational influence and control among unacquainted strangers lead to power. Does the same hold in intergroup contexts? Later studies show that conversational influence and control through speaking turns remain important, but the intergroup context now generates social identification processes that selectively determine what behavior counts as important for the ingroup and the outgroup (→ Social Identity Theory). Crucially, as shown by Reid & Ng (2000), verbal utterances that represent or exemplify the ingroup position and are directed successfully at the outgroup correlate strongly with leader emergence. These outgroup-directed prototypical utterances mobilize the ingroup and advocate for the ingroup position (and hence enhance group identity) in the face of outgroup competition, for which the speaker is accorded leadership (→ Power, Dominance, and Social Interaction).

The discussion above portrays leader emergence as the outcome of cumulative conversational influence and control mediated by social identificational processes. Influence and control are assumed to merely culminate into power. This is a superficial view of what is in fact a sequential and collective process of power creation. A more nuanced discussion can be gleaned from Berger et al.’s *Expectation states theory: A theoretical research paradigm* (1974). The insight from EST is that when enough conversational influence and control culminate to give evidence of an *incipient* power hierarchy at the early state of group interaction, group members develop expectations of who is and will be leading the group. Acting on these expectations, group members collectively shape the behavior of each other to fall in line with the expectations, for example, to look up and give preferential right to incipient leaders to speak and thereby to amplify their influence and control. There are some preliminary results supporting the role of expectations in intergroup contexts (Reid & Ng 2006), but more fine-grained and longer-range observation and data analysis are required to test it.

Still on the theme of power creation, our final discussion takes us beyond small group research to research dealing with large groups and large-scale social movements. The big

question is: how may power be generated to bring about social change, including a change in existing unequal power relations? A small answer can be found in the politicization of collective identity.

In their triangular model of politicized collective identity, Simon & Klandermans (2001, 319) postulate that people “evinced politicized collective identity to the extent that they engage as self-conscious group members in a power struggle on behalf of their group knowing that it is the wider, more inclusive societal context in which this struggle has to be fought out.” For this to happen, members need to become aware of shared grievance, then attribute the cause of their grievance to the adversary outgroup, and finally triangulate the power struggle by getting a third party (e.g., society at large) on their side.

Throughout the process and its extension, language and communication play a number of crucial roles. They provide an inclusive rhetoric to connect the group in question with other local identities into a collective identity to mobilize collective action (→ Collective Action and Communication). A collective identity, though powerful, carries the risk of submerging the group’s distinctiveness and consequently diluting its claim to leadership. Hence the group must reinvent itself as the prototype among the collective identity to advance and lead the cause. Here again, language plays a critical role in providing a world vision that creates the necessary system of categorization for identifying different targets for influence (Chrysochoou & Volpato 2004). Collective action is sustained in and through the construction and promulgation of narratives to politicize culture into a (symbolic) resource for power, by undermining the legitimacy of the status quo and envisioning a better future (→ Social Movements and Communication; Communication Strategies for Empowerment). These complex and dynamical relationships, where language and communication are heavily and critically implicated, make for interesting study across disciplines.

## Pragmatism

*Peter Simonson*

*University of Colorado at Boulder*

Pragmatism is an international philosophical movement that coalesced in the two decades before World War I, and has reverberated widely since. From the beginning, it featured communication, sometimes as an explicit concept, and more generally by emphasizing interaction, community, and communicable consequences as key components of knowledge, meaning, politics, ethics, aesthetics, and selfhood.

In the twentieth century, pragmatism was often characterized as a “distinctly American” philosophy associated with four thinkers – Charles Peirce, William James, John Dewey, and George Herbert Mead. In fact, the movement developed in a trans-Atlantic network of letters and print that included a number of European philosophers. Pragmatism’s center of gravity has generally been on American soil, but the family of philosophical positions it names grew up in dialogue with European, and especially German, thought (Joas 1993). Recent historical work has broadened the pragmatist genealogy considerably (Simonson 2001).

Pragmatism has long served as a covering term for a variety of related, but distinct positions. James publicly launched “the principle of pragmatism” in an 1898 lecture, but credited Peirce, whom he heard use it during a meeting of the later-famous “Metaphysical Club” (Menand 2001). The principle named a position Peirce had established several years earlier, that the meaning of ideas lies in the consequences and “habits of action” that those ideas produce (1992, 131). Peirce drew the name for his doctrine from Kant’s *Critique of pure reason*, which held the *pragmatisch* belief to be one among several kinds, characterized by contingency and lack of ultimate certainty.

In contrast to Kant, pragmatism has generally taken *contingency* as an inescapable part of knowing, counteracted through communal inquiry and communication. Against the Cartesian notion of certainty as built upon the foundations of introspective philosophy, Peirce turned instead to the community of knowers as the best hope for establishing adequate beliefs. James de-emphasized the communal aspects, and (to Peirce’s chagrin) transformed a theory of meaning into a theory of truth, opening up the first of many fissures among pragmatists. Dewey would re-emphasize the communal element of knowing and democratize it by leveling distinctions between scientists and non-scientists, and by championing a general experimental attitude worked out through communication.

Early pragmatists also developed *accounts of self and society* that featured communication. Humans were conceived as animals for whom language was both a tool and an inescapable medium of life. Along with Charles Cooley, Mead laid the foundations for what became known as → symbolic interactionism. He took physical gesture as basic to the development of mind and self, and as preparing the foundation for linguistic interactions, which, in turn, produce higher-order consciousness (→ Linguistics; Nonverbal Communication and Culture). For Cooley, Mead, and Dewey, societies and selves exist by and through communication.

Communication carries strong moral and political dimensions for pragmatists. For Mead, it is a social process that involves taking the perspective of others, and eventually the community writ large, or what he called “the generalized other.” Dewey, meanwhile, worked out a vision of participatory democracy actualized through newspapers, face-to-face conversation, and education. Art too would play a role as a communicative form for Dewey, as it did for Alain Locke, the architect of the Harlem Renaissance and its “New Negro” aesthetic (→ Art as Communication).

First-generation pragmatists influenced a number of early students of media and communication, including Robert Park, Walter Lippmann, Harold Lasswell, Kenneth Burke, Herbert Blumer, Helen McGill Hughes, Hugh Duncan, and C. Wright Mills. As a philosophical movement, though, pragmatism fell on hard times from the late 1930s until the late 1960s, when it began to be revived by a disparate array of thinkers. Ideas of communication coursed through their work, often as key elements in accounts of knowledge, ethics, politics, and culture. The German philosophers Karl-Otto Apel and → Jürgen Habermas led the way. In the late 1960s, Apel wrote introductions to translations of Peirce, and suggested that pragmatism offered “the starting point for a new foundation of the human sciences . . . as sciences of communicative understanding” (1981, 194). Habermas, in his turn, drew upon Mead to develop his widely influential theory of communicative action as that “coordinated not through egocentric calculations of success but through acts of reaching understanding” (1984, 286).

While Habermas, Apel, and others used pragmatism to establish new philosophical foundations, others revived it for postmodernist projects that rejected foundations all together (→ Postmodernism and Communication). None was more influential in this regard than Richard Rorty, whose *Philosophy and the mirror of nature* (1979) did more than any book to place pragmatism on the intellectual agenda again. Abandoning early pragmatism's embrace of science as a model for knowing, Rorty turned instead to art and literature, while rhetoric provided a template for the anti-foundationalist pragmatisms of critics like Stanley Fish. Recent literature on pragmatism extends across many fields, including philosophy, law, criticism, political theory, history, and communication.

# Precision Journalism

Stephen K. Doig

Arizona State University

Precision journalism is the use of social and behavioral science → research methods to gather and analyze data, bringing a level of rigor to journalistic work beyond anecdotal evidence. Although it can be practiced without computers, precision journalism is usually a subset of “computer-assisted reporting,” the catch-all term for anything from using the Internet for gathering information to developing newsroom intranets for sharing information among reporters. Another common term is “database journalism,” which focuses on gathering and analyzing large collections of government data.

Precision journalism may expand most in places with high concentrations of computers, where public records exist in electronic form, but internationally journalists practice it using any available techniques if they can get access to information and have sufficient training to carry out an analysis.

## ORIGINS

The term “precision journalism,” and the central idea behind it, were popularized by the 1973 book of the same name written by Knight-Ridder reporter Philip Meyer. He had discovered the journalistic potential of using public opinion research (→ Survey) and other social science methods during a sabbatical year at Harvard University in 1966–1967. He applied what he learned shortly thereafter by doing groundbreaking surveys of participants in race riots in Detroit and Miami. He credits journalism educator Everette Dennis with creating the term precision journalism (Meyer 1991).

Perhaps the earliest precursor to precision journalism occurred on the US presidential election night of 1952. Walter Cronkite, then the Washington correspondent for CBS News (→ Broadcast Journalism; Election Polls and Forecasts; Political Journalists), used a Univac I computer analysis of early returns to predict correctly that Dwight Eisenhower would easily win the presidency.

A pioneering use of the techniques was a 1969 *Miami Herald* study of the Dade County, Florida, criminal justice system. In 1972, the *New York Times* analyzed how arrest statistics differed across New York police precincts. A year later, the *Philadelphia Inquirer* investigative team worked with Meyer to quantify racial bias in criminal sentencing (→ Investigative Reporting). In 1978, Meyer assisted *Miami Herald* reporters (one of whom, Rich Morin, later became survey research editor for the *Washington Post*) in an analysis of property tax records that revealed the undervaluation of expensive homes compared to more modest homes in the Miami area (Cox 2000). These US examples illustrate the initial pattern of major newspapers using advanced computing in a media system that fostered journalistic independence.

Despite a widely read book and successful models, precision journalism was slow to spread in its country of origin or elsewhere during the 1970s for two reasons. First, it required access to large mainframe computers like the Univac or IBM 360, expensive “big

iron” hardware typically available only at large corporations or major universities. Second, most datasets interesting to journalists, such as court records, existed only on paper, requiring tedious hand-entry into a computer before analysis.

In the early 1980s, the spread of microcomputers started with hobbyist machines and then entered small businesses. Microcomputers also began to appear in government offices, leading to increased availability of machine-readable data that did not need keypunch data entry. Precision journalism then had the possibility of international diffusion but lagged behind the spread of its instrumental technologies (→ Information and Communication Technology, Development of).

## DIFFUSION

A tiny scattering of US reporters began using early microcomputers, including machines like the Apple, Atari, Kaypro, and IBM PC, for newsroom work. Some had purchased computers for home hobby use, but then began to realize how the machines could help with their reporting. For instance, a reporter in the *Miami Herald* state capital bureau in 1983 wrote, for his IBM PC in the computer language BASIC, a vote analysis program that would take in a legislative roll-call vote and produce cross-tabulations of the data (→ Statistics, Descriptive) based on political demographics of law-makers (party, race, gender, leadership role, region, campaign funds from special interests, and the like).

The profile of database reporting grew in the mid-1980s when Elliot Jaspin, a reporter for the *Providence Journal*, matched Rhode Island databases of school bus drivers, traffic violators, and drug arrests, finding bus drivers with histories of bad driving records or drug dealing. On another occasion, he used a computer to analyze 35,000 mortgages meant to help lower-income home buyers and discovered many of the best loans going to the children of senior state officials. His stories prompted changes in state licensing procedures for bus drivers and indictments for those who had abused the mortgage program, attracting the attention of investigative reporters around the country (Cox 2000).

Interest in precision journalism skills exploded in 1989 when a young *Atlanta Journal-Constitution* reporter named Bill Dedman won a Pulitzer Prize for an investigative project called “The Color of Money.” Computer analysis of mortgage applications showed how banks in the Atlanta area were shunning predominantly African-American neighborhoods, refusing to approve home loans there even for families with good incomes. The stories forced Atlanta banks to stop the practice and prompted US newspapers to do similar analyses in their own areas.

Later that year, Jaspin joined the University of Missouri journalism school and created what became the National Institute of Computer-Assisted Reporting (NICAR), under the wing of Investigative Reporters and Editors (IRE), an organization based there (→ Journalism Education; Journalists: Professional Associations). NICAR began training reporters in the techniques of using computers and database software to extract government data from magnetic tapes and analyze it for patterns. At about the same time, the first national conference of reporters focused on precision journalism took place at Indiana University. Centers at other universities followed.

Interest in and application of precision journalism grew rapidly in the United States during the 1990s. In 1992, IRE began computer-assisted reporting training sessions and

panels at its annual conferences. The next year, NICAR held the first of what have become annual conferences that hundreds of reporters now attend. More than a thousand reporters now subscribe to the NICAR-L email listserv.

## METHODS AND APPLICATIONS

Notable precision journalism stories include topics such as natural disasters, school performance, and crime, and apply a range of methods, including surveys (→ Public Opinion Polling), geographic information software (GIS), financial data analysis, and cross-tabulations. Most of these applications of information technologies to → news originated in the United States.

Precision journalism techniques have enhanced the coverage of *natural and human-produced disasters*. The *Miami Herald* won a Pulitzer in 1993 for a computer-aided analysis of the destruction patterns from Hurricane Andrew. Even more extensive computer work went into tracking the diaspora of victims of Hurricane Katrina in New Orleans in 2005, mapping the debris field from the 2003 loss of the space shuttle *Columbia*, and cataloguing the devastation of the September 11, 2001, attacks on New York City and Washington, DC.

To cover *school performance*, reporters have used statistical software like SPSS to create linear regression models that account for the effect of students' poverty on standardized test scores (→ Test Theory). The same statistical techniques also have uncovered significant cases of teachers and administrators fraudulently inflating classroom test scores in order to qualify for salary bonuses.

To cover the *criminal justice system*, one striking example was the use by the *Dallas Morning News* of logistic regression models to examine racial bias in jury selection by prosecutors and defense attorneys. Curiously, the paper found that both sides were biased in opposite directions, thereby canceling out the effects of the bias. In Brazil, *O Globo* did a computer-aided study of the incarcerations of more than 700 violent criminals, revealing that most had been quietly released long before their sentences were up. Newspapers and their network news partners in major cities around the world regularly do national public opinion polls using scientifically drawn random samples of respondents (→ Sampling, Random). Papers and networks such as the *New York Times*, the → BBC World Service, *Le Monde* in Paris, *El País* in Madrid, *Yomiuri Shinbun* in Japan, and *Folha de Sao Paulo* in Brazil practice this type of precision journalism. Geographic information systems software allows newspapers and television stations to reveal crime patterns, show the impact of toxic waste sites on the poor, and examine overbuilding in areas prone to floods or fires, among other topics. Dutch papers, for instance, used GIS to map the results of the referendum on the European Union constitution.

*Financial data* can uncover scandals involving the dates of stock transactions and trades favorable to insiders. Social → network analysis software can show, for example, the relationships of those who make large donations to the political candidates they support. Other examples include the creation of a database of the personal finances of Brazilian legislators, and analyses of the uncounted votes in Florida's controversial presidential election returns in 2000.

Precision journalism is not only for major investigative projects. Examples of lighter topics include cross-tabulation of pet licenses for most popular breeds and names; the

different traits men and women seek when placing personal ads, the pattern of parking tickets on college campuses, sports ratings for the performance of players and teams, and a study of the profits of Mexican soccer teams.

### INTERNATIONAL SPREAD

Precision journalism may have started in the United States, but the practice is spreading around the world. In 1997, IRE trainers held their first computer-assisted reporting workshops in Europe. The Danish International Center for Analytical Reporting (DICAR) then became an early proselytizer for precision journalism among international reporters. Since then, Global Investigative Journalism conferences in Copenhagen, Amsterdam, and Toronto have provided training in the use of spreadsheets, database programs, mapping, and statistics. *Precision journalism trainers* have conducted workshops in South Korea, China, and Nigeria, as well as in other countries in Latin America and Europe, including Bosnia. After attending the training sessions, reporters have gone on to do important stories despite the difficulty of getting public records in many countries. In a 2006 example, DICAR founder Nils Mulvad organized an international team of reporters to gather and publish a database revealing country-by-country details of the European Union 55-billion-euro farm subsidy program for the first time.

By the beginning of the twenty-first century, precision journalism had evolved from an exotic newsroom specialty into mainstream practice among some reporters in all but the smallest US newspapers as well as television stations. Journalism schools have begun teaching the basics to students. Although institutions and practitioners have emerged slowly in other countries, precision journalism has become widespread. The use of precision journalism techniques can grow as more countries put their census, courts, economic, election, and other data online. Ambitious international reporters can easily discover how the power of precision journalism is being used elsewhere and learn to use those tools in their own work.

# Prejudiced and Discriminatory Communication

Janet B. Ruscher

Tulane University

Devin L. Wallace

Towson University

Prejudiced and discriminatory communication is studied in a wide range of social science disciplines, including communication, sociology, anthropology, and social psychology. Some forms, such as hate speech, are explicit, and they are recognized easily by an audience as reflecting prejudiced viewpoints. Other forms are more implicit: neither the speaker nor the audience may be aware that the speaker holds prejudiced views, even though independent evidence demonstrates that such views indeed are held. The conditions under which prejudiced views are expressed, as well as the forms that these communications take, are the subject of this entry (→ Social Stereotyping and Communication; Stereotypes).

## FUNCTIONS OF DISCRIMINATORY LANGUAGE

Discriminatory language is insidious because of the myriad functions that it serves. Drawing upon the extant literature on prejudice, Ruscher (2001) identifies *five types of functions*: economy of expression, group enhancement/ego defense, social functions, ingroup dominance, and impression management. These functions are not mutually exclusive, and can have similar surface features. For instance, two individuals may have similar stereotypes of lower income individuals and both call them “trailer trash,” but one may use the term when his or her own middle income group is threatened (i.e., ego defense) and the other simply may use the term as a quickly understood social reference (i.e., economy of expression). Specific illustrations of these functions appear below in the discussion of explicitly and implicitly prejudiced language.

The five functions are important to consider because they provide insight into *why* speakers use prejudiced and discriminatory language. For example, *economical expression*, often seen in the short or symbolic labels used for outgroups, helps individuals preserve mental resources. As cognitive misers, social perceivers utilize shortcuts or heuristics whenever possible. Using stereotypes to group people is economical because attention is freed to focus elsewhere. Reliance upon the perceptual shortcuts of stereotypes – and shorthand expressions to reference the stereotyped group – proves both functional and practical. Speakers should use economical expressions when they would use stereotypes: when they are not motivated to think carefully about the targeted group or when they are under time pressure (→ Elaboration Likelihood Model; Information Processing; Stereotypes; Limited Capacity Model).

Discriminatory language also serves as an *ego protector* and as a way to enhance the social status of the ingroup. In many cases, people derive self-esteem from comparing

their own status to that of others. When downward social comparisons are made, people feel good about their status relative to others, and self-esteem can be maintained or even increased. As Thompson and Crocker (1990) demonstrated, social comparisons at the group level may engender intergroup bias, which tends to increase as presumed group threats also increase. Thus, certain forms of discriminatory and prejudiced language emerge when people feel threatened.

Prejudiced language also serves three social functions: avoiding contact, detachment, and delegitimization. By *avoiding interactions* with groups who may be the subject of prejudice or discrimination, people convince themselves that they are nonprejudiced. When people selectively avoid contact with disparaged outgroups, they reduce their opportunities to behave in a discriminatory fashion. Ironically, rather than recognizing their avoidance as discriminatory, individuals who have limited their own opportunities for further discrimination instead boast of their exemplary record in not discriminating in daily interactions.

If contact is inevitable, people may become *verbally and emotionally detached* from certain outgroups, and reference them in sterile ways, if they mention them at all. For example, rather than referencing outgroups in ways that might evoke emotion or action (e.g., “Women are raped in Dafur refugee camps”), detached speakers avoid emotional descriptions (e.g., “There’s unrest in Sudan”). Finally, *delegitimization* is the most severe social function of prejudiced language. Bar-Tal (1989) notes that this process involves rejection based on the perceived “less than human” status of a group or individual. People use language to communicate these perceived differences to others, which in turn justifies an outgroup’s low status and mistreatment. Discriminatory and prejudiced language that serves social functions appears most when a group benefits from social distinctions, such as during wartime or periods of scarce resources.

A fourth function served by discriminatory language is *dominance maintenance*. In order to maintain power hierarchies, privileged groups attempt to guard other groups’ access to certain resources. Privileged groups may blatantly prevent or subtly interfere with certain ethnic minority groups and women acquiring or maintaining high-status positions. By blocking avenues to access, the ingroup protects and maintains its power. The more powerful ingroup may, for example, control the news media or determine which dialects and languages are appropriate for formal discourse. A more subtle example in interpersonal communication involves the use of “tags” to imply what positions are descriptively or prescriptively normal. Unless otherwise specified, listeners often assume “doctor” references a white man, and speakers’ use of terms such as “lady doctor” emphasize this assumption. Such tags implicitly can communicate both how speakers believe the world is and how it should be.

Finally, using discriminatory language allows people to *maintain their nonprejudiced self-perceptions*. Social sanctions discourage people from openly expressing prejudiced ideals; consequently, people use language to deny or mask their prejudice. To this end, people may use bifurcations (verbally distinguishing between acceptable and unacceptable subgroups of the outgroup) or concessions (disparaging qualities about the outgroup that are acknowledged in the occasional ingroup member). Alternatively, prejudiced language can serve → impression-management functions by playing to the audience’s presumed opinions: a speaker who wishes to be viewed favorably will adjust his or her

degree of explicitly prejudiced language to match the audience's presumed views of the outgroup.

## EXPLICITLY PREJUDICED AND DISCRIMINATORY LANGUAGE

Explicitly prejudiced and discriminatory communication often involves derogatory comments about an outgroup or outgroup member. Sometimes these comments comprise brief group epithets, whereas sometimes they are lengthy narratives about an outgroup's alleged negative behavior.

Group epithets comprise short, usually negative, labels applied to outgroups and individual outgroup members. Sometimes called ethnophaulisms (from *ethnos* for "nationality" or "a people" and *phaulizo* "to disparage"), these slurs provide economical expressions for outgroups. Historical examples include "frogs" for Frenchmen, "iron maidens" for professional women, "pickaninnies" for African-Americans, and "crackers" for lower income rural whites. Derogatory labels provide insight into how the speaker – and his or her own group – views members of an outgroup. First and foremost, the use of a label implies that the speaker views the target as an outgroup member rather than as an individual. Second, the speaker views the target negatively, and is willing to let listeners infer that negativity; even speakers ignorant of a label's meaning will use it in order to convey negativity.

Derogatory labels also serve a *social function*, insofar as they can indicate social roles or delegitimize group members from the larger society. The speaker essentially tells listeners to stay away from labeled outgroup members. The most extreme form of delegitimization involves the reconstruction of outgroup members into less-than-human outcasts. In wartime or during periods of "ethnic cleansing," for example, outgroup members are referenced with dehumanizing terms such as "gooks," "social diseases," "savages," and "animals." Bar-Tal (1989) notes that extreme delegitimization helps justify atrocities such as slavery, internment, and extermination.

Derogatory labels for outgroups may be used when ingroup members are communicating among themselves, or they may be used in communications intended for outgroup members to overhear or inadvertently read. Most people recognize derogatory labels as being intentionally expressed and potentially harmful; such labels epitomize the subjective understanding of hate speech. From a *legal standpoint*, however, derogatory labels may not meet stringent criteria for hate speech. In the United States, for example, the first constitutional amendment protects freedom of speech; hate speech is an exception, but is not simply hateful language. The criteria for hate speech are that the words threaten an immediate breach of the peace, are intended to hurt message recipients, and that exposure to these words is inescapable to their target (i.e., "fighting words"). Scrawling derogatory labels in public locations (e.g., graffiti) is unlikely to meet these stringent criteria, although obfuscating the source and potentially affecting more recipients actually may be more destructive than "fighting words" (→ Hate Speech and Ethnophaulisms).

Although few objective truths about outgroups are easily proven, social scientists regularly find that people prefer to believe that their own viewpoints are veridical. With respect to views of outgroups, validation can be provided through a wide variety of storytelling methods. In both casual and formal communication settings, speakers

provide alleged evidence for why certain outgroups deserve to be viewed negatively; speakers may be indoctrinating new group members or may be validating the views of veteran group members. For example, van Dijk (1988) reports a storytelling session by a Dutch couple who relay a tale about their Turkish neighbor. The story details the slaughtering of a sheep in a bathtub during Ramadan, pieces of the sheep becoming lodged in the drain, and the eventual arrival of the police. In recounting this explicitly prejudiced communication, the couple clearly is aware that their impression of the outgroup is negative. But because they have presented factual disparaging evidence, they also presumably expect the listener to share their view, or at least to appreciate why they have the right to hold it.

In recent years, stories about outgroup members have circulated on weblogs (→ Blogger) and → electronic mail. Occasionally, the stories include digitally manipulated photographs or are attributed to an expert. Although these stories share a similar purpose – demonstrating an outgroup’s abominable behavior – the → Internet medium allows communication to be rapid and widespread. Prejudiced communication over the Internet also has ideal features for impression management. Bloggers can post anonymously or through a pseudonym. Alternatively, individuals who forward stories through electronic mail can include comments that mask their own opinion (e.g., “I didn’t write this . . . just passing it along”). Electronically shared stories quickly can develop into urban legends. One example – which has been falsified – provides a detailed testimonial about unsanitary and aggressive behavior of a busload of New Orleans evacuees at a Texas rest stop following Hurricane Katrina. Like the interpersonally communicated story of the Turkish neighbor, the electronic story of evacuees helps ease guilt about the Hurricane Katrina catastrophe and justifies social distance (→ Online Media).

Discriminatory language also may be couched in terms of *jokes or purportedly humorous emails*. In a sense, prejudiced jokes are a type of storytelling about disparaged outgroups. Prejudiced humor serves many roles, including entertainment, promoting ingroup camaraderie, and expressing shared attitudes and values. Depending on the particulars of the joke, this form of prejudiced communication may serve group enhancement functions (e.g., disparaging the outgroup), social functions (e.g., prescriptions for social interaction), dominance maintenance (e.g., proving why the outgroup deserves its inferior social status), or impression management (e.g., the audience will think more favorably of the person who sent it). Outgroup-disparaging humor also serves economical expression in the sense that it can bolster the stereotypes held by recipients, rendering them stronger and more easily retrieved for use.

### **IMPLICITLY PREJUDICED AND DISCRIMINATORY LANGUAGE**

Prejudiced and discriminatory communication also can assume more subtle implicit forms; speakers of these communication patterns may not even recognize that they are betraying their own prejudices and listeners also may not realize that the language is discriminatory.

Several types of implicit discriminatory communication patterns serve the *ego-defensive/group enhancement function*. For example, researchers find that first person plural pronouns (e.g., we) are associated quickly with positive feelings about the ingroup,

and are used when referencing the ingroup. Cialdini et al. (1976) found that when the home sports team won a game, people used expressions such as “we won,” thereby enhancing themselves through connection to the team. Conversely, people used expressions such as “they lost” when the home team lost a game, thereby protecting self-esteem by distancing themselves. Thus, consistent with the ego-defensive/group enhancement function of discriminatory language, people desire to see their own group in a favorable light; when they cannot easily do so, they find a way to distance themselves from it.

The general preference to view the ingroup in a favorable fashion in part underlies intergroup bias. Consistent with intergroup bias, people tend to see their own groups as possessing more favorable characteristics and producing more superior work than other groups. In communication, intergroup bias is seen clearly in the *linguistic intergroup bias* (LIB), initially investigated by Maass (1999) and her colleagues. Generally speaking, the LIB reflects a communication pattern in which the behaviors of the ingroup are portrayed more favorably than the behaviors of an outgroup. When an ingroup member performs a positive behavior, the speaker characterizes the behavior abstractly, as though the behavior is indicative of the actor’s personality.

For example, if an ingroup member donates money to charity, the speaker might say, “she is generous.” Using this adjective implies that the actor performs similar actions across time and different situations. In contrast, if an outgroup member performs the same behavior, however, the speaker concretely might say, “she gave some money today,” which fails to imply generosity across time and situations. For negative behaviors, the LIB shows the converse: negative behavior performed by an ingroup member is characterized concretely (e.g., “He did not tell the truth about Paul”) whereas negative behavior performed by an outgroup member is characterized abstractly (e.g., “He is dishonest”). Because so many of the stereotypic qualities that people believe about outgroups are negative, abstract characterizations often serve to bolster and preserve stereotypes.

Among the most researched indicators of intergroup bias in communication settings, the LIB shows considerable generalizability across languages, communication mediums, and type of intergroup relationship. The pattern has been demonstrated in multiple languages in various countries, including Italy, Spain, the United States, and China. It also emerges orally, in writing, and when people select among written descriptions. Finally, the pattern emerges in a variety of intergroup settings, such as with ethnic, regional, and political outgroups, age cohorts, personal relationships (e.g., enemies vs. friends), and rival teams. Perhaps most interesting, the bias can be exacerbated or mitigated by motivational and dispositional factors. Threats to self-esteem or high levels of dispositional prejudice can exacerbate the LIB, whereas the motivation to be accurate can mitigate the bias. Research suggests that most people do not realize that they are displaying any bias in their communication patterns.

