It is not known at what time theſe weapons were firſt invented. Though, comparatively ſpeaking, the introduction of guns into the weſtern part of the world is but of a modern date; yet it is certain that in ſome parts of Aſia they have been uſed, though in a very rude and imperfect manner, for many ages.—Philoſtratus ſpeaks of a city near the river Hyphaſis in the Indies, which was ſaid to be impregnable, and that its inhabitants were relations of the gods, becauſe they threw thunder and lightning upon their enemies. Hence ſome imagine that guns were uſed by the eaſtern nations even in the time of Alexander the Great; but however this may be, many of our modern travellers aſſert that they were uſed in China as far back as the year of Chriſt 85, and have continued in uſe ever ſince. Gun.

The firſt hint of the invention of guns in Europe, is in the works of Roger Bacon, who flouriſhed in the 13th century. In a treatiſe wrote by him about the year 1280, he propoſes to apply the violent explosive force of gun-powder, for the deſtruction of armies. In 1320, Bartholomew Schwartz, a German monk, is commonly ſaid to have invented gun-powder; tho' it is certainly known that this compoſition is deſcribed by Bacon in ſome of his treatiſes long before the time of Schwartz. The following is ſaid to have been the manner in which Schwartz invented gun-powder. Having pounded the materials for it in a mortar, which he afterwards covered with a ſtone; a ſpark of fire accidentally fell into the mortar, and ſet the mixture on fire: upon which the exploſion blew the ſtone to a conſiderable diſtance. Hence it is probable that Schwartz might be taught the ſimpleſt method of applying it in war; for Bacon ſeems rather to have conceived the manner of uſing it to be by the violent effort of the flame unconfined, and which is indeed capable of producing aſtoniſhing effects *. The figure and name of *mortars* given to a ſpecies of old artillery, and their employment (which was throwing great ſtone-bullets at an elevation) very much corroborates this conjecture.

* See *Gun-Powder*.

Soon after the time of Schwartz, we find guns commonly made uſe of as inſtruments of war. Great guns were firſt uſed. They were originally made of iron bars ſoldered together, and fortified with ſtrong iron-hoops; ſome of which are ſtill to be ſeen, viz. one in the tower of London, two at Woolwich, and one in the royal arſenal at Liſbon. Others were made of thin ſheets of iron rolled up together, and hooped; and on emergencies they were made of leather, with plates of iron or copper. Theſe pieces were made in a rude and imperfect manner, like the firſt eſſays of many new inventions. Stone balls were thrown out of them, and a ſmall quantity of powder uſed on account of their weakneſs. Theſe pieces had no ornaments, were placed on their carriages by rings, and were of a cylindrical form. When or by whom they were made, is uncertain: the Venetians, however, uſed cannon at the ſiege of Claudia Jeſſa, now called *Chioggia*, in 1366, which were brought thither by two Germans, with ſome powder and leaden balls; as likewiſe in their wars with the Genoeſe in 1379. King Edward III. made uſe of cannon at the battle of Creſſy in 1346, and at the ſiege of Calais in 1347. Cannon were made uſe of by the Turks at the ſiege of Conſtantinople, then in poſſeſſion of the Chriſtians, in 1394, and in that of 1452, that threw a weight of 1001b. but they generally burſt, either the firſt, ſecond, or third ſhot. Louis XII. had one caſt at Tours, of the ſame ſize, which threw a ball from the Baſtile to Charenton. One of thoſe famous cannon was

Gun. was taken at the ſiege of Dieu in 1546, by Don John de Caſtro; and is in the caſtle of St Juiliao da Barra, 10 miles from Liſbon: its length is 20 feet 7 inches, diameter at the centre 6 feet 3 inches, and it diſcharges a ball of 100 lb. It has neither dolphins, rings, nor button; is of a curious kind of metal; and has a large Indoſtan inſcription upon it, which ſays it was caſt in 1400.

Formerly the cannon were dignified with uncommon names; for, in 1503, Louis XII. had 12 braſs cannon caſt, of an extraordinary ſize, called after the names of the 12 peers of France. The Spaniſh and Portugueſe called them after their ſaints. The emperor Charles V. when he marched before Tunis, founded the 12 Apoſtles. At Milan there is a 70 pounder, called the *Pimontelle*; and one at Bois-le-duc, called the *Devil*. A 60 pounder at Dover caſtle, called *Queen Elizabeth's pocket-piſtol*. An 80 pounder in the tower of London, (formerly in Stirling caſtle), called *Mounts-meg*. An 80 pounder in the royal arſenal at Berlin, called the *Thunderer*. An 80 pounder at Malaga, called the *Terrible*. Two curious 60 pounders in the arſenal at Bremen, called the *Meſſengers of bad news*. And laſtly, an uncommon 70 pounder in the caſtle of St Angelo at Rome, made of the nails that faſtened the copper-plates which covered the ancient Pantheon, with this inſcription upon it: *Ex clavis trabalibus porticus Agrippæ*.

In the beginning of the 15th century theſe uncommon names were generally aboliſhed, and the following more univerſal ones took place, viz.

	Pounders.	Cwt.
Cannon royal, or carthoun	= 48	about 90
Baſtard cannon, or ½ carthoun	= 36	79
½ carthoun	= 24	60
Whole culverins	= 18	50
Demi culverins	= 9	30
Falcon	= 6	25
Sacker, loweſt ſort	= 5	13
Sacker, ordinary	= 6	15
Sacker, largeſt ſize	= 8	18
Baſiliſk	= 48	85
Serpentine	= 4	8
Aſpic	= 2	7
Dragon	= 6	12
Syren	= 60	81
Falconet	= 3, 2, & 1	15,10,5.

Moyens, which carried a ball of 10 or 12 ounces, &c.

Rabinet, which carried a ball of 16 ounces.

Theſe curious names of beaſts and birds of prey were adopted, on account of their ſwiftneſs in motion, or of their cruelty; as the falconet, falcon, facker, and culverin, &c. for their ſwiftneſs in flying; the baſiliſk, ſerpentine, aſpike, dragon, ſyren, &c. for their cruelty.

At preſent cannon take their names from the weight of the ball they diſcharge. Thus a piece that diſcharges a ball of 24 pounds, is called a 24 *pounder*; one that caries a ball of 12 pounds, is called a 12 *pounder*: and ſo of the reſt, divided into the following ſorts, viz.

Ship-guns, conſiſting in 42, 36, 32, 24, 18, 12, 9, 6, and 3 pounders. Gun. Gunner.

Garriſon-guns, in 42, 32, 24, 18, 12, 9, and 6 pounders.

Battering-guns, in 24, 18, and 12 pounders.

Field-pieces, in 12, 9, 6, 3, 2, 1½, 1, and ½ pounders.

Mortars are thought to have been fully as ancient as cannon. They were employed in the wars of Italy, to throw balls of red-hot iron, ſtones, &c. long before the invention of ſhells. Theſe laſt are thought to be of German invention, and the uſe of them in war to have been taught by the following accident. A citizen of Venlo, at a certain feſtival celebrated in honour of the duke of Cleves, threw a number of ſhells, one of which fell on a houſe and ſet fire to it, by which misfortune the greateſt part of the town was reduced to aſhes. The firſt account of ſhells uſed for military purpoſes is in 1435, when Naples was beſieged by Charles VIII. Hiſtory informs us with more certainty, that ſhells were thrown out of mortars at the ſiege of Wachtendonk, in Guelderland, in 1588, by the Earl of Mansfield. Mr Malter, an Engliſh engineer, firſt taught the French the art of throwing ſhells, which they practiſed at the ſiege of Motte in 1634. The method of throwing red-hot balls out of mortars was firſt certainly put in practice at the ſiege of Straſund in 1675 by the elector of Brandenburg; though ſome ſay in 1653 at the ſiege of Bremen. For the proper dimenſions of guns, their weight, the metal of which they are formed, &c. ſee the article GUNNERY.

Muſkets were firſt uſed at the ſiege of Rhege in the year 1521. The Spaniards were the firſt who armed part of their foot with theſe weapons. At firſt they were very heavy, and could not be uſed without a reſt. They had match-locks, and did execution at a great diſtance. On their march, the ſoldiers carried only the reſts and ammunition, and had boys to bear their muſkets after them. They were very ſlow in loading; not only by reaſon of the unwieldineſs of their pieces, and becauſe they carried the powder and ball ſeparate, but from the time it took to prepare and adjuſt the match; ſo that their fire was not near ſo briſk as ours is now. Afterwards a lighter matchlock-muſquet came in uſe: and they carried their ammunition in bandeliers, to which were hung ſeveral little caſes of wood, covered with leather, each containing a charge of powder. The balls were carried looſe in a pouch, and a priming horn hanging by their ſide. The muſkets with reſts were uſed as late as the beginning of the civil wars in the time of Charles I. The lighter kind ſucceeded them, and continued till the beginning of the preſent century, when they alſo were diſuſed, and the troops throughout Europe armed with firelocks.

GUNELLUS, in ichthyology. See BLENNIUS.

GUNNER, an officer appointed for the ſervice of the cannon; or one ſkilled to fire the guns.

In the tower of London, and other garriſons, as well as in the field, this officer carries a field ſtaff, and a large powder-horn in a ſtring over his left ſhoulder: he marches by the guns; and when there is any apprehenſion of danger, his field-ſtaff is armed with match: his buſineſs is to lay the gun to paſs, and to help to load and traverſe her.

Gunnery. *Maſter* GUNNER, a patent-officer of the ordinance, who is appointed to teach all ſuch as learn the art of gunnery, and to certify to the maſter-general the ability of any perſon recommended to be one of the king's gunners. To every ſcholar he adminiſters an oath, not to ſerve, without leave, any other prince or ſtate; or teach any one the art of gunnery, but ſuch as have taken the ſaid oath. Gunnery.

GUNNERY,

IS the art of charging, directing, and exploding fire arms, as cannons, mortars, muſkets, &c. to the beſt advantage.—As this art depends greatly on having the guns and ſhot of a proper ſize and figure, and well adapted to each other, it hence follows that the proper dimenſions, &c. of cannon and ſmall arms come properly to be conſidered under the preſent article.

SECT. I. *Hiſtory of Gunnery.*

1 Hiſtory. THE ancients, who knew not the uſe of gun-powder and fire-arms, had, notwithſtanding, machines which were capable of diſcharging ſtones, darts, and arrows, with great force. Theſe were actuated chiefly by the elaſtic force of ropes, or of ſtrong ſprings, and required a great number of men to work them; for which reaſon, the exploſion of gun-powder, as acting inſtantaneouſly, and ſeemingly with irreſiſtible force, ſeemed to be a moſt proper ſuccedaneum for all the powers by which the military engines in former times were actuated. It ſoon appeared, however, that this force was not very eaſily applied. Though the experiment of Bartholomew Schwartz, mentioned under the article GUN, had given a good hint towards this application in a ſucceſsful manner, yet the violent reaction of the inflamed powder on the containing veſſels rendered them very apt to burſt, to the great danger of thoſe who ſtood near them. The gun-powder in thoſe days, therefore, was much weaker than it is now made; tho' this proved a very inſufficient remedy for the inconvenience abovementioned. It was alſo ſoon diſcovered, that iron bullets of much leſs weight than ſtone ones would be more efficacious if impelled by greater quantities of ſtronger powder. This occaſioned an alteration in the matter and form of the cannon, which were now caſt of braſs. Theſe were lighter and more manageable than the former, at the ſame time that they were ſtronger in proportion to their bore. Thus they were capable of enduring greater charges of a better powder than what had been formerly uſed; and their iron bullets, (which were from 40 to 60 pounds weight, being impelled with greater velocities, were more effectual than the heavieſt ſtones could ever prove. This change took place about the latter end of the 15th century.

By this means powder compounded in the manner now practiſed over all Europe came firſt in uſe. But the change of the proportion of materials was not the only improvement it received. The method of graining it is undoubtedly a conſiderable advantage. At firſt the powder was always in the form of fine meal, ſuch as it was reduced to by grinding the materials together. It is doubtful whether the firſt graining of powder was intended to increaſe its ſtrength, or only to render it more convenient for filling into ſmall charges and the charging of ſmall arms, to which alone it was applied for many years, whilſt meal-powder was ſtill made uſe of for cannon. But at laſt the additional ſtrength which the grained powder was found to acquire from the free paſſage of the air between the grains, occaſioned the meal-powder to be entirely laid aſide.

For the laſt two hundred years, the formation of cannon hath been very little improved; the beſt pieces of modern artillery differing little in their proportions from thoſe uſed in the time of Charles V. Indeed lighter and ſhorter pieces have been often propoſed and eſſayed; but though they have their advantages in particular caſes, yet it ſeems now to be agreed that they are altogether inſufficient for general ſervice. But though the proportions of the pieces have not been much varied within that period, yet their uſe and application have undergone conſiderable alterations; the ſame ends being now accompliſhed by ſmaller pieces than what were formerly thought neceſſary. Thus the battering cannon now univerſally approved of are thoſe formerly called *demi-cannons*, carrying a ball of 24 pounds weight; it being found by experience, that their ſtroke, though leſs violent than that of larger pieces, is yet ſufficiently adapted to the ſtrength of the uſual profiles of fortification; and that the facility of their carriage and management, and the ammunition they ſpare, give them great advantages beyond the whole cannons formerly employed in making breaches. The method alſo of making a breach, by firſt cutting off the whole wall as low as poſſible before its upper part is attempted to be beat down, ſeems alſo to be a conſiderable modern improvement in the practical part of gunnery. But the moſt conſiderable improvement in the practice is the method of firing with ſmall quantities of powder, and elevating the piece ſo that the bullet may juſt go clear of the parapet of the enemy, and drop into their works. By this means the bullet, coming to the ground at a ſmall angle and with a ſmall velocity, does not bury itſelf, but bounds or rolls along in the direction in which it was fired: and therefore, if the piece be placed in a line with the battery it is intended to ſilence, or the front it is to ſweep, each ſhot rakes the whole length of that battery or front; and has thereby a much greater chance of diſabling the defendants, and diſmounting their cannon, than it would have if fired in the common manner. This method was invented by Vauban, and was by him ſtyled *Batterie a Ricochet*. It was firſt put in practice in the year 1692 at the ſiege of Aeth.—Something ſimilar to this was put in practice by the king of Pruſſia at the battle of Roſbach in 1757. He had ſeveral ſix-inch mortars, made with trunnions and mounted on travelling carriages, which fired obliquely on the enemy's lines and amongſt their horſe. They were charged with eight ounces of powder, and elevated at an angle of one degree fifteen minutes, and did great execution; for the ſhells rolling along the lines with burn-

THEORY. burning fuſes made the ſtouteſt of the enemy not wait for their burſting.

SECT. II. *Theory of Gunnery.*

2 Theory of gunnery firſt attempted by Tartalea.

THE uſe of fire-arms had been known for a long time before any theory concerning them was attempted. The firſt author who wrote profeſſedly on the flight of cannon-ſhot was Tartalea. In 1537 he publiſhed a book, at Venice, entitled *Nova Scientia;* and afterwards another, entitled *Queſiti et Inventioni diverſi*, printed at the ſame place in 1546, in which he treats profeſſedly on theſe motions. His diſcoveries were but few, on account of the imperfect ſtate of mechanical knowledge at that time. However, he determined, that the greateſt range of cannon was with an elevation of 45 degrees. He likewiſe determined, (contrary to the opinion of practitioners), that no part of the track deſcribed by a bullet was a right line; although the curvature was in ſome caſes ſo little, that it was not attended to. He compared it to the ſurface of the ſea; which, though it appears to be a plane, is yet undoubtedly incurvated round the centre of the earth. He alſo aſſumes to himſelf the invention of the gunner's quadrant, and often gave ſhrewd gueſſes at the event of ſome untried methods. But as he had not opportunities of being converſant in the practice, and founded his opinions only on ſpeculation, he was condemned by moſt of the ſucceeding writers, though often without any ſufficient reaſon. The philoſophers of thoſe times alſo intermeddled in the queſtions hence ariſing; and many diſputes on motion were ſet on foot (eſpecially in Italy), which continued till the time of Galileo, and probably gave riſe to his celebrated *Dialogues on motion.* Theſe were publiſhed in the year 1638; but in this interval, and before Galileo's doctrine was thoroughly eſtabliſhed, many theories of the motion of military projectiles, and many tables of their comparative ranges at different elevations, were publiſhed; all of them egregiouſly fallacious, and utterly irreconcileable with the motions of theſe bodies. Very few of the ancients indeed refrained from indulging themſelves in ſpeculations concerning the difference betwixt natural, violent, and mixed motions; although ſcarce any two of them could agree in their theories.

3 Experiments by different perſons on the ranges of artillery.

It is ſtrange, however, that, during all theſe conteſts, ſo few of thoſe who were intruſted with the charge of artillery thought it worth while to bring theſe theories to the teſt of experiment. Mr Robins informs us, in his Preface to the *New Principles of Gunnery*, that he had met with no more than four authors who had treated on this ſubject. The firſt of theſe is Collado, who has given the ranges of a falconet carrying a three-pound ſhot to each point of the gunner's quadrant. But from his numbers it is manifeſt, that the piece was not charged with its cuſtomary allotment of gun-powder. The reſults of his trials were, that the point-blank ſhot, or that in which the path of the ball did not ſenſibly deviate from a right line, extended 208 paces. At an elevation of one point (or $7^{\circ}\frac{1}{2}$ of the gunner's quadrant) the range was 594 paces; at an elevation of two points, 794 paces; at three points, 954 paces; at four, 1010; at five, 1040; and at ſix, 1053 paces. At the ſeventh point, the range fell between thoſe of the third and fourth; at the eighth point, it fell between the ranges of the ſecond and third; at the ninth point, it fell between the ranges of the firſt and ſecond; at the tenth point, it fell between the point-blank diſtance and that of the firſt point; and at the eleventh point, it fell very near the piece.—The paces ſpoke of by this author are not geometrical ones, but common ſteps. THEORY.

The year after Collado's treatiſe, another appeared on the ſame ſubject by one Bourne an Engliſhman. His elevations were not regulated by the points of the gunner's quadrant, but by degrees; and he aſcertains the proportions between the ranges at different elevations and the extent of point-blank ſhot. According to him, if the extent of the point-blank ſhot be repreſented by 1, the range at 5° elevation will be $2\frac{2}{3}$, at 10° it will be $3\frac{1}{3}$, at 15° it will be $4\frac{1}{5}$, at 20° it will be $4\frac{6}{10}$, and the greateſt random will be $5\frac{1}{4}$. This laſt, he tells us, is in a calm day when the piece is elevated to 42°; but according to the ſtrength of the wind, and as it favours or oppoſes the flight of the ſhot, it may be from 45° to 36°.—He hath not informed us with what piece he made his trials; tho' by his proportions it ſeems to have been a ſmall one. This however ought to have been attended to, as the relation between the extent of different ranges varies extremely according to the velocity and denſity of the bullet.

After him Eldred and Anderſon, both Engliſhmen, publiſhed treatiſes on this ſubject. The firſt publiſhed his treatiſe in 1646, and has given the actual ranges of different pieces of artillery at ſmall elevations all under ten degrees. His principles were not rigorouſly true, though not liable to very conſiderable errors; yet, in conſequence of their deviation from the truth, he found it impoſſible to make ſome of his experiments agree with his principles.

4 Galileo's theory.

In 1638, Galileo printed his dialogues on motion. In theſe he pointed out the general laws obſerved by nature in the production and compoſition of motion; and was the firſt who deſcribed the action and effects of gravity on falling bodies. On theſe principles he determined, that the flight of a cannon ſhot, or any other projectile, would be in the curve of a parabola, except in as far as it was diverted from that track by the reſiſtance of the air. He has alſo propoſed the means of examining the inequalities which ariſe from thence, and of diſcovering what ſenſible effects that reſiſtance would produce in the motion of a bullet at ſome given diſtance from the piece.

Though Galileo had thus ſhewn, that, independent of the reſiſtance of the air, all projectiles would, in their flight, deſcribe the curve of a parabola; yet thoſe who came after him, ſeem never to have imagined that it was neceſſary to conſider how far the operations of gunnery were affected by this reſiſtance. The ſubſequent writers indeed boldly aſſerted, without making the experiment, that no conſiderable variation could ariſe from the reſiſtance of the air in the flight of ſhells or cannon-ſhot. In this perſuaſion they ſupported themſelves chiefly by conſidering the extreme rarity of the air, compared with thoſe denſe and ponderous bodies; and at laſt it became an almoſt generally eſtabliſhed maxim, that the flight of theſe bodies was nearly in the curve of a parabola.

EXPLANATION.

By this plan events may be referred to the year of the world; and, within the proper periods, to the æras of the Olympiads, of Nabonassar, and of Rome: but the principal reference is to the birth of Christ, marked as above by a deep black line.

The plan extends only to the Flood; the preceding period of 1656 years is left blank as above.

There being 2348 years from the Flood to the birth of Christ, the space between them is divided into 23 parts, each representing an hundred years or century, and a fraction representing the remaining 48 years.

As we are now in the 18th century, the space from the birth of Christ downwards is divided into eighteen parts or centuries; and all these parts, together with some centuries preceding the birth of Christ, are subdivided into tens.

The vertical columns, titled as above, are geographical divisions; and events are marked in their proper centuries and proper columns. Thus the rise of any state, as that of Assyria, is marked in its proper geographical column, and in that place of the 21st century before Christ at which the beginning of its history is dated; from thence we trace its continuance to the end of the 7th century before Christ, when it became extinct. The building of Rome is marked about the middle of the 8th century before Christ. Its territory extends by degrees to the conquest of all Italy; next to Spain, Macedonia, &c. until it comes to extend from Britain to Egypt. It continues of this greatness until about the middle of the 5th century after Christ, when it begins to lose those provinces out of which the modern kingdoms of Europe have been formed in the order here set down.—As the order in which states have risen or fallen, relatively to one another, appears on mere inspection, it will be more easily remembered than when it is conveyed in numbers alone.

The dates are taken chiefly from that comprehensive and useful work, Blair's Chronological Tables. Use has likewise been made of the Chart of Universal History, formed on a design like this, but differently executed.—Compared to that chart, the present may be thought incomplete. Nor would it have been difficult for the gentleman who sketched it, to have filled it up with remarkable events, successions of kings, and lives of men; but he preferred clearness and simplicity, leaving to every person the filling up of his own plan with such articles as are most in the way of his curiosity and study. He has contented himself with a few specimens of this sort, in the succession of the Roman emperors, of the kings of England and France; and in the lives of one or two remarkable men, as in those of Tacitus the historian, and Attila. One person may choose to fill his plan with the names of statesmen and warriors, another with scholars and men of letters. To attempt inserting all that deserve being recorded, would crowd and embarrass the whole.

As space is here employed to represent time, it is material that equal periods should be represented by equal spaces; and, if possible, that the parts of the same empire should be placed together. Both these circumstances are neglected in the Chart of Universal History.

5 New theory by Anderson.

In 1674, Mr Anderson above-mentioned published his treatise on the nature and effects of the gun; in which he proceeds on the principles of Galileo, and strenuously asserts, that the flight of all bullets is in the curve of a parabola; undertaking to answer all objections that could be brought to the contrary. The same thing was also undertaken by Mr Blondel, in a treatise published at Paris in 1683; where, after long discussion, the author concludes, that the variations from the air's resistance are so slight as scarce to merit notice. The same subject is treated of in the Philosophical Transactions, N° 216. p. 68. by Dr Halley: and he also, swayed by the very great disproportion between the density of the air, and that of iron or lead, thinks it reasonable to believe, that the opposition of the air to large metal-shot is scarcely discernible; although in small and light shot he owns that it must be accounted for.

But though this hypothesis went on smoothly in speculation; yet Anderson, who made a great number of trials, found it impossible to support it without some new modification. For, though it does not appear that he ever examined the comparative ranges of either cannon or musquet shot, when fired with their usual velocities, yet his experiments on the ranges of shells thrown with small velocities (in comparison of those above-mentioned), convinced him that their whole tract was not parabolical. But instead of making the proper inferences from hence, and concluding the resistance of the air to be of considerable efficacy, he framed a new hypothesis; which was, that the shell or bullet, at its first discharge, flew to a certain distance in a right line, from the end of which line only it began to describe a parabola. And this right line, which he calls the *line* of the *impulse* of the *fire*, he supposes to be the same in all elevations. Thus, by assigning a proper length to this line of impulse, it was always in his power to reconcile any two shots made at different angles, let them differ as widely as we please to suppose. But this he could not have done with three shots; nor indeed doth he ever tell us the event of his experiments when three ranges were tried at one time.

6 Laws of the air's resistance laid down by Newton.

When Sir Isaac Newton's *Principia* was published, he particularly considered the resistance of the air to projectiles which moved with small velocities; but as he never had an opportunity of making experiments on those which move with such prodigious swiftnesses, he did not imagine that a difference in velocity could make such differences in the resistance as are now found to take place. Sir Isaac found, that, in small velocities, the resistance was increased in the duplicate proportion of the swiftness with which the body moved; that is, a body moving with twice the velocity of another of equal magnitude, would meet with four times as much resistance as the first, with thrice the velocity it would meet with nine times the resistance, &c.—This principle itself is now found to be erroneous with regard to military projectiles; though, if it had been properly attended to, the resistance of the air might even from thence have been reckoned much more considerable than was commonly done. So far, however, were those who treated this subject scientifically, from giving a proper allowance for the resistance of the atmosphere, that their theories differed most egregiously from the truth. Huygens alone seems to have attended to this principle: for, in the year 1690, he published a treatise on Gravity, in which he gave an account of some experiments tending to prove, that the track of all projectiles moving with very swift motions was widely different from that of a parabola. All the rest of the learned acquiesced in the justness of Galileo's doctrine, and very erroneous calculations concerning the ranges of cannon were accordingly given. Nor was any notice taken of these errors till the year 1716. At that time Mr Ressons, a French officer of artillery, distinguished by the number of sieges at which he had served, by his high military rank, and by his abilities in his profession, gave in a memoir to the Royal Academy, of which he was a member, importing, that, "although it was agreed, that theory joined with practice did constitute the perfection of every art; yet experience had taught him, that theory was of very little service in the use of mortars: That the works of M. Blondel had justly enough described the several parabolic lines, according to the different degrees of the elevation of the piece; but that practice had convinced him, there was no theory in the effect of gunpowder; for having endeavoured, with the greatest precision, to point a mortar agreebly to these calculations, he had never been able to establish any solid foundation upon them."

8 All these theories widely different from the truth.

From the history of the academy, it doth not appear that the sentiments of Mr Ressons's were at any time controverted, or any reason offered for the failure of the theory of projectiles when applied to use. Nothing farther, however, was done till the time of Benjamin Robins, who in 1742 published a treatise, entitled, New Principles of Gunnery, in which he hath treated particularly not only of the resistance of the atmosphere, but almost every thing else relating to the flight of military projectiles, and indeed advanced the theory of gunnery much nearer perfection than ever it was before.

9 Mr Robins first introduces a true theory.

10 His method of determining the force of gunpowder.

The first thing considered by Mr Robins, and which is indeed the foundation of all other particulars relative to gunnery, is the explosive force of gunpowder. This he determined to be owing to an elastic fluid similar to our atmosphere, having its elastic force greatly increased by the heat. "If a red-hot iron (says he) be included in a receiver, and the receiver be exhausted, and gunpowder be then let fall on the iron, the powder will take fire, and the mercurial gage will suddenly descend upon the explosion; and though it immediately ascends again, it will never rise to the height it first stood at, but will continue depressed by a space proportioned to the quantity of powder which was let fall on the iron.—The same production likewise takes place when gunpowder is fired in the air: for if a small quantity of powder is placed in the upper part of a glass tube, the lower part of which is immersed in water, and the fluid be made to rise so near the top, that only a small portion of air is left in that part where the gunpowder is placed; if in this situation the communication of the upper part of the tube with the external air is closed, and the gunpowder fired, which may be easily done by means of a burning-glass, the water will in this experiment descend on the explosion, as the quicksilver did in the last; and will always continue depressed below the place at which it stood before

7 Erroneous in military projectiles.

THEORY. fore the explosion. The quantity of this depression will be greater if the quantity of powder be increased, or the diameter of the tube be diminished.

" When any considerable quantity of gunpowder is fired in an exhausted receiver, by being let fall on a red-hot iron, the mercurial gage instantly descends upon the explosion, and as suddenly ascends again. After a few vibrations, none of which except the first are of any great extent, it seemingly fixes at a point lower than where it stood before the explosion. But even when the gage has acquired this point of apparent rest, it still continues rising for a considerable time, although by such imperceptible degrees, that it can only be discovered by comparing its place at distant intervals: however, it will not always continue to ascend; but will rise slower and slower, till at last it will be absolutely fixed at a point lower than where the mercury stood before the explosion. The same circumstances nearly happen, when powder is fired in the upper part of an unexhausted tube, whose lower part is immersed in water.

" That the elasticity or pressure of the fluid produced by the firing of gunpowder is, *cæteris paribus*, directly as its density, may be proved from hence, that if in the same receiver a double quantity of powder be let fall, the mercury will subside twice as much as in the firing of a single quantity. Also the descents of the mercury, when equal quantities of powder are fired in different receivers, are reciprocally as the capacities of those receivers, and consequently as the density of produced fluid in each. But as, in the usual method of trying this experiment, the quantities of powder are so very small that it is difficult to ascertain these proportions with the requisite degree of exactness, I took a large receiver containing about 520 inches, and letting fall at once on the red-hot iron one drachm or the sixteenth part of an ounce avoirdupois of powder, the receiver being first nearly exhausted: the mercury, after the explosion, was subsided two inches exactly, and all the powder had taken fire. Then heating the iron a second time, and exhausting the receiver as before, two drachms were let down at once, which sunk the mercury three inches and three quarters; and a small part of the powder had fallen beside the iron, which (the bottom of the receiver being wet) did not fire, and the quantity which thus escaped did appear to be nearly sufficient, had it fallen on the iron, to have sunk the mercury a quarter of an inch more; in which case the two descents, viz. two inches and four inches, would have been accurately in the proportion of the respective quantities of powder; from which proportion, as was, they very little varied.

" As different kinds of gunpowder produce different quantities of this fluid, in proportion to their different degrees of goodness, before any definite determination of this kind can take place, it is necessary to ascertain the particular species of powder that is proposed to be used. (Here Mr Robins determines in all his experiments to make use of government-powder, as consisting of a certain and invariable proportion of materials, and therefore preferable to such kinds as are made according to the fancy of private persons.)

" This being settled, we must further premise these two principles: 1. That the elastiy of this fluid increases by heat and diminishes by cold, in the same manner as that of the air; 2. That the density of this fluid, and consequently its weight, is the same with the weight of an equal bulk of air, having the same elasticity and the same temperature. Now from the last experiment it appears, that $\frac{1}{10}$ of an ounce avoirdupoise or about 27 grains Troy of powder, sunk the gage, on its explosion, two inches; and the mercury in the barometer standing at near 30 inches, $1\frac{1}{10}$ths of an ounce avoirdupois, or 410 grains Troy, would have filled the receiver with a fluid whose elasticity would have been equal to the whole pressure of the atmosphere, or the same with the elasticity of the air we breathe; and the content of the receiver being about 520 cubic inches, it follows, that $\frac{1}{7}\frac{1}{7}$ths of an ounce of powder will produce 520 cubic inches of a fluid possessing the same degree of elasticity with the common air; whence, an ounce of powder will produce near 575 cubic inches of such a fluid. THEORY.

" But in order to ascertain the density of this fluid, we must consider what part of its elasticity, at the time of this determination, was owing to the heat it received from the included hot-iron and the warm receiver. Now the general heat of the receiver being manifestly less than that of boiling water, which is known to increase the elasticity of the air to somewhat more than $\frac{1}{4}$ of its augmented quantity; I collect from hence and other circumstances, that the augmentation of elasticity from this cause was about $\frac{1}{7}$ of the whole: that is, if the fluid arising from the explosion had been reduced to the temperature of the external air, the descent of the mercurial gage, instead of two inches, would have been only $1\frac{3}{4}$ inch; whence 575, reduced in the proportion of five to four, becomes 460; and this last number represents the cubic inches of an elastic fluid equal in density and elasticity with common air, which are produced from the explosion of 1 ounce avoirdupoise of gunpowder; the weight of which quantity of fluid, according to the usual estimation of the weight of air, is 131 grains; whence the weight of this fluid is $\frac{1}{4}\frac{1}{3}\frac{3}{7}$ or $\frac{1}{35}$ths nearly of the weight of the generating powder. The ratio of the bulk of gunpowder to the bulk of this fluid may be determined from considering that 17 drams avoirdupoise of powder fill two cubic inches, if the powder be well shook together: therefore, augmenting the number last found in the proportion of 16 to 17, the resulting term $488\frac{3}{4}$ is the number of cubic inches of an elastic fluid, equal in density with the air produced from two cubic inches of powder: whence the ratio of the respective bulk of the powder, and of the fluid produced from it, is in round numbers as 1 to 244."—This calculation was afterwards justified by experiments.

" If this fluid, instead of expanding when the powder was fired, had been confined in the same space which the powder filled before the explosion; then it would have had, in that confined state, a degree of elasticity 244 times greater than that of common air; and this independent of the great augmentation this elasticity would receive from the action of the fire in that instant.

" Hence, then, we are certain, that any quantity of powder fired in a confined space, which it adequately fills, exerts, at the instant of its explosion, against the sides of the vessel containing it, and the bodies it impels before it, a force at least 244 times greater than the

THEORY. the elaſticity of the common air, or, which is the ſame thing, than the preſſure of the atmoſphere; and this without conſidering the great addition which this force will receive from the violent degree of heat with which it is affected at that time.

" To determine how far the elaſticity of air is augmented when heated to the extremeſt degree of red-hot iron, I took a piece of a muſquet-barrel about ſix inches in length, and ordered one end to be cloſed up entirely; but the other end was drawn out conically, and finiſhed in an aperture of about $\frac{1}{4}$ of an inch in diameter. The tube thus fitted, was heated to the extremity of a red heat in a ſmith's forge; and was then immerged with its aperture downwards in a bucket of water, and kept there till it was cool; after which it was taken out carefully, and the water which had entered it in cooling was exactly weighed. The heat given to the tube at each time, was the beginning of what workmen call a *white heat*; and to prevent the ruſhing in of the aqueous vapour at the immerſion, which would otherwiſe drive out great part of the air, and render the experiment fallacious, I had an iron wire filed tapering, ſo as to fit the aperture of the tube, and with this I always ſtopped it up before it was taken from the fire, letting the wire remain in till the whole was cool, when, removing it, the due quantity of water would enter. The weight of the water thus taken in at three different trials was 600 grains, 595 grains, and 600 grains, reſpectively. The content of the whole cavity of the tube was 796 grains of water; whence the ſpaces remaining unfilled in theſe three experiments were 186, 201, and 196 grains reſpectively. Theſe ſpaces undoubtedly contained all the air which, when the tube was red-hot, extended thro' its whole concavity; conſequently the elaſticity of the air, when heated to the extreme heat of red-hot iron, was to the elaſticity of the ſame air, when reduced to the temperature of the ambient atmoſphere, as the whole capacity of the tube to the reſpective ſpaces taken up by the cooled air; that is, as 796 to 186, 201, 196; or, taking the medium of theſe three trials, as 796 to $194\frac{1}{3}$.

" As air and this fluid appear to be equally affected by heat and cold, and conſequently have their elaſticities equally augmented by the addition of equal degrees of heat to each; if we ſuppoſe the heat with which the flame of fired powder is endowed, to be the ſame with that of the extreme heat of red-hot iron, then the elaſticity of the generated fluid will be greater at the time of the exploſion than afterwards, when it is reduced to the temperature of the ambient air, in the ratio of 796 to $194\frac{1}{3}$ nearly. It being allowed then, (which ſurely is very reaſonable), that the flame of gunpowder is not leſs hot than red-hot iron, and the elaſticity of the air, and conſequently of the fluid generated by the exploſion, being augmented in the extremity of this heat in the ratio of $194\frac{1}{3}$ to 796, it follows, that if 244 be augmented in this ratio, the reſulting number which is $999\frac{1}{3}$, will determine how many times the elaſticity of the flame of fired powder exceeds the elaſticity of common air, ſuppoſing it to be confined in the ſame ſpace which the powder filled before it was fired.—Hence then the abſolute quantity of the preſſure exerted by gunpowder at the moment of its exploſion may be aſſigned; for, ſince the fluid then generated has an elaſticity of $999\frac{1}{3}$, or in round numbers 1000 times greater than that of the atmoſphere, and ſince common air by its elaſticity exerts a preſſure on any given ſurface equal to the weight of the incumbent atmoſphere with which it is in equilibrio, the preſſure exerted by fired powder before it dilated itſelf is 1000 times greater than the preſſure of the atmoſphere: and conſequently the quantity of this force, on a ſurface of an inch ſquare, amounts to above ſix ton weight; which force, however, diminiſhes as the fluid dilates itſelf. THEORY.

11 Prodigious power of fired powder.

" But though we have here ſuppoſed that the heat of gunpowder, when fired in any conſiderable quantity, is the ſame with iron heated to the extremity of red heat, or to the beginning of a white heat, yet it cannot be doubted but that the fire produced in the exploſion is ſomewhat varied (like all other fires) by a greater or leſſer quantity of fuel; and it may be preſumed, that, according to the quantity of powder fired together, the flame may have all the different degrees, from a languid red heat, to that ſufficient for the vitrification of metals. But as the quantity of powder requiſite for the production of this laſt mentioned heat, is certainly greater than what is ever fired together for any military purpoſe, we cannot be far from our ſcope, if we ſuppoſe the heat of ſuch quantities as are uſually fired to be nearly the ſame with that of red-hot iron; allowing a gradual augmentation to this heat in larger quantities, and diminiſhing it when the quantities are very ſmall."

12 Mr Robins's method of determining the velocities of balls.

Having thus determined the force of the gunpowder, Mr Robins next proceeds to determine the velocity with which the ball is diſcharged. The ſolution of this problem depends on the two following principles. 1. That the action of the powder on the bullet ceaſes as ſoon as the bullet is got out of the piece. 2. That all the powder of the charge is fired and converted into elaſtic fluid before the bullet is ſenſibly moved from its place.

" The firſt of theſe (ſays Mr Robins) will appear manifeſt when it is conſidered how ſuddenly the flame will extend itſelf on every ſide, by its own elaſticity, when it is once got out of the mouth of the piece; for by this means its force will then be diſſipated, and the bullet no longer ſenſibly affected by it.

13 Inſtantaneous firing of powder.

" The ſecond principle is indeed leſs obvious, being contrary to the general opinion of almoſt all writers on this ſubject. It might however be ſufficient for the proof of this poſition, to obſerve the prodigious compreſſion of the flame in the chamber of the piece. Thoſe who attend to this circumſtance, and to the eaſy paſſage of the flame through the intervals of the grains, may ſoon ſatisfy themſelves, that no one grain contained in that chamber can continue for any time unînflamed, when thus ſurrounded and preſſed by ſuch an active fire. However, not to rely on mere ſpeculation in a matter of ſo much conſequence, I conſidered, that if part only of the powder is fired, and that ſucceſſively; then by laying a greater weight before the charge, (ſuppoſe two or three bullets inſtead of one), a greater quantity of powder would neceſſarily be fired, ſince a heavier weight would be a longer time in paſſing through the barrel. Whence it ſhould follow, that two or three bullets would be impelled by a much greater force than one only. But the contrary to this appears by experiment; for firing one, two, and

THEORY. and three bullets laid contiguous to each other with the same charge respectively, I have found that their velocities were not much different from the reciprocal of their subduplicate quantities of matter; that is, if a given charge would communicate to one bullet a velocity of 1700 feet in a second, the same charge would communicate to two bullets a velocity from 1250 to 1300 feet in a second, and to three bullets a velocity from 1050 to 1110 feet in the same time. From hence it appears, that, whether a piece is loaded with a greater or less weight of bullet, the action is nearly the same; since all mathematicians know, that if bodies containing different quantities of matter are successively impelled through the same space by the same power acting with a determined force at each point of that space; then the velocities given to these different bodies will be reciprocally in the subduplicate ratio of their quantities of matter. The excess of the velocities of the two and three bullets above what they ought to have been by this rule, (which are that of 1200 and 980 feet in a second) undoubtedly arises from the flame, which, escaping by the side of the first bullet, acts on the surface of the second and third.

14 Why some powder is blown out of the mouth of a cannon without being fired.

"Now, this excess has in many experiments been imperceptible, and the velocities have been reciprocally in the subduplicate ratios of the number of bullets, to sufficient exactness; and where this error has been greater, it has never arisen to an eighth part of the whole: but, if the common opinion was true, that a small part only of the powder fires at first, and other parts of it successively as the bullet passes through the barrel, and that a considerable part of it is often blown out of the piece without firing at all; then the velocity which three bullets received from the explosion ought to have been much greater than we have found it to be.—But the truth of this second postulate more fully appears from those experiments, by which it is shewn, that the velocities of bullets may be ascertained to the same exactness when they are acted on through a barrel of four inches in length only, as when they are discharged from one of four feet.

"With respect to the grains of powder which are often blown out unfired, and which are always urged as a proof of the gradual firing of the charge, I believe Diego Ufano, a person of great experience in the art of gunnery, has given the true reason for this accident; which is, that some small part of the charge is often not rammed up with the rest, but is left in the piece before the wad, and is by this means expelled by the blast of air before the fire can reach it. I must add, that, in the charging of cannon and small arms, especially after the first time, this is scarcely to be avoided by any method I have yet seen practised. Perhaps, too, there may be some few grains in the best powder, of such an heterogeneous composition as to be less susceptible of firing; which, I think, I have myself observed: and these, though they are surrounded by the flame, may be driven out unfired.

15 Demonstration of the force of fired powder on the ball. Plate CXLIV. fig. 4.

"These postulates being now allowed to be just, let AB represent the axis of any piece of artillery, A the breech, and B the muzzle; DC the diameter of its bore, and DEGC a part of its cavity filled with powder. Suppose the ball that is to be impelled to lie with its hinder surface at the line GE; then the pressure exerted at the explosion on the circle of which GE is the diameter, or, which is the same thing, the pressure exerted in the direction FB on the surface of the ball, is easily known from the known dimensions of that circle. Draw any line FH perpendicular to FB, and AI parallel to FH; and through the point H, to the asymptotes IA and AB, describe the hyperbola KHNQ; then, if FH represents the force impelling the ball at the point F, the force impelling the ball at any other point as at M, will be represented by the line MN, the ordinate to the hyperbola at that point. For when the fluid impelling the body along has dilated itself to M, its density will be then to its original density in the space DEGC reciprocally as the spaces through which it is extended; that is, as FA to MA, or as MN to FH; but it has been shewn, that the impelling force or elasticity of this fluid is directly as its density; therefore, if FH represents the force at the point F, MN will represent the like force at the point M.

THEORY.

"Since the absolute quantity of the force impelling the ball at the point F is known, and the weight of the ball is also known, the proportion between the force with which the ball is impelled and its own gravity is known. In this proportion take FH to FL, and draw LP parallel to FB; then, MN the ordinate to the hyperbola in any point will be to its part MR, cut off by the line LP, as the impelling force of the powder in that point M to the gravity of the ball; and consequently the line LP will determine a line proportional to the uniform force of gravity in every point; whilst the hyperbola HNQ determines in like manner such ordinates as are proportional to the impelling force of the powder in every point; whence by the 39th Prop. of lib. 1. of Sir Isaac Newton's Principia, the areas FLPB and FHQB are in the duplicate proportion of the velocities which the ball would acquire when acted upon by its own gravity through the space FB, and when impelled through the same space by the force of the powder. But since the ratio of AF to AB and the ratio of FH to FL are known, the ratio of the area FLPB to the area FHQB is known; and thence its subduplicate. And since the line FB is given in magnitude, the velocity which a heavy body would acquire when impelled through this line by its own gravity is known; being no other than the velocity it would acquire by falling through a space equal to that line: find then another velocity to which this last mentioned velocity bears the given ratio of the subduplicate of the area FLPB to the area FHQB; and this velocity thus found is the velocity the ball will acquire when impelled thro' the space FB by the action of the inflamed powder.

"Now to give an example of this: Let us suppose AB, the length of the cylinder, to be 45 inches; its diameter DC, or rather the diameter of the ball, to be $\frac{1}{4}$ of an inch; and AF, the extent of the powder, to be $2\frac{1}{8}$ inches; to determine the velocity which will be communicated to a leaden bullet by the explosion, supposing the bullet to be laid at first with its surface contiguous to the powder.

"By the theory we have laid down, it appears, that at the first instant of the explosion the flame will exert, on the bullet lying close to it, a force 1000 times greater than the pressure of the atmosphere. The medium pressure of the atmosphere is reckoned equal to

THEORY. to a column of water 33 feet in height; whence, lead being to water as 11,345 to 1, this preſſure will be equal to that of a column of lead 34,9 inches in height. Multiplying this by 1000, therefore, a column of lead 34900 inches (upwards of half a mile) in height, would produce a preſſure on the bullet equal to what is exerted by the powder in the firſt inſtant of the explosion; and the leaden ball being $\frac{1}{2}$ of an inch in diameter, and conſequently equal to a cylinder of lead of the ſame baſe half an inch in height, the preſſure at firſt acting on it will be equal to 34900×2, or 69800 times its weight: whence FL to FH as 1 to 69800; and FB to FA as $45 - 2\frac{1}{2}$, or $42\frac{1}{2}$ to $2\frac{1}{2}$; that is, as 339 to 21; whence the rectangle FLPB is to the rectangle AFHS as 339 to 21×69800, that is, as 1 to 4324—And from the known application of the logarithms to the menſuration of the hyperbolic ſpaces it follows, that the rectangle AFHS is to the area FHQB as 43,429, &c. is to the tabular logarithm of $\frac{AB}{AF}$; that is, of $\frac{160}{147}$; which is 1,2340579; whence the ratio of the rectangle FLPB to the hyperbolic area FHQB is compounded of the ratios of 1 to 4324— and of ,43429, &c. to 1,2340579; which together make up the ratio of 1 to 12263, the ſubduplicate of which is the ratio of 1 to 110,7; and in this ratio is the velocity which the bullet would acquire by gravity in falling thro' a ſpace equal to FB, to the velocity the bullet will acquire from the action of the powder impelling it thro' FB. But the ſpace FB being $42\frac{1}{2}$ inches, the velocity a heavy body will aquire in falling through ſuch a ſpace is known to be what would carry it nearly at the rate of 15,07 feet in a ſecond; whence the velocity to which this has the ratio of 1 to 110,7 is a velocity which would carry the ball at the rate of 1668 feet in one ſecond. And this is the velocity which, according to the theory, the bullet in the preſent circumſtances would acquire from the action of the powder during the time of its dilatation.

" Now this velocity being once computed for one caſe, is eaſily applied to any other; for if the cavity DEGC left behind the bullet be only in part filled with powder, then the line HF, and conſequently the area FHQB will be diminiſhed in the proportion of the whole cavity to the part filled. If the diameter of the bore be varied, the lengths AB and AF remaining the ſame, then the quantity of powder and the ſurface of the bullet which it acts on, will be varied in the duplicate proportion of the diameter, but the weight of the bullet will vary in the triplicate proportion of the diameter; wherefore the line FH, which is directly as the abſolute impelling force of the powder, and reciprocally as the gravity of the bullet, will change in the reciprocal proportion of the diameter of the bullet. If AF, the heighth of the cavity left behind the bullet, be increaſed or diminiſhed, the rectangle of the hyperbola, and conſequently the area correſponding to ordinates in any given ratio, will be increaſed or diminiſhed in the ſame proportion. From all which it follows, that the area FHQB, which is in the duplicate proportion of the velocity of the impelled body, will be directly as the logarithm $\frac{AB}{AF}$ (where AB repreſents the length of the barrel, and AF the length of the cavity left behind the bullet); alſo directly as the part of that cavity filled with powder; and inverſely, as the diameter of the bore, or rather of the bullet; likewiſe directly as AF, the height of the cavity left behind the bullet. Conſequently the velocity being computed as above, for a bullet of a determined diameter, placed in a piece of a given length, and impelled by a given quantity of powder, occupying a given cavity behind that bullet; it follows, that, by means of theſe ratios, the velocity of any other bullet may be thence deduced; the neceſſary circumſtances of its poſition, quantity of powder, &c. being given. Where note, That in the inſtance of this ſuppoſition, we have ſuppoſed the diameter of the ball to be $\frac{1}{2}$ of an inch; whence the diameter of the bore will be ſomething more, and the quantity of powder contained in the ſpace DEGC, will amount exactly to twelve penny-weight, a ſmall wad of tow included.

" In order to compare the velocities communicated to bullets by the exploſion, with the velocities reſulting from the theory by computation; it is neceſſary that the actual velocities with which bullets move ſhould be diſcovered. The only methods hitherto practiſed for this purpoſe, have been either by obſerving the time of the flight of a ſhot through a given ſpace, or by meaſuring the range of a ſhot at a given elevation; and thence computing, on the parabolic hypotheſis, what degree of velocity would produce this range.—The firſt method labours under this inſurmountable difficulty, that the velocities of theſe bodies are often ſo ſwift, and conſequently the time obſerved is ſo ſhort, that an imperceptible error in that time, may occaſion an error in the velocity thus found of 2, 3, 4, 5, or 600 feet, in a ſecond. The other method is ſo fallacious, by reaſon of the reſiſtance of the atmoſphere (to which inequality the firſt is alſo liable), that the velocities thus aſſigned may not perhaps be the tenth part of the actual velocities ſought.

" The ſimpleſt method of determining this velocity is by means of the inſtrument repreſented Plate CXLII. fig. 5. where ABÇD repreſents the body of the machine compoſed of the three poles B, C, D, ſpreading at bottom, and joining together at the top A; being the ſame with what is vulgarly uſed in lifting and weighing very heavy bodies, and is called by workmen the *triangles*. On two of theſe poles, towards their tops, are ſcrewed on the ſockets RS; and on theſe ſockets the pendulum EFGHIK is hung by means of its croſs-piece EF, which becomes its axis of ſuſpenſion, and on which it muſt be made to vibrate with great freedom. The body of this pendulum is made of iron, having a broad part at bottom, and its lower part is covered with a thick piece of wood GKIH, which is faſtened to the iron by ſcrews. Something lower than the bottom of the pendulum there is a brace OP, joining the two poles to which the pendulum is ſuſpended; and to this brace there is faſtened a contrivance MNU, made with two edges of ſteel, bearing on each other in the line UN, ſomething in the manner of a drawing-pen; the ſtrength with which theſe edges preſs on each other being diminiſhed or increaſed at pleaſure by means of a ſcrew Z going through the upper piece. There is faſtened to the bottom of the pendulum a narrow ribbon LN, which paſſes between theſe ſteel edges, and which afterwards, by means of an opening cut in the lower piece of ſteel, hangs looſely down, as at W.

THEORY.

16 Machine diſcovering the velocities of bullets.

This

THEORY.

17 Method of using the machine.

"This inſtrument thus fitted, if the weight of the pendulum be known, and likewiſe the reſpective diſtances of its centre of gravity, and of its centre of oſcillation from its axis of ſuſpenſion, it will thence be known, what motion will be communicated to this pendulum by the percuſſion of a body of a known weight moving with a known degree of celerity, and ſtriking it in a given point; that is, if the pendulum be ſuppoſed at reſt before the percuſſion, it will be known what vibration it ought to make in conſequence of ſuch a determined blow; and, on the contrary, if the pendulum, being at reſt, is ſtruck by a body of a known weight, and the vibration, which the pendulum makes after the blow, is known, the velocity of the ſtriking body may from thence be determined.

"Hence then, if a bullet of a known weight ſtrikes the pendulum, and the vibration, which the pendulum makes in conſequence of the ſtroke, be aſcertained; the velocity, with which the ball moved, is thence to be known.

"Now the extent of the vibration, made by the pendulum after the blow, may be meaſured to great accuracy by the ribbon LN. For let the preſſure of the edges UN on the ribbon be ſo regulated by the ſcrew Z, that the motion of the ribbon between them may be free and eaſy, though with ſome minute reſiſtance; then ſettling the pendulum at reſt, let the part LN between the pendulum and the edges be drawn ſtrait, but not ſtrained, and fix a pin in that part of the ribbon which is then contiguous to the edges: let now a ball impinge on the pendulum; then the pendulum ſwinging back will draw out the ribbon to the juſt extent of its vibration, which will conſequently be determined by the interval on the ribbon between the edges UN and the place of the pin.

"The weight of the whole pendulum, wood and all, was 56 lb. 3 oz. its centre of gravity was 52 inches diſtant from its axis of ſuſpenſion, and 200 of its ſmall ſwings were performed in the time of 253 ſeconds; whence its centre of oſcillation (determined from hence) is $62\frac{3}{4}$ inches diſtant from that axis. The centre of the piece of wood GKIH is diſtant from the ſame axis 66 inches.

"In the compound ratio of 66 to $62\frac{3}{4}$, and 66 to 52, take the quantity of matter of the pendulum to a 4th quantity, which will be 42 lb. $\frac{1}{4}$ oz. Now geometers will know, that if the blow be ſtruck on the centre of the piece of wood GKIH, the pendulum will reſiſt to the ſtroke in the ſame manner as if this laſt quantity of matter only (42 lb. $\frac{1}{4}$ oz.) was concentrated in that point, and the reſt of the pendulum was taken away: whence, ſuppoſing the weight of the bullet impinging in that point to be the $\frac{1}{176}$ of a pound, or the $\frac{1}{7392}$ of this quantity of matter nearly, the velocity of the point of oſcillation after the ſtroke will, by the laws obſerved in the congreſs of ſuch bodies as rebound not from each other, be the $\frac{1}{175}$ of the velocity the bullet moved with before the ſtroke; whence the velocity of this point of oſcillation after the ſtroke being aſcertained, that multiplied by 505 will give the velocity with which the ball impinged.

"But the velocity of the point of oſcillation after the ſtroke is eaſily deduced from the chord of the arch, through which it aſcends by the blow; for it is a well-known propoſition, that all pendulous bodies aſcend to the ſame height by their vibratory motion as they would do, if they were projected directly upwards from their loweſt point, with the ſame velocity they have in that point: wherefore, if the verſed ſine of the aſcending arch be found, (which is eaſily determined from the chord and radius being given), this verſed ſine is the perpendicular height, to which a body projected upwards with the velocity of the point of oſcillation would ariſe; and, conſequently, what that velocity is, can be eaſily computed by the common theory of falling bodies.

"For inſtance, the chord of the arch, deſcribed by the aſcent of the pendulum after the ſtroke meaſured on the ribbon, has been ſometimes $17\frac{1}{4}$ inches; the diſtance of the ribbon from the axis of ſuſpenſion is $71\frac{5}{8}$ inches; whence reducing $17\frac{1}{4}$ in the ratio of $71\frac{5}{8}$ to 66, the reſulting number, which is nearly 16 inches, will be the chord of the arch through which the centre of the board GKIH aſcended after the ſtroke: now the verſed ſine of the arch, whoſe chord is 16 inches, and its radius 66, is 1.93939; and the velocity, which would carry a body to this height, or, which is the ſame thing, the velocity which a body would acquire by deſcending through this ſpace, is nearly that of $3\frac{1}{4}$ feet in 1″.

"To determine then the velocity with which the bullet impinged on the centre of the wood, when the chord of the arch deſcribed by the aſcent of the pendulum, in conſequence of the blow, was $17\frac{1}{4}$ inches meaſured on the ribbon, no more is neceſſary than to multiply $3\frac{1}{4}$ by 505, and the reſulting number 1641 will be the feet which the bullet would deſcribe in 1″, if it moved with the velocity it had at the moment of its percuſſion: for the velocity of the point of the pendulum, on which the bullet ſtruck, we have juſt now determined to be that of $3\frac{1}{4}$ feet in 1″; and we have before ſhewn, that this is the $\frac{1}{505}$ of the velocity of the bullet. If then a bullet weighing $\frac{1}{176}$ of a pound ſtrikes the pendulum in the centre of the wood GKIH, and the ribbon be drawn out $17\frac{1}{4}$ inches by the blow; the velocity of the bullet is that of 1641 feet in 1″. And ſince the length the ribbon is drawn is always nearly the chord of the arch deſcribed by the aſcent, (it being placed ſo as to differ inſenſibly from thoſe chords which moſt frequently occur), and theſe chords are known to be in the proportion of the velocities of the pendulum acquired from the ſtroke; it follows, that the proportion between the lengths of ribbon drawn out at different times, will be the ſame with that of the velocities of the impinging bullets; and conſequently, by the proportion of theſe lengths of ribbon to $17\frac{1}{4}$, the proportion of the velocity with which the bullets impinge to the known velocity of 1641 feet in 1″, will be determined.

18 Cautions to be obſerved in making theſe experiments.

"Hence then is ſhewn, in general, how the velocities of bullets of all kinds may be found out by means of this inſtrument; but that thoſe who may be diſpoſed to try theſe experiments may not have unforeſeen difficulties to ſtruggle with, we ſhall here ſubjoin a few obſervations, which it will be neceſſary for them to attend to, both to ſecure ſucceſs to their trials, and ſafety to their perſons.

"And firſt, that they may not conceive the piece of wood GKIH to be an unneceſſary part of the machine, we muſt inform them, that if a bullet impelled

THEORY. by a full charge of powder ſhould ſtrike directly on the iron, the bullet would be beaten into ſhivers by the ſtroke, and theſe ſhivers will rebound back with ſuch violence, as to bury themſelves in any wood they chance to light on, as I have found by hazardous experience; and beſides the danger, the pendulum will not in this inſtance aſcertain the velocity of the bullet, becauſe the velocity with which the parts of it rebound is unknown.

"The weight of the pendulum, and the thickneſs of the wood, muſt be in ſome meaſure proportioned to the ſize of the bullets which are uſed. A pendulum of the weight here deſcribed will do very well for all bullets under three or four ounces, if the thickneſs of the board be increaſed to ſeven or eight inches for the heavieſt bullets; beech is the toughеſt and properеſt wood for this purpoſe.

"It is hazardous ſtanding on the ſide of the pendulum, unleſs the board be ſo thick, that the greateſt part of the bullet's force is loſt before it comes at the iron; for if it ſtrikes the iron with violence, the ſhivers of lead, which cannot return back thro' the wood, will force themſelves out between the wood and iron, and will fly to a conſiderable diſtance.

"As there is no effectual way of faſtening the wood to the iron but by ſcrews, the heads of which muſt come through the board; the bullets will ſometimes light on thoſe ſcrews, from whence the ſhivers will diſperſe themſelves on every ſide.

"When in theſe experiments ſo ſmall a quantity of powder is uſed, as will not give to the bullet a velocity of more than 400 or 500 feet in 1"; the bullet will not ſtick in the wood, but will rebound from it entire, and (if the wood be of a very hard texture) with a very conſiderable velocity. Indeed I have never examined any of the bullets which have thus rebounded; but I have found them indented by the bodies they have ſtruck againſt in their rebound.

"To avoid then theſe dangers, to the braving of which in philoſophical reſearches no honour is annexed; it will be convenient to fix whatſoever barrel is uſed, on a ſtrong heavy carriage, and to fire it with a little ſlow match. Let the barrel too be very well fortified in all its length; for no barrel (I ſpeak of muſket barrels) forged with the uſual dimenſions will bear many of the experiments without burſting. The barrel I have moſt relied on, and which I procured to be made on purpoſe, is nearly as thick at the muzzel as at the breech; that is, it has in each place nearly the diameter of its bore in thickneſs of metal.

"The powder uſed in theſe experiments ſhould be exactly weighed: and that no part of it be ſcattered in the barrel, the piece muſt be charged with a ladle in the ſame manner as is practiſed with cannon; the wad ſhould be of tow, of the ſame weight each time, and no more than is juſt neceſſary to confine the powder in its proper place: the length of the cavity left behind the ball ſhould be determined each time with exactneſs; for the increaſing or diminiſhing that ſpace will vary the velocity of the ſhot, although the bullet and quantity of powder be not changed. The diſtance of the mouth of the piece from the pendulum ought to be ſuch, that the impulſe of the flame may not act on the pendulum; this will be prevented in a common barrel charged with $\frac{1}{4}$ an ounce of powder, if it be at the diſtance of 16 or 18 feet: in larger charges the impulſe is ſenſible farther off, I have found it to extend to above 25 feet; however, between 25 and 18 feet is the diſtance I have uſually choſen." THEORY.

19 Account of Mr Robins's experiments.

With this inſtrument, or others ſimilar to it, Mr Robins made a great number of experiments on barrels of different lengths, and with different charges of powder. He hath given us the reſults of 61 of theſe; and having compared the actual velocities with the computed ones, his theory appears to have come as near the truth as could well be expected. In ſeven of the experiments there was a perfect coincidence; the charges of powder being ſix or twelve pennyweights; the barrels 45, 24.312, and 7.06 inches in length. The diameter of the firſt (marked A) was $\frac{1}{2}$ of an inch; of the ſecond (B) was the ſame; and of D, 83 of an inch. In the reſt of the experiments, another barrel (C) was uſed, whoſe length was 12.375 inches, and the diameter of its bore $\frac{1}{2}$ inches.---In 14 more of the experiments, the difference between the length of the chord of the pendulum's arch ſhewn by the theory and the actual experiment was one-tenth of an inch over or under. This ſhewed an error in the theory varying according to the different lengths of the chord from $\frac{1}{11}$ to $\frac{1}{17}$ of the whole; the charges of powder were the ſame as in the laſt.---In 16 other experiments, the error was two-tenths of an inch, varying from $\frac{1}{11}$ to $\frac{1}{17}$ of the whole: the charges of powder were 6, 8, 9, or 12 pennyweights.---In ſeven other experiments, the error was three-tenths of an inch, varying from $\frac{1}{11}$ to $\frac{1}{17}$ of the whole; the charges of powder ſix, or twelve, pennyweights. In eight experiments, the difference was four-tenths of an inch, indicating an error from $\frac{1}{11}$ to $\frac{1}{17}$ of the whole; the charges being 6, 9, 12, and 24 pennyweights of powder. In three experiments, the error was five-tenths, varying from $\frac{1}{11}$ to $\frac{1}{17}$ of the whole; the charges 8 and 12 pennyweights of powder.---In two experiments the error was ſix-tenths, in one caſe amounting to ſomething leſs than $\frac{1}{11}$, in the other to $\frac{1}{17}$ of the whole; the charges 12 and 36 pennyweights of powder. By one experiment the error was ſeven, and by another eight, tenths; the firſt amounting to $\frac{1}{10}$ nearly, the latter to almoſt $\frac{1}{9}$ of the whole: the charges of powder 6 or 12 pennyweights. The laſt error, however, Mr Robins aſcribes to the wind. The two remaining experiments varied from the theory by 1.3 inches, ſomewhat more than $\frac{1}{9}$ of the whole: the charges of powder were 12 pennyweights in each; and Mr Robins aſcribes the error to the dampneſs of the powder. In another caſe, he aſcribes an error of ſix-tenths to the blaſt of the powder on the pendulum.

20 His concluſions from them.

From theſe experiments Mr Robins deduces the following concluſions. "The variety of theſe experiments, and the accuracy with which they correſpond to the theory, leave us no room to doubt of its certainty.—This theory, as here eſtabliſhed, ſuppoſes, that, in the firing of gunpowder, about $\frac{1}{100}$ of its ſubſtance is converted by the ſudden inflammation into a permanently elaſtic fluid, whoſe elaſticity, in proportion to its heat and denſity, is the ſame with that of common air in the like circumſtances; it farther ſuppoſes, that all the force exerted by gunpowder in its moſt

THEORY. most violent operations, is no more than the action of the elasticity of the fluid thus generated; and these principles enable us to determine the velocities of bullets impelled from fire-arms of all kinds, and are fully sufficient for all purposes where the force of gunpowder is to be estimated.

"From this theory many deductions may be made, of the greatest consequence to the practical part of gunnery. From hence the thickness of a piece, which will enable it to confine, without bursting, any given charge of powder, is easily determined, since the effort of the powder is known. From hence appears the inconclusiveness of what some modern authors have advanced, relating to the advantages of particular forms of chambers for mortars and cannon; for all their laboured speculations on this head are evidently founded on very erroneous opinions about the action of fired powder. From this theory too we are taught the necessity of leaving the same space behind the bullet when we would, by the same quantity of powder, communicate to it an equal degree of velocity; since, on the principles already laid down, it follows, that the same powder has a greater or less degree of elasticity, according to the different spaces it occupies. The method which I have always practised for this purpose has been by marking the rammer; and this is a maxim which ought not to be dispensed with when cannon are fired at an elevation, particularly in those called by the French *batteries a ricochet*.

"From the continued action of the powder, and its manner of expanding described in this theory, and the length and weight of the piece, one of the most essential circumstances in the well directing of artillery may be easily ascertained. All practitioners are agreed, that no shot can be depended on, unless the piece be placed on a solid platform: for if the platform shakes with the first impulse of the powder, it is impossible but the piece must also shake; which will alter its direction, and render the shot uncertain. To prevent this accident, the platform is usually made extremely firm to a considerable depth backwards; so that the piece is not only well supported in the beginning of its motion, but likewise through a great part of its recoil. However, it is sufficiently obvious, that when the bullet is separated from the piece, it can be no longer affected by the trembling of the piece or platform; and, by a very easy computation, it will be found, that the bullet will be out of the piece before the latter hath recoiled half an inch: whence, if the platform be sufficiently solid at the beginning of the recoil, the remaining part of it may be much slighter; and hence a more compendious method of constructing platforms may be found out.

"From this theory also it appears how greatly these authors have been mistaken, who have attributed the force of gunpowder, or at least a considerable part of it, to the action of the air contained either in the powder, or between the intervals of the grains: for they have supposed that air to exist in its natural elastic state, and to receive all its addition of force from the heat of the explosion. But from what hath been already delivered concerning the increase of the air's elasticity by heat, we may conclude that the heat of the explosion cannot augment this elasticity to five times its common quantity; consequently the force arising from this cause only cannot amount to more than the 200th part of the real force exerted on the occasion. THEORY.

"If the whole substance of the powder was converted into an elastic fluid at the instant of the explosion, then from the known elasticity of this fluid assigned by our theory, and its known density, we could easily determine the velocity with which it would begin to expand, and could thence trace out its future augmentations in its progress through the barrel: but as we have shewn that the elastic fluid, in which the activity of the gunpowder consists, is only $\frac{1}{100}$ of the substance of the powder, the remaining $\frac{99}{100}$ will, in the explosion, be mixed with the elastic part, and will by its weight retard the activity of the explosion; and yet they will not be so completely united as to move with one common motion; but the unelastic part will be less accelerated than the rest, and some will not even be carried out of the barrel, as appears by the considerable quantity of unctuous matter which adheres to the inside of all fire-arms after they have been used.—These inequalities in the expansive motion of the flame oblige us to recur to experiments for its accurate determination.

21 Experiments for determining the velocity of fired gunpowder.

"The experiments made use of for this purpose were of two kinds. The first was made by charging the barrel A with 12 penny-weights of powder, and a small wad of tow only; and then placing its mouth 19 inches from the centre of the pendulum. On firing it in this situation, the impulse of the flame made it ascend through an arch whose chord was 13.7 inches; whence, if the whole substance of the powder was supposed to strike against the pendulum, and each part to strike with the same velocity, that common velocity must have been at the rate of about 2650 feet in a second.—But as some part of the velocity of the flame was lost in passing through 19 inches of air; I made the remaining experiments in a manner not liable to this inconvenience.

"I fixed the barrel A on the pendulum, so that its axis might be both horizontal, and also perpendicular to the plane HK; or, which is the same thing, that it might be in the plane of the pendulum's vibration: the height of the axis of the piece above the centre of the pendulum was six inches; and the weight of the piece, and of the iron that fastened it, &c. was 12¼lb. The barrel in this situation being charged with 12 penny-weights of powder, without either ball or wad, only put together with the rammer; on the discharge the pendulum ascended through an arch whose chord was 10 inches, or reduced to an equivalent blow in the centre of the pendulum, supposing the barrel away, it would be 14.4 inches nearly. The same experiment being repeated, the chord of the ascending arch was 10.1 inches, which, reduced to the centre, is 14.6 inches.

"To determine what difference of velocity there was in the different parts of the vapour, I loaded the piece again with 12 penny-weights of powder, and rammed it down with a wad of tow, weighing one penny-weight. Now, I conceived that this wad being very light, would prefently acquire that velocity with which the elastic part of the fluid would expand itself when uncompressed; and I accordingly found, that the chord of the ascending arch was by

THEORY. this means increased to 12 inches, or at the centre to 17.3: whence, as the medium of the other two experiments is 14.5, the pendulum ascended through an arch 2.8 inches longer, by the additional motion of one penny-weight of matter, moving with the velocity of the swiftest part of the vapour; and consequently the velocity with which this penny-weight of matter moved, was that of about 7000 feet in a second.

"It will perhaps be objected to this determination, that the augmentation of the arch through which the pendulum vibrated in this case was not all of it owing to the quantity of motion given to the wad, but part of it was produced by the confinement of the powder, and the greater quantity thereby fired. But if it were true that a part only of the powder fired when there was no wad, it would not happen that in firing different quantities of powder without a wad the chord would increase and decrease nearly in the ratio of these quantities; which yet I have found it to do: for with nine pennyweights that chord was 7.3 inches, which with 12 pennyweights we have seen was only 10, and 10.1 inches; and even with three pennyweights the chord was two inches; deficient from this proportion by .5 only; for which defect too other valid reasons are to be assigned.

"And there is still a more convincing proof that all the powder is fired, although no wad be placed before the charge, which is, that the part of the recoil arising from the expansion of powder alone, is found to be no greater when it impels a leaden bullet before it, than when the same quantity is fired without any wad to confine it. We have seen that the chord of the arch through which the pendulum rose from the expansive force of the powder alone is 10, or 10.1; and the chord of that arch, when the piece was charged in the customary manner with a bullet and wad, I found to be the first time $22\frac{1}{2}$, and the second $22\frac{7}{8}$, or at a medium 22.56. Now the impulse of the ball and wad, if they were supposed to strike the pendulum in the same place in which the barrel was suspended, with the velocity they had acquired at the mouth of the piece, would drive it through an arch whose chord would be about 12.3; as is known from the weight of the pendulum, the weight and position of the barrel, and the velocity of the bullet determined by our former experiments; whence, subtracting this number 12.3 from 22.56, the remainder 10.26 is nearly the chord of the arch which the pendulum would have ascended through from the expansion of the powder alone with a bullet laid before it. And this number, 10.26, differs but little from 10.1, which we have above found to be the chord of the ascending arch, when the same quantity of powder expanded itself freely without either bullet or wad before it.

"Again, that this velocity of 7000 feet in a second is not much beyond what the most active part of the flame acquires in expanding, is evinced from hence, that in some experiments a ball has been found to be discharged with a velocity of 2400 feet in a second; and yet it appeared not that the action of the powder was at all diminished on account of this immense celerity: consequently the degree of swiftness with which, in this instance, the powder followed the ball without losing any part of its pressure, must have been much short of what the powder alone would have expanded with, had not the ball been there. THEORY.

"From these determinations may be deduced the force of petards; since their action depends entirely on the impulse of the flame: and it appears that a quantity of powder properly disposed in such a machine, may produce as violent an effort as a bullet of twice its weight, moving with a velocity of 1400 or 1500 feet in a second.

22 A bullet flies off with the greatest velocity when laid at a distance from the powder.

"In many of the experiments already recited, the ball was not laid immediately contiguous to the powder, but at a small distance, amounting, at the utmost, only to an inch and a half. In these cases the theory agreed very well with the experiments. But if a bullet is placed at a greater distance from the powder, suppose at 12, 18, or 24 inches, we cannot then apply to this ball the same principles which may be applied to those laid in contact, or nearly so, with the powder; for when the surface of the fired powder is not confined by a heavy body, the flame dilates itself with a velocity far exceeding that which it can communicate to a bullet by its continued pressure: consequently, as at the distance of 12, 18, or 24 inches, the powder will have acquired a considerable degree of this velocity of expansion, the first motion of the ball will not be produced by the continued pressure of the powder, but by the actual percussion of the flame; and it will therefore begin to move with a quantity of motion proportioned to the quantity of this flame, and the velocities of its respective parts.

"From hence then it follows, that the velocity of the bullet, laid at a considerable distance before the charge, ought to be greater than what would be communicated to it by the pressure of the powder acting in the manner already mentioned: and this deduction from our theory we have confirmed by manifold experience; by which we have found, that a ball laid in the barrel A, with its hinder part $11\frac{1}{2}$ inches from its breech, and impelled by twelve pennyweights of powder, has acquired a velocity of about 1400 feet in a second; when, if it had been acted on by the pressure of the flame only, it would not have acquired a velocity of 1200 feet in a second. The same we have found to hold true in all other greater distances, (and also in lesser, though not in the same degree), and in all quantities of powder: and we have likewise found, that these effects nearly correspond with what has been already laid down about the velocity of expansion and the elastic and inelastic parts of the flame.

"From hence too arises another consideration of great consequence in the practice of gunnery; which is, that no bullet should at any time be placed at a considerable distance before the charge, unless the piece is extremely well fortified: for a moderate charge of powder, when it has expanded itself through the vacant space, and reaches the ball, will, by the velocity each part has acquired, accumulate itself behind the ball, and thereby be condensed prodigiously; whence, if the barrel be not extremely firm in that part, it must, by means of this re-inforced elasticity, infallibly burst. The truth of this reasoning I have experienced in an exceeding good Tower-musket, forged of very tough iron; for, charging it with twelve pennyweights of powder, and placing the ball 16 inches from the breech, on firing it, the part of the barrel just

THEORY. juſt behind the bullet was ſwelled out to double its diameter like a blown bladder, and two large pieces of two inches long were burſt out of it.

" Having ſeen that the entire motion of a bullet laid at a conſiderable diſtance from the charge, is acquired by two different methods in which the powder acts on it; the firſt being the percuſſion of the parts of the flame with the velocity they had reſpectively acquired by expanding, the ſecond the continued preſſure of the flame through the remaining part of the barrel; I endeavoured to ſeparate theſe different actions, and to retain that only which aroſe from the continued preſſure of the flame. For this purpoſe I no longer placed the powder at the breech, from whence it would have full ſcope for its expanſion; but I ſcattered it as uniformly as I could through the whole cavity left behind the bullet; imagining that by this means the progreſſive velocity of the flame in each part would be prevented by the expanſion of the neighbouring parts: and I found, that the ball being laid $11\frac{1}{2}$ inches from the breech, its velocity, inſtead of 1400 feet in a ſecond, which it acquired in the laſt experiments, was now no more than 1100 feet in the ſecond, which is 100 feet ſhort of what according to the theory ſhould ariſe from the continued preſſure of the powder only.

" The reaſon of this deficiency was, doubtleſs, the inteſtine motion of the flame: for the accenſion of the powder thus diſtributed through ſo much larger a ſpace than it could fill, muſt have produced many reverberations and pulſations of the flame; and from theſe internal agitations of the fluid, its preſſure on the containing ſurface will (as is the caſe of all other fluids) be conſiderably diminiſhed; and in order to avoid this irregularity, in all other experiments I took care to have the powder cloſely confined in as ſmall a ſpace as poſſible, even when the bullet lay at ſome little diſtance from it.

2.3 Of the reſiſtance of the air to the motion of bullets.

" With regard to the reſiſtance of the air, which ſo remarkably affects all military projectiles, it is neceſſary to premiſe, that the greateſt part of authors have eſtabliſhed it as a certain rule, that while the ſame body moves in the ſame medium, it is always reſiſted in the duplicate proportion of its velocity; that is, if the reſiſted body move in one part of its track with three times the velocity with which it moved in ſome other part, then its reſiſtance to the greater velocity will be nine times the reſiſtance to the leſſer. If the velocity in one place be four times greater than in another, the reſiſtance of the fluid will be 16 times greater in the firſt than in the ſecond, &c. This rule, however, though pretty near the truth when the velocities are confined within certain limits, is exceſſively erroneous when applied to military projectiles, where ſuch reſiſtances often occur as could ſcarcely be effected, on the commonly received principles, even by a treble augmentation of its denſity.

" By means of the machine already deſcribed, I have it in my power to determine the velocity with which a ball moves in any part of its track, provided I can direct the piece in ſuch a manner as to cauſe the bullet to impinge on the pendulum placed in that part: and therefore, charging a muſket-barrel three times ſucceſſively with a leaden ball $\frac{1}{4}$ of an inch in diameter, and about half its weight of powder; and taking ſuch precaution in weighing of the powder and placing it, that I was aſſured, by many previous trials, that the velocity of the ball could not differ by 20 feet in a ſecond from its medium quantity; I fired it againſt the pendulum placed at 25, 75, and 125 feet diſtance from the mouth of the piece reſpectively; and I found that it impinged againſt the pendulum, in the firſt caſe, with a velocity of 1670 feet in a ſecond; in the ſecond caſe, with a velocity of 1550 feet in a ſecond; and in the third caſe, with a velocity of 1425 feet in a ſecond: ſo that, in paſſing through 50 feet of air, the bullet loſt a velocity of 120 or 125 feet in a ſecond; and the time of its paſſing through that ſpace being about $\frac{1}{75}$d or $\frac{1}{75}$th of a ſecond, the medium quantity of reſiſtance muſt, in theſe inſtances, have been about 120 times the weight of the ball; which (as the ball was nearly $\frac{1}{12}$th of a pound) amounts to about 10 lb avoirdupoiſe. THEORY.

" Now, if a computation be made according to the method laid down for compreſſed fluids in the 38th propoſition of Newton's *Principia*, ſuppoſing the weight of water to that of air as 850 to 1, it will be found, that the reſiſtance to a globe of $\frac{1}{4}$ of an inch diameter, moving with a velocity of about 1600 feet in a ſecond, will not, on theſe principles, amount to any more than $4\frac{1}{6}$ lb avoirdupoiſe; whence, as we know that the rules contained in that propoſition are very accurate with regard to ſlow motions, we may hence conclude, that the reſiſtance of the air in ſlow motions is leſs than that in ſwift motions, in the ratio of $4\frac{1}{6}$ to 10; a proportion between that of 1 to 2, and 1 to 3.

" Again, I charged the ſame piece a number of times with equal quantities of powder, and balls of the ſame weight, taking all poſſible care to give to every ſhot an equal velocity; and, firing three times againſt the pendulum placed only 25 feet from the mouth of the piece, the medium of the velocities with which the ball impinged was nearly that of 1690 feet in a ſecond: then removing the piece 175 feet from the pendulum, I found, taking the medium of five ſhots, that the velocity with which the ball impinged at this diſtance, was 1300 feet in a ſecond; whence the ball, in paſſing through 150 feet of air, loſt a velocity of about 390 feet in a ſecond; and the reſiſtance computed from theſe numbers, comes out ſomething more than in the preceding inſtance, it amounting here to between 11 and 12 pounds avoirdupoiſe; whence, according to theſe experiments, the reſiſting power of the air to ſwift motions is greater than to ſlow ones, in a ratio which approaches nearer to that of 3 to 1 than in the preceding experiments.

" Having thus examined the reſiſtance to a velocity of 1700 feet in a ſecond, I next examined the reſiſtance to ſmaller velocities: and for this purpoſe, I charged the ſame barrel with balls of the ſame diameter, but with leſs powder, and placing the pendulum at 25 feet diſtance from the piece, I fired againſt it five times with an equal charge each time: the medium velocity with which the ball impinged, was that of 1180 feet in a ſecond; then, removing the pendulum to the diſtance of 250 feet, the medium velocity of five ſhots, made at this diſtance, was that of 950 feet in a ſecond: whence the ball, in paſſing through 225 feet of air, loſt a velocity of 230 feet in a ſecond; and

THEORY. and as it paſſed through that interval in about $\frac{1}{3}$th of a ſecond, the reſiſtance to the middle velocity will come out to be near $33\frac{1}{7}$ times the gravity of the ball, or 2 lb. 10 oz. avoirdupoiſe. Now, the reſiſtance to the ſame velocity, according to the laws obſerved in ſlower motions, amounts to $\frac{1}{77}$ of the ſame quantity; whence, in a velocity of 1065 feet in a ſecond, the reſiſting power of the air is augmented in no greater a proportion than that of 7 to 11; whereas we have ſeen in the former experiments, that to ſtill greater degrees of velocity the augmentation approached very near the ratio of one to three.

" But farther, I fired three ſhot, of the ſame ſize and weight with thoſe already mentioned, over a large piece of water; ſo that their dropping into the water being very diſcernible, both the diſtance and time of their flight might be accurately aſcertained. Each ſhot was diſcharged with a velocity of 400 feet in a ſecond; and I had ſatisfied myſelf by many previous trials of the ſame charge with the pendulum, that I could rely on this velocity to ten feet in a ſecond. The firſt ſhot flew 313 yards in four ſeconds and a quarter, the ſecond flew 319 yards in four ſeconds, and the third 373 yards in five ſeconds and an half. According to the theory of reſiſtance eſtabliſhed for ſlow motions, the firſt ſhot ought to have ſpent no more than 3.2 ſeconds in its flight, the ſecond 3.28, and the third 4 ſeconds: whence it is evident that every ſhot was retarded conſiderably more than it ought to have been had that theory taken place in its motion; conſequently the reſiſtance of the air is very ſenſibly increaſed, even in ſuch a ſmall velocity as that of 400 feet in a ſecond.

" As no large ſhot are ever projected in practice with velocities exceeding that of 1700 feet in a ſecond, it will be ſufficient for the purpoſes of a practical gunner to determine the reſiſtance to all leſſer velocities, which may be thus exhibited. Let AB be taken to AC, in the ratio of 1700 feet in a ſecond to the given velocity to which the reſiſting power of the air is required. Continue the line AB to D, ſo that BD may be to AD, as the reſiſting power of the air to ſlow motions is to its reſiſting power to a velocity of 1700 feet in a ſecond; then ſhall CD be to AD, as the reſiſting power of the air to ſlow motions is to its reſiſting power to the given velocity repreſented by AC.

Plate CXLII. fig. 6.

" From the computations and experiments already mentioned, it plainly appears, that a leaden ball of $\frac{1}{2}$ of an inch diameter, and weighing nearly $1\frac{1}{4}$ oz. avoirdupoiſe, if it be fired from a barrel of 45 inches in length, with half its weight of powder, will iſſue from that piece with a velocity which, if it were uniformly continued, would carry it near 1700 feet in a ſecond.—If, inſtead of a leaden ball, an iron one, of an equal diameter, was placed in the ſame ſituation in the ſame piece, and was impelled by an equal quantity of powder, the velocity of ſuch an iron-bullet would be greater than that of the leaden one in the ſubduplicate ratio of the ſpecific gravities of lead and iron; and ſuppoſing that ratio to be as three to two, and computing on the principles already laid down, it will appear, that an iron-bullet of 24 lb. weight, ſhot from a piece of ten feet in length, with 16 lb. of powder, will acquire from the exploſion a velocity which, if uniformly continued, would carry it nearly 1650 feet in a ſecond. THEORY.

" This is the velocity, which, according to our theory, a cannon-ball of 24 lb weight is diſcharged with when it is impelled by a full charge of powder; but if, inſtead of a quantity of powder weighing two thirds of the ball, we ſuppoſe the charge to be only half the weight of it, then its velocity will on the ſame principles be no more than 1490 feet in a ſecond. The ſame would be the velocities of every leſſer bullet fired with the ſame proportions of powder, if the lengths of all pieces were conſtantly in the ſame ratio with the diameters of their bore: and although, according to the uſual dimenſions of the ſmaller pieces of artillery, this proportion does not always hold, yet the difference is not great enough to occaſion a very great variation from the velocities here aſſigned; as will be obvious to any one who ſhall make a computation thereon. But in theſe determinations we ſuppoſe the windage to be no more than is juſt ſufficient for putting down the bullet eaſily; whereas in real ſervice, either through negligence or unſkilfulneſs, it often happens, that the diameter of the bore ſo much exceeds the diameter of the bullet, that great part of the inflamed fluid eſcapes by its ſide; whence the velocity of the ſhot in this caſe may be conſiderably leſs than what we have aſſigned. However, this perhaps may be compenſated by the greater heat which in all probability attends the firing of theſe large quantities of powder.

24 Solution of the difficulty concerning point-blank ſhot.

" From this great velocity of cannon-ſhot we may clear up the difficulty concerning the point-blank ſhot which occaſioned the invention of Anderſon's ſtrange hypotheſis *. Here our author was deceived by his not knowing how greatly the primitive velocity of the heavieſt ſhot is diminiſhed in the courſe of its flight by the reſiſtance of the air. And the received opinion of practical gunners is not more difficult to account for; ſince, when they agree that every ſhot flies in a ſtraight line to a certain diſtance from the piece, which imaginary diſtance they have called the *extent of the point-blank ſhot*, we need only ſuppoſe, that, within that diſtance which they thus determine, the deviation of the path of the ſhot from a ſtraight line is not very perceptible in their method of pointing. Now, as a ſhot of 24 lb. fired with two thirds of its weight of powder will, at the diſtance of 500 yards from the piece, be ſeparated from the line of its original direction by an angle of little more than half a degree; thoſe who are acquainted with the inaccurate methods often uſed in the directing of cannon will eaſily allow, that ſo ſmall an aberration may not be attended to by the generality of practitioners, and the path of the ſhot may conſequently be deemed a ſtraight line; eſpecially as other cauſes of error will often intervene much greater than what ariſes from the incurvation of this line by gravity.

* See nº 5.

25 By increaſing the quantity of powder, the velocity of the ſhot will not continually increaſe.

" We have now determined the velocity of the ſhot, both when fired with two thirds of its weight and with half its weight of powder reſpectively; and on this occaſion I muſt remark, that on the principles of our theory, the increaſing the charge of powder will increaſe the velocity of the ſhot, till the powder arrives

THEORY. rives at a certain quantity; after which, if the powder be increaſed, the velocity of the ſhot will diminiſh. The quantity producing the greateſt velocity and the proportion between that greateſt velocity, and the velocity communicated by greater and leſſer charges, may be thus aſſigned. Let AB repreſent the axis of the piece; draw AC perpendicular to it, and to the aſymptotes AC and AB draw any hyperbola LF, and draw BF parallel to AC; find out now the point D, where the rectangle ADEG is equal to the hyperbolic area DEFB; then will AD repreſent that height of the charge which communicates the greateſt velocity to the ſhot: whence AD being to AB as 1 to 2.71828, as appears by the table of logarithms, from the length of the line AD thus determined, and the diameter of the bore, the quantity of powder contained in this charge is eaſily known. If, inſtead of this charge, any other filling the cylinder to the height AI be uſed, draw IH parallel to AC, and thro' the point H, to the ſame aſymptotes AC and AB deſcribe the hyperbola HK; then the greateſt velocity will be to the velocity communicated by the charge AI, in the ſubduplicate proportion of the rectangle AE to the ſame rectangle diminiſhed by the trilinear ſpace KKE.

Plate CXLII. fig. 6.

26 Exceeding great reſiſtance of the air.

"It hath been already ſhewn, that the reſiſtance of the air on the ſurface of a bullet of $\frac{1}{2}$ of an inch diameter moving with a velocity of 1670 feet in a ſecond, amounted to about 10 lb. It hath alſo been ſhewn, that an iron bullet weighing 24 lb. if fired with 16 lb. of powder (which is uſually eſteemed its proper battering charge) acquires a velocity of about 1650 feet in a ſecond, ſcarcely differing from the other: whence, as the ſurface of this laſt bullet is more than 54 times greater than the ſurface of a bullet of $\frac{1}{2}$ of an inch diameter, and their velocities are nearly the ſame, it follows, that the reſiſtance on the larger bullet will amount to more than 540 lb. which is near 23 times its own weight.

"The two laſt propoſitions are principally aimed againſt thoſe theoriſts who have generally agreed in ſuppoſing the flight of ſhot and ſhells to be nearly in the curve of a parabola. The reaſon given by thoſe authors for their opinion is the ſuppoſed inconſiderable reſiſtance of the air; ſince, as it is agreed on all ſides that the track of projectiles would be a perfect parabola if there was no reſiſtance, it has from thence been too raſhly concluded, that the interruption which the ponderous bodies of ſhells and bullets would receive from ſuch a rare medium as air would be ſcarcely ſenſible, and conſequently that their parabolic flight would be hereby ſcarcely affected.

"Now the prodigious reſiſtance of the air to a bullet of 24 lb. weight, ſuch as we have here eſtabliſhed it, ſufficiently confutes this reaſoning; for how erroneous muſt that hypotheſis be, which neglects, as inconſiderable, a force amounting to more than 20 times the weight of the moving body?" But here it is neceſſary to aſſume a few particulars, the demonſtrations of which, on the commonly received principles, may be ſeen under the article PROJECTILES.

27 Common maxims concerning the motion of projectiles.

"1. If the reſiſtance of the air be ſo ſmall, that the motion of a projected body is in the curve of a parabola; then the axis of that parabola will be perpendicular to the horizon; and conſequently the part of the curve in which the body aſcends will be equal and ſimilar to that in which it deſcends.

"2. If the parabola in which the body moves, be terminated on a horizontal plane; then the vertex of the parabola will be equally diſtant from its two extremities.

"3. Alſo the moving body will fall on that horizontal plane in the ſame angle, and with the ſame velocity with which it was firſt projected.

"4. If a body be projected in different angles, but with the ſame velocity; then its greateſt horizontal range will be when it is projected in an angle of 45 with the horizon.

"5. If the velocity with which the body is projected be known, then this greateſt horizontal range may be thus found. Compute, according to the common theory of gravity, what ſpace the projected body ought to fall through to acquire the velocity with which it is projected: then twice that ſpace will be the greateſt horizontal range, or the horizontal range when the body is projected in an angle of 45° with the horizon.

"6. The horizontal ranges of a body, when projected with the ſame velocity at different angles, will be between themſelves as the ſines of twice the angle in which the line of projection is inclined to the horizon.

"7. If a body is projected in the ſame angle with the horizon, but with different velocities; the horizontal ranges will be in the duplicate proportion of thoſe velocities.

28 Prodigious errors of the common theory.

"Theſe poſtulates which contain the principles of the modern art of gunnery, are all of them falſe: for it hath been already ſhewn, that a muſket-ball $\frac{1}{4}$ of an inch in diameter, fired with half its weight of powder, from a piece 45 inches long, moves with a velocity of near 1700 feet in a ſecond. Now, if this ball flew in the curve of a parabola, its horizontal range at 45° would be found by the fifth poſtulate to be about 17 miles. But all the practical writers aſſure us, that this range is really ſhort of half a mile. Diego Ufano aſſigns to an arquebuſs, four feet in length, and carrying a leaden ball of $1\frac{1}{2}$ oz. weight (which is very near our dimenſions), an horizontal range of 797 common paces, when it is elevated between 40 and 50 degrees, and charged with a quantity of fine powder equal in weight to the ball. Merſennus alſo tells us, that he found the horizontal range of an arquebuſs at 45° to be leſs than 400 fathom, or 800 yards; whence, as either of theſe ranges are ſhort of half an Engliſh mile, it follows, that a muſket ſhot, when fired with a reaſonable charge of powder at the elevation of 45°, flies not $\frac{1}{17}$ part of the diſtance it ought to do if it moved in a parabola. Nor is this great contraction of the horizontal range to be wondered at, when it is conſidered, that the reſiſtance of this bullet, when it firſt iſſues from the piece, amounts to 120 times its gravity, as hath been experimentally demonſtrated, n° 23.

"To prevent objections, our next inſtance ſhall be in an iron bullet of 24 lb weight, which is the heavieſt in common uſe for land-ſervice. Such a bullet fired from a piece of the common dimenſions with its greateſt allotment of powder hath a velocity of 1650 feet in ſecond, as already ſhewn. Now, if the horizontal range of this ſhot, at 45°, be computed

THEORY. on the parabolic hypothefis by the fifth poſtulate, it will come out to be about 16 miles, which is between five and ſix times its real quantity; for the practical writers all agree in making it leſs than three miles.

"But farther, it is not only when projectiles move with theſe very great velocities, that their flight ſenſibly varies from the curve of a parabola; the ſame aberration often takes place in ſuch as move ſlow enough to have their motion traced out by the eye: for there are few projectiles that can be thus examined, which do not viſibly diſagree with the firſt, ſecond, and third poſtulate; obviouſly deſcending thro' a curve, which is ſhorter and leſs inclined to the horizon than that in which they aſcended. Alſo the higheſt point of their flight, or the vertex of the curve, is much nearer the place where they fall to the ground than to that from whence they were at firſt diſcharged.

"I have found too by experience; that the fifth, ſixth, and ſeventh poſtulates are exceſſively erroneous, when applied to the motions of bullets moving with ſmall velocities. A leaden bullet $\frac{1}{8}$ of an inch in diameter, diſcharged with a velocity of about 400 feet in a ſecond, and in an angle of 19° 5′ with the horizon, ranged on the horizontal plane no more than 448 yards: whereas its greateſt horizontal range, being found by the fifth poſtulate, to be at leaſt 1700 yards, the range at 19° 5′ ought by the ſixth poſtulate to have been 1050 yards; whence, in this experiment, the range was not $\frac{1}{4}$ of what it muſt have been, had the commonly received theory been true."

39 Rotatory motion of bullets a great ſource of deflection.

From this and other experiments it is clearly proved, that the track deſcribed by the flight even of the heavieſt ſhot, is neither a parabola, nor approaching to a parabola, except when they are projected with very ſmall velocities. The nature of the curve really deſcribed by them is explained under the article PROJECTILES. But as a ſpecimen of the great complication of that ſubject, we ſhall here inſert an account of a very extraordinary circumſtance which frequently takes place therein.

"As gravity acts perpendicularly to the horizon, it is evident, that if no other power but gravity deflected a projected body from its courſe, its motion would be conſtantly performed in a plane perpendicular to the horizon, paſſing through the line of its original direction: but we have found, that the body in its motion often deviates from this plane; ſometimes to the right hand, and at other times to the left; and this in an incurvated line, which is convex towards that plane: ſo that the motion of a bullet is frequently in a line having a double curvature, it being bent towards the horizon by the force of gravity, and again bent out of its original direction to the right or left by ſome other force: in this caſe no part of the motion of the bullet is performed in the ſame plane, but its track will lie in the ſurface of a kind of cylinder, whoſe axis is perpendicular to the horizon.

"This propoſition may be indiſputably proved by the experience of every one in the leaſt converſant with the practice of gunnery. The ſame piece which will carry its bullet within an inch of the intended mark at 10 yards diſtance, cannot be relied on to 10 inches in 100 yards, much leſs to 30 inches in 300 yards. Now this inequality can only ariſe from the tract of the bullet being incurvated ſideways as well as downwards: for by this means the diſtance between that incurvated line and the line of direction will increaſe in a much greater ratio than that of the diſtance; theſe lines being coincident at the mouth of the piece, and afterwards ſeparating in the manner of a curve and its tangent, if the mouth of the piece be conſidered as the point of contact.—To put this matter out of all doubt, however, I took a barrel carrying a ball $\frac{1}{8}$ of an inch diameter, and fixing it on a heavy carriage, I ſatisfied myſelf of the ſteadineſs and truth of its direction, by firing at a board $1\frac{1}{2}$ feet ſquare, which was placed at 180 feet diſtance; for I found, that in 16 ſucceſſive ſhot I miſſed the mark but once. Now, the ſame barrel being fixed on the ſame carriage, and fired with a ſmaller quantity of powder, ſo that the ſhock on the diſcharge would be much leſs, and conſequently the direction leſs changed, I found, that at 760 yards diſtance, the ball flew ſometimes 100 yards to the right of the line it was pointed on, and ſometimes as much to the left. I found too, that its direction in the perpendicular line was not leſs uncertain, it falling one time above 200 yards ſhort of what it did at another; although, by the niceſt examination of the piece after the diſcharge, it did not appear to have ſtarted in the leaſt from the poſition it was placed in.

"The reality of this doubly curvated tract being thus demonſtrated, it may perhaps be aſked, What can be the cauſe of a motion ſo different from what has been hitherto ſuppoſed? And to this I anſwer, that the deflection in queſtion muſt be owing to ſome power acting obliquely to the progreſſive motion of the body; which power can be no other than the reſiſtance of the air. If it be farther aſked, How the reſiſtance of the air can ever come to be oblique to the progreſſive motion of the body? I farther reply, that it may ſometimes ariſe from inequalities in the reſiſted ſurface; but that its general cauſe is doubtleſs a whirling motion acquired by the bullet about its axis: for by this motion of rotation, combined with the progreſſive motion, each part of the bullet's ſurface will ſtrike the air very differently from what it would do if there was no ſuch whirl; and the obliquity of the action of the air ariſing from this cauſe, will be greater as the motion of the bullet is greater in proportion to its progreſſive one.

"This whirling motion undoubtedly ariſes from the friction of the bullet againſt the ſides of the piece: and as the rotatory motion will in ſome part of its revolution conſpire with the progreſſive one, and in another part be equally oppoſed to it; the reſiſtance of the air on the fore part of the bullet will be hereby affected, and will be increaſed in that part where the whirling motion conſpires with the progreſſive one, and diminiſhed where it is oppoſed to it: and by this means, the whole effort of the reſiſtance, inſtead of being oppoſite to the direction of the body, will become oblique thereto, and will produce thoſe effects already mentioned. If it was poſſible to predict the poſition of the axis round which the bullet ſhould whirl, and if that axis was unchangeable during the whole flight of the bullet, then the aberration of the bullet by this oblique force would be in a

THEORY.

THEORY. a given direction; and the incurvation produced thereby, would regularly extend the same way from one end of its track to the other. For instance, if the axis of the whirl was perpendicular to the horizon, then the incurvation would be to the right or left. If that axis was horizontal, and perpendicular to the direction of the bullet, then the incurvation would be upwards or downwards. But as the first position of this axis is uncertain, and as it may perpetually shift in the course of the bullet's flight; the deviation of the bullet is not necessarily either in one certain direction, or tending to the same side in one part of its track that it does in another, but more usually is continually changing the tendency of its deflection, as the axis round which it whirls must frequently shift its position to the progressive motion by many inevitable accidents.

" That a bullet generally acquires such a rotatory motion, as here described, is, I think, demonstrable; however, to leave no room for doubt or dispute, I confirmed it, as well as some other parts of my theory, by the following experiments.

30 Machine for measuring the air's resistance.

" I caused the machine to be made, represented, Plate CXLII. fig. 7. BCDE, is a brass-barrel, moveable on its axis, and so adjusted by means of friction-wheels, not represented in the figure, as to have no friction worth attending to. The frame in which this barrel is fixed is so placed, that its axis may be perpendicular to the horizon. The axis itself is continued above the upper plate of the frame, and has fastened on it a light hollow cone, AFG. From the lower part of this cone, there is extended a long arm of wood, GH, which is very thin, and cut feather-edged. At its extremity, there is a contrivance for fixing on the body, whose resistance is to be investigated, (as here the globe P); and to prevent the arm GH from swaying out of its horizontal position by the weight of the annexed body P, there is a brace, AH, of fine wire, fastened to the top of the cone which supports the end of the arm.

" Round the barrel BCDE, there is wound a fine silk line, the turns of which appear in the figure; and after this line hath taken a sufficient number of turns, it is conducted nearly in a horizontal direction to the pully L over which it is passed, and then a proper weight M is hung to its extremity. If this weight be left at liberty, it is obvious that it will descend by its own gravity, and will, by its descent, turn round the barrel BCDE, together with the arm GH, and the body P fastened to it. And whilst the resistance on the arm GH and on the body P is less than the weight M, that weight will accelerate its motion; and thereby the motion of GH and P will increase, and consequently their resistance will increase, till at last this resistance and the weight M become nearly equal to each other. The motion with which M descends, and with which P revolves, will not then sensibly differ from an equable one. Whence, it is not difficult to conceive, that, by proper observations made with this machine, the resistance of the body P may be determined. The most natural method of proceeding in this investigation, is as follows: Let the machine first have acquired its equable motion, which it will usually do in about five or six turns from the beginning; and then let it be observed, by counting a number of turns, what time is taken up by one revolution of the body P: then taking off the body P and the weight M, let it be examined what smaller weight will make the arm GH revolve in the same time as when P was fixed to it: this smaller weight being taken from M, the remainder is obviously equal in effort to the resistance of the revolving body P; and this remainder being reduced in the ratio of the length of the arm to the semidiameter of the barrel, will then become equal to the absolute quantity of the resistance. And as the time of one revolution is known, and consequently the velocity of the revolving body, there is hereby discovered the absolute quantity of the resistance to the given body P moving with a given degree of celerity. THEORY.

" Here, to avoid all objections, I have generally chose, when the body P was removed, to fix in its stead a thin piece of lead of the same weight, placed horizontally; so that the weight which was to turn round the arm GH, without the body P, did also carry round this piece of lead. But mathematicians will easily allow that there was no necessity for this precaution.—The diameter of the barrel BCDE, and of the silk string wound round it, was 2.06 inches. The length of the arm GH, measured from the axis to the surface of the globe P, was 49.5 inches. The body P, the globe made use of, was of pasteboard; its surface very neatly coated with marbled-paper. It was not much distant from the size of a 12 lb. shot, being in diameter 4.5 inches, so that the radius of the circle described by the centre of the globe was 51.75 inches. When this globe was fixed at the end of the arm, and a weight of half a pound was hung at the end of the string at M, it was examined how soon the motion of the descending weight M, and of the revolving body P, would become equable as to sense. With this view, three revolutions being suffered to elapse, it was found that the next 10 were performed in $27''\frac{1}{4}$, 20 in less than 55", and 30 in $82''\frac{1}{4}$; so that the first ten were performed in $27''\frac{1}{4}$, the second in $27''\frac{1}{2}$, and the third in $27''\frac{1}{2}$.

" These experiments sufficiently evince, that even with half a pound, the smallest weight made use of, the motion of the machine was sufficiently equable after the first three revolutions.

" The globe above-mentioned being now fixed at the end of the arm, there was hung on at M a weight of $3\frac{1}{4}$ lb; and ten revolutions being suffered to elapse, the succeeding 20 were performed in $21''\frac{1}{4}$. Then the globe being taken off, and a thin plate of lead, equal to it in weight, placed in its room; it was found, that instead of $3\frac{1}{4}$ lb. a weight of one pound would make it revolve in less time than it did before; performing now 20 revolutions after 10 were elapsed, in the space of 19".

" Hence then it follows, that from the $3\frac{1}{4}$ lb. first hung on, there is less than 1 lb. to be deducted for the resistance on the arm; and consequently the resistance on the globe itself is not less than the effort of $2\frac{1}{4}$ lb. in the situation M; and it appearing from the former measures, that the radius of the barrel is nearly $\frac{1}{10}$ of the radius of the circle, described by the centre of the globe; it follows, that the absolute resistance of the globe, when it revolves 20 times in $21''\frac{1}{4}$, (about 25 feet in a second), is not less than the fiftieth part of two pounds and a quarter, or of 36 ounces; and

and this being conſiderably more than half an ounce, and the globe nearly the ſize of a twelve-pound ſhot, it irrefragrably confirms a propoſition I had formerly laid down from theory, that the reſiſtance of the air to a twelve-pound iron ſhot, moving with a velocity of 25 feet in a ſecond, is not leſs than half an ounce.

" The reſt of the experiments were made, in order to confirm another propoſition, namely, that the reſiſtance of the air within certain limits is nearly in the duplicate proportion of the velocity of the reſiſted body. To inveſtigate this point, there were ſucceſſively hung on at M, weights in the proportion of the numbers 1, 4, 9, 16; and letting 10 revolutions firſt elapſe, the following obſervations were made on the reſt.—With $\frac{1}{4}$ lb. the globe went 20 turns in $54''\frac{2}{3}$, with 2 lb. it went 20 turns in $27''\frac{1}{2}$, with $4\frac{1}{4}$ lb. it went 30 turns in $27\frac{1}{2}$, and with 8 lb. it went 40 turns in $27\frac{1}{2}$.—Hence it appears, that to reſiſtances proportioned to the numbers 1, 4, 9, 16, there correſpond velocities of the reſiſted body in the proportion of the numbers 1, 2, 3, 4: which proves, with great nicety, the propoſition above-mentioned.

" With regard to the rotatory motion, the firſt experiment was to evince, that the whirling motion of a ball combining with its progreſſive motion, would produce ſuch an oblique reſiſtance and deflective power as already mentioned. For this purpoſe a wooden ball of $4\frac{1}{2}$ inches diameter was ſuſpended by a double ſtring, about eight or nine feet long. Now, by turning round the ball and twiſting the double ſtring, the ball when left to itſelf would have a revolving motion given it from the untwiſting of the ſtring again. And if, when the ſtring was twiſted, the ball was drawn to a conſiderable diſtance from the perpendicular, and there let go; it would at firſt, before it had acquired its revolving motion, vibrate ſteadily enough in the ſame vertical plane in which it firſt began to move: but when, by the untwiſting of the ſtring, it had acquired a ſufficient degree of its whirling motion, it conſtantly deflected to the right or left of its firſt track; and ſometimes proceeded ſo far as to have its direction at right angles to that in which it began its motion; and this deviation was not produced by the ſtring itſelf, but appeared to be entirely owing to the reſiſtance being greater on the one part of the leading ſurface of the globe, than the other. For the deviation continued when the ſtring was totally untwiſted; and even during the time that the ſtring, by the motion the globe had received, was twiſting the contrary way. And it was always eaſy to predict before the ball was let go, which way it would deflect, only by conſidering on which ſide the whirl would be combined with the progreſſive motion; for on that ſide always the deflective power acted, as the reſiſtance was greater here than on the ſide where the whirl and progreſſive motion were oppoſed to one another."

Though Mr Robins conſidered this experiment as an inconteſtable proof of the truth of his theory, he undertook to give ocular demonſtration of this deflection of muſket-bullets even in the ſhort ſpace of 100 yards.

" As all projectiles," ſays he, " in their flight, are acted upon by the power of gravity, the deflection of a bullet from its primary direction, ſuppoſes that deflection to be upwards or downwards in a vertical plane; becauſe, in the vertical plane, the action of gravity is compounded and entangled with the deflective force. And for this reaſon my experiments have been principally directed to the examination of that deflection which carries the bullet to the right or left of that plane in which it began to move. For if it appears at any time that the bullet has ſhifted from that vertical plane in which the motion began, this will be an inconteſtable proof of what we have advanced.—Now, by means of ſcreens of exceeding thin paper, placed parallel to each other at proper diſtances, this deflexion in queſtion may be many ways inveſtigated. For by firing bullets which ſhall traverſe theſe ſcreens, the flight of the bullet may be traced; and it may eaſily appear whether they do or do not keep invariably to one vertical plane. This examination may proceed on three different principles, which I ſhall here ſeparately explain.

" For firſt, an exactly vertical plane may be traced out upon all theſe ſcreens, by which the deviation of any ſingle bullet may be more readily inveſtigated, only by meaſuring the horizontal diſtance of its trace from the vertical plane thus delineated; and by this means the abſolute quantity of its aberration may be known. Or if the deſcription of ſuch a vertical plane ſhould be eſteemed a matter of difficulty and nicety, a ſecond method may be followed; which is that of reſting the piece in ſome fixed notch or ſocket, ſo that though the piece may have ſome little play to the right and left, yet all the lines in which the bullet can be directed ſhall interſect each other in the centre of that fixed ſocket: by this means, if two different ſhot are fired from the piece thus ſituated, the horizontal diſtances made by the two bullets on any two ſcreens ought to be in the ſame proportion to each other as the reſpective diſtances of the ſcreens from the ſocket in which the piece was laid. And if theſe horizontal diſtances differ from that proportion, then it is certain that one of the ſhot at leaſt hath deviated from a vertical plane, although the abſolute quantity of that deviation cannot hence be aſſigned; becauſe it cannot be known what part of it is to be imputed to one bullet, and what to the other.

" But if the conſtant and invariable poſition of the notch or ſocket in which the piece was placed, be thought too hard an hypotheſis in this very nice affair; the third method, and which is the ſimpleſt of all, requires no more than that two ſhot be fired through three ſcreens without any regard to the poſition of the piece each time: for in this caſe, if the ſhots diverge from each other, and both keep to a vertical plane, then if the horizontal diſtances of their traces on the firſt ſcreen be taken from the like horizontal diſtances on the ſecond and third, the two remainders will be in the ſame proportion with the diſtances of the ſecond and third ſcreen from the firſt. And if they are not in this proportion, then it will be certain that one of them at leaſt hath been deflected from the vertical plane; though here, as in the laſt caſe, the quantity of that deflexion in each will not be known.

" All theſe three methods I have myſelf made uſe of at different times, and have ever found the ſucceſs agreeable to my expectation. But the moſt eligible method ſeemed to be a compound of the two laſt. The apparatus was as follows.—Two ſcreens were ſet

31 Remarkable deviations of bullets to the right and left.

THEORY. fet up in the large walk in the charter-houſe garden; the firſt of them at 250 feet diſtance from the wall, which was to ſerve for a third ſcreen; and the ſecond 200 feet from the ſame wall. At 50 feet before the firſt ſcreen, or at 300 feet from the wall, there was placed a large block weighing about 200 lb. weight, and having fixed into it an iron bar with a ſocket at its extremity, in which the piece was to be laid. The piece itſelf was of a common length, and bored for an ounce ball. It was each time loaded with a ball of 17 to the pound; ſo that the windage was extremely ſmall, and with a quarter of an ounce of good powder. The ſcreens were made of the thineſt ſine paper; and the reſiſtance they gave to the bullet, (and conſequently their probability of deflecting it) was ſo ſmall, that a bullet lighting one time near the extremity of one of the ſcreens, left a fine thin fragment of it towards the edge entire, which was ſo very weak that it was difficult to handle it without breaking. Theſe things thus prepared, five ſhot were made with the piece reſted in the notch abovementioned; and the horizontal diſtances between the firſt ſhot, which was taken as a ſtandard, and the four ſucceeding ones, both on the firſt and ſecond ſcreen and on the wall, meaſured in inches, were as follows:

	1ſt Screen.	2d Screen.	Wall.
1 to 2	1,75 R.	3,15 R.	16,7 R.
3	10 L.	15,6 L.	69,25 L.
4	1,25 L.	4,5 L.	15,0 L.
5	2,15 L.	5,1 L.	19,0 L.

" Here the letters R and L denote that the ſhot in queſtion went either to the right or left of the firſt.

" If the poſition of the ſocket in which the piece was placed be ſuppoſed fixed, then the horizontal diſtances meaſured above on the firſt and ſecond ſcreen, and on the wall, ought to be in proportion to the diſtances of the firſt ſcreen, the ſecond ſcreen, and the wall from the ſocket. But by only looking over theſe numbers, it appears, that none of them are in that proportion; the horizontal diſtance of the firſt and third, for inſtance, on the wall being above nine inches more than it ſhould be by this analogy.

" If, without ſuppoſing the invariable poſition of the ſocket, we examine the comparative horizontal diſtances according to the third method deſcribed above, we ſhall in this caſe diſcover divarications ſtill more extraordinary; for, by the numbers ſet down, it appears, that the horizontal diſtances of the ſecond and third ſhot on the two ſcreens, and on the wall, are as under.

1ſt Screen.	2d Screen.	Wall.
11.75	18.75	83.95

Here, if, according to the rule given above, the diſtance on the firſt ſcreen be taken from the diſtances on the other two, the remainder will be 7, and 74.2: and theſe numbers, if each ſhot kept to a vertical plane, ought to be in the proportion of 1 to 5; that being the proportion of the diſtances of the ſecond ſcreen and of the wall from the firſt: but the laſt number 74.2 exceeds what it ought to be by this analogy by 39.2; ſo that between them there is a deviation from the vertical plane of above 39 inches, and this too in a tranſit of little more than 80 yards.

" But farther, to ſhew that theſe irregularities do not depend on any accidental circumſtance of the balls fitting or not fitting the piece, there were five ſhots more made with the ſame quantity of powder as before; but with ſmaller bullets, which ran much looſer in the piece. And the horizontal diſtances being meaſured in inches from the trace of the firſt bullet to each of the ſucceeding ones, the numbers were as under. THEORY.

	1ſt Screen.	2d Screen.	Wall.
1 to 2	15.6 R.	31.1 R.	94 0 R.
3	6.4 L.	12.75 L.	23.0 L.
4	4.7 R.	8.5 R.	15.5 R.
5	12.6 R.	24 0 R.	63.5 R.

Here, again, on the ſuppoſed fixed poſition of the piece, the horizontal diſtance on the wall between the firſt and third will be found above 15 inches leſs than it ſhould be if each kept to a vertical plane; and like irregularities, though ſmaller, occur in every other experiment. And if they are examined according to the third method ſet down above, and the horizontal diſtances of the third and fourth, for inſtance, are compared, thoſe on the firſt and ſecond ſcreen, and on the wall, appear to be thus.

1ſt Screen.	2d Screen.	Wall.
11.1.	21.25.	38.5.

And if the horizontal diſtance on the firſt ſcreen be taken from the other two, the remainders will be 10.15, and 27.4; where the leaſt of them, inſtead of being five times the firſt, as it ought to be, is 23.35 ſhort of it; ſo that here is a deviation of 23 inches.

" From all theſe experiments, the deflection in queſtion ſeems to be inconteſtably evinced. But to give ſome farther light to this ſubject, I took a barrel of the ſame bore with that hitherto uſed; and bent it at about three or four inches from its muzzle to the left, the bend making an angle of three or four degrees with the axis of the piece. This piece thus bent was fired with a looſe ball, and the ſame quantity of powder hitherto uſed, the ſcreens of the laſt experiment being ſtill continued. It was natural to expect, that if this piece was pointed by the general direction of its axis, the ball would be canted to the left of that direction by the bend near its mouth. But as the bullet, in paſſing through that bent part, would, as I conceived, be forced to roll upon the right-hand ſide of the barrel, and thereby its left ſide would turn up againſt the air, and would increaſe the reſiſtance on that ſide; I predicted to the company then preſent, that if the axis, on which the bullet whirled, did not ſhift its poſition after it was ſeparated from the piece; then, notwithſtanding the bend of the piece to the left, the bullet itſelf might be expected to incurvate towards the right; and this, upon trial, did moſt remarkably happen. For, one of the bullets fired from this bent piece, paſſed through the firſt ſcreen about 1¼ inch diſtant from the trace of one of the ſhot fired from the ſtraight piece in the laſt ſet of experiments. On the ſecond ſcreen, the traces of the ſame bullets were about three inches diſtant; the bullet from the crooked piece paſſing on both ſcreens to the left of the other: but, comparing the places of theſe bullets on the wall, it appeared, that the bullet from the crooked piece, though it diverged from the track on the two ſcreens, had now croſſed that track, and was deflected conſiderably to the right of it; ſo that it was obvious, that though the bullet from the crooked piece might firſt be canted to the left, and had diverged from the track of the

THEORY. other bullet with which it was compared, yet by degrees it deviated again to the right, and a little beyond the fecond fcreen croffed that track from which it before diverged, and on the wall was deflected 14 inches, as I remember, on the contrary fide. And this experiment is not only the moft convincing proof of the reality of this deflection here contended for; but is likewife the ftrongeft confirmation that it is brought about in the very manner and by the very circumftances which we have all along defcribed.

" I have only now to add, that as I fufpected the conſideration of the revolving motion of the bullet, compounded with its progreffive one, might be conſidered as a fubject of mathematical fpeculation, and that the reality of any deflecting force thence arifing might perhaps be denied by fome computifts upon the principles hitherto received of the action of fluids; I thought proper to annex a few experiments, with a view of evincing the ſtrange deficiency of all theories of this fort hitherto eſtabliſhed, and the unexpected and wonderful varieties which occur in theſe matters: The propoſition which I advanced for this purpoſe being, That two equal ſurfaces meeting the air with the ſame degree of obliquity, may be ſo differently reſiſted, that though in one of them the reſiſtance is leſs than that of a perpendicular ſurface meeting the ſame quantity of air, yet in another it ſhall be conſiderably greater.

32 Strange anomaly in the reſiſtance of the air.

" To make out this propoſition, I made uſe of the machine already deſcribed: and having prepared a paſteboard pyramid, whoſe baſe was four inches ſquare, and whoſe planes made angles of 45° with the plane of its baſe; and alſo a parallellogram four inches in breadth, and $5\frac{7}{8}$ in length, which was equal to the ſurface of the pyramid, the globe P was taken off from the machine, and the pyramid was firſt fixed on; and 2 lb. being hung at M, and the pyramid ſo fitted as to move with its vertex forwards, it performed 20 revolutions after the firſt ten were elapſed, in 33″. Then the pyramid being turned, ſo that its baſe, which was a plane of four inches ſquare, went foremoſt, it now performed 20 revolutions with the ſame weight in $38''\frac{1}{2}$.—After this, taking off the pyramid, and fixing on the parallellogram with its longer ſide perpendicular to the arm, and placing its ſurface in an angle of 45° with the horizon by a quadrant, the parallellogram, with the ſame weight, performed 20 revolutions in $43''\frac{1}{2}$.

" Now here this parallellogram and the ſurface of the pyramid are equal to each other, and each of them met the air in an angle of 45°; and yet one of them made 20 revolutions in 33″, whilſt the other took up $43\frac{1}{2}$. And at the ſame time it appears, that a flat ſurface, ſuch as the baſe of a pyramid, which meets the ſame quantity of air perpendicularly, makes 20 revolutions in $38''\frac{1}{2}$, which is the medium between the other two.

" But to give another, and ſtill more ſimple, proof of this principle; there was taken a parallellogram four inches broad, and $8\frac{1}{2}$ long. This being fixed at the end of the arm, with its long ſide perpendicular thereto, and being placed in an angle of 45° with the horizon, there was a weight hung on at M of $3\frac{1}{2}$ lb. with which the parallellogram made 20 revolutions in $40''\frac{3}{4}$. But after this, the poſition of the parallellogram was ſhifted, and it was placed with its ſhorter ſide perpendicular to the arm, though its ſurface was ſtill inclined to an angle of 45° with the horizon; and now, inſtead of going ſlower, as might be expected from the greater extent of part of its ſurface from the axis of the machine, it went round much faſter: for in this laſt ſituation it made 20 revolutions in $35''\frac{1}{4}$, ſo that there were 5″ difference in the time of 20 revolutions; and this from no other change of circumſtance than as the larger or ſhorter ſide of the oblique plane was perpendicular to the line of its direction." THEORY.

33 Why the art of gunnery cannot become perfect.

Theſe are the principal experiments made by Mr Robins, in confirmation of his theory, and which not only far exceed every thing that had been formerly done, but even bid fair for advancing the art of gunnery to its *ne plus ultra*. It muſt be obſerved, however, that in this art it is impoſſible we ſhould ever arrive at abſolute perfection; that is, it can never be expected that a gunner, by any method of calculation whatever, could be enabled to point his guns in ſuch a manner, that the ſhot would hit the mark if placed any where within its range. Aberrations which can by no means be either foreſeen or prevented, will take place from a great number of different cauſes. A variation in the denſity of the atmoſphere, in the dampneſs of the powder, or in the figure of the ſhot, will cauſe variations in the range of the bullet, which cannot by any means be reduced to rules, and conſequently muſt render the event of each ſhot very precarious. The reſiſtance of the atmoſphere ſimply conſidered, without any of thoſe anomalies ariſing from its denſity at different times, is a problem, which, notwithſtanding the labours of Mr Robins and others, hath not been completely ſolved: and indeed, if we conſider the matter in a phyſical light, we ſhall find, that without ſome other data than thoſe which are yet obtained, an exact ſolution of it is impoſſible.

34 The air acts as a moving power as well as a reſiſting one.

It is an objection that hath been made to the mathematical philoſophy, and to which in many caſes it is moſt certainly liable, that it conſiders the *reſiſtance* of matter more than its capacity of giving motion to other matter. Hence, if in any caſe matter acts both as a reſiſting and a moving power, and the mathematician overlooks its effort towards motion, founding his demonſtrations only upon its property of reſiſting, theſe demonſtrations will certainly be falſe, tho' they ſhould be ſupported by all the powers of geometry. It is to an error of this kind that we are to attribute the great differences already taken notice of between the calculations of Sir Iſaac Newton, with regard to the reſiſting force of fluids, and what actually takes place upon trial. Theſe calculations were made upon the ſuppoſition that the fluid through which a body moved could do nothing elſe but reſiſt it; yet it is certain, that the air (the fluid with which we have to do at preſent) proves a ſource of *motion*, as well as reſiſtance, to all bodies which move in it.

Plate CXLII. fig. 8.

To underſtand this matter fully, let ABC repreſent a crooked tube made of any ſolid matter, and *a*, *b*, two piſtons which exactly fill the cavity. If the ſpace between theſe piſtons is full of air, it is plain they cannot come into contact with each other on account of the elaſticity of the included air, but will remain at ſome certain diſtance as repreſented in the figure. If the piſton *b* is drawn up, the air which preſſes in the direc-

tion

THEORY. tion Cb acts as a reſiſting power, and the piſton will not be drawn up with ſuch eaſe as if the whole was *in vacuo*. But though the column of air preſſing in the direction Cb acts as a reſiſting power on the piſton b, the column preſſing in the direction Aa will act as a moving power upon the piſton a. It is therefore plain, that if b is moved upwards till it comes to the place marked d, the other will deſcend to that marked c. Now if we ſuppoſe the piſton a to be removed, it is plain, that when b is pulled upwards to d, the air deſcending through the leg $AaCB$ will preſs on the under ſide of the piſton b, as ſtrongly as it would have done upon the upper ſide of the piſton a, had it been preſent. Therefore, though the air preſſing down thro' the leg CB reſiſts the motion of the piſton b when drawn upwards, the air preſſing down through the leg AB forwards it as much; and accordingly the piſton b may be drawn up or puſhed down at pleaſure, and with very little trouble. But if the orifice at A is ſtopped, ſo that the air can only exert its reſiſting power on the piſton b, it will require a conſiderable degree of ſtrength to move the piſton from b to d.

If now we ſuppoſe the tube to be entirely removed (which indeed anſwers no other purpoſe than to render the action of the air more evident), it is plain, that if the piſton is moved either up or down, or in any other direction we can imagine, the air preſſes as much upon the back part of it, as it reſiſts it on the fore part; and of conſequence, a ball moving through the air with any degree of velocity, ought to be as much accelerated by the action of the air behind, as it is retarded by the action of that before.—Here then it is natural to aſk, If the air accelerates a moving body as much as it retards it, how comes it to make any reſiſtance at all? yet certain it is, that this fluid doth reſiſt, and that very conſiderably. To this it may be anſwered, that the air is always kept in ſome certain ſtate or conſtitution by another power which rules all its motions, and it is this power undoubtedly which gives the reſiſtance. It is not to our purpoſe at preſent to inquire what that power is; but we ſee that the air is often in very different ſtates: one day, for inſtance, its parts are violently agitated by a ſtorm; and another, perhaps, they are comparatively at reſt in a calm. In the firſt caſe, nobody heſitates to own, that the ſtorm is occaſioned by ſome cauſe or other, which violently reſiſts any other power that would prevent the agitation of the air. In a calm, the caſe is the ſame; for it would require the ſame exertion of power to excite a tempeſt in a calm day, as to allay a tempeſt in a ſtormy one. Now it is evident, that all projectiles, by their motion, agitate the atmoſphere in an unnatural manner; and conſequently are reſiſted by that power, whatever it is, which tends to reſtore the equilibrium, or bring back the atmoſphere to its former ſtate.

If no other powers beſides that above-mentioned acted upon projectiles, it is probable, that all reſiſtance to their motion would be in the duplicate proportion of their velocities; and accordingly, as long as the velocity is ſmall, we find it generally is ſo. But when the velocity comes to be exceedingly great, other ſources of reſiſtance ariſe. One of theſe, is a ſubtraction of part of the moving power; which though not properly a *reſiſtance*, or oppoſing another power to it, is an equivalent thereto. This ſubtraction ariſes from the following cauſe. The air, as we have already obſerved, preſſes upon the hinder part of the moving body by its gravity, as much as it reſiſts the forepart of it by the ſame property. Nevertheleſs, the velocity with which the air preſſes upon any body by means of its gravity, is limited; and it is poſſible that a body may change its place with ſo great velocity that the air hath not time to ruſh in upon the back part of it, in order to aſſiſt its progreſſive motion. When this happens to be the caſe, there is in the firſt place a deficiency of the moving power equivalent to 15 pounds on every ſquare inch of ſurface; at the ſame time that there is a poſitive reſiſtance of as much more on the forepart, owing to the gravity of the atmoſphere, which muſt be overcome before the body can move forward. THEORY.

This deficiency of moving power, and increaſe of reſiſtance, do not only take place when the body moves with a very great degree of velocity, but in all motions whatever. It is not in all caſes perceptible, becauſe the velocity with which the body moves, frequently bears but a very ſmall proportion to the velocity with which the air preſſes in behind it. Thus, ſuppoſing the velocity with which the air ruſhes into a vacuum to be 1200 feet in a ſecond, if a body moves with a velocity of 30, 40, or 50 feet in a ſecond, the force with which the air preſſes on the back part is but $\frac{1}{1}\frac{1}{7}$ at the utmoſt leſs than that which reſiſts on the forepart of it, which will not be perceptible: but if, as in the caſe of bullets, the velocity of the projectile comes to have a conſiderable proportion to the velocity wherewith the air ruſhes in behind it; then a very perceptible, and otherwiſe unaccountable reſiſtance is obſerved, as we ſeen in the experiments already related by Mr Robins. Thus, if the air preſſes in with a velocity of 1200 feet in a ſecond, if the body changes its place with a velocity of 600 feet in the ſame time, there is a reſiſtance of 15 pounds on the fore part, and a preſſure of only $7\frac{1}{2}$ on the back part. The reſiſtance therefore not only overcomes the moving power of the air by $7\frac{1}{2}$ pounds, but there is a deficiency of other $7\frac{1}{2}$ pounds owing to the want of half the preſſure of the atmoſphere on the back part, and thus the whole loſs of the moving power is equivalent to 15 pounds; and hence the exceeding great increaſe of reſiſtance obſerved by Mr Robins beyond what it ought to be according to the common computations.—The velocity with which the air ruſhes into a vacuum is therefore a deſideratum in gunnery. Mr Robin's ſuppoſes that it is the ſame with the velocity of ſound; and that when a bullet moves with a velocity greater than that of 1200 feet in a ſecond, it leaves a perfect vacuum behind it. Hence he accounts for the great increaſe of reſiſtance to bullets moving with ſuch velocities; but as he doth not take notice of the loſs of the air's moving power, the anomalies of all leſſer velocities are inexplicable on his principles. Nay, he even tells us, that Sir Iſaac Newton's rule for computing reſiſtances may be applied in all velocities leſs than 1100 or 1200 feet in a ſecond, though this is expreſsly contradicted by his own experiments mentioned n °23.

35 It reſiſts by its elaſticity as well as gravity.

Though for theſe reaſons it is evident how great difficulties muſt occur in attempting to calculate the reſiſtance of the air to military projectiles, we have not even yet diſcovered all the ſources of reſiſtance to theſe bodies when moving with immenſe velocities. Another

PRACTICE

scribed; and perhaps somewhat of this kind, says Mr Robins, tho' not in the manner now practised, would be of all others the most perfect method for the construction of these kinds of barrels.

From the whirling motion communicated by the rifles, it happens, that when the piece is fired, that indented zone of the bullet follows the sweep of the rifles; and thereby, besides its progressive motion, acquires a circular motion round the axis of the piece; which circular motion will be continued to the bullet after its separation from the piece; and thus a bullet discharged from a rifled barrel is constantly made to whirl round an axis which is coincident with the line of its flight. By this whirling on its axis, the aberration of the bullet which proves so prejudicial to all operations in gunnery, is almost totally prevented. The reason of this may be easily understood from considering the slow motion of an arrow through the air. For example, if a bent arrow, with its wings not placed in some degree in a spiral position, so as to make it revolve round its axis as it flies through the air, were shot at a mark with a true direction, it would constantly deviate from it, in consequence of being pressed to one side by the convex part opposing the air obliquely. Let us now suppose this deflection in a flight of 100 yards to be equal to 10 yards. Now, if the same bent arrow were made to revolve round its axis once every two yards of its flight, its greatest deviation would take place when it had proceeded only one yard, or made half a revolution; since at the end of the next half revolution it would again return to the same direction it had at first; the convex side of the arrow having been once in opposite positions. In this manner it would proceed during the whole course of its flight, constantly returning to the true path at the end of every two yards; and when it reached the mark, the greatest deflection to either side that could happen would be equal to what it makes in proceeding one yard, equal to $\frac{1}{100}$th part of the former, or 3.6 inches, a very small deflection when compared with the former one. In the same manner, a cannon-ball which turns not round its axis, deviates greatly from the true path, on account of the inequalities on its surface; which, although small, cause great deviations by reason of the resistance of the air, at the same time that the ball acquires a motion round its axis in some uncertain direction occasioned by the friction against its sides. But by the motion acquired from the rifles, the error is perpetually corrected in the manner just now described; and accordingly such pieces are much more to be depended on, and will do execution at a much greater distance, than the others.