Besides the degree of linguistic abstraction for specific behaviors, implicitly prejudiced communication also emerges in *how speakers characterize events*. For example, in their delineation of how powerful people camouflage the control that they wield, Ng & Bradac (1993) proposed how speakers rely upon a number of linguistic masking devices; these non-mutually exclusive devices include generalization and permutation. Generalizations can include the use of adjectives to characterize behaviors (i.e., as in the LIB), but also comprise generalizations to entire groups (e.g., “People on welfare don’t want to work”)

or to unspecified events (e.g., “Immigrants cause a lot of problems”). Permutation relies upon the fact that listeners typically assign greater responsibility to the subject of the sentence than to factors later in the sentence. A statement such as “The defendant lied to the judge” implicitly assigns more blame to the defendant than a statement such as “The judge was lied to by the defendant.” As with the LIB, the groups to which speakers belong and their prejudices can influence their use of linguistic masking devices (→ Power in Intergroup Settings).

Implicitly discriminatory language also emerges in whether language is inclusive or prescribes what is normal. Organizations that address invitations for social events to “employees and their wives” send a subtle message to female employees, unmarried individuals, same-sex couples, and couples in unformalized relationships: although diversity may be tolerated, it is not expected or celebrated. Gender-biased language also sends messages about what is normal. The tags (e.g., lady doctor) discussed earlier are one example. Another example involves use and perceptions of gender-biased terms such as stewardess instead of flight attendant or chairman instead of chair. Research shows that individual differences in sexist attitudes are linked to the use and perceptions of gender-biased language, suggesting that it can serve a group-dominance function. Finally, subtle discrimination in language can be found in what is *not* said. For instance, men may ask a female co-worker her opinion on a tie or retail store, but may fail to include her in discussions of football (→ Gender and Discourse).

Although most widely considered with respect to gender, language that prescribes normalcy extends to bias toward other groups. For example, speakers may include an ethnic tag for historically white male positions (e.g., black doctor). Whites may solicit computer advice from an Asian colleague. Job recruitment websites may be devoid of photographs depicting applicants over 45, suggesting older adults are unwelcome and consequently deterring applications. Implicitly prejudiced communication therefore can be subtle, barely noticed, and far-reaching.

## Presence

*Tilo Hartmann*

*Free University Amsterdam*

Presence, in its broadest sense, is a media user’s state that is characterized by the illusion of nonmediation. If present, media users are temporarily unaware of the mediated origin of their experience. Their thoughts, feelings, and behavior tend to react to the media content as if the portrayed scenery, persons, or objects were real, because the general artificiality of media imitation produced by human-made technology is not recognized (International Society for Presence Research 2001; → Media Equation Theory).

As a psychological state, presence is determined by the interplay of both situational or enduring individual factors, and environmental factors, which include qualities of the media technology and aspects of the content. The potential of the media technology to evoke illusions of nonmediation is addressed as its “immersive quality” (Slater & Steed 2000). The greater the likelihood that technological aspects or content factors foster the formation of presence, the more immersive is a medium. As any kind of media experience builds on subjective → perceptions, however, low-immersive media might also initiate a state of presence if users are susceptible to forget about the illusory origins of their experiences (for relevant individual factors, like a person’s willingness to suspend disbelief, see Wirth et al. 2007; → Suspension of Disbelief).

The umbrella term “presence” has been picked up in diverse fields of communication and related disciplines. As a result of the diverse perspectives that have applied the term, presence has been understood in different ways. A review by Lombard and Ditton (1997) lists six different meanings, ranging from “presence as social richness” to “presence as transportation” (→ Transportation Theory) to “presence as medium as social actor.” In general, a state of presence can occur in two distinct ways (Lombard & Ditton 1997): (1) “the medium can appear to be . . . transparent . . . as a large open window, with the user and the medium content (objects and entities) sharing the same physical environment” (invisible medium) or “the medium can appear to be transformed into something other than a medium” (transformed medium). In the context of presence that builds on an invisible medium, a popular classification is to distinguish *spatial presence* (sometimes addressed as physical presence or telepresence) from *social presence*.

## SPATIAL PRESENCE

Spatial presence can be defined as “a binary experience, during which perceived self-location and, in most cases, perceived action possibilities are connected to a mediated spatial environment, and mental capacities are bound by the mediated environment instead of reality” (Wirth et al. 2007, 497). In short, spatial presence refers to a user’s “*feeling of being there*” in the mediated environment (Biocca 1997; Riva et al. 2003; Lee 2004). Research on spatial presence evolved in technology-oriented disciplines like computer science and engineering. The term was first coined by Minsky (1980). Particularly, researchers concerned with interactive teleworking applications and sophisticated virtual reality systems applied the construct to their studies (Steuer 1992; → Computer–User Interaction; Virtual Reality). Spatial presence was deemed relevant as it was thought to affect a user’s task performance (Barfield et al. 1995). Some definitions that originated from this perspective characterized spatial presence solely on the basis of technological determinants. Among the most often cited factors are the degree of interactivity provided by a medium, and the number and balance of human sensory channels addressed by a medium (Steuer 1992; Biocca 1997).

More recently, the construct of spatial presence has also received the attention of researchers who are concerned with the description and explanation of experiential phenomena of media exposure and → media effects (→ Exposure to Communication Content). In this way, the perspective changed from rather technology-driven approaches to rather psychological interpretations (Ijsselstein et al. 2000). With the shift to a psychological perspective, the user’s → attention to media content emerged as one of the central determinants of spatial presence (Draper et al. 1998). More recently, → emotions and arousal have been addressed as important determinants of the formation of spatial presence as well (Baumgartner et al. 2006; → Excitation and Arousal). With researchers from more diverse backgrounds starting to work on the construct, not only highly immersive media like virtual reality systems were deemed capable of evoking spatial presence, but also low-immersive media, for example, books (the so-called “book problem”). In sum, in the past the concept of spatial presence has been studied in the context of quite different media, like virtual reality environments, → video games, the → Internet, → television, and → books (→ Computer Games and Reality Perception).

Throughout the past two decades, related approaches to nonmediation phenomena that emerged in other disciplines were continuously incorporated in research on spatial presence, particularly the study of transportation, which originated in literature research, conceptualizations of a user’s → involvement with media content (Schubert et al. 2001), flow experiences (Draper et al. 1998), and explications about the perceived reality of authentic or fictional media content (Lee 2004; → Media and Perceptions of Reality). Today, the existing conceptualizations still differ in the way they define spatial presence as psychological state, for example, in terms of the dimensionality of the construct. Accordingly, they also highlight different determinants. For example, Schubert et al. (2001) argue that a user’s experience of self-location, his or her involvement, and the perceived realness of the media content resemble three dimensions of spatial presence. In a more recent conceptualization, Wirth et al. (2007) argue that involvement and realness resemble determinants, while they regard the user’s self-location and perceived action possibilities as actual dimensions of the construct. As the concept of spatial presence has been addressed

from very heterogeneous areas of research, an interdisciplinary shared theoretical understanding that clearly distinguishes determinants, dimensions, and outcomes is still a major challenge of this line of research.

A broad range of measurements to assess spatial presence have been developed in the past (see [www.presence-research.org](http://www.presence-research.org) for an overview; Laarni et al. in press). Certainly, the variety of theoretical approaches to spatial presence also accounts in part for the diversity of existing measurements (Schuemie et al. 2001). Post-test questionnaires are applied immediately after the exposure to a medium and have been the most common way to measure spatial presence in the past. The most popular questionnaires include the Presence Questionnaire, the ITC Sense of Presence Inventory, and the I-Group Presence Questionnaire. Recent methodological issues were concerned with the → validity of existing questionnaires to assess spatial presence (Schuemie et al. 2001; Insko 2003), as well as with the different factor structures underlying existing paper-and-pencil measurements (→ Factor Analysis). Next to questionnaires, other subjective methods like think-aloud have been applied to study spatial presence as well. Also, a multitude of objective measurements have been introduced in the past, like psychophysiological measures, postural responses, and functional magnetic resonance imaging.

## **SOCIAL PRESENCE**

Social presence can be defined as a “sense of being together” with one or more other social beings, although the others are fictional (like characters in a science-fiction movie) or mediated appearances of real counterparts (e.g., through camera recordings or as avatars; Biocca et al. 2003; → Avatars and Agents). The conceptualization of the term is still a little bit vague and the construct combines different aspects and outcomes of interpersonal encounters (Schroeder 2002).

The term was first introduced to the realm of media technologies by Short et al. (1976) in the context of mediated interpersonal communication. Social presence was defined as “the salience of the other in a mediated communication and the consequent salience of [the] interpersonal interactions” (Short et al. 1976, 65). The authors used the term for the users’ evaluation of the extent to which different communication media convey social cues. Accordingly, social presence was not conceptualized as an experience but rather as an attitude toward a medium that guides → selective exposure behavior. Similar notions of social presence have been pursued in successive theoretical conceptualizations of interpersonal communication media, like the media richness theory.

In the context of virtual reality research, the term has been applied to describe the sense of being together in collaborative environments. Thus, the term changed to describe rather an experience than an attitude. For example, Biocca et al. (2003) construe social presence as a multidimensional experience that involves the feeling of sharing a space with another social being, being emotionally and cognitively connected to another person, and feeling reciprocally engaged in an interaction. Bente et al. (2005) argue that social presence builds on shared meaning and develops as intimacy, awareness, understanding, and contingency throughout the interaction. Still other researchers regard social presence as an experience, but argue for a distinction between feeling present with another entity and feeling connected to another entity.

So far only a few measurements have been developed for the study of social presence. Short et al. (1976) simply applied four semantic differential scales to assess the social qualities of a communication medium perceived by users (insensitive–sensitive, cold–warm, impersonal–personal, unsociable–sociable). Other recent paper-and-pencil tools have been introduced by Biocca et al. (2003) and others.

## **AUGMENTED REALITY**

A reality is augmented, if in a real surrounding one or more objects or social entities are perceived as real that actually are displayed or imitated by human-made technology (Azuma 1997). Thus, in contrast to states of presence that build on an “invisible medium” (see above), in augmented reality it is not the media that create the illusion of an environment. Rather, the real environment of the user is enhanced by the mediated illusion of an object or social entity. Lombard and Ditton (1997) speak of a medium that is transformed into an object or social entity that is erroneously perceived as real. If nonmediated sensations occur this way, they are addressed as “presence as augmented reality.” For example, a hologram imitating a shelf in a real living-room could create an augmented reality. Another example would be glasses that enrich the perception of the real world by adding simulated objects or social beings to the perceived scenery.

## Press Conference

Craig Allen

Arizona State University

Newsmakers arrange a *press conference* to announce news to groups of reporters. The meetings vary in size, setting, and subject. Some detail plans and decisions. Others promise surprise revelations. A common feature distinguishes all press conferences: the opportunity for reporters to question a newsmaker.

The most familiar are those of presidents, prime ministers, and crisis managers during key events, but smaller press conferences supply much of the information the public

receives as news. The thousands of briefings, councils, and exchanges that the public seldom sees generate the daily flow of news. In most countries, the press conferences of government officials, dignitaries, business leaders, activists, scientists, politicians, and entertainers shape national news (→ News Sources). In local communities, the same is true of the press conferences that civic leaders, police and emergency personnel, arriving celebrities, and sports figures hold.

For their sponsors, as well as for those obliged or impelled to become newsmakers, press conferences are opportunities to reach the public. Not all the information they provide is urgent and vital. Press conferences are first and foremost a public relations device that fails unless it supplies news (→ Public Relations: Media Influence). Except for those conferences broadcast live, the public knows about press conferences only through reporters' later news accounts. Newsmakers cannot control what unfolds in a press conference, given the uncertainty of reporters' questions, which can foul the messages newsmakers seek to convey.

For reporters, press conferences are essential but not without constraints. Research shows that reporters dislike press conferences for forcing them to share information with competitors, but appreciate them for allowing direct access to those making news (Bantz 1985). Alert reporters watch for angles and leads that might later inspire a story that will scoop the competition or win an award.

Press conferences are characteristic of older democratic countries, notably the United States, where governments do not control the press. Only in societies with many news organizations are press conferences needed. Press conferences are rare in authoritarian societies where press systems are monolithic and run by the state (Frederick 1993). The *first press conferences* were convened around the beginning of the twentieth century when newspapers first gave regular assignments to writers and correspondents (→ Newspaper, History of). In the United States, President Theodore Roosevelt popularized press sessions. His famed pulpit for Progressive Era reforms was the talks he gave to the reporters assigned the White House beat (McKerns 1990). US president Franklin Roosevelt developed the *modern press conference* format during the New Deal programs in 1933. Seeking favorable publicity, Roosevelt invited question-and-answer sessions (Winfield 1990). Even so, by mid-century, when Harry Truman was US president, only newspaper and wire service reporters could attend. Microphones were prohibited, and reporters had to crowd around the president's Oval Office desk (Startt 1990).

Dramatic changes came with the *arrival of television* in the 1950s (→ Television News). Under US president Dwight Eisenhower, press conferences became public events. The rules changed, and reporters sat in large auditoriums. The first televised press conference, with Eisenhower, was broadcast in 1954. Early TV press conferences were recorded on film. Finally in 1961, US president John Kennedy permitted live cameras. His appearances captivated the public, and every succeeding president followed his example by doing press conferences on live TV (Allen 1993).

A major *criticism of press conferences* – that newsmakers arrange media events for the cameras – emerged because of television. US president Ronald Reagan, a former actor, staged press conferences with Hollywood-like effects. Engaging TV communication, directed not at reporters but at opinion leaders and home viewers, contributed to Reagan's popularity. News reporters could not question him effectively (Donaldson

1987). Other leaders including Canadian prime minister Pierre Trudeau, British prime minister Margaret Thatcher, and Russian president Boris Yeltsin were known for staging press conferences with popular and charismatic appeal.

The presence of cameras influences even the most routine press sessions. Only major press conferences attract live TV coverage, but almost all aim for televised accounts and recaps on the evening news. Research shows that reporters and their editors reduce and frequently eliminate coverage of press conferences they perceive as media events (Berkowitz 1993; Harmon 1989). Studies further suggest that the largest news organizations most often compress or dismiss press events (Carroll 1986). To help insure coverage, newsmakers answer reporters with rehearsed statements appropriate for TV sound bites. They also attend to the needs that Reagan instilled, for staging and for looking at the camera so that they appear to speak to the viewer (Hilton 1990).

Around the world, press conferences are spurred by policies that seek privatization and media multiplicity (→ Privatization of the Media). In Japan and many Asian countries, and particularly in western Europe, monolithic state-operated public broadcasters are joined by numerous private networks and channels (Dragomir & Reljic 2005). In the UK, televised press conferences were not common until the 1980s and 1990s, when newsmakers needed to gather reporters not only from the BBC but from Sky-TV, newly expanded independent channels, and other private TV news providers.

Changes within the US media stemming from the fragmentation and decline of newspaper and broadcast audiences have encouraged *alternatives to press conferences*. When print, broadcast, and online news providers employ a common newsroom, newsmakers can give announcements to the one reporter that several media share (Quinn & Filak 2005). In another trend, the media have divided news staffs into specialty teams, with the aim of targeting particular demographic groups. Instead of convening a mass gathering of reporters, newsmakers now channel information to appropriate specialists.

Changes in *media technology* have accompanied the evolution of press conferences. Little research has been conducted on the impact of recent technology. Yet from the Internet, reporters can acquire information with superior detail to that packaged in press sessions. Compelling questions for scholars relate to newsmakers' uses of new technology. Newsmakers can avoid the ordeal of convening reporters in some situations, communicating directly to the public through websites, weblogs, streaming audio and video, and other innovations, many of them incorporating interactivity (→ Technology and Communication; Interactivity, Concept of).

Despite changing arrangements and newer techniques, press conferences are still useful. They remain the standard means for news exchange, because of their convenience, expedience, and success at disseminating information widely. Press conferences can enlarge the esteem of organizations and leaders, and so newsmakers continue to meet the press. Reporters continue to attend for the volume of news and the interaction that the meetings provide.

## **Prevention and Communication**

*Claudia Lampert*

*University of Hamburg*

The main objective of prevention is to avoid diseases by reducing risks that may negatively affect health (→ Health Communication). The prevention approach complements the health promotion approach. While prevention intends to avoid disease and reduce risks, health promotion focuses on resources that sustain the opportunity of healthy living. Even though the two concepts are sometimes used synonymously, lately the prevention approach has been proffered as independent of the health promotion concept. Both prevention and health promotion aim at a modification of attitudes and behavior by specific communication strategies to raise the empowerment of individuals. The problem is that not all individuals are interested in health-related topics per se. In most cases, information is sought when people are directly or indirectly (e.g., through a family member or friend) concerned with a disease.

### **TYPES OF PREVENTION**

There exist different typologies of prevention classified by either stages of health or illness or by target audience. For example, some have differentiated between *behavioral and/or*

*environmental prevention*. While behavioral prevention concentrates on personal factors that influence health-related behaviors of an individual, environmental prevention focuses on factors that are external to the individual, such as living conditions and the opportunities to enact health behaviors such as legislation (e.g., with regard to drug use), economic and ecological preconditions for healthy living and so forth.

Another popular and often cited typology is the trichotomy of *primary, secondary, and tertiary prevention*, which considers different stages of health and/or illness. Primary prevention aims at people who are not yet affected by a disease and encompasses broad population-wide communication strategies. Secondary prevention strategies address people in a very early stage of a disease to minimize and/or avoid health risks. Tertiary prevention measures are as a general rule targeted at those who already have established diseases to avoid aggravation and complications.

In 1994, a similar classification system was proposed by the Institute of Medicine (IOM) in the United States. This classification makes the distinction between *universal, selective, and indicated prevention interventions*. In comparison to the former classification, the IOM classification focuses on the general target group of a prevention intervention, not on the underlying objective. Universal prevention concentrates on the broad population to prevent risky and unhealthy behavior. The main objective is to provide information and improve the individual skills for healthy living. Selective prevention addresses special risk groups. Indicated prevention aims at individuals with existing risky and/or unhealthy behavior, e.g., drug abuse.

## MEDIA IN HEALTH CONTEXT

Apart from different typologies of prevention, different levels of communication strategies can be differentiated: → interpersonal communication, communication in and/or from health organizations, and communication via mass media. Most people talk about health-related issues with their doctor and/or family members and have the highest confidence in personal advisers (Identity Foundation 2001; → Patient–Provider Communication). But also the media have become a very important source of health-related information and a communication platform for health-related problems and support. In particular, health-related information TV programs are of high interest and are attributed with a high level of trust, followed by the pharmacist and health-related books (Identity Foundation 2001). Even health organizations (e.g., hospitals) are important for preventive strategies.

The role of media in health has been a subject of controversy. Media are an important source of information on health, and casual or incidental use of media is associated with people's knowledge, attitudes, and behavior (Finnegan & Viswanath 2002, 328). On the other hand, some have focused on the harmful effects of media, such as the effects of → video games and media violence on aggressive behavior in children (→ Computer Games and Child Development; Violence as Media Content, Effects on Children of). The role of media in health promotion through health campaigns has also been widely studied (→ Health Campaigns, Communication in; Health Campaigns for Development).

One important problem in connection with health communication strategies is that health information is often not sought until a health-related problem has occurred

(→ Information Scanning; Information Seeking). Some media, such as the → Internet, assist in active seeking of health information (→ Health Communication and the Internet), while others, such as → television and → radio, may expose people to health information through routine use (Dutta-Bergman 2004). Media that lead to passive or casual use, nonetheless, are useful in reaching individuals who may be either uninterested in or not actively seeking health information. A major goal and challenge of prevention is to reach individuals with preventive or health-related information before a disease has developed. Media, with their broad reach and appeal, can draw attention, arouse interest, and provide alternative ways of enacting behaviors.

In recent times, the amount and range of health information has increased enormously in a variety of media, such as television and the Internet, and in different genres, such as → soap operas, telenovelas, comedy programs, music videos, talk shows, and public service advertisements, among others (→ Broadcast Talk). These programs address a variety of topics, such as nutrition and eating disorders, cancer, HIV/AIDS, and alcohol and tobacco, among others. But the presence of health-related information in the media is no guarantee that individuals will change their attitudes or behaviors. A number of individual and situational characteristic influence media effects.

### EXAMPLES FOR COMMUNICATION STRATEGIES

Different preventive communication strategies can be distinguished: public information campaigns, health journalism, and entertainment education, among others.

*Information campaigns* encompass different communicative activities to influence individual knowledge, → attitude, → meaning, and/or behavior. Social marketing is an example of an activity that promotes social or health messages in the same way as commercial marketing (→ Social Marketing). Different promotional activities and media channels are combined to reach the target audience. Typical vehicles are posters at public places, public service announcements in different media, as well as hotlines and events. Information campaigns offer the opportunity to reach a broad target group, but it is difficult to communicate complex and sophisticated information. To get the attention of the audience, it is necessary to promote consonant and creative messages in a cumulative way. A related strategy is “media advocacy,” which addresses not individuals but decision-makers such as legislators, policymakers, and media personnel, among others (→ Media Advocacy in Health Communication). For example, the *Harvard Alcohol Project*, which promoted the concept of the designated driver, is often cited as a successful example of media advocacy.

*Health journalism* has an important role with regard to the communication of health-related or preventive messages (→ Health Communication and Journalism). Journalists “translate” relevant scientific information for a broad audience under an enormous time pressure (Viswanath 2005, 833). They also influence the agenda concerning health-related and preventive topics (→ Agenda-Setting Effects). Media coverage of health is often criticized by scientists as superficial or inaccurate and often suffers from the disadvantage of reaching only the educated and those who are already interested in the topic (→ Communication Inequality).

*Entertainment education (E-E)* combines entertainment and education to promote pro-social messages drawing from such theories as → social cognitive theory (→ Entertainment Education). Using long-running entertainment programs, the E-E approach uses positive and negative role models to promote the desired and/or the undesired attitudes and/or behavior. Transitional characters represent the viewer's perspective, which changes over time in the desired direction. In E-E programs the health relative message is mediated in an indirect, almost subtle way. Parasocial interaction and identification with the positive or transitional character might raise the viewer's sense of self-efficacy to solve problems or to change individual behavior. Several evaluation studies have shown that the implementation of health relative, preventive messages is successful and might change attitudes under certain circumstances (Singhal et al. 2004). The idea is to encourage interpersonal discussion and reflection about the presented topics and positions as a precondition for attitude change and behavior modification. The E-E strategy offers the opportunity to reach especially those who are not interested in health-related topics and who are often hard to reach with preventive messages, e.g., adolescents or persons with a lower level of education, who are generally less information oriented. Relevant factors for the success of an E-E project are the viewer preferences (preferred medium, format, and genre) and the accurate implementation of the intended message. Media offer many opportunities for preventive purposes (Papa et al. 2000). As yet, there is no evidence that the integration of pro-social or health-related messages in entertainment generates negative reactions among the audience.

## CHALLENGES

Success in prevention requires several considerations. First, the access to valid health information for different social groups has to be assured. There still exist both health and information disparities with regard to socio-economic status (→ Knowledge Gap Effects). Therefore, special communication strategies are needed to reach the different groups and to close the gap between them (Viswanath 2005).

Second, the perception of the message as the most important precondition for following cognitive processes has to be considered: age, gender, socio-economic status, educational background, and health conditions are relevant factors which have influence on media use, and access to and perception of health-related messages (Viswanath 2005). Third, individual understanding and interpretation of a message have to be taken into account. There has been a shift to an individual perspective and qualitative studies that give important hints for the construction of preventive messages. Even participative approaches offer great potential and should be regarded in the future (Singhal et al. 2004).

Communication strategies have to be seen in a context of a varied media landscape, which consists of different and sometimes inconsistent, contradictory messages (Sherry 2002; Viswanath 2005). The success of a strategy might increase if the program is embedded in a media environment that is hospitable to the communicated message. Apart from intentional communication measures, also the unintended effects of media programs have to be considered. The resonance they generate can only be investigated in long-term media effect studies.

# Priming Theory

*Shanto Iyengar*

*Stanford University*

The priming effect refers to media-induced changes in voters' reliance on particular issues as criteria for evaluating government officials. The more prominent any given issue in the news, the greater the impact of voters' opinions about that issue on their evaluations of government. The priming effect creates volatility in public opinion, especially during election campaigns (→ Public Opinion, Media Effects on; Election Campaign Communication). As casual observers of the political scene, ordinary citizens only notice events and issues that are in the news; those not covered by the media might as well not exist. What is noticed becomes the principal basis for the public's beliefs about the state of the country. Thus, the relative prominence of issues in the news is the major determinant of the public's perceptions of the problems facing the nation (see, e.g., Iyengar and Kinder 1987).

The relationship between news coverage and public concern has come to be known as the → agenda-setting effect. Over the past four decades, agenda-setting effects have been replicated in numerous studies. Cross-sectional → surveys, panel surveys, aggregate-level → time-series analyses of public opinion, and laboratory experiments (→ Experiment, Laboratory) all converge on the finding that issues in the news are the issues that people care about.

## PRIMING AS AN EXTENSION OF AGENDA SETTING

Beyond merely affecting the salience of issues, news coverage influences the criteria the public uses to evaluate political candidates and institutions. A simple extension of agenda setting, priming describes a process by which individuals assign weights to their opinions on particular issues when they make summary political evaluations. In general, the evidence indicates that when asked to appraise politicians and public figures, voters weight opinions on particular policy issues in proportion to the perceived salience of these issues: the more salient the issue, the greater the impact of opinions about that issue on the appraisal (→ Issue Voting; for reviews of priming research, see Miller & Krosnick 2000; Druckman 2004).

Their dynamic nature make priming effects especially important during election campaigns. Consider the case of the 1980 American presidential campaign. Less than a week before the election, polls showed Jimmy Carter and Ronald Reagan to be dead even. Suddenly, the Iranian government offered a last-minute proposal for releasing the Americans held hostage for over a year. President Carter suspended his campaign to devote his full attention to these negotiations. The hostage story became the major news item of the day. The prominence of the hostage story caused voters to seize upon the candidates' ability to control terrorism as a basis for their vote choice (Iyengar & Kinder 1987). Given his unimpressive record on this issue while in office, the effect proved disastrous for President Carter.

Similar volatility in the state of the public agenda bedeviled President George H. Bush in the 1992 election. One year previously, he had presided over the successful liberation

**Figure 1** Ingredients of President Bush's popularity  
*Source:* Gallup CBS News Polls and Gallup polls, 2001–2004

of Kuwait from Iraqi occupation and his popularity ratings reached 90 percent. But as news coverage of the economy gradually drowned out news about the Gulf conflict, voters came to prefer Clinton over Bush. Had the media played up military or security issues, of course, the tables would have been turned.

The most recent instance of priming comes from the post-9/11 era. Prior to September 11, President George W. Bush's overall popularity was closely tied to perceptions of his performance on economic issues (see Fig. 1). After September 11 and extending through 2003, however, Bush's popularity was more closely tied to assessments of his performance on terrorism. Terrorism and national security had replaced the economy as the yardstick for judging Bush's performance. It was only in 2004, after the onset of the presidential campaign, that economic performance and overall performance were again linked. This finding is reinforced by a time-series analysis of Bush's popularity (see Iyengar & McGrady 2007), which demonstrates that following the 9/11 attacks, news coverage of terrorism became the single most important determinant of Bush's public approval.

### ANCILLARY CONDITIONS FOR PRIMING EFFECTS

Media priming effects have been documented in a series of experiments and surveys, with respect to evaluations of presidents, legislators, and lesser officials, and with respect to a variety of attitudes ranging from voting preferences, assessments of incumbents' performance in office, and ratings of candidates' personal attributes to racial and gender identities. In recent years, the study of priming has been extended to arenas other than the United States, including a series of elections in Israel (Sheafer & Weimann 2005), Germany (Schoen 2004), and Denmark (de Vreese 2004).

Typically, news coverage of issues elicits stronger priming effects in the area of *performance assessments* than in the area of personality assessments (Iyengar & Kinder

1987). In one noteworthy exception – involving “personality priming” – voters who watched the famous 1960 debate between John Kennedy and Richard Nixon on television were more likely to rely on image factors (such as integrity) when considering the candidates’ performance in the debate (see Druckman 2003; → Televised Debates) than were voters who listened to the debate on the radio. The radio group, on the other hand, took into account both image and the candidates’ positions on the issues. This study suggests that the visual imagery provided by television encourages voters to focus on personality-related rather than issue-related considerations when evaluating the candidates.

A special case of priming concerns the phenomenon of *momentum* in primary elections. Because news coverage during the early primaries tends to focus exclusively on the state of the “horse race,” primary voters are likely to rely heavily on information about the candidates’ electoral viability when making their choices (Brady & Johnston 1987). In a study of the 2004 primary campaign, researchers found that the single most important determinant of Democrats’ primary vote preference between senators John Kerry and John Edwards was the voters’ perceptions of the two candidates’ personalities. The second-most powerful predictor of vote choice was the candidates’ electoral viability (Iyengar et al. 2004). Viability was more important to voters than the candidates’ positions on major issues, including the war in Iraq and outsourcing of American jobs.

The ability of the news media to prime political evaluations depends on both media content and the *predispositions of the audience*. Unsurprisingly, priming effects peak when news reports explicitly suggest that politicians are responsible for the state of national affairs, or when they clearly link politicians’ actions with national problems. Thus, evaluations of President Reagan’s performance were more strongly influenced by news stories when the coverage suggested that “Reaganomics” was responsible for rising American unemployment than when the coverage was directed at alternative causes of unemployment (Iyengar & Kinder 1987, ch. 9).

In a further parallel with agenda-setting research, individuals differ in their susceptibility to media priming effects. Miller and Krosnick (2000) found that priming effects occurred only among people who were highly knowledgeable about political affairs and had high levels of trust in the media (→ Credibility of Content). Iyengar and Kinder (1987) found that partisanship affected the issues on which people could be primed: Democrats tended to be most susceptible to priming when the news focused on issues that favor Democrats, such as unemployment and civil rights, while Republicans were influenced most when the news focused on traditional Republican issues like national defense (→ Exposure to Communication Content).

In sum, issues and events in the news are deemed important and weigh heavily in evaluations of incumbent officials and political candidates. As is clear from the way in which President George H. Bush benefited from media coverage of the 1991 Gulf War and then suffered from coverage of the economy, priming results equally from news of political successes and news of political failures. Priming is a double-edged sword.

## **Printer-Editors**

*Stephen J. A. Ward*

*University of British Columbia*

Printers acted as editors from the origin of printing in eastern and western society. But Gutenberg's press in the mid-fifteenth century gave birth to journalistic printer-editors who published news regularly and informed a wide public (→ Journalism, History of). These early journalists used book production techniques to generate broadsheets, pamphlets, mercuries, intelligencers, gazettes, and newsbooks (Boyce et al. 1978). Under the eye of monarchs and their censors (→ Censorship), they disseminated reports on war, discoveries, and omens, and campaigned for or against political and religious movements across Europe in the sixteenth and seventeenth centuries as part of an emerging western print culture (Eisenstein 1979).

These printer-editors emerged in two stages (Briggs & Burke 2002). From the second half of the 1500s to the early 1600s, before the establishment of a periodic press, printer-editors were relatively obscure, were scattered widely, and operated small presses under strict censorship. Their occasional publications tended to focus on one topic or event.

The second stage extended to the eighteenth century, when printer-editors became periodic journalists, publishing well-known weekly or biweekly papers in major cities.

Printer-editors gleaned their material from many sources: officials for court gossip, soldiers for accounts of battles, alleged eyewitnesses for marvels, and correspondents for foreign news. Printer-editors operated on both sides of the law. Some were used by monarchs to defend their claims or actions, and others operated secret presses for religious dissent, much of it propaganda inspired by the upheavals of the Reformation, including Luther's 95 theses. In Mexico City, during the early 1500s, newsbooks called *hojas volantes* (flying pages) appeared in the streets, well before the first press in North America.

A periodic news press took root in the seventeenth century, encouraged – at different rates in different countries – by a more tolerant political climate, a literate public in growing cities, a network of publishers and correspondents linked by a postal service, and the stimulus of print capitalism. In England, the evolution of a Parliament-restrained monarchy allowed for periods of greater press freedom (→ Freedom of the Press, Concept of) than in France or Germany. In the colonies of North America, printer-editors labored at first under old-world governors.

Conflicts such as the Thirty Years War fueled readership and encouraged periodic publication, but news of commerce also mattered. In the freer political climate of trading centers such as Amsterdam, printer-editors published brusque *corantos* or newssheets on business and politics (Shaaber 1967). In England, under the censorious Stuarts, a cautious weekly news press took root in the London of the 1620s, imitating the Amsterdam newssheets. A vigorous periodic press arose during the Civil War (→ Partisan Press), as royalist and anti-royalist printer-editors quarreled (Smith 1994), but the Restoration brought back censorship. The English periodic press could not grow beyond a few official papers until the restrictive Printing Act expired in the late 1600s. Outside of England, authoritarian governments licensed a small periodic press while struggling to contain an illegal *underground* press. German principalities imposed strict regulations on printers. In France, Cardinal Richelieu, wary of inflammatory newsbooks, granted a monopoly on news publication to Théophraste Renaudot and his *Gazette de France*.

Printer-editors had a dubious social status well into the eighteenth century (→ Journalism). They did not fit existing social categories: part craftsman, part entrepreneur, part bookseller, part printer, part editor, and part writer. Their ephemeral papers were neither serious books on history nor crude broadsides. Conservative clergymen and officials regarded them as crass opportunists or dangerous voices of criticism and immoral ideas.

In the eighteenth century, the role of the printer-editor changed, divided, and declined. The growth of periodic news to serve the many sites of the Enlightenment public sphere – the English coffee house, the French salon, the German scientific association – required a division of labor (Habermas 1989). By the late 1700s, daily newspapers such as the London *Times* were expanding newsrooms for thousands of readers (Rea 1963). The newspaper was a corporate product, requiring separate contributions from printers, publishers, editors, and news writers (→ Commercialization of the Media). The printer-editor, as author of many forms of journalism, was replaced by specialists – the essayist, the factual reporter, the reforming editor, the revolutionary polemist. Nineteenth-century newspapers became large commercial enterprises. The printer-editor of a small, personalized paper had receded into history.

## **Printing, History of**

*Paul Arblaster*

*Catholic University of Leuven*

In the broadest sense, printing is any means by which a pattern, text, or image is impressed on another surface. The creation of an impression in clay or wax with a seal, or in metal with a punch, and the printing of patterns on textiles are all ancient arts that bear some similarity to printing proper. Paper money, wallpaper, official forms, tickets, texts, images, and many other things have been and are printed with ink on paper. The concern here will be with the printing of texts on paper.

### **EARLY ASIAN PRINTING**

By the ninth century, printing texts in ink on paper by means of relief-carved wooden blocks was a widespread practice in East Asia. The paper to be printed on was laid face down upon the inked block and rubbed over with a hand-held implement to transfer the ink. The earliest use of printing was for the reproduction of texts from the Buddhist scriptures, a ritualized pious deed not necessarily implying that such texts would be read. Some of the oldest examples of printing to survive were deposited in stupas (monuments housing Buddhist relics) in such a way as to be inaccessible to readers. Printing was, however, rapidly applied to many different forms of textual and pictorial reproduction.

China was not only the place where woodblock printing (xylography) was invented, but also the first place where movable type was cast in clay or carved as individual hardwood blocks. The first recorded use of movable metal type, probably cast in bronze, took place in Korea in 1234.

Woodblock printing remained the preferred method in East Asia for all but long print runs of important texts – often texts of a scriptural, ceremonial, administrative, or encyclopedic nature, printed by government commission or under the aegis of a wealthy private patron. The number of characters needed even for simple printing jobs entailed far more complicated systems of storage and retrieval than were required for movable type with alphabetic scripts. Even in Korea, where an alphabetic script had been invented in the fifteenth century, the continuing cultural prestige of Chinese script limited the use of the Korean alphabet until well into the nineteenth century.

Joan Nieuwhof, chamberlain of a Dutch trade mission to China in the mid-seventeenth century, included in his report a passage on Chinese printing, based on personal observation and the writings of Jesuit missionaries. He considered skilled Chinese workmen capable of producing woodblock impressions at as quick a rate as European compositors and pressmen with movable type and a printing press, while Chinese methods were better adapted to East Asian scripts and had the further advantage that the publisher could store hardwood blocks, and print off from them as the occasion arose (a form of print-on-demand), rather than having to print a run all at once, perhaps underestimating or overestimating its selling potential. One advantage of metal type that Nieuwhof fails to consider is that for long runs it was more durable, and damaged parts more easily replaced.

## **THE GUTENBERG PRESS**

Since parchment copies could not be economically produced on a large scale, printing only became a feasible proposition in Europe from the early fifteenth century, when the use of paper had become common. Woodblock printing, primarily of religious images and playing cards, began in Europe around 1400. Some have postulated an Asian inspiration for this, but the issue remains open. By the 1460s, block-books were being printed, combining text and image in a manner that was impossible to achieve with movable type.

### **Gutenberg's Inventions**

The dominant form of printing in early modern Europe, however, was the printing press invented by Johannes Gutenberg, in Mainz, around 1450. Gutenberg's invention of a means of "mechanical writing" was shrouded in a commercial secrecy that even the surviving legal records of disputes with his business partners have failed to disperse. The technical details of his invention have to be inferred from later presses. The upshot of Gutenberg's falling-out with his backers was the establishment of rival presses, making it impossible to retain a monopoly on the technology; thereafter, the initiation of new individuals into the mystery of printing in some cases seems to have been on condition that they not set up shop in the immediate locality. As a result, Gutenberg's technology spread rapidly, and within a century of its invention was in use throughout western Europe and in European settlements in Mexico and Goa.

The “forme,” a locked frame of metal type ready to be inked and printed from, was known to thirteenth-century Korea; one of Gutenberg’s innovations was the press itself, probably based on a wine press. What resulted was a device by which a printer, working a screw-mounted platen by means of a hand-operated bar, evenly pressed the paper against an inked forme. Two sturdy columns, the “cheeks,” not only served as the central support of the press, but held the platen straight during its movement up and down. For the same purpose, the size of the platen was restricted, and each side of a full sheet of paper had to be printed one half at a time. The forme was secured face up in the bed of the press, or “coffin,” and then inked with hand-held inking balls or tampons. The paper, lightly dampened to take the oil-based ink that metal type required, was secured in a light fold-over frame, a “tympan,” attached to one end of the coffin. The tympan was folded down over the coffin, the whole was slid under the platen, the bar was pulled one way to apply pressure, then the other to release the platen; the coffin was then moved along and the exercise repeated for the second half of the sheet. The coffin was then slid out again and the tympan opened to remove the printed sheet, which was hung up to dry. The forme of type was prepared by a compositor before being secured in the coffin, from racks of different individual pieces of type. These pieces of type had been cast in a mold that had to be of variable width for different letters, but of a standard height in order to give an even impression. The metal type was an alloy of lead, tin, and antimony; the mold was made with a punch. This method of textual reproduction provided greater standardization and considerable savings in time when compared to scribal copying, and for reproducibility of long runs or large texts also offered distinct advantages over woodblock printing.

### **Consequences of Gutenberg’s Printing Press**

Much debate has surrounded the historical importance of the printing press, which Eisenstein (1979) has viewed as an invention so revolutionary as to mark a clear break with pre-typographical culture, but Chartier (1989) more simply as an important stimulus to the dissemination of cultural practices already inherent in alphabetic script and the codex book. Consideration of non-European history suggests that any technological determinism would be misplaced. Late Ming China, without any new technology, saw a tremendous growth in publishing, and the emergence of a literary class of professional authors, editors, commentators, and anthologists that only partially overlapped with the state-authorized aristocracy of learning established by the imperial examination system. At the same time, awareness of the printing press did not lead to any immediate changes in the book culture of Russia or of the Muslim world, until figures in authority decided that it should. In these cases the printing press was much more an instrument of change than its agent.

The cultural impact of the shift from scribal publication to print may have been only an acceleration of existing trends, certainly in the first decades when printing was simply a mechanical means of producing books otherwise identical to those already being produced by scribes or stationers. But the impact of printing on the technical and economic organization of → book production and the book trade was without doubt revolutionary. The physical reproduction of texts on paper came to rely on three skilled technical jobs: casting type (technologically the hardest nut for Gutenberg to crack), composing type with speed and exactness, and pulling the press, which itself demanded

great skill to produce a clean impression. The compositors and pressmen worked in the master printer's shop; most punch-cutters and type-founders set up in business independently, selling type to numerous different printing shops, but some big printing houses cast their own type on the premises. Publishing and bookselling could be independent commercial functions, but in the first two centuries of printing it was usually a single individual who owned the press and bookshop, and decided what to print and sell. Over the course of time, mechanical and commercial activities became increasingly specialized, with separation of the roles of printer and bookseller, and the dividing of type-casting, compositing, and working the press into multiple sub-specialties. Printing workers were among the most skilled and best paid of the time, and their "chapels" were early precursors of unionization. The uniquely well-preserved print shop and archive of the Plantin Office in Antwerp (now the Plantin-Moretus Museum) illuminates every aspect of the trade in the late sixteenth and seventeenth centuries.

The first decades of printing saw a series of minor but crucial developments in book design: the diversification of Latin types (Blackletter, Roman, Italic, etc.) and the creation of types for printing in Greek, Hebrew, and other scripts; the creation of decorative type and borders, and of methods of combining woodcut illustrations with letterpress text, making the work of illuminators redundant; the perfection of methods of printing in color, particularly in red and black on the same page; and the invention of the title page, first as a means of identifying printed texts and then as a means of advertising them.

The rapid dissemination of the technology, and the imperative to produce books in previously unheard of numbers, and then sell them as quickly as possible, led to new commercial interactions and marketing strategies. Although most printers initially combined the roles of publisher and bookseller, they would also happily act as printer for another bookseller, and vice versa, so that any given bookshop would contain works from many different print shops. Book trade contacts, and especially the great book fairs, initially in Lyons and later in Frankfurt and Leipzig, created new forms of commercial and intellectual networking that linked centers of printing and book-buying across western Christendom.

The very first products of the Gutenberg press were Latin Bibles, printed indulgences, and calendars, all of which required standardized reproduction in relatively large numbers. These were soon followed by Latin grammars, the works of Cicero, and then those of other classical authors read in large numbers, major works of medieval scholarship in theology, canon and civil law, natural philosophy, and medicine, and vernacular books and booklets of all sorts: devotional, educational, self-help, romantic, and sensationalist. By 1600 every type of printed work had seen the light of day, from lottery tickets and flysheets advertising wonder drugs to the great polyglot Bibles that presented parallel texts in three or four different scripts on the same page. There were ever more editions of ancient texts (classical, scriptural, or patristic), even of the more obscure ancient writers, constant reprints of late medieval romances for a popular readership, but also an increasing range of new discoveries, opinions, and arguments made available to the general public (→ Newspaper, Antecedents of).

The controversies of the Reformation greatly stimulated the growth of the press, which presented a new means of disseminating religious → propaganda, but also led to stricter regulation, on confessional grounds, of what could be published (→ Censorship; Censorship, History of). The contact that ordinary folk had with texts was increased greatly by

the printing of almanacs and catechisms. In the seventeenth century, the interlocking developments in scientific experiment and the publication of results, whether in books, pamphlets, or learned journals (→ Magazine; Magazine, History of), owed a great deal to the printing press as a means of disseminating knowledge.

### THE MECHANIZATION OF PRINTING IN THE NINETEENTH CENTURY

For 350 years the Gutenberg press in use in Europe, and increasingly throughout lands of European settlement overseas, saw constant minor improvements but no major modifications. Little had changed between Gutenberg's own day and the description of printing provided in Diderot's *Encyclopaedia*, itself a major printing achievement. The last improvement of the handpress era, and the first that considerably increased press output, was Charles Stanhope's press. Built entirely of iron, this was a much harder-wearing machine than earlier wood-frame presses, saving on repairs and replacement; the platen was large enough to print one side of a full sheet at a single impression, and it was moved by a system of levers and counterweights rather than a screw, so that it required less force to operate. The Stanhope press, brought on to the market in 1802, was greeted by the British and Foreign Bible Society (founded 1804) as a providential invention that made it economically feasible to envisage putting a Bible in every home.

In 1812 the first steam-powered printing machine was built in London by Frederick König. The forme was secured in the flat bed of the machine, as in a Gutenberg press, but inking and impression were both carried out automatically by rollers. König's machine could produce 800 impressions per hour, as against 250 on a Stanhope press. Within two years König had developed a double-cylinder machine, first taken into use by *The Times*, that could produce over 1,000 impressions per hour. As with Gutenberg, disputes between König and his backers led to him leaving London, thus speeding the adoption of the new technology elsewhere. The König and Bauer machine works, which he co-founded, exported printing machines across Europe.

In 1844, in New York, Richard Hoe built the first practical rotary printing press – abandoning the flat bed just as König had abandoned the flat platen, so that the paper ran between an impression cylinder and a type cylinder. His machine could produce 8,000 impressions per hour. The Bullock press of 1865 added a continuous roll of paper, boosting the speed of production still further. These developments were of particular interest to newspaper publishers, who throughout the nineteenth century faced the need to print ever larger runs at ever greater speeds.

In parallel with the mechanization of printing itself, machines for making paper, for casting type, and for compositing were developed and refined, patent following patent. From the mid-nineteenth century onward newspapers, cheap novels, and other ephemera were increasingly printed on high-acid wood-pulp paper, made in Fourdrinier machines, as a cheap alternative to traditional rag- or linen-based papers. By the end of the nineteenth century, linotype, photogravure, and offset lithography all provided means of printing without traditional movable type or engraved plates. Lithography was the first European technology to offer undoubted advantages over traditional East Asian methods of reproducing nonalphabetic scripts, and was rapidly adopted in China and Japan, as were later developments. At the same time, the use of western printing technology had

been spread beyond areas of European settlement by missionary societies and colonial governments, and as a tool of administrative and religious reformers was making considerable inroads into the traditional book culture of Muslim lands.

Nineteenth-century mechanization was followed in the twentieth century by a profusion of chemical printing processes, electrification, and most recently computerization. Offset filmsetting, or photocomposition, and now computer-to-plate offset printing, have made cast-metal type itself, like the woodblock, obsolete for all but bibliophile editions and quality bespoke printing.

## **Prints**

*Lisa Pon*

*Southern Methodist University*

Printing, strictly defined, is the process by which ink is transferred from a prepared matrix to another surface; prints are the material objects that bear the ink transferred by

this process (→ Printing, History of). From the mid-fifteenth century until the early nineteenth century in the west, a printing press powered by hand was most commonly used to effect the transfer. As a result, the surface receiving the ink, often a sheet of paper, was usually relatively small in scale in order to fit into the press. The matrix was routinely inked and printed repeatedly, producing hundreds or thousands of prints that were identical in content. Although, by the late sixteenth century, collectors were able to discern qualitative differences between prints made from a new or much used matrix, and were willing to pay substantially more for the former, print scholar William Ivins was correct to point out that the fundamental importance of printed images was their status as “exactly repeatable pictorial statements” (1953).

Physical portability, existence in large numbers, and low cost in comparison to drawn or painted pictures have made prints a powerful means of bringing largely identical images to many people in many places (→ Painting). By the end of the fifteenth century, some thousand years after printing on paper began in China, printing in Europe was producing pictures faster and in greater numbers than had ever been possible previously. Since then, prints have had profound effects on how the socio-cultural world has been constituted and understood. Like printed texts (Eisenstein 1979), printed pictures led to a stabilization of certain → codes, such as a shared vocabulary of classical architecture (Carpo 2001) or a common legal tender in the form of engraved bank notes. Prints have also offered a flexible medium through which civic, national, or religious identities around the Mediterranean basin, Europe, the Americas, and Asia could be constructed and contested (San Juan 2001; van den Boogaart 2003; Wilson 2004; → Socialization by the Media). For example, the chromolithographs produced in the 1880s by the Chitrashala Press in Poona, India, emphasized the martial prowess of Hindu deities such as Khandoba and Bhavani as a call to action to a wide and politically sensitized viewership then under colonial rule (Pinney 2004).

Prints could also be presented as a means to universal knowledge. The most extensively illustrated printed → *book* of the fifteenth century, the *Nuremberg chronicle* (*Liber chronicarum*) compiled by Hermann Schedel, was organized as a year-by-year account of notable historical events in all the world then known to Europeans from Creation through the years just before its publication in 1493. More than 600 woodcuts from the workshop of Michael Wolgemut and Wilhelm Pleydenwurff, many printed more than once in the book to produce almost 1,900 illustrations, depicted biblical scenes, subjects from classical and medieval history, and a series of city views. Some of these views were distinct, recognizable representations (for example, Nuremberg, Venice, and Jerusalem), whereas others used the same image repeatedly to denote various cities (for example, a single woodcut was used to indicate the land of the Amazons, Alexandria, Athens, Pavia, and Prussia).

## MATERIAL MANIPULATIONS

Another publication from Nuremberg demonstrates how the physical nature of prints allowed and even sometimes explicitly invited manipulation by its viewers. The *Picture academy for the young* (*Bilder-Akademie für die Jugend*) was published between 1780 and 1784 by Johann Siegmund Stoy as a volume of 52 engravings for children and two

volumes of text for their teachers (Heesen 2002). Each engraving contained nine pictures, related thematically but drawn from different orders of knowledge, from biblical history to everyday life. Teachers were to start by presenting only one picture at a time, covering the others with a paper mask; alternatively, the nine pictures were to be cut apart, mounted on cardboard for durability, and stored in a specially constructed box, whose compartments mimicked the placement of each picture on its original uncut sheet. By taking the printed pictures from compartments, comparing them and replacing them to their proper places, children were prompted both to learn about the world and to organize that learning according to Stoy's framework (→ Media Use and Child Development; Media Use by Children).

The arrival of Japanese woodblock prints in Europe in the early nineteenth century offers an example of the manipulation of printed material without such explicit authorial direction. Prints by Utamaro, Hokusai, and others were first brought to the Netherlands from Nagasaki, a Dutch trading center, as wrapping for parcels and stuffing for bales of merchandise being transported to Europe. Early Dutch officials stationed in Japan did collect woodblock prints as "native illustrations . . . of passing scenes" (Captain Sherard Osborn, cited in Stewart 1979), but a European recognition of Japanese woodblock prints as objects that communicated aesthetically rather than packing material flourished only in the second half of the nineteenth century, with the 1862 International Exhibition in London. Subsequently, these prints had a profound impact on many European painters including Vincent Van Gogh, Paul Gauguin, and Claude Monet.

While the early Dutch merchandise packers in Japan and the children who used Stoy's *Picture academy* remain anonymous, there is information about other individuals who materially manipulated the prints they collected, a practice that reached a high point in the sumptuously bound, multi-volume print albums compiled by the great connoisseurs of the eighteenth century (Griffiths 1994). Jacopo Rubieri, a fifteenth-century notary in northern Italy, collected prints during his travels, cut out or painted over parts of them, and glued them into his juridical notes. Anna Jäck, prioress of the Augustinian convent in Inzigkofen, collected prints along with hand-drawn pictures to paste into a manuscript book she completed in 1449. The German text, *Sister Regula's life of Jesus (Leben Jesu der Schwester Regula)*, was a manual intended to teach its readers to meditate by envisioning in the fullest possible detail scenes from Christ's life and passion. As an external aid to this contemplation, Jäck collected 45 small images to paste beside the relevant passages. She began writing the manuscript only after obtaining all the pictures, which fit neatly into the blank spaces she had left in the columns of text. Jäck was concerned with neither the pictures' makers nor the techniques used; rather she gathered pictures from different sources to communicate to her readers the types of images they could bring to mind during their devotions.

### INTERPELLATING PUBLICS

Stoy's *Picture academy* and Anna Jäck's meditation manual were aimed at specific groups of viewers. The *Picture academy* targeted children seeking to learn about history and the world around them, while Jäck's manuscript was directed toward pious people in her community who sought instruction in devotional meditation (→ Religion and Popular

Communication). Prints were effective at mobilizing these and other types of knowledge for visual consumption by many different individuals; having interpellated these disparate viewers, prints could coalesce them into cultivated publics that could confront, contest, or accept a shared body of knowledge (→ Social Movements and Communication). In this way, they are a prime example of what Bruno Latour (1988) called “immutable mobiles,” things that allow one member of a community to make a claim that can be entertained by the community at large. Prints are especially effective at communicating visual information in order to bring together a public then able to make further cultural claims (→ Art as Communication; Visual Communication). For example, Marcantonio Raimondi’s print, *Parnassus* (c.1517), was not intended to reproduce the exact composition of Raphael’s fresco in the Vatican. Rather, the print’s message was that Raphael had made the picture: as the engraved inscription states, “Raphael depicted this in the Vatican” (RAPHAEL PINXIT IN VATICANO). The print’s sixteenth-century viewers were mobilized to form a public accepting that message and crediting Raphael with both the painted and printed Parnassus. That new public, brought together by print, established Raphael’s place in the history of sixteenth-century art (Pon 2005).

Marcantonio Raimondi’s print was an engraving, a particularly labor-intensive technique that involved cutting into the surface of the matrix with a sharp implement called a burin. As Walter Benjamin pointed out, the development of the technique of lithography at the end of the eighteenth century allowed the production of regular, eventually daily, → news images in virtually unlimited numbers; this newly enriched traffic in printed images was a key factor the emergence of a → public sphere. Photography and digital print production, developed in the nineteenth and twentieth centuries, further accelerated the traffic in images available to the public and its various counter-publics. Whether → Jürgen Habermas’s classic formulation of a well-informed, rational, and democratic bourgeois public sphere was ever actually achieved is debatable (→ Public Sphere, Fragmentation of). But the power of prints to interpellate publics is clear from the struggles to control print production during the decades in which lithographs became widespread. In Paris in the autumn of 1830, Charles Philipon began publishing a weekly paper, *La Caricature*; this was soon followed by a daily journal, *Le Charivari* (Cuno 1983; Kerr 2000; → Caricature). Both publications contained collectible lithographs about contemporaneous events, often political in nature. The political caricatures, including a biting series on the recently installed constitutional monarch, Louis-Philippe, had by 1832 led to 20 seizures by government censors, some 6,000 francs in fines, and 13 months in prison for Philipon himself as well as the arrests of his publisher, his printer, and one of his artists, Honoré Daumier.

In response, Philipon used prints to bring together a politically engaged public as the Association for the Freedom of the Press (Association pour la Liberté de la Presse), which became better known as the Association Mensuelle Lithographique. Subscribers paid a monthly fee, and in return received a lithograph exclusively commissioned for them; the fees were to be used to offset any further court costs Philipon and his journals might incur. One of Daumier’s best-known lithographs, *Rue Transnonain: 15 April 1834*, was published in the last issue of *L’Association Mensuelle*. The print depicts victims of a massacre during the Paris riots of that month, killed in their homes at close range by French soldiers who believed a fatal sniper’s bullet had come from the building. By

bringing this single, politically potent image to the subscribers of the *Association Mensuelle* in a detachable format suitable for framing, Daumier's lithograph demonstrates how prints can be valued simultaneously for their aesthetic qualities and their power to form and inform communities.

# Privacy

*Fred H. Cate*

*Indiana University*

*Brooke Barnett*

*Elon University*

“Privacy” is widely recognized as a legal right, but with a range of different meanings. These include restraints on intrusion into the home, confidentiality of correspondence, freedom to make certain fundamental decisions, control of personal data, anonymity, and many others. Countries differ as to the specific understandings of privacy their laws protect and whether those understandings apply equally against the government and private sector entities.

Since the end of World War II, *international legal agreements* have recognized privacy as a human right because “laws protecting privacy are the means through which the collective acknowledges rules of civility that are designed to affirm human autonomy and dignity” (Smolla 1992, 119). The Universal Declaration of Human Rights provides that “no one shall be subject to arbitrary interference with his privacy, family, home, or correspondence.” The International Covenant on Civil and Political Rights and the European Convention on Human Rights contain identical provisions. The “Right to Privacy” clause of the → American Convention on Human Rights likewise provides that “no one may be the object of arbitrary or abusive interference with his private life, his family, his home, or his correspondence.”

## **COMPARATIVE LAW: CONSTITUTIONS, STATUTES, AND COMMON LAW**

A number of countries recognize privacy in their constitutions. For example, the South Korean Constitution states: “The privacy of no citizen shall be infringed.” Similarly, the Basic Law of Germany protects privacy as part of “human dignity,” “inviolability of the home,” and the “privacy of correspondence, posts and telecommunications.” Other countries in which privacy emanates from constitutions include Brazil, Ireland, India, Japan, the Netherlands, Russia, and the United States.

In addition to the constitutional guarantee of privacy, many nations regulate privacy as a civil or criminal offense through statutes. This is true in the 27 member countries of the European Union, which are required by the 1995 EU Data Protection Directive to adopt omnibus data protection laws applicable to both the government and the private sector (→ European Union: Communication Law). Although many European nations had adopted privacy laws prior to the Directive taking effect in 1998, the Directive significantly increased the scope and burden of privacy law throughout Europe. Argentina, Australia, Canada, Hong Kong, Japan, Singapore, South Korea, Switzerland, Taiwan, and other nations have also adopted broad data protection statutes. Common law has also played a significant role in evolving privacy requirements, especially in the United States and New Zealand.

## US Constitutional Provisions

“Privacy,” as a distinct set of legal rights, originated in the United States with the 1890 publication of Samuel Warren and Louis Brandeis’s *Harvard Law Review* article, “The right to privacy.” Warren and Brandeis proposed the creation of a tort action for invasion of privacy by the news media. In the century since, privacy law has expanded to exist in all of the forms discussed above, with the exception so far of an omnibus data protection law. This exception is increasingly bringing the United States into conflict with other nations.

The US Supreme Court has found three *privacy rights implicit in the US Constitution*. The *first* is based in the Fourth Amendment “right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures.” The Court has held that the protected zone of Fourth Amendment privacy is defined by the individual’s “actual,” subjective expectation of privacy and the extent to which that expectation is “one that society was prepared to recognize as ‘reasonable.’” The protection afforded by the Fourth Amendment is subject to many exceptions. For example, there can be no reasonable expectation of privacy in information held by a third party. Hence, the US government can collect even the most sensitive information from a third party without a warrant and without risk that the search may be found unreasonable under the Fourth Amendment.

The *second* of the constitutional privacy protections is a more general constitutional right against government-compelled “disclosure of personal matters.” This right has proved quite weak, and in fact has never been used by the Supreme Court to block any government demand for personal data. The *third* constitutional privacy provision is an amorphous but controversial right of individuals to make certain fundamental decisions concerning themselves or their families. This right has been the source of considerable controversy in debates over abortion, reproduction, education, and childrearing, and seems unlikely to survive the appointment of more conservative Supreme Court justices.

The contours of the Fourth Amendment and of the right against nondisclosure of personal matters are of great importance to journalists, because they define the constitutional protection against the government seizing or searching journalists’ papers, files, photographs, and outtakes. As many journalists have learned to their consternation, there are today few, if any, limits, and those that there are can always be overcome by the government applying to a court for a warrant.