The reasons commonly alleged for the superiority of rifle-barrels over common ones, are, either that the inflammation of the powder is greater, by the resistance which the bullet makes by being thus forced into the barrel, and that hereby it receives a much greater impulse; or that the bullet by the compounding of its circular and revolving motions, did as it were bore the air, and thereby flew to a much greater distance than it would otherwise have done; or that by the same boring motion it made its way through all solid substances, and penetrated into them much deeper than when fired in the common manner. But Mr Robins hath proved these reasons to be altogether erroneous, by a great number of experiments made with rifle-barrelled pieces. "In these experiments," says he, "I have found that the velocity of the bullet fired from a rifled barrel was usually less than that of the bullet fired from a common piece with the same proportion of powder. Indeed it is but reasonable to expect that this should be the case; for if the rifles are very deep, and the bullet is large enough to fill them up, the friction bears a very considerable proportion to the effort of the powder. And that in this case the friction is of consequence enough to have its effects observed, I have discovered by the continued use of the same barrel. For the metal of the barrel being soft, and wearing away apace, its bore by half a year's use was considerably enlarged, and consequently the depth of its rifles diminished; and then I found that the same quantity of powder would give to the bullet a velocity near a tenth part greater than what it had done at first. And as the velocity of the bullet is not increased by the use of rifled barrels, so neither is the distance to which it flies, nor the depth of its penetration into solid substances. Indeed these two last suppositions seem at first sight too chimerical to deserve a formal confutation. But I cannot help observing that those who have been habituated to the use of rifled pieces are very excusable in giving way to these prepossessions. For they constantly found, that with them they could fire at a mark with tolerable success, though it were placed at three or four times the distance to which the ordinary pieces were supposed to reach. And therefore, as they were ignorant of the true cause of this variety, and did not know that it arose only from preventing the deflection of the ball; it was not unnatural for them to imagine that the superiority of effect in the rifled piece was owing either to a more violent impulse at first, or to a more easy passage through the air.

PRACTICE

"In order to confirm the foregoing theory of rifle-barrelled pieces, I made some experiments by which it might be seen whether one side of the ball discharged from them uniformly keeps foremost during the whole course. To examine this particular, I took a rifled barrel carrying a bullet of six to the pound; but instead of its leaden bullet I used a wooden one of the same size, made of a soft springy wood, which bent itself easily into the rifles without breaking. And firing the piece thus loaded against a wall at such a distance as the bullet might not be shivered by the blow, I always found, that the same surface which lay foremost in the piece continued foremost without any sensible deflection during the time of its flight. And this was easily to be observed, by examining the bullet; as both the marks of the rifles, and the part that impinged on the wall, were sufficiently apparent. Now, as these wooden bullets were but the 16th part of the weight of the leaden ones; I conclude, that if there had been any unequal resistance or deflective power, its effects must have been extremely sensible upon this light body, and consequently in some of the trials I made the surface which came foremost from the piece must have been turned round into another situation.

"But again, I took the same piece, and, loading it now with a leaden ball, I set it nearly upright, sloping it only three or four degrees from the perpendicular in the direction of the wind; and firing it in this situation, the bullet

PRACTICE bullet generally continued about half a minute in the air, it rising by computation to near three quarters of a mile perpendicular height. In these trials I found that the bullet commonly came to the ground to the leeward of the piece, and at such a distance from it, as nearly corresponded to the angle of its inclination, and to the effort of the wind; it usually falling not nearer to the piece than 100, nor farther from it than 150, yards. And this is a strong confirmation of the almost steady flight of this bullet, for about a mile and a half: for were the same trial made with a common piece, I doubt not but the deviation would often amount to half a mile, or perhaps considerably more; though this experiment would be a very difficult one to examine, on account of the little chance there would be of discovering where the ball fell.

37 Balls from rifled pieces will at length deviate from their true course.

"It must be observed, however, that though the bullet impelled from a rifle-barrelled piece keeps for a time to its regular track with sufficient nicety; yet if its slight be so far extended that the track becomes considerably incurvated, it will then undergo considerable deflections. This, according to my experiments, arises from the angle at last made by the axis on which the bullet turns, and the direction in which it flies: for that axis continuing nearly parallel to itself, it must necessarily diverge from the line of the flight of the bullet, when that line is bent from its original direction; and when it once happens that the bullet whirls on an axis which no longer coincides with the line of its flight, then the unequal resistance formerly described will take place, and the deflecting power hence arising will perpetually increase as the track of the bullet by having its range extended becomes more and more incurvated.—This matter I have experienced in a small rifle-barrelled piece, carrying a leaden ball of near half an ounce weight. For this piece, charged with one drachm of powder, ranged about 550 yards at an angle of 12 degrees with sufficient regularity; but being afterwards elevated to an angle of 24 degrees, it then ranged very irregularly, generally deviating from the line of its direction to the left, and in one case not less than 100 yards. This apparently arose from the cause above-mentioned, as was confirmed from the constant deviation of the bullet to the left; for by considering how the revolving motion was continued with the progressive one, it appeared that a deviation that way was to be expected.

"The best remedy I can think of for this defect, is the making use of bullets of an egg-like form instead of spherical ones. For if such a bullet hath its shorter axis made to fit the piece, and it be placed in the barrel with its smaller end downwards; then it will acquire by the rifles a rotation round its larger axis; and its centre of gravity lying nearer to its fore than its hinder part, its longer axis will be constantly forced by the resistance of the air into the line of its flight; as we see, that by the same means arrows constantly lie in the line of their direction, however that line be incurvated.

"But, besides this, there is another circumstance in the use of these pieces, which renders the flight of their bullets uncertain when fired at a considerable elevation. For I find by my experiments, that the velocity of a bullet fired with the same quantity of powder from a rifled barrel, varies much more from itself in different trials, than when fired from a common piece.—This, as I conceive, is owing to the great quantity of friction, and the impossibility of rendering it equal in each experiment. Indeed, if the rifles are not deeply cut, and if the bullet is nicely fitted to the piece, so as not to require a great force to drive it down, and if leather or fustain well greased is made use of between the bullet and barrel, perhaps, by a careful attention to all these particulars, great part of the inequality in the velocity of the bullet may be prevented, and the difficulty in question be in some measure obviated: but, till this be done, it cannot be doubted, that the range of the same piece, at an elevation, will vary considerably in every trial; although the charge be each time the same. And this I have myself experienced, in a number of diversified trials, with a rifle-barrelled piece loaded at the breech in the English manner. For here the rifles being indented very deep, and the bullet so large as to fill them up completely; I found, that though it flew with sufficient exactness to the distance of four or five hundred yards; yet, when it was raised to an angle of about 12 degrees, (at which angle, being fired with one-fifth of its weight in powder, its medium range is nearly 1000 yards); in this case, I say, I found that its range was variable, although the greatest care was taken to prevent any inequalities in the quantity of powder, or in the manner of charging. And as, in this case, the angle was too small for the first-mentioned irregularity to produce the observed effects; they can only be imputed to the different velocities which the bullet each time received by the unequal action of the friction."

Thus we see, that it is in a manner impossible entirely to correct the aberrations arising from the resistance of the atmosphere; as even the rifle-barrelled pieces cannot be depended upon for more than one half of their actual range at any considerable elevation. It becomes therefore a problem very difficult of solution, to know, even within a very considerable distance, how far a piece will carry its ball with any probability of hitting its mark, or doing any execution. The best rules hitherto laid down on this subject, are those of Mr Robins. The foundation of all his calculations, is the velocity with which the bullet flies off from the mouth of the piece. Mr Robins himself had not opportunities of making many experiments on the velocities of cannon-balls, and the calculations from smaller ones cannot always be depended upon. In the 68th volume of the Phil. Trans. Mr Hutton hath recited a number of experiments made on cannon carrying balls from one to three pounds weight. His machine for discovering the velocities of these balls was the same with that of Mr Robins, only of a larger size. His charges of powder were two, four, and eight ounces; and the results of 15 experiments which seem to have been the most accurate, are as follow.

38 Mr Hutton's experiments on the velocity of cannon-balls.

Velocity with two ounces.	Velocity with four ounces.	Velocity with eight ounces.
702 feet in 1"	1068 feet in 1"	1419 feet in 1"
682	1020	1332
695	948	1443
703	973	1360
715	957	1412
5)3507	5)4966	5)6986
Mean velocities 701	993	1397

PRACTICE. In another courſe, the mean velocities, with the ſame charges of powder, were 613, 873, 1162. " The mean velocities of the balls in the firſt courſe of experiments, ſays Mr Hutton, with two, four, and eight ounces of powder, are as the numbers 1, 1.414, and 1.993; but the ſubduplicate ratio of the weights (two, four, and eight) give the numbers 1, 1.414, and 2, to which the others are ſufficiently near. It is obvious, however, that the greateſt difference lies in the laſt number, which anſwers to the greateſt velocity. It will ſtill be a little more in defect if we make the allowance for the weights of the balls; for the mean weights of the balls with the two and four ounces is $18\frac{1}{4}$ ounces, but of the eight ounces it is $18\frac{3}{4}$: diminiſhing therefore the number 1.993 in the reciprocal ſubduplicate ratio of $18\frac{3}{4}$ to $18\frac{1}{4}$, it becomes 1.985, which falls ſhort of the number 2 by .015, or the 133d part of itſelf. A ſimilar defect was obſerved in the other courſe of experiments; and both are owing to three evident cauſes, viz. 1. The leſs length of cylinder through which the ball was impelled; for with the eight-ounce charge, it lay three or four inches nearer to the muzzle of the piece than with the others. 2. The greater quantity of elaſtic fluid which eſcaped in this caſe than in the others by the windage. This happens from its moving with a greater velocity; in conſequence of which, a greater quantity eſcapes by the vent and windage than in ſmaller velocities. 3. The greater quantity of powder blown out unfired in this caſe than in that of the leſſer velocities; for the ball which was impelled with the greater velocity, would be ſooner out of the piece than the others, and the more ſo as it had a leſs length of the bore to move through; and if powder fire in time, which cannot be denied, though indeed that time is manifeſtly very ſhort, a greater quantity of it muſt remain unfired when the ball with the greater velocity iſſues from the piece, than when that which has the leſs velocity goes out, and ſtill the more ſo as the bulk of powder which was at firſt to be inflamed in the one caſe ſo much exceeded that in the others.

" Let us now compare the correſponding velocities in both caſes. In the one they are, 701, 993, 1397; in the other, 613, 873, 1162. Now the ratio of the firſt two numbers, or the velocities with two ounces of powder, is that of 1 to 1.1436, the ratio of the next two is that of 1 to 1.1375, and the ratio of the laſt is that of 1 to 1.2022. But the mean weight of the ſhot for two and four ounces of powder, was $28\frac{1}{4}$ ounces in the firſt courſe, and $18\frac{1}{4}$ in this; and for eight ounces of powder, it was $28\frac{3}{4}$ in the firſt, and $18\frac{3}{4}$ in this. Taking therefore the reciprocal ſubduplicate ratios of theſe weights of ſhot, we obtain the ratio of 1 to 1.224 for that of the balls which were fired with two ounces and four ounces of powder, and the ratio of 1 to 1.241 for the balls which were fired with eight ounces. But the real ratios above found are not greatly different from theſe; and the variation of the actual velocities from this law of the weights of ſhot, inclines the ſame way in both courſes of experiments. We may now collect into one view the principal inferences that have reſulted from theſe experiments.

1. " It is evident from them, that powder fires almoſt inſtantaneouſly.

2. " The velocities communicated to balls or ſhot of the ſame weight with different quantities of powder, are nearly in the ſubduplicate ratio of theſe quantities; a very ſmall variation in defect taking place when the quantities of powder become great.

3. " When ſhot of different weights are fired with the ſame quantity of powder, the velocities communicated to them are nearly in the reciprocal ſubduplicate ratio of their weights.

4. " Shot which are of different weights, and impelled by different quantities of powder, acquire velocities which are directly as the ſquare roots of the quantities of powder, and inverſely as the ſquare roots of the weights of the ſhot nearly."

The velocities of the bullets being thus found as nearly as poſſible, the ranges may be found by the following rules laid down by Mr Robins. 39 Mr Robins's method of finding the ranges of bullets.

1. " Till the velocity of the projectile ſurpaſſes that of 1100 feet in a ſecond, the reſiſtance may be reckoned to be in the duplicate proportion of the velocity, and its mean quantity may be reckoned about half an ounce avoirdupoiſe on a 12-pound ſhot moving with a velocity of about 25 or 26 feet in a ſecond.

2. " If the velocity be greater than that of 1100 or 1200 feet in a ſecond, then the abſolute quantity of the reſiſtance in theſe greater velocities will be near three times as great as it ſhould be by a compariſon with the ſmaller velocities.—Hence then it appears, that if a projectile begins to move with a velocity leſs than that of 1100 feet in 1", its whole motion may be ſuppoſed to be conſidered on the hypotheſis of a reſiſtance in the duplicate ratio of the velocity. And if it begins to move with a velocity greater than this laſt mentioned, yet if the firſt part of its motion, till its velocity be reduced to near 1100 feet in 1", be conſidered ſeparately from the remaining part in which the velocity is leſs than 1100 feet in 1"; it is evident, that both parts may be truly aſſigned on the ſame hypotheſis; only the abſolute quantity of the reſiſtance is three times greater in the firſt part than in the laſt. Wherefore, if the motion of a projectile on the hypotheſis of a reſiſtance in the duplicate ratio of the velocity be truly and generally aſſigned, the actual motions of reſiſted bodies may be thereby determined, notwithſtanding the increaſed reſiſtances in the great velocities. And, to avoid the diviſion of the motion into two, I ſhall ſhow how to compute the whole at one operation with little more trouble than if no ſuch increaſed reſiſtance took place.

" To avoid frequent circumlocutions, the diſtance to which any projectile would range in a vacuum on the horizontal plain at 45° of elevation, I ſhall call the potential random of that projectile; the diſtance to which the projectile would range *in vacuo* on the horizontal plane at any angle different from 45°, I ſhall call the potential range of the projectile at that angle; and the diſtance to which a projectile really ranges, I ſhall call its actual range.

" If the velocity with which a projectile begins to move is known, its potential random and its potential range at any given angle are eaſily determined from the common theory of projectiles *; or more generally, if either its original velocity, its potential random, or its potential range, at a given angle, are known, the other two are eaſily found out.

* See *Projectile*.

"To facilitate the computation of reſiſted bodies, it is neceſſary, in the conſideration of each reſiſted body, to aſſign a certain quantity, which I ſhall denominate F, adapted to the reſiſtance of that particular projectile. To find this quantity F to any projectile given, we may proceed thus: Firſt find, from the principles we

PRACTICE already delivered, with what velocity the projectile muſt move, ſo that its reſiſtance may be equal to its gravity. Then the height, from whence a body muſt deſcend in a vacuum to acquire this velocity, is the magnitude of F ſought. But the conciſeſt way of finding this quantity F to any ſhell or bullet is this: If it be of ſolid iron, multiply its diameter meaſured in inches by 300, the product will be the magnitude of F expreſſed in yards. If, inſtead of a ſolid iron-bullet, it is a ſhell or a bullet of ſome other ſubſtance; then, As the ſpecific gravity of iron is to the ſpecific gravity of the ſhell or bullet given, ſo is the F correſponding to an iron bullet of the ſame diameter, to the proper F for the ſhell or bullet given. The quantity F being thus aſſigned, the neceſſary computations of theſe reſulted motions may be diſpatched by the three following propoſitions, always remembering that theſe propoſitions proceed on the hypotheſis of the reſiſtance being in the duplicate proportion of the velocity of the reſiſted body. How to apply this principle, when the velocity is ſo great as to have its reſiſtance augmented beyond this rate, ſhall be ſhewn in a corollary to be annexed to the firſt propoſition.

Actual ranges expreſſed in F.	Correſponding potential ranges expreſſed in F.	Actual ranges expreſſed in F.	Correſponding potential ranges expreſſed in F	Actual ranges expreſſed in F	Correſponding potential ranges expreſſed in F

"PROP. I. Given the actual range of a given ſhell or bullet at any ſmall angle not exceeding 8° or 10°, to determine its potential range, and conſequently its potential random and original velocity. PRACTICE

"SOL. Let the actual range given be divided by the F correſponding to the given projectile, and find the quote in the firſt column of the preceding Table. Then the correſponding number in the ſecond column multiplied into F, will be the potential range ſought; and thence, by the methods already explained, the potential random and the original velocity of the projectile is given.

"EXAM. An 18 pounder, the diameter of whoſe ſhot is about 5 inches, when loaded with 2lb. of powder, ranged at an elevation of 3° 30′, to the diſtance of 975 yards.

"The F correſponding to this bullet is 1500 yards, and the quote of the actual range by this number is 65; correſponding to which, in the ſecond column, is ,817; whence, 817 F, or 1225 yards, is the potential range ſought; and this, augmented in the ratio of the fine of twice the angle of elevation to the radius, gives 10050 yards for the potential random; whence it will be found, that the velocity of this projectile was that of 984 feet in a ſecond.

"COR. 1ſt. If the converſe of this propoſition be deſired; that is, if the potential range in a ſmall angle be given, and thence the actual range be ſought; this may be ſolved with the ſame facility by the ſame table. For if the given potential range be divided by its correſpondent F, then oppoſite to the quote ſought in the ſecond column, there will be found in the firſt column a number, which multiplied into F will give the actual range required. And from hence it follows, that, if the actual range be given at one angle, it may be found at every other angle not exceeding 8° or 10°.

"COR. 2d. If the actual range at a given ſmall angle be given, and another actual range be given, to which the angle is ſought; this will be determined by finding the potential ranges correſponding to the two given actual ranges; then the angle correſponding to one of theſe potential ranges being known, the angle correſponding to the other will be found by the common theory of projectiles.

"COR. 3d. If the potential random deduced from the actual range by this propoſition exceeds 13000 yards; then the original velocity of the projectile was ſo great as to be affected by the treble reſiſtance deſcribed above; and conſequently the real potential random will be greater than what is here determined. However, in this caſe, the true potential random may be thus nearly aſſigned. Take a 4th continued proportional to 13000 yards, and the potential random found by this propoſition, and the 4th proportional thus found may be aſſumed for the true potential random ſought. In like manner, when the true potential random is given greater than 13000 yards, we muſt take two mean proportionals between 13000 and this random*; and the firſt of theſe mean proportionals muſt be aſſumed inſtead of the random given, in every operation deſcribed in theſe propoſitions and their corollaries. And this method will nearly allow for the increaſed reſiſtance in large velocities, the difference only amounting to a few minutes in the angle of direction of the projected body, which, provided that angle exceeds two

* The operations directed in this corollary are beſt performed by the table of logarithms.

PRACTICE or three degrees, is ufually fcarce worth attending to.

Of this procefs take the following example.

"A 24 pounder fired with 12 pounds of powder, when elevated at 7° 15′, ranged about 2500 yards. Here the F being near 1700 yards, the quote to be fought in the firft column is 147, to which the number correfponding in the fecond column is 2,556; whence the potential range is near 4350 yards, and the potential random thence refulting 17400. But this being more than 13,000, we muft, to get the true potential random, take a 4th continued proportional to 13000 and 17400; and this 4th proportional, which is about 31000 yards, is to be eſteemed the true potential random fought; whence the velocity is nearly that of 1730 feet in a fecond.

"SCHOLIUM. This propofition is confined to fmall angles, not exceeding 8° or 10°. In all poſſible cafes of practice, this approximation, thus limited, will not differ from the moſt rigorous folution by fo much as what will often intervene from the variation of the denfity of the atmofphere in a few hours time; fo that the errors of the approximation are much fhort of other inevitable errors, which arife from the nature of this fubject.

"PROP. II. Given the actual range of a given fhell or bullet, at any angle not exceeding 45°, to determine its potential range at the fame angle; and thence its potential random and original velocity.

"SOL. Diminifh the F correfponding to the fhell or bullet given in the proportion of the radius to the cofine of $\frac{1}{2}$ of the angle of elevation. Then, by means of the preceding table, operate with this reduced F in the fame manner as is preſcribed in the folution of the laſt propofition, and the refult will be the potential range fought; whence the potential random, and the original velocity, are eaſily determined.

"EXAM. A mortar for ſea-ſervice, charged with 30lb of powder, has fometimes thrown its fhell, of $12\frac{1}{4}$ inches diameter, and of 231 lb. weight, to the diſtance of 2 miles, or 5450 yards. This at an elevation of 45°.

"The F to this fhell, if it were folid, is 3825 yards; but as the fhell is only $\frac{5}{9}$ of a folid globe, the true F is no more than 3060 yards. This, diminiſhed in the ratio of the radius to the cofine of $\frac{1}{2}$ of the angle of elevation, becomes 2544. The quote of the potential range by this diminiſhed F is 1,384; which fought in the firſt column of the preceding table gives 2,280 for the correſponding number in the ſecond column; and this multiplied into the reduced F, produces 5800 yards for the potential range fought, which, as the angle of elevation was 45°, is alſo the potential random: and hence the original velocity of this fhell appears to be that of about 748 feet in a ſecond.

"COR. The converſe of this propoſition, that is, the determination of the actual range from the potential range given, is eaſily deduced from hence by means of the quote of the potential range divided by the reduced F; for this quote ſearched out in the ſecond column will give a correſponding number in the firſt column, which multiplied into the reduced F, will be the actual range ſought.

Alſo, if the potential random of a projectile be given, or its actual range at a given angle of elevation; its actual range at any other angle of elevation, not greater than 45°, may hence be known. For the potential random will aſſign the potential range at any PRACTICE given angle; and thence, by the method of this corollary, the actual range may be found.

"EXAM. A fit muſquet-bullet fired from a piece of the ſtandard dimenſions, with $\frac{1}{7}$ of its weight in good powder, acquires a velocity of near 900 feet in a ſecond; that is, it has a potential random of near 8400 yards. If now the actual range of this bullet at 15° was ſought, we muſt proceed thus:

"From the given potential random it follows, that the potential range at 15° is 4200 yards; the diameter of the bullet is $\frac{1}{4}$ of an inch; and thence, as it is of lead, its proper F is 337,5 yards, which, reduced in the ratio of the radius to the cofine of $\frac{1}{2}$ of 15°, becomes 331 yards. The quote of 4200 by this number is 12,7 nearly; which, being ſought in the ſecond column, gives 3,2 nearly for the correſponding number in the firſt column; and this multiplied into 331 yards (the reduced F) makes 1059 yards for the actual range fought.

"EXAM. II. The ſame bullet, fired with its whole weight in powder, acquires a velocity of about 2100 feet in a ſecand, to which there correſponds a potential random of about 45700 yards. But this number greatly exceeding 13,000 yards, it muſt be reduced by the method deſcribed in the third corollary of the firſt propoſition, when it becomes 19700 yards. If now the actual range of this bullet at 15° was required, we ſhall from hence find, that the potential range at 15° is 9850 yards; which, divided by the reduced F of the laſt example, gives for a quote 2975: and thence following the ſteps preſcribed above, the actual range of this bullet comes out 1396 yards, exceeding the former range by no more than 337 yards; whereas the difference between the two potential ranges is above ten miles. Of ſuch prodigious efficacy is the reſiſtance of the air, which hath been hitherto treated as too inſignificant a power to be attended to in laying down the theory of projectiles!

"SCHOL. I muſt here obſerve, that as the denſity of the atmoſphere perpetually varies, increaſing and diminiſhing often by $\frac{1}{10}$ part, and ſometimes more, in a few hours; for that reaſon I have not been over rigorous in forming theſe rules, but have conſidered them as ſufficiently exact when the errors of the approximation do not exceed the inequalities which would take place by a change of $\frac{1}{10}$ part in the denſity of the atmoſphere. With this reſtriction, the rules of this propoſition may be fafely applied in all poſſible caſes of practice. That is to ſay, they will exhibit the true motions of all kinds of ſhells and cannon-ſhot, as far as 45° of elevation, and of all muſket-bullets fired with their largeſt cuſtomary charges, if not elevated more than 30°. Indeed, if experiments are made with extraordinary quantities of powder, producing potential randoms greatly ſurpaſſing the uſual rate; then in large angles ſome farther modifications may be neceſſary. And though, as theſe caſes are beyond the limits of all practice, it may be thought unneceſſary to conſider them; yet, to enable thoſe who are ſo diſpoſed to examine theſe uncommon caſes, I ſhall here inſert a propoſition, which will determine the actual motion of a projectile at 45°, how enormous ſoever its original velocity may be. But as this propoſition will rather relate to ſpeculative than practical

PRACTICE practical cases, instead of supposing the actual range known, thence to assign the potential random, I shall now suppose the potential random given, and the actual range to be thence investigated.

"PROP. III. Given the potential random of a given shell or bullet, to determine its actual range at 45°.

SOL. Divide the given potential random by the F corresponding to the shell or bullet given, and call the quotient q, and let l be the difference between the tabular logarithms of 25 and of q, the logarithm of 10 being supposed unity; then the actual range sought is $3{,}4\ F + \frac{11}{10}lF - \frac{11}{10}F$, where the double sine of 2lF is to be thus understood; that if q be less than 25, it must be — 2lF; if it be greater, then it must be + 2lF. In this solution, q may be any number not less than 3, nor more than 2500.

"COR. Computing in the manner here laid down, we shall find the relation between the potential randoms, and the actual range at 45°, within the limits of this proposition, to be as expressed in the following table.

Potential Random.	Actual Range at 45°.
3 F	1,5 F
6 F	2,1 F
10 F	2,6 F
20 F	3,2 F
30 F	3,6 F
40 F	3,8 F
50 F	4,0 F
100 F	4,6 F
200 F	5,1 F
500 F	5,8 F
1000 F	6,4 F
2500 F	7,0 F

Whence it appears, that, when the potential random is increased from 3F to 2500F, the actual range is only increased from 1½ F to 7 F, so that an increase of 2497F in the potential random produces no greater an increase in the actual range than 5½F, which is not its $\frac{1}{450}$ part; and this will again be greatly diminished on account of the increased resistance, which takes place in great velocities. So extraordinary are the effects of this resistance, which we have been hitherto taught to regard as inconsiderable.

"That the justness of the approximations laid down in the 2d and 3d propositions may be easier examined; I shall conclude these computations by inserting a table of the actual ranges at 45° of a projectile, which is resisted in the duplicate proportion of its velocity. This table is computed by methods different from those hitherto described, and is sufficiently exact to serve as a standard with which the result of our other rules may be compared. And since whatever errors occur in the application of the preceding propositions, they will be most sensible at 45° of elevation, it follows, that hereby the utmost limits of those errors may be assigned.

Potential Randoms.	Actual Range at 45°.

PRACTICE

40 Of the different parts and proportions of guns.

WE have now only to consider that part of practical gunnery which relates to the proportions of the different parts of cannon, the metal of which they are made, &c.

Formerly the guns were made of a very great length, and were on that account extremely troublesome and unmanageable. The error here was first discovered by accident; for some cannon, having been cast by mistake two feet and an half shorter than the common standard, were found to be equally efficacious in service with the common ones, and much more manageable. This soon produced very considerable alterations in the form of the artillery throughout Europe; but in no country have greater improvements in this respect been made than in our own. For a long time brass, or rather a kind of bell-metal, was thought preferable to cast iron for making of cannon. The composition of this metal is generally kept a secret by each particular founder.

41 Composition for brass guns.

The author of the Military Dictionary gives the following proportions as the most common, viz. "To 240 lb. of metal fit for casting they put 68 lb. of copper, 52 lb. of brass, and 12 lb. of tin. To 4200 lb. of metal fit for casting the Germans put 3687$\frac{1}{2}\frac{1}{7}$ lb. of copper, 204$\frac{1}{2}\frac{1}{7}$ lb. of brass, and 307$\frac{1}{2}\frac{1}{7}$ lb. of tin. Others use 100 lb. of copper, 6 lb. of brass, and 9 lb. of tin; while some make use of 100 lb. of copper, 10 lb. of brass, and 15 lb. of tin. This composition was both found to be very expensive, and also liable to great inconveniencies in the using. A few years ago, therefore, a proposal was made by Mr Muller for using iron guns of a lighter construction than the brass ones, by which he supposed that a very great saving would be made in the expence; and likewise, that the guns of the new construction would be more manageable, and even efficacious, than the old ones. "The reduction of the expence (says Mr Muller) of the very large artillery necessary for sea and land service, is to be considered under,

42 Mr Muller's proposal for reducing the weight of guns.

PRACTICE der two heads: the one, To diminish the weight; and the other, Not to use any brass field-artillery, but only iron, to lessen the great burden of our ships of war, and to carry larger calibers than those of other nations of the same rate. If the weights of our guns are diminished, they will require fewer hands to manage them, and of consequence a smaller number will be exposed to danger at a time: and if we carry larger calibers, our rates will be a match for larger ships.

"The advantage of using iron guns in the field instead of brass, will be that the expences are lessened in proportion to the cost of brass to that of iron, which is as 8 to 1.

"The only objection against iron is, its pretended brittleness: but as we abound in iron that is stronger and tougher than any brass, this objection is invalid. This I can assert; having seen some that cannot be broke by any force, and will flatten like hammered iron: if then we use such iron, there can be no danger of the guns bursting in the most severe action.

"Though brass guns are not liable to burst, yet they are sooner rendered unserviceable in action than iron. For by the softness of the metal, the vent widens so soon, and they are so liable to bend at the muzzle, that it would be dangerous to fire them; as we found by experience at Belleisle, and where we were obliged to take guns from the ships to finish the siege.

"These being undeniable facts, no possible reason can be assigned against using iron guns in both sea and land service, and thereby lessen the expences of artillery so considerably as will appear by the following tables.

Lengths and Weights of Iron Ship-Guns.

OLD PIECES.

Calib.	Length.	Weight.
	Ft. In.	
3	4 6	7 1 7
4	6 0	12 2 13

Diff. 72.

"That these guns are sufficiently strong, is evident from the former trial; besides, there are several 32 pounders of the same dimensions and weight now existing and serviceable, though cast in king Charles the Second's time.

N. B. These battering pieces may serve in garrisons.

"It appears from these tables, that no proportion has been observed in any guns hitherto made, in respect to their length or weight, but merely by guess.

Some Examples to shew what may be saved by this Scheme.

The Royal George carries 100 brass guns, which weigh together 218.2 tons; the ton costs 130 pounds, workmanship included.

The expence of these guns is then 28366 pounds
A set of the iron guns of the same number and calibers, according to my construction, weighs - 127.8 tons
The ton costs 16 pounds, and the whole set - - - 2044.8 pounds
The Royal George carries then 90.4 tons more than is necessary, and the difference between the expence is - - 26321.2 pounds
That is, 12.5 times more than the new iron set costs: or 12 ships of the same rate may be fitted out at less charge.
A set of the { Old } iron guns for a { New } first-rate weighs { 204.4 / 127.8 } tons
The difference between the weight of the old and new is - 76.6 tons
The difference between the expence is then - - 1225.6 pounds
A set of brass battering pieces weighs 11.36 tons
A ton costs 130 pounds, and the set 1476.8 pounds
A set of the new weighs - 7.55 tons
The ton costs 16 pounds, and the set 117.8 pounds
That is, the old set costs 11 times, and 632 over, more than the new set; or eleven sets of the new could be made at less expence than one of the old.

"This table shews what may be saved in the navy; and if we add those on board sloops, the different garrisons, and the field-train, with the great expence of their

PRACTICE their carriage in the field, it may be found pretty near as much more.

This and other propofals for reducing the weight and expence of guns have been greatly attended to of late; and the Carron-company in Scotland have not only greatly improved thofe of the old conftruction, but a gun of a new conftruction hath been invented by Mr Charles Gafcoigne director of that work, which promifes to be of more effectual fervice than any hitherto made ufe of.——Fig. 9. reprefents the form and proportions of the guns made at Carron, and which ferve for thofe of all fizes, from ½ pounders and upwards. The proportions are meafured by the diameters of the caliber, or bore of the gun, divided into 16 equal parts, as reprefented in the figure. The following are the names of the different parts of a cannon.

43 Proportions, &c. of the guns made at Carron.

A B, the length of the cannon.
A E, the firft reinforce.
E F, the fecond reinforce.
F B, the chafe.
H B, the muzzle.
A o, the cafcabel, or pomiglion.
A C, the breech.
C D, the vent-field.
F I, the chafe-girdle.
r s, the bafe-ring and ogee.
t, the vent-aftragal and fillets.
p q, the firft reinforce-ring and ogee.
v w, the fecond reinforce ring and ogee.
x, the chafe-aftragal and fillets.
z, the muzzle-aftragal and fillets.
n, the muzzle-mouldings.
m, the fwelling of the muzzle.
A i, the breech-mouldings.
T T, the trunnions.

The dotted lines along the middle of the piece fhew the dimenfions of the calibre, and the dotted circle fhews the fize of the ball. Fig. 10. fhews a cohorn made alfo at Carron, and which may be meafured by the fame fcale.

PRACTICE

44 Ufe and defcription of carriages.

As the breech of the cannon receives an equal impulfe with the bullet from the action of the inflamed gunpowder, it thence follows, that, at the moment the bullet flies off, the piece itfelf pufhes backward with very great force. This is called the *recoil* of the cannon; and if the piece is not of a very confiderable weight, it would fly upwards, or to a fide, with extreme violence. If again it was firmly faftened down, fo that it could not move in the leaft, it would be very apt to burft, on account of the extreme violence with which the powder would then act upon it. For this reafon it hath been found neceffary to allow the recoil to take place, and confequently all large pieces of artillery are mounted upon carriages with wheels, which allow them to recoil freely; and thus they may be fired without any danger. There are feveral forts of carriages for ordnance, viz. baftard carriages, with low wheels and high wheels; fea-carriages, made in imitation of thofe for fhip-guns; and carriages for field-pieces, of which there are two kinds. The carriages muft be proportioned to the pieces mounted on them. The ordinary proportion is for the carriage to have once and a half the length of the gun, the wheels to be half the length of the piece in height. Four times the diameter or caliber gives the depth of the planks in the fore end; in the middle, 3½.

45 Defcription of the Carronade.

Fig. 11. fhews Mr Gafcoigne's newly-invented gun called a *carronade*; and which, in June 1779, was by the king and council inftituted a ftandard navy-gun, and 10 of them appointed to be added to each fhip of war, from a firft-rate to a floop. Of this gun the Carron Company have publifhed the following account.

"The carronade is made fo fhort, that it is worked with its carriage in the fhip's port; the trunnions lying immediately over the fill of the port: it is correctly bored; and the fhot, being perfectly round, fills the caliber with fuch exactnefs, that the leaft poffible of the impulfe of the powder efcapes, upon explofion, between the cylinder and the fhot; which laft alfo is thereby more truly directed in its flight. The bottom of the cylinder is a hemifphere, to which the end of the cartridge is not liable to ftick, and in which the fmalleft charge of powder envelopes the fhot, exhaufting nearly the whole of its impelling force upon it: the trunnions are placed fo as to leffen the recoil, and that the gun cannot reft againft the fides of the carriage, and is balanced with the utmoft facility. There are views caft upon the vent and muzzle, to point the gun quickly to an object at 250 and 500 yards diftance. There is an handle A fixed upon the pommel-end of the gun, by which it is horizontally ranged and pointed; and there is a ring caft upon the cafcabel, through which the breechin rope is reeved, the only rope ufed about thefe guns.

"The carronade is mounted upon a carriage B, with a perfectly fmooth bottom of ftrong plank, without trucks; inftead of which there is fixed on the bottom of the carriage, perpendicular from the trunnions, a gudgeon C of proper ftrength, with an iron wafher D and pin E at the lower end thereof. This gudgeon is let into a corresponding groove F, cut in a fecond carriage

PRACTICE carriage G, called a *ſlide-carriage*; the waſher ſupported by the pin over-reaching the under-edges of the groove H. This ſlide-carriage is made with a ſmooth upper ſurface, upon which the gun-carriage is moved, and by the gudgeon always kept in its right ſtation to the port; the groove in the ſlide-carriage being of a ſufficient length to allow the gun to recoil, and be loaded within board. The ſlide-carriage, the groove included, is equally broad with the fore-part of the gun-carriage, and about four times the length; the fore-part of the ſlide-carriage is fixed by hinge-bolts I, to the quick-work of the ſhip below the port, the end lying over the ſill, cloſe to the outſide plank, and the groove reaching to the fore end; the gudgeon of the gun-carriage, and conſequently the trunnions of the gun, are over the ſill of the port, when the gun is run out; and the port is made of ſuch breadth, with its ſides bevelled off within board, that the gun and carriage may range from bow to quarter. The ſlide-carriage is ſupported from the deck at the hinder end, by a wedge K, or ſtep-ſtool; which being altered at pleaſure, and the fore-end turning upon the hinge-bolts, the carriage can be conſtantly kept upon an horizontal plane, for the more eaſy and quick working of the gun when the ſhip lies along.

"The gun and carriages being in their places, the breechin rope, which muſt be ſtrong and limber, is reeved through the ring on the breech, then led thro' an eye-bolt drove downwards, the eye ſtanding upright upon the upper edge of each cheek of the gun-carriage; from theſe eye-bolts the ends of the breechin rope are ſeized down as uſual to an eye-bolt driven into the quick-work on each ſide, in a line with the lower ſurface of the ſlide-carriage.

"The gun being mounted and ready for action, is loaded with $\frac{1}{4}$th part of the weight of its ball in ſervice charge of powder put into a woollen cartridge, and the end tied up with a worſted yarn, and placed next to the ſhot; and with a ſingle ball, well rammed home upon the powder, without a wadding between them: the gun being then run out in the port, is ranged and elevated with great facility, by means of the handle on the pommel; and, by the views, very quickly pointed.—Upon diſcharge, the gun attempts to kick upwards, which being prevented by the waſher of the gudgeon bearing hard againſt the under part of the ſlide-carriage, the recoil takes place; and the gudgeon ſliding backwards in the groove, (the waſher ſtill bearing againſt an iron plate on the under edge of the groove,) till the gun is brought up by the breechin rope, as much re-action ſucceeds as ſlackens the rope, ſo that the gun and carriage may be inſtantly turned fore and aft by the handle, and loaded again.

"This gun has many ſingular advantages over the others of light conſtruction.—It is ſo extremely light, that the ſmalleſt ſhips can carry almoſt any weight of ſhot, (the 12-pounder weighing under 500 wt. and the other calibers in proportion,) and that without being attended with the inconveniencies imputed generally to light guns, ſince it cannot injure its carriage, or jump out of its ſtation in the port upon recoil; and it will never heat.

"It can be eaſily managed and worked of all calibers, from the 12-pounders downwards with two hands, and the 18 and 24-pounders with three hands. It may be readily ranged, pointed, and diſcharged, twice in three minutes, which doubles the ſtrength of the ſhip againſt an enemy of equal force. It is wrought upon an horizontal plane to windward or to leeward, how much ſoever the ſhip lies along under a preſſure of ſail; and therefore, beſides being hampered with no tackles or other ropes, except the breechin rope, it may be worked with as much eaſe and expedition in chace or in a gale of wind, as in lying to for action. —It can be ranged from bow to quarter, ſo as to bring a broadſide to bear in a circuit of above 10 points of the compaſs on each ſide.—It is no more expenſive in ammunition than the old guns of two-thirds leſs weight of ſhot; and it requires very few hands above the compliment neceſſary for navigating merchant-ſhips; and increaſes the ſtrength of privateers crews, by expoſing few hands at the guns, and augmenting the number at ſmall arms. PRACTICE

"Though the carronade cannot, ſtrictly ſpeaking, throw its ſhot to an equal diſtance with a longer gun; yet, from the fitneſs of the ſhot to its cylinder, the powers of this gun will greatly ſurpaſs the expectations of ſuch as are not intimately acquainted with the effects of the elaſtic force of fired powder, ſince, with a $\frac{1}{12}$th part of the weight of its ball, at very ſmall elevations, it will range its ſhot to triple the diſtance at which ſhips generally engage, with ſufficient velocity for the greateſt execution, and with all the accuracy in its direction that can be attained from guns of greater lengths.

"There have been two ſeeming diſadvantages imputed to this gun, which it does not merit, viz. the nicety of fitting the ſhot to the bore of the gun, and its incapacity to hold more than two ſhot at one charge. But, as ſeamen have few opportunities of confirming themſelves in juſt opinions by experiments made on ſhore, and cannot, in that caſe, be fully converſant with the ſubject; the following looſe hints may not be inept towards removing theſe objections. 46 Objections to its uſe anſwered.

"It is an axiom in projectiles, That a ſhot cannot be impelled from a gun to any diſtance in a direction truly parallel to the axis of the cylinder of the piece, or what is commonly called *point-blank*, ariſing from ſeveral well-known cauſes: for, however juſt may be the cylinder, and however perfect and ſmooth may be the ſphere of its correſponding ſhot, and admitting that the impulſe of the powder acts through the centre of gravity of the ſhot, and alſo that the ſhot conſequently leaves the piece *in a direction parallel to the axis of its cylinder*; yet is the ſhot no ſooner diſcharged, but it becomes more or leſs inflected by its *gravity*, and deflected, according to its velocity, by the *reſiſtance of the air and wind*.

"Theſe irregularities are of little importance in cloſe ſea-fights, and, being the effect of natural cauſes, are common to all. Beſides theſe, the deviation of a ſhot from its true direction, is further augmented by the windage between the cylinder and its ſhot; but the greateſt uncertainty in the flight of a ſhot, making allowance for the action of its gravity, and the air's reſiſtance, ſprings from the defects of the ſhot itſelf. Round-ſhot for ſhip-guns, are ſeldom nicely examined; and, unleſs they are caſt *ſolid and truly globular*, and free

PRACTICE free of all hollows, roughneſs, and other outſide blemiſhes, and well fitted to the gun, it cannot even *be diſcharged inthe direction of the axis of the piece;* to the diſappointment of thoſe that uſe ſuch, and to the diſcredit of the gun-founder, however juſtly the piece is viewed, or diſparted; but, being impelled againſt the ſurface of the cylinder, bounds and rebounds from ſide to ſide, acquires a rotatory motion, and when caſt hollow withal, and breaking within the cylinder before diſcharge, (which ſometimes happens, eſpecially with double charges) never fails to injure; and, when often repeated, may, at laſt, burſt the very beſt guns. —Round-ſhot ſhould not be taken on board a ſhip, without being examined as to its ſhape and ſurface, gaged for its ſize to the caliber of the gun, and weighed that it be not above or below the ſtandard more than half an ounce in the pound of its reſpective caliber: good ſhot then, being of the ſame importance to all guns, removes the firſt objection.

"If the direction of the flight of a ſhot to its object is affected by ſo many ſeeming trivial cauſes, how much more uncertain muſt it be, when two or more ſhot are diſcharged together from one gun? for the ſhot next the powder being impelled with more celerity than that immediately before it, ſtrikes againſt it after diſcharge, and ſometimes ſhivers itſelf to pieces, and never fails to change obliquely the direction of both; and this happens with round and double-headed, &c. and all double charges; and which, from their various figures, cannot reach an object at the ſame elevations with the round-ſhot; eſpecially when theſe other ſhots are of greater weight than the round, which

1ſt	ſhot	ſtruck	1 foot 7 inches	below	the horizontal line,	and	5 feet	——	from the mark.

"The Carronade was laid each time by the views without an inſtrument; and the ſhot were all to the left of the mark, owing to a ſmall error in diſparting the views; the third, fourth, and fifth ſhot, made one fracture, as did alſo ſixth, ſeventh, and eighth, and the ſixth and eighth ſtruck the ſame ſpot.

"The Carronade was eaſily worked with four men, and may be readily worked and diſcharged on board a ſhip twice a-minute with ſix men.—With ſix pound weight of powder the ſhot was impelled with a velocity of 1400 feet a ſecond."

47 Deſcription of rifled ordnance.

WE have already ſeen of how much conſequence rifle-barrels are in order to bring the art of gunnery to perfection; as they enlarge the ſpace in which the ball will fly without any lateral deflection to three or four times its uſual quantity. This improvement, however, till very lately, only took place in muſket-barrels. But in the beginning of the year 1774, Dr Lind, and Captain Alexander Blair of the 69th regiment of foot, invented a ſpecies of rifled field-pieces. They are made of caſt iron; and are not bored like the common pieces, but have the rifles moulded on the core, after which they are cleaned out and finiſhed

is often the caſe. However frightful a broadſide with PRACTICE double charges may appear at ſea, more confuſion is created by them, and more time loſt, *within board*, by the ſtrain and exceſſive recoil, than real damage done *without board* by the additional charge: for, upon a trial on ſhore, where the effect can be traced, it will be found, that, at 100 yards diſtance, more ſhot will take place within a ſmall compaſs by ſingle than by double charges; and the charges will be oftener repeated in a given time, without heating the gun: and theſe facts being eſtabliſhed, remove alſo the ſecond objection."

The following account of the proof of one of theſe guns will perhaps ſerve to give a more adequate idea of the great uſefulneſs of them, than any deſcription:

"On Monday, Oct. 4, 1779, there was an experiment made at Carron, before the earl of Dunmore, &c. &c. with a 68-pounder Carronade, nearly of the weight of a Britiſh navy 12-pounder gun, and charged with the ſame quantity (viz. 6lb.) of powder.—— The carronade was mounted, on its proper carriages, into a port of the dimenſions of a 74 gun ſhip's lower-deck port; was pointed without elevation, at a centre of eight inches diameter, marked on a bulk's head of the thickneſs of two feet five inches ſolid wood, at 163 yards diſtance; behind which, at 168 yards, there was another bulk's head of two feet four inches thick; and behind that again, at 170 yards diſtance, a bank of earth. The ſhot pierced the bulk's heads each time, and was buried from three to four feet into the bank, and the ſplinters were thrown about to a conſiderable diſtance on all ſides.

with proper inſtruments; but for the method of doing this, and of boring the ordinary pieces, ſee the articles ORDNANCE and RIFLE.

Guns of this conſtruction, which are intended for the field, ought never to be made to carry a ball of above one or two pounds weight at moſt; a leaden bullet of that weight being ſufficient to deſtroy either man or horſe.—A pound-gun, of this conſtruction, of good metal, ſuch as is now made by the Carron company, need not to weigh above an hundred pounds weight, and its carriage about another hundred. It can, therefore, be eaſily tranſported from place to place, by a few men; and a couple of good horſes may tranſport ſix of theſe guns and their carriages, if put into a cart.

But, for making experiments, in order to determine the reſiſtance which bodies moving with great velocities meet with from the air, a circumſtance to which theſe guns are particularly well adapted, or for annoying an enemy's ſappers that are carrying on their approaches towards a beſieged place, a larger caliber may be uſed.

The length of the gun being divided into ſeven

PRACTICE equal parts, the length of the firſt reinforce AB is two of theſe parts; the ſecond BC, one and $\frac{1}{16}$ of the diameter of the caliber; the chaſe CD, four wanting $\frac{1}{16}$ of the diameter of the caliber.

The diſtance from the hind-part of the baſe-ring A, to the beginning of the bore, is one caliber and $\frac{1}{16}$ of a caliber. The trunnions TT are each a caliber in breadth, and the ſame in length; their centres are placed three-ſevenths of the gun's length from the hind part of the baſe-ring, in ſuch a manner, that the axis of the trunnions paſſes through the centre line of the bore, which prevents the gun from kicking, and breaking its carriage. The length of the caſcable is one caliber and $\frac{1}{16}$ of a caliber.

The vent ſhould be placed about half an inch from the bottom of the chamber or bore, that the cartridge may be pricked, leſt ſome of the bottoms of the cartridges ſhould be left in when the gun is ſponged, a circumſtance which might retard the firing till the ſhot be again drawn (which is no eaſy matter), and the gun be cleaned out. From ſome experiments of colonel Deſaguliers and Mr Muller, it has been imagined, that the powder never has ſo ſtrong an effect as when it is fired cloſe to the bottom of the bore; yet it is found, by the experiments of Count de la Lippe, to have the greateſt effect when fired near to the middle of the charge. This he proved by firing it with tubes, introduced at a vent bored through the button and breech of the gun, of different lengths, ſo as to reach the different parts of the powder. In the ſame manner, a muſket or fowling-piece is found to puſh more when the touch-hole is placed at ſome little diſtance from the bottom of the bore; which ariſes from nothing but the powder's acting with more force, by being inflamed to greater advantage; conſequently, in this caſe, the ſame quantity of powder will have a greater effect, than when the touch-hole is placed at the bottom of the bore, which may be of ſome uſe in huſbanding the powder. PRACTICE

The above dimenſions are taken from ſome elegant $\frac{1}{2}$ pound guns, which were made for the prince of Aſturias by the Carron company.

The rifles make one ſpiral turn in the length of the bore; but go no nearer to the breech, in their full ſize, than two calibers; and then terminate with a gentle ſlope in half a caliber more, ſo as not to prevent the cartridge with the powder from being eaſily ſent home to the bottom of the gun, which would otherwiſe conſtantly happen with the flannel cartridges, and even ſometimes with paper ones, if not made to enter very looſely. The ſhape of the rifles is ſemicircular, their breadth being equal to the diameter, which is $\frac{1}{16}$ of a caliber, and their depth equal to the ſemi-diameter, or $\frac{1}{32}$ of a caliber.

The bullets, fig. 13. are of lead, having ſix knobs caſt on them to fit the rifles of the gun. Being thus made of ſoft metal, they do not injure the rifles; and may alſo ſave an army the trouble of carrying a great quantity of ſhot about with them, ſince a ſupply of lead may be had in moſt countries from roofs, &c. which can be caſt into balls as occaſion requires. Lead likewiſe being of greater ſpecific gravity than caſt-iron, flies to a much greater diſtance.

Rifled ordnance of any caliber might be made to carry iron ſhot, for battering or for other purpoſes; provided holes, that are a little wider at their bottoms than at their upper parts, be caſt in a zone round the ball, for receiving afterwards leaden knobs to fit the rifles of the cannon; by which means, the iron ſhot will have its intended line of direction preſerved, without injuring the rifles more than if the whole ball was of lead, the rotatory motion round its axis, in the line of its direction, (which corrects the aberration), being communicated to it by the leaden knobs, following the ſpiral turn of the rifles in its progreſs out of the gun. It is particularly to be obſerved, that the balls muſt be made to go eaſily down into the piece, ſo that the cartridge with the powder and the bullet may be both ſent home together, with a ſingle puſh of the hand, without any wadding above either powder or ball; by which means, the gun is quickly loaded, and the ball flies farther than when it is forcibly driven into the gun, as was found from many experiments. The only reaſon why, in common rifled muſkets, the bullets are rammed in forcibly, is this, that the zone of the ball which is contiguous to the inſide of the bore may have the figure of the rifles impreſſed upon it, in ſuch a manner as to become part of a male ſcrew, exactly fitting the indents of the rifle, which is not at all neceſſary in the preſent caſe, the figure of the rifles being originally caſt upon the ball. Theſe knobs retard the flight of the bullet in ſome degree; but this ſmall diſadvantage is fully made up by the eaſe with which the gun is loaded, its

PRACTICE its service being nearly as quick as that of a common field-piece; and the retardation and quantity of the whirling motion which is communicated to the bullet being conſtantly the ſame, it will not in the leaſt affect the experiments made with them, in order to determine the reſiſtance of the air.

48. Sector and teleſcope belonging to this kind of ordnance.

In order to hit the mark with greater certainty than can be done in the common random method, theſe guns are furniſhed with a ſector, the principal parts of which are, 1. The limb, which is divided in ſuch a manner as to ſhew elevations to 15 or 20 degrees. The length of the radius is five inches and an half, and its nonius is ſo divided as to ſhew minutes of a degree. 2. The teleſcope, AB, fig. 14. an achromatic refractor, is ſeven inches in length, (ſuch as is uſed on Hadley's quadrants, that are fitted for taking diſtances of the moon from the ſun or ſtars, in order to obtain the longitude at ſea), having croſs hairs in it. 3. The parallel cylindric bar, CD, is $\frac{4}{10}$ of an inch in diameter, having two rectangular ends EF, each half an inch ſquare and an inch long. On one ſide of the end next the limb of the ſector, is a mark correſponding to a ſimilar one on the hinder cock of the gun, with which it muſt always coincide when placed on the gun. The length of the parallel bar, together with its ends, is 7 inches. This bar is fixed to the ſector by means of two hollow cylinders, G, H, which allow the ſector a motion round the bar. There is a finger-ſcrew, a, upon the hollow cylinder G, which is ſlit, in order to tighten it at pleaſure upon the bar. 4. The circular level I, fig. 14. and 15. for ſetting the plane of the ſector always perpendicular when placed upon the gun, is $\frac{1}{2}$ of an inch in diameter. There is a ſmall ſcrew, d, to adjuſt the level at right angles to the plane of the ſector. 5. The finger ſcrew, b, for fixing the index of the ſector at any particular degree of elevation propoſed.

The line of collimation (that is, the line of viſion cut by the interſecting point of the two croſs-hairs in the teleſcope) muſt be adjuſted truly parallel to the bar of the ſector when at 0 degrees. This is done by placing the ſector ſo that the vertical hair may exactly cover ſome very diſtant perpendicular line. If it again covers it when the ſector is inverted, by turning it half round upon the bar, which has all the while been kept ſteady and firm, that hair is correct; if not, correct half the error by means of the ſmall ſcrews, c d e, fig. 14. and 16. at the eye-end of the teleſcope, and the other half by moving the bar; place it again to cover the perpendicular line, and repeat the above operation till the hair covers it in both poſitions of the ſector. Then turn the ſector, till the horizontal hair cover the ſame perpendicular line; and turning the ſector half round on its bar, correct it, if wrong, in the ſame manner as you did the vertical hair.

N. B. Of the four ſmall ſcrews at the eye-end of the teleſcope, thoſe at the right and left hand move whatever hair is vertical, and thoſe at top or underneath move whatever hair is horizontal.

On the ſide of the gun upon the firſt reinforce, are caſt two knobs, F, fig. 12. and 17. having their middle part diſtant from each other ſix inches, for fixing on the braſs cocks, A, fig. 17. and 18. which ceive the rectangular ends of the parallel cylindric bar of the ſector, when placed on the gun.

The next adjuſtment is to make the parallel bar, and line of collimation of the teleſcope, when ſet at 0 degrees, parallel to the bore of the gun, and conſequently to the direction of the ſhot. The gun being loaded, the cartridge pricked, and the gun primed, place the ſector in the cocks of the gun; and having firſt ſet the ſector to what elevation you judge neceſſary, bring the interſection of the croſs-hairs in the teleſcope, upon the center of the mark, the limb of the ſector being ſet vertical by means of the circular level, and then take off the ſector without moving the gun. Fire the gun; and if the bullet hits any where in the perpendicular line, paſſing through the centre of the mark, the line of collimation of the teleſcope and direction of the ſhot agree. But if it hit to the right of the mark, ſo much do they differ. In order to correct which, bring the gun into the ſame poſition it was in before firing, and ſecure it there. Then file away as much of the forecock, on the ſide next the gun, as will let the interſection of the croſs-hair fall ſomewhere on the line paſſing perpendicularly through the point where the ſhot fell; and it is then adjuſted in that poſition, ſo much being filed off the ſide of the cock at *a*, fig. 17. and 18. as will allow the ſide *b* to be ſcrewed cloſer, that the ends of the parallel bar may have no ſhake in the cocks. To correct it in the other poſition, and ſo to find the true 0 degrees of the gun, that is, to bring the line of collimation of the teleſcope, parallel bar, and bore of the gun, truly parallel to each other, repeat the above with the trunnions perpendicular to the horizon, the ſector being turned a quarter round upon its bar, ſo as to bring its plane vertical. The deviation of the ſhot found in this way is corrected by deepening one of the cocks, ſo that the vertical hair of the teleſcope may be brought to cover the line paſſing perpendicularly through the point where the bullet hits; the gun being placed in the ſame poſition it was in before it was fired. This adjuſtment being repeated two or three times, and any error that remains being corrected, the gun is fit to be mounted on its carriage for ſervice. It is to be obſerved, that this ſector will fit any gun, if the cocks and rectangular ends, &c. of the parallel bar be of the above dimenſions, and will be equally applicable to all ſuch pieces whoſe cocks have been adjuſted, as if it had been adjuſted ſeparately with each of them. And if the ſector be ſet at any degree of elevation, and the gun moved ſo as to bring the interſection of the croſs-hairs on the object to be fired at (the limb of the ſector being vertical), the bore of the gun will have the ſame elevation above it, in the true direction of the ſhot, whatever poſition the carriage of the gun is ſtanding in. A teleſcope with croſs-hairs, fixed to a common rifled muſket, and adjuſted to the direction of the ſhot, will make any perſon, with a very little practice, hit an object with more preciſion than the moſt experienced markſman.

49. Their carriages.

For garriſon-ſervice, or for batteries, the ſhip or garriſon carriage, with two iron ſtaples on each ſide to put through a couple of poles to carry theſe guns from place to place with more diſpatch, are as proper as any. But, for the field, a carriage like that at fig. 19. where the ſhafts puſh in upon taking out the iron pins a b, and moving the croſs bar A,

PRACTICE upon which the breech of the gun rests, as far down as the shafts were pushed in, is the properest, since the whole can then be carried like a hand-barrow, over ditches, walls, or rough ground, all which may be easily understood from the figure.

The principal advantage that will accrue from the use of rifled ordnance, is the great certainty with which any object may be hit when fired at with them, since the shot deviates but little from its intended line of direction, and the gun is capable of being brought to bear upon the object, with great exactness, by means of the telescope and cross-hairs.

50 Mortars described.

THE other pieces of artillery commonly made use of are mortars, howitzers, and royals. The mortars are a kind of short cannon of a large bore, with chambers for the powder, and are made of brass or iron. Their use is to throw hollow shells filled with powder, which falling on any building, or into the works of a fortification, burst, and with their fragments destroy every thing near them. Carcases are also thrown out of them; which are a sort of shells with five holes, filled with pitch and other materials, in order to set buildings on fire; and sometimes baskets full of stones, of the size of a man's fist, are thrown out of them upon an enemy placed in the covert-way in the time of a siege. Of late the ingenious General Desaguliers has contrived to throw bags filled with grape-shot, containing in each bag from 400 to 600 shot of different dimensions, out of mortars. The effect of these is tremendous to troops forming the line of battle, passing a defile, or landing, &c. the shot pouring down like a shower of hail on a circumference of above 300 feet.

Mortars are chiefly distinguished by the dimensions of their bore; for example, a 13-inch mortar is one the diameter of whose bore is 13 inches, &c.—The land-mortars are those used in sieges, and of late in battles. They are mounted on beds, and both mortar and bed are transported on block carriages. There is likewise a kind of land-mortars mounted on travelling carriages, invented by count Buckeburg, which may be elevated to any degree; whereas all the English mortars are fixed to an angle of 45°. This custom, however, does not appear to have any foundation in reason. In a siege, shells should never be thrown with an angle of 45 degrees, excepting one case only; that is, when the battery is so far off, that they cannot otherwise reach the works: for when shells are thrown out of the trenches into the works of a fortification, or from the town into the trenches, they should have as little elevation as possible, in order not to bury themselves, but to roll along the ground, whereby they do much more damage, and occasion a much greater consternation among the troops, than if they sunk into the ground. On the contrary, when shells are thrown upon magazines, or any other buildings, the mortars should be elevated as high as possible, that the shells may acquire a greater force in their fall, and consequently do more execution.

There are other kinds of mortars, called *partridge-mortars*, *hand-mortars*, and *firelock-mortars*; which last are also called *bombards*. The partridge-mortar is a common one, surrounded with 13 other little mortars bored round its circumference, in the body of the metal; the middle one is loaded with a shell, and the others with grenades. The vent of the large mortar being fired, communicates its fire to the rest; so that both the shell and grenades go off at once. Hand-mortars were frequently used before the invention of cohorns. They were fixed at the end of a staff four feet and a half long, the other end being shod with iron to stick in the ground; and while the bombardier with one hand elevated it at pleasure, he fired it with the other. The firelock-mortars, or bombards, are small mortars fixed to the end of a firelock. They are loaded as all common firelocks are; and the grenade, placed in the mortar at the end of the barrel, is discharged by a flint-lock. To prevent the recoil hurting the bombardier, the bombard rests on a kind of halberd made for that purpose. PRACTICE

The chamber in mortars is the place where the powder is lodged. They are of different forms, and made variously by different nations; but the cylindric seems to be preferable to any other form.

51 Howitzes and royals.

The howitz is a kind of mortar mounted on a field-carriage like a gun: it differs from the common mortars in having the trunnions in the middle, whereas those of the mortar are at the end. The construction of howitzes is as various and uncertain as that of mortars, excepting that the chambers are all cylindric. They are distinguished by the diameter of their bore; for instance, a 10-inch howitz is that which has a bore of 10 inches diameter, and so of others. They were much more lately invented than mortars, and indeed are plainly derived from them.

Royals are a kind of small mortars, which carry a shell whose diameter is 5.5 inches. They are mounted on beds in the same way as other mortars.

52 Parts of a mortar.

Fig. 20. represents a mortar; and the names of its parts are as follow.

AB, the whole length of the mortar.
AC, the muzzle.
CD, chace.
DE, reinforce.
EF, breech.
GH, trunnions.
a, vent.
b, dolphins.
c d, vent-astragal and fillets.
d e, breech-ring and ogee.
f g, reinforce-ring and ogee.
g h, reinforce-astragal and fillets.
i k, muzzle-astragal and fillets.
k l, muzzle-ring and ogee.
l m, muzzle mouldings.
n, shoulders.

Interior parts.

o, chamber.
p, bore.
q, mouth.
r, vent.

The mortar-beds are formed of very solid timber, and placed upon very strong wooden frames, fixed in such a manner, that the bed may turn round. The fore-part of these beds is an arc of a circle described from the centre on which the whole turns.

53 Instruments used in loading cannon.

There are several instruments employed in the loading of cannon. The names of these are as follow:

1. The lantern or ladle, which serves to carry the powder

PRACTICE powder into the piece, and which consists of two parts, viz. of a wooden box, appropriated to the caliber of the piece for which it is intended, and of a caliber and a half in length with its vent; and of a piece of copper nailed to the box, at the height of a half caliber.—This lantern must have three calibers and a half in length, and two calibers in breadth, being rounded at the end to load the ordinary pieces.

2. The rammer is a round piece of wood, commonly called a *box*, fastened to a stick 12 foot long, for the pieces from 12 to 33 pounders; and 10 for the 8 and 4 pounders; which serve to drive home the powder and ball to the breech.

3. The sponge is a long staff or rammer, with a piece of sheep or lamb-skin wound about its end, to serve for scouring the cannon when discharged, before it be charged with fresh powder; to prevent any spark of fire from remaining in her, which would endanger the life of him who should load her again.

4. Wad-screw consists of two points of iron turned serpent-wise, to extract the wad out of the pieces when one wants to unload them, or the dirt which had chanced to enter into it.

5. The botefeux are sticks two or three feet long, and an inch thick, split at one end, to hold an end of the match twisted round it, to fire the cannon.

6. The priming-iron is a pointed iron rod, to clear the touch-hole of the pieces of powder or dirt; and also to pierce the cartridge, that it may sooner take fire.

7. The primer, which must contain a pound of powder at least, to prime the pieces.

8. The quoin of mire, which are pieces of wood with a notch on the side to put the fingers on, to draw them back or push them forward when the gunner points his piece. They are placed on the sole of the carriage.

9. Leaden-plates, which are used to cover the touch-hole, when the piece is charged, lest some dirt should enter it and stop it.

54 Method of managing them.

Before charging the piece, it is well spunged, to clean it of all filth and dirt within-side; then the proper weight of gunpowder is put in and rammed down; care being taken that the powder be not bruised in ramming, which weakens its effect; it is then run over by a little quantity of paper, hay, or the like; and lastly, the ball is thrown in.

To point, level, or direct the piece, so as to play against any certain point, is done by the help of a quadrant with a plummet: which quadrant consists of two branches made of brass or wood; one about a foot long, eight lines broad, and one line in thickness; the other four inches long, and the same thickness and breadth as the former. Between these branches is a quadrant, divided into 90 degrees, beginning from the shorter branch, and furnished with thread and plummet.

The longest branch of this instrument is placed in the cannon's mouth, and elevated or lowered till the thread cuts the degree necessary to hit the proposed object. Which done, the cannon is primed, and then set fire to. The method by the sector however, proposed by Dr Lind, is certainly in all cases to be preferred.

A 24 pounder may very well fire 90 or 100 shots, every day in summer; and 60 or 75 in winter. In case of necessity, it may fire more. And some French officers of artillery assure, that they have caused such a piece to fire every day 150 shots in a siege.—A 16 and a 12 pounder fire a little more, because they are easier served. There have even been some occasions, where 200 shots have been fired from these pieces in the space of nine hours, and 138 in the space of five. In quick firing, tubes are made use of. They are made of tin, and their diameter is two tenths of an inch, being just sufficient to enter into the vent of the piece. They are about six inches long, with a cap above, and cut slanting below, in the form of a pen; the point is strengthened with some solder, that it may pierce the cartridge without bending. Through this tube is drawn a quick-match, the cap being fitted with mealed powder moistened with spirits of wine. To prevent the mealed powder from falling out by carriage, a cap of paper or flannel steeped in spirits of wine is tied over it. To range pieces in a battery, care must be taken to reconoitre well the ground where it is to be placed, and the avenues to it. The pieces must be armed, each with two lanterns or ladles, a rammer, a sponge, and two priming-irons. The battery must also be provided with carriages, and other implements, necessary to remount the pieces which the enemy should chance to dismount. PRACTICE

To serve expeditiously and safely a piece in a battery, it is necessary to have to each a sack of leather, large enough to contain about 20 pounds of powder to charge the lanterns or ladles, without carrying them to the magazine; and to avoid thereby making those trains of powder in bringing back the lantern from the magazine, and the accidents which frequently happen thereby.

A battery of three pieces must have 30 gabions, because six are employed on each of the two sides or epaulments, which make 12, and nine for each of the two merlons.

There ought to be two gunners and six soldiers to each piece, and four officers of artillery.

The gunner, posted on the right of the piece, must take care to have always a pouch-full of powder, and two priming irons; his office is to prime the piece, and load it with powder. The gunner on the left fetches the powder from the little magazine, and fills the lantern or ladle which his comrade holds; after which, he takes care that the match be very well lighted, and ready to set fire to the piece at the first command of the officer.

There are three soldiers on the right, and three on the left of the piece. The two first take care to ram and spunge the piece, each on his side. The rammer and spunge are placed on the left, and the lantern or ladle on the right. After having rammed well the wad put over the powder, and that put over the bullet, they then take each a handspike, which they pass between the foremost spokes of the wheel, the ends whereof will pass under the head of the carriage, to make the wheel turn round, leaning on the other end of the handspike, towards the embrasure.

It is the office of the second soldier on the right, to provide wad, and to put it into the piece, as well over the powder as over the bullet; and that of his comrade on the left, to provide 50 bullets, and, every time the piece is to be charged, to fetch one of them and put it into the piece after the powder has been rammed.

PRACTICE med. Then they both take each an handſpike, which they paſs under the hind part of the wheel, to puſh it in battery.

The officer of artillery muſt take care to have the piece diligently ſerved.

In the night he muſt employ the gunners and ſoldiers, who ſhall relieve thoſe who have ſerved 24 hours to repair the embraſures.

If there be no water near the battery, care muſt be taken to have a caſk filled with it, in which to dip the ſponges and cool the pieces every 10 or 12 rounds.

The carriage for a mortar of 12 inches of diameter muſt be 6 foot long, the flaſks 12 inches long and 10 thick. The trunnions are placed in the middle of the carriage.

The carriage of an 18 inch mortar muſt be 4 foot long; and the flaſks 11 inches high, and 6 thick.

To mount the mortars of new invention, they uſe carriages of caſt iron.

55 Method of managing mortars.

In Germany, to mount mortars from 8 to 9 inches, and carry them into the field, and execute them horizontally as a piece of cannon, they make uſe of a piece of wood 8 feet 2 inches long, with a hole in the middle to lodge the body of the mortar and its trunnions as far as their half diameter, and mounted on two wheels four feet high, to which they join a vantrain proportioned to it, and made like thoſe which ſerve to the carriages of cannons.

Having mounted the mortar on its carriage, the next thing is to caliber the bomb, by means of a great caliber, the two branches whereof embrace the whole circumference of the bomb: theſe two branches are brought on a rule where the different calibers are marked, among which that of the bomb is found.

If no defect be found in the bomb, its cavity is filled, by means of a funnel, with whole gunpowder; a little ſpace or liberty is left, that when a fuſee or wooden tube, of the figure of a truncated cone, is driven thro' the aperture, (with a wooden mallet, not an iron one, for fear of accident), and faſtened with a cement made of quick-lime, aſhes, brick-duſt, and ſteel-filings worked together in a glutinous water, or of four parts of pitch, two of colophony, one of turpentine, and one of wax, the powder may not be bruiſed. This tube is filled with a combuſtible matter, made of two ounces of nitre, one of ſulphur, and three or more of gunpowder duſt well rammed. See FUZE.

This fuſee ſet on fire, burns ſlowly till it reaches the gunpowder; which goes off at once, burſting the ſhell to pieces with incredible violence. Special care, however, muſt be taken, that the fuſee be ſo proportioned, as that the gunpowder do not take fire ere the ſhell arrives at the deſtined place; to prevent which, the fuſee is frequently wound round with a wet clammy thread.

Batteries conſiſt,—1. Of an epaulment to ſhelter the mortars from the fire of the enemy. 2. Of platforms on which the mortars are placed. 3. Of ſmall magazines of powder. 4. Of a boyau which leads to the great magazine. 5. Of ways which lead from the battery to the magazine of bombs. 6. Of a great ditch before the epaulment. 7. Of a berm or retraite.

The platforms for mortars of 12 inches muſt have 9 feet in length, and 6 in breadth.—The lambourds for common mortars muſt be four inches thick; thoſe of a PRACTICE concave chamber of 8 lb. of powder, 5 inches; thoſe of 12 lb. 6 inches; thoſe of 18 lb. 7 inches, or thereabouts. Their length is at diſcretion, provided there be enough to make the platforms 9 feet long.—The forepart of the platform will be ſituated at two foot diſtance from the epaulment of the battery.—The bombardiers, to ſhelter themſelves in their battery, and not be ſeen from the town beſieged, raiſe an epaulment of 7 foot or more high, which epaulment has no embraſures.

To ſerve expeditiouſly a mortar in battery, there are required,—five ſtrong handſpikes; a dame or rammer, of the caliber of the conic chamber, to ram the wad and the earth; a wooden knife a foot long, to place the earth round the bomb; an iron ſcraper two feet long, one end whereof muſt be four inches broad and round-wiſe, to clean the bore and the chamber of the mortar, and the other end made in form of a ſpoon to clean the little chamber; a kind of brancard to carry the bomb, a ſhovel, and pick-ax.

The officer who is to mind the ſervice of the mortar, muſt have a quadrant to give the degrees of elevation.

Five bombardiers, or others, are employed in that ſervice; the firſt muſt take care to fetch the powder to charge the chamber of the mortar, putting his priming-iron in the touch-hole before he charges the chamber; and never going to fetch the powder before he has aſked his officer at what quantity of powder he deſigns to charge, becauſe more or leſs powder is wanted according to the diſtance where it is fired; the ſame will take care to ram the wad and earth, which another ſoldier puts in the chamber.

The ſoldier on the right will put again two ſhovels full of earth in the bottom of the bore, which ſhould be likewiſe very well rammed down.

This done, the rammer or dame is returned into its place, againſt the epaulment on the right of the mortar: he takes an handſpike in the ſame place to poſt himſelf behind the carriage of the mortar, in order to help to puſh it into battery: having laid down his handſpike, he takes out his priming-iron, and primes the touch-hole with fine powder.

The ſecond ſoldier on the right and left will have by that time brought the bomb ready loaded, which muſt be received into the mortar by the firſt ſoldier, and placed very ſtrait in the bore or chaſe of the mortar.

The firſt, on the right, will furniſh him with earth to put round the bomb, which he muſt take care to ram cloſe with the knife given him by the ſecond on the left.

This done, each ſhall take a handſpike, which the two firſt, on the right and left, ſhall put under the pegs of retreat of the forepart, and the two behind under thoſe of the hind-part; and they together puſh the mortar in battery.

Afterwards the officer points or directs the mortar.

During that time, the firſt ſoldier takes care to prime the touch-hole of the mortar, without ramming the powder; and the laſt on the right, muſt have the match ready to ſet fire to the fuſee of the bomb on the right, while the firſt is ready with his on the left,

A Bell Sculp.t

PRACTICE to set fire to the touch-hole of the mortar; which he ought not to do till he sees the fusee well lighted.

The foremost soldiers will have their handspikes ready to raise the mortar upright, as soon as it has discharged; while the hindmost on the left shall, with the scraper, clean the bore and chamber of the mortar.

The magazine of powder for the service of the battery, shall be situated 15 or 20 paces behind, and covered with boards, and earth over it.—The loaded bombs are on the side of the said magazine, at five or six paces distance.

The officer who commands the service of the mortar, must take care to discover, as much as possible, with the eye, the distance of the place where he intends to throw his bomb, giving the mortar the degree of elevation, according to the judgment he has formed of the distance. Having thrown the first bomb, he must diminish or increase the degrees of elevation, according to the place upon which it shall fall. Several make use of tables to discover the different distances according to the differences of the elevations of the mortar, especially the degrees of the quadrant from 1 to 45; but these, from the principles already laid down, must be fallacious.

57 Of the petard.

The petard is the next piece of artillery which deserves our attention, and is a kind of engine of metal, somewhat in shape of a high-crowned hat, serving to break down gates, barricades, draw-bridges, or the like works, which are intended to be surprized, It is very short, narrow at the breech, and wide at the muzzle, made of copper mixed with a little brass, or of lead with tin.

The petards are not always of the same height and bigness; they are commonly 10 inches high, 7 inches of diameter at top, and 10 inches at bottom. They weigh commonly 40, 45, and 50 pounds.

The madrier, on which the petard is placed, and where it is tied with iron circles, is of two feet for its greatest width, and of 18 inches on the sides, and no thicker than a common madrier. Under the madrier are two iron-bars passed crosswise, with a hook, which serves to fix the petard.

To charge a petard 15 inches high, and 6 or 7 inches of caliber or diameter at the bore, the inside must be first very well cleaned and heated, so that the hand may bear the heat; then take the best powder that may be found, throw over it some spirit of wine, and expose it to the sun, or put it in a frying-pan; and when it is well dried, 5 or 6 lb. of this powder is put into the petard, which reaches within three fingers of the mouth: the vacancies are filled with tow, and stopped with a wooden tampion; the mouth being strongly bound up with cloth tied very tight with ropes; then it is fixed on the madrier, that has a cavity cut in it to receive the mouth of the petard, and fastened down with ropes.

PRACTICE Some, instead of gun-powder for the charge, use one of the following composition, viz. gun-powder seven pounds, mercury sublimate one ounce, camphor eight ounces; or gun-powder six pounds, mercury sublimate three ounces, and sulphur three; or gun-powder six, beaten glass $\frac{1}{2}$ an ounce, and camphor $\frac{1}{2}$.

Before any of these pieces are appropriated for service, it is necessary to have each undergo a particular trial of its soundness, which is called a *proof*, to be made by or before one authorised for the purpose, called the *proof-master*.

To make a proof of the piece, a proper place is chosen, which is to be terminated by a mount of earth very thick to receive the bullets fired against it, that none of them may run through it. The piece is laid on the ground, supported only in the middle by a block of wood. It is fired three times: the first with powder of the weight of the bullet, and the two others with $\frac{1}{2}$ of the weight; after which a little more powder is put in to singe the piece; and after this, water, which is impressed with a spunge, putting the finger on the touch-hole, to discover if there be any cracks; which done, they are examined with the eat, which is a piece of iron with three grasps, disposed in the form of a triangle, and of the caliber of the piece; then it is visited with a wax-candle, but it is of very little service in the small pieces, because if they be a little long, the smoke extinguishes it immediately. See Plate cxli.

58 Of small arms.

Besides the large pieces already mentioned, invented for the destruction of mankind, there are others called *small guns*, viz. muskets of ramparts, common muskets, fusils, carabines, musketoons, and pistols.

A musket, or musquet, is a fire-arm borne on the shoulder, and used in war, formerly fired by the application of a lighted match, but at present with a flint and lock. The common musket is of the caliber of 20 leaden balls to the pound, and receives balls from 22 to 24: its length is fixed to 3 feet 8 inches from the muzzle to the touch-pan.

A fusil, or fire-lock, has the same length and caliber; and serves at present instead of a musket.

A carabine is a small sort of fire-arm, shorter than a fusil, and carrying a ball of 24 in the pound, borne by the light-horse, hanging at a belt over the left shoulder. This piece is a kind of medium between the pistol and the musket; and bears a near affinity to the arquebuse, only that its bore is smaller. It was formerly made with a match-lock, but of late only with a flint-lock.

The musquetoon is of the same length of the carabine, the barrel polished, and clean within. It carries five ounces of iron, or seven and a half of lead, with an equal quantity of powder.

The barrel of a pistol is generally 14 inches long.

GUN

GUN-POWDER, a composition of saltpetre, sulphur, and charcoal, mixed together, and usually granulated; which easily takes fire, and, when fired, rarifies, or expands with great vehemence, by means of its elastic force.

It is to this powder we owe all the action and effect of guns, ordnance, &c. so that the modern military art, fortification, &c. in a great measure depend thereon.

Invention of GUN-POWDER. See GUN.

Method of making GUN-POWDER. Dr Shaw's receipt for this purpose is as follows: Take four ounces of

Gun-powder.

of refined ſaltpetre, an ounce of brimſtone, and ſix drams of ſmall-coal: reduce theſe to a fine powder, and continue beating them for ſome time in a ſtone mortar, with a wooden peſtle, wetting the mixture between whiles with water, ſo as to form the whole into an uniform paſte, which is reduced to grains, by paſſing it through a wire-ſieve fit for the purpoſe; and in this form being carefully dried, it becomes the common gun-powder.

For greater quantities, mills are uſually provided; by means of which more work may be performed in one day, than a man can do in a hundred.

The nitre or ſaltpetre is refined thus: Diſſolve four pounds of rough nitre as it comes to us from the Indies, by boiling it in as much water as will commodiouſly ſuffice for that purpoſe: then let it ſhoot for two or three days in a covered veſſel of earth, with ſticks laid acroſs for the cryſtals to adhere to. Theſe cryſtals being taken out, are drained and dried in the open air.

In order to reduce this ſalt to powder, they diſſolve a large quantity of it in as ſmall a proportion of water as poſſible; then keep it conſtantly ſtirring over the fire, till the water exhales, and a white dry powder is left behind.

In order to purify the brimſtone employed, they diſſolve it with a very gentle heat; then ſcum and paſs it through a double ſtrainer. If the brimſtone ſhould happen to take fire in the melting, they have an iron cover that fits on cloſe to the melting veſſel, and damps the flame. The brimſtone is judged to be ſufficiently refined if it melts, without yielding any fetid odour, between two hot iron-plates, into a kind of red ſubſtance.

The coal for the making of gun-powder is either that of willow, or hazel, well charred in the uſual manner, and reduced to powder. And thus the ingredients are prepared for making this commodity: but as theſe ingredients require to be intimately mixed, and as there would be danger of their firing if beat in a dry form, the method is to keep them continually moiſt, either with water, urine, or a ſolution of ſal ammoniac: they continue thus ſtamping them together for twenty-four hours, after which the maſs is fit for corning and drying in the ſun, or otherwiſe, ſo as ſeduloufly to prevent its firing.

Different kinds of Gun-powder. The three ingredients of gun-powder are mixed in various proportions according as the powder is intended for muſkets, great guns, or mortars: though theſe proportions ſeem not to be perfectly adjuſted or ſettled by competent experience.

Semienowitz, for mortars, directs an hundred pounds of ſaltpetre, twenty-five of ſulphur, and as many of charcoal; for great guns, an hundred pounds of ſaltpetre, fifteen pound of ſulphur, and eighteen pound of charcoal; for muſkets and piſtols, an hundred pound of ſaltpetre, eight pound of ſulphur, and ten pound of charcoal. Miethius extols the proportion of one pound of ſaltpetre to three ounces of charcoal, and two or two-and-a-quarter of ſulphur; than which, he affirms, no gun-powder can poſſibly be ſtronger. He adds, that the uſual practice of making the gun-powder weaker for mortars than guns, is without any foundation, and renders the expence needleſly much greater: for whereas to load a large mortar, twenty-four pound of common powder is required, and conſequently, to load it ten times, two hundred and forty pound, he ſhews, by calculation, that the ſame effect would be had by one hundred and fifty pound of the ſtrong powder.

Gun-powder.

To increaſe the ſtrength of powder, Dr Shaw thinks it proper to make the grains conſiderably large, and to have it well ſifted from the ſmall duſt. We ſee that gun-powder, reduced to duſt, has little explofive force; but when the grains are large, the flame of one grain has a ready paſſage to another, ſo that the whole parcel may thus take fire nearly at the ſame time, otherwiſe much force may be loſt, or many of the grains go away as ſhot unfired.

It ſhould alſo ſeem that there are other ways of increaſing the ſtrength of powder, particularly by the mixture of ſalt of tartar; but perhaps, adds the laſt-mentioned author, it were improper to divulge any thing of this kind, as gun-powder ſeems already ſufficiently deſtructive.

Method of Trying and Examining Gun-powder. There are two general methods of examining gun-powder; one with regard to its purity, the other with regard to its ſtrength. Its purity is known by laying two or three little heaps near each other upon white paper, and firing one of them. For if this takes fire readily, and the ſmoke riſes upright, without leaving any droſs or feculent matter behind, and without burning the paper, or firing the other heaps, it is eſteemed a ſign that the ſulphur and nitre were well purified, that the coal was good, and that the three ingredients were thoroughly incorporated together: but if the other heaps alſo take fire at the ſame time, it is preſumed, that either common ſalt was mixed with the nitre, or that the coal was not well ground, or the whole maſs not well beat, and mixed together; and if either the nitre or ſulphur be not well purified, the paper will be black or ſpotted.

In order to try the ſtrength of gun-powder, there are two kinds of inſtruments in uſe; but neither of them appear ſo exact as the common method of trying with what velocity a certain weight of powder will throw a ball from a muſket.

There has been much talk of a white powder, which, if it anſwered the character given it, might be a dangerous compoſition; for they pretend that this white powder will throw a ball as far as the black, yet without making a report: but none of the white powder we have ſeen, ſays Dr Shaw, anſwers to this character; being, as we apprehend, commonly made either with touchwood or camphor, inſtead of coal.

Under the article Gunnery, the phyſical cauſe of the explofion of powder, and the force wherewith it expands, have been ſo fully conſidered, that it would be ſuperfluous to add any thing here concerning them. Only we may obſerve, that though it is commonly made uſe of for military purpoſes only in ſmall quantities, and confined in certain veſſels; yet when large quantities are fired at once, even when unconfined, in the open air, it is capable of producing terrible deſtruction. The accounts of damage done by the blowing up of magazines, powder-mills, &c. are too numerous and well-known to be here taken notice of. The following is a relation of what even a moderate quantity

of

Gun-powder, Gunter.

of powder will accompliſh, when fired in the open air. "The king of Navarre took Monſegur. Captain Milon incloſed 500 pounds of powder in a bag, which he found means to introduce, by a drain from the town, into the ditch between two principal gates; the end of the leader was hid in the graſs. Every thing being ready to play off this machine, the king gave us leave to go and ſee its effects; which was ſurpriſing. For one of the gates was thrown into the middle of the town, and the other into the field fifty paces from the wall: all the vaults were deſtroyed, and a paſſage was made in the wall for three men to enter abreaſt, by which the town was taken."—For further accounts of the force of large quantities of powder, ſee the article MINES.

To recover damaged GUN-POWDER. The method of the powder-merchants is, to put part of the powder on a ſail-cloth, to which they add an equal weight of what is really good; and with a ſhovel mingle it well together, dry it in the ſun, and barrel it up, keeping it in a dry and proper place. Others again, if it be very bad, reſtore it by moiſtening it with vinegar, water, urine, or brandy: then they beat it fine, ſearce it, and to every pound of powder add an ounce, an ounce and a half, or two ounces, according as it is decayed, of melted ſalt-petre. Afterwards, theſe ingredients are to be moiſtened and mixed well, ſo that nothing can be diſcerned in the compoſition, which may be known by cutting the maſs; and then they granulate it as aforeſaid. In caſe the powder be in a manner quite ſpoiled, the only way is to extract the ſaltpetre with water, according to the uſual manner, by boiling, ſiltrating, evaporating, and cryſtallizing; and then with freſh ſulphur and charcoal to make it up anew again.

In regard to the medical virtues of gun-powder, Boerhaave informs us, that the flame of it affords a very healthy fume in the height of the plague, becauſe the explosive acid vapour of nitre and ſulphur corrects the air; and that the ſame vapour, if received in a ſmall cloſe pent-up place, kills inſects.

It is enacted by 5 and 11 of Geo. I. and 5 Geo. II. *c.* 20. that gun-powder be carried to any place in a covered carriage; the barrels being cloſe-jointed; or in caſes and bags of leather, &c. And perſons keeping more than 200 pounds weight of gun-powder at one time, within the cities of London and Weſtminſter, or the ſuburbs, &c. are liable to forfeitures if it be not removed; and juſtices of peace may iſſue warrants to ſearch for, ſeize, and remove the ſame.

GUN-*Shot Wounds*. See SURGERY.

GUNTER (Edmund), an excellent Engliſh mathematician and aſtronomer, was born in Hertfordſhire in 1581, and ſtudied at Weſtminſter ſchool; from whence he removed to Oxford, where he took the degree of maſter of arts in 1606, and afterwards entered into holy orders. In 1615, he took the degree of bachelor of divinity: but being peculiary eminent for his knowledge in the mathematics, he had two years before been choſen profeſſor of aſtronomy in Greſham college, London; where he diſtinguiſhed himſelf by his lectures and writings. He invented a ſmall portable quadrant; and alſo the famous line of proportions, which, after the inventor, is called *Gunter's Scale*. He likewiſe publiſhed *Canon Triangulorum*; and a work entitled, *Of the ſector, croſs-ſtaff, and other inſtruments*. This laſt was publiſhed, with an Engliſh tranſlation of his *Canon Triangulorum*, in 4to, by Samuel Foſter, profeſſor of Greſham college. Mr Gunter died at that college in 1626. Gunter, Gun-wale.

GUNTER'S-*Line*, a logarithmic line, uſually graduated upon ſcales, ſectors, &c.

It is alſo called the *line of lines*, and *line of numbers*; being only the logarithms graduated upon a ruler, which therefore ſerves to ſolve problems inſtrumentally in the ſame manner as logarithms do arithmetically. It is uſually divided into an hundred parts, every tenth whereof is numbered, beginning with 1, and ending with 10: ſo that, if the firſt great diviſion, marked 1, ſtand for one tenth of any integer, the next diviſion, marked 2, will ſtand for two tenths; 3, three tenths, and ſo on; and the intermediate diviſions will, in like manner, repreſent 100dth-parts of the ſame integer. If each of the great diviſions repreſent 10 integers, then will the leſſer diviſions ſtand for integers; and if the greater diviſions be ſuppoſed each 100, the ſubdiviſions will be each 10.

Uſe of GUNTER'S-*Line*. 1. *To find the product of two numbers*. From 1 extend the compaſſes to the multiplier; and the ſame extent, applied the ſame way from the multiplicand, will reach to the product. Thus if the product of 4 and 8 be required, extend the compaſſes from 1 to 4, and that extent laid from 8 the ſame way will reach to 32, their product. 2. *To divide one number by another*. The extent from the diviſor to unity, will reach from the dividend to the quotient: thus, to divide 36 by 4, extend the compaſſes from 4 to 1, and the ſame extent will reach from 36 to 9, the quotient ſought. 3. *To three given numbers, to find a fourth proportional*. Suppoſe the numbers 6, 8, 9: extend the compaſſes from 6 to 8; and this extent, laid from 9 the ſame way, will reach to 12, the fourth proportional required. 4. *To find a mean proportional between any two given numbers*. Suppoſe 8 and 32: extend the compaſſes from 8, in the left-hand part of the line, to 32 in the right; then biſſecting this diſtance, its half will reach from 8 forward, or from 32 backward, to 16, the mean proportional ſought. 5. *To extract the ſquare-root of any number*. Suppoſe 25; biſſect the diſtance between 1 on the ſcale and the point repreſenting 25: then the half of this diſtance, ſet off from 1, will give the point repreſenting the root 5. In the ſame manner, the cube root, or that of any higher power, may be found by dividing the diſtance on the line between 1 and the given number, into as many equal parts as the index of the power expreſſes; then one of thoſe parts, ſet from 1, will find the point repreſenting the root required.

GUNTER'S *Quadrant*, one made of wood, braſs, &c. containing a kind of ſtereographic projection of the ſphere, on the plane of the equinoctial; the eye being ſuppoſed placed in one of the poles.

GUNTER'S *Scale*, called by navigators ſimply the *gunter*, is a large plain ſcale, generally two foot long, and about an inch and a half broad, with artificial lines delineated on it, of great uſe in ſolving queſtions in trigonometry, navigation, &c.

GUN-WALE, or GUNNEL, is the uppermoſt wale of a ſhip, or that piece of timber which reaches on either

Gurk ‖ Guy.

ther ſide from the quarter-deck to the foreca ſtle, being the uppermoſt bend which finiſhes the upper works of the hull, in that part in which are put the ſtanchions which ſupport the waſte-trees.

GURK, an epiſcopal town of Carinthia in Germany, ſeated on the river Gurk, in E. Long. 14. 15. N. Lat. 47. 10.

GURNARD, in ichthyology. See TRIGLA.

GUST, a ſudden and violent ſquall of wind, burſting from the hills upon the ſea, ſo as to endanger the ſhipping near the ſhore. Theſe are peculiar to ſome coaſts, as thoſe of South Barbary and Guinea.

GUSTAVUS I. king of Sweden, ſon of Eric de Vaſa duke of Gripſholm. Chriſtian II. king of Denmark having made himſelf maſter of the kingdom of Sweden, confined Guſtavus at Copenhagen; but he making his eſcape, wandered a long time in the foreſts, till the cruelties of the tyrant having occaſioned a revolution, he was firſt declared governor of Sweden, and in 1513 elected king. This prince introduced Lutheraniſm into his dominions, which in a little time ſpread itſelf all over the kingdom. He died in 1560; having made his kingdom hereditary, which was before elective. See SWEDEN.

GUSTAVUS *Adolphus*, ſurnamed *the Great*, king of Sweden, was born at Stockholm in 1594, and ſucceeded his father Charles in 1611. He eſpouſed the cauſe of the Proteſtants in Germany, who were oppreſſed and almoſt entirely ruined by the emperor Ferdinand. He was a great warrior, and gained many victories, of which an account is given under the article SWEDEN. He was at laſt killed in the battle of Lutzen, where his troops got the victory, and defeated two of the emperor's armies.

GUTTA ROSACEA, in medicine, called alſo ſimply *Roſacea*, from the little red drops or fiery tubercles diſperſed about the face and noſe. See (the *Index* ſubjoined to) MEDICINE.

GUTTA *Serena*, a diſeaſe in which the patient, without any apparent fault in the eye, is deprived of ſight. See (*Index* ſubjoined to) MEDICINE.

GUTTA, in architecture, are ornaments in the form of little cones uſed in the Doric corniche, or on the architrave underneath the triglyphs, repreſenting a fort of drops or bells.

GUTTURAL, a term applied to letters or ſounds pronounced or formed as it were in the throat.

GUTTY, in heraldry, a term uſed when any thing is charged or ſprinkled with drops. In blazoning, the colour of the drops is to be named; as gutty of ſable, of gules, &c.

GUY (Thomas), an eminent bookſeller, founder of the hoſpital for ſick and lame in Southwark bearing his name, was the ſon of Thomas Guy lighterman and coal-dealer in Horſleydown, Southwark. He was put apprentice, in 1660, to a bookſeller in the porch of Mercer's chapel; and ſet up trade with a ſtock of about 200 l. in the houſe that forms the angle between Cornhill and Lombard-ſtreet. The Engliſh Bibles being at that time very badly printed, Mr Guy engaged with others in a ſcheme for printing them in Holland and importing them; but this being put a ſtop to, he contracted with the univerſity of Oxford for their privilege of printing them, and carried on a great bible-trade for many years to a conſiderable advantage. Thus he began to accumulate money, and his gains reſted in his hands; for being a ſingle man, and very penurious, his expences could not be great when it was his cuſtom to dine on his ſhop-counter with no other table-covering than an old newſpaper: he was moreover as little ſcrupulous about the ſtyle of his apparel. The bulk of his fortune, however, was acquired by purchaſing ſeamens tickets during queen Anne's wars, and by South-Sea-ſtock in the memorable year 1720. To ſhew what great events ſpring from trivial cauſes, it may be obſerved, that the public owe the dedication of the greateſt part of his immenſe fortune to charitable purpoſes, to the indifcreet officiouſneſs of his maid-ſervant in interfering with the mending of the pavement before the door. Guy had agreed to marry her; and, preparatory to his nuptials, had ordered the pavement before his door, which was in a neglected ſtate, to be mended, as far as to a particular ſtone which he pointed out. The maid, while her maſter was out, innocently looking on the paviours at work, ſaw a broken place that they had not repaired, and mentioned it to them: but they told her that Mr Guy had directed them not to go ſo far. Well, ſays ſhe, do you mend it, tell him I bade you, and I know he will not be angry. It happened, however, that the poor girl preſumed too much on her influence over her careful lover, with whom a few extraordinary ſhillings expence turned the ſcale totally againſt her: the men obeyed, Guy was enraged to find his orders exceeded, his matrimonial ſcheme was renounced, and ſo he built hoſpitals in his old age. In the year 1707 he built and furniſhed three wards on the north-ſide of the outer court of St Thomas's Hoſpital in Southwark, and gave 100 l. to it annually for eleven years preceding the erection of his own hoſpital: and, ſome time before his death, erected the ſtately iron gate, with the large houſes on each ſide, at the expence of about 3000 l. He was 76 years of age when he formed the deſign of building the hoſpital contiguous to that of St Thomas's, which bears his name, and lived to ſee it roofed in; dying in the year 1724. The charge of erecting this vaſt pile amounted to 18,793 l. and he left 219,499 l. to endow it; a much larger ſum than had ever been dedicated to charitable uſes in this kingdom by any one man. He erected an alms-houſe with a library at Tanworth in Staffordſhire (the place of his mother's nativity, and for which he was repreſentative in parliament) for 14 poor men and women; and for their penſions, as well as for the putting out poor children apprentices, bequeathed 125 l. a year. Laſtly, he bequeathed 1000 l. to every one who could prove themſelves in any degree related to him.

GUY, a rope uſed to keep ſteady any weighty body whilſt it is hoiſting or lowering, particularly when the ſhip is ſhaken by a tempeſtuous ſea.

GUY is likewiſe a large ſlack rope, extending from the head of the main-maſt to the head of the fore-maſt, and having two or three large blocks faſtened to the middle of it. This is chiefly employed to ſuſtain the tackle uſed to hoiſt in and out the cargo of a merchant ſhip, and is accordingly removed from the maſt-head as ſoon as the veſſel is laden or delivered.

GUYON (Johanna Mary Bouriers de la Mothe), a French lady, memorable for her writings, and for her ſufferings in the cauſe of Quietiſm, was deſcended from

Guy, Guyon.

Gyarus || Gymnasium.

a noble family, and born at Montargis in 1648. She gave fome extraordinary fymptoms of illumination from her earlieft infancy, and tried to take the veil before fhe was of age to difpofe of herfelf; but her parents obliged her to marry a gentleman to whom they had promifed her. She was a widow at the age of 28; when diftinguifhing herfelf in, and making many converts to, the way of contemplation and prayer, known by the name of *quietifm*, complaints were made of her fpiritualifm; and fhe confined by order of the king, and feverely examined for eight months. She was difcharged; but was afterwards involved in the perfecution of the archbifhop of Cambray, and thrown into the Baftile, where fhe underwent many examinations: but nothing being made out againft her, fhe once more obtained her liberty, and lived private to her death in 1717. She fpent her latter years in myftical reveries; covering her tables, cielings, and every thing that would receive them, with the fallies of a vifionary imagination. Her pious verfes were collected after her death, in 5 vols, entitled *Cantiques fpirituels, ou d'Emblemes fur l'Amour Divin.* Her publications were, *Le moyen court it tres facile de faire Oraifons;* and *Le Cantique des Cantiques de Salomon interprete, felon le fens myftique;* which were condemned by the archbifhop of Paris.

GYARUS, (anc. geog.), one of the Cyclades, 12 miles in compafs, lying to the eaft of Delos. It was a defart ifland, and alloted for a place of baniſhment by the Romans.

GYBING, the act of fhifting any boom-fail from one fide of the maft to the other.

In order to underftand this operation more clearly, it is neceffary to remark, that by a boom-fail is meant any fail whofe bottom is extended by a boom, the fore-end of which is hooked to its refpective maft; fo as to fwing occafionally on either fide of the veffel, defcribing an arch, of which the maft will be the centre. As the wind or the courfe changes, it alfo becomes frequently neceffary to change the pofition of the boom, together with its fail, which is accordingly fhifted to the other fide of the veffel as a door turns upon its hinges. The boom is puſhed out by the effort of the wind upon the fail, and is reſtrained in a proper fituation by a ſtrong tackle communicating with the veſſels ſtern, and called the *ſheet*. It is alſo confined on the fore-part by another tackle, called the *guy*.

GYMNASIARCH, in antiquity, the director of the gymnaſium. He had two deputies under him; the one called *xyſtarch*, who preſided over the athletæ, and had the overſight of wreſtling; the other was *gymnaſtes*, who had the direction of all other exerciſes.

GYMNASIUM, in Grecian antiquity, a place fitted for performing exerciſes.—The word is Greek, formed of γυμνος, "naked;" by reaſon they anciently put off their clothes, to practiſe with the more freedom.

Gymnaſia, according to Potter, were firſt uſed at Lacedæmon, but were afterwards very common in all parts of Greece; and imitated, very much augmented, and improved, at Rome. They were not ſingle edifices, but a knot of buildings united, being ſufficiently capacious to hold many thouſands of people at once; and having room enough for philoſophers, rhetoricians, and the profeſſors of all other ſciences to read their lectures,—and wreſtlers, dancers, and all others who had a mind, to exerciſe,—at the ſame time, without the leaſt diſturbance or interruption. They conſiſted of a great many parts; the chief of which were the portico, eleotheſium, palæſtra, coniſtorium, &c.

Gymnaſtics || Gymnoſophiſts.

Athens had ſeveral gymnaſia, of which the lycæum, academia, and cynoſurges, were thoſe of moſt note.

The lycæum was ſeated on the banks of the river Iliſſus; and received its name from Apollo, to whom it was dedicated. This was the place where Ariſtotle taught philoſophy, walking there every day till the hour of anointing: whence he and his followers were named *Peripatetics*.

The academy was part of the Ceramicus without the city, where Plato lectured.

The cynoſurges was alloted for the populace.

GYMNASTICS, the art of performing the ſeveral bodily exerciſes, as wreſtling, running, fencing, dancing, &c.

That part of medicine which regulates the exerciſes of the body, whether for preſerving or reſtoring health, is alſo termed *gymnaſtic*.

GYMNOPYRIS, in natural hiſtory, a name given by Dr Hill to the pyritæ of a ſimple internal ſtructure, and not covered with a cruſt. See PYRITES.

Of theſe there are only two ſpecies. 1. A green variouſly ſhaped kind. 2. A botryoide kind.

The firſt ſpecies is the moſt common of all the pyritæ, and appears under a great diverſity of ſhapes. It is very hard and heavy, very readily gives fire with ſteel, but will not at all ferment with aquafortis. The ſecond ſpecies is very elegant and beautiful, and its uſual colour is a very agreeable pale green; but what moſt diſtinguiſhes it from all other pyritæ is, that its ſurface is always beautifully elevated into tubercles of various ſizes, reſembling a cluſter of grapes.

GYMNOSOPHISTS, a ſect of philoſophers who clothed themſelves no farther than modeſty required. There were ſome of theſe ſages in Africa; but the moſt celebrated clan of them was in India. The African gymnoſophiſts dwelt upon a mountain in Ethiopia, near the Nile, without the accommodation either of houſe or cell. They did not form themſelves into ſocieties like thoſe of India; but each had his private receſs, where he ſtudied, and performed his devotions by himſelf. If any perſon had killed another by chance, he applied to theſe ſages for abſolution, and ſubmitted to whatever penances they enjoined. They obſerved an extraordinary frugality, and lived only upon the fruits of the earth. Lucan aſcribes to theſe gymnoſophiſts ſeveral new diſcoveries in aſtronomy.

As to the Indian gymnoſophiſts, they dwelt in the woods, where they lived upon the wild products of the earth, and never drank wine nor married. Some of them practiſed phyſic, and travelled from one place to another; theſe were particularly famous for their remedies againſt barrenneſs. Some of them, likewiſe, pretended to practiſe magic, and to foretel future events.

In general, the gymnoſophiſts were wiſe and learned men: their maxims and diſcourſes, recorded by hiſtorians, do not in the leaſt favour of a barbarous education; but are plainly the reſult of great ſenſe and deep thought. They kept up the dignity of their

Gymnospermia, Gymnotus.

character to so high a degree, that it was never their custom to wait upon any body, not even upon princes themselves; for which reason Alexander, who would not condescend to visit them in person, sent some of his courtiers to them in order to satisfy his curiosity. Their way of educating their disciples is very remarkable: every day, at dinner, they examined them how they had spent the morning; and every one was obliged to shew, that he had discharged some good office, practised some virtue, or improved in some part of learning: if nothing of this appeared, he was sent back without his dinner. They held a transmigration of souls; and it is probable that Pythagoras borrowed his doctrine from them.

GYMNOSPERMIA, in botany, from γυμνος, *naked*, and σπερμα, *seed*; the first order in Linnæus's class of didynamia. It comprehends those plants of that class which have naked seeds. The seeds are constantly four in number, except in one genus, viz. phryma, which is monospermous. See BOTANY, p. 1292.

GYMNOTUS, in ichthyology, a genus of fishes belonging to the order of apodes. They have two tentacula at the upper lip; the eyes are covered with the common skin; there are five rays in the membrane of the gills; the body is compressed, and carinated on the belly with a fin. There are five species; the most remarkable of which is the electricus. This species is peculiar to Surinam; and is found in the rocky parts of the river, at a great distance from the sea. The most accurate description we have of this fish is in the Phil. Trans. for 1775, where Alex. Garden, M. D. gives an account of three of them brought to Charlestown in South-Carolina. The largest was about three feet eight inches in length, and might have been from 10 to 14 inches in circumference about the thickest part of its body. The head was large, broad, flat, and smooth; impressed here and there with holes, as if perforated with a blunt needle, especially towards the sides, where they were more regularly ranged in a line on each side. There were two nostrils on each side; the first large, tubular, and elevated above the surface; the others small, and level with the skin. The eyes were small, flattish, and of a bluish colour, placed about three quarters of an inch behind the nostrils. The whole body, from about four inches below the head, was clearly distinguished into four longitudinal parts or divisions. The upper part or back was of a dark colour, and separated from the other parts on each side by the *lateral lines*. These lines took their rise at the base of the head, just above the pectoral fins, and run down the sides, gradually converging as the fish grew smaller to the tail. The second division was of a lighter and clearer colour than the first, inclining to blue. It seemed to swell out on each side; but towards the under part it is again contracted and sharpened into the third part or *carina*. This part is easily distinguished from the other two by its thinness, its apparent laxness, and by the reticulated skin of a more grey and light colour, with which it is covered. The carina begins about six or seven inches below the base of the head; and, gradually deepening or widening as it goes along, reaches down to the tail, where it is thinnest. The fourth part is a long, deep, soft and wavy fin, which takes its rise about three or four inches at most below the head; and thus runs down the sharp edge of the carina to the extremity of the tail. The situation of the anus was very singular; being an inch more forward than the pectoral fins. Externally it seemed to be a pretty large *rima*; but the formed excrements were only the size of a quill of a common dunghill-fowl. There were two pectoral fins situated just behind the head, scarcely an inch in length; of a very thin, delicate consistence, and orbicular shape. They seemed to be chiefly useful in supporting and raising the head of the fish when he came up to breathe; which he was obliged to do every four or five minutes. Across the body were a number of small bands, annular divisions, or rather *rugæ* of the skin. By means of these the fish seemed to partake of the vermicular nature, had the power of lengthening or shortening its body like a worm, and could swim backwards as well as forwards, which is another property of the vermicular tribe. Every now and then it laid itself on one side in the water, as if to rest. Gymnotus.

This fish hath the astonishing property of giving the electric shock to any person, or number of persons, either by the immediate touch with the hand, or by the mediation of any metallic conductor; and the person who kept them, told Dr Garden, that they had this property much stronger when first catched than afterwards: "The person (says he) who is to receive the shock, must take the fish with both hands, at some considerable distance asunder, so as to form the communication, otherwise he will not receive it: at least I never saw any one shocked from taking hold of it with one hand only; though some have assured me, that they were shocked by laying one hand on it. I myself have taken hold of the largest with one hand often, without ever receiving a shock; but I never touched it with both hands, at a little distance asunder, without feeling a smart shock. I have often remarked, that when it is taken hold of with one hand, and the other is put into the water over its body, without touching it, the person received a smart shock; and I have observed the same effect follow, when a number joined hands, and the person at one extremity of the circle took hold of or touched the fish, and the person at the other extremity put his hand into the water, over the body of the fish. The shock was communicated through the whole circle, as smartly as if both the extreme persons had touched the fish. In this it seems to differ widely from the *torpedo* *, or else we are much misinformed of the manner in which the benumbing effect of that fish is communicated. The shock with our Surinam fish gives, seems to be wholly electrical; and all the phenomena or properties of it exactly resemble those of the electric *aura* of our atmosphere when collected, as far as they are discoverable from the several trials made on this fish. This stroke is communicated by the same conductors, and intercepted by the interposition of the same original electrics, or electrics *per se* as they used to be called. The keeper of this fish informs me, that he catched them in Surinam river, a great way up, beyond where the salt-water reaches; and that they are a fresh-water fish only. He says, that they are eaten, and by some people esteemed a great delicacy. They live on fish, worms, or any animal-food if it is cut small.

* See *Torpedo*.

Gymnotus. small so that they can swallow it. When small fishes are thrown into the water, they first give them a shock, which kills or so stupifies them, that they can swallow them easily, and without any trouble. If one of these small fishes, after it is shocked, and to all appearance dead, be taken out of the vessel where the electrical fish is, and put into fresh water, it will soon revive again. If a larger fish than they can swallow be thrown into the water, at a time that they are hungry, they give him some smart shocks, till he is apparently dead, and then they try to swallow or suck him in; but, after several attempts, finding he is too large, they quit him. Upon the most careful inspection of such fish, I could never see any mark of teeth, or the least wound or scratch on them. When the electrical fish are hungry, they are pretty keen after their food; but they are soon satisfied, not being able to contain much at one time. An electrical fish of three feet and upwards in length cannot swallow a small fish above three or at most three inches and a half long. I am told, that some of these have been seen in Surinam river upwards of 22 feet long, whose stroke or shock proved instant death to any person that unluckily received it."

Several other accounts of this fish have been published by different persons, but none of them so full and distinct as the above. They all agree that the electric virtue of the fish is very strong. Mr Fermin in his natural history of Surinam, published in 1765, tells us, that one cannot touch it with the hands, or even with a stick, without feeling a horrible numbness in the arms up to the shoulders; and he farther relates, that, making 14 persons grasp each other by the hands, while he grasped the hand of the last with one of his, and with the other touched the eel with a stick, the whole number felt so violent a shock, that he could not prevail on them to repeat the experiment. V. Vanderlott, in two letters from Rio Essequebo dated in 1761, makes two species, the black and the reddish; though he acknowledges, that, excepting the difference of colour and degree of strength, they are not materially different. In most experiments with these animals, he remarked a surprising resemblance between them and an electrical apparatus: nay, he observed, that the shock could be given to the finger of a person held at some distance from the bubble of air formed by the fish when he comes to the surface of the water to breathe; and he concluded, that at such times the electrical matter was discharged from its lungs. He mentions another characterizing circumstance, which is, that though metals in general were conductors of its electric property, yet some were found to be sensibly better than others for that purpose. Of this property Dr Priestley takes notice, and says that a gold ring is preferable to any thing else. The same is likewise observed by Linnæus. Dr Priestley adds, that the sensation is strongest when the fish is in motion, and is transmitted to a great distance; so that if persons in a ship happen to dip their fingers or feet in the sea, when the fish is swimming at the distance of 15 feet from them, they are affected by it. He also tells us, that the gymnotus itself, notwithstanding all its electric powers, is killed by the lobster.

GYNÆCEUM, among the ancients, the apartment of the women, a separate room in the inner part of the house, when they employed themselves in spinning, weaving, and needle-work.

Gynæocracy || Gypsies.

GYNÆCOCRACY, denotes the government of women, or a state where women are capable of the supreme command. Such are Britain and Spain.

GYNANDRIA, (from γυνη, a "woman;" and ανηρ, a "man.") The name of the 20th class in Linnæus's sexual system, consisting of plants with hermaphrodite flowers, in which the stamina are placed upon the style, or, to speak more properly, upon a pillar-shaped receptacle, resembling a style, which rises in the middle of the flower, and bears both the stamina and pointal; that is, both the supposed organs of generation. See BOTANY, p. 1292.

The flowers of this class, says Linnæus, have a monstrous appearance, arising, as he imagines, from the singular and unusual situation of the parts of fructification.

GYPSIES, or EGYPTIANS, in our statutes, a kind of impostors and jugglers, who disguising themselves in uncouth habits, smearing their faces and bodies, and framing to themselves a canting language, wander up and down, and, under pretence of telling fortunes, curing diseases, &c. abuse the common people, trick them of their money, and steal all that they can come at. There are several statutes made again them.

Egyptians coming into England are to depart the realm in fifteen days, or be imprisoned, by 22 Hen. VIII. cap. 10. And by 1 & 2 P. & M. cap. 4. any person importing them into this kingdom, shall forfeit forty pounds; and if they remain here above one month, or if any person, fourteen years old, consort with them, they are guilty of felony, without benefit of clergy; 5 Eliz. cap. 20. And we are informed by Sir M. Hale, that at one Suffolk assizes, no less than thirteen Gypsies were executed upon these statutes, a few years before the Restoration. See also 39 Eliz. cap. 4. § 2. 17 & Geo II. cap. 5. § 2.

The origin of this tribe of vagabonds is somewhat obscure; at least, the reason of the denomination is so. It is certain, the ancient Egyptians had the character of great cheats, and were famous for the subtilty of their impostures; whence the name might afterwards pass proverbially into other languages, as it is pretty certain it did into the Greek and Latin: or else, the ancient Egyptians, being much versed in astronomy, which in those days was little else but astrology, the name was on that score assumed by these tellers of good fortune.

Be this as it will, there is scarce any country of Europe but has its Egyptians, though not all of them under that denomination: the Latins call them *Ægyptii*; the Italians, *Cingani* and *Cingari*; the Germans, *Zigeuner*; the French, *Bohemiens*; others, *Saracens*; and others, *Tartars*, &c.

Munster, *Geogr. lib. iii. cap.* 5. relates, that they made their first appearance in Germany in 1417, exceedingly tawny and sun-burnt, and in pitiful array, though they affected quality, and travelled with a train of hunting dogs after them, like nobles. The above date should probably have been 1517, as Munster himself owns he never saw any till 1524. He adds, that they had passports from king Sigismund of Bohemia, and other princes. Ten years afterwards, they came into France, and thence passed into England. Several

Gypſies.

ral hiſtorians inform us, that when ſultan Selim conquered Egypt in the year 1517, ſeveral of the natives refuſed to ſubmit to the Turkiſh yoke; but, being at length ſubdued and baniſhed, they agreed to diſperſe in ſmall parties over the world, where their ſuppoſed ſkill in the black art gave them an univerſal reception in that age of ſuperſtition and credulity. In a few years, the number of their proſelytes multiplied, and they became formidable to moſt of the ſtates of Europe. Paſquier, in his *Recherch. lib. iv. chap.* 19. relates a leſs probable origin of the Gypſies, thus: On the 17th of April 1427, there came to Paris twelve penitents, or perſons, as they ſaid, adjudged to penance, viz. one duke, one count, and ten cavaliers or perſons on horſeback: they took on themſelves the character of *Chriſtians of the Lower Egypt*, expelled by the Saracens; who, having made application to the Pope, and confeſſed their ſins, received for penance, that they ſhould travel through the world for ſeven years, without ever lying on a bed. Their train conſiſted of 120 perſons, men, women, and children; which were all that were left of 1200, who came together out of Egypt. They had lodgings aſſigned them in the chapel, and people went in crowds to ſee them. Their ears were perforated, and ſilver-buckles hung to them; their hair was exceedingly black, and frizzled; their women were ugly, thieviſh, and pretenders to telling of fortunes. The biſhop ſoon afterwards obliged them to retire, and excommunicated ſuch as had ſhewn them their hands.

By an ordonnance of the eſtates of Orleans in the year 1560, it was enjoined all theſe impoſtors, under the name of *Bohemians* and *Egyptians*, to quit the kingdom, on penalty of the galleys. Upon this they diſperſed into leſſer companies, and ſpread themſelves over Europe. The firſt time we hear of them in England, was in the year 1530, when they were deſcribed by the ſtatute already cited, 22 Hen. VIII. cap. 10. They were expelled from Spain in 1591.

Ralph. Volaterranus, making mention of them, aſſirms, that they firſt proceeded or ſtrolled from among the Uxii, a people of Perſis or Perſia.

GYPSUM, or PLASTER-STONE, in natural hiſtory, a genus of foſſils, naturally and eſſentially ſimple, not inflammable nor ſoluble in water, and compoſed of flat ſmall particles, which form bright, gloſſy, and in ſome degree tranſparent maſſes, not flexible or elaſtic, not giving fire with ſteel, nor fermenting with or being ſoluble in acid menſtrua, and very eaſily calcined in the fire. Gypſum

Of theſe gypſums, ſome are harder, others ſofter, and are of ſeveral colours, as white, grey, red, green, &c. ſometimes diſtinct, and ſometimes variouſly blended together. Gyſhorn.

The origin of all theſe gypſums is from the vitriolic acid and calcareous earth. See CHEMISTRY, n° 127. They are much uſed for ſtuccoing rooms, and for caſting buſts and ſtatues; for which laſt purpoſe they are excellently adapted by the property they have of expanding when they *ſet*, or become ſolid, after being mixed with water. See PLASTER.

Gypſum by itſelf is very difficult of fuſion: yet if a piece of forged iron is ſurrounded with gypſum in a crucible, and urged with a vehement heat, that metal, though otherwiſe unfuſible, will be melted, and retain its malleability, though ſome ſay it aſſumes the nature of caſt iron. Another very remarkable property of gypſum is, that when mixed with chalk, clay, limeſtone, and ſome other unfuſible earths, they melt, in a heat not very great, into a yelloviſh glaſs. It is impoſſible, however, either to reduce this glaſs to a ſufficient degree of fineneſs and tranſparency by itſelf, or by means of it to give a good yellow colour to other glaſs.

GYR-FALCO, in zoology, the name of a large and fierce ſpecies of falcon called in Engliſh the *jer-falcon*. See FALCO.

It is a very bold and daring bird, attacking all other fowl without reſerve, particularly the heron and ſtork kinds. The other falcons are all afraid of this.

GYSHORN, a town of Germany in the duchy of Lunenburg, ſituated on the river Aller, in E. Long. 10. 45. N. Lat. 52. 50.

H.

H, The eighth letter and ſixth conſonant in our alphabet; though ſome grammarians will have it to be only an aſpiration, or breathing. But nothing can be more ridiculous than to diſpute its being a diſtinct ſound, and formed in a particular manner by the organs of ſpeech, at leaſt in our language: witneſs the words *eat* and *heat*, *arm* and *harm*, *ear* and *hear*, *at* and *hat*, &c. as pronounced with or without the *h*.

It is pronounced by a ſtrong exſpiration of the breath between the lips, cloſing, as it were, by a gentle motion of the lower jaw to the upper, and the tongue nearly approaching the palate.

There ſeems to be no doubt, but that our *h*, which is the ſame with that of the Romans, derived its figure from that of the Hebrew ה. And, indeed, the Phœnicians, moſt ancient Greeks and Romans, uſed the ſame figure with our H, which in the ſeries of all theſe alphabets keeps its primitive place, being the eighth letter.

H, uſed as a numeral, denotes 200; and with a daſh over it, H, 200,000.

As an abbreviation, H was uſed by the ancients to denote *homo*, *hæres*, *hora*, &c. Thus H. B. ſtood for *hæres bonorum*; and H. S. corruptly for L L S. ſeſterce; and H. A. for Hadrianus.

HAAG, or HAG, a town of the duchy of Bavaria in Germany, ſeated on a hill on the weſt ſide of the river Inn, in E. Long. 12. 23. N. Lat. 48. 16.

HABAKKUK, one of the twelve leſſer prophets, whoſe prophecies are taken into the canon of the Old Teſta-

Habat ‖ Habeas.

Teſtament. The name is wrote in the Hebrew with ח *bheth*; and ſignifies "a wreſtler." There is no preciſe time mentioned in ſcripture when this Habakkuk lived; but from his predicting the ruin of the Jews by the Chaldeans, it may be concluded, that he propheſied before Zedekiah, or about the time of Manaſſeh. He is reported to have been the author of ſeveral prophecies which are not extant: but thoſe that are indiſputably his, are contained in three chapters. In theſe the prophet complains very pathetically of the diſorders which he obſerved in the kingdom of Judæa. God reveals to him, that he would ſhortly puniſh them in a very terrible manner by the arms of the Chaldæans. He foretels the conqueſts of Nebuchadnezzar, his metamorphoſis, and death. He foretels, that the vaſt deſigns of Jehoiakim would be fruſtrated. He ſpeaks againſt a prince (probably the king of Tyre) who built with blood and iniquity; and he accuſes another king (perhaps the king of Egypt) of having intoxicated his friend, in order to diſcover his nakedneſs. The third chapter is a ſong or prayer to God, whoſe majeſty he deſcribes with the utmoſt grandeur and ſublimity of expreſſion.

HABAT, a province of Aſia, in Barbary, and in the kingdom of Fez. It is furrounded by the Mediterranean, the Straits of Gibraltar, and the Atlantic Ocean. The principal towns are Arzilla, Tetuan, and Ceuta; which laſt is in poſſeſſion of the Spaniards.

HABDALA, a ceremony of the Jews obſerved on the evening of the ſabbath, when every one of the family is come home. At that time they light a taper or lamp, with two wicks at leaſt. The maſter of the family then takes a cup, with ſome wine, mixed with fragrant ſpices, and having repeated a paſſage or two of ſcripture, as for example, "I will take the cup of ſalvation," &c. Pſal. cxvi. and "The Jews had light and gladneſs," &c. Eſth. viii. he bleſſes the wine and ſpices. Afterwards he bleſſes the light of the fire; and then caſts his eyes on his hands and nails, as remembering that he is going to work. The whole is intended to ſignify, that the ſabbath is over, and is from that moment divided from the day of labour which follows. For this reaſon the ceremony is called *Habdala*, which ſignifies "diſtinction." After the ceremony is over, and the company breaks up, they wiſh one another, not "a good night," but "a good week."

HABEAS CORPUS, in law, is the great remedy in caſes of *Falſe* IMPRISONMENT. The incapacity of the three other remedies referred to under that article, to give complete relief in every caſe, hath almoſt entirely antiquated them, and hath cauſed a general recourſe to be had, in behalf of perſons aggrieved by illegal impriſonment, to the preſent writ, the moſt celebrated in the Engliſh law. Of this there are various kinds made uſe of by the courts at Weſtminſter, for removing priſoners from one court into another for the more eaſy adminiſtration of juſtice. Such is the *habeas corpus ad reſpondendum*, when a man hath a cauſe of action againſt one who is confined by the proceſs of ſome inferior court; in order to remove the priſoner, and charge him with this new action in the court above. Such is that *ad ſatisfaciendum*, when a priſoner hath had judgment againſt him in an action, and the plaintiff is deſirous to bring him up to ſome ſuperior court to charge him with proceſs of execution. Such alſo are thoſe *ad proſequendum*, *teſtificandum*, *deliberandum*, &c.; which iſſue when it is neceſſary to remove a priſoner, in order to proſecute or bear teſtimony in any court, or to be tried in the proper juriſdiction wherein the fact was committed. Such is, laſtly, the common writ *ad faciendum et recipiendum*, which iſſues out of any of the courts of Weſtminſter-hall, when a perſon is ſued in ſome inferior juriſdiction, and is deſirous to remove the action into the ſuperior court; commanding the inferior judges to produce the body of the defendant, together with the day and cauſe of his caption and detainer (whence the writ is frequently denominated an *habeas corpus cum cauſa*) to *do and receive* whatſoever the king's court ſhall conſider in that behalf. This is a writ grantable of common right, without any motion in court; and it inſtantly ſuperſedes all proceedings in the court below. But, in order to prevent the ſurreptitious diſcharge of priſoners, it is ordered by ſtatute 1 & 2 P. & M. c. 13. that no *habeas corpus* ſhall iſſue to remove any priſoner out of any gaol, unleſs ſigned by ſome judge of the court out of which it is awarded. And, to avoid vexatious delays by removal of frivolous cauſes, it is enacted by ſtatute 21 Jac. I. c. 23. that, where the judge of an inferior court of record is a barriſter of three years ſtanding, no cauſe ſhall be removed from thence by *habeas corpus* or other writ, after iſſue or demurrer deliberately joined: that no cauſe, if once remanded to the inferior court by writ of *procedendo* or otherwiſe, ſhall ever afterwards be again removed: and that no cauſe ſhall be removed at all, if the debt or damages laid in the declaration do not amount to the ſum of five pounds. But an *expedient* having been found out to elude the latter branch of the ſtatute, by procuring a nominal plaintiff to bring another action for five pounds or upwards, (and then by the courſe of the court the *habeas corpus* removed both actions together), it is therefore enacted by ſtatute 12 Geo. I. c. 29. that the inferior court may proceed in ſuch actions as are under the value of five pounds, notwithſtanding other actions may be brought againſt the ſame defendant to a greater amount.

Habeas corpus.

But the great and efficacious writ, in all manner of illegal confinement, is that of *habeas corpus ad ſubjiciendum;* directed to the perſon detaining another, and commanding him to produce the body of the priſoner, with the day and cauſe of his caption and detention, *ad faciendum, ſubjiciendum, et recipiendum*, to do, ſubmit to, and receive whatſoever the judge or court awarding ſuch writ ſhall conſider in that behalf. This is a high prerogative writ, and therefore by the common law iſſuing out of the court of king's bench not only in term-time, but alſo during the vacation, by a *fiat* from the chief juſtice, or any other of the judges, and running into all parts of the king's dominions: for the king is at all times entitled to have an account, why the liberty of any of his ſubjects is reſtrained, wherever that reſtraint may be inflicted. If it iſſues in vacation, it is uſually returnable before the judge himſelf who awarded it, and he proceeds by himſelf thereon; unleſs the term ſhould intervene, and then it may be returned in court. Indeed, if the party were privileged in the courts of common pleas and exchequer, as being an officer or ſuitor of the court, an *habeas*

Blackſtone's Commentaries.

Habeas corpus.

beas corpus ad ſubjiciendum might alſo have been awarded from thence; and, if the cauſe of impriſonment were palpably illegal, they might have diſcharged him: but, if he were committed for any criminal matter, they could only have remanded him, or taken bail for his appearance in the court of king's bench; which occaſioned the common pleas to diſcountenance ſuch applications. It hath alſo been ſaid, and by very reſpectable authorities, that the like *habeas corpus* may iſſue out of the court of chancery in vacation: but, upon the famous application to lord Nottingham by Jenks, notwithſtanding the moſt diligent ſearches, no precedent could be found where the chancellor had iſſued ſuch a writ in vacation, and therefore his lordſhip refuſed it.

In the court of King's-bench it was, and is ſtill, neceſſary to apply for it by motion to the court, as in the caſe of all other prerogative writs *(certiorari*, prohibition, *mandamus*, &c.) which do not iſſue as of mere courſe, without ſhewing ſome probable cauſe why the extraordinary power of the crown is called in to the party's aſſiſtance. For, as was argued by lord chief juſtice Vaughan, "it is granted on motion, be-"cauſe it cannot be had of courſe; and there is there-"fore no *neceſſity* to grant it: for the court ought to "be ſatisfied that the party hath a probable cauſe to "to be delivered." And this ſeems the more reaſonable, becauſe (when once granted) the perſon to whom it is directed can return no ſatisfactory excuſe for not bringing up the body of the priſoner. So that, if it iſſued of mere courſe, without ſhewing to the court or judge ſome reaſonable ground for awarding it, a traitor or felon under ſentence of death, a ſoldier or mariner in the king's ſervice, a wife, a child, a relation, or a domeſtic, confined for infanity or other prudential reaſons, might obtain a temporary enlargement by ſuing out an *habeas corpus*, though ſure to be remanded as ſoon as brought up to the court. And therefore Sir Edward Coke, when chief juſtice, did not ſcruple, in 13 Jac. I. to deny a *habeas corpus* to one confined by the court of admiralty for piracy; there appearing, upon his own ſhewing, ſufficient grounds to confine him. On the other hand, if a probable ground be ſhewn, that the party is impriſoned without juſt cauſe, and therefore hath a right to be delivered, the writ of *habeas corpus* is then a writ of right, which "may not be denied, but ought to be granted to "every man that is committed, or detained in priſon, "or otherwiſe reſtrained, though it be by the com-"mand of the king, the privy-council, or any o-"ther."

In the articles LIBERTY and RIGHTS, we expatiated at large on the perſonal liberty of the ſubject. This was ſhewn to be a natural inherent right, which could not be ſurrendered or forfeited unleſs by the commiſſion of ſome great and atrocious crime, and which ought not to be abridged in any caſe without the ſpecial permiſſion of law. A doctrine coeval with the firſt rudiments of our conſtitution; and handed down to us from the Anglo-Saxons, notwithſtanding all their ſtruggles with the Danes, and the violence of the Norman conqueſt: aſſerted afterwards and confirmed by the conqueror himſelf and his deſcendants: and though ſometimes a little impaired by the ferocity of the times, and the occaſional deſpotiſm of jealous or uſurping princes, yet eſtabliſhed on the firmeſt baſis by the proviſions of *magna charta*, and a long ſucceſſion of ſtatutes enacted under Edward III. To aſſert an abſolute exemption from impriſonment in all caſes, is inconſiſtent with every idea of law and political ſociety; and in the end would deſtroy all civil liberty, by rendering its protection impoſſible: but the glory of the Engliſh law conſiſts in clearly defining the times, the cauſes, and the extent, when, wherefore, and to what degree, the impriſonment of the ſubject may be lawful. This it is, which induces the abſolute neceſſity of expreſſing upon every commitment the reaſon for which it is made; that the court, upon an *habeas corpus*, may examine into its validity; and according to the circumſtances of the caſe may diſcharge, admit to bail, or remand the priſoner. Habeas corpus. *Blackſtone's Commentaries.*

And yet, early in the reign of Charles I. the court of king's-bench, relying on ſome arbitrary precedents (and thoſe perhaps miſunderſtood), determined * that they could not upon an *habeas corpus* either bail or deliver a priſoner, though committed without any cauſe aſſigned, in caſe he was committed by the ſpecial command of the king, or by the lords of the privy-council. This drew on a parliamentary inquiry, and produced the *petition of right*, 3 Car. I. which recites this illegal judgment, and enacts that no freeman hereafter ſhall be ſo impriſoned or detained. But when, in the following year, Mr Selden and others were committed by the lords of the council, in purſuance of his majeſty's ſpecial command, under a general charge of "notable contempts and ſtirring up ſedition againſt "the king and government," the judges delayed for two terms (including alſo the long vacation) to deliver an opinion how far ſuch a charge was bailable. And, when at length they agreed that it was, they however annexed a condition of finding ſureties for the good behaviour, which ſtill protracted their impriſonment; the chief juſtice Sir Nicholas Hyde, at the ſame time declaring †, that "if they were again remanded "for that cauſe, perhaps the court would not after-"wards grant a *habeas corpus*, being already made "acquainted with the cauſe of the impriſonment." But this was heard with indignation and aſtoniſhment by every lawyer preſent; according to Mr Selden's own account of the matter, whoſe reſentment was not cooled at the diſtance of four and twenty years. * *State Trials*, viii. 136. † *Ibid.* 240.