## US Tort Privacy Law

US common law, and later statutes, have also provided for four types of privacy torts over the years. First, the tort of unreasonable intrusion requires that it involve one’s invasion of the solitude of another or his private affairs and that it be “highly offensive to a reasonable person.” Second, the tort of disclosure of embarrassing facts applies to publication of private information that would be “highly offensive to a reasonable person” and is not of “legitimate public concern.”

The third privacy tort is publicity that places a person in a false light before the public. To be actionable under the false light tort, the publication must be both false and highly

offensive to a reasonable person. The final privacy tort is for commercial appropriation of an individual's name, likeness, or other personal characteristic without permission. Most state laws require that the appropriation be for "direct commercial gain"; the activities of the press rarely are found to satisfy this requirement. Because the torts restrict expression and therefore must withstand First Amendment review, they are rarely successful. To date, only a few awards to privacy tort plaintiffs have ever survived the Supreme Court's First Amendment scrutiny.

## **DATA PROTECTION AS RIGHT OF PRIVACY**

### **Euro-American Experience**

Privacy concerns almost always respond to new technologies. The latter third of the twentieth century witnessed the creation of a new and different form of privacy protection – data protection – in response to the development of computers since the 1960s. These data protection laws have evolved over the past three decades, and they have taken widely varying forms in different countries (→ Information and Communication Technology, Development of).

Data protection laws generally focus on investing individuals with control over the collection and use of information about themselves. Earlier data protection laws tended to lay less stress on individual control. Later data protection laws have become almost wholly preoccupied with this goal. The first data protection laws emerged in the United States and applied primarily to industry sectors (such as credit reporting and higher education) far removed from the activities of most journalists.

Perhaps the high point of data protection law focused on individual control is the *European Union Data Protection Directive*. The Directive reflects the European experience with personal data being misused by the Gestapo and by the East German Stazi and other national police and intelligence organizations during and after World War II. Thus, European nations have pursued a broader approach to privacy and one that regards it as a basic human right.

Europe was the site of the first national omnibus privacy legislation (Sweden, 1973). Today, all 27 members of the EU have broad-based laws, adopted in compliance with the EU Data Protection Directive of 1995. The Directive requires each member state to enact laws governing the processing of personal data. Personal data are defined as "any information relating to an identified or identifiable natural person." This would include not only textual information, but also photographs, audiovisual images, and sound recordings of an identified or identifiable person, whether dead or alive. As a practical matter, the Directive does not apply in only two contexts: activities outside of the scope of Community law, such as national security and criminal law, and the processing of personal data that is performed by a "natural person in the course of a purely private and personal activity."

The EU Data Protection Directive is noteworthy for its broad scope, its sweeping requirements, and its singular focus on privacy, often to the exclusion of other values. The national laws adopted under the EU Directive vary widely, thus largely undermining the value of the Directive in facilitating pan-European data flows. Even though member states

are permitted, but not required, to carve out exceptions to most of the Directive's provisions for journalistic purposes, because national governments and individuals have broad rights to block the collection, use, and transfer of personal data, national data protection laws reduce the store of personal data on which journalists may draw.

### **Other National Data Protection Laws**

Article 25 of the EU Data Protection Directive restricts the flow of data to countries found by European officials to lack "adequate" data protection, and this has added considerable pressure to the existing incentives for other nations to adopt new data protection laws and to model those on the Directive. To date, Switzerland, Canada, Argentina, Guernsey, and the Isle of Man have all adopted restrictive data protection laws that have been found "adequate" under the Directive. Many other nations (including Australia, Hong Kong, Japan, South Korea, and Taiwan) have adopted such laws but have not applied for adequacy determinations or have been turned down because the provisions were not considered adequate under the Directive. The United States negotiated a "safe harbor" agreement that allows US companies in many industries, on a case-by-case basis, to agree to be bound by the Directive's "principles" and to be subject to enforcement by the US Federal Trade Commission (or other federal authorities) if they fail to. In exchange for a publicly acknowledged agreement to do so, the companies may then import personal data from the EU.

### **Later US Data Protection Laws**

The US Congress and many state legislatures have adopted more restrictive data protection laws. These laws reflect considerable movement toward investing individuals with control over information about them, irrespective of whether the information is, or could be, used to cause harm.

The Children's Online Privacy Protection Act of 1998 requires operators of websites directed to children under 13, or who knowingly collect personal information from children under 13 on the Internet, to provide parents with notice of their information practices, and obtain prior, verifiable opt-in parental consent for the collection, use, and/or disclosure of personal information from children (with certain limited exceptions). The Driver's Privacy Protection Act of 1994 bars states and their employees from releasing information from motor vehicle records, including names, addresses, photographs, and telephone and social security numbers. The law has many exemptions, but none for the news media.

These laws apply to the press directly. The result has been quite pronounced in terms of *restricting press access* to traditionally accessible sources of information. A study by Brooke Barnett (2001) found that journalists routinely use public records not merely to check facts or find specific information, but to actually generate stories in the first place (→ Freedom of Information; Journalism: Legal Situation). Other laws do not directly regulate the activities of journalists, but have limited their ability to obtain important information. For example, the privacy rules under the Health Insurance Portability and Accountability Act address the privacy of personal health information and thus severely restrict the ability of hospitals and other health-care providers to comment on the

medical condition of their patients. Thus, journalists are often unable to discover even the most basic information concerning public officials and victims of crimes and natural disasters.

While more recently adopted data protection laws increasingly restrict journalists' access to personal data, in the United States they continue to impose few restraints on the use of data once obtained because of the powerful role of the First Amendment. The US Supreme Court held in *Bartnicki v. Vopper* (2001) that the broadcast of an illegally intercepted cellular telephone conversation concerning labor negotiations over public school teacher salaries was protected by the First Amendment.

# Privatization of the Media

*Andrew Calabrese*

*University of Colorado at Boulder*

The term “privatization” refers to the transfer of property and/or operations from state or public ownership and control into private hands. Among the principal reasons given to justify privatization is that private ownership and operation make a company perform more efficiently because its managers will be financially obligated to make the company accountable to shareholders. By contrast, government operations are often criticized for being inefficient, corrupt, and insufficiently responsive to the interests of the taxpayers who fund them. Advocates of privatization argue that the competitive environment of private industry fosters greater technological innovation, and that it pressures companies to introduce more stringent cost-cutting measures.

Privatizations of vital public services have become a lightning-rod topic in recent decades, most notably in countries where economic and political institutions have undergone radical structural transformations, for example in central and eastern Europe and in Latin America. Following the collapse of the Soviet Union, gas and oil industries were privatized and then became the focus of corruption scandals and civic unrest as former government officials and communist party leaders became wealthy “oligarchs” through massive stock acquisitions. Elsewhere, recent attempts to privatize water services have led to public outrage and riots, most notably in Bolivia in 2000. Government efforts to privatize universal health-care services, education, and other social services have also led to significant debate and protest in several countries throughout the world. In many poor countries, privatizations have taken place as a form of “structural adjustment” in response to pressures from the International Monetary Fund and the World Bank in exchange for loans.

The government of the United States has been in the global vanguard in promoting a political economic ideology that favors the privatization of state and public services (→ Political Economy of the Media). In its foreign policy initiatives, in bilateral and multilateral agreements, and as an influential model for other governments, the US government premises its global policy agenda on firm beliefs in the value of market self-regulation, liberalization, and privatization. The US government sub-contracts with private companies for the performance of sensitive government functions. Hundreds of prisons are run by large for-profit corporations, and the US military is supported by many private enterprises, from defense contractors who design and build high-technology weapon systems, to “private military companies” (PMCs) who provide such support services as security forces, interrogation of prisoners, and training. The nature and extent to which private enterprise can be made to supplant state and public services seems to be unlimited, and the rationales and processes of privatization are especially relevant for understanding the economic and political history of the telecommunications and mass media industries. Many of the basic infrastructures and vital services in the United States are built and/or owned by private corporations, including telecommunications. US domestic policy historically has favored private ownership of media and

telecommunications companies, and has tended to define the → “public interest” according to shareholder interest, a view that is increasingly embraced on a global basis.

### **PRIVATIZATION OF BROADCASTING**

Because media industries and related policies are widely considered vital to sustaining public life, there is strong and widespread opposition to regulating them as any other industry, such as steel, coffee, or coal. Instead, the governments of most countries in the world view media and culture as exceptional because of the role they play in sustaining public life and culture (→ Culture: Definitions and Concepts). For example, the argument in favor of a “cultural exception” by signatories of the → UNESCO Convention on Cultural Diversity is in part a response to the actual or perceived threats to the sustainability of nationally based media industries that are dwarfed by global media empires (→ Globalization of the Media; Media Conglomerates). Although media privatization is on the rise worldwide, many governments tend to intervene by attempting to sustain the viability of their national media industries through import quotas and subsidies. Such policies are generally opposed by economists, and by governments and intergovernmental organizations that actively promote privatization and market liberalization.

Media industries have been privatized in many countries throughout the world for the past several decades, but the pace accelerated significantly in the 1980s and 1990s, particularly in post-socialist central and eastern Europe, throughout Latin America and much of Africa, and in India and selected East Asian economies. As well, liberal democratic welfare states in western Europe and other parts of the world have embraced media privatization. In the United States, the radio and television broadcasting system as a whole is overwhelmingly commercial, and the US system of public broadcasting, especially television, generally lacks stable and sufficient funding, or influence and importance as a vital stage for American culture and politics.

Historic resistance to socialism in the United States has provided an ideological framework for severely limiting government funding of media and cultural industries. By comparison, in many other countries, public service broadcasting has been articulated through government interventions, with reference to liberal democratic ideals, affirming a role for public leaders to develop and sustain political and cultural discourse through the media. Such systems have been well funded and insulated from political pressure (for example, through license fees rather than direct government appropriations), and have been much more central to national public life. The United Kingdom’s → BBC, Germany’s ARD, Japan’s NHK, Canada’s CBC, and Australia’s ABC are among the systems that serve as public service models, particularly because of their commitments to innovative quality programming, and to the insulation of programming from direct government and market influence (→ Public Service Broadcasting: Law and Policy).

However, due to pressures from global competition and the rapid increase in the availability of new media sources, even where they are well established and relatively successful, public service broadcasters (PSBs) have found themselves having to compete for audiences in an unfamiliar commercial and multichannel media landscape. One result has been that PSBs have had to adapt at a faster pace to technological change, and to develop business models that enable them to compete with commercial networks. Such

changes have led to concerns about the demise of the distinct identity and mission of public service broadcasting. Although not technically privatized, numerous PSBs have taken on more characteristics of private, commercial broadcasters, including paid advertising (→ United States of America: Media System).

## PRIVATIZATION OF TELECOMMUNICATIONS

Perhaps even more dramatic than the changes to broadcasting have been the trends in privatizations of telecommunications infrastructures and the convergence of mass media and telecommunications infrastructure ownership (→ Telecommunications: Law and Policy). In the past 20 years, many governments around the world have privatized their postal, telegraph, and telephone companies (PTTs), resulting in numerous subsequent mergers with and acquisitions by larger foreign companies. As well, foreign telecommunications firms have entered new markets in which privatizations and market liberalization occurred. For example, foreign direct investment poured into post-socialist central and eastern Europe to construct new landline and wireless infrastructures, sometimes in partnership with PTTs and also through new, private companies. Telecommunications infrastructures are viewed widely as vital tools for developing the economies of the global south, which is why key intergovernmental organizations, such as the Organization for Economic Cooperation and Development (OECD), the International Telecommunications Union (ITU), and the World Bank have been active in promoting this sector. The World Bank in particular has been an advocate of telecommunications privatization, which it has advanced through a “toolkit” developed expressly for this industry sector. Given the limits of public funds in many poor countries, privatization initiatives are geared mainly toward attracting foreign direct investment.

Although it would be an exaggeration to attribute global trends in telecommunications privatization to the influence of the United States, many patterns and controversies related to deregulation, liberalization, and privatization throughout the world reflect *pre-existing patterns of policymaking in the United States* (→ Media Policy; Communication Law and Policy: North America). The US telegraph and telephone industries historically have been privately owned, with little exception of note, whereas PTTs throughout most of the world have functioned as government-owned and operated agencies. Despite the fact of private ownership, under heavy government regulation to control prices and insure quality of service, AT&T, the national telephone monopoly, functioned in many ways like a PTT. When a federal court decided in 1982 that AT&T should be broken down into several smaller companies, the results were very much like a privatization. The break-up was intended to promote a more competitive, innovative, and open network environment. The breakup contributed to the destabilization of familiar distinctions between telecommunications and the mass media, and since then, US telecommunications policy has moved in the direction of encouraging the “convergence” of previously separate industries and technologies, and the promotion of cross-industry “synergies.” Also since that time, the US telephone industry has undergone a process of reconsolidation, resulting in new vertically integrated firms that combine media content production and distribution systems.

As in the case of → *cable television systems*, US telephone companies now have a conflict of interest in that their own content providers compete with other content providers

needing access to the same infrastructure. Today, public interest advocates worry about the possibility that the telephone/telecommunications industry in the United States is losing its historic neutrality as a “common carrier” by having a vested interest in the success of its own content subsidiaries, which are in competition with other content providers on the same system, potentially resulting in discriminatory pricing and lower quality of service provided to competitors needing access to the same infrastructure. Whereas an original goal of the breakup of AT&T was to promote a more “open network,” subsequent vertical integration of content and infrastructure has introduced a disincentive for telecommunications carriers to keep their networks open and accessible to all content providers.

Not surprisingly, similar concerns have emerged in Europe and elsewhere over the question of whether privately owned networks can serve as neutral carriers of the content of their competitors. Another important development in media privatization has been the growth of the Internet. A significant global policy concern has been the disproportionate *de facto* control the United States has over Internet governance through the US-based Internet Corporation for Assigned Names and Numbers (ICANN), which is self-described as being “responsible for the global coordination of the Internet’s system of unique identifiers.” By having control over these identifiers, ICANN possesses the capacity to shut down a country’s access to the global Internet. In the wake of the UN World Summit on the Information Society, governments around the world have begun to take steps to increase multilateral control over Internet governance, particularly in response to ICANN.

### QUESTIONS OF THE FUTURE

In the twenty-first century, distinctions between *ownership of media content and infrastructure* are completely blurred, and a new wave of privatization has emerged. While in the 1980s and 1990s, privatization was typically undertaken by public trading in the stock market, a new pattern of private equity investment in media and telecommunications has emerged. Through speculative forms of investment, private equity firms and majority shareholders have managed to take some of the world’s leading media and telecommunications companies off the publicly traded stock market, resulting in the removal of these companies from regulatory reach or public scrutiny. This new airtight form of privatization has raised concerns about the lack of transparency in how companies operate, and the weakening of any form of public interest regulatory oversight (Noam 2007).

Beyond the question of whether media are privately or publicly owned is the matter of the *changing relationship between media and the state*. As telecommunications firms develop increasingly sophisticated capacities for surveillance and data mining, they are able to use that information not only to place their services at a competitive advantage compared with content provided by other firms on their networks. Telecommunications firms now provide surveillance services to governments through the use of data gathered about the communication patterns and information-seeking behavior of average citizens. These developments illustrate that media privatization does not necessarily signal an absence of government control or abuse of powers, nor does it insure greater public accountability.

## **Professionalization of Journalism**

*Chris Anderson*

*Columbia University*

The professionalization of journalism refers to the process by which a category of workers engaged in reporting and commentary in the public media on current events and ideas achieves the status of the occupational professional. Key issues in understanding the professionalization of journalism center on the difficulties in defining “professionalization” itself; the historical differences between US and non-American trajectories of professionalization; the relationship between journalistic objectivity (→ Objectivity in Reporting) and professionalism, especially in the American case; and the current economic, technological, and political challenges to the professional status of → journalism.

### **DEFINITIONS**

The difficulty most media scholars face in determining whether to consider journalism a profession links partly to the social and cultural practices of journalism and partly to difficulties in the study of the professions in general. Although the scholarly criteria for considering whether or not an occupation is a profession has remained largely stable since Durkheim – professions control their own recruitment, claim an exclusive area of competence, and postulate various normative benefits generated by their occupational autonomy – the method of analysis has moved from seeing professions as the bearers of functional traits to viewing them as interested social actors.

An older *trait approach* to the sociology of professions engaged in a → functional analysis of professional systems, a research program whose openly normative tendencies define a profession as a model of occupational autonomy and responsible self-management that everyone should imitate. Trait theories continue to manifest themselves within much of the literature on journalism, primarily in attempts to determine whether or not journalism is a profession. Most scholars working in the sociology of the professions have abandoned the trait approach and its functionalism. Many sociologists care less about answering the question “Is this occupation a profession?” and more about analyzing the circumstances in which workers attempt to turn an occupation into a profession and themselves into professionals (Hughes 1965). The study of “the profession” as an idealized functionalist category has been replaced by the more Weberian study of “professionalization” and the “professional project” (Larson 1977).

The *theory of the professional project* has remained at the center of much of the most important work in the sociology of the professions for the past several decades (MacDonald 1995). For scholars in this tradition, professions are neither naturally existing occupational categories nor the bearers of socially functional traits. Instead they are collective social actors that attempt to translate one order of scarce resources – special knowledge and skills – into social and economic rewards. Within the studies of journalism, this Weberian analysis is seen in studies that trace the rise of journalistic professionalism over the course of history.

Key to the success or failure of an occupation’s professional project is its ability to achieve a regulative bargain with the state. Professional groups must also do more to secure their monopoly than simply petition state elites; they must engage in a competitive struggle with other occupational groups that offer similar knowledge-based services, a process of *struggle over jurisdiction* (Abbott 1988). Finally, the fundamental aim of a profession is less a strict monopoly than a looser form of social closure: a process that allows the professional group itself to define the criteria for judging its own competence, by promulgating abstract standards of conduct and controlling the selection and training of its members.

In the study of journalism, scholarship has moved along a similar track. Much recent research analyzes the means and methods that the journalist has employed to seize control of both the abstract knowledge base and the occupational autonomy needed to establish professional dominance. For instance, cross-national empirical evidence demonstrates that journalists see themselves as a professional ingroup (Donsbach 1981). Rather than attempting to shoehorn journalists into traditional professional criteria, a more interesting approach is to *determine categories of professional journalistic competence* and analyze how much the practice of actual journalists reflects these categories.

## CROSS-NATIONAL DIMENSIONS

Many cross-national studies of professionalism and journalism adopt some or all of the sociological perspectives on professionalization, though not always explicitly. Three important cross-national studies of journalistic professionalism are “Professionalization in the media world?” (Kepplinger & Köcher 1990), *Comparing media systems* (Hallin & Mancini 2004) and *Making journalists* (deBurgh 2005). These three join others that probe

professionalization and journalism (Frohlich & Holtz-Bacha 2003). The benefits of cross-national comparisons are that they call into question some of the basic assumptions of a professionalization model grounded solely in the historical experience of American or British journalism.

Hallin and Mancini (2004) includes professionalization as one of the four axes (along with media market development, political parallelism, and state intervention; → Party-Press Parallelism) along which to analyze the three major media systems of North America and Europe (the polarized pluralist, the democratic corporatist, and the North Atlantic liberal; → Political Communication Systems). The three media systems vary in their approximation to the abstract model of professionalism that Hallin and Mancini propose. *Polarized pluralist journalism* as practiced in Mediterranean countries possesses a weaker level of professionalism and closer ties to the perspectives and activities of other political and social actors. *Democratic corporatist journalism* within the northern and central European countries is a highly professionalized endeavor; journalists often join press organizations and subscribe to overt, written codes of enforceable conduct. “Professional” does not translate into either objective or “free from ties to political parties,” but rather defines journalistic autonomy as a form of active political intervention in the political world. The overview of the *North Atlantic model*, finally, largely parallels analysis of the development of professionalism in the United States: high levels of professionalism of a noninstitutionalized sort, primarily dependent upon claims to journalistic objectivity and an overt abstention from political life.

Other cross-national studies have also addressed issues of journalistic professionalism. The main limitation of many of these comprehensive and theoretically sophisticated overviews of major journalism systems and global variations in professionalism and professionalization is their focus on the west: North America, Britain, and Europe. Other scholars have launched moves toward expanding the comparative frame, exploring global issues related to journalism education, training, and practice and, secondarily, professionalization (Waisbord 2000).

## DISCUSSION IN THE UNITED STATES

Despite moving toward a deeper understanding of cross-national professionalism, most journalistic analyses of professionalism still use the *United States as a typical case*, either in comparison to other countries or as the definition in need of conceptual adjustment. A review of how journalistic professionalism developed in the United States must therefore precede any analysis of current challenges to journalistic professionalism (→ United States of America: Media System).

A factor complicating an overview of the American case is that few historical studies tracing the development of journalism see professionalism as the primary object of study (→ Journalism, History of). Some of the most historically detailed overviews trace the growth of the occupation of journalism in general, colorful terms (Summers 1994), and many of the most useful case studies see the emergence of objectivity as synonymous with the growth of professionalism (Kaplan 2002; Mindich 1998). As a result, journalism scholarship regularly conflates “journalistic objectivity” with “journalistic professionalism,” even though the correlation does not necessarily hold true on the comparative level.

In any case, most sociologists and historians of journalism point to the *emergence of paid, full-time reporters* (coinciding with the birth of the inexpensive popular newspapers in major American urban areas, especially New York City; → Penny Press) as marking the first step toward journalistic professionalization. Originally considered a disreputable or marginal activity, reporting would, in the decades after the Civil War, yoke itself to the largely middle-class professionalization project. Journalists began to shed their so-called bohemian ways (Tucher 2004) in favor of an adopted image of solid respectability. By the early twentieth century, the Progressive Movement developed a growing emphasis on, even a mania for, democratic professionalism, and journalism moved in tandem, organizing its first professional schools, adopting its first codes of ethics, launching its first trade publications, and organizing industry and trade groups such as the American Society of Newspaper Editors (ASNE; Banning 1999).

Even more important than the adoption of these formal markers of professionalism, however, was the decoupling of the newspaper from the political party machine (Kaplan 2002) and the growth of an explicitly *commercial model of news reporting* that seized upon “objectivity” as its primarily narrative marker (Schudson 1978; → Commercialization of the Media). Scholars dispute the exact timing of this shift, as well as its sociological backdrop, but in the decades between the turn of the century and World War II, North American journalism institutionalized the current, familiar model of professionalism on a national scale.

Over the next half century, this dominant narrative fusing objectivity and professionalism would not go unchallenged. In reaction to widespread social unrest and the collapse of the postwar liberal consensus, *critical professionalism* grew in the late 1960s (Hallin & Mancini 2004), fusing a professional reportorial style with a more aggressive and power-challenging approach to the craft. Several decades later, a widespread disgust with a process of politics seen as trivial and relentlessly negative gave rise to the public journalism movement, a similarly anti-professional response among a small faction of journalists (Carey 1999). In sociology, the description of journalistic objectivity as a strategic ritual (Tuchman 1978), the detailed analysis of the daily processes for making news decisions (Gans 1979), and the critique of how the national media shaped the image and social behavior of the new left (Gitlin 1980) challenged the epistemological foundations underlying journalists’ self-image (→ Journalists’ Role Perceptions). Still, the success of the narrative that the North American professional model proposed has been remarkable, especially considering that journalistic professionalism rests upon shaky foundations.

## CURRENT CHALLENGES

How great a challenge journalistic professionalism faces varies from country to country, depending on national factors and how institutionalized professionalized journalism has become. Several long-term social trends threaten the still weak status of journalism as a profession: growing corporatization (and its counterpart, politicization); the diffusion of digital communicative tools (→ Internet); and, at least in the United States, the collapse of the three-decades-old modus vivendi between news organizations and the government on using journalists as witnesses in legal proceedings.

Sociologists have long had theoretical and empirical concerns about the process of educated labor becoming increasingly proletarian (Larson 1977), and a few American

media scholars have drawn an explicit link between the growth of centralized, profit-driven media systems (Bagdikian 2000) and a decline in journalistic professionalism. In the European context, where the tradition of mixing state and private media enterprises faces increasing pressure to Americanize, scholars have drawn a far more forceful link between professional decline and a media system grounded in a capitalistic communications environment. Bourdieu (1998) was especially polemical in this regard. To complicate matters further, *increased corporate control and consolidation* find their apparent opposite in a second trend that also could affect the status of journalism as a profession (→ Consolidation of Media Markets): the explosive growth of digital communications via the Internet, which futurists, online entrepreneurs, and scholars say has the potential to democratize the current journalistic system. Most commentators doubt that → online media forms like weblogs (→ Blogger), podcasts, videoblogs, one-woman media startups, or radical media enterprises like Indymedia will replace the professional journalist (→ Alternative Journalism; Citizen Journalism), but nearly all argue that the profession will not emerge from the Internet era unscathed. Scholars have so far done little to no research on how the impact of the Internet on professional journalism varies across national boundaries, leaving to speculation whether its effects have been universal.

In a sociological and cultural sense, these technological, regulatory, and economic trends are in their early stages and difficult to assess, but they are the likely terrain where the professional project of journalism will unfold. In the coming years, research should include an examination of technological challenges to journalism and journalistic expertise, a comparative analysis of legal-political culture in the relative failure of journalism professionalization; and the cross-national study of institutions of journalism education. Finally, the professional project of journalism manifests itself as much in practice as in theory or education. In the so-called “distributed newsroom” of the twenty-first century, research should assess how the organizational structures, work routines, staff interactions, and ethical decision-making processes of journalists are changing.

## Professionalization of Public Relations

*Magda Pieczka*

*Queen Margaret University*

The term “professionalization” refers to the way in which occupations become recognized as professions, usually explained by a range of factors related to the improvement of services offered and status enjoyed. The precise meaning of the term depends on the approach taken to defining the concept of “profession.” Three theoretical perspectives are in evidence in sociological literature: the functionalist approach, as articulated by Parsons (1954) and indebted to Durkheim, sees professions as key to maintaining social order;

the critical approach, initiated in the 1970s (Freidson 1970, Johnson 1972), which views professions as centers of monopoly power and elitism; and the Foucauldian perspective, which defines the profession as characterized on the one hand by high status and power, and on the other hand by subjugation resulting from the exercise of *self-discipline*. Professionalization, therefore, can be understood respectively as: a process of improvement of services, knowledge, and standards; a process of social closure and exploitation of a monopoly position; and finally, a “soft” technology of control of expert labor (→ Professionalization of Journalism).

In → public relations, professionalization has been discussed predominantly within the functionalist framework, and with specific reference to the dimensions established by Wilensky’s seminal article “The professionalization of everyone?” (1964): emergence of a full-time occupation; establishment of formal training; formation of a professional association; agitation to achieve legal protection for the occupation; and establishment of a formal code of ethics (→ Functional Analysis). Public relations in the USA is an important case in point: it offers a good illustration of this *professionalization discourse* as well as of its influence worldwide (see Pieczka & L’Etang 2001). The critical approach to the question of professionalization of public relations has been championed mainly by media sociologists and cultural historians whose disapproval of the practice is rooted in Marxist critiques of capitalism and in the Habermasian preoccupation with the → public sphere (L’Etang, 2004; → Habermas, Jürgen). Consequently, public relations is treated here as a profession whose increasing power is seen as a corrupting influence in terms of social justice and the existence of the public sphere. This critical stance is best summed up by Wernick’s verdict on promotional professions, public relations included, as “deficient in good faith” (Wernick 1991, 194). The third, Foucauldian approach to professionalization has so far not been developed in public relations.

The *history of the professionalization of public relations* post-World War II can be structured around two key moments: the emergence of professional associations at the national level in the late 1940s, significantly in the USA (Public Relations Society of America in 1947) and UK (Institute of Public Relations in 1948), and the publication of Grunig’s *Excellence in public relations and communication management* in 1992. National professional associations are important because they focus efforts given to defining and representing the best interests of the occupational group, which tend to be pursued through programs of professional education, public statements and campaigns, and the drafting of codes of ethics. *Excellence in public relations* is noteworthy because, as a publication resulting from a research project conducted by an academic team and funded by a professional association, the International Association of Business Communicators, it makes a point about the value attached by the profession to abstract knowledge, while simultaneously harnessing academic interests to the professional agenda.

The set of ideas contained in the *Excellence* project became the reference point in the 1990s for the *profession’s search for its modern identity*, which came to be anchored in liberal pluralism and the “empirical-administrative” approach (Dozier & Lauzen 2000). Thus the public relations profession described itself as instrumental to the existence of democracy, transparency, and order in public life through the practice of two-way-symmetrical communication, while at the same time being attentive to the worldview of corporate actors. The popularity of these ideas as represented in published research and

public relations textbooks throughout the 1990s can be at least partly attributed to their usefulness to the professional project.

An important strand of research relevant to professionalization, and included in the *Excellence* project, is based on the concept of → *public relations roles*, which stratifies the profession into two layers, technicians and managers, defined with reference to tasks, competences, autonomy, and access to power. This scheme, originally developed in researching American practitioners, was subsequently applied to other countries, proposing, as its critics pointed out, the idea of the uniformity of public relations practice and professional standards globally (→ Public Relations, Intercultural). Roles research also turned out to be important in identifying gender differences within the profession and contributing to the development of the feminist theory of public relations (Grunig et al. 2001).

# Propaganda

*Jürgen Wilke*

*Johannes Gutenberg University of Mainz*

The term “propaganda” is of Latin origin, meaning spreading, extending, or propagating with the help of the laity. It was first used by the Catholic church to denominate its mission. In 1622, the *Sacra Congregatio de Propaganda Fide*, a council of cardinals responsible for the spread of the Catholic faith, was established in Rome under Pope Gregory XV. During the Age of Enlightenment the term assumed a polemic connotation. In the course of the French Revolution “propaganda” lost its ecclesiastic meaning in favor of a political one. The term then stood for the proclamation of an ideological expansion program hitherto unknown. Propaganda was adapted in a positive sense by the European labor movement in the nineteenth century and consequently also became a central concept of communist ideology. Lenin adopted propaganda, agitation, and organization as core terms of his press theory. The term also gained ground in commerce and became partly a synonym for → advertising. While the latter term, however, referred to economic goods, propaganda took on a more psychological meaning. It was also taken on favorably in the twentieth century by the National Socialist (Nazi) movement in Germany and the fascist movement in Italy. This has always been typical of totalitarian and authoritarian states. As a consequence, the term aroused highly negative associations in western democracies and was replaced there by the term → public relations.

## DEFINITIONS

There are numerous definitions of the term propaganda in the literature. It is variably interpreted in a narrow or broad sense and as rather neutral or connoted. One of the earliest scientific definitions was introduced by → Harold D. Lasswell, who wrote: “Propaganda is the management of collective attitudes by the manipulation of significant symbols” (1927a, 627). Edward L. Bernays, one of the fathers of public relations (PR), wrote at around the same time: “Modern propaganda is a consistent, enduring effort to create or shape events to influence the relations of the public to the enterprise, idea or group” (1928, 25). Jacques Ellul, a French sociologist, defined propaganda even more broadly, as the pervasive process of influencing social values (1973).

## HISTORY

Although the term propaganda was only shaped ideologically and institutionally in the early seventeenth century, the phenomena it refers to are much older and may be traced back to antiquity. Thus the Athenian statesmen Solon and Pericles were characterized as early protagonists of propaganda (Sturminger 1960). Propaganda was also used in the medieval conflicts between state and church. Propaganda also flourished during the schism of the different Christian confessions of the Reformation and the subsequent political conflicts in central Europe. Propaganda was no longer limited to the religious sphere but encroached upon the state sphere too.

World War I (1914–1918) led to a hitherto unprecedented expansion especially of military propaganda. All parties were convinced that the fight by psychological means was as important as the one with military weapons. All belligerent parties created their own institutions for this purpose: Wellington House and Crewe House in the UK, the *Maison de la Presse* in France, the Central Office for Foreign Services in Germany, the Committee on Public Information (CPI) in the USA. Therefore, it is justified to speak of a major propaganda campaign in which even drastic means were used (“atrocities propaganda”).

After World War I, the western democratic states at first demobilized their propaganda, while twentieth-century totalitarian movements drew upon massive propaganda to enforce their ideologies and claims to power. This was first the case in the Soviet Union, where a department of agitation and propaganda of the Central Committee of the Communist Party was established in 1920. The other communist countries followed this example later. In the rightist ideologies, propaganda played a no less important role. In the 1920s, the National Socialists in Germany created a propaganda apparatus at party level, which they applied to state level after 1933. Adolf Hitler was convinced that Germany’s defeat in World War I had to be assigned to deficient propaganda. He followed an eclectic propaganda theory, taking up elements of mass psychology (e.g., the work of Le Bon and McDougall). A propaganda ministry under the direction of Joseph Goebbels was responsible for central control. In fascist Italy, propaganda was pursued in a similar way.

Even more than in World War I, national and international propaganda reached a climax in World War II (1939–1945; → Propaganda in World War II). This was again true of all warring countries. While the totalitarian regimes abused propaganda to mislead their peoples, the western democracies, bound to the ideals of freedom of opinion and freedom of the press, wanted to abstain from such propaganda after the war. Instead, they tended to speak of information or educational work. In military contexts, the term “psychological warfare” had been introduced. The western countries believed it necessary to defend themselves against the threat of Soviet totalitarianism even by informing and undeceiving attempts at manipulation. Therefore, the means of propaganda ruled again during the Cold War. Even after the end of the east/west conflict, propaganda has been revived in recent conflicts such as the Gulf War, Afghanistan, the Balkans, and Iraq (MacArthur 1993; → War Propaganda). Propagandists, such as groups of Islamic terrorists, now even use the Internet (→ Mediated Terrorism).

### **FORMS AND MEANS OF PROPAGANDA**

There are three different forms of propaganda: (1) white propaganda, i.e., the open distribution of information regarded as truth; (2) gray propaganda, consisting of statements of doubtful quality, which systematically avoid identification of the source of the information; and (3) black propaganda, consisting of lies whose source is concealed, with the aim of embarking upon deception.

Propaganda may be directed inwards (national propaganda) or outwards (foreign propaganda). In the first case, the national population or parts of it are addressed by the propaganda. In the second case, propaganda is directed toward people in other countries. The form and content of such propaganda depends on whether these countries are neutral, allied, or adversary (→ International Communication).

All sorts of communication means may be employed for propaganda. In the time before modern mass media were available, symbols, coins, heraldic signs, architecture, sculptures, and paintings were used. Speeches and the theatre have also been applied. The invention of printing offered greater possibilities for distribution in more recent times. This applied especially to propaganda writings (leaflets, pamphlets). With the help of new graphic techniques visual propaganda became more diverse (→ Propaganda, Visual Communication of). With the help of lithography, caricatures as well as posters became means of propaganda. Photography and film were also very soon adopted for purposes of propaganda. The → radio, which appeared in the 1920s, served the warring parties in World War II to broadcast messages across country borders and front lines. Because of this advantage, radio transmissions were also a favored medium during the Cold War and still are established where free distribution of information within a country is not possible: → Radio Free Europe and Radio Liberty broadcast their programs to the Soviet Union and eastern Europe until 1989, and Radio Martí addresses the Cuban population from the US. In this case, television is also used (TV Martí; → Cuba: Media System). During recent years, terrorist groups have been trying to conduct propaganda to promote their aims with the help of video tapes; for this purpose the same groups make use of the Internet. Beyond the propaganda communicated through the media, it is common to speak of “propaganda of action” (demonstrations, hunger strikes, terrorist attacks).

## RESEARCH

The effect of the massive impact of propaganda during World War I stimulated an intensive preoccupation with the subject. The beginning of scientific research about propaganda in the field of communication was marked by Harold D. Lasswell's study *Propaganda technique in the World War* (1927b). Lasswell not only described the organization of propaganda, but also distinguished four major aims: “(1) To mobilize hatred against the enemy; (2) To preserve the friendship of allies; (3) To preserve the friendship and, if possible, to procure the co-operation of neutrals; (4) To demoralize the enemy” (1927b, 195). Important elements of propaganda were the war objectives, the question of war guilt, the demonization of the enemy (above all by “atrocious propaganda”), and the belief in victory.

The necessity for research on and countering of propaganda increased in the US again in the late 1930s. In 1937 the Institute for Propaganda Analysis was founded, with the communication scientist Hadley Cantril as the first president. The institute was designed to detect National Socialist propaganda in the United States and to counteract it. The most important publication of the institute laid down and illustrated seven general rules of propaganda: (1) name calling, i.e., giving an idea a bad label; (2) glittering generality, i.e., associating something with a “virtue” word; (3) transfer of authority, sanction, and prestige; (4) testimonial, i.e., having someone respected say that something is good or bad; (5) plain folks, i.e., convincing by referring to other people or the majority; (6) card stacking, i.e., giving the best or worst possible case; (7) bandwagon, i.e., following the majority (Lee & Lee 1939).

Apart from the Institute for Propaganda Analysis, which above all wished to serve education, further institutions for propaganda research were founded in the US. They became the basis of empirical communication science. It was again Harold D. Lasswell

who conducted a research project on National Socialist and allied propaganda, financed by the Rockefeller Foundation (Rogers 1994, 203ff.). This project became a laboratory of method development, where Lasswell systematically refined the process of → quantitative content analysis. By using this method – in quasi-diagnostic investigations – undisclosed intentions and plans of the adversary side were to be uncovered. This was based on the assumption that verbal statements were “representational” of attitudes and intentions. Several other scientists who established empirical communication research were involved in the US war propaganda research: emigrants such as Hans Speier and → Paul F. Lazarsfeld at the Columbia Bureau for Applied Social Research (New York), but also the group of researchers conducting the “American soldier” studies, including → Carl I. Hovland, who had a significant influence on the social psychological analysis of persuasion (Rogers 1994, 362ff.).

Lasswell expanded his propaganda studies after World War II in comprehensive, broadly based historical panoramas (Lasswell et al. 1979/1980). On the other hand, however, propaganda research lost its significance. The experiences with propaganda had fostered a belief in the great power of mass media. However, this conviction seemed to be jeopardized by the survey-based studies of Paul F. Lazarsfeld and his colleagues. On the basis of these studies, the *minimal effects theory* in fact became accepted (→ Media Effects; Media Effects, History of). The effects of propaganda seemed to have been overrated. This was the reason for criticizing propaganda research (Lazarsfeld & Merton 1943). Propaganda research almost disappeared from the scientific stage.

Historical and scientific reasons have again caused a revival of propaganda research. The age of propaganda by no means ended with World War II. In the east/west confrontation, propaganda remained a proven agent on both sides, all the more so as the balance of the atomic threat could avoid a “hot” war between the great powers. Above all, within the confrontation of these powers, further propaganda campaigns were launched. And also the new local wars in the world are supported by propaganda. On the other hand, the boom in public relations has led to a rediscovery of propaganda as a phenomenon representing, to a certain extent, a precursor. Additionally, the minimal effects theory has been questioned, if not abandoned. With the return of the assumption of more powerful mass media, propaganda has in turn regained attention. As a result, interest in historical propaganda research has been revived too.

## Propaganda, Visual Communication of

Garth Jowett

University of Houston

There is no more difficult concept to clearly define than that of → propaganda. Countless books and learned essays have grappled with a definition of this persuasive practice that would encompass all of its many manifestations. The difficulty in arriving at a definition that satisfies all aspects of this particular type of persuasive behavior is compounded by the historical shift in the acceptance of those activities that today might be labeled as propaganda. Propaganda, in its most neutral sense, means to disseminate or promote particular ideas. A working definition of propaganda which focuses on the communication process is as follows: “Propaganda is the deliberate, systematic attempt to shape perceptions, manipulate cognitions, and direct behavior to achieve a response that furthers the desired intent of the propagandist” (Jowett & O’Donnell 2006).

The concept of persuasion is an integral part of human nature and the use of specific techniques to bring about large-scale shifts in ideas and beliefs can be traced back to the ancient world (→ Persuasion; Rhetoric, Argument, and Persuasion). While propaganda activities utilize a wide range of media and virtually every form of human social interaction, the utilization of visual media has been particularly effective throughout human history (→ Rhetoric and Visuality; Visual Communication). The psychological effect attained through the visual sense is particularly powerful, and tends to lend a sense of credibility and veracity, as well as providing a strong emotional response. From the earliest periods of recorded history we have numerous examples of visual stimuli used as propaganda devices to convey a sense of power, control the flow of → information, or manipulate the → emotions and → cognitions of the → public (→ Affects and Media Exposure; Cognitive Dissonance Theory; Emotions, Media Effects on; Visuals, Cognitive Processing of).

## THE EARLY HISTORY OF VISUAL PROPAGANDA

### Ancient Days

The development of visual propaganda throughout history moves along two basic trajectories. The first is the desire to disseminate the message to an ever-wider public; the second is to disseminate this message as quickly and effectively as possible. In the ancient world, where communications were severely limited by distance, visual propaganda was initially confined to monumental displays associated with official sites of power such as palaces and temples, where large architectural structures, statues, obelisks, wall engravings, and other visual devices were used as a means of establishing a sense of power, social order, and hierarchy. As transportation and communications improved in the ancient world, new methods of visual propaganda emerged as a means of creating and maintaining a sense of unity and stability across far-flung regions. In particular, the use of coins, circulated widely and embossed with the visual images of rulers and symbols of state, were extremely effective as a means of conveying the importance and centrality of the state in the lives of people (Fig. 1).

Julius Caesar (100–44 BCE) was particularly adept at using sophisticated propaganda techniques. He used coins to advertise his victories or display himself in various guises, such as warlord, god, or protector of the empire. Caesar also made maximum use of the public spectacle, spending lavishly on massive triumphal processions to celebrate military victories (→ Spectacle).

### The Emergence of Print

Until the fifteenth century, aside from coins, there was no means of duplicating imagery on any large scale in the west. Pictures were made for palaces, churches, and monasteries and did not travel. With the development of printing, it was possible to produce visual

Figure 1 One of Julius Caesar's coins. Coins such as this were the first genuine form of mass visual propaganda in the ancient world

Figure 2 *The leaflet seller*, an etching by Amman from 1588. Illustrated leaflets have been a staple form of visual propaganda since the development of printing in the fifteenth century

imagery as well as textual material in large quantities and transportable forms. In many ways, printing can be seen as the first mass production industry, and the modern age begins with the negation of the uniqueness found in the previous forms of handwritten communication.

The eventual development of woodblock prints, and later engravings on metal, was a significant breakthrough in the development of visual propaganda. Now the visceral power of the image, often accompanied by written text, could be widely disseminated in the form of broadsheets or pamphlets. These visual prints were intended to elucidate current events for the common man, and were focused to a large extent on religious or political themes. This new form of visual communication fostered a new profession, that of the engraver-artist. Lucas Cranach (1472–1553) was a master engraver whose work was of enormous assistance to Martin Luther's propaganda campaign against the Roman Catholic Church. His portraits celebrated the reformers and supporting Protestant princes as heroes, and his caricatures satirized the pope and the Roman Church. These early propaganda prints were sold on the streets, and widely circulated, and were the forerunner of the extensive use of printed material in the development of propaganda techniques in the modern age (Fig. 2).

The emergence of printed propaganda signaled a major shift away from the feudal power structure of the Middle Ages into a modern “bourgeois” mentality. It was at this point that propaganda as a deliberate, systematic strategy to alter perceptions, beliefs, and actions of politically engaged publics begins to emerge, fueled by new forms of communication capable of reaching a wide → audience within a relatively short period of time (→ Public Sphere). Propaganda, especially in the form of visual stimuli, enters the structure of the modern political state as a powerful weapon both of groups opposed to authority and those in power, and → prints and other forms of visual propaganda such as flags, → heraldry, medals, regalia, and all manner of art and architecture were used to legitimize authority and symbolize the inherent power of the state.

New forms of printing accelerated this development (→ Printing, History of). Lithographic printing was invented in 1798 by Alois Senefelder, and by 1848, could produce 10,000 sheets per hour. In 1856, the element of color was added, leading to the emergence of the “golden age of posters” in the late nineteenth century. While → posters had been around for centuries, the new printing techniques now available precipitated and encouraged the emergence of the poster as the foremost medium of visual propaganda in the pre-motion picture and television ages. In both of the great wars of the twentieth century the poster became a major propaganda weapon, especially in creating morale and civic motivation on the home front with slogans like “Loose lips sink ships” and “Is your journey really necessary?”

## MODERN DAYS

### Photography and Motion Pictures

The emergence of → *photography* in the 1830s created an entirely new possibility for increasing the effectiveness and emotional impact of visual propaganda. By the 1860s the use of photography as a dramatic illustration of the horrors of war or the plight of the poor in slum living conditions had become a major weapon for the propagandist, despite the fact that such photographs were often deliberately staged by the propagandist as a means of influencing public opinion. By the turn of the century photographs could be mechanically reproduced in newspapers and magazines, and between the world wars, → picture magazines such as the *Berliner Illustrierte Zeitung* and the *Münchener Illustrierte Presse* in Germany, *Vu* in France, the *Picture Post* in the UK, and *Life* and *Look* in the US provided the major visual news experience for a mass public (→ Photojournalism).

Photography proved to be a particularly powerful propaganda tool in the hands of skilled photographers such as Robert Capra, with his famous “Moment of death” picture from the Spanish Civil War, or Dorothea Lange, and her work in Appalachia for the New Deal administration of Franklin Delano Roosevelt. Heinrich Hoffman’s carefully crafted pictures of Adolf Hitler contributed greatly to the Nazi → iconography, and were found in almost every home in Germany during that period.

The use of photographs continues to be a major weapon in the propaganda arsenal, but the digitization of photography and the potential for the manipulation of the image has both created the potential for greater “agitative creativity” and caused a growing distrust of the pictorial image as an indication of “reality” (→ Digital Imagery).

Figure 3 Part of the crowd of 151,000 who attended Party Day celebrations in the Nuremberg Stadium in 1933 to listen to Adolf Hitler's speech

The *motion picture* has always been an enigma when it comes to its use as a propaganda weapon (→ Cinema). Even as early as the 1890s, films taken of the Boer War (many of these were faked) were shown in British and American cinemas for propaganda purposes. By the time of World War I, the cinema was so popular with the international public that motion pictures became an integral part of the “official” propaganda activities of most governments. However, through its long history as an important and successful entertainment medium, the motion picture has had a checkered history of success as a vehicle for disseminating propaganda. There are, of course, individual films such as director Leni Riefenstahl's *Triumph of the will* (1935), a brilliant cinematic paean to Hitler's 1934 Nazi Party rally in Nuremberg (see Fig. 3), or current controversial documentaries, such as Michael Moore's *Fahrenheit 9/11* (2005), which can be seen as successfully communicating their propaganda objectives, but there are far more films that have failed to achieve the desired result of their propagandist creators (→ Documentary Film). It appears that over time movie audiences have come to expect entertainment, and resent being confronted with explicitly political content. The most successful forms of motion picture propaganda have always come in the guise of entertainment. The depiction of “the American way of life” in countless Hollywood films, for example, seems to have had a greater impact on foreign audiences (→ Cultural Products as Tradable Services) than a myriad of propaganda documentaries turned out by the US government.

## Television

Television was first introduced to the world in the 1930s, when it was broadcast to small, elite audiences in Britain and Germany (→ Television). The Nazis immediately attempted to exploit both their scientific breakthrough and their athletic prowess by televising the 1936 Berlin Olympic Games, but this demonstration was available only to a small number of the Nazi Party elite and to the general public in tiny viewing rooms. Nevertheless, this exhibition established television's potential as a propaganda medium. The British used their early experiments with television to broadcast entertainment, thus setting a precedent for an entirely different model of how television would be used. In the United States, television was introduced in the late 1940s, largely as a visual extension of highly popular commercial → radio networks, and there was never any real question of its “power to persuade” being usurped by governmental or other potential agencies of propaganda (→ Television as Popular Culture). Of course, if we include → advertising as a form of propaganda, then television has indeed succeeded in becoming the largest propaganda medium in the world (→ Advertising as Persuasion). Even the use of television for formal educational purposes, a role for which it was ideally suited, never achieved the potential that had been part of its promise for so long (→ Educational Communication; Educational Media; Educational Media Content; Television: Social History).

Because of the technological barriers to broadcasting television signals across oceans and borders, it has only been in the past 25 years that the development of → satellite television has created the potential for global television propaganda (→ Global Media, History of; Globalization of the Media; Technology and Globalization). However, here too the public has shown a marked preference for entertainment programming, but in very recent years, particularly with growing international conflicts in the former Soviet Union, the Balkans, and the Middle East, satellite television news channels such as Fox News, → CNN, and Al Jazeera have begun to emerge as significant sources for delivering propaganda messages (→ Arab Satellite TV News; Newscast, 24-Hour). The continuous broadcasting of images of conflict, many “live” as they are unfolding, has made these satellite channels, as well as the traditional broadcast networks, among the most powerful propaganda agencies now in existence (→ International Communication; International Television).

New communication technologies, including hand-held mobile phone devices, digital cameras, and palm-sized computer interfaces, all linked to the → Internet, promise to facilitate the dissemination of imagery which could be used for a wide variety of propaganda purposes. Government attempts to regulate such widespread use of visual devices have proven to be rather futile, and there is little doubt that in the future the free flow of imagery will only increase, providing an even greater potential for diverse expression, but also for manipulation and the creation of more powerful visual propaganda.

## **Propaganda in World War II**

*Philip M. Taylor*

*University of Leeds*

World War II witnessed the greatest propaganda campaigns in history. Often referred to as the “Fourth Arm” after the army, navy, and air force, → propaganda was conducted by all belligerents and was essentially designed to sustain domestic civilian morale during a long war at home while undermining enemy civilian *and* military confidence in the ability to achieve victory. Although propaganda was becoming a characteristic of peacetime politics in the first half of the twentieth century, it was still seen largely as a weapon of war, especially in democracies.

Dictatorships in the Soviet Union, Fascist Italy, and Nazi Germany more readily embraced its peacetime use as a form of coercion of mass populations instead of the individualistic democratic predisposition toward → persuasion and consensus-building. These different ideologies eventually went to war against each other in 1939, in a conflict that began with a cavalry charge in Poland and ended, six years later, with atomic explosions over Hiroshima and Nagasaki. It became a war of national survival – total war

– in which propaganda was used by all sides as a psychological weapon to supplement, reinforce, or counter the destructive power of military force. Ultimately, however, World War II was won by military power – which prompts the question of what role propaganda actually played in determining the final outcome (→ War Propaganda).

### **TOTAL WAR, TOTAL PROPAGANDA**

Propaganda was highly organized from the outset, although most sides found it difficult to centralize its various functions. The Nazi Propaganda Ministry had several rival voices from within the “divide and rule” bureaucracy created by Adolf Hitler (Welch 1994). The British set up a Ministry of Information that stumbled its way through the early wartime years (including the “Phony War” or “Bore War”) fighting other Whitehall departments like the Foreign Office and Service Ministries. It eventually settled down after 1941 when Brendan Bracken was appointed minister and a Political Warfare Executive was created to conduct overseas propaganda (Taylor 1999). Once the Americans entered the war in late 1941, sufficient lessons had been learned to separate out domestic and overseas propaganda functions through the Office of War Information and the Office of Special Services. For all sides, fighting the war was the major priority, but who was responsible for publicly chronicling or interpreting its progress – image rather than reality – was also important.

The idea of a *home front* or of a “nation at arms,” of mobilizing entire populations for sustained conflict, first emerged during the 1914–1918 war. It came into sharper focus in the 1930s with the arrival of the bombing aircraft and its indiscriminate impact on the civilian populations of cities, first witnessed during the Sino–Japanese War (1931–1933 and from 1937 onward) and especially the Spanish Civil War (1936–1939) through newsreel footage of the bombing of Guernica. The mass bombing of cities between 1939 and 1945 was to substantially narrow the gap between soldier and civilian both physically and psychologically; all were now combatants in a people’s war where the home front became as much the front line as far away battlefields. In such an environment, morale became a critical factor and one that might determine the eventual outcome. That environment was also media-rich compared to wars of the past – traditional print media were now supplemented by the arrival of broadcast → radio and sound → cinema. Although television was technically available, all belligerents decided largely to suspend its development for the duration and use the facilities for radio or jamming purposes.

Propaganda was also a weapon that could be *deployed against the enemy* when no other means of attacking them were available, especially in the form of electronic broadcasting. This was true of Britain following its retreat at Dunkirk in 1940. Until Britain could launch a “strategic” bombing offensive against the all-conquering Nazis, the → BBC played a major role in sustaining resistance movements, challenging the Nazi version of events as they unfolded and sowing seeds of doubt throughout occupied Europe about the eventual outcome. Radio broadcasts were supplemented by the dropping of millions of leaflets.

At home, the British came to blend self-knowing mockery with propaganda through the popular BBC radio show *ITMA* (“it’s that man again”), whose host, Tommy Handley, lampooned the Ministry of Information (MoI) as the “Ministry of Aggravation.” George

Orwell, who was to satirize the MoI as the “Ministry of Truth” in his postwar novel *Nineteen Eighty-Four*, was himself an effective wartime broadcaster, along with J. B. Priestley, whose “postscript” broadcasts from the summer of 1940 were credited with the biggest regular listening broadcasts in the world. The BBC decided not to jam German broadcasts to Britain led by William Joyce (“Lord Haw Haw”) on the grounds that only → news and not views should be censored, although the views about plucky Londoners “taking it” during the 1940 Blitz espoused by such North American broadcasters as Quentin Reynolds and Edward R. Murrow did much to persuade American listeners which side they should sympathize with (Cull 1995; → Censorship, History of; Censorship).

Propaganda flourishes most effectively in the wake of victories. Until 1943, despite a decade-long existence for Josef Goebbels’s Ministry of Popular Enlightenment and Propaganda, the *Nazi propaganda machine* never really shifted into top gear because it had no real need to (Balfour 1979). Hitler, who had devoted two chapters of his *Mein Kampf* to the subject, had regarded propaganda as an essential instrument of achieving, and sustaining, political power. Nazi propaganda, however, did not export successfully – except among those who wanted to believe it. For the first years of the war, Nazi propaganda flourished in the wake of military success. But after defeat at Stalingrad, Goebbels rallied the nation to “total war” with slogans such as “victory or death.” This theme was partly prompted by the Allied call for “unconditional surrender” made following the Casablanca Conference of 1942 – the first real Anglo-American declaration of war aims following the USA’s entry into the war after the Japanese attack on Pearl Harbor in December 1941. The British had survived their “finest hour” in the Battle of Britain of 1940 – just. They had even managed to transform the military humiliation of Dunkirk into a patriotic rallying cry – the “Dunkirk Spirit” – that is still evoked by nationalists today. In 1942, Prime Minister Winston Churchill secured one of his greatest achievements by persuading the American president, Franklin Roosevelt, to deploy the sheer weight of American military power against the Germans and Italians in a “Europe first” strategy rather than go for full-out revenge against the Japanese.

### PROPAGANDA MEDIA

This was a significant development in the aftermath of Pearl Harbor, and the American film industry was mobilized to reinforce the policy decisions (→ Film Production). Hollywood movies brought the distant war beyond the Atlantic and Pacific oceans to the only home front that did not have to endure bombing. Hollywood professionals like Frank Capra were likewise enlisted to make “indoctrination films” explaining to recruits from Iowa why they should fight Germans rather than just the Japanese (→ Hollywood). Capra’s *Why We Fight* series of seven films became compulsory viewing for all US armed forces personnel. The major theme of these films was that Japan, Germany, and Italy had formed an “axis” that had conspired to turn the “free world” into a “slave world” and, if they were not stopped, the “four freedoms” espoused by Roosevelt (freedom of speech and religion and freedom from want and fear), and adapted in 1941 to the Atlantic Charter with Churchill, would see the triumph of the “man-machine” over the individual.

Movies were so thoroughly infused with wartime propaganda themes that it was difficult for audiences to stand back and say “That is just a propaganda film.” So all-pervading was

propaganda that the experience of being propagandized could almost be defined as having lived at the time. Propaganda not only manifested itself in films and radio broadcasts, it also took the form of posters, picture postcards, china plates and ornaments, biscuit tins, cigarette cards, songs, and music. It proved capable of almost infinite applications, as with the British (and later American) "V for victory" campaign.

The effectiveness of much propaganda depended not only upon events at the fighting fronts but also upon media access to them. It took the British more than a year for the military authorities to appreciate the need for war reporters and camera men to be allowed to accompany the troops (→ War Correspondents). Operational security issues and a military predisposition toward censorship overrode any propaganda benefits. For the Nazis, it was the reverse. Their front line propaganda company units were able to capture spectacular images of the German army's initial successes in Belgium and France, which were duly incorporated into the official newsreels. Once the Americans entered the war, they allowed camera crews to accompany bombing raids over Germany, and William Wyler's documentary *The Memphis Belle* (1943) was testimony to the success of such decisions. The American influence on the British became evident with the later wartime release of major documentaries such as *Desert Victory* (1943) and the Anglo-American collaboration *The True Glory* (1945).

Almost without exception, propagandists on all sides, including journalists, saw themselves as patriotic members of the war effort (Collier 1989). Propaganda was a pejorative word; it was something that the enemy did "to us" or that "we" did "to them." The democracies had Ministries or Offices of War Information that told "the truth" whereas the dictatorships engaged in the "big lie." Although this was itself part of the propaganda war, it does highlight differences of approach toward the manipulation of opinion. Democracies understood that, in a long war of national survival, a "strategy of truth" was required to sustain credibility in a war between "good" and "evil." Goebbels famously remarked that if you repeated something over and over again – whether it was true or not – people would believe it. One of the tragedies of World War II was that when stories began to emerge from 1943 onward of the death camps built for the "final solution" they were dismissed by many people as being "atrocious propaganda" such as that used to demonize the Germans during World War I.

The war in the Pacific also saw major propaganda campaigns that were strikingly racist in tone. The Japanese saw themselves as the superior race in their drive for a Greater East Asian Co-Prosperity Sphere. "Tokyo Rose" (in fact several female broadcasters) tried to undermine the morale of Allied troops as island after island fell with high American casualties. Hollywood films depicted the "yellow peril" as "buck-toothed" fanatics who would rather commit suicide than be captured. The American troops, especially segregated black soldiers, were depicted by Axis propaganda as decadent, cowardly, and racially inferior. The Nazi depiction of Soviet peasant soldiers as "Untermenschen" ("sub-humans") was only countered by military defeats after Stalingrad. And, of course, Nazi anti-Semitic propaganda in such films as *The Eternal Jew* (1940) exploited historical stereotypes as a method of inducing support for, or acquiescence in, the final solution. Even in Britain, the popularity of concepts like "Vansittartism" (the doctrine that the German people are innately belligerent) evoked comments that "the only good German is a dead German," while, at one point, the Americans devised the Morgenthau Plan, which

would have seen the postwar pastoralization of German society. So deeply rooted were some of these prejudices that they survived long after the war had ended.