Theſe pitiful evaſions gave riſe to the ſtatute 16 Car. I. c. 10. §. 8. whereby it is enacted, that if any perſon be committed by the king himſelf in perſon, or by his privy council, or by any of the members thereof, he ſhall have granted unto him, without any delay upon any pretence whatſoever, a writ of *habeas corpus*, upon demand or motion made to the court of king's bench or common-pleas; who ſhall therupon, within three court-days after the return is made, examine and determine the legality of ſuch commitment, and do what to juſtice ſhall appertain, in delivering, bailing, or remanding ſuch priſoner. Yet ſtill in the caſe of Jenks, before alluded to, who in 1676 was committed by the king in council for a turbulent ſpeech at Guildhall, new ſhifts and devices were made uſe of to prevent his enlargement by law; the chief juſtice (as well as the chancellor) declining to award a writ of *habeas corpus ad ſubjiciendum* in vacation, though

Habeas Corpus.

though at last he thought proper to award the usual writs *ad deliberandum*, &c. whereby the prisoner was discharged at the Old Bailey. Other abuses had also crept into daily practice, which had in some measure defeated the benefit of this great constitutional remedy. The party imprisoning was at liberty to delay his obedience to the first writ, and might wait till a second and a third, called an *alias* and a *pluries*, were issued, before he produced the party: and many other vexatious shifts were practised to detain state-prisoners in custody. But whoever will attentively consider the English history may observe, that the flagrant abuse of any power, by the crown or its ministers, has always been productive of a struggle; which either discovers the exercise of that power to be contrary to law, or (if legal) restrains it for the future. This was the case in the present instance. The oppression of an obscure individual gave birth to the famous *habeas corpus* act, 31 Car. II. c. 2. which is frequently considered as another *magna carta* of the kingdom; and by consequence has also in subsequent times reduced the method of proceeding on these writs (though not within the reach of that statute, but issuing merely at the common law) to the true standard of law and liberty.

The statute itself enacts, 1. That the writ shall be returned and the prisoner brought up, within a limited time according to the distance, not exceeding in any case twenty days. 2. That such writs shall be endorsed, as granted in pursuance of this act, and signed by the person awarding them. 3. That on complaint and request in writing by or on behalf of any person committed and charged with any crime (unless committed for treason or felony expressed in the warrant, or for suspicion of the same, or as accessory thereto before the fact, or convicted or charged in execution by legal process) the lord chancellor or any of the twelve judges, in vacation, upon viewing a copy of the warrant, or affidavit that a copy is denied, shall (unless the party has neglected for two terms to apply to any court for his enlargement) award a *habeas corpus* for such prisoner, returnable immediately before himself or any other of the judges; and upon the return made shall discharge the party, if bailable, upon giving security to appear and answer to the accusation in the proper court of judicature. 4. That officers and keepers neglecting to make due returns, or not delivering to the prisoner or his agent within six hours after demand a copy of the warrant of commitment, or shifting the custody of a prisoner from one to another without sufficient reason or authority (specified in the act) shall for the first offence forfeit 100 l. and for the second offence 200 l. to the party grieved, and be disabled to hold his office. 5. That no person, once delivered by *habeas corpus*, shall be recommitted for the same offence, on penalty of 500 l. 6. That every person committed for treason or felony shall, if he requires it the first week of the next term or the first day of the next session of *oyer* and *terminer*, be indicted in that term or session, or else admitted to bail; unless the king's witnesses cannot be produced at that time: and if acquitted, or if not indicted and tried in the second term or session, he shall be discharged from his imprisonment for such imputed offence: but that no person, after the assizes shall be opened for the county in which he is detained, shall be removed by *habeas corpus*, till after the assizes are ended; but shall be left to the justice of the judges of assize. 7. That any such prisoner may move for and obtain his *habeas corpus*, as well out of the chancery or exchequer, as out of the king's bench or common pleas; and the lord chancellor or judges denying the same, on sight of the warrant or oath that the same is refused, forfeit severally to the party grieved the sum of 500 l. 8. That the writ of *habeas corpus* shall run into the counties palatine, cinque ports, and other privileged places, and the islands of Jersey and Guernsey. 9. That no inhabitant of England (except persons contracting, or convicts praying, to be transported; or having committed some capital offence in the place to which they are sent) shall be sent prisoner to Scotland, Ireland, Jersey, Guernsey, or any places beyond the seas, within or without the king's dominions: on pain that the party committing, his advisers, aiders, and assistants, shall forfeit to the party grieved a sum not less than 500 l. to be recovered with treble costs; shall be disabled to bear any office of trust or profit; shall incur the penalties of *præmunire*; and shall be incapable of the king's pardon.

Habeas Habit.

This is the substance of that great and important statute: which extends (we may observe) only to the case of commitments for such criminal charge as can produce no inconvenience to public justice by a temporary enlargement of the prisoner; all other cases of unjust imprisonment being left to the *habeas corpus* at common law. But even upon writs at the common law it is now expected by the court, agreeable to ancient precedents and the spirit of the act of parliament, that the writ should be immediately obeyed, without waiting for any *alias* or *pluries*; otherwise an attachment will issue. By which admirable regulations, judicial as well as parliamentary, the remedy is now complete for removing the injury of unjust and illegal confinement. A remedy the more necessary, because the oppression does not always arise from the ill-nature, but sometimes from the mere inattention, of government. For it frequently happens in foreign countries, (and has happened in England during the temporary suspensions of the statute), that persons apprehended upon suspicion have suffered a long imprisonment, merely because they were forgotten.

HABICOT (Nicholas), a celebrated surgeon, born at Bonny in Gatinois, acquired great reputation by his skill in his profession, and by his works; and died in 1624. He wrote a treatise on the plague, and several other curious works.

HABINGTON (William), an English poet and historian, was the son of Thomas Habington, Esq. He was born in 1605, at Hendlip in Worcestershire; and was educated at St Omers and at Paris. He died in 1654, and left several manuscripts in the hands of his son. His printed works are, 1. Poems under the title of *Castara*. 2. The queen of Aragon, a tragi-comedy. 3. Observations upon History. 4. The history of Edward IV. king of England, written and published at the desire of Charles I. This work is composed in a very florid style.

HABIT, in philosophy, an aptitude or disposition either of mind or body, acquired by a frequent repe-

tition of the fame act. See CUSTOM *and Habit.*

HABIT is alſo uſed for a dreſs or garb, or the compoſition of garments, wherewith a perſon is covered; in which ſenſe we ſay, the habit of an eccleſiaſtic, of a religious, &c. a military habit, &c.

HABITE *and* REPUTE, in Scots law, the common opinion of the people, among whom a perſon lives, with reſpect to any circumſtance relating to him.

HABITUDE, among ſchoolmen, the reſpect or relation one thing bears to another. See RELATION.

HABSBURG, or HAPSBURG, an ancient caſtle of Switzerland, in the canton of Bern. It is the place where the ancient counts of Hapſburg reſided, and is ſeated near the lake of Lucern, and to the eaſt of the town of that name. E. Long. 8. 10. N. Lat. 47. 22.

HACHA, a ſea-port town of South America, in Terra Firma, ſeated at the mouth of a river of the ſame name. Here the Spaniſh galleons touch at their arrival in South America, from whence expreſſes are ſent to all the ſettlements to give them notice of it. W. Long. 72. 0. N. Lat. 11. 30.

HACKET (John), biſhop of Litchfield and Coventry, was born in 1592. In 1623, he was made chaplain to James I. and prebendary of Lincoln: and ſoon after obtained the rectory of St Andrew's Holborn, with that of Cheam in Surrey; his patron telling him, he intended Holborn for wealth, and Cheam for health. In 1642 he was preſented to a prebendary and reſidentiary; but was deprived of the enjoyment of them, as well as of St Andrew's, by the enſuing troubles. He then lived retired at Cheam with little diſturbance, until he recovered his preferments by the reſtoration of Charles II. by whom he was preferred to the ſee of Litchfield and Coventry in 1661. Finding the beautiful cathedral of Litchfield almoſt battered to the ground, he in eight years finiſhed a complete church ſuperior to the former, at his own expence of 20,000 l. excepting 1000 l. he had from the dean and chapter, with what he could procure from private benefactors. He laid out 1000 l. on a prebendal houſe, his palaces at Litchfield and Eccleſhall having been demoliſhed during the civil wars: and beſide theſe acts of munificence, left ſeveral other benefactions at his death in 1670. He publiſhed before he entered into orders, a comedy entitled *Loyola*, which was twice acted before king James I. After his death there appeared a "Century of his ſermons on ſeveral remarkable ſubjects," in folio; and "The life of archbiſhop Williams," in folio, which was abridged in 1700 by Ambroſe Philips.

HACKNEY-COACHES, thoſe expoſed to hire in the ſtreets of London, and ſome other great cities, at rates fixed by authority. See COACH.—Theſe firſt began to ply in the ſtreets of London, or rather waited at inns, in the year 1625, and were only 20 in number; but in 1635 they were ſo much increaſed, that king Charles iſſued out an order of council for reſtraining them. In 1637, he allowed 50 hackney-coachmen, each of whom might keep 12 horſes. In 1652, their number was limited to 200; and in 1654, it was extended to 300. In 1661, 400 were licenſed, at 5 l. annually for each. In 1694, 700 were allowed, and taxed by the 5 and 6 of W. & M. at 4 l. *per annum* each. By 9 Anne cap. 23. 800 coaches were allowed in London and Weſtminſter; but by 8 Geo. III. cap. 24. the number is increaſed to 1000, which are to be licenſed by commiſſioners, and to pay a duty of 5 l. *per* week to the king. On Sundays there were formerly only 175 hackney-coaches to ply, which were to be appointed by commiſſioners; but their number is now unlimited.

Hackney
||
Haderſleben.

The fare of hackney coachmen in London, or within ten miles of the city, is 12 ſhillings and ſixpence per day, allowing 12 hours per day. By the hour it is 1s. 6d. for the firſt, and 1s. for every hour after; and none are obliged to pay above 1s. for any diſtance not exceeding a mile and a half; or above 1s. 6d. for any diſtance not exceeding two miles. Where hackney coachmen refuſe to go at, or exact more than, their limited hire, they are ſubject to a forfeit not under 10s. nor exceeding 3l. and which the commiſſioners have power to determine. Every hackney-coach muſt be provided with cheque ſtrings, and every coachman plying without them incurs a penalty of 5s.—Drivers of hackney-coaches are to give way to perſons of quality and gentlemens coaches, under the penalty of 5 l.

The duty ariſing from licences to hackney-coaches and chairs in London, forms a branch of the king's extraordinary and perpetual revenue *. This revenue is governed by commiſſioners of its own, and is in truth a benefit to the ſubject; as the expence of it is felt by no individual, and its neceſſary regulations have eſtabliſhed a competent juriſdiction, whereby a very refractory race of men may be kept in ſome tolerable order.

* See *Revenue.*

HADDINGTON, a borough-town of Scotland, in Eaſt Lothian, which ſends one member to parliament. It is ſurrounded with many ſeats of nobility and gentry. It is about 17 miles E. of Edinburgh. W. Long. 2. 25. N. Lat. 55. 50.

HADDOCK, the Engliſh name of a ſpecies of GADUS.

HADDON (Dr Walter), a great reſtorer of the learned languages in England, was born in 1516. He diſtinguiſhed himſelf particularly by writing Latin in a fine ſtyle, which he acquired by a conſtant ſtudy of Cicero. He was a ſtrenuous promoter of the reformation under king Edward; and was therefore thought a proper perſon to ſucceed biſhop Gardiner in the maſterſhip of Trinity-hall, Cambridge, on his deprivation. He lay concealed during the reign of queen Mary; but acquired the favour of Elizabeth, who conſtituted him one of the maſters of the court of requeſts, and ſent him one of the three agents to Bruges in 1566, to reſtore commerce between England and the Netherlands. He was alſo engaged with Sir John Cheke in drawing up in Latin that uſeful code of eccleſiaſtical law, publiſhed in 1571 by the learned John Fox, under the title of *Reformatio legum eccleſiaſticarum*; his other works are collected and publiſhed under the title of *Lucubrations*. He died in 1572.

HADERSLEBEN, a ſea-port town of Denmark, in the duchy of Sleſwick, with a ſtrong citadel, built upon a ſmall iſland. It is ſeated on a bay of the Baltic Sea, and has a well-frequented harbour. E. Lon. 9. 35. N. Lat. 55. 24.

HADLEY,

Hadley || Hæmatopus.

HADLEY, a town in Suffolk, ſeated in a bottom on the river Preſton. It conſiſts of about 600 houſes; with a very handſome church, a chapel of eaſe, and a Preſbyterian meeting-houſe. The ſtreets are pretty broad, but not paved. Large quantities of yarn are ſpun here for the Norwich manufacture; and this town had once a conſiderable woollen manufacture, which is now decayed. E. Lon. 1. 0. N. Lat. 52. 7.

HADRIAN. See ADRIAN.

HÆMAGOGOS, among phyſicians, a compound medicine, conſiſting of fetid and aromatic ſimples mixed with black hellebore, and preſcribed in order to promote the menſtrua and hæmorrhoidal fluxes; as alſo to bring away the lochia.

HÆMANTHUS, the BLOOD-FLOWER; a genus of the monogynia order, belonging to the hexandria claſs of plants.

Species. 1. The coccineus, with plain tongue-ſhaped leaves, riſes about a foot high, with a ſtalk ſupporting a cluſter of bright red tubulous flowers. It hath a large bulbous root, from which in the autumn comes out two broad flat leaves of a fleſhy conſiſtence, ſhaped like a tongue, which turn backward on each ſide, and ſpread on the ground, ſo that they have a ſtrange appearance all the winter. In the ſpring theſe decay; ſo that from May to the beginning of Auguſt they are deſtitute of leaves. The flowers are produced in the autumn juſt before the leaves come out. 2. The carinatus with keel-ſhaped leaves, has a taller ſtalk and paler flowers than the former; its leaves are not flat, but hollowed like the keel of a boat. 3. The puniceus, with large ſpear-ſhaped waved leaves, grows about a foot high, and hath flowers of a yellowiſh red colour. Theſe are ſucceeded by berries, which are of a beautiful red colour when ripe.

Culture. All theſe plants are natives of the Cape of Good Hope, and do not propagate very faſt in Europe, their roots ſeldom putting forth many off-ſets. The beſt method of managing them is to have a bed of good earth in a bricked pit, where they may be covered with glaſſes, and in hard froſts with mats and ſtraw. The earth in the frame ſhould be two feet deep, and the frame ſhould riſe two feet above the ſurface, to allow height for the flower-ſtems to grow. The roots ſhould be planted nine or ten inches aſunder; and in winter, if they are protected from froſt, and not ſuffered to have too much wet, but in mild weather expoſed to the air, they will flower every year, and the flowers will be much ſtronger than with any other management. The third ſort requires to be conſtantly kept in a dry ſtove.

HÆMATITES, or BLOOD-STONE, a hard mineral ſubſtance, red, black, or purple, but the powder of which is always red. It is found in maſſes ſometimes ſpherical, ſemi-ſpherical, pyramidal, or cellular, that is like a honeycomb. It contains a large quantity of iron. Forty pounds of this metal have been extracted from a quintal of the ſtone; but the iron is of ſuch a bad quality, that this ore is not commonly ſmelted. The great hardneſs of hæmatites renders it fit for burniſhing and poliſhing metals.

HÆMATOPUS, the SEA-PYE, in ornithology, a genus belonging to the order of grallæ. The beak is compreſſed, with an equal wedge-ſhaped point; the noſtrils are linear; and the feet have three toes without nails. There is but one ſpecies, viz. the aſtralegus, a native of Europe and America. It feeds upon ſhell-fiſh near the ſea-ſhore. Hæmatoxylum || Hag

HÆMATOXYLUM, LOGWOOD, or *Campeachy Wood*; a genus of the monogynia order, belonging to the decandria claſs of plants.

Species. Of this genus there is only one ſpecies, viz. the campechianum, which grows naturally in the bay of Campeachy at Honduras, and other parts of the Spaniſh Weſt-Indies *, where it riſes from 16 to 24 feet high. The ſtems are generally crooked, and very deformed; and ſeldom thicker than a man's thigh. The branches which come out on each ſide are crooked, irregular, and armed with ſtrong thorns, garniſhed with winged leaves, compoſed of three pair of obſcure lobes indented at the top. The flowers come in a racemus from the wings of the leaves ſtanding erect, and are of a pale yellowiſh colour, with a purple empalement. They are ſucceeded by flat oblong pods, each containing two or three kidney-ſeeds. * See *Campeachy.*

Culture. The ſeeds, which are frequently brought from America, will readily grow if ſown upon a good hot-bed in this country, and will thrive very well if kept conſtantly in a good degree of heat in the back-ſtove.

Uſes. The logwood is uſed in great quantities for dying purple, but eſpecially black colours. All the colours, however, which can be prepared from it, are of a fading nature, and cannot by any art be made equally durable with thoſe prepared from ſome other materials. Of all the colours prepared from logwood, the black is the moſt durable. Dr Lewis recommends it as an ingredient in making ink. "In dyeing cloth, (ſays he,) vitriol and galls, in whatever proportions they are uſed, produce only browns of different ſhades: I have often been ſurpriſed that with theſe capital materials of the black dye I never could obtain any true blackneſs in white cloth, and attributed the failure to ſome unheeded miſmanagement in the proceſs, till I found it to be a known fact among the dyers. Logwood is the material which adds blackneſs to the vitriol and gall-brown; and this black dye, though not of the moſt durable kind, is the moſt common. On blue cloth a good black may be dyed by vitriol and galls alone; but even here, an addition of Logwood contributes not a little to improve the colour."——Mr Delaval, however, in his Eſſay on Colours, informs us, that with an infuſion of galls and iron-filings, he not only made an exceeding black and durable ink, but alſo dyed linen cloth of a very deep black. See COLOUR-*Making*, n° 12, 13, 14.; DYEING, n° 17.; and INK. Logwood is alſo found to have a conſiderable aſtringent virtue as a medicine, and an extract of it is ſometimes given with great ſucceſs in diarrhœas.

HÆMOPTYSIS, HÆMAPTYSIS, or *Hæmoptöe*; a ſpitting of blood. See (*Index* ſubjoined to) MEDICINE.

HÆMORRHOIDAL, an appellation given by anatomiſts to the arteries and veins going to the inteſtinum rectum.

HÆMORRHOIDS, or PILES, an hæmorrhage, or iſſue of blood from the hæmorrhoidal veſſels. (See (*Index* ſubjoined to) MEDICINE.

HAERLEM. See HARLEM.

HAG, in zoology. See MYXINE.

Hagai || Hague.

HAGAI, a canonical book of the Old Teſtament, ſo called from the prophet of that name, who, in all probability was born at Babylon, from whence he returned with Zerubbabel.

This prophet, by the command of God, exhorted the Jews, after their return from the captivity, to finiſh the rebuilding of the temple, which they had intermitted for 14 years. His remonſtrances had the deſired effect; and to encourage them to proceed in the work, he aſſured them from God, that the glory of this latter houſe ſhould be greater than the glory of the former: which was accordingly fulfilled, when Chriſt honoured it with his preſence; for, with reſpect to the building, this latter temple was nothing in compariſon with the former.

HAGEDORN (Frederick de), a celebrated German poet, was born at Hamburg, where his father was reſident for the king of Denmark, in 1708. He finiſhed his ſtudies at Jena; and, in 1728, publiſhed a number of poetical pieces in Germany, which were well received. He afterwards came to England, where he obtained the friendſhip of many of the learned; and, at his return, was made ſecretary to the Engliſh Hamburgh company, a lucrative employment that left him ſufficient time for cultivating the muſes. In 1738, he publiſhed his Fables and Tales, the firſt collection of the kind of which Germany can boaſt. He afterwards publiſhed other pieces of poetry of different kinds, as Moral Poems, Epigrams, and five books of Songs: which of all his poetical pieces are moſt eſteemed. He died in 1754.

HAGENAU, a town of Germany, and capital of a bailiwick of the ſame name, which was formerly imperial, but now belongs to the French. It was taken by them in 1673; the Imperialiſts retook it in 1704; after which it was ſeveral times taken and retaken by both parties; but at laſt the French got poſſeſſion of it in 1706. It is divided by the river Motter into two parts; and is ſeated near a foreſt of its own name, in E. Long. 7. 53. N. Lat. 48. 49.

HAGIOGRAPHA, or "holy writings;" a name given to a particular diviſion of the Old Teſtament, as containing hymns to God, and moral precepts for the conduct of life. The books diſtinguiſhed by this term were the Pſalms, Proverbs, Eccleſiaſtes, and the Song of Solomon.

HAGUE, a town of the United Provinces, in Holland, ſituated in E. Long. 4. 10. N. Lat. 48. 49. —In Latin it is called *Haga Comitis;* in French, *La Haye;* in Dutch *der Haag*, or *'S-Graavenhage*, i. e. the Earl's Grove or Wood, from the wood near which it is built, and in which the earls of Holland had a country-houſe. Though it ſends no deputies to the ſtates, it is one of the moſt conſiderable towns in Holland, pleaſantly ſituated, and exceeding beautiful. It may indeed compare with almoſt any city in Europe, though geographers account it but a village. The inhabitants alſo breathe a better air than thoſe of the other cities, as it ſtands on a dry ſoil, ſomewhat higher than the reſt of the country. It has no gates or walls, but is ſurrounded by a moat over which there are many draw-bridges. Two hours are required to walk round it, and it contains about 40,000 or 50,000 ſouls. It is a place of much ſplendor and buſineſs, being the ſeat of the high colleges of the republic and province of Holland, and the reſidence of the ſtadtholder and foreign ambaſſadors; and there are a great many fine ſtreets and ſquares in it. In the inner court all the high colleges and courts of juſtice hold their aſſemblies: there alſo the foot-guards do duty, as the horſe-guards in the outer, when the ſtates are ſitting. De Plaats is an open airy place, in form of a triangle, adorned with neat and beautiful buildings: the Vyverberg is an eminence, laid out into ſeveral fine ſhady walks, with the Vyver, a large baſon of water, at the bottom: the Voorhout is the moſt celebrated part of the Hague, and conſiſts of the mall, and three ways for coaches on each ſide, planted with trees, being much the ſame as St James's park at London: the palace of Opdam, or Waſſenaar, is built in a very elegant taſte: the prince and princeſs grafts are fine ſtreets: the plain, in Dutch *Het Pleyn*, is a beautiful grove, laid out in ſeveral croſs walks, and ſurrounded with ſtately houſes. The Jewiſh ſynagogue is well worth being ſeen by a curious traveller; and alſo the palaces of the prince of Orange, the hotel of Spain, the new Voorhout, the mauſoleum of the baron of Opdam in the great church, and the ſeveral hoſpitals. The environs of the Hague are exceedingly pleaſant. Among other agreeable objects are the wood, with the palace of Orange at the extremity of it, called the *houſe in the wood;* the village of Scheveling; and the ſand-hills along the north-ſea; with the village of Voorburg, and the charming ſeats and fine gardens round it. Two miles from the Hague is Ryſwick, a village: and, a quarter of a mile from that, a noble palace belonging to the prince of Orange, famous for the treaty of peace concluded there in 1697. Looſduynen, where Margaret, counteſs of Henneburg, and daughter of Florence IV. count of Holland and Zealand, is ſaid to have been delivered of 365 children at a birth, in 1276, is about five miles from the Hague. Five miles beyond Looſduynen, and not far from the beautiful village of Graveſande, is Honſlardyck, another palace belonging to the prince of Orange, and one of the fineſt ſtructures in the Low-Countries.

Hague || Hall.

HAHN (Simon Frederick), a celebrated German hiſtorian. At ten years of age he was not only far advanced in the Latin, but underſtood ſeveral living languages. Four years after, he pronounced a ſpeech on the origin of the cloyſter at Bergen, the place of his birth, which was printed with ſome other pieces; and in 1708 he publiſhed a *Continuation of Meibomius's Chronicle of Bergen.* After having for ſeveral years given public lectures at Hall, he became, at the age of 24, profeſſor of hiſtory at Helmſtadt; and was at length counſellor, hiſtoriographer, and libra-rian, to the king of Great Britain, elector of Hanover. He died in 1729, aged 37.—Beſides the above, and ſome other works, he wrote, 1. The firſt volume of the *Hiſtory of the Empire.* 2. *Collectio monumentorum veterum et recentium ineditorum*, 2 vols 8vo.

HAIL, in natural hiſtory, a meteor generally defined frozen rain, but differing from it in that the hailſtones are not formed of ſingle pieces of ice, but of many little ſpherules agglutinated together. Neither are theſe ſpherules all of the ſame conſiſtence; ſome of them being hard and ſolid like perfect ice; others ſoft, and moſtly like ſnow hardened by a ſevere froſt. Sometimes

Hail. times the hailſtone hath a kind of core of this ſoft matter; but more frequently the core is ſolid and hard, while the outſide is formed of a ſofter matter. Hailſtones aſſume various figures, being ſometimes round, at other times pyramidal, crenated, angular, thin, and flat, and ſometimes ſtellated, with ſix radii like the ſmall cryſtals of ſnow.

Natural hiſtorians furniſh us with various accounts of ſurpriſing ſhowers of hail, in which the hailſtones were of extraordinary magnitude. Mezeray, ſpeaking of the war of Louis XII. in Italy, in the year 1510, relates, that there was for ſome time an horrible darkneſs, thicker than that of night; after which the clouds broke into thunder and lightning, and there fell a ſhower of hailſtones, or rather (as he calls them) pebble-ſtones, which deſtroyed all the fiſh, birds, and beaſts of the country.—It was attended with a ſtrong ſmell of ſulphur; and the ſtones were of a bluiſh colour, ſome of them weighing an hundred pounds. *Hiſt. de France*, Tom. II. p. 339.

At Liſle in Flanders, in 1686, fell hailſtones of a very large ſize; ſome of which contained in the middle a dark brown matter, which, thrown on the fire, gave a very great report. *Philoſoph. Tranſact.* N° 203.

Dr Halley and others alſo relate, that in Cheſhire, Lancaſhire, &c. April 29, 1697, a thick black cloud, coming from Carnarvonſhire, diſpoſed the vapours to congeal in ſuch a manner, that for about the breadth of two miles, which was the limit of the cloud, in its progreſs for the ſpace of 60 miles, it did inconceivable damage; not only killing all ſorts of fowls and other ſmall animals, but ſplitting trees, knocking down horſes and men, and even ploughing up the earth; ſo that the hailſtones buried themſelves under ground an inch, or an inch and a half deep. The hailſtones, many of which weighed five ounces, and ſome half a pound, and being five or ſix inches about, were of various figures; ſome round, others half round; ſome ſmooth, others emboſſed and crenated: the icy ſubſtance of them was very tranſparent and hard, but there was a ſnowy kernel in the middle of them.

In Hertfordſhire, May 4. the ſame year, after a ſevere ſtorm of thunder and lightning, a ſhower of hail ſucceeded, which far exceeded the former: ſome perſons were killed by it, their bodies beat all black and blue; vaſt oaks were ſplit, and fields of rye cut down as with a ſcythe. The ſtones meaſured from 10 to 13 or 14 inches about. Their figures were various, ſome oval, others picked, ſome flat. *Philoſoph. Tranſ.* N° 229.

It is remarkable, that, far as we know, hail is a meteor which never produces any beneficial effect. The rain and dew invigorate and give life to the whole vegetable tribe; the froſt, by expanding the water contained in the earth, pulveriſes and renders the ſoil fertile; ſnow covers and preſerves the tender vegetables from being deſtroyed by too ſevere a froſt. But hail does none of all theſe. In winter, it lies not ſufficiently cloſe to cover vegetables from the nipping froſts; and in ſpring and ſummer it not only has a chilling and blaſting effect from its coldneſs, but often does great damage to the more tender plants by the weight of the ſtones, and in great hail-ſtorms the damage done in this manner is prodigious.

Hail is one of the natural phenomena for which it is almoſt impoſſible to account in any ſatisfactory manner. It is certain, that on the tops of mountains hailſtones, as well as drops of rain, are very ſmall, and continually increaſe in bulk till they reach the lower grounds. It would ſeem, therefore, that during their paſſage through the air, they attract the congealed vapour which increaſes them in ſize. But here we are at a loſs how they come to be ſolid hard bodies, and not always ſoft, and compoſed of many ſmall ſtars like ſnow. The flakes of ſnow, no doubt, increaſe in ſize as they deſcend, as well as the drops of rain or hail-ſtones; but why ſhould the one be in ſoft cryſtals, and the other in large hard lumps, ſeeing both are produced from congealed vapour? Some modern philoſophers aſcribe the formation of hail to electricity. Signior Beccaria ſuppoſes hail to be formed in the higher regions of the air, where the cold is intenſe, and where the electric matter is very copious. In theſe circumſtances, a great number of particles of water are brought near together, where they are frozen, and in their deſcent collect other particles, ſo that the denſity of the ſubſtance of the hailſtone grows leſs and leſs from the centre; this being formed firſt in the higher regions, and the ſurface being collected in the lower. Agreeable to this, it is obſerved, that, in mountains, hail-ſtones, as well as drops of rain, are very ſmall, there being but little ſpace through which they can fall and increaſe their bulk. Drops of rain and hail alſo agree in this, that the more intenſe the electricity that forms them, the larger they are. Motion is known to promote freezing, and ſo the rapid motion of the electrified clouds may produce that effect. A more intenſe electricity alſo, he thinks, unites the particles of hail more cloſely than the more moderate electricity does thoſe of ſnow. In like manner we ſee thunder-clouds more denſe than thoſe that merely bring rain; and the drops of rain are larger in proportion, though they fall not from ſo great a height.

Hailing ‖ Haiman.

HAILING, the ſalutation or accoſting of a ſhip at a diſtance, either at ſea, or in a harbour. The uſual expreſſion is, "Hoa, the ſhip ahoay!" To which ſhe anſwers, "Holloa! Whence came ye? Where are ye bound? Good voyage! What cheer? All well! How fare ye?" &c.

HAILLAN (Bernard de Girard, lord of), a celebrated French hiſtorian. After having made ſome figure in the literary world, and as a tranſlator, he applied himſelf to hiſtory with ſuch ſucceſs, that in 1571, Charles IX. made him hiſtoriographer of France. His hiſtory of France extends from Pharamon to the death of Charles VII. and is the firſt complete hiſtory of that kingdom compoſed in the French tongue. He was honoured by Henry III. with ſeveral marks of favour; and propoſed to continue his hiſtory to the reign of Henry IV. but did not perform his promiſe. He died at Paris in 1610.

HAIMSUCKEN, ſee HAMBSECKEN.

HAINAN, a conſiderable iſland of Aſia, ſituated in between 18° and 20° N. Lat. It belongs to China; and lies to the north of the Gulf of Cochin China, and about twelve miles ſouth from the province of Canton. It is about 400 miles in circumference. The ſoil of the northern parts is level, but the ſouthern and eaſtern ones are mountainous; among which ſome of

Hainault, Hair.

of the valleys produce two crops of rice every year. The inhabitants are generally ſhort, deformed ſavages, of a reddiſh colour. In the interior parts of the iſland they have not ſubmitted to the Chineſe; but they are great cowards, and 50 Chineſe will put 100 of them to flight. There are mines of gold and lapis lazuli, which laſt is carried to Canton to paint the porcelain. This iſland produces the ſame fruits as China, beſides ſugar, tobacco, cotton, and indigo.

HAINAULT, a province of the Netherlands, belonging partly to France and partly to the houſe of Auſtria. It is bounded to the ſouth by Champagne and Picardy, to the north by Flanders, to the eaſt by the duchy of Brabant, the county of Namur, and the biſhopric of Liege; and to the weſt by Artois and Flanders. Its extent from north to ſouth is about 45 miles, and about 48 from eaſt to weſt. The air is pleaſant and temperate, and the ſoil fruitful: it abounds in rich paſtures, corn-fields, woods, and foreſts, coal, iron, lead, beautiful marble, ſlate, and other uſeful ſtones: it is well watered by rivers and lakes, and breeds abundance of black cattle, and ſheep, whoſe wool is very fine. Its principal rivers are the Scheldt, the Selle, and the Dender. This province is reckoned to contain 24 walled towns, 950 villages, one duchy, and ſeveral principalities, earldoms, peerdoms, and baronies. The abbeys in it are 27. For ſpiritual matters, the greater part of it is ſubject to the archbiſhop of Cambray, and the reſt to the biſhops of Liege and Arras. The ſtates of the province conſiſt of the clergy, nobility, and commoners. The clergy are the abbots, deputies of the chapters, and rural deans; but the chapters of St Waudru and St. Germain, in Mons, ſend no deputies, as they contribute nothing to the public taxes. The nobility conſiſt of the earls and barons, and all thoſe who, by their birth, have a right to a ſeat in the aſſembly of the ſtates. The commoners are compoſed of the deputies of the towns. The clergy in this county are uncommonly rich. The ſtates meet only when they are ſummoned by the ſovereign; but there is a ſtanding committee at Mons, which meets weekly. This county had counts of its own, till the year 1436; when Philip the Good, duke of Burgundy, arrived to the poſſeſſion of it, upon the death of Jaqueline, the heireſs, without iſſue. The French acquired that part of it which they poſſeſs, partly by the peace of the Pyrenees, and partly by thoſe of Nimeguen and Reſwyck. The arms of this county are quartered, and contain four lions, in a field *or*. For the government of it, there is a ſovereign-council, at the head of which is the high-bailiff, who has very great authority: he repreſents the ſovereign, is governor of Mons, and captain-general of the province.

HAIR, ſmall filaments, iſſuing out of the pores of the ſkins of animals; and ſerving moſt of them as a tegument or covering *.—In lieu of hair, the nakedneſs of ſome animals is covered with feathers, wool, ſkins, &c.

* See *Anatomy*, n° 81.

Hair is found on all parts of the human body, except the ſoles of the feet and the palms of the hands.—But it grows longeſt on the head, chin, breaſt, in the arm-pits, and about the privities.

The ancients held the hair a ſort of excrement, fed only with excrementitious matters, and no proper part of a living body.—They ſuppoſed it generated of the ſuliginous parts of the blood, exhaled by the heat of the body to the ſurface, and there condenſed in paſſing through the pores.—Their chief reaſons were, that the hair being cut, will grow again apace, even in extreme old age, and when life is very low: that in hectic and conſumptive people, where the reſt of the body is continually emaciating and attenuating, the hair ſhall thrive: nay, and that it will grow again in dead carcaſes.—They added, that hair does not feed and grow, like the other parts, by intuſuſception, *i. e.* by a juice circulating within it; but, like the nails, by juxtapoſition, each part next the root thruſting forward that immediately before it. Hair.

But the moderns are agreed, that every hair does properly and truly live, and receive nutriment to fill and diſtend it like the other parts: which they argue hence, that the roots do not turn grey in aged perſons ſooner than the extremities, but the whole changes colour at once, and the like is obſerved in boys, &c.; which ſhews that there is a direct communication, and that all the parts are affected alike.

It may be obſerved, however, that, in propriety, the life and growth of hairs is of a different kind from that of the reſt of the body; and is not immediatly derived therefrom, or reciprocated therewith.—It is rather of the nature of vegetation. They grow as plants do out of the earth; or as ſome plants ſhoot from the parts of others; from which though they draw their nouriſhment, yet each has, as it were, its ſeveral life and a diſtinct œconomy.—They derive their food from ſome juices in the body, but not from the nutritious juices of the body; whence they may live, tho' the body be ſtarved.—Wulferus, in the *Philoſophical Collections*, gives an account of a woman buried at Norimberg, whoſe grave being opened 43 years after her death, there was hair found iſſuing forth plentifully through the clefts of the coffin; inſomuch, that there was reaſon to imagine the coffin had ſome time been covered all over with hair.—The cover being removed, the whole corps appeared in its perfect ſhape; but, from the crown of the head to the ſole of the foot, covered over with a thick-ſet hair, long and curled.—The ſexton going to handle the upper part of the head with his fingers, the whole ſtructure fell at once, leaving nothing in his hand but an handful of hair: there was neither ſkull nor any other bone left; yet the hair was ſolid and ſtrong enough.—Mr Arnold, in the ſame collection, gives a relation of a man hanged for theft, who, in a little time, while he yet hung upon the gallows, had his body ſtrangely covered over with hair.—Some moderns, however, deny the authenticity of theſe and other ſimilar inſtances.

The hairs ordinarily appear round or cylindrical; but the microſcope alſo diſcovers triangular and ſquare ones; which diverſity of figure ariſes from that of the pores, to which the hairs always accommodate themſelves. Their length depends on the quantity of the proper humour to feed them, and their colour on the quality of that humour: whence, at different ſtages of life, the colour uſually differs. Their extremities ſplit into two or three branches, eſpecially when kept dry, or ſuffered to grow too long; ſo that what appears only a ſingle hair to the naked eye, ſeems a bruſh to the microſcope.

The hair of a mouſe, viewed by Mr Derham with a micro-

Hair. microscope, seemed to be one single transparent tube, with a pith made up of fibrous substances, running in dark lines, in some hairs transversely, in others spirally. The darker medullary parts or lines, he observes, were no other than small fibres convolved round, and lying closer together than in the other parts of the hair. They run from the bottom to the top of the hair; and, he imagines, may serve to make a gentle evacuation of some humour out of the body. Hence the hair of hairy animals, this author suggests, may not only serve as a fence against cold, &c. but as an organ of insensible perspiration.

Though the external surface of the body is the natural place for hairs, we have many well-attested instances of their being found also on the internal surface. Amatus Lusitanus mentions a person who had hair upon his tongue. Pliny and Valerius Maximus concur in their testimonies, that the heart of Aristomenes the Messenian was hairy. Cælius Rhodiginus relates the same of Hermogenes the rhetorician; and Plutarch, of Leonidas the Spartan.——Hairs are said to have been frequently found in the breasts of women, and to have occasioned the distemper called *trichiasis*; but some authors are of opinion, that these are small worms and not hairs. There have been, however, various and indisputable observations of hairs found in the kidneys, and voided by urine.

Hippocrates is of opinion, that the glandular parts are the most subject to hair; but bundles of hair have been found in the muscular parts of beef, and in such parts of the human body as are equally firm with that. — Hair has been often found in abscesses and impostumations. Schultetus, opening the abdomen of a woman, found 12 pints of water, and a large lock or bundle of hair swimming loose in it. But of all the integral parts, there is none so much subject to an unnatural growth of hair as the ovaries of females, and that as well of the human species as of other animals. Of this Dr Tyson relates three remarkable instances; two of these were young women, and the other was a bitch. The animal had been much emaciated in its hinder parts; the hair was about an inch and an half long: but the most remarkable particular was, that hair was also found lying loose in the cavities of the veins. We have several instances of mankind being affected in the same manner. Cardan relates, that he found hair in the blood of a Spaniard; and Slonatius in that of a gentlewoman of Cracovia; and Schultetus declares from his own observation, that those people who are afflicted with the plica polonica, have very often hair in their blood.

Diseases of the Hair. Almost the only disease of the hair, besides the remarkable one called *plica polonica*, is its falling off, or *baldness*. For this many remedies have been recommended, but scarce any of them can be depended upon. The juice of burdock, and the lixivial salts of vine-ashes, are said to be efficacious; also the powder of hermodactyls, and the decoction of boxwood. A remarkable instance of the efficacy of this last is given under the article Buxus.—Some authors give instances of the hair changing its colour in a short time, thro' grief, or by reason of a fright, &c.

Human-Hair makes a considerable article of trade; the goodness of it consists in its being neither too coarse nor too slender.

Hair that does not curl or buckle naturally, is made to do so by first boiling, and then baking it. Having sorted it, they next roll it carefully upon pipes hollowed in the middle; these they put into a pot or cauldron, and let them boil about two hours; then taking them out, they are dried and covered with papers; and, lastly, sent to the pastry-cook, who bakes them in an oven, till the crust with which they are covered is about three fourths baked. Hair.

The hair of several other animals, as the beaver, hare, coney, &c. is also used in commerce, and especially in the manufacture of hats. See Hat.

Staining of Hair. Hair may be changed from a red, grey, or other disagreeable colour, to a brown or deep black, by a solution of silver. The liquors sold under the name of *hair-waters*, are at bottom no more than solutions of silver in aqua-fortis, largely diluted with water, with the addition perhaps of other ingredients, which contribute nothing to their efficacy. The solution should be fully saturated with the silver, that there may be no more acid in it than is necessary for holding the metal dissolved; and besides dilution with water, a little spirit of wine may be added for the further dulcification of the acid. It must be observed, that, for diluting the solution, distilled water, or pure rain-water, must be used; the common spring-waters turning it milky, and precipitating a part of the dissolved silver. It is to be observed also, that if the liquor touches the skin, it has the same effect on it as on the matter to be stained, changing the part moistened with it to an indelible black.—Hair may also be dyed of any colour in the same manner as wool*. * See *Dyeing*.

Hair *as an Ensign of Dignity, or of Religion.* It was esteemed a notable honour among the ancient Gauls to have long hair, and hence came the appellation *Gallia comata*. For this reason Julius Cæsar, upon subduing the Gauls, made them cut off their hair as a token of submission.—It was with a view to this, that such as afterwards quitted the world to go and live in cloisters, procured their hair to be shaven off; to shew that they bid adieu to all earthly ornaments, and made a vow of perpetual subjection to their superiors.

Greg. of Tours assures us, that in the royal family of France, it was a long time the peculiar mark and privilege of kings and princes of the blood to wear long hair, artfully dressed and curled: every body else was obliged to be polled, or cut round, in sign of inferiority and obedience. Some writers assure us, that there were different cuts for all the different qualities and conditions; from the prince who wore it at full length, to the slave or villain who was quite crop. —To cut off the hair of a son of France, under the first race of kings, was to declare him excluded from the right of succeeding to the crown, and reduced to the condition of a subject.

In the eighth century, it was the custom of people of quality to have their childrens hair cut the first time by persons they had a particular honour and esteem for; who, in virtue of this ceremony, were reputed a sort of spiritual parents or godfathers thereof: Tho' this practice appears to have been more ancient; insomuch as we read, that Constantine sent the pope the hair of his son Heraclius, as a token that he desired him to be his adoptive father.

The parade of long hair became still more and more ob-

Hair. obnoxious in the progreſs of Chriſtianity, as ſomething utterly inconſiſtent with the profeſſion of perſons who bore the croſs. Hence numerous injunctions and canons to the contrary.—Pope Anicetus is commonly ſuppoſed to have been the firſt who forbade the clergy to wear long hair: but the prohibition is of an older ſtanding in the churches of the eaſt; and the letter wherein that decree is wrote, is of a much later date than that pope.—The clerical tonſure is related by Iſidore Hiſpalenſis, as of apoſtolical inſtitution.

Long hair was anciently held ſo odious, that there is a canon ſtill extant of the year 1096, importing, that ſuch as wore long hair, ſhould be excluded coming into church while living, and not be prayed for when dead.

We have a furious declamation of Luitprand againſt the emperor Phocas, for wearing long hair, after the manner of the other emperors of the eaſt, all except Theophilus, who being bald, enjoined all his ſubjects to ſhave their heads.

The French hiſtorians and antiquaries have been very exact in recording the head of hair of their ſeveral kings. Charlemagne wore it very ſhort, his ſon ſhorter; Charles the bald had none at all. Under Hugh Capet it began to appear again; this the eccleſiaſtics took in dudgeon, and excommunicated all who let their hair grow. Peter Lombard expoſtulated the matter ſo warmly with Charles the Young, that he cut off his hair; and his ſucceſſors for ſome generations wore it very ſhort.—A profeſſor of Utrecht, in 1650, wrote expreſsly on the queſtion, Whether it be lawful for men to wear long hair? and concluded for the negative.—Another divine, named Reves, who had wrote for the affirmative, replied to him.

The Greeks, and after their example, the Romans, wore falſe hair. See PERUKE.

HAIR, in farriery, is generally called the *coat*; and, with regard to horſes, deſerves particular conſideration.

The hair growing on the fetlock, ſerves as a defence to the prominent part of it, in travelling in ſtony ways, or in froſty weather: if the hair of a horſe's neck, and the parts moſt uncovered, be cloſe, ſmooth and ſleek, it is an indication of his being in health and good caſe. In order to make the hair of an horſe ſoft and ſleek, he muſt be kept warm at heart, for the leaſt inward cold will cauſe the hair to ſtare; alſo ſweat him often, for that will looſen and raiſe the duſt and filth that renders his coat foul; and when he is in the heat of a ſweat, ſcrape off all the white foam, ſweat, and filth, that is raiſed up, with an old ſword-blade; and alſo when he is blooded, if you rub him all over with his own blood, repeating it two or three days, and curry and dreſs him well, it will make his coat ſhine as if covered with a fine varniſh.

Hair falling from the main or tail, is cauſed either by his having taken ſome heat, which has engendered a dry mange; or from ſome furfeit which cauſes the evil humours to reſort to thoſe parts. To cure this, anoint the horſe's mane and creſt with black ſoap; make a ſtrong lee of aſhes, and waſh it all over with it. But if a canker ſhould grow on a horſe's tail, which will eat away both fleſh and bone; then put ſome oil of vitriol to it, and it will conſume it: and if you find that the vitriol corrodes too much, you need only to wet it with cold water, and it will put a ſtop to it.

If you would take away hair from any part of a horſe's body, boil half a pound of lime in a quart of water, till a fourth part is conſumed, to which add an ounce of orpiment; make this into a plaſter, and lay it on. Hair, Hakluyt.

HAIR, or *Down*, of Plants; a general term expreſſive of all the hairy and glandular appearances on the ſurface of plants, to which they are ſuppoſed by naturaliſts to ſerve the double purpoſe of defenſive weapons and veſſels of ſecretion.

Theſe hairs are minute threads of greater or leſs length and ſolidity; ſome of them viſible to the naked eye; whilſt others are rendered viſible only by the help of glaſſes. Examined by a microſcope, almoſt all the parts of plants, particularly the young ſtalks or ſtems, appear covered with hairs.

Hairs on the ſurface of plants preſent themſelves under various forms: in the leguminous plants, they are generally cylindric; in the mallow tribe, terminated in a point; in agrimony, ſhaped like a fiſh-hook; in nettle, awl-ſhaped and jointed; and in ſome compound flowers with hollow or funnel-ſhaped florets, they are terminated in two crooked points.

Probable as ſome experiments have rendered it, that the hairs on the ſurface of plants contribute to ſome organical ſecretion, their principal uſe ſeems to be to preſerve the parts in which they are lodged from the bad effects of violent frictions, from winds, from extremes of heat and cold, and ſuch like external injuries.

M. Guettard, who has eſtabliſhed a botanical method from the form, ſituation, and other circumſtances of the hairy and glandular appearances on the ſurface of plants, has demonſtrated, that theſe appearances are generally conſtant and uniform in all the plants of the ſame genus. The ſame uniformity ſeems to characteriſe all the different genera of the ſame natural order.

The different ſorts of hairs which form the down upon the ſurface of plants were imperfectly diſtinguiſhed by Grew in 1682, and by Malphigi in 1686. Mr Guettard juſt mentioned, was the firſt who examined the ſubject both as a botaniſt and a philoſopher: his obſervations were publiſhed in 1747.

HAKLUYT (Richard), a naval hiſtorian, is ſuppoſed to have been born in London about the year 1553, and deſcended of a genteel family in Herefordſhire, as the name frequently occurs in the liſt of high ſheriffs for that county, in former reigns. He was educated at Weſtminſter ſchool; and thence, in 1570, removed to Chriſt-church, Oxford; where he applied himſelf particularly to the ſtudy of coſmography, and read public lectures in that ſcience.

Sir Edward Stafford being ſent ambaſſador to France in 1583, Mr Hakluyt was one of his attendants, probably in the capacity of chaplain. He was at this time maſter of arts, and profeſſor of divinity. In 1585 he obtained the royal mandate for the next vacant prebend of Briſtol, to which preferment he ſucceeded during his reſidence at Paris. Conſtantly attentive to his favourite coſmographical inquiries, in ſearching the French libraries, he found a valuable hiſtory of Florida, which had been diſcovered about 20 years before, by Captain Loudonniere, and others: this he cauſed to be publiſhed, at his own expence, in the French language,

Hakluyt Halberſtadt

language, and ſoon after reviſed and republiſhed Peter Martyr's book *De orbe novo*. After five years reſidence in France, Mr Hakluyt returned to England in company with lady Sheffield, ſiſter to the lord admiral Howard. In the year 1589 he publiſhed his Collection of Voyages in one folio volume, which in 1598 was republiſhed in three. In 1605, our author was made prebendary of Weſtminſter; which, with the rectory of Wetheringſet in the county of Suffolk, ſeems to have been the ſummit of his preferment. He died in 1616, and was buried in Weſtminſter abbey, bequeathing to his ſon Edmund his manor of Bridge-Place, and ſeveral houſes in Tothil-ſtreet, Weſtminſter. He was an indefatigable and faithful hiſtorian. His works are, 1. A collection of voyages and diſcoveries, a ſmall volume. 2. Hiſtory of Florida, abovementioned. 3. The principal navigations, voyages, and diſcoveries of the Engliſh nation, made by ſea or over land to the moſt and fartheſt diſtant quarters of the earth, at any time within the compaſs of theſe 1500 years, in 3 vols folio. 4. The diſcoveries of the world, from the firſt original to the year 1555, written in the Portugal tongue by Ant. Galvano; corrected, much amended, and tranſlated into Engliſh, by Richard Hakluyt. 5. Virginia richly valued, by the deſcription of the main land of Florida, her next neighbour, &c. written by a Portugal gentleman of Elvas, and tranſlated by Richard Hakluyt. Beſides theſe, he left ſeveral manuſcripts, which were printed in Purchas's collection.

HALBERSTADT, a ſmall principality of Germany, bounded on the north-eaſt by the duchy of Magdeburg, on the ſouth by the principality of Anhalt, on the weſt by the dioceſe of Hildſheim, on the eaſt by part of the electorate of Saxony, and on the north by Brunſwic Wolfenbuttle. It is near 40 miles in length and 30 in breadth. The ſoil in general is fertile in corn and flax; and there are ſome woods, though in general fuel is ſcarce. There are three large towns in it which ſend repreſentatives to the diet, together with ten ſmall ones, and 91 county-towns and villages. The number of the inhabitants is computed at about 200,000: the greateſt part of them are Lutherans; but there are alſo Calviniſts, Jews, and Roman Catholics. The manufactures are chiefly woollen (for the country produces a great number of ſheep); the exports are grain, and a kind of beer called *broihan*. The annual revenue ariſing from this principality, and the incorporated counties and lordſhips, is ſaid to amount to 500,000 rix-dollars. Till the treaty of Weſtphalia in 1648, this country was a dioceſe, but was then transferred to the electoral houſe of Brandenburg as a temporal principality. It is entitled to a vote both in the diet of the empire, and that of the circle. The principal places are Halberſtadt, Groningen, Oſcherſleben, Otterwick, &c.

HALBERSTADT, a city of Germany, in the circle of Lower Saxony, ſeated near the river Hothein. It is a neat uniform place; and has ſome good churches and other handſome buildings, of which the cathedral is the chief. There is an inn in this place, which is looked upon to be the largeſt and to have the beſt accommodations of any in Europe. Before the Reformation, it was a biſhop's ſee. E. Long. 11. 29. N. Lat. 52. 6.

HALBERT, or HALBARD, in the art of war, a well-known weapon carried by the ſergeants of foot and dragoons. It is a ſort of ſpear, the ſhaft of which is about five feet long, and made of aſh or other wood. Its head is armed with a ſteel point, not unlike the point of a two-edged ſword. But, beſides this ſharp point which is in a line with the ſhaft, there is a croſs piece of ſteel, flat and pointed at both ends; but generally with a cutting edge at one extremity, and a bent ſharp point at the other; ſo that it ſerves equally to cut down, or to puſh withal. It is alſo uſeful in determining the ground between the ranks, and adjuſting the files of a battalion. The word is formed of the German *hal* "hall," and *bard* "an hatchet." Voſſius derives it from the German *hellebaert*, of *hel*, "clarus, ſplendens," and *haert*, "ax."

Halbert || Hale.

The halbert was anciently a common weapon in the army; where there were companies of halbardeers. It is ſaid to have been uſed by the Amazons, and afterwards by the Rhætians and Vindelicians about the year 570.

It was called the *Daniſh ax*, becauſe the Danes bore an halbert on the left ſhoulder. From the Danes it was derived to the Scots; from the Scots to the Engliſh Saxons; and from them to the French.

HALCYON, in ornithology, a name given by the ancients to the alcedo or king's-fiſher. See ALCEDO.

HALCYON-*Days*, in antiquity, a name given to ſeven days before and as many after the winter-ſolſtice; by reaſon the halcyon, invited by the calmneſs of the weather, laid its eggs in neſts built in the rocks, cloſe by the brink of the ſea, at this ſeaſon.

HALDE (John Baptiſt du), a learned French Jeſuit born at Paris in 1674. He was extremely well verſed in Aſiatic geography; and we have of his compilation a work intitled *Grand deſcription de la Chine & de la Tartarie*, from original memoirs of the Jeſuitical miſſionaries, in 4 vols, folio. He was alſo concerned in a collection of letters begun by father Gobien, called *Des lettres edifiantes*, in 18 vols; and publiſhed ſome Latin poems and orations. He died in 1743.

HALE, in the ſea-language, ſignifies *pull*; as, To hale up, is to pull up; to hale in or out, is to pull in or out. To over-hale a rope, is to hale it too ſtiff, or to hale it the contrary way.

Keel-HALE. See DUCKING.

HALE (Sir Matthew,) lord chief juſtice of the king's-bench in the reign of Charles II. was the ſon of Robert Hale, eſq; a barriſter of Lincoln's Inn, and was born in 1609. He was educated at Oxford, where he made a conſiderable progreſs in learning; but was afterwards diverted from his ſtudies by the levities of youth. From theſe he was reformed by Mr John Glanvill, ſerjeant at law; and applying to the ſtudy of the law, entered into Lincoln's-Inn. Noy, the attorney-general, took early notice of him, and directed him in his ſtudies. Mr Selden alſo took much notice of him; and it was this acquaintance that firſt ſet Mr Hale on a more enlarged purſuit of learning, which he had before confined to his own profeſſion. During the civil wars, he behaved ſo well as to gain the eſteem of both parties. He was employed in his practice by all the king's party; and was appointed by the parliament one of the commiſſioners to treat with the

Hale.

king. The murder of king Charles gave him very ſenſible regret. However, he took the engagement; and was appointed, with ſeveral others, to conſider of the reformation of the law. In 1653 he was by writ made ſergeant at law, and ſoon after appointed one of the juſtices of the Common Pleas. Upon the death of Oliver Cromwell he refuſed to accept of the new commiſſion offered him by Richard his ſucceſſor. He was returned one of the knights of Glouceſterſhire in the parliament which called home Charles II. Soon after, he was made lord chief baron of the exchequer; but declined the honour of knighthood, till lord chancellor Hyde, ſending for him upon buſineſs when the king was at his houſe, told his Majeſty, that "there was his modeſt chief baron;" upon which he was unexpectedly knighted. He was one of the principal judges that ſat in Clifford's Inn about ſettling the difference between landlord and tenant, after the fire of London, in which he behaved to the ſatisfaction of all parties concerned, and alſo in his poſt of chief baron acted with inflexible integrity. One of the firſt peers went once to his chamber, and told him, "That having a ſuit in law to be tried before him, he was then to acquaint him with it, that he might the better underſtand it when it ſhould come to be tried in court." Upon which the lord chief baron interrupted him, and ſaid, "He did not deal fairly to come to his chambers about ſuch affairs; for he never received information of ſuch cauſes but in open court, where both parties were to be heard alike." Upon which his Grace (for it was a duke) went away not a little diſſatisfied, and complained of it to the king as a rudeneſs that was not to be endured: but his Majeſty bid him content himſelf that he was uſed no worſe; and ſaid, "That he verily believed, he would have uſed him no better, if he had gone to ſolicit him in any of his own cauſes." Another remarkable incident happened in one of his circuits. A gentleman who had a trial at the aſſizes had ſent him a buck for his table. When judge Hale therefore heard his name, he aſked "if he was not the ſame perſon who had ſent him the veniſon?" and finding that he was the ſame, told him, that "he could not ſuffer the trial to go on till he had paid him for his buck." The gentleman anſwered, that "he never ſold his veniſon; and that he had done nothing to him, which he did not do to every judge who had gone that circuit:" which was confirmed by ſeveral gentlemen preſent. The lord chief-baron, however, would not ſuffer the trial to proceed till he had paid for the preſent: upon which the gentleman withdrew the record. In ſhort, he was, in 1671, advanced to be lord chief juſtice of the king's bench; but about four years after this promotion, his health declining, he reſigned his poſt in February 1675-6, and died in December following. This excellent man, who was an ornament to the bench, to his country, and to humau nature, wrote, 1. An eſſay on the gravitation and non-gravitation of fluid bodies. 2. Obſervations touching the Torricellian experiment. 3. Contemplations, moral and divine. 4. The life of Pomponius Atticus, with political and moral reflections. 5. Obſervations on the principles of natural motion. 6. The primitive origination of mankind. He alſo left a great number of manuſcripts, in Latin and Engliſh, upon various ſubjects; among which are, his "Pleas of the Crown," ſince publiſhed by Mr Emyln in two volumes folio; and his "Original inſtitution, power, and juriſdiction of Parliaments."

Hales.

Hales (Stephen), D. D. a celebrated divine and philoſopher, was born in 1677. He was the ſixth ſon of Thomas Hales, Eſq; the eldeſt ſon of Sir Robert Hales created a baronet by king Charles II. and Mary the heireſs of Richard Langley of Abbots-Wood in Hertfordſhire. In 1696, he was entered a penſioner at Benet-College, Cambridge; and was admitted a fellow in 1703, and became bachelor of divinity in 1711. He ſoon diſcovered a genius for natural philoſophy. Botany was his firſt ſtudy; and he uſed frequently to make excurſions among Gogmagog hills, in company with Dr Stukely, with a view of proſecuting that ſtudy. In theſe expeditions he likewiſe collected foſſils and inſects, having contrived a curious inſtrument for catching ſuch of the latter as have wings. In company with this friend he alſo applied himſelf to the ſtudy of anatomy, and invented a curious method of obtaining a reprefentation of the lungs in lead. They next applied themſelves to the ſtudy of chemiſtry; in which, however, they did not make any remarkable diſcoveries.

In the ſtudy of aſtronomy Mr Hales was equally aſſiduous. Having made himſelf acquainted with the Newtonian ſyſtem, he contrived a machine for ſhewing the phenomena on much the ſame principles with that afterwards made by Mr Rowley, and, from the name of his patron, called an *Orrery*.

About the year 1710, he was preſented to the perpetual cure of Teddington near Twickenham, in Middleſex; and afterwards accepted of the living of Porlock in Somerſetſhire, which vacated his fellowſhip in the college, and which he exchanged for the living of Faringdon in Hampſhire.

Soon after, he married Mary, the daughter and heireſs of Dr Newce, who was rector of Haliſham in Suſſex, but reſided at Much-Haddam in Hertfordſhire.

On the 13th of March 1718, he was elected member of the Royal Society; and on the 5th of March, in the year following, he exhibited an account of ſome experiments he had lately made on the effect of the ſun's warmth in raiſing the ſap in trees. This procured him the thanks of the ſociety, who alſo requeſted him to proſecute the ſubject. With this requeſt he complied with great pleaſure; and on the 14th of June 1725, exhibited a treatiſe in which he gave an account of his progreſs. This treatiſe being highly applauded by the ſociety, he farther enlarged and improved it; and in April 1727 he publiſhed it under the title of *Vegetable Statics*. This work he dedicated to his late majeſty king George the ſecond, who was then prince of Wales; and he was, the ſame year, choſen one of the council of the Royal Society, Sir Hans Sloan being at the ſame annual election choſen their preſident. The book being well received, a ſecond edition of it was publiſhed in 1731; in a preface to this edition Mr Hales promiſed a ſequel to the work, which he publiſhed in 1733, under the title of *Statical eſſays*, &c.

In 1732, he was appointed one of the truſtees for eſtabliſhing a new colony in Georgia. On the 5th of July 1733, the univerſity of Oxford honoured him with

Hales. with a diploma for the degree of doctor in divinity; a mark of diſtinction the more honourable, as it is not uſual for one univerſity to confer academical honours on thoſe who were educated at another.

In 1734, when the health and morals of the lower and middling claſs of people were ſubverted by the exceſſive drinking of gin, he publiſhed, though without his name, "A friendly admonition to the drinkers of brandy and other ſpirituous liquors;" which was twice re-printed. The latter end of the ſame year he publiſhed a ſermon which he preached at St Bride's before the reſt of the truſtees for eſtabliſhing a new colony in Georgia. His text was, *Bear ye one another's burthens, and ſo fulfil the law of Chriſt*; Galatians vi. 2.

In 1739, he printed a volume in 8vo, intitled, *Philoſophical experiments on ſea-water, corn, fleſh, and other ſubſtances:* this work, which contained many uſeful inſtructions for voyagers, was dedicated to the lords of the admiralty. The ſame year he exhibited to the Royal Society an account of ſome farther experiments towards the diſcovery of medicines for diſſolving the ſtone in the kidneys and bladder, and preſerving meat in long voyages; for which he received the gold medal of Sir Godfrey Copley's donation. The year following he publiſhed ſome account of "Experiments and obſervations on Mrs Stephens's medicines for diſſolving the ſtone, in which their diſſolvent power is inquired into and demonſtrated."

In 1741, he read before the Royal Society an account of an inſtrument which he invented, and called a *ventilator*, for conveying freſh air into mines, hoſpitals, priſons, and the cloſe parts of ſhips: he had communicated it to his particular friends ſome months before; and it is very remarkable that a machine of the ſame kind, for the ſame purpoſe, was in the ſpring of the ſame year invented by one Martin Triewald, an officer in the ſervice of the king of Sweden, called *captain of mechanics*, for which the king and ſenate granted him a privilege in October following, and ordered every ſhip of war in the ſervice of that ſtate to be furniſhed with one of them; a model alſo of this machine was ſent into France, and all the ſhips in the French navy were alſo ordered to have a ventilator of the ſame ſort.

It happened alſo, that about the ſame time one Sutton, who kept a coffee houſe in Alderſgate-ſtreet, invented a ventilator of another conſtruction to draw off the foul air out of ſhips, by means of the cook-room fire: but poor Sutton had not intereſt enough to make mankind accept the benefit he offered them; though its ſuperiority to Dr Hales's contrivance was evident, and among others Dr Mead and the late ingenious Mr Benjamin Robins gave their teſtimony in its favour. See AIR-*Pipes*.

The public, however, is not leſs indebted to the ingenuity and benevolence of Dr Hales, whoſe ventilators came more eaſily into uſe for many purpoſes of the greateſt importance to life, particularly for keeping corn ſweet, by blowing through it freſh ſhowers of air; a practice very ſoon adopted by France, a large granary having been made, under the direction of Duhamel, for the preſervation of corn in this manner, with a view to make it a general practice.

In 1743, Dr Hales read before the Royal Society a deſcription of a method of conveying liquors into the *abdomen* during the operation of tapping, and it was afterwards printed in their Tranſactions. In 1745, he publiſhed ſome experiments and obſervations on tar-water, which he had been induced to make by the publication of a work called *Siris*, in which the late learned and moſt excellent Dr Berkeley, biſhop of Cloyne, had recommended tar-water as an univerſal medicine: on this occaſion ſeveral letters paſſed between them on the ſubject, particularly with reſpect to the uſe of tar-water in the diſeaſe of the horned cattle. Hales.

In the ſame year he communicated to the public, by a letter to the editor of the Gentleman's Magazine, a deſcription of a *back-heaver*, which will winnow and clean corn much ſooner and better than can be done by the common method. He alſo, at the ſame time, and by the ſame channel, communicated to the public a cheap and eaſy way to preſerve corn ſweet in ſacks; an invention of great benefit to farmers, eſpecially to poor leaſers, who want to keep ſmall quantities of corn for ſome time, but have no proper granary or repoſitory for that purpoſe. He alſo the ſame year took the ſame method to publiſh directions how to keep corn ſweet in heaps without turning it, and to ſweeten it when muſty. He publiſhed a long paper, containing an account of ſeveral methods to preſerve corn by ventilators; with a particular deſcription of ſeveral ſorts of ventilators, illuſtrated by a cut, ſo that the whole mechaniſm of them may be eaſily known, and the machine conſtructed by a common carpenter. He publiſhed alſo in the ſame volume, but without his name, a detection of the fallacious boaſts concerning the efficacy of the liquid ſhell in diſſolving the ſtone in the bladder. In 1746 he communicated to the Royal Society a propoſal for bringing ſmall paſſable ſtones ſoon, and with eaſe, out of the bladder; and this was alſo printed in their Tranſactions. In the Gentleman's Magazine for July 1747, he publiſhed an account of a very conſiderable improvement of his back-heaver, by which it became capable of clearing corn of the very ſmall grain, ſeeds, blacks, ſmut balls, &c. to ſuch perfection as to make it fit for ſeed-corn. In 1748 he communicated to the Royal Society a propoſal for checking, in ſome degree, the progreſs of fires, occaſioned by the great fire which happened that year in Cornhill: And the ſubſtance of this propoſal was printed in their Tranſactions. In the ſame year he alſo communicated to the Society two memoirs, which are printed in their Tranſactions; one on the great benefit of ventilators, and the other on ſome experiments in electricity.

In 1749 his ventilators were fixed in the Savoy priſon, by order of the right hon. Henry Fox, eſq; then ſecretary at war, afterwards lord Holland; and the benefit was ſo great, that though 50 or 100 in a year often died of the gaol-diſtemper before, yet from the year 1749 to the year 1752 incluſive, no more than four perſons died, though in the year 1750 the number of priſoners was 240; and of thoſe four, one died of the ſmall-pox, and another of intemperance.

In the year 1750 he publiſhed ſome conſiderations on the cauſes of earthquakes; occaſioned by the ſlight ſhocks felt that year in London. The ſubſtance of

Hales. this work was also printed in the Philosophical Transactions. The same year he exhibited an examination of the strength of several purging waters, especially of the water of *Jessop's well*, which is printed in the Philosophical Transactions.

He had now been several years honoured with the esteem and friendship of his royal highness Frederick prince of Wales; who frequently visited him at Teddington, from his neighbouring palace at Kew, and took a pleasure in surprising him in the midst of those curious researches into the various parts of nature which almost incessantly employed him. Upon the prince's death, which happened this year, and the settlement of the household of the princess dowager, he was, without his solicitation, or even knowledge, appointed clerk of the closet, or almoner to her royal highness.

In 1751 he was chosen by the college of physicians to preach the annual sermon called *Crowne's lecture:* Dr William Crowne having left a legacy for a sermon to be annually preached on "the wisdom and goodness of God displayed in the formation of man." Dr Hales's text was, *With the ancient is wisdom, and in length of days understanding*, Job xii. 12. This sermon, as usual, was published at the request of the college.

In the latter end of the year 1752, his ventilators, worked by a windmill, were fixed in Newgate, with branching trunks to 24 wards; and it appeared that the disproportion of those that died in the gaol before and after this establishment was as 16 to 7. He published also a farther account of their success, and some observations on the great danger arising from foul air, exemplified by a narrative of several persons seized with the gaol fever by working in Newgate.

On the death of Sir Hans Sloane, which happened in the year 1753, he was elected a member of the Academy of Sciences at Paris in his room. The same year he published in the Gentleman's Magazine some farther considerations about means to draw the foul air out of the sick rooms of occasional army-hospitals, and private houses in town. He also published many other curious particulars relative to the use and success of ventilators. The same year a description of a sea-gage, which the doctor invented to measure unfathomable depths, was communicated to the public in the same miscellany: this paper was drawn up about the year 1732 or 1733, by the doctor, for the late Colin Campbell, esq; who employed the ingenious Mr Hawksbee to make the machine it describes, which was tried in various depths, and answered with great exactness, yet was at last lost near Bermuda.

In 1754, he communicated to the Royal Society some experiments for keeping water and fish sweet with lime-water, an account of which was published in the Phil. Trans. He also continued to enrich their memoirs with many useful articles from this time till his death, particularly a method of forwarding the distillation of fresh from salt water by blowing showers of fresh air up through the latter during the operation.

In 1757 he communicated to the editor of the Gentleman's Magazine, an easy method of purifying the air, and regulating its heat in melon-frames and green-houses, also further improvements in his method of distilling sea-water.

His reputation and the interest of his family and friends might easily have procured him farther preferment: but of farther preferment he was not desirous; for being nominated by his late majesty to a canonry of Windsor, he engaged the princess to request his majesty to recall his nomination. That a man so devoted to philosophical studies and employments, and so conscientious in the discharge of his duty, should not desire any preferment which would reduce him to the dilemma either of neglecting his duty, or foregoing his amusement, is not strange: but that he would refuse an honourable and profitable appointment, for which no duty was to be done that would interrupt his habits of life, can scarce be imputed to his temperance and humility without impeaching his benevolence; for if he had no will of any thing more for himself, a liberal mind would surely have been highly gratified by the distribution of so considerable a sum as a canonry of Windsor would have put into his power, in the reward of industry, the alleviation of distress, and the support of helpless indigence. He was, however, remarkable for social virtue and sweetness of temper; his life was not only blameless, but exemplary in a high degree; he was happy in himself, and beneficial to others, as appears by this account of his attainments and pursuits; the constant serenity and cheerfulness of his mind, and the temperance and regularity of his life, concurred, with a good constitution, to preserve him in health and vigour to the uncommon age of fourscore and four years.

Hales || Hali-Beigh.

He died at Teddington in 1761; and was buried, pursuant to his own directions, under the tower of the parish church, which he built at his own expence not long before his death.—Her royal highness the princess of Wales erected a monument to his memory in Westminster abbey.

HALESWORTH, a town of Suffolk in England, seated on a neck of land between two branches of the river Blith. It is a well frequented thriving place, and has a trade in linen-yarn and sail-cloth. It has one large church, and about 600 good houses; but the streets are neither wide nor paved. About the town is raised a great deal of hemp. E. Long. 1. 40. N. Lat. 52. 30.

HALF-BLOOD, in law, is where a man marries a second wife, the first being dead, and by the first venter has a son, and by his second venter has likewise a son; the two brothers, in this case, are but of half-blood. See CONSANGUINITY and DESCENT.

HALF-*Merk*; a noble, or 6s. 8d.

HALF-*Moon*, in fortification; an outwork composed of two faces, forming a saliant angle, whose gorge is in form of a crescent or half-moon, whence the name.

HALI-BEIGH, first dragoman or interpreter at the Grand Signior's court in the 17th century, was born of Christian parents in Poland; but having been taken by the Tartars when he was young, they sold him to the Turks, who brought him up in their religion in the seraglio. His name, in his native country, was Bobowski. He learnt many languages, and Sir Paul Ricaut owns he was indebted to him for several things which he relates in his *Present state of the Ottoman empire*. He held a great correspondence with the English, who persuaded him to translate some books into the Turkish language; and

Halietus, Halifax.

and he had a mind to return into the bofom of the Chriſtian church, but died before he could accompliſh the deſign. Dr Hyde publiſhed his book *Of the liturgy of the Turks, their pilgrimages to Mecca, their circumciſion and viſiting of the ſick.* He tranſlated the catechiſm of the church of England, and the bible, into the Turkiſh language. The MS. is lodged in the library of Leyden. He wrote likewiſe a Turkiſh grammar and dictionary.

HALIÆTUS, in ornithology. See FALCO.

HALIFAX, the capital of the province of Nova Scotia in America, ſituated in W. Long. 64. 30. N. Lat. 44. 45. It was founded in 1749, in order to ſecure the Britiſh ſettlements there from the attempts of the French and Indians. It was divided into 35 ſquares, each containing 16 lots of 40 by 60 feet; one eſtabliſhed church, and one meeting-houſe, and a ſmall number of houſes out of the regular ſtreets, which are 65 feet broad. The town was ſurrounded by pickettings, and guarded by forts on the outſide; but, ſince the commencement of the American troubles, it has been very ſtrongly fortified. Along the river Chebucto, to the ſouthward of the town, are buildings and fiſh-ſtakes for at leaſt two miles, and to the northward on the river for about one mile. The plan, however, has been greatly improved by the earl of Halifax, who was the original contriver. The proclamation iſſued for this ſettlement, offered 50 acres of land to every ſoldier and ſailor who would ſettle in that part of America, without paying any rent or doing any ſervice for ten years, and no more than one ſhilling *per annum* for each 50 acres ever afterwards: to every ſoldier and ſailor who had a wife and children, ten acres more were added for every individual of his family, and for every increaſe that ſhould afterwards happen in the ſame proportion. To each ſubaltern officer, 80 acres, and 15 for each of his family; 200 acres to each enſign; 300 to each lieutenant; 400 to each captain; 600 to every officer in rank above a captain, and 30 for each of his family. The government alſo engaged to tranſport and maintain the new ſettlers for one year at its own expence, and to furniſh them with ſuch arms, proviſions, utenſils, implements, &c. as ſhould be neceſſary to put them in a way to cultivate their lands, to build habitations, and to commence a fiſhery. The ſame conditions were likewiſe offered to all carpenters and other handicraftſmen; and ſurgeons were offered the ſame conditions with the enſigns.—This proclamation was publiſhed in March, and by the month of May 3700 perſons had offered themſelves. They accordingly embarked, and eſtabliſhed themſelves in the bay of Chebucto; calling their city *Halifax*, from the title of their patron. Before the end of October the ſame year, 350 comfortable wooden houſes were built, and as many more during the winter.—The ſame year in which the ſettlers embarked, the government granted them 40,000l. for their expences. In 1750, they granted 57,582l. 17s. 3¼d. for the ſame purpoſe; in 1751, 53,927l. 14s. 4d.; in 1752, 61,492l. 19s. 4½; in 1753, 94,615l. 12s. 4d.; in 1754, 58,447l. 2s.; and in 1755, 49,418l. 7s. 8d.

HALIFAX, earl of. See SAVILLE.

HALIFAX, a town in the weſt riding of Yorkſhire in England, ſeated on the river Calder, in W. Long. 2. 0. N. Lat. 53. 45. It has the title of an earldom, and is very eminent for the clothier trade. The pariſh is ſaid to be the moſt populous, if not the moſt extenſive, in England: for it is above 30 miles in circumference; and, beſides the mother-church at Halifax, and 16 meeting-houſes, has 12 chapels, two of which are parochial. What is a little ſingular, all the meeting-houſes here, except the quakers, have bells and burying grounds. The woollens principally manufactured here, are kerſeys and ſhalloons. Of the former it is affirmed, that one dealer hath ſent by commiſſion 60,000 pounds worth in a year to Holland and Hamburgh; and of the latter, it is ſaid, 100,000 pieces are made in this pariſh yearly. The inhabitants here, and in the neighbouring towns, are ſo entirely employed in theſe manufactures, that agriculture is but little minded. Moſt of their proviſions of all ſorts are brought from the north and eaſt ridings, and from Lancaſhire, Cheſhire, Nottinghamſhire, and Warwickſhire. The markets are very much crowded for the buying and ſelling proviſions and manufactures. The cloths, at the firſt erecting of the woollen manufactures in theſe parts, having been frequently ſtolen off the tenters in the night, a law was made, by which the magiſtrates of Halifax were empowered to paſs ſentence on and execute all offenders, if they were taken in the fact, or owned it, or if the ſtolen cloth was found upon them, provided alſo the crime was committed, and the criminal apprehended, within the liberties of the foreſt of Hardwick. Thoſe found guilty were executed in the following manner: an axe was drawn by a pulley to the top of a wooden engine, and faſtened by a pin, which being pulled out, the axe fell down in an inſtant, and did its work. If they had ſtole an ox, horſe, or any other beaſt, it was led with them to the ſcaffold, and there faſtened by a cord to the pin, that held up the axe; and when the ſignal was given by the jurors, who were the firſt burghers within the ſeveral towns of the foreſt, the beaſt was driven away, and the pin plucked out, upon which the axe fell and did its office. This ſevere and ſummary courſe of juſtice, gave occaſion to a litany, which is ſtill much more frequent in the mouths of the beggars and vagrants of theſe parts, than is the common prayer, viz.

Halifax Hall.

"*From* Hell, Hull, and Hallifax, good Lord deliver us:"

though neither the engine, nor manner of proceeding againſt them, are now in uſe.

HALIOTIS, the EAR-SHELL, a genus of inſects belonging to the order of vermes teſtacea. This is an animal of the ſnail-kind, with an open ſhell reſembling an ear. There are ſeven ſpecies, diſtinguiſhed by the figure of their ſhells. See Plate CLVIII.

HALITZ, a town of Poland, and capital of a territory of the ſame name, in Red Ruſſia, with a caſtle. It is ſeated on the river Neiſter. E. Long. 26. 0. N. Lat. 49. 20.

HALL, in architecture, a large room at the entrance of a fine houſe and palace. Vitruvius mentions three kinds of halls; the tetraſtyle, with four columns, ſupporting the platfond or ceiling; the Corinthian, with columns all round let into the wall, and vaulted over; and the Egyptian, which had a periſtyle of inſulated Corinthian columns, bearing a ſecond order with a ceiling.

The

Hall || Halle.

The hall is properly the fineſt as well as firſt member of an apartment; and in the houſes of miniſters of ſtate, magiſtrates, &c. is the place where they diſpatch buſineſs, and give audience. In very magnificent buildings, where the hall is larger and loftier than ordinary, and placed in the middle of the houſe, it is called a *ſalon*.

The length of a hall ſhould be at leaſt twice and a quarter its breadth; and in great buildings, three times its breadth. As to the height of halls, it may be two thirds of the breadth; and, if made with an arched ceiling, it will be much handſomer, and leſs liable to accidents by fire. In this caſe, its height is found by dividing its breadth into ſix parts, five of which will be the height from the floor to the under ſide of the key of the arch.

HALL (Joſeph), an eminent prelate of the church of England, was born in 1574, and educated at Cambridge. He became profeſſor of Rhetoric in that univerſity, and then ſucceſſively was made rector of Halſted in Suffolk, preſented to the living of Waltham in Eſſex, made prebendary of Wolverhampton, dean of Worceſter, biſhop of Exeter, and laſtly of Norwich.

His works teſtify his zeal againſt Popery, and are much eſteemed. He lamented the diviſions of the Proteſtants, and wrote ſomething concerning the means of putting an end to them. July 1616, he attended the embaſſy of lord Doncaſter into France, and upon his return was appointed by his majeſty to be one of the divines who ſhould attend him into Scotland. In 1618 he was ſent to the ſynod of Dort with other divines, and pitched upon to preach a Latin ſermon before that aſſembly. But being obliged to return from thence before the ſynod broke up, on account of his health, he was by the ſtates preſented with a gold medal. He wrote, 1. Miſcellaneous epiſtles. 2. *Mundus alter et idem*. 3. A juſt cenſure of travellers. 4. The Chriſtian Seneca. 5. Satires, in ſix books. 6. A century of meditations; and many other works, which, beſides the above ſatires, make in all five volumes in folio and quarto. He died in 1656.

HALL (John), a poet of diſtinguiſhed learning, was born at Durham, and educated at Cambridge, where he was eſteemed the brighteſt genius in that univerſity. In 1646, when he was but 19 years of age, he publiſhed his *Horæ Vacivæ*, or Eſſays; and the ſame year came out his poems. He tranſlated from the Greek "Hierocles upon the golden verſes of Pythagoras;" before which is an account of the ingenious tranſlator and his works, by John Davies of Kidwelly. He died in 1656, aged 29.

HALLAGE, a fee or toll paid for cloth brought to be ſold in Blackwell-hall, London.

HALLAMASS. See ALL-SAINTS.

HALLAND, a country of Sweden, in the iſland of Schonen, lying along the ſea-coaſt, at the entrance of the Baltic Sea, and oppoſite to Jutland. It is 60 miles along the coaſt, but is not above 12 in breadth. Halmſtadt is the capital town.

HALLATON, a town of Leiceſterſhire, in England. It is ſeated on a rich ſoil, 12 miles ſouth-eaſt of Leiceſter, in E. Lon. 0. 50. N. Lat. 52. 35.

HALLE, a little diſmantled town of the Auſtrian Netherlands, in Hainault. The church of Notre Dame contains an image of the Virgin Mary, held in great veneration. E. Lon. 3. 15. N. Lat 50. 44.

Halle || Haller.

HALLE, a handſome and conſiderable town of Germany, in the circle of Upper Saxony, and in the duchy of Magdeburg, with a famous univerſity and ſalt-works. It belongs to the king of Pruſſia; and is ſeated in a pleaſant plain on the river Sale, in E. Lon. 12. 33. N. Lat. 51. 36.

HALLE, a free and imperial town of Germany, in Suabia, famous for its ſalt-pits. It is ſeated on the river Kocher, among rocks and mountains, in E. Lon. 10. 50. N. Lat. 49. 6.

HALLEIN, a town of Germany, in the circle of Bavaria, and archbiſhopric of Saltſburg; ſeated on the river Saltza, among the mountains, wherein are mines of ſalt, which are the chief riches of the town and country. E. Lon. 12. 15. N. Lat. 47. 33.

HALLELUJA, a word ſignifying "Praiſe the Lord." The ſinging halleluja (firſt introduced into the church-ſervice by St Jerom), was a ſort of invitatory, or call to each other, to praiſe the Lord. St Auſtin ſays, that in ſome churches it was ſung only on Eaſter-day, and the 50 days of Pentecoſt; but that even in thoſe churches where it was moſt in uſe, it was never uſed in the time of Lent.

HALLER (Albert Van), an eminent phyſician, was born at Bern, on the 16th of October 1708. He was the ſon of an advocate, of conſiderable eminence in his profeſſion. His father had a numerous family, and Albert was the youngeſt of five ſons. From the firſt period of his education, he ſhewed a very great genius for literature of every kind: to forward the progreſs of his ſtudies, his father took into his family a private tutor, named *Abraham Billodz*; and ſuch was the diſcipline exerted by this pedagogue, that the accidental ſight of him, at any future period of life, excited in Haller very great uneaſineſs, and renewed all his former terrors.

According to the accounts which are given us, the progreſs of Haller's ſtudies, at the earlieſt periods of life, was rapid almoſt beyond belief. When other children were beginning only to read, he was ſtudying Bayle and Moreri; and at nine years of age he was able to tranſlate Greek, and was beginning the ſtudy of Hebrew. Not long after this, however, the courſe of his education was ſomewhat interrupted by the death of his father; an event which happened when he was in the 13th year of his age. After this he was ſent to the public ſchool at Bern, where he exhibited many ſpecimens of early and uncommon genius. He was diſtinguiſhed for his knowledge in the Greek and Latin languages; but he was chiefly remarkable for his poetical genius: and his eſſays of this kind, which were publiſhed in the German language, were read and admired throughout the whole empire.

In the 16th year of his age, he began the ſtudy of medicine at Tubingen, under thoſe eminent teachers Duvernoy and Camerarius; and continued there for the ſpace of two years, when the great reputation of the juſtly celebrated Boerhaave drew him to Leyden. Nor was this diſtinguiſhed teacher the only man from whoſe ſuperior abilities he had there an opportunity of profiting. Ruyſch was ſtill alive, and Albinus was riſing into fame. Animated by ſuch examples, he ſpent all the day, and the greateſt part of the night, in the moſt

Haller. most intenſe ſtudy; and the proficiency which he made, gained him univerſal eſteem both from his teachers and fellow-ſtudents.

From Holland, in the year 1727, he came to England. Here, however, his ſtay was but ſhort; and it was rather his intention to viſit the illuſtrious men of that period, than to proſecute his ſtudies at London. He formed connexions with ſome of the moſt eminent of them. He was honoured with the friendſhip of Douglas and Cheſelden; and he met with a reception proportioned to his merit from Sir Hans Sloane, preſident of the Royal Society. After his viſit to Britain, he went to France; and there, under thoſe eminent maſters, Winſlow and Le Dran, with the latter of whom he reſided during his ſtay in Paris, he had opportunities of proſecuting anatomy, which he had not before enjoyed. But the zeal of our young anatomiſt was greater than the prejudices of the people at that period, even in the enlightened city of Paris, could admit of. An information being lodged againſt him to the police for diſſecting dead bodies, he was obliged to cut ſhort his anatomical inveſtigations by a precipitate retreat. Still, however, intent on the farther proſecution of his ſtudies, he went to Baſil, where he became a pupil to the celebrated Bernoulli.

Thus improved and inſtructed by the lectures of the moſt diſtinguiſhed teachers of that period, by uncommon natural abilities, and by unremitting induſtry, he returned to the place of his nativity in the 26th year of his age. Not long after this, he offered himſelf a candidate, firſt for the office of phyſician to an hoſpital, and afterwards for a profeſſorſhip. But neither the character which he had before he left his native country, nor the fame which he had acquired and ſupported while abroad, were ſufficient to combat the intereſt oppoſed to him. He was diſappointed in both; and it was even with difficulty that he obtained, in the following year, the appointment of keeper of a public library at Bern. The exerciſe of this office was indeed by no means ſuited to his great abilities: but it was agreeable to him, as it afforded him an opportunity for that extenſive reading by which he has been ſo juſtly diſtinguiſhed.

The neglect of his merit which marked his firſt outſet, neither diminiſhed his ardour for medical purſuits, nor detracted from his reputation either at home or abroad. And ſoon after he was nominated a profeſſor in the univerſity of Gottingen, by king George II. The duties of this important office he diſcharged, with no leſs honour to himſelf than advantage to the public, for the ſpace of ſeventeen years; and it afforded him an ample field for the exertion of thoſe great talents which he poſſeſſed. Extenſively acquainted with the ſentiments of others reſpecting the œconomy of the human body, ſtruck with the diverſity of opinions which they held, and ſenſible that the only means of inveſtigating truth was by careful and candid experiment, he undertook the arduous taſk of exploring the phænomena of human nature from the original ſource. In theſe purſuits he was no leſs induſtrious than ſucceſsful, and there was hardly any function of the body on which his experiments did not reflect either a new or a ſtronger light. Nor was it long neceſſary for him, in this arduous undertaking, to labour alone. The example of the preceptor inſpired his pupils with the ſpirit of induſtrious exertion. Zinn, Zimmerman, Caldani, and many others, animated by a generous emulation, laboured with indefatigable induſtry to proſecute and to perfect the diſcoveries of their great maſter. And the mutual exertion of the teacher and his ſtudents, not only tended to forward the progreſs of medical ſcience, but placed the philoſophy of the human body on a more ſure, and an almoſt entirely new baſis. Haller.

But the labours of Dr Haller, during his reſidence at Gottingen, were by no means confined to any one department of ſcience. He was not more anxious to be an improver himſelf, than to inſtigate others to ſimilar purſuits. To him, the Anatomical Theatre, the School of Midwifery, the Chirurgical Society, and the Royal Academy of Sciences, at Gottingen, owe their origin. Such diſtinguiſhed merit could not fail to meet with a ſuitable reward from the ſovereign under whoſe protection he then taught. The king of Great Britain not only honoured him with every mark of attention which he himſelf could beſtow, but procured him alſo letters of nobility from the emperor. On the death of Dillenius, he had an offer of the profeſſorſhip of botany at Oxford; the ſtates of Holland invited him to the chair of the younger Albinus; the king of Pruſſia was anxious that he ſhould be the ſucceſſor of Maupertuis at Berlin. Marſhal Keith wrote to him in the name of his ſovereign, offering him the chancellorſhip of the univerſity of Halle, vacant by the death of the celebrated Wolff. Count Orlow invited him to Ruſſia, in the name of his miſtreſs the empreſs, offering him a diſtinguiſhed place at St Peterſburgh. The king of Sweden conferred on him an unſolicited honour, by raiſing him to the rank of knighthood of the order of the polar ſtar; and the emperor of Germany did him the honour of a perſonal viſit, during which he thought it no degradation of his character to paſs ſome time with him in the moſt familiar converſation.

Thus honoured by ſovereigns, revered by men of literature, and eſteemed by all Europe, he had it in his power to have held the higheſt rank in the republic of letters. Yet, declining all the tempting offers which were made to him, he continued at Gottingen, anxiouſly endeavouring to extend the riſing fame of that medical ſchool. But after ſeventeen years reſidence in that univerſity, an ill ſtate of health rendering him leſs fit for the duties of the important office which he held, he ſolicited and obtained permiſſion from the regency of Hanover to return to his native city of Bern. His fellow-citizens, who might at firſt have fixed him among themſelves, with no leſs honour than advantage to their city, were now as ſenſible as others of his ſuperior merit. A penſion was ſettled upon him for life, and he was nominated at different times to fill the moſt important offices in the ſtate. Theſe occupations, however, did not diminiſh his ardour for uſeful improvements. He was the firſt preſident, as well as the greateſt promoter, of the Oeconomical Society at Bern; and he may be conſidered as the father and founder of the Orphan-hoſpital of that city. Declining health, however, reſtrained his exertions in the more active ſcenes of life, and for many years he was confined entirely to his own houſe. Even this, however, could not put a period to his utility: for, with indefatigable induſtry he continued his favourite employment

Halley. ployment of writing till within a few days of his death; which happened in the 70th year of his age, on the 12th of December 1777. His *Elementa Phyſiologiæ* and *Bibliotheca Medicinæ*, will afford, to lateſt poſterity, undeniable proofs of his indefatigable induſtry, penetrating genius, and ſolid judgment. But he was not leſs diſtinguiſhed as a philoſopher, than beloved as a man; and he was not more eminent for his improvement in every department of medical ſcience, than for his piety to God, and benevolence to all mankind.

HALLEY (Dr Edmund), an eminent aſtronomer, was the only ſon of a ſoap-boiler in London, and was born in 1656. He firſt applied himſelf to the ſtudy of the languages and ſciences, but at length gave himſelf up wholly to that of aſtronomy. In 1676 he went to the iſland of St Helena to complete the catalogue of fixed ſtars, by the addition of thoſe that lie near the ſouth pole; and having delineated a planiſphere, in which he laid them all down in their exact places, he returned to England in 1678. In the year 1680 he took what is called *the grand tour*, accompanied by his friend the celebrated Mr Nelſon. In the midway between Calais and Paris, Mr Halley had a ſight of a remarkable comet, as it then appeared a ſecond time that year, in its return from the ſun. He had the November before ſeen it in its deſcent; and now haſtened to complete his obſervations upon it, in viewing it from the royal obſervatory of France. His deſign in this part of his tour was, to ſettle a friendly correſpondence between the two royal aſtronomers of Greenwich and Paris, and in the mean time to improve himſelf under ſo great a maſter as Caſſini. From thence he went to Italy, where he ſpent great part of the year 1681; but his affairs calling him home, he returned to England. In 1683, he publiſhed his *Theory of the variation of the magnetical compaſs*; in which he ſuppoſes the whole globe of the earth to be a great magnet, with four magnetical poles, or points of attraction: but afterwards thinking that this theory was liable to great exceptions, he procured an application to be made to king William, who appointed him commander of the Paramour pink, with orders to ſeek by obſervations the diſcovery of the rule of variations, and to lay down the longitudes and latitudes of his majeſty's ſettlements in America.—He ſet out on this attempt on the 24th of November 1698: but having croſſed the line, his men grew ſickly; and his lieutenant mutinying, he returned home in June 1699. Having got the lieutenant tried and caſhiered, he ſet ſail a ſecond time in September following, with the ſame ſhip, and another of leſs bulk, of which he had alſo the command. He now traverſed the vaſt Atlantic ocean from one hemiſphere to the other, as far as the ice would permit him to go; and having made his obſervations at St Helena, Braſil, Cape Verd, Barbadoes, the Madeiras, the Canaries, the coaſt of Barbary, and many other latitudes, arrived in September 1700; and the next year publiſhed a general chart, ſhewing at one view the variation of the compaſs in all thoſe places. Captain Halley, as he was now called, had been at home little more than half a year, when he was ſent by the king to obſerve the courſe of the tides, with the longitude and latitude of the principal head-lands in the Britiſh channel; which having executed with his uſual expedition and accuracy, he publiſhed a large map of the Britiſh channel. Soon after, the emperor of Germany reſolving to make a convenient harbour for ſhipping in the Adriatic, Captain Halley was ſent by queen Anne to view the two ports on the coaſt of Dalmatia. He embarked on the 22d of November 1702; paſſed over to Holland; and going through Germany to Vienna, he proceeded to Iſtria: but the Dutch oppoſing the deſign, it was laid aſide; yet the emperor made him a preſent of a rich diamond-ring from his finger, and honoured him with a letter of recommendation, written with his own hand, to queen Anne. Preſently after his return, he was ſent again on the ſame buſineſs; when paſſing thro' Hanover, he ſupped with king George I. then electoral prince, and his ſiſter the queen of Pruſſia. On his arrival at Vienna, he was the ſame evening preſented to the emperor, who ſent his chief engineer to attend him to Iſtria, where they repaired and added new fortifications to thoſe of Trieſte. Halley ‖ Halſtead.

Mr Halley returned to England in 1703; and the ſame year was made profeſſor of geometry in the univerſity of Oxford, in the room of Dr Wallis, and had the degree of doctor of laws conferred on him by that univerſity. He is ſaid to have loſt the profeſſorſhip of aſtronomy in that city, becauſe he would not profeſs his belief of the Chriſtian religion. He was ſcarcely ſettled at Oxford, when he began to tranſlate into Latin from the Arabic, *Apollonius de ſectione rationis*; and to reſtore the two books *De ſectione ſpatii* of the ſame author, which are loſt, from the account given of them by Pappius; and he publiſhed the whole work in 1706. Afterwards he had a ſhare in preparing for the preſs Apollonius's Conics; and ventured to ſupply the whole eighth book, the original of which is alſo loſt. He likewiſe added Serenus on the ſection of the cylinder and cone, printed from the original Greek, with a Latin tranſlation, and publiſhed the whole in folio. In 1713, he was made ſecretary of the Royal Society; in 1720, he was appointed the king's aſtronomer at the royal obſervatory at Greenwich, in the room of Mr Flamſtead; and, in 1729, was choſen as a foreign member of the Academy of Sciences at Paris. He died at Greenwich in 1742. His principal works are, 1. *Catalogus ſtellarum auſtraliorum*. 2. *Tabulæ aſtronomicæ*. 3. An abridgment of the aſtronomy of comets, &c. We are alſo indebted to him for the publication of ſeveral of the works of the great Sir Iſaac Newton, who had a particular friendſhip for him, and to whom he frequently communicated his diſcoveries.

HALLEY's *Quadrant*. See QUADRANT.

HALLIARDS, the ropes or tackles uſually employed to hoiſt or lower any ſail upon its reſpective maſt or ſtay. See JEARS.

HALMOTE, or HALIMOTE, is the ſame with what we now call a *court-baron*, the word implying a meeting of the tenants of the ſame hall or manor. The name is ſtill retained at Luſton, and other places in Herefordſhire. See MOTE.

HALMSTADT. See HELMSTADT.

HALSTEAD, town of Eſſex, in England, ſeated on the river Coln, in E. Lon. 0. 45. N. Lat. 51. 55. It has an old church, the ſteeple of which was once burnt down by lightning, but rebuilt at the expence of an individual, (Robert Fiſke, eſq:). The

town

Halo ‖ Ham.

town conſiſts of about 600 pretty good houſes, and is ſituated on a riſing ground, but the ſtreets are not paved. The inhabitants are about 4000 in number. Here is a good manufactory of ſays, bays, callimancoes, &c. alſo a good free-ſchool for 40 boys, and a very antique Bridewell.

HALO, or CORONA, in natural hiſtory, a coloured circle appearing round the body of the ſun, moon, or any of the large ſtars. See CORONA.

HALT, in war, a pauſe or ſtop in the march of a military body.—Some derive the word from the Latin *halitus*, breath; it being a frequent occaſion of halting to take breath: others from *alto*, becauſe in halting they raiſed their pikes on end, &c.

HALTERISTÆ, in antiquity, a kind of players at diſcus; denominated from a peculiar kind of diſcus called by the Greeks ἅλτης, and by the Latins *Halter*. See DISCUS.

Some take the diſcus to have been a leaden weight or ball which the vaulters bore in their hands, to ſecure and keep themſelves the more ſteady in their leaping. Others will have the *halter* to be a lump or maſs of lead or ſtone, with an hold or handle fixed to it, by which it might be carried; and that the *halteriſtæ* were thoſe who exerciſed themſelves in removing theſe maſſes from place to place.

Hier. Mercurialis, in his treatiſe *De arte gymnaſtica*, l. ii. c. 12. diſtinguiſhes two kinds of *halteriſtæ*; for though there was but one *halter*, there were two ways of applying it. The one was to throw or pitch it in a certain manner; the other only to hold it out at arm's-end, and in this poſture to give themſelves divers motions, ſwinging the hand backwards and forwards, according to the engraven figures thereof given us by Mercurialis.—The *halter* was of a cylindrical figure, ſmaller in the middle, where it was held, by one diameter, than at the two ends. It was above a foot long, and there was one for each hand: it was either of iron, ſtone, or lead.

Galen, *De tuend. valetud.* lib. i. v. & vi. ſpeaks of this exerciſe, and ſhews of what uſe it is in purging the body of peccant humours; making it equivalent both to purgation and phlebotomy.

HALTWHISTLE, a town of Northumberland, in England, ſituated in E. Lon. 2. 0. N. Lat. 55. 0. It is pretty well built, and affords good entertainment for travellers.

HALYMOTE, properly ſignifies an holy or eccleſiaſtical court. See HALMOTE.

There is a court held in London by this name before the Lord-Mayor and ſheriffs, for regulating the bakers. It was anciently held on Sunday next before St Thomas's day, and for this reaſon called the *Halymote*, or *Holy-court*.

HALYWERCFOLK, in old writers, were perſons who enjoyed land, by the pious ſervice of repairing ſome church, or defending a ſepulchre.

This word alſo ſignified ſuch perſons in the diocеſe of Durham, as held their lands to defend the corps of St Cuthbert, and who from thence claimed the privilege of not being forced to go out of the biſhopric.

HAM is a Saxon word uſed for "a place of dwelling;" a village or town; hence the termination of ſome of our towns, *Nottingham*, *Buckingham*, &c.

Alſo a home cloſe, or little narrow meadow, is called a *ham*.

Ham ‖ Hamamelis.

HAM, in cookery, the leg of a hog, ſeaſoned and dried.

To ſalt a ham in imitation of thoſe of Weſtphalia: Let the ham be of young pork; ſprinkle it with ſalt for one day, that it may fetch out the blood; then wipe it dry, and rub it with the following mixture: Take a pound of brown ſugar, half a pound of ſaltpetre, half a pint of bay-ſalt, and three pints of common ſalt; ſtir theſe together in an iron-pan over the fire till they are pretty hot, and then rub the leg of pork with it: let it lie three weeks in this ſalting, frequently turning it, and then dry it in a chimney.

HAM, a city of Germany, in the circle of Weſtphalia, capital of the county of Mark, and ſubject to the king of Pruſſia. It is ſeated on the river Lippe, on the frontiers of Munſter. The adjacent country abounds in corn, hemp, and flax; and the inhabitants get a good deal of money by travellers. It was formerly a hanſe-town, but is now reduced. E. Lon. 7. 53. N. Lat. 51. 42.

HAM, a town of Picardy, in France, ſeated on the river Somme, among marſhes. It has three pariſhes, and there is here a round tower whoſe walls are 36 feet thick. It was taken by the Spaniards in 1557, but reſtored by treaty. E. Lon. 3. 9. N. Lat. 49. 45.

HAMADAN. See AMADAN.

HAMADRYADS, in Heathen theology, certain rural deities; being nymphs of the woods, whoſe fate depended upon certain trees, together with which they were ſuppoſed both to be born and to die.

HAMAH, a town of Turky in Aſia, in Syria, ſituated in E. Lon. 36. 15. N. Lat. 35. 15. By ſome travellers it is corruptly called *Amarl* and *Amant*. Some miſtake it for the ancient Apamea; but this is now called *Afamiyah*, and is ſituated a day's journey from Hamah. Hamah is ſituated among hills, and has a caſtle ſeated on a hill. It has all along been a conſiderable place, and in the 13th century had princes of its own. It is very large, and being ſeated on the aſcent of a hill, the houſes riſe above one another, and make a fine appearance. It is, however, like moſt other towns under the Turkiſh government, going to decay. Many of the houſes are half ruined; but thoſe which are ſtill ſtanding, as well as the moſques and caſtle, have their walls built of black and white ſtones, diſpoſed in ſuch manner as to form various figures. The river Aſſi, the ancient Orontes, runs by the ſide of the caſtle, and fills the ditches round it, which are cut very deep into the rock. This river, leaving the caſtle, paſſes through the town from ſouth to north, and has a bridge over it, though it is pretty broad. In its courſe through the town it turns 18 great wheels, called by the natives *ſaki*, which raiſe great quantities of water to a conſiderable height, and throw it into canals ſupported by arches, by which means it is conveyed into the gardens and fountains. There are ſome pretty good bazars or market-places in Hamah, where there is a trade for linen, which is manufactured there, and ſent to Tripoli to be exported into Europe.

HAMAMELIS, WITCH HAZEL; a genus of the digynia order, belonging to the tetrandria claſs of plants. There is but one ſpecies, a native of Virgi-

Hambden, Hamburg.

nia. It hath a ſhrubby or woody ſtem, branching three or four feet high; oval, indented, alternate leaves, reſembling thoſe of common hazel; and flowers growing in cluſters from the joints of the young branches, but not ſucceeded by ſeeds in this country.—The plant is hardy, and is admitted as a variety in our gardens; but its flowers are more remarkable for their appearing in November and December, when the leaves are fallen, than for their beauty.—It may be propagated either by ſeeds or layers.

HAMBDEN (John), a celebrated patriot, deſcended of the ancient family of Hambden in Buckinghamſhire, was born in 1594. From the univerſity he went to the inns of court, where he made a conſiderable progreſs in the ſtudy of the law. He was choſen to ſerve in the parliament which began at Weſtminſter February 5th 1626; and ſerved in all the ſucceeding parliaments in the reign of Charles I. In 1636 he became univerſally known, by his refuſal to pay ſhip-money, as being an illegal tax; upon which he was proſecuted, and his carriage throughout this tranſaction gained him a great character. When the long parliament began, the eyes of all men were fixed on him as their *pater patriæ*. On January 3d 1642, the king ordered articles of high treaſon and other miſdemeanours to be prepared againſt Lord Kimbolton, Mr Hambden, and four other members of the Houſe of Commons, and went to that houſe to ſeize them: but they were then retired. Mr Hambden afterwards made a ſpeech in the houſe to clear himſelf of the charge laid againſt him. In the beginning of the wars he commanded a regiment of foot, and did good ſervice to the parliament at the battle of Edge-hill. He received a mortal wound in an engagement with Prince Rupert, in Chalgrave-field in Oxfordſhire, and died in 1643. He is ſaid to have had the art of Socrates to a great degree, of interrogating, and, under the notion of doubts, inſinuating objections, ſo that he infuſed his own opinions into thoſe from whom he pretended to learn and receive them. He was, ſay his panegyriſts, a very wiſe man, and of great parts; and poſſeſſed of the moſt abſolute ſpirit of popularity to govern the people, that ever was in any country: He was maſter over all his appetites and paſſions, and had thereby a very great aſcendant over other mens': He was of an induſtry and vigilance never to be tired out, of parts not to be impoſed upon by the moſt ſubtile, and of courage equal to his beſt parts.

HAMBURG, an imperial city of Germany, ſeated in E. Lon. 9. 40. N. Lat. 54. 0. Its name is derived from the old German word *Hamme*, ſignifying a wood, and *Burg*, a caſtle; and ſtands on the north-ſide of the river Elbe. This river is not leſs than four miles broad oppoſite the city. It forms two ſpacious harbours, and likewiſe runs through moſt part of it in canals. It flows above Hamburg many miles; but when the tide is accompanied with north-weſt winds, a great deal of damage is done by the inundations occaſioned thereby. There are a great many bridges over the canals, which are moſtly on a level with the ſtreets, and ſome of them have houſes on both ſides. In the year 833, Ludovicus Pius erected Hamburg firſt into a biſhopric, and afterwards into an archbiſhopric; and Adolphus III. duke of Saxony, among many other great privileges, granted it the right of fiſhing in the Elbe, eight miles above and below the city. The kings of Denmark, ſince they have ſucceed to the counts of Holſtein, have continually claimed the ſovereignty of this place, and often compelled the citizens to pay large ſums to purchaſe the confirmation of their liberties. Nay, it has more than once paid homage to the king of Denmark; who, notwithſtanding, keeps a miniſter here with credentials, which is a ſort of acknowledgment of its independency and ſovereignty. Though Hamburg has been conſtantly ſummoned to the diet of the empire ever ſince the year 1618, when it was declared a free imperial city, by a decree of the aulic council; yet it waves this privilege, in order to keep fair with Denmark. The emperor ſeveral other emperors, and the privilege is now exerand ſilver money; and the emperor Frederic I. exempted the citizens from paying any tolls on the Elbe. By their ſituation among a number of poor princes, the Hamburghers are continually expoſed to their rapacioufneſs, eſpecially that of the Danes, who have extorted vaſt ſums from them. The city is very populous, in proportion to its bulk; for though one may walk with eaſe round the ramparts in two hours, yet it contains, excluſive of Jews, at leaſt 100,000 inhabitants. Here are a great many charitable foundations, the regulations of which are greatly admired by foreigners. All perſons found begging in the ſtreets are committed to the houſe of correction to hard labour, ſuch as the raſping of Brazil and other kinds of wood. There is an hoſpital into which unmarried women may be admitted for a ſmall ſum, and comfortably maintained during the reſidue of their lives. The number of hoſpitals in this place is greater in proportion to its bigneſs, than in any other Proteſtant city in Europe. The revenue of the orphan-houſe alone is ſaid to amount to between 50 and 60,000 l. There is a large ſumptuous hoſpital for receiving poor travellers that fall ſick. In one of their work-houſes or houſes of correction, thoſe who have not performed their taſk are hoiſted up in a baſket over the table in the common-hall while the reſt are at dinner, that they may be tantalized with the ſight and ſmell of what they cannot taſte. The eſtabliſhed religion of Hamburgh is Lutheraniſm; as for the Calviniſts and the Roman-catholics, they go to the ambaſſadors chapels to celebrate their divine ſervice and worſhip. They have here what they call *a private confeſſion*, previous to the holy communion, which differs in nothing from that of the church of England, and the abſolution is the ſame, only the pooreſt of the people here are forced to give a fee to the prieſt on theſe occaſions. Their churches, which are ancient large fabrics, are open thoroughfares, and in ſome of them there are bookſellers ſhops. The pulpit of St Catharine's is of marble, curiouſly carved and adorned with figures and other ornaments of gold; and its organ, reckoned one of the beſt in Europe, has 6000 pipes. The cathedral is very ancient, and its tower leans as if juſt going to fall; yet, on account of the ſingularity and beauty of its architecture, the danger attending it has been hitherto overlooked. There is ſtill a dean and chapter belonging to this church, though ſecularized; from whoſe court there lies no appeal, but to the imperial chamber

Hamburg.

Hamburg. chamber at Wetzlar. The chapter conſiſts of a provoſt, dean, 13 canons, eight minor canons, and 30 *vicarii immunes*, beſides others who are under the juriſdiction of the city. The cathedral, with the chapter, and a number of houſes belonging to them, are under the immediate protection of his Britannic majeſty as duke of Bremen, who diſpoſes of the prebends that fall in ſix months of the year, not ſucceſſively, but alternately with the chapter. Hamburgh is almoſt of a circular form, and ſix miles in compaſs. It has ſix gates, and three entrances by water, viz. two from the Elbe and one from the Alſter, being divided into the old and new, which are ſtrongly fortified with moats, ramparts, baſtions, and out-works. The ramparts are very lofty, and planted with trees; and of ſuch a breadth, that ſeveral carriages may go a-breaſt. In the new town, towards Altena, are ſeveral ſtreets of mean houſes inhabited by Jews. Through that entrance from the Elbe called *the lower Baum*, paſs all ſhips going to or coming from ſea. Every morning at the opening of it is ſeen a multitude of boats and ſmall barks, whoſe cargoes conſiſt of milk, fruits, and all kinds of proviſions, ruſhing in at the ſame time. There are ſome fine chimes here, eſpecially thoſe of St Nicholas, which play every morning early, at one o'clock in the afternoon, and on all feſtivals and ſolemnities. The other public ſtructures in this city, beſides the churches, make no great appearance: however, the yard, arſenal, and two armories, are well worth ſeeing. There are ſeveral convents or cloiſters ſtill remaining; which having been ſecularized, are now poſſeſſed by the Lutherans. One of them holds its lands by this tenure, "That they offer a glaſs of "wine to every malefactor who is carried by it for "execution." There is a fine exchange, though inferior to that of London. It is the cuſtom of Hamburgh, that a citizen, when he dies, muſt leave the tenth of his eſtate to the city; and foreigners, not naturalized, muſt pay a certain ſum annually for liberty to trade. The common carts here are only a long pulley laid upon an axle-tree between two wheels, and drawn not by horſes, but by men, of whom a dozen or more are ſometimes linked to theſe machines, with ſlings acroſs their ſhoulders. Such of the ſenators, principal elders, divines, regular phyſicians, and graduates in law, as aſſiſt at funerals, have a fee. The hangman's houſe is the common priſon for all malefactors; on whom ſentence is always paſſed on Friday, and on Monday they are executed. As, by their laws, no criminal is puniſhable unleſs he plead guilty, they have five different kinds of torture to extort ſuch confeſſion. The government of this city is lodged in the ſenate and three colleges of burghers. The former is veſted with almoſt every act of ſovereignty, except that of laying taxes and managing the finances, which are the prerogatives of the latter. The magiſtracy is compoſed of four burgo-maſters, four ſyndics, and 24 aldermen, of whom ſome are lawyers and ſome merchants. Any perſon elected into the magiſtracy, and declining the office, muſt depart the place. No burgher is admitted into any of the colleges, unleſs he dwells in a houſe of his own within the city, and is poſſeſſed of 1000 rix-dollars in ſpecie, over and above the ſum for which the houſe may be mortgaged; or 2000 in moveable goods, within the juriſdiction of the ſame. For the adminiſtration of juſtice, here are ſeveral inferior courts, from Hamburg. which an appeal lies to the Obergericht, or high court, and from that to the aulic council and other imperial colleges. For naval cauſes here is a court of admiralty, which, jointly with the city-treaſury, is alſo charged with the care of the navigation of the Elbe, from the city to the river's mouth. In conſequence of this, 100 large buoys, ſome white, others black, are kept conſtantly floating in the river in ſummer; but in winter, inſtead of ſome of them, there are machines, like thoſe called *ice-beacons*, to point out the ſhoals and flats. Subordinate to the admiralty is a company of pilots; and at the mouth of the Elbe is, or at leaſt ought to be, a veſſel always riding, with pilots ready to put on board the ſhips. At the mouth of the river alſo is a good harbour, called *Cuxhaven*, belonging to Hamburgh; a light-houſe; and ſeveral beacons, ſome of them very large. For defraying the expence of theſe, certain tolls and duties were formerly granted by the emperors to the city. Beſides the Elbe, there is a canal by which a communication is opened with the Trave, and thereby with Lubeck and the Baltic, without the hazard, trouble, and expence of going about by the Sound. The trade of Hamburgh is exceeding great, in exporting all the commodities and manufactures of the ſeveral cities and ſtates of Germany, and ſupplying them with whatever they want from abroad. Its exports conſiſt of linens of ſeveral ſorts and countries; as lawns, diapers, Oſnaburgs, dowlas, &c. linen-yarn, tin-plates, iron, braſs and ſteel wire, clap-board, pipe-ſtaves, wainſcot-boards, oak-plank and timber, kid-ſkins, corn, beer in great quantities, with flax, honey, wax, aniſeed, linſeed, drugs, wine, tobacco, and metals. Its principal imports are the woollen manufactures and other goods of Great Britain, to the amount of ſeveral hundred thouſand pounds a-year: they have alſo a great trade with Spain, Portugal, and Italy, which is carried on moſtly in Engliſh bottoms, on account of their Mediterranean paſſes. Their whale-fiſhery is alſo very conſiderable, 50 or 60 ſhips being generally ſent out every year in this trade. Add to theſe a variety of manufactures, which are performed here with great ſucceſs; the chief of which are, ſugar-baking, calico-printing, the weaving of damaſks, brocades, velvets, and other rich ſilks. The inland trade of Hamburgh is ſuperior to that of any in Europe, unleſs perhaps we ſhould except that of Amſterdam and London. There is a paper publiſhed here at ſtated times, called the *Preiſcourant*, ſpecifying the courſe of exchange, with the price which every commodity and merchandiſe bore laſt upon the exchange. There is alſo a board of trade, erected on purpoſe for the advancing every project for the improvement of commerce. Another great advantage to the merchants is, the bank eſtabliſhed in 1619, which has a flouriſhing credit. To ſupply the poor with corn at a low price, here are public granaries, in which great quantities of grain are laid up. By charters from ſeveral emperors, the Hamburghers have a right of coinage, which they actually exerciſe. The Engliſh merchants, or *Hamburgh company*, as it is called, enjoy great privileges; for they hold a court with particular powers, and a juriſdiction among themſelves, and have a church and miniſter of their own.—This city has a diſtrict belonging to it of conſiderable extent, which abounds with excellent pa-

Hamburg
Hamilton.

ſtures, intermixed with ſeveral large villages and noblemens ſeats. A ſmall bailiwic, called *Bergedorf*, belongs to this city and Lubeck.—Though Hamburgh has an undoubted right to a ſeat in the diet of the empire, yet as ſhe pays no contributions to the military cheſt in time of war, and is alſo unwilling to draw upon herſelf the reſentment of Denmark, ſhe makes no uſe of that privilege. There is a *ſchola illuſtris* or gymnaſium here, well endowed, with ſix able profeſſors, who read lectures in it as at the univerſities. There are alſo ſeveral free ſchools, and a great number of libraries, public and private. The public cellar of this town has always a prodigious ſtock and vent of old hock, which brings in a conſiderable revenue to the ſtate. Beſides the militia, or trained bands, there is an eſtabliſhment of regular forces, conſiſting of 12 companies of infantry, and one troop of dragoons, under the commandant, who is uſually a foreigner, and one who has diſtinguiſhed himſelf in the ſervice. There is alſo an artillery company, and a night-guard; the laſt of which is poſted at night all over the city, and calls the hours.

HAMEL (John Baptiſte du), a very learned French philoſopher and writer in the 17th ceutury. At 18 he wrote a treatiſe, in which he explained in a very ſimple manner, Theodoſius's three books of Spherics; to which he added a tract upon trigonometry, extremely perſpicuous, and deſigned as an introduction to aſtronomy. Natural philoſophy, as it was then taught, was only a collection of vague, knotty, and barren queſtions; when our author undertook to eſtabliſh it upon right principles, and publiſhed his *Aſtronomia Phyſica*. In 1666 Mr Colbert propoſed to Lewis XIV. a ſcheme, which was approved of by his majeſty, for eſtabliſhing a royal academy of ſciences; and appointed our author ſecretary of it. He publiſhed a great many books; and died at Paris in 1706, of mere old age, being almoſt 83. He was regius profeſſor of philoſophy, in which poſt he was ſucceeded by M. Varignon. He wrote Latin with purity and elegance.

HAMELIN, a ſtrong town of Germany, in the duchy of Calemberg in Lower Saxony. It is ſituated at the extremity of the duchy of Brunſwick, to which it is the key, near the confluence of the rivers Hamel and Weſer, in E. Long. 9. 55. N. Lat. 52. 13.

HAMESECKEN. Burglary, or *Nocturnal Houſe-breaking*, was by the ancient Engliſh law called *Hamefecken*, as it is in Scotland to this day.—Violating the privilege of a man's houſe in Scotland is as ſeverely puniſhed as raviſhing a woman.

HAMILTON, a town of Scotland, in Clydeſdale, ſeated on the river Clyde, eleven miles ſouth-eaſt of Glaſgow; from whence the noble family of Hamilton take their name, and title of duke. The town is ſeated in the middle of a very agreeable plain; and on the weſt of the town this family has a large park, which is near ſeven miles in circumference, incloſed with a high wall, full of deer and other game. The rivulet called *Avon* runs through the park, and falls into the river Clyde, over which laſt there is a bridge of free-ſtone. W Lon. 3. 50. N. Lat. 55. 40. The original name of this place, or the lands about it, was *Cadzow* or *Cadyow*, a barony granted to an anceſtor of the noble owner, on the following occaſion. In the time of Edward II. lived *Sir Gilbert de Hamilton*, or *Hampton*, an Engliſhman of rank; who happening at court to ſpeak in praiſe of Robert Bruce, received on the occaſion an inſult from John de Spenſer, chamberlain to the king; whom he fought and ſlew. Dreading the reſentment of that potent family, he fled to the Scottiſh monarch; who received him with open arms, and eſtabliſhed him at the place poſſeſſed by the duke of Hamilton. In after-times the name was changed from *Cadzow* to *Hamilton*; and in 1445 the lands were erected into a lordſhip, and the then owner Sir James ſat in parliament as lord Hamilton. The ſame nobleman founded the collegiate church at Hamilton in 1451, for a provoſt and ſeveral prebendaries. The endowment was ratified at Rome by the pope's bull, which he went in perſon to procure.—Hamilton-houſe, or palace, is at the end of the town; a large diſagreeable pile, with two deep wings at right angles with the centre: the gallery is of great extent; and furniſhed, as well as ſome other rooms, with moſt excellent paintings. Hamilton

HAMILTON (Anthony, count), deſcended from a noble family in Scotland, was born in Ireland, and ſettled in France. He wrote ſeveral poetical pieces; and was the firſt who compoſed romances in an agreeable taſte, without imitating the burleſque of Scarron. He is alſo ſaid to be the author of the *Memoirs of the count de Grammont*, one of the beſt written pieces in the French language. His works were printed in 6 vols 12mo. He died at St Germain-en-Laye, in 1720.

HAMILTON (George), earl of Orkney, and a brave warrior, was the fifth ſon of William earl of Selkirk, and early betook himſelf to the profeſſion of arms. Being made colonel in 1689-90, he diſtinguiſhed himſelf by his bravery at the battle of the Boyne; and ſoon after, at thoſe of Aghrim, Steinkirk, and Landen, and at the ſieges of Athlone, Limerick, and Namur. His eminent ſervices in Ireland and Flanders, through the whole courſe of that war, recommended him ſo highly to king William III. that, in 1696, he advanced him to the dignity of a peer of Scotland, by the title of *earl of Orkney*; and his lady, the ſiſter of Edward viſcount Villiers, afterwards earl of Jerſey, had a grant made to her, under the great ſeal of Ireland, of almoſt all the private eſtates of the late king James, of very conſiderable value.

Upon the acceſſion of queen Anne to the throne, he was promoted to the rank of major-general in 1702, and the next year to that of lieutenant-general, and was likewiſe made knight of the thiſtle. His lordſhip afterwards ſerved under the great duke of Marlborough; and contributed by his bravery and conduct to the glorious victories of Blenheim and Malplaquet, and to the taking ſeveral of the towns in Flanders.

In the beginning of 1710, his lordſhip, as one of the 16 peers of Scotland, voted for the impeachment of Dr Sacheverel; and the ſame year was ſworn of the privy-council, and made general of the foot in Flanders. In 1712, he was made colonel of the royal regiment of fuzileers, and ſerved in Flanders under the duke of Ormond. In 1714, he was appointed gentleman-extraordinary of the bed chamber to king George I. and afterwards governor of Virginia. At length

Hamlet || Hammond.

length he was appointed conſtable, governor, and captain of Edinburgh caſtle, lord lieutenant of the county of Clydeſdale, and field-marſhal. He died at his houſe in Albemarle-ſtreet, in 1737.

HAMLET, Hamel, or *Hampſel*, (from the Saxon *Ham*, i. e. *Domus*, and the German *Let*, i. e. *Membrum*), ſignifies a little village, or part of a village or pariſh; of which three words the firſt is now only uſed, tho' Kitchen mentions the two laſt. By Spelman there is a difference between *villam integram*, *villam dimidiam*, and *hamletam*; and Stowe expounds it to be the ſeat of a freeholder. Several county-towns have hamlets, as there may be ſeveral hamlets in a pariſh; and ſome particular places may be out of a town or hamlet, though not out of the county.

HAMMOCK, on ſhipboard, a piece of canvas ſix feet long and three feet wide, gathered together at the two ends, and hung horizontally under the deck lengthwiſe, for the ſailors to ſleep therein. There are uſually from 14 to 20 inches in breadth allowed between-decks for every hammock in a ſhip of war: this ſpace, however, muſt in ſome meaſure depend on the number of the crew, &c. in proportion to the room of the veſſel. In the time of battle the hammocks, together with their bedding, are all firmly corded, and fixed in the nettings on the quarter-deck, or where-ever the men are too much expoſed to the view or fire of the enemy.

HAMMER, a well-known tool uſed by mechanics, conſiſting of an iron-head, fixed croſſwiſe upon a handle of wood. There are ſeveral ſorts of hammers uſed by blackſmiths; as, 1. The hand-hammer, which is of ſuch weight that it may be wielded or governed with one hand at the anvil. 2. The up-hand ſledge, uſed with both hands, and ſeldom lifted above the head. 3. The about-ſledge, which is the biggeſt hammer of all, and held by both hands at the fartheſt end of the handle; and being ſwung at arms-length over the head, is made to fall upon the work with as heavy a blow as poſſible. There is alſo another hammer uſed by ſmiths, called a *rivetting-hammer*; which is the ſmalleſt of all, and is ſeldom uſed at the forge, unleſs upon ſmall work.—Carpenters and joiners have likewiſe hammers accommodated to their ſeveral purpoſes.

HAMMOND (Henry), D. D. one of the moſt learned Engliſh divines in the 17th century, was born in 1605. He ſtudied at Oxford, and in 1629 entered into holy orders. In 1633 he was inducted into the rectory of Penſhurſt in Kent. In 1643 he was made archdeacon of Chicheſter. In the beginning of 1645 he was made one of the canons of Chriſt-church, Oxford, and chaplain in ordinary to king Charles I. who was then in that city; and he was alſo choſen public orator of the univerſity. In 1647, he attended the king in his confinement at Wooburn, Caveſham, Hampton-Court, and the iſle of Wight, where he continued till his majeſty's attendants were again put from him. He then returned to Oxford, where he was choſen ſub-dean; and continued there till the parliament viſitors firſt ejected him, and then impriſoned him for ſeveral weeks in a private houſe in Oxford. During this confinement he began his Annotations on the New Teſtament. At the opening of the year 1660, when every thing viſibly tended to the reſtoration of the royal family, the doctor was deſired by the biſhops to repair to London, to aſſiſt there in the compoſure of the breaches of the church, his ſtation in which was deſigned to be the biſhopric of Worceſter; but on the 4th of April he was ſeized by a fit of the ſtone, of which he died on the 25th of that month, aged 55. Beſides the above work, he wrote many others; all of which have been publiſhed together in four volumes folio. Hammonds Hampſhire.

HAMMOND (Anthony, eſq;) an ingenious Engliſh poet, deſcended from a good family of Somerſham Place in Huntingdonſhire, was born in 1608. After a liberal education at St John's college, Cambridge, he was choſen member of parliament, and ſoon diſtinguiſhed himſelf as a fine ſpeaker. He became a commiſſioner of the royal navy, which place he quitted in 1712. He publiſhed "A miſcellany of original poems by the moſt eminent hands;" in which himſelf, as appears by the poems marked with his own name, had no inconſiderable ſhare. He wrote the life of Walter Moyle, eſq; prefixed to his works. He was the intimate friend of that gentleman, and died about the year 1726.

Hammond (Mr.), known to the world by the Love-Elegies, which, ſome years after his death, were publiſhed by the earl of Cheſterfield, was the ſon of a merchant in London, and preferred to a place about the perſon of the late prince of Wales, which he held till an unfortunate accident deprived him of his ſenſes. The cauſe of this calamity was a paſſion he entertained for a lady, who would not return it: upon which he wrote thoſe love-elegies which have been ſo much celebrated for their tenderneſs. The editor obſerves, that he compoſed them before he was 21 years of age: a period, ſays he, when fancy and imagination commonly riot at the expence of judgment and correctneſs. He was ſincere in his love as in his friendſhip; and wrote to his miſtreſs as he ſpoke to his friends, nothing but the genuine ſentiments of his heart. Tibullus ſeems to have been the model our author judiciouſly preferred to Ovid; the former writing directly from the heart to the heart, the latter too often yielding and addreſſing himſelf to the imagination. Mr Hammond died in the year 1743, at Stow, the ſeat of lord Cobham, who honoured him with a particular intimacy.

HAMPSHIRE, a county of England, bounded on the weſt by Dorſetſhire and Wiltſhire, on the north by Berkſhire, on the eaſt by Surry and Suſſex, and on the ſouth by the Engliſh channel. It extends 64 miles in length from north to ſouth, and 36 in breadth from eaſt to weſt. It is divided into 39 hundreds, and 253 pariſhes; in which are one city, 18 market-towns, and about 180,000 inhabitants. It ſends 26 members to parliament; viz. two for the county, two for the city of Winchеſter the capital, and two for each of the following boroughs, Southampton, Portſmouth, Yarmouth, Petersfield, Newport, Stockbridge, Newton, Chriſtchurch, Lymington, Whitchurch, and Andover.—The air is very pure and pleaſant, eſpecially upon the downs, on which vaſt flocks of ſheep are kept and bred. In the champaign part of the county, where it is free of wood, the ſoil is very fertile, producing all kinds of grain. The county is extremely well wooded and watered; for beſides many woods on private eſtates,

Hampshire Hampton.

ſtates, in which there are vaſt quantities of well-grown timber, there is the new foreſt of great extent, belonging to the crown, well ſtored with venerable oaks. In theſe woods and foreſts, great numbers of hogs run at large, and feed on the acorns; and hence it is that the Hampſhire bacon ſo far excells that of moſt other countries. The rivers are the Avon, Anton, Arle, Teſt, Stowre, and Itchin; beſides ſeveral ſmaller ſtreams, all abounding in fiſh, eſpecially trout. As its ſea-coaſt is of a conſiderable extent, it poſſeſſes many good ports and harbours, and is well ſupplied with ſalt-water fiſh. Much honey is produced in the county, and a great deal of mead and metheglin made. Here is alſo plenty of game, and on the downs is moſt delightful hunting. The manufacture of cloth and kerſies in this county, though not ſo extenſive as that of ſome others, is yet far from being inconſiderable, and employs great numbers of the poor, as well as contributes to the enriching of the manufacturers by what is ſent abroad.

New HAMPSHIRE, a province of North America, in New England. It is bounded on the north by Nova Scotia, on the eaſt by the Ocean, on the ſouth by Maſſachuſet's bay, and on the weſt by New-York. Before the commencement of the American war, it was ruled by a governor and council appointed by the king, and a houſe of repreſentives. As it is a very proper country for furniſhing naval ſtores, great part of its timber was appointed for maſts and yards to the royal navy.

HAMPSTEAD, a pleaſant village of Middleſex, five miles north of London. As the air is exceeding good, the place is well furniſhed with fine ſeats built in an elegant manner, and much reſorted to in the ſummer-time by all ſorts of people. As for the medicinal waters formerly in requeſt, they are now much neglected. In Henry VIII's time it was chiefly inhabited by laundreſſes, who waſhed for the Londoners.

HAMPTON, a town of Glocesterſhire in England, ſeated on the Cotſwold hills, and had formerly a nunnery. W. Long. 2. 15. N. Lat. 51. 38.

HAMPTON-*Court*, a town of Middleſex in England, ſeated on the river Thames, 12 miles weſt of London, and two from Kingſtown. It is chiefly famous for the royal palace there, which is the fineſt in Britain. It was built by cardinal Wolſey, who had 280 ſilk beds for ſtrangers only, and furniſhed it richly with gold and ſilver plate. The buildings, gardens, and the two parks, to which William III. made conſiderable additions, are about four miles in circumference, and are watered on three ſides by the Thames. The inward court, built by king William, forms a piazza, the pillars of which are ſo low, that it looks more like a cloyſter than a palace; however, the apartments make ample amends, being extremely magnificent, and more exactly diſpoſed than in any other palace in the world, and adorned with moſt elegant furniture. Since the acceſſion of his preſent majeſty, however, this palace hath been much neglected, as the king has generally made choice of Richmond for his ſummer retreat. Thoſe inimitable paintings by Raphael Urbin called the *cartoons*, which were placed there by king William, have been removed to the queen's palace at Weſtminſter. For theſe pieces Lewis XV. is ſaid to have offered 100,000l.

Hanau Handel.