Intelligence historians have been able to make a good case that the Enigma machine that cracked the “Ultra secret” probably helped the allies to knock two years off the war. Propaganda historians can make no equivalent claims. If anything, propaganda most likely lengthened the war through instilling hatred of the enemy and bolstering domestic support for the war effort. We need only recall the 14-year-old boys defending the streets of Berlin as the Russians advanced on the city in 1945.

## **Proxemics**

*Laura K. Guerrero*  
Arizona State University

Proxemics is the study of how humans perceive, structure, and use space as communication. Space helps people manage the dual needs for privacy and closeness in social and personal relationships. Early work on proxemics focused on classifying territory and conversational distance. Contemporary research has examined how proxemics is related to messages such as liking and dominance.

A *territory* is a fixed geographic space that is occupied, controlled, and defended by a person or group. Scholars have identified *four basic types of territory* (Altman 1975; Lyman & Scott 1967). “Body territory” includes a person’s physical body as well as the invisible, adjustable, and portable bubble of personal space surrounding one’s body. Personal space insulates people against physical and emotional threats from the external environment, including other people. “Primary or home territories” are private spaces that clearly belong to a person or group and provide a physical and psychological retreat from the public world. People can let their guard down in primary territories such as homes, cars, and private offices. “Secondary or interactional territories” are semi-public

territories that are inhabited and temporarily “owned” by particular people at different times. Examples include university classrooms, country clubs, and gyms. Finally, “public territory” is open for use by anyone. Public beaches, shopping malls, and sidewalks are all examples of public territory, although public places are sometimes claimed as primary territories (e.g., a gang’s turf).

Research has examined how *crowding* affects humans and other animals. Studies of deer and rats showed that crowding leads to stress, hyperactivity, infertility, and even death. College students are healthier and earn better grades when they live in less crowded dormitories. Crime, juvenile delinquency, and neighborhood violence go up in crowded conditions. Yet people can experience positive affect when they are part of a unified crowd, such as fans at a football game. Altman (1975) distinguished between *density* (the number of people per square foot or mile) and *psychological crowding* (discomfort and anxiety due to having one’s personal space violated). Although these two terms are related, some people may experience psychological crowding in an environment characterized by low density; conversely, densely populated environments may not be experienced as crowded.

People actively identify and protect their territories. *Boundary markers* such as doorways, fences, and walls demarcate where a territory begins and ends. *Central markers*, such as draping a sweater over a chair, are used to reserve a territory. *Ear markers* are placed directly on possessions (e.g., “This book belongs to Maria”) or boundary markers (“Steve’s room”). When a person’s territory is invaded, people often become aroused and defensive, leading to a flight or fight response. Research by Judee Burgoon suggests that violations of personal space lead to aversive reactions when they are committed by an unattractive or unrewarding communicator (Burgoon et al. 1996; → Expectancy Violation). People are more lenient when proxemic violations are committed by a highly regarded person. In fact, such violations sometimes lead to increased liking.

Like territory, conversational distance is an important component of proxemics. Edward Hall’s classic work identified *four perceptual categories of conversational distance*: “intimate” (0 to 18 inches), “personal” (18 inches to 4 feet), “social” (4 to 10 feet), and “public” (over 10 feet; Hall 1966, 1968). Conversation at closer distances is defined by more sensory stimulation and a perceptual focus on the face and upper body. At farther distances, people have an overall rather than close-up view of each other and are more easily distracted. These specific distances are most applicable to North America and central/northern Europe. The intimate zone is smaller in places such as South America and the Mediterranean region and larger in most of Asia (Andersen 1999). Yet, across various cultures, people generally use smaller conversational distances with people whom they like and trust. Couples are more likely to sit close together when they are satisfied rather than dissatisfied with their relationship. People also use closer distances when they discuss personal topics and expect to have a positive interaction with someone. In the US, romantic partners and women friends generally sit closer together and in more face-to-face positions than men friends.

Contemporary communication research has investigated how other proxemic cues relate to liking. Leaning forward, communicating on the same physical plane (or at the same level), and using a face-to-face position all help reduce physical distance between people. These three cues, along with close distancing, are part of a larger cluster of

*immediacy* behaviors that communicate intimacy, liking, and social support (→ Teacher Immediacy). However, proxemic immediacy only leads to liking if the receiver is comfortable with increased physical closeness.

Proxemic cues also communicate dominance and regulate interaction. Leaning in close to someone can be intimidating, as can towering over someone rather than communicating on the same physical plane. Powerful people also have more control of space; they have larger and more private territories, display more territorial markers, and have gatekeepers such as secretaries who prevent intrusion into their private quarters. In terms of regulating interaction, people lean forward when they want a speaking turn, lean back when they wish to relinquish their turn, and step away when trying to end a conversation. As these examples illustrate, proxemics play a subtle yet powerful role in people's everyday interactions.

# **Psychology in Communication Processes**

*Jeremy N. Bailenson*

*Stanford University*

*Nick Yee*

*Stanford University*

Psychology is generally concerned with studying the mind, the brain, and human behavior. While popular media often focus on clinical psychology (the study and

treatment of mental illness), there are many other forms of psychology, ranging from neuropsychology to cultural psychology to sports psychology. This entry largely focuses on experimental psychology, an overarching branch that includes all areas of psychology in which researchers manipulate variables in order to perform empirical tests of how people think and behave (→ Experimental Design). Examples of experimental psychology areas include cognitive, cultural, developmental, perceptual, and social psychology, all of which hold implications for communication research (→ Cognitive Science).

### HUMAN COGNITIVE ARCHITECTURE

The framework of human cognitive architecture is helpful in discussing how different types of thought, as well as the corresponding areas of psychology, relate to each other along a continuum, and how this continuum, in turn, relates to communication processes. Alan Newell (1990), in his landmark text *Unified theories of cognition*, established a hierarchical structure that is based on the processing time which goes into organizing different types of human behaviors. At the very bottom level, taking fractions of seconds, are biological events, such as neurons firing. These biological events combine into *cognitive actions*, such as retrieving a memory, which typically take between 10 milliseconds and 10 seconds. Cognitive actions, next, are joined in rational actions, such as solving a math problem, which may take from minutes to hours. All of these behaviors enter into social actions, such as forming an identity, which takes months or years, and further mold historical actions such as the forming of a racial stereotype within a culture, which takes decades. Finally, at the evolutionary level, over millennia, the mind, body, and behavior of a species will change. A crucial aspect of Newell's framework is that "lower level" processes, such as neurological and perceptual events, combine and emerge as "higher level" processes, such as making decisions, forming social impressions, and communicating.

There are, of course, a number of non-experimental sub-fields within psychology that do not employ a "bottom-up" methodology. For example, one of the earliest and perhaps most controversial theories is *psychodynamics*, which posits that significant parts of our emotional or motivational forces operate at a subconscious level, and are strongly influenced by early childhood experiences and development. These latent traumas or motivations may remain in the mind and emerge on a conscious level as neuroses or psychoses. The role of psychoanalytic therapists is to identify the underlying subconscious reasons for the surface problems. The two scholars most associated with this tradition are Sigmund Freud and Carl Jung, who utilized clinical interviews with patients as the basis for formulating their theories.

### COMMUNICATION PROCESSES

The relationship between psychology and communication research can be specified with reference to *three key types of communication processes* in the context of the human cognitive architecture framework introduced above. The three processes are face-to face interpersonal interaction, mediated interpersonal interaction, and communication via mass media. This framing is not intended as a historical account of these different

communicative practices, nor as an exhaustive description of communication, but serves to highlight some general similarities and differences between the two fields of inquiry.

### Face-to-Face Interpersonal Interaction

Consider an everyday conversation between two people sitting in a restaurant. As these people interact, they exchange information via both verbal and nonverbal cues (→ Interaction; Interpersonal Communication; Nonverbal Communication and Culture). Understanding what processes govern such social interaction, and how verbal and nonverbal cues interact in providing meaning and structure to social interaction, has been one of the cornerstones of communication research since the field took shape in the 1950s.

An early theoretical framework by Adam Kendon (1970) discussed the notion of *interactional synchrony*, i.e., the idea that verbal and nonverbal behaviors are intricately tied to one another, both within a person (i.e., person A's verbal behaviors match her nonverbal behaviors) and across several individuals (i.e., person A's verbal behaviors match person B's nonverbal behaviors). By rigorously observing people as they interacted with one another in experimental settings, Kendon uncovered a number of fundamental aspects of how social interaction proceeds, establishing just how closely tied verbal and nonverbal behaviors are in what he metaphorically termed a "complex dance." Since Kendon's groundbreaking work, other researchers have elaborated theoretical frameworks covering various relationships between verbal and nonverbal behaviors.

Burgoon's → expectancy violations theory addressed how people's expectations of one another guide the ways in which they exchange verbal and nonverbal information (Burgoon 1978). When individuals violate each other's expectations in terms of how the interaction should proceed, either verbally or nonverbally, they can be seen to follow specific patterns of social interaction. For example, if a person violates a social norm, such as touching a stranger, then the stranger will react to that violation of his or her expectations, based on an assessment of the potential subsequent outcomes of his or her reaction to the unexpected touch.

Patterson (1983) expanded these previous theoretical frameworks concerning face-to-face interaction through a sequential functional model of nonverbal exchange. It allowed for more specific predictions of verbal and nonverbal behavior with reference to different parameters and relational structures of social interaction. In particular, the model incorporated long-term personal history as an antecedent to a given exchange, short-term contextual information that conditions the interaction at its outset, as well as various types of processes that occur during the exchange itself. In the scenario described above in which a person touches a stranger, the approach would consider the arousal levels or psychological states of both individuals before the event occurred, their personal characteristics such as degree of extroversion and introversion, and historical circumstances, including events that may have occurred during previous and perhaps similar meetings.

In sum, psychological frameworks and models have allowed communication researchers to produce detailed descriptions and to form specific predictions of how people exchange both verbal and nonverbal information with one another. When similar exchanges of information occur through some mediating technology, it becomes relevant to examine additional psychological processes.

### Mediated Interpersonal Interaction

When small groups of people interact with one another in real time, using different types of media (e.g., telephones, computers, and video conferencing), the processes that unfold during face-to-face interaction are combined with and complicated by various factors that are unique to mediation (→ Mediated Social Interaction). One prominent example of research on this topic examines the kind of *computer-mediated communication* (CMC) in which two individuals rely on computer-based technology to conduct an interaction (→ Personal Communication by CMC).

The literature on face-to-face interactions provided the foundation for studying CMC, in which different qualities of face-to-face interaction appeared to be degraded or missing altogether. For example, in an online message board, users interact asynchronously via typed messages in a pseudonymous setting. How might the lack of visual cues or synchronicity affect such interactions? Early research in CMC hypothesized and found that the lack of social cues in CMC led to less personal forms of interaction than in face-to-face contexts (Sproull & Kiesler 1986).

But as online communities emerged, it became clear that CMC could support relationship formation and even intimate interactions (Parks & Floyd 1996; → Virtual Communities). In an attempt to reconcile experimental findings concerning the poorness of CMC with his own field observations, Walther proposed the social information processing theory, arguing that the more limited bandwidth or sensory richness of CMC, relative to face-to-face communication, meant that it would take longer for individuals to exchange information (Walther et al. 1994). Over time, however, the two types of social interaction may achieve comparable interpersonal effects and intimacy levels. One methodological lesson was that even if CMC may appear less personal in short-term experimental settings, CMC compares to other types of interaction that are typically deemed more intimate when it comes to naturalistic settings, as examined in observational studies.

Later work by Walther suggested that certain unique features of CMC enable interactions that actually can be more personal or intimate than comparable situations in face-to-face settings (Walther 1996). According to Walther, CMC creates a feedback loop of positive impression management, idealization, and reciprocity that leads to more intense interactions, which he referred to as hyperpersonal interactions. Furthermore, studies by Bailenson et al. (2005) extended the notion of hyperpersonal CMC by simulating unique communication processes that could not occur in real-life face-to-face interaction. For example, a specially designed CMC system that allowed a speaker to make eye contact with several audience members simultaneously, provided the participants with “conversational superpowers.” In CMC, a speaker thus may transform his or her actions strategically to maximize intimacy or social influence.

One of the most renowned lines of research within CMC has explored how people interact with *media interfaces*. Reeves and Nass (1996) showed via a series of experiments that people have a tendency to treat media interfaces (e.g., televisions and computers) as if they were social actors (→ Media Equation Theory). For example, people become polite to computers under certain conditions in order to conform to a social norm. In one study, participants performed a learning task on a computer. They then filled out an evaluation of the event, either on the same computer or a different computer. Participants

gave more positive ratings if they filled out the evaluation on the same computer that had administered the learning task than if they were assigned to a different computer. Reeves and Nass concluded that this pattern is analogous to the social norm of being polite to individuals asking for an evaluation of themselves.

To sum up, when people use media to conduct interpersonal interactions, they are combining processes that occur within face-to-face interpersonal interactions with new processes that are unique to utilizing various kinds of technology. Thus, the additive model of psychological processing, outlined in the introduction, can work as a framework for understanding mediated forms of interpersonal communication. In a further, metaphorical, sense, mass communication can be viewed as combining processes of face-to-face as well as mediated group interaction with additional processes that are inherent to the large-scale dissemination of information, even if historically, the use of mass media predates CMC.

### **Mass Communication**

Mass communication has typically been understood as organizations (e.g., newspapers, film production companies, or television studios) using some media technology to distribute information to large audiences (→ Media Effects). With the rise of digital technology, the contrast between large organizations and large audiences has been blurred, as it is now possible for any individual to send an email to websites and listservs, which, in turn, send this message to thousands of other people (→ Media Effects, History of). As John Durham Peters has noted (1999), mass communication technologies have changed how we think about communication in general – as dialogue, dissemination, and combinations of the two. From the perspective of psychological processes, one way to approach mass communication is as a combination of face-to-face and mediated interpersonal interactions.

In the 1970s and 1980s, → George Gerbner provided some compelling evidence for his → *cultivation theory*, which is a macroscopic theory of how interpersonal interaction and mass media use may be shown to combine in predictable ways. The basic argument is that, after much exposure to various forms of mass media, people will change their patterns of interpersonal behavior because they have acquired an altered mental representation or worldview. For example, people who watched large amounts of television, which often features violence, were more likely to begin avoiding going out late at night. The theory illustrates the combinatorial aspect of the psychological processes entering into communication. In order to create a model of how a worldview is cultivated, it is necessary to understand how people perceive and attend to stimuli (e.g., watch television), how they interact with mediated versions of people, and how, as a consequence, their interpersonal interaction with actual people changes. While some of the methods employed by Gerbner and colleagues have been called into question, his approach suggested the importance of examining the connections between interpersonal communication and mass communication.

### **CROSS-CULTURAL RESEARCH AS A COMMON GROUND**

One area which is common to psychology and communication is the study of *cultural influences* on identity formation and social interaction. Psychology has a well-respected tradition of examining cultural differences in how the mind functions. For example, work

by Hazel Markus and her colleagues has demonstrated that culture is rooted so deeply within the mind that the way in which people construe the self – how we relate to other people, how interdependent social relationships are, and how cognition, emotion, and motivations are formed – vary drastically between eastern and western cultures (Markus & Kitayama 1991).

These differences are so pervasive that they extend down to the “low level” cognitive actions discussed above. For example, work by Douglas Medin and colleagues has examined biological concepts among various groups: from Petan, Guatemala, and from Native American, Amish, and majority culture groups in Wisconsin, USA. The data from these different cultures exhibit systematic differences regarding very basic and supposedly “universal” aspects of cognition – how people form categories about objects, as well as how people draw inferences based on what category an object belongs to. A methodological lesson is that when data is collected from American undergraduates, as is common practice, the findings, models, and theories may not generalize to the world at large. Even at the level of how people perceive physical objects visually (→ Visuals, Cognitive Processing of), there are differences across cultures (Kitayama et al. 2003).

Also, communication scholars have argued that message production and social interaction should be studied outside the laboratory and with regard to the cultures in which those processes are entrenched (→ Intercultural and Intergroup Communication). In a wider sense, James Carey (1989) has argued that communication is not simply a transmission of information, but a *ritualistic process* that creates and sustains social reality. In a ritualistic view, reading a newspaper is not so much a way of gaining new information as a communal affirmation of a shared worldview. All types of human expression – from architecture to dance to news broadcasts – confirm and propagate a symbolic order that governs social processes. In sum, psychologists have focused on how culture shapes thought by directly comparing people from different cultures. Communication scholars, in turn, have theorized and examined the very acts of expression and interaction as inherently cultural processes.

## **A CONTINUING INTERDISCIPLINARY RELATIONSHIP**

The fields of psychology and communication are closely related, to the extent that the line differentiating the two is often quite blurry. In terms of historical roots, some of the studies that are considered landmarks in the field of communication originally were carried out in psychology departments, and/or published in psychological journals; for example, work by → Bandura, → Hovland, → Lasswell, and Lewin.

Even now, there is continuing cross-over between the two fields in terms of publication venues, collaborations among scholars, and even migration across departments for faculty and students trained in either of the two disciplines. Given the historical development of the two areas of inquiry, psychology is more of an established discipline than communication, so communication may benefit from the relatively consolidated approaches of psychology. In the future, the fields will be entering into shifting configurations as each develops further. The relationship between psychology and communication has been productive in the past, and communication scholars will continue to both learn from and inform psychologists.

# Public

*Nikolaus Jakob*

*Johannes Gutenberg University of Mainz*

Few concepts in the social sciences have attracted more attention and caused more confusion than the concept of the “public.” The dispute concerning the nature of the public is at least as old as Greek democracy. Since that time, one of the most divisive questions has been whether the public is characterized by an everyman, holding common opinions (*doxa*), or by an intellectual elite, endowed with deeper insight, knowledge, and wisdom (*episteme*). This controversy is the starting point for the following considerations. After a summary of different theoretical concepts, the relationship between the individual and the public is reviewed. The question of exposure to communication content is then addressed.

Since its beginnings in ancient times, the term “public” has bred a multiplicity of *competing meanings* (Habermas 1962; Childs 1965), which continue to shape scientific discourse today. Three major theoretical schools of thought can be identified: a normative or qualitative concept, an operationalist or quantitative concept, and a functionalist concept.

The *normative or qualitative concept* defines the public as a social elite comprising well-informed, responsible, and interested citizens. These pursue the common good and participate in an enlightened and rational discourse on societal affairs. In a democratic system, the public forms a critical counterpart to the government, acting as an imaginary parliament and engaging in political deliberation. Moreover, the public discussion of political ideas and the free exchange of arguments are regarded as the heart of the democratic process, as they make the best, wisest solutions possible (Berelson 1952; Hennis 1957; Habermas 1962; → Political Discourse; Public Opinion).

In the *operationalist or quantitative concept*, the public is regarded as a collective of diverse individuals whose views on a particular issue can be measured by opinion polls. According to this quantitative concept, the public is a certain cross-section of society, an “issue public,” as defined by survey research (Converse 1987). The *functionalist concept* defines the public as a system of social monitoring, enabling a society to observe itself and to react to issues which are or may become relevant to its members. The public has the function of monitoring trends and developments in society. It identifies and brings up important issues, reduces the complexity of social and political matters, and thus reaches a consensus on social conflicts (Luhmann 1970).

In addition, according to → Noelle-Neumann (1993), the public can be understood as an institution of social control: its purpose is to enforce social conformity, stabilizing society as a whole. In contrast to the normative concept, in this view the public is concerned with political and nonpolitical issues, and includes not only the intellectual elite but every single individual within a social collective. Furthermore, the existence of the public is restricted neither to democratic systems nor to societies familiar with survey research or modern mass media (→ Spiral of Silence; Climate of Opinion).

The functionalist approach is the oldest concept: single thoughts, fragments of theory, and even comprehensive analyses can be found in every period of history (e.g., in the works of Cicero, Michel de Montaigne, or John Locke). In contrast, the normative concept did not emerge

until the eve of modern democracies, during the age of Enlightenment in the seventeenth and eighteenth centuries. Finally, the operationalist concept, which is closely connected to the advent of empirical social research, appeared in the first half of the twentieth century.

An examination of the public's exposure to communication content must concentrate on the *relationship between the individual and the public*. The public is frequently viewed metaphorically as an organic being with a collective mind, yet this is an intangible generalization. Accordingly, all three concepts make statements about the relationship between the individual and the public. They share the view that the public consists of individuals who are both members of social groups and parts of specific media → audiences. In the functionalist concept, these individuals, groups – including the elite – and audiences are pooled to form a single public. According to this understanding, the mass media are also social units and components of the public. Their function is to confer publicity, to set important issues on the public agenda (→ Agenda-Setting Effects), and to serve as a general communication forum and source of information for the public. The media give attention to specific topics and problems, thereby influencing public awareness of these issues. Additionally, their coverage serves as a frame of reference in public discourse (→ Framing Effects).

The relationship between the individual and the public is determined by a *mechanism of symbolic representation* in the mind of every individual (Lippmann 1922; Mead 1934; Goffman 1963): virtually all people continuously form views of the public – it represents the generalized others in the individual's imagination, even if nobody is physically present. As the individual's perception or imagination of the public sentiment affects his or her own decisions (e.g., on voting) and opinions, it also contributes to the shaping of public opinion. Consequently, the public can also be defined as both a state of being exposed to others and an awareness of being (potentially) watched by the anonymous "public eye." Individuals rely on two sources of information in order to assess public attitudes and behavior: interpersonal communication and the mass media (Noelle-Neumann 1993). Media statements regarding public sentiment pervade interpersonal communication along several steps of the flow of communication (→ Two-Step Flow of Communication; Diffusion of Information and Innovation). In this manner, the media exert influence on the way the public is perceived; they shape the individual's understanding of the proportion of opinions, i.e., of the size of minorities and majorities (→ Media Effects). Although individuals arrive in many cases at correct estimates of the opinion of others, erroneous judgments are possible (→ Pluralistic Ignorance).

The circulation of communication content among the public takes place via intervening psychological and social processes: on the one hand, people's exposure is framed by interpersonal relations; on the other hand, individuals expose themselves selectively to communication content, i.e., they actively seek information that is consonant with their initial attitudes and that is likely to satisfy their needs (→ Selective Exposure). Exposure thus varies according to personality and social factors (→ Media Use by Social Variable; Personality and Exposure to Communication). Members of the intellectual elite, for example, usually gain greater exposure to information content in the media than does the general population (Fig. 1).

In summary, it can be concluded that the public consists of individuals who seek exposure to communication content. This content derives either from interpersonal

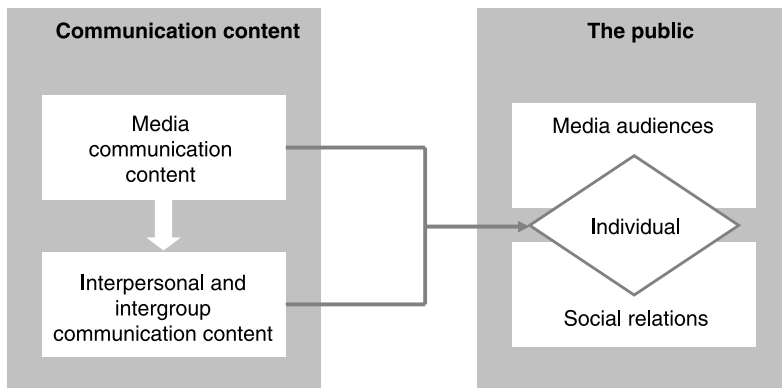

Figure 1 Exposure to communication content: the individual and the public

(intergroup) communication or from the mass media – which themselves in many cases influence interpersonal communication through their coverage. The public can be understood as a large collective of partially interconnected individuals, groups, and audiences through which (mass) communication is channeled.

# Public Access Television

John S. Armstrong

Furman University

Public access television – also known as community television or open channels (→ Community Media) – is a form of → television in which citizens produce programs and bypass corporations, governments, journalists, and other gatekeepers to transmit their programs directly to audiences (→ Access to the Media). Proponents of public access television promote it as a remedy to commercialism, centralization, and lack of diversity in television systems around the world (→ Commercialization of the Media; Plurality). As a systematic alternative to commercial or government-supported television, public access television first emerged in Canada and the United States in the late 1960s and early 1970s. Public access channels have since appeared in hundreds of communities in North America, Europe, Asia, Latin America, and Oceania, although public access outlets have never attracted audiences large enough to rival those of professional television systems.

The emergence of public access television in *Canada* and the *United States* was closely associated with three developments: the appearance of media-activist movements (→ Activist Media) that promoted public access television as a means to nurture democracy and localism; the development of lightweight and relatively inexpensive equipment that facilitated video production (→ Video) by amateurs; and the construction of urban cable systems with channels available for public access programming (→ Cable Television). Beginning in 1966, the Canadian National Film Board sponsored documentaries in which citizens voiced their opinions about social and economic issues. The concept of public access was wedded to cable television in 1970 when a citizens' organization in Thunder Bay, Ontario, persuaded the local government to negotiate for community access on the local cable system. In 1971, the Thunder Bay model was adopted nationally when the Canadian Radio and Television Board stipulated that public access be a part of the country's burgeoning cable system (→ Community Video).

In the United States, media activists campaigned for similar access to cable systems (→ Citizens' Media; Citizen Journalism). Because the country's young cable industry needed allies in its regulatory battles with over-the-air broadcasters, it formed an alliance with public access advocates. When private companies negotiated the rights to wire local communities for cable, the agreement often included the reservation of channels for local public access, as well as channels for local governmental and educational programs. Frequently, the companies also agreed to provide public access producers with facilities and video equipment. In 1972, the Federal Communications Commission began requiring access channels in most local cable systems.

Produced largely on scant budgets, Canadian and US public access programs vary widely in format, content, and production quality, as do many public access programs around the world. Many address political or social issues, while others are purely entertainment. The most successful programs have attracted viewers with their originality and their willingness to address subjects ignored by other television outlets.

By the beginning of the twenty-first century, some of the world's most robust public access channels were in the Federal Republic of *Germany*. Again, they took root with the widespread advent of cable, in this case in West Germany in the 1980s. Germany's public access channels grant nondiscriminatory access to citizens and provide free production facilities. Unlike the cash-strapped systems in North America, the Federal Republic's "open channels" receive a portion of the subscription fees that Germans pay for television services. These funds support studios, technicians, and equipment for public access productions. Open channel services have also been established on local cable systems in *Sweden* and the *Netherlands*, and, to a lesser extent, in other European countries.

Although public access television is often associated with local communities, there have also been attempts to reach national audiences. In *South Korea*, the Broadcast Law of 2000 requires KBS 1, a national broadcast network, to set aside a small portion of its schedule for programs produced by the public. In 2002, South Korea's RTV network inaugurated the world's first satellite television channel devoted to public access programming (→ *South Korea: Media System*). In 2006, *Australia's* Satellite Community Television (SCTV) began beaming multiethnic, multilanguage public access programs nationwide. Previously, SCTV had been limited to local broadcasts on an over-the-air channel in Sydney.

In the first decade of the twenty-first century, the future of public access television is uncertain. With over 1,000 local cable channels devoted to public access, the United States had the most extensive system in the world in 2006. However, US cable channels remain chronically underfunded and face regulatory challenges. In 1979, in the case of *FCC vs. Midwest Video*, the US Supreme Court ruled that the Federal Communications Commission could no longer require cable companies to include public access channels in local cable systems. Since that decision, local governments have had to choose whether to negotiate for public access channels and production facilities in their franchise agreements with private cable companies. The now entrenched cable industry continues to lobby the US Congress to eliminate local governments' authority to negotiate such concessions. Public access television faces similar regulatory and economic threats in many nations, and also faces the challenge of adapting to new media such as satellite television and the world wide web (→ *Satellite Television*; *Internet*). Nonetheless, the notion of unfiltered citizen access to television is likely to remain attractive to critics of professional media.

*University of Houston*

Public affairs is both a generic term for the trends and conditions that define and result from socio-economic–socio-political trends, and the corporate management function that works to position each organization comfortably and cooperatively in its non-marketplace context. Focusing on the latter meaning, Madden (2005, 665) defined public affairs as “the management function responsible for interpreting an organization’s external environment, or in the case of a corporation, its noncommercial environment, and managing an effective and appropriate response to that environment.” Its primary connection with society centers on governmental relations, the factors in the public policy (non-marketplace) arena that can lead government to influence (support or oppose) management decisions and organizational operations and policies (→ Organizational Communication; Corporate Communication; Corporate Reputation; Organizational Image).

### ORGANIZATIONAL ROLE OF PUBLIC AFFAIRS

Its corporate role, and hence its definition, depends on whose eye is seeing the beauty. Some define it as a management function that subsumes public relations and other communication functions. Especially in companies with a primary emphasis on product marketing, the public relations function is likely to be dominant. For some observers, it is often confused with or used interchangeably with → public relations. Those who see public relations as the dominant discipline feature public affairs as a sub-function devoted to government relations in the broad sense and → lobbying more narrowly. In many large organizations, especially national and international or multinational corporations, public affairs is the dominant discipline. In such organizations, public relations is a marketing, product promotion, publicity, and image-management function that reports to public affairs. In non-profits that feature public affairs, it is the planning function, whereas public relations often is designed to implement the public affairs plans. To further obscure the differences or similarities, some organizations name these kinds of functions corporate communications, external affairs, and even community affairs.

Public affairs, as a department and function, is not limited to businesses. Many non-profit organizations, especially if they are large and approach the discipline as an integration

of many specialties, feature their public affair department, which often also has a public relations function. However defined and positioned, proponents of these disciplines – public relations and public affairs – prefer that they are integrated and interconnected (→ Integrated Marketing Communications). Organizations that feature public relations as the dominant discipline tend to see it as implementing marketing and advertising promotion. In such organizations, public affairs is merely government relations, if it is a part of the organization chart at all. When public affairs is the dominant discipline, marketing may reside beneath public affairs and be part of or even report to public relations. So the definition is like a kaleidoscope. As it turns, it gives different perspectives on the subject at hand, namely the nature of public affairs as an organizational discipline.

### **DIMENSIONS IN PUBLIC AFFAIRS RESEARCH**

Dennis's (1996) book is one of the few devoted to public affairs. It was published by the Public Relations Society of America and openly vowed to not attempt to fully reconcile the specific definitions of public relations and public affairs. This work featured public relations as a broader function: "Public relations helps an organization develop and maintain quality relationships with the various groups of people ('publics') who can influence its future . . . Public affairs is the public relations practice that addresses public policy and the publics who influence such policy" (1996, xviii).

Viewed this way, public affairs is the discipline that centers its attention, management counseling, and communication efforts on the dynamic factors and conditions specific to the ways in which organizations can affect public policy and the manner in which public policy can affect organizations. Public affairs, from its seminal days, has been more than publicity and promotion. It has developed to bring large organizations into the *societal dialogue* that shapes the socio-economic, socio-political arena. Public affairs became a vital topic under that rubric in the 1950s in the United States. From the start, the term "public affairs" seemed more comfortable to executives and politicians because "public relations" carried a lot of semantic baggage, which today is reflected in the editorial comment "just public relations," or the pejorative appellation "spin." As public relations seemed to lack substance and respectability, something was needed to define how this important function could be made credible and functional in the public policy arena. Continuing this tradition today, many companies and other large organizations see public affairs as being central to their efforts to manage risks, whereas public relations is more likely to be associated with revenue generation through sales or fundraising. Although experts disagree on the best methodology and independent variables (Hillman 2002; Schuler 2002), the central academic and corporate assumption is that effective public affairs performance helps overall management and organizational performance.

### **EMERGENCE OF PUBLIC AFFAIRS**

President Dwight D. Eisenhower played a major role in the inception of public affairs when he brought a group of leading business executives together to give a bipartisan forum for Democrats and Republicans. Following World War II, many forces seemed imminently about to define and shape business interests. Eisenhower was keenly aware of

the potential of international socio-economic collisions that would define the political and commercial arrangements and approach in the United States. In a spirit of citizen participation, he fostered the naming of the group as the Effective Citizens Organization. This group eventually changed its name to the Public Affairs Council (PAC) in 1965.

Many felt that public affairs was the new face of public relations practice. The 1960s and 1970s were a period of ferment, activism, reflection, combat, and self-examination in all of the institutions in the United States. Corporations and other large organizations were increasingly convinced that to ignore the public policy arena would leave them out of many decisions and allow others to define them and write their organizational missions. Whereas public relations had developed a reputation among many as featuring promotion, publicity, and image management, the tumult of the time called for a more basic and encompassing approach to positioning organizations and policies. The goal increasingly came to be to adjust organizations to the public policy arena and to adjust public policy to the needs and interests of large organizations. These organizations had increasingly become the voices that needed to be heard and needed to listen to one another, as the United States and other countries forged a postwar understanding of economics, finance, regulation, legislation, and standards of corporate citizenry.

### **PUBLIC AFFAIRS IN PRACTICE**

Public affairs departments perform many functions. One of the most crucial is serving in the *management council* of each organization. Using monitoring and issue analysis, public affairs specialists bring ethical and public policy issues to management-level decision-making. Specialists continually assess how comfortably the organization's policies fit with those of other key organizations working to shape public affairs. As a communication function, public affairs fosters public relations, corporate communications, media relations, employee relations, and strategic philanthropy, and may participate in investor relations. Additional points of strategic response include lobbying, grassroots organization, campaign finance, management consulting, and benchmarking. In addition, public affairs specialists often play a vital role in meeting the management challenge to know and achieve the level of performance that fosters rather than diminishes the organization's social capital (→ Strategic Communication).

From the inception of modern issues management in the 1970s, public affairs has adopted that approach to its public policy challenges. It defines issues management as "the process of prioritizing and proactively addressing public policy and reputation issues that can affect an organization's success. Many large companies, in particular, use issues management techniques to keep all of their external relations activities focused on high-priority challenges and opportunities" (Public Affairs Council 2006). Public affairs and → *issue management*, perhaps the offspring of public affairs, are viewed as being necessary for companies because of the keen abilities of their adversaries to shape public opinion and therefore drive public policy. It is not coincidental that public affairs and issues management started and became mature during a period of socio-political ferment.

The *Public Affairs Council*, located in Washington, DC, has been a driving force in supporting and promoting a public affairs approach to relationship building and non-commercial positioning of organizations and their stakeholder publics (→ Stakeholder

Theory). One of the stellar accomplishments of the public affairs movement, the Council performs research to understand and refine the discipline, produces cutting-edge publications, and conducts workshops for executives and public affairs specialists. It believes that the discipline stays vital and refines its practice through continuing education. Its membership consists of major companies, associations, and consulting groups. It was one of the first organizations to innovate in, define, and give substance to issues management. “Born of a marriage between lobbying and communications and schooled in the techniques of community organizing, public affairs has grown up to be a credible participant in the formation of public policy” (Duke & Hart 1996, 14).

The public affairs movement has focused considerable attention on the *challenges facing large organizations* operating in an environment made ever more complex to management because of the tangles and challenges of public policy advocacy. If we accept that public relations failed to satisfactorily meet this challenge starting in the 1950s in the United States, then its mantle shifted to the shoulders of public affairs. Public relations seemed to lack the character and respectability to weigh in on the matters of regulatory and legislative shifts and twists. One of the failings was its historic connection with fabrication, spin, and smoke and mirrors. Some believe it came to rely on cleverly worded press releases to the extent that it lacked proactive participation in public dialogue. If an organization, industry, or other sector of society waits for other forces to shape public opinion, that body may have the conditions of its operation made more difficult. Public relations needed to act less reactively and more proactively.

Public affairs departments, and the discipline as such, developed to engage organizations earlier in the dialogues that lead to public policy formation. Some saw the advantage of working early when opinions are not well formed. Such a view can lead critics to surmise that public affairs can and will seek to undercut legitimate change in the public policy arena not by debating issues but by manipulating how those issues are debated.

In an era when public relations/public affairs scholars are again addressing responsible advocacy, one can imagine that the challenge to public affairs as a professional practice and academic discipline will be to refine its theory, ethics, practice, and management impact so that the larger interests of all legitimate voices are heard and respected. It seems that the challenge is not to know how to make an organization effective, but to learn the ways for the organization to work with other interested parties in a reflective manner to make society better, more fully functioning. Thus, public affairs as a discipline and employer of best practices is challenged to understand, appreciate, and proactively participate in the creation of effective public affairs, the socio-economic, socio-political dynamics that affect the organization’s ability to function in the interest of its various stakeholders.

## Public Broadcasting, History of

Jamie Medhurst

Aberystwyth University

Public broadcasting is notoriously difficult to define, and yet it has been at the center of debates in → media policy for decades in those countries where it exists. Proponents of public broadcasting argue that at its heart is the notion of providing the “best” in programming for all, while detractors would argue that it is a form of state control over what we can listen to or watch (→ Public Service Broadcasting: Law and Policy).

Public broadcasting can also be defined in economic terms (funding from the state or public taxation), cultural terms (maintaining and supporting a minority culture), social terms (broadcasting for the “social good”; → Public Goods), → audience terms (the listener/viewer as citizen) and, finally, as “that which is not commercial broadcasting.” In relation to the final statement, Tracey (1998) has suggested a simple epigram for defining public broadcasting as opposed to broadcasting funded by commercial means: the former gets money to make programs while the latter makes programs to get money. However simplistic, this is what public broadcasting is about in essence (→ Media Economics; Cost and Revenue Structures in the Media).

A history of public broadcasting can usefully be divided into three periods: the early history from the 1920s until World War II, the immediate postwar period, and the 1960s onwards.

### EARLY HISTORY

Scannell (2000) has argued that a historical understanding of public broadcasting needs to take into account two factors: public broadcasting as defined by the state and public broadcasting as interpreted by the broadcaster. In the UK for instance, the government

decided upon a broadcasting service that would operate via a license granted by the Post Office. As the service had to share the airwaves with the military and emergency services, a shortage of frequencies meant that the scarce resources had to be utilized in the national interest. A similar rationale was behind the broadcasting services in Belgium and Denmark, for example. Broadcasting was viewed as a public utility, and the mandate to develop it as a national service in the public interest came from the state (→ United Kingdom: Media System).

This was in contrast to the model in the *United States*. Although the broadcaster David Sarnoff had referred to broadcasting as a public service in a speech in 1922, drawing attention to its potential to inform, educate, and entertain the nation, broadcasting development took the commercial as opposed to the state-controlled, public service path (→ United States of America: Media System). Although it would be unfair to argue that the broadcast media in the US developed in a completely chaotic and unregulated manner, there were fewer restrictions than in the UK (Hilmes & Jacobs 2003).

### Monopoly Days

Once established, the British Broadcasting Company (which became a Corporation in 1927), or → BBC, was soon fashioned under the watchful eye of its first managing director, then director-general, Sir John Reith. Reith interpreted public broadcasting by developing a set of principles which were to dominate British broadcasting for decades. This Reithian approach to public broadcasting in the early days of radio broadcasting was based on four tenets. First, the need to protect broadcasting from commercial pressures was safeguarded by creating an assured source of funding (a license fee for all those who owned wireless sets). Second, the service was to be provided for the whole nation regardless of the geographical location of the listener. This policy of a universal service was achieved, third, by the establishment of a national program (broadcast from London) and, fourth, by a regional program from selected cities across the UK (including Cardiff and Birmingham).

Broadcasting had a duty to bring the “best” of British culture to every household in the UK, and this reflected the director-general’s almost missionary zeal for the task in hand. It also allied Reith with the Victorian essayist, Matthew Arnold, who argued that culture was the “best” that had been thought and written in the world. Therefore, the early years of broadcasting in the UK were forged by a combination of a notion of public service and an Arnoldian vision of culture (→ Culture: Definitions and Concepts).

Meanwhile, the period of the Weimar Republic (1918–33) in *Germany* witnessed an emergent public broadcasting system, one which was state-governed and -controlled. The *Reichpost*, the state regulatory authority covering postal services, telegraphy, and the telephone service, allocated broadcasting licenses and controlled transmission facilities, and the state’s hold over broadcasting was further tightened by the establishment of the Imperial Broadcasting Company in 1925. As Humphreys (1996) has argued, “the state’s grip on the medium had become almost absolute by the time Hitler came to power.” By the early 1930s, the service had incorporated clear elements of public broadcasting and broadcast a range of music, drama, documentary (→ Documentary Film), talk (→ Broadcast Talk), → news, and current affairs programs. When Hitler came to power in 1933, the radio service was instantly commandeered by the Nazis and exploited as a → propaganda tool under the watchful eye of the chief propagandist, Joseph Goebbels. By the mid-1930s

the Nazis had turned their attention to the new medium of television, and they soon established the world's first high-definition television service. The service was distributed to public spaces as opposed to domestic receivers, however, and so the BBC receives credit for the creation of the first public television service for the home (→ Television; Television Technology; Television: Social History).

## THE POSTWAR PERIOD

The world's first regular domestic television service began on November 2, 1936, when the BBC broadcast from Alexandra Palace in north London. However, the outbreak of World War II brought the service to an abrupt halt in September 1939. By the time the service resumed on June 7, 1946, it was clear that television in the UK was to be developed along the same public service principles that governed radio (→ Television Broadcasting, Regulation of; Radio Broadcasting, Regulation of). Although John Reith had left the BBC in 1938, his legacy remained and was to dominate broadcasting policy for at least another 20 years. The high moral enterprise, achieved by a policy of mixed programming on radio and television and a refusal not to pander to audience tastes alone, nevertheless alienated sections of the audience who felt that the tone and content did not reflect their interests or needs. Indeed, one member of the UK government-appointed 1949 committee of enquiry into broadcasting (the Beveridge Committee) referred to the policy as "compulsory uplift."

Reith's concept of public broadcasting nevertheless influenced the development of radio and television services in many European countries after the end of World War II and formed a key part of the → political economy of the media in these countries. For many, the adoption of this model allowed for a degree of state control and nation-building following a period of upheaval and turmoil. With nations eager to redevelop, rebuild or rediscover a sense of national consciousness in a new Europe, a model of broadcasting which catered for a national service in the national interest was seen as the way forward. Programming in which nations could reflect their own identity within and without the outside world, free from commercial pressures, would flourish under the public broadcasting model.

As television services emerged in postwar Europe, some variation in the "degree" of public service appeared. In France, for example, the state had a closer hold on broadcasters than in Spain, where the television service (which began in 1956) was funded by → advertising but controlled by the state (→ France: Media System; Spain: Media System). The main aim of the Allies' postwar broadcasting policy in Germany was to ensure that party political influence on broadcasting as a social good remained minimal. To this end, the BBC's Hugh Carleton Greene (later to become the corporation's director-general in 1960) was deployed to run the BBC-inspired *Nordwestdeutscher Rundfunk* in the British zone of occupied Germany. As a result, the overwhelming influence on German broadcasting up until the 1980s was a public broadcasting ethos. Further afield, Japan's NHK television service, introduced in 1953, drew closely on the BBC's public service model and was funded by a license fee. The Japanese public broadcasting model, whilst carrying a comprehensive diet of news and current affairs, placed its prime emphasis on entertainment (→ Japan: Media System).

Chinese broadcasting history is one of unprecedented growth and expansion after a small, relatively inauspicious start. The Communist Party which came to power in 1949

established broadcasting as a state propaganda tool. Television was introduced in 1958 in Beijing alone and spread across the country at a very slow pace. The rapid expansion took place after 1976, and by today Chinese viewers have access to a wide range of channels, some of them still closely monitored by the state (→ China: Media System). These examples highlight how political and cultural contexts impact upon the development of public broadcasting in different countries.

### COMMERCIAL COMPETITION

Despite the dominance of the public broadcasting model in Europe, the postwar years saw a gradual shift towards commercialism (→ Commercialization of the Media). In the UK, the debate over a rival television service to compete with the BBC began in the years immediately after the war. The debate was fuelled by the publication of the Beveridge Report on broadcasting which, although supporting the maintenance of the BBC's monopoly over broadcasting, accused the corporation of a London-centric bias at the expense of the nations and regions of the UK. A minority report by one of the committee's members, the Conservative MP Selwyn Lloyd, went so far as to advocate the establishment of a commercially funded television service. It was this impetus, together with the activity of backbench Conservative MPs and external pressure groups, that led to the passing of the 1954 Television Act, which introduced a television service funded by advertising revenue to the UK for the first time (→ Advertising, Economics of). The 1960s and 1970s saw the continued abandonment of the Reithian model of public broadcasting across Europe. In the US, however, there was a concerted attempt to "ringfence" public broadcasting by the establishment of the *Public Broadcasting Service* (PBS) in 1969. This network of nonprofit-making stations was launched in October 1970 and drew (and continues to draw) its programming from a variety of sources offering programming in news and current affairs, children's programming, entertainment, science, and the arts. After initial success, however, the service soon declined in the face of stiff commercial competition. The 1960s saw an increasingly liberal approach to broadcasting (particularly in terms of content) and in the UK the matter came to a head in 1977 with the publication of the *Annan Report* on broadcasting. For the first time, the appropriateness of a paternalistic mode of public broadcasting in a pluralistic society was questioned, and the concerns voiced in the report reflected the changing nature of British society during the 1960s and 1970s.

A further shift took place during the 1980s when citizens were being increasingly defined as consumers. The neo-liberalist stance of the *Peacock Report* in the United Kingdom, published in 1986, referred to the now-famous notion of "consumer sovereignty," a sign for many that the death knell for public broadcasting had been rung. Across Europe, technological advances and changes in regulatory legislation made it easier to establish networks. Throughout the 1990s, increasing de-regularization, globalization, and the international marketplace placed public broadcasting systems under threat (→ Competition in Media Systems; Globalization of the Media). The notion of the "national" territory or boundary with which much of the public broadcasting ideal was bound up was eroding. At a global level, the market was considered to be the most appropriate mechanism for satisfying audience demand for broadcasting services, and the basic tenets of public broadcasting were gradually eroded.

The future of public broadcasting is uncertain. In the UK, for example, the communications regulatory body, Ofcom (Office of Communications), undertook a wholesale review of public service broadcasting during 2004–2005. The aim of the review was “to set out a new framework for public service broadcasting . . . designed for the future and sufficiently adaptable to respond to and reflect changing technologies, markets, and the needs of citizens and consumers” (Ofcom 2005). An indication of how the notion of public broadcasting has changed since the mid-1920s can be seen clearly in the inclusion of two terms that would be anathema to John Reith – “markets” and “consumers” (→ Audience Commodity). The impulse to inform, educate, and entertain remains, but it also remains to be seen whether or not the market can deliver or whether there will still be a role for the public broadcasting ideal.

# Public Broadcasting Systems

*Jo Bardoel*

*University of Amsterdam and Radboud University Nijmegen*

Public service broadcasting (PSB), according to McQuail (2005, 179), refers to “a system that is set up by law and generally financed by public funds (often a compulsory license fee paid by households) and given a large degree of editorial and operating independence.” Public service broadcasting is supposed to function independently of both the market and the state, and therefore differs from the alternative systems of commercial broadcasting on the one hand and authoritarian or state-operated broadcasting on the other (→ Communication and Law; Media Policy; Radio Broadcasting, Regulation of; Television Broadcasting, Regulation of).

Until the 1980s public service broadcasting was dominant, or even held a monopoly, in most countries of the western world. During that decade public broadcasters lost their dominant position because of liberalizing policies following the advent of new distribution technologies and the eroding legitimacy of the argument of spectrum scarcity as well as growing political and public criticism of the privileged position of PSBs (→ Satellite Television; Cable Television). In the 1990s commercial stations became the dominant actors in most broadcasting markets, and public service broadcasters had to adapt to a new, “dual” broadcasting context in which they are the exception rather than the rule. At the beginning of the third millennium new multimedia platforms represent yet another challenge for public broadcasters.

## ORIGINS AND PHILOSOPHICAL TRACES

There is no clear definition or coherent theory of public broadcasting. When → radio was invented at the beginning of the twentieth century and → television by the middle of the same century, national governments had to regulate → access to the media – unlike the situation with the press – because of the scarcity of frequencies and a widespread concern about the impact of these new, electronic media on people and society (→ Media Effects). In this context public, noncommercial corporations were set up that presented a comprehensive program, consisting of information, education, culture, and entertainment that would raise the level of political awareness and cultural taste of citizens, not consumers. The first director general of the British Broadcasting Corporation (→ BBC), John Reith, had already put these ideals on paper in the 1920s, and his BBC became a trusted source amidst the → propaganda of authoritarian regimes in those days and indeed a model for the world (→ United Kingdom: Media System).

The philosophical traces of the concept of PSB lie in humanistic Enlightenment ideals and in normative notions on the social responsibility and public interest of media in modern societies (→ Freedom of the Press, Concept of; Journalism: Normative Theories). These notions stem from policy advisory commissions like the Hutchins commission in the US (1947), the British Royal Commission on the Press (1949 and 1977) and successive committees on broadcasting in the UK (Scannell 1980). As such this is a negotiated concept

that results from a process of political struggle, social debate, and academic reflection and differs from country to country and from period to period, reflecting national media policies and research traditions.

In a situation of channel scarcity for broadcasting, where government interference was considered inevitable, explicit legitimization for a public broadcasting policy was not really necessary. But from the 1970s, interfering in public broadcasting and giving the organizations a financial prerogative and a specific role “in the → public interest” began to require legitimizing. The public monopoly, originally of a more ritualistic nature, was not seriously contested but an open government had to legitimize its prescriptive regulations. With the introduction of commercial television and, in the European context, the changed policy environment following the EC directive “Television without Frontiers,” interference and preferential treatment required a more deliberate strategic policy and legitimacy (→ European Union: Communication Law).

### **GOALS AND DISTRIBUTION**

In spite of all the differences mentioned, the goals of public broadcasting across cultures show a striking resemblance (see Broadcasting Research Unit 1985; Council of Europe 1994; McQuail 2005): (1) universality of geographic coverage and audience reach, and a common reference point and forum for all members of the → public; (2) pluralistic, innovative, and varied programming, independent of both government and market forces; (3) concern for national culture, language, and identity as well as a reflection of ideas and beliefs in a multiethnic and multicultural society; (4) accountability toward society and the audience (→ Accountability of the Media).

At present public broadcasting systems exist all over the world, but are most frequently found in European countries and in countries that have historical or colonial ties with these European countries (→ Communication Law and Policy: Europe). The example and model of PSB worldwide is the BBC, but within Europe the BBC’s position is in many respects the exception rather than the rule. In fact, the position and organization of PSBs, as national institutions, reflects the history of the respective nation-states.

The American public broadcasting system, PBS, has quite a different tradition and position (Avery 1993). The United States Radio Act of 1927 enabled the commercial, advertiser-funded broadcasting system for which the US is known. In 1945 the Federal Communications Commission created licenses for noncommercial educational radio stations with a public service ideal. Educational television officially began by 1952, but it was only with the Public Broadcasting Act of 1967, following the report of the Carnegie Commission on Educational Television, that more (although limited) funding for both educational radio and television became available. Since then public radio and television gained a fixed but, compared to public broadcasters in Europe and elsewhere in the world, rather marginal position in the media landscape (→ United States of America: Media System).

### **PUBLIC BROADCASTING IN QUESTION**

The reflection on the concept of public broadcasting has considerably increased since its existence is not self-evident any more, due to the advent of new media technologies and a

liberalization of media policies all over the world. The new context of PSB has raised continual criticism on almost every aspect of its operations: its mission and its realization, its programming, organization, control, its funding and expenditure.

The question of the *mission* of public service broadcasters is greater than ever. It shows that an explicit legitimization in terms of PSB's role in society has become imperative, and serves as a battleground for different interests and insights. Traditionally, the political function of PSB in relation to democracy, pluralism, and public debate was emphasized, but more recently socio-cultural goals, such as serving social integration and cohesion, have become more prominent (Bardoel & Brants 2003). At a more practical, nonrhetorical level the independence of public broadcasting, from both the state and the market, is constantly at stake. For public broadcasters the relation to politics is most crucial, and Hallin & Mancini's seminal book *Comparing media systems* (2004) demonstrates that the relation between politics and the media and media freedom across western countries varies greatly according to their political history and culture and the room it leaves for a vivid → public sphere, including public broadcasting. In this respect, the countries of North America and western Europe are ahead of the European countries of the south and the east that have a relatively young democratic tradition.

Public broadcasters also have to redefine their relation to the public. Although the public should be the primary frame of reference, many PSBs have kept the people and civil society at a distance, while politics and the government proved to be the preferred partner. This is also a result of a tradition of paternalism, which is more or less inherent in the pedagogical imperative practised by public broadcasters in the past. Although public broadcasters have a problem of redefining their mission in the context of the new "dual" broadcasting market and a changing, multicultural society, many believe that basic functions such as a low-cost and universally available reliable provision of information, education, and culture and the catering for minority tastes and interests cannot or will not be sufficiently served by the commercial market ("market failure").

Closely related to the mission is the *program* assignment of public broadcasting. The recent debate on this issue can be summarized by the catchwords "comprehensive or complementary": should PSB still present a full-scale program offering or should it just supplement programs that its commercial counterpart does not offer? Despite accusations of copycat strategies and a convergence between public and commercial broadcasters, research shows that most public broadcasters have chosen, principally or pragmatically, the middle way of compensation. Although there is much debate on the mission of public service broadcasting, almost no country has made the choice to really narrow the program task of PSB (→ Public Service Broadcasting: Law and Policy). In response to this critical debate, most public broadcasters look for arguments in favor of the full-scale model and try to stress their distinctiveness more than ever. The alternative option of de-institutionalizing PSB by introducing public program funds comparable with policies vis-à-vis culture and the arts ("distributed public service") has been proposed in countries that reconsidered their public broadcasting system, but no country has dared to take that far-reaching step, with the notable exception of New Zealand, where a drastic reorganization of PSB took place in 1988. Open competition via an "arts council of the air" model was meant to lead to greater value for money and add to the quality of PSB programming, but in practice it did not work out that way.

Looking further into the *organizational* aspects, the rapid rise of commercial television from the 1980s, leading to the majority of stations being private by the middle of the 1990s, has also changed the structure and culture of public broadcasting institutions considerably (→ Convergence of Media Systems). Already in the 1980s quasi-commercial elements were introduced within public service broadcasting, such as the popularization of programming in peak time in order to maximize → audiences and advertising revenues, the increasing cost-consciousness and efficiency in its activities and the adaptation of management practices from the commercial sector (→ Cost and Revenue Structures in the Media). Although there is still considerable support for the maintenance of strong PSB institutions in most countries, there is also a growing need for continual monitoring of its overall efficiency and effectiveness.

The main source of *finance* for most PSBs remains the license fee, but most countries have mixed systems. There are countries in which at least three-quarters of the budget of public television comes from license fees or public subsidies, as opposed to countries where → advertising is the major part of a channel's income. In addition, the overall financial position of public television channels differs considerably from country to country. The BBC budget is about seven times higher than the total budget of the 22 public broadcasting organizations that make up the public broadcasting service in the Netherlands. The comparative "poverty" or "wealth" of PSBs is of course closely related to the size of the population (or market) to be served. Although there is strong criticism of advertising as a partial but important source of income for public broadcasters, mixed funding has been defended as a proper tool to minimize unilateral dependence on politics and to strengthen the programming freedom of broadcasters. On the other hand, income from advertisements may motivate even PBSs to conform to tuning-in quota.

## **PUBLIC SERVICE BROADCASTING IN A NEW MEDIA CONTEXT**

In 10 years' time TV households will devote much less of their viewing time to linear, generalist channels. Audiences will use more distribution platforms and channels alongside the currently available open broadcast channels. In order to maintain a reasonable level of audience reach public broadcasters may decide to extend their portfolio of platforms and channels. The first step will involve thematic channels, which will, to the extent that they prove successful, change the function of the present open channels to showrooms for program offerings on thematic channels and "on demand" platforms. Gradually these media and platforms will be linked as part of deliberate cross-media strategies that try to keep the viewer and the listener in their network for as long as possible. In general, brand building across media and platforms will become more important for public broadcasters. In the new media context the *raison d'être* of PSBs, more than ever, will lie in offering quality programming and setting the standard as well as serving as a trusted brand or as an "anchor" for citizens in the new flood of information.

## **Public Diplomacy**

*Beata Ociepka*

*University of Wrocław*

The notion of public diplomacy has been used in international relations and in international communication studies since about the mid-1960s. It originates from US foreign policy from the period of the Cold War. Public diplomacy is understood as a dialogical communication between governments and other actors on the stage of international relations via the mass communication media and non-mediated channels of contact with the foreign countries' mass audience. The aim of public diplomacy is to create or reinforce a positive → image of the country and its society, and by influencing → public opinion to shape positive attitudes toward the country, and in consequence to make the achievement of international policy goals easier.

At the beginning of the twenty-first century the notion was widely discussed, as a result of the campaigns undertaken by the USA and European countries after the September 11, 2001, attacks and the employment of public diplomacy tools by many governments in order to rebrand their country or reposition it in the new international environment. The new campaigns adjusted the images of countries in relation to political, economic, and cultural changes, acknowledging the impact the rise of global communications has had on international relations (→ Globalization Theories; Globalization of the Media).

Nowadays public diplomacy is still understood as a supplementary means of American international policy, and often taken for a new version of international → propaganda. In the past this approach was supported by the activities of the United States Information Agency (1953–1999), which was frequently cited as a model institution for public diplomacy. Nevertheless, public diplomacy understood as the long-term, symmetric, dialogical communication of governments and NGOs with broad foreign audiences differs from propaganda, but may still use the same means and apply these to the same audience as propaganda. According to Leonard et al. (2002), public diplomacy is played out in three spheres: political/military, economic (promoting products and businesses), and societal/cultural.

Public diplomacy differs from traditional forms of diplomacy in the means used, the channels the messages are sent through, and the target groups that should be reached. Traditional diplomacy was characterized by the flow of messages from government (diplomats) to government (g2g), whereas public diplomacy implies the direction governments (diplomats) to foreign public (g2p). Thus public diplomacy is understood in the countries where it has been conducted for a relatively short time as a means of supplementing traditional government-to-government diplomacy. The third form of public diplomacy nowadays is characterized by the people-to-people (p2p) flow of information. In the third case the messages are sent and received between members of the public in different countries without the mediation of governments.

### THREE DIMENSIONS OF PUBLIC DIPLOMACY

According to Leonard et al. (2002), there are three dimensions of public diplomacy: news management, strategic communication, and relationship building. *News management* is seen as a short-term, reactive activity, having a long tradition in the classic form of diplomacy. It relies very much on cooperation with → foreign correspondents (→ Framing of the News; Spin Doctor).

*Strategic communication* covers cooperation with the mass media of communication in a longer-term and proactive way. The mass media are still seen as important tools of public diplomacy. Also, public relations agencies hired by governments have an enormous impact on strategic communication (→ Public Relations). In the media field nowadays, public diplomacy implements → advertising, as in the case of the US “Shared Values Initiative” campaign in 2003. This consisted of television spots targeted at the public in Muslim countries. The aim of the campaign was to improve the attitudes of Muslim societies toward the USA.