HANAU, a town of Germany, and capital of a county of the ſame name, is pleaſantly ſituated on the river Kenzig near its confluence with the Mayne. The river divides it into the old and new towns, both of which are fortified. The new town, which was built at firſt by French and Flemiſh refugees, who had great privileges granted them, is regular and handſome. The caſtle in which the counts uſed to reſide, and which ſtands in the old town, is fortified, and has a fine flower-garden with commodious apartments, but makes no great appearance. The Jews are tolerated here, and dwell in a particular quarter. The magiſtracy of the new town, and the diſpoſal of all offices in it, belong to the French and Dutch congregations. Here is an univerſity, with ſeveral manufactures, particularly of that of roll tobacco, and a very conſiderable traffic. E. Long. 9. 0. N. Lat. 49. 58.

HANAU-*Munzenberg*, a county of Germany. The greateſt part of it is ſurrounded by the electorate of Mentz, the biſhopric of Fulda, the lordſhips of Reineck, Iſenburg, and Solms; as alſo by the territories of Heſſe-Homburg, Burg-Friedburg, and Frankfort. Its length is near 40 miles, but its greateſt breadth not above 12. It is exceeding fertile in corn, wine, and fruits; yielding alſo ſalt ſprings, with ſome copper, ſilver, and cobalt. The chief rivers are, the Mayne, the Kinzeg, and the Nidda. The prevailing religion is Calviniſm, but Lutherans and Catholics are tolerated. The country is populous, and trade and manufactures flouriſh in it. In 1736, the whole male line of the counts of Hanau failing in John Reinard, William VIII. landgrave of Heſſe Caſſel, by virtue of a treaty of mutual ſucceſſion between the families of Hanau and Heſſe Caſſel, took poſſeſſion of the county, ſatisfaction having been firſt made to the houſe of Saxony for their claims; and in the year 1754 transferred it to prince William, eldeſt ſon to the then hereditary prince Frederic, afterwards landgrave. The revenues of the laſt count, ariſing from this and other territories, are ſaid to have amounted to 500,000 florins. The principal places are Hanau, Bergen, Steinau, and Glenhauſen.

HAND, in anatomy, the extreme part of the arm. Anaxagoras is repreſented by ancient authors, as maintaining, that man owes all his wiſdom, knowledge, and ſuperiority over other animals, to the uſe of his hands. —Galen puts the thing another way: man, according to him, is not the wiſeſt creature becauſe he has hands; but he had hands given him becauſe he was the wiſeſt creature.

HAND, in the manege, a meaſure of four inches, or of a clenched fiſt, by which the height of a horſe is computed.

HAND-*Breadth*, a meaſure of three inches.

HANDEL (George Frederic), a moſt eminent maſter and compoſer of muſic, was born at Hall, a city of Upper Saxony in Germany. His father was a phyſician and ſurgeon of that place, and was upwards of 60 years of age when Handel was born. During his infancy young Handel is ſaid to have amuſed himſelf with muſical inſtruments, and to have made conſiderable progreſs before he was ſeven years of age, without any inſtructions. His propenſity for muſic at laſt became ſo ſtrong, that his father, who deſigned him for the ſtudy of the civil law, thought proper to forbid him,

Handel. him, even at this early period of life, to touch a muſical inſtrument, and would ſuffer none to remain in his houſe. Notwithſtanding this prohibition, however, Handel found means to get a little clavichord privately conveyed to a room in the uppermoſt ſtory of the houſe, to which room he conſtantly ſtole when the family were aſleep; and thus made ſuch advances in his art, as enabled him to play on the harpſichord. He was firſt taken notice of by the duke of Saxe Weiſenfels on the following occaſion. His father went to pay a viſit to another ſon by a former wife, who was valet de chambre to the duke, and reſided at his court. Young Handel, being then in his ſeventh year, earneſtly deſired permiſſion to go along with him; but being refuſed, he followed the chaiſe on foot, and overtook it, the carriage being probably retarded by the roughneſs of the way. His father at firſt chid him for his diſobedience, but at laſt took him into the chaiſe along with him. While he was in the duke's court, he ſtill continued to ſhew the ſame inclination for muſic: it was impoſſible to keep him from harpſichords; and he uſed ſometimes to get into the organloft at church, and play after ſervice was over. On one of theſe occaſions, the duke happening to go out later than uſual, found ſomething ſo uncommon in Handel's manner of playing, that he inquired of his valet who it was; and receiving for anſwer that it was his brother, he deſired to ſee him. This nobleman was ſo much taken with the muſical genius ſhewn by young Handel, that he perſuaded his father to let him follow the bent of his inclination. He made the boy a preſent; and told him, that if he minded his ſtudies, no encouragement ſhould be wanting.

On his return to Hall, Handel was placed under one Zackaw, the organiſt of the cathedral church; and our young muſician was even then able to ſupply his maſter's place in his abſence. At nine years of age he began to compoſe church-ſervices for voices and inſtruments, and continued to compoſe one ſuch ſervice every week for three years ſucceſſively. At the age of 14, he far excelled his maſter, as he himſelf owned; and he was ſent to Berlin, where he had a relation in ſome place about the court, on whoſe care and fidelity his parents could rely. The opera was then in a flouriſhing condition, being encouraged by the grandfather of the preſent king of Pruſſia, and under the direction of many eminent perſons from Italy, among whom were Buononcini and Attilio. Buononcini, being of a haughty diſpoſition, treated Handel with contempt; but Attilio behaved to him with great kindneſs, and he profited much by his inſtructions. His abilities ſoon recommended him to the king, who frequently made him preſents, and at laſt propoſed to ſend him into Italy under his own patronage, and to take him under his immediate protection as ſoon as his ſtudies ſhould be compleated. But Handel's parents not thinking proper to ſubmit their child to the caprice of the king, declined the offer; upon which it became neceſſary for him to return to Hall.

Handel having now obtained ideas in muſic far excelling every thing that could be found in Hall, continued there very unwillingly, and it was reſolved to ſend him into Italy: but as the expence of this journey could not then be ſpared, he went to Hamburg, where the opera was little inferior to that of Berlin. Soon after his arrival in this city, his father died; and his mother being left in narrow circumſtances, her ſon thought it neceſſary to procure ſome ſcholars, and to accept a place in the orcheſtra, by which means, inſtead of being a burden, he became a great relief to her. Handel.

At this time, the firſt harpſichord in Hamburg was played by one Keſer, a man who alſo excelled in compoſition; but he, having involved himſelf in ſome debts, was obliged to abſcond. Upon this vacancy, the perſon who had been uſed to play the ſecond harpſichord claimed the firſt by right of ſucceſſion: but he was oppoſed by Handel, who founded a claim to the firſt harpſichord upon his ſuperior abilities. After much diſpute, in which all who ſupported or directed the opera engaged with much vehemence, it was decided in favour of Handel; but this good ſucceſs had almoſt coſt him his life. His antagoniſt reſented the ſuppoſed affront ſo much, that, as they were coming out of the orcheſtra together, he made a puſh at Handel's breaſt with a ſword; which muſt undoubtedly have killed him, had there not fortunately been a muſic-book in the boſom of his coat.

Handel, though yet but in his 15th year, became compoſer to the houſe; and the ſucceſs of *Almeria*, his firſt opera, was ſo great, that it ran 30 nights without interruption. Within leſs than a twelvemonth after this, he ſet two others, called *Florinda* and *Norene*, which were received with the ſame applauſe. During his ſtay here, which was about four or five years, he alſo compoſed a conſiderable number of ſonatas, which are now loſt. Here his abilities procured him the acquaintance of many perſons of note, particularly the prince of Tuſcany, brother to John Gaſton de Medicis the grand duke. This prince preſſed him to go with him to Italy, where he aſſured him that no convenience ſhould be wanting; but this offer Handel thought proper to decline, being reſolved not to give up his independency for any advantage that could be offered him.

In the 19th year of his age, Handel took a journey to Italy on his own bottom; where he was received with the greateſt kindneſs by the prince of Tuſcany, and had at all times acceſs to the palace of the grand duke. His Serene Highneſs was impatient to have ſomething compoſed by ſo great a maſter; and notwithſtanding the difference between the ſtyle of the Italian muſic and the German, to which Handel had hitherto been accuſtomed, he ſet an opera called *Roderigo*, which pleaſed ſo well, that he was rewarded with 100 ſequins, and a ſervice of plate. After ſtaying about a year in Florence, he went to Venice, where he is ſaid to have been firſt diſcovered at a maſquerade. He was playing on a harpſichord in his viſor, when Scarlatti, a famous performer, cried out, that the perſon who played could be none but the famous Saxon or the devil. But a ſtory ſimilar to this is reported of many eminent perſons whoſe abilities have been diſcovered in diſguiſe. Here he compoſed his opera called *Agrippina*, which was performed 27 nights ſucceſſively, with the moſt extravagant applauſe.

From Venice, our muſician proceeded to Rome, where he became acquainted with cardinal Ottoboni and many other dignitaries of the church, by which means he was frequently attacked on account of his religion; but Handel declared he would live and die in the

Handel. the religion in which he had been educated, whether it was true or falſe. Here he compoſed an oratorio called *Reſurrectione*, and 150 cantatas, beſides ſome ſonatas, and other muſic. Ottoboni alſo contrived to have a trial of ſkill between him and Dominici Scarlatti, who was conſidered as the greateſt maſter on that inſtrument in Italy. The event is differently reported. Some ſay that Scarlatti was victorious, and others give the victory to Handel; but when they came to the organ, Scarlatti himſelf aſcribed the ſuperiority to Handel.

From Rome, Handel went to Naples; after which, he paid a ſecond viſit to Florence; and at laſt, having ſpent ſix years in Italy, ſet out for his native country. In his way thither, he was introduced at the court of Hanover with ſo much advantage by the baron Kilmanſeck, that his Electoral Highneſs offered him a penſion of 1500 crowns a-year as an inducement for him to continue there. This generous offer he declined on account of his having promiſed to viſit the court of the Elector Palatine, and likewiſe to come over to England in compliance with the repeated invitations of the duke of Manchester. The elector, however, being made acquainted with this objection, generouſly ordered him to be told, that his acceptance of the penſion ſhould neither reſtrain him from his promiſe nor reſolution; but that he ſhould be at full liberty to be abſent a year or more if he choſe it, and to go wherever he thought fit. Soon after, the place of maſter of the chapel was beſtowed upon Handel; and our muſician having viſited his mother, who was now extremely old and blind, his old maſter Zackaw, and ſtaid ſome time at the court of the Elector Palatine, ſet out for England, where he arrived in 1710.

At that time operas were a new entertainment in England, and were conducted in a very abſurd manner: but Handel ſoon put them on a better footing; and ſet a drama called *Rinaldo*, which was performed with uncommon ſucceſs. Having ſtaid a year in England, he returned to Hanover; but in 1712 he again came over to England; and the peace of Utrecht being concluded a few months afterwards, he compoſed a grand *Te Deum* and *Jubilate* on the occaſion. He now found the nobility very deſirous that he ſhould reſume the direction of the opera houſe in the Hay-market; and the queen having added her authority to their ſolicitations, and conferred on him a penſion of L. 200 a-year, he forgot his engagements to the elector of Hanover, and remained in Britain till the death of the queen in 1714. On the arrival of king Geo. I. Handel, conſcious of his ill behaviour, durſt not appear at court; but he was extricated from his dilemma by the baron Kilmanſeck. Having engaged ſeveral of the Engliſh nobility in his behalf, the baron perſuaded the king to a party of pleaſure on the water. Handel was appriſed of the deſign, and ordered to prepare ſome muſic for the occaſion. This he executed with the utmoſt attention, and on the day appointed it was performed and conducted by himſelf. The king with pleaſure and ſurpriſe inquired whoſe it was, and how the entertainment came to be provided without his knowledge. The baron then produced the delinquent; and aſked leave to preſent him to his Majeſty as one too ſenſible of his fault to attempt an excuſe, but ſincerely deſirous to atone for it. This interceſſion was accepted, Handel was reſtored to favour, his water-muſic was honoured with the higheſt approbation, and the king added a penſion of L. 200 a-year to that formerly beſtowed on him by queen Anne; which he ſoon after increaſed to L. 400, on his being appointed to teach the young princeſſes muſic. Handel.

In the year 1715, Handel compoſed his opera of *Amadige;* but from that time to the year 1720 he compoſed only *Teſeo* and *Paſtor Fido*, Buononcini and Attilio being then compoſers for the operas. About this time a project was formed by the nobility for erecting a kind of academy at the Hay-market, with a view of ſecuring to themſelves a conſtant ſupply of operas to be compoſed by Handel, and performed under his direction. No leſs than L. 50,000 was ſubſcribed for this ſcheme, of which the king himſelf ſubſcribed L. 1000, and it was propoſed to continue the undertaking for 14 years. Handel went over to Dreſden in order to engage ſingers, and returned with Senefino and Duriſtanti. Buononcini and Attilio had ſtill a ſtrong party in their favour, but not equal to that of Handel; and therefore in 1720 he obtained leave to perform his opera of *Radamiſto*. The houſe was ſo crowded, that many fainted through exceſſive heat; and forty ſhillings were offered by ſome for a ſeat in the gallery, after having in vain attempted to get one elſewhere. The contention, however, ſtill ran very high between Handel's party and that of the two Italian maſters; and at laſt it was determined that the rivals ſhould be jointly employed in making an opera, in which each ſhould take a diſtinct act, and he who by the general ſuffrage was allowed to have given the beſt proof of his abilities ſhould be put in poſſeſſion of the houſe. This opera was called *Muzio Scævola*, and Handel ſet the laſt act. It is ſaid that Handel's ſuperiority was owned even in the overture before it; but when the act came to be performed, there remained no pretence of doubt or diſpute. The academy was now therefore firmly eſtabliſhed, and Handel conducted it for nine years with great ſucceſs; but about that time an irreconcileable emnity took place between Handel himſelf and Senefino. Senefino accuſed Handel of tyranny, and Handel accuſed Senefino of rebellion. The merits of the quarrel are not known: the nobility, however, became mediators for ſome time, and having failed in that good deſign, they became parties in the quarrel. Handel was reſolved to diſmiſs Senefino, and the nobility ſeemed alſo reſolved not to permit him to do ſo. The haughtineſs of Handel's temper would not allow him to yield, and the affair ended in the total diſſolution of the academy.

Handel now found that his abilities, great as they were, could not ſupport him againſt the powerful oppoſition he met with. After the diſmiſſion of Senefino, his audience inſenſibly dwindled away, and Handel entered into an agreement with Mr Keidegger to carry on operas in conjunction with him. New ſingers were engaged from Italy; but the offended nobility raiſed a ſubſcription againſt him, to carry on operas in the play-houſe in Lincoln's-Inn fields. Handel bore up four years againſt this oppoſition; three in partnerſhip with Keidegger, and one by himſelf: but though his muſical abilities were ſuperior to thoſe of his antagoniſts, the aſtoniſhing powers of the voice of Farinelli, whom the oppoſite party had engaged, determined the victory

Handel. tory againſt him. At laſt Handel, having ſpent all he was worth in a fruitleſs oppoſition, thought proper to deſiſt. His diſappointment had ſuch an effect upon him, that for ſome time he was diſordered in his underſtanding, and at the ſame time his right arm was rendered uſeleſs by a ſtroke of the palſy. In this deplorable ſituation, it was thought neceſſary that he ſhould go to the baths of Aix-la-Chapelle; and from them he received ſuch extraordinary and ſudden relief, that his cure was looked upon by the nuns as miraculous.

In 1736, Handel again returned to England; and ſoon after his return his Alexander's feaſt was performed with applauſe at Covent-Garden. The ſucceſs and ſplendor of the Hay-market was by this time ſo much reduced by repeated miſmanagements, that lord Middleſex undertook the direction of it himſelf, and once more applied to Handel for compoſition. He accordingly compoſed two operas called *Faramondo*, and *Aleſſandro Severo*, for which in 1737 he received L. 1000. In 1738 he received L. 1500 from a ſingle benefit, and nothing ſeemed wanting to retrieve his affairs, excepting ſuch conceſſions on his part as his opponents had a right to expect. Theſe conceſſions, however, he could not be prevailed upon to make; and that he might no longer be under obligations to act as he was directed by others, he refuſed to enter into any engagements upon ſubſcription. After having tried a few more operas at Covent-Garden without ſucceſs, he introduced another ſpecies of muſic called *oratorios*, which he thought better ſuited to the native gravity of an Engliſh audience. But as the ſubjects of theſe pieces were always taken from ſacred hiſtory, it was by ſome thought to be a profanation to ſet them to muſic and perform them at a playhouſe. In conſequence of this prejudice, the oratorios met with very indifferent ſucceſs; and in 1741 Mr Handel found his affairs in ſuch a bad ſituation, that he was obliged to quit England, and go to Dublin.

He was received in Ireland in a manner ſuitable to his great merit; and his performing his oratorio called the *Meſſiah*, for the benefit of the city-priſon, brought him into univerſal favour. In nine months time he had brought his affairs into a better ſituation; and on his return to England in 1742, he found the public much more favourably diſpoſed. His oratorios were now performed with great applauſe: his Meſſiah, which before had been but coldly received, became a favourite performance; and Handel, with a generous humanity, determined to perform it annually for the benefit of the ſoundling hoſpital, which at that time was only ſupported by private benefactions. In 1743, he had a return of his paralytic diſorder; and in 1751 became quite blind by a *gutta ſerena* in his eyes. This laſt misfortune for ſome time ſunk him into the deepeſt deſpondency; but at laſt he was obliged to acquieſce in his ſituation, after having without any relief undergone ſome very painful operations. Finding it now impoſſible to manage his oratorios alone, he was aſſiſted by Mr Smith, who at his requeſt frequently played for him, and conducted them in his ſtead; and with this aſſiſtance they were continued till within eight days of his death. During the latter part of his life, his mind was often diſordered; yet at times it appears to have reſumed its full vigour, and he compoſed ſeveral ſongs, choruſes, &c. which from their dates may be conſidered almoſt as the laſt ſounds of his dying voice. From about October 1758 his health declined very faſt; his appetite, which had been remarkably keen, and which he had gratified to a great degree, left him; and he became ſenſible of the approach of death. On the 6th of April 1759, his laſt oratorio was performed, at which he was preſent, and died on the 14th of the ſame month. On the 20th he was buried by the right reverend Dr Pearce, biſhop of Rocheſter, in Weſtminſter abbey; where, by his own order, and at his own expence, a monument was erected to his memory. Hands, Hanging.

With regard to the character of this moſt eminent muſician, he is univerſally allowed to have been a great epicure. In his temper he was very haughty, but was ſeldom or never guilty of mean actions. His pride was uniform; he was not by turns a tyrant and a ſlave. He appears to have had a moſt extravagant love for liberty and independence; inſomuch, that he would, for the ſake of liberty, do things otherwiſe the moſt prejudicial to his own intereſt. Nay, ſo far is he ſaid to have carried this principle, that, merely for the ſake of preſerving his independence, he often refuſed the higheſt favours from the ladies; though others aſcribe this to a very different cauſe. Certain it is, that he never ſhewed the leaſt attachment to the fair ſex. He was liberal even when poor, and remembered his former friends when he was rich. His muſical powers can perhaps be beſt expreſſed by Arbuthnot's reply to Pope, who ſeriouſly aſked his opinion of him as a muſician; "Conceive (ſaid he) the higheſt you can of his abilities, and they are much beyond any thing you can conceive."

HANDS, in heraldry, are borne in coat-armour dexter and ſiniſter; that is, right and left, expanded or open. Theſe are the moſt neceſſary parts of the human body, as they ſerve to expreſs all actions, and even our very thoughts and deſigns; thus, joining of hands is an univerſal token of friendſhip, and clapping of hands a general mark of applauſe.

HANGING, a common method of inflicting death on criminals, by ſuſpending them by the neck. Phyſicians are not agreed as to the manner in which death is brought on by hanging. De Haen hanged three dogs, whom he afterwards opened. In one, nothing remarkable appeared in the lungs. In another, from whom half an ounce of blood was taken from the jugular vein, the dura and pia mater were of the natural appearance; but the lungs were much inflamed. In the third, the meninges were ſound, and there was no effuſion of blood in the ventricles of the brain, but the left lobe of the lungs was turgid with blood. Wepfer, Littræus, Alberti, Bruhierius, and Boerhaave, affirm that hanged animals die apoplectic. Their arguments for this are chiefly drawn from the livid colour of the face; from the turgeſcency of the veſſels of the brain; the inflammation of the eyes; and from the ſparks of fire which thoſe who have ſurvived hanging allege they have ſeen before their eyes. On the contrary, Bonetus, Petit, Haller, and Lancifi, from obſerving that death is occaſioned by any ſmall body falling into the glottis, have aſcribed it to the ſtoppage of reſpiration. Others, deeming both theſe cauſes ill-founded, have aſcribed it to a luxation of the vertebræ of the neck.—De Haen adduces the authority of many eminent au-

Hangings || Hannibal.

thors to prove the poſſibility of recovering hanged perſons; and obſerves, in general, that with bleeding in the jugular vein, and anointing the neck with warm oil, the ſame remedies are to be employed in this caſe as for the recovery of drowned people. See DROWNING.

HANGINGS, denote any kind of drapery hung up againſt the walls or wainſcotting of a room.

Paper HANGINGS. See PAPER-*Hangings*.

Wove HANGINGS. See TAPESTRY.

HANGCLIFF, a remarkable point of land on the eaſt coaſt of the largeſt of the Shetland Iſlands. It is frequently the firſt land ſeen by ſhips in northern voyages. Captain Phipps determined its ſituation to be in W. Long. 0° 56′ 30″. N. Lat. 60° 9′.

HANNIBAL, a famous Carthaginian general, of whoſe exploits an account is given under the articles CARTHAGE and ROME. After having had the misfortune to loſe a ſea-fight with the Rhodians, through the cowardice of Apollonius one of the admirals of Antiochus the Great, he was forced to fly into Crete, to avoid falling into the hands of the Romans. On his arrival in this iſland, he took ſanctuary among the Gortynii; but as he had brought great treaſure along with him, and knew the avarice of the Cretans, he thought proper to ſecure his riches by the following ſtratagem. He filled ſeveral veſſels with melted lead, juſt covering them over with gold and ſilver. Theſe he depoſited in the temple of Diana, in the preſence of the Gortynii, with whom, he ſaid, he truſted all his treaſure: Juſtin tells us, that he left this with them as a ſecurity for his good behaviour, and lived for ſome time very quietly in theſe parts. He took care, however, to conceal his riches in hollow ſtatues of braſs; which, according to ſome, he always carried along with him; or, as others will have it, expoſed in a public place, as things of little value. At laſt he retired to the court of Pruſias king of Bithynia, where he found means to unite ſeveral of the neighbouring ſtates with that prince into a confederacy againſt Eumenes king of Pergamus, a profeſſed friend to the Romans; and during the enſuing war gave Eumenes ſeveral defeats, more through the force of his own genius, than the valour of his troops. The Romans having received intelligence of the important ſervices performed by Hannibal, immediately diſpatched T. Quintius Flaminius as an ambaſſador to Pruſias, in order to procure his deſtruction. At his firſt audience, he complained of the protection given to that famous general, repreſenting him "as the moſt inveterate and implacable enemy the Romans ever had; as one who had ruined both his own country and Antiochus, by drawing them into a deſtructive war with Rome."—Pruſias, in order to ingratiate himſelf with the Romans, immediately ſent a party of ſoldiers to ſurround Hannibal's houſe, that he might find it impoſſible to make his eſcape. The Carthaginian, having before diſcovered that no confidence was to be repoſed in Pruſias, had contrived ſeven ſecret paſſages from his houſe, in order to evade the machinations of his enemies, even if they ſhould carry their point at the Bithynian court. But guards being poſted at theſe, he could not fly, though, according to Livy, he attempted it. Perceiving, therefore, no poſſibility of eſcaping, he had recourſe to poiſon, which he had long reſerved for ſuch a melancholy occaſion. Then taking it in his hand, "Let us (ſaid he) deliver the Romans from the diſ- Hannibal.
"quietude with which they have long been tortured,
"ſince they have not patience to wait for an old man's
"death. Flaminius will not acquire any reputation
"or glory by a victory gained over a betrayed and
"defenceleſs perſon. This ſingle day will be a laſt-
"ing teſtimony of the degeneracy of the Romans.
"Their anceſtors gave Pyrrhus intelligence of a de-
"ſign to poiſon him, that he might guard againſt the
"impending danger, even when he was at the head
"of a powerful army in Italy; but they have deputed
"a perſon of conſular dignity to excite Pruſias im-
"piouſly to murder one who has taken refuge in his
"dominions, in violation of the laws of hoſpitality."
Then having denounced dreadful imprecations againſt Pruſias, he drunk the poiſon, and expired at the age of 70 years. Cornelius Nepos acquaints us, that he put an end to his life by a ſubtle poiſon which he carried about with him in a ring. Plutarch relates, that, according to ſome writers, he ordered a ſervant to ſtrangle him with a cloak wrapped about his neck; and others ſay, that, in imitation of Midas and Themiſtocles, he drank bull's blood.

With reſpect to the character of this general, it appears to have been in military affairs what Demoſthenes was in oratory, or Newton in mathematics; namely, abſolutely perfect, in which no human wiſdom could diſcover a fault, and to which no man could add a perfection. Rollin hath contraſted his character with that of Scipio Africanus. He enumerates the qualities which make a complete general; and having then given a ſummary of what hiſtorians have related concerning both commanders, is inclined to give the preference to Hannibal. "There are, however, (he ſays) two difficulties which hinder him from deciding; one drawn from the characters of the generals whom Hannibal vanquiſhed; the other from the errors he committed. May it not be ſaid, (continues our author,) that thoſe victories which made Hannibal ſo famous were as much owing to the imprudence and temerity of the Roman generals, as to his bravery and ſkill? When a Fabius and a Scipio were ſent againſt him, the firſt ſtopped his progreſs, the other conquered him."

Theſe reaſons have been anſwered by Mr Hooke, who hath taken ſome pains to vindicate Hannibal's character, by fully and fairly comparing it with that of Scipio Africanus, and other Roman commanders. "I do not ſee (ſays he) why theſe difficulties ſhould check our author's inclination to declare in favour of the Carthaginian. That Fabius was not beaten by Hannibal, we cannot much wonder, when we remember how ſteadily the old man kept to his reſolution never to fight with him. But from Fabius's taking this method to put a ſtop to the victories of the enemy, may we not conclude that he knew no other, and thought Hannibal an overmatch for him? And why does our author forget Publius Scipio (Africanus's father), a prudent and able general, whom Hannibal vanquiſhed at the Ticin? Livy relates ſome victories of Hannibal over the celebrated Marcellus; but neither Marcellus nor any other general ever vanquiſhed Hannibal before the battle of Zama, if we may believe Polybius, (lib. xv. c. 16.). Terentius Varro, indeed, is repreſented as a headſtrong raſh man; but the battle

Hannibal ‖ Hanover.

battle of Cannæ was not loſt by his imprudence. The order in which he drew up his army is no where condemned; and Chevalier Folard thinks it excellent. And as to the conduct of the battle, Æmilius Paulus, a renowned captain, and a diſciple of Fabius, had a greater ſhare in it than his colleague. The imprudence with which Varro is taxed, was his venturing, contrary to his colleague's advice, with above 90,000 men to encounter in a plain field, an enemy who had only 50,000, but was ſuperior in horſe. And does not the very advice of Æmilius, and the charge of temerity on Varro for not following it, imply a confeſſion of Hannibal's ſuperiority in military ſkill, over Æmilius as well as Varro? It ought likewiſe to be obſerved, that Hannibal's infantry had gained the victory over the Roman infantry, before this latter ſuffered any thing from the Carthaginian cavalry. It was otherwiſe when Scipio gained the victory at Zama. His infantry would probably have been vanquiſhed but for his cavalry. Hannibal, with only his third line of foot (his Italian army), maintained a long fight againſt Scipio's three lines of foot; and ſeems to have had the advantage over them, when Maſiniſſa and Lælius, with the horſe, came to their aſſiſtance. Polybius indeed ſays, that Hannibal's Italian forces were equal in number to all Scipio's infantry; but this is contradicted by Livy, and is not very probable. The authority of Polybius, who was an intimate friend of Scipio Æmilianus, is, I imagine, of little weight in matters where the glory of the Scipios is particularly concerned. His partiality and flattery to them are, in many inſtances, but too viſible."

Our author then proceeds to ſhew, that Hannibal was not guilty of any of the faults laid to his charge as a general; and having contraſted the moral characters of the two generals with each other, makes it evident, that as a man, as well as a general, Hannibal had greatly the advantage of his rival. See *Hooke's Roman hiſtory*, vol. iv. p. 151. *& ſeq.*

HANNO, general of the Carthaginians, was commanded to ſail round Africa. He entered the ocean through the Straits of Gibraltar, and diſcovered ſeveral countries. He would have continued his navigation, had it not been for want of proviſions. He wrote an account of his voyage, which was often quoted, but not much credited. Sigiſmund Gelenius publiſhed it in Greek at Baſil, by Frobenius, in 1533. He lived, according to Pliny, when the affairs of the Carthaginians were in the moſt flouriſhing condition; but this is a very indeterminate expreſſion.

HANOVER, a city of Germany, and capital of an electorate of the ſame name, of which the king of Great Britain is elector.—Though the houſe of Hanover is the laſt that hath been raiſed to the electoral dignity in the empire, it may vie with any in Germany for the antiquity and nobleneſs of its family. It is likewiſe very conſiderable for the extent of its territories, which at preſent are, The duchy of Calenberg, in which are the cities of Hanover, Calenberg, Hamelen, Neuſtadt, Gottingen, &c.; the duchy of Grubenhagen, the county of Diepholt, the county of Hoya, in the biſhopric of Hildeſheim; the bailiages of Coldingen, Luther, Badenburg, and Weſterſhoven, with the right of protection of the city of Hildeſheim; and the county of Danneberg, ceded by the dukes of Wolfenbuttle to the dukes of Lunenburg, as an equivalent for their pretenſions on the city of Brunſwic. The elector poſſeſſes likewiſe the county of Delmenhorſt, and the duchies of Bremen and Verden, ſold by the king of Denmark in 1715: the right of poſſeſſing alternatively the biſhopric of Oſnabruck belongs ſolely to the electoral branch; but if it ſhall happen to fail, the dukes of Wolfenbuttle are to enjoy the ſame right. Hanover, Hanſe.

In conſideration of the great ſervices performed by Erneſt Auguſtus, duke of Brunſwic-Hanover, in the wars which the emperor Leopold had with Louis XIV. that emperor conferred the dignity of an elector of the holy Roman empire upon him and his heirs male, of which he received the inveſtiture on the 19th of December 1692. This new creation met with great oppoſition both in the electoral college and the college of princes; but at laſt, by a concluſion of the three colleges on the 30th of January 1708, it was unanimouſly determined, that the electoral dignity ſhould be confirmed to the duke of Hanover and his heirs male; but it was added, that if, while that electoral dignity ſubſiſted, the Palatine electorate ſhould happen to fall into the hands of a Proteſtant prince, the firſt Catholic elector ſhould have a ſupernumerary vote.

The princes of this houſe have their ſeat in the college of princes, immediately after thoſe of the electoral houſes; each branch having a vote. The elector, beſides his ſeat in the electoral college, was inveſted with the office of arch ſtandard-bearer of the empire; but this being diſputed with him by the duke of Wirtemberg, the elector Palatine having obtained the office of arch-ſteward, yielded that of arch-treaſurer to the elector of Hanover, who was confirmed in this dignity by a decree of the diet of the 13th of January 1710. For the adminiſtration of the government, the elector has a council of ſtate, a council of war, the court of juſtice, the chancery, the juſtice of the court, and a conſiſtory. But for making new laws, or eſtabliſhing new taxes, the conſent of the ſtates, which are compoſed of the nobility, clergy, and burghers, is required.

The city of Hanover is agreeably ſituated in a ſandy plain on the river Leyne, in E. Long. 10. 5. N. Lat. 22. 5. It is a large well-built town, and pretty well fortified. The eſtabliſhed religion is the Lutheran; but the Catholics are tolerated, and have a handſome church. It has ſuffered greatly by the French, who got poſſeſſion of it in 1757, but were ſoon after driven out. It is noted for a particular kind of beer, reckoned excellent in theſe parts. This city was the reſidence of the elector before he aſcended the throne of Great Britain. The palace makes no great ſhew outwardly, but within it is richly furniſhed. The regency of the country is adminiſtered in the ſame manner as if the ſovereign was preſent.

HANSE, or Hans, an ancient name for a ſociety or company of merchants; particularly that of certain cities in Germany, &c. hence called *Hanſe-towns*. See Hanse-*Towns*.—The word *hanſe* is obſolete High Dutch or Teutonic; and ſignifies "alliance, confederacy, aſſociation," &c. Some derive it from the two German words, *am-ſee*, that is, "on the ſea;" by reaſon the firſt hanſe towns were all ſituated on the ſea-coaſt: whence the ſociety is ſaid to have been firſt

Hanse-towns.

called *am zee ſteden*, that is, "cities on the ſea;" and afterwards, by abbreviation, *hanſee*, and *hanſe*.

HANSE *Towns*. The hanſeatic ſociety was a league between ſeveral maritime cities of Germany, for the mutual protection of their commerce. Bremen and Amſterdam were the two firſt that formed it; whoſe trade received ſuch advantage by their fitting out two men of war in each to convoy their ſhips, that more cities continually entered into the league: even kings and princes made treaties with them, and were often glad of their aſſiſtance and protection; by which means they grew ſo powerful both by ſea and land, that they raiſed armies as well as navies, enjoyed countries in ſovereignty, and made peace or war, though always in defence of their trade, as if they had been an united ſtate or commonwealth.

At this time alſo abundance of cities, though they had no great intereſt in trade, or intercourſe with the ocean, came into their alliance for the preſervation of their liberties: ſo that in 1200 we find no leſs than 72 cities in the liſt of the towns of the Hanſe; particularly Bremen, Amſterdam, Antwerp, Rotterdam, Dort, Bruges, Oſtend, Dunkirk, Middleburg, Calais, Rouen, Rochelle, Bourdeaux, St Malo, Bayonne, Bilboa, Liſbon, Seville, Cadiz, Carthagena, Barcelona, Marſeilles, Leghorn, Naples, Meſſina, London, Lubec, Roſtock, Straſund, Stetin, Wiſmar, Konigſberg, Dantzig, Elbing, Marienburg.

The alliance was now ſo powerful, that their ſhips of war were often hired by other princes to aſſiſt them againſt their enemies. They not only awed, but often defeated, all that oppoſed their commerce; and, particularly in 1358, they took ſuch revenge of the Daniſh fleet in the Sound, for having interrupted their commerce, that Waldemar III. then king of Denmark, for the ſake of peace, gave them up all Schonen for 16 years; by which they commanded the paſſage of the Sound in their own right.—In 1428 they made war on Erick king of Denmark with 250 ſail, carrying on board 12,000 men. Theſe ſo ravaged the coaſt of Jutland, that the king was glad to make peace with them.

Many privileges were beſtowed upon the hanſe towns by Lewis XI. Charles VIII. Lewis XII. and Francis I. kings of France; as well as by the emperor Charles V. who had divers loans of money from them; and by king Henry III. who alſo incorporated them into a trading body, in acknowledgment for money which they had advanced to him, as well as for the good ſervices they did him by their naval forces in 1206.

Theſe towns exerciſed a juriſdiction among themſelves; for which purpoſe they were divided into four colleges or provinces, diſtinguiſhed by the names of their four principal cities, viz. Lubec, Cologne, Brunſwic, and Dantzic, wherein were held their courts of judicature. They had a common ſtock or treaſury at Lubec, and power to call an aſſembly as often as neceſſary.—They kept magazines or warehouſes for the ſale of their merchandiſes in London, Bruges, Antwerp, Berg in Norway, Revel in Livonia, Novogorod in Muſcovy, which were exported to moſt parts of Europe, in Engliſh, Dutch, and Flemiſh bottoms. One of their principal magazines was at London, where a ſociety of German merchants was formed, called the *ſteelyard company*. To this company great privileges were granted by Edward I. but revoked by act of parliament in 1552 in the reign of Edward VI. on a complaint of the Engliſh merchants that this company had ſo engroſſed the cloth-trade, that, in the preceding year, they had exported 50,000 pieces, while all the Engliſh together had ſhipped off but 1100. Queen Mary, who aſcended the throne the year following, having reſolved to marry Philip the emperor's ſon, ſuſpended the execution of the act for three years: but after that term, whether by reaſon of ſome new ſtatute, or in purſuance of that of king Edward, the privileges of that company were no longer regarded, and all efforts of the hanſe-towns to recover this loſs were in vain. Hanse-towns.

Another accident that happened to their mortification was while queen Elizabeth was at war with the Spaniards. Sir Francis Drake happening to meet 60 ſhips in the Tagus, loaden with corn belonging to the hanſe-towns, took out all the corn as contraband goods which they were forbid to carry by their original patent. The hanſe towns having complained of this to the diet of the empire, the queen ſent an ambaſſador thither to declare her reaſons. The king of Poland likewiſe intereſted himſelf in the affair, becauſe the city of Dantzic was under his protection. At laſt, though the queen ſtrove hard to preſerve the commerce of the Engliſh in Germany, the emperor excluded the Engliſh company of merchant-adventurers, who had conſiderable factories at Stade, Embden, Bremen, Hamburg, and Elbing, from all trade in the empire. In ſhort, the hanſe-towns, in Germany in particular, were not only in ſo flouriſhing, but in ſo formidable a ſtate, from the 14th to the 16th centuries, that they gave umbrage to all the neighbouring princes, who threatened a ſtrong confederacy againſt them; and, as the firſt ſtep towards it, commanded all the cities within their dominion or juriſdiction to withdraw from the union or hanſe, and be no farther concerned therein. This immediately ſeparated all the cities of England, France, and Italy, from them. The hanſe, on the other hand, prudently put themſelves under the protection of the empire: and as the cities juſt now mentioned had withdrawn from them; ſo they withdrew from ſeveral more, and made a decree among themſelves, that none ſhould be admitted into their ſociety but ſuch as ſtood within the limits of the German empire, or were dependent thereon; except Dantzic, which continued a member, though in nowiſe dependent on the empire, only it had been ſummoned formerly to the imperial diet. By this means they maintained their confederacy for the protection of their trade, as it was begun, without being any more envied by their neighbours. Hereby likewiſe they were reduced to Lubec, Bremen, Hamburgh, and Dantzic; in the firſt of which they kept their regiſter, and held aſſemblies once in three years at leaſt. But this hanſe or union has for ſome time been diſſolved; and now every one of the cities carries on a trade ſeparately for itſelf, according to the ſtipulation in ſuch treaties of peace, &c. as are made for the empire betwixt the emperor and other potentates.

HARANGUE, a modern French name for a ſpeech or oration made by an orator in public.—Menage derives the word from the Italian *arenga*, which ſignifies the ſame; formed, according to Ferrari, from *arringo*, "a

Harbour || Hardouin.

" a juſt, or place of juſting." Others derive it from the Latin *ara*, " altar;" by reaſon the firſt harangues were made before altars: whence the verſe of Juvenal,

Aut Lugdunenſis rhetor diſturus ad aram.

The word is alſo frequently uſed in an ill ſenſe, viz. for a too pompous, prolix, or unſeaſonable ſpeech or declamation.

HARBOUR, a general name given to any ſea-port or haven; as alſo to any place convenient for mooring ſhipping, although at a great diſtance from the ſea. The qualities requiſite in a good harbour are, that the bottom be entirely free from rocks or ſhallows; that the opening be of ſufficient extent to admit the entrance or departure of large ſhips, without difficulty; that it ſhould have good anchoring-ground, and be eaſy of acceſs; that it ſhould be well defended from the violence of the wind and ſea; that it ſhould have room and convenience to receive the ſhipping of different nations, and thoſe which are laden with different merchandiſes; that it be furniſhed with a good light-houſe, and have variety of proper rings, poſts, moorings, &c. in order to remove or ſecure the veſſels contained therein; and, finally, that it have plenty of wood, and other materials for firing, beſides hemp, iron, mariners, &c.

HARBURG, a ſmall town of Germany in the circle of Lower Saxony, and duchy of Lunenburg, ſeated on the river Elbe over againſt Hamburgh. It was ſurrounded with walls in 1355; and 30 years after, a ſtrong caſtle, which ſtill remains, was built by the biſhop. E. Long. 9. 41. N. Lat. 53. 51.

HARDENING, the giving a greater degree of hardneſs to bodies than they had before.

There are ſeveral ways of hardening iron and ſteel, as by hammering them, quenching them in cold water, &c. See STEEL.

Caſe HARDENING. See CASE-*Hardening*.

HARDERWICK, a town of the United Provinces in Dutch Guelderland. It is a well-built town, and the chief of the ſea-ports of this province. It has ſeveral good buildings, particularly the great church, which is much admired. In 1648, the public ſchool here was turned into an univerſity. The French did it a great deal of damage in 1672, ſince which time it has been on the decline. E. Long. 5. 37. N. Lat. 52. 14.

HARDNESS, a quality of certain bodies, which conſiſts in an intimate union and ſtrong adheſion of their integrant parts, which cannot therefore be eaſily diſjoined.—We cannot preciſely determine what diſpoſition of parts occaſions the greateſt hardneſs; but this probably depends on the perfection and extent of the contact of theſe parts: and this quality depends eſſentially upon their figure, which we do not know.—The hardeſt of bodies which we do know, are vitrifiable ſtones; and amongſt theſe the hardeſt are alſo the moſt pure and homogeneous, that is, diamonds. Not any one of all known bodies is perfectly hard. This quality belongs undoubtedly to the primary or elementary particles of matter, which of all beings we know the leaſt of.

HARDOUIN (John), a learned French Jeſuit in the beginning of the 18th century, known by the remarkable paradoxes he advanced in his writings; this in particular, That all the works of the ancient profane writers, except Cicero's works, Virgil's Georgics, Horace's ſatires and epiſtles, and Pliny's natural hiſtory, are mere forgeries. He died at Paris in 1729, aged 83. His principal works are, 1. An edition of Pliny's natural hiſtory, with notes, which is much eſteemed. 2. An edition of the councils, which made much noiſe. 3. Chronology reſtored by medals, 4to. 4. A commentary on the New Teſtament, folio; in which he pretends that our Saviour and his apoſtles preached in Latin, &c.

Hardwicke || Harleian.

HARDWICKE. See YORK.

HARE, in zoology. See LEPUS.

The hare is a beaſt of venery, or of the foreſt, but peculiarly ſo termed in the ſecond year of her age. There are reckoned four ſorts of them, from the place of their abode: ſome live in the mountains, ſome in the fields, ſome in marſhes, and ſome wander about every where. The mountain-hares are the ſwifteſt, the field-hares are not ſo nimble, and thoſe of the marſhes are the ſloweſt: but the wandering hares are the moſt dangerous to follow; for they are cunning in the ways and mazes of the fields, and, knowing the neareſt ways, run up the hills and rocks, to the confuſion of the dogs, and the diſcouragement of the hunters. See the article HUNTING.

HARE-*Lip*, in ſurgery. See SURGERY.

HARFLUER, an ancient town of France, in Normandy; but is now a poor place, on account of its fortifications being demoliſhed, and its harbour choaked up. It was taken by the Engliſh, by aſſault, in the year 1415. It is ſeated on the river Lizarda, near the Seine, five miles from Havre de Grace, forty north-weſt of Rouen, and one hundred and ſix north-weſt of Paris. E. Lon. 0. 17. N. Lat. 49. 30.

HARIOT, or HERIOT, in law, a due belonging to a lord at the death of his tenant, conſiſting of the beſt beaſt, either horſe, or cow, or ox, which he had at the time of his death; and in ſome manors the beſt goods, piece of plate, &c. are called hariots.

HARIOT (Thomas), See HARRIOT.

HARLECH, a town of Merioneth ſhire, in north Wales. It is ſeated on a rock, on the ſea-ſhore; and is but a poor place, though the ſhire-town, and ſends a member to parliament. It had formerly a ſtrong, handſome caſtle, which was a garriſon for Charles I. in the civil wars, for which reaſon it was afterwards demoliſhed by the parliament. W. Long. 4. 0. N. Lat. 54. 47.

HARLEIAN COLLECTION.—A moſt valuable collection of uſeful and curious manuſcripts, begun near the end of the laſt century, by Robert Harley of Brampton Bryan, eſq. in Herefordſhire, afterwards earl of Oxford and lord high-treaſurer; and which was conducted upon the plan of the great Sir Robert Cotton. He publiſhed his firſt conſiderable collection in Auguſt 1705, and in leſs than ten years he got together near 2500 rare and curious MSS. Soon after this, the celebrated Dr George Hicks, Mr Anſtis garter king at arms, biſhop Nicolſon, and many other eminent antiquaries, not only offered him their aſſiſtance in procuring MSS. but preſented him with ſeveral that were very valuable. Being thus encouraged to perſeverance by his ſucceſs, he kept many perſons employed in purchaſing MSS. for him abroad, giving them written inſtructions for their

Harlem ‖ Harley.

their conduct. By these means the MS. library was, in the year 1721 increased to near 6000 books, 14,000 original charters, and 500 rolls.

On the 21st of May 1724, lord Oxford died: but his son Edward, who succeeded to his honours and estate, still farther enlarged the collection; so that when he died, June 16th 1741, it consisted of 8000 volumes, several of them containing distinct and independent treatises, besides many loose papers which have been since sorted and bound up in volumes; and above 40,000 original rolls, charters, letters patents, grants, and other deeds and instruments of great antiquity.

The principal design of making this collection was the establishment of a MS. English historical library, and the rescuing from destruction such national records as had eluded the diligence of preceding collectors: but lord Oxford's plan was more extensive; for his collection abounds also with curious MSS. in every science.—This collection is now in the British Museum; and an enumeration of its contents may be seen in the Annual Register, vi. 140, &c.

HARLEM, a town of the United Provinces, in Holland, situated on the river Sparen, in E. Lon. 5. 17. N. Lat. 53. 22. It is a large and populous city, and stands near a lake of the same name, with which it has a communication as well as with Amsterdam and Leyden, by means of several canals. Schemes have been often formed for draining of this lake, but were never put in execution. To the south of the town lies a wood, cut into delightful walks and vistas. The town is famous for the siege which it held out against the Spaniards for ten months in 1573; the townsmen, before they capitulated, being reduced to eat the vilest animals, and even leather and grass. The inhabitants corresponded with the prince of Orange for a considerable time by means of carrier-pigeons. Harlem, as is well known, claims the invention of printing; and in fact, the first essays of the art are indisputably to be attributed to Laurentius, a magistrate of that city. [See LAURENTIUS, and *(History of)* PRINTING.] Before the Reformation, Harlem was a bishop's see; and the Papists still greatly outnumber the Protestants. An academy of sciences was founded here in 1752. Vast quantities of linen and thread are bleached here; the waters of the lake having a peculiar quality, which renders them very fit for that purpose.—A sort of phrensy with regard to flowers, particularly tulips, once prevailed here, in consequence of which the most beautiful sorts were bought and sold at an extravagant price.

HARLEQUIN, a buffoon or merry-andrew; but the word is now used for a person of extraordinary agility, dressed in party-coloured clothes, the principal character in a pantomime entertainment.

HARLEY (Robert), earl of Oxford and Mortimer, was the eldest son of Sir Edward Harley, and born in 1661. At the Revolution, Sir Edward and his son raised a troop of horse at their own expence; and after the accession of king William and queen Mary, he obtained a seat in parliament. His promotions were rapid: in 1702, he was chosen speaker of the house of commons; in 1704, he was sworn of queen Anne's privy council, and the same year made secretary of state; in 1706, he acted as one of the commissioners for the treaty of Union; and in 1710, was appointed a commissioner of the treasury, and chancellor and under-treasurer of the exchequer. A daring attempt was made on his life, March 8. 1711, by the marquis of Guiscard a French papist; who, when under an examination before a committee of the privy council, stabbed him with a penknife. Of this wound, however, he soon recovered; and was the same year created earl of Oxford, and lord high treasurer, which office he resigned just before the queen's death. He was impeached of high treason in 1715, and committed to the tower; but was cleared by trial, and died in 1724. His character has been variously represented, but cannot be here discussed. He was not only an encourager of literature, but the greatest collector in his time of curious books and MSS. his collection of which makes a capital part of the British Museum. See HARLEIAN *Collection*.

Harling ‖ Harmonia.

HARLING. See HERLING.

HARLINGEN, a sea-port town of the United Netherlands, in West Friesland. It stands on the coast of the Zuyder sea, at the mouth of a large canal, in E. Long. 5. 25. N. Lat. 53. 12. It was only a hamlet till about the year 1234, when it was destroyed by the sea; and being afterwards rebuilt, became a considerable town. In 1579, it was considerably enlarged by the care of William prince of Orange. It is now very well fortified, and is naturally strong, as the adjacent country can very easily be laid under water. The city is square; and the streets are handsome, straight, and clean, with canals in the middle of them. It has five gates; four towards the land, and one towards the sea; but though the harbour is good, yet vessels of great burthen cannot get into it until they are lightened, for want of water. The admiralty college of Friesland has its seat here. The manufactures are salt, bricks, and tiles; a considerable trade is also carried on in all sorts of linen cloth, and the adjacent country yields abundance of corn and good pastures.

HARLOT, a woman given to incontinency, or that makes a habit or a trade of prostituting her body.—The word is supposed to be used for the diminutive *whorelet*, a "little whore."—Others derive it from *Arletta*, mistress to Robert duke of Normandy, and mother to William the Conqueror: Camden derives it from one *Arlotha*, concubine to William the Conqueror: Others from the Italian *Arlotta*, "a proud whore."

HARMONIA, in fabulous history, the wife of Cadmus, both of whom were turned into serpents. See CADMUS.

Though many of the ancient authors make Harmonia a princess of divine origin, there is a passage in Athenæus from Euhemerus, the Vanini of his time, which tells us, that she was by profession a player on the flute, and in the service of the prince of Zidon previous to her departure with Cadmus. This circumstance, however, might encourage the belief, that, as Cadmus brought letters into Greece, his wife brought *harmony* thither; as the word ἁρμονία, *harmonia*, has been said to have no other derivation than from her name: which makes it very difficult to ascertain the sense in which the Greeks made use of it in their music†; for it has no roots by which it can be decompounded, in order to deduce from them its etymology. The common account of the word, however, that is given

† See *Harmony*.

Harmonica. given by lexicographers, and generally adopted by the learned, does not confirm this opinion. It is generally derived from αρμοζω, and this from the old verb Αρω *aro*, to *fit* or *join*.

HARMONICA. This word, when originally appropriated by Dr Franklin to that peculiar form or mode of *muſical glaſſes*, which he himſelf, after a number of happy experiments, had conſtituted, was written *Armonica*. In this place, however, we have ventured to reſtore it to its native plenitude of ſound, as we have no antipathy againſt the moderate uſe of aſpirations. It is derived from the Greek word αρμονια. The radical word is αρω, to *ſuit* or *fit one thing to another*. By the word αρμονια, the Greeks expreſſed *aptitudes* of various kinds; and from the uſe which they made of that expreſſion, we have reaſon to conclude, that it was intended to import the higheſt degree of refinement and delicacy in thoſe relations which it was meant to ſignify. Relations or aptitudes of ſound, in particular, were underſtood by it; and in this view, Dr Franklin could not have ſelected a name more expreſſive of its nature and genius, for the inſtrument which we are now to deſcribe; as, perhaps, no muſical tone can poſſibly be finer, nor conſequently ſuſceptible of juſter concords, than thoſe which it produces.

In an old Engliſh book, whoſe title we cannot at preſent recollect, and in which a number of various amuſements were deſcribed, we remember to have ſeen the elements or firſt approaches to muſic by glaſſes. That author enjoins his pupil to chooſe half a dozen of ſuch as are uſed in drinking; to fill each of them with water in proportion to the gravity or acuteneſs of the ſound which he intended it ſhould produce; and, having thus adjuſted them one to another, he might entertain the company with a church-tune. Theſe, perhaps, were the rude and barbarous hints which Mr Puckeridge afterwards improved. But, for a farther account of him, of the ſtate in which he left the inſtrument, and of the ſtate to which it has afterwards been carried, we muſt refer our readers to the following extracts from Dr Franklin's letters, and from others who have written upon the ſame ſubject.

The Doctor, in his letter to Father Beccaria, has given a minute and elegant account of the *Harmonica*. Nor does it appear that his ſucceſſors have either more ſenſibly improved, or more accurately delineated, that angelic inſtrument. The detail of his own improvements, therefore, ſhall be given in his own words.

"Perhaps (ſays he) it may be agreeable to you, as you live in a muſical country, to have an account of the new inſtrument lately added here to the great number that charming ſcience was poſſeſſed of before: As it is an inſtrument that ſeems peculiarly adapted to *Italian* muſic, eſpecially that of the ſoft and plaintive kind, I will endeavour to give you ſuch a deſcription of it, and of the manner of conſtructing it, that you or any of your friends may be enabled to imitate it, if you incline ſo to do, without being at the expence and trouble of the many experiments I have made in endeavouring to bring it to its preſent perfection.

"You have doubtleſs heard the ſweet tone that is drawn from a drinking-glaſs, by preſſing a wet finger round its brim. One Mr Puckeridge, a gentleman from Ireland, was the firſt who thought of playing tunes formed of theſe tones. He collected a number of glaſſes of different ſizes; fixed them near each other on a table; and tuned them, by putting into them water, more or leſs, as each note required. The tones were brought out by preſſing his fingers round their brims. He was unfortunately burnt here, with his inſtrument, in a fire which conſumed the houſe he lived in. Mr E. Delaval, a moſt ingenious member of our Royal Society, made one in imitation of it, with a better choice and form of glaſſes, which was the firſt I ſaw or heard. Being charmed with the ſweetneſs of its tones, and the muſic he produced from it, I wiſhed to ſee the glaſſes diſpoſed in a more convenient form, and brought together in a narrower compaſs, ſo as to admit of a greater number of tones, and all within reach of hand to a perſon ſitting before the inſtrument; which I accompliſhed, after various intermediate trials, and leſs commodious forms, both of glaſſes and conſtruction, in the following manner. Harmonica.

"The glaſſes are blown as near as poſſible in the form of hemiſpheres, having each an open neck or ſocket in the middle. The thickneſs of the glaſs near the brim is about the tenth of an inch, or hardly quite ſo much, but thicker as it comes nearer the neck; which in the largeſt glaſſes is about an inch deep, and an inch and a half wide within; theſe dimenſions leſſening as the glaſſes themſelves diminiſh in ſize, except that the neck of the ſmalleſt ought not to be ſhorter than half an inch.—The largeſt glaſs is nine inches diameter, and the ſmalleſt three inches. Between theſe there are 23 different ſizes, differing from each other a quarter of an inch in diameter. To make a ſingle inſtrument, there ſhould be at leaſt ſix glaſſes blown of each ſize; and out of this number one may probably pick 37 glaſſes (which are ſufficient for three octaves with all the ſemitones) that will be each either the note one wants, or a little ſharper than that note, and all fitting ſo well into each other as to taper pretty regularly from the largeſt to the ſmalleſt. It is true, there are not 37 ſizes; but it often happens that two of the ſame ſize differ a note or half a note in tone, by reaſon of a difference in thickneſs, and theſe may be placed one in the other without ſenſibly hurting the regularity of the taper form.

"The glaſſes being choſen, and every one marked with a diamond the note you intend it for, they are to be tuned by diminiſhing the thickneſs of thoſe that are too ſharp. This is done by grinding them round from the neck towards the brim, the breadth of one or two inches as may be required; often trying the glaſs by a well-tuned harpſichord, comparing the note drawn from the glaſs by your finger, with the note you want, as ſounded by that ſtring of the harpſichord. When you come near the matter, be careful to wipe the glaſs clean and dry before each trial, becauſe the tone is ſomething flatter when the glaſs is wet than it will be when dry;—and grinding a very little between each trial, you will thereby tune to great exactneſs. The more care is neceſſary in this, becauſe, if you go below your required tone, there is no ſharpening it again but by grinding ſomewhat off the brim, which will afterwards require poliſhing, and thus increaſe the trouble.

"The glaſſes being thus tuned, you are to be pro-

Harmonica. provided with a cafe for them, and a ſpindle on which they are to be fixed. My caſe is about three feet long, eleven inches every way wide within at the biggeſt end, and five inches at the ſmalleſt end; for it tapers all the way, to adapt it better to the conical figure of the ſet of glaſſes. This caſe opens in the middle of its height, and the upper part turns up by hinges fixed behind. The ſpindle is of hard iron, lies horizontally from end to end of the box within, exactly in the middle, and is made to turn on braſs gudgeons at each end. It is round, an inch diameter at the thickeſt end, and tapering to a quarter of an inch at the ſmalleſt.—A ſquare ſhank comes from its thickeſt end through the box, on which ſhank a wheel is fixed by a ſcrew. This wheel ſerves as a fly to make the motion equable, when the ſpindle, with the glaſſes, is turned by the foot like a ſpinning wheel. My wheel is of mahogany, 18 inches diameter, and pretty thick, ſo as to conceal near its circumference about 25 lb of lead.—An ivory pin is fixed in the face of this wheel, about four inches from the axis. Over the neck of this pin is put the loop of the ſtring that comes up from the moveable ſtep to give it motion. The caſe ſtands on a neat frame with four legs.

" To fix the glaſſes on the ſpindle, a cork is firſt to be fitted in each neck pretty tight, and projecting a little without the neck, that the neck of one may not touch the inſide of another when put together, for that would make a jarring. Theſe corks are to be perforated with holes of different diameters, ſo as to ſuit that part of the ſpindle on which they are to be fixed. When a glaſs is put on, by holding it ſtiffly between both hands, while another turns the ſpindle, it may be gradually brought to its place. But care muſt be taken that the hole be not too ſmall, leſt in forcing it up the neck ſhould ſplit; nor too large, leſt the glaſs, not being firmly fixed, ſhould turn or move on the ſpindle, ſo as to touch or jar againſt its neighbouring glaſs. The glaſſes thus are placed one in another; the largeſt on the biggeſt end of the ſpindle, which is to the left hand: the neck of this glaſs is towards the wheel; and the next goes into it in the ſame poſition, only about an inch of its brim appearing beyond the brim of the firſt; thus proceeding, every glaſs when fixed ſhows about an inch of its brim (or three quarters of an inch, or half an inch, as they grow ſmaller) beyond the brim of the glaſs that contains it; and it is from theſe expoſed parts of each glaſs that the tone is drawn, by laying a finger on one of them as the ſpindle and glaſſes turn round.

" My largeſt glaſs is G a little below the reach of a common voice, and my higheſt G, including three complete octaves.—To diſtinguiſh the glaſſes more readily to the eye, I have painted the apparent parts of the glaſſes within-ſide, every ſemitone white, and the other notes of the octave with the ſeven priſmatic colours, viz. C, red; D, orange; E, yellow; F, green; G, blue; A, indigo; B, purple; and C, red again;—ſo that the glaſſes of the ſame colour (the white excepted) are always octaves to each other.

" This inſtrument is played upon, by ſitting before the middle of the ſet of glaſſes, as before the keys of a harpſicord, turning them with the foot, and wetting them now and then with a ſponge and clean water. The fingers ſhould be firſt a little ſoaked in water, and quite free from all greaſineſs; a little fine chalk upon them is ſometimes uſeful, to make them catch the glaſs and bring out the tone more readily. Both hands are uſed, by which means different parts are played together.—Obſerve, that the tones are beſt drawn out when the glaſſes turn *from* the ends of the fingers, not when they turn *to* them. Harmonica.

" The advantages of this inſtrument are, that its tones are incomparably ſweet beyond thoſe of any other; that they may be ſwelled and ſoftened at pleaſure by ſtronger or weaker preſſures of the finger, and continued to any length; and that the inſtrument, being once well-tuned, never again wants tuning."

Such was the ſtate in which this learned and ingenious author found, and ſuch the perfection to which he carried, that celeſtial inſtrument of which we now treat. We call it *celeſtial*; becauſe, in compariſon with any other inſtrument which we know, the ſounds that it produces are indeed heavenly. Some of them, however, are ſtill conſtructed in the ſame imperfect manner as the inſtrument of Mr Puckeridge. They are contained in an oblong cheſt; their poſitions are either exactly or nearly rectilineal; the artificial ſemitones by which the full notes are divided, form another parallel line; but the diſtances between each of them are much greater than thoſe between the notes of the natural ſcale, as they take their places, not directly oppoſite to the notes which they are intended to heighten or depreſs, but in a ſituation between the higheſt and loweſt, to ſhow, that, in aſcending, they are ſharps to the one, and, in deſcending, flats to the other. This ſtructure, however, is doubly inconvenient; for it not only increaſes the labour and difficulty of the performer, but renders ſome muſical operations impracticable, which upon the *Harmonica*, as conſtituted by Dr Franklin, may be executed with eaſe and pleaſure. In this fabric, if properly formed and accurately tuned, the inſtrument is equally adapted to harmony and melody. But as no material ſtructure could ever yet be brought to the perfection even of human ideas, this inſtrument ſtill in ſome meaſure retains the perverſe nature of its original ſtamina. Hence it is not without the utmoſt difficulty that the glaſſes can be tuned by grinding, and the leaſt conceivable redundancy or defect renders the diſcord upon this inſtrument more conſpicuous and intolerable than upon any other. Hence likewiſe that inexpreſſible delicacy to be obſerved in the manner of the friction by which the ſound is produced: for if the touch be too gentle, it cannot extort the tone; and if too ſtrong, beſides the mellow and delicate ſound which ought to be heard, we likewiſe perceive the finger jarring upon the glaſs, which, mingled with thoſe ſofter ſounds by which the ſenſes had been ſoothed, gives a feeling ſimilar to iron grating upon iron, but more diſagreeable. In wind-inſtruments the operation of the tongue, in harpſichords the ſtroke of the quill, and on the violin the motion of the bow, gives that ſtrong and ſenſible interruption of ſound which may be called *articulation*, and which renders the rithmus or meaſure of an air more perceptible: but, upon the glaſſes, the touch of the finger is too ſoft to divide the notes with ſo much force; ſo that, unleſs the mind be ſteadily attentive, they ſeem to melt one into another, by which means the idea of rhythmus is almoſt loſt. There is no way of performing a ſlur, but by for-

Harmonica. forbearing to ſtop the firſt ſound, when that which is immediately ſubſequent commences. Thus, when the ſlur is of any length, and regularly deſcends or riſes by the interval of a ſecond, all the notes in the ſlur muſt be heard together, and produce no agreeable diſſonance; yet if it riſes or deſcends by perfect chords, the effect is pleaſing. The open ſhake, or trill, is another unhappy operation upon muſical glaſſes; which can only be performed by the alternate pulſations of two continued ſounds, differing from each other only by a note or ſemitone. But, as theſe pulſations, thus managed, cannot be diſtinct, the reſult is far from being pleaſant; nor is there any ſuccedaneum for the cloſe ſhake, which in the violin is performed by alternately depreſſing the ſtring to the finger-board, and ſuffering it to riſe without entirely removing the finger from it, and which, by giving the note that tremulous ſound produced by the human voice affected with grief, is a grace peculiarly adapted to pathetic and plaintive airs.

We proceed, however, to a farther account of the ſame inſtrument, extracted from the Annual Regiſter, vol. iv. p. 149.

"Beſides thoſe tones (ſays the author of that account) which every elaſtic ſtring produces by a vibration of all its parts, it is capable of another ſet of tones, in which only a part of the ſtring is ſuppoſed to vibrate. Theſe ſounds are produced by the lighteſt touches, either by air, as in Oſwald's lyre, or by rubbing the bow in the ſofteſt manner on the ſtring of a fiddle.

"Analogous to theſe ſounds are thoſe produced by bells: in thoſe laſt, beſides thoſe tones produced by their elliptical vibrations, there are a ſet of tones which may be brought by gently rubbing their edges, and in which the whole inſtrument does not appear to vibrate in all its parts as before.

"Take, for inſtance, a bell finely poliſhed at the edges; or, what will perhaps be more convenient, a drinking-glaſs: let the edges be as free from any thing oily as poſſible; then, by moiſtening the finger in water (I have found alum-water to be beſt), and rubbing it circularly round the edge of the glaſs, you will at length bring out the tone referred to.

"This note is poſſeſſed of infinite ſweetneſs; it has all the excellencies of the tone of a bell, without its defects. It is loud, has a ſufficient body, is capable of being ſwelled and continued at pleaſure; and, beſides, has naturally that vibratory ſoftening, which muſicians endeavour to imitate, by mixing with the note to be played, a quarter-tone from below.

"To vary theſe tones, nothing more is required than to procure ſeveral bells or glaſſes of different tones, tuned as nearly as poſſible, which may be done by thinning the edges of either: or, for immediate ſatisfaction, the glaſſes may be tuned by pouring in water; the more water is poured in, the graver the tone will be.

"Let us ſuppoſe then a double octave of thoſe glaſſes, thus tuned, to be procured. Any common tune may be executed by the fingers rubbing upon each glaſs ſucceſſively; and this I have frequently done without the leaſt difficulty, only chooſing thoſe tunes which are ſlow and eaſy. Here then are numbers of delicate tones, with which muſicians have been, till very lately, unacquainted; and the only defect is, that they cannot be made to follow each other with that celerity and eaſe which is requiſite for melody. In order to remedy this, I took a large drinking-glaſs, and by means of a wheel and gut, as in the electrical machine, made it to turn upon its axis with a moderately quick but equable motion; then moiſtening the finger as before, nothing more was required than merely to touch the glaſs at the edge, without any other motion, in order to bring out the tone. Harmonica.

"Inſtead of one glaſs only turning in this manner, if the whole number of glaſſes were ſo fixed as to keep continually turning, by means of a wheel, it follows, that upon every touch of the finger a note would be expreſſed; and thus, by touching ſeveral glaſſes at once, an harmony of notes might be produced, as in an harpſichord.

"As I write rather to excite than ſatisfy the curious, I ſhall not pretend to direct the various ways this number of glaſſes may be contrived to turn; it may be ſufficient to ſay, that if the glaſſes are placed in the ſegment of a circle, and then a ſtrap, as in a cutler's wheel, be ſuppoſed to go round them all, the whole number will by this means be made to turn, by means of a wheel.

"Inſtead of the finger, I have applied moiſtened leather to the edge of the glaſs, in order to bring out the tone: but, for want of a proper elaſticity, this did not ſucceed. I tried cork, and this anſwered every purpoſe of the finger; but made the tone much louder than the finger could do. Inſtead, therefore of the finger, if a number of corks were ſo contrived as to fall with a proper degree of preſſure on the edge of the glaſs, by means of keys like the jacks of an organ, it is evident, that in ſuch a caſe a new and tolerably perfect inſtrument would be produced; not ſo loud indeed as ſome, but infinitely more melodious than any.

"The mouths of the glaſſes or bells uſed in this experiment ſhould not reſemble the mouth of a trumpet, but ſhould rather come forward with a perpendicular edge. The corks uſed in this caſe ſhould be ſmooth, even free from thoſe blemiſhes which are uſually found in them, and at the ſame time the more elaſtic the better."

In the two accounts here given ſeems to be comprehended every thing valuable which has been ſaid upon the ſubject. It remains, however, our permanent opinion, that the form and ſtructure deſigned and conſtituted by Dr Franklin is by much the moſt eligible; nor can we admit, that a cork, however ſucceſsfully applied, will produce the ſame mellowneſs and equability of tone in general, with the finger. It appears to us, that, by this kind of voluntary attrition, a note may be ſunk or ſwelled with much more art and propriety than by the ſubſtitution of any thing elſe extrinſic to the hand; and when chords are long protracted, that degree of friction, which renders every ſound in the chord ſenſible to the ear, without harſhneſs, muſt be the moſt agreeable. For this reaſon, likewiſe, we ſhould recommend alum-water in preference to chalk.

From what has already been ſaid, it will eaſily be perceived, that this inſtrument requires to be tuned with the niceſt degree of delicacy which the laws of temperament will poſſibly admit. For theſe laws the reader will naturally have recourſe to the article Music †, † Chap. vii. art. 64. in

Harmonica in this Dictionary; where, from M. D'Alembert, is given a plain and satisfactory account, both of the method propofed by Rameau, and of that eftablifhed in common practice, without anticipating the experience and taffe of the reader, by dictating which of thefe plans is preferable. To thofe who have occafion to tune the inftrument, it may likewife be ufeful to perufe the detached article TEMPERAMENT in this Work. Without recapitulating the different rules of alteration prefcribed in thefe accounts, we fhall prefuppofe the reader acquainted with them; and proceed to defcribe how, under their influence, the *Harmonica* may be tuned. But it is previoufly expedient to obferve, that the fame rules which conduct the procefs of tuning a harpfichord, will be equally effectual in tuning the *Harmonica;* with this only difference, that greater delicacy in adjufting the chords fhould, if practicable, be attempted.

There are different notes from whence the procedure of tuning may commence. *La* or A, which is the key that pretty nearly divides the harpfichord, is chofen by fome; this *la* in common fpinets is 24 natural keys from the bottom, and 13 from the top: and the *ut* above it, or fecond C upon the G cleff, by others. This laft we fhould rather advife, becaufe we imagine thofe intervals which we have called *feconds major* to be more juft through the whole octave, when the courfe of tuning is begun by a natural femitone. The initiate, therefore, may begin by tuning the fecond *ut* of his *Harmonica*, or C above the treble cleff, in unifon with its correfpondent C upon the harpfichord or any other inftrument in concert-pitch; then, defcending to its octave below, adjuft it with the *ut* above, till every pulfation if poffible be loft, and the founds rendered fcarcely diftinguifhable when fimultaneoufly heard. To the loweft note of this octave he muft tune the *fol* or G immediately above it by a fifth, ftill obferving the laws of temperament: To this G, the *re*, or D immediately above it, by the fame chord: To the *re*, or D above, its octave below: To this, by a fifth, the *la* or A immediately above it: To *la*, the *mi* or E afcending in the fame proportion: To *mi*, its octave below: To this, the *fi* or B immediately above it by a fifth: To the firft *ut*, or C, which was tuned, the *fa* or F immediately below by the fame chord.

That the practitioner may be ftill more fecure in the juftice and propriety of his procedure, he may try the thirds of the notes already adjufted, and alter, as much as is conftent with the fifths and octaves, fuch among thefe thirds as may feem grating and difagreeable to his ear. Thus far having accomplifhed his operation, he may tune all the other natural notes whether above or below by octaves. His next concern is with the femitones. And here it will be fuggefted by common fenfe, that as in all inftruments with fixed fcales the fharp of a lower muft likewife anfwer for the flat of a higher tone, the femitone ought as nearly as poffible to divide the interval. He may begin with *la* or A fharp, which *la* in its natural ftate is a third minor beneath the *ut* or C, from whence he began in the natural fcale. This femitone fhould correfpond with the F natural immediately above by a fifth. To it may be tuned the *re* or D fharp immediately below by a fimilar chord: To D fharp, its octave above: To *fi* or B natural, immediately above the *la* or A firft mentioned, may be adjufted the F or *fa* fharp immediately above it: To this its octave below: To that octave, the C or *ut* fharp above by a fifth: To the C fharp, its octave below: To this, by a fifth, the G or *fol* fharp above. Between this G fharp and the D fharp immediately above it, the fifth will probably be too fharp; but if the others are juftly tuned, that difcord will not be extremely offenfive; and it is a neceffary confequence of temperament. The reft of the fharps and flats, like their naturals, whether afcending or defcending, may be tuned by their octaves. Harmonica Harmony.

The notes, with their chords, may be expreffed by letters and figures, thus; where, however, it muft be obferved, that the higher notes of any chord are marked with larger capitals. It fhould likewife be remarked, that the figures are not expreffive of the different ratios which the notes bear one to another, confidered with refpect to their vibrations; but only fignificant of their nominal diftances, according to the received denominations of the intervals. $C_{5}^{8}c$ $G_{5}^{8}G$ $D_{5}^{8}d$ $D_{5}^{8}D$ $A_{5}^{8}a$ $E_{5}^{8}e$ $B_{5}^{8}b$ $C_{5}^{8}f$. The fharps and flats thus, $A\#F\flat$, $A\#_{5}^{8}D\#$, $D\#_{5}^{8}D\#$, $B\flat F\#$, $F\#_{5}^{8}F\#$, $F\#_{5}^{8}C\#$, $C\#_{5}^{8}c\#$, $c\#G\#$. In running over the fharps and flats as the naturals, it will likewife be neceffary to try the thirds, and to alter fuch as may offend the ear; which, if cautioufly done, will not fenfibly injure the other chords.—Though this article has been protracted to a length which we did not originally intend, we have however the fatisfaction to find, that it comprehends every thing eflential; fo that any perfon who underftands the nature of chords, and the practical principles of mufic as univerfally taught, may not only be able to tune his inftrument, but to acquire its whole manœuvre, without the leaft affiftance from a mafter.

On Plate CLIX. is reprefented an inftrument of this kind, made by Mr Dobb of St Paul's Church-yard, London.

HARMONIC. As an adjective, it fignifies in general any thing belonging to harmony; though, in our language, the adjective is more properly written *harmonical*. In this fenfe it may be applied to the *harmonical* divifions of a monochord; or, in a word, to conſonances in general. As a fubftantive neuter, it imports all the concomitant or acceffory founds which, upon the principles refulting from the experiments made on fonorous bodies, attend any given found whatever, and render it appretiable. Thus all the aliquot parts of a mufical ftring produce *harmonical* founds, or *harmonics*.

HARMONY. The fenfe which the Greeks gave to this word in their mufic, is fo much lefs eafy to be determined, becaufe, the word itfelf being originally a fubftantive proper, it has no radical words by which we might analyfe it, to difcover its etymology. In the ancient treatifes which remain to us, *harmony* appears to be that department whofe object is the agreeable fucceffion of founds, merely confidered as high or low; in oppofition to the two others called *rhythmica* and *metrica*, which have their principle in time and meafure. This leaves our ideas concerning that aptitude of found vague and undetermined; nor can we fix them without ſtudying for that purpofe all the rules of

Harmony. of the art: and even after we have done ſo, it will be very difficult to diſtinguiſh *harmony* from melody, unleſs we add to the laſt the ideas of rhythmus and meaſure; without which, in reality, no melody can have a diſtinguiſhing character: whereas harmony is characteriſed by its own nature, independent of all other quantities except the chords or intervals which compoſe it.

It appears by a paſſage of Nicomachus, and by others, that they likewiſe gave the name of *harmony* to the chord of an octave, and to concerts of voices and inſtruments, which performed in the diſtance of an octave one from the other, and which is more commonly called *antiphone*.

Harmony, according to the moderns, is a ſucceſſion of chords agreeable to the laws of modulation. For a long time this *harmony* had no other principle but ſuch rules as were almoſt arbitrary, or ſolely founded on the approbation of a practiſed ear, which decided concerning the agreeable or diſagreeable ſucceſſion of chords, and whoſe determinations were at laſt reduced to calculation. But Father Merſenne and M. Saveur having found, that every ſound, however ſimple in appearance, was always accompanied with other ſounds leſs ſenſible, which conſtitute with itſelf a perfect chord-major; with this experiment M. Rameau ſet out, and upon it formed the baſis of his harmonic ſyſtem, which he has extended to a great many volumes, and which at laſt M. D'Alembert has taken the trouble of explaining to the public.

Signior Tartini, taking his route from an experiment which is newer and more delicate, yet not leſs certain, has reached concluſions ſimilar enough to thoſe of Rameau, by purſuing a path whoſe direction ſeems quite oppoſite. According to M. Rameau, the treble is generated by the baſs; Signior Tartini makes the baſs reſult from the treble. One deduces *harmony* from melody, and the other ſuppoſes quite the contrary. To determine from which of the two ſchools the beſt performances are likely to proceed, no more is neceſſary than to inveſtigate the end of the compoſer, and diſcover whether the air is made for the accompaniments, or the accompaniments for the air. At the word System in Rouſſeau's Muſical Dictionary, is given a delineation of that publiſhed by Signor Tartini. Here he continues to ſpeak of M. Rameau, whom he has followed through this whole work, as the artiſt of greateſt authority in the country where he writes.

He thinks himſelf obliged, however, to declare, That this ſyſtem, however ingenious it may be, is far from being founded upon nature; an affirmation which he inceſſantly repeats: "That it is only eſtabliſhed upon analogies and congruities, which a man of invention may overturn to-morrow, by ſubſtituting others more natural: that, in ſhort, of the experiments from whence he deduces it, one is detected fallacious, and the other will not yield him the conſequences which he would extort from it. In reality, when this author took it in his head to dignify with the title of *demonſtration* the reaſonings upon which he eſtabliſhed his theory, every one turned the arrogant pretence into ridicule. The Academy of Sciences loudly diſapproved a title ſo ill-founded, and ſo gratuitouſly aſſumed; and M. Eſtive, of the Royal Society at Montpelier, has ſhewn him, that even to begin with this propoſition, That according to the law of nature, ſounds are repreſented by their octaves, and that the octaves may be ſubſtituted for them, there was not any one thing demonſtrated, or even firmly eſtabliſhed, in his pretended demonſtration." He returns to his ſyſtem. Harmony.

"The mechanical principle of reſonance preſents us with nothing but independent and ſolitary chords; it neither preſcribes nor eſtabliſhes their ſucceſſion. Yet a regular ſucceſſion is neceſſary; a dictionary of ſelected words is not an oration, nor a collection of legitimate chords a piece of muſic: there muſt be a meaning, there muſt be connections in muſic as well in language: it is neceſſary that what has preceded ſhould tranſmit ſomething of its nature to what is ſubſequent, ſo that all the parts conjoined may form a whole, and be ſtamped with the genuine character of unity.

"Now, the complex ſenſation which reſults from a perfect chord, muſt be reſolved into the ſimple ſenſation of each particular ſound which compoſes it, and into the ſenſation of each particular interval which forms it, aſcertained by compariſon one with another. Beyond this there is nothing ſenſible in any chord; from whence it follows, that it is only by the relation between ſounds, and by the analogy between intervals, that the connection now in queſtion can be eſtabliſhed; and this is the genuine, the only ſource, from whence flow all the laws of *harmony* and modulation. If, then, the whole of *harmony* were only formed by a ſucceſſion of perfect chords-major, it would be ſufficient to proceed by intervals ſimilar to thoſe which compoſe ſuch a chord; for then ſome one or more ſounds of the preceding chord being neceſſarily protracted in that which is ſubſequent, all the chords would be found ſufficiently connected, and the *harmony* would, at leaſt in this ſenſe, be one.

"But beſides that theſe ſucceſſions muſt exclude all melody by excluding the diatonic ſeries which forms its foundation, it would not arrive at the real end of the art; becauſe, as muſic is a ſyſtem of meanings like a diſcourſe, it ought like a diſcourſe to have its periods, its phraſes, its ſuſpenſes, its cadences, its punctuation of every kind; and becauſe the uniformity of a harmonical procedure implies nothing of all this. Diatonic procedures require that major and minor chords ſhould be intermixed; and the neceſſity of diſſonances has been felt in order to diſtinguiſh the phraſes, and render the cadences ſenſible. Now, a connected ſeries of perfect chords-major, can neither be productive of perfect chords-minor nor of diſſonances, nor can ſenſibly mark any muſical phraſe, and the punctuation muſt there be found entirely defective.

"M. Rameau being abſolutely determined, in his ſyſtem, to deduce from nature all the *harmony* practiſed among us, had recourſe, for this effect, to another experiment of his own invention, of which I have formerly ſpoken, and which by a different arrangement is taken from the firſt. He pretended, that any ſimple ſound whatever afforded in its multiples a perfect minor or flat chord, of which it was the dominant or fifth, as it furniſhed a perfect chord-major by the vibration of its aliquot parts, of which it is the tonic or fundamental ſound. He has affirmed as a certain fact, that a vocal ſtring cauſed two others lower than itſelf to vibrate through their whole ex-

Harmony. tent, yet without making them produce any found, one to its twelfth major and the other to its feventeenth; and from this joined to the former fact, he has very ingeniouſly deduced, not only the application of the minor mode and of diſſonances in *harmony*, but the rules of harmonic phraſes and of all modulation, ſuch as they are found at the words *Chord*, *Accompaniment*, *Fundamental Baſs*, *Cadence*, *Diſſonance*, *Modulation*.

"But firſt, (continues Rouſſeau) the experiment is falſe. It is diſcovered, that the ſtrings tuned beneath the fundamental ſound do not entirely vibrate when this fundamental ſound is given; but that they are divided in ſuch a manner as to return its uniſon alone, which of conſequence can have no harmonics below. It is moreover diſcovered, that the property of ſtrings in dividing themſelves, is not peculiar to thoſe which are tuned by a twelfth and ſeventeenth below the principal ſound; but that oſcillations are likewiſe produced in the lower ſtrings by all its multiples. Whence it follows, that the intervals of the twelfth and ſeventeenth below, not being ſingular phenomena of their kind, nothing can be concluded in favour of the perfect minor chord which they repreſent.

"Though the truth of this experiment were granted, even this would by no means remove the difficulty. If, as M. Rameau alleges, all harmony is derived from the reſonance of ſonorous bodies, it cannot then be derived only from the vibrations of ſuch bodies as do not reſound. In reality, it is an extraordinary theory, to deduce from bodies that do not reſound the principles of *harmony*; and it is a poſition in natural philoſophy no leſs ſtrange, that a ſonorous body ſhould vibrate without reſounding, as if ſound itſelf were any thing elſe but the air impelled by theſe vibrations. Moreover, ſonorous bodies do not only produce, beſides the principal ſound, the other tones which with itſelf compoſe a perfect chord; but an infinite number of other ſounds, formed by all the aliquot parts of the bodies in vibration, which do not enter into that perfect harmony. Why then ſhould the former ſounds produce conſonances, and why ſhould the latter not produce them, ſince all of them equally reſult from nature?

"Every ſound exhibits a chord truly perfect, ſince it is compoſed of all its harmonics, and ſince it is by them that it becomes a ſound. Yet theſe harmonics are not heard, and nothing is diſtinguiſhed but a ſimple ſound, unleſs it be exceedingly ſtrong: whence it follows, that the only good harmony is an uniſon; and that as ſoon as the conſonances can be diſtinguiſhed, the natural proportion being altered, the *harmony* has loſt its purity.

"That alteration is in this caſe produced two different ways. Firſt, by cauſing certain harmonics to reſound, and not the others, the proportion of force which ought to prevail in all of them is altered, for producing the ſenſation of a ſingle ſound; whence the unity of nature is deſtroyed. By doubling theſe harmonics, an effect is exhibited ſimilar to that which would be produced by ſuppreſſing all the others; for in that caſe we cannot doubt, but that, along with the generating ſound, the tones of the other harmonics which were permitted to ſound would be heard: whereas, in leaving all of them to their natural operations, they deſtroy one another, and conſpire together in forming and ſtrengthning the ſimple ſenſation of the principal ſound. It is the ſame effect which the full ſound of a ſtop in the organ produces, when, by ſucceſſively removing the ſtopper or regiſter, the third and fifth are permitted to ſound with the principal; for then that fifth and third, which remained abſorbed in the other ſounds, are ſeparately and diſagreeably diſtinguiſhed by the ear. Harmony.

"Moreover, the harmonics which we cauſe to ſound have other harmonics pertaining to themſelves, which cannot be ſuch to the fundamental ſound. It is by theſe additional harmonics that the ſounds which produce them are diſtinguiſhed with a more ſenſible degree of harſhneſs; and theſe very harmonics which thus render the chord perceptible, do not enter into its *harmony*. This is the reaſon why the moſt perfect chords are naturally diſpleaſing to ears whoſe reliſh for harmony is not ſufficiently formed; and I have no heſitation in thinking, that even the octave itſelf might be diſpleaſing, if the mixture of male and female voices did not inure us to that interval from our infancy.

"With diſſonance it is ſtill worſe; becauſe, not only the harmonics of the ſound by which the diſcord is produced, but even the ſound itſelf is excluded from the natural harmony of the fundamental: which is the cauſe why diſcord is always diſtinguiſhed amongſt all the other ſounds in a manner ſhocking to the ſenſe.

"Every key of an organ, with the ſtop fully opened, gives a perfect chord with its third-major, which are not diſtinguiſhed from the fundamental ſound, if the hearer is not extremely attentive, and if he does not ſound the whole ſtop in ſucceſſion; but theſe harmonic ſounds are never abſorbed in the fundamental, but on account of the prodigious noiſe, and by ſuch a ſituation of the regiſters as may cauſe the pipes which produce the fundamental ſound to conceal by their force the other ſounds which produce theſe harmonics. Now, no perſon obſerves, nor can obſerve, this continual proportion in a concert; ſince, by the manner of inverting the *harmony*, its greateſt force muſt in every inſtant be transferred from one part to another; which is not practicable, and would deſtroy the whole melody.

"When we play upon the organ, every key in the baſs cauſes to reſound the perfect chord major; but becauſe that baſs is not always fundamental, and becauſe the muſic is often modulated in a perfect minor chord, this perfect chord-major is rarely ſtruck with the right hand; ſo that we hear the third minor with the major, the fifth with the triton, the ſeventh redundant with the octave, and a thouſand other cacophonies, which, however, do not much diſguſt our ears, becauſe habit renders them tractable; but it is not to be imagined that an ear naturally juſt would prove ſo patient of diſcords, when firſt expoſed to the teſt of this *harmony*.

"M. Rameau pretends, that trebles compoſed with a certain degree of ſimplicity naturally ſuggeſt their own baſſes; and that any man having a juſt, though unpractiſed ear, would ſpontaneouſly ſing that baſs. This is the prejudice of a muſician, refuted by univerſal experience. Not only would he, who has never heard either baſs or *harmony*, be of himſelf incapable

of

Harmony.

of finding either the baſs or the *harmony* of M. Rameau, but they would be diſpleaſing to him if he heard them, and he would greatly prefer the ſimple uniſon.

"When we conſider, that, of all the people upon earth, who have all of them ſome kind of muſic and melody, the Europeans are the only people who have a *harmony* conſiſting of chords, and who are pleaſed with this mixture of ſounds; when we conſider that the world has endured for ſo many ages, whilſt, of all the nations which cultivated the fine arts, not one has found out this *harmony*: that not one animal, not one bird, not one being in nature, produces any other chord but the uniſon, nor any other muſic but melody: that the eaſtern languages, ſo ſonorous, ſo muſical; that the ears of the Greeks, ſo delicate, ſo ſenſible, practiſed and cultivated with ſo much art, have never conducted this people, luxurious and enamoured of pleaſure as they were, towards this *harmony* which we imagined ſo natural: that without it their muſic produced ſuch aſtoniſhing effects; that with it ours is ſo impotent: that, in ſhort, it was reſerved for the people of the north, whoſe groſs and callous organs of ſenſation are more affected with the noiſe and clamour of voices, than with the ſweetneſs of accents and the melody of inflections, to make this grand diſcovery, and to vend it as the eſſential principle upon which all the rules of the art were founded; when, in ſhort, attention is paid to all theſe obſervations, it is very difficult not to ſuſpect that all our *harmony* is nothing but a Gothic and barbarous invention, which would never have entered into our minds, had we been truly ſenſible to the genuine beauties of art, and of that muſic which is unqueſtionably natural.

"M. Rameau aſſerts, however, that *harmony* is the ſource of the moſt powerful charms in muſic. But this notion is contradictory both to reaſon and to matter of fact. To fact it is contradictory; becauſe, ſince the invention of counter-point, all the wonderful effects of muſic have ceaſed, and it has loſt its whole force and energy. To which may be added, that ſuch beauties as purely reſult from harmony are only perceived by the learned; that they affect none with tranſport but ſuch as are deeply converſant in the art: whereas the real beauties of muſic, reſulting from nature, ought to be, and certainly are, equally obvious to the adept and the novice. To reaſon it is contradictory; ſince harmony affords us no principle of imitation by which muſic, in forming images and expreſſing ſentiments, can riſe above its native excellence till it becomes in ſome meaſure dramatic or imitative, which is the higheſt pitch of elevation and energy to which the art can aſpire; ſince all the pleaſures which we can receive from the mere mechanical influence of ſounds are extremely limited, and have very little power over the human heart."

Thus far we have heard M. Rouſſeau, in his obſervations on *harmony*, with patience; and we readily grant, that the *ſyſtem of harmony* by M. Rameau is neither demonſtrated, nor capable of demonſtration. But it will not follow, that any man of invention can ſo eaſily and ſo quickly ſubvert thoſe aptitudes and analogies on which the ſyſtem is founded. Every hypotheſis is admitted to poſſeſs a degree of probability proportioned to the number of phenomena for which it offers a ſatisfactory ſolution. The firſt experiment of M. Rameau is, that every ſonorous body, together with its principal ſound and its octave, gives likewiſe its twelfth and ſeventeenth major above; which being approximated as much as poſſible, even to the chords immediately reprefented by them, return to the third, fifth, and octave, or, in other words, produce perfect harmony. This is what nature, when ſolicited, ſpontaneouſly gives; this is what the human ear, unprepared and uncultivated, imbibes with ineffable avidity and pleaſure. Could any thing which claims a right to our attention, and acceptance from nature, be impreſſed with more genuine or more legible ſignatures of her function than this? We do not contend for the truth of M. Rameau's ſecond experiment. Nor is it neceſſary we ſhould. The firſt, expanded and carried into all its conſequences, reſolves the phenomena of harmony in a manner ſufficient to eſtabliſh its authenticity and influence. The difficulties for which it affords no ſolution are too few and too trivial either to merit the regard of an artiſt or a philoſopher, as M. D'Alembert in his *elements* has clearly ſhown. The facts with which M. Rouſſeau confronts this principle, the armies of multiplied harmonics generated *in infinitum*, which he draws up in formidable array againſt it, only ſhow the thin partitions which ſometimes may divide philoſophy from whim. For, as bodies are infinitely diviſible, according to the philoſophy now eſtabliſhed, or, as, according to every philoſophy, they muſt be indefinitely diviſible, each infinitеſimal of any given maſs, which are only harmonics to other principal ſounds, muſt have fundamental tones and harmonics peculiar to themſelves; ſo that, if the reaſoning of Rouſſeau has any force againſt M. Rameau's experiment, the ear muſt be continually diſtracted with a chaos of inappretiable harmonics, and melody itſelf muſt be loſt in the confuſion. But the truth of the matter is, that, by the wiſe inſtitution of nature, there is ſuch a conformity eſtabliſhed between our ſenſes and their proper objects, as muſt prevent all theſe diſagreeable effects. Rouſſeau and his opponent are agreed in this, that the harmonics conſpire to form one predominant ſound; and are not to be detected but by the niceſt organs, applied with the deepeſt attention. It is equally obvious, that, in an artificial harmony, by a proper management of this wiſe precaution of nature, diſſonances themſelves may be either entirely concealed, or conſiderably ſoftened. So that, ſince by nature ſonorous bodies in actual vibration are prediſpoſed to exhibit perfect harmony; and ſince the human ear is, by the ſame wiſe regulation, fabricated in ſuch a manner as to perceive it; the harmonical chaos of M. Rouſſeau may be left to operate on his own brain, where it will probably meet with the warmeſt reception it can expect to find†. Nor does it avail him to pretend, that before the harmonics can be diſtinguiſhed, ſonorous bodies muſt be impelled with a force which alters the chords, and deſtroys the purity of the harmony; for this poſition is equally falſe both in theory and practice. In theory, becauſe an impulſe, however forcible, muſt proportionally operate on all the parts of any ſonorous body, ſo far as it extends: in practice, becauſe the human ear actually perceives the harmony to be pure. What effects his various manœuvres upon the organ may have, we leave to ſuch as have leiſure and curioſity enough to try the experiments: but it is ap-

Harmony.

† M. Rouſſeau was alive when this article was written.

Harmony. apprehended, that when tried, their refults will leave the fyftem of Rameau, particularly as remodelled by D'Alembert, in its full force.

Of all the whims and paradoxes maintained by this philofopher, none is more extravagant than his aflertion, that every chord, except the fimple unifon, is difpleafing to the human ear: nay, that we are only reconciled to octaves themfelves by being inured to hear them from our infancy. Strange, that nature fhould have fixed this invariable proportion between male and female voices, whilft at the fame time fhe infpired the hearers with fuch violent prepoffeffions againft it as were invincible but by long and confirmed habit! The tranflator of *D'Alembert's Elements*, as given under the article MUSIC in this Dictionary, has been at peculiar pains to inveftigate his earlieft recollections upon this fubject; and has had fuch opportunities, both of attending to his original perceptions, and of recognifing the fidelity of his memory, as are not common. He can remember, even from a period of early childhood, to have been pleafed with the fimpleft kinds of artificial harmony; to have diftinguifhed the harmonics of fonorous bodies with delight; and to have been ftruck with horror at the found of fuch bodies as, by their ftructure, or by the cohefion of their parts, exhibited thefe harmonics falfe. This is the chief, if not the only caufe, of the tremendous and difagreeable fenfation which we feel from the found of the Chinefe ghong. The fame horrible cacophony is frequently, in fome degree, produced by a drum unequally braced: from this found the tranflator often remembers to have ftarted and fcreamed, when carried through the ftreets of the town in which he was born in the arms of his nurfery-maid; and as he is conficious, that the acouftic organs of many are as exquifite as his own, he cannot doubt but they may have had the fame fenfations, though perhaps they do not recollect the facts. So early and fo nicely may the fenfations of harmony and difcord be diftinguifhed. But after all, it feems that *harmony* is no more than a modern invention, and, even at this late period, only known to the Europeans. We fhould, however, be glad to know, from what oracle our philofopher learned, that harmony was not known to antiquity. From what remains of their works, no proof of his pofition can be derived; and we have at leaft mentioned one probability againft it in our notes to the Preliminary Difcourfe to the article MUSIC, (fee Note B.) But though Rouffeau's mighty objections were granted, that harmony can only be endured by fuch ears as are habitually formed and cultivated; that the period of its prevalence has been fhort, and the extent of its empire limited to Europe; ftill his conclufion, that it is a Gothic and barbarous invention, is not fairly deducible even from thefe premifes. Muft we affirm, that epic poetry has no foundation in nature, becaufe, during the long interval which happened from the beginning of the world to the deftruction of Troy, no epic poem feems to have appeared? Or becaufe a natural and mellifluous verification is lefs relifhed by an unpolifhed taffe, than the uncouth rhymes of a common ballad, fhall we infer, that the power of numbers is merely fuppofititious and arbitrary? On the contrary, we will venture to affirm, that though harmony cannot, as Rameau fuppofes, be mathematically demonftrated from the nature and vibrations of fonorous bodies; yet Harmony. the idea of its conftituent parts, and of their coalefcence, is no lefs eftablifhed, no lefs precife and definite, than any mode or property of fpace or quantity to be inveftigated by geometrical refearches or algebraical calculations. It is certain, that the mimetic or imitative power of mufic chiefly confifts in melody; but from this truth, however evident, it cannot be fairly deduced, that harmony is abfolutely unfufceptible of imitation. Perhaps every mufical found, even to the moft fimple, and all modulations of found, are more or lefs remotely connected with fome fentiment or paffion of the human heart. We know, that there are inftinctive expreffions of pain or pleafure in their various modes and degrees, which, when uttered by any fenfitive, and perceived by any confcious being, excite in the mind of the percipient a feeling fympathetic with that by which they are prompted. We likewife know from experience, that all artificial founds modulated in the fame manner, have fimilar, though not equal, effects. We have feen, that, in order to render harmony compatible with itfelf, the melody of each part muft be congenial; and, for that reafon, one kindred melody refult from the whole. So far, therefore, as any compofer has it in his power to render the general melody homogeneous; fo far the imitation may be preferved, and even heightened: for fuch objects as are majeftic and auguft, or the feelings which they excite, are more aptly expreffed by a compofition of kindred founds, than by any fimple tone whatever. They who fuppofe the mimetic powers of mufic to be conftimmated in the imitation of mere unmeaning founds or degrees of motion, muft entertain limited and unworthy ideas of its province. It is naturally a repreffentative almoft of every fentiment or affection of the foul; and, when this end is gained, the art muft have reached its higheft perfection, and produced its nobleft effects. But thefe effects, however fenfible among the ancients, may in us be fuperfeded by other caufes which remain yet unexplored. Theatrical performances are likewife, by them, faid to have produced the moft wonderful effects; yet thefe we do not recognife amongft ourfelves, tho' we have dramatic entertainments perhaps not inferior to theirs.

Rouffeau proceeds to tell us, that among the ancients, the *enharmonick* fpecies of mufic was fometimes called *harmony*.

Direct HARMONY, is that in which the bafs is fundamental, and in which the upper parts preferve among themfelves, and with that fundamental bafs, the natural and original order which ought to fubfift in each of the chords that compofe this harmony.

Inverted HARMONY, is that in which the fundamental or generating found is placed in fome of the upper parts, and when fome other found of the chord is tranferred to the bafs beneath the others.

HARMONY *of the Spheres*, or *Celeftial* HARMONY, a fort of mufic much talked of by many of the ancient philofophers and fathers, fuppofed to be produced by the fweetly tuned motions of the ftars and planets. This harmony they attributed to the various proportionate impreffions of the heavenly globes upon one another, acting at proper intervals. It is impoffible, according to them, that fuch prodigious large bodies, moving with fo much rapidity, fhould be filent: on the contrary,

Harold, Harp.

trary, the atmoſphere, continually impelled by them, muſt yield a ſet of ſounds proportionate to the impreſſion it receives; conſequently, as they do not all run the ſame circuit, nor with one and the ſame velocity, the different tones ariſing from the diverſity of motions, directed by the hand of the Almighty, muſt form an admirable ſymphony or concert.

They therefore ſuppoſed, that the moon, as being the loweſt of the planets, correſponded to *mi*; Mercury, to *fa*; Venus to *ſol*; the Sun, to *la*; Mars, to *fi*; Jupiter, to *ut*; Saturn, to *re*; and the orb of the fixed ſtars, as being the higheſt of all, to *mi*, or the octave.

HAROLD, the name of two Engliſh kings. See ENGLAND, n° 76, 82.

HARP, a muſical inſtrument of the ſtringed kind, of a triangular figure, and held upright between the legs of the performer.

There is ſome diverſity in the ſtructure of harps. That called the *triple harp* has three rows of ſtrings or chords, which in all make 78, or four octaves; the ſecond row makes the half turn, and the third is uniſon with the firſt. There are two rows of pins on the right ſide, called *buttons*, that ſerve to keep the ſtrings tight in their holes; which are faſtened at the other end to three rows of pins on the upper ſide called the *keys*. This inſtrument is ſtruck with the fingers and thumbs of both hands: its muſic is like that of the ſpinet, whence ſome have called it the *inverted ſpinet*. There are among us two ſorts of this inſtrument, viz. the Iriſh harp, which is ſtrung with wire; and the Welſh harp, ſtrung with gut.

As to ancient harps, two are repreſented on Plate CL.——Fig. 26. is a *trigonum* or triangular harp. It is taken from an ancient painting in the muſeum of the king of Naples, in which it is placed on the ſhoulder of a little dancing cupid, who ſupports the inſtrument with his left hand, and plays upon it with his right. The trigonum is mentioned by Athenæus, lib. iv. and by Julius Pollux, lib. iv. cap. 9. According to Athenæus, Sophocles calls it a *Phrygian inſtrument*; and one of his dipnoſophiſts tells us, that a certain muſician, named *Alexander Alexandrinus*, was ſuch an admirable performer upon it, and had given ſuch proofs of his abilities at Rome, that he made the inhabitants μανομενους, muſically mad.

Fig. 25. is the Theban harp, according to a drawing made by J. Bruce, eſq; from an ancient painting in one of the ſepulchral grottos of the firſt kings of Thebes. "The performer is clad in a habit made like a ſhirt, ſuch as the women ſtill wear in Abyſſinia, and the men in Nubia. This ſeems to be white linen or muſlin, with narrow ſtripes of red. It reaches down to his ancles; his feet are without ſandals and bare; his neck and arms are alſo bare; his looſe wide ſleeves are gathered above his elbows; and his head is cloſe ſhaved. His left hand ſeems employed in the upper part of the inſtrument among the notes in *alto*, as if in an arpeggio; while, ſtooping forwards, he ſeems with his right hand to be beginning with the loweſt ſtring, and promiſing to aſcend with the moſt rapid execution: this action, ſo obviouſly rendered by an indifferent artiſt, ſhews that it was a common one in his time; or, in other words, that great hands were then frequent, and conſequently that muſic was well underſtood, and diligently followed. Harp.

"If we allow the performer's ſtature to be about five feet ten inches, then we may compute the harp in its extreme length to be ſomething leſs than ſix feet and a half. It ſeems to ſupport itſelf *in equilibrio* on its foot or baſe, and needs only the player's guidance to keep it ſteady. It has 13 ſtrings; the length of theſe, and the force and liberty with which they are treated, ſhew that they are made in a very different manner from thoſe of the lyre. (See LYRE.)

"This inſtrument is of a much more elegant form than the triangular Grecian harp. It wants the forepiece of the frame, oppoſite to the longeſt ſtring; which certainly muſt have improved its tone, but muſt likewiſe have rendered the inſtrument itſelf weaker, and more liable to accidents if carriage had not been ſo convenient in Egypt. The back part is the ſounding board, compoſed of four thin pieces of wood, joined together in form of a cone, that is, growing wider towards the bottom; ſo that, as the length of the ſtring increaſes, the ſquare of the correſpondent ſpace, in the ſounding board, in which the tone is to undulate, always increaſes in proportion.

"Beſides that the whole principles upon which the harp is conſtructed are rational and ingenious, the ornamental parts are likewiſe executed in the very beſt manner; the bottom and ſides of the frame ſeem to be fineered, or inlaid, probably with ivory, tortoiſeſhell, and mother-of-pearl, the ordinary produce of the neighbouring ſeas and deſerts. It would be even now impoſſible to finiſh an inſtrument with more taſte and elegance.

"Beſides the elegance of its outward form, we muſt obſerve, likewiſe, how near it approached to a perfect inſtrument; for it wanted only two ſtrings of having two complete octaves in compaſs. Whether theſe were intentionally omitted or not, we cannot now determine, as we have no idea of the muſic or taſte of that time; but if the harp be painted in the proportions in which it was made, it might be demonſtrated that it could ſcarce bear more than the 13 ſtrings with which it was furniſhed. Indeed the croſs-bar would break with the tenſion of the four longeſt, if they were made of the ſize and conſiſtence and tuned to the pitch that ours are at preſent.

"I look upon this inſtrument then, as the Theban harp, before and at the time of Seſoſtris, who adorned Thebes, and probably cauſed it to be painted there, as well as the other figures in the ſepulchre of his father, as a monument of the ſuperiority which Egypt had in muſic at that time over all the barbarous nations that he had ſeen or conquered.

"We know, about the time of Seſoſtris, if, as Sir Iſaac Newton ſuppoſes, this prince and Seſac were the ſame, that in Paleſtine the harp had only ten ſtrings; but as David, while he played upon it, both danced and ſung before the ark, it is plain, that the inſtrument upon which he played could have been but of ſmall volume, we may ſuppoſe little exceeding in weight our guitar; though the origin of this harp was probably Egyptian, and from the days of Moſes it had been degenerating in ſize, that it might be more portable in the many peregrinations of the Iſraelites."

To the above account by Mr Bruce, Dr Burney ſubjoins the following obſervations. "The number of *History of Muſic*, p. 225.

Harp. of ſtrings, the ſize and form of this inſtrument, and the elegance of its ornaments, awaken reflections, which to indulge would lead us too far from our purpoſe, and indeed out of our depth. The mind is wholly loſt in the immenſe antiquity of the painting in which it is repreſented. Indeed the time when it was executed is ſo remote, as to encourage a belief, that arts after having been brought to great perfection, were again loſt, and again invented long after this period.—

"With reſpect to the number of ſtrings upon this harp, if conjectures may be allowed concerning the method of tuning them, two might be offered to the reader's choice. The firſt idea that preſented itſelf at the ſight of 13 ſtrings was, that they would furniſh all the ſemitones to be found in modern inſtruments within the compaſs of an octave, as from C to *c*, D to *d*, or E to *e*. The ſecond idea is more Grecian, and conformable to antiquity; which is, that if the longeſt ſtring repreſented *Proſlambanomenos*, or D, the remaining 12 ſtrings would ſupply all the tones, ſemitones, and quarter-tones, of the diatonic, chromatic, and enharmonic genera of the ancients, within the compaſs of an octave: but for my part I would rather incline to the firſt arrangement, as it is more natural, and more conformable to the ſtructure of our organs, than the ſecond. For with reſpect to the genera of the Greeks, though no hiſtoric teſtimony can be produced concerning the invention of the diatonic and chromatic, yet ancient writers are unanimous in aſcribing to Olympus the Phrygian the firſt uſe of the enharmonic: and though in the beginning the melody of this genus was ſo ſimple and natural as to reſemble the wild notes and rude eſſays of a people not quite emerged from barbariſm; yet in after-times it became overcharged with finical fopperies, and fanciful beauties, ariſing from ſuch minute diviſions of the ſcale as had no other merit than the great difficulty of forming them.

"It ſeems a matter of great wonder, with ſuch a model before their eyes as the Theban harp, that the form and manner of uſing ſuch an inſtrument ſhould not have been perpetuated by poſterity; but that, many ages after, another of an inferior kind, with fewer ſtrings, ſhould take place of it. Yet if we conſider how little we are acquainted with the uſe and even conſtruction of the inſtruments which afforded the greateſt delight to the Greeks and Romans, or even with others in common uſe in a neighbouring part of Europe only a few centuries ago, our wonder will ceaſe; eſpecially if we reflect upon the ignorance and barbariſm into which it is poſſible for an ingenious people to be plunged by the tyranny and devaſtation of a powerful and cruel invader."

Bell-Harp, a muſical inſtrument of the ſtring kind, thus called from the common players on it ſwinging it about, as a bell on its bais.

It is about three feet long; its ſtrings, which are of no determinate number, are of braſs or ſteel wire, fixed at one end, and ſtretched acroſs the ſound-board by ſcrews fixed at the other. It takes in four octaves, according to the number of the ſtrings, which are ſtruck only with the thumbs, the right hand playing the treble, and the left hand the baſe: and in order to draw the ſound the clearer, the thumbs are armed with a little wire pin. This may perhaps be the lyra, or cythara of the ancients; but we find no mention made of it under the name it now bears, which muſt be allowed to be modern.

Harquebuſs || Harpocration.

Harp *of Æolus*. See Acoustics, n° 10.

HARPAGIUS. See Arpagius.

HARPALUS, a Greek aſtronomer, who flouriſhed about 480 B. C. corrected the cycle of eight years invented by Cleoſtratus; and propoſed a new one of nine years, in which he imagined the ſun and moon returned to the ſame point. But Harpalus's cycle was afterwards altered by Meton, who added ten full years to it. See Astronomy, n° 304.

HARPIES, among the ancient poets, fabulous impure monſters, ſaid to be the daughters of Neptune and Terra. Virgil mentions three of them, Aello, Ocypete, and Celæno; they are deſcribed to be fowls, with the face of a virgin, bears ears, their bodies like vultures, and hands like their crooked talons.

HARPING iron. See Harpoon.

HARPINGS, the fore-parts of the wales which encompaſs the bow of a ſhip, and are faſtened to the ſtem, being thicker than the after part of the wales, in order to reinforce the ſhip in this place, where ſhe ſuſtains the greateſt ſhock of reſiſtance in plunging into the ſea, or dividing it, under a great preſſure of ſail.

HARPOCRATES, in Pagan theology, was the ſon of Iſis, and eſteemed the god of ſilence. He was repreſented under the form of a young man half naked, crowned with an Egyptian mitre, holding in his left hand a cornucopia, and a finger of the other placed on his lips as recommending ſilence.

HARPOCRATION, (Valerius), a celebrated ancient rhetorician of Alexandria, who has left us an excellent *Lexicon upon the ten orators of Greece*. Aldus firſt publiſhed this lexicon in the Greek at Venice in 1603. Many learned men have laboured upon it; but the beſt edition was given by James Gronovius at Leyden in 1696.

HARPSICHORD, the moſt harmonious of all the muſical inſtruments of the ſtring-kind. It is played on after the manner of the organ, and he is furniſhed with a ſet, and ſometimes with two ſets of keys; the touching or ſtriking of theſe keys moves a kind of little jacks, which alſo move a double row of chords or ſtrings, of braſs or iron, ſtretched over four bridges on the table of the inſtrument.

HARPOON, or Harping-iron, a ſpear or javelin uſed to ſtrike the whales in the Greenland fiſhery.

The harpoon, which is ſometimes called the *harping-iron*, is furniſhed with a long ſtaff, having at one end a broad and flat triangular head ſharpened at both edges, ſo as to penetrate the whale with facility: to the head of this weapon is faſtened a long cord, called the *whale line*, which lies carefully *coiled* in the boat, in ſuch a manner, as to run out without being interrupted or entangled. See Whale-*Fiſhery*.

HARQUEBUSS, a piece of fire-arms, of the length of a muſket, uſually cocked with a wheel. It carried a ball that weighed one ounce ſeven-eighths.

There was alſo a larger ſort, called the great harquebuſs, uſed for the defence of ſtrong places, which carried a ball of about three ounces and a half: but they are now but little uſed, except in ſome old caſtles, and by the French in ſome of their garriſons.

HAR-

Harrier || Harriot.

HARRIER, a kind of hound, endowed with an admirable gift of ſmelling, and very bold in the purſuit of his game.

HARRINGTON (Sir John), an ingenious Engliſh poet, was the ſon of John Harrington, eſq; who was committed to the tower by queen Mary for holding a correſpondence with her ſiſter Elizabeth; who, when ſhe came to the crown, ſtood godmother to this ſon. Before he was 30, he publiſhed a tranſlation of Arioſto's Orlando Furioſo, a work by which he was principally known; for though he afterwards publiſhed ſome epigrams, his talent did not ſeem to have lain that way. He was created knight of the bath by James I.; and preſented a MS. to prince Henry, levelled chiefly at the married biſhops. He is ſuppoſed to have died about the latter end of James's reign.

HARRINGTON (James), a moſt eminent Engliſh writer in the 17th century, bred at Oxford, travelled into Holland, France, Denmark and Germany, and learned the languages of thoſe countries. Upon his return to England, he was admitted one of the privy-chamber extraordinary to king Cha. I. He ſerved the king with great fidelity, and made uſe of his intereſt with his friends in parliament to procure matters to be accommodated with all parties. The king loved his company except when the converſation happened to turn upon commonwealths. He found means to ſee the king at St James's; and attended him on the ſcaffold, where, or a little before, he received a token of his majeſty's affection. After the death of king Charles, he wrote his *Oceana*; a kind of political romance, in imitation of Plato's Commonwealth, which he dedicated to Oliver Cromwell. It is ſaid, that when Oliver peruſed it, he declared, that "the gentleman had wrote very well, but muſt not think to cheat him out of his power and authority; for that what he had won by the ſword, he would not ſuffer himſelf to be ſcribbled out of." This work was attacked by ſeveral writers, againſt whom he defended it. Beſide his writings to promote republican principles, he inſtituted likewiſe a nightly meeting of ſeveral ingenious men in the New Palace-Yard, Weſtminſter; which club was called the *Rota*, and continued till the ſecluded members of parliament being reſtored by general Monk, all their models vaniſhed. In 1661, he was committed to the tower for treaſonable deſigns and practices; and chancellor Hyde, at a conference with the lords and commons, charged him with being concerned in a plot. But a committee of lords and commons could make nothing of that plot. He was conveyed to St Nicolas' iſland, and from thence to Plymouth, where he fell into an uncommon diſorder of the imagination. Having obtained his liberty by means of the earl of Bath, he was carried to London, and died in 1677. He publiſhed, beſides the above works, ſeveral others, which were firſt collected by Toland, in one volume folio, in 1700; but a more complete edition was publiſhed, in 1737, by the reverend Dr Birch.

HARRIOT (Thomas), a celebrated algebraiſt, was born at Oxford in 1560, where he was alſo educated. In 1579, he completed his bachelor's degree; and, being already diſtinguiſhed for his mathematical learning, was ſoon after recommended to Sir Walter Raleigh, as a proper perſon to inſtruct him in that ſcience. He was accordingly received into the family of that gentleman; who, in 1585, ſent him with the colony, under Sir Richard Grenville, to Virginia; of which country, having remained there about a year, he afterwards publiſhed a topographical deſcription. About the year 1588, Mr Hariot was introduced by his patron Sir Walter Raleigh, to Henry Percy earl of Northumberland, who allowed him a penſion of 120l. *per annum*. He ſpent many years of his life in Sion college; where he died in July 1621, of a cancer in his lip, and was buried in the church of St Chriſtopher, where a handſome monument was erected to his memory. Anthony Wood tells us he was a deiſt, and that the divines looked upon his death as a judgement. Be his religious opinions what they might, he was doubtleſs one of the firſt mathematicians of the age in which he lived, and will always be remembered as the inventor of the preſent improved method of algebraical calculation. His improvements in algebra were adopted by Des Cartes, and for a conſiderable time impoſed upon the French nation as his own invention; but the theft was at laſt detected, and expoſed by Dr Wallis, in his Hiſtory of Algebra, where the reader will find our author's invention accurately ſpecified. His works are, 1. A brief and true report of the new-found land of Virginia; of the commodities there found, and to be raiſed, &c. 2. *Artis analyticæ praxis ad æquationes algebraicas nova expedita, et generali methodo reſolvendas, e poſthumis Thomæ Harrioti*, &c. 3. *Ephemeris chyrometrica*. Manuſcript, in the library of Sion college. He is ſaid to have left ſeveral other manuſcripts which are probably loſt. Harriot, Harriſon.

HARRISON (John), a moſt accurate mechanic, the celebrated inventor of the famous *time-keeper* for aſcertaining the longitude at ſea, and alſo of the compound, or, as it is commonly called, the *gridiron pendulum*; was born at Foulby, in the pariſh of Wragby, near Pontefract in Yorkſhire, in 1693. The vigour of his natural abilities, if not even ſtrengthened by the want of education, which confined his attention to few objects, at leaſt amply compenſated the deficiencies of it; as fully appeared from the aſtoniſhing progreſs he made in that branch of mechanics to which he devoted himſelf. His father was a carpenter, in which profeſſion the ſon aſſiſted; occaſionally alſo, according to the miſcellaneous practice of country artiſts, ſurveying land, and repairing clocks and watches. He was, from his early childhood, attached to any machinery moving by wheels, as appeared while he lay ſick of the ſmall-pox about the 6th year of his age, when he had a watch placed open upon his pillow to amuſe himſelf by contemplating on the movement. In 1700, he removed with his father to Barrow in Lincolnſhire; where, though his opportunities of acquiring knowledge were very few, he eagerly improved every incident from which he might collect information; frequently employing all, or great part of his nights, in writing, or drawing: and he always acknowledged his obligations to a clergyman who came every ſunday to officiate in the neighbourhood, who lent him a MS. copy of profeſſor Saunderſon's Lectures; which he carefully and neatly tranſcribed, with all the diagrams. His native genious exerted

Harriſon.

itſelf ſuperior to theſe ſolitary diſadvantages; for in the year 1726, he had conſtructed two clocks, moſtly of wood, in which he applied the eſcapement and compound pendulum of his own invention: theſe ſurpaſſed every thing then made, ſcarcely erring a ſecond in a month. In 1728, he came up to London with the drawings of a machine for determining the longitude at ſea, in expectation of being enabled to execute one by the the board of longitude. Upon application to Dr Halley, he referred him to Mr George Graham; who, diſcovering he had uncommon merit, adviſed him to make his machine before he applied to the board of longitude. He returned home to perform this taſk; and 1735, came to London again with his firſt machine; with which he was ſent to Liſbon the next year for a trial of its properties. In this ſhort voyage, he corrected the dead reckoning about a degree and a half; a ſucceſs that proved the means of his receiving both public and private encouragement. About the year 1739, he completed his ſecond machine, of a conſtruction much more ſimple than the former, and which anſwered much better: this, though not ſent to ſea, recommended Mr Harriſon yet ſtronger to the patronage of his private friends and of the public. His third machine, which he produced in 1749, was ſtill leſs complicated than the ſecond, and ſuperior in accuracy, as erring only three or four ſeconds in a week. This he conceived to be the *ne plus ultra* of his attempts; but in an endeavour to improve pocket-watches, he found the principles he applied, to ſurpaſs his expectations ſo much, as to encourage him to make his fourth time-keeper, which is in the form of a pocket watch, about ſix inches diameter. With this time-keeper his ſon made two voyages, the one to Jamaica, and the other to Barbadoes: in both which experiments it corrected the longitude within the neareſt limits required by the act of the 12th of queen Anne; and the inventor therefore, at different times, though not without infinite trouble, received the propoſed reward of 20,000 l. Theſe four machines were given up to the board of longitude. The three former were not of any uſe, as all the advantages gained by making them were comprehended in the laſt: they were worthy, however, of being carefully preſerved as mechanical curioſities, in which might be traced the gradations of ingenuity executed with the moſt delicate workmanſhip; whereas they now lie totally neglected, in the royal obſervatory at Greenwich. The fourth machine, emphatically diſtinguiſhed by the name of *The time-keeper*, has been copied by the ingenious Mr Kendal; and that duplicate, during a three years circumnavigation of the globe in the ſouthern hemiſphere by captain Cook, anſwered as well as the original. The latter part of Mr Harriſon's life was employed in making a fifth improved time-keeper on the ſame principles with the preceding one; which, at the end of a ten weeks trial, in 1772, at the king's private obſervatory at Richmond, erred only 4½ ſeconds. Within a few years of his death, his conſtitution viſibly declined; and he had frequent fits of the gout, a diſorder that never attacked him before his 77th year: he died at his houſe in Red-Lion Square, in 1776, aged 83. The reeluſe manner of his life in the unremitted purſuit of his favourite object, was by no means calculated to qualify him as a man of the world; and the many diſcouragements he encountered in ſoliciting the legal reward of his labours, ſtill leſs diſpoſed him to accommodate himſelf to the humours of mankind. In converſing on his profeſſion, he was clear, diſtinct, and modeſt; yet, like many other mere mechanics, found a difficulty in delivering his meaning by writing; in which he adhered to a peculiar and uncouth phraſeology. This was but too evident in his *Deſcription concerning ſuch mechaniſm as will afford a nice or true menſuration of time*, &c. 8vo. 1775; which his well-known mechanical talents will induce the public to account for from his unacquaintance with letters, from his advanced age, and attendant mental infirmities; among which may be reckoned his obſtinate refuſal to accept of any aſſiſtance whatever in this publication. This ſmall work includes alſo an account of his new muſical ſcale; or mechanical diviſion of the octave, according to the proportion which the radius and diameter of a circle have repectively to the circumference. He had in his youth been the leader of a diſtinguiſhed band of church-ſingers; had a very delicate ear for muſic; and his experiments on ſound, with a moſt curious monochord of his own improvement, are reported to have been not leſs accurate than thoſe he was engaged in for the menſuration of time.

Harrow ‖ Hartford-ſhire.

HARROW, in agriculture. See there, n° 89.

HART, a ſtag, or male deer, in the ſixth year. See Cervus.

Hart's *Horns*, in pharmacy, the whole horns of the common male deer, as ſeparated from the head, without farther preparation.

The chemical analyſis of hart's-horn is ſufficiently known: it yields a water highly impregnated with a volatile ſalt, which is called *ſpirit of hartſhorn*, with a fetid oil, and a volatile ſalt, by the common diſtillation in a retort.—The ſalt of hartſhorn, when pure, differs in nothing from other purified volatile alkalies. See Chemistry, n° 329—336; Volatile *Alkali*; and *Alkaline* Spirits.

HARTFORDSHIRE, a county of England, deriving its name from Hartford, the capital; and that from the harts with which it anciently abounded, being then over-run with woods. It is bounded on the eaſt by Eſſex, on the weſt by Bedfordſhire and Buckinghamſhire, on the ſouth by Middleſex, and on the north by Cambridgeſhire. This county is much indented by thoſe that ſurround it: the longeſt part is about 30 miles, the broadeſt about 24, and 130 in compaſs; in which are contained about 451,000 acres, 18 market-towns, 120 pariſhes, and above 95,000 inhabitants, who ſend ſix members to parliament, viz. two for the ſhire, two for Hartford, and two for St Alban's. Before the reign of queen Elizabeth, one ſheriff ſerved both for this ſhire and Eſſex; but in the ninth year of her reign, it had one allotted for itſelf. With regard to eccleſiaſtical juriſdiction, it belongs partly to the dioceſe of Lincoln, and partly to that of London.

Though the ſoil in general, eſpecially in the Chiltern and ſouthern parts, is but very indifferent, and much inferior to that of the neighbouring counties; yet the air is ſo much ſuperior, that lands in this ſhire generally ſell at three or four years purchaſe more than in many others, on that account. But it muſt be owned,

Hartford || Hartlepool.

owned, that the foil of Hartfordſhire has been much improved of late, by draining, ſowing graſs-ſeeds, and other methods. There are few or no manufactures in the county; but its markets are much frequented, in conſequence of its being near London, for malt and all ſorts of grain, which, with the many thoroughfares through it, make ample amends.

HARTFORD, the capital of the county of the ſame name, ſignifying, as is commonly thought, the "ford of harts," ſtands on the river Lea, in W. Long. 7'. N. Lat. 51. 45. In William the Conqueror's time, as we find in doomſday-book, there were 26 burgeſſes in it. It has a caſtle upon the Lea, ſuppoſed to have been built by Edward the Elder, which Edward III. granted to his ſon John duke of Lancaſter, together with the town and honour of Hartford, that (as it is expreſſed in the grant) he might keep a houſe ſuitable to his quality and have a decent habitation. Here the Eaſt-Saxon kings often kept their court; and here, in 673, was held a ſynod. King Edward the Elder built a village for his tenants, and fortified it with a wall of turf for their defence, which is what was originally meant by a burgh, whence the houſes were called *burgages*, and the inhabitants *burgher* or *burgeſſes*. The manor of this town was an honour and a royal manor, and even the town and caſtle were held of the king *in capite*; of the latter of which the ſheriffs of Hartfordſhire and Eſſex were uſually governors. The manor was granted by queen Elizabeth to lord Burleigh, whoſe deſcendants ſtill poſſeſs it. The town ſent members to parliament in Edward I.'s time, but after the ſeventh of Henry V. the bailiff and burgeſſes petitioned the parliament to be excuſed on account of their poverty. It has had ſeveral charters and grants of privileges from different kings, particularly ſeveral fairs and markets. In Henry VII.'s reign, the ſtandards of weights and meaſures were ordered to be kept here. Here was anciently a monaſtery; founded by a nephew of William the Conqueror's, and five churches, which are now reduced to two. As the town is remarkable for its pleaſant dry ſituation and wholeſome air, the governors of Chriſt's-hoſpital have fitted up a large building for the reception of their ſickly or ſupernumerary children. It is governed at preſent by a mayor, high-ſteward, recorder, nine aldermen, a town-clerk, chamberlain, 10 capital burgeſſes, and 16 aſſiſtants; and it has two fergeants at mace. Its markets are very conſiderable for wool, wheat, and malt; of which, eſpecially the laſt, great quantities are conveyed to London by the river Lea. The town has had a great many benefactors; but to particularize them and their benefactions, would require more room than we can allow. It gives the title of earl to the noble family of Seymour-Conway.

HARTLAND, a town in Devonſhire, near the Briſtol channel, with a market on Saturdays, much frequented by the people of Cornwall, who come hither in boats. It gives its name to a point, called *Hartland Point*, at the entrance of Briſtol channel. W. Lon. 4. 45. N. Lat. 51. 9.

HARTLEPOOL, a ſea-port town in the county of Durham. It is commodiouſly ſeated on a promontory, and is almoſt encompaſſed by the ſea. It is an ancient corporation, governed by a mayor and aldermen, with other ſubordinate officers. It is at preſent a pretty large, but poor place. It depends chiefly on the fiſhing trade; and its harbour is much frequented by colliers paſſing to and from Newcaſtle. W. Lon. 0. 55. N. 54. 40.

Hartley || Hartſpices.

HARTLEY (David), M. A. born at Ilingworth, where his father was curate, received his academical education at Jeſus college, Cambridge, of which he was a fellow. He firſt began to practiſe phyſic at Newark, in Nottinghamſhire; from whence he removed to St Edmund's Bury, in Suffolk. After this, he ſettled for ſome time in London; and laſtly went to live at Bath, where he died in 1757, aged 53, leaving two ſons and a daughter. He publiſhed "A view of the preſent evidence for and againſt Mrs Stephens's * medicines as a ſolvent for the ſtone, containing 155 caſes, with ſome experiments and obſervations;" London, 1739.

* See *Stephens's Medicines*.

He is ſaid to have alſo written againſt Dr Warren, of St Edmund's Bury, in defence of inoculation; and ſome letters of his are to be met with in the Philoſophical Tranſactions.—The doctor was certainly a man of learning, and reputed a good phyſician; but too fond of noſtrums.

But his moſt conſiderable literary production is a work entitled, "Obſervations on man, his frame, his duty, and his expectations, in two parts;" London, 1749, 2 vols, 8vo. The firſt part contains obſervations on the frame of the human body and mind, and on their mutual connexions and influences. The ſecond part contains obſervations on the duty and expectations of mankind.

HARTMAN (John Adolphus), a learned divine and hiſtorian, was born at Munſter in 1680. After being a Jeſuit for ſeveral years, he became a Calviniſt, at Caſſel, in 1715, and ſoon after was made profeſſor of philoſophy and poetry, and in 1722 profeſſor of hiſtory and eloquence at Marpurg, where he died in 1744. The moſt eſteemed of his works are, 1. The ſtate of the ſciences at Heſſe, in German. 2. *Hiſtoria Haſſiaca*, 3 vols. 3. *Præcepta eloquentiæ rationalis*, &c.

He ought not to be confounded with *George Hartman*, a German mathematician, who, in 1540, wrote a book on perſpective; nor with *Wolfgang Hartman*, who, in 1596, compoſed the Annals of Augſburg.

HARUSPICES, pretenders to divination by certain ſigns, or omens, among the Romans.—The Roman haruſpices were at firſt all taken from Hetruria, where their art had moſt credit. Afterwards young Romans were ſent into Hetruria, in order to be brought up in the ſcience. It conſiſted in fortelling future events by attending to various circumſtances of the victims. Firſt, It was an ill omen when the victim would not come to the altar without dragging, when it broke its rope, fled away, avoided the ſtroke, ſtruggled much after it, made a great bellowing, was long a-dying, or bled but little. Secondly, Preſages were drawn from inſpecting the noble parts of the victim when opened; as the heart, lungs, ſpleen, and eſpecially the liver. If all theſe were ſound, if the top of the liver was large and well-made, and if its fibres were ſtrong, it preſaged well for the affair in queſtion. Thirdly, Knowledge was alſo drawn by the haruſpices from the manner in which the fire conſumed the

Haruſpicy || Harwich.

victim. If the flame brightened immediately, was pure and clear, roſe up in a pyramid without noiſe, and did not go out till the victim was conſumed, theſe were happy ſigns. Fourthly, The ſmoke alſo was conſidered, whether it whirled about in curls, or ſpread itſelf to the right or the left, or gave a ſmell different from the common one of broiled meat. Fifthly, it was a lucky omen if the incenſe they burned melted all at once, and gave a moſt agreeable ſmell.

HARUSPICY. See HARUSPICES and DIVINATION.

HARVEY (Dr William), an eminent Engliſh phyſician in the 17th century, was incorporated Doctor of phyſic in Cambridge, afterwards admitted into the college of phyſicians in London, and was appointed lecturer of anatomy and chirurgery in that college. In theſe lectures he opened his diſcovery relating to the circulation of the blood; which, after a variety of experiments, he communicated to the world in his *Exercitatio anatomica de motu cordis et ſanguinis*. He was phyſician to king James I. and to king Charles I. and adhered to the royal cauſe. His works have eternized his memory. In 1651, he publiſhed his *Exercitationes de generatione animalium*, a very curious work; but it would have been more ſo, had not his papers been deſtroyed during the civil wars. In 1654, he was choſen preſident of the college of phyſicians in his abſence: but his age and weakneſs were ſo great, that he could not diſcharge the duty of that office; and, therefore, deſired them to chooſe Dr Pringle. As he had no children, he ſettled his paternal eſtate upon the college. He had three years before built a combination-room, a library, and a muſeum; and in 1656 he brought the deeds of his eſtate, and preſented them to the college. He was then preſent at the firſt feaſt, inſtituted by himſelf, to be continued annually, together with a commemoration ſpeech in Latin, to be ſpoken on the 18th of October, in honour of the benefactors to the college; he having appointed a handſome ſtipend for the orator, and alſo for the keeper of the library and muſeum, which are ſtill called by his name. He died in 1657.

This great phyſician had the happineſs, in his lifetime, to find the clamours of ignorance, envy, and prejudice, againſt his doctrine, totally ſilenced, and to ſee it univerſally eſtabliſhed. It has, by length of time, been more and more confirmed, and every man now ſees and knows it from his own experience. It appears to be of the utmoſt importance in medicine; as it is perhaps impoſſible to define health and ſickneſs in fewer words, than that the one is a free, and the other an obſtructed, circulation.—Dr Harvey was not only an excellent phyſician, but an excellent man; his modeſty, candour, and piety, were equal to his knowledge; the farther he penetrated into the wonders of nature, the more he was inclined to venerate the Author of it.

HARVEST, the time or ſeaſon of the year in which the corn is ripe, and fit to be taken into barns.

HARVEST-*Fly*, in zoology, a large four-winged fly of the cicada kind, very common in Italy, and erroneouſly ſuppoſed to be a graſshopper. See CICADA.

HARWICH, a town of Eſſex, in England, ſituated in E. Lon. 1. 25. N. Lat. 52. 3. It is not large, but is neat and well-built, and is walled and paved with a ſort of petrified clay that falls from the cliffs in the neighbourhood. The harbour or bay is very large, ſafe, and deep; and is commanded by a ſtrong fort on the Suffolk ſide, though not in that county. Here is a dock belonging to the government, with all conveniencies for building, cleaning, and refitting men of war. A little way from the town, on a high hill called *Beacon-hill*, is a very fine light-houſe, which is ſeen at a very great diſtance, and is very uſeful on this dangerous coaſt. At this place the packet-boats that paſs between England, Holland, and Germany, are ſtationed, and the town is much benefited by the paſſengers. The government, by a charter from king James I. is veſted in a mayor, eight aldermen, 24 capital burgeſſes, the electors, and recorder. The town has alſo an admiralty juriſdiction within its liberties, and the return of all writs, fines, &c. Haſlewere || Haſtings.

HASLEMERE, a town of Surry, in England, ſeated on the edge of the county next Hampſhire, and ſends two members to parliament. This borough is governed by a conſtable; has one church, and about 100 low brick houſes in two paved ſtreets. The number of inhabitants is computed at about 4000. W. Lon. 0. 30. N. Lat. 51. 4.

HASSELT, a handſome town of the United Provinces, in Overyſſel, ſeated on the river Wecht, in E. Lon. 6. 5. N. Lat. 23. 46.

HASSELT, a town of Germany, in the circle of Weſtphalia, and in the territory of Liege, ſituated on the river Demer, in E. Lon. 4. 49. N. Lat. 50. 55.

HASSIDEANS, or ASSIDEANS. See ASSIDEANS.

HASSOCK, a baſs made of ruſhes, to kneel or reſt the feet upon in churches.

HASP *and* STAPLE, in Scots law, the ſymbol commonly uſed in burgage tenements for entering and infefting an heir, by delivering into his hands the haſp and ſtaple of the door.

HASTATED LEAF. See BOTANY, p. 2196.

HASTINGS, a town of Suſſex, in England, ſituated in E. Lon. 0. 36. N. Lat. 50. 50.—This town is remarkable for a battle fought in its neighbourhood, between Harold king of England, and William duke of Normandy, on the 15th of October 1066, in which the former was defeated and killed, and by his death, William, ſurnamed the *Conqueror*, became king of England. See ENGLAND, n° 85.—The night before the battle, the aſpect of things was very different in the two camps. The Engliſh ſpent the time in riot, jollity, and diſorder; the Normans in ſilence and prayer, and in the other duties of religion. The next day both armies prepared for battle. The duke divided his army into three lines: the firſt, headed by Montgomery, conſiſted of archers and light-armed infantry: the ſecond, commanded by Martel, was compoſed of his braveſt battalions, heavy-armed, and ranged in cloſe order: his cavalry, at whoſe head he placed himſelf, formed the third line; and were ſo diſpoſed, that they ſtretched beyond the infantry; and flanked each wing of the army. He ordered the ſignal of battle to ſound; and the whole army, moving at once, and ſinging the hymn or ſong of Roland the famous peer of Charlemagne, advanced, in order and with alacrity, towards the enemy.

Harold had ſeized the advantage of a riſing ground, and having beſides drawn ſome trenches to ſecure his flanks, he reſolved to ſtand upon the defenſive, and to avoid

Haſtings. avoid all action with the cavalry, in which he was inferior. The Kentiſh men were placed in the van, a poſt which they had always claimed as their due; the Londoners guarded the ſtandard; and the king himſelf, accompanied by his two valiant brothers, Gurth and Leofwin, diſmounting from horſeback, placed himſelf at the head of his infantry, and expreſſed his reſolution to conquer or to periſh in the action. The firſt attack of the Normans was deſperate, but was received with equal valour by the Engliſh: and after a furious combat, which remained long undecided, the former, overcome by the difficulty of the ground, and hard preſſed by the enemy, began firſt to relax their vigour; then to give ground; and confuſion was ſpreading among the ranks, when William, who found himſelf on the brink of deſtruction, haſtened, with a ſelect band, to the relief of his diſmayed forces. His preſence reſtored the action; the Engliſh were obliged to retreat with loſs; and the duke, ordering his ſecond line to advance, renewed the attack with freſh forces and with redoubled courage. Finding that the enemy, aided by the advantage of ground, and animated by the example of their prince, ſtill made a vigorous reſiſtance, he tried a ſtratagem, which was very delicate in its management, but which ſeemed adviſeable in his deſperate ſituation, when, if he gained not a deciſive victory, he was totally undone: he commanded his troops to make a haſty retreat, and to allure the enemy from their ground by the appearance of flight. The artifice ſucceeded againſt theſe unexperienced troops, who, heated by the action, and ſanguine in their hopes, precipitantly followed the Normans into the plain. William gave orders, that at once the infantry ſhould face about upon their purſuers, and the cavalry make an aſſault upon their wings, and both of them purſue the advantage which the ſurprize and terror of the enemy muſt give them in that critical and deciſive moment. The Engliſh were repulſed with great ſlaughter, and drove back to the hill; where being rallied again by the bravery of Harold, they were able, notwithſtanding their loſs, to maintain the poſt and continue the combat. The duke tried the ſame ſtratagem a ſecond time with the ſame ſucceſs; but even after this double advantage, he ſtill found a great body of the Engliſh, who, maintaining themſelves in firm array, ſeemed determined to diſpute the victory to the laſt extremity. He ordered his heavy-armed infantry to make the aſſault upon them; while his archers, placed behind, ſhould gall the enemy, who were expoſed by the ſituation of the ground, and who were intent in defending themſelves againſt the ſwords and ſpears of the aſſailants. By this diſpoſition he at laſt prevailed; Harold was ſlain by an arrow, while he was combating with great bravery at the head of his men. His two brothers ſhared the ſame fate: and the Engliſh, diſcouraged by the fall of theſe princes, gave ground on all ſides, and were purſued with great ſlaughter by the victorious Normans. A few troops, however, of the vanquiſhed dared ſtill to turn upon their purſuers; and taking them in deep and miry ground, obtained ſome revenge for the ſlaughter and diſhonour of the day. But the appearance of the duke obliged them to ſeek their ſafety by flight, and darkneſs ſaved them from any farther purſuit by the enemy.

Thus was gained by William, duke of Normandy, the great and deciſive victory of Haſtings, after a battle which was fought from morning till ſunſet, and which ſeemed worthy, by the heroic feats of valour diſplayed by both armies, and by both commanders, to decide the fate of a mighty kingdom. William had three horſes killed under him; and there fell near fifteen thouſand men on the ſide of the Normans. The loſs was ſtill more conſiderable on that of the vanquiſhed; beſides the death of the king and his two brothers. The dead body of Harold was brought to William, and was generouſly reſtored without ranſom to his mother.——

The town of Haſtings is the chief of the cinque-ports; and was formerly obliged to find 21 ſhips, within 40 days after the king's ſummons, well furniſhed and armed for ſervice, and to maintain the crews a fortnight at its own charge. It ſends two members to parliament, and ſupplies London with abundance of fiſh. It lies between a high cliff towards the ſea, and a high hill on the land-ſide, having two ſtreets, and two pariſh-churches. About the year 1377 this town was burnt by the French; and, when it was rebuilt, it was divided into two pariſhes. There was a caſtle on the hill which overlooked the town, but it is now in ruins.

HAT, a covering for the head, worn by the men in moſt parts of Europe. Thoſe moſt in eſteem are made of the pure hair of the caſtor or beaver; for they are alſo made of the hair or wool of divers other animals, and that by much the ſame proceſs.

Hats are ſaid to have been firſt ſeen about the year 1400; at which time they became of uſe for country wear, riding, &c.—Father Daniel relates, that when Charles II. made his public entry into Rouen in 1449, he had on a hat lined with red-velvet, and furmounted with a plume or tuft of feathers.—He adds, that it is from this entry, at leaſt under this reign, that the uſe of hats and caps is to be dated, which henceforward began to take place of the chaperoons and hoods that had been wore before.

In progreſs of time, from the laity, the clergy likewiſe took the habit; but it was looked on as a crying abuſe, and ſeveral regulations were publiſhed, forbidding any prieſt, or religious perſon, to appear in a hat without cornets; and enjoining them to keep to the uſe of chaperoons, made of black cloth, with decent cornets: if they were poor, they were at leaſt to have cornets faſtened to their hats, and this upon pain of ſuſpenſion and excommunication.—Indeed the uſe of hats is ſaid to have been of a longer ſtanding among the eccleſiaſtics of Brittany by 200 years, and eſpecially among the canons: but theſe were no other than a kind of caps; and it was from hence aroſe the ſquare caps worn in colleges, &c. Lobineau * obſerves, that a biſhop of Dol, in the 12th century, zealous for good order, allowed the canons alone to wear ſuch hats; enjoining, that if any other perſon ſhould come with them to church, divine ſervice ſhould immediately ſtand ſtill.

* *Tom. I.* p. 845.

Method of Making HATS. To make the beaver-hats, they tear off the long and ſhort hair from the ſkin, with knives ſuitable to the occaſion: after which they proportion the quantity of the ſeveral ſorts of beaver-hair, by mixing one third of the dry caſtor to two-thirds

Hat. thirds of *old-coat*, which is a term for a ſkin that has been worn ſome time by the Indians of America, who catch and ſell them to the Europeans. The hair, ſo mixed, is carded and weighed out into parcels, according to the ſize and thickneſs of the hat intended. The ſtuff is now laid on the hurdle, with an inſtrument called a *bow*, reſembling that of a violin, but larger; whoſe ſtring being worked with a ſmall bow-ſtick, and made to play on the furs, they fly, and mix themſelves together, the duſt and filth at the ſame time paſſing through the chinks. Inſtead of a bow, ſome hat-makers uſe a fearce of hair, through which they paſs the ſtuff. Thus hats are formed of an oval figure, ending with an acute angle at the top: with what ſtuff remains, they ſtrengthen them where ſlendereſt, yet deſignedly make them thicker in the brim near the crown, than towards the circumference, or in the crown itſelf. They next harden the ſtuff, ſo managed, into more compact flakes, by preſſing down a hardened leather upon it. This done, they are carried to the baſon; upon which laying one of the hardened hats, they ſprinkle it over with water, and mould it; and the heat of the fire, with the water and preſſing, embody the ſtuff into a ſlight hairy ſort of felt: after which, turning up the edges all round over the mould, they lay it by, and proceed with another; which being in like manner reduced to the ſame conſiſtence and form, they are both joined together, ſo as to make them meet in an angle at top, making only one conical cap. The next proceſs is to remove the hat to a trough, reſembling a mill-hopper, which is a copper kettle filled with water and grounds, kept hot for the purpoſe; and, after being dipped in the kettle, the hat is laid on the ſloping ſide, called the *plank*. Here they proceed to work it, by rolling and unrolling it again and again, one part after another, firſt with the hand, and afterwards with a ſmall wooden roller, taking care to dip it from time to time; till at length, by thus fulling and thickening it four or five hours, it is brought to the dimenſions intended. In this violent labour, the workmen uſually guard their hands with thick leather, which they call *gloves*. The hat thus wrought into the form of a conical cap, is reduced into proper ſhape on a block of the ſize of the intended crown, by tying it round with a ſtring, called a *commander*; after which, with a bent iron called a *ſlamper*, they gradually beat down the commander all round, till it has reached the bottom of the block, and what remains at the bottom below the ſtring forms the brim. In this ſtation it is ſet to dry; and is afterwards ſinged, by holding it over the blaze of a fire made of ſtraw or ſhavings: it is then rubbed with pumice-ſtone, to take off the coarſer nap; then rubbed over with ſeal-ſkin, to lay the nap ſtill finer; and, laſtly, carded with a fine card, to raiſe the fine cotton with which the hat is to appear when finiſhed: then fitting it to the block, they tie it, cut round the edges, and deliver it to the dyers. The dye being completed, the hat is dyed by being hung in the roof of a ſtove heated with a charcoal-fire: and, when dry, it is ſtiffened with melted glue, or rather gum ſenega, which is ſmeared over the hat with a bruſh, and rubbed in with the hand. Then, having ſpread a cloth over the ſteaming baſon, which is a little fire-place raiſed about three feet high, with an iron plate laid over it, exactly covering the fire, the hat is laid upon the cloth, with the brim downwards, the cloth being firſt ſprinkled with water, to raiſe a ſtrong ſteam, to force in the ſtiffening. When it is moderately hot, the workman ſtrikes gently on the brim, with the flat of his hand, to make the joinings incorporate and bind ſo as not to appear, turning it from time to time, and at laſt ſetting it on the crown. And when it has been ſufficiently ſteamed and dried, it is put again on the block, bruſhed, ironed, well ſmoothed, and fitted for lining. Hat.

Hats make a conſiderable article in commerce: England ſupplies Spain, Portugal, Italy, and Germany, with extraordinary quantities of them; and as our manufacturers have the reputation of making the beſt hats in Europe, their importation is prohibited.

Hats are alſo made for womens wear, of chips, ſtraw, or cane, by platting, and ſewing the plats together; beginning with the centre of the crown, and working round till the whole is finiſhed. Hats for the ſame purpoſe are alſo wove and made of horſe-hair, ſilk, &c.

Hat is alſo figuratively uſed for the dignity of cardinal, or a promotion to that dignity. In this ſenſe they ſay, "to expect the hat; to claim, or have pretenſions to, the hat," &c.

Pope Innocent IV. firſt made the hat the ſymbol or cognizance of the cardinals, enjoining them to wear a red hat at the ceremonies and proceſſions, in token of their being ready to ſpill their blood for Jeſus Chriſt.

Dyeing of Hats. The inſtructions of Mr Colbert direct hats to be firſt ſtrongly galled, by boiling them a long time in a decoction of galls with a little logwood, that the dye may penetrate the better into their ſubſtance; after which a proper quantity of vitriol, and decoction of logwood, with a little verdigreaſe, are added, and the hats continued in this mixture alſo for a conſiderable time. They are afterwards to be put in a freſh liquor of logwood, galls, vitriol, and verdigreaſe; and where the hats are of great price, or of a hair which difficultly takes the dye, the ſame proceſs is to be repeated a third time. For obtaining the moſt perfect colour, the hair or wool is to be dyed blue, previouſly to its being formed into hats.—The preſent practice is more compendious, and affords, as we may daily ſee, a very good black. According to Dr Lewis, it does not materially differ from that of the *Encyclopedie*, which is as follows.

An hundred pounds of logwood, 12 pounds of gum, ſix pounds of galls, are boiled in a proper quantity of water for ſome hours; after which, about ſix pounds of verdigreaſe, and ten of green vitriol, are added, and the liquor kept juſt ſimmering, or of a heat a little below boiling. Ten or twelve dozen of hats are immediately put in, each on its block, and kept down by croſs bars for about an hour and an half: they are then taken out and aired, and the ſame number of others put in their room. The two ſets of hats are thus dipped and aired alternately, eight times each; the liquor being refreſhed each time with more of the ingredients, but in leſs quantity than at firſt.

This proceſs (ſays Dr Lewis) affords a very good black on woollen and ſilk ſtuffs as well as on hats, as we may ſee in the ſmall pieces of both kinds which are ſometimes dyed by the hatters. The workmen lay great ſtreſs upon the verdigreaſe, and affirm that they can-

Hatch || Hatching.

cannot dye a black hat without it: it were to be wiſhed that the uſe of this ingredient were more common in the other branches of the black dye; for the hatters dye, both on ſilk and woollen, is reckoned a finer black than what is commonly produced by the woollen and ſilk dyer.

HATCH, or HATCHWAY, a ſquare or oblong opening in the DECK of a ſhip, of which there are ſeveral, forming the paſſages from one deck to another, and into the hold, or lower apartments. See Plate LXXXVIII. where A repreſents the main hatchway of the lower deck; NN the fore-hatchway; and OO the after-hatchway.—There are likewiſe hatches of a ſmaller kind, called *ſcuttles*. See UU in the ſame figure; as alſo the article SCUTTLE.—Hatches is alſo, though improperly, a name applied by ſailors to the covers or lids of the hatchway.

HATCHES, in mining, a term uſed in Cornwal, to expreſs any of the openings of the earth either into mines or in ſearch of them. The fruitleſs openings are called *eſſay-hatches;* the real mouths of the veins, *tin hatches;* and the places where they wind up the buckets of ore, *wind hatches*.

HATCHES alſo denote flood-gates ſet in a river, &c. to ſtop the current of the water, particularly certain dams or mounds made of rubbiſh, clay, or earth, to prevent the water that iſſues from the ſtream-works and tin-waſhes in Cornwal from running into the freſh rivers.

HATCHET, a ſmall light ſort of an axe, with a baſil-edge on its left ſide, and a ſhort handle, as being to be uſed with one hand.—Hatchets are uſed by various artificers, and more particularly in hewing of wood.

HATCHING, the maturating fecundated eggs, whether by the incubation and warmth of the parent bird, or by artificial heat, ſo as to produce young chickens alive.

The art of hatching chickens by means of ovens has long been practiſed in Egypt; but it is there only known to the inhabitants of a ſingle village named *Berme*, and to thoſe that live at a ſmall diſtance from it. Towards the beginning of autumn they ſcatter themſelves all over the country; where each perſon among them is ready to undertake the management of an oven, each of which is of a different ſize; but, in general, they are capable of containing from forty to fourſcore thouſand eggs. The number of theſe ovens placed up and down the country is about 386, and they uſually keep them working for about ſix months: as, therefore, each brood takes up in an oven, as under a hen, only 21 days, it is eaſy in every one of them to hatch eight different broods of chickens. Every Bermean is under the obligation of delivering to the perſon who intruſts him with an oven, only two thirds of as many chickens as there have been eggs put under his care; and he is a gainer by this bargain, as more than two thirds of the eggs uſually produce chickens. In order to make a calculation of the number of chickens yearly ſo hatched in Egypt, it has been ſuppoſed that only two thirds of the eggs are hatched, and that each brood conſiſts of at leaſt 30,000 chickens; and thus it would appear, that the ovens of Egypt give life yearly to at leaſt 92,640,000 of theſe animals.

This uſeful and advantageous method of hatching eggs has been lately diſcovered in France, by the ingenious Mr Reaumur; who, by a number of experiments, has reduced the art to certain principles. He found by experience, that the heat neceſſary for this purpoſe is nearly the ſame with that marked 32 on his thermometer, or that marked 96 on Farenheit's. This degree of heat is nearly that of the ſkin of the hen, and, what is remarkable, of the ſkin of all other domeſtic fowls, and probably of all other kinds of birds. The degree of heat which brings about the developement of the cygnet, the goſling, and the turkey-pout, is the ſame as that which fits for hatching the canary-ſong-ſter, and, in all probability, the ſmalleſt hummiag-bird: the difference is only in the time during which this heat ought to be communicated to the eggs of different birds; it will bring the canary bird to perfection in 11 or 12 days, while the turkey-pout will require 27 or 28. Hatching.

After many experiments, Mr Reaumur found, that ſtoves heated by means of a baker's oven, ſucceeded better than thoſe made hot by layers of dung: and the furnaces of glaſs-houſes and thoſe of the melters of metals, by means of pipes to convey heat into a room, might, no doubt, be made to anſwer the ſame purpoſe. As to the form of the ſtoves, no great nicety is required. A chamber over an oven will do very well. Nothing more will be neceſſary but to aſcertain the degree of heat; which may be done by melting a lump of butter of the ſize of a walnut, with half as much tallow, and putting it into a phial. This will ſerve to indicate the heat with ſufficient exactneſs: for when it is too great, this mixture will become as liquid as oil; and when the heat is too ſmall, it will remain fixed in a lump: but it will flow like a thick ſyrup, upon inclining the bottle, if the ſtove be of a right temper. Great attention therefore ſhould be given to keep the heat always at this degree, by letting in freſh air if it be too great, or ſhutting the ſtove more cloſe if it be too ſmall: and that all the eggs in the ſtove may equally ſhare the irregularities of the heat, it will be neceſſary to ſhift them from the ſides to the centre; thereby imitating the hens, who are frequently ſeen to make uſe of their bills, to puſh to the outer parts thoſe eggs that were neareſt to the middle of their neſts, and to bring into the middle ſuch as lay neareſt the ſides.

Mr Reaumur has invented a ſort of low boxes, without bottoms, and lined with furs. Theſe, which he calls *artificial-parents*, not only ſhelter the chickens from the injuries of the air, but afford a kindly warmth, ſo that they preſently take the benefit of their ſhelter as readily as they would have done under the wings of a hen. After hatching, it will be neceſſary to keep the chickens, for ſome time, in a room artfully heated and furniſhed with theſe boxes; but afterwards they may be ſafely expoſed to the air in the court-yard, in which it may not be amiſs to place one of theſe artificial-parents to ſhelter them if there ſhould be occaſion for it.

As to the manner of feeding the young brood, they are generally a whole day after being hatched, before they take any food at all; and then a few crumbs of bread may be given them for a day or two, after which they will begin to pick up inſects and graſs for themſelves.

But to ſave the trouble of attending them, capons may

Hatching || Havanna.

may be taught to watch them in the same manner as hens do. Mr Reaumur assures us, that he has seen above 200 chickens at once, all led about and defended only by three or four such capons. Nay, cocks may be taught to perform the same office; which they, as well as the capons, will continue to do all their lives after.

HATCHING, or HACHING, in designing, &c. the making of lines with a pen, pencil, graver, or the like; and the intersecting or going across those lines with others drawn a contrary way, is called *counter-hatching*. The depths and shadows of draughts are usually formed by hatching.

Hatching is of singular use in heraldry, to distinguish the several colours of a shield, without being illumined: thus, gules or red is hatched by lines drawn from the top to the bottom; azure, by lines drawn across the shield; and so of other colours.

HATCHMENT, in heraldry, the coat-of-arms of a person dead, usually placed on the front of a house, whereby may be known what rank the deceased person was of when living: the whole distinguished in such a manner as to enable the beholder to know, whether he was a bachelor, married man, or widower; with the like distinctions for women.

HATFIELD, a town in Hartfordshire in England. The kings of England had formerly a royal palace here, where Edward VI. was educated. King James I. exchanged the manor with Sir Robert Cecil, afterwards earl of Salisbury, for Theobalds, in the parish of Chesthunt in this country; and the lordship still remains in that noble family, who have a very fine seat here. The rectory, which is in that earl's gift, is reckoned worth 800 pounds a-year. W. Long. 0. 12. N. Lat. 51. 42.

HATFIELD-BROAD-OAK, a town of Essex in England, seated on a branch of the river Lea, in E. Long. 0. 13. N. Lat. 51. 58.

HATTEM, a town of the United Provinces in the duchy of Guelderland, seated on the river Ussel, in E. Lon. 6. 0. N. Lat. 53. 30.

HATTOCK, a shock of corn containing twelve sheaves; others make it only three sheaves laid together.

HATUAN, a town and fort of Upper Hungary in the county of Novigrod. It was taken by the Imperialists in 1685. It is seated on a mountain, in E. Long. 19. 48. N. Lat. 47. 52.

HAVANNA, a sea-port town of America, in the island of Cuba, and on the north-west part of it, opposite to Florida. It is famous for its harbour, which is so large that it may hold 1000 vessels; and yet the mouth is so narrow, that only one ship can enter at a time. This is the place where all the ships that come from the Spanish settlements rendezvous on their return to Spain. It is near two miles in circumference; and contains about 10,000 inhabitants, consisting of Spaniards, Mulattoes, and Negroes. The entrance into the harbour is well defended by forts and platforms of great guns; and the bishop of St Jago resides here, as well as most men of fashion and fortune belonging to the island. It was taken by the British in 1762; but restored to the Spaniards by the treaty of peace in 1763. W. Long. 84. 10. N. Lat. 23. 0.

HAVEL, a river of Brandenburg, which proceeds from a lake in the duchy of Mecklenburg, and running thro' the middle Marche, and thro' Brandenburg and other towns, runs north, and falls into the Elbe. Havelberg || Hannch.

HAVELBERG, a town of Germany, in the circle of Lower Saxony, and in the electorate of Brandenburg, with a bishop's see, secularized in favour of the house of Brandenburg. It is seated on the river Havel, in E. Long. 12. 43. N. Lat. 53. 4.

HAVEN, a sea-port or harbour. See HARBOUR.

HAVERCAMP (Sigibert), a celebrated Dutch scholar and critic, professor of history, eloquence, and the Greek tongue, at Leyden. He was particularly skilled in medals; and was the author of some esteemed works in that way, beside giving good and elegant editions of several Greek and Latin authors. He died at Leyden in 1742, aged 58.

HAVERFORD-WEST, a town of Pembrokeshire in South Wales, seated in W. Long. 5. N. Lat. 51. 50. It is a town and county of itself; and stands commodiously on the side of a hill, and on a creek of Milford-haven, over which there is a stone bridge. It is a large handsome place, with several good houses, and contains three parish-churches. It has also a considerable trade, with several vessels belonging to it; and sends one member to parliament. The assizes and county-gaol are kept here; and it had once a wall and castle, now demolished.

HAVERILL, a town of England, in the county of Suffolk, where there is a considerable manufactory of checks, cottons, and fustians. By the ruins of a church and castle still to be seen, it appears to have been formerly a place of much greater consequence than at present. It has now only about 300 poor clay-houses, and one wide street not paved.

HAUL, an expression peculiar to seamen, implying to pull a single rope, without the assistance of blocks or other such mechanical powers. When a rope is otherwise pulled, as by the application of tackles, or the connection with blocks, &c. the term is changed into *bowsing*.

To HAUL *the Wind*, is to direct the ship's course nearer to that point of the compass from which the wind arises. Thus, supposing a ship to sail south-west, with the wind northerly, and some particular occasion requires to haul the wind more westward; to perform this operation, it is necessary to arrange the sails more obliquely with her keel; to brace the yards more forward, by slackening the starboard, and pulling in the larboard braces, and to haul the lower sheets further aft; and finally, to put the helm a-port, i. e. over to the larboard side of the vessel. As soon as her head is turned directly to the westward, and her sails are trimmed accordingly, she is said to have hauled the wind four points; that is to say, from south-west to west. She may still go two points nearer to the direction of the wind, by disposing her sails according to their greatest obliquity, or, in the sea-phrase, by *trimming all sharp*; and in this situation she is said to be close hauled, as sailing west north-west.

HAUNCH, or HANCH, the *Hip*, or that part of the body between the last ribs and the thigh.

The haunches of a horse are too long, if when standing in the stable he limps, with his hind-legs farther back than he ought; and when the top or onset of his tail is not in a perpendicular line to the tip of his

Havre
§
Haute.

his hocks, as it always does in horſes whoſe haunches are of a juſt length. There are ſome horſes, which though they have too long haunches, yet commonly walk well: ſuch are good to climb hills, but are not at all ſure upon a deſcent; for they cannot ply their hams, and never gallop ſlowly, but always nearly upon a full ſpeed. The art of riding the great horſe has not a more neceſſary leſſon than that of putting a horſe upon his haunches; which, in other words, is called *coupling him well*, or putting him well together, or compact. A horſe that cannot bend or lower his haunches, throws himſelf too much upon his ſhoulder, and lies heavy upon the bridle.

HAVRE *de* Grace, a ſea-port town of France, and capital of a diſtrict of the ſame name, is ſeated in the province of Normandy, on the Engliſh channel, in a large plain at the mouth of the river Seine. It is a ſmall fortified town, nearly of a ſquare figure, divided into two parts by the harbour, ſurrounded with a wall and other works, and defended by a very ſtrong citadel. It is one of the moſt important places in France, on account of its foreign trade and convenient harbour; for which reaſon it was made a diſtinct government from the reſt of Normandy. It was ſurpriſed in 1562, by the Proteſtants, who delivered it to queen Elizabeth; but it was loſt next year. In 1694 it was bombarded by the Engliſh, and alſo in the year 1758. E. Long. 0. 11. N. Lat. 49. 29.

HAURIANT, in heraldry, a term peculiar to fiſhes; and ſignifies their ſtanding upright, as if they were refreſhing themſelves by ſucking in the air.

HAUTE FEUILLE (John), an ingenious mechanic born at Orleans in 1647. Though he embraced the ſtate of an eccleſiaſtic, and enjoyed ſeveral benefices, he applied almoſt his whole life to mechanics, in which he made a great progreſs. He had a particular taſte for clock-work, and made ſeveral diſcoveries in it that were of ſingular uſe. It was he who found out the ſecret of moderating the vibration of the balance by means of a ſmall ſteel-ſpring, which has ſince been made uſe of. This diſcovery he laid before the members of the Academy of Sciences in 1674; and theſe watches are, by way of eminence, called *pendulum-watches*; not that they have real pendulums, but becauſe they nearly approach to the juſtneſs of pendulums. M. Huygens perfected this happy invention; but having declared himſelf the inventor, and obtained from Lewis XIV. a patent for making watches with ſpiral ſprings, the abbé Feuille oppoſed the regiſtering of this privilege, and publiſhed a piece on the ſubject againſt M. Huygens. He wrote a great number of other pieces, moſt of which are ſmall pamphlets conſiſting of a few pages, but very curious; as, 1. His perpetual pendulum, quarto. 2. New inventions, quarto. 3. The art of breathing under water, and the means of preſerving a flame ſhut up in a ſmall place. 4. Reflections on machines for raiſing water. 5. His opinion on the different ſentiments of Mallebranche and Regis relating to the appearance of the moon when ſeen in the horizon. 6. The magnetic balance. 7. A placet to the king on the longitude. 8. Letter on the ſecret of the longitude. 9. A new ſyſtem on the flux and reflux of the ſea. 10. The means of making ſenſible experiments that prove the motion of the earth; and many other pieces. He died in 1724.

Hautboy
§
Hawking.

HAUTBOY, a muſical inſtrument of the wind kind, ſhaped much like the lute; only that it ſpreads and widens towards the bottom, and is ſounded thro' a reed. The treble is two feet long; the tenor goes a fifth lower, when blown open: it has only eight holes; but the baſs, which is five feet long, has eleven.

The word is French, *haut bois*, q. d. *high wood*; and is given to this inſtrument becauſe the tone of it is higher than that of the violin.

HAW, a ſort of berry, the fruit of ſeveral ſpecies of meſpilus, thence denominated *hawthorns*. See Mespilus.

Haw, among farriers, an excreſcence reſembling a griſtle, growing under the nether eye-lid and eye of a horſe, which, if not timely removed, will put it quite out. See Farriery, § xi. 15.

Haw, a ſmall parcel of land ſo called in Kent, as a *Hemphaw*, or *Beanhaw*, lying near the houſe, and incloſed for theſe uſes. But Sir Edward Coke, in an ancient plea concerning Feverſham in Kent, ſays *Hawes* are houſes.

Haw-*Finch*. See Loxia.

HAWGH, or Howgh, ſignifies a green plot in a valley, as they uſe it in the north of England.

HAWK, in ornithology. See Falco.

HAWKERS, anciently were fraudulent perſons, who went about from place to place buying and ſelling braſs, pewter, and other merchandiſe, which ought to be uttered in open market. In this ſenſe the word is mentioned *anno* 25 Hen. VIII. *c.* 6. and 33 *ejuſdem*, *c.* 4.—The appellation *hawkers* ſeems to have ariſen from their uncertain wandering, like thoſe who with hawks ſeek their game where they can find it.

Hawkers, is alſo now applied to thoſe who go up and down London ſtreets crying new books, and ſelling them by retail. The women who furniſh the hawkers, i. e. ſell the papers by wholeſale from the preſs, are called *mercuries*.

HAWKING, the exerciſe of taking wild fowl by means of hawks. The method of reclaiming, manning, and bringing up a hawk to this exerciſe, is called *falconry*. See Falconry.

There are only two countries in the world where we have any evidence that the exerciſe of hawking was very anciently in vogue. Theſe are, Thrace and Britain. In the former, it was purſued merely as the diverſion of a particular diſtrict, if we may believe Pliny †, whoſe account is rendered obſcure by the darkneſs of his own ideas of the matter. The primæval Britons, with a fondneſs for the exerciſe of hunting, had alſo a taſte for that of hawking; and every chief among them maintained a conſiderable number of birds for that ſport. It appears alſo from a curious paſſage in the poems of Oſſian *, that the ſame diverſion was faſhionable at a very early period in Scotland. The poet tells us, that a peace was endeavoured to be gained by the proffer of 100 managed ſteeds, 100 foreign captives, and "100 hawks with fluttering wings, that fly "acroſs the ſky." To the Romans this diverſion was ſcarce known in the days of Veſpaſian; yet it was introduced immediately afterwards. Moſt probably they adopted it from the Britons; but we certainly know that they greatly improved it by the introduction of ſpaniels into the iſland. In this ſtate it appears among

† *l.* x. 8.

* *Vol.* I. *p.* 115.

Hawking. the Roman Britons in the ſixth century. Gildas, in a remarkable paſſage in his firſt epiſtle, ſpeaks of Maglocunus, on his relinquiſhing the ſphere of ambition, and taking refuge in a monaſtery; and proverbially compares him to a dove, that haſtens away at the noiſy approach of the dogs, and with various turns and windings takes her flight from the talons of the hawk.

In after-times, hawking was the principal amuſement of the Engliſh: a perſon of rank ſcarce ſtirred out without his hawk on his hand; which, in old paintings, is the criterion of nobility. Harold, afterwards king of England, when he went on a moſt important embaſſy into Normandy, is painted embarking with a bird on his fiſt, and a dog under his arm: and in an ancient picture of the nuptials of Henry VI. a nobleman is repreſented in much the ſame manner; for in thoſe days, *it was thought ſufficient for noblemen to winde their horn, and to carry their hawk fair, and leave ſtudy and learning to the children of mean people.* The former were the accompliſhments of the times; Spenſer makes his gallant Sir Triſtram boaſt,

Biogr. Brit. art. Caxton.

> Ne is there hawk which mantleth her on pearch,
> Whether high towring, or accoaſting low,
> But I the meaſure of her flight doe ſearch,
> And all her prey, and all her diet know. B. vi. Canto 2.

In ſhort, this diverſion was, among the old Engliſh, the pride of the rich, and the privilege of the poor; no rank of men ſeems to have been excluded the amuſement: we learn from the book of St Alban's, that every degree had its peculiar hawk, from the *emperor* down to the *holy-water clerk*. Vaſt was the expence that ſometimes attended this ſport. In the reign of James I. Sir Thomas Monſon is ſaid to have given 1000l. for a caſt of hawks: we are not then to wonder at the rigour of the laws that tended to preſerve a pleaſure that was carried to ſuch an extravagant pitch. In the 34th of Edward III. it was made felony to ſteal a hawk; to take its eggs, even in a perſon's own ground, was puniſhable with impriſonment for a year and a day, beſides a fine at the king's pleaſure: in queen Elizabeth's reign, the impriſonment was reduced to three months; but the offender was to find ſecurity for his good behaviour for ſeven years, or lie in priſon till he did. Such was the enviable ſtate of the times of *old* England: during the whole day the gentry were given to the fowls of the air, and the beaſts of the field; in the evening, they celebrated their exploits with the moſt abandoned and brutiſh ſottiſhneſs; at the ſame time, the inferior rank of people, by the moſt unjuſt and arbitrary laws, were liable to capital puniſhments, to fines, and loſs of liberty, for deſtroying the moſt noxious of the feathered tribe.

According to Olearius, the diverſion of hawking is more followed by the Tartars and Perſians, than ever it was in any part of Europe. *Il n'y avoit point de butte* (ſays he) *qui n'euſt ſon aigle ou ſon faucon.*

The falcons or hawks that were in uſe in theſe kingdoms, are now found to breed in Wales, and in North-Britain and its iſles. The peregrine falcon inhabits the rocks of Caernarvonſhire. The ſame ſpecies, with the gyrfalcon, the gentil, and the goſhawk, are found in Scotland, and the lanner in Ireland.

We may here take notice, that the Norwegian breed was, in old times, in high eſteem in England: they were thought bribes worthy a king. Jeoffrey Fitz-pierre gave two good Norway hawks to king John, to obtain for his friend the liberty of exporting 100 wt. of cheeſe; and Nicholas the Dane was to give the king a hawk every time he came into England, that he might have free liberty to traffic throughout the king's dominions. Hawking. *Maddox Antiquit. Exchequer.* I. 469, 470.

They were alſo made the tenures that ſome of the nobility held their eſtates by, from the crown. Thus Sir John Stanley had a grant of the Iſle of Man from Henry IV. to be held of the king, his heirs and ſucceſſors, by homage and the ſervice of two falcons, payable on the day of his or their coronation. And Philip de Haſtang held his manor of Combertoun in Cambridgeſhire, by the ſervice of keeping the king's falcons. *Blunt's Anc. Tenures.* 20.

Hawking, though an exerciſe now much diſuſed among us, in compariſon of what it anciently was, does yet furniſh a great variety of ſignificant terms, which ſtill obtain in our language. Thus, the parts of a hawk have their proper names.—The legs, from the thigh to the foot, are called *arms;* the toes, the *petty-ſingles;* the claws, the *pounces.*—The wings are called the *ſails;* the long feathers thereof, the *beams;* the two longeſt, the *principal feathers;* thoſe next thereto, the *flags.*—The tail is called the *train;* the breaſt-feathers, the *mails;* thoſe behind the thigh, the *pendant feathers.*—When the feathers are not yet full grown, ſhe is ſaid to be *unſummed;* when they are complete, ſhe is *ſummed:*—The craw, or crop, is called the *gorge:*—The pipe next the fundament, where the fæces are drawn down, is called the *pannel:*—The ſlimy ſubſtance lying in the pannel, is called the *glut:*—The upper and crooked part of the bill is called the *beak;* the nether-part, the *clap;* the yellow part between the beak and the eyes, the *ſear* or *fere;* the two ſmall holes therein, the *nares.*

As to her furniture:—The leathers, with bells buttoned on her legs, are called *bewits.*—The leathern thong, whereby the falconer holds the hawk, is called the *leaſe*, or *leaſh;* the little ſtraps, by which the leaſe is faſtened to the legs, *jeſſes;* and a line or pack-thread faſtened to the leaſe, in diſciplining her, a *creance.*—A cover for her head, to keep her in the dark, is called a *hood;* a large wide hood, open behind, to be worn at firſt, is called a *ruſter hood:* To draw the ſtrings, that the hood may be in readineſs to be pulled off, is called *unſtriking the hood.*—The blinding a hawk juſt taken, by running a thread through her eye-lids, and thus drawing them over the eyes, to prepare her for being hooded, is called *ſeeling.*—A figure or reſemblance of a fowl, made of leather and feathers, is called a *lure.*—Her reſting-place, when off the falconer's fiſt, is called the *pearch.*—The place where her meat is laid, is called the *hack;* and that wherein ſhe is ſet, while her feathers fall and come again, the *mew.*

Something given a hawk, to cleanſe and purge her gorge, is called *caſting.*—Small feathers given her to make her caſt, are called *plumage:*—Gravel given her to help to bring down her ſtomach, is called *rangles:*—Her throwing up filth from the gorge after caſting, is called *gleaming.*—The purging of her greaſe, &c. *eſteaming.*—A being ſtuffed is called *gurgiting.*—The inſerting a feather in her wing, in lieu of a broken one, is called *imping.*—The giving her a leg, wing, or pinion of a fowl

Hawking. fowl to pull at, is called *tiring*:—The neck of a bird the hawk preys on, is called the *inke*:——What the hawk leaves of her prey, is called the *pill*, or *pelf*.

There are alſo proper terms for her ſeveral actions. —When ſhe flutters with her wings, as if ſtriving to get away, either from perch or fiſt, ſhe is ſaid to *bate*. —When, ſtanding too near, they fight with each other, it is called *crabbing*:—When the young ones quiver, and ſhake their wings in obedience to the elder, it is called *cowring*:—When ſhe wipes her beak after feeding, ſhe is ſaid to *feak*:—When ſhe ſleeps, ſhe is ſaid to *jouk*:—From the time of exchanging her coat, till ſhe turn white again, is called her *intermewing*:—Treading is called *cawking*:—When ſhe ſtretches one of her wings after her legs, and then the other, it is called *mantling*:—Her dung is called *muting*; when ſhe mutes a good way from her, ſhe is ſaid to *ſlice*; when ſhe does it directly down, inſtead of yerking backwards, ſhe is ſaid to *ſlime*; and if it be in drops, it is called *dropping*.—When ſhe as it were ſneezes, it is called *ſniting*.—When ſhe raiſes and ſhakes herſelf, ſhe is ſaid to *rouze*:——When, after mantling, ſhe croſſes her wings together over her back, ſhe is ſaid to *warble*.

When a hawk ſeizes, ſhe is ſaid to *bind*:—When, after ſeizing, ſhe pulls off the feathers, ſhe is ſaid to *plume*.—When ſhe raiſes a fowl aloft, and at length deſcends with it to the ground, it is called *truſſing*.—When, being aloft, ſhe deſcends to ſtrike her prey, it is called *ſtooping*.—When ſhe flies out too far from the game, ſhe is ſaid to *rake*.—When, forſaking her proper game, ſhe flies at pyes, crows, &c. that chance to croſs her, it is called *check*.—When, miſſing the fowl, ſhe betakes herſelf to the next check, ſhe is ſaid to *fly on head*.——The fowl or game ſhe flies at is called the *quarry*.—The dead body of a fowl killed by the hawk, is called a *pelt*.—When ſhe flies away with the quarry, ſhe is ſaid to *carry*.---When in ſtooping ſhe turns two or three times on the wing, to recover herſelf ere ſhe ſeizes, it is called *canceliering*.---When ſhe hits the prey, yet does not truſs it, it is called *ruff*.----The making a hawk tame and gentle, is called *reclaiming*. ---The bringing her to endure company, *manning* her. ---An old ſtaunch hawk, uſed to fly and ſet example to a young one, is called a *make-hawk*.

The reclaiming, manning, and bringing up a hawk to the ſport, is not eaſy to be brought to any preciſe ſet of rules.---It conſiſts in a number of little practices and obſervances, calculated to familiarize the falconer to his bird, to procure the love thereof, &c. See the article Falconry.

When your hawk comes readily to the lure, a large pair of luring-bells are to be put upon her; and the more giddy-headed and apt to rake out your hawk is, the larger muſt the bells be. Having done this, and ſhe being ſharp-fet, ride out in a fair morning, into ſome large field, unencumbered with trees or wood, with your hawk on your fiſt; then having looſened her hood, whiſtle ſoftly, to provoke her to fly; unhood her, and let her fly with her head into the wind; for by that means ſhe will be the better able to get upon the wing, and will naturally climb upwards, flying a circle. After ſhe has flown three or four turns, then lure her with your voice, caſting the lure about your head, having firſt tied a pullet to it; and if your falcon come in, and approach near you, caſt out the lure into the wind, and, if ſhe ſtoop to it, reward her. Hawking. Hawkwood

You will often find, that when ſhe flies from the fiſt, ſhe will take ſtand on the ground: this is a fault which is very common with ſoar-falcons. To remedy this, fright her up with your wand; and when you have forced her to take a turn or two, take her down to the lure, and feed her. But if this does not do, then you muſt have in readineſs a duck ſealed, ſo that ſhe may ſee no way but backwards, and that will make her mount the higher. Hold this duck in your hand, by one of the wings near the body; then lure with the voice, to make the falcon turn her head; and when ſhe is at a reaſonable pitch, caſt your duck up juſt under her; when, if ſhe ſtrike, ſtoop, or truſs the duck, permit her to kill it, and reward her by giving her a reaſonable gorge. After you have practiſed this two or three times, your hawk will leave the ſtand, and, delighted to be on the wing, will be very obedient.

It is not convenient, for the firſt or ſecond time, to ſhew your hawk a large fowl; for it frequently happens, that they eſcape from the hawk, and ſhe, not recovering them, rakes after them: this gives the falconer trouble, and frequently occaſions the loſs of the hawk. But if ſhe happens to purſue a fowl, and, being unable to recover it, gives it over, and comes in again directly, then caſt out a ſealed duck; and if ſhe ſtoop and truſs it acroſs the wings, permit her to take her pleaſure, rewarding her alſo with the heart, brains, tongue, and liver. But if you have not a quick duck, take her down with a dry lure, and let her plume a pullet and feed upon it. By this means a hawk will learn to give over a fowl that rakes out, and, on hearing the falconer's lure, will make back again, and know the better how to hold in the head.

Some hawks have a diſdainful coyneſs, proceeding from their being high fed: ſuch a hawk muſt not be rewarded, though ſhe ſhould kill: but you may give her leave to plume a little; and then taking a ſheep's heart cold, or the leg of a pullet, when the hawk is buſy in pluming, let either of them be conveyed into the body of the fowl, that it may favour of it; and when the hawk has eaten the heart, brains, and tongue of the fowl, take out what is incloſed, call her to your fiſt, and feed her with it: afterwards give her ſome of the feathers of the fowl's neck, to ſcower her, and make her caſt.

If your hawk be a ſtately high-flying one, ſhe ought not to take more than one flight in a morning; and if ſhe be made for the river, let her not fly more than twice: when ſhe is at the higheſt, take her down with your lure; and when ſhe has plumed and broken the fowl a little, feed her, by which means you will keep her a high-flyer, and fond of the lure.

HAWKWOOD (Sir John), a famous Engliſh general, was the ſon of a tanner at Heddingham-Sibil in Eſſex, where he was born in the reign of Edward III. He was bound apprentice to a taylor in London; but being fortunately preſſed into the army, was ſent abroad, where his genius ſoon expanded itſelf, and ſurmounted the narrow prejudices which adhered to his birth and occupation. He ſignalized himſelf as a ſoldier in France and Italy, and particularly at Piſa

Hawſe || Hay.

and Florence. He commanded with great ability and ſucceſs in the army of Galeacia duke of Milan; and was in ſuch high eſteem with Barnabas his brother, that he gave him Domitia his natural daughter in marriage, with an ample fortune. He died at Florence, full of years and military fame, in 1394. See (Hiſtory of) ITALY.

HAWSE, or HAUSE, is generally underſtood to imply the ſituation of the cables before the ſhip's ſtem, when ſhe is moored with two anchors out from forward, viz. one on the ſtarboard, and the other on the larboard-bow. Hence it is uſual to ſay, *ſhe has a clear hawſe*, or *a foul hawſe*. It alſo denotes any ſmall diſtance *a-head* of a ſhip, or between her head and the anchors employed to ride her; as, "He has "anchored in our hawſe, The brig fell athwart our "hawſe," &c.

A ſhip is ſaid to ride with a clear hawſe, when the cables are directed to their anchors, without lying athwart the ſtem; or croſſing, or being twiſted round each other by the ſhip's winding about, according to the change of the wind, tide, or current.

A foul hauſe, on the contrary, implies that the cables lie acroſs the ſtem, or bear upon each other, ſo as to be rubbed and chafed by the motion of the veſſel.—The hawſe accordingly is foul, by having either a croſs, an elbow, or a round turn. If the larboard cable, lying acroſs the ſtem, points out on the ſtarboard ſide, while the ſtarboard cable at the ſame time grows out on the larboard ſide, there is a croſs in the hawſe. If, after this, the ſhip, without returning to her former poſition, continues to wind about the ſame way, ſo as to perform an entire revolution, each of the cables will be twiſted round the other, and then directed out from the oppoſite bow, forming what is called a round turn. An elbow is produced when the ſhip ſtops in the middle of that revolution, after having had a croſs: or, in other words, if ſhe rides with her head northward with a clear hawſe, and afterwards turns quite round ſo as to direct her head northward again, ſhe will have an elbow.

HAUSE-*Holes*, certain cylindrical holes cut through the bows of a ſhip on each ſide of the ſtem, through which the cables paſs in order to be drawn into or let out of the veſſel as occaſion requires. They are fortified on each ſide by the

HAWSE-*Pieces*, a name given to the foremoſt timbers of a ſhip, whoſe lower ends reſt on the knuckle-timber, or the foremoſt of the cant-timbers. They are generally parallel to the ſtem, having their upper ends ſometimes terminated by the lower part of the beak-head; and otherwiſe, by the top of the bow, particularly in ſmall ſhips and merchantmen.

HAWSER, a large rope which holds the middle degree between the *cable* and *tow-line*, in any ſhip whereto it belongs, being a ſize ſmaller than the former, and as much larger than the latter.

HAY, any kind of graſs cut and dried for the food of cattle.

The time of mowing graſs for hay muſt be regulated according to its growth and ripeneſs; nothing being more prejudicial to the crop than mowing it too ſoon; becauſe the ſap is not then fully come out of the root, and when made into hay the graſs ſhrinks away to nothing. It muſt not, however, be let ſtand too long till it have ſhed its ſeeds. When the tops of the graſs look brown, and begin to bend down, and the red honeyſuckle flowers begin to wither, you may conclude it ripe for mowing. Hay.

Sain-Foin HAY, is of ſeveral ſorts, which may be diſtinguiſhed by the following terms, viz. 1. The virgin. 2. The bloſſomed. 3. The full-grown. And, 4. The threſhed hay. The firſt of theſe is beyond compariſon the beſt. It muſt be cut before the bloſſoms generally appear; for when it ſtands till it is full blown, the moſt ſpirituous and nouriſhing parts of its juice are ſpent, the ſap is much impoveriſhed, and the ſaint-foin can never recover that richneſs it had in its virgin-ſtate. But this fine hay cannot well be had of uncultivated ſain-foin, becauſe that may not be much above an handful high when it is in a condition to be cut; it would then make a very light crop, and would be a great while before it ſprang up again: but the rich will have two or three tuns to an acre, and ſpring again immediately for a ſecond crop; ſo that little or none in quantity would be loſt by ſo great an improvement of its quality.

The ſecond ſort is that cut in the flower, which, though much inferior to the virgin-hay, far exceeds any other kind as yet commonly propagated in Britain; and if it be a full crop, it may amount to three tuns an acre. This is that ſain-foin which is commonly made; and the larger it is, the more nouriſhing it is for horſes.

The next ſort of ſain-foin is the full grown, cut when the bloſſoms are gone or going off: this alſo is good hay, though it falls ſhort by many degrees of the goodneſs of the other two ſorts; but it makes a greater crop than either of them, becauſe it grows to its full bulk, and ſhrinks little in drying.

The laſt ſort is the threſhed hay; which, when not damaged by wet weather, has been found more nouriſhing to horſes than coarſe water-meadow hay; and, when it is cut ſmall by an engine, is good for cattle, and much better than the chaff of corn. The beſt time to cut it, is when the greateſt part of the ſeed is well filled; the firſt-blown ripe, and the laſt-blown beginning to be full.

The goodneſs of the hay depends greatly upon the manner of ordering it. The beſt hay in all England is made of ſain-foin, without ever ſpreading it. This method, though it be longer before it be finiſhed, coſts leſs labour than the other. If ſain-foin be laid up pretty green, it will take no damage, provided it be ſet in ſmall round ricks, with a large baſket drawn up in the middle of each, to have a vent-hole through which the ſuperfluous moiſture of the hay may tranſpire. As ſoon as its heating is over, theſe ricks ought to be thatched; and all ſain-foin ricks, that are made when the hay is full dried in the cocks, ought to be thatched immediately after the making them. That which is laid up moſt dried, will come out of the rick of a green colour; but that which has been much heated in the rick, will be brown.

The ſeed affords the owner another opportunity of making a profit of his ſain-foin: but this, if the hoeing huſbandry were general, would not be vendible in great quantities for planting; becauſe the ordinary crop of an acre will produce ſeed enough to drill an hundred acres, which would not want planting for a

long

Hay
&
Hazard.

long time. The other uſe then of this ſeed is for provender; and it has been affirmed by ſome who have made trials of it, that three buſhels of good ſain-foin ſeed given to horſes, will nouriſh them as much as four buſhels of oats; and when well ordered, it is ſo ſweet, that moſt ſorts of cattle are greedy of it.

HAY-*Making*. See AGRICULTURE, n° 152, *et ſeq.*

HAY, a town in Brecknockſhire, in Wales, ſeated near the confluence of the rivers Wye and Dulas. It was a town of good note in the time of the Romans; it being then fortified with a caſtle and a wall, which were ruined in the rebellion of Owen Glendower. It is at preſent a pretty good town; and the market is large for corn, cattle, and proviſions. W. Long. 0. 56. N. Lat. 52. 10.

HAYNAULT. See HAINAULT.

HAYS, particular nets for taking rabbits, hares, &c. common to be bought in ſhops that ſell nets, and they may be had larger or ſhorter as you think fit; from 15 to 20 fathom is a good length, and for depth a fathom.

As rabbits often ſtraggle abroad about mid-day for freſh graſs, where you perceive a number gone forth to any remote brakes or thickets, pitch two or three of theſe hays about their burrows; lie cloſe there: but in caſe you have not nets enough to incloſe all their burrows, ſome may be ſtopped up with ſtones, &c. Then ſet out with the coney dog to hunt up and down at a good diſtance, and draw on by degrees to the man who is with you, and lies cloſe by the hay, who may take them as they bolt into it.

HAYWARD, the perſon who keeps the common herd or cattle of a town. He is appointed by the lord's court; and his office is to ſee that the cattle neither break nor crop the hedges of incloſed grounds.

HAYWARD (Sir John), an eminent Engliſh hiſtorian and biographer, in the beginning of the 17th century, was educated in the univerſity of Cambridge, where he took the degree of doctor of laws. In 1610, he was appointed one of the hiſtoriographers of a college then at Chelſea; and, in 1619, received the honour of knighthood. He wrote, 1. The lives of the three Norman kings of England, William I. and II. and Henry I.. 2. The firſt part of the life and reign of king Henry IV. 3. The life and reign of king Edward VI.; and ſeveral theological works. He died in 1627.

HAZAEL, an officer belonging to Benhadad king of Syria, cauſed that prince to be put to death, and reigned in his ſtead. He defeated Joram, Jehu, and Jehoahaz, kings of Iſrael; and, after his death, was ſucceeded by Benhadad his ſon, 852 B. C.

HAZARD, a game on dice, without tables, is very properly ſo called; ſince it ſpeedily makes a man, or undoes him.

It is played with only two dice; and as many may play at it as can ſtand round the largeſt round table.

Two things are chiefly to be obſerved, viz. main and chance; the latter belonging to the caſtor, and the former, or main, to the other gameſters. There can be no main thrown above nine, nor under five; ſo that five, ſix, ſeven, eight, and nine, are the only mains flung at hazard. Chances and nicks are from four to ten: thus four is a chance to nine, five to eight, ſix to ſeven, ſeven to ſix, eight to five; and nine and ten a chance to five, ſix, ſeven, and eight: in ſhort, four, five, ſix, ſeven, eight, nine, and ten, are chances to any main, if any of theſe nick it not. Now nicks are either when the chance is the ſame with the main, as five and five, or the like; or ſix and twelve, ſeven and eleven, eight and twelve. Here obſerve, that twelve is out to nine, ſeven, and five; eleven is out to nine, eight, ſix, and five: and ames-ace and duce-ace, are out to all mains whatever.

Hazle, Head.

HAZLE, or HAZEL, in botany. See CORYLUS.

The kernels of the fruit have a mild, farinaceous, oily taſte, agreeable to moſt palates. Squirrels and mice are fond of them, as well as ſome birds, ſuch as jays, nutcrackers, &c. A kind of chocolate has been prepared from them, and there are inſtances of their having been formed into bread. The oil expreſſed from them is little inferior to the oil of almonds; and is uſed by painters, and by chemiſts, for receiving and retaining odours. The charcoal made of the wood is uſed by painters in drawing.—Some of the Highlanders, where ſuperſtition is not totally ſubdued, look upon the tree itſelf as unlucky; but are glad to get two of the nuts naturally conjoined, which is a good omen. Theſe they call *cno-chomhlaich*, and carry them as an efficacious charm againſt witchcraft.

Evelyn tells us, that no plant is more proper for thickening of copſes than the hazle, for which he directs the following expeditious method. Take a pole of hazle (aſh or poplar may alſo be uſed) of 20 or 30 feet in length, the head a little lopped, into the ground, giving it a chop near the ground to make it ſuccumb; this faſtened to the earth with a hook or two, and covered with ſome freſh mould at a competent depth, (as gardeners lay their carnations), will produce a great number of ſuckers, and thicken and furniſh a copſe ſpeedily.

HAZLE-*Earth*, or *Hazley-earth*, a kind of red loam, which is ſaid to be an excellent mixture with other ſorts of earth; uniting what is too looſe, cooling what is too hot, and gently entertaining the moiſture.

HEAD, in anatomy. See ANATOMY, Part I. chap. ii.

HEAD-*Ach*, a moſt troubleſome ſenſation in the head, produced by various cauſes, and attended with different ſymptoms, according to its different degrees and the place where it is ſeated. See (the *Index* ſubjoined to) MEDICINE.

Dragon's HEAD, in aſtronomy, is the aſcending node of the moon or other planet.

HEAD *of a Ship*, an ornamental figure erected on the continuation of a ſhip's ſtem, as being expreſſive of her name, and emblamatical of war, navigation, commerce, &c.

HEAD, is alſo uſed in a more enlarged ſenſe to ſignify the whole front or forepart of the ſhip including the bows on each ſide: the head threefore opens the column of water through which the ſhip paſſes when advancing. Hence we ſay, head-ſails, head-ſea, headway, &c.

Thus, fig. 1. Plate CLIX. repreſents one ſide of the fore-part or head of a 74 four gun-ſhip, together with part of the bow, keel, and gunnel. The names of the ſeveral pieces, exhibited therein, are as follow:

A A Fore-part of the keel, with *a a* the two falſe keels

Head.

keels beneath it.

A C the ſtem.

a a The cat-head.

b b The ſupporter of the cat-head.

c c The knight-head, or bollard-timber, of which there is one on each ſide, to ſecure the inner end of the bowſprit.

d d The hauſe-holes.

e e The naval-hoods, *i. e.* thick pieces of plank laid upon the bow to ſtrengthen the edges of the hauſe-holes.

f The davit-chock, by which the *davit* is firmly wedged while employed to fiſh the anchor.

g The bulk-head, which terminates the forecaſtle on the fore-ſide, being called the *beak-head bulk-head* by ſhipwrights.

H The gun-ports of the lower deck.

h The gun-ports of the upper deck and forecaſtle.

I, I, The channels, with their dead-eyes and chain-plates.

i The gripe, or fore-foot, which unites the keel with the ſtem, forming a part of either.

k k Theſe dotted lines repreſent the thickneſs and deſcent of the different decks from the fore-part of the ſhip towards the middle. The loweſt of the three dotted lines *l* expreſſes the convexity of the beams, or the difference between the height of the deck in the middle of its breadth, and at the ſhip's ſide. This is alſo exhibited more clearly in the MIDSHIP-*Frame*; where the red curve of the beam is delineated. N. B. Theſe lines muſt be always parallel to the lines which terminate the gun-ports above and below.

m n The timbers of the head, and part of the bowſprit.

X The rails of the head which lie acroſs the timbers.

Q Z Fore-part of the main-wale.

R X Fore-part of the channel-wale.

U C The load water-line.

Fig. 2. repreſents a head-view of a ſhip, with the projection of her principal timbers, and all her planks laid on one ſide.

It is evident that the fore-part of a ſhip is called its *head*, from the affinity of motion and poſition it bears to a fiſh, and in general to the horizontal ſituation of all animals whilſt ſwimming.

By the HEAD; the ſtate of a ſhip, which is laden deeper at the fore-end than the after-end.

HEAD-*Faſt*, a rope employed to faſten a ſhip to a wharf, chain, or buoy, or to ſome other veſſel alongſide.

HEAD-*Land*, a name frequently given to a cape, or promontory.

HEADMOST, the ſituation of any ſhip or ſhips which are the moſt advanced in a fleet, or line of battle.

HEAD-*Rope*, that part of the bolt-rope which terminates any of the principal ſails on the upper edge, which is accordingly ſewed thereto. See the article BOLT-ROPE.

HEAD-*Sails*, a general name for all thoſe ſails which are extended on the fore-maſt and bowſprit, and employed to command the fore-part of the ſhip: ſuch are the fore-ſail, fore-top-ſail, fore-top-gallant-ſail, jib, fore-ſtay-ſail, and the ſprit-ſail with its top-ſail. This term is uſed in oppoſition to *after-ſails, viz.* all thoſe which are extended on the mizen-maſt, and on the ſtays between the mizen and main maſts.

Head || Heart.

HEAD *To-wind*; the ſituation of a ſhip or boat, when her head is turned to windward.

HEAD-*Way*, the motion of advancing at ſea. It is generally uſed when a ſhip firſt begins to advance; or when it is doubtful whether ſhe is in a ſtate of reſt or motion. It is in both ſenſes oppoſed to retreating, or moving with the ſtern foremoſt. See the article STERN-WAY.

HEALTH, is a right diſpoſition of the body, and of all its parts; conſiſting in a due temperature, a right conformation, juſt connection, and ready and free exerciſe of the ſeveral vital functions.

Health admits of latitude, as not being the ſame in all ſubjects, who may yet be ſaid to enjoy health.

That part of medicine, which ſhews the means of preſerving health, is termed *hygieine*. See MEDICINE.

The Greeks and Romans deified Health, repreſenting it under the figure of a woman, whom they ſuppoſed to be the daughter of Æſculapius. We find the name of the goddeſs *Salus*, or Health, on many medals of the Roman emperors, with different inſcriptions; as, SALUS PUBLICA, SALUS REPUBLICÆ, SALUS AUGUSTI, &c.

Methods of preſerving the HEALTH *of Mariners*. See MARINER.

HEAM, in beaſts, is the ſame with the ſecundines or after-birth in women.

HEARING. See ANATOMY, n° 405.

HEARNE (Thomas), a celebrated antiquarian, eminent for his writings and editions of MSS. His father was pariſh-clerk of Little Waltham in Berkſhire, where he was born in 1680. He had a liberal education by the patronage of a neighbouring gentleman; and even from a boy diſcovered a ſtrong propenſity to the ſtudy of antiquities. He did great ſervices to the Bodleian library, and died in 1735.

HEARSE, among ſportſmen, a hind of the ſecond year of her age.

HEART, in anatomy. See there, n° 382 [385].

Several ingenious perſons have from time to time attempted to make eſtimates of the force of the blood in the heart and arteries; who have as widely differed from each other, as they have from the truth, for want of a ſufficient number of data to argue upon. This ſet the truly ingenious Dr Hales upon making proper experiments, in order to aſcertain the force of the blood in the veins and arteries of ſeveral animals.

If, according to Dr Keil's eſtimate, the left ventricle of a man's heart throws out in each ſyſtole an ounce or 1.638 cubic inches of blood, and the area of the orifice of the aorta be =0.4187, then dividing the former by this, the quotient 3.9 is the length of the cylinder of blood which is formed in paſſing through the aorta in each ſyſtole of the ventricle; and in the ſeventy-five pulſes of a minute, a cylinder of 292.5 inches in length will paſs: this is at the rate of 1462 feet in an hour. But the ſyſtole of the heart being performed in one third of this time, the velocity of the blood in that inſtant will be thrice as much, viz. at the rate of 4386 feet in an hour, or 73 feet in a minute. And if the ventricle throws out one ounce in a pulſe, then in the ſeventy-five pulſes of a minute, the quantity

Heart ‖ Heat.

quantity of blood will be equal to 4.4lb 11 oz. and, in thirty-four minutes, a quantity equal to a middle-sized man, viz. 158 lb. will pass through the heart. But if, with Dr Harvey and Dr Lower, we suppose two ounces of blood, that is, 3.276 cubic inches, to be thrown out at each systole of the ventricle, then the velocity of the blood in entering the orifice of the aorta will be double the former, viz. at the rate of 146 feet in a minute, and a quantity of blood equal to the weight of a man's body will pass in half the time, viz. 17 minutes.

If we suppose, what is probable, that the blood will rise $7\frac{1}{4}$ feet high in a tube fixed to the carotide artery of a man, and that the inward area of the left ventricle of his heart is equal to fifteen square inches; these multiplied into $7\frac{1}{4}$ feet, give 1350 cubic inches of blood, which presses on that ventricle, when it first begins to contract, a weight equal to 15.5 pounds.

Heart ‖ Heat.

What the doctor thus calculates, from supposition, with regard to mankind, he actually experimented upon horses, dogs, fallow-does, &c. by fixing tubes in orifices opened in their veins and arteries; by observing the several heights, to which the blood rose in these tubes, as they lay on the ground; and by measuring the capacities of the ventricles of the heart, and orifices of the arteries. And, that the reader may the more readily compare the said estimates together, he has given a table of them, ranged in the following order.

The several animals.	Weight of each.		Height of the blood in the tube from the jugular vein.	Height of the blood in tubes fixed to arteries.		Capacity of the left ventricle of the heart.	Area of the orifice of the aorta.	Velocity of the blood in the aorta.	Quantities of blood equal to the weight of the animal, in what time.	How much in a minute.	Weight of the blood sustained by the left ventricle contracting.	No of pulses in a minute.	Area of transverse section of descending aorta.	Area of the transverse section of ascending aorta.
	Pounds.	Ounces.	Inches.	Feet.	Inches	Cubic inches.	Square inches.	Feet and inches in a minute.	Minutes.	Pounds.	Pounds.		Square inches.	Square inches.

HEARTBURNING, or PYROSIS. See (the *Index* subjoined to) MEDICINE.

HEARTH, that part of the pavement of a room on which the fire is immediately placed.

HEARTH-*Money*. See CHIMNEY-*Money*.

HEAT, in physiology, is used in a double sense, either as that peculiar sensation which is felt on the approach of burning bodies; or the cause of that sensation, in which last sense it is synonymous with FIRE.

Heat owing to the action of a fluid.

The disputes which were formerly carried on with regard to the nature of heat, namely, whether we were to account it merely an effect of motion in the parts of terrestrial bodies, or of a fluid *per se*, seem now to be generally determined in favour of the latter opinion. The electric fluid and elementary fire are commonly thought to be the same, for which opinion some proofs are adduced under the article ELECTRICITY. The discovery made by Dr Black that heat is capable of remaining in many bodies in a *latent* state, also confirms this opinion considerably *. The consequence * See *Evaporation*, *Cold*, and *Congelation*. of this discovery, however, undoubtedly is, That what we call *heat* or *fire*, depends not on the *presence* or *absence* of that fluid distinguished by the name of *elementary fire*, but on its action; just as the phenomena of electricity depend not on the presence or absence of the electric fluid, which is equally present at all times and in all places, but on its action.—Another inference, easily deducible from this principle is, That as the electric fluid is by its different manner of action capable of producing two different and seemingly opposite effects, distinguished by the names of *positive* and *negative* electricity; so doth the same fluid, acting as elementary fire, produce two different and seemingly opposite effects, called *heat* and *cold*.—This assertion will

Heat.

will not be thought paradoxical, when we conſider that ocular demonſtration may be given us, that a ſubſtance (namely, vapour), exceedingly cold to the touch, ſhall yet contain as much heat, as would be ſufficient to heat the water of which it is compoſed, red hot, did the nature of water permit it to endure an heat of this kind.

See EVAPORATION, nº 9.

2 Dr Martin's opinions concerning heat.

The philoſophers of this country who have moſt recently treated the ſubject of heat ſcientifically are, Dr Martin of St Andrews, Dr Black of Edinburgh, and Dr Irvin of Glaſgow. Dr Martin, in an eſſay on the various degrees of heat in bodies, endeavours to ſhew, that what we call *heat*, depends not entirely upon the quantity of elementary fire which is poured upon the body *ab extra*; but upon certain circumſtances ariſing from the conſtitution of the body itſelf, and its ſituation with regard to others. "We all find (ſays he) our great heats to be in thoſe places that lie low, and have a great height of atmoſphere above them, and ſurrounded by eminences and riſing grounds. If you aſcend on high to the tops of very elevated mountains, you are chilled with cold, and you find everlaſting ſnows, that after thouſands of ſummers have ſcarce ever been thawed, though every day expoſed to the direct rays of the ſun, which in ſome places are darted perpendicularly upon them. So neceſſary, it ſeems, is a long and direct paſſage through all or the greateſt part of the depth of our atmoſphere, or the aſſiſtance of its preſſure, or the reflections of rays from the earth's own ſurface, to invigorate thoſe rays, and to give them ſtrength for warming terreſtrial bodies. To which too the particular ſulphureous nature of the low parts of the atmoſphere may not a little contribute.

"But what if the real ſolar heat, both in itſelf, and what it can communicate to us and other planetary bodies (while it is not concentrated by burning-glaſſes, or ſtrengthened by other aſſiſtances), be vaſtly leſs than is commonly reckoned? All the natural heat we meet with here on the earth we are ready to aſcribe to the heat of the ſun, which perhaps has but a ſmall ſhare in it, overlooking a ſource of heat, which, though often ſpoke of by the theoriſts of the earth, is ſeldom conſidered in that advantageous light I would chooſe to take it. Every body has felt or heard, that the temperature of the air in mines or other places deep under ground is warm, or at leaſt very tolerable; and we know from the niceſt obſervations, that in the cave of the Obſervatory at Paris, only about 90 feet under ground, the heat keeps the thermometer at 53°; and that without any aſſiſtance from the ſun, it being never ſenſibly increaſed by the moſt ſcorching ſeaſons beyond its heat in the moſt ſevere winters that have been felt there.—And the ſame conſtant and unalterable degree of heat was obſerved by Mr Boyle, in a cave cut deep into the earth. And great and even troubleſome heats are ſaid to be obſerved at greater depths, and increaſing in proportion to theſe depths; though I could wiſh that theſe heats had been more regularly meaſured and aſcertained than what I find they have yet been. So that it would ſeem the body of the earth has a very great proper internal heat independent on the ſun, and very much beyond what he without the intervention of our atmoſphere could communicate to it; ſo great as, within 90 feet of its ſurface, to raiſe the thermometer 93 diviſions above Fahreinheit's cold mixture (of ſnow and ſpirit of nitre), or 453 diviſions above what Mr Amontons reckoned the loweſt degree of heat *. This heat of the earth at its ſurface is ſomething leſs; and beyond that, its force decreaſes indeed very faſt, ſo as to leave the air at a ſmall height above it a good deal colder; and which we find on the very high hills to be exceſſively cold, and not to be much warmed by the additional heat of the ſun's direct rays, if they be but little altered by the earth's ſurface and atmoſphere.—So then the ſun, though it be not the ſole or chief fountain, is as it were the great regulator of motion, heat, and life, to the inhabitants of this ſyſtem."

Heat.

* See *Internal* HEAT *of the Earth*, infra.

3 Objections to which they are liable.

This opinion hath alſo been adopted by others, but will probably never come into general credit. We certainly perceive the ſun to be the force and fountain of heat to the ſurface of the earth at leaſt, as much as we perceive a common fire to be the ſource of heat to a perſon who ſtands before it. Nor is the ſun's heat increaſed or diminiſhed, except by thoſe very circumſtances which increaſe or diminiſh the heat of a common fire. Though a perſon ſhould ſtand directly before the fire, yet if a ſtrong blaſt of air ruſhes into the room at the ſame time, he will not find himſelf warm; but it would be a very erroneous concluſion to infer from thence, that the heat of the fire was leſs than what people commonly ſuppoſed. If he excludes the blaſt of air by ſhutting the room-door, he will find the heat greatly increaſed, though he comes no nearer the fire than before; and if he cauſes any ſubſtance capable of reflecting the light ſtrongly to be placed at a ſmall diſtance behind him, ſuch as a large piece of tinned iron, he will then very probably feel the heat intolerable in that very place where it was diſagreeably cold before. Now the circumſtances which increaſe or diminiſh the heat of the ſun are quite ſimilar to thoſe above-mentioned. On the top of an high mountain the air has free acceſs on all ſides, except the ſmall point of earth where the perſon ſtands; the reſt of the earth alſo is at too great a diſtance to have any effect in diminiſhing the cold by its reflective power; and as in theſe high regions there are commonly violent winds, the cold is thereby greatly increaſed. But when we deſcend into the plain, the air has much leſs acceſs. The immenſe body of the earth effectually ſhelters us from the air on one ſide, at the ſame time that by its reflection it acts like the piece of metal abovementioned; while its inequalities in a great meaſure ſhelter us from the winds all around; and hence the heat at the foot of a mountain may be intolerable, while the cold is equally ſo at the top. It will now follow, that *heat* is not properly ſpeaking the mere preſence of the rays of the ſun, but their action after a certain manner, without interruption from any other ſubſtance; and that *cold* is not any privation or abſence of theſe rays, but is occaſioned by whatever prevents them from acting in the manner abovementioned; and if there is any ſubſtance in nature which conſtantly tends to prevent that action, ſuch a ſubſtance is *cold* in the abſtract. A ſubſtance of this kind is our atmoſphere, or ſome principle in it *; tho' very poſſibly that principle, as already hinted, may be no other than elementary fire itſelf acting in a different manner.

* See *Cold*, nº 4.

With regard to the opinions of Dr Black and Irvine

Heat.

vin upon this subject, it is impossible to give such a full account as could be wished; because the gentlemen have not thought proper to publish their sentiments to the world. From what we have been able to collect, however, and which is authenticated by Dr Black himself, his general opinion is, that heat is a substance *per se*: that when this substance is present in any terrestrial body, in a certain degree, that body is sensibly hot; when a lesser quantity of heat is present, the substance is cold: but there is no such thing as a positive cold; and all those degrees of cold known to us, even the most violent, are only smaller degrees of heat; and of this heat the sun is to us the only source and fountain. For his opinions concerning sensible and latent heat, see the articles CONGELATION, EVAPORATION, and FLUIDITY.

5 Dr Cleghorn's account of Dr Irvin's opinions.

Dr Irvin hath attempted to give a solution of the phenomena of latent heat; and though he hath not yet published this explanation himself, an account of it hath appeared in an inaugural dissertation *De igne*, published at Edinburgh, by Dr Cleghorn, in 1779. The substance of what this gentleman hath delivered, is as follows:

"Heat is occasioned by a certain fluid, and not by motion alone, as some eminent writers have imagined: because, 1. Those who have adopted the hypothesis of motion, could never even prove the existence of that motion for which they contended; and though it should be granted, the phenomena could not from it be explained. 2. If heat depended on motion, it would instantaneously pass through an elastic body; but we see that heat passes through bodies slowly like a fluid. 3. If heat depended on vibration, it ought to be communicated from a given vibration in proportion to the quantity of matter, which is found not to hold true in fact. On the other hand, there are numberless arguments in favour of the opinion that heat proceeds from elementary fire. 1. Mr Locke hath observed, that when we perceive a number of qualities always existing together, we may gather from thence, that there is really some substance which produces these qualities. 2. The hypothesis of elementary fire is simple, and agreeable to the phænomena. 3. From some experiments made by Sir Isaac Newton it appears, that bodies acquire heat and cold *in vacuo*, until they become of the same temperature with the atmosphere; so that heat exists in the absence of all other matter, and is therefore a substance by itself.

"Our senses are no just measures of the degrees of heat and cold*:—but the thermometer truly shews the increase or diminution of heat in the same body, *while it preserves the same form*; but this it will only do within certain limits. For when fluids are on the point of freezing, they contract irregularly, and expand in the same manner when brought near the boiling point. The thermometer, however, cannot shew the absolute quantity of heat contained in any body, because the beginning of the thermometrical scale by no means denotes the total absence of heat. For the same reason, it cannot even shew us the proportion between the quantities of heat contained in two different bodies; but Dr Black hath discovered a very ingenious and accurate method of shewing this last.

"It is universally known, that when two substances of different temperatures are mixed together, the one loses and the other acquires heat, till they both appear of the same temperature. Let, therefore, any quantity of water be mixed with an equal bulk of any other substance, either hotter or colder than itself, and observe what happens on the mixture. If the one gains as much as the other loses, both of them contain the same quantity of heat, when in their natural state; but if the one gains more than the other loses, then their natural quantities of heat differ in the same proportion.

"If any body, heated beyond the common temperature of the air, is exposed to it, the heat flows out from it into the atmosphere, and disposes itself equally around, till the air becomes of the same temperature with itself. The same happens to bodies suspended *in vacuo*. Hence it is justly concluded, there exists between the particles of heat a repulsive power, by which they mutually recede from each other.

"Notwithstanding this repulsive power, however, the quantities of heat contained in different substances even of the same temperature, are found to be altogether different. This is sufficiently proved by some experiments made by Fahreinheit and Boerhaave, and still further confirmed by others made by the learned Dr Black. He took equal bulks of water and mercury; and having heated the mercury 50° above the other, mixed them together as quick as possible. The temperature of the mixture was 20 degrees above the original temperature of the water. Again, having made the water 50° hotter than the mercury, the temperature of the mixture was 30° above the original temperature of the mercury. Hence it appears that the quantity of heat in water is to that in mercury when both are of an equal temperature, as 3 to 2. By similar experiments he hath also determined the quantities of heat contained in a great many different bodies; so that now it appears that the quantity of heat is scarce ever the same in any two different bodies; and hence we may conclude, that terrestrial bodies have a power of attracting heat, and that this power is different in different substances.

"From these principles it evidently follows, that heat is distributed among bodies directly in proportion to their attracting powers, and inversely according to the repulsive power between the particles of heat themselves.—Such is the distribution of heat among bodies in the neighbourhood of each other; and which is called the equilibrium of heat, because the thermometer shews no difference of temperature among them. For, seeing the heat is distributed according to the attracting power of each, the thermometer having also a proper attractive power of its own, can shew no difference in the quantity of heat contained in each; for which reason, all bodies in the neighbourhood of each other are soon reduced to the same temperature. Hence we can neither assent to the opinion of Boerhaave, who supposed that heat was distributed among bodies in proportion to their bulks; nor to the hypotheses of others, who imagined that they were heated in proportion to their densities. For the thermometer shews only the quantity of heat *going out* of a body, not that which is really contained in it; and both the abovementioned hypotheses are overturned by the experiments already recited.

"This equilibrium of heat may be broken while the quantity of heat in the different bodies remains

* See *Cold*, n° 1.

Heat. the ſame. For ſeeing the heat is diſtributed through all bodies directly in proportion to their attraction of it, and inverſely in proportion to the repulſion of the igneous particles; if in any body the former is diminiſhed, or the latter augmented, the fire will flow out of the body until the equilibrium is again reſtored, and then the heat is ſaid to be *generated*. On the contrary, if the attraction of any body towards heat is augmented, or the repulſion between its particles diminiſhed, then heat will flow into the body, and cold is ſaid to be generated.—This is explained by an experiment of Dr Cullen's. A thermometer ſuſpended in the receiver of an air-pump, deſcended ſome degrees while the air was exhauſting, but quickly recovered the temperature of the external atmoſphere; and when the air was again admitted, it aſcended beyond the temperature of the external air. While the air was exhauſting, the thermometer deſcended, becauſe the air which remained being rarified, the repulſion between the particles of fire contained in it was diminiſhed, and therefore the heat flowed out from the thermometer; but being allowed to remain for a ſhort time *in vacuo*, it acquired the temperature of the extrnal air, and the equilibrium was reſtored. When the external air was admitted, then that which had remained in the receiver, and acquired the temperature of the external air, being ſuddenly compreſſed, the repulſion between the igneous particles was increaſed, and the heat entering into the thermometer cauſed it riſe. From other experiments alſo it appears, that the temperature of the air becomes hotter by condenſation, and colder by rarefaction; the reaſon of which is manifeſt from the principles already laid down.

"Fluidity and evaporation are juſtly reckoned general effects of heat; for there is ſcarce any body which cannot be liquefied, and even carried off into vapour by an intenſe heat. The fluidity of water is univerſally known to depend on heat. Mercury likewiſe, by an intenſe cold, may be deprived of its fluidity *. Air is a kind of vapour which always becomes denſer by a diminution of its heat; and it is not improbable, that by a very great diminution of its heat the air itſelf might become ſolid; and this concluſion is confirmed by the analogy of other vapours.

* See *Congelation*, nº 2. and *Cold*, nº 8.

"Theſe phænomena may be explained from the principles already laid down. For the particles of all ſolids are connected by the attraction of cohefion; of which, as well as of every other attraction, the nature is ſuch, that if any new attraction is induced, the former is weakened. As much heat, therefore, may be added to a body as may increaſe its power of attracting heat to ſuch a degree, that the attraction of cohefion will be totally diſſolved, and the particles will eaſily ſlide over one another, in which caſe the body becomes fluid. If the fire is ſtill kept up, that fluid becomes rarer, the heat communicates the repulſion between its own particles to thoſe of the fluid, which is now raiſed in vapour. Again, this vapour by a diminution of the heat is converted into a fluid, and by a ſtill farther diminution remains perpetually contracted into the form of a ſolid.

"If indeed ſuch is the power of bodies to attract heat, and ſuch the nature of heat as has been already laid down, we might conclude *à priori*, that the force by which any ſubſtance attracts heat would be increaſed while it was melting, or going off in vapour; that is, that liquefaction or evaporation would produce cold: and on the other hand, that when vapour was reduced into a liquid, or any fluid congealed into a ſolid, its power of attracting heat would be diminiſhed; and therefore heat, according to the common phraſe, would be *generated*. For when, by the ſolution of the body, the attraction of cohefion is taken away, the attraction of the body for heat is increaſed. And when evaporation takes place, the body, and therefore the heat, which is in it, becomes more rare; the conſequence of which is, that the repulſive power between the particles of fire is diminiſhed, the equilibrium is taken off, and the heat enters the vapour on all ſides. Heat.

"The learned philoſopher Dr Black was the firſt who demonſtrated experimentally that heat entered bodies in great quantity while they liquefy or are converted into vapour; and that the ſame quantity flowed out of them again while they were condenſing into fluids, or congealing into ſolids; and from this principle he hath explained a great number of phænomena, in which heat or cold were formerly ſaid to be *generated*. The heat, as long as it is inherent in theſe bodies, he calls *latent*; becauſe, while it enters the body, it does not change its ſenſible temperature; nor, after it has entered, does it affect the thermometer: and he was of opinion, that upon a certain quantity of latent heat the ſtates of fluidity and vapour principally depended.

"But an ingenious phyſician (Dr Irvin, profeſſor of chemiſtry at Glaſgow,) having made many experiments in order to find out the quantity of heat contained in different bodies, according to Dr Black's method, hath obſerved, that the ſame body, under different forms, ſhews different diſpoſitions with reſpect to heat; that ice, for inſtance, mixed with mercury 20 degrees colder than itſelf, leſſened the cold of the mixture in a ſmaller degree, or imparted to it a ſmaller quantity of heat than water mixed with mercury 20 degrees colder than itſelf. Hence that learned gentleman hath concluded, that the great quantity of heat which is found to enter into bodies while they evaporate, or are reduced to a fluid ſtate, is abſorbed by them becauſe of their change of form, and conſequently of their diſpoſition towards heat; and hence that the entrance of the heat is not to be accounted the *cauſe*, but the *effect* or *conſequence*, of fluidity or vapour. This opinion indeed ſeems more probable, and agreeable to the principles already laid down, than the other. But we muſt carefully remember, that the thermometer can only meaſure that quantity of heat which flows out from bodies, not that which enters into them. If, therefore, a quantity of heat in vapour affects the thermometer leſs than an equal quantity in water, we are thence to conclude, that vapour has a ſtronger attraction for heat than water, and therefore the thermometer attracts a ſmaller quantity of heat from it than from water. When melting ice abſorbs a great quantity of heat, which yet does not affect the thermometer; and when water converted into ice, throws out a great quantity of heat upon the thermometer or other bodies around it; theſe phænomena are eaſily explained from the greater attraction which water has for heat.

"The increaſe of the attraction which water has for

Heat. for heat, arifes from the folution of its attraction of cohefion, as appears probable from analogy. But heat ruflies into vapour, becaufe it is diftributed among bodies directly in proportion to their attractive powers, and inverfely in proportion to the repulfive power between its own particles. When water is converted into vapour, its parts are removed to a diftance from each other, and confequently the particles of heat. The repulfion between the latter, therefore, is diminifhed; the heat flows into the vapour, until the repulfion between its particles with refpect to the attracting power of the body becomes the fame as before; whence we plainly fee the reafon why vapour abforbs the greater quantity of heat in proportion as it is more expanded.

"That heat accompanies the rays of the fun, is beyond all doubt; but whether the fun communicates heat to the rays of light, or whether they attract it from the air, is with me a matter of uncertainty. If heat is derived from the fun, how comes it to pafs that the earth is no hotter after having received fuch an immenfe quantity of heat for fo many ages? If the heat is communicated from the earth to the air, and is not again carried off from thence, why is the atmofphere fo cold in its upper parts; or why has not the equilibrium of heat yet pervaded the whole atmofphere? If the rays of light have received heat from the fun himfelf, why does not an equal quantity of heat accompany the fame quantity of light at all different diftances from the earth?—Thefe, and other objections, fhew, that heat does not flow from the fun; and fome of them plainly fhew, that heat is attracted from the atmofphere; which thought we fhall now profecute a little farther.

"Heat is of fuch a nature, as I have already fhewn, that, when accumulated, it diffufes itfelf all around, and joins with bodies in proportion to their attractive powers; but if the rays of light are collected into a focus in the air, and no more heat is added to the air, the quantity of heat in the collected rays is not increafed in proportion to their own attraction, more than of the air in proportion to its attraction. But if they are *in equilibrio* as to their heat, before the collection by the focus, this fhews, that heat has entered the rays of light from the atmofphere, feeing their temperature increafes by condenfation. But that the rays of the fun really do attract heat from the atmofphere, feems to be proved by the obfervations of De Luc; who hath obferved, that the heat is very much, and very fuddenly, decreafed before fun-rifing; which fhews, that the rays of the fun, fweeping along at a fmall diftance above the earth, abftracted the heat from that part of the atmofphere, which therefore flowed from the lower parts to fupply the place of that which was taken away."

7 Objections to Dr Cleghorn's doctrine.

From this laft paragraph it feems natural to conclude, that the fun, inftead of being the fource of heat, is really a fource of cold; and the atmofphere the only refervoir of heat to us. But, on this fuppofition, it feems difficult to conceive how the heat of the atmofphere could remain the fame in quantity, even for a fingle moment. The rays of the fun, it is faid, cool the atmofphere, and carry off its heat; while they fweep along it at a little diftance from the furface of the earth. But this they are perpetually doing. While the fun, for inftance, is fhining directly upon Britain, his rays are cooling the atmofphere above America. But thefe rays which thus pafs through the atmofphere without touching the earth's furface, fly into the moft remote regions of fpace, and confequently muft carry the heat of our atmofphere along with them, where it muft be for ever loft to us. Thus the general quantity of heat would be perpetually diminifhing; and in fuch a number of ages as have intervened from the beginning of the world, it muft have been totally diffipated, or diffufed through fpaces to which our earth and its atmofphere bear not the proportion of 1 to 10,000,000,000. Heat.

His explanation of Dr Black's principle of latent heat is, perhaps, equally liable to objection. We fhall for a moment allow, that the abforption of heat is the *confequence*, and not the *caufe*, of fluidity and vapour: but what then is the caufe? It feems undeniable, that the caufe is a quantity of heat, greater than what the body is naturally fitted to contain, forced upon it *ab extra*: but this heat, the moment it enters the body, is to appearance loft and annihilated, while the body changes its form. How is it poffible, then, to aflign another caufe for the change of form in the body, than its abforption of the quantity of heat which was forced upon it *ab extra*?—To fay that the body now attracts heat from the atmofphere in greater quantity than it did before, and which enters it copioufly, cannot be admitted. The body did not originally *attract* the heat; it was plainly forced upon it; a quantity of heat entered it, and changed its form. This quantity therefore remains within the body, and neither attracts nor repels that which is in the atmofphere. The body can attract no more, unlefs that which has already entered was to be thrown out; and therefore the coldnefs of vapour cannot be owing to its attraction of heat from the atmofphere: neither is it owing to its attracting heat more than water does; for vapour may be heated in fuch a manner, that it will part with heat as readily as water, or any other fubftance whatever.——Nor does the experiment adduced in favour of this doctrine feem conclufive. Ice communicates lefs heat to mercury 20 degrees colder than itfelf, than water does; but for this two reafons may be afligned. 1. When bodies are intenfely heated, they part with their heat very readily, and in great quantity; but as the heat decreafes, it alfo flies off, or is communicated to furrounding bodies more flowly and with more difficulty than before. Water always contains a greater quantity of heat than ice, and therefore ought to part with an equal quantity of heat more readily and eafily than ice does. 2. When water is cooled to 32 degrees, it freezes; when juft above 32 degrees, it becomes fluid; and, with every degree of heat fuperior to that, evaporates. If water heated to 212 degrees, or near it, is placed within the receiver of an air-pump, and the air exhaufted, a great quantity of fteam iffues from it, and the heat of the water fuddenly decreafes to 98 or 100 degrees. Hence it is plain, that 112 degrees of the heat of boiling water is contained, not in the water itfelf, but in the fteam detained among its particles by the preffure of the atmofphere. Had this water, therefore, been mixed with mercury much colder than itfelf, a quantity of the fteam would have been condenfed by the coldnefs of the metal. But fteam cannot be condenfed

Heat. without giving out, not only its ſenſible heat, but that which is *latent* alſo; and hence we may eaſily ſee why water communicates degrees of heat ſo much greater in proportion than ice does.

Laſtly, The principle on which the whole doctrine is founded, does not ſeem to agree either with the phænomena of nature, or with the concluſions which muſt be drawn from itſelf. It is ſaid, that fire tends to diffuſe itſelf equally on all bodies in the neighbourhood of one another. But does this hold in fact? Heat has a diſpoſition to aſcend; and that not only in the atmoſphere, but *in vacuo*, and through ſolid bodies. If a bar of iron, red-hot at one end, is ſet to cool with its red part undermoſt, the heat will aſcend farther and quicker through it, than it will deſcend if the iron is placed the contrary way. The argument, therefore, for the repulſive power between the particles of heat does not hold, nor that for the attraction between the particles of heat and thoſe of other matter. Though different bodies contain different quantities of heat, this difference may be occaſioned otherwiſe than by attraction. We have already ſeen, that a certain quantity of heat abſorbed by water in the ſtate of ice, is the *cauſe* of its fluidity. The ſame is the caſe with mercury; but the latter can remain fluid with much leſs heat than water can. It muſt, however, be admitted, that the ſubſtances we call *water* and *mercury* are only ſo in conſequence of the action of heat. Thus, water deprived of a certain quantity of heat, is no longer *water*, but a kind of glaſs; and mercury is no longer *mercury*, but a ſolid metal. Now, let us ſuppoſe, that ice at 32 degrees is applied to a quantity of mercury at 32; we know that the ice is only water deprived of a quantity of its natural heat, and of conſequence it ought to have a violent attraction for that quantity which has been forced from it. The mercury has a great deal of heat to ſpare, yet the ice attracts none from it; neither will the fluid water attract heat from mercury of the ſame temperature, though the one is ſaid to attract it more ſtrongly than the other. That water ſhould be heated by mercury hotter than itſelf, is not wonderful; nor can we account this an effect of attraction, becauſe the ſuperfluous quantity of heat would not remain in the mercury, though the water was not applied to it.

9 Explanation of the phenomena of heat on other principles. From theſe, and a multitude of other conſiderations, we would conclude, that heat itſelf, and not the attractive and repulſive power ſuppoſed by Dr Cleghorn and others, is the active principle which has ſo great a ſhare in the operations of nature. The principles on which the actions of heat depend, may perhaps be explained in a leſs exceptionable manner, from the following propoſitions.

1. It is in all caſes obſerved, That when light proceeds in conſiderable quantity from a point, diverging as the radii of a circle from its centre, there a conſiderable degree of heat is found to exiſt, if an opaque body, having no great reflective power, is brought near that point.

2. This action of the light, therefore, may be accounted the ultimate cauſe of heat, without having recourſe to any farther ſuppoſitions; becauſe nothing elſe beſides this action is evident to our ſenſes.

3. If the point from which the rays are emitted is placed in a tranſparent medium, ſuch as air or water, that medium, without the preſence of an opaque body, will not be heated. Heat.

4. Another cauſe of heat, therefore, is the reſiſtance of the parts of that body on which which the light falls, to the action mentioned in Prop. 1. Where this reſiſtance is weak, as in the caſes juſt mentioned, the heat is either nothing, or very little.

5. If a body capable of reflecting light very copiouſly is brought near the lucid point, it will not be heated *. * See the article BURNING-*Glaſs*.

6. A penetration of the light, therefore, into the ſubſtance of the body, and likewiſe a conſiderable degree of reſiſtance on the part of that body to the action of the light, are the requiſites to produce heat.

7. Thoſe bodies ought to conceive the greateſt degrees of heat, into whoſe ſubſtance the light can beſt penetrate, *i. e.* which have the leaſt reflective power, and which moſt ſtrongly reſiſt its action; which is evidently the caſe with black and ſolid ſubſtances.

8. By heat all bodies are expanded in their dimenſions every way, and that in proportion to their bulk and the quantity of heat communicated to them.

9. This expanſion takes place not only by an addition of *ſenſible* heat, but likewiſe of that which is *latent*. Of this laſt we have a remarkable inſtance in the caſe of ſnow mixed with ſpirit of nitre. The ſpirit of nitre contains a certain quantity of latent heat, which cannot be ſeparated from it without effecting a change on the ſpirit itſelf; ſo that, if deprived of this heat, it would no longer be ſpirit of nitre.—Beſides this, it contains a quantity of ſenſible heat, of a great part of which it may be deprived, and yet retain its characteriſtic properties as nitrous acid. When it is poured upon ſnow, the latter is immediately melted by the action of the latent heat in the acid. The ſnow cannot be melted or converted into water, without imbibing a quantity of latent heat, which it receives immediately from the acid which melts it. But the acid cannot part with this heat without decompoſition; to prevent which, its ſenſible heat occupies the place of that which has entered the ſnow and liquefied it. The mixture then becomes exceedingly cold, and the heat forces into it from all the bodies in the neighbourhood; ſo that, by the time it has recovered that quantity of ſenſible heat which was loſt, or arrived at the temperature of the atmoſphere around it, it will contain a conſiderably larger quantity of heat than it originally did, and is therefore obſerved to be expanded in bulk. Another inſtance of this expanſive power of latent heat is in the caſe of ſteam, which always occupies a much larger ſpace than the ſubſtance from which it was produced; and this whether its temperature is greater or leſs than the ſurrounding atmoſphere.

10. The difference between latent and ſenſible heat, then, as far as we can perceive, is, that the expanſive power of the firſt is directed only againſt the particles of which the body is compoſed; but that of the ſecond is directed alſo againſt other bodies. Neither doth there ſeem to be any difference at all between them farther than in quantity. If water, for inſtance, hath but a ſmall quantity of heat, its parts are brought near each other, it contracts in bulk, and feels cold. Still, however, ſome part of the heat is detained among the aqueous particles, which prevents the fluid from

Heat. from congealing into a ſolid maſs. But, by a continuation of the contracting power of the cold, the particles of water are at laſt brought ſo near each other that the internal or *latent* heat is forced out. By this diſcharge a quantity of air is alſo produced, the water is congealed, and the ice occupies a greater ſpace than the water did; but then it is full of air-bubles, which are evidently the cauſe of its expanſion. The heat then becomes *ſenſible*, or, as it were, lies on the outſide of the matter; and conſequently is eaſily diſſipated into the air, or communicated to other bodies. Another way in which the latent heat may be extricated is by a conſtant addition of ſenſible heat. In this caſe the body is firſt raiſed into vapour, which for ſome time carries off the redundant quantity of heat. But as the quantity of this heat is continually increaſed, the texture of the vapour itſelf is at laſt totally deſtroyed. It becomes too much expanded to contain the heat, which is therefore violently thrown out on all ſides into the atmoſphere, and the body is ſaid to burn, or be on fire. See Flame and Ignition.

11. Hence it follows, that thoſe bodies which have the leaſt ſhare of latent heat, appear to have the greateſt quantity of ſenſible heat; but this is only in appearance, for the great quantity they ſeem to contain is owing really to their inability to contain it. Thus, if we can ſuppoſe a ſubſtance capable of tranſmitting heat through it as faſt as it received it; if ſuch a ſubſtance was ſet over a fire, it would be as hot as the fire itſelf, and yet the moment it was taken off, it would be perfectly cool, on account of its incapacity to detain the heat among the particles of which it was compoſed.

12. The heat, therefore, in all bodies, conſiſts in a certain violent action of the elementary fire within them tending from a centre to a circumference, and thus making an effort to ſeparate the particles of the body from each other, and thereby to change its form or mode of exiſtence. When this change is effected, bodies are ſaid to be diſſipated in vapour, calcined, vitrified, or burnt, according to their different natures.

13. Inflammable bodies are ſuch as are eaſily raiſed in vapours; that is, the fire eaſily penetrates their parts, and combines with them in ſuch quantity, that, becoming exceedingly light, they are carried up by the atmoſphere. Every ſucceeding addition of heat to the body increaſes alſo the quantity of latent heat in the vapour, till at laſt, being unable to reſiſt its action, the heat breaks out all at once, the vapour is converted into flame, and is totally decompoſed. See the article Flame, and Prop. 10.

14. Uninflammable bodies are thoſe which have their parts more firmly connected, or otherwiſe diſpoſed in ſuch a manner, that the particles of heat cannot eaſily combine with them or raiſe them into vapour.

15. Heat therefore being only a certain mode of the action of elementary fire, it follows, that the capacity of a body for containing it, is only a certain conſtitution of the body itſelf, or a diſpoſition of its parts which can allow the elementary fire contained in it to exert its expanſive power upon them without being diſſipated on other bodies. Thoſe ſubſtances which allow the expanſive power of the fire to operate on their own particles are ſaid to contain a great deal of heat; but thoſe which throw it away from themſelves upon other bodies, though they feel very hot, yet philoſophically ſpeaking they contain very little. Heat.

16. What is called the *quantity* of heat contained in any ſubſtance, if we would ſpeak with the ſtricteſt propriety, is only the apparent force of its action either upon the parts of the body itſelf, or upon other bodies in its neighbourhood. The expanſive force of the elementary fire contained in any body upon the parts of that body is the *quantity of latent heat* contained in it; and the expanſive force of the fire exerted upon other bodies which touch or come near it, is the *quantity of ſenſible heat* it contains.

17. If what we call *heat* conſiſts only in a certain action of that fluid called *elementary fire*, namely, its expanſion, or acting from a centre to a circumference, it follows, that if the ſame fluid act in a manner directly oppoſite to the former, or preſs upon the particles of a body as from a circumference to a centre, it will then produce effects directly oppoſite to thoſe of heat, i. e. it will then be abſolute *cold*, and produce all the effects already attributed to Cold. See that article.

18. If heat and cold then are only two different modifications of the ſame fluid, it follows, that if a hot body and a cold one are ſuddenly brought near each other, the heat of the one ought to drive before it a part of the cold contained in the other, *i. e.* the two portions of elementary fire acting in two oppoſite ways, ought in ſome meaſure to operate upon one another as any two different bodies would when driven againſt each other. When a hot and a cold body therefore are brought near each other, that part of the cold body fartheſt from the hot one ought to become colder than before, and that part of the hot body fartheſt from the cold one ought to become hotter than before.

19. For the ſame reaſon, the greateſt degree of cold in any body ought to be no obſtacle, or at leaſt very little, to its conceiving heat, when put in a proper ſituation. Cold air, cold fuel, &c. ought to become as intenſely heated, and very nearly as ſoon, as that which is hotter.

The two laſt propoſitions are of great importance. When the firſt of them is thoroughly eſtabliſhed, it will confirm beyond a doubt, that cold is a *poſitive* as well as heat; and that each of them has a ſeparate and diſtinct power, of which the action of its antagoniſt is the only proper limit; *i. e.* that heat can only limit the power of cold, and *vice verſa*. A ſtrong confirmation of this propoſition is the experiment related by M. Geoffroy; an account of which is given under the article Cold, n° 5. Another, but not ſo well authenticated, is related under the article Congelation, n° 11.—De Lue's obſervation alſo, mentioned by Dr Cleghorn affords a pretty ſtrong proof of it; for if the lower parts of the atmoſphere are cooled by the paſſage of the ſun's rays at ſome diſtance above, and it hath been already ſhewn that they do not *attract* the heat from the lower parts, it follows, that they muſt *expel* part of the cold from the upper regions.—The other propoſition, when fully eſtabliſhed, will prove, that heat and cold are really convertible into one another; which indeed ſeems not improbable, as we ſee that fires will burn with the greateſt fierceneſs during the time of intenſe froſts, when the coldeſt air is admitted

Heat. mitted to them; and even in thofe difmal regions of Siberia, when the intenfe cold of the atmofphere is fufficient to congeal quickfilver, it cannot be doubted that fires will burn as well as in this country; which could not happen if heat was a fluid *per fe*, and capable of being carried off, or abfolutely diminifhed in quantity, either in any part of the atmofphere itfelf, or in fuch terreftrial bodies as are ufed for fuel.

This theory of heat, if found admiffible by philofophers, would introduce a greater fimplicity into natural philofophy, and explain the phenomena of nature in a manner much more eafy and lefs liable to objection, than hath yet been done: we would then fee the phenomena of attraction, repulfion, electricity, fire, light, ignition, &c. &c. to be only as many different effects of one etherial fluid, which the Deity hath appointed to be the firft of all fecondary caufes, and to alter, modify, compound, and feparate, the different parts of terreftrial fubftances, as we daily fee done by the different natural agents.

HEAT *of Burning Bodies*. See IGNITION.

HEAT *of Chemical Mixtures*. This is a phenomenon neceffarily refulting from the change of form produced in the different fubftances which are mixed together; and the manner in which it happens may be eafily underftood from the example of oil of vitriol and water. If equal quantities of concentrated vitriolic acid and water are mixed together, a very great degree of heat immediately takes place; infomuch, that if the veffel which contains the mixture is made of glafs, it will probably break; and after it is cold, the mixture will be found to have fhrunk in its dimenfions, or will occupy lefs fpace than the bulk of the water and acid taken feparately. In this cafe we know that the water, while in its fluid ftate, hath as much latent heat as it can contain; *i. e.* the elementary fire within it expands, or feparates its parts from each other, as much as is conftftent with the conftitution of the body. If any more is added, it cannot be abforbed, or direct its force upon the particles of the water without raifing them in vapour: of confequence, part of this additional expanfive power will be employed in the formation of vapour, and the reft will be difcharged upon the neighbouring bodies; *i. e.* will be converted into *fenfible* heat. The vitriolic acid, in its concentrated ftate, contains a great quantity of latent heat which is neceffary to preferve its fluidity. But when it is mixed with the fluid water, the latent heat contained in the latter is abundantly fufficient for both: of confequence, the great expanfive power in the oil of vitriol itfelf becomes now totally ufelefs, and therefore exerts its force upon the neighbouring bodies; and when the mixture returns to the original temperature of the oil of vitriol and water, it fhews a lofs of fubftance by its diminution in bulk. This may ferve to explain all cafes in chemiftry where heat or cold is produced: and it will generally be found, that where bodies, by being mixed together, produce heat, they fhrink in their dimenfions; but when they produce cold, they are enlarged.

HEAT *of Climates*. See HEAT, n° 2; and AMERICA, n° 3---24.

Methods of Meafuring HEAT. See THERMOMETER.

Expanfion of Metals by HEAT. See PYROMETER.

Degrees of HEAT *which Animals are capable of bearing*. The ancients were of opinion that all countries lying within the tropics were uninhabitable by reafon of their heat; but time has difcovered their miftake, and it is now found that no part of the world is too hot for mankind to live in. The learned profeffor Boerhaave, in his chemiftry, relates certain experiments made with great accuracy by the celebrated Fahrenheit, and others, at his defire, on this fubject, in a fugar-baker's office; where the heat, at the time of making the experiments, was up to 146 degrees of Fahrenheit's thermometer. A fparrow, fubjected to air thus heated, died, after breathing very laborioufly, in lefs than feven minutes. A cat refifted this great heat fomewhat above a quarter of an hour; and a dog about 28 minutes, difcharging, before his death, a conficerable quantity of a ruddy-coloured foam, and exhaled a ftench fo peculiarly offenfive, as to throw one of the affiftants into a fainting fit. This diffolution of the humours, or great change from a natural ftate, the profeffor attributes not to the heat of the ftove alone, which would not have produced any fuch effect on the flefh of a dead animal; but likewife to the vital motion, by which a ftill greater degree of heat, he fuppofes, was produced in the fluids circulating through the lungs, in confequence of which the oils, falts, and fpirits of the animal became fo highly exalted.

Meffieurs Du-Hamel and Tillet having been fent into the province of Augomois, in the years 1760 and 1761, with a view of endeavouring to deftroy an infect which confumed the grain of that province, effected the fame in the manner related in the Memoirs for 1761, by expofing the affected corn, with the the infects included in it, in an oven, where the heat was fufficient to kill them without injuring the grain. This operation was performed at Rochefoucalt, in a large public oven, where, for œconomical views, their firft ftep was to aflure themfelves of the heat remaining in it, on the day after bread had been baked in it. This they did, by conveying in a thermometer on the end of a fhovel, which, on its being withdrawn, indicated a degree of heat conficerably above that of boiling water: but M. Tillet, convinced that the thermometer had fallen feveral degrees in drawing to the mouth of the oven, and appearing under fome embarraffment on that head, a girl, one of the attendants on the oven, offered to enter, and mark with a pencil the height at which the thermometer ftood within the oven. The girl fmiled on M. Tillet's appearing to hefitate at this ftrange propofition; and entering the oven, with a pencil given her for that purpofe, marked the thermometer, after ftaying two or three minutes, ftanding at 100 degrees of Reaumur's fcale, or, to make ufe of a fcale better known in this country, at near 260 degrees of Fahrenheit's. M. Tillet began to expreis an anxiety for the welfare of his female affiftant, and to prefs her return. This female falamander, however, afluring him that fhe felt no inconvenience from her fituation, remained there 10 minutes longer; that is, near the time when Boerhaave's cat parted with her nine lives, under a much lefs degree of heat; when the thermometer ftanding at 288 degrees, or 76 degrees above that of boiling water, fhe came out of the oven, her complexion indeed conficerably heightened, but her refpiration in-

no

Heat. means quick or laborious. After M. Tillet's return to Paris, theſe experiments were repeated by Monſ. Marantin, commiſſaire de guerre, at Rochefoucault, an intelligent and accurate obſerver, on a ſecond girl belonging to the oven; who remained in it, without much inconvenience, under the ſame degree of heat, as long as her predeceſſor; and even breathed in air heated to about 325 degrees, for the ſpace of five minutes. Heat.

M. Tillet endeavoured to clear up the very apparent contrariety between theſe experiments and thoſe made under the direction of Boerhaave, by ſubjecting various animals, under different circumſtances, to great degrees of heat. From his experiments, in ſome of which the animals were ſwaddled with clothes, and were thereby enabled to reſiſt for a much longer time the effects of the extraordinary heat, he infers, that the heat of the air received into the lungs was not, as was ſuppoſed by Boerhaave, the only or principal cauſe of the anxiety, laborious breathing, and death, of the animals on whom his experiments were made; but that the hot air, which had free and immediate acceſs to every part of the ſurface of their bodies, penetrated the ſubſtance on all ſides, and brought on a fever, from whence proceeded all the ſymptoms: on the contrary, the girls at Rochefoncault, having their bodies in great meaſure protected from this action by their clothes, were enabled to breathe the air, thus violently heated, for a long time without great inconvenience. In fact, we ſhould think too, that the bulk of their bodies, though not thought of much conſequence by M. Tillet, appears to have contributed not a little to their ſecurity. In common reſpiration, the blood, in its paſſage through the lungs, is cooled by being brought into contact with the external inſpired air: In the preſent experiments, on the contrary, the veſicles and veſſels of the lungs receiving at each inſpiration an air heated to 300 degrees, muſt have been continually cooled and refreſhed, as well as the ſubcutaneous veſſels, by the ſucceſſive arrival of the whole maſs of blood contained in the interior parts of the body, whoſe heat might be ſuppoſed at the beginning of the experiment not to exceed 100 degrees. Not to mention, that M. Tillet's two girls may not poſſibly have been ſubjected to ſo great a degree of heat as that indicated by the thermometer; which appears to us to have always remained on the ſhovel, in contact with the earth.

Theſe experiments ſoon excited other philoſophers to make ſimilar ones, of which ſome very remarkable ones are thoſe of Dr Dobſon at Liverpool, who gives the following account of them in the Philoſophical Tranſactions, vol. lxv.

"I. The ſweating-room of our public hoſpital at Liverpool, which is nearly a cube of nine feet, lighted from the top, was heated till the quickſilver ſtood at 224° on Fahrenheit's ſcale, nor would the tube of the thermometer indeed admit the heat to be raiſed higher. The thermometer was ſuſpended by a ſtring fixed to the wooden frame of the ſky-light, and hung down about the centre of the room. Myſelf and ſeveral others were at this time incloſed in the ſtove, without experiencing any oppreſſive or painful ſenſation of heat proportioned to the degree pointed out by the thermometer. Every metallic about us ſoon became very hot.

"II. My friend Mr Park, an ingenious ſurgeon of this place, went into the ſtove heated to 202°. After ten minutes, I found the pulſe quickened to 120. And to determine the increaſe of the animal-heat, another thermometer was handed to him, in which the quickſilver already ſtood at 98°; but it roſe only to 99½, whether the bulb of the thermometer was incloſed in the palms of the hands, or received in the the mouth (A). The natural ſtate of this gentleman's pulſe is about 65.

"III. Another gentleman went through the ſame experiment in the ſame circumſtances, and with the ſame effects.

"IV. One of the porters to the hoſpital, a healthy young man, and the pulſe 75, was incloſed in the ſtove when the quickſilver ſtood at 210°; and he remained there, with little inconvenience, for 20 minutes. The pulſe, now 164, and the animal-heat, determined by another thermometer as in the former experiments, was 101¼.

"V. A young gentleman of a delicate and irritable habit, whoſe natural pulſe is about 80, remained in the ſtove ten minutes when heated to 224°. The pulſe roſe to 145, and the animal-heat to 102°. This gentleman, who had been frequently in the ſtove during the courſe of the day, found himſelf feeble, and diſpoſed to break out into ſweats for 24 hours after the experiment.

"VI. Two ſmall tin veſſels, containing each the white of an egg, were put into the ſtove heated to 224°. One of them was placed on a wooden ſeat near the wall, and the other ſuſpended by a ſtring about the middle of the ſtove. After ten minutes, they began to coagulate; but the congulation was ſenſibly quicker and firmer in that which was ſuſpended, than in that which was placed on the wooden ſeat. The progreſs of the coagulation was as follows: it was firſt formed on the ſides, and gradually extended itſelf; the whole of the bottom was next coagulated; and laſt of all, the middle part of the top.

"VII. Part of the ſhell of an egg was peeled away, leaving only the film which ſurrounds the white; and part of the white being drawn out, the film ſunk ſo as to form a little cup. This cup was filled with ſome of the *albumen ovi*, which was conſequently detached as much as poſſible from every thing but the contact of the air and of the film which formed the cup. The lower part of the egg ſtood upon ſome light tow in a common gallipot, and was placed on the wooden ſeat in the ſtove. The quickſilver in the thermometer ſtill continued at 224°. After remaining in the ſtove for an hour, the lower part of the egg which was covered with the ſhell, was firmly coagulated; but that which was in the little cup, was fluid and tranſparent. At the end of another hour it was ſtill fluid, except on the edges where it was thineſt; and here it was ſtill tranſparent; a ſufficient proof that it

(A) The ſcale of the thermometer, which was ſuſpended by the ſtring about the middle of the room, was of metal; this was the only one I could then procure, on which the degrees ran ſo high as to give any ſcope to the experiment. The ſcale of the other thermometer, which was employed for aſcertaining the variations in the animal-heat, was of ivory.

Heat. it was dried, not coagulated.

" VIII. A piece of bees-wax, placed in the same situation with the *albumen ovi* of the preceding experiment, and exposed to the same degree of heat in the stove, began to melt in five minutes: another piece suspended by a string, and a third piece put into the tin vessel and suspended, began likewise to liquefy in five minutes."

Even these experiments, though more accurate than the former, do not shew the utmost degrees of heat which the human body is capable of enduring. Some others, still more remarkable, (as in them the body was exposed to the heat without clothes), by Drs Fordyce and Blagden, are also recorded in the Philosophical Transactions. They were made in rooms heated by flues in the floor, and by pouring upon it boiling water. There was no chimney in them, nor any vent for the air, excepting through crevices at the door. In the first room were placed three thermometers, one in the hottest part of it, another in the coolest part, and a third on the table, to be used occasionally in the course of the experiment. Of these experiments, the two following may be taken as a specimen.

" About three hours after breakfast, Dr Fordyce having taken off all his clothes, except his shirt, and being furnished with wooden shoes tied on with list, went into one of the rooms, where he staid five minutes in a heat of 90°, and begun to sweat gently. He then entered another room, and stood in a part of it heated to 110°. In about half a minute his shirt became so wet, that he was obliged to throw it aside, and then the water poured down in streams over his whole body. Having remained in this heat for ten minutes, he removed to a part of the room heated 120°; and after staying there 20 minutes, found that the thermometer placed under his tongue, and held in his hand, stood just at 100°, and that his urine was of the same temperature. His pulse had gradually risen to 145 pulsations in a minute. The external circulation was greatly increased, the veins had become very large, and an universal redness had diffused itself all over the body, attended with a strong feeling of heat; his respiration, however, was little affected. He concluded this experiment by plunging in water heated to 100°; and after being wiped dry, was carried home in a chair; but the circulation did not subside for two hours.

" Dr Blagden took off his coat, waistcoat, and shirt, and went into one of the rooms, as soon as the thermometer had indicated a degree of heat above that of boiling water. The first impression of this hot air upon his body was exceedingly disagreeable, but in a few minutes all his uneasiness was removed by the breaking out of a sweat. At the end of 12 minutes he left the room very much fatigued, but no otherwise disordered. His pulse beat 136 in a minute, and the thermometer had risen to 220 degrees."

In others of these experiments it was found, that a heat even of 260° of Fahreinheit's thermometer could be submitted to with tolerable ease. But it must be observed, that in these great heats every piece of metal they carried about with them become intolerably hot. Small quantities of water placed in metalline vessels quickly boiled; but in a common earthen vessel it required an hour and an half to arrive at a temperature of 140°, nor could it ever be brought near the boiling point. Neither durst the people, who with impunity breathed the air of this very hot room at 264 degrees, bear to put their fingers into the boiling water which indicated only a heat of 212°. So far from this, they could not bear the touch of quicksilver heated only to 120°, and could but just bear spirit of wine at 130°. Heat.

Animal-Heat. Of this there are various degrees; some animals preserving a heat of 100° or more in all the different temperatures of the atmosphere; others keep only a few degrees warmer than the medium which furrounds them; and in some of the more imperfect animals, the heat is scarcely one degree above the air or water in which they live.

The phenomenon of animal-heat hath, from the earliest ages, been the subject of philosophical discussion; and, like most other subjects of this nature, its cause is not yet ascertained. The best treatises that have appeared on the subject are those of Dr Dugud Leslie, published in 1778; and Mr Adair Crawford, in 1779. From the first of these performances, the following account of the different opinions on this subject is extracted. 1

" The ancients possessed not the requisites for minutely investigating the science of nature; and, prone to superstition, attributed every phenomenon which eluded their investigation, to the influence of a superior natural power. Hippocrates, the father and founder of medicine, accounted animal-heat a mystery, and bestowed on it many attributes of the deity. In treating of that subject, he says in express terms, " what we call heat, appears to me to be something immortal, which understands, sees, hears, and knows every thing present and to come."—Aristotle seems to have considered the subject particularly, but nothing is to be met with in his works that can be said to throw light upon it.—Galen tells us that the dispute between the philosophers and physicians of his time was, " whether animal-heat depended on the motion of the heart and arteries; or whether, as the motion of the heart and arteries was innate, the heat was not also innate." Both these opinions, however, he rejects; and attempts a solution of the question in his favourite system, namely, the peripatetic philosophy: but his leading principles being erroneous, his deductions are of course inadmissible. Opinions of the ancients concerning animal-heat.

" To enter into a minute detail of all the opinions offered by the moderns on the cause of animal-heat, would far exceed our limits. Most of them, however, may be referred to one or other of the three general causes of heat, viz. mixture, fermentation, and mechanical means, each of which we shall particularly consider. 2 Of the moderns.

" 1. *Chemical mixture.* When chemical philosophy first came into vogue, and prevailed in the theory as well as practice of medicine, almost every operation in the animal machine was said to be the effect of ferment or mixture. From observing, that on the mixing of certain bodies far below the temperature of the human body, a degree of heat sometimes rising to actual inflammation was produced; they, without further investigation, pronounced mixture the sole cause of animal heat. Various, however, were the opinions, not

Heat. not only respecting the place where the mixture happened, but also concerning the nature of the fluids of which it consisted. Van Helmont, Sylvius, and several others, supposed that the mixture took place in the intestinal tube; and ascribed it to an effervescence between the pancreatic juice and the bile. Others discovered acids in one place, and alkalies in another; but the general opinion for near two centuries was, That acescent fluids taken in, meeting with others of an alkaline nature already prepared in the body, gave rise to the degree of heat peculiar to animals. But those who are in the least acquainted with the laws of the animal œconomy, need not be told that these opinions are mere conjectures, founded on facts gratuitously assumed. No experiments have shewn either an acescency or alkalescency in the bile that is sufficient to unite with the other animal juices, and generate the heat of animals. But though we should admit the supposition in its full extent, still it would by no means be sufficient to account for the stability of animal heat in different climates and seasons; its equability all over the body when in health; its partial increase in topical inflammations; or hardly indeed for any one phænomenon attending its production.

"Since, then, it appears that the fluids supposed to be mixed, the place in which the mixture is made, and every other circumstance relating to it, are neither ascertained nor seconded by analogy, none will, we presume, hesitate to reject every hypothesis of the cause of animal-heat founded on the effects of mixture.

"2. *Fermentation.* When a more accurate and extensive knowledge of the various operations of nature had convinced physiologists of the absurdity of explaining the vital functions of animals, and the several changes which take place in the living body by the effects of chemical mixture, fermentation was substituted in its stead. All had observed, that fermentation was generally accompanied by heat; and few were ignorant, that that identical process, or one extremely similar to it, was constantly going forward in living animals; and it was not without some appearance of truth, that physiologists attributed animal-heat to that cause.

"Formerly there were various modifications of this opinion; but of late it has been chiefly confined to one species of fermentation, viz. the putrefactive, which indeed is more consentaneous to experience and sound philosophy. For although animal-substances are either directly or indirectly produced from vegetables, as all animals live on vegetables, or on animals that have lived on them; and though they may be ultimately resolved into the same principles; yet they are certainly combined in a different manner: for they constitute compounds, the natures of which are essentially different; and of the three stages of fermentation, the vinous, acetous, and putrid, the last is the only one to which they shew a tendency. Milk indeed tends to the acetous, and even to the vinous fermentation; but as it can hardly be considered as perfectly animalized, it ought not to be considered as an exception to the general position. And though it be readily admitted, that animal matter is extremely apt to putrefy, and that even in the living body there is a tendency to that process; yet it may be shewn, that the degree to which it takes place can have little or no share in generating the heat of animals. In the first place, the effect of any degree of putrefaction in producing heat, is to this day so ill ascertained, that, with many ingenious philosophers it is altogether problematical, whether or not animal substances, during the putrefactive process, do ever generate heat. Neither M. Beaume nor Dr Pearson, who made several accurate experiments with a view to ascertain this point, could, by the assistance of the most sensible thermometers, discover the least difference betwixt the temperature of the putrefying mixtures, and the surrounding medium; and were the putrefaction of animal-substances really attended with the generation of heat, we might expect to find it greater in proportion to the bulk of the putrefying mass. This, however, is not the case; for it has often been found, that the largest masses of animal matter, such as the carcase of a large whale, laid out and exposed to the air in such a putrid condition as to affect all the neighbourhood with an intolerable stench, did not to the persons handling it feel sensibly hotter than the circumambient air. But what at once overturns every thing that can be advanced in favour of the generation of animal-heat on the principles of putrefaction is, that heat is far more considerable in a living than in a dead body; and no rational physiologist will deny, that the putrid fermentation is going forward more rapidly in the latter than in the former.

"3. *The mechanical generation of heat.* This opinion first took its rise from an observation, that animal-heat generally keeps pace with the state of the circulation: while the action of the heart and arteries continues unimpaired, a high degree of animal-heat is produced; but when that action becomes more languid, the heat of the animal is diminished also. This, till very lately, was the favourite opinion of physicians, and was introduced immediately after Harvey had discovered the circulation of the blood, and indeed seems to be supported by many striking facts. Physiologists looked upon it as a matter almost capable of mathematical demonstration; yet they could not agree whether the heat of animals is occasioned by the friction of the blood against the vessels which contain it, or by the internal friction and agitation of the particles among one another. Various hypotheses accordingly were framed, and many ingenious arguments brought in support of them: but all suppositions of the mechanical kind are overthrown by some thermometrical observations of De Haen and others, from which it appeared, that the heat of the body was sometimes greater than is usual with healthy people, at the time the person was just expiring, when the action of the vessels was very weak; nay, even after he was dead, when it had entirely ceased. The abovementioned physician relates two very remarkable cases of this kind. In the one, he found that the temperature of his patient, which during the course of an inflammatory fever had never exceeded 103 degrees, at the time he expired, and for two minutes after, stood at 106. From the other it appeared, that the heat of a person who was dying of a lingering distemper, rose in the last agony from 100 to 101, and continued there stationary for two hours; and, even at the expiration of 15 hours, had only fallen to 84°, though the surrounding medium did not exceed 60°. The examples also of those who

Heat.

are suffocated by fixed air, entirely overturn not only the mechanical syſtem, but almoſt every other which hath yet appeared on the ſubject. [See the article BLOOD, n° 31.]

3 Dr Cullen's opinion, with objections.

"One or other of the abovementioned hypotheſes continued to be adopted by phyſicians, till Dr Cullen attempted a ſolution on a new ſet of principles; but, attentive to the diffidence with which novel opinions ought to be broached, he delivered his as little more than a mere conjecture. 'May it not (ſays he) be ſuppoſed, That there is ſome circumſtance in the vital principle of animals, which is in common to thoſe of the ſame claſs, and of like œconomy; and which determines the effect of motion upon the vital principle to be the ſame, though the motion acting upon it may be in different circumſtances?'——The doctor was driven to this ſuppoſition from the difficulty he found in explaining how ſo many animals of a different age, ſize, and temperament, ſhould poſſeſs very nearly the ſame degree of heat; and in which it is impoſſible to ſhew, that the motion of the blood in all its circumſtances, is exactly the ſame; or that in the different animals in which the degree of heat is conſiderably different, the motion of the circulating maſs is, in each, correſpondent to the difference of temperature. But, granting that the degree of heat does not always obtain in an exact ratio with the motion of the blood, and that this is an inſuperable objection to its mechanical generation, yet there appear no plauſible grounds for ſuppoſing that the effect of motion may be the ſame, while the motion acting upon it is in different circumſtances. By this Dr Cullen means, That the different temperature of different animals is owing to a difference of the vital principle, inſomuch that the velocity of the blood may be the ſame in a frog as in a man; and yet, in conſequence of the different vital principle, the heat produced may be different. The facts upon which he ſeems to lay the greateſt ſtreſs are, That neither where the ſurrounding medium conſiderably ſurpaſſes the temperature of the living body, nor where it is far below it, is there any ſenſible change in the heat of animals. Theſe, and ſome ſimilar facts, in appearance countenance his hypotheſis; yet we have no ſolid reaſon for imagining the principle of life to be different in different animals. And how are we to conceive, that the ſame degree of motion ſhould in one claſs of animals always produce a certain degree of heat, and in another claſs as regularly a different one? A propoſition of ſuch a nature ſhould, no doubt, require the moſt obvious facts and concluſive arguments to eſtabliſh it; but, in the preſent inſtance, we do not perceive any probable reaſon, even from analogy. Beſides, to ſay that the principle of life can generate heat or cold, independent of chemical or mechanical means, is contrary to experience, and ſeems in itſelf abſurd.

Inſtit. of Medicine, p. 224.

"In the 66th volume of the Philoſophical Tranſactions, Dr Hunter, after reciting ſome experiments concerning animal-heat, aſſerts, That certain animals entirely deſtitute of nerves, are endowed with a power of generating their own heat; and this he brings as an *argumentum crucis* againſt thoſe who account the nervous ſyſtem the ſeat of animal-heat. If this is really a fact, it muſt, no doubt, have all the weight he aſcribes to it; but it is plain that no ſtreſs can be laid upon it, unleſs it was better aſcertained, which it is evident it never can be. For though we can poſitively aſſert that nerves exiſt where we ſee them, yet we cannot affirm with equal certainty that they do not alſo exiſt where we are not able to diſcover them. For all anatomiſts allow, that there are thouſands of nervous filaments ſo finely interwoven into the compoſition of the more perfect animals of every ſize, that they elude not only the knife and naked eye, but even the beſt optical inſtruments hitherto invented. Since then we admit the preſence of nerves in one tribe of animals, though we can only perceive them in their effects; what ſolid reaſon have we to deny them in another, in which we have the very ſame evidence, viz. certain indications of ſenſe and motion?

Heat.

4 Dr Black's opinion.

"Another theory, and perhaps the beſt ſupported which hath yet appeared on the ſubject, is that of Dr Black. That excellent chemiſt having obſerved, That not only breathing animals are of all others the warmeſt, but alſo that there ſubſiſts ſuch a cloſe and ſtriking connexion between the ſtate of reſpiration and the degree of heat in animals, that they appear to be in an exact proportion to one another, was led to believe, that animal-heat depends on the ſtate of reſpiration; that it is all generated in the lungs by the action of the air upon the principle of inflammability, in a manner little diſſimilar to what he ſuppoſed to occur in actual inflammation; and that it is thence diffuſed by means of the circulation over the reſt of the vital ſyſtem.

"This opinion is ſupported by many forcible arguments. 1. It is pretty generally known to naturaliſts, that a quantity of mephitic phlogiſticated air is conſtantly exhaling from the lungs of living animals.—Since, therefore, atmoſpherical air, by paſſing through the lungs, acquires the very ſame properties as by paſſing through burning fuel, or by being expoſed to any other proceſs of phlogiſtication, it is obvious, that the change which the common air undergoes in both caſes, muſt be attributed to one and the ſame cauſe, viz. its combination with phlogiſton. 2. It has likewiſe been urged in favour of the ſame hypotheſis, That the celerity with which the principle of inflammability is ſeparated in reſpiration, is very cloſely connected with the degree of heat peculiar to each animal. Thus, man, birds, and quadrupeds, vitiate air very faſt; ſerpents, and all the amphibious kind, very ſlowly; and the latter are of a temperature inferior to the former, and breathe leſs frequently. 3. The moſt cogent arguments that have been brought in ſupport of this opinion are, That no heat is generated till the function of reſpiration is eſtabliſhed; and that the fœtus *in utero* derives all its heat from the mother."

Upon this theory our author makes the following obſervations, which we ſhall give in his own words.

5 Objections to it.

"Theſe arguments may, perhaps, on a ſuperficial view of the queſtion, appear concluſive; but a found reaſoner, who ſhall coolly and impartially weigh every circumſtance, will, I am confident, allow that they only afford a very ambiguous and imperfect evidence of the doctrine they are meant to eſtabliſh: and the ſubſequent animadverſions on Dr Black's theory at large, will, it is hoped, ſuffice to ſhew, that it is not only founded on dubious and controvertible principles, but that

Heat. that it is, in every point of light, clogged with unfurmountable difficulties.

"I. Many and various are the proofs which evince the improbability of the lungs being the fource or elaboratory of animal-heat: for, though it be granted, that there fubfifts a very ftriking connexion between the ftate of refpiration and the degree of heat in animals, and that they are even in proportion to one another; yet it by no means enfues, that the former is pofitively the caufe of the latter. For, were that really the cafe, it is obvious, that thofe animals which are deftitute of the organs of refpiration would generate no heat. That, however, is not true in fact: for thofe fifhes which are even deftitute of gills, appear from various experiments to be warmer than the ordinary temperature of the element in which they live; an irrefragable proof that the function of refpiration is not abfolutely neceffary to the production of heat in animals.