*Relationship building*, perceived as a long-term activity, relies on winning support in foreign countries by cultural and educational programs targeted at students, artists, academics, and journalists (people exchange). The practice of public diplomacy might here originate from traditional cultural diplomacy (social/cultural level). In this case, public diplomacy is understood as a “soft power” (Nye 2004) in international relations, focusing on the image and reputation of the country. The concept of public diplomacy as a soft power builds on the difference between public diplomacy and propaganda, and puts the stress on “attractive” power rooted in culture, typical of public diplomacy in contrast to propaganda.

Public diplomacy as a concept and a practice is rooted in international studies, the theory and practice of diplomacy, international and intercultural communication, and international public relations. The approach rooting public diplomacy in international

studies and international communication is well illustrated by the writings of Gilboa and, recently, Melissen. According to Gilboa (2001), public diplomacy is one of the ways in which the mass media of communication are used as an instrument of foreign policy and international negotiations. The core of this activity lies in influencing a foreign government by influencing their citizens. This model applies to the g2p level of public diplomacy. Melissen (2005, xxi) argues that it would be a simplification to view public diplomacy as only another instrument of foreign policy. He analyzes the notion in a framework of propaganda, national branding, and cultural relations, and understands it as “part of the fabric of world politics.”

The last dimension of public diplomacy according to Leonard et al., i.e., relationship building, is often equated with governmental public relations.

### **PUBLIC DIPLOMACY AND INTERNATIONAL PUBLIC RELATIONS**

In some interpretations, public diplomacy is a part of public relations, or both notions are used interchangeably (Hiebert 2003). In the latter case public diplomacy is understood as *international public relations*. According to Signitzer and Coombs, public diplomacy and international public relations are in “a natural process of convergence” (1992, 137). Depending on the approach and the country, the theory and practice of public diplomacy might stem from public relations, meaning promotion of products and businesses (economic level of public diplomacy), and concentrate on → branding, or relate to cultural and educational exchange (social/cultural level).

Practitioners of place *branding* use the term “public diplomacy” only with reluctance, or perceive it as a core element of national branding (Anholt & Hildreth 2004). They reject the parallel use of both terms as they claim that public diplomacy is more limited to the proliferation of governmental policy. According to this approach, public diplomacy is included as a tool, part of a broader campaign of building the country’s brand, understood as “the most important channel of transmitting national identities to consumers” (Leonard et al. 2002). Public relations specialists argue that branding aims at upgrading the country-of-origin effect, whereas public diplomacy concentrates mainly on the political/military level. Building a positive image of the country is much easier if its products are widely perceived as being of high quality. On the one hand, the country-of-origin effect may help to build a positive image; on the other hand, it might also become the main obstacle to rebranding the country if the place of origin is perceived in a negative way. Still, public diplomacy should be seen as wider than branding in defining its goals. Whereas branding builds on the differences between countries, and seeks for products that would be typical only of the one country, public diplomacy might also stress the similarities if it is required to support any act of international policy. Also, the target group definition in public diplomacy is wider than “consumers” only.

Images of countries are also influenced by the *image of their leaders*. In heads-of-states public diplomacy, leaders or other famous personalities are perceived as a country’s products and contribute to the image of the country. The same must be said about diasporas, members of the public living abroad, and domestic institutions such as parliaments and political parties. The performance of the institutions, and contacts with elites and the general public abroad, have a significant impact on the perception of the country.

## STRATEGY

Public diplomacy is implemented by governments, especially by ministries of foreign affairs but, in accordance with the logic of contemporary international politics, also by NGOs. The *main actors* of public diplomacy nowadays are still governments, coordinating the campaigns. One of the key problems of public diplomacy with the government as the main actor is how to manage perceptions of the country as a whole and coordinate such differentiated fields as politics, trade, tourism, investment, and cultural and educational relations. In the p2p type of public diplomacy, NGOs or informal groups play the main role. As public diplomacy includes promotion of products and businesses, companies might also be seen as important actors.

Because one of the main goals of public diplomacy campaigns is to foster positive attitudes among the audience abroad, the campaigns are usually *long-term activities*. Before launching the campaign a SWOT (strengths, weaknesses, opportunities, and threats) analysis is done, the country profile is analyzed, and target groups are defined. The most effective tactic, according to Leonard et al. (2002), is careful selection of foreign publics and target groups among them. Campaigns targeted at too large a community of different countries are not effective. The next step is the selection of means and tools, including the choice of channels through which to communicate the message. Key messages of the country are elaborated, often in combination with a selection of leading products and services that will be promoted. At this stage of preparation the coordination of campaigns is essential.

Many public diplomacy campaigns are run by public relations agencies in the target countries (Gilboa [2001, 6] calls such campaigns “the domestic public relations variant”). *In practice*, an agency in the target country is better accustomed to local specifics. Governments also hire well-known public relations firms to maintain favorable attitudes abroad, as was the case during Iraq’s war against Kuwait in 1991, when the Kuwaiti government hired Hill and Knowlton. In the process of branding or rebranding the country, foreign specialists are employed also in order to throw fresh light on the country in question; this hiring of foreign specialists applies especially to the key messages elaboration stage. The last stage of public diplomacy campaigns is evaluation. Evaluating the effects of public diplomacy campaigns is rather difficult. First, they are long-term activities, especially if they aim at changing negative stereotypes. Second, changing attitudes are difficult to measure. The tools that are used after the campaigns are attitudes surveys, media content analyses (both quantitative and qualitative), and tracking the amount of contact with target groups. In Europe the most effective long-term campaigns are illustrated by two cases: those of Spain and Ireland to rebrand after joining the EU.

The campaigns might, according to Leonard et al. (2002), build on competition or cooperation. Competition occurs when one government sends messages to the same key audiences abroad as another government or governments, all aiming to win the audience over to achieve their goals, and the countries’ policy goals are seen as contradictory. A cooperative public diplomacy suggests working together in fields and regions where competition might be abandoned, especially in those such as democracy promotion, human rights, and good governance.

Public diplomacy is still perceived as a bilateral action, but nowadays we are also confronted with a multilateral form of it.

## **Public Goods**

*Peter A. Thompson*

*Unitec New Zealand*

The idea of public goods has been subject to considerable debate and contestation. The term is generally used to classify products or services that are not diminished through usage and for which charges cannot be levied on individual consumption (e.g., street lighting). The concept of public goods is significant for media and communication scholars because it potentially applies to some forms of broadcasting and informational or audiovisual products and services. Such classifications also have implications for contemporary media policy debates concerning the regulation of communication technologies and the legitimate role of state intervention in market activities (→ Communication and Law; Media Policy).

### **THEORETICAL CONSIDERATIONS**

In contemporary economic theory, the notion of public goods refers to products or services that exhibit the two key characteristics of *nonrivalry* and *nonexcludability* (Ver Eecke 1999; Shankar & Pavitt 2002). Nonrivalry means that the consumption of the goods by one person does not preclude consumption by another. When, say, a loaf of bread is eaten, it ceases to be available to anyone else. In contrast, the reception of a television program can

be extended to extra viewers at no additional cost without diminishing its availability (i.e., Pareto efficiency; see Samuelson 1964; Minasian 1964). Nonexcludability, meanwhile, means that there is no technically practical or cost-effective way of preventing additional consumption without payment (free riding). For example, if a community organized a neighborhood patrol to deter crime, any increase in security would extend to all residents in the area irrespective of whether they personally contributed to the initiative. Likewise, an unencrypted broadcast or Internet website can potentially be used by an unlimited number of nonpaying users. If consumers of the product or service cannot be required to pay, the private sector is likely to underprovide them in a purely commercial market (Ver Eecke 1999).

Goods that are excludable and rivalrous are more likely to be provided by the private sector. However, market inefficiencies in pricing and information mechanisms mean that goods that are socially beneficial may also be undersupplied or underconsumed. Products and services that confer benefits external to individual private consumption are known as *merit goods* (Fiorito & Kollintzas 2002). For example, commercial broadcasters often prioritize populist genres that maximize ratings and revenue rather than educational programs that may enhance informed citizenship.

The underprovision of public/merit goods is an important consideration in explaining the role of the state or public sector in economic theory. Some scholars categorize particular products or services as intrinsic public/merit goods that require state provision or subsidy (e.g., national defense, public parks, or public service broadcasting). However, there is both theoretical and political disputation about *which* goods and services – if any – require state intervention and the extent to which this should complement or substitute for their provision by the private sector (Ver Eecke 1999; Fursich & Roushazamir 2001). Although distinct, public, private, and merit goods are therefore better understood as *ideal types* that are not necessarily mutually exclusive in their application to empirical examples (Ver Eecke 1999). For example, a public broadcaster might include light entertainment in the schedule that a subscription broadcaster provides as a private good, while a commercial free-to-air broadcaster's schedule could include news and documentaries with merit-good value (see Anderson & Coate 2000; Samuelson 1964; Minasian 1964).

## REGULATORY AND TECHNOLOGICAL ISSUES

The trend toward international free trade regimes has increased pressure on governments to restrict their provision of public/merit goods to cases of demonstrable market failure. In the EU, for instance, public broadcasting interventions must be clearly delineated and proportionally funded to avoid market distortion (→ Public Service Broadcasting: Law and Policy; European Union: Communication Law). However, the assumption that efficient commercial markets are a natural state of affairs overlooks the point that economic activity is embedded in social, political, and legal institutional arrangements (e.g., enforcement of property laws). Whether or not a product or service can be categorized as public or private depends on these underlying structures. Consequently, reconfigurations of regulatory and technological arrangements alter the base conditions upon which the classification and legitimization of public goods are premised.

Informational or audiovisual goods are particularly contentious because different institutional arrangements potentially alter their nonrivalrous or nonexcludable character.

This is reflected in recent tensions between commercial and open-source software providers (→ Open Source) and controversies over Internet-based media file-sharing services such as Napster (see Becker & Clement 2006; also Stewart et al. 2004). The combination of market liberalization, digitalization, and media convergence is especially significant here: Digital media facilitate the potentially unlimited replication (nonrivalry) and distribution (nonexcludability) of informational or audiovisual goods (→ Digitization and Media Convergence). However, artificial scarcity (i.e., the elimination of nonexcludability) can be imposed through conditional access or encryption technology and intellectual property regulations (→ Intellectual Property Law). The potential to transform public goods into private goods (→ Commodification of the Media) and vice versa explains why these concepts are subject to ideological, legal, and technical contestation.

## **Public Interest**

*Stylios Papathanassopoulos*

*National and Kapodistrian University of Athens*

As mass media play an increasing role in our societies by providing an arena of public debate and making politicians, policies, and relevant facts widely known, they are expected

to follow certain rules of conduct. These rules and the normative media theories they draw upon typically imply presumptions as to the public interest the media should serve (McQuail 1992; 2005; → Journalism: Normative Theories). Presumptions about what is the public interest, directly or indirectly, determine the institutional set-up of media systems, legal regulations, and media policy measures as well as journalistic codes of ethic and performance standards (→ Communication and Law; Ethics in Journalism; Ethics of Media Content; Media Performance; Media Policy).

Not surprisingly, there is no agreed definition of the public interest, although its history goes back to classical times. The modern understanding of the concept can be traced back to the Enlightenment era when political philosophers who discussed the notion of interests in general, especially partisan interests and the aggregation of private interests, developed the idea of a public interest as a normative objective of political action. The various meanings of the concept we can find today may be subdivided into *substantive* and *procedural* interpretations. While the former are concerned with the content of political actions and their consequences, the latter focus on the quality of decision-making processes (Alexander 2002). For example, procedural interpretations of the public interest are implied in the concept of deliberative democracy and in → Habermas's idea of procedural rationality created in → political discourse (→ Deliberativeness in Political Communication). Instances of substantive interpretations are the three main views distinguished by McQuail (2005): utilitarianism, unitary, and common interest approaches.

*Utilitarianism*, or the majoritarian view, equates the public interest with aggregated individual values and preferences. The public interest is merely the sum of individuals' wealth, happiness, and avoidance of pain. Therefore, the state's role must be limited to maximizing individuals' benefit according to the overall popular vote. In the case of the media the public interest will be best achieved by free market forces and by giving the public what it says it wants (Veljanovski 1990). A common assumption is that audience ratings and public opinion polls indicate the preferences of the citizens (→ Audience Research; Nielsen Ratings; Readership Research; Public Opinion; Public Opinion Polling; Survey). On the other hand, this involves the risk of a "tyranny of the majority." Also, pleasing the majority in the media market may lead to a mainstreaming of media content and an erosion of quality standards (→ Commercialization: Impact on Media Content; Political Media Content, Quality Criteria in; Quality of the News).

By contrast, the *unitary* approach derives the public interest from a collective moral imperative that transcends particular or private interests. In other words, the public interest necessarily takes precedence over the interests of individuals, in order to pursue a vision of an ideal society (Berki 1979). The public interest is decided by reference to some single dominant value or ideology. However, this would work only in a paternalist (or even nondemocratic) system in which decisions about what is good are made by guardians or experts. As to political communication, the unitarian approach may lead to a "manufacture of consent" since the media will tend to confirm the political status quo (or the "official" ideology as defined by the ruling elite or party).

A third approach conceptualizes the public interest as *common interest* (Held 1970; McQuail 1992; 2003). In this view the public interest is not an aggregation of individual interests, but rather a shared interest. In other words, the public interest is equated with the interests all citizens have in common. Based on this idea modern states provide public

services of transport, power, water, and even broadcasting. Basic features of national broadcasting systems and the services they provide (for example, frequency allocations, access to political parties, rules for advertising) are thus justified on grounds of a wider “common good,” transcending individual choices and preferences (→ Public Service Broadcasting: Law and Policy). The principle of media freedom may itself be supported on grounds of long-term benefits to society that are not immediately apparent to many individual citizens. A key element of the common interest approach is the notion of accountability which stresses that media freedom has to be balanced by responsibility (McQuail 2003; → Accountability of the Media; Accountability of the News).

In one way or another, the public interest has been the subject of three different sorts of skepticism. First, it has a rather vague and confusing meaning that seems to include the public welfare, the common good, and the national interest (Dennis 2002). Second, it is hardly possible to identify empirically where the public interest lies. And third, there is some doubt whether the practices and institutions of modern politics and the media are such that the public interest is pursued, even if there is agreement on how it should be defined. By and large, the conventional wisdom even among political and social theorists is that vested and concentrated interests often are more able to promote their interests at the expense of the public interest.

# Public Journalism

*David D. Kurpius*

*Louisiana State University*

Public journalism is a movement that arose principally among journalists in the United States during the late twentieth century, as an effort to draw the people to the media at a time of declining readership and viewership by showing the value of the media in civic life. Public journalism is also known as “civic,” or less often “community,” journalism. The movement developed in part as an answer to the decline of civic participation that scholars noted (Yankelovich 1991; Merritt 1998; Rosen 1999; Putnam 2000) at a time of renewal in many cities (Sirianni & Friedland 2001). Public journalism refocused news on issues and engagement using a community approach. Its founders believed that journalism could improve public dialogue by developing content that citizens engaged in the deliberative process could use in their communities to develop solutions to common problems.

Public journalism inspired discussion among professionals and scholars about the craft of journalism. The debate between → Walter Lippmann and John Dewey in the 1920s marked a seminal time in determining the role of professional journalists in the United States. Lippmann focused on informing elites and using the media to monitor those in power. Dewey believed citizens were capable of a greater participatory role beyond simply voting. In his view, everyday citizens would deliberate on issues if given the information and the opportunity. Lippmann’s view prevailed, and American journalism spent the better part of a century pursuing greater professionalism and more scientific reporting methods. Public journalism marks a return to Dewey’s view of journalism in democratic life (→ Journalists’ Role Perception; Professionalization of Journalism).

Some critics argue that public journalism is just good “shoe-leather journalism,” implying a tradition of close-to-the-ground reporting and editing, but traditional journalists spend more time in places of power (such as city hall) than in ordinary life (→ News Sources). By rooting stories in communities, journalists capture the richness of civic conversations. Public journalism encourages journalists to probe systematically from the bottom up, starting with citizens. The top-down model of traditional journalism typically starts with officials and their issue frames (→ Framing of the News). Public journalism starts with those living in communities – their concerns, issues, aspirations, and problems – and builds meaningful comparisons, illuminates trends, and seeks out solutions for citizens to consider. Instead of leaving out officials and experts, the process may prevent elites from framing issues without considering alternative community frames.

The techniques public journalists employ encourage contextual reporting. Reporters develop sources after considering a range of potential stakeholders. “Real people” sources are not simply the opening storyline but the main threads that hold the story together throughout the coverage. Public journalists seek to portray the similarities and differences among stakeholders and look for common ground. The journalists do not select the solutions, but leave the people to decide. By reporting on potential outcomes, journalists help the process go well among citizens.

Professionals and scholars developed public journalism through experimentation and observation. What public journalism seeks to accomplish has come to define the movement.

Other characteristics include cultivating diverse sources from all strata of civic life, finding high-quality information for citizens to use, and providing feedback from citizens as well as the information needed for mobilization.

## FOUNDATIONS IN THE UNITED STATES

Public journalism took shape in the late 1980s and early 1990s. Experiments began in Georgia, but the *Wichita Eagle* of Kansas conducted the first major newspaper project in 1990, when editor Davis “Buzz” Merritt wanted to give the people a voice in election coverage. In another early project, the *Charlotte Observer* ran a series called Taking Back Our Neighborhoods. The paper partnered with broadcast stations to cover housing and crime, leading to changes in policing housing and in housing code enforcement.

On television (→ Television News), public journalism developed in parallel. It began with public stations that developed local public affairs coverage. For example, the Wisconsin Collaborative Project connected stations in small and medium markets to develop cooperative coverage of regional issues. Television eventually connected with print (→ Newspaper Journalism), when commercial broadcasters created project partnerships with newspapers. Such collaboration became a core element of public journalism.

The longest running collaboration is “We the People Wisconsin,” involving Wisconsin Public Broadcasting (the eleven stations of Wisconsin Public Radio and seven stations of Wisconsin Public Television), the commercial CBS affiliate for Madison (WISC-TV on VHF broadcast and cable), the *Wisconsin State Journal* (the main outlet of the Capital Newspapers chain of southern Wisconsin), and Wood Communications, a public relations firm in the region. The partnership continually redefined ways to bring citizens into the deliberative process, developing town hall meetings, mock courtroom hearings, and conferences on issues such as health-care.

*Foundation funding* promoted public journalism. The Knight Foundation funded the Project on Public Life and the Press, led by Jay Rosen at New York University. The Pew Charitable Trusts created the Pew Center for Civic Journalism, under the direction of Ed Fohy and Jan Schaffer. During its decade-long run, the Pew Center held workshops, created opportunities for journalists to share experiences, and funded grants. The grants were small compared to the budgets of news businesses but were large enough, usually up to \$20,000, to seed experiments. The US Corporation for Public Broadcasting (CPB) and Public Broadcasting System (PBS) (→ Public Broadcasting Systems) joint Challenge Fund, with support from the Pew Charitable Trusts, supported Best Practices in Journalism, an effort to improve broadcast coverage of local politics by running campaign coverage workshops from 2000 to 2004. Another offshoot of the Pew Center, the J-Lab Institute for Interactive Journalism, received support from the Knight Foundation and from the Ethics and Excellence in Journalism Foundation of Oklahoma. J-Lab continues to focus on interactive journalism and incorporates ideas from public journalism.

Many public journalism grants favored *partnerships*, which combine the capacity of broadcasting to reach a wide audience and raise awareness of a problem with the resources of newspapers capable of reporting stories more deeply. Early grants supported the hiring of people for community liaison; they set up listening posts, organized town hall meetings, and connected to communities. These strategies shortened the start-up time journalists needed

for gathering information about community concerns and aspirations. Large public journalism projects would likely have been too costly for media outlets without these partnerships.

### BENEFITS AND CRITICISMS

Public journalism alters long-entrenched patterns of journalistic practice. Newspapers engaged in public journalism use more graphics to present issues and solutions (Coleman 2000). On television, public journalism coverage uses more diverse sources, including women, minorities, and non-elites (Kurpius 2002). Partnerships accompanied increased volunteerism, better political processes, and improved citizenship; the problem-solving frames worked better than traditional human-interest or historical frames; and the opportunities for feedback encouraged citizens to get involved (Nichols et al. 2006).

Early *critics* objected that public journalism pandered to the public as a marketing ploy to sell news or advertising. Others said either that it was no different from good journalism (→ Standards of News), or that it gave too much power over the focus of coverage to citizens, who are not well enough informed to understand complex and difficult aspects of public life (→ Public Sphere). Still other critics said that public journalism imposes the editor's view of political processes on citizens and presumes that editors know the public interest best. The town hall meetings drew fire for failing to produce thoughtful debate. These criticisms diminished in the latter part of the 1990s.

One main criticism has persisted: that public journalism undermines journalistic detachment and the *quest for objectivity*, a core professional norm for journalism (→ Objectivity in Reporting). Public journalism projects challenge the idea of detachment by encouraging journalists to spend time in communities, getting to know their ideas and their issues. Objectivity may be unachievable, a fact professional journalists can skirt by seeking truth and accuracy through lesser, more-realistic goals, such as fairness, balance, depth, and context. Innovative television news managers found ways to alter journalistic routines at the station when implementing public journalism, without raising objections, but not every newsroom had such leadership.

A recent criticism is that public journalism is *too expensive for daily practice*. Deep, contextual news coverage of issues may require resources that news organizations lack (Hamilton 2006). Other ways to fund hard news might relieve the pressures to make a profit, as did the Pew Center grants, which moved news businesses not only to try public journalism but also to delve into reporting on trends facing their communities.

Although newspapers and broadcast stations across the United States practiced public journalism, the experimentation was difficult to sustain. Foundation funding created only enclaves of innovation within newsrooms. A partnership among media organizations often depended on core individuals to keep it going and would falter and die once the key actors left. News outlets would let community liaisons go once foundation money ran out, and the ties they built to the community would wither. Or when the reporters practicing public journalism left for other jobs, the trust they had developed within the community would not transfer to the reporters replacing them. The amount of time journalists spent getting to know the community well instead of turning out daily stories caused economic stress in the system. The commercial media struggled to justify the costs of conducting such an intensive form of reporting.

Public journalism emerged in response to the primarily commercial US media system and did not spread intact to other countries (→ Commercialization of the Media; United States of America: Media System). Although scholars around the world study the phenomenon, they treat public journalism as a phase in US journalism practice.

Foundations that supported public journalism have turned to other issues, but its influence endures. “We the People Wisconsin” is still an active media partnership that reinvents itself, but at a slower pace. Individual public journalists continue to practice their craft at television stations and newspapers, but, in the absence of the labels and the debate, they weave the elements of public journalism into daily routines. The experiments bearing the label and the resulting discussion of the craft aimed at altering coverage routines (→ News Routines). The introspection, research, and development arguably made journalism better.

# Public Meetings

Theresa Castor

University of Wisconsin-Parkside

A public meeting is a gathering in which there are limited, if any, restrictions on who may participate. Public meetings, as an ideal, are a form of democracy (→ Public Sphere), but in fact are often viewed as frustrating and futile. Researchers have studied issues and topics related to public meetings (e.g., leadership, public participation); there is now increased attention on studying public meetings themselves as structured communication events. Labeling an event as a meeting calls attention to the communicative dimensions of this activity. Communication scholars have examined public meetings as situations in which identity, social action, and culture, among other practices, are enacted.

Scholars have specified two or, more commonly, three participants as a minimum for constituting a meeting. While people may gather in a variety of situations, not all gatherings are labeled as meetings; e.g., it would be unusual to call a gathering of friends a meeting. A meeting is explicitly framed as such by participants, but not all meetings are public. For those that are, the public may be involved as observers or participants. Public meetings usually have a *specific structure* and *rules for participation* (e.g., parliamentary procedures or *Robert's Rules of Order*). One characteristic of public meetings that distinguishes them from organizational meetings is that the latter form is more open in terms of participation. Also, the latter will have several audiences, some of which may not even be physically present at the time of a meeting but may know of the discussion through mediated forms of communication, such as print or television broadcast. Several types of meetings fall within the domain of public meetings, including public hearings, public inquiries, town meetings, and some board meetings (this last area intersects the domains of the public and organizational study).

Tracy and Dimock (2004) outline two major *research traditions* that provide an understanding of public meetings: public deliberation and public participation. The former area focuses on a normative ideal for the type of communication that should occur during public meetings: talk is rational and assumes equality among participants. Public participation research examines views of participants regarding public meetings. Tracy and Dimock fault both areas for failing to pay attention to the actual communication practices associated with public meetings.

Language and social interaction scholars have used various *perspectives* to study the actual communication practices associated with public meetings; these perspectives include → ethnography of communication, → discourse analysis, → ethnomethodology, → conversation analysis, speech act theory, and critical/narrative approaches. While meetings have been a part of the background context for many studies, Schwartzman (1989) was among the first to call attention to the need to study meetings in and of themselves as communication events. Applying an ethnography of communication framework, Schwartzman identified the varying structures, purposes, participants, settings, and norms for meetings. Several studies have highlighted the role of culture in meeting discourse (e.g., Brison 1992). Because talk and culture are interconnected,

participants may have varying assumptions regarding the purpose of talk during a meeting (e.g., to convey information, to express emotions, to present arguments, etc.). Discourse analysts have shown how differences in participant background can contribute to different meanings for words that are used during meetings, possibly leading to sustained disagreement (e.g., Gephart 1992). More recently, the action-implicative discourse analytic approach (→ Action-Implicative Discourse Analysis) has been applied specifically to examining school board meetings and how participants, through their language use, construct identity and negotiate their interactional dilemmas (e.g., Tracy & Ashcraft 2001).

One *challenge* in the study of public meetings deals with definition. As described earlier, public meetings have been included in many studies as part of a context, but not necessarily as the main focus per se. One reason for this relates to how the unit of analysis is defined for a given study. For example, the topic of focus may be the group (e.g., a governing board) or the purpose (e.g., decision-making, problem-solving, deliberation). Focusing on the group as the unit of study, however, highlights participants rather than communication. Orientation to purpose brings the focus back to communication, but identifying type of talk ahead of time forecloses consideration of the multiple forms of talk that may occur during a public meeting and what those forms may contribute to the various outcomes of a meeting. The most promising future direction for research on public meetings is the development of a practical theory approach (Craig 1989). Practical theory examines communication as naturally occurring practices and seeks to understand the situated ideals of participants for their communication practices. Within the frame of public meetings, a key issue is how participants manage multiple, and possibly competing, goals such as how to develop a consensus or community while voicing individual preferences.

## Public Opinion

*Carroll J. Glynn*

*Ohio State University*

*Michael E. Hoge*

*Ohio State University*

Bearing the dubious distinction of being one of the oldest, yet least understood, concepts in social science, *public opinion* continues to inspire and perplex scholars from communication and other fields. The term can be adequately defined as a general measure of the directionality and strength of issue-specific views and sentiments held by a relevant group. Public opinion bears a sort of syntactical internal contradiction: While “public” denotes the group and the universal, “opinion” on its own is typically associated with the individual and considered a somewhat internal, subjective formulation. The rise of survey research during the early twentieth century further complicated matters with a trend toward quantifying public opinion as a simple aggregation of individual survey responses (→ Survey; Public Opinion Polling). The rejection of such mathematical reductions – along with the suggestion that public opinion was in fact a group-level social force iteratively constructed through interpersonal interaction and media use (→ Interpersonal Communication; Political Media Use; Media Use by Social Variable) – set the stage for a social science debate that has continued for well over 50 years.

### HISTORICAL APPROACHES

The French term “l’opinion publique,” originally attributed to sixteenth-century French Renaissance writer Montaigne, was adopted in European thinking as political power and decision-making shifted away from the monarchy and toward the citizenry during the Enlightenment. With the advent of the printing press (→ Printing, History of), knowledge became more distributed within societies, and this led to a realization that it might be possible to arrive at better decisional outcomes if more affected parties (i.e., the citizenry) were consulted. Until recent times, however, the citizenry considered to have a voice consisted primarily of land-owning, wealthy white males. One of the earliest problems to arise in conceptualizing what constituted public opinion was the difficulty of coming to some type of decisional outcome at the end of a public opinion process in which many different viewpoints were voiced. When parties disagreed, it was difficult to discern (1)

whose views should be most prominently considered and (2) how other ideas could be eliminated. Additional debate centered on how “rational” a group could be considered in arriving at a public viewpoint. While some argued for an ideal speech situation, in which all points of view could be heard and equally considered, concern remained that public debate would be sullied by an emotional mob mentality in which rash decisions would be reached through manipulative means.

With these challenges in mind, Enlightenment-era thinkers set out to incorporate the views of the public into governmental decisions, while at the same time balancing this democratic input with the presumed knowledge and experience of government officials. In this way, a democratic government could consider the will of the people while maintaining stability against abrupt shifts in sentiment that could overrun the long-term authority of the state. This potential for mob-like behavior is often referred to as the “tyranny of the majority.” Divergent views of the role of public opinion in a democracy (i.e., a mandate from the people or merely the views of those affected by decisions) were typified by the 1920s debate between → Walter Lippmann and John Dewey (Splichal 1999). Dewey believed that the more people included in arriving at a public opinion outcome, the better off the entire society would be. From Lippmann’s point of view, governmental decisions were best left to elected and appointed officials who were free to use public opinion as a guide to varying degrees.