"II. If the heat of living animals be generated folely in the lungs, two things neceffarily follow: the firft, That it can only be communicated to the other parts of the body through the channel of the arterial fyftem; the fecond, That the heat muft decreafe as it recedes from its fuppofed centre. And a clear and fatisfactory evidence of both thefe points will, no doubt, be deemed requifite to render Dr Black's opinion in any degree probable. So far, however, are we from meeting with thofe pofitive and convincing proofs which we had reafon to expect, that we are not prefented with a fingle plaufible argument in favour of either of the points. On the contrary, it is more conformable to facts, that the venal blood is, if not warmer, at leaft as warm as the arterial. Dr Stevenfon, an ingenious and accurate phyfiologift, with a view to afcertain this matter, laid bare the jugular vein and carotid artery of a calf, and then tied and cut them off at once, in order to let equal quantities of blood flow, in a given time, into veffels of an equal capacity, in each of which he had placed a well-adjufted thermometer; the refult of the experiment was, That the thermometer immerfed in the venous blood rofe feveral degrees above that placed in the arterial. But though it is probable that there is not fuch a difference as that experiment feems to make, yet feveral reafons incline me to think, that the venous blood, inftead of being colder, as Dr Black maintains, is in fact fomewhat warmer, than the arterial; and what entirely overturns his opinion is, That no experiment, though many have been made, has ever fhewn that the temperature of the blood is higher in the left ventricle of the heart than in the right, which muft neceffarily be the cafe, were all the heat of the animal-body generated in the lungs.

"III. Having thus rendered it improbable that the generation of animal-heat fhould be entirely confined to the lungs, we fhall venture a ftep farther, and endeavour to fhew, that the vital fluid, fo far from acquiring all its heat in the pulmonary fyftem, communicates no inconfiderable portion of what it had received in the courfe of the circulation to the air alternately entering into that organ and iffuing from it. Various are the arguments which tend to evince this opinion. Were the blood heated in the lungs, we fhould certainly need lefs of their function in a warm than in a cold atmofphere: but we are taught by experience, that when the air is extremely hot, and we wifh to be cooled, we breathe full and quick; and that when it is intenfely cold, our refpiration is flow and languid; which, were the blood heated in the lungs by the action of the air upon it, furely fhould not be the cafe. It is therefore more confonant with reafon and experience, that the air which we infpire, by carrying off a quantity of evolved phlogifton from the lungs, rather contributes to diminifh than increafe the heat of breathing animals. Refpiration, for this reafon, has been very properly compared, by an ingenious phyfiologift, Dr Duncan of Edinburgh, to the blowing of bellows on a hot body. In both cafes a confiderable degree of heat is communicated to the air: but in neither can the air be faid to generate any heat; for if it did, the heat of breathing animals fhould increafe in proportion to the quantity of air inhaled, and a piece of inert matter heated to a certain degree fhould become hotter by ventilation. Heat.

"IV. The fœtus *in utero*, according to Dr Black's hypothefis, generates no heat. The arguments by which he fupports that pofition, how ingenious foever they may be, feem not fufficiently cogent to produce conviction; and as the queftion from its nature hardly admits of any direct experiment, our reafoning upon it muft neceffarily be analogical. Hence arifes our embarraffment; for, as the difcovering of analogies depends on the quicknefs and fertility of fancy, and the truth of all analogical ratiocination on the acutenefs and nicety of judgment, two powers of the foul feldom united in an eminent degree, we cannot wonder that arguments of this kind, which to one man feem unanfwerable, fhould to another appear futile.

"The only plaufible objection to the generation of heat in the fœtus, is, the fuppofition that it would in a fhort time accumulate in fuch a manner as to become incompatible with life.

"This argument, however, is more fpecious than folid; for, granting that the circulation which is carried on between the fœtus and the mother, tranfmits very nearly the temperature of her blood, that by no means entirely fuperfedes the neceffity of heat being generated in it. Various reafons lead to this opinion.—It is an axiom, that heat decreafes as it recedes from the fource from which it fprang. Now, if we admit for a moment Dr Black's opinion, and believe the heat of animals to be generated folely in the lungs, is it not obvious, that before it reaches the uterus, paffes through the very minute tubes by which that organ is connected to the placenta, circulates through the umbilical veffels, and pervades the extreme parts of the fœtus, it muft be too much diminifhed to fupport that equilibrium which obtains in every part of the living fyftem. Befides, as the fœtus *in utero* may properly enough be accounted a part of the mother, the fame objections that are brought againft the generation of heat in it would hold equally good againft the production of heat in any part or organ of her body, except the lungs. But fuch a multitude of accurate thermometrical obfervations have evinced the partial increafe of heat in local inflammations, that no room is left to doubt, that in every individual part of the vital frame heat is generated; and if the fœtus be, from any caufe whatever, liable to topical inflam-

Heat.

mation, a thing which no phyſiologiſt has ever pretended to deny, what ſhadow of reaſon is there for doubting that ſuch affections are accompanied with the ſame effects before as after birth, and conſequently with a partial increaſe of heat?'

6 Dr Dugud's theory.

Our author having now, as he ſuppoſes, refuted the opinions of others, after ſhewing that heat though *generated* cannot *accumulate* in the fœtus, proceeds to lay down his own theory, which depends on the following principles.

1. That the blood does contain phlogiſton.

2. That this phlogiſton is evolved, extricated, or brought into a ſtate of activity and motion by the action of the blood-veſſels to which it is ſubjected in the courſe of circulation.

3. That the evolution of phlogiſton is a cauſe which throughout nature produces heat, whether that heat be apparently excited by mixture, fermentation, percuſſion, friction, inflammation, ignition, or any ſimilar cauſe.

4. That this heat, which muſt be produced in conſequence of the evolution of the phlogiſton from the blood of different animals, is in all probability equal to the higheſt degree of heat which theſe animals in any caſe poſſeſs.

7 Objections to it.

The firſt and ſecond of theſe propoſitions will readily be granted: but the third is liable to a very great objection, namely, that from putrefying bodies, phlogiſton is evolved in quantity ſufficient to reduce to their metallic form the calces of ſome metals expoſed to the vapour, as Dr Dugud hath acknowledged; yet he himſelf affirms, "that no ſenſible heat is produced by putrefying animal-ſubſtances. To this he is obliged to reply, that phlogiſton is extricated more ſlowly from mixtures undergoing the putrid fermentation, than from ſuch as are undergoing the vinous and acetous ones; and that the volatile alkali produced from putrefying ſubſtances likewiſe hinders the action of the phlogiſton. But the firſt part of this anſwer is not proved, and is what he himſelf calls only a *probable conjecture*. Neither doth the ſecond appear to be well founded: for putrefying ſubſtances, urine excepted, afford but little volatile alkali; and even putrid urine itſelf, which affords ſuch a large portion, is not colder than other putrid matters.

It is however needleſs to inſiſt farther on this theory, ſince his fundamental principle, namely, That the venous blood is warmer than the arterial, hath been ſhewn to be falſe by Mr Adair Crawford, of whoſe hypotheſis we muſt now give an account.

8 Mr Crawford's theory.

This gentleman, who, in his general doctrine of heat, ſeems to agree with Dr Irvin of Glaſgow, begins with an explanation of his terms. The words *heat* and *fire*, he tells us, are ambiguous. *Heat* in common language has a double ſignification. It is uſed indiſcriminately to expreſs a ſenſation of the mind, and an unknown principle, whether we call it a *quality* or a *ſubſtance*, which is the exciting cauſe of that ſenſation. The latter, he, with Dr Irvin, calls *abſolute heat*; the former, *ſenſible heat*. The following are the general facts upon which his experiments are founded.

1. Heat is contained in great quantities in all bodies when at the common temperature of the atmoſphere.

2. Heat has a conſtant tendency to diffuſe itſelf over all bodies, till they are brought to the ſame degree of ſenſible heat.

3. If the parts of the ſame homogeneous body have the ſame degree of ſenſible heat, the quantities of abſolute heat will be proportionable to the bulk or quantity of matter. Thus the quantity of abſolute heat contained in two pounds of water, muſt be conceived to be double of that which is contained in one pound, when at the ſame temperature.

4. The mercurial thermometer is an accurate meaſure of the comparative quantities of abſolute heat which are communicated to the ſame homogeneous bodies or ſeparated from them, as long as ſuch bodies continue in the ſame form. If therefore the ſenſible heat of a body, as meaſured by the mercurial thermometer, were to be diminiſhed the one half, or the one third, or in any given proportion, the abſolute heat would be diminiſhed in the ſame proportion.

5. The comparative quantities of abſolute heat which are communicated to different bodies, or ſeparated from them, cannot be determined in a direct manner by the thermometer. Thus, if the temperature of a pound of mercury be raiſed one degree, and that of a pound of water one degree, as indicated by the thermometer, it does not by any means follow, that equal quantities of abſolute heat have been communicated to the water and the mercury. [See HEAT and THERMOMETER.]—If a pint of mercury at 100° be mixed with an equal bulk of water at 50°, the change produced in the heat of the mercury will be to that produced in the water, as three to two: from which it may be inferred, that the abſolute heat of a pint of mercury is to that of an equal bulk of water, as two to three; or, in other words, that the comparative quantities of their abſolute heats are reciprocally proportionable to the changes which are produced in their ſenſible heats, when they are mixed together at different temperatures. This rule, however, does not apply to thoſe mixtures which generate ſenſible heat or cold by chemical action.

From the above poſition, ſays Mr Crawford, it follows, that equal weights of heterogeneous ſubſtances, as air and water, having the ſame temperature, may contain unequal quantities of abſolute heat. There muſt, therefore, be certain eſſential differences in the nature of bodies, in conſequence of which ſome have the power of collecting and retaining the element of fire in greater quantities than others, and theſe differences he calls throughout his treatiſe the *capacities* of bodies for containing heat.

Having premiſed theſe general facts, our author gives an account of a number of experiments made, in order to aſcertain the quantity of abſolute heat contained in different bodies. Theſe experiments were made by mixing the bodies to be examined with water, heated to different degrees; and by the temperature of the mixture, he found the proportion of the capacity of the bodies for containing heat, to water, and, of conſequence, to one another. Thus he found the capacity of wheat for containing heat to be to that of water, as 1 to 2.9; and, of conſequence, the abſolute heats of the two ſubſtances to be in the ſame proportion. The abſolute heat of oats to that of water he found as 1 to 2½; of barley, as 1 to 2.4; of beans, as 1 to 1.6; of fleſh, as 1 to 1.3; of milk, as 1 to 1.1; and of a mixture of venous and arterial blood

Heat.

Heat. blood from a ſheep, as 25.4 to 24.4. By other experiments he determined, that the abſolute heat of venous blood was to that of water, only as 100 to 112, whereas the abſolute heat of arterial blood was to that of water, as 100 to 97.08.

By experiments made with air of different kinds contained in bladders, and immerſed in water, he found that the abſolute heat of atmoſpherical air was exceedingly great, being to that of water as 18.6 to 1; that of dephlogiſticated air was ſtill greater, being to the heat of common atmoſpherical air as 4.6 to 1. The heat of phlogiſticated and fixed air was much leſs; that of the latter, particularly, being to the heat of atmoſpherical air only as 1 to 67.

From other experiments made on metals, Mr Crawford concludes, that the abſolute heat of tin, in its metallic ſtate, is to that of water as 1 to 14.7; but the heat of calcined tin is to that of water as 1 to 10.4. In like manner, the heat of iron was to that of water only as 1 to 8; but that of the calx of iron was to the heat of water as 1 to 3.1, &c. And from theſe experiments he is of opinion, that the more phlogiſton that is added to any body, the leſs is its capacity for containing heat.

From theſe experiments our author deduces the following theory of animal-heat.—"It has been proved, that the air, which is exſpired from the lungs of animals, contains leſs abſolute heat than that which is inhaled in inſpiration. It has been ſhown, particularly, that, in the proceſs of reſpiration, atmoſpherical air is converted into fixed air; and that the abſolute heat of the former is to that of the latter, as 67 to 1.

"Since, therefore, the fixed air which is exhaled by exſpiration is found to contain only the one ſixty-ſeventh part of the heat which was contained in the atmoſpherical air previous to inſpiration, it follows, that the latter muſt neceſſarily depoſit a very great proportion of its abſolute heat in the lungs. It has moreover been ſhown, that the abſolute heat of florid arterial blood is to that of venous as $11\frac{1}{2}$ to 10. And hence, as the blood, which is returned by the pulmonary vein to the heart, has the quantity of its abſolute heat increaſed, it is evident that it muſt have acquired this heat in its paſſage through the lungs. We may conclude, therefore, that in the proceſs of reſpiration, a quantity of abſolute heat is ſeparated from the air and abſorbed by the blood.

"That heat is ſeparated from the air in reſpiration, is farther confirmed by the experiment with phlogiſticated air; from which, compared with Dr Prieſtley's diſcoveries, it is manifeſt, that the power of any ſpecies of air in ſupporting animal-life, is nearly in proportion to the quantity of abſolute heat which it contains, and is conſequently proportionable to the quantity which it is capable of depoſiting in the lungs.

"The truth of this concluſion will perhaps appear in a clearer light from the following calculation, by which we may form ſome idea of the quantity of heat yielded by atmoſpherical air when it is converted into fixed air, and alſo of that which is abſorbed during the converſion of venous into arterial blood.

"We have ſeen, that the ſame heat, which raiſes atmoſperical air one degree, will raiſe fixed air nearly 67 degrees; and conſequently, that the ſame heat, which raiſes atmoſpherical air any given number of degrees, will raiſe fixed air the ſame number of degrees multiplied by 67. In the Peterſburgh experiment of freezing quickſilver, the heat was diminiſhed 200 degrees below the common temperature of the atmoſphere. We are therefore certain, that atmoſpherical air, when at the common temperature of the atmoſphere, contains at leaſt 200 degrees of heat. Hence, if a certain quantity of atmoſpherical air, not in contact with any body that would immediately carry off the heat, ſhould ſuddenly be converted into fixed air, the heat which was contained in the former would raiſe the latter 200 degrees multiplied by 67, or 13400 degrees. And the heat of red hot iron being 1050, it follows that the quantity of heat, which is yielded by atmoſpherical air when it is converted into fixed air, is ſuch, (if it were not diſſipated), as would raiſe the air ſo changed to more than 12 times the heat of red-hot iron. Heat.

"If, therefore, the abſolute heat which is diſengaged from the air in reſpiration, were not abſorbed by the blood, a very great degree of ſenſible heat would be produced in the lungs.

"Again, it has been proved, that the ſame heat which raiſes venous blood 115 degrees, will raiſe arterial only 100 degrees; and conſequently, that the ſame heat, which raiſes venous blood any given number of degrees, will raiſe arterial a leſs number, in the proportion of 100 to 115, or 20 to 23. But we know that venous blood contains at leaſt 230 degrees of heat. Hence, if a certain quantity of venous blood, not in contact with any body that would immediately ſupply it with heat, ſhould ſuddenly be converted into arterial, the heat which was contained in the former would raiſe the latter only $\frac{20}{23}$ of 230 degrees, or 200 degrees; and conſequently the ſenſible heat would ſuffer a diminution, equal to the difference between 230 and 200, or 30 degrees. But the common temperature of blood is 96: when, therefore, venous blood is converted into arterial in the lungs, if it were not ſupplied by the air with a quantity of heat proportionable to the change which it undergoes, its ſenſible heat would be diminiſhed 30 degrees, or it would fall from 96 to 66.

"That a quantity of heat is detached from the air, and communicated to the blood, in reſpiration, is moreover ſupported by the experiments with metals and their calces: from which it appears, that when bodies are joined to phlogiſton, they loſe a portion of their abſolute heat; and that, when the phlogiſton is again diſengaged, they reabſorb an equal portion of heat from the ſurrounding bodies.

"Now it has been demonſtrated by Dr Prieſtley, that in reſpiration, phlogiſton is ſeparated from the blood and combined with the air. During this proceſs, therefore, a quantity of abſolute heat muſt neceſſarily be diſengaged from the air, by the action of the phlogiſton; the blood, at the ſame moment, being left at liberty to unite with that portion of heat which the air had depoſited.

"And hence animal-heat ſeems to depend upon a proceſs ſimilar to a chemical elective attraction. The air is received into the lungs, containing a great quantity of abſolute heat. The blood is returned from the

Heat. the extremities, highly impregnated with phlogiſton. The attraction of the air to the phlogiſton, is greater than that of the blood. This principle will, therefore, leave the blood to combine with the air. By the addition of the phlogiſton, the air is obliged to depoſit a part of its abſolute heat; and as the capacity of the blood is at the ſame moment increaſed by the ſeparation of the phlogiſton, it will inſtantly unite with that portion of heat which had been detached from the air.

"We learn from Dr Prieſtley's experiments with reſpect to reſpiration, that arterial blood has a ſtrong attraction to phlogiſton: it will conſequently, during the circulation, imbibe this principle from thoſe parts which retain it with leaſt force, or from the putrefcent parts of the ſyſtem: and hence the venous blood, when it returns to the lungs, is found to be highly impregnated with phlogiſton. By this impregnation, its capacity for containing heat is diminiſhed. In proportion, therefore, as the blood, which had been dephlogiſticated by the proceſs of reſpiration, becomes again combined with phlogiſton in the courſe of the circulation, it will gradually give out that heat which it had received in the lungs, and diffuſe it over the whole ſyſtem.

"Thus it appears, that, in reſpiration, the blood is continually diſcharging phlogiſton and abſorbing heat; and that, in the courſe of the circulation, it is continually imbibing phlogiſton and emitting heat.

"It may be proper to add, that as the blood, by its impregnation with phlogiſton, has its capacity for containing heat diminiſhed; ſo on the contrary, thoſe parts of the ſyſtem from which it receives this principle, will have their capacity for containing heat increaſed, and will conſequently abſorb heat.

"Now if the changes in the capacities, and the quantities of matter changed in a given time, were ſuch, that the whole of the abſolute heat ſeparated from the blood were abſorbed, it is manifeſt that no part of the heat which is received in the lungs would become ſenſible in the courſe of the circulation.

"That this, however, is not the caſe, will, I think, be evident from the following conſiderations:

"We know that ſenſible heat is produced by the circulation of the blood; and we have proved by experiment, that a quantity of abſolute heat is communicated to that fluid in the lungs, and is again diſengaged from it in its progreſs through the ſyſtem. If, therefore, the whole of the abſolute heat, which is ſeparated from the blood, were abſorbed by thoſe parts of the ſyſtem from which it receives the phlogiſton, it would be neceſſary to have recourſe to ſome other cauſe, to account for the ſenſible heat which is produced in the circulation. But, by the rules of philoſophiſing, we are to admit no more cauſes of natural things than ſuch as are both true and ſufficient to explain the appearances; for nature delights in ſimplicity, and affects not the pomp of ſuperfluous cauſes.

"We may, therefore, ſafely conclude, that the abſolute heat which is ſeparated from the air in reſpiration, and abſorbed by the blood, is the true cauſe of animal-heat.

"It muſt nevertheleſs be granted, that thoſe parts of the ſyſtem which communicate phogiſton to the blood, will have their capacity for containing heat increaſed; and therefore, that a part of the abſolute heat which is ſeparated from the blood will be abſorbed.

"But from the quantity of heat, which becomes ſenſible in the courſe of the circulation, it is manifeſt that the portion of heat which is thus abſorbed is very inconſiderable.

"It appears, therefore, that the blood, in its progreſs through the ſyſtem, gives out the heat which it had received from the air in the lungs: a ſmall portion of this heat is abſorbed by thoſe particles which impart the phlogiſton to the blood; the reſt becomes redundant, or is converted into moving and ſenſible heat."

Mr Crawford's theory, which doth not eſſentially differ from Dr Black's, ſeems to be the beſt that hath yet appeared. There is, however, one difficulty which ſeems common to them all, and which, even on Mr Crawford's principles, ſeems not to admit of ſolution. If animal-heat entirely depends on ſomething peculiar to a living body, why doth it ſometimes continue after life hath ceaſed? If heat depends on the evolution of phlogiſton by the action of the blood-veſſels, according to Dr Dugud, why ſhould it remain when theſe veſſels ceaſe to act, as, according to Dr Dugud himſelf, it ſometimes doth? If, according to Mr Crawford, it is every moment attracted from the air, why is it not always in proportion to the reſpiration? Or, if fixed air contains ſuch a ſmall proportion of abſolute heat as, by Mr Crawford's experiments, it ſeems to do, why doth it impart ſuch a ſtrong and laſting degree of heat to the bodies of thoſe who are killed by it? See the article Blood, n° 31. The conjecture mentioned under that article, n° 32, is therefore ſtill probable, namely, that animal-heat is occaſioned by the elaſtic principle of fixed air; tho' in what manner it is occaſioned, ſeems to be problematical. 9 The ſubject ſtill uncertain.

Internal Heat *of the Earth.* That there is a very conſiderable degree of heat always felt in digging to great depths in the earth, is agreed upon by all naturaliſts: but the quantity of this heat hath ſeldom been meaſured in any part; much leſs is it known, whether, in digging to an equal depth in different parts of the earth, the heat is found always the ſame. In digging mines, wells, &c. they find that at a little depth below the ſurface it feels cold. A little lower it is colder ſtill, as being beyond any immediate influence of the ſun's rays; inſomuch, that water will freeze almoſt at any ſeaſon of the year: but when we go to the depth of 40 or 50 feet, it begins to grow warm, ſo that no ice can bear it; and then the deeper we go, ſtill the greater the heat, until at laſt reſpiration grows difficult, and the candles go out.

This heat of the earth hath been variouſly explained. Some have had recourſe to an immenſe body of fire lodged in the centre of the earth, which they conſider as a central ſun, and the great principle of the generation, vegetation, nutrition, &c. of foſſil and vegetable bodies. But Mr Boyle, who had been at the bottom of ſome mines himſelf, ſuſpects that this degree of heat, at leaſt in ſome of them, may ariſe from the peculiar nature of the minerals generated therein. To confirm this, he inſtances a mineral of a vitriolic kind, dug up in large quantities in many parts of England, which by the bare affuſion of common water will grow

ſo

Heat.

Heat. so hot, that it will almoſt take fire.—Theſe hypotheſes are liable to the following objections. 1. If there is within the earth a body of actual fire, it ſeems difficult to ſhew why that fire ſhould not conſume and moulder away the outer ſhell of earth, till either the earth was totally deſtroyed, or the fire extinguiſhed. 2. If the internal heat of the earth is owing to the action of water upon mineral ſubſtances, that action thro' time muſt have ceaſed, and the heat have totally vaniſhed; but we have no reaſon to think, that the heat of the earth is any thing leſs juſt now than it was a thouſand years ago. The phenomenon is eaſily explained by the propoſitions laid down under the article HEAT. If heat is nothing elſe than a certain mode of action in the ethereal fluid, or the matter of light, by which it flows out from a body in all directions as radii drawn from the centre to the circumference of a circle; it will then follow, that if an opaque body abſorbs any conſiderable quantity of light, it muſt neceſſarily grow hot. The reaſon of this is plain. The body can hold no more than a certain quantity of ethereal matter; if more is continually forcing itſelf in, that which has already entered muſt go out. But it cannot eaſily get out, becauſe it is hindered by the particles of the body among which it is detained. It makes an effort therefore in all directions to ſeparate theſe particles from each other; and hence the body expands, and the effort of the fluid to eſcape is felt when we put our hands on the body, which we then ſay is *hot*. Now as the earth is perpetually abſorbing the ethereal matter, which comes from the ſun in an immenſe ſtream, and which we call his *light*, it is plain, that every pore of it muſt have been filled with this matter long ago. The quantity that is lodged in the earth, therefore, muſt be continually endeavouring to ſeparate its particles from each other, and conſequently muſt make it hot. The atmoſphere, which is perpetually receiving that portion of the ethereal matter which iſſues from the earth, counteracts the force of the internal heat, and cools the external ſurface of the earth, and for a conſiderable way down; and hence the earth for 20 or 30 feet down, ſhews none of that heat which is felt at greater depths. See HEAT.

HEAT, in medicine. Great heats are not ſo much the immediate, as the remote, cauſe of a general ſickneſs, by relaxing the fibres, and diſpoſing the juices to putrefaction; eſpecially among ſoldiers and perſons expoſed the whole day to the ſun: for the greateſt heats are ſeldom found to produce epidemic diſeaſes, till the perſpiration is ſtopped by wet clothes, fogs, dews, damps, &c.; and then ſome bilious or putrid diſtemper is the certain conſequence, as fluxes and ardent intermitting fevers. Neverthelefs, it muſt be allowed, that heats have ſometimes been ſo great as to prove the more immediate cauſe of particular diſorders; as when centinels have been placed without cover, or frequent reliefs in ſcorching heats; or when troops march or are exerciſed in the heat of the day; or when people imprudently lie down and ſleep in the ſun. All theſe circumſtances are apt to bring on diſtempers, varying according to the ſeaſon of the year. In the beginning of ſummer, theſe errors produce inflammatory fevers; and in autumn, a remitting fever or dyſentery. To prevent, therefore, the effects of immoderate heats, commanders have found it expedient ſo to order the marches, that the men come to their ground before the heat of the day; and to give ſtrict orders, that none of them ſleep out of their tents, which, in fixed encampments, may be covered with boughs to ſhade them from the ſun. It is likewiſe a rule of great importance to have the ſoldiers exerciſed before the cool of the morning is over; for by that means not only the ſultry heats are avoided, but the blood being cooled, and the fibres braced, the body will be better prepared to bear the heat of the day. Laſtly, in very hot weather, it has often been found proper to ſhorten the centinels duty, when obliged to ſtand in the ſun.

Heath || Hebraiſm.

HEATH, in botany. See ERICA.

Berry-bearing HEATH. See EMPETRUM.

HEATHENS, in matters of religion. See PAGANS.

HEAVEN, literally ſignifies the expanſe of the firmament, ſurrounding our earth, and extended every way to an immenſe diſtance.

The Hebrews acknowledged three heavens: the firſt the aërial heaven, in which the birds fly, the winds blow, and the ſhowers are formed; the ſecond, the firmament, in which the ſtars are placed; the third, the heaven of heavens, the reſidence of the Almighty, and the abode of ſaints and angels.

Heaven is conſidered by Chriſtian divines and philoſophers, as a place in ſome remote part of infinite ſpace, in which the omnipreſent Deity is ſaid to afford a nearer and more immediate view of himſelf, and a more ſenſible manifeſtation of his glory, than in the other parts of the univerſe. This is often called the *empyrean*, from that ſplendor with which it is ſuppoſed to be inveſted; and of this place the inſpired writers give us the moſt noble and magnificent deſcriptions.

The Pagans conſidered heaven as the reſidence only of the celeſtial gods, into which no mortals were admitted after death, unleſs they were deified. As for the ſouls of good men, they were conſigned to the elyſian fields. See ELYSIAN-*Fields*.

HEBDOMARY, a ſolemnity of the ancient Greeks, in honour of Apollo, in which the Athenians ſung hymns to his praiſe, and carried in their hands branches of laurel. The word ſignifies the *ſeventh day*, this ſolemnity being obſerved on the ſeventh day of every lunar month.

HEBE, in fabulous hiſtory, the daughter of Juno without a father, was the goddeſs of Youth, and cup-bearer to Jupiter; who afterwards diſplaced her, and put Ganymede in her room. When Hercules was made a god, ſhe was married to him, and then ſhe reſtored Iolaus to his former youth. See IOLAUS.

HEBER, the ſon of Salah, and father of Peleg, from whom the Hebrews derived their name, according to Joſephus, Euſebius, Jerome, Bede, and moſt of the interpreters of the ſacred writings; but Huet biſhop of Avranches, in his Evangelical Demonſtration, has attempted to prove, that the Hebrews took their name from the word *heber*, which ſignifies *beyond*, becauſe they came from beyond the Euphrates. Heber is ſuppoſed to have been born 2281 years B. C. and to have lived 464 years.

HEBRAISM, an idiom, or manner of ſpeaking, peculiar to the Hebrew language. See the next article.

Hebrew || Hebrides.

HEBREW, or HEBREW *Language*, that ſpoken by the ancient Jews, and wherein the old Teſtament is wrote.

This appears to be the moſt ancient of all the languages in the world, at leaſt we know of none older; and ſome learned men are of opinion, that this is the language in which God ſpoke to Adam in Paradiſe.

The books of the Old Teſtament are the only pieces to be found, in all antiquity, written in pure Hebrew; and the language of many of theſe is extremely ſublime: it appears perfectly regular, and particularly ſo in its conjugations. Indeed, properly ſpeaking, it has but one conjugation; but this is varied in each ſeven or eight different ways, which has the effect of ſo many different conjugations, and affords a great variety of expreſſions to repreſent by a ſingle word the different modifications of a verb, and many ideas which in the modern and in many of the ancient and learned languages cannot be expreſſed without a periphraſis.

The primitive words, which are called *roots*, have ſeldom more than three letters or two ſyllables.

In this language there are 22 letters, only five of which are uſually reckoned vowels, which are the ſame with ours, viz. *a, e, i, o, u*; but then each vowel is divided into two, a long and a ſhort, the ſound of the former being ſomewhat grave and long, and that of the latter ſhort and acute: it muſt however be remarked, that the two laſt vowels have ſounds that differ in other reſpects beſides quantity and a greater or leſs elevation. To theſe 10 or 12 vowels may be added others, called *ſemi-vowels*, which ſerve to connect the conſonants, and to make the eaſier tranſitions from one to another. The number of accents in this language are, indeed, prodigious: of theſe there are near 40, the uſe of ſome of which, notwithſtanding all the inquiries of the learned, are not yet perfectly known. We know, in general, that they ſerve to diſtinguiſh the ſentences like the points called *commas*, *ſemicolons*, &c. in our language; to determine the quantity of the ſyllables; and to mark the tone with which they are to be ſpoken or ſung. It is no wonder, then, that there are more accents in the Hebrew than in other languages, ſince they perform the office of three different things, which in other languages are called by different names.

HEBREWS, the deſcendants of Heber, commonly called *Jews*. See HEBER and JEWS.

HEBREWS, or *Epiſtle to the* HEBREWS, a canonical book of the New Teſtament.

Though St Paul did not prefix his name to this epiſtle, the concurrent teſtimony of the beſt authors ancient and modern afford ſuch evidence of his being the author of it, that the objections to the contrary are of little or no weight.

The Hebrews, to whom this epiſtle was wrote, were the believing Jews of Paleſtine; and its deſign was to convince them, and by their means all the Jewiſh converts wherefoever diſperſed, of the inſufficiency and abolithment of the ceremonial and ritual law.

HEBRIDES, the general name of ſome iſlands lying to the north-weſt of Scotland, of which kingdom they conſtitute a part. They are ſituated between the 55th and 59th degrees of latitude, are ſuppoſed to be about 300 in number, and to contain 48,000 inhabitants. The names of the largeſt are SKIE, MULK, LEAY, and ARRAN. Of theſe iſlands Mr Pennant hath given the following hiſtory. Hebrides.

"The leiſure of a calm gave ample time for reflection on the hiſtory and great events of the iſlands now in view, and of the others the objects of the voyage. In juſtice to that able and learned writer, the rev. Dr John Macpherſon, late miniſter of Slate in Skie, let me acknowledge the aſſiſtance I receive from his ingenious eſſay on this very ſubject: for his labours greatly facilitate my attempt; not undertaken without conſulting the authors he refers to; and adding numbers of remarks overſeen by him, and giving a conſiderable continuation of the hiſtory. It would be an oſtentatious taſk to open a new quarry, when ſuch heaps of fine materials lie ready to my hand. *Tour in Scotland*, ii. 200.

"All the accounts left us by the Greek and Roman writers are involved with obſcurity: at all times brief, even in their deſcriptions of places they had eaſieſt acceſs to, and might have deſcribed with the moſt ſatisfactory preciſion; but in remote places, their relations furniſh little more than hints, the food for conjecture to the viſionary antiquary.

"That Pytheas, a traveller mentioned by Strabo, had viſited Great Britain, I would wiſh to make only *apocryphal*. He aſſerts, that he viſited the remoter parts; and that he had alſo ſeen Thule, the land of romance amongſt the ancients: which all might pretend to have ſeen; but every voyager, to ſwell his fame, made the iſland he ſaw laſt, the Ultima Thule of his travels. If Pytheas had reached theſe parts, he might have obſerved, floating in the ſeas, multitudes of gelatinous animals, the *meduſæ* of Linnæus, and out of theſe have formed his fable: he made his THULE a *compoſition of neither earth, ſea, nor air; but like a compoſition of them all:* then, catching his ſimile from what floated before him, compares it to the *lungs* of the ſea, the Ariſtotelian idea of theſe bodies; and from him adopted by naturaliſts, ſucceſſors to that great philoſopher. Strabo very juſtly explodes theſe abſurd tales; yet allows him merit in deſcribing the climate of the places he had ſeen. As a farther proof of his having viſited the Hebrides, he mentions their unfriendly ſky, that prohibits the growth of the finer fruits; and that the natives are obliged to carry their corn under ſhelter, to beat the grain out, leſt it ſhould be ſpoiled by the defect of ſun and violence of the rains. This is the probable part of his narrative; but when the time that the great geographer wrote is conſidered, at a period that theſe iſlands had been neglected for a very long ſpace by the Romans, and when the difficulties of getting among a fierce and unfriendly nation muſt be almoſt inſuperable, doubts innumerable, reſpecting the veracity of this relater, muſt ariſe. All that can be admitted in favour of him is, That he was a great traveller: and that he might have either viſited Britain, from ſome of the nations commercing with our iſle; or received from them accounts, which he afterwards dreſſed out, mixed with the ornaments of fable. A traffic muſt have been carried on with the very northern inhabitants of our iſlands in the time of Pytheas; for one of the articles of commerce mentioned by Strabo, the ivory bits, were made either of the teeth of the walrus, or of a ſpecies of whale native of the northern ſeas.

"The

Hebrides. " The geographer Mela, who flouriſhed in the reign of Claudius, is the next who takes notice of our leſſer iſlands. He mentions the Orcades as conſiſting of 30; the Æmodæ of ſeven. The Romans had then made a conqueſt of the former, and might have ſeen the latter: but, from the words of the hiſtorian, it is probable that the Shetlands iſlands were thoſe intended; for he informs us, that the " Æmodæ were carried out over againſt Germany:" the ſite of the Hebrides will not admit this deſcription, which agrees very well with the others; for the ancients extended their Germany, and its imaginary iſlands, to the extreme north.

" Pliny the elder is the next that mentions theſe remote places. He lived later than the preceding writers, and of courſe his information is fuller: by means of intervening diſcoveries, he has added ten more to the number of the Orcades; is the firſt writer that mentions the Hœbudes, the iſlands in queſtion; and joins in the ſame line the Æmodæ, or, as it is in the beſt editions more properly written, the *Acmodæ*, or extreme point of the Roman expeditions to the north, as the Shetland iſles in the higheſt probability were. Pliny and Mela agree in the number of the Æmodæ, or Acmodæ: the former makes that of the Hœbudes 30; an account extremely near the truth, deducting the little iſles, or rather rocks, that ſurround moſt of the greater, and many of them ſo indiſtinct as ſcarcely to be remarked, except on an actual ſurvey.

" Solinus ſucceeds Pliny. If he, as is ſuppoſed, was cotemporary with Agricola, he has made very ill uſe of the light he might have received from the expeditions of that great general: his officers might have furniſhed the hiſtorian with better materials than thoſe he has communicated. He has reduced the number of the Hœbudes to five. He tells us, that " the inhabi- " tants were unacquainted with corn: that they lived " only on fiſh and milk: that they had one king, as " the iſlands were only ſeparated from each other by " narrow ſtraits: that their prince was bound by cer- " tain rules of government, to do juſtice; and was " prevented by poverty from deviating from the true " courſe, being ſupported by the public, and allowed " nothing that he could call his own, not even a wife; " but then he was allowed free choice, by turns one " out of every diſtrict, of any female that caught his " his affection; which deprived him of all ambition a- " bout a ſucceſſor.

" By the number of theſe iſlands, and by the minute attention given by the hiſtorian to the circumſtance of their being ſeparated from each other by very narrow ſtraits, I ſhould imagine, that which is now called the *Long iſland*, and includes Lewis, North Uiſt, Benbecula, South Uiſt, and Barra, to have been the five Hœbudes of Solinus; for the other great iſlands, ſuch as Skie, &c. are too remote from each other to form the preceding very characteriſtic deſcription of that chain of iſlands. Theſe might naturally fall under the rule of our petty prince; almoſt the only probable part of Solinus's narrative.

" After a long interval appears Ptolemy, the Egyptian geographer. He alſo enumerates five Ebudæ; and has given each a name: the weſtern, *Ebuda;* the eaſtern, *Ricina, Maleos, Epidium.* Cambden conjectures them to be the modern Skie, Lewis, Rathry or Racline, Mull, and Ilay: and I will not controvert his opinion. Hebrides.

" The Roman hiſtorians give very little light into the geography of theſe parts. Tacitus, from whom moſt might have been expected, is quite ſilent about the names of places; notwithſtanding, he informs us, that a fleet by the command of Agricola performed the circumnavigation of Britain. All that he takes notice of is the diſcovery and the conqueſt of the Orkneys: it ſhould ſeem, that with the biographers of an ambitious nation, nothing ſeemed worthy of notice, but what they could dignify with the glory of victory.

" It is very difficult to aſſign a reaſon for the change of name from *Ebudæ* to *Hebrides:* the laſt is modern; and ſeems, as the annotator on Dr Macpherſon ſuppoſes, to have ariſen from the error of a tranſcriber, who changed the *u* into *ri*.

" From all that has been collected from the ancients, it appears, that they were acquainted with little more of the Hebrides than the bare names: it is probable, that the Romans, either from contempt of ſuch barren ſpots, from the dangers of ſeas, the violence of the tides, and horrors of the narrow ſounds, in the inexperienced ages of navigation, never attempted their conqueſt, or ſaw more of them than what they had in ſight during the few circumnavigations of Great Britain, which were expeditions more of oſtentation than of utility.

" The inhabitants had probably for ſome ages their own governors; one little king to each iſland, or to each groupe as neceſſity required. It is reaſonable to ſuppoſe, that their government was as much divided as that of Great Britain, which, it is well known, was under the direction of numbers of petty princes before it was reduced under the power of the Romans.

" No account is given in hiſtory of the time theſe iſlands were annexed to the government of Scotland. If we may credit our Saxon hiſtorians, they appear to have been early under the dominion of the Picts; for Bede and Adamnanus informs, that ſoon after the arrival of St Columba in their country, Brudeus, a Pictiſh monarch, made the ſaint a preſent of the celebrated iſland of Iona.

" But neither the holy men of this iſland, nor the natives of the reſt of the Hebrides, enjoyed a permanent repoſe after this event.

" The firſt invaſion of the Danes does not ſeem to be eaſily aſcertained. It appears that they ravaged Ireland, and the iſle of Rathry, as early as the year 735. In the following century, their expeditions became more frequent: Harold Harfager, or the *light-haired*, purſued, in 875, ſeveral petty princes, whom he had expelled out of Norway; who had taken refuge in the Hebrides, and moleſted his dominions by perpetual deſcents from thoſe iſlands. He ſeems to have made a rapid conqueſt: he gained as many victories as he fought battles; he put to death the chief of the pirates, and made an indiſcriminate ſlaughter of their followers. Soon after his return, the iſlanders repoſſeſſed their ancient ſeats: and, in order to repreſs their inſults, he ſent Ketil the *flat-noſed*, with a fleet and ſome forces for that purpoſe. He ſoon reduced them to terms, but made his victories ſubſervient to his own ambition: he made alliances with the reguli he had ſub-

Hebrides. subdued; he formed intermarriages, and confirmed to them their old dominions. This effected, he sent back the fleet to Harold; openly declared himself independent; made himself prince of the Hebrides; and caused them to acknowledge him as such, by the payment of tribute and the badges of vassalage. Ketil remained, during life, master of the islands; and his subjects appear to have been a warlike set of freebooters, ready to join with any adventurers. Thus when Eric, son of Harold Harfager, after being driven out of his own country, made an invasion of England, he put with his fleet into the Hebrides, received a large reinforcement of people fired with the hopes of prey, and then proceeded on his plan of rapine. After the death of Ketil, a kingdom was in after-times composed out of them, which, from the residence of the little monarch in the isle of Man, was styled that of *Man*. The islands became tributary to that of Norway for a considerable time, and princes were sent from thence to govern; but at length they again shook off the yoke. Whether the little potentates ruled independent, or whether they put themselves under the protection of the Scottish monarchs, does not clearly appear; but it is reasonable to suppose the last, as Donald-bane is accused of making the Hebrides the price of the assistance given him by the Norwegians against his own subjects. Notwithstanding they might occasionally seek the protection of Scotland, yet they never were without princes of their own: policy alone directed them to the former. From the chronicles of the kings of Man we learn, that they had a succession of princes.

"In 1089 is an evident proof of the independency of the islanders on Norway; for, on the death of Lagman, one of their monarchs, they sent a deputation to O'Brian king of Ireland, to request a regent of royal blood to govern them during the minority of their young prince. They probably might in turn compliment in fome other respects their Scottish neighbours: the islanders must have given them some pretence to sovereignty; for,

"In 1093, Donald-bane, king of Scotland, calls in the assistance of Magnus the Barefooted, king of Norway, and bribes him with the promise of all the islands. Magnus accepts the terms; but at the same time boasts, that he does not come to invade the territories of others, but only to resume the ancient rights of Norway. His conquests are rapid and complete; for, besides the islands, by an ingenious fraud he adds Cantyre to his dominions.

"The Hebrides continued governed by a prince dependent on Norway, a species of viceroy appointed by that court; and who paid, on assuming the dignity, ten marks of gold, and never made any other pecuniary acknowledgment during life: but if another viceroy was appointed, the same sum was exacted from him. These viceroys were sometimes Norwegians, sometimes natives of the isles. In 1097 we find, that Magnus deputes a nobleman of the name of Ingemund: in after-times we learn, that natives were appointed to that high office. Thus were the Hebrides governed, from the conquest by Magnus, till the year 1263, when Acho, or Haquin, king of Norway, by an unfortunate invasion of Scotland, terminating in his defeat at Largs, so weakened the powers of his kingdom, that his successor Magnus IV. was content Hebrides. to make a cession of the islands to Alexander III.; but not without stipulating for the payment of a large sum, and of a tribute of a hundred merks for ever, which bore the name of the *annual of Norway*. Ample provision was also made by Magnus in the same treaty, for the security of the rights and properties of his Norwegian subjects, who chose to continue in the isles; where many of their posterity remain to this day.

"Notwithstanding this revolution, Scotland seems to have received no real acquisition of strength. The islands still remained governed by powerful chieftains, the descendents of Somerled, thane of Heregaidel, or Argyle, who, marrying the daughter of Olave, king of Man, left a divided dominion to his fons Dugal and Reginald: from the first were descended the Macdougals of Lorn; from the last, the powerful clan of the Macdonalds. The lordship of Argyle, with Mull, and the islands north of it, fell to the share of the first; Ilay, Cantyre, and the southern isles, were the portion of the last: a division that formed the distinction of the Sudereys and Nordereys, [as farther noticed in the article IONA.]

"These chieftains were the scourges of the kingdom: they are known in history but as the devastations of a tempest; for their paths were marked with the most barbarous desolation. Encouraged by their distance from the seat of royalty, and the turbulence of the times, which gave their monarchs full employ, they exercised a regal power, and often assumed the title; but are more generally known in history by the style of the *lord of the isles*, or the earls of Ross; and sometimes by that of the *Great Macdonald*.

"Historians are silent about their proceedings, from the retreat of the Danes, in 1263, till that of 1335, when John, lord of the isles, withdrew his allegiance. In the beginning of the next century his successors were so independant, that Henry IV. entered into a formal alliance with the brothers Donald and John. This encouraged them to commit fresh hostilities against their natural prince. Donald, under pretence of a claim to the earldom of Ross, invaded and made a conquest of that county; but penetrating as far as the shire of Aberdeen, after a fierce but undecisive battle with the royal party, thought proper to retire, and in a little time to swear allegiance to his monarch James I. But he was permitted to retain the county of Ross, and assume the title of earl. His successor, Alexander, at the head of 10,000 men, attacked and burnt Inverness; at length, terrified with the preparations made against him, he fell at the royal feet, and obtained pardon as to life, but was committed to strict confinement.

"His kinsman and deputy, Donald Balloch, resenting the imprisonment of his chieftain, excited another rebellion, and destroyed the country with fire and sword: but on his flight was taken and put to death by an Irish chieftain, with whom he sought protection.

"These barbarous inroads were very frequent with a set of banditti, who had no other motive in war but the infamous inducement of plunder.

"In the reign of James II. in the year 1461, Donald, another petty tyrant, an earl of Ross, and lord of the isles, renewed the pretence of independency; fur-

Hebrides. furpriſed the caſtle of Inverneſs; forced his way as far as Athol; and obliged the earl and counteſs, with the principal inhabitants, to ſeek refuge in the church of St Bridget, in hopes of finding ſecurity from his cruelty by the ſanctity of the place: but the barbarian and his followers ſet fire to the church, put the eccleſiaſtics to the ſword, and, with a great booty, carried the earl and counteſs priſoners to his caſtle of Claig, in the iſland of Ilay. In a ſecond expedition, immediately following the firſt, he ſuffered the penalty of his impiety: a tempeſt overtook him, and overwhelmed moſt of his aſſociates; and he, eſcaping to Inverneſs, periſhed by the hands of an Iriſh harper: his ſurviving followers returned to Ilay, conveyed the earl and counteſs of Athol to the ſanctuary they had violated, and expiated their crime by reſtoring the plunder, and making large donations to the ſhrine of the offended ſaint.

" John, ſucceſſor to the laſt earl of Roſs, entered into alliance with Edward IV. and ſent ambaſſadors to the court of England, where Edward empowered the biſhop of Durham and earl of Wincheſter to conclude a treaty with him, another Donald Balloch, and his ſon and heir John. They agreed to ſerve the king with all their power, and to become his ſubjects: the earl was to have a hundred marks ſterling for life in time of peace, and two hundred pounds in time of war; and theſe iſland allies, in caſe of the conqueſt of Scotland, were to have confirmed to them all the poſſeſſions benorth of the Scottiſh ſea; and in caſe of a truce with the Scottiſh monarch, they were to be included in it. But about the year 1476, Edward, from a change of politics, courted the alliance of James III. and dropt his new allies. James, determined to ſubdue this rebellious race, ſent againſt them a powerful army, under the earl of Athol; and took leave of him with this good wiſh, *Furth, Fortune, and fill the fetters;* as much as to ſay, " Go forth, be fortunate, and bring home many captives:" which the family of Athol have uſed ever ſince for its motto. Roſs was terrified into ſubmiſſion; obtained his pardon; but was deprived of his earldom, which by act of parliament was then declared unalienably annexed to the crown: at the ſame time the king reſtored to him Knapdale and Cantyre, which the earl had reſigned; and inveſted him anew with the lordſhip of the iſles, to hold them of the king by ſervice and relief.

" Thus the great power of the iſles was broken: yet for a conſiderable time after, the petty chieftains were continually breaking out into ſmall rebellions, or harraſſed each other in private wars; and tyranny ſeems but to have been multiplied. James V. found it neceſſary to make the voyage of the iſles in perſon, in 1536; ſeized and brought away with him ſeveral of the moſt conſiderable leaders; and obliged them to find ſecurity for their own good behaviour, and that of their vaſſals. The names of theſe chieftains were (according to Lindeſay), *Mydyart, Mac-connel, Macloyd* of the Lewis, *Mac-niel, Mac-lane, Mac-intoſh, John Mudyart, Mac-kay, Mac-kenzie*, and many others: but by the names of ſome of the above, there ſeem to have been continental as well as inſular male-contents. He examined the titles of their holdings; and finding ſeveral to have been uſurped, re-united their lands to the crown. In the ſame voyage he had the glory of cauſing a ſurvey to be taken of the coaſts of Scotland, and of the iſlands, by his pilot Alexander Lindeſay; which were publiſhed in 1583, at Paris, by Nicholas de Nicholay, geographer to the French monarch. Hebrides.

" The troubles that ſucceeded the death of James occaſioned a neglect of theſe inſulated parts of the Scottiſh dominions, and left them in a ſtate of anarchy. In 1614, the Mac-donalds made a formidable inſurrection, oppugning the royal grant of Cantyre to the earl of Argyle and his relations. The petty chieftains continued in a fort of rebellion; and the ſword of the greater, as uſual in weak government, was employed againſt them: the encouragement and protection given by them to pirates, employed the power of the Campbells during the reign of James VI. and the beginning of that of Charles I. (A).

" But the turbulent ſpirit of the old times continued even to the preſent age. The heads of Clans were by the diviſions, and a falſe policy that predominated in Scotland during the reign of William III. flattered with an unreal importance: inſtead of being treated as bad ſubjects, they were courted as deſirable allies: inſtead of feeling the hand of power, money was allowed to bribe them into the loyalty of the times. They would have accepted the ſubſidies, notwithſtanding they deteſted the prince that offered them. They were taught to believe themſelves of ſuch conſequence, that in theſe days turned to their deſtruction. Two recent rebellions gave legiſlature a late experience of the folly of permitting the feudal ſyſtem to exiſt in any part of its dominions. The act of 1748, for aboliſhing heretable juriſdictions, at once deprived the chieftains of all power of injuring the public by their commotions. Many of theſe *Reguli* ſecond this effort of legiſlature, and neglect no opportunity of rendering themſelves hateful to their unhappy vaſſals, the former inſtruments of their ambition."

" The ſituation of theſe iſlands in the great Atlantic ocean renders the air cold and moiſt in the greater part of them. In the moſt northerly iſles the ſun, at the ſummer ſolſtice, is not above an hour under the horizon at midnight, and not longer above it at midday in the depth of winter. The ſoil of the Hebrides varies alſo in different iſles, and in different parts of the ſame iſland: ſome are mountainous and barren, producing little elſe than heath, wild myrtle, fern, and a little graſs; while others, being cultivated and manured with ſea-weed, yield plentiful crops of oats and barley. *Smollet's Mod. Hiſt.* i. 430, &c.

" Lead mines have been diſcovered in ſome of theſe iſlands, but not worked to much advantage; the people being unſkilful, and fuel extremely ſcarce: others have been found to contain quarries of marble, limeſtone, and free-ſtone; nor are they deſtitute of iron, talc, cryſtals, and many curious pebbles, ſome of which emulate the Braſilian topaz.

" With reſpect to vegetables, over and above the plentiful harveſts of corn that the natives earn from

20 I 2 agri-

(A) In the beginning of the laſt century the Flanders were continually harraſſing Ireland with their plundering invaſions, or landing there to ſupport rebellions: at length it was made treaſon to receive theſe Hebridian Redſhanks, as they were ſtyled.

Hebrides. agriculture, and the pot-herbs and roots that are planted in gardens for the ſuſtenance of the people, theſe iſlands produce ſpontaneouſly a variety of plants and ſimples, uſed by the iſlanders in the cure of their diſeaſes; but there is hardly a ſhrub or tree to be ſeen, except in a very few ſpots, where ſome gentlemen have endeavoured to rear them with much more trouble than ſucceſs.

"The animals, both of the land and ſea, domeſtic and wild, quadrupeds, fowls, and fiſhes, found in and about theſe iſlands, are of the ſame ſpecies, ſize, and configuration, with thoſe of the ORKNEYS.

"The people inhabiting theſe iſlands are of the ſame race with thoſe who live in the Highlands of Scotland; ſpeak the ſame language, wear the ſame habit, and obſerve the ſame cuſtoms. [See the article HIGHLANDS.]

"The commodities which may be deemed the ſtaples of this country, are black cattle, ſheep, and fiſh, which they ſell to their fellow-ſubjects of Scotland. Part of the wool they work up into knit-ſtockings, coarſe cloth, and that variegated ſtuff called *tartan*. They likewiſe ſalt mutton in the hide, and export it in boats, or barklings, to different parts of the main land. Cod, ling, mackerel, whiting, haddock, and ſoles, are here caught in abundance, together with a ſmall red cod, remarkably voracious, of a very delicate flavour: there are likewiſe two kinds of white fiſh, which ſeem to be peculiar to this coaſt, known by the names of *lithe* and *cea*, eſteemed good eating: but the greateſt treaſure the ocean pours forth, is the prodigious quantity of herrings, which, at one ſeaſon of the year, ſwarm in all the creeks and bays along the weſtern ſhore of Scotland. Theſe are counted the largeſt, fatteſt, and fineſt herrings caught in any part of the northern ſeas. This fiſhery employs a great number of hands, and brings a conſiderable advantage to the kingdom. The fiſh are caught, cured, barrelled up, and exported: but whether from want of ſkill, or a proper ſalt for pickling, the Scotch-cured herrings of this coaſt, though ſuperior to all others in their natural ſtate, are counted inferior to thoſe which are dreſſed and pickled by the Dutch fiſhermen.

"How mean and contracted ſoever the commerce and produce of theſe iſlands may be at preſent, they are, perhaps, more capable of improvement, in both articles, than any part of the Britiſh dominions in Europe. The inhabitants are ſo little ſkilled in huſbandry, that the ſoil, though generally good in the low grounds, yields nothing but ſcanty crops of oats and barley; and great tracts of land lie altogether uncultivated. If a very ſmall number of judicious farmers would ſettle in ſome of the moſt conſiderable iſlands, they would ſoon raiſe ſuch harveſts as would enrich themſelves; employ and maintain all the idle people, a great number of whom are obliged to repair to foreign countries for ſubſiſtence; afford ſufficient bread for the inhabitants, and even ſupply the barren parts of the oppoſite continent. The ſoil, in many places, would produce wheat, and in almoſt every where would give good paſturage, inſomuch that, with proper culture, the people might provide hay and fodder for their cattle, which, during the ſeverity of the winter, die in great numbers for want of proviſion. Improvements of this kind would be the more eaſily made, as the ſea-ſhore abounds with ſhells for lime, and ſea-weeds for manure; and the labourers would be eaſily ſubſiſted by the fiſh that ſwarm, not only in the ocean which ſurrounds theſe iſlands, but likewiſe in the numerous lakes and rivers of freſh water. Martin declares, that he knew 100 families in this country maintained by as many little farms, the rent of each not exceeding 5 s. one ſheep, and a few pecks of oats. Hebrides.

"The commerce of theſe iſlands might be extended in ſuch a manner as to render them a ſtaple of trade, and an excellent nurſery for ſeamen. They are furniſhed with an infinite number of bays, creeks, and harbours, for the convenience of navigation: the inhabitants are numerous, ſtrong, active, and every way qualified for the life of a mariner. The ſea affords myriads of fiſh for exportation: the lands might afford plenty of paſturage for black cattle, horſes, and ſheep, as well as plenteous harveſts of corn, and other grain: woollen and linen manufactures might be proſecuted to great advantage, where labour is cheap and proviſions are reaſonable. The iſlands afford good ſtone and lime; and ſome parts of the oppoſite main land, timber for building: they have plenty of fuel, not only for the ordinary purpoſes of life, but alſo for ſalt-pans, which might be erected on different parts of the coaſt; and for burning ſea-ware for the uſe of a glaſs or ſoap manufacture. Finally, the ſituation of theſe iſlands is ſo commodious for trade, that the navigator is immediately in the open ſea, and almoſt in the neighbourhood of Denmark, Sweden, Hamburgh, Holland; nay, with a favourable wind, he can reach the coaſts of France and Spain in a week's ſailing; if he is bound for the Britiſh plantations, or indeed for any part of the known globe, he is at once diſencumbered of the land, and proſecutes his voyage thro' the open ſea without obſtruction or difficulty."

New HEBRIDES, a cluſter of iſlands lying in the Great South Sea, or Pacific Ocean. The northen iſlands of this archipelago were firſt diſcovered by that great navigator Quiros in 1606, and, not without reaſon, conſidered as a part of the ſouthern continent, which at that time, and till very lately, was ſuppoſed to exiſt. They were next viſited by M. de Bougainville in 1768, who, beſides landing on the iſland of Lepers, did no more than diſcover that the land was not connected, but compoſed of iſlands, which he called the *Great Cyclades*. Captain Cook, beſides aſcertaining the extent and ſituation of theſe iſlands, added the knowledge of ſeveral in this group which were before unknown: he explored the whole cluſter; and thinking himſelf thereby entitled to affix to them a general appellation, he named them the *New Hebrides*. They are ſituated between latitudes of 14 deg. 25 min. and 20 deg. 4 min. ſouth; and between 166 deg. 41 min. and 170 deg. 21 min. eaſt longitude; and extend one hundred and twenty-five leagues in the direction of north-north-weſt, and ſouth-ſouth-eaſt. The moſt northern part of this archipelago was called by M. de Bougainville the *Peak of the Etoile*. The whole cluſter conſiſts of the following iſlands; ſome of which have received names from the different European navigators; others retain the names which they bear

Hebron || Hecatompolis.

bear among the natives, viz. Tierra del Eſperitu Santo, Mallicollo, St Bartholomew, Iſle of Lepers, Aurora, Whitſuntide, Ambrym, Immer, Apee, Three Hills, Sandwich, Montagu, Hinchinbrook, Shepherd, Eorramanga, Irronan, Annatom, and Tanna.

HEBRON (anc. geog.), a very ancient city ſituated in the hilly country of the tribe of Judah to the ſouth. Its more ancient name was *Kiriath Arba*, or *Cariath Arba*. In antiquity this city vied with the moſt ancient cities of Egypt, being ſeven years priors to Zoan, tranſlated *Tanis* by the ſeventy. Joſephus makes it not only older than Tanis, but even than Memphis. It ſtood to the weſt of the lake Aſphaltites, and was for ſome time the royal reſidence of David. After the captivity, it fell into the hands of the Edomites, as did all the ſouth country of Judæa.

HECATE, in Pagan worſhip, a goddeſs called *Luna* in heaven, *Diana* on earth, and *Hecate* in the infernal regions. But others repreſent her as a diſtinct deity. She was the goddeſs of the infernal regions, and of inevitable fate. She preſided over ſtreets and highways, for which reaſon ſhe was called *Tricia*; and and the doors of houſes being under her protection, ſhe was called *Propylea*. She was alſo famous for her ſkill in poiſonous roots and herbs, inchantments, and magical arts, in the practice of which her name was conſtantly invoked.

HECATOMB, Ἑκατόμβη, in antiquity, a ſacrifice of 100 beaſts of the ſame kind, at 100 altars, and by 100 prieſts or ſacrificers.—The work is formed of the Greek ἑκατὸν βοῦς which properly ſignifies a ſumptuous or magnificent ſacrifice.—Others derive it from the Greek ἑκατὸν, *centum*, "a hundred, and βους, *bos*, "bullock," &c.; on which footing the hecatomb ſhould be a ſacrifice of 100 bullocks.—Others derive the word from ἑκατὸν, and πους, *pes*, "foot;" and on that principle hold, that the hecatomb might conſiſt of only 25 four-footed beaſts. They add, that it did not matter what kind of beaſts were choſe for victims, provided the quota of feet were but had.

Pythagoras is ſaid to have ſacrificed a hecatomb to the muſes, of 100 oxen, in joy and gratitude for his diſcovering the demonſtration of the 47th propoſition of the firſt book of Euclid, viz. that, in a rectangled triangle, the ſquare of the hypothenuſe is equal to the ſquares of the two other ſides.

For the origin of hecatombs: Strabo relates, that there were 100 cities in Laconia, and that each city uſed to ſacrifice a bullock every year for the common ſafety of the country; whence the inſtitution of the celebrated ſacrifice of 100 victims, called *hecatombs*. Others refer the origin of hecatombs to a plague, wherewith the 100 cities of Peloponneſus were afflicted; for the removal whereof, they jointly contributed to ſo ſplendid a ſacrifice.

Julius Capitolinus relates, that for a hecatomb they erected 100 altars of turf, and on theſe ſacrificed 100 ſheep, and 100 hogs. He adds, that when the emperors offered ſacrifices of this kind, they ſacrificed 100 lions, 100 eagles, and 100 other beaſts of the like kind.

HECATOMPOLIS, (anc. geog.), a ſurname of the iſland of Crete, from its 100 cities. The territory of Laconia alſo had anciently this name, for the ſame reaſon; and the cuſtom of theſe 100 cities was to ſacrifice a hecatomb annually.

Hecatompylos || Hedera.

HECATOMPYLOS, (anc. geog.) the metropolis of Parthia, and royal reſidence of Arſaces, ſituated at the ſprings of the Araxes. Thebes, in Egypt, had alſo the ſame name, from its 100 gates.

HECK, an engine to take fiſh. A ſalmon heck is a grate for catching that ſort of fiſh.

HECTIC FEVER. See (the *Index* ſubjoined to) MEDICINE.

HECTOR, the ſon of Priam and Hecuba, and the father of Aſtyanax, is celebrated for the valour with which he defended the city of Troy againſt the Greeks. He was killed by Achilles, who dragged his body, faſtened to his chariot, thrice round the walls of Troy, and afterwards reſtored it to Priam for a large ranſom. See TROY.

HEDERA, Ivy, in botany, a genus of the monogynia order, belonging to the pentandria claſs of plants.

Species. 1. The helix, or common ivy, grows naturally in many parts of Britain; and, where it meets with any ſupport, will riſe to a great height, ſending out roots on every ſide, which ſtrike into the joints of walls or the bark of trees. If there is no ſupport, they trail on the ground, and take root all their length, ſo that they cloſely cover the ſurface, and are difficult to eradicate. While theſe ſtalks are fixed to any ſupport, or trail upon the ground, they are ſlender and flexible; but when they have reached to the top of their ſupport, they ſhorten and become woody, forming themſelves into large buſhy heads, and their leaves are larger, more of an oval ſhape, and not divided into lobes like the lower leaves, ſo that it hath a quite different appearance. There are two varieties of this ſpecies, one with ſilver-ſtriped leaves, the other with yelloviſh leaves on the top of the branches; and theſe are ſometimes admitted into gardens. 2. The quinquefolia, or Virginia creeper, is a native of all the northern parts of America. It was firſt brought to Europe from Canada; and has been long cultivated in the Britiſh gardens, chiefly to plant againſt walls or buildings to cover them: which theſe plants will do in a ſhort time; for they will ſhoot almoſt 20 feet in one year, and will mount up to the top of the higheſt building: but as the leaves fall off in autumn, the plants make but an indifferent appearance in winter, and therefore are proper only for ſuch ſituations as will not admit of better plants; for this will thrive in the midſt of cities, and is not injured by ſmoke or the cloſeneſs of the air.

Culture. The firſt ſpecies is eaſily propagated by its trailing branches, and will thrive in almoſt any ſoil or ſituation. The ſecond may be propagated by cuttings; which if planted in autumn in a ſhady border will take root, and by the following autumn will be fit to plant in thoſe places where they are deſigned to remain.

Uſes. The roots of the ivy are uſed by leather-cutters to whet their knives upon. Apricots and peaches covered with ivy during the month of February, have been obſerved to bear fruit plentifully. The leaves have a nauſeous taſte; Haller ſays, they are given to children in Germany as a ſpecific for the atrophy. The common people of England apply them to iſſues; and an ointment made from them is in great eſteem among the

Hederaceæ, Hedges.

the Highlanders of Scotland as a ready cure for burns. The berries have a little acidity. When fully ripe, a dose of them has been recommended in the plague. In warm climates, a resinous juice exsudes from the stalks, which is said to be a powerful resolvent and discutient, and an excellent ingredient in plasters and ointments adopted for those purposes. Horses and sheep eat the plant; goats and cows refuse it.—Caspar Bauhine and Tournefort mention a sort of ivy that grows in many of the islands of the Archipelago, to which they have given the name of the *poet's ivy*, because the ancients are said to have made crowns of this plant for adorning the brows of their poets. By others it is called *hedera dionysias*, because they made use of the same sort of ivy in their public rejoicings and feasts in honour of Bacchus. The berries are of a fine gold colour, whence this species has been termed by others *chrysocarpos*.

HEDERACEÆ, (from *hedera* "ivy.") The name of the 46th order in Linnæus's fragments of a natural method, consisting of ivy, and a few other genera which from their general habit and appearance seem nearly allied to it. See BOTANY, p. 1315.

HEDGES, in agriculture, are either planted to make fences round inclosures, or to divide the several parts of a garden. When they are designed as outward fences, they are planted either with hawthorn, crabs, or black-thorn; but those hedges which are planted in gardens, either to surround wilderness-quarters, or to screen the other parts of a garden from sight, are planted according to the fancy of the owner; some preferring ever-greens, in which case the holly is best; next the yew, then the laurel, lauristinus, phillyrea, &c. Others prefer the beech, the hornbeam, and the elm.

Before planting, it is proper to consider the nature of the land, and what sort of plants will thrive best in it; and also, what is the soil from whence the plants are to be taken. As for the size, the sets ought to be about the thickness of one's little finger, and cut within about four or five inches of the ground; they ought to be fresh taken up, straight, smooth, and well rooted. Those plants that are raised in the nursery, are to be preferred.

In planting outside hedges, the turf is to be laid, with the grass-side downwards, on that side of the ditch the bank is designed to be made; and some of the best mould should be laid upon it to bed the quick, which is to be set upon it a foot asunder. When the first row of quick is set, it must be covered with mould; and when the bank is a foot high, you may lay another row of sets against the spaces of the former, and cover them as you did the others: the bank is then to be topped with the bottom of the ditch, and a dry or dead-hedge laid, to shade and defend the underplantation. Stakes should then be driven into the loose earth, so low as to reach the firm ground: these are to be placed at about two feet and a half distance: and in order to render the hedge yet stronger, you may edder it, that is, bind the top of the stakes with small long poles, and when the eddering is finished, drive the stakes anew.

The quick must be kept constantly weeded, and secured from being cropped by cattle; and in February it will be proper to cut it within an inch of the ground, which will cause it strike root afresh, and help it much in the growth. Hedges.

The crab is frequently planted for hedges; and if the plants are raised from the kernels of the small wild crabs, they are much to be preferred to those raised from the kernels of all sorts of apples without distinction; because the plants of the true small crab never shoot so strong as those of the apples, and may therefore be better kept within the proper compass of an hedge.

The black-thorn, or sloe, is frequently planted for hedges: and the best method of doing it, is to raise the plants from the stones of the fruit, which should be sown about the middle of January, if the weather will permit, in the place where the hedge is intended; but when they are kept longer out of the ground, it will be proper to mix them with sand, and keep them in a cool place. The same fence will do for it when sown, as when it is planted.

The holly is sometimes planted for hedges; but where it is exposed, there will be great difficulty in preventing its being destroyed: otherwise, it is by far the most beautiful plant; and, being an ever-green, will afford much better shelter for cattle in winter than any other sort of hedge. The best method of raising these hedges, is to sow the stones in the place where the hedge is intended; and, where this can be conveniently done, the plants will make a much better progress than those that are transplanted: but these berries should be buried in the ground several months before they are sown. The way to do this, is to gather the berries about Christmas, when they are usually ripe, and put them into large flower-pots, mixing some sand with them; then dig holes in the ground, into which the pots must be sunk, covering them over with earth, about ten inches thick. In this place they must remain till the following October, when they should be taken up, and sown in the place where the hedge is intended to be made. The ground should be well trenched, and cleared from the roots of all bad weeds, bushes, trees, &c. Then two drills should be made, at about a foot distance from each other, and about two inches deep, into which the seeds should be scattered pretty close, lest some should fail. When the plants grow up, they must be carefully weeded: and if they are designed to be kept very neat, they should be cut twice a year, that is in May and in August; but if they are only designed for fences, they need only be sheered in July. The fences for these hedges, while young, should admit as much free air as possible: the best sort are those made with posts and rails, or with ropes drawn through holes made in the posts; and if the ropes are painted over with a composition of melted pitch, brown Spanish colour and oil, well mixed, they will last several years.

Hedges for ornament in gardens are sometimes planted with ever-greens, in which case the holly is preferable to any other: next to this, most people prefer the yew; but the dead colour of its leaves renders those hedges less agreeable. The laurel is one of the most beautiful ever-greens; but the shoots are so luxuriant that it is difficult to keep it in any tolerable shape; and as the leaves are large, to prevent the disagreeable appearance given them by their being cut through with the sheers, it will be the best way to prune them with a knife, cutting the shoots just down to a leaf. The lauristinus is a very fine

plant

Hedges. plant for this purpose; but the same objection may be made to this as to the laurel: this, therefore, ought only to be pruned with a knife in April, when the flowers are going off; but the new shoots of the same spring must by no means be shortened. The small-leaved and rough-leaved laurustinus are the best plants for this purpose. The true phillyrea is the next best plant for hedges, which may be led up to the height of 10 or 12 feet; and if they are kept narrow at the top, that there may be not too much width for the snow to lodge upon them, they will be close and thick, and make a fine appearance. The ilex, or ever-green oak, is also planted for hedges, and is a fit plant for those designed to grow very tall.—The deciduous plants usually planted to form hedges in gardens are, The hornbeam, which may be kept neat with less trouble than most other plants. The beech, which has the same good qualities as the hornbeam; but the gradual falling of its leaves in winter causes a continual litter. The small-leaved English elm is a proper tree for tall hedges, but these should not be planted closer than eight or ten feet. The lime-tree has also been recommended for the same purpose; but after they have stood some years, they grow very thin at bottom, and their leaves frequently turn of a black disagreeable colour.

Many of the flowering shrubs have also been planted in hedges, such as roses, honeysuckles, sweet-briar, &c. but these are difficult to train; and if they are cut to bring them within compass, their flowers, which are their greatest beauty, will be entirely destroyed.

Mr Anderson who hath treated the subject of hedging very particularly, is of opinion, that some other plants besides those abovementioned, might be usefully employed in the construction of hedges. Among these he reckons the common willow. This, he says, by no means requires the wetness of soil which is commonly supposed. "It is generally imagined, (says he,) that the willow can be made to thrive no where except in wet or boggy ground: but this is one of those vulgar errors, founded upon inaccurate observation, too often to be met with in subjects relating to rural affairs; for, experience has sufficiently convinced me, that this plant will not only grow, but thrive, in any rich well-cultivated soil, (unless in particular circumstances that need not here be mentioned), even altho' it be of a very dry nature. It could not, however, in general, be made to thrive, if planted in the same manner as thorns; nor would it, in any respect, be proper to train it up for a fence in the same way as that plant. The willow, as a fence, could seldom be successfully employed, but for dividing into separate inclosures any extensive field of rich ground: and, as it is always necessary to put the soil into as good order as possible before a hedge of this kind is planted in it, the easiest method of putting it into the necessary high tilth, will be to mark off the boundaries of your several fields in the winter, or early in the spring, with a design to give a complete fallow to a narrow ridge, six or eight feet broad, in the middle of which the hedge is intended to be planted the ensuing winter. This ridge ought to be frequently ploughed during the summer-season, and in autumn to be well manured with dung, or lime, or both, (for it cannot be made too rich) and be neatly formed into a ridge before winter.

Essays on Agriculture, i. 54, &c.

"Having prepared the ground in this manner, it will be in readiness to receive the hedge, which ought to be planted as early in winter as can be got conveniently done; as the willow is much hurt by being planted late in the spring. But before you begin to make a fence of this kind, it will be necessary to provide a sufficient number of plants: which will be best done by previously rearing them in a nursery of your own, as near the field to be inclosed as you can conveniently have it; for, as they are very bulky, the carriage of them would be troublesome if they were brought from any considerable distance. The best kinds of willow for this use, are such as make the longest and strongest shoots, and are not of a brittle nature. All the large kinds of hoop-willows may be employed for this use; but there is another kind with stronger and more taper shoots, covered with a dark green bark when young, which, upon the older shoots, becomes of an ash-gray, of a firm texture, and a little rough to the touch. The leaves are not so long, and a great deal broader than those of the common hoop-willow, pretty thick, and of a dark-green colour. What name this species is usually known by, I cannot tell; but, as it becomes very quickly of a large size at the root, and is strong and firm, it ought to be made choice of for this purpose in preference to all other kinds that I have seen. The shoots ought to be of two or three years growth before they can be properly used, and should never be less than eight or nine feet in length. These ought to be cut over close by the ground immediately before planting, and carried to the field at their whole length. The planter having stretched a line along the middle of the ridge which was prepared for their reception, begins at one end thereof, thrusting a row of these plants firmly into the ground, close by the side of the line, at the distance of 18 or 20 inches from one another; making them all slant a little to one side in a direction parallel to the line. This being finished, let him begin at the opposite end of the line, and plant another row in the intervals between the plants of the former row; making these incline as much as the others, but in a direction exactly contrary; and then, plaiting these basket-ways, work them into lozenges like a net, fastening the tops by plaiting the small twigs with one another, which with very little trouble may be made to bind together very firmly. The whole, when finished, assumes a very beautiful net-like appearance, and is even at first a tolerable good defence: and, as these plants immediately take root and quickly increase in size, it becomes, after a few years, a very strong fence which nothing can penetrate. This kind of hedge I myself have employed; and find that a man may plant and twist properly about a hundred yards in a day, if the plauts be laid down to his hand: and, in a situation such as I have described, I know no kind of fence which could be reared at such a small expence, so quickly become a defence, and continue so long in good order. But it will be greatly improved by putting a plant of eglantine between each two plants of willow, which will quickly climb up and be supported by them; and, by its numerous prickles would effectually preserve the defenceless willow from being browsed upon by cattle.

Hedges.

"As it will be necessary to keep the narrow ridge, upon

Hedges. upon which the hedge is planted in culture for one year at leaſt, that the plants of eglantine may not be choked by weeds, and that the roots of the willow may be allowed to ſpread with the greater eaſe in the tender mold produced by this means, it will be proper to ſtir the earth once or twice by a gentle horſe-hoe in the beginning of ſummer; and, in the month of June, it may be ſowed with turnips, or planted with cole-worts, which will abundantly repay the expence of the fallow."

The ſame author alſo gives the following uſeful directions for planting hedges in ſituations very much expoſed to the weather, and recovering them when on the point of decaying. "Thoſe who live in an open uncultivated country, have many difficulties to encounter, which others who inhabit more warm and ſheltered regions never experience; and, among theſe difficulties, may be reckoned that of hardly getting hedges to grow with facility. For, where a young hedge is much expoſed to violent and continued guſts of wind, no art will ever make it riſe with ſo much freedom, or grow with ſuch luxuriance, as it would do in a more ſheltered ſituation and favourable expoſure.

Vol. II. p. 16, &c.

"But, although it is impoſſible to rear hedges, in this ſituation, to ſo much perfection as in the others, yet they may be reared even there, with a little attention and pains, ſo as to become very fine fences.

"It is adviſeable, in all caſes, to plant the hedges upon the face of a bank; but it becomes abſolutely neceſſary in ſuch an expoſed ſituation as that I have now deſcribed: for the bank, by breaking the force of the wind, ſcreens the young hedge from the violence of the blaſt, and allows it to advance, for ſome time at firſt, with much greater luxuriance than it otherwiſe could have done.

"But, as it may be expected ſoon to grow as high as the bank, it behoves the provident huſbandman to prepare for that event, and guard, with a wiſe forecaſt, againſt the inconvenience that may be expected to ariſe from that circumſtance.

"With this view, it will be proper for him, inſtead of making a ſingle ditch, and planting one hedge, to raiſe a pretty high bank, with a ditch on each ſide of it, and a hedge on each face of the bank; in which ſituation, the bank will equally ſhelter each of the two hedges, while they are lower than it; and, when they at length become as high as the bank, the one hedge will in a manner afford ſhelter to the other, ſo as to enable them to advance with much greater luxuriance than either of them would have done ſingly.

"To effectuate this ſtill more perfectly, let a row of ſervice-trees be planted along the top of the bank, at the diſtance of 18 inches from each other, with a plant of eglantine between each two ſervices. This plant will advance, in ſome degree, even in this expoſed ſituation; and, by its numerous ſhoots, covered with large leaves, will effectually ſcreen the hedge on each ſide of it, which, in its turn, will receive ſome ſupport and ſhelter from them, ſo that they will be enabled to advance all together, and form, in time, a cloſe, ſtrong, and beautiful fence.

"The *ſervice* is a tree but little known in Scotland; although it is one of thoſe that ought perhaps to be often cultivated there in preference to any other tree whatever, as it is more hardy, and, in an expoſed ſituation, affords more ſhelter to other plants than almoſt any other tree I know: for it ſends out a great many ſtrong branches from the under part of the ſtem, which, in time, aſſume an upright direction, and continue to advance with vigour, and carry many leaves to the very bottom, almoſt as long as the tree exiſts; ſo that, if it is not pruned, it riſes a large cloſe buſh, till it attains the height of a foreſt-tree. Hedges.

"It is of the ſame genus with the rawn-tree—and has a great reſemblance to it both in flower and fruit; its branches are more waving and pliant—its leaves undivided, broad and round, ſomewhat reſembling the elm, but white and mealy on the under ſide. It deſerves to be better known than it is at preſent.

"But if, from the poorneſs of the ſoil in which your hedge is planted, or from any other cauſe, it ſhould ſo happen, that, after a few years, the hedge becomes ſickly, and the plants turn poor and ſtinted in appearance, the eaſieſt and only effectual remedy for that diſeaſe, is to cut the ſtems of the plants clean over, at the height of an inch or two above the ground; after which they will ſend forth much ſtronger ſhoots than they ever would have done without this operation. And, if the hedge be kept free of weeds, and trained afterwards in the manner above deſcribed, it will, in almoſt every caſe, be recovered, and rendered freſh and vigorous.

"This amputation ought to be performed in autumn, or the beginning of winter; and, in the ſpring, when the young buds begin to ſhow themſelves, the ſtumps ought to be examined with care, and all the buds be rubbed off, excepting one or two of the ſtrongeſt and beſt placed, which ſhould be left for a ſtem. For, if the numerous buds that ſpring forth round the ſtem are allowed to ſpring up undiſturbed, they will become in a few years as weak and ſtinted as before; and the hedge will never afterwards be able to attain any conſiderable height, ſtrength, or healthfulneſs.—I have ſeen many hedges, that have been repeatedly cut over, totally ruined by this circumſtance not having been attended to in proper time.

"If the ground for 16 or 20 feet on each ſide of the hedge be fallowed at the time that this operation is performed, and get a thorough dreſſing with rich manures, and be kept in high order for ſome years afterwards by good culture and meliorating crops, the hedge will proſper much better than if this had been omitted, eſpecially if it has been planted on the level ground, or on the bank of a ſhallow ditch.

"It ſometimes happens, that a hedge may have been long neglected, and be in general in a healthy ſtate, but full of gaps and openings, or ſo thin and ſtraggling, as to form but a very imperfect ſort of fence. On theſe occaſions, it is in vain to hope to fill up the gaps by planting young quicks; for theſe would always be outgrown, choaked, and ſtarved, by the old plants: nor could it be recovered by cutting clear over by the roots, as the gaps would ſtill continue where they formerly were. The only methods that I know of rendering this a fence are, either to mend up the gaps with dead wood, or to *plaſh* the hedge; which laſt operation is always the moſt eligible, where the gaps are not too large to admit of being cured by this means.

"The operation I here call *plaſhing*, may be defined,

Hedges. fined, "a wattling made of living wood." To form this, ſome ſtems are firſt ſelected, to be left as ſtakes at proper diſtances, the tops of which are all cut over at the height of four feet from the root. The ſtraggling ſide-branches of the other part of the hedge are alſo lopped away. Several of the remaining plants are then cut over, cloſe by the ground, at convenient diſtances; and the remaining plants are cut perhaps half through, ſo as to permit them to be bent to one ſide. They are then bent down almoſt to a horizontal poſition, and interwoven with the upright ſtakes, ſo as to retain them in that poſition. Care ought to be taken, that theſe be laid very low, at thoſe places where there were formerly gaps; which ought to be farther ſtrengthened by ſome dead ſtakes or truncheons of willows, which will frequently take root in this caſe, and continue to live. And ſometimes a plant of eglantine will be able to overcome the difficulties it there meets with, ſtrike root, and grow up ſo as to ſtrengthen the hedge in a moſt effectual manner.

"The operator begins at one end of the field, and proceeds regularly forward, bending all the ſtems in one direction, ſo that the points riſe above the roots of the others, till the whole wattling is completed to the ſame height as the uprights.

"An expert operator will perform this work with much greater expedition, than one who has not ſeen it done could eaſily imagine. And, as all the diagonal wattlings continue to live and ſend out ſhoots from many parts of their ſtems, and as the upright ſhoots that riſe from the ſtumps of thoſe plants that have been cut over quickly ruſh up through the whole hedge, theſe ſerve to unite the whole into one entire maſs, that forms a ſtrong, durable, and beautiful fence.

"This is the beſt method, of recovering an old neglected hedge, that hath as yet come to my knowledge.

"In ſome caſes it happens that the young ſhoots of a hedge are killed every winter; in which caſe it ſoon becomes dead and unſightly, and can never riſe to any conſiderable height. A remedy for this diſeaſe may therefore be wiſhed for.

"Young hedges are obſerved to be chiefly affected with this diſorder; and it is almoſt always occaſioned by an injudicious management of the hedge, by means of which it has been forced to ſend out too great a number of ſhoots in ſummer, that are thus rendered ſo ſmall and weakly as to be unable to reſiſt the ſevere weather in winter.

It often happens that the owner of a young hedge, with a view to render it very thick and cloſe, cuts it over with the ſhears a few inches above the ground the firſt winter after planting; in conſequence of which, many ſmall ſhoots ſpring out from each of the ſtems that has been cut over:—Each of which, being afterwards cut over in the ſame manner, ſends forth a ſtill greater number of ſhoots, which are ſmaller and ſmaller in proportion to their number.

"If the ſoil in which the hedge has been planted is poor, in conſequence of this management, the branches, after a few years, become ſo numerous, that the hedge is unable to ſend out any ſhoots at all, and the utmoſt exertion of the vegetative powers enables it only to put forth leaves. Theſe leaves are renewed in a ſickly ſtate for ſome years, and at laſt ceaſe to grow at all—the branches become covered with fog, and the hedge periſhes entirely. Hedges.

"But if the ſoil be very rich, notwithſtanding this great multiplication of the ſtems, the roots will ſtill have ſufficient vigour to force out a great many ſmall ſhoots, which advance to a great length, but never attain a proportional thickneſs. And, as the vigour of the hedge makes them continue to vegetate very late in autumn, the froſts come on before the tops of theſe dangling ſhoots have attained any degree of woody firmneſs, ſo that they are killed almoſt entirely by it; the whole hedge becomes covered with theſe long dead ſhoots, which are always diſagreeable to look at, and uſually indicate the approaching end of the hedge.

"The cauſes of the diſorder being thus explained, it will readily occur, that the only radical cure is amputation; which, by giving an opportunity to begin with training the hedge anew, gives us alſo an opportunity of avoiding the errors that occaſioned it. In this caſe, care ought to be taken to cut the plants as cloſe to the ground as poſſible, as there the ſtems will be leſs numerous than at any greater height. And particular attention ought to be had to allow very few ſhoots to ariſe from the ſtems that have been cut over, and to guard carefully againſt ſhortening them.

"But as the roots, in the caſe here ſuppoſed, will be very ſtrong, the ſhoots that are allowed to ſpring from the ſtems will be very vigorous, and there will be ſome danger of their continuing to grow later in the ſeaſon than they ought in ſafety to do; in which caſe, ſome part of the top of the ſhoot may perhaps be killed the firſt winter, which ought if poſſible to be prevented. This can only be effectually done by giving a check to the vegetation in autumn, ſo as to allow the young ſhoots to harden in the points before the winter approaches. If any of the leaves or branches of a tree are cut away while it is in the ſtate of vegetation, the whole plant feels the loſs, and it ſuffers a temporary check in its growth in proportion to the loſs that it thus ſuſtains. To check, therefore, the vigorous vegetation at the end of autumn, it will be prudent to chooſe the beginning of September for the time of lopping off all the ſupernumerary branches from the young hedge, and for clipping off the ſide-branches that have ſprung out from it; which will, in general, be ſufficient to give it ſuch a check in its growth at that ſeaſon, as will prevent any of the ſhoots from advancing afterwards. If the hedge is extremely vigorous, a few buds may be allowed to grow upon the large ſtumps in the ſpring, with a view to be cut off at this ſeaſon, which will tend to ſtop the vegetation of the hedge ſtill more effectually.

"By this mode of management, the hedge may be preſerved entire through the firſt winter. And, as the ſhoots become leſs vigorous every ſucceſſive ſeaſon, there will be leſs difficulty in preſerving them at any future period. It will always be proper, however, to trim the ſides of a very vigorous hedge for ſome years while it is young, about the ſame ſeaſon of the year, which will tend powerfully to prevent this malady. But when the hedge has advanced to any conſiderable height, it will be equally proper to clip it during any of the winter-months, before Candlemas."

Hedge-*Hog*. See Erinaceus.

HEDYSARUM, in botany, a genus of the decandria order, belonging to the diadelphia claſs

Heel || Heem.

of plants. There are 49 species of this plant, of which the most remarkable are, 1. The movens, or moving plant, a native of the East Indies, where it is called *burrum chundalli*. The seeds of it were sent to Edinburgh by Mr Kerr, and the plant is now growing in the botanical garden there. It arrives at the height of four feet, and in autumn produces bunches of yellow flowers. The root is annual or biennial. It is a trifolious plant, and the lateral leaves are smaller than those at the end, and all day long they are in constant motion without any external impulse. They move up and down and circularly. This last motion is performed by the twisting of the footstalks; and while the one leaf is rising, its associate is generally descending. The motion downwards is quicker and more irregular than the motion upwards, which is steady and uniform. These motions are observable for the space of 24 hours in the leaves of a branch which is lopped off from the shrub if it is kept in water. If from any obstacle the motion is retarded, upon the removal of that obstacle it is resumed with a greater degree of velocity. This species was unknown to Linnæus.—2. The coronarium, or common biennial French honeysuckle, hath large deeply-striking biennial roots; upright, hollow, smooth, very branchy stalks, three or four feet high, garnished with pinnated leaves; and from the places of the leaves proceed long spikes of beautiful red flowers, succeeded by jointed seed-pods.

Culture. The first species being a native of hot climates, requires the common culture of tender exotics; the second is easily raised from seed in any of the common borders, and is very ornamental.

HEEL, in anatomy. See there, n° 65.

HEEL *of a Horse*, the lower hinder-part of the foot comprehended between the quarters and opposite to the toe. The heel of a horse should be high and large, and one side of it should not rise higher than the other upon the pastern. To recover the heels of a horse that is hoof-bound, you should take out his sole and keep his heels very wide, by which they will be restored in a month.

HEEL *of a Horseman.* This being the part that is armed with the spur, the word is used for the spur itself; as, "This horse understands the heel well." To ride a horse from one heel to another, is to make him go sideways, sometimes to one heel and sometimes to another.

HEEL, in the sea-language. If a ship leans on one side, whether she be a-ground or a-float, then it is said she heels a-starboard, or a-port; or that she heels offwards, or to the shore; that is, inclines more to one side than to another.

HEELER, or *Bloody*-HEEL-*Cock*, a fighting cock, that strikes or wounds much with his spurs.

The masters know such a cock, even while a chicken, by the striking of his two heels together in his going.

HEEM, (John David,) an able painter, born at Utrecht in 1604. He excelled in painting flowers, fruit, vases, and instruments of music, which he performed in such a perfect manner, that a person was apt to attempt taking them in his hand. His colouring is agreeable, and the insects in his pictures appear alive. He died at Antwerp in 1674.

Cornelius de HEEM, his son, was also a good painter, though inferior to his father.

Heemskirk || Heineccius.

HEEMSKIRK. See HEMSKIRK.

HEGIRA, in chronology, a celebrated epocha among the Mahometans.

The event which gave rise to this epocha was the flight of Mahomet from Mecca, with his new proselytes, to avoid the persecution of the Coraischites; who, being then most powerful in the city, could not bear that Mahomet should abolish idolatry, and establish his new religion. This flight happened in the fourteenth year after Mahomet had commenced prophet: he retired to Medina, which he made the place of his residence. See ARABIA, n° 44.

HEIDENHEIM, a town of Germany, in Swabia, and in the territory of Brentzhall, with a handsome palace or castle, belonging to the house of Wirtemberg. E. Long. 10. 19. N. Lat. 48. 37.

HEIDLEBERG, a considerable and populous town of Germany, capital of the Lower Palatinate, with a celebrated university. It is noted for its great ton, which holds 800 hogsheads, generally kept full of good Rhenish wine. It stands in a pleasant rich country, and was a famous seat of learning: but it has undergone so many calamities, that it is nothing now to what it was formerly. It was first reduced to a heap of ruins in 1622, by the Spaniards; and the rich library was transported by to Vienna, and partly to the Vatican at Rome. After this it enjoyed the benefits of peace, till the Protestant electoral house became extinct, and a bloody war ensued, in which not only the castle was ruined, but the tombs and bodies of the electors were shamefully violated and pillaged. This happened in 1693; and the people of the Palatinate were obliged to leave their dwellings, and to go for refuge into foreign countries. To add to these misfortunes, the elector resided at Manheim, and carried most of the people of distinction along with him, so that it is uncertain whether Heidleberg will ever recover itself or not, though they have begun to rebuild some of the fortifications. The great ton was broke to pieces in 1693 by the French, and at great expence in 1729 was repaired. The town stands on the river Neckar, over which there is a handsome bridge. E. Long. 8. 48. N. Lat. 49. 25.

HEIGHT, in general, signifies the difference between the ground and the top of any object measured perpendicularly.

Methods of measuring HEIGHTS. See GEOMETRY, TRIGONOMETRY, BAROMETER, MOUNTAIN, and (BAROMETER in the APPENDIX.)

HEILA, a town of Royal Prussia, in Cassubia, seated at the mouth of the river Vistula, on the Baltic Sea, and subject to Poland, 12 miles north of Dantzick. E. Long. 19. 25. N. Lat. 54. 53.

HEILEGEN-HAVE, a sea-port town of Germany, in Lower Saxony, and in Wageria, seated on the Baltic Sea, over-against the island of Termeren. E. Long. 11. 15. E. Lat. 57. 30.

HEINECCIUS (John Gotlieb), one of the greatest civilians of the 18th century, was born at Eisenberg, in the principality of Altenburg, in 1681. After having studied at Gosslar and Leipsick, he was designed for the ministry, and began to preach; but disliking that profession, he laid it aside, and applied himself entirely to the study of philosophy and the civil

Heinetken, Heinsius.

vil law. In 1710, he became professor of philosophy at Hall; and in 1721, he was made professor of civil law, with the title of *counsellor of the court*. His great reputation made the states of Friesland invite him to Francker in 1724; but three years after, the king of Prussia prevailed on him to accept of a professorship of law at Francfort on the Oder, where he distinguished himself till the year 1733. Becoming again professor at Hall, he remained there till his death, which happened in 1741, notwithstanding his being invited to Marpurg, Denmark, and three academies in Holland. He wrote many works, all of them much esteemed. The principal are, 1. *Antiquitatum Romanarum jurisprudentiam illustrantium syntagma*. It was this excellent abridgment that gave rise to his reputation in foreign countries. 2. *Elementa juris civilis secundum ordinem institutionum & pandectarum*. 3. *Fundamenti styli cultioris*. There are few works so useful as this for forming a Latin style. 4. *Elementa philosophiæ rationalis & moralis, quibus præmissa historia philosophica*. 5. *Historia juris civilis Romani ac Germanici*. 6. *Elementa juris naturæ & gentium*, &c.

HEINETKEN (Christian), an extraordinary child, the prodigy of the North, was born at Lubeck in 1721. He spoke his maternal tongue fluently at 10 months. At one year old, he knew the principal events of the pentateuch; in two months more, he was master of the entire history of the Old and New Testaments; at two years and an half, he answered the principal questions in geography and in ancient and modern history; and he spoke Latin and French with great facility before the commencement of his fourth year. His constitution was so delicate, that he was not weaned till a few months before his death. M. Martini of Lubec published a pamphlet in 1730, in which he endeavoured to give natural reasons for the extraordinary capacity of this infant, who died in his fifth year.

HEINSIUS (Daniel), professor of politics and history at Leyden, and librarian to the university there, was born at Gand in Flanders in 1580. He became a scholar to Joseph Scaliger at Leyden, and was indebted to the encouragement and care of that great man, for the perfection to which he attained in literature, and which at the beginning of his life there was little reason to hope from him. He distinguished himself as a critic by his labours on many classical authors; and was highly honoured as well abroad as at home: Gustavus Adolphus king of Sweden gave him a place among his counsellors of state; the republic of Venice made him a knight of the order of St Mark; and pope Urban VIII. made him great offers, if he would come, as he expressed it, "to rescue Rome from barbarism." He died in 1666, leaving several works of his own, both in poetry and prose.

HEINSIUS (Nicholas), the son of Daniel Heinsius, was born at Leyden; and became as great a Latin poet, and a greater critic than his father. His poems have been several times printed, but the best edition is that of Amsterdam in 1666. He gave editions of several of the classics, with notes; his Claudian is dedicated in a Latin poem to queen Christina of Sweden, and his Ovid to Thuanus. At his death, which happened in 1681, he bequeathed all his works, and expressed the utmost regret at having left behind him so many "monuments of his vanity," as he called them. He was as much distinguished by his great employments in the state, as by his talents, learning, and good qualities.

Heir || Helena.

HEIR, in law, signifies the person who succeeds another by descent to lands, tenements, and hereditaments, being an estate of inheritance, or an estate in fee; because nothing passes by right of inheritance but in fee. See the articles Consanguinity, Descent, Fee, Succession; and Law, N° lxxvi. & clxxx. *et seq.*

Heir *Apparent*, is a person so called in the lifetime of his ancestor, at whose death he is heir at law.

HEIRESS, a female heir to one who has an estate in lands, &c. See Heir.

Stealing an Heiress. See Forcible *Marriage*.

HEIRSHIP moveables, in Scots law, the best of certain kinds of moveables, which the heir of line is intitled to take, besides the heritable estate. See Law, N° clxxx. 7.

HELENA, or St Helena, an island in the Atlantic Ocean, belonging to the English East India company, and situated in W. Long. 6. 30. S. Lat. 16°. The greatest length of the island is about eight miles, and its circumference about 20. It hath some high mountains, particularly one called *Diana's peak*, which is covered with woods to the very top. Other hills there are which bear evident marks of a volcanic origin; and some have huge rocks of lava, and a kind of half-vitrified flags. The country, according to Mr Forster, has a fine appearance; the soil is in many places a rich mould, from six to ten inches deep, and a variety of plants thrive in it luxuriantly. He found many plants here which he had not observed in other parts of the world. Among these were some called by the natives *cabbage-trees*, *gum-trees*, and *red wood*. The former thrive in moist places; but the latter are always found on the ridges of hills where the soil is dry. The cabbage-tree has rather large leaves; but after many inquiries Mr Forster could not find that it was used for any other purpose than that of fuel, and no reason could be assigned why it had obtained that name. It must not be confounded with the cabbage-tree of America, India, and the South Seas, which is a species of palm.

The island is laid out entirely in gardens and pasturage. Peaches are the only European fruits that thrive here. Cabbages and other greens which thrive extremely well are devoured by caterpillars; and every species of corn is destroyed by rats. All the pastures were over-run with furze; which, though in our country a very useless and even pernicious plant, was of singular advantage to the inhabitants of St Helena. Before the introduction of that plant, the ground was parched by the intense heat, and all kinds of grass and herbage were shrivelled up. But the furze-bushes, which throve as it were in despite of the sun, preserved a degree of moisture in the ground; by which means the grass sprung up vigorously, and the country became covered with a rich and beautiful sod. The furze is now no longer wanted, and the people assiduously root it out for fuel. The number of people on St Helena does not exceed 2000 persons, including 500 soldiers, and 600 slaves; and it is said that the number of females born on the island considerably exceeds that of the males. By the arrival of the In-

Helena Helenium.

dia ships which they supply with refreshments, they are in return provided with all sorts of manufactures and other necessaries; and the Company annually order one or two of their ships to touch there in their way to India, in order to send them a sufficient quantity of European goods and provisions. Many of their slaves are employed in catching fish, which are very plentiful; and, by the help of these, together with their poultry, cattle, roots, and salt provisions, they subsist through the year. Their life (says Mr Forster) seems to pass along very happily; free from the multitude of cares which distress their countrymen in England, and blessed with quiet and content.

St Helena was first discovered by the Portuguese in 1502, on St Helen's day; whence its name. They stocked it with different kinds of useful animals; but whether they ever settled a colony on it or not, is uncertain. The Portuguese having either abandoned, or never taken possession of it, the Dutch became its masters; and kept possession of it till the year 1600, when they were driven out by the English. In 1673, the Dutch took it by surprise; but a short time after it was recovered by the brave captain Munden, who also took three Dutch East Indiamen then lying in the harbour. On this occasion the Hollanders had fortified the landing-place, of which there is only one on the island; and erected batteries of great guns to prevent a descent: but the English having knowledge of a small creek, where only two men abreast could creep up, climbed to the top of the rock in the night; and appearing the next morning behind the batteries, the Dutch were so terrified, that they threw down their arms, and surrendered at discretion. This creek has been since fortified, and a battery of large cannon placed at the entrance of it; so that now the island is rendered perfectly secure against all regular approaches or sudden attacks.

HELEN, (in fab. hist.) the daughter of Tyndarus and Leda, was married to Menelaus king of Sparta, but was stolen from him by Theseus, 1235 B. C. She was restored soon after; but carried off again by Paris, the Trojan prince; which occasioned the famous Trojan war. See TROY.

HELENIUM, BASTARD SUN-FLOWER; a genus of the polygamia superflua order, belonging to the syngenesia class of plants.

Species. 1. The autumnale, with spear-shaped narrow leaves. 2. The latifolium, with pointed, spear-shaped, sawed leaves.—Both these are natives of North America, where they grow wild in great plenty. They rise to the height of seven or eight feet in good ground. The roots, when large, send up a great number of stalks, which branch toward the top; the upper part of the stalk sustains one yellow flower shaped like the sun-flower, but much smaller, having long rays, which are jagged pretty deep into four or five segments.

Culture. These plants may be propagated by seeds, or by parting their roots; the latter is generally practised in this country. The best season to transplant and part the old roots is in October when their leaves are past, or in the beginning of March just before they begin to shoot. They delight in a soil rather moist than dry, provided it is not too strong, or does not hold the wet in winter.

HELEPOLIS, in the ancient art of war, a machine for battering down the walls of a place besieged, the invention of which is ascribed to Demetrius Poliorcetes.—Diodorus Siculus says, that each side of the Helepolis was 405 cubits in breadth, and 90 in height; that it had nine stages, and was carried on four strong solid wheels eight cubits in diameter; that it was armed with large battering rams, and had two roofs capable of supporting them; that in the lower stages there were different sorts of engines for casting stones; and in the middle they had large catapultas for discharging arrows, and smaller ones in those above, with a number of expert men for working all these machines.

HELIÆA, in Grecian antiquity, was the greatest and most frequented court in Athens for the trial of civil affairs. See HELIASTÆ.

HELIACAL, in astronomy, a term applied to the rising and setting of the stars; or, more strictly speaking, to their emersion out of, and immersion into, the rays and superior splendor of the sun.—A star is said to rise heliacally, when, after having been in conjunction with the sun, and on that account invisible, it comes to be at such a distance from him, as to be seen in the morning before sun-rising; the sun, by his apparent motion, receding from the star towards the East. On the contrary, the heliacal setting is, when the sun approaches so near a star as to hide it with his beams, which prevent the fainter light of the star from being perceived; so that the terms *apparition* and *occultation* would be more proper than *rising* and *setting*.

HELIANTHUS, the GREAT SUNFLOWER; a genus of the polygamia frustanea order, belonging to the syngenesia class of plants. There are 12 species, most of which are now very common in our gardens, tho' all of them are natives of America. They are all very hardy, and will prosper in almost any soil or situation. They may be propagated either by seeds, or by parting their roots.

HELIASTÆ, in antiquity, the judges of the court HELIÆA. They were so called, according to some authors, from a Greek word which signifies *to assemble in a great number*; and, according to others, from another word which signifies *the sun*, because they held their assemblies in an open place. They composed not only the most numerous, but likewise the most important of the Athenian tribunals; for their province was either to explain the obscure laws, or to give new vigour and authority to those which had been violated. The Thesmothetæ convoked the assembly of the Heliastæ, which sometimes amounted to 1000, sometimes to 1500 judges. Mr Blanchard is of opinion, that, to make this number, the Thesmothetæ sometimes summoned those of each tribe who had last quitted the public offices which they had exercised in another court.

However that may be, it appears that the assemblies of the Heliastæ were not frequent, as they would have interrupted the jurisdiction of the stated tribunals, and the common course of affairs.

The Thesmothetæ paid to each member of this assembly, for his attendance, three oboli: which are equal to two Roman sesterces, or to half a drachma. Hence Aristophanes terms them *the brothers of the triobolus*.

Heliæa Heliastæ.

Heliastæ. *triobolus*. They were likewise condemned to pay a fine if they came too late; and if they did not present themselves till after the orators had begun to speak, they were not admitted. Their attendance was requited out of the public treasury, and their pay was called *misthos heliasticus*. Heliastæ.

The assembly met, at first, according to Aristophanes, at the rising of the sun. If the judges were obliged to meet under cover on account of frost and snow, they had a fire; but there is not a passage in any ancient author which informs us of the place where these assemblies were held, either in the rigorous or in the mild seasons. We only learn that there was a double inclosure around the assembly, that it might not be disturbed. The first was a kind of arbor-work, from space to space, separated by doors, over which were painted in red the ten or twelve first letters of the Greek alphabet, which directed the entrance of the officers who composed the tribunal, each of them entering under the letter which distinguished his tribe. The beadles of the court, to whom they shewed the wands which had been sent them by the Thesmothetæ as a summons to meet, examined its mark, to see if it was authentic, and then introduced them. The second inclosure, which was at the distance of 20 feet from the former, was a rope, or cord; that the people who stood round the first inclosure, and were desirous to see what passed within the second, might not be prevented from gratifying their curiosity at a proper distance. Thus the attention of the judges was not interrupted by the concourse of the multitude, many of whom were heated by views of interest or of party.

To each of the members of the assembly were distributed two pieces of copper; one of which was perforated, not, certainly, that it might be distinguished from the other by feeling; for these assemblies met at the rising, and were dissolved at the setting of the sun. Those pieces of copper had been substituted for little sea-shells, which were at first in use. The king was present at the assembly, at whose command it had been summoned. The Thesmothetæ read the names of those who were to compose it, and each man took his place as he was called. The Thesmothetæ were then sent for, whose function it was to observe prodigies, and to superintend the sacrifices; and if they gave their sanction, the deliberations were begun. It is well known, that the officers called *Exegetæ* were often corrupted by those who were interested in the debates of the assembly; and that they excited such tumults as were raised by the Roman tribunal in the popular assemblies convoked by the consuls.

Of all the monuments which remain relating to the Heliastæ, the most curious is the oath which those judges took before the Thesmothetæ: Demosthenes hath preserved it in his oration against Timocrates, who having been bribed by those who had been intrusted with the effects taken on board a vessel of Naucratis, and refused to give an account of them, got a law passed, by which an enlargement was granted to prisoners for public debts, on giving bail. Demosthenes, in making his oration against that law, ordered the oath of the Heliastæ to be read aloud, as a perpetual auxiliary to his arguments, and happily calculated to interest the multitude and inflame their passions. This oath we shall quote, that our readers may know how respectable a tribunal that of the Heliastæ was, and the importance of their decisions. Heliastæ.

"I will judge according to the laws and decrees of "the people of Athens, and of the senate of 500. "I will never give my vote for the establishment of a "tyrant, nor of an oligarchy. Nor will I ever give "my approbation to an opinion prejudicial to the "liberty, or to the union, of the people of Athens. "I will not second those persons who may propose a "reduction of private debts, or a distribution of the "lands or houses of the Athenians. I will not recall "exiles, nor endeavour to procure a pardon for those "who shall be condemned to die. Nor will I force "those to retire whom the laws and the suffrages of "the people shall permit to remain in their country. "I will not give my vote to any candidate for a "public function, who gives not an account of his "conduct in the office which he has previously filled; "nor will I presume to solicit any trust from the "commonwealth, without subjecting myself to this "condition, which I mean as obligatory to the nine "archons, to the chief of religious matters, to those "who are balloted on the same day with the nine "archons, to the herald, the ambassador, and the "other officers of their court. I will not suffer the "same man to hold the same office twice, or to hold "two offices in the same year. I will not accept any "present, either myself or by another, either directly "or indirectly, as a member of the Heliastic assembly. "I solemnly declare that I am 30 years old. I will "be equally attentive and impartial to the accuser "and the accused; I will give my sentence rigorously "according to evidence. Thus I swear, by Jupiter, "by Neptune, and by Ceres, to act. And if I vio- "late any of my engagements, I imprecate, from "these deities, ruin on myself and my family. And "I request them to grant me every kind of prosperity, "if I am faithful to my oath."

The reader should perufe what follows this oath, to see with what eloquence Demosthenes avails himself of it, and how he applies its principles to the cause which he defends.

Here we have one of the motives of the meeting of this assembly. Aristotle informs us of another; which was, by the public authority, deputed to them, to elect a magistrate in the room of one dead. It is surprising, that Pausanias, who enters so often into details, gives us no particular account of this assembly. All that he says of it is, that the most numerous of the Athenian assemblies was called *Helicè*.

We are told by Diogenes Laertius, in his life of Solon, that it was before one of these Heliastic assemblies that Pisistratus presented himself, covered with wounds and contusions, (for thus he had treated himself and the mules which drew his car,) to excite the indignation of the people against his pretended enemies, who, jealous, as he alleged, of the popularity he had acquired by asserting the rights of his poorer fellow-citizens, in opposition to the men in power, had attacked him while he was hunting, and had wounded him in that barbarous manner. His design succeeded; a guard was appointed him, by the assistance of which he acquired the sovereignty or tyranny of Athens, and kept it 33 years. The power of the assembly

Heliastæ ‖ Heliocometes

assembly appeared remarkably on that occasion; for Solon, who was present, opposed it with all his efforts, and did not succeed.

As to the manner in which the judges gave their suffrages, there was a sort of vessel, covered with an osier mat, on which were placed two urns, the one of copper, the other of wood. In the lid of these urns there was an oblong hole, which was large at the top, and grew narrower downwards, as we see in some old boxes of our churches. The suffrages which condemned the accused person, were thrown into the wooden urn, which was termed *kyrios*. That of copper, named *akyroi*, received those which absolved him.

Aristotle observes, that Solon, whose aim was to make his people happy, and who found an aristocracy established by the election of the nine archons, (annual officers, whose power was almost absolute,) tempered their sovereignty, by instituting the privilege of appealing from *them* to the people, who were to be assembled by lot to give their suffrage; after having taken the oath of the Heliastæ, in a place near the Panathenæum; where Hissus had, in former days, calmed a sedition of the people, and bound them to unanimity by an oath. It has likewise been remarked, that the god Apollo was not invoked in the oath of the Heliastæ, as in the oaths of the other judges. We have observed, that he who took the oath of the Heliastæ, engaged that he would not be corrupted by solicitation or money. Those who violated this part of their oath, were condemned to pay a severe fine. The decemvirs at Rome made such corruption a capital crime. But Asconius remarks, that the punishment denounced against them was mitigated in later times; and that they were expelled the the senate, or banished for a certain time, according to the degree of their guilt.

HELICON, (anc. geog.), a mountain on the borders of Bœotia and Phocis; of fertile soil, covered with woods, and very extensive, its north side touching Phocis, and partly its west side, quite to Mychos, its utmost port-town. There also we have the river Helicon; which sinking in the earth rises again at some distance under a new name, *Baphyræ*. This mountain is the poets' sport and delight: *Heliconius* the epithet; *Heliconiades*, and *Heliconides*, the muses.

HELICTERES, the Screw-tree; a genus of the decandria order, belonging to the gynandria class of plants. There are four species, all natives of warm climates. They are shrubby plants, rising from five to fourteen feet in height, adorned with flowers of a yellow colour. They are propagated by seeds; but are tender, and in this country must be kept in a stove during the winter.

HELIOCENTRIC latitude *of a Planet*, the inclination of a line drawn between the centre of the sun, and the centre of a planet, to the plane of the ecliptic.

Heliocentric *Place of a Planet*, the place of the ecliptic wherein the planet would appear to a spectator placed at the centre of the sun.

HELIOCOMETES, a phenomenon sometimes observed about sunsetting; being a large luminous tail or column of light proceeding from the body of the sun, and dragging after it, not unlike the tail of a comet; whence the name.

HELIODORUS *of* Phœnicia, bishop of Trica in Thessaly, better known by the romance he composed in his youth, entitled *Æthiopics*, and relating the amours of Theagenes and Chariclea. Some say he was deposed by a synod, because he would not consent to the suppressing of that romance: the fable has a moral tendency, and particularly inculcates the virtue of chastity. As it was the first of this species of writing, he is styled the *Father of Romances*. He was also a good Latin poet. He lived in the 4th century. Heliodorus Helix.

HELIOPOLIS, (anc. geog.), so called by Herodotus and Diodorus Siculus, by Moses *On*, and in Jeremiah *Bethsemes*; a city of Egypt, to the south-east of the Delta, and east of Memphis; of a very old standing, its origin terminating in fable. Here stood the temple of the sun, held in religious veneration. The city stood on an extraordinary mount, but in Strabo's time was desolate. It gave name to the *Nomos Heliopolites*.—There was another *Heliopolis* in Cœlosyria, near the springs of the Orontes; so called from the worship of the sun, which was in great vogue over all Syria.

HELIOSCOPE, in optics, a sort of telescope, peculiarly fitted for viewing the sun, without hurting the eyes. See Telescope.

As the sun may be viewed through coloured glasses, without hurt to the eyes, if the object and eye glasses of a telescope be made of coloured glass, as red or green, such a telescope will become an helioscope.

But Mr Huygens only used a plain glass, blacked at the flame of a candle on one side, and placed between the eye-glass and the eye; which answers the design of an helioscope very well.

HELIOSTATA, in optics, an instrument invented by the late learned Dr 'S. Gravesande; who gave it this name from its fixing, as it were, the rays of the sun in an horizontal direction across the dark chamber all the while it is in use. See Optics.

HELIOTROPIUM, Turnsole; a genus of the monogynia order, belonging to the pentandria class of plants. There are a number of species, all of them natives of warm countries. Only one, called the *tricoccum*, grows in Europe; and is a native of France, Spain, and Italy. It is only remarkable for the property of its berries, of which an account is given under Colour-*Making*, n° 35.

HELIX, in anatomy. See there, n° 405.

Helix, the *Snail*, in zoology, a genus belonging to the order of vermes testacea. The shell consists of one spiral, brittle, and almost diaphanous valve; and the aperture is narrow. There are 60 species, principally distinguished by the figure of their shells. They are of various sizes, from that of a small apple to less than half a pea. Some of them live on land, frequenting woods and gardens, or inhabiting clefts of rocks and dry sand-banks. Others of them are aquatic, inhabiting ponds, deep rivers, and the ocean. The principal species are,

1. The janthina, with a violet-coloured shell, is remarkable for the extreme thinness of its texture, which breaks with least pressure, and seems therefore entirely calculated to keep the open sea, or at least to shun rocky shores. It inhabits the seas of Europe, especially the Mediterranean; those of Asia and Africa; and

Helix, Hell.

and also the ocean. The living animal, when touched, exsudes a juice, which stains the hands of a violet colour. Dr Hawkesworth, in his account of Cooke's voyage, mistakes this shell for that which yielded the *purpura* of the ancients. But whoever looks into Pliny, can never have the least idea that the thin shell aforementioned could be the same with it. They had several shells which yielded the purple dye: but these were all rock-shells *, and very different, both in figure and hardness, from the little helix jacintha; which is not calculated for the neighbourhood of rocks, as already mentioned. Vid. *Plin.* lib. v. cap. 1. and lib. ix. cap. 60, 61. See also Don Ant. Ulloa's voyage to South America, book iv. ch. 8.

* See *Buccinum* and *Murex*.

2. The pomatia, or exotic snail, with five spires, most remarkably ventricose, and fasciated with a lighter and a deeper brown, is a native of France, where it inhabits the woods; but has been naturalized in England, where it inhabits the woods of the southern counties. It was introduced, as it is said, by Sir Kenelm Digby; whether for medical purposes, or as food, is uncertain: tradition says, that to cure his beloved wife of a decay was the object.—They are quite confined to our southern counties. An attempt was made to bring them into Northamptonshire, but they would not live there.—These are used as a food in several parts of Europe during lent; and are preserved in an escargatoire, or a large place boarded in, with a floor covered half a foot deep with herbs, in which the snails nestle and fatten *.—They were also a favourite dish with the Romans, who had their *cochlearia*, a nursery similar to the above. Fulvius Hirpinus † was the first inventor of this luxury, a little before the civil wars between Cæsar and Pompey. The snails were fed with bran and sodden wine. If we could credit Varro ‡, they grew so large, that the shells of some would hold ten quarts! People need not admire the temperance of the supper of the younger Pliny ||, which consisted of only a lettuce a-piece, three *snails*, two eggs, a barley-cake, sweet wine and snow,—in case his snails bore any proportion in size to those of Hirpinus.—Its name is derived not from any thing relating to an orchard, but from κοχλος, an *operculum*, it having a very strong one. This seems to be the species described by Pliny, lib. viii. c. 39. which he says was scarce; that it covered itself with the opercle, and lodged under ground; and that they were at first found only about the maritime Alps, and more lately near Velitræ. [See Plate CLVIII. the figure half the natural size.]

* *Addison's Trav.* 272.

† *Pliny, l.* x. *c.* 56.

‡ *L.* iii. *c.* 14.

|| *Epist.* xv.

3. The hortensis, or garden-snail, is in form like the last, but lesser, and not umbilicated and clouded, or mottled with browns.—These are often used with success in consumptive cases.

HELL, the place of divine punishment after death.

As all religions have supposed a future state of existence after this life, so all have their hell or place of torment in which the wicked are supposed to be punished. The hell of the ancient heathens was divided into two mansions; the one called *Elysium*, on the right hand, pleasant and delightful, appointed for the souls of good men; the other called *Tartara*, on the left, a region of misery and torment, appointed for the wicked. The latter only was hell, in the present restrained sense of the word. See ELYSIUM.

The philosophers were of opinion, that the infernal regions were at an equal distance from all the parts of the earth; nevertheless it was the opinion of some, that there were certain passages which led thither, as the river Lethe near the Syrtes, and the Acherusian cave in Epirus. At Hermione it was thought, that there was a very short way to hell; for which reason the people of that country never put the fare into the mouths of the dead to pay their passage. Hell.

The Jews placed hell in the centre of the earth, and believed it to be situated under waters and mountains. According to them, there are three passages leading to it: the first is in the wilderness, and by that Korah, Dathan, and Abiram, descended into hell; the second is in the sea, because Jonah, who was thrown into the sea, cried to God out of the belly of hell; the third is in Jerusalem, because it is said the fire of the Lord is in Zion, and his furnace is in Jerusalem. They likewise acknowledged seven degrees of pain in hell, because they find this place called by seven different names in scripture. Though they believed that infidels, and persons eminently wicked, will continue for ever in hell; yet they maintained, that every Jew who is not infected with some heresy, and has not acted contrary to the points mentioned by the rabbins, will not be punished therein for any other crimes above a year at most.

The Mahometans believe the eternity of rewards and punishments in another life. In the Koran it is said, that hell has seven gates, the first for the Musulmans, the second for the Christians, the third for the Jews, the fourth for the Sabians, the fifth for the Magians, the sixth for the Pagans, and the seventh for the hypocrites of all religions.

Among Christians, there are two controverted questions in regard to hell; the one concerns locality, the other the duration of its torments. The locality of hell, and the reality of its fire, began first to be controverted by Origen. That father, interpreting the scripture account metaphorically, makes hell to consist, not in external punishments, but in a conscIousness or sense of guilt, and a remembrance of past pleasures. Among the moderns, Mr Whiston advanced a new hypothesis. According to him, the comets are so many hells appointed in their orbits alternately to carry the damned into the confines of the sun, there to be scorched by its violent heat, and then to return with them beyond the orb of Saturn, there to starve them in these cold and dismal regions. Another modern author, not satisfied with any hypothesis hitherto advanced, assigns the sun to be the local hell. As to the second question, viz. the duration of hell-torments, we have Origen again at the head of those who deny that they are eternal; it being that father's opinion, that not only men, but devils, after a due course of punishment suitable to their respective crimes, shall be pardoned and restored to heaven. The chief principle upon which Origen built his opinion, was the nature of punishment, which he took to be emendatory, applied only as physic for the recovery of the patient's health. The chief objection to the eternity of hell-torments among modern writers, is the disproportion between temporary crimes and eternal punishments. Those who maintain the affirmative, ground their opinions on scripture-accounts, which represent

Hellanicus
||
Helleborus.

represent the pains of hell under the figure of a worm which never dies, and a fire which is not quenched; as alſo upon the words, "Theſe ſhall go away into "everlaſting puniſhment, but the righteous into life "eternal."

HELLANICUS of Mitylene, a celebrated Greek hiſtorian, born before Herodotus, flouriſhed about 480 B. C. He wrote a hiſtory of the ancient kings and founders of cities, but which hath not come down to us.

HELLAS, (anc. geog.), an appellation comprihing, according to the more ancient Greeks and Romans, Achaia and Peloponneſus, but afterwards reſtrained to Achaia. It was bounded on the weſt by the river Achelous, on the north by mounts Othrys and Octa, on the eaſt by the Egean ſea, and on the ſouth by the Saronic and Corinthian bays, and by the iſthmus which joins it to Peloponneſus. It was called *Hellas*, from *Hellen* the ſon of Deucalion; or from *Hellas*, a diſtrict of Theſſaly; whence *Hellenes*, the gentilitious name, denoting *Greeks*. Now called *Livadia*.

HELLEBORUS, HELLEBORE; a genus of the polygynia order, belonging to the polyandria claſs of plants.

Species. The moſt remarkable ſpecies of this plant is the niger, commonly called *Chriſtmas roſe*. It hath roots compoſed of many thick fleſhy ſpreading fibres, crowned by a large cluſter of lobbed leaves, conſiſting each of ſeven or eight obtuſe fleſhy lobes, united to one foot-ſtalk; and between the leaves ſeveral thick fleſhy flower-ſtalks three or four inches high, ſurmounted by large beautiful white flowers of five roundiſh petals, and numerous filaments, appearing in winter, about or ſoon after Chriſtmas.

Culture. This plant may be propagated either by ſeeds or parting the roots. It proſpers in the open borders, or may be planted in pots to move when in bloom in order to adorn any particular place; but it alway flowers faireſt and moſt abundantly in the front of a warm ſunny border. The plants may be removed, and the roots divided for propagation, in September, October, or November; but the ſooner in autumn it is done, the ſtronger will the plants flower at their proper ſeaſon.

Uſes. The root of this plant was anciently uſed as a cathartic. The taſte of it is acrid and bitter. Its acrimony, as Dr Grew obſerves, is firſt felt on the tip of the tongue, and then ſpreads itſelf immediately to the middle, without being much perceived in the intermediate part. On chewing the root for a few minutes, the tongue ſeems benumbed, and affected with a kind of paralytic ſtupor, as when burnt by eating any thing too hot. The fibres are more acrimonious than the head of the root from whence they iſſue. Black hellebore root, taken from 15 to 30 grains, proves a ſtrong cathartic; and, as ſuch, has been celebrated for the cure of maniacal and other diſorders proceeding from what the ancients called the *atrabilis*; in which caſes, medicines of this kind are doubtleſs occaſionally of uſe, though they are by no means poſſeſſed of any ſpecific power. It does not however appear, that our black hellebore acts with ſo much violence as that of the ancients; whence many have ſuppoſed it to be a different ſpecies of plant: and indeed the deſcriptions which the ancients have left us of their hellebore, do not agree with thoſe of any of the ſorts uſually taken notice of by modern botaniſts. Another ſpecies has been diſcovered in the Eaſtern countries, which Tournefort diſtinguiſhes by the name of *helleborus niger orientalis, amplifſimo folio, caule præalto, flore purpuraſcente*, and ſuppoſes to be the true ancient hellebore, from its growing in plenty about mount Olympus, and in the iſland of Anticyra, celebrated of old for the production of this antimaniacal drug: he relates, that a ſcruple of this ſort, given for a doſe, occaſioned convulſions.—Our hellebore is at preſent looked upon principally as an alterative; and in this light is frequently employed, in ſmall doſes, for attenuating viſcid humours, promoting the uterine and urinary diſcharges, and opening inveterate obſtructions of the remoter glands. It often proves a powerful emmenagogue in plethoric habits, where ſteel is ineffectual or improper. In ſome parts of Germany, a ſpecies of black hellebore has been made uſe of, which frequently produced violent, and ſometimes deleterious, effects. It appears to be the fetid kind of Linnæus, called in Engliſh *ſtinkwort*, *fetterwort*, or *baſtard hellebore*. The roots of this may be diſtinguiſhed from thoſe of the true kind, by their being leſs black.

Hellen
||
Helm.

HELLEN, the ſon of Deucalion, is ſaid to have given the name of Helleniſts to the people before called *Greeks*, 1521 B. C. See GREECE.

HELLENISM, in matters of language, a phraſe in the idiom, genius, or conſtruction of the Greek tongue.

This word is only uſed when ſpeaking of the authors who, writing in a different language, expreſs themſelves in a phraſeology peculiar to the Greek.

HELLENISTIC LANGUAGE, that uſed by the Grecian Jews who lived in Egypt and other parts where the Greek tongue prevailed. In this language it is ſaid the Septuagint was written, and alſo the books of the New Teſtament; and that it was thus denominated to ſhew that it was Greek filled with Hebraiſms and Syriaciſms.

HELLESPONT, the entrance of the ſtreights which divides Aſia from Europe, and paſſes from the Archipelago to Conſtantinople. It is now called the *Dardanelles*, and is about two miles wide.

HELM, a long and flat piece of timber, or an aſſemblage of ſeveral pieces, ſuſpended along the hind-part of a ſhip's ſtern-poſt, where it turns upon hinges to the right or left, ſerving to direct the courſe of the veſſel, as the tail of a fiſh guides the body.

The helm is uſually compoſed of three parts, viz. the rudder, the tiller, and the wheel, except in ſmall veſſels, where the wheel is unneceſſary.

As to the form of the rudder, it becomes gradually broader in proportion to its diſtance from the top, or to its depth under the water. The *back*, or inner part of it, which joins to the ſtern-poſt, is diminiſhed into the form of a wedge throughout its whole length, ſo as that the rudder may be more eaſily turned from one ſide to the other, where it makes an obtuſe angle with the keel. It is ſupported upon hinges; of which thoſe that are bolted round the ſtern-poſt to the after-extremity of the ſhip, are called *googings*, and are furniſhed with a large hole on the after-part of the ſtern-poſt. The other parts of the hinges, which are bolted to the back of the rudder, are called *pintles*, being ſtrong cylindrical pins, which enter into the googings, and

Helm. and reſt upon them. The length and thickneſs of the rudder is nearly equal to that of the ſtern-poſt.

The rudder is turned upon its hinges by means of a long bar of timber, called the *tiller*, which is fixed horizontally in its upper end within the veſſel. The movements of the tiller to the right and left, accordingly, direct the efforts of the rudder to the government of the ſhip's courſe as ſhe advances; which, in the ſea language, is called *ſteering*. The operations of the tiller are guided and aſſiſted by a fort of tackle, communicating with the ſhip's ſide, called the *tiller-rope*, which is uſually compoſed of untarred rope-yarns for the purpoſe of traverſing more readily through the blocks or pullies.

In order to facilitate the management of the helm, the tiller-rope, in all large veſſels, is wound about a wheel, which acts upon it with the powers of a crane or windlaſs. The rope employed in this ſervice being conveyed from the fore-end of the tiller *k*, to a ſingle block *i*, on each ſide of the ſhip †, is farther communicated to the wheel, by means of two blocks ſuſpended near the mizen-maſt, and two holes immediately above, leading up to the wheel, which is fixed upon an axis on the quarter-deck, almoſt perpendicularly over the fore-end of the tiller. Five turns of the tiller-rope are uſually wound about the barrel of the wheel; and, when the helm is amidſhip, the middle turn is nailed to the top of the barrel, with a mark by which the helmſman readily diſcovers the ſituation of the helm, as the wheel turns it from the ſtarboard to the larboard ſide. The ſpokes of the wheel generally reach about eight inches beyond the rim or circumference, ſerving as handles to the perſon who ſteers the veſſel. As the effect of a lever increaſes in proportion to the length of its arm, it is evident that the power of the helmſman to turn the wheel will be increaſed according to the length of the ſpokes beyond the circumference of the barrel.

† See Deck, Pl. lxxxviii

When the helm, inſtead of lying in a right line with the keel, is turned to one ſide or the other, as in BD, fig. 1. it receives an immediate ſhock from the water, which glides along the ſhip's bottom in running *aft* from A to B; and this fluid puſhes it towards the oppoſite ſide, whilſt it is retained in this poſition: ſo that the ſtern, to which the rudder is confined, receives the ſame impreſſion, and accordingly turns from B to *b* about ſome point *c*, whilſt the head of the ſhip paſſes from A to *a*. It muſt be obſerved, that the current of water falls upon the rudder obliquely, and only ſtrikes it with that part of its motion which acts according to the line of incidence, puſhing it in the direction NP, with a force which not only depends on the velocity of the ſhip's courſe, by which this current of water is produced, but alſo upon the extent of the line of incidence. This force is by conſequence compoſed of the ſquare of the velocity with which the ſhip advances, and the ſquare of the line of incidence, which will neceſſarily be greater or ſmaller according to circumſtances; ſo that if the veſſel runs three or four times more ſwiftly, the abſolute ſhock of the water upon the rudder will be nine or ſixteen times ſtronger under the ſame incidence: and, if the incidence is increaſed, it will yet be augmented in a greater proportion, becauſe the ſquare of the line of incidence is more enlarged. This impreſſion, or, what is the ſame thing, the power of the helm, is always very feeble, when compared with the weight of the veſſel; but as it operates with the force of a long lever, its efforts to turn the ſhip are extremely advantageous. For the helm being applied to a great diſtance from the centre of gravity G, or from the point about which the veſſel turns horizontally, if the direction PN of the impreſſion of the water upon the rudder be prolonged, it is evident that it will paſs perpendicularly to R, widely diſtant from the centre of gravity G: thus the abſolute effort of the water is very powerful. It is not therefore ſurpriſing, that this machine impreſſes the ſhip with a conſiderable circular movement, by puſhing the ſtern from B to *b*, and the head from A to *a*; and even much farther whilſt ſhe ſails with rapidity, becauſe the effect of the helm always keeps pace with the velocity with which the veſſel advances. Helm.

Amongſt the ſeveral angles that the rudder makes with the keel, there is always one poſition more favourable than any of the others, as it more readily produces the deſired effect of turning the ſhip, in order to change her courſe. To aſcertain this, it muſt be conſidered, that if the obliquity of the rudder with the keel is greater than the obtuſe angle ABD, ſo as to diminiſh that angle, the action of the water upon the rudder will increaſe, and at the ſame time oppoſe the courſe of the ſhip in a greater degree; becauſe the angle of incidence will be more open, ſo as to preſent a greater ſurface to the ſhock of the water, by oppoſing its paſſage more perpendicularly. But at that time the direction NP of the effort of the helm upon the ſhip will paſs, with a ſmaller diſtance from the centre of gravity G towards R, and leſs approach the perpendicular NL, according to which it is abſolutely neceſſary that the power applied ſhould act with a greater effect to turn the veſſel. Thus it is evident, that if the obtuſe angle ABD is too much incloſed, the greateſt impulſe of the water will not counterbalance the loſs ſuſtained by the diſtance of the direction NP from NL, or by the great obliquity which is given to the ſame direction NP of the abſolute effort of the helm with the keel AB. If, on the contrary, the angle ABD is too much opened, the direction NP of the force of the action of the helm will become more advantageous to turn the veſſel, becauſe it will approach nearer the perpendicular NL; ſo that the line prolonged from NP will increaſe the line GR, by removing R to a greater diſtance from the centre of gravity G: but then the helm will receive the impreſſion of the water too obliquely, for the angle of incidence will be more acute; ſo that it will only preſent a ſmall portion of its breadth to the ſhock of the water, and by conſequence will only receive a feeble effort. By this principle it is eaſy to conceive, that the greateſt diſtance GR from the centre of gravity G, is not ſufficient to repair the diminution of force occaſioned by the too great obliquity of the ſhock of the water. Hence we may conclude, that when the water either ſtrikes the helm too directly, or too obliquely, it loſes a great deal of the effect it ought to produce. Between the two extremes there is therefore a mean poſition, which is the moſt favourable to its operations.

Plate CXLVIII.

The diagonal NP of the rectangle IL repreſents the abſolute direction of the effort of the water upon the helm. NI expreſſes the portion of this effort which is

Helm. oppoſed to the ſhip's head-way, or which puſhes her aſtern, in a direction parallel to the keel. It is eaſily perceived, that this part NI of the whole power of the helm contributes but little to turn the veſſel; for, if IN is prolonged, it appears that its direction approaches to a very ſmall diſtance GV from the centre of gravity G; and that the arm of the lever BN=GV, to which the force is applied, is not in the whole more than equal to half the breadth of the rudder: but the relative force NL, which acts perpendicular to the keel, is extremely different. If the firſt NI is almoſt uſeleſs, and even pernicious, by retarding the velocity; the ſecond NL is capable of a very great effect, becauſe it operates at a conſiderable diſtance from the centre of gravity G of the ſhip, and acts upon the arm of a lever GE, which is very long. Thus it appears, that between the effects NL and NI, which refult from the abſolute effort NP, there is one which always oppoſes the ſhip's courſe, and contributes little to her motion of turning; whilſt the other produces only this movement of rotation, without operating to retard her velocity.

Geometricians have determined the moſt advantageous angle made by the helm with the line prolonged from the keel, and fixed it at 54° 44′, preſuming that the ſhip is as narrow at her floating-line, or at the line deſcribed by the ſurface of the water round her bottom, as at the keel. But as this ſuppoſition is abſolutely falſe, inaſmuch as all veſſels augment their breadth from the keel upward to the extreme breadth, where the floating-line or the higheſt water-line is terminated; it follows, that this angle is too large by a certain number of degrees. For the rudder is impreſſed by the water, at the height of the floating-line, more directly than at the keel, becauſe the fluid exactly follows the horizontal outlines of the bottom: ſo that a particular poſition of the helm might be ſuppoſed neceſſary for each different incidence which it encounters from the keel upwards. But as a middle poſition may be taken between all theſe points, it will be ſufficient to conſider the angle formed by the ſides of the ſhip, and her *axis*, or the middle-line of her length, at the ſurface of the water, in order to determine afterwards the mean point, and the mean angle of incidence.

It is evident that the angle 54° 44′ is too open, and very unfavourable to the ſhip's head-way, becauſe the water acts upon the rudder there with too great a fine of incidence, as being equal to that of the angle which it makes with the line prolonged from the keel below: but above, the ſhock of the water is almoſt perpendicular to the rudder, becauſe of the breadth of the bottom, as we have already remarked. If then the rudder is only oppoſed to the fluid, by making an angle of 45° with the line prolonged from the keel, the impreſſion, by becoming weaker, will be leſs oppoſed to the ſhip's head-way, and the direction NP of the abſolute effort of the water upon the helm drawing nearer to the lateral perpendicular, will be placed more advantageouſly, for the reaſons above-mentioned. On the other hand, experience daily teſtifies, that a ſhip ſteers well when the rudder makes the angle DBE equal to 35° only.

It has been already remarked, that the effect of moving the wheel to govern the helm increaſes in proportion to the length of the ſpokes; and ſo great is the power of the wheel, that if the helmſman employs a force upon its ſpokes equivalent to 30 pounds, it will produce an effect of 90 or 120 pounds upon the tiller. On the contrary, the action of the water is collected into the middle of the breadth of the rudder, which is very narrow in compariſon with the length of the tiller; ſo the effort of the water is very little removed from the fulcrum B upon which it turns; whereas the tiller forms the arm of a lever 10 or 15 times longer, which alſo increaſes the power of the helmſman in the ſame proportion that the tiller bears to the lever upon which the impulſe of the water is directed. This force then is by conſequence 10 or 15 times ſtronger; and the effort of 30 pounds, which at firſt gave the helmſman a power equal to 90 or 120 pounds, becomes accumulated to one of 900 or 1800 pounds upon the rudder. This advantage then ariſes from the ſhortneſs of the lever upon which the action of the water is impreſſed, and the great comparative length of the tiller, or lever, by which the rudder is governed; together with the additional power of the wheel that directs the movements of the tiller, and ſtill farther accumulates the power of the helmſman over it. Such a demonſtration ought to remove the ſurpriſe with which the prodigious effect of the helm is ſometimes conſidered, from an inattention to its mechaniſm: for we need only to obſerve the preſſure of the water, which acts at a great diſtance from the centre of gravity G, about which the ſhip is ſuppoſed to turn, and we ſhall eaſily perceive the difference there is between the effort of the water againſt the helmſman, and the effect of the ſame impulſe againſt the veſſel. With regard to the perſon who ſteers, the water acts only with the arm of a very ſhort lever NB, of which B is the fulcrum: on the contrary, with regard to the ſhip, the force of the water is impreſſed in the direction NP, which paſſes to a great diſtance from G, and acts upon a very long lever EG, which renders the action of the rudder extremely powerful in turning the veſſel; ſo that, in a large ſhip, the rudder receives a ſhock from the water of 2700 or 2800 pounds, which is frequently the caſe when ſhe ſails at the rate of three or four leagues by the hour; and this force being applied in E, perhaps 100 or 110 feet diſtant from the centre of gravity G, will operate upon the ſhip, to turn her about, with 270,000 or 308,000 pounds; whilſt, in the latter caſe, the helmſman acts with an effort which exceeds not 30 pounds upon the ſpokes of the wheel. Helm.

After what has been ſaid of the helm, it is eaſy to judge, that the more a ſhip increaſes her velocity with regard to the ſea, the more powerful will be the effect of the rudder; becauſe it acts againſt the water with a force, which increaſes as the ſquare of the ſwiftneſs of the fluid, whether the ſhip advances or retreats; or, in other words, whether ſhe has head-way or ſtern-way; with this diſtinction, that in theſe two circumſtances the effects will be contrary. For if the veſſel retreats, or moves aſtern, the helm will be impreſſed from I to N; and inſtead of being puſhed, according to NP, it will receive the effort of the water from N towards R; ſo that the ſtern will be tranſported to the ſame movement, and the head turned in a contrary direction.

When the helm operates by itſelf, the centre of rotation

Helmet ‖ Helos.

tation of the ſhip, and her movement, are determined by eſtimating the force of this machine; that is to ſay, by multiplying the ſurface of the rudder by the ſquare of the ſhip's velocity.

There are ſeveral terms in the ſea-language relating to the helm; as, *Bear up the helm*; that is, Let the ſhip go more large before the wind. *Helm a mid ſhip*, or *right the helm*: that is, Keep it even with the middle of the ſhip. *Port the helm*, Put it over the left ſide of the ſhip. *Starboard the helm*, Put it on the right ſide of the ſhip.

HELMET, an ancient defenſive armour worn by horſemen both in war and in tournaments. It covered both the head and face, only leaving an aperture in the front ſecured by bars, which was called the *viſor*.

In atchievements, it is placed above the eſcutcheon for the principal ornament, and is the true mark of chivalry and nobility. Helmets vary according to the different degrees of thoſe who bear them. They are alſo uſed as a bearing in coats of arms. See HERALDRY.

HELMINTHOLITHUS, in natural hiſtory, a name given by Linnæus to petrified bodies reſembling worms.

Of theſe he reckons four genera. 1. Petrified lithophyta, found in the mountains of Sweden. 2. Petrified ſhells. 3. Petrified zoophytes. 4. Petrified reptiles.

HELMONT (John Baptiſt Van), a celebrated Flemiſh gentleman, was born at Bruſſels in 1577. He acquired ſuch ſkill in natural philoſophy, phyſic, and chemiſtry, that he was accounted a magician, and thrown into the inquiſition: but having with difficulty juſtified himſelf, as ſoon as he was releaſed he retired to Holland; where he died in 1644. He publiſhed, 1. *De magnetica corporum curatione*. 2. *Febrium doctrina inaudita*. 3. *Ortus medicinæ*. 4. *Paradoxa de aquis ſpadanis*; and other works, printed together in one volume folio.

HELMONT, a ſmall town in the Netherlands, in Dutch Brabant, and capital of the diſtrict of Peelland, with a good caſtle. It is ſeated on the river Aa, in E. Long. 5. 37. N. Lat. 51. 31.

HELMSTADT, a town of Germany, in the duchy of Brunſwick, built by Charlemagne, in E. Long. 11. 10. N. Lat. 52. 20.

HELMSTADT, a ſtrong maritime town of Sweden, and capital of the province of Holland, ſeated near the Baltic ſea; in E. Long. 21. 5. N. Lat. 56. 44.

HELOISE, famous for her unfortunate affection for her tutor Abelard, and for her Latin letters to him after they had retired from the world. She died abbeſs of Paraclet in 1163. See ABELARD.

HELOS, (anc. geog.), a maritime town of Laconia, ſituated between Trinaſus and Acriæ, in Pauſanias's time in ruins. The diſtrict was called *Helotea*, and the people *Helotes*, *Helotæ*, *Helei*, and *Heleatæ*, by Stephanus; and *Ilotæ*, by Livy. Being ſubdued by the Lacedæmonians, they were all reduced to a ſtate of public ſlavery, or made the ſlaves of the public, on theſe conditions, viz. that they could neither recover their liberty nor be ſold out of the territory of Sparta. Hence the term ειλωτευειν, in Harpocration, for being in a ſtate of ſlavery; and hence alſo the Lacedæmonians called the ſlaves of all nations whatever *helotes*. *Heloticus* is the epithet.

Helots ‖ Helvoet-Sluys.

HELOTS, in Grecian antiquity, the ſlaves of the Spartans. See HELOS.—The freemen of Sparta were forbidden the exerciſe of any mean or mechanical employment, and therefore the whole care of ſupplying the city with neceſſaries devolved upon the Helots.

HELSINBURG. See ELSIMBURG.

HELSINGIA, a province of Sweden, bounded on the north by Jempterland and Medelpadia; on the eaſt by the Bothnic gulf, and on the ſouth and weſt by Dalecarlia and Geſtricia. It is full of mountains and foreſts, and the inhabitants are almoſt conſtantly employed in hunting and fiſhing. It has no cities: the principal towns are Hudwickvald, Alta, and Dilſbo.

HELSINGIC CHARACTER, a peculiar kind of character found inſcribed on ſtones in the province of Helſingia. The Runic and Helſingic characters may be eaſily transformed into each other.

HELSTON, a town of Cornwall in England, ſeated on the river Lowed, in W. Long. 5. 45. N. Lat. 50. 8. It contains about 400 houſes, is well inhabited, and ſends two members to parliament. The ſteeple with its ſpire, which is about 90 feet high, is a notable ſea-mark. A little below the town is a harbour where ſeveral tin-ſhips take in their lading, and here is the largeſt market-houſe in the county. The inhabitants neither pay to the church nor poor, theſe being ſupported by the revenues of the town.

HELVETIUS (Adrian), an eminent phyſician, born in Holland. After having ſtudied phyſic at Leyden, he went to Paris, where he acquired great reputation in his profeſſion. He introduced in France the uſe of ipecacuanha in the cure of dyſenteries, a remedy which he at firſt kept ſecret; but was ordered to make it public, and on that account received a gratification from the king of 1000 louis d'ors. He was made inſpector-general of the hoſpitals in Flanders, phyſician to the duke of Orleans, regent of France, &c.; and died at Paris, in 1727, aged 65. He wrote a treatiſe on the moſt common diſeaſes, and the remedies proper for their cure, (the beſt edition of which is that of 1724, in two volumes octavo); and other works.

HELVETIUS (John), ſon of the former, was born in 1685. He was bred to phyſic; in which line he became eminent both as a practitioner and a writer, but is beſt known by his famous philoſophical work entitled *L'Eſprit*. He died in 1755.

HELVICUS (Chriſtopher), profeſſor of divinity, Greek, and the Oriental tongues, in the univerſity of Giſſen, died in the flower of his age in 1617; after having publiſhed ſeveral books, and projected more. The Hebrew language was ſo familiar to him, that he ſpoke it as fluently as his mother tongue. He was not only a good grammarian, but alſo an able chronologer. His chronological tables have been greatly eſteemed, though they are not free from errors.

HELVOET-SLUYS, a ſea-port town of the United Netherlands, ſeated on the iſland of Voorn, in the province of Holland, and where the Engliſh packet-boat always goes. It is but a ſmall place, conſiſting only of a handſome quay, and two or three little ſtreets. But it is very well fortified, and eſteemed the ſafeſt harbour in the country. The largeſt men of war may come up to the middle of the town; and yet

Hemelar || Hemina.

it has but very little trade, becauſe the merchants chooſe to live higher up the country. E. Long. 4. 0. N. Lat. 51. 44.

HEMELAR (John), an eminent antiquary, and canon of Antwerp, in the 17th century, was born at the Hague; and wrote a work, entitled, *Expoſitio Numiſmatum imperatorum Romanorum à Julio Cæſare ad Heraclium*; which is very ſcarce, though it has had ſeveral editions.

HEMATH, or HAMATH, (anc. geog.), the name of a city (whoſe king was David's friend, 2 Sam. ix.) to the ſouth of Lebanon; from which a territory was called *Nemath*, on the north of Canaan and ſouth of Syria, as appears by the ſpies, Numb. xiii. 1 Kings viii. Ezek. xlvii. Whether one or more cities and diſtricts of this name lay in this tract, neither interpreters nor geographers are agreed. The eaſtern part was called *Hemath-zoba*, 2 Chron. viii. unleſs we ſuppoſe that there was a city in *Zoba* of this name fortified by Solomon. In defining the boundary of Paleſtine, it is often ſaid, *from the entering of Hamath*; as a province to be entered into through a ſtrait or defile. And if there was ſuch, the next queſtion is, From what metropolis it was called *Hemath*. Antioch, capital of Syria, is ſuppoſed to be called *Hemath* or *Amatha*, (Jonathan, Targum, &c.); and again, *Epiphania*, (Joſephus.) Both were to the north of Lebanon; conſequently not the *Hemath* of Scripture, the immediate boundary of Paleſtine to the north, and lying to the ſouth of Lebanon.

HEMATITES. See HÆMATITES.

HEMEROBIUS, in zoology, a genus of inſects of the neuroptera order, the characters of which are theſe. The mouth is furniſhed with two teeth; the palpi are four; the wings are deflected, but not plaited; and the antennæ are briſtly, and longer than the breaſt. There are 15 ſpecies, principally diſtinguiſhed by their colours.

HEMEROCALLIS, DAY-LILY, or *lily-aſphodel*; a genus of the monogynia order, belonging to the hexandria claſs of plants.

Species. 1. The flava, or yellow day-lily, hath ſtrong fibrous roots, ſending up large hollow keel-ſhaped leaves, two feet long, upright, leafleſs, firm ſtalks, two feet high; dividing at top into ſeveral foot-ſtalks, each terminated by one large lilaceous yellow flower of an agreeable odour. Of this there is a variety called the *hemerocallis minor*, or ſmall yellow day-lily. 2. The fulva, reddiſh, or copper-coloured day-lily, hath roots compoſed of ſtrong fleſhy fibres and large oblong tubes; radical, keel-ſhaped, hollow, pointed leaves, a yard long, reflexed at top; with leafleſs ſtalks three or four feet high, and large copper-coloured liliaceous flowers. Theſe have large ſtamina, charged with a kind of brown-coloured farina; which, on being touched or ſmelled to, is diſcharged in great plenty all over the hands or face.

Culture. Both theſe ſpecies are hardy, and will thrive any where. They may be eaſily propagated by parting their roots in autumn, or almoſt any time after flowering or before they begin to flower.

HEMI, a word uſed in the compoſition of divers terms, ſignifying the ſame with *ſemi*, or *demi*, viz. "one half."

HEMINA, in Roman antiquity, a liquid meaſure, which, according to Arbuthnot, was equal to half a wine-pint Engliſh meaſure; its contents being 2.818 ſolid inches. Hemiplegia || Hemp.

HEMIPLEGIA, or HEMIPLEXIA, among phyſicians, a palſy of one half of the body. See (the *Index* ſubjoined to) MEDICINE.

HEMISPHERE, in geometry, the half of a globe or ſphere, when it is ſuppoſed to be cut thro' its centre in the plane of one of its great circles.

HEMISPHERE, is alſo uſed to denote a projection of half the terreſtrial globe, or half the celeſtial ſphere, on a plane, and frequently called *planiſphere*.

HEMISTICH, in poetry, denotes half a verſe, or a verſe not completed.

Of this there are frequent examples in Virgil's Æneid; but whether they were left unfiniſhed by deſign or not, is diſputed among the learned: ſuch are, *Ferro accincta vocat*, Æn. II. v. 614. And, *Italiam non ſponte ſequor*, Æn. IV. v. 361.

In reading common Engliſh verſes, a ſhort pauſe is required at the end of each hemiſtich or half-verſe.

HEMITRITÆUS, in medicine, a kind of fever, denoting the ſame as ſemi-tertian, returning twice every day. The word is Greek, and compounded of ἡμισυς, "half," and τριταιος, "third, or tertian."

HEMLOCK, in botany. See CICUTA and CONIUM.

HEMOIPTOTON. See ORATORY, n° 77.

HEMP, in botany. See CANNABIS.

The raiſing and dreſſing of hemp ſcarcely differs from the raiſing and dreſſing of flax, but in the following particulars.

Hemp requires a light, free, duſty, and even a ſandy warm ſoil; which if not naturally rich, muſt be made ſo by manure. New broke-up ground does not anſwer for hemp, producing it thin and poor upon the ſtalk. Hemp does well to follow beans. The ground ſhould be ploughed and harrowed three or four times, a fortnight or three weeks intervening between each time. In ſome parts of Lincoln and Holland, the ſoil is naturally ſo free and rich, that it will produce hemp conſtantly year after year without manure. The leaves which fall off the ſtalk help to manure the ground. It is frequently ſown with a view to clear the ground of weeds; which it does moſt effectually, growing faſt, and ſoon checking every weed but mugwort, which is picked out with a fork.

It is ſown about the firſt of May; ſo thin, that about four pecks are ſufficient for an Engliſh acre; and the ground muſt then be covered as much as poſſible to preſerve the ſeed from the birds, who are very fond of it.

The *taper-topped* ſtalk which does not bear the pods, is called the *female*; though in fact it is the *male*, ſcattering from its bloom a ſmall duſt, which impregnates the pods of the *buſhy-topped*; which laſt is commonly, tho' improperly, called the *male* or *carle hemp*.

When hemp is the object of the farmer more than a crop of ſeed, the whole ſhould be pulled when the ſtalk begins to grow yellow, and the earth remaining about the roots ſhould be beat off to prevent more growth: but if the ſeed is wanted in its greateſt perfection, the ſtalks bearing the pods muſt be pulled before the uppermoſt pod begins to open; the earth ſhould

Hemp || Henoticon.

should not be beat off from the roots; it should be stooked in sheaves upon the field, to dry and win as corn; and the top of these stooks should be covered with undergrowth or the like, to preserve the seed from the birds.

Hemp is sooner watered than flax, and the canals must be deeper.

In keeping the seed, care must be taken to preserve it from rats, mice, and such like vermin, who are all fond of it.

It is dressed as coarse flax, but is sooner dressed; and its greater length requires more care, and renders it more troublesome in the handling, especially in the stutching of it by the water lint-mills with horizontal stutchers, when it must be folded double. What is too coarse and strong in the stalk for the hand or foot machines, may be broke and peeled by the hand. See FLAX.

HEMP-*Agrimony*, a species of EUPATORIUM.—It has a very bitter taste. A decoction of the roots operates as a violent emetic and cathartic, and is sometimes taken by the lower class of people to cure the jaundice, dropsy, and cachexy; but is a rough medicine, and ought to be used with caution. Boerhaave made use of an infusion of this plant to foment ulcers and putrid sores. Tournefort informs us, that the Turks cure the scurvy with it. An ounce of the juice, or a dram of the extract, is a dose.

HEMPSTEAD, a town of Hartfordshire in England, seated among the hills on a branch of the river Coln. W. Long. 0. 40. N. Lat. 51. 44.

HEN, in ornithology. See PHASIANUS.

Guinea-HEN. See NUMIDA.

HEN-*Bane*. See HYOSCIAMUS.

HENDECAGON, in geometry, a figure that hath 11 sides and as many angles.

HENLEY, a town of Oxfordshire in England, seated on the river Thames, over which there is a handsome bridge. It sends malt, corn, and other things, to London in barges. W. Long. 0. 40. N. Lat. 51. 34.

HENLEY, a town of Warwickshire in England, seated on the river Alne, in W. Long. 1. 45. N. Lat. 52. 18.

HENNA, or ALHENNA. See LAWSONIA.

HENNEBERG, a county of Germany, in the circle of Franconia. It is bounded on the north by Thuringia, on the west by Hesse, on the south by the bishopric of Wertzburg, and on the east by that of Bamberg. It abounds in mountains and woods; and it is populous, and pretty fertile. Maininger is the capital town.

HENNEBERG, a town of Germany, in the circle of Franconia, which gives title to a county of the same name, with a castle. E. Long. 9. 17. N. Lat. 50. 40.

HENNEBON, a town of France in Bretagne, in the diocese of Vannes. It is inhabited by rich merchants, and is seated on the river Blavet, in W. Long. 2. 13. N. Lat. 47. 48.

HENOTICON, in church-history, a decree or edict of the emperor Zeno, made at Constantinople in the year 482, by which he pretended to reconcile all parties under one faith. It is generally agreed, that Peter, patriarch of Alexandria, and Acacius, patriarch of Constantinople, were the authors of this decree; and that their design was to compliment the emperor with a right of prescribing regulations in matters of faith. The emperor, by this decree, arrogated to himself the right of being head of the church. Pope Simplicius, however, in the year 483, condemned the henoticon, and cited Acacius to appear before him at Rome; but it was not entirely suppressed till the year 518. Henry.

HENRY, or CAPE-HENRY, the south cape of Virginia, at the entrance of Chesapeak-bay. W. Long. 74. 50. N. Lat. 37. 0.

HENRY, the name of several emperors of Germany, and kings of England and France. See ENGLAND, FRANCE, and GERMANY.

HENRY IV. emperor of Germany in 1056, styled *the Great*, was memorable for his quarrels with pope Gregory II. whom at one time he deposed, for having presumed to judge his sovereign; but at another, dreading the effects of the papal anathemas, he had the weakness to submit to the most humiliating personal solicitations and penances to obtain absolution, which impolitic measure increased the power of the Pope, and alienated the affections of his subjects: thus circumstanced, he reassumed the hero, but too late; marched with an army to Rome, expelled Gregory, deposed him, and set up another Pope. Gregory died soon after: but Urban II. and Pascal II. successively, excited his ambitious sons, Conrad and Henry, to rebel against him, and the latter was crowned emperor by the title of Henry V. in 1106; and he had the inhumanity to arrest his father, and to deprive him, not only of all his dignities, but even of the necessaries of life. The unfortunate Henry IV. was reduced to such extremities, (after having fought 62 battles in defence of the German empire), that he solicited the bishop of Spire to grant him an underchaunter's place in his cathedral, but was refused. He died the same year, at Liege, aged 55, a martyr to the ignorance and superstition of the age, and to his own blind confidence in favourites and mistresses.

HENRY IV. king of France (in 1589) and Navarre, justly styled *the Great*, was the son of Anthony de Bourbon, chief of the branch of Bourbon, (so called from a fief of that name which fell to them by marriage with the heiress of the estate). His mother was the daughter of Henry de Albert, king of Navarre; a woman of a masculine genius; intrepid, simple and rustic in her manners, but deeply versed in politics, and a zealous protestant. Foreseeing that her party would want such a protector (for her husband was a weak indolent prince), she undertook the care of the education of the young hero: his diet was coarse; his clothes neat, but plain; he always went bare-headed; she sent him to school with the other children of the same age, and accustomed him to climb the rocks and neighbouring mountains, according to the custom of the country. He was born in 1553; and in 1569, the 16th year of his age, he was declared the Defender and Chief of the Protestants at Rochelle. The peace of St Germain, concluded in 1570, recalled the lords in the Protestant interest to court; and in 1572 Henry was married to Margaret de Valois, sister to Charles IX. king of France. It was in the midst of the rejoicings for these nuptials, that the horrid massacre of Paris took

Henry. took place. Henry was reduced, by this infernal ſtroke of falſe policy, to the alternative of changing his religion or being put to death: he choſe the former, and was detained priſoner of ſtate three years. In 1587, he made his eſcape; put himſelf at the head of the Huguenot party, expoſing himſelf to all the riſks and fatigues of a religious war, often in want of the neceſſaries of life, and induring all the hardſhips of the common ſoldier: but he gained a victory this year at Courtras, which eſtabliſhed his reputation in arms, and endeared him to the Proteſtants. On the death of Henry III. religion was urged as a pretext for one half of the officers of the French army to reject him, and for the leaguers not to acknowledge him. A phantom, the cardinal de Bourbon, was ſet up againſt him; but his moſt formidable rival was the duke de Mayenne: however, Henry, with few friends, fewer important places, no money, and a very ſmall army, ſupplied every want by his activity and valour. He gained ſeveral victories over the duke; particularly that of Ivri in 1590, memorable for his heroic admonition to his ſoldiers: "If you love your enſigns, rally by my white plume, you will always find it in the road to honour and glory." Paris held out againſt him, notwithſtanding his ſucceſſes: he took all the ſuburbs in one day; and might have reduced the city by famine, if he had not humanely ſuffered his own army to relieve the beſieged; yet the bigotted friars and prieſts in Paris all turned ſoldiers, except four of the Mendicant order; and made daily military reviews and proceſſions, the ſword in one hand and the cruciſix in the other, on which they made the citizens ſwear rather to die with famine than to admit Henry. The ſcarcity of proviſions in Paris at laſt degenerated to an univerſal famine; bread had been ſold, whilſt any remained, for a crown the pound, and at laſt it was made from the bones of the charnel-houſe of St Innocents; human fleſh became the food of the obſtinate Pariſians, and mothers eat the dead bodies of their children. In fine, the duke of Mayenne, ſeeing that neither Spain nor the league would ever grant him the crown, determined to aſſiſt in giving it to the lawful heir. He engaged the ſtates to hold a conference with the chiefs of both parties; which ended in Henry's abjuration of the Proteſtant religion at St Dennis, and his conſecration at Chartres in 1593. The following year Paris opened its gates to him; in 1596, the duke of Mayenne was pardoned; and in 1598, peace was concluded with Spain. Henry now ſhewed himſelf doubly worthy of the throne, by his encouragement of commerce, the fine arts, and manufactures, and by his patronage of men of ingenuity and ſound learning of every country: but though the fermentations of Romiſh bigotry were calmed, the leaven was not deſtroyed; ſcarce a year paſſed without ſome attempt being made on this real father of his people; and at laſt the monſter Ravaillac ſtabbed him to the heart in his coach, in the ſtreets of Paris, on the 14th of May 1610, in the 57th year of his age and 22d of his reign.

Henry VIII. king of England, was the ſecond ſon of Henry VII. by Elizabeth the eldeſt daughter of Edward IV. He was born at Greenwich, on the 28th of June 1491. On the death of his brother Arthur, in 1502, he was created prince of Wales; and the following year betrothed to Catharine of Arragon, prince Arthur's widow, the Pope having granted a diſpenſation for that purpoſe. Henry VIII. acceded to the throne, on the death of his father, the 22d of April 1509, and his marriage with Catharine was ſolemnized about two months after. In the beginning of his reign he left the government of his kingdom entirely to his miniſters; and ſpent his time chiefly in tournaments, balls, concerts, and other expenſive amuſements. We are told that he was ſo extravagant in his pleaſures, that, in a very ſhort time, he entirely diſſipated 1,800,000 l. which his father had hoarded. This will ſeem leſs wonderful, when the reader is informed, that gaming was one of his favourite diverſions. Nevertheleſs he was not ſo totally abſorbed in pleaſure, but he found leiſure to ſacrifice, to the reſentment of the people, two of his father's miniſters, Empſon and Dudley. A houſe in London, which had belonged to the former of theſe, was in 1510 given to Thomas Wolſey, who was now the king's almoner, and who from this period began to inſinuate himſelf into Henry's favour. In 1513, he became prime miniſter, and from that moment governed the king and kingdom with abſolute power. In this year Henry declared war againſt France, gained the battle of Spurs, and took the towns of Terouenne and Tournay; but before he embarked his troops, he beheaded the earl of Suffolk, who had been long confined in the tower. In 1521, he ſacrificed the duke of Buckingham to the reſentment of his prime miniſter Wolſey, and the ſame year obtained from the Pope the title of *Defender of the Faith*. Henry.

Henry, having been 18 years married, grew tired of his wife, and in the year 1527 reſolved to obtain a divorce; but after many fruitleſs ſolicitations, finding it impoſſible to perſuade the Pope to annul his marriage with Catharine, he eſpouſed Ann Bullen in the year 1531. During this interval his favourite Wolſey was diſgraced, and died; Henry threw off the Papal yoke, and burnt three Proteſtants for hereſy. In 1535, he put to death Sir Thomas More, Fiſher, and others, for denying his ſupremacy, and ſuppreſſed all the leſſer monaſteries.

His moſt ſacred majeſty, having now poſſeſſed his ſecond queen about five years, fell violently in love with lady Jane Seymour. Ann Bullen was accuſed of adultery with her own brother, and with three other perſons: ſhe was beheaded the 19th of May, 1536. He married Jane Seymour the day following. In 1537, he put to death five of the noble family of Kildare, as a terror to the Iriſh, of whoſe diſloyalty he had ſome apprehenſions; and in the year following he executed the marquis of Exeter, with four other perſons of diſtinction, for the ſole crime of correſponding with cardinal Pole. In 1538 and 1539, he ſuppreſſed all the monaſteries in England, and ſeized their revenues for his own uſe. The queen having died in childbed, he this year married the princeſs Ann of Cleves: but diſliking her perſon, immediately determined to be divorced; and his obſequious parliament and convocation unanimouſly pronounced the marriage void, for reaſons too ridiculous to be recited: but this was not all; Henry was ſo incenſed with his miniſter and quondam favourite, Cromwell, for negociating this match, that he revenged himſelf by

Henry. by the hand of the executioner. Yet this was not the only public murder of the year 1540. A few days after Cromwell's death, feveral perfons were burnt for denying the king's fupremacy, and other articles of herefy.

His majefty being once more at liberty to indulge himfelf with another wife, fixed upon Catharine Howard, niece to the duke of Norfolk. She was declared queen in Auguft 1540; but they had been privately married fome time before. Henry, it feems, was fo entirely fatisfied with this lady, that he daily bleffed God for his prefent felicity; but that felicity was of fhort duration: he had not been married above a year, before the queen was accufed of frequent proftitution, both before and fince her marriage: fhe confeffed her guilt, and was beheaded in February 1542. In July 1543, he married his fixth wife, the Lady Catharine Parr, the widow of John Nevil lord Latimer, and lived to the year 1547, without committing any more flagrant enormities: but finding himfelf now approach towards diffolution, he made his will; and, that the laft fcene of his life might refemble the reft, he determined to end the tragedy with the murder of two of his beft friends and moft faithful fubjects, the duke of Norfolk, and his fon the earl of Surrey. The earl was beheaded on the 19th of January; and the duke was ordered for execution on the 29th, but fortunately efcaped by the king's death on the 28th. They were condemned without the fhadow of a crime; but Henry's political reafon for putting them to death, was his apprehenfion, that, if they were fuffered to furvive him, they would counteract fome of his regulations in religion, and might be troublefome to his fon. Henry died on the 28th of January 1547, in the 56th year of his age, and was buried at Windfor.

As to his character, it is pretty obvious from the facts above related. Lord Herbert palliates his crimes, and exaggerates what he calls his *virtues*. Bifhop Burnet fays, "he was rather to be reckoned among the *great* than the *good* princes." He afterwards acknowledges, that "he is to be numbered among the ill princes;" but adds, "I cannot rank him with the worft." Sir Walter Raleigh, with infinitely more juftice, fays, "If all the pictures and patterns of a mercilefs prince were loft to the world, they might again be painted to the life out of the hiftory of this king." He was indeed a mercilefs tyrant, a fcurvy politician, a foolifh bigot, a horrible affaffin. See ENGLAND, n° 212—230.

HENRY *of Huntingdon*, an Engliſh hiſtorian, of the 12th century, was canon of Lincoln, and afterwards archdeacon of Huntingdon. He wrote, 1. A hiſtory of England, which ends with the year 1154. 2. A continuation of that of Bede. 3. Chronological tables of the kings of England. 4. A ſmall treatiſe on the contempt of the world. 5. Several books of epigrams and love-verſes. 6. A poem on herbs; all which are written in Latin.——His invocation of Apollo and the goddeſſes of Tempe, in the exordium of his poem on herbs, may not be unacceptable as a ſpecimen of his poetry.

Vatum magne parens, herbarum Phœbe repertor.
Voſque, quibus reſonant Tempe jucoſa Deæ!
Si mihi ſerta prius hedera florente paraſtis,
Ecce meos flores, ſerta parate fero.

HENRY *of Suſa*, in Latin, *de Segufio*, a famous civilian and canoniſt of the 13th century, acquired ſuch reputation by his learning, that he was called *the ſource and ſplendor of the law*. He was archbiſhop of Embrun about the year 1258, and cardinal biſhop of Oſtia in 1262. He wrote *A ſummary of the canon and civil law*; and *A commentary on the book of the decretals*, compoſed by order of Alexander IV. Henry.

HENRY (Philip), a pious and learned nonconformiſt miniſter, was the ſon of Mr John Henry, page of the back-ſtairs to James duke of York, and was born at Whitehall in 1631. He was admitted into Weſtminſter ſchool at about 12 years of age; became the favourite of Dr Buſby, and was employed by him, with ſome others, in collecting materials for the Greek grammar he afterwards publiſhed. From thence he removed to Chriſt-church, Oxford; where, having obtained the degree of maſter of arts, he was taken into the family of judge Puleſton, at Emeral in Flintſhire, as tutor to his ſons, and to preach at Worthenbury. He ſoon after married the only daughter and heireſs of Mr Daniel Matthews of Broad-oak near Whitchurch, by whom he became poſſeſſed of a competent eſtate. When the king and epiſcopacy were reſtored, he refuſed to conform, was ejected, and retired with his family to Broad-oak; here, and in the neighbourhood, he ſpent the remainder of his life, about 28 years, relieving the poor, employing the induſtrious, inſtructing the ignorant, and exerciſing every opportunity of doing good. His moderation in his nonconformity was eminent and exemplary; and upon all occaſions he bore teſtimony againſt uncharitable and ſchiſmatical ſeparation. In church-government he wiſhed for archbiſhop Uſher's reduction of epiſcopacy. He thought it lawful to join in the common-prayer in public aſſemblies; which, during the time of his ſilence and reſtraint, he commonly attended with his family, with reverence and devotion.

HENRY (Matthew), an eminent diſſenting miniſter and author, was the ſon of the former, and was born in the year 1662. He continued under his father's care till he was 18 years of age; in which time he became well ſkilled in the learned languages, eſpecially in the Hebrew, which his father had rendered familiar to him from his childhood; and from firſt to laſt the ſtudy of the ſcriptures was his moſt delightful employment. He completed his education in an academy kept at Iſlington by Mr Doolittle, and was afterwards entered in Gray's-Inn for the ſtudy of the law; where he became well acquainted with the civil and municipal law of his own country, and from his application and great abilities it was thought he would have become very eminent in that profeſſion. But at length, reſolving to devote his life to the ſtudy of divinity, in 1686 he retired into the country, and was choſen paſtor of a congregation at Cheſter, where he lived about 25 years, greatly eſteemed and beloved by his people. He had ſeveral calls from London, which he conſtantly declined; but was at laſt prevailed upon to accept an unanimous invitation from a congregation at Hackney. He wrote, 1. Expoſitions of the Bible, in 5 vols. folio. 2. The life of Mr Philip Henry. 3. Directions for daily communion with God. 4. A method for prayer. 5. Four diſcourſes againſt vice and immorality. 6. The communicant's companion. 7. Family hymns. 8. A ſcrip-

Hepar ‖ Hepatica.

scriptural catechism; and, 9. A discourse concerning the nature of schism. He died of an apoplexy at Nantwich, when upon a journey, in 1714; and was interred at Trinity-church, in Chester.

HEPAR SULPHURIS, or LIVER *of* SULPHUR, a combination of alkaline salt and sulphur. See CHEMISTRY, n° 321—325.

By means of the fume arising on the decomposition of *hepar sulphuris* by an acid, Mr Bergman hath found a method of imitating the hot or sulphureous mineral waters, to as great perfection as the cold ones are now imitated by fixed air. The process consists simply in adding the vitriolic acid to *hepar sulphuris*, and impregnating water with the peculiar species of *air* that arises from this mixture; in the same manner as when water is impregnated with the fixed air arising from the mixture of that or any other acid with chalk. This *hepatic air*, as the author calls it, is very readily absorbed by water; to which it gives the smell, taste, and all the other sensible qualities of the sulphureous waters. A Swedish *cantharus* of distilled water, containing 12¼ Swedish cubic inches, will absorb about 60 cubic inches of this hepatic air; and on dropping into it the *nitrous acid*, it will appear, that a real sulphur is contained, in a state of perfect solution, in this water, to the quantity of eight grains. It does not appear that any other acid, except what the author calls the *dephlogisticated marine acid*, will produce this effect.—When any particular sulphureous water is to be imitated, we scarce need to observe, that the saline, or other contents peculiar to it, are to be added to the artificial *hepatic water*. Instead of the liver of sulphur, the operator may use a mixture of three parts of filings of iron and two parts of sulphur melted together.

It may, perhaps, be thought, that water thus prepared, does not differ from that in which a portion of the *hepar sulphuris* has been dissolved: but it appears evidently to differ from it in this material circumstance;—that in the solution of *hepar sulphuris*, the sulphur is held in solution by the water, through the means of the *alkali* combined with it: whereas, in M. Bergman's process, it does not appear probable that the *hepar sulphuris* rises substantially in the form of air; for, in that case, its presence in the hepatic water might be detected by means of the weakest of the acids (even the mephitic), which would precipitate the sulphur from it. Nor can it be supposed that any portion or constituent part of the *alkali* itself (except a part of its remaining fixed air) can come over. The water, therefore, must owe its impregnation to the sulphur, raised, in some peculiar manner, into the state of an elastic vapour; permanent, when the experiment is made in quicksilver; but condensible in water, and rendered soluble in that fluid through the means of some unknown principle combined with it, and which the author supposes to be the matter of heat, combined with it through the medium of *phlogiston*.

HEPATIC, in medicine and anatomy, any thing belonging to the liver.

HEPATIC *Air*. See HEPAR *Sulphuris*.

HEPATIC *Aloes*, the inspissated juice of a species of ALOES.

HEPATIC *Water*. See HEPAR *Sulphuris*.

HEPATICA, in botany, a species of ANEMONE.

HEPATITIS, in medicine, an inflammation of the liver. See (the *Index* subjoined to) MEDICINE. Hepatitis ‖ Heracleum

HEPHÆSTIA, in Grecian antiquity, an Athenian festival in honour of Vulcan, the chief ceremony of which was a race with torches. It was performed in this manner: The antagonists were three young men, one of whom, by lot, took a lighted torch in his hand, and began his course; if the torch was extinguished before he finished the race, he delivered it to the second: and he in like manner to the third: the victory was his who first carried the torch lighted to the end of the race; and to this successive delivering of the torch, we find many allusions in ancient writers.

HEPTACHORD, in the ancient poetry, signified verses that were sung or played on seven chords, that is, on seven different notes. In this sense it was applied to the lyre when it had but seven strings. One of the intervals is also called an *heptachord*, as containing the same number of degrees between the extremes.

HEPTAGON, in geometry, a figure consisting of seven sides, and as many angles. In fortification, a place is termed an *heptagon*, that has seven bastions for its defence.

HEPTAGONAL NUMBERS, in arithmetic, a sort of polygonal numbers, wherein the difference of the terms of the corresponding arithmetical progression is 5. One of the properties of these numbers is, that if they be multiplied by 40, and 9 be added to the product, the sum will be a square number.

HEPTANDRIA, in botany, (from ἑπτα, *septem*, and ανηρ, *a man;)* the seventh class in Linnæus's sexual method, consisting of plants with hermaphrodite flowers, which have seven stamina, or male-organs. The orders are four, derived from the number of styles or female-organs.

HEPTANGULAR, in geometry, an appellation given to figures which have seven angles.

HEPTARCHY, a government of seven persons; also a state or country divided into seven kingdoms, and governed by seven independent princes; in which sense it is particularly applied to the government of South-Britain, when divided among the Saxons. See ENGLAND, n° 43.

HERACLEA, an ancient city of Turky in Europe, and in Romania, with the see of an archbishop of the Grecian church, and a sea-port. It was a very famous place in former times, and there are still some remains of its ancient splendor. Theodore Lascaris took it from David Comnenus, emperor of Trebisond; when it fell into the hands of the Genoese, but Mahomet II. took it from them; since which time it has been in the possession of the Turks. It is near the sea. E. Lon. 27. 48. N. Lat. 40. 27.

HERACLEONITES, a sect of Christians, the followers of Heracleon, who refined upon the Gnostic divinity, and maintained that the world was not the immediate production of the Son of God, but that he was only the occasional cause of its being created by the demiurgus. The Heracleonites denied the authority of the prophecies of the Old Testament, maintaining that they were mere random sounds in the air; and that St John the Baptist was the only true voice that directed to the Messiah.

HERACLEUM, MADNESS; a genus of the digynia order,

Heraclidæ ‖ Heraclitus.

order, belonging to the pentandria clafs of plants.—There are five fpecies, of which the moft remarkable is the fpondylium, or cow-parfnip. This is common in many parts of Britain, and other northern parts of Europe and Afia.—Gmelin, in his *Flora Siberica*, p. 214, tells us, that the inhabitants of Kamtfchatka, about the beginning of July, collect the foot-ftalks of the radical leaves of this plant, and, after peeling off the rhind, dry them feparately in the fun, and then, tying them in bundles, dry them carefully in the fhade: in a fhort time afterwards, thefe dried ftalks are covered over with a yellow faccharine efflorefcence, tafting like liquorice; and in this ftate they are eaten as a great delicacy.—The Ruffians not only eat the ftalks thus prepared, but procure from them a very intoxicating fpirit. They firft ferment them in water with the greater bilberries, *(vaccinium uliginofum)*, and then diftil the liquor to what degree of ftrength they pleafe; which Gmelin fays is more agreeable to the tafte than fpirits made from corn. This may therefore prove good fuccedaneum for whifky; and prevent the confumption of much barley, which ought to be applied to better purpofes.—Swine and rabbits are very fond of this plant. In the county of Norfolk it is called *hogweed*.

HERACLIDÆ, in antiquity, the defcendants of Hercules. The Heraclidæ were expelled from Peloponnefus, by Euriftheus king of Mycenæ, after the death of Hercules.

Return of the HERACLIDÆ into Peloponnefus, is a celebrated epocha in the ancient chronology.—The time of this return is differently affigned; by reafon authors miftake the divers attempts they made to return, for the return itfelf. The firft attempt was 20 years before the taking of Troy: the fecond was 100 years later, or 80 years after the taking of Troy. This laft is fuppofed to have fucceeded; at leaft, according to Petavius, who mentions only thefe two. Scaliger diftinguifhes three attempts; and fixes the firft 50 years later than Petavius, viz. 30 years after the taking of Troy. He fays nothing of the fecond, which was unfortunate like the firft; but places the third in the fame year with Petavius. As it occafioned a world of changes and revolutions in the affairs of Greece, infomuch that fcarce a ftate or people but were turned upfide down thereby, the return of the Heraclidæ is the epocha of the beginning of profane hiftory: all the time that preceded it is reputed fabulous. Accordingly, Ephorus, Cumanus, Califthenes, and Theopompus, only begin their hiftories from hence.

HERACLIDES *of* PONTUS, a Greek philofopher, the difciple of Speufippus, and afterwards of Ariftotle, flourifhed about 336 B. C. His vanity prompted him to defire one of his friends to put a ferpent into his bed juft as he was dead, in order to raife a belief that he was afcended to the heavens among the gods; but the cheat was difcovered. All his works are loft.

HERACLITUS, a famous Ephefian philofopher, who flourifhed about the 69th Olympiad, in the time of Darius Hyftafpes. He is faid to have continually bewailed the wicked lives of men, and, as often as he came among them, to have fallen a-weeping; contrary to Democritus, who made the follies of mankind a fubject of laughter. He retired to the temple of Diana, and played at dice with the boys there; faying to the Ephefians who gathered round him, "Worft "of men, what do ye wonder at? Is it not better to "do thus than to govern you?" Darius wrote to this philofopher to come and live with him; but he refufed the offer: at laft, out of hatred to mankind, he retired to the mountains, where he contracted a dropfy by living on herbs, which deftroyed him at 60 years of age. His writings gained him fo great reputation, that his followers were called *Heraclitians*. Laertius fpeaks of a treatife upon nature, divided into three books, one concerning the univerfe, the fecond political, the third theological, which he depofited in the temple of Diana.

Heraclides ‖ Herald.

HERACLIUS, emperor of the eaft, a renowned warrior, died A. D. 641. He carried on long and bloody wars with the Saracens, by whom he was almoft always defeated. See ARABIA, n° 67—93.

HERALD, fays Verftegan, is derived from the Saxon word *Herehault*, and, by abbreviation, *Heralt*, which in that language fignifies the champion of an army; and, growing to be a name of office, it was given to him who, in the army, had the fpecial charge to denounce war, to challenge to battle and combat, to proclaim peace, and to execute martial meffages. But the bufinefs of heralds with us is as follows, viz. To marfhal, order, and conduct all royal calvacades, ceremonies at coronations, royal marriages, inftallations, creations of dukes, marquifes, earls, vifcounts, barons, baronets, and dubbing of knights; embaffies, funeral proceffions, declarations of war, proclamations of peace, &c.: To record and blazon the arms of the nobility and gentry; and to regulate any abufes therein thro' the Engliffh dominions, under the authority of the Earl-Marfhal, to whom they are fubfervient. The office of Windfor, Chefter, Richmond, Somerfet, York, and Lancafter heralds, is to be affiftants to the kings at arms, in the different branches of their office; and they are fuperior to each other, according to creation, in the above order.

Heralds were formerly held in much greater eſteem than they are at prefent; and were created and chriſtened by the king, who, pouring a cold-cup of wine on their head, gave them the herald-name: but this is now done by the earl-marfhal. They could not arrive at the dignity of herald without having been feven years purfuivant; nor could they quit the office of herald, but to be made king at arms.

The office and dignity of a herald was firft inftituted by Ancus Martius, fourth king of the Romans, as Livy declares; but fome writers aſcribe its origin to Numa Pompilius, and that he ordained a college of heralds. Richard III. was the firft who formed them, in this kingdom, into a college; and afterwards great privileges were granted them by Edward VI. and Philip and Mary.

HERALDRY,

Definition origin, &c. of Heraldry.

A SCIENCE which teaches how to blazon, or explain in proper terms, all that belongs to coats-of-arms; and how to marſhal, or diſpoſe regularly, divers arms on a field. It alſo teaches whatever relates to the marſhalling of ſolemn calvacades, proceſſions, and other public ceremonies at coronations, inſtallations, creations of peers, nuptials, chriſtening of princes, funerals, &c.

Arms, or coats-of-arms, are hereditary marks of honour, made up of fixed and determined colours and figures, granted by ſovereign princes, as a reward for military valour, a ſhining virtue, or a ſignal public ſervice; and which ſerve to denote the deſcent and alliance of the bearer, or to diſtinguiſh ſtates, cities, ſocieties, &c. civil, eccleſiaſtical, and military.

Thus heraldry is the ſcience, of which *arms* are the proper object; but yet they differ much both in their origin and antiquity. Heraldry, according to Sir George Mackenzie, "as digeſted into an art, and ſubjected to rules, muſt be aſcribed to Charlemaign and Frederick Barbaroſſa, for it did begin and grow with the fendal law." Sir John Ferne is of opinion, that we did borrow *arms* from the Egyptians; meaning, from their hieroglyphicks. Sir William Dugdale mentions, that arms, as marks of honour, were firſt uſed by great commanders in war, neceſſity requiring that their perſons ſhould be notified to their friends and followers. The learned Alexander Niſbet, in his excellent ſyſtem of heraldry, ſays, that arms owe their riſe and beginning to the light of nature; and that ſigns and marks of honour were made uſe of in the firſt ages of the world, and by all nations, however ſimple and illiterate, to diſtinguiſh the noble from the ignoble. We find in Homer, Virgil, and Ovid, that their heroes had divers figures on their ſhields, whereby their perſons were diſtinctly known. Alexander the Great, deſirous to honour thoſe of his captains and ſoldiers who had done any glorious action, and alſo to excite an emulation among the reſt, did grant them certain badges to be borne on their armour, pennons, and banners; ordering, at the ſame time, that no perſon or potentate, through his empire, ſhould attempt or preſume to give or tolerate the bearing of thoſe ſigns upon the armour of any man, but it ſhould be a power reſerved to himſelf; which prerogative has been claimed ever ſince by all other kings and ſovereign princes within their dominions.

After theſe and many other different opinions, all that can be ſaid with any certainty is, that, in all ages, men have made uſe of figures of living creatures, or ſymbolical ſigns, to denote the bravery and courage either of their chief or nation, to render themſelves the more terrible to their enemies, and even to diſtinguiſh themſelves or families, as names do individuals. The famous C. Agrippa, in his treatiſe of the vanity of ſciences, cap. 81. has collected many inſtances of theſe marks of diſtinction, anciently borne by kingdoms and ſtates that were any way civilized, viz.

Hereditary arms, &c.

The Egyptians	bore	an Ox,
The Athenians		an Owl,
The Goths		a Bear,
The Romans		an Eagle,
The Franks		a Lion,
The Saxons		a Horſe.

The laſt is ſtill borne in the arms of his preſent Britannic Majeſty. As to hereditary arms of families, William Cambden, Sir Henry Spelman, and other judicious heralds, agree, that they began no ſooner than towards the latter end of the 11th century. According to Father Meneſtrier's opinion, a French writer whoſe authority is of great weight in this matter, Henry l'Oiſeleur (the Falconer) who was raiſed to the imperial throne of the Weſt in 920, by regulating tournaments in Germany gave occaſion to the eſtabliſhment of family-arms, or hereditary marks of honour, which undeniably are more ancient and better obſerved among the Germans than in any other nation. Moreover, this laſt author aſſerts, that with tournaments firſt came up coats-of-arms; which were a ſort of livery, made up of ſeveral lifts, fillets, or narrow pieces of ſtuff of divers colours, from whence came the feſs, the bend, the pale, &c. which were the original charges of family-arms; for they who never had been at tournaments, had not ſuch marks of diſtinction. They who inliſted themſelves in the Croiſades, took up alſo ſeveral new figures hitherto unknown in armorial enſigns; ſuch as alerions, bezants, eſcalop-ſhells, martlets, &c. but more particularly croſſes, of different colours for diſtinction's ſake. From this it may be concluded, that heraldry, like moſt human inventions, was inſenſibly introduced and eſtabliſhed; and that, after having been rude and unſettled for many ages, it was at laſt methodiſed, perfected, and fixed, by the Croiſades and tournaments.

Theſe marks of honour are called *arms*, from their being principally and firſt worn by military men at war and tournaments, who had them engraved, embоſſed, or depicted on ſhields, targets, banners, or other martial inſtruments. They are alſo called *coats-of-arms*, from the cuſtom of the ancients embroidering them on the coats they wore over their arms, as heralds do to this day.

Arms are diſtinguiſhed by different names, to denote the cauſes of their bearing; ſuch as,

ARMS	
Of Dominion,	Of Patronage,
Of Pretenſion,	Of Family,
Of Conceſſion,	Of Alliance,
Of Community,	Of Succeſſion.

Arms of *dominion* or ſovereignty are thoſe which emperors, kings, and ſovereign ſtates, do conſtantly bear; being, as it were, annexed to the territories, kingdoms, and provinces, they poſſeſs. Thus the three lions are the arms of England, the fleurs-de-lis thoſe of France, &c.

Arms of *pretenſion* are thoſe of ſuch kingdoms, pro-

Different sorts of Arms.

provinces, or territories, to which a prince or lord has some claim, and which he adds to his own, although the said kingdoms or territories be poſſeſſed by a foreign prince or other lord. Thus the kings of England have quartered the arms of France with their own, ever ſince Edward III. laid claim to the kingdom of France, which happened in the year 1330, on account of his being ſon to Iſabella, ſiſter to Charles the Handſome, who died without iſſue.

Arms of *conceſſion* or augmentation of honour, are either entire arms, or elſe one or more figures, given by princes as a reward for ſome extraordinary ſervice. We read in hiſtory, that Robert Bruce, king of Scotland, allowed the earl of Wintoun's anceſtor to bear, in his coat-armour, a crown ſupported by a ſword, to ſhew that he, and the clan Seaton, of which he was the head, ſupported his tottering crown. The late Queen Anne granted to Sir Cloudeſly Shovel, rear-admiral of Great Britain, a cheveron between two fleurs-de-lis in chief, and a creſcent in baſe, to denote three great victories he had gained; two over the French, and one over the Turks.

Arms of *community*, are thoſe of biſhoprics, cities, univerſities, academies, ſocieties, companies, and other bodies corporate.

Arms of *patronage*, are ſuch as governors of provinces, lords of manors, patrons of benefices, &c. add to their family-arms, as a token of their ſuperiority, rights, and juriſdiction. Theſe arms have introduced into heraldry, caſtles, gates, wheels, ploughs, rakes, harrows, &c.

Arms of *family*, or *paternal-arms*, are thoſe that belong to one particular family, that diſtinguiſh it from others, and which no perſon is ſuffered to aſſume without committing a crime, which ſovereigns have a right to reſtrain and puniſh.

Arms of *alliance*, are thoſe which families, or private perſons, take up and join to their own, to denote the alliances they have contracted by marriage. This ſort of arms is either impaled, or borne in an *eſcutcheon of pretence*, by thoſe who have married heireſſes.

Arms of *ſucceſſion*, are ſuch as are taken up by them who inherit certain eſtates, manors, &c. either by will, entail, or donation, and which they either impale or quarter with their own arms; which multiplies the titles of ſome families out of neceſſity, and not through oſtentation, as many imagine.

Theſe are the eight claſſes under which the divers ſorts of arms are generally ranged; but there is a ſort which blazoners call *aſſumptive arms*, being ſuch as are taken up by the caprice or fancy of upſtarts, though of ever ſo mean extraction, who, being advanced to a degree of fortune, aſſume them without a legal title. This, indeed, is a great abuſe of heraldry; and common only in Britain, for on the continent no ſuch practice takes place.

We now proceed to conſider the eſſential and integral parts of arms, which are theſe:

The Escutcheon,	The Charges,
The Tinctures,	The Ornaments.

CHAP. I.

Of the Shield *or* Escutcheon.

The *Shield*, or *Eſcutcheon*, is the field or ground whereon are repreſented the figures that make up a coat of arms: for theſe marks of diſtinction were put on bucklers or ſhields, before they were placed on banners, ſtandards, flags, and coat-armour; and wherever they may be fixed, they are ſtill on a plane or ſuperficies, whoſe form reſembles a ſhield. Of the Shield, &c.

Shields, in heraldry called *eſcutcheons*, or *ſcutcheons*, from the Latin word *ſcutum*, have been, and ſtill are, of different forms, according to different times and nations. Amongſt ancient ſhields, ſome were almoſt like a horſe-ſhoe, ſuch as is repreſented by n° 1. in the figure of Eſcutcheons; others triangular, ſomewhat rounded at the bottom, as n° 2. The people who inhabited Meſopotamia, now called *Diarbeck*, made uſe of this ſort of ſhield, which, it is thought, they had of the Trojans. Sometimes the ſhield was heptagonal, that is, had ſeven ſides, as n° 3.—The firſt of this ſhape is ſaid to have been uſed by the famous triumvir M. Antony. That of knights-banneret was ſquare, like a banner, as n° 4. As to modern eſcutcheons, thoſe of the Italians, particularly of eccleſiaſtics, are generally oval, as n° 5. The Engliſh, French, Germans, and other nations, have their eſcutcheons formed different ways, according to the carver's or painter's fancy; ſee the various examples contained from n° 6—16 of the figure. But the eſcutcheon of maids, widows, and of ſuch as are born ladies, and are married to private gentlemen, is in the form of a lozenge. See n° 17—20. Sir George Mackenzie mentions one Muriel, counteſs of Strathern, who carried her arms in a lozenge, anno 1284, which ſhews how long we have been verſant in heraldry. Plate CXLIV.

Armoriſts diſtinguiſh ſeveral parts or points in eſcutcheons, in order to determine exactly the poſition of the bearings they are charged with; they are here denoted by the firſt nine letters of the alphabet, ranged in the following manner:

A——*the dexter chief.*
B——*the* preciſe *middle chief.*
C——*the ſiniſter chief.*
D——*the honour point.*
E——*the feſs point.*
F——*the nombril point.*
G——*the dexter baſe.*
H——*the* preciſe *middle baſe.*
I——*the ſiniſter baſe.*

A	B	C
	D	
	E	
	F	
G	H	I

The knowledge of theſe points is of great importance, and ought to be well obſerved, for they are frequently occupied with ſeveral things of different kinds. It is neceſſary to obſerve, that the dexter-ſide of the eſcutcheon is oppoſite to the left hand, and the ſiniſter ſide to the right hand of the perſon that looks on it.

CHAP. II.

Of Tinctures, Furs, Lines, *and* Differences.

Sect. I. *Of Tinctures.*

By *tinctures* is meant that variable hue of arms which is common both to ſhields and their bearings. According to the French heralds, there are but ſeven tinctures in armory; of which two are metals, the other five are colours.

The Metals are,
Gold, Silver, } termed { *Or.* *Argent.*

The Tinctures.

The Colours are

Blue, Red, Green, Purple, Black,	termed	*Azure.* *Gules.* *Vert.* *Purpure.* *Sable.*

When natural bodies, such as animals, plants, celestial bodies, &c. are introduced into coats of arms, they frequently retain their natural colours, which is expressed in this science by the word *proper*.

Besides the five colours abovementioned, the English writers on heraldry admit two others, viz.

Orange, Blood-colour,	termed	*Tenny.* *Sanguine.*

But these two are rarely to be found in British bearings.

These tinctures are represented in engravings and drawings (the invention of the ingenious Silvester Petra Sancta, an Italian author of the last century), by dots and lines, as in fig. ii. n° 1—9. Plate CXLIV.

Or is expressed by dots.

Argent needs no mark, and is therefore plain.

Azure, by horizontal lines.

Gules, by perpendicular lines.

Vert, by diagonal lines from the dexter chief to the sinister-base points.

Purpure, by diagonal lines from the sinister-chief to the dexter-base points.

Sable, by perpendicular and horizontal lines crossing each other.

Tenny, by diagonal lines from the sinister-chief to the dexter-base points, traversed by horizontal lines.

Sanguine, by lines crossing each other diagonally from dexter to sinister, and from sinister to dexter.

Sir George M'Kenzie observes, that "some fantastic heralds have blazoned not only by the ordinary colours and metals, but by flowers, days of the week, parts of a man's body, &c. and have been condemned for it by the heralds of all nations. Yet the English have so far owned this fancy," (the most judicious of them, as Mr Cartwright and others, reprobate it as absurd,) "that they give it for a rule, that the coats of sovereigns should be blazoned by the planets, those of noblemen by precious stones; and have suited them in the manner here set down:

" Or	Topaz	Sol
" Argent	Pearl	Luna
" Sable	Diamond	Saturn
" Gules	Ruby	Mars
" Azure	Sapphire	Jupiter
" Vert	Emerald	Venus
" Purpure	Amethyst	Mercury
" Tenny	Jacinth	Dragon's-head
" Sanguine	Sardonix	Dragon's-tail.

"But I crave leave to say, that these are but mere "fancies, and are likewise unfit for the art, for these "reasons: 1st, The French (from whom the English "derive their heraldry, not only in principles, but in "words of the French language,) do not only not "use these different ways of blazoning, but treat "them *en ridicule*. 2dly, The Italian, Spanish, and "Latin heralds use no such different forms, but blazon "by the ordinary metals and colours. 3dly, Art "should imitate nature; and as it would be an un- The Furs. "natural thing in common discourse not to call red "*red*, because a prince wears it, so it is unnatural to "use these terms in heraldry, and it may fall out to "be very ridiculous in some arms; for instance, if "a prince had for his arms an *ass couchant* under his "burden *gules*, how ridiculous would it be to say he "had an *ass couchant Mars?*——A hundred other "examples might be given; but it is enough to say, "that this is to confound colours with charges, and "the things that are borne with colours. 4thly, It "makes the art unpleasant, and detera gentlemen "from studying it, and strangers from understanding "what our heraldry is; nor could the arms of our "princes and nobility be translated in this disguise "into Latin or any other language. But that which "convinces most that this is an error is, because it "makes that great rule unnecessary, whereby colour "cannot be put upon colour, nor metal upon metal; "but this cannot hold but where metals and colours "are expressed."

The English heralds give different names to the roundlet (n° 10), according to its colour. Thus, if it is

Or, Argent, Azure, Gules, Vert, Purpure, Sable, Tenny, Sanguine,	it is called a	*Bezant.* *Plate.* *Hurt.* *Torteau.* *Pomey.* *Golpe.* *Pellet.* *Orange.* *Guze.*

The French, and all other nations, do not admit such a multiplicity of names to this figure; but call them *Bezants*, after an ancient coin struck at Constantinople, once *Byzantium*, if they are Or and Torteaux; if of any other tincture, expressing the same.

Sect. II. *Of Furs.*

Furs represent the hairy skin of certain beasts, prepared for the doublings or linings of robes and garments of state: and as shields were anciently covered with furred skins, they are therefore used in heraldry not only for the linings of the mantles, and other ornaments of the shields, but also in the coats of arms themselves.

There are three different kinds in general use, viz. Plate CXLIV.

1. *Ermine;* which is a field argent, powdered with black spots, their tails terminating in three hairs. (Fig. ii. n° 11.)

2. *Counter-ermine*, where the field is sable, and the powdering white. (n° 12.)

3. *Vair* (n° 15.), which is expressed by blue and white skins, cut into the forms of little bells, ranged in rows opposite to each other, the base of the white ones being always next to that of the blue ones. Vair is usually of six rows; if there be more or fewer, the number ought to be expressed; and if the colours are different from those abovementioned, they must likewise be expressed.

The English multiply the furs, as well as the names of the tinctures, though no other nation has adopted such varieties. Thus they give us,

1. *White*, which is the natural colour of the ermine; but

Of Lines. but it is uſed on no other occaſion but in the deſcriptions of mantles.

2. *Ermines*, which is the ſame with contra-ermine.

3 *Erminois*; the field is Or, the powdering Sable, (n° 13.). For the uſe of this fur Guillim cites Bara, p. 14. but no ſuch fur is to be found in Bara.

4. *Pean*; the field is Sable, the powdering Or, (n° 14.) The French uſe no ſuch term; but they call all furs or doublings *des pannes*, or *pennes*, which term has poſſibly given riſe to this miſtake, and many others, in thoſe who do not underſtand the French language.

5. *Erminites*; the ſame as Ermine, with the addition of a red hair on each ſide of the black. Sir Geo. Mackenzie calls theſe diſtinctions "but fancies, for "*Erminites* ſignifies properly *little Ermines*."

6. *Counter-vair*; when the bells of the ſame tincture are placed baſe againſt baſe, and point againſt point, (n° 16.).

7. *Potent-counter-potent*, anciently called *Vairy-cuppy*, as when the field is filled with crutches or potents counter-placed, (n° 17.).

It may not be improper to obſerve, that the uſe of the tinctures took its riſe from the ſeveral colours uſed by warriors whilſt they were in the army, which S. de Petra Sancta proves by many citations. And becauſe it was the cuſtom to embroider gold and ſilver on ſilk, or ſilk on cloth of gold and ſilver, the heralds did therefore appoint, that in imitation of the clothes ſo embroidered, colour ſhould never be uſed upon colour, nor metal upon metal.

Sect. III. *Of the Lines uſed in the Parting of Fields.*

Escutcheons are either of one tincture, or more than one: thoſe that are of one only, that is, when ſome metal, colour, or fur, is ſpread all over the ſurface or field, ſuch a tincture is ſaid to be predominant. But in ſuch as have on them more than one, as moſt have, the field is divided by lines, which, according to their divers forms, receive various names.

Lines may be either ſtraight or crooked. Straight lines are carried evenly through the eſcutcheon; and are of four different kinds, viz. a perpendicular line, |; a horizontal, —; a diagonal dexter, \; a diagonal ſiniſter, /.

Crooked lines are thoſe which are carried unevenly through the eſcutcheon with riſing and falling. French armoriſts reckon 11 different ſorts of them; Guillim admits of ſeven only; but there are 14 diſtinct kinds, the figures and names of which are as in fig. i. (A), Plate CXLIV. n° 1—14. viz.

1. The engrailed. 2. The invected. 3. The wavy. 4. The embattled, or crenelle. 5. The nebule. 6. The raguly. 7. The indented. 8. The dancette. 9. The dove-tail. 10. The grafted. 11. The embattled aronde. 12. The battled embattled. 13. The patee or dove-tail. 14. Champaine.

The principal reaſon why lines are thus uſed in heraldry, is to difference bearings which would be otherwiſe the ſame; for an eſcutcheon charged with a chief engrailed, differs from one charged with a chief wavy, as much as if the one bore a croſs and the other a ſaltier. Of Differences.

As the forementioned lines ſerve to divide the field, it muſt be obſerved, that if the diviſion conſiſts of two equal parts made by the perpendicular-line, it is called *parted per pale*; by the horizontal-line, *parted per feſs*; by the diagonal-dexter, *parted per bend*; by the diagonal-ſiniſter, *parted per bend-ſiniſter*; examples of which will be given in the ſequel of this treatiſe.

If a field is divided into four equal parts by any of theſe lines, it is ſaid to be *quartered*, which may be done two ways, viz.

Quartered or parted *per croſs*; which is made by a perpendicular and horizontal line, which, croſſing each other at the centre of the field, divide it into four equal parts called *quarters*. See Plate CXLIV. under fig. i. (A).

Quartered or parted *per ſaltier*; which is made by two diagonal lines, dexter and ſiniſter, that croſs one another in the centre of the field, and likewiſe divide it into four equal parts. *Ibid.*

The eſcutcheon is ſometimes divided into a greater number of parts, in order to place in it the arms of the ſeveral families to which one is allied; and in this caſe it is called a *genealogical atchievement*. Theſe diviſions may conſiſt of 6, 8, 12, and 16, quarters, [as under fig i. (A).] and even ſometimes of 20, 32, 64, and upwards; there being examples of ſuch diviſions frequently exhibited at pompous funerals. An extraordinary inſtance of this kind was lately exhibited at the pompous funeral of the late worthy viſcounteſs Townſhend, whoſe corps was brought from Dublin caſtle in Ireland, to Rainham-hall in Norfolk, one of the principal tenants on horſeback carrying before the hearſe a genealogical banner, containing the quarterings of his lordſhip's and her ladyſhip's family, to the amount of upwards of 160 coats. Sir George Booth, the preſent-rector of the valuable living of Aſhton under Line, bears ſix diſtinct coats-of-arms in his ſhield, viz. thoſe for Booth, Barton, Venables, Mountfort, Aſhton, Egerton; and has beſides a right to 37 other coats: but Sir William Dugdale very juſtly objects to ſo many arms being cluſtered together in one ſhield or banner, on account of the difficulty of diſcerning and knowing aſunder one coat-of-arms from another.

Sect. IV. *Of the Differences of Coats-of-Arms.*

Armorists have invented divers differences, or characteriſtical marks, whereby bearers of the ſame coat-of-arms are diſtinguiſhed each from others, and their nearneſs to the principal bearer demonſtrated. According to J. Guillim, theſe differences are to be conſidered either as ancient or modern.

Art. I. Of Ancient Differences.

Those he calls *ancient differences* conſiſt in *bordures* (A); which is a bearing that goes all round, and parallel to the boundary of the eſcutcheon, in form of a hem, and always contains a fifth part of the field in breadth. Bordures were uſed in ancient times for the diſtinguiſhing not only of one nation or tribe from another, but alſo to note a diverſity between particular perſons deſcended of one family and from the ſame parents.

(A) Bordures are ſtill introduced into Engliſh coats-of-arms, but for particular reaſons, which heralds can beſt explain. They are by the French frequently taken for a principal figure, and numbered among the reſt of the ordinaries.

Ancient Differences.

parents. This diſtinction, however, was not expreſsly ſignified by unvariable marks; nor were bordures always appropriated to denote the different degrees of conſanguinity: for, as Sir Henry Spelman obſerves in his *Aſpilogia*, p. 140, ancient heralds, being fond of perſpicuous differences, often inverted the paternal tincture, or ſometimes inſerted another charge in the eſcutcheon, ſuch as bends, croſſets, cantons, or the like; which irregularity has, I ſuppoſe, induced modern armoriſts to invent and make uſe of others."

Ancient Differences.

There are bordures of different forms and tinctures, as in the examples, fig. iii.

Plate CXLV.

N° 1. is "Sable, a Bordure Argent;" borne by the right hon. Sackville Tufton, Earl of Thanet.—When a bordure is plain, you are not to mention it, as it is always underſtood ſo in heraldry, though it be not expreſſed; but if it has any other form, you are to ſignify it.

2. "Gules, a Bordure engrailed Argent;" borne by the right hon. Charles Gray, lord Gray.—This is called *engrailed*, from the French word *engrêlé*, which ſignifies a thing the hail has fallen upon and broken off the edges, leaving it with little ſemicircles ſtruck out of it.

3. "Gules, a Bordure engrailed Or;" borne by the right hon. George Talbot, earl of Shrewſbury.—You muſt obſerve, that, in a bordure or ordinary formed of theſe lines, the points are repreſented on all ſides towards the field, and the ſemicircles turned towards the bordure or ordinary.

4. "Argent, a Bordure invected Azure."—This is quite contrary to the laſt; for, as the other turns its points from the bordure into the field, ſo contrarywiſe this does, by the inverſion of the points from the field into the bordure. Such a charge, or any other formed of theſe lines, is feldom to be met with in Engliſh coats-of-arms.

5. "Gules, a Bordure indented Argent."—The word *indented* requires very little explanation, the ſignification being obvious to all perſons, from its figure, which is compoſed of tracts reſembling teeth, called in Latin *dentes*.

6. "Azure, a Bordure Ermine."

7. "Vert, a Bordure Vair."

8. "Ermine, a Bordure compony, or gobony, Or and Sable."—This is ſo termed from its being compoſed of ſmall and equal pieces. J. Guillim calls this bordure *gobenated*, which implies the ſame meaning; but the word being obſolete, is not uſed by modern heralds.

9. "Quarterly, Azure and Gules, a Bordure compony Argent and Azure;" borne by his grace Henry Somerſet, duke of Beaufort, &c.

10. "Azure, a Bordure counter-compony Argent and Gules."—Obſerve, that the counter-compony does always conſiſt of two tracts, and no more.

11. "Or, a Bordure checky Argent and Sable."—This has a great reſemblance with the laſt bordure, having only one tract more; therefore you muſt take care, before you blazon, to number them, or elſe you may eaſily err in taking the one for the other.

12. "Gules, a Bordure Argent charged with eight Trefoils ſlipped proper, that is, Vert."—All nations uſe few terms in blazoning bordures; but Engliſh armoriſts, in order, poſſibly, to raiſe the dignity of this ſcience, have perplexed it, and rendered it unintelligible to all foreigners, by introducing into it ſeveral myſtical names, among which may be reckoned the following ones, viz. They call a bordure, if charged with eight plants, fruits, flowers, or leaves, *verdoy* of ſuch vegetables; or *enaluron* of ſuch birds, *enurny* of beaſts, *perſlew* of furs, and *entoyre* of inanimate things of what kind ſoever.

13. "Gules on a Bordure Azure, eight Stars Or."

14. "Argent, a Bordure compony of the laſt and Guies, the firſt charged with Roſes of the ſecond, barbed and ſeeded proper."—This bordure is borne by his grace Charles Lennox, duke of Richmond, &c.

15. "Ermine, within a Bordure engrailed Gules;" the coat-of-arms of the right hon. Henry-Benedict Barnewall, viſcount Kingſland, &c. of Ireland.—This ancient and noble family is of French extraction, and allied to the dukes of Little-Bretagne, where the name continues ſtill in great repute.

16. "Argent, a Bordure Sable charged with eight Beſants;" borne by the right hon. ——— Cole, lord Ranelagh, of Ireland.

17. "Party per pale Argent and Gules, a Bordure charged with eight Eſcalops counterchanged;" the coat-of-arms of the right hon. William Maule, earl of Panmure, &c. of Ireland. This very ancient family is originally French, and derives its ſurname from the town and lordſhip of Maule in Normandy, where the ſame arms are ſtill to be ſeen in the pariſh-church.

18. "Azure, a Bordure quarterly, the firſt and fourth Ermine, the ſecond and third counter-compony Argent and Azure."

19. "Purpure, a Bordure compony Or and Gules, each of the laſt charged with a Beſant."

20. "Quarterly Or and Gules, within a Bordure Vert, charged with eight Eſcalops Or."

We ſhall conclude this head with obſerving, that a bordure is never of metal upon metal, and ſeldom of colour upon colour, but rather of the tincture which the principal bearing or charge is of. Thus Sir —— Dalziel of Glenae, whoſe predeceſſor was a younger brother of the noble family of Carnwath, has, within a Bordure Argent, the paternal coat of the ancient name of Dalziel, viz. "Sable, a hanged man with his arms extended, Argent;" formerly they carried him hanging on a gallows. This bearing, though ſo very ſingular for a coat-of-arms, was given as a reward to one of the anceſtors of the late Robert Dalziel, earl of Carnwath, to perpetuate the memory of a brave and hazardous exploit performed in taking down from a gallows the body of a favourite and near relation of king Kenneth II. hung up by the Picts, which ſtory is thus related by Alexander Niſbet: "The king being exceedingly grieved that the body of his minion and kinſman ſhould be ſo diſgracefully treated, he proffered a great reward to any of his ſubjects who would adventure to reſcue his corpſe from the diſgrace his cruel enemies had unjuſtly put upon it: but when none would undertake this hazardous enterpriſe, at laſt a valorous gentleman came and ſaid to the king, *Dalzeil*, which ſignifies, "I dare;" and he did actually perform that noble exploit to the king's ſatisfaction and his own immortal honour, and in memory of it got the aforeſaid remarkable bearing; and afterwards his poſterity took the word *Dalziel* for their ſurname, and the

the interpretation of it, *I dare*, continues even to this day to be the motto of that noble family." We can have no better proof of the truth of this tradition than this, that the heads of this ancient family have, for many ages, carefully retained this bearing without any alteration or addition.

Art. 2. Of Modern Differences.

The modern differences, which the Engliſh have adopted, not only for the diſtinguiſhing of ſons iſſued out of one family, but alſo to denote the difference and ſubordinate degrees in each houſe from the original anceſtors, are nine, viz.

Plate CXLIV. under fig. i. (A.)

For the heir or firſt ſon, the Label. 2d ſon, the Creſcent. 3d ſon, the Mullet. 4th ſon, the Martlet. 5th ſon, the Annulet. 6th ſon, the Flower-de-luce. 7th ſon, the Roſe. 8th ſon, the Croſs-moline. 9th ſon, the Double Quater-foil.

By theſe differences, the ſix ſons of Thomas Beauchamp, the 15th earl of Warwick, who died in the 34th year of king Edward III. are diſtinguiſhed in an old window of the church of St Mary at Warwick; ſo that although they are called *modern differences*, their uſage with the Engliſh is ancient.

It muſt be obſerved, that, of all the forementioned marks of diſtinction, none but the label is affixed on the coats-of-arms belonging to any of the royal family; which the introducers of this peculiarity have, however, thought proper to difference by additional pendants and diſtinct charges on them.

Plate CXLV.

As to the diſtinction to be made in the arms of the oſſpring belonging to each of the above-mentioned brothers, it is expreſſed by figures on the top and margin of the table contained in fig. iv. For inſtance, The heir or firſt ſon of the ſecond houſe, beareth a creſcent charged with a label during his father's life only. The ſecond ſon of the ſecond houſe, a creſcent charged with another creſcent. The third ſon of the ſecond houſe, a creſcent charged with a mullet. The fourth ſon of the ſecond houſe, a creſcent charged with a martlet. The fifth ſon of the ſecond houſe, a creſcent charged with an annulet. The ſixth ſon of the ſecond houſe, a creſcent charged with a flower-de-luce; and ſo on of the other ſons, taking care to have them of a different tincture.

In what part of the eſcutcheon theſe differences ſhould be borne is not certain; for Guillim, Morgan, and others, give us many different examples of their poſition. The honour-point would be the propereſt place, if the arms would admit of it; but that is not always the caſe, as that part may be charged with ſome figure in the paternal coat, which cannot with propriety receive the difference. There are inſtances where theſe are borne as perfect coats of arms, as the examples ſubjoined to the Table of Houſes ſufficiently ſhew, which are to be blazoned thus:

The firſt is "Azure, a Label argent."—When ſuch a label is borne as a difference, the pendants, according to G. Leigh, ſignify that he is but the third perſon; the dexter pendant referring to his father, the ſiniſter to his mother, and the middle one to himſelf.

The ſecond is "Argent, a Label of five points Azure;" borne by the name of Hentington. If a label has more or leſs than three pendants or points, they are to be expreſſed as in the foregoing example.

Modern Differences.

The third is "Azure, a Creſcent argent," borne by the name of Lucy.—The reaſon G. Leigh aſſigns for the ſecond ſon's having a creſcent for a difference, is to ſhow that he ſhould increaſe the family by adding to it riches and reputation.

The fourth is "Argent, a Mullet Sable, on a Chief Azure, a Fleur-de-lis Or;" borne by the name of Rogers, in Glouceſterſhire.—A mullet or ſpur was appointed for the third ſon's difference, as the laſt-mentioned author ſays, to ſhew that he ſhould follow chivalry.

The fifth is "Azure, a Fleur-de-lis Argent;" borne by the Right-hon. Henry Digby, baron Digby of Geaſhil, in King's county, Ireland.

Theſe few examples, among many more that might be given, demonſtrate the impropriety of adopting theſe *modern differences*, as they are called, for marks of cadency to diſtinguiſh the different branches of a family: for it is impoſſible to diſtinguiſh the uncle or grand-uncle, from the nephew or grand-nephew, if each of them are ſecond, third, or fourth ſons; and in the courſe of ſucceſſion theſe differences would multiply to ſuch a number, that it would be impoſſible to delineate them diſtinctly in moſt caſes. But as they are given by moſt of the Engliſh writers on heraldry, though no foreign nation uſes them, it was thought proper to inſert them here.

Siſters, except of the blood-royal, have no other mark of difference in their coats-of-arms, but the form of the eſcutcheon, (as obſerved before); therefore they are permitted to bear the arms of their father, even as the eldeſt ſon does after his father's deceaſe. The reaſon of which is by Guillim ſaid to be, that when they are married, they loſe their ſurname, and receive that of their huſbands.

Next to theſe diminutions G. Leigh, J. Guillim, and after them Dr Harris in his *Lexicon Technicum*, ſet forth at large divers figures, which they pretend were formerly added to the coats of ſuch as were to be puniſhed and branded for cowardice, fornication, ſlander, adultery, treaſon, or murder, for which they give them the name of *abatements of honour*; but as they produce but one inſtance of ſuch whimſical bearings, we have not inſerted them here. Beſides, arms, being marks of honour, they cannot admit of any note of infamy; nor would anybody now-a-days bear them, if they were ſo branded. It is true, a man may be degraded for divers crimes, particularly high treaſon; but in ſuch caſes the eſcutcheon is reverſed, trod upon, and torn in pieces, to denote a total extinction and ſuppreſſion of the honour and dignity of the perſon to whom it belonged.

CHAP. III.

Of the Charges.

Armoriſts call a charge whatſoever is contained in the field, whether it occupy the whole, or only a part thereof. All charges are diſtinguiſhed by the names of *honourable ordinaries*, *ſub-ordinaries*, and *common charges*.

Honourable ordinaries, the principal charges in heraldry, are made of lines only, which, according to their

Honourable Ordinaries.

their disposition and form, receive different names.

Sub-ordinaries are ancient heraldric figures frequently used in coats-of-arms, and which are distinguished by terms appropriated to each of them.

Common charges are composed of natural, artificial, and even chimerical things, such as planets, creatures, vegetables, instruments, &c.

Sect. I. *Of Honourable Ordinaries.*

The most judicious armorists admit only of nine honourable ordinaries, viz.

The Chief	The Bar
The Pale	The Cheveron
The Bend	The Croſs
The Bend ſiniſter	and
The Feſs	The Saltier.

Of theſe, but ſix have diminutives, which are called as follows: That of the chief is a *fillet:* The pale has a *pallet* and *endorſe;* the bend, a *bendlet, coſt,* and *ribband:* The bend-ſiniſter has the *ſcarpe* and *bâton;* the bar, the *cloſet* and *barulet;* the cheveron a *chevronel* and *couple-cloſe.* All which ſhall be treated of in order.

Art. I. Of the Chief.

The chief is an ordinary determined by an horizontal line, which, if it is of any other form but ſtraight, muſt be expreſſed. It is placed in the upper part of the eſcutcheon, and containeth in depth the third part of the field. Its diminutive is a fillet, the content of which is not to exceed one fourth of the chief, and ſtandeth in the loweſt part thereof. This ordinary is ſubject to be charged with variety of figures; and may be indented, wavy, nebule, &c. as in the examples, fig. v.

Plate CXLV.

N° 1. is "Or, a Chief indented Azure;" borne by the right hon. Edmund Butler, viſcount Mountgarret, &c. of the kingdom of Ireland. This great and illuſtrious family of the Butlers, ſo renowned for the many valiant and loyal perſons it has produced, is deſcended from the ancient counts of Brion in Normandy; but ſince king Henry II. conferred the office of chief butler of Ireland upon one of the family, he and his ſucceſſors have aſſumed the name of *Butler.*

2. "Azure a Chief engrailed Or."

3. "Argent, a Chief invected Vert."

4. "Vert, a Chief undy Or."

5. "Azure, a Chief nebule Argent."

6. "Or, a Chief checky Azure and Argent."

7. "Ermine, a Chief quarterly Or and Gules;" borne by the name of Peckham.

8. "Argent, a Chief Sable, in the lower part thereof a Fillet of the Field."

9. "Azure, fretty Argent, a Chief Or;" borne by the right hon. Hayes St Leger, viſcount Doneraile, &c. of the county of Cork in Ireland. This ancient and noble family is of French extraction; and is deſcended from Sir Robert Sent Legére, knight, who, in 1066, accompanied William duke of Normandy in his expedition into England; and the family have a tradition, that he, with his own hand, ſupported the ſaid duke when he quitted the ſhip to land in Suſſex.

10. "Argent, on a Chief engrailed Azure, a Tortoiſe paſſant Or;" borne by the name of *Bidgood.*

11. "Argent, on a Chief Gules, two Spur revels Or;" borne by the right hon. John St John, lord St John of Bletſhoe, &c. Of this ancient family, which derive their ſurname from a place called *St John* in Normandy, was John de St John, Eſq. who having a principal employment in the army of the Norman duke, attended him in his expedition into England. Honourable Ordinaries

12. "Argent, on a Chief Vert, two Spears Heads erect of the Field, the points imbrued Gules;" borne by the Right Hon. George Brodrick, Viſcount Middleton, &c. of the kingdom of Ireland. This family is lineally deſcended from George de Brodrick, who came into England in the reign of William II.

13. "Or, on a Chief Sable, three Eſcalops of the field," for the name of *Graham;* and borne quartered in the arms of his Grace William Graham, duke, marquis, and earl of Montroſe, *&c.* with Argent three Roſes Gules. According to the Scots writers, this great and noble family is deſcended from the renowned Greme or Grame, who, in the year 404, was general of king Fergus II.'s, army, and, in 420, forced his way through the wall built by the Romans between the rivers Forth and Clyde to keep out the Scots from moleſting them in their poſſeſſions, and the ſaid breach has ever ſince been called *Grame's dike.*

14. "Argent, on a Chief indented Gules, three Croſſes pattee of the Field;" borne by the right hon. John Perceval, earl of Egmont, *&c.* This very ancient and noble family is ſuppoſed, from circumſtances little ſhort of poſitive proof, to have ſprung from a younger branch of the ſovereign dukes of Bretagne in France, of the ſame name. They were tranſplanted into Normandy before the conqueſt, poſſeſſed of great eſtates and power, and inveſted with the office of chief butler. Upon the Norman invaſion, two of this family came over into England with the Conqueror, from one of which the deſcent of the preſent earl of Egmont is deduced by the cleareſt and moſt indiſputable proofs of hiſtorians and records.

15. "Azure, on a Chief indented Or, three Spur-revels Gules;" borne by the right hon. Charles Moore, earl of Drogheda, *&c.* of the kingdom of Ireland. This noble family, which is of French extraction, came into England ſoon after the conqueſt, and made their firſt reſidence in the manor of Moore-court, in the county of Kent.

16. "Ermine, on a Chief indented Azure, three ducal coronets Or;" borne by the name of *Lytton.*

17. "Azure, on a Chief Or, three Martlets Gules," for the name of *Wray;* and borne by Sir Cecil Wray, Bart. of Lincolnſhire.

18. "Ermine, on a Chief Gules; five Lozenges of the firſt;" borne by the name of *Dixin.*

19. "Argent, fretty Gules, on a Chief of the ſecond, three Leopard's Faces Or;" borne by the right hon. Henry Liddel, lord Ravenſworth. This noble lord is deſcended from the ancient lords of Liddle-caſtle, in the county of Durham, where they have been proprietors of great-coal-mines time out of mind.

20. "Ermine, a Chief party per pale Azure and Or; on the dexter the Sun in its ſplendor, on the ſiniſter a Croſs pattee Gules." The arms of the biſhopric of Raphoe, in the kingdom of Ireland.

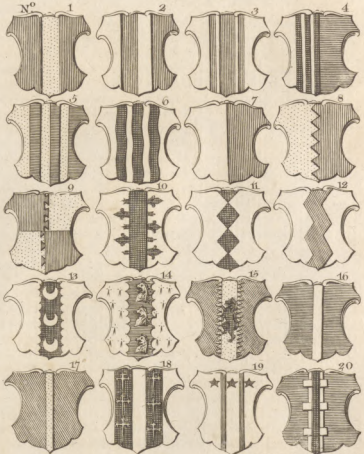
PALES &c.



A. Bell Sculpt.

Of the Pale.

Art. II. Of the Pale.

The Pale is an ordinary, conſiſting of two perpendicular lines drawn from the top to the baſe of the Eſcutcheon, and contains the third middle part of the field. Its diminutives are, The pallet, which is the half of the pale; and the endorſe, which is the fourth part of a pale. This ordinary and the pallet may receive any charge, but the endorſe ſhould not be charged. The endorſe, beſides, is never uſed, according to J. Leigh, but to accompany the pale in pairs, as cotices do the bend; but Sir John Ferne is of a different opinion.

Plate CXLV. fig. vi.

Ex. 1. "Gules, a Pale Or;" by the name of *Grandmain.*

2. "Party per Pale Argent and Gules, a Pale counterchanged."

3. "Argent, a Pale between two Endorſes Gules."

4. "Party per Pale, 1*ſt*, Paly of ſix Argent and Sable, 2*d*, Azure;" borne by the name of *Trenchard.*

5. "Paly of ſix Or and Azure."

6. "Argent, three Pallets undy Sable;" by the name of *Downes.*

7. "Party per Pale, Argent and Gules;" borne by the right hon. John Waldegrave, earl Waldegrave, &c. This noble earl is deſcended from John de Waldegrave, who was ſheriff of London in the year 1205, in the ſeventh year of king John.

8. "Party per Pale indented, Or and Gules;" borne by the right hon. Thomas Bermingham, baron of Athenry, in the kingdom of Ireland. Of this ancient and noble family, which are of Engliſh extraction, and took their name from the town of Bermingham in the county of Warwick, was William de Bermingham, who was poſſeſſed of the town of that name in the reign of Henry II. which continued in that family till the reign of Henry VIII.

9. "Quarterly per Pale dove-tail, Gules and Or;" borne by the right hon. Thomas Bromley, lord Montfort, &c. This noble lord is maternally deſcended from Sir Walter Bromleghe, of Bromleghe, in the county of Stafford, who flouriſhed in the reign of king John. Sir Thomas Bromley, another of his lordſhip's anceſtors, was conſtituted lord high chancellor of England, 21 Elizabeth; in which poſt he died, 29 Elizabeth.

10. "Argent, a Pale flory counterflory Sable."

11. "Argent, a Pale lozengy Sable;" borne by the name of *Savage.*

12. "Argent, a Pale indented Vert;" borne by the name of Dixon.

13. "Argent, on a Pale engrailed Sable, three Creſcents Or;" borne by the name of *Aſhley.*

14. "Ermine, on a Pale engrailed azure, three Lion's Heads couped Or;" borne by the name of *Avery.*

15. "Vert, on a Pale radiant Or, a Lion rampant Sable;" borne by the right hon. James O'Hara, lord Tyrawley, &c. in the kingdom of Ireland. This noble lord is deſcended from Mileſius king of Spain, by his eldeſt ſon Hiberius, who, with his brother Heremon, eſtabliſhed a colony in Ireland. Sir Charles O'Hara, father to the preſent lord, was created baron of Tyrawley by queen Anne, Jan. 10. 1706, being at that time a lieutenant-general, and colonel of the royal regiment of fuſileers: and the next year was made general in Spain, where this ſon, lord James, was wounded at the battle of Almanza.

Of the Bend.

16. "Azure, a Pallet Argent."

17. "Vert, an Endorſe Or."

18. "Argent, on two Pallets Sable, ſix Croſs-croſlets fitchy Or;" borne by the name of *Betunes,* of the county of Salop.

19. "Argent, two Endorſes Gules, in Chief three Mullets Sable;" borne by the name of *Vautort.*

20. "Azure, on a Pale walled with three pieces on each ſide Or, an Endorſe Sable;" borne by the name of *Sublet de Noyers,* a family of diſtinction in France.

Art. III. Of the Bend and Bend-sinister.

The Bend is an ordinary formed by two diagonal lines, drawn from the dexter-chief to the ſiniſter-baſe; and contains the fifth part of the field in breadth, if uncharged; but if charged, then the third. Its diminutives are, The bendlet, which is the half of a bend; the coſt or cotice, when two of them accompany a bend, which is the fourth part of a bend; and the riband, the moiety of a coſt, or the eighth part of the field.

There is alſo the bend-ſiniſter, which is of the ſame breadth as the bend, but drawn the contrary way: this is ſubdivided into a ſcarpe, which is the half of the bend, and into a bâton, which is the fourth part of the bend, but does not extend itſelf to the extremities of the field, there being part of it ſeen at both ends. See the examples, fig. vii.

Ex. 1. "Argent, a Bend wavy Sable;" borne by the right hon. John Wallop, earl of Portſmouth, &c. This noble earl is deſcended from the Wallops of Hampſhire, a Saxon family, who were poſſeſſed of lands to a conſiderable value in the county at the time of the conqueſt. Plate CXLVI.

2. "Checky Or, and Azure, a Bend Ermine;" borne by the right hon. John Ward, viſcount Dudley and Ward, &c. The anceſtors of this noble lord were anciently of the county of Norfolk, of which was Simon Ward, who had large poſſeſſions in the reign of Edward I. and was in France and Scotland in the reigns of king Edward II. and III.

3. "Azure, a Bend engrailed Argent, between two Cotices Or;" borne by the right hon. Matthew Forteſcue, lord Forteſcue, as alſo by the right hon. Hugh Forteſcue-Aland, baron Forteſcue, in the kingdom of Ireland, this laſt nobleman bearing a eſcheſcent in his arms for difference. The family of Forteſcue is deſcended from Sir Richard le Forte, a perſon of extraordinary ſtrength and courage, who accompanied William duke of Normandy in his invaſion of England; and bearing a ſtrong ſhield before the duke, at the battle of Haſtings, had three horſes killed under him, and from that ſignal event the name and motto of the family were aſſumed; for the Latin word *ſcutum,* or the old French word *eſcue* (a *ſhield*) being added to *forte (ſtrong),* compoſe their name; and the motto is, *Forte ſcutum ſalus ducum.*

4. "Sable, a Bend Argent between two Cotices indented Or;" borne by the name of *French.*

5. "Paly of ſix Or and Sable, a Bend counterchanged;" borne by the right hon. Frederick Calvert, baron Baltimore. The original of this family is from an ancient and noble houſe of that ſurname in the earl-

Of the Bend, &c.

dom of Flanders, whereof Sir George Calvert, knight, among other honourable employments, was secretary of ſtate to king James I. by whom he was created a baron, Feb. 20. 1624, and from whom he had a grant to him, and his heirs, of the province of Maryland and Avalon in America.

6. " Party per Bend crenelle Argent and Gules;" borne by the right hon. Edmund Boyle, earl of Cork and Orrery, &c. in the kingdom of Ireland. This noble lord is ſaid to be deſcended from Sir Philip Boyle, a knight of Arragon, who, in the reign of king Henry VI. tilted at a tournament with Sir Joſeph Aſtley, knight of the Garter.

7. " Argent, three Bendlets *enhanſed* Gules," as the Engliſh expreſs it, but the phraſe *enhanſed* is uſed by no other nation. The proper blazon of this arms is, Parted per bend, 1ſt bendy of ſix gules, and argent; 2d of the laſt. Borne by the right hon. William Byron, lord Byron. From Doomſday-book it appears, that this family was poſſeſſed of numerous manors and lands in the reign of the Conqueror; and that Sir John Byron, one of his lordſhip's anceſtors, attended king Edward III. in his wars in France.

8. " Ermine, a Bend voided Gules;" borne by the name of *Ireton*.

9. " Argent three Bendlets wavy Azure;" borne by the name of *Wilbraham*.

10. " Bendy of ſix pieces Argent and Azure". Obſerve, that when the ſhield is filled with an equal number of bendlets of metal and colour, it is called *bendy*; but if the number of them is unequal, they are to be blazoned by the name *bendlets*, and their number ſpecified.

11. " Party per Bend Azure and Argent, two Bendlets engrailed counterchanged"; borne by the name of *Frenes*.

12. " Quarterly, Or and Gules, a Bend over-all Vair;" borne by his grace Lionel Cranfield Sackville, duke of Dorſet and earl of Middleſex, &c. The anceſtors of this family were lords of the town and feigniory of Sackville in Normandy, and came over with the Conqueror when he invaded England in 1066.

13. " Gules on a Bend Argent, three Trefoils ſlipped proper;" borne by the right hon. George William Hervey, earl of Briſtol, &c. This noble lord derives his pedigree from Robert Fitz-Hervey, a younger ſon of Hervey duke of Orleans, who came over from France with William the Conqueror.

14. " Argent, on a bend Gules cotiſed Sable, three pairs of Wings conjoined of the firſt;" borne by the right hon. Richard Wingfield, viſcount Powerscourt, in the kingdom of Ireland. This noble lord is denominated from the manor of Wingfield in Suffolk, where they had a ſeat before the Norman conqueſt, called *Wingfield-caſtle*.

15. " Gules, on a Bend contre Ermine cotiſed Or, three Boars Heads couped Argent;" borne by the right hon. George Edgcumbe, lord Edgcumbe, &c. The anceſtors of this noble lord received their name from the manor of Edgcumbe in Devonſhire. One of this lord's anceſtors was Sir Richard Edgcumbe, who came over to England with the earl of Richmond, having a great ſhare in the victory he obtained over king Richard III. at Boſworth, by which the earl made his way to the throne of England.

16. " Argent, a Bend-ſiniſter Gules."

17. " Or, a Bendlet Gules."

The Feſs and Bar.

18. " Argent, a Ribband Gules.—The name of this bearing correſponds well with its form, being both long and narrow, which is the ſhape of a ribband.

19. " Azure, a Scarpe Or."—This bearing, as Guillim obſerves, is that kind of ornament called now a-days *a Scarf*, which is uſed by officers on duty, and uſually worn after the ſame manner.

20. This contains three Batons. The firſt is compony ermine and azure; ſet over the royal arms, for his grace William Fitzroy duke of Cleveland. The ſecond is compony argent and azure; ſet over the royal arms, for his grace Auguſtus Henry Fitzroy, duke of Grafton. The third is Gules, charged with three roſes argent, ſeeded and barbed proper; ſet over the royal arms, for his grace George Beauclerk, duke of St Albans. The grandfathers of theſe noble dukes being natural ſons of king Charles II. is what entitles them to the royal arms.

Art. IV. Of the Feſs and Bar.

The Feſs is an ordinary which is produced by two parallel lines drawn horizontally acroſs the centre of the field, and contains in breadth the third part thereof. Some Engliſh writers ſay it has no diminutive, for the bar is a diſtinct ordinary of itſelf.

The Bar, according to their definition, is formed of two lines, and contains but the fifth part of the field: which is not the only thing wherein it differs from the feſs; for there may be more than one in an eſcutcheon, placed in different parts thereof, whereas the feſs is limited to the centre-point; but in this the French differ from them. The bar has two diminutives: the barulet, which contains the half of the bar; and the cloſet, which is the half of the barulet. When the ſhield contains a number of bars of metal and colour alternate, of even number, that is called *barry* of ſo many pieces, expreſſing their number. See the examples, Fig. viii.

N° 1. is " Argent, a Feſs indented Sable;" borne by the right hon. John Weſt, earl Delawarr, &c. This noble family is deſcended from the Weſts, a great family in the weſt of England; but in the reign of Edward II. they appear to have been ſeized of manors and lands in the county of Warwick. Sir Thomas de Weſt, knight, one of his lordſhip's anceſtors, being at the battle of Creſſy, and there taking John the French king priſoner, had granted him, for that remarkable action, an augmentation to his atchievement, viz. a crampette or, diſtinguiſhed by the chape of a ſword in the middle; the chape being given him by the ſaid king, as an acknowledgment of his becoming his priſoner: his cognizance was a roſe parted per pale, argent, and gules; which two badges are ſtill borne in the atchievement of the preſent lord Delawarr.

Plate CXLVI.

2. " Argent, a Feſs wreathed Azure and Gules;" borne by the right hon. John Carmichael, earl of Hyndford. Of this ancient family, which is ſaid to aſſume their ſurname from the lands of Carmichael, in the county of Lanark, in Scotland, where they ſtill have their chief ſeat, was Sir John Carmichael, who accompanied Archibald, earl of Douglas, to the aſſiſtance

The Fefs and Bar.

assistance of Charles VI. of France, against the English; and signalizing his valour at the battle of Baughey in April 1421, and breaking his spear when the French and Scots got the victory, had thereupon added to his paternal coat, a dexter arm holding a broken spear, which is now the creft of the family.

3. " Party per Fefs Or and Argent, a Fefs nebule Gules;" borne by the name of *Antefhed*.

4. " Party per Fefs indented Or and Azure;" borne by the name of *Saunders*.

5. " Checky Or and Azure on a Fefs Gules, a Crefcent argent for difference;" borne by the right hon. Hugh Clifford, lord Clifford, of Chudley. This noble lord is defcended from Walter de Clifford, of Clifford-caftle, in the county of Hereford, who came over into England with the Conqueror; of which family was fair Rofamond, miftrefs to king Henry II.

6. " Argent on a Fefs Azure three Lozenges Or;" borne by the right hon. Bafil Fielding, earl of Denbigh and Defmond, &c. This noble earl is defcended from the earls of Hapfburg, in Germany. Geoffrey earl of Hapfburg, being oppreffed by Rodolph emperor of Germany, came over into England, and one of his fons ferved king Henry III. in his wars, whofe anceftors laying claim to the territories of Lauffenburg and Rhin-Filding, in Germany, he took the name of *Fielding*.

7. " Or, on a Fefs Gules, three Fleur-de-lis of the firft;" borne by the name of *Lennard*. This is in the firft and fourth quarters of the right hon. Thomas Barret Lennard lord Dacre's arms.

8. " Ermine, on a Fefs Gules, a Lion paffant Or;" borne by the right hon. John Proby, baron Carysfort, &c. in the kingdom of Ireland.

9. " Sable, a Fefs Ermine, between three Crefcents Or;" borne by the right hon. George-William Coventry, earl of Coventry, &c. This noble earl is defcended from John Coventry, a native of the city of Coventry, and afterwards mercer and lord mayor of London, in the reign of Henry V.; from whom defcended Thomas Coventry, one of the juftices of the court of common-pleas, in the reign of queen Elizabeth; whofe fon Thomas was recorder of London, and afterwards lord keeper of the great feal in the the reign of king Charles I.

" 10. Sable, a Fefs checky, Or and Azure, between three Befants;" borne by the right hon. Ridgeway Pitt, earl and baron of Londonderry, &c." Of this noble family, which were anciently of Bandfort, in the county of Dorfet, was Thomas Pitt, efq; who, in the reign of Queen Anne, was made governor of fort St George in the Eaft Indies, where he refided many years, and purchafed a diamond, which he fold to the king of France for 125,000l. Sterling, weighing 136 carats, and commonly known at this day by the name of *Pitt's diamond*.

11. " Or, on a Fefs Sable, between three Muſcovy Ducks proper, a Rofe of the Field;" borne by the right hon. John Bateman, vifcount Bateman, &c. Of this noble family, which was anciently feated at Halefbrook, near St Omers in Flanders, was Giles Bateman, efq; whofe fon was a merchant of London, and was father to Sir James Bateman, knight, who, in 1712, was chofen member of parliament for Ilcheſter in the county of Somerfet, and re-chofen in 1713.

12. " Sable, on a Fefs Argent, between three Leopards paffant guardant Or, three Efcalops Gules;" borne by the right hon. Wills Hill, earl of Hillſborough, &c. Of this family, which, in the reign of Queen Elizabeth, were of note in the county of Downe, was Sir Moſes Hill, who, during O'Neile's rebellion, was one of thoſe gentlemen who aſſociated under the earl of Eſſex to ſuppreſs it; and afterwards ſerved under Arthur, lord Chicheſter, lord deputy, and by king James I. was appointed provoſt-marſhal of the whole province of Ulſter in Ireland.

13. " Gules, two Bars Or;" borne by the right hon. Simon Harcourt, earl of Harcourt, &c. This noble earl is deſcended from the Harcourts of Normandy, who took their name from a place called *Harcourt*, in that province, where the family uſually reſided. Gervaiſe, count de Harcourt, with his two ſons Jeffrey and Arnold, came over with the conqueror, when he invaded England, in 1066.

14. " Ermine, two Bars Gules;" borne by the right hon. Thomas Nugent, earl of Weſtmeath, and baron Delvin.

15. " Argent, two Bars indented Sable;" borne by the right hon. Godart Ginkle, earl of Athlone. Godart, who was the firſt earl, was deſcended of a very ancient family in the united provinces of Holland, where he was baron de Reede and Ginkle, &c. In 1691, he was a lieutenant-general of king William's forces in Ireland; where, in June the ſame year, he took Ballymore for the Engliſh; and, in July following, the Iriſh town of Athlone, which laſt exploit is one of the greateſt recorded in hiſtory.

16. " Argent, three Bars gemels Gules;" borne by the right hon. Richard Barry, earl of Barrymore, &c. This noble family, who have been renowned for their loyalty and valour, are ſaid to derive their ſurname from the iſland of Barry, in the county of Glamorgan, in Wales; and from their riches and eſtates have been called by the people *Barrymore*, or the Great Barry.

17. " Or, a Feſs-couped Gules, between two Lions paſſant Sable;" borne by the right hon. Samuel Maſham, lord Maſham, &c. This noble lord is deſcended from Sir John Maſham, who flouriſhed in the reign of king Henry VI. and was buried at Thorneham, in the county of Suffolk, in 1455.

18. " Argent, a Lion rampant guardant Gules, debruiſed by a Feſs Azure, between three Etoiles iſſuing out of as many Creſcents of the ſecond;" borne by the right hon. Robert Dillon, earl of Roſcommon, &c. in the kingdom of Ireland. This noble family is derived from Logan, ſurnamed *Diſune* or *Delion*, which ſignifies brave and valiant, to whom the duke of Aquitaine gave his daughter in marriage, in whoſe right, after her father's death, he became prince and ſovereign of Aquitaine, which continued in his poſterity till Henry II. married Alionora, daughter and heir to William V. duke of Aquitaine, and about 1172 obtained that principality by ſuperior force; and, to prevent any diſturbance, brought Sir Henry Delion or Dillon, and his brother Thomas, then infants, to England, their father being ſlain.

19. " Or, two Bars Azure, a Chief quarterly of the ſecond and Gules, the 1ſt and 4th charged each with two Fleur-de-lis of France; the 2d and 3d with

Of the Cheveron.

a Lion of England;" borne by his grace John Manners, duke of Rutland, marquis of Granby, &c. This chief was anciently Gules; and the charge thereon is an honorary augmentation, ſhewing his grace's deſcent from the blood royal of king Edward IV.

20. "Barry of ten pieces Argent and Azure, over all ſix Eſcutcheons; 3, 2, 1, Sable, each charged with a Lion rampant of the firſt, armed, and langued Gules, a Crefcent for difference;" borne by the right hon. James Cecil, earl of Saliſbury, &c. This noble earl is deſcended from the famous *William* Cecil lord Burleigh, ſtateſman in the reigns of Edward VI. and Elizabeth. This great man left two ſons, Thomas and Robert, who were both made earls in one day, May 4. 1603. Robert, the younger ſon, anceſtor of the preſent noble lord, was created earl of Saliſbury in the morning; and Thomas, the eldeſt, earl of Exeter in the afternoon.

Of the Cheveron.

Art. V. Of the Cheveron.

The Cheveron, which repreſents two rafters of a houſe well jointed together, or a pair of compaſſes half open, takes up the fifth part of the field with the Engliſh, but the French give it the third. Its diminutives are, The cheveronel, which contains the half of a cheveron; and the couple-cloſe, which is the half of a cheveronel, that is, its breadth is but the fourth part of a cheveron. Leigh obſerves, that this laſt diminutive is never borne but in pairs, or with a cheveron between two of them. The French have but one diminution of this ordinary called *Etaye*, containing the third part of its breadth.

Examples of cheverons are given in fig. ix. viz.

Plate CXLVI.

1. "Argent, a Cheveron Gules between three Torteaux;" borne by the right hon. Bennet Sherrard, earl of Harborough, &c. This noble earl is lineally deſcended from Scherard, who was poſſeſſed of manors and lands to a great value in the counties of Cheſhire and Lancaſhire in the reign of William the Conqueror. Geoffrey, another of this earl's anceſtors, was three times ſheriff of Rutlandſhire, in the reigns of king Edward IV. and king Richard III.

2. "Sable, a Cheveron between three Etoiles Argent;" borne by the right hon. Marmaduke Langdale, lord Langdale. This noble lord is deſcended from the Langdales of Yorkſhire, who reſided at the town of Langdale, from whence they took their name, in the reign of king John; but his anceſtor, who makes the greateſt figure in hiſtory, is Sir Marmaduke Langdale, who raiſed forces in the north of England in defence of king Charles I. was victorious in numberleſs battles and ſieges, and when his Majeſty, by the united forces of England and Scotland, was at length overpowered, he attended king Charles II. in his exile, and returned to England with his Majeſty at the reſtoration.

3. "Sable, a Cheveron between three Leopards Heads Or;" borne by the right hon. William Wentworth, earl of Strafford, &c. All genealogiſts agree, that the name of *Wentworth* is of Saxon original, and taken from the manor of Wentworth in Yorkſhire, where, in the reign of William the Conqueror, lived Reginald de Wenteworde, as it is ſpelt in doomſday-book.

4. "Argent, a Cheveron between three Griffons paſſant Sable, a Creſcent for difference;" borne by the right hon. Heneage Finch, earl of Ailesford, &c. This family is deſcended from Herbert Fitz-Herbert, earl of Pembroke, and chamberlain to king Henry I. They took the name of *Finch* in the reign of king Edward I. One of the anceſtors of the preſent earl was the right hon. Heneage Finch, earl of Nottingham, who was conſtituted lord high-chancellor of England in 1675; and lord high-ſteward on the trials of Philip earl of Pembroke, and William viſcount Stafford, in 1680.

Of the Cheveron.

5. "Azure, a Cheveron Ermine, between three Eſcalops Argent;" borne by the right hon. George Townſhend, viſcount Townſhend, &c. This family is of Norman extraction, and came into England about the time of the conqueſt. Charles, lord viſcount Townſhend, grandfather of the preſent viſcount, was appointed principal ſecretary of ſtate in the reign of king George I. in 1720, and continued ſo to the end of his majeſty's reign; when, upon reſigning the ſeals, they were returned to him again by his late majeſty king George II. who continued him in that honourable office to the year 1730.

6. "Azure, a Cheveron between three Mullets Or;" borne by the right hon. John Chetwind, viſcount Chetwind, &c. of the kingdom of Ireland. Of this family, which hath been of great antiquity in the county of Salop, taking their ſurname from Chetwynd in that county, was Adam de Chetwynd, who married Agnes daughter of John lord Lovel, baron of Dockinges, and lord of Minſter Lovel in Oxfordſhire; and by her had iſſue Sir John de Chetwynd, who, in the 37th of Henry III. had a charter of free-warren thro' all his demeſne in the counties of Salop, Stafford, and Warwick.

7. "Argent, a Cheveron Gules, between three ſquare Buckles Sable;" borne by the right hon. Matthew Ducie-Morton, lord Ducie, &c. This noble lord is deſcended from the Ducies in Normandy. After they came into England, king Edward I. conferred on them the lordſhip of Morton in Staffordſhire, and ſeveral other lordſhips and manors, which the family enjoyed for many years. Sir Robert Ducie, one of his lordſhip's anceſtors, was lord-mayor of London in the reign of king Charles I. and though he lent his majeſty L. 80,000, which was loſt by the king's being driven out of London, he died, however, worth L. 400,000.

8. "Argent, a Cheveron Checky Gules, and of the Field, between three Bugle-horns ſtrung Sable, garniſhed of the ſecond;" borne by the right hon. lord Hugh Semple, lord Semple. The principal family of this name was Semple of Elliotſton in Renfrew, where they had large poſſeſſions and offices, as ſtewards and bailiffs under the family of Stewart, proprietors of that county before they came to the crown. The firſt lord Semple was Sir Robert, who, being much in favour with king James IV. was by him created lord Semple in 1489.

9. "Argent, a Cheveron engrailed between three Lions paſſant Sable;" borne by the right hon. and the reverend Philip Smithe, viſcount Strangford. One of this lord's anceſtors was John Smithe, eſq; who acquired a conſiderable eſtate whilſt he was farmer of the cuſtoms in the reign of Henry VIII. He left two

ſons,

Of the Cheveron.

fons, John and Sir Thomas, which laſt was ſent ambaſſador by king James I. to the empreſs of Ruſſia.

10. " Quarterly Argent and Azure, a Cheveron engrailed counter-changed;" borne by the name of *Chamber*.

11. " Party per Cheveron engrailed Gules and Argent, three Talbots Heads eraſed counter-changed;" borne by the right hon. Anthony Duncombe, lord Feverſham, &c. His lordſhip is deſcended from the Duncombes of Barley-end in Buckinghamſhire. Sir Charles Duncombe, uncle to the preſent lord, was lord-mayor of London in 1709; and this nobleman was created lord Feverſham and baron of Dowton in Wiltſhire, June 23, 1744.

12. " Paly of ſix, Argent and Gules, on a Cheveron Azure, three Croſs-croſlets Or;" borne by the right hon. George Carpenter, baron Carpenter, of Killaghy in Ireland. This ancient and noble family are of great antiquity in the county of Hereford, and have been lords of the manor of the Home in the pariſh of Delwyn, near Weobly, for above 300 years. George, the firſt lord Carpenter, was ſo created May 4. 1719.

13. " Azure, on a Cheveron Or, between three Beſants, a Bay Leaf Proper;" borne by the right hon. James Hope, earl of Hopeton, &c. This noble family is deſcended from Henry Hope, a native of Holland, who, about two centuries ago, came over and ſettled in Scotland. Charles Hope, eſq; father of the preſent earl, was created an earl by queen Anne, April 15. 1703.

14. " Vert, on a Cheveron between three Unicorns Heads eraſed Argent, horned and maned Or, three Mullets Sable;" borne by the name of *Ker*, being the 1ſt and 4th quarters in the arms of his grace John Ker, duke of Roxburgh, &c. This ancient family is ſaid to come from Normandy. John Ker, marquis of Beaumont and Ceſford, the firſt duke of Roxburgh, was ſo created April 27. 1707.

15. " Azure, on a Cheveron Or, between three Bears Heads couped Argent, muzzled Gules, a Roebuck's Head eraſed, between two Hands holding Daggers all proper;" borne by the right hon. Donald Mackay, lord Reay. This family is ſaid to derive their deſcent from Alexander, a younger ſon of Ochonacker, who, about the end of the twelfth century, came from Ireland; and the fourth in deſcent from him was Donald of Strathnavern, whoſe ſon was named *Y More:* and from him began the ſurname of *Mac Y, Mackie*, or *Mackay*. Donald, the firſt lord of this family, was created baronet in 1625, and on June 20. 1628, was created baron Reay of the county of Caithneſs, by Charles I.

16. " Ermine, on a Cheveron Azure, three Foxes Heads eraſed Or, and in a Canton of the ſecond a Fleur-de-lis of the third;" borne by the right hon. Stephen Fox, earl of Ilcheſter, &c. Of the family of Fox there have been many perſons of note living in the counties of Dorſet, Somerſet, Wilts, and Hants, particularly Richard Fox, biſhop of Wincheſter. His lordſhip was created lord Ilcheſter and baron Strangeways, May 11. 1741, 14 Geo. II. and earl of Ilcheſter in June 1756.

17. " Or, two Cheveronels Gules;" borne by the right hon. John Monſon, lord Monſon. This noble lord is deſcended from John Monſon, who flouriſhed in the reign of king Edward III. from whom deſcended another John, who attended king Henry V. in his wars in France. Sir John Monſon, bart. father of the preſent lord, was created lord Monſon, May 28, 1728.

Of the Croſs.

18. " Or, on a Feſs, between two Cheveronels Sable, three Croſs-croſlets of the firſt;" borne by the right hon. George Walpole, earl of Orford, &c. This family took their name from Walpole in Norfolk, where they reſided before the conqueſt. Sir Robert Walpole was, in king George II.'s reign, elected knight of the garter in 1726, and created earl of Orford, February 9. 1741-2.

19. " Azure, three Cheveronels interlaced Or, and a Chief of the laſt;" borne by the name of *Fitz-Hugh*.

" 19. Argent, three Cheveronels Gules, in Chief a Label Azure;" borne by the right hon. William Wildman Barrington, viſcount Barrington, &c. This family is of Norman extraction; in which duchy, whilſt it continued annexed to the Engliſh crown, there were to be ſeen the remains of a caſtle bearing the name of *Chute* or *Shute*, and formerly in the family, with other monuments in ſeveral towns of that dutchy. John Shute, the late viſcount Barrington, was in 1708 made a commiſſioner of the cuſtoms, and ſucceeded to the eſtates of Francis Barrington, Eſq; and of John Wildman of the county of Berks, who made him their heir; and, in purſuance of the will of the former, he took the name and arms of *Barrington*. On June 11, 1720, he was created viſcount Barrington, with a reverſionary grant of the office of maſter of the rolls in Ireland.

Art. VI. Of the Croſs.

The *Croſs* is an ordinary formed by the meeting of two perpendicular with two horizontal lines in the feſs-point, where they make four right-angles; the lines are not drawn throughout, but diſcontinued the breadth of the ordinary, which takes up only the fifth part of the field when not charged; but if charged, then the third. It is borne as well engrailed, indented, &c. as plain.

There is ſo great a variety of croſſes uſed in heraldry, that it would be a very difficult taſk to treat of them all. Guillim has mentioned 39 different ſorts; De la Columbiere, 72; Leigh, 46; and Upton declares he dares not aſcertain all the various croſſes borne in arms, for that they are almoſt innumerable: therefore, as all their forms cannot be expected here, we will only take notice of ſuch as are moſt commonly ſeen at preſent in coats-of-arms. See Fig. x.

The firſt is " Quarterly, Ermine and Azure, a Croſs Or;" borne by his grace Thomas Oſborne duke of Leeds, &c. This noble duke is deſcended from the honourable family of the Oſbornes of Aſhford, in the county of Kent; Sir Thomas Oſborne, the grandfather to the preſent duke, was advanced to the peerage by king Charles II. Plate CXLVI.

2. " Gules, a Croſs engrailed Argent, a Lozenge in the dexter-chief of the ſecond;" borne by the right hon. Edward Leigh, lord Leigh. This family took their ſurname from the town of High-Leigh in Cheſhire, where they reſided before the Norman Conqueſt. Sir Thomas Leigh, the firſt lord of this family, was created

Of the Crofs.

created baron Leigh of Stonely, by king Charles I. on July 1, 1643.

3. "Gules, a Crofs Argent fretty Azure;" borne by the right hon. Nicholas Taaffe, vifcount Taaffe, of Corran, &c. in Ireland. Of this noble and ancient family was Richard Taaffe, who lived in 1282; as in 1306 did John Taaffe, who was archbifhop of Armagh; and, in 1479, the order of the Garter being eftablifhed in Ireland, Sir Nicholas Taaffe was one of the firft members; and John, his fon and heir, was created a baron and vifcount by Charles I. Auguft 1, 1628.

4. "Sable, a Crofs raguly Or;" borne by the name of *Stoway*.

5. "Argent, on a Crofs Sable a Leopard's-face Or;" borne by his grace Henry Brydges duke of Chandos, &c. The anceftors of this noble family took their name from the city of Bruges in Flanders; and one of them came over with William the Conqueror, and had a conliderable fhare in the victory obtained near Haftings in Suffex, 1066. James, the father of the prefent duke, was created vifcount Wilton and earl of Caernarvon, October 19, 1714; and marquis of Cearnarvon and duke of Chandos, —— 30, 1719.

6. "Or, on a Crofs Sable, a patriarchal Crofs of the Field;" borne by the right hon. Thomas Vefey, baron of Knapton in the kingdom of Ireland. The truly noble family of Vefcey or Vefey, derives its origin from Charles the Great, king of France, and emperor of the weft, who died at Aix-la-Chapelle in Germany, Jan. 28, 814. His lordfhip's father was created a peer April 10, 1750.

7. "Argent, on a Crofs Gules, five Efcalops Or;" borne by the right hon. William Villiers earl of Jerfey, &c. This noble earl is defcended from the family of Villiers in Normandy, fome whom came over to England with the Conqueror; feveral manors and lands in England being foon after granted to Pagan de Villiers, one of this earl's anceftors. The firft peer of this family was created a baron and vifcount, March 20, 1690.

8. "Sable, on a Crofs within a Bordure engrailed Or, five Pellets;" borne by the right hon. Francis Greville, earl of Brooke and Warwick, &c. The anceftors of this noble family are of Norman extraction, and came over with William the Conqueror, who conferred manors and land on them in England, of a conliderable value; and at length they obtained the government of the caftle of Warwick, the prefent feat of the family. Sir Fulke, the firft peer of this family, was created baron Brooke by king James I. Jan. 9, 1620.

9. "Argent, a Crofs botonny Sable;" borne by the name of *Winwood*.

10. "Or, a Crofs-croflet Gules;" borne by the name of *Taddington*.

11. "Azure, a Crofs potent fitchy Or." This enfign is faid to have been borne by Ethelred king of the Weft-Saxons; and croffes of this fort are frequently met with in coats-of-arms.

12. "Party per pale, Gules and Argent; a Crofs potent quadrate in the centre, between four Croffes pattee counter-changed;" the arms of the epifcopal fee of Litchfield and Coventry. This fee was originally fixed at Litchfield; from thence removed to Chefter, and from both to Coventry. It contains the whole county of Stafford, except two parifhes; all Derbyfhire; the better part of Warwickfhire, and near half Shropfhire; divided into the four archdeaconries of Coventry, Stafford, Derby, and Salop. The parifhes are 557 in number; but, including chapels, they amount to 643.

Of the Crofs.

13. "Azure, a Crofs moline Argent;" borne by his grace William Henry Bentick, duke of Portland, &c. This noble duke is defcended from a very ancient and diftinguifhed family in the United Provinces of Holland, of which was William Bentick, Efq. who, in his youth was page of honour to William prince of Orange, afterwards William III. king of Great Britain, and, on the acceffion of William and his conforf, was made groom of the ftole, privy-purfe to his majefty, lieutenant-general of his majefty's army, &c. and alfo created baron of Cirencefter, vifcount Woodftock, and earl of Portland, April 19. 1689.

14. "Argent, a Crofs patonce Sable;" borne by the name of *Rice*.

15. "Sable, a Crofs patee Argent;" borne by the name of *Maplefden*.

16. "Azure, a Crofs flowery Or;" borne by the name of *Cheney*.—This is faid to have alfo been the arms of Edwine, the firft Chriftian king of Northumberland.

17. "Argent, fix Crofs croflets fitchy 3, 2, 1, Sable, on a Chief Azure, two Mullets pierced Or;" borne by his grace Henry Clinton, duke of Newcaftle, &c. This noble family is defcended from Jeffrey de Clinton, lord chamberlain and treafurer to king Henry I. grandfon to William de Tankerville, chamberlain of Normandy; from whom defcended William de Clinton, chief juftice of Chefter, governor of Dover caftle, lord Warden of the king's foreffs fouth of Trent. Edward, lord Clinton, another of this noble earl's anceftors, was conftituted lord high-admiral of England for life, in the reign of queen Elizabeth, who created him earl of Lincoln, May 4. 1572.

18. "Gules, a Cheveron between ten Croffes pattee, fix above and four below, Argent;" borne by the right hon. Frederick-Auguftus Berkely, earl of Berkeley, &c. This noble family is defcended from Robert Fitz-Harding, who obtained a grant of Berkeley-caftle in Glouceterfhire, which the family ftill inherits, and from whence they obtained the furname of *Berkeley*, from Henry duke of Normandy, afterwards king of England; the faid Robert Fitz-Harding was defcended from the royal line of the kings of Denmark.

19. "Azure, three Mullets Or, accompanied with feven Crofs-croflets fitchy Argent, three in Chief, one in Fefs, two in Flanks, and the laft in Bafe;" borne by the right hon. James Somerville, lord Somerville. The firft of this name on record is Sir Walter de Somerville, lord of Wichnore, in the county of Stafford, who came to England with William the Conqueror. About the beginning of the reign of king William, in 1170, the Somervilles were poffeffed of a fair eftate in the county of Lanark and elfewhere.

20. "Gules, three Croffes recercelée, voided Or, a Chief vairy ermine and contre ermine;" borne by the

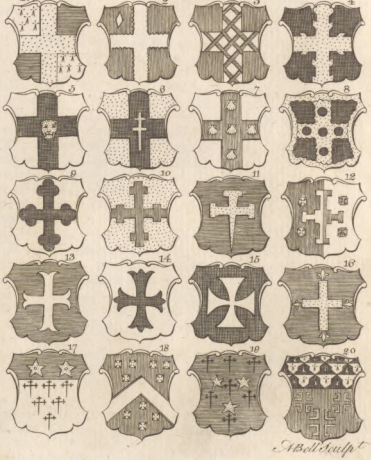
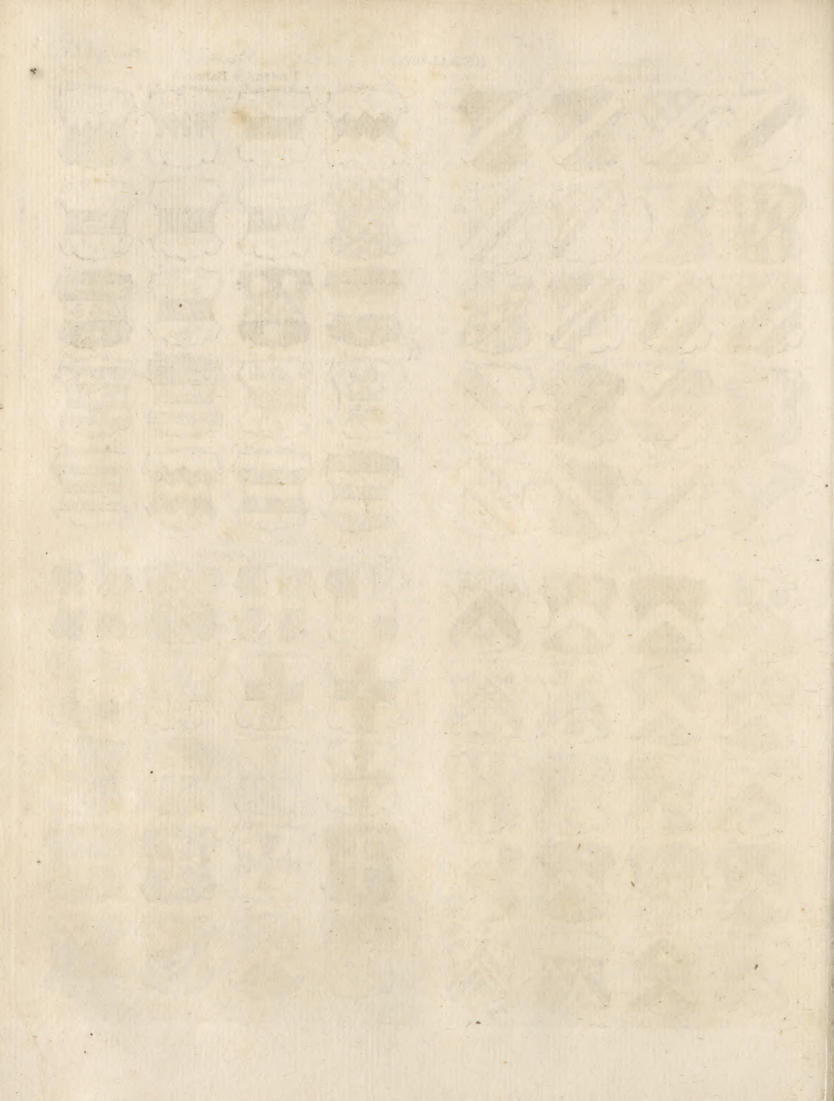
CROSSES.





Of the Saltier.

the right hon. John-Peyto Verney, baron Willoughby de Broke. This noble lord is deſcended from William de Vernai, who flouriſhed in the reign of king Henry I. 1419.

ART. VII. Of the SALTIER.

THE Saltier, which is formed by the bend and bend-ſiniſter croſſing each other in right angles, as the interſecting of the pale and feſs forms the croſs, contains the fifth part of the field, but if charged then the third. In Scotland, this ordinary is frequently called a *St Andrew's croſs*. It may, like the others, be borne engrailed, wavy, &c. as alſo between charges or charged with any thing. See examples, fig. xi.

Plate CXLVII.

N° 1. is "Argent, a Saltier Gules;" borne by his grace James Fitz-Gerald, duke of Leinſter, &c. This noble lord is deſcended from Otho, or Other, a rich and powerful lord in the time of king Alfred, deſcended from the dukes of Tuſcany; who paſſing from Florence into Normandy, and thence into England, there the family flouriſhed, until Richard Strongbow, earl of Pembroke, their kinſman, engaged them to partake in his expedition to Ireland, in which Maurice Fitz-Gerald embarked, and was one of the principal conquerors of that kingdom, for which he was rewarded with a great eſtate in lands in the province of Leinſter, and particularly the barony of Offaley, and the caſtle of Wicklow; and died, covered with honours, in the year 1177, 24 Henry II.

2. "Gules, a Saltier Argent, between twelve Croſs croſſets Or;" borne by the right hon. Other-Lewis Windſor Hickman, earl of Plymouth, &c. This noble earl is deſcended from Robert Fitz-Hickman, lord of the manor of Bloxham, Oxfordſhire, in the 56 Hen. III. 1272; and he is maternally deſcended from the noble family of the Windſors, who were barons of the realm at the time of the conqueſt.

3. "Vert, a Saltier wavy Ermine:" borne by the name of *Wakeman* of Beckford, in Glouceſterſhire.

4. "Ermine, a Saltier counter-compony Or and Gules;" borne by the name of *Ulmſton*.

5. "Argent, a Saltier Azure with a Bezant in the centre:" borne by the right hon. Philip Yorke, earl of Hardwicke, &c. He was in October 1733 conſtituted lord chief-juſtice of the king's bench, and November 23, in the ſame year, created baron Hardwicke of Hardwicke.

6. "Argent on a Saltier Gules an Eſcallop Or;" the arms of the biſhoprick of Rocheſter—This Dioceſe, the leaſt in England, comprehends only a ſmall part of Kent, in which there are 150 churches and chapels; and the two pariſhes in Iſelham in Cambridgeſhire, and Frekenham in Suffolk. It has only one archdeacon, that of Rocheſter. For many years it was in the immediate patronage of the archbiſhop of Canterbury.

7. "Party per Saltier, Azure and Argent, on a Saltier Gules a Creſcent of the ſecond for difference;" quartered by the right hon. William Hall Gage, viſcount Gage, of Caſtle-Iſland in Ireland. This noble family is of Norman extraction, and derives deſcent from de Gaga or Gage, who attended William I. in his expedition to England: and, after the conqueſt thereof, was rewarded with large grants of lands in the foreſt of Dean, and county of Glouceſter, near which foreſt he fixed his reſidence, by building a ſeat at Clerenwell, in the ſame place where the houſe of Gage now ſtands: he alſo built a great houſe in the town of Cirencester, at which place he died, and was buried in the abbey there. Sir Thomas Gage, the eighth baronet, and father to the preſent lord Gage, was created baron of Caſtle-Bar, and viſcount Gage, 1721.

Of the Saltier.

8. "Gules, on a Saltier Argent, a Roſe of the firſt barbed and ſeeded proper;" borne by the right hon. George Neville, lord Abergavenny, premier baron of England.

9. "Or, on a Saltier Azure, nine Lozenges of the firſt;" the paternal arms of the right hon. John Dalrymple, earl of Stair, &c. Of this family, which took their ſurname from the barony of Dalrymple, lying on the river Dun in Ayrſhire, Scotland, was Adam de Dalrymple, who lived in the reign of Alexander III.

10. "Argent, on a Saltier engrailed Sable, nine Annulets Or;" borne by the name of Leak.

11. "Gules, a Saltier between four Creſcents Or;" borne as the 2d and 3d quarters in the coat-of-arms of the right hon. Charles Kinnaird, lord Kinnaird. George Kinnaird, eſq; one of the preſent lord's anceſtors, being of great ſervice to king Charles II. during the uſurpation of Oliver Cromwell, he was by that prince, at his reſtoration, made one of the privy-council; and December 28. 1682, created a baron.

12. "Argent, a Saltier engrailed between four Roſes Gules," for Lennox; and borne as 1ſt and 4th quarters in the coat-of-arms of the right hon. Francis Napier, lord Napier. This family is ſaid to be deſcended from the ancient thanes or ſtewards of Lennox in Scotland, but took their ſurname of Napier from the following event. King David II. in his wars with the Engliſh, about the year 1344, convocating his ſubjects to battle, the earl of Lennox ſent his ſecond ſon Donald, with ſuch forces as his duty obliged him; and, coming to an engagement, where the Scots gave ground, this Donald, taking his father's ſtandard from the bearer, and valiantly charging the enemy with the Lennox men, the fortune of the battle changed, and they obtained the victory; whereupon every one advancing, and reporting their acts, as the cuſtom was, the king declared they had all behaved valiantly, but that there was one among them who had *na pier*, that is, no equal; upon which the ſaid Donald took the name of Napier, and had, in reward for his good ſervices, the lands of Goſfield, and other eſtates in the county of Fife.

13. "Gules, a Saltier Or, ſurmounted of another Vert," for the name of *Andrews*; and borne by Sir William Andrews, bart. of Denton in Northamptonſhire, who is deſcended from Sir Robert Andrews of Normandy, knight, who came into England with William the Conqueror. Sir William Andrews, the firſt baronet of this family, was created December 11, 1641.

14. "Azure, a Saltier quarterly quartered Or and Argent." The arms of the epiſcopal ſee of Bath and Wells.—The dioceſe of Bath and Wells contains all Somerſetſhire, except a few churches in Briſtol. And in it there are three archdeaconries, viz. thoſe of Wells, Bath, and Taunton. The number of the pariſhes is 388, though, according to ſome, the total number of the churches and chapels amounts to 503.

Sub-Ordinaries.

15. "Party per Saltier Argent and Gules, a Saltier counter-changed."

16. "Party per Pale indented Argent and Sable, a Saltier counter-changed;" borne by the name of *Scote*.

17. "Argent, three Saltiers couped and engrailed Sable;" borne by the name of *Benton*.

18. "Argent, a Saltier Gules, and a Chief Ermine;" borne by the right hon. Francis Thomas Fitz-Maurice, earl of Kerry, &c. This very ancient and noble family is a branch of the family of Kildare, who are originally deſcended from the great duke of Tuſcany, and of which was Otho, a noble baron of Italy, whoſe ſon Walter, attending the Norman Conqueror into England, was made conſtable of the caſtle of Windſor. Raymond, one of the preſent earl's anceſtor's, had a principal hand in the reduction of Ireland to the ſubjection of Henry II. and Dermoid Mac-Carty, king of Cork, fought his aid againſt his ſon Cormac O'Lehanagh, which he undertook, and delivered the king from his rebellious ſon; for which that prince rewarded him with a large tract of land in the county of Kerry, where he ſettled his ſon Maurice, who gave his name to the county, which he called *Clan Maurice*, and is enjoyed by the preſent earl of Kerry, who is viſcount Clan Maurice. Thomas the firſt earl, and father of the laſt, was the 21ſt lord Kerry, who was created earl, January 17. 1722.

19. "Sable, a Saltier Argent, on a Chief Azure, three Fleurs-de-lis Or;" borne by the right hon. John Fitz-Patrick, earl of Upper Oſſory, and baron of Gowran in Ireland. This moſt ancient and princely family is deſcended from Heremon, the firſt monarch of the Mileſian race in Ireland; and after they had aſſumed the ſurname of Fitz-Patrick, they were for many ages kings of Oſſory, in the province of Leinſter. John, the firſt earl of this family, ſucceeded his father Richard as lord Gowran, June 9. 1727, was created earl, October 5. 1751, and died 1758.

20. "Party per Pale Argent and Gules, three Saltiers counter-changed;" borne by the name of *Lane*. Theſe arms are alſo borne, without the leaſt alteration, by the name of *Kingſman*; for which ſimilitude we can no otherwiſe account, than by ſuppoſing there has been ſome miſtake made through many tranſcriptions.

Sect. II. *Of Sub-Ordinaries.*

Besides the honourable ordinaries and the diminutions already mentioned, there are other heraldic figures, called *ſub-ordinaries*, or *ordinaries* only, which, by reaſon of their ancient uſe in arms, are of worthy bearing, viz. The Gyron, Franc-quarter, Canton, Pairle, Fret, Pile, Orle, Ineſcutcheon, Treſſure, Annulet, Flanches, Flaſques, Voiders, Billet, Lozenge, Gutts, Fuſil, Ruſtre, Maſcle, Papillone, and Diaper. See Plate CXLIV. fig. i. (A.)

The Gyron is a triangular figure formed by two lines, one drawn diagonally from one of the four angles to the centre of the ſhield, and the other is drawn either horizontal or perpendicular, from one of the ſides of the ſhield, meeting the other line at the centre of the field.

Gyronny is ſaid, when the field is covered with ſix, eight, ten, or twelve gyrons in a coat-of-arms: but a French author would have the true gyronny to conſiſt of eight pieces only, as in the fig. which repreſents the coat-of-arms of the right hon. John Campbell, earl of Loudon, &c. whoſe anceſtor was created baron of Loudon in 1604 by James VI. and earl of the ſame place, May 12. 1633, the 9th of Charles I. Sub-Ordinaries.

The Franc-quarter is a ſquare figure, which occupies the upper dexter quarter of the ſhield. It is but rarely carried as a charge. Silveſtra Petra Sancta has given us a few inſtances of its uſe.

The Canton is a ſquare part of the eſcutcheon, ſomewhat leſs than the quarter, but without any fixed proportion. It repreſents the banner that was given to ancient knights-bannerets, and, generally ſpeaking, poſſeſſes the dexter-chief-point of the ſhield, as in the fig.; but ſhould it poſſeſs the ſiniſter-corner, which is but ſeldom, it muſt be blazoned a canton-ſiniſter.

James Coats reckons it as one of the nine honourable ordinaries, contrary to moſt heralds opinion. It is added to coats-of-arms of military men as an augmentation of honour: thus John Churchill, baron of Eymouth in Scotland, and one of the anceſtors of the preſent duke of Marlborough, being lieutenant general to king James II. received from him a canton argent, charged with the red croſs of England, added to his paternal coat, "which is Sable, a lion rampant Argent."

The pairle is a figure formed by the conjunction of the upper half of the faltier with the under half of the pale.

The fret is a figure repreſenting two little ſticks in faltier, with a maſcle in the centre interlaced. J. Gibbon terms it the *heralds true-lover's knot.*; but many diſſent from his opinion.

Fretty is ſaid when the field or bearings are covered with a fret of ſix, eight, or more pieces, as in the fig. The word *fretty* may be uſed without addition, when it is of eight pieces; but if there be leſs than that number, they muſt be ſpecified.

The pile, which conſiſts of two lines, terminating in a point, is formed like a wedge, and is borne engrailed, wavy, &c. as in the fig. It iſſues in general from the chief, and extends towards the baſe, yet there are ſome piles borne in bend, and iſſuing from other parts of the field, as may be ſeen in Plate CXLVII. fig. xii. n° 12, &c.

The Orle is an ordinary compoſed of two lines going round the ſhield, the ſame way as the bordure, but its breadth is but one half of the latter, and at ſome diſtance from the brim of the ſhield, as in the fig.

The Inecſutcheon is a little eſcutcheon borne within the ſhield; which, according to Guillim's opinion, is only to be ſo called when it is borne ſingle in the eſcutcheon or centre; ſee the fig. on Plate CXLIV. but modern heralds, with more propriety, give the name of *ineſcutcheon* to ſuch as are contained in Plate CXLVII. fig. xii. n° 2. and call that which is fixed on the eſcutcheon-point *eſcutcheon of pretence*, which is to contain the arms of a wife that is an heireſs, as mentioned above.

The *Treſſure* is an ordinary commonly ſuppoſed to be the half of the breadth of an orle, and is generally borne flowery and counter-flowery, as it is alſo very often double, and ſometimes treble. See the fig. (Plate CXLIV.). This double treſſure makes part of the arms of Scotland, as marſhalled in the royal atchieve-

Sub-Ordinaries.

chievement, Plate CXLIX. fig. xxi. n° 7. and was granted to the Scots kings by Charlemagne, being then emperor and king of France, when he entered in a league with Achaius king of Scotland, to ſhew that the French lilies ſhould defend and guard the Scottiſh lion.

The Annulet, or ring, is a well-known figure, and is frequently to be found in arms through every kingdom in Europe.

Plate CXLIV.

The Flanches are formed by two curved lines, or ſemicircles, being always borne double. See the figure. G. Leigh obſerves, that on two ſuch Flanches two ſundry coats may be borne.

The Flaſques reſemble the flanches, except that the circular lines do not go ſo near the centre of the field; (ſee the figure). J. Gibbon would have theſe two ordinaries to be both one, and wrote *flank*; alleging, that the two other names are but a corruption of this laſt: but as G. Leigh and J. Guillim make them two diſtinct and ſubordinate ordinaries, we have inſerted them here as ſuch.

The Voiders are by Guillim conſidered as a ſubordinate ordinary, and are not unlike the flaſques, (ſee the figure,) but they occupy leſs of the field.

The Billet is an oblong ſquare figure, twice as long as broad. Some heralds imagine, that they repreſent bricks for building; others more properly conſider them as repreſenting folded paper or letters.

The Lozenge is an ordinary of four equal and parallel ſides, but not rectangular; two of its oppoſite angles being acute, and the other two obtuſe. Its ſhape is the ſame with thoſe of our window-glaſſes, before the ſquare came ſo much in faſhion. See the figure.

Gutts, or drops, are round at bottom, waved on the ſides, and terminate at the top in points. Heralds have given them different names according to their different tinctures: thus if they are

Yellow	they are called	*d' Or*
White		*de Eau*
Red		*de Sang*
Blue		*de Larmes*
Green		*de Vert*
Black		*de Poix*

The fuſil is longer than the lozenge, having its upper and lower part more acute and ſharp than the other two collateral middle parts, which acuteneſs is occaſioned by the ſhort diſtance of the ſpace between the two collateral angles; which ſpace, if the fuſil is rightly made, is always ſhorter than any of the four equal geometrical lines whereof it is compoſed. See the fig. *ibid.*

The Ruſtre is a lozenge pierced round in the middle; (ſee the figure.) They are called by the Germans, *rutten*. Meneſtrier gives an example of them in the arms of Lebaret in France, argent three ruſtres azure.

The Maſcle is pretty much like a lozenge, but voided or perforated through its whole extent, ſhewing a narrow border, as in the figure. Authors are divided about its reſemblance; ſome taking it for the maſh of a net, and others for the ſpots of certain ſtints found about Rohan; and as no writer has given a clearer account in ſupport of this laſt opinion than Colombiere, author of *La Science Heraldique*, we ſhall tranſcribe it for the ſatisfaction of the curious.

" Rohan (ſays he) bears Gules, nine Maſcles Or, 3, 3, 3. Opinions have varied very much about the original of the maſcles or maſhes, as being ſomewhat like the maſhes of nets: but for my own part, having often obſerved that thoſe things which are remarkable and ſingular in ſome countries, have ſometimes occaſioned the lords thereof to repreſent them in their eſcutcheons, and to take them for their arms, I am of opinion, that the lords of Rohan, who, I believe, are the firſt that bore theſe figures in their arms, tho' deſcended from the ancient kings and princes of Bretagne, took them, becauſe in the moſt ancient viſcounty of Rohan, afterwards erected into a duchy, there are abundance of ſmall ſtints, which being cut in two, this figure appears on the inſide of them; as alſo the carps, which are in the fiſh-ponds of that duchy, have the ſame mark upon their ſcales; which, being very extraordinary and peculiar to that country, the ancient lords of the ſame had good reaſon, upon obſerving that wonder, to take thoſe figures for their arms, and to tranſmit them to their poſterity, giving them the name of *macles*, from the latin word *macula*, ſignifying a ſpot; whence ſome of that houſe have taken for their motto, *Sine macula macla*, that is, A maſcle without a ſpot."

Sub-Ordinaries.

Papillone is an expreſſion uſed for a field or charge that is covered with figures like the ſcales of a fiſh. Monſ. Baron gives as an example of it the arms of Monti Gueules Papelone d'Argent. The proper term for it in Engliſh would he *ſcallop-work*.

Diapering is ſaid of a field or charge ſhadowed with flouriſhings or foliage with a colour a little darker than that on which it is wrought. The Germans frequently uſe it; but it does not enter into the blazoning or deſcription of an arms, it only ſerves to embelliſh the coat.

If the fore-mentioned ordinaries have any attributes, that is, if they are engrailed, indented, wavy, &c. they muſt be diſtinctly ſpecified, after the ſame manner as the honourable ordinaries.

See examples of ſub-ordinaries, &c. fig. xii.

Plate CXLVII.

1. " Gules, an Orle Ermine;" borne by the name of *Humfranville*.

2. " Argent, three Ineſcutcheons Gules;" borne by the name of *Hay*, and the 2d and 3d quarters in the coat-of-arms of the right hon. Thomas Hay, earl of Kinnoul, &c.—The firſt of the name of Hay that bore theſe arms, got them, as Mr Niſbet obſerves, becauſe he and his two ſons, after having defeated a party of the Danes at the battle of Loncarty, *anno* 942, were brought to the king with their ſhields all ſtained with blood.

3. " Argent, a Fret Sable;" borne by the right hon. Lionel Talmaſh, earl of Dyſart, &c. This family was advanced to the peerage by king Charles I. in 1646.

4. " Or, fretty of Gules, a Canton Ermine;" borne by the right hon. Henry Noel, earl of Gainſborough, &c. This nobleman is deſcended from —— Noel, who came into England with William the Conqueror, and, in confideration of his ſervices, obtained a grant of ſeveral manors and lands of very great value. Sir Edward, who was knighted by king James on his acceſſion to the throne, and created a baronet June 29, 1611, was the firſt advanced to the honour of baron Noel, March 23, 1616.

5. " Girony of eight Pieces Or and Sable;" the

1ſt and 4th quarters of the coat-of-arms of the right hon. John Campbell, earl of Breadalbane, &c. This ancient and noble family is deſcended, in a regular ſucceſſion, from Duncan the firſt Lord Campbell, anceſtor of the family of Argyll. John, the firſt earl, in conſideration of his perſonal merit, was, from a baronet, created lord Campbell, viſcount Glenorchie, and earl of Breadalbane, Jan. 28. 1677, by Charles II.

6. " Lozengy Argent and Gules;" borne by the right hon. George Fitz-William, earl Fitz-William, &c. This noble earl is deſcended from Sir William Fitz-William, marſhal of the army of William the Conqueror at the battle of Haſtings in Suſſex, by which victory that prince made his way to the throne.

7. " Sable, a Maſcle within a Treſſure flowery Argent;" borne by the name of *Hoblethorne*.

8. " Gules, three Mullets Or, within a Bordure of the latter, charged with a double Treſſure flowery and counter-flowery with Fleurs-de-lis of the firſt;" borne by the right hon. William Sutherland, earl of Sutherland, &c. According to the traditional account of ſome Scottiſh writers, this family, in the peerage, is older than any in North-Britain, if not in all Europe; the title of *earl* being conferred on one of their anceſtors in 1057.

9. " Azure, a Pile Ermine," for the name of *Wyche*; and is quartered as firſt and fourth in the coat-of-arms of Sir Cyril Wyche, bart. his majeſty's reſident at the Hans-Towns.

10. " Or, on a Pile engrailed Azure, three Croſs-croſlets fitchy of the firſt;" borne by the name of *Rigdon*.

11. " Or, on a Pile Gules three Lions of England between ſix Fleurs-de-lis Azure;" the firſt and fourth quarters of his grace Edward Seymour, duke of Somerſet, &c. granted him by king Henry VIII. on his marriage with the lady Jane Seymour.

12. " Ermine, two Piles iſſuing from the dexter and ſiniſter ſides, and meeting in Baſe Sable;" for the name of *Holles*.

13. " Argent, three Piles, one iſſuing from the Chief between the others reverſed, Sable;" for the name of *Hulſe*, and borne by Sir Edward Hulſe, bart. of Lincoln's-inn fields, Middleſex.

14. " Azure, a Pile wavy bendways Or;" borne by the name of *Aldham*.—There is no mention made of its iſſuing out of the dexter-corner of the eſcutcheon, for this is ſufficiently determined by the term *bendways*.

15. " Or, three Piles in Bend, each point enſigned with a Fleur-de-lis Sable;" borne by the name of *Norton*.

16. " Argent, three Piles meeting near the point of the Baſe Azure;" borne by the name of *Bryan*.

17. " Party per Pale and per Bend Or and Azure counter-changed;" borne by the name of *Johnſon*.—This bearing is equal to two gyrons; ſee p. 3596. col. 1.

18. " Party per Pale and per Cheveron Argent and Gules counter-changed."

19. " Party per Pale chappé Or and Vert counter-changed." This is a bearing ſeldom to be met with.

20. " Party per Feſs Gules and Argent, a Pale counterchanged;" borne by the name of *Lavider*. Common Charges.

Sect. III. *Of* Common Charges *borne in coats-of-arms.*

It has been already obſerved, that in all ages men have made uſe of the repreſentation of living creatures, and other ſymbolical ſigns, to diſtinguiſh themſelves in war; and that theſe marks, which were promiſcuouſly uſed for hieroglyphs, emblems, and perſonal devices, gave the firſt notion of heraldry. But nothing ſhews the extent of human wit more, than the great variety of theſe marks of diſtinction, ſince they are compoſed of all ſorts of figures, ſome natural, others artificial, and many chimerical; in alluſion, it is to be ſuppoſed, to the ſtate, quality, or inclination of the bearer.

Hence it is, that the ſun, moon, ſtars, comets, meteors, &c. have been introduced to denote glory, grandeur, power, &c. Lions, leopards, tygers, ſerpents, flags, &c. have been employed to ſignify courage, ſtrength, prudence, ſwiftneſs, &c.

The application to certain exerciſes, ſuch as war, hunting, muſic, &c. has furniſhed lances, ſwords, pikes, arms, fiddles, &c. Architecture, columns, cheverons, &c.; and the other arts ſeveral things that relate to them.

Human bodies, or diſtinct parts of them, alſo clothes and ornaments, have, for ſome particular intention, found place in armory; trees, plants, fruits, and flowers, have likewiſe been admitted to denote the rarities, advantages, and ſingularities, of different countries.

The relation of ſome creatures, figures, &c. to particular names, has been likewiſe a very fruitful ſource of variety in arms. Thus the family of Coningſby bears three coneys; of Arundel, ſix ſwallows; of Urſon, a bear; of Lucie, three pikes, in Latin *tres lucios piſces*; of Starkey, a ſtork; of Caſtleman, a caſtle triple-towered; of Shuttleworth, three weaver's ſhuttles, &c.

Beſides theſe natural and artificial figures, there are chimerical or imaginary ones uſed in heraldry, the reſult of fancy and caprice; ſuch as centaurs, hydras, phenixes, griffons, dragons, &c. Which great variety of figures ſhews the impoſſibility of comprehending all common charges in a work of this nature; therefore ſuch only ſhall be treated of as are moſt frequently borne in coats-of-arms.

Art. I. Of Natural Figures borne in coats-of-arms.

Among the multitude of natural things which are uſed in coats-of-arms, thoſe moſt uſually borne are, for the ſake of brevity as well as perſpicuity, diſtributed into the following claſſes, viz.

Celeſtial figures; as the ſun, moon, ſtars, &c. and their parts.

Effigies of men, women, &c. and their parts.

Beaſts; as lions, ſtags, foxes, boars, &c. and their parts.

Birds; as eagles, ſwans, ſtorks, pelicans, &c. and their parts.

Fiſhes; as dolphins, whales, ſturgeons, trouts, &c. and their parts.

Reptiles

Celeſtial Figures.

Reptiles and *inſects*; as tortoiſes, ſerpents, graſshoppers, &c. and their parts.

Vegetables; as trees, plants, flowers, herbs, &c. and their parts.

Stones; as diamonds, rubies, pebbles, rocks, &c.

Theſe charges have, as well as ordinaries, divers attributes or epithets, which expreſs their qualities, poſitions, and diſpoſitions. Thus the ſun is ſaid to be *in his glory*, *eclipſed*, &c. The moon *in her complement*, *increſcent*, &c. Animals are ſaid to be *rampant*, *paſſant*, &c. Birds have alſo their denominations, ſuch as *cloſe*, *diſplayed*, &c. Fiſhes are deſcribed to be *hauriant*, *naiant*, &c.

I. *Examples of Celeſtial Figures.*

Plate CXLVII. fig. xiii.

1. "Azure, a Sun in his Glory;" borne by the name of *St. Clere*; and is found in the 1ſt and 4th quarters of the coat-of-arms of the moſt noble William-Henry Ker, marquis of Lothian, &c. It is needleſs to expreſs the colour of the ſun, nothing being capable to denote it but gold.

2. "Azure, one Ray of the Sun, bendways Gules, between ſix Beams of that Luminary Argent;" borne by the name of *Aldam*. There is no mention made of their iſſuing out of the dexter-corner of the eſcutcheon; for this is implied in the term *bendways*, for the reaſon mentioned before.

3. "Argent, five Rays of the Sun iſſuing out of the ſiniſter-corner Gules;" borne by the name of *Mudſhideler*, a family of diſtinction in Franconia.

4. "Or, a Sun eclipſed." This bearing is ſeldom to be met with, except in emblematic or hieroglyphic figures; and might be expreſſed *Sable*, becauſe that hue is accidental and not natural.

5. "Gules, the Moon in her complement Or, illuſtrated with all her light proper." This is ſufficient without naming the colour, which is *Argent*.

6. "Azure, a Moon decreſcent proper;" borne by the name of *Delaluna*.

7. "Gules, a Moon increſcent Or;" borne by the name of *Deſcus*.

8. "Argent, a Moon in her *detriment*, Sable." This word is uſed in heraldry to denote her being *eclipſed*.

9. "Azure, a Creſcent Argent;" borne by the name of *Lucy*. This bearing is alſo uſed as a difference, it being aſſigned to the ſecond ſon, as before-mentioned.

10. "Gules, three Creſcents Argent;" borne by the right hon. David Oliphant, lord Oliphant. Amongſt the anceſtors of this noble family was David de Oliphant, one of thoſe barons who, in 1142, accompanied king David I. into England with an army, to aſſiſt his niece Matilda againſt king Stephen; but, after raiſing the ſiege of Wincheſter, the ſaid king David was ſo cloſely purſued, that, had it not been for the ſingular conduct of this brave perſon, the king would have been taken priſoner.

11. "Azure, a Creſcent between three Mullets Argent;" borne by the right hon. John Arbuthnot, viſcount and baron Arbuthnot. In the year 1105, the firſt of this family marrying a daughter of the family of Oliphard, ſheriff of the county of Kincardin, with her he had the lands of Arbuthnot in that county, from whence he took his ſurname. Robert Arbuthnot was the firſt of this family who, for his loyalty to king Charles I. was, Nov. 16. 1641, dignified with the title of *baron* and *viſcount Arbuthnot*. Effigies of Men.

12. "Gules, a Star iſſuing from between the Horns of a Creſcent Argent."

13. "Azure, a Star of 16 points Argent;" borne by the name of *Huitſon*.

14. "Argent, three Mullets pierced Sable;" borne by the name of *Wollaſton*.

15. "Azure, ſix Mullets 3, 2, 1, Or;" borne by the name of *Welſh*.

16. "Ermine, a Mullet of ſix points Gules, pierced;" borne by the name of *Huſſenhul*.—When a mullet has more than five points, their number muſt, in blazoning, be always named.

17. "Argent, a Rain-bow with a Cloud at each end proper." This is part of the creſt to the earl of Hopeton's coat-of-arms, which is inſerted in fig. ix. n° 13. The whole of it is a globe ſplit on the top, and above it is the rain-bow, &c.

18. "Party per Feſs crenelle Gules and Azure, three Suns proper;" borne by the name of *Pierſon*.

19. "Gules, a Mullet between three Creſcents Argent;" borne by the name of *Oliver*.

20. "Gules, a Chief Argent, on the lower part thereof a Cloud, the Sun's reſplendent rays iſſuing throughout proper;" borne by the name of *Leeſon*.

II. *Examples of Effigies of Men, &c. and their parts.*

Fig. xiv.

1. "Azure, the Virgin Mary crowned, with her Babe in her right arm, and a Sceptre in her left, all Or;" The coat-of-arms of the biſhopric of Saliſbury.—This biſhop's ſee was at firſt fixed at Sherborn in Dorſetſhire; and contained all that diſtrict which is now divided into the dioceſes of Saliſbury, Briſtol, Wells, and Exeter. In the year 905, the dioceſes of Wells, Crediton, and St Germans (now Exeter), were taken from it. And it was, moreover, parcelled out into the two biſhoprics of Sherborn and Wilton. The preſent dioceſe of Saliſbury, or Sarum, contains all Wiltſhire, except two pariſhes; and all Berkſhire, excepting one pariſh, and part of another. There are in it three archdeaconries, namely, of Saliſbury, Wilts, and Berks; and the number of pariſh-churches and chapels, in the whole, is about 550. It has ſeveral peculiars of its own in Dorſetſhire; though in Briſtol dioceſe.

2. "Azure, a Preſbyter, ſitting on a Tomb-ſtone, with a Crown on his Head and Glory Or, his right hand extended, and holding in his left an open Book Argent, with a Sword croſs his mouth Gules." The coat-of-arms of the biſhopric of Chicheſter. The ſee of Chicheſter was anciently in the iſle of Selſey, but removed to Chicheſter by Stigand. This dioceſe contains the whole county of Suſſex (except 22 peculiars belonging to the archbiſhopric of Canterbury), wherein there are 250 pariſhes, and two archdeacons, thoſe of Chicheſter and Lewis. Some reckon the number of churches and chapels to be 302.

3. "Azure, a Biſhop habited in his pontificals, ſitting on a chair of ſtate, and leaning on the ſiniſter ſide thereof, holding in his left hand a croſier, his right being extended towards the dexter chief of the eſcutcheon, all Or; and reſting his feet on a cuſhion, Gules, taſſeled of the ſecond." The coat-of-arms of the biſhopric

Effigies of Men.

ſhopric of Clogher, in Ireland.

4. " Azure, a Biſhop habited in his pontificals, holding before him, in a Pale, a Crucifix proper." The coat-of-arms of the biſhopric of Waterford, in Ireland.

5. " Or, a Man's Leg couped at the midſt of the thigh Azure;" borne by the name of *Haddon*.

6. " Azure, three ſiniſter Hands couped at the wriſt, and erected Argent;" borne by the ancient family of Malmains.

7. " Argent, three ſiniſter Hands couped at the wriſt, and erected Gules;" borne by the name of *Maynard*. By theſe two laſt examples it appears, that different coats-of-arms may be eaſily made from the ſame figure or figures, by varying the colours only, without the addition of any other charge, counter-changings, partings, &c.

8. " Argent, a Man's Leg eraſed at the midſt of the thigh Sable;" borne by the name of *Prime*.

9. " Gules, three Legs armed proper, conjoined in the Feſs-point at the upper part of the thighs, flexed in triangle, garniſhed and ſpurred Or." This is the coat-of-arms of the Iſle of Man; and is quartered by the moſt noble John Murray, duke of Athole, titular lord or king of that iſle.

10. " Gules, three dexter Arms vambraced feſsways in Pale proper;" borne by the name of *Armſtrong*. This coat is very well adapted to the bearer's name, and ſerves to denote a man of excellent conduct and valour.

11. " Or, three Legs couped above the knee Sable;" borne by the name of *Hoſy*.

12. " Vert, three dexter Arms conjoined at the ſhoulders in the Feſs-point, and flexed in triangle Or, with fiſts clenched Argent;" borne by the name of *Tremain*.

13. " Argent, a Man's Heart Gules, within two equilateral triangles interlaced Sable;" borne by the name of *Villages*, a family of diſtinction in Provence.

14. " Azure, a ſiniſter Arm, iſſuing out of the dexter-chief, and extended towards the ſiniſter-baſe Argent."

15. " Argent, a dexter Hand couped at the wriſt and erected, within a Bordure engrailed Sable;" borne by the name of *Manley*.

16. " Argent, a Man's Heart Gules, enſigned with a Crown Or, and on a Chief Azure, three Mullets of the firſt." The paternal coat of the name of *Douglas*, and quartered in the arms of the dukes of Hamilton and Queenſbury; as alſo in thoſe of the earls of Morton and March, and the Lord Mordington.

17. " Gules, a Saracen's Head affrontée eraſed at the neck Argent, environed about the temples with a wreath of the ſecond and Sable;" borne by the name of *Mergith*.

18. " Argent, three Blackamoors Heads couped proper, banded about the head Argent and Gules;" borne by the name of *Tanner*.

19. " Gules, three Beſants each charged with a man's face affrontée proper;" borne by the name of *Gamin*.

20. " Or, a Blackamoor's Head couped proper, banded about the Head Argent;" borne by the name of *Uſtoc*.

Poſitions of Lions.

Obſerve, that when half of the face, or little more, of human figures, is ſeen in a field, it is then ſaid to be *in profile*; and when the head of a man, woman, or other animal, is repreſented with a full face, then it is termed *affrontée*.

III. *Examples of the different Poſitions of Lions, &c. in coats-of-arms.*

1. " Or, a Lion rampant Gules;" quartered by the right hon. Hugh Percy-Smithſon, earl of Northumberland, &c. This noble earl is deſcended from the family of the Smithſons of Newſham in Yorkſhire, which appears to have been poſſeſſed of lands in that county in the reign of king Richard II. His lordſhip, married July 18. 1740, the lady Elizabeth Seymour, only daughter of Algernon Seymour, late duke of Somerſet, and earl of Northumberland, on whoſe death he was created earl of the ſame county, Feb. 7. 1749-50, and duke of the ſame county Oct. 22. 1766. Plate CXLVIII. fig. xv.

2. " Azure, a Lion rampant-guardant Or;" borne by the name of *Fitz-Hammond*.

3. " Gules, a Lion rampant-reguardant Or;" quartered by the right hon. Charles Cadogan, lord Cadogan, &c. This noble lord is deſcended from Kchdlin, prince of Powis in Wales, from whom deſcended William Cadwyan or Cadogan of Llanbeder, in the county of Pembroke, another of the anceſtors of this preſent lord, who was created a peer of Great Britain on June 21. 1716.

4. " Ermine, a Lion ſaliant Gules;" borne by the name of *Worley*.

5. " Azure, a Lion ſtatant-guardant Or;" borne by the name of *Bromfield*.

6. " Or, a Lion paſſant Gules;" borne by the name of *Games*.

7. " Argent, a Lion paſſant-guardant Gules, crowned Or;" quartered by the right hon. James Ogilvy, earl of Findlater, &c.

8. Gules, a Lion ſejant Argent."

9. " Or, a Lion rampant double-headed Azure;" borne by the name of *Maſon*.

10. "Sable, two Lions rampant-combatant Or, armed and langued Gules;" borne by the name of *Carter*.

11. " Azure, two Lions rampant-adoſſee Or." This coat-of-arms is ſaid to have been borne by Achilles at the ſiege of Troy.

12. " Sable, two Lioncels counter-paſſant Argent, the uppermoſt towards the ſiniſter ſide of the eſcutcheon, both collared Gules;" borne by the name of *Glegg*.—It is the natural diſpoſition of the lion not to bear a rival in the field: therefore two lions cannot be borne in one coat-of-arms, but muſt be ſuppoſed to be lion's whelps, called *lioncels*; except when they are parted by an ordinary, as in fig. viii. n° 17. or ſo diſpoſed as that they ſeem to be diſtinctly ſeparated from each other, as in fig. xv. n° 20. In the two foregoing examples they are called *lions*, becauſe in the 10th they ſeem to be ſtriving for the ſovereignty of the field, which they would not do unleſs they were of full growth: and, in the 11th, they are ſuppoſed to repreſent two valiant men, whoſe diſpute being accommodated by the prince, are leaving the field, their pride not ſuffering them to go both one way.

13. " Argent, a Demi-lion rampant Sable;" borne by the name of *Mervin*.

Fig. 11.

SALTIERS.

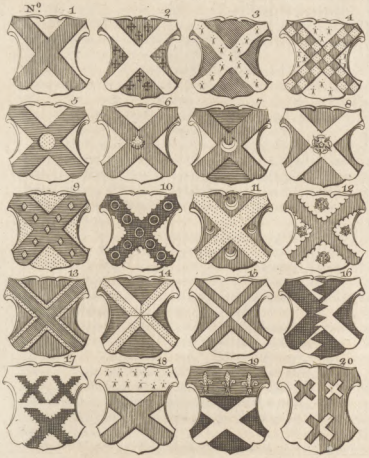


Fig. 12.

ORDINARYS &c.

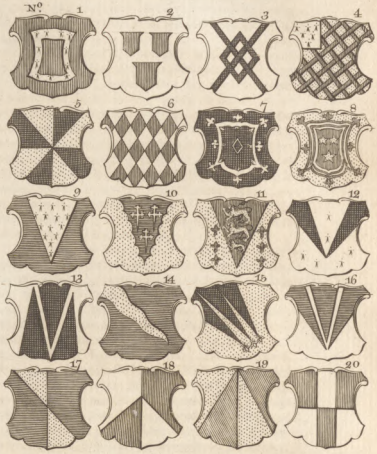

Fig. 13.

CELESTIALS.

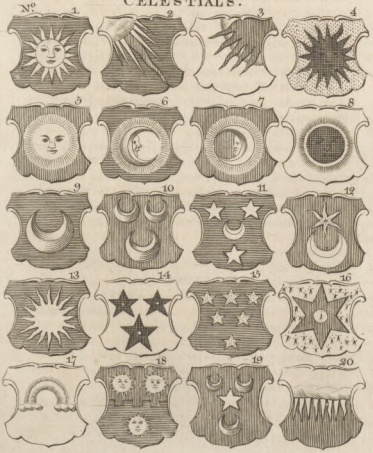

Fig. 14.

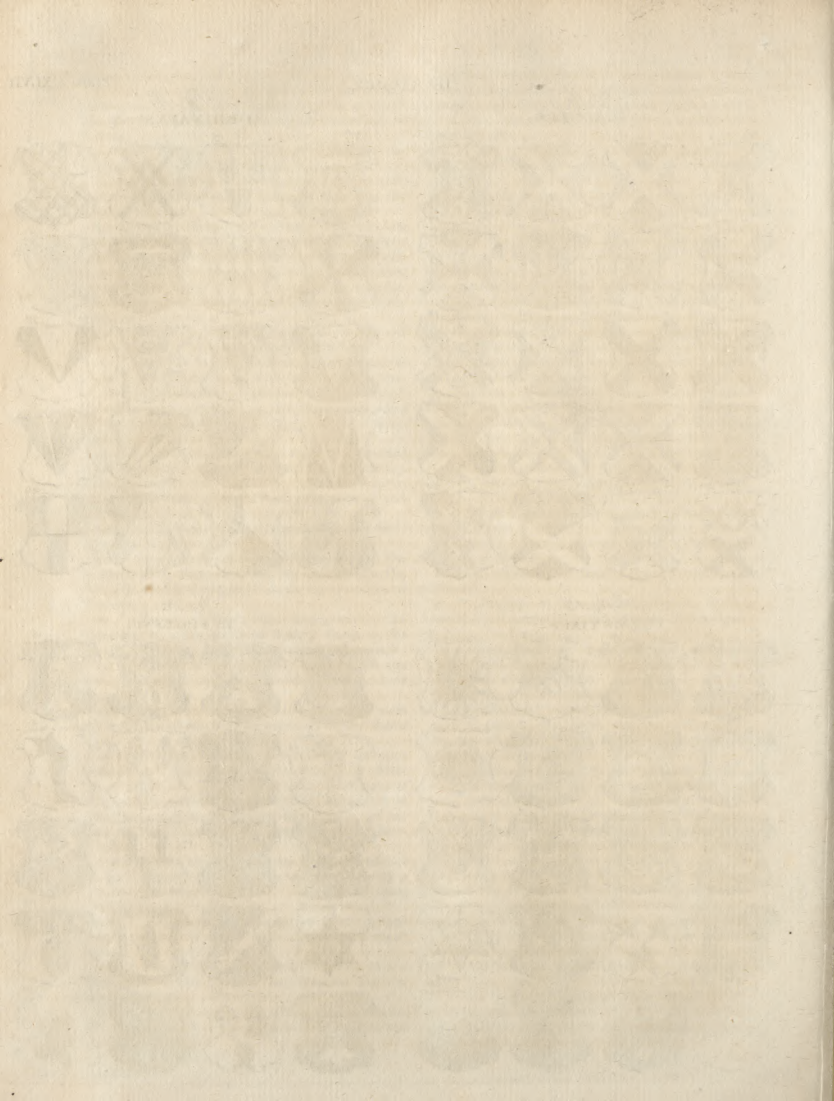
EFFIGIES &c.



Of Lions, &c.

14. " Gules, a lion couchant between six croſs-croſslets, three in Chief, and as many in Baſe, Argent;" for the name of *Tynte*; and is the firſt and fourth quarter of the arms of Sir Charles-Kemys Tynte, bart. elected knight of the ſhire for the county of Somerſet to the four laſt and preſent parliaments, colonel of the ſecond battalion of the Somerſet militia, and LL. D.

15. " Azure, a Lion dormant Or."

16. " Or, out of the midſt of a Feſs Sable, a Lion rampant-naiſſant Gules;" borne by the name of *Emme*. This form of blazon is peculiar to all living things that ſhall be found iſſuing out of the midſt of ſome ordinary or other charge.

17. " Azure, three Lioncels rampant Or;" borne by the right hon. Richard Fienes, viſcount and baron Saye and Sele. This noble lord is deſcended from John, baron Fienes, hereditary conſtable of Dover-caſtle, and lord Warden of the Cinque-ports, in the 12th century.

18. " Gules, a tricorporated Lion iſſuing from three parts of the Eſcutcheon, all meeting under one Head in the Feſs-point Or, langued and armed Azure;" borne by the name of *Crouchback*. This coat appertained to Edmund Crouchback, earl of Lancaſter, in the reign of his brother king Edward I.

19. "Gules, a Beſant between three Demi-lions rampant Argent;" borne by the right hon. Charles Bennet, earl of Tankerville, &c. This noble earl is deſcended from the family of the Bennets in Berkſhire, who flouriſhed in the reign of king Edward III. Charles, lord Oſſulſton, grandfather of the preſent earl, was created earl of Tankerville, on October 19. 1714, by George I.

20. " Party per Pale Azure and Gules, three Lions rampant Argent;" borne by the right hon. Henry Herbert earl of Pembroke, &c. This noble family is deſcended from Henry Fitz-Roy, natural ſon to Henry I. Sir William Herbert, one of the anceſtors of the preſent earl, was maſter of the horſe to king Henry VIII. lord preſident of the marches of Wales, and knight of the garter. He was alſo, by that king, advanced to the dignity of baron Herbert of Caerdiff, October 10. 1551, and the very next day created earl of Pembroke.—Obſerve, that if a lion, or any other beaſt, is repreſented with its limbs and body ſeparated, ſo that they remain upon the field at a ſmall diſtance from their natural places, it is then termed *Dehaché* or *couped in all its parts*, of which very remarkable bearing, there is an inſtance in armory, which is, " Or, a Lion rampant Gules, dehaché, or couped in all its parts, within a double Treſſure flowery and counter-flowery of the ſecond;" borne by the name of *Maitland*.

IV. *Examples of other Quadrupeds, and their Parts, borne in Coats-of Arms.*

Fig. xvi.

1. " Sable, a Camel ſtatant Argent;" borne by the name of *Camel*.

2. " Gules, an Elephant ſtatant Argent, tuſked Or;"

3. " Argent, a Boar ſtatant Gules, armed Or;" borne by the name of *Trewarthen*.

4. " Sable, a Bull paſſant Or;" borne by the name of *Fitz-Geffrey*.

5. " Sable, three Nags Heads eraſed Argent;" borne by the right hon. and the reverend Charles-Talbot Blayney, baron Blayney of Monaghan, in Ireland. This noble family is deſcended in a direct line from Cadwallader, a younger ſon of the prince of Wales; and the firſt peer was Sir Edward Bleyney, knight, who was created a baron by king James I. July 29, 1621.

Different Animals.

6. " Argent, three Boars Heads eraſed and erect Sable, langued Gules," for the name of *Booth*; and borne by Sir George Booth, bart. the preſent rector of Aſhton-under-Line, in the county of Lancaſter.—Various are the traditions touching the original ſtem of this ancient family, which, like moſt others of long ſtanding, is ſo ingulfed in the obſcurity of all-devouring time, that no other light than conjecture is now to be had thereof. The moſt probable is, that their beginning was at a certain place called the *Booths*, in the county of Lancaſter, where being ſeated, they were thence ſurnamed, as the manner of thoſe ages was to ſtyle men from the places where they lived.

7. " Azure, three Boars Heads eraſed Or;" quartered by his grace Alexander Gordon duke of Gordon, &c. Of this great and noble family, which took their ſurname from the barony of Gordon in the county of Berwick, there have been, beſides thoſe in North-Britain, ſeveral of great diſtinction in Muſcovy; and in the time of king Malcolm IV. 1160, this family was very numerous, and flouriſhed in the county aforeſaid.

8. " Argent, three Bulls Heads eraſed, Sable, armed Or;" borne by the right hon. Clotworthy Skeffington, earl of Maſſareene, &c. of Ireland. This ancient and noble family derives its name from the village of Skeffington, in the county of Leiceſter, of which place Simon Skeffington was Lord in the reign of Edward I. and from him deſcended Sir William Skeffington, knt. made ſo by king Henry VII.

9. " Argent, two Foxes counter-ſaliant, the dexter ſurmounted of the ſiniſter Gules;" for the name of *Kadrod-Hard*, an ancient Britiſh family, from which is deſcended Sir Watkyn-Williams Wynne, bart. who bears this quartered, ſecond and third, in his coat-of-arms.

10. " Argent, three Bulls paſſant Sable, armed and unguled Or;" for Aſhley, and quartered by the right hon. Anthony-Aſhley Cooper, earl of Shafteſbury, &c. This noble earl is deſcended from Richard Cooper, who flouriſhed in the reign of king Henry VIII. and purchaſed the manor of Paulet in the county of Somerſet; of which the family are ſtill proprietors. But his anceſtor, who makes the greateſt figure in hiſtory, is Sir Anthony-Aſhley Cooper, who was created baron Aſhley of Winbourn, April 20, 1661, and afterwards earl of Shafteſbury, April 23, 1672.

11. " Ermine, three Cats paſſant in Pale Argent," for the name of *Adams*; and borne by Sir Thomas Adams, bart. a captain of his majeſty's navy, who commanded ſeveral different ſhips in the laſt war with bravery and conduct.

12. " Gules, two Grehounds rampant Or, reſpecting each other;" borne by the name of *Dogget*.

13. " Or, an Aſs's Head eraſed Sable;" borne by the name of *Hackwell*.

14. " Gules, three Lions gambs eraſed Argent;" for the name of *Newdigate*, and borne by Sir Roger New-

Birds, Fishes, &c.

Newdigate, bart. LL.D. and repreſentative in the preſent and three laſt parliaments for the univerſity of Oxford.

15. " Argent, three lions tails erected and erafed Gules;" borne by the name of *Cork*.

16. " Azure, a Buck's Head caboſſed Argent;" borne by the right hon. William Legge, earl of Dartmouth, &c. This noble earl is deſcended from Signior de Lega, an Italian nobleman, who flouriſhed in Italy in the year 1297. What time the family came into England is uncertain; but it appears they were ſettled at Legge-place, near Tunbridge in Kent, for many generations; and Thomas, one of their anceſtors, was twice lord-mayor of London, viz. in 1346 and 1353.

17. " Argent, two Squirrels ſejant adoſſee Gules," for the name of *Samwell*; and borne by Sir Thomas Samwell, bart. of Upton, in Northamptonſhire, who is lineally deſcended from the ancient family of the Samwells in Cornwall.

18. " Gules, a Goat paſſant Argent;" borne by the name of *Baker*.

19. " Sable, a Stag ſtanding at gaze Argent;" borne by the name of *Jones*, of Monmouthſhire.

20. " Azure, three Holy-Lambs Or;" borne by the name of *Row*.

V. *Examples of Birds, Fiſhes, Reptiles*, &c.

Fig. xvii.

1. " Ermine, an Eagle diſplayed Sable; borne by the name of *Beddingfield*.

2. " Gules, a Swan cloſe proper;" borne by the name of *Leigham*.

3. " Argent, a Stork Sable, membred Gules;" borne by the name of *Starkey*.

4. " Gules, a Pelican in her neſt with wings eſevated, feeding her young ones Or; vulned proper;" borne by the name of *Carne*.

5. " Argent, three Peacocks in their pride proper;" borne by the name of *Pawne*.

6. " Sable, a Goſhawk Argent, perching upon a ſtock in the Baſe point of the Eſcutcheon of the ſecond, armed, jeſſed, and belled Or;" borne by the name of *Weele*.

7. " Or, a Raven proper;" borne by the name of *Corbet*.

8. " Argent, three Cocks Gules, creſted and jowlopped Sable, a Creſcent furmounted of a Creſcent for difference, borne by the right hon. Charles Cockayne, viſcount Cullen, of Donegal in Ireland. Of this ancient family was Andreas Cockayne, of Aſhburne in the county of Derby, who lived in the 28th year of Edward I. Charles, ſon to Sir William Cockayne, lord-mayor of London, 1619, was the firſt who was advanced to the Peerage, by Charles I. Auguſt 11, 1642.

9. " Sable a Dolphin naiant embowed Or;" borne by the name of *Symonds*. This animal is borne by the eldeſt ſon of the French king, and next heir to the crown, no other ſubject in that kingdom being permitted to bear it. In England, where that rule cannot take place, there are ſeveral families that have dolphins in their coats-of-arms.

10. " Argent, three Whales Heads erect and erafed Sable;" borne by the name of *Whalley*.

11. " Gules, three Eſcallops Argent;" borne by the right hon. George Keppel, earl of Albemarle, &c. This preſent earl is deſcended from Arnold Jooſt, van Keppel, a nobleman of the province of Gelderland in Holland, who came over into England with the prince of Orange in 1688, to whom he was then a page of honour, and afterwards maſter of the robes, and was by him created a peer of England, by the title of earl of Albemarle, in the duchy of Normandy in France, February 10. 1696.

Reptiles, Plants, &c.

12. " Azure, three Trouts fretted in Triangle Argent;" borne by the name of *Troutbeck*.

13. " Vert, a Graſshopper paſſant Or."

14. " Azure, three Bees two and one volant in pale Argent;" borne by the name of *Bye*.

15. " Vert, a Tortoiſe paſſant Argent;" borne by the name of *Gawdy*.

16. " Gules, an Adder nowed Or;" borne by the name of *Nathiley*. Adders, ſnakes, and ſerpents are ſaid to repreſent many things, which being according to the fancy of the ancients, and a few modern authors who have adopted their opinions, it is needleſs to enlarge upon. It is certain they often occur in armory; but the nobleſt is that of the dutchy of Milan, viz. " Argent, a Serpent gliding in Pale Azure, crowned Or, vorant an Infant iſſuing Gules." The occaſion of this bearing was thus: Otho, firſt viſcount of Milan, going to the Holy-land with Godfrey of Bouillon, defeated and ſlew in a ſingle combat the great giant Volux, a man of an extraordinary ſtature and ſtrength, who had challenged the braveſt of the Chriſtian army. The viſcount having killed him, took his armour, and among it his helmet, the creſt whereof was a ſerpent ſwallowing an infant, worn by him, to ſtrike a terror into thoſe who ſhould be ſo bold as to engage him.

17. " Ermine, a Roſe Gules barbed and ſeeded proper;" borne by the right hon. Hugh Boſcawen viſcount Falmouth, &c. This noble lord is deſcended from Richard Boſcawen, of the town of Boſcawen, in the county of Cornwall, who flouriſhed in the reign of king Edward VI. Hugh, the late viſcount, and the firſt peer of this ancient family, was created baron of Boſcawen-Roſe, and viſcount Falmouth, on the 13th of June, 1720, 6th of George I.

18. " Azure, three Laurel-leaves ſlipped Or;" borne by the name of *Leveſon*, and quartered by the right hon. Granville-Leveſon Gower, earl of Gower, &c.

19. " Azure, three Garbs Or;" borne by the name of *Cuming*. Theſe are ſheaves of wheat; but though they were barley, rye, or any other corn whatſoever, it is ſufficient, in blaxoning, to call them *Garbs*, telling the tincture they are of.

20. " Gules, three Cinquefoils Argent;" borne by the right hon. lord Ford Lambart, baron of Cavan, &c. in Ireland. Of this ancient family, which is of French extraction, was Sir Oliver, who, in the reign of queen Elizabeth, attending the earl of Eſſex to Spain, was there knighted by him, and afterwards returning with that earl into Ireland, was, for his ſingular ſervice in the north againſt O'Neal earl of Tyrone, made camp-maſter general, and preſident of Connaught; and February 17. 1617, was created lord Lambart and baron of Cavan, by king James I.

It muſt be obſerved that trees and plants are ſometimes ſaid to be trunked, eradicated, fructuated, or raguled, according as they are repreſented in arms.

Art.

Artificial Figures.

ART. 2. Of ARTIFICIAL FIGURES borne in Coats-of-arms.

Artificial Figures.

AFTER the various productions of nature, artificial figures, the objects of arts and mechanics, claim the next rank. They may be distributed into the following classes, viz.

Warlike instruments, as swords, arrows, battering-rams, gauntlets, helmets, spears, pole-axes, &c.

Ornaments used in royal and religious ceremonies, as crowns, coronets, mitres, wreaths, crosiers, &c.

Architecture, as towers, castles, arches, columns, plummets, battlements, churches, portcullisses, &c.

Navigation, as ships, anchors, rudders, pendants, sails, oars, masts, flags, galleys, lighters, &c.

All these bearings have different epithets, serving either to express their position, disposition, or make, viz. Swords are said to be erect, pommeled, hilted, &c. Arrows, armed, feathered, &c. Towers, covered, embattled, &c.; and so on of all others, as will appear by the following examples.

Fig. xviii. 1. "Sable, three swords, their points meeting in the Base Argent, pommelled and hilted Or, a Crescent in chief of the second for difference;" borne by his grace Charles Powlet, duke of Bolton, &c. This noble duke is descended from Hercules, lord of Tournon in Picardy, who came over to England with Jeffrey Plantagenet earl of Anjou, third son of king Henry II. and among other lands had the lordship of Paulet in Somersetshire conferred on him. William Powlet, the first peer of this illustrious and loyal family, was treasurer of the household to king Henry VIII. and by him created baron St. John of Basing, in the county of Southampton, March 9. 1538.

2. "Argent, three Battering-rams barways in Pale, headed azure and hooped Or, an Annulet for difference:" borne by the right hon. Willoughby Bertie, earl of Abington, &c. The first of the family of Bertie that bore the title of earl of Abington, was James Bertie lord Norris of Rycote, being created earl, November 30. 1682, by Charles II.

3. "Azure, three left-hand Gauntlets with their backs forward Or;" borne by the right hon. Thomas Fane, earl of Westmoreland, &c. This noble earl is descended from the Fanes, an ancient family which resided at Badsal in Kent, from which descended Francis Fane, son and heir of Sir Thomas Fane, knight, by Mary his wife, sole daughter and heiress to Henry Nevil lord Abergavenny, afterwards created baroness Despenser. The said Francis was a knight of the Bath; and in the reign of king James I. was created baron Burghersh, and earl of Westmoreland, December 29. 1624.

4. "Azure, three Arrows their points in base Or;" borne by the right hon. Thomas Archer, lord Archer, &c. This noble lord is descended from John de Archer, who came over from Normandy with William the Conqueror; and this family is one of the most ancient in Warwickshire, being settled at Umberslade, in that county, ever since the reign of Henry II. His lordship is the first peer; and was created lord Archer and baron of Umberslade by king George II. July 14. 1747.

5. "Gules, two helmets in chief proper, garnished Or, in a Base of a Garb of the third;" borne by the right hon. George Cholmondeley, earl of Cholmondely, &c. This noble earl is descended from the ancient family of Egerton in Cheshire, which flourished in the time of the conquest, from whom also the duke of Bridgewater is descended. The first English peer of this branch was Hugh, viscount Cholmondeley of Kells, in Ireland, who, joining with those who opposed the arbitrary measures of king James II. was on the accession of king William and queen Mary, created lord Cholmondeley of Nampt-wich, in the county of Chester.

6. "Argent, a Ship with its Sails furled up Sable;" quartered by the right hon. James Hamilton, earl of Abercorn, &c. The descent of this noble family is from that of the duke of Hamilton: for James, the fourth lord Hamilton and second earl of Arran, marrying lady Margaret Douglas, daughter of James the third earl of Morton, by her had four sons, James, John, Claud, and David; whereof Cland was progenitor of the lord we are now speaking of; and in confideration of his merit and loyalty to Mary queen of Scots, James VI. created him lord Paisley in 1591, as also earl of Abercorn, baron of Hamilton, &c. July 10. 1606.

7. "Or, an Anchor in pale Gules;" quartered by the most noble George Johnston, marquis of Annandale, &c. The Johnstons are an ancient and warlike family, and derive their surname from the barony of Johnston in Annandale.

8. "Sable, three Spears Heads erect Argent, imbrued Gules, on a chief Or, as many Pole-axes Azure;" borne by the right hon. William King, lord King, &c. Peter King, esq; the first lord of this ancient family, was chosen recorder of the city of London, July 27. 1708, and on the 12th of September following had the honour of knighthood conferred on him. He was constituted lord-chief-justice of the common-pleas in the first year of king George I. 1714; on the 5th of April following was sworn of his majesty's most hon. privy council; and on May 19. 1723, was created a peer of this kingdom by the title of lord King, baron of Ockham.

9. "Gules, three Clarions Or;" quartered by the right hon. Robert Carteret, earl of Granville, &c. This ancient and worthy family derives its pedigree from Offerey de Carteret, who attended William the Conqueror in his descent upon England, and contributed to the victory he obtained over king Harold, at Hastings in Suffex, 1066, he had manors and lands in England conferred on him by that prince, as a reward for his eminent services. George Carteret, grandfather to the present earl, was, in consideration of his own merit and the services of his ancestors, created a peer of Great Britain, October 19th 1681.

10. "Argent, a Maunch Sable;" borne by the right hon. Francis Hastings, earl of Huntingdon, &c. This noble earl is descended from Hugh de Hastings, a younger son of the ancient and noble family of the Hastings, earl of Pembroke, of which family was William de Hastings, steward of the household to king Henry I.—William, the first lord Hastings, was created a baron on July 6, 1461, by king Edward IV.

11. "Azure, a circular Wreath Argent and Sable, with four Hawk's Bells joined thereto in quadrature Or;"

Artificial Figures.

Or;" borne by the right hon. Robert Jocelyn, viſcount Jocelyn, &c. This noble family is of great antiquity; for, after the Romans had been maſters of Britain 500 years, wearied with the wars, they took their final farewel of it, and carried away with them a great many of their brave old Britiſh ſoldiers, who had ſerved them in their wars both at home and abroad, to whom they gave Amorica in France, for their former ſervices, which country was from them afterwards called *Little Britain*. It is ſuppoſed that there were ſome of this family amongſt them; and that they gave the name of *Jocelyn* to a town in this country, which ſtill preſerves that name: and it is thought probable that they returned with William the Conqueror; for we find, in 1066, mention made of Sir Gilbert Jocelyn. This preſent nobleman, the firſt lord of the family, was created baron Newport, of Newport in Ireland, on November 29, 1743, and viſcount in November 1751.

12. "Gules, three Towers Argent;" quartered by the right hon. William Fowler, viſcount Aſhbrook, &c. William Fowler, eſq; father to this preſent lord, was advanced to the peerage by king George II. and created baron of Caſtle-Durrow, in the county of Kilkenny, October 27, 1733, and his ſon was created viſcount Aſhbrook, of Aſhbrook in Ireland, on Sept. 30, 1751, now extinct.

13 "Gules, two keys in Saltier Argent, in Chief a Royal Crown proper;" the arms of the archbiſhopric of York. This archbiſhopric comprehends only the biſhoprics of Carliſle, Cheſter, and Durham. And the dioceſe contains about three parts in four of Yorkſhire, all Nottinghamſhire, and Hexham peculiar juriſdiction; divided into 903 pariſhes and chapels; and into four archdeaconries, of York, Eaſt-Riding, Cleveland, and Nottingham.

14. "Gules, two Swords in Saltier Argent, pommeled and hilted Or;" the arms of the biſhopric of London. This dioceſe contains London, the counties of Middleſex and Eſſex, and part of Hertfordſhire, in which there are about 665 churches and chapels. In it are alſo five archdeaconries, viz. thoſe of London, Middleſex, Eſſex, Colcheſter, and St Albans.

15. "Sable, a Key in Bend, ſurmounted by a Croſier in Bend ſiniſter, both Or;" the arms of the biſhopric of St Aſaph. This dioceſe contains no one whole county; but part of Denbigh, Flint, Montgomery, and Merioneth ſhires, and ſome towns in Shropſhire, wherein are to the number of 121 pariſhes; but there are in all 131 churches and chapels, moſt of which are in the immediate patronage of the biſhops. It hath but one archdeaconry, called *of St Aſaph*, which is united to the biſhopric, for the better ſupport of it.

16. "Gules, two Keys adoſſee in Bend, the uppermoſt Argent, the other Or, a Sword interpoſed between them in Bend ſiniſter of the ſecond, pommeled and hilted of the third;" the arms of the biſhopric of Wincheſter. This dioceſe contains the whole county of Southampton, with the Iſle of Wight, and the iſles of Jerſey, Guernſey, Sark, and Alderney. It alſo contains one pariſh in Wiltſhire, and all Surry, except eleven peculiars belonging to Canterbury. The number of churches and chapels in it are 415; and it has two archdeacons, viz. of Wincheſter and Surry. Artificial Figures.

17. "Gules, three Mitres with their pendants Or;" the arms of the biſhopric of Cheſter. The biſhopric of Cheſter was anciently part of the dioceſe of Litchfield; one of whoſe biſhops, removing his ſee hither in the year 1075, occaſioned his ſucceſſors being frequently called *biſhops of Cheſter*. But it was not erected into a diſtinct biſhopric till the year 1541, by king Henry VIII. It contains the entire counties of Cheſter and Lancaſter; part of Weſtmoreland, Cumberland, and Yorkſhire; two chapelries in Denbighſhire, and five churches and chapels in the county of Flint: in all, 506 churches and chapels. It is divided into two archdeaconries, viz. Cheſter and Richmond.

18. "Sable, three Ducal Coronets paleways Or;" the arms of the biſhopric of Briſtol. The biſhopric of Briſtol was founded by king Henry VIII. and taken out of the dioceſes of Saliſbury, Wells, and Worceſter. It contains the city of Briſtol, and the county of Dorſet; in which there are 276 churches and chapels; and one archdeaconry, viz. that of Dorſet.

19. "Gules, a Sword erect in pale Argent, pommeled and hilted Or, ſurmounted by two Keys in Saltier of the laſt;" the arms of the biſhopric of Exeter. When Chriſtianity was firſt planted in theſe parts, Cornwall and Devonſhire were placed under the juriſdiction of the biſhop of Dorcheſter; but, that epiſcopal ſeat being removed to Wincheſter in the year 660, theſe weſtern parts were made ſubject to that new ſee. When the monaſtery of Sherbourn was turned into a cathedral about the year 705, theſe counties were included in that dioceſe, which continued about 200 years; and then Plegmund, archbiſhop of Canterbury, at the command of king Edward the Elder, erected three new biſhoprics; one at Wells, for Somerſetſhire; another at Bodmin, for Cornwall; and the laſt at Tawton-Biſhops, for Devon, which was after removed to Crediton, and at length ſettled at Exeter. That dioceſe contains the entire counties of Devon and Cornwall; in which there are 725 churches and chapels, and four archdeaconries, viz. thoſe of Exeter, Barnſtable, Totneſs, and Cornwall.

20. "Gules, three Ducal Coronets, Or;" the arms of the biſhopric of Ely. The biſhopric of Ely was taken from that of Lincoln by king Henry I. anno 1109. It contains all Cambridgeſhire, and the iſle of Ely, excepting Iſelham, which belongs to the ſee of Rocheſter, and 15 other pariſhes that are in the dioceſe of Norwich: but it has one pariſh, viz. Emneth, in Norfolk. The whole number of the churches and chapels within the dioceſe of Ely are 164. It hath only one archdeacon, viz. that of Ely.

Art. III. Of Chimerical Figures.

The laſt and the oddeſt kind of bearings in coats-of-arms, is comprehended under the name of *chimerical figures*; that is to ſay, ſuch as have no real exiſtence, but are mere fabulous and fantaſtical inventions. Theſe charges, griffons, martlets, and unicorns excepted, are ſo uncommon in Britiſh coats, that in order to make up the ſame number of examples hitherto contained in each collection, ſeveral foreign bearings are introduced here;

Fig. 15.
LIONS &c.

ANIMALS &c.

Fig. 17.
BIRDS &c.

Fig. 18.
ARTIFICIAL FIGURES.

N. Bell Sculpt.

Chimerical Figures.

here; which, however, as they are conform to the laws of heraldry, will alſo contribute both to entertain and inſtruct the reader. Thoſe moſt in uſe are the following, viz.

Angels, Cherubim, Tritons, Centaurs, Martlets, Griffons, Unicorns, Dragons, Mermaids, Satyrs, Wiverns, Harpies, Cockatrices, Phenixes.

Theſe, like the foregoing charges, are ſubject to various poſitions and diſpoſitions, which, from the principles already laid down, will be plainly underſtood. See the examples, fig. xix.

N° 1. is "Gules, an Angel ſtanding affrontée, with his hands conjoined and elevated upon his breaſt, habited in a long Robe cloſe girt Argent, his Wings diſplayed Or;" borne by the name of *Brangor de Cereviſia*, a foreign prelate, who aſſiſted at the council of Conſtance 1412. This example is quoted by Guillim, Sect. III. Chap. i.

2. "Sable, a Cheveron between three Cherubim Or;" borne by the name of *Chaloner*, of Yorkſhire and Cheſhire.

3. "Azure, a Feſs indented between three Cherubim Argent." Theſe arms were granted to John Ayde, eſq; of Doddington in Kent, by Sir William Segar, garter.

4. "Gules, a Cherub having three pair of Wings, the uppermoſt and lowermoſt counter-croſſed Saltierways, and the middlemoſt diſplayed Argent;" borne by the name of *Buocafoco*, a foreign prelate. This example is copied from Meneſtrier's *Methode du Blaſon*, p. 120, N° viii.

5. "Azure, a Griffon ſegreant Or, armed and langued Gules, between three Creſcents Argent;" quartered by the right hon. John Bligh, lord Clifton, &c. The great grandfather of this noble lord, who lived in London, going over to Ireland in the time of Oliver Cromwell, as an agent to the adventurers there, acquired a good eſtate, and laid the foundation for the grandeur of this family.

6. "Gules, three Martlets Or;" borne by the name of *Macgill*. Guillim obſerves, that this bird, which is repreſented without feet, is given for a difference to younger brothers, to put them in mind, that, in order to raiſe themſelves, they are to truſt to their wings of virtue and merit, and not to their legs, having but little land to ſet their feet on.

7. "Azure, three Mullets Argent within a double Treſſure counter-flowery Or, in the centre a Martlet of the laſt;" borne by the right hon. Patrick Murray, lord Elibank. Sir Gideon Murray, knighted by king James VI. by whom he was made treaſurer-depute, was third ſon of Sir Andrew Murray of Blackbarony. His ſon Patrick, in reſpect of his loyalty to Charles I. was, on May 16. 1628, made a baronet, and, in 1643, created lord Elibank.

8. "Sable, a Cockatrice diſplayed Argent, creſted, membred, and jowllopped Gules."

9. "Argent, a Mermaid Gules, crined Or, holding in her right hand a Comb, and in her left a Mirror, both proper;" borne by the name of *Ellis*.

10. "Argent, a Wivern, his Wings elevated, and his Tail nowed below him Gules;" borne by the name of *Drakes*.

11. "Or, a Dragon paſſant Vert."

12. "Gules, a Centaur or Sagittary in full ſpeed reguardant proper." This was the coat-of-arms of Stephen, furnamed of *Blois*, ſon to Adela daughter of William the Conqueror, and of Stephen earl of Blois; and on this deſcent grounding his pretenſion to the crown of England, he was proclaimed king in 1135, and reigned to the 25th of October 1154.

External Ornaments.

13. "Argent, an Unicorn ſejant Sable, unguled and horned Or;" borne by the name of *Harling*.

14. "Argent, a Dragon's Head eraſed Vert, holding in his Mouth a ſiniſter Hand couped at the Wriſt Gules;" borne by the name of *Williams*.

15. "Gules, three Unicorns Heads couped Or;" borne by the name of *Paris*.

16. "Argent, a Wivern volant Bendways Sable;" borne by the name of *Raynon*.

17. "Azure, a Lion ſejant guardant winged Or, his Head encircled with a Glory, holding in his forepaws an open Book, wherein is written, *Pax tibi, Marce, Evangeliſta meus*; over the dexter ſide of the Book a Sword erect, all proper." Theſe are the arms of the republic of Venice.

18. "Azure, a Bull ſaliant and winged Or;" borne by the name of *Cadenet*, a family of diſtinction in Provence.

19. "Argent, a Wyvern with a human Face affrontée hooded, and winged Vert;" borne by the name of *Buſeraghi*, an ancient and noble family of Luques.

20. "Azure, a Harpy diſplayed, armed, crined, and crowned Or." Theſe are the arms of the city of Noremberg in Germany.

To the forementioned figures may be added the montegre, an imaginary creature, ſuppoſed to have the body of a tyger with a Satyr's head and horns; alſo thoſe which have a real exiſtence, but are ſaid to be endowed with extravagant and imaginary qualities, viz. the ſalamander, beaver, cameleon, &c.

CHAP. IV.

Of the EXTERNAL ORNAMENTS *of* ESCUTCHEONS.

THE ornaments that accompany or ſurround eſcutcheons were introduced to denote the birth, dignity, or office, of the perſons to whom the coat-of-arms appertaineth; which is practiſed both among the laity and clergy. Thoſe moſt in uſe are of ten ſorts, *viz.* Crowns, Coronets, Mitres, Helmets, Mantlings, Chapeaux, Wreaths, Creſts, Scrolls, Supporters.

SECT. I. *Of Crowns.*

THE firſt crowns were only diadems, bands, or fillets; afterwards they were compoſed of branches of divers trees, and then flowers were added to them.

Among the Greeks, the crowns given to thoſe who carried the prize at the Iſthmian games, were of pine; at the Olympick, of laurel; and at the Nemean, of ſmallage.

The Romans had various crowns to reward martial exploits and extraordinary ſervices done to the republic: for which ſee the detached article CROWN in this Dictionary, and Plate LXXXII.

Examples of ſome of theſe crowns are frequently

Crowns. met with in modern atchievements, *viz.* 1. The *mural* crown in that of lord Montfort, which was conferred on Sir John Bromley, one of his lordship's ancestors, as an augmentation to his arms, for his great courage at the battle of Le Croby. Part of the creſt of lord Archer is alſo a mural crown. And there are no leſs than ten Engliſh baronets, whoſe arms are ornamented with the ſame crown. 2. The *naval* or roſtral crown, is ſtill uſed with coats-of-arms, as may be ſeen in thoſe of Sir William Burnaby, bart. now admiral of the red ſquadron, and of John Clerke, eſq; as part of their creſts. 3. Of the *caſtrenſe* or vallary crown, we have inſtances in the coat-of-arms of Sir Reginald Graham, and of Iſaac Akerman, eſq. 4. The creſt of Grice Blakeney, eſq; is encompaſſed with a *civic* crown. 5. The *radiated* crown, according to J. Yorke, was placed over the arms of the kings of England, till the time of Edward III. It is ſtill uſed, as a creſt, on the arms of ſome private families; thoſe, for example, borne by the name of *Whitfield*, are ornamented with it. The celeſtial crown is formed like the radiated, with the addition of a ſtar on each ray; and is only uſed upon tomb-ſtones, monuments, and the like. —Others of the ancient crowns are ſtill borne, as creſts, by the right hon. Jeffrey Amherſt, baron Amherſt of Holmeſdale, in Kent; Sir James Gray, bart.; Thomas Sheriff, eſq; and others.

But modern crowns are only uſed as an ornament, which emperors, kings, and independent princes fet on their heads, in great ſolemnities, both to denote their ſovereign authority, and to render themſelves more awful to their ſubjects. Theſe are the moſt in uſe in heraldry, and are as follows:

Plate CXLX. fig. xx.

The imperial crown, (n° 1.) is made of a circle of gold, adorned with precious ſtones and pearls, heightened with fleurs-de-lis, bordered and ſeeded with pearls, raiſed in the form of a cap voided at the top, like a creſcent. From the middle of this cap riſes an arched fillet enriched with pearls, and furmounted of a mound, whereon is a croſs of pearls.

The crown of the kings of Great Britain (2.), is a circle of gold, bordered with ermine, enriched with pearls and precious ſtones, and heightened up with four croſſes pattee and four large fleurs-de-lis alternately; from theſe riſe four arched diadems adorned with pearls, which cloſe under a mound, furmounted of a croſs like thoſe at bottom. Mr Sandford, in his Genealogical Hiſtory, p. 381. remarks, that Edward IV. is the firſt king of England that in his ſeal, or on his coin, is crowned with an arched diadem.

The crown of the kings in France (3.) is a circle enamelled, adorned with precious ſtones, and heightened up with eight arched diadems, riſing from as many fleurs-de-lis, that conjoin at the top under a double fleur-de-lis, all of gold.

The crowns of Spain, Portugal, and Poland, are all three of the ſame form, and are, amongſt others, thus deſcribed by colonel Parſons, in his Genealogical Tables of Europe, *viz.* A ducal coronet, heightened up with eight arched diadems that ſupport a mound, enſigned with a plain croſs. Thoſe of Denmark and Sweden are both of the ſame form; and conſiſt of eight arched diadems, riſing from a marquis's coronet, which that conjoin at the top under a mound enſigned with a croſs-bottony.

Coronets. The crowns of moſt other kings are circles of gold, adorned with precious ſtones, and heightened up with large trefoils, and cloſed by four, ſix, or eight diadems, ſupporting a mound, ſurmounted of a croſs.

The Great Turk (4.), bears over his arms a turband, enriched with pearls and diamonds, under two coronets, the firſt of which is made of pyramidical points heightened up with large pearls, and the uppermoſt is ſurmounted with creſcents.

The Pope, or biſhop of Rome, appropriates to himſelf a Tiara (n° 5.), or long cap of golden cloth, from which hang two pendants embroidered and fringed at the ends, *ſemée* of croſſes of gold. This cap is incloſed by three marquis's coronets; and has on its top a mound of gold, whereon is a croſs of the ſame, which croſs is ſometimes repreſented by engravers and painters pometted, recroſſed, flowery, or plain.—It is a difficult matter to aſcertain the time when theſe haughty prelates aſſumed the three forementioned coronets. A patched up ſucceſſion of the holy pontiffs, engraved and publiſhed a few years ago by order of Clement XIII. the late Pope, for the edification of his good ſubjects in Great Britain and Ireland, repreſents Marcellus, who was choſen biſhop of Rome *anno* 310, and all his ſucceſſors, adorned with ſuch a cap: but it appears, from very good authority, that Boniface VIII. who was elected into the ſee of Rome *anno* 1295, firſt compaſſed his cap with a coronet; Benedict XII. in 1335, added a ſecond to it; and John XXIII. in 1411, a third; with a view to indicate by them, that the Pope is the ſovereign prieſt, the ſupreme judge, and the ſole legiſlator amongſt Chriſtians.

Sect. II. *Of Coronets.*

The Coronet of the prince of Wales, or eldeſt ſon of the king of Great Britain, (n° 7.), was anciently a circle of gold ſet round with four croſſes-pattee, and as many fleurs-de-lis alternately; but ſince the reſtoration, it has been cloſed with one arch only, adorned with pearls, and furmounted of a mound and croſs, and bordered with ermine like the king's.

Beſides the aforeſaid coronet, his royal highneſs the prince of Wales has another diſtinguiſhing mark of honour, peculiar to himſelf, called by the vulgar the *prince's arms*, viz. A plume of three oſtrich-feathers, with an ancient coronet of a prince of Wales. Under it, in a ſcroll, is this motto, *Ich Dien*, which in the German or old Saxon language ſignifies "I ſerve;" (ſee n° 6). This device was at firſt taken by Edward prince of Wales, commonly called the *black prince*, after the famous battle of Creſſy, in 1346, where having with his own hand killed John king of Bohemia, he took from his head ſuch a plume, and put it on his own.

The coronet of the preſent dukes of Glouceſter and Cumberland, and of all the immediate ſons and brothers of the kings of Great Britain, is a circle of gold, bordered with ermine, heightened up with four fleurs-de-lis, and as many croſſes-pattee alternate, (ſee n° 8). —The particular and diſtinguiſhing form of ſuch coronets as are appropriated to princes of the blood-royal, is deſcribed and ſettled in a grant of Charles II. the 13th of his reign.

The coronet of the princeſſes of Great Britain is a circle

Mitres, &c.

circle of gold, bordered with ermine, and heightened up with crosses-pattee, fleurs-de-lis and strawberry leaves alternate (n° 9.); whereas a prince's coronet has only fleurs-de-lis and crosses.

A duke's coronet is a circle of gold, bordered with ermine, enriched with precious stones and pearls, and set round with eight large strawberry or parsley leaves; (n° 10).

A marquis's coronet is a circle of gold, bordered with ermine, set round with four strawberry leaves, and as many pearls on pyramidical points of equal height, alternate; (n° 11).

An earl's coronet is a circle of gold, bordered with ermine, heightened up with eight pyramidical points or rays, on the tops of which are as many large pearls, and are placed alternately with as many strawberry-leaves, but the pearls much higher than the leaves; (n° 12).

A viscount's coronet differs from the preceding ones as being only a circle of gold bordered with ermine, with large pearls set close together on the rim, without any limited number, which is his prerogative above the baron, who is limited (see n° 13).

A baron's coronet, (n° 14), which was granted by king Charles II. is formed with six pearls set at equal distance on a gold circle, bordered with ermine, four of which only are seen on engravings, paintings, &c. to shew he is inferior to the viscount.

The eldest sons of peers, above the degree of a baron, bear their father's arms and supporters with a label, and use the coronet appertaining to their father's second title; and all the younger sons bear their arms with proper differences, but use no coronets.

As the crown of the king of Great Britain is not quite like that of other potentates, so do most of the coronets of foreign noblemen differ a little from those of the British nobility: as for example, the coronet of a French earl is a circle of gold with 18 pearls set on the brim of it; a French viscount's coronet is a circle of gold only enamelled, charged with four large pearls; and a French baron's coronet is a circle of gold enamelled and bound about with a double brace-set of pearls: and these coronets are only used on French noblemens coats-of-arms, and not worn on their heads, as the British noblemen and their ladies do at the king's coronation.

Sect. III. *Of Mitres.*

The archbishops and bishops of England and Ireland place a mitre over their coats-of-arms. It is a round cap pointed and cleft at the top, from which hang two pendants fringed at both ends; with this difference, that the bishop's mitre is only surrounded with a fillet of gold, set with precious stones, (see fig. 23. n° 6.) whereas the archbishop's issues out of a ducal coronet, (see fig. 20. n° 15).

This ornament, with other masquerade garments, is still worn by all the archbishops and bishops of the church of Rome, whenever they officiate with solemnity; but it is never used in England, otherwise than on coats of arms, as before mentioned.

Sect. IV. *Of Helmets.*

The Helmet was formerly worn as a defensive weapon, to cover the bearer's head; and is now placed over a coat-of-arms as its chief ornament, and the true mark of gentility. There are several sorts, distinguished, 1st, by the matter they are made of; 2dly, by their form; and, 3dly, by their position.

1st, As to the matter they are, or rather were, made of: The helmets of sovereigns were of burnished gold damasked; those of princes and lords, of silver figured with gold; those of knights, of steel adorned with silver; and those of private gentlemen, of polished steel.

2dly, As to their form: Those of the king and the royal family, and noblemen of Great Britain, are open-faced and grated, and the number of bars serves to distinguish the bearers quality; that is, the helmet appropriated to the dukes and marquises is different from the king's, by having a bar exactly in the middle, and two on each side, making but five bars in all, (see fig. xxi. n° 1.) whereas the king's helmet has six bars, viz. three on each side, (ibid. n° 7.) The other grated helmet with four bars is common to all degrees of peerage under a marquis. The open-faced helmet without bars denotes baronets and knights. The close helmet is for all esquires and gentlemen.

3dly, Their position is also looked upon as a mark of distinction. The grated helmet in front belongs to sovereign princes. The grated helmet in profile is common to all degrees of peerage. The helmet standing direct without bars, and the beaver a little open, denotes baronets and knights. Lastly, the side-standing helmet, with the beaver close, is the way of wearing it amongst esquires and gentlemen. See n° 1, 2, 3, 4, and 7, inserted in fig. xxi. *Ornaments.*

Helmets, Mantlings, &c.

Sect. V. *Of Mantlings.*

Mantlings are pieces of cloth jagged or cut into flowers and leaves, which now-a-days serve as an ornament for escutcheons. They were the ancient covering of helmets, to preserve them, or the bearer, from the injuries of the weather, as also to prevent the ill consequences of their too much dazzling the eye in action. But Guillim very judiciously observes, that their shape must have undergone a great alteration since they have been out of use, and therefore might more properly be termed *flourishings* than *mantlings*. See the examples annexed to the helmets represented in fig. xxi.

The French heralds assure us, that these mantlings were originally no other than short coverings which commanders wore over their helmets, and that, going into battles with them, they often, on their coming away, brought them back in a ragged manner, occasioned by the many cuts they had received on their heads: and therefore the more hacked they were, the more honourable they were accounted; as our colours in time of war are the more esteemed, for having been shot through in many places.

Sometimes skins of beasts, as lions, bears, &c. were thus borne, to make the bearer look more terrible; and that gave occasion to the doubling of mantlings with furs.

Sect. VI. *Of Chapeaux.*

A chapeau is an ancient hat, or rather cap, of dig-

Wreaths, Crests, &c.

nity worn by dukes, generally ſcarlet-coloured velvet on the outſide lined and turned up with fur; of late frequently to be met with above an helmet, inſtead of a wreath, under gentlemens and noblemens creſts. Heretofore they were feldom to be found, as of right appertaining to private families; but by the grants of Robert Cooke, Clarencieux, and other ſucceeding heralds, theſe, together with ducal coronets, are now frequently to be met with in families, who yet claim not above the degree of gentlemen. See the repreſentation of the chapeau, n° 5. fig. xxi.

Sect. VII. *Of Wreaths.*

The Wreath is a kind of roll made of two ſkains of ſilk of different colours twiſted together, which ancient knights wore as a head-dreſs when equipped for tournaments. The colours of the ſilk are always taken from the principal metal and colour contained in the coat-of-arms of the bearer. They are ſtill accounted as one of the leſſer ornaments of eſcutcheons, and are placed between the helmet and the creſt; (ſee fig. xxi. n° 6). In the time of Henry I. and long after, no man, who was under the degree of a knight, had his creſt ſet on a wreath; but this like other prerogatives, has been infringed ſo far, that every body now-a-days wears a wreath.

Sect. VIII. *Of Creſts.*

The Creſt is the higheſt part of the ornaments of a coat-of-arms. It is called *creſt*, from the Latin word *criſta*, which ſignifies comb or tuft, ſuch as many birds have upon their heads, as the peacock, pheaſant, &c. in alluſion to the place on which it is fixed.

Creſts were formerly great marks of honour, becauſe they were only worn by heroes of great valour, or by ſuch as were advanced to ſome ſuperior military command, in order that they might be the better diſtinguiſhed in an engagement, and thereby rally their men if diſperſed; but they are at preſent conſidered as a mere ornament. The creſt is frequently a part either of the ſupporters, or of the charge borne in the eſcutcheon. Thus the creſt of the royal atchievement of Great Britain is a "Lion guardant crown'd," as may be ſeen in fig. xxi. n° 7. The creſt of France is "a double Flower-de-luce." Out of the many creſts borrowed from ſupporters, are the following, viz. The duke of Montagu's, "A Griffon's head coup'd Or, back'd and wing'd Sable:" the marquis of Rockingham's, "A Griffon's head Argent, gorg'd with a ducal coronet;" the earl of Weſtmoreland's, "a Bull's head Argent, py'd Sable, armed Or;" and lord Archer's, which is, "Out of a mural crown Or, a Wyvern's head Argent." There are ſeveral inſtances of creſts that are relative to alliances, employments, or names; and which on that account have been changed.

Sect. IX. *Of the Scroll.*

The Scroll is the ornament placed above the creſt, containing a motto, or ſhort ſentence, alluding thereto, or to the bearings; or to the bearer's name, as in the two following inſtances. The motto of the noble earl of Cholmondeley is, *Caſſis tutiſſima virtus*; i. e. "Virtue is the ſafeſt helmet;" on account of helmets in the coat-of-arms. The motto of the right hon. lord Forteſcue is, *Forte ſcutum ſalus ducum*; i. e. "A ſtrong ſhield is the ſafety of the commanders;" alluding to the name of that ancient family. Sometimes it has a reference to neither, but expreſſes ſomething divine or heroic; as that of the earl of Scarborough, which is, *Murus æreus conſcientia ſana*; i. e. "A good conſcence is a wall of braſs." Others are ænigmatical; as that of the royal atchievement, which is *Dieu et mon droit*, i. e. "God and my right;" introduced by Edward III. in 1340, when he aſſumed the arms and title of *king of France*, and began to proſecute his claim, which occaſioned long and bloody wars, fatal, by turns, to both kingdoms: or that of the prince of Wales, which is *Ich Dien*, "I ſerve," the origin of which has been already mentioned. Mottos, though hereditary in the families that firſt took them up, have been changed on ſome particular occaſions, and others appropriated in their ſtead, inſtances of which are ſometimes met with in the hiſtory of families.

Of Supporters.

Sect. X. *Of Supporters.*

Supporters are figures ſtanding on the ſcroll, and placed at the ſide of the eſcutcheon; they are ſo called, becauſe they ſeem to ſupport or hold up the ſhield. The riſe of ſupporters is, by F. Meneſtrier, traced up to ancient tournaments, wherein the knights cauſed their ſhields to be carried by ſervants or pages under the diſguiſe of lions, bears, griffons, blackamoors, &c. who alſo held and guarded the eſcutcheons, which the knights were obliged to expoſe to public view for ſome time before the liſts were opened. Sir George Mackenzie, who diſſents from this opinion, ſays, in his *Treatiſe on the ſcience of heraldry*, chap. xxxi. p. 93. "That the firſt origin and uſe of them was from the "cuſtom which ever was, and is, of leading ſuch as "are inveſted with any great honour to the prince "who confers it: thus, when any man is created a "duke, marquis, or knight of the garter, or any "other order, he is ſupported by, and led to the "prince betwixt two of the quality, and ſo receives "from him the ſymbols of that honour; and in re-"membrance of that ſolemnity, his arms are there-"after ſupported by any two creatures he chooſes." Supporters have formerly been taken from ſuch animals or birds as are borne in the ſhields, and ſometimes they have been choſen as bearing ſome alluſion to the names of thoſe whoſe arms they are made to ſupport. The ſupporters of the arms of Great Britain, ſince king James the firſt's acceſſion to the throne, are *a Lion rampant guardant crowned Or, on the dexter-ſide*, and *an Unicorn Argent, crowned, armed, unguled, maned and gorged with an antique Crown, to which a chain is affixed, all Or*, on the ſiniſter; as it appears by fig. xxi. n° 7.

This laſt figure repreſents the coat-of-arms of the king of Great Britain, or the royal atchievement, as it has been marſhalled ſince the acceſſion of king George I. in 1714, and is blazoned as follows, viz.

ARMS. *Quarterly, in the firſt grand quarter Gules, three Lions rampant guardant in pale Or*, the imperial enſigns of England; *impaled with Or, a Lion rampant, within a double treſſure flowery and counter-flowery Gules*, the royal arms of Scotland. *The ſecond is Azure, three Fleurs-de-lis Or*, the arms of France. *The third is Azure, a Harp Or, ſtringed Argent*, the enſign of Ireland. *The fourth grand quarter*

Of Supporters.

quarter is Gules, two Lions paſſant guardant in pale Or, for Brunſwick; *impaled with Or ſemée of Hearts proper, a Lion rampant Azure*, for Lunenburgh; *with graſted in baſe Gules, a Horſe current Argent*, for ancient Saxony; *and in a ſhield furtout Gules, the Crown of Charlemagne Or*, as arch-treaſurer of the empire; *the whole within a Garter, inſcribed with this motto*, HONI SOIT QUI MAL Y PENSE, as ſovereign of that noble order, given by the founder king Edward III.

CREST. *On a Helmet full-faced, grated and ſurmounted of a Crown, a Lion guardant crowned Or; the mantlings of the laſt, and lining Ermine.*

SUPPORTERS. *On the Dexter-ſide, a Lion rampant guardant Or, crowned as the Creſt. On the Sinifter-ſide an Unicorn Argent, crowned, armed, maned, and unguled Or, gorged with an antique Crown; a Chain affixed thereto, reflecting over the back, and paſſing over the hind legs of the laſt, both ſtanding on a Scroll inſcribed with this motto*, DIEU ET MON DROIT, *from which iſſue the two Royal Badges of his Majeſty's chief Dominions, viz. on the Dexter-ſide a Roſe party per Pale Argent and Gules, ſtalked and leaved proper*, for England; *and on the Sinifter-ſide a Thiſtle proper*, for Scotland; being ſo adorned by king James I. upon his ſucceeding to the crown of England As king of Scotland, he bore two unicorns, as above, for his ſupporters; but upon the union of that kingdom with England, 1603, he introduced one of the above ſupporters on the ſiniſter-ſide of the royal atchievement, and which continues to this day.

It is to be obſerved, that bearing coats-of-arms ſupported, is, according to the heraldrical rules of England, the prerogative, 1ſt, Of thoſe called *nobiles majores*, viz. dukes, marquiſes, earls, viſcounts, and barons; 2d, Of all knights of the garter, though they ſhould be under the degree of barons; 3d, Of knights of the Bath, who both receive on their creation a grant of ſupporters. And, laſtly, of ſuch knights as the king chooſes to beſtow this honour upon; as in the inſtance of Sir Andrew Fountain, who was knighted by Philip earl of Pembroke, when lord-lieutenant of Ireland, Fountain being then his ſecretary; and on his return to England, king William granted him ſupporters to his arms, viz. *two Griffons Gules and Or*. In Scotland, all the chiefs of clans or names have the privilege of claiming ſupporters; alſo the baronets. But by act of parliament, 10th September, 1672, none are allowed to uſe either arms or ſupporters, under a penalty and confiſcation of all moveables whereon arms are put, without the lord Lyon's authority.

CHAP. V.

Of the Rules or Laws of HERALDRY.

THE ſeveral eſcutcheons, tinctures, charges, and ornaments of coats-of-arms, and their various properties, being now explained; it may not be improper to ſubjoin ſuch rules for blazoning the ſame, as the ancient uſage and laws of heraldry have eſtabliſhed amongſt us.

I. The *firſt* and moſt general rule is, to expreſs one's ſelf in proper terms, ſo as not to omit any thing that ought to be ſpecified, and at the ſame time to be clear and conciſe without tautology; as in Ex. xiv. p. 3588. and alſo in Ex. ix. p. 3595. wherein theſe expreſſions, *of the Field*, or *of the Firſt*, prevent the repetition of the forementioned tincture. Rules of Heraldry.

II. One muſt begin with the tincture of the field, and then proceed to the principal charges which poſſeſs the moſt honourable place in the ſhield, ſuch as Feſs, Cheveron, &c. always naming that charge firſt which lies next and immediately upon the field; as in Ex. xv. p. 3593.

III. After naming the tincture of the field, the honourable ordinaries, or other principal figures, you muſt ſpecify their attributes, and afterwards their metal or colour, as in Ex. xvi. p. 3601.

IV. When an honourable ordinary, or ſome one figure, is placed upon another, whether it be a Feſs, Cheveron, Croſs, &c. it is always to be named after the ordinary or figure over which it is placed, with one of theſe expreſſions, *furtout*, or *over-all*, as in Ex. xx. p. 3592.

V. In the blazoning of ſuch ordinaries as are plain, the bare mention of them is ſufficient; but if an ordinary ſhould be made of any of the crooked lines mentioned above, its form muſt be ſpecified; that is, whether it be Engrailed, Wavy, &c. as in Ex. i. ii. iii. &c. p. 3588.

VI. When a principal figure poſſeſſes the centre of the field, its poſition is not to be expreſſed: or (which amounts to the ſame thing) when a bearing is named, without ſpecifying the point where it is placed, then it is underſtood to poſſeſs the middle of the ſhield, as in Ex. xv. p. 3602.

VII. The number of the points of mullets or ſtars muſt be ſpecified when more than five; and alſo if a mullet or any other charge be pierced, it muſt be mentioned as ſuch, to diſtinguiſh it from what is plain; as in Ex. xiii. and xiv. p. 3599.

VIII. When a ray of the ſun, or other ſingle figure, is borne in any other part of the eſcutcheon than the centre, the point it iſſues from muſt be named; as in Ex. iii. p. 3599. col. 1.

IX. The natural colour of trees, plants, fruits, birds, &c. is no otherwiſe to be expreſſed in blazoning but by the word *proper*, as in Exam. ii. vii. p. 3602.: but if diſcoloured, that is, if they differ from their natural colour, it muſt be particularized; as in Ex. i. ii. &c. p. 3600.

X. When three figures are in a field, and their poſition is not mentioned in the blazoning, they are always underſtood to be placed two above, and one below; as fig. xxii. n° 3.

XI. When there are many figures of the ſame ſpecies borne in a coat-of-arms, their number muſt be obſerved as they ſtand, and diſtinctly expreſſed; as in Ex. i. p. 3603.

But for the better underſtanding of this laſt rule, we have inſerted examples of the *different diſpoſitions of figures*, wherein they are properly repreſented; viz.

Two may be ranged in Pale, in Feſs, &c. See fig. xxii. n° 1 and 2.

Three, may be 2 and 1, as alſo in bend, &c. See n° 3 and 4.

Four, are placed 2 and 2, or cantoned, as in n° 5.

Five, 1, 3, 1, in Croſs; or 2, 1, 2, in Saltier. See n° 6 and 7.

Six,

Marſhalling

Six, 3, 2, 1, in Pile; or 2, 2, 2, Paleways. See n° 8 and 9.

Eight, in Orle, or on a Bordure. See n° 10.

Nine, 3, 3, 3, Barways; or 3, 3, 2, 1, in Pile. See n° 11 and 12.

Ten, 4, 3, 2, 1, in Pile; or elſe 4, 2, 4, Barways. See n° 13 and 14.

Twelve, are placed 4, 4, 4, Barways. See n° 15.

There are other poſitions called *irregular*; as for example, when three figures which are naturally placed 2 and 1, are diſpoſed 1 and 2, &c. It muſt alſo be obſerved, that when the field is ſtrewed with the ſame figures, this is expreſſed by the word *ſemée:* but, according to a French armoriſt's opinion, if the figures ſtrewed on the field are whole ones, it muſt be denoted by the words *ſans nombre;* whereas, if part of them is cut off at the extremities of the eſcutcheon, the word *ſemée* or *ſemi* is then to be uſed.

CHAP. VI.

Of MARSHALLING *Coats-of-arms.*

BY *marſhalling* coats-of-arms, is to be underſtood the art of diſpoſing divers of them in one eſcutcheon, and of diſtributing their contingent ornaments in proper places.

Various cauſes may occaſion arms to be thus conjoined, which J. Guillim compriſes under two heads, viz. *manifeſt* and *obſcure*.

What this learned and judicious herald means by *manifeſt cauſes* in the marſhalling of coats-of-arms, are ſuch as betoken marriages, or a ſovereign's gift, granted either through the ſpecial favour of the prince, or for ſome eminent ſervices. Concerning marriages, it is to be obſerved,

I. When the coats-of-arms of a married couple, deſcended of diſtinct families, are to be put together in one eſcutcheon, the field of their reſpective arms is conjoined Paleways, and blazoned *parted per Pale, Baron and Femme, two coats; firſt, &c.* In which caſe the baron's arms are always to be placed on the dexter-ſide, and the femme's arms on the ſiniſter-ſide, as in n° 1 and 2, and fig. xxiii. *Of arms marſhalled* which are,

1. The coat-of-arms of the rev. Edward Barnard, D. D. chaplain in ordinary to his majeſty, provoſt of Eton-college, canon of Windſor, &c. impaled with that of S. Haggatt, his late ſpouſe.

2. The coat-of-arms of the rev. Thomas Dampier, D. D. chaplain in ordinary to his majeſty, prebendary of Durham, canon of Windſor, &c. impaled with that of F. Walker, his ſpouſe.

If a widower marry again, his late and preſent wife's arms are, according to G. Leigh, "to be both "placed on the ſiniſter-ſide, in the eſcutcheon with "his own, and parted per Pale. The firſt wife's "coat ſhall ſtand on the Chief, and the ſecond on the "Baſe; or he may ſet them both in Pale with his "own, the firſt wife's coat next to himſelf, and his "ſecond outermoſt. If he ſhould marry a third wife, "then the two firſt matches ſhall ſtand on the Chief, "and the third ſhall have the whole Baſe. And if "he take a fourth wife, ſhe muſt participate one-half "of the Baſe with the third wife, and ſo will they "they ſeem to be ſo many coats quartered." But it muſt be obſerved, that theſe forms of impaling are meant of hereditary coats, whereby the huſband ſtands in expectation of having the hereditary poſſeſſions of his wife united to his patrimony. Marſhalling

II. In the arms of femmes joined to the paternal coat of the baron, the proper differences by which they were borne by the fathers of ſuch women muſt be inſerted.

III. If a coat-of-arms that has a Bordure be impaled with another, as by marriage, then the Bordure muſt be wholly omitted in the ſide of the arms next the centre.

IV. The perſon that marries an heireſs, inſtead of impaling his arms with thoſe of his wife, is to bear them in an eſcutcheon placed in the centre of his ſhield, after the ſame manner as the baronet's badge is marſhalled in n° 3. and which, on account of its ſhewing forth his pretenſion to her eſtate, is called *an eſcutcheon of pretence*, and is blazoned *fur-tout*, i. e. *over-all*, as the ineſcutcheon borne in the fourth quarter of the royal atchievement. But the children are to bear the hereditary coat-of-arms of their father and mother *quarterly*, which denotes a fixed inheritance, and ſo tranſmit them to poſterity. The firſt and fourth quarters generally contain the father's arms, and the ſecond and third the mother's; except the heirs ſhould derive not only their eſtate, but alſo their title and dignity, from their mother.

V. If a maiden or dowager lady of quality marry a commoner, or a nobleman inferior to her rank, their coats-of-arms may be ſet aſide of one another in two ſeparate eſcutcheons, upon one mantle or drapery, and the lady's arms ornamented according to her title; ſee n° 4 and 5, which repreſent the coats-of-arms of Gen. C. Montagu, and lady Elizabeth Villiers viſcounteſs Grandiſon.

VI. Archbiſhops and biſhops impale their arms differently from the fore-mentioned coats, in giving the place of honour, that is, the dexter-ſide, to the arms of their dignity, as it is expreſſed in n° 6, which repreſents the coat-of-arms of Dr Philip Yonge, lord biſhop of Norwich. It may be obſerved of the above prelates, that they thus bear their arms parted per Pale, to denote their being joined to their cathedral church in a ſort of ſpiritual marriage.

With reſpect to ſuch armorial enſigns as the ſovereign thinks fit to augment a coat-of-arms with, they may be marſhalled various ways, as may be ſeen by the arms of his grace the duke of Rutland, inſerted in fig. viii. n° 19. and the example contained in fig. xii. n° 11.

To thoſe augmentations may be added, 1ſt, The baronet's mark of diſtinction, or the arms of the province of Ulſter in Ireland, granted and made hereditary in the male line by king James I. who erected this dignity on the 22d of May, 1611, in the 9th year of his reign, in order to propagate a plantation in the fore-mentioned province. This mark is *Argent, a ſiniſter Hand couped at the Wriſt, and erected Gules*; which may be borne either in a canton or in an eſcutcheon, as will beſt ſuit the figures of the arms. See fig. xxiii. n° 3. which repreſents the coat-of-arms of Sir William Lorrayne, of Kirk-harle, Northumberland, and are thus blazoned: *Quarterly, Sable and Argent, a plain Croſs counter-quartered of the Field.*

The Creſt,—*A Laurel-tree couped, two branches ſprouting out proper, and fixed to the lower part thereof with a Belt Gules, edged and buckled Or.* This, according to tradition in the family, was granted for ſome worthy action in the field.

2dly. The ancient and reſpectable badge of the moſt noble order of the Garter, inſtituted by king Edward III. 1349, in the 27th year of his reign; and which, ever ſince its inſtitution, has been looked upon as a great honour beſtowed on the nobleſt perſons of this nation and other countries. This honourable augmentation is made to furround, as with a garter, the arms of ſuch knights, and is inſcribed with this motto, *Honi ſoit qui mal y penſe:* See n° 7. which repreſents the coat-of-arms of his grace the duke of Montagu, earl of Cardigan, baron Brudenel of Stanton-Wivil, conſtable and lieutenant of Windſor-caſtle, knight of the moſt noble order of the Garter, and baronet, preſident of St Luke's Hoſpital, and F. R. S.

This nobleman, whoſe arms were *Argent, a Cheveron Gules between three Morions proper*, has, ſince the deceaſe of John duke of Montagu, taken the name and arms of *Montagu*, on account of his being married to lady Mary Montagu, youngeſt daughter and one of the co-heireſſes of his grace.

So far the cauſes for marſhalling divers arms in one ſhield, &c. are *manifeſt*. As to ſuch as are called *obſcure*, that is, when coats-of-arms are marſhalled in ſuch a manner, that no probable reaſon can be given why they are ſo conjoined, they muſt be left to heralds to explain, as being the propereſt perſons to unfold theſe and other myſteries of this ſcience.

CHAP. VII.

Of Funeral Escutcheons.

After having treated of the eſſential parts of the coats-of-arms, of the various charges and ornaments uſually borne therewith, of their attributes and diſpoſitions, and of the rules for blazoning and marſhalling them, we ſhall next deſcribe the ſeveral funeral eſcutcheons, uſually called *hatchments*; whereby may be known, after any perſon's deceaſe, what rank either he or ſhe held when living; and if it be a gentleman's hatchment, whether he was a batchelor, married man, or widower, with the like diſtinctions for gentlewomen.

Plate CLI.

The hatchment, N° 1. repreſents ſuch as are affixed to the fronts of houſes, when any of the nobility and gentry dies; the arms therein being thoſe of a private gentleman and his wife parted per pale; the dexter-ſide, which is Gules, three Bars Or, for the huſband; having the ground without the eſcutcheon black, denotes the man to be dead; and the ground on the ſiniſter-ſide being white, ſignifies that the wife is living, which is alſo demonſtrated by the ſmall hatchment, n° 2. which is here depicted without mantling, helmet, and creſt, for perſpicuity's ſake only.

When a married gentlewoman dies firſt, the hatchment is diſtinguiſhed by a contrary colour from the former; that is, the arms on the ſiniſter-ſide have the ground without the eſcutcheon black; whereas thoſe on the dexter-ſide, for her ſurviving huſband, are upon a white ground: the hatchment of a gentlewoman is, moreover, differenced by a cherub over the arms inſtead of a creſt. See n° 3.

When a batchelor dies, his arms may be depicted ſingle or quartered, with a creſt over them, but never impaled as the two firſt are, and all the ground without the eſcutcheon is alſo black. See n° 4.

When a maid dies, her arms, which are placed in a lozenge, may be ſingle or quartered, as thoſe of a batchelor; but, inſtead of a creſt, have a cherub over them, and all the ground without the eſcutcheon is alſo black. See n° 5.

When a widower dies, his arms are repreſented impaled with thoſe of his deceaſed wife, having a helmet, mantling, and creſt over them, and all the ground without the eſcutcheon black. See n° 6.

When a widow dies, her arms are alſo repreſented impaled with thoſe of her deceaſed huſband, but incloſed in a lozenge, and, inſtead of a creſt, a cherub is placed over them; all the ground without the eſcutcheon is alſo black. See n° 7.

If a widower or batchelor ſhould happen to be the laſt of his family, the hatchment is depicted as in n° 6.; and that of a maid or widow, whoſe family is extinct by her death, is depicted as in n° 7. with this difference only, that a death-head is generally annexed to each hatchment, to denote, that death has conquered all.

By the forementioned rules, which are ſometimes neglected through the ignorance of illiterate people, may be known, upon the ſight of any hatchment, what branch of the family is dead; and by the helmet or coronet, what title and degree the deceaſed perſon was of.

The ſame rules are obſerved with reſpect to the eſcutcheons placed on the hearſe and horſes uſed in pompous funerals, except that they are not ſurmounted with any creſt, as in the foregoing examples of hatchments, but are always plain. It is neceſſary, however, to enſign thoſe of peers with coronets, and that of a maiden lady with a knot of ribbands.

In *Scotland*, a funeral eſcutcheon not only ſhews forth the arms and condition of the defunct, but is alſo a proof of the gentility of his deſcent; and ſuch perſons for whom this ſpecies of eſcutcheon can be made out, are legally entitled to the character of gentlemen of blood, which is the higheſt ſpecies of gentility. The Engliſh hatchment above deſcribed exhibits no more than a right to a coat-of-arms which may be acquired by purchaſe, and is only the firſt ſtep towards eſtabliſhing gentility in a family.

The funeral eſcutcheon as exhibited in Scotland, France, and Germany, is in form of a lozenge, above ſix feet ſquare, of black cloth; in the centre of which is painted, in proper colours, the complete atchievement of the defunct, with all its exterior ornaments and additional marks or badges of honour; and round the ſides are placed the ſixteen arms of the families from which he derives his deſcent, as far back as the grandfather's grandfather, as the proofs of his gentility: they exhibit the armorial bearings of his father and mother, his two grandmothers, his four great-grandmothers, and his eight great-grandmothers mothers; if all theſe families have acquired a legal right

to.

Of Precedency

to bear arms, then the gentility of the perſon whoſe proof it is muſt be accounted complete, but not otherwiſe. On the four corners are placed mort-heads, and the initials of his name and titles or deſignation; and the black interſtices are ſemée or powdered with tears, as in the figure, n° 8. which is the eſcutcheon of the right hon. James 5th earl of Balcarras, chief of the ancient ſurname of *Lindeſay*.

On the morning of the interment, one of theſe is placed on the front of the houſe where the deceaſed lies; and another on the church in which he is to be buried, which after the burial is fixed above the grave. The pall, too, is generally adorned with theſe proofs of gentility, and the horſes of the hearſe with the defunct's arms.

CHAP. VIII.

Of PRECEDENCY.

THE order of precedency, which is obſerved in general, is thus, That perſons of every degree of honour or dignity take place according to the ſeniority of their creation, and not of years, unleſs they are deſcended from the blood-royal; in which caſe, they have place of all others of the ſame degree.

The younger ſons of the preceding rank take place from the eldeſt ſon of the next mediate, viz. the younger ſons of dukes from the eldeſt ſons of earls; the younger ſons of earls from the eldeſt ſons of barons. All the chain of precedency is founded upon this gradation, and thus ſettled by act of parliament, 31 Henry VIII. cap. 10. *anno* 1539.

But there have been ſince ſome alterations made in this act by ſeveral decrees and eſtabliſhments in the ſucceeding reigns, whereby all the ſons of viſcounts and barons are allowed to precede baronets. And the eldeſt ſons and daughters of baronets have place given them before the eldeſt ſons and daughters of any knights, of what degree or order ſoever, though ſuperior to that of a baronet; theſe being but temporary dignities, whereas that of baronets is hereditary: and the younger ſons of baronets are to have place next after the eldeſt ſons of knights.

Obſerve alſo, that as there are ſome great officers of ſtate, who take place, although they are not noblemen, above the nobility of higher degree; ſo there are ſome perſons, who, for their dignities in the church, degrees in the univerſities, and inns of court, officers in the ſtate, or army, although they are neither knights, nor gentlemen born, yet take place amongſt them. Thus, all colonels and field officers who are honourable, as alſo the maſter of the ordnance, quarter-maſter general, doctors of divinity, law, phyſic, and muſic; deans, chancellors, prebendaries, heads of colleges in univerſities, and ſerjeants at law, are, by courteſy, allowed place before ordinary eſquires. And all bachelors of divinity, law, phyſic, and muſic; maſters of arts, barriſters in the inns of courts; lieutenant-colonels, majors, captains, and other commiſſioned military officers; and divers patent officers in the king's houſehold, may equal, if not precede, any gentleman that has none of theſe qualifications.

In towns corporate, the inhabitants of cities are preferred to thoſe of boroughs; and thoſe who have borne magiſtracy, to all others. And herein a younger alderman takes not precedency from his ſenior by being knighted, or as being the elder knight, as was the caſe of Alderman Craven, who, though no knight, had place as ſenior alderman, before all the reſt who were knights, at the coronation of king James. This is to be underſtood as to public meetings relating to the town; for it is doubted whether it will hold good in any neutral place. It has been alſo determined in the earl marſhal's court of honour, that all who have been lord mayors of London, ſhall every where take place of all knights-batchelors, becauſe they have been the king's lieutenants.

Of Precedency

It is alſo quoted by Sir George Mackenzie, in his obſervations on precedency, that in the caſe of Sir John Crook, ſerjeant at law, it was adjudged by the judges in court, that ſuch ſerjeants as were his ſeniors, though not knighted, ſhould have preference notwithſtanding his knighthood.—The precedency among men is as follows:

The KING, and Prince of WALES.

PRINCES of the BLOOD, viz. Sons, Grandſons, Brothers, Uncles, &c. of the king.

The following precede all Dukes by authority of the aforementioned Act of Parliament.

Archbiſhop of Canterbury.
Lord Chancellor, or Lord-Keeper.
Archbiſhop of York.
Lord Treaſurer of England.
Lord Preſident of the Privy-council.
Lord Privy-Seal.

Theſe alſo precede all of their own Degree.

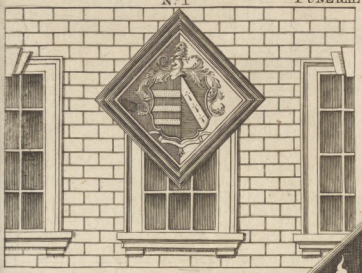
Lord Great-Chamberlain.
Lord High-Conſtable.
Lord Earl-Marſhal.
Lord High-Admiral.
Lord Steward of the Houſhold.
Lord Chamberlain of the Houſhold.
Secretaries of State.

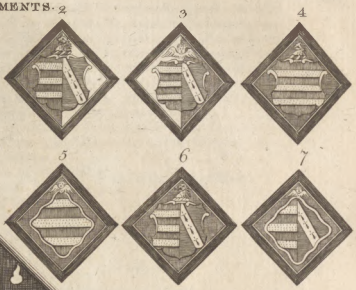
Then, according to their reſpective Creations,

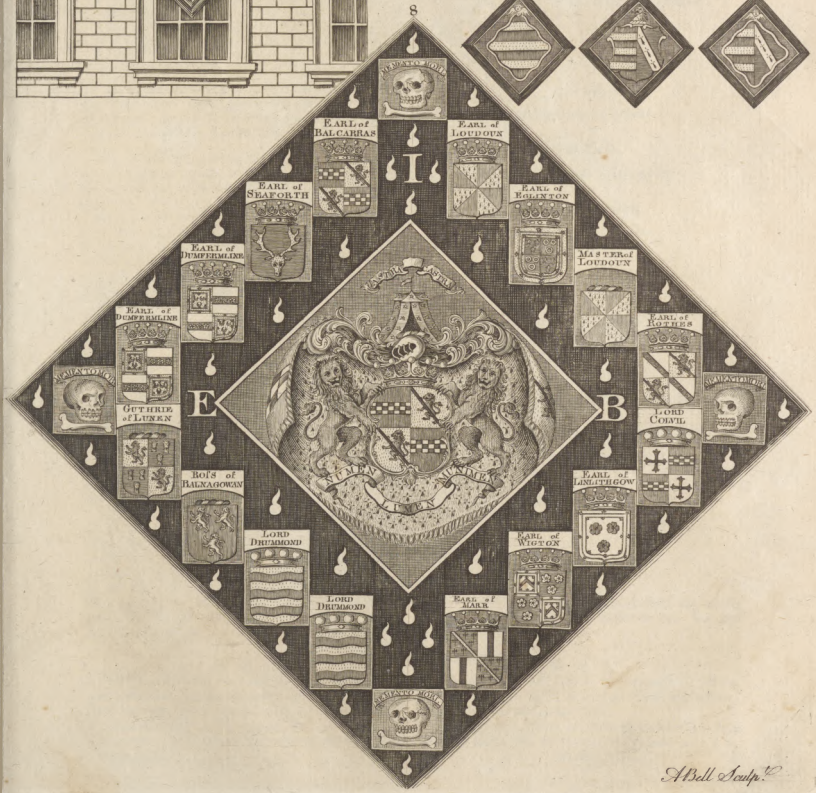
Dukes.
Marquiſes.
Dukes eldeſt ſons.
Earls.
Marquiſes eldeſt ſons.
Dukes younger ſons.
Viſcounts.
Earls eldeſt ſons.
Marquiſes younger ſons.
Biſhops.
Barons.
Speaker of the Houſe of Commons.
Viſcounts eldeſt ſons.
Earls younger ſons.
Barons eldeſt ſons.
Knights of the Garter.
Privy-counſellors, who are ſtyled Right Honourable.
Chancellor and Under-treaſurer of the Exchequer.
Chancellor of the dutchy of Lancaſter.
Lord Chief-juſtice of the King's-bench.
Maſter of the Rolls.
Lord Chief-juſtice of the Common-pleas.
Lord Chief-baron of the Exchequer.
Juſtices and Barons in the Courts of Law.
Viſcounts younger ſons.
Barons younger ſons.

Ba-

FUNERAL ATCHIEVEMENTS.







A Bell Sculp.

Of Precedency

Baronets of England.
Baronets of Scotland.
Baronets of Ireland.
Knights of the Bath.
Field *and* Flag-officers.
Knights-bachelors.
Maſters in Chancery.
Doctors, Deans, &c.
Serjeants at law.
Baronets eldeſt ſons.
Knights of the Garter's eldeſt ſons.
Knights of the Bath's eldeſt ſons.
Knights-Bachelors eldeſt ſons.
Baronets younger ſons.
Eſquires by creation.
Eſquires by office.
Gentlemen.
Citizens.
Burgeſſes, &c.

The eſquires attending on knights of the Bath take place alſo from thoſe gentlemen who are reputed eſquires only during the time they are in office, and no longer; ſuch as high ſheriffs, juſtices of the peace, &c.

The precedency among men being known, that which is due to women, according to their ſeveral degrees, will be eaſily demonſtrated: but it is to be obſerved, that women, before marriage, have precedency by their father; with this difference between them and the male children, that the ſame precedency is due to all the daughters that belongs to the eldeſt; which is not ſo among the ſons; and the reaſon of this diſparity ſeems to be, that daughters all ſucceed equally, whereas the eldeſt ſon excludes all the reſt.

By marriage, a woman participates of her huſband's dignities; but none of the wife's dignities can come by marriage to her huſband, but are to deſcend to her next heir.

If a woman have precedency by creation, or birth, ſhe retains the ſame though ſhe marry a commoner: but if a woman nobly born marry any peer, ſhe ſhall take place according to the degree of her huſband only, though ſhe be a duke's daughter.

A woman, privileged by marriage with one of noble degree, ſhall retain the privilege due to her by her huſband, though he ſhould be degraded by forfeiture, &c.; for crimes are perſonal.—Sir G. Mackenzie, *Of Precedency*, chap. ix.

The wife of the eldeſt ſon of any degree takes place of the daughters of the ſame degree, who always have place immediately after the wives of ſuch eldeſt ſons, and both of them take place of the younger ſons of the preceding degree. Thus, the lady of the eldeſt ſon of an earl takes place of an earl's daughter, and both of them precede the wife of the younger ſon of a marquis; alſo the wife of any degree precedes the wife of the eldeſt ſon of the preceding degree. Thus, the wife of a marquis precedes the wife of the eldeſt ſon of a duke.

This holds not only in comparing degrees, but alſo families of the ſame degree amongſt themſelves; for inſtance, the daughter of a ſenior earl yields place to the wife of a junior earl's eldeſt ſon: Though, if ſuch daughter be an heireſs, ſhe will then be allowed place before the wives of the eldeſt ſons of all younger earls. (W. Segar, *Of Honourable Places*, chap. xxii.) The precedency among women is as follows:

The Queen, and Princeſs of Wales.
Princeſſes, and Ducheſſes of the Blood.
Ducheſſes.
Wives of the eldeſt ſons; Daughters, } of Dukes of the Blood.
Marchioneſſes.
Wives of the eldeſt ſons; Daughters, } of Dukes.
Counteſſes.
Wives of the eldeſt ſons; Daughters, } of Marquiſes.
Wives of the younger ſons of Dukes.
Viſcounteſſes.
Wives of the eldeſt ſons; Daughters, } of Earls.
Wives of the younger ſons of Marquiſes.
Baroneſſes.
Wives of the eldeſt ſons; Daughters, } of Viſcounts.
Wives of the younger ſons of Earls.
Wives of the eldeſt ſons; Daughters, } of Barons.
Wives of the younger ſons of Viſcounts.
Wives of the younger ſons of Barons.
Wives of Baronets.
Wives of Knights of the Garter.
Wives of Knights of the Bath.
Wives of Knights Bachelors.
Wives of the eldeſt ſons; Daughters, } of Baronets.
Wives of the eldeſt ſons; Daughters, } of Knights of the Garter.
Wives of the eldeſt ſons; Daughters, } of Knights of the Bath.
Wives of the eldeſt ſons; Daughters, } of Knights-Bachelors.
Wives of the younger ſons of Baronets.
Wives of Eſquires, by creation.
Wives of Eſquires, by office.
Wives of Gentlemen.
Daughters of Eſquires.
Daughters of Gentlemen.
Wives of Citizens.
Wives of Burgeſſes, &c.

The Wives of Privy-counſellors, Judges, &c. are to take the ſame place as their huſbands do. See the former liſt.

H E R

HERB, in botany; a name by which Linnæus denominates that portion of every vegetable which ariſes from the root, and is terminated by the fructification. It comprehends, 1. The trunk, ſtalk, or ſtem. 2. The leaves. 3. Thoſe minute external parts called by

H E R

the ſame author the *fulcra*, or ſupports of plants. 4. The buds, or, as he alſo terms them, the *winter-quarters* of the future vegetable.

Herbaceous *Plants*, are thoſe which have ſucculent ſtems or ſtalks that die down to the ground every year.

Herbage || Herbert

Of herbaceous plants, thofe are annual which periſh ſtem and root and all every year; biennial, which ſubſiſt by the roots two years; perennial which are perpetuated by their roots for a ſeries of years, a new ſtem being produced every ſpring.

HERBAGE, in law, ſignifies the paſture provided by nature for the food of cattle; alſo the liberty to feed cattle in the foreſt, or in another perſon's ground.

HERBAL, ſignifies a book that treats of the claſſes, genera, ſpecies, and virtues of plants.

Herbal is ſometimes alſo uſed for what is more uſually called *hortus ſiccus*. See Hortus.

HERBELOT (Bartholomew d'), a French writer, eminent for his oriental learning, was born at Paris in 1625. He travelled ſeveral times into Italy, where he obtained the eſteem of ſome of the moſt learned men of the age. Ferdinand II. grand duke of Tuſcany, gave him many marks of his favour: a library being expoſed to ſale at Florence, the duke deſired him to examine the manuſcripts in the oriental languages, to ſelect the beſt of them, and to mark the price; which being done, that generous prince purchaſed them, and made him a preſent of them. M. Colbert being at length informed of Herbelot's merit, recalled him to Paris, and obtained a penſion for him of one thouſand five hundred livres: he afterwards became ſecretary and interpreter of the oriental languages, and royal profeſſor of the Syriac tongue. He died at Paris in 1695. His principal work is intitled *Bibliotheque Orientale*, which he firſt wrote in Arabic, and afterwards tranſlated into French. It is greatly eſteemed. M. Herbelot's modeſty was equal to his erudition; and his uncommon abilities were accompanied with the utmoſt probity, piety, and charity, which he practiſed through the whole courſe of his life.

HERBERT (Mary), countefs of Pembroke, was ſiſter of the famous Sir Philip Sidney, and wife of Henry earl of Pembroke. She was not only a lover of the muſes, but a great encourager of polite literature; a character not very common among ladies. Her brother dedicated his incomparable romance *Arcadia* to her, from which circumſtance it hath been called *The counteſs of Pembroke's Arcadia*. She tranſlated a dramatic piece from the French, intitled *Antonius*, a tragedy; though it is ſaid ſhe was aſſiſted by her lord's chaplain, Dr Babington, afterwards biſhop of Exeter. She alſo turned the pſalms of David into Engliſh metre; but it is doubtful whether theſe works were ever printed. She died in 1621; and an exalted character of her is to be found in Francis Oſborne's memoirs of king James I.

HERBERT (Edward), lord Herbert of Cherbury in Shropſhire, an eminent Engliſh writer, was born in 1581, and educated at Oxford; after which he travelled, and at his return was made knight of the Bath. James I. ſent him embaſſador to Lewis XIII. in behalf of the Proteſtants who were beſieged in ſeveral cities of France; and continued in this ſtation till he was recalled, on account of a diſpute between him and the conſtable de Luines. In 1625 he was advanced to the dignity of a baron in the kingdom of Ireland, by the title of lord Herbert of Caſtle Iſland; and in 1631 to that of lord Herbert of Cherbury in Shropſhire. After the breaking out of the civil wars, he adhered to the parliament; and, in 1644, obtained a penſion, on account of his having been plundered by the king's forces. He wrote a hiſtory of the life and reign of Henry VIII. which was greatly admired; a treatiſe *de veritate*; and ſeveral other works. He died at London in 1648.

Herbert || Herculaneum.

"Lord Herbert," ſays Mr Granger, "ſtands in the firſt rank of the public miniſters, hiſtorians, and philoſophers, of his age. It is hard to ſay whether his perſon, his underſtanding, or his courage, was the moſt extraordinary; as the fair, the learned, and the brave, held him in equal admiration. But the fame man was wiſe and capricious; redreſſed wrongs, and quarrelled for punctilios; hated bigotry in religion, and was himſelf a bigot to philoſophy. He expoſed himſelf to ſuch dangers, as other men of courage would have carefully declined; and called in queſtion the fundamentals of a religion which none had the hardineſs to diſpute beſides himſelf."

Herbert (George), an Engliſh poet and divine, was brother to the preceding. He was born in 1593, and educated at Cambridge. In 1619 he was choſen public orator of that univerſity, and afterwards obtained a ſinecure from the king. In 1626 he was collated to the prebend of Layton Eccleſia, in the dioceſe of Lincoln; and in 1630 was inducted into the rectory of Bamerton, near Sarum. The great lord Bacon had ſuch an opinion of his judgment, that he would not ſuffer his works to be printed before they had paſſed his examination. He wrote a volume of devout poems called *The Temple*, and another intitled *The prieſt of the temple*. This pious divine died about the year 1635.

Herbert (Sir Thomas), an eminent gentleman of the Pembroke family, was born at York, where his father was an alderman. William earl of Pembroke ſent him to travel at his expence in 1626, and he ſpent four years in viſiting Aſia and Africa: his expectations of preferment ending with the death of the earl, he went abroad again, and travelled over ſeveral parts of Europe. In 1634, he publiſhed, in folio, A relation of ſome years travel into Africa and the Great Aſia, eſpecially the territories of the Perſian monarchy, and ſome parts of the oriental Indies, and iſles adjacent. On the breaking out of the civil war, he adhered to the parliament; and at Oldenby, on the removal of the king's ſervants, by deſire of the commiſſioners from the parliament, he and James Harrington were retained as grooms of his bed-chamber, and attended him even to the block. At the reſtoration he was created a baronet by Charles II. for his faithful ſervices to his father during his two laſt years. In 1678 he wrote *Threnodia Carolina*, containing an account of the two laſt years of the life of Charles I. and he aſſiſted Sir William Dugdale in compiling the third volume of his *Monaſticon Anglicanum*. He died at York in 1682, leaving ſeveral MSS to the public library at Oxford, and others to that of the cathedral at York.

HERBIVOROUS animals, thoſe which feed only on vegetables.

HERCULANEUM, a city of Naples, ſwallowed up by an earthquake in the reign of the emperor Titus, at the ſame time that there was an eruption of Mount Veſuvius: or rather it was overwhelmed with the aſhes, ſulphur, and other matter thrown out of that mountain, to the depth of eighty feet, and in ſome places of more than

Herculanæum, Herculeo.

than a hundred; as appears from the whole earth thereabouts being made up of the matter which has been diſgorged from the mountain, and all the houſes which have appeared hitherto ſtand perfectly upright, which could not be the caſe if this diſaſter had happened from an earthquake. According to Strabo, one ſide of this ancient city was waſhed by the ſea, and lay expoſed to the ſouth-weſt wind, which rendered it a very ſalutary and agreeable place to dwell in. There have been ſeveral attempts to open a paſſage to it: and about a hundred years ſince, a private gentleman found means to get out as much treaſure, of one ſort or other, as he ſold for eighteen thouſand pounds; but one of his companions betraying him to the government, his effects were ſeized, and he was forced to fly into Germany. In 1738, this place was again examined, by order of the government: and ſome years ago they ſunk a new paſſage into the higher part of the city, and when they were got to the level of the town, came to a broad and open ſquare, partly natural, and partly made by the workmen; and round this they have broken in to ſeveral fine apartments, and in one place into a whole ſtreet. In this ſquare they found various antiquities, which ſhew the magnificence of the ancients. One room was lined with moſt beautiful purple and white marble, in regular pannels, each of which was edged with a black and gold-coloured marble, and ſurrounded with another of blue, green, white, and purple. The fineſt rooms were all covered with paintings, which are ſtill extremely beautiful. In the niches there were ſtatues, exquiſitely carved; particularly a Juno of a blueiſh white marble, the folding of whoſe robes, at a ſmall diſtance, would be taken for real linen. The expreſſion of the face is much beyond any thing of the kind that has been lately ſeen. Among the paintings there is a Prometheus chained to a rock, and a large bird feeding upon his liver; and the whole is executed with ſo much beauty and majeſty, that it exceeds all deſcription. The figure is eight feet in length, and the muſcles are expreſſed with ſurprizing art. The plumage of the bird ſeems to be looſe and trembling, as in expectation of a feaſt; and the fierceneſs of its eye is very remarkable. This indeed is a horrible portrait; but that of Semele melting into tranſport at the ſight of Jupiter, is all ſoftneſs. There are a multitude of other figures, many of which are not underſtood. However, there is a repreſentation of the public ſhow of beaſts, where ſome of the animals are painted in a ſurpriſing manner; as for inſtance, a dying tyger, the nobleſt performance of the kind ever executed. There is likewiſe the death of Achilles, in which the paſſions are well expreſſed, and a concealed joy in the face of Polixena that nothing can come up to. There have been likewiſe found a great many of the utenſils and inſtruments formerly uſed among the Romans; and many manuſcripts, which are greatly decayed, and much art and care has been uſed to render them legible.—Theſe manuſcripts were thought to be the moſt valuable of all the curioſities which had been diſcovered; and it was hoped that by their means ſome defects in ancient hiſtory might have been ſupplied; but nothing of that kind hath been yet accompliſhed.

HERCULES, in fabulous hiſtory, a moſt renowned Grecian hero, ſaid to have been born at Thebes about the year 1280 B. C. He is reported to have been the ſon of Jupiter by Alcmena (wife to Amphitryon king of Argos), whom Jupiter enjoyed in the ſhape of her huſband while he was abſent; and in order to add the greater ſtrength to the child, made that amorous night as long as three. Amphitryon having ſoon after accidentally killed his uncle and father-in-law Electryon, was obliged to fly to Thebes, where Hercules was born. The jealouſy of Juno, on account of her huſband's amour with Alcmena, prompted her to deſtroy the infant. For this purpoſe ſhe ſent two ſerpents to kill him in the cradle, but young Hercules ſtrangled them both. As he grew up, he diſcovered ſuch extraordinary ſtrength and fierceneſs, that he was ſent to be brought up among ſome ſhepherds, where he killed a lion before he was eighteen years of age. Hercules.

Euriſtheus, the ſon of Amphitryon, having ſucceeded his father, ſoon became jealous of Hercules; and fearing leſt he might by him be deprived of his crown, left no means untried to get rid of him. Of this Hercules was not inſenſible, becauſe he was perpetually engaging him on ſome deſperate expedition; and therefore went to conſult the oracle. But being anſwered that it was the pleaſure of the gods that he ſhould ſerve Euriſtheus 12 years, he fell into a deep melancholy, which at laſt ended in a furious madneſs; during which, among other deſperate actions, he put away his wife Megara, and murdered all the children he had by her. As an expiation of this crime, the king impoſed upon him twelve labours ſurpaſſing the power of all other mortals to accompliſh, which nevertheleſs our hero performed with great eaſe.

The firſt labour impoſed upon him was the killing of a lion in Nemea, a wood of Achaia; whoſe hide was proof againſt any weapon, ſo that he was forced to ſeize him by the throat and ſtrangle him; in memory of which he afterwards wore his ſkin about his ſhoulders.

In the ſecond, he killed the Hydra; a monſter with two heads, one of which was no ſooner cut off, than two ſprung up in its room.

In the third, he brought the Erymanthian boar alive upon his ſhoulders; at the ſight of which the king is ſaid to have been ſo frighted, that he ran and hid himſelf in a brazen hogſhead. It was likewiſe in this expedition that he overcame the famous Centaurs.

In his fourth, he caught a hart with golden horns, and of prodigious ſwiftneſs.

In his fifth labour, he was commanded to cleanſe Augeas's ſtable in one day, which he did by turning the river Alpheus into it. See AUGEAS.

In the ſixth he chaſed away the miſchievous birds of the lake Stymphalis, who are feigned to have lived upon human fleſh, and to have been at length deſtroyed by Hercules's arrows, or, according to others, to have been only ſcared away from thence.

His ſeventh was to fetch a famous bull from the iſle of Crete, with which Paſiphäe the wife of Minos is ſaid to have fallen in love. In this expedition, having helped Jupiter to overcome the Titanic giants, he reconciled Prometheus to him, and looſed him from mount Caucaſus.

The eighth was to fetch the mares of Diomedes out of Thrace, which were tied with iron-chains to bra-

Hercules. zen mangers, and were fed with the fleſh of the ſtrangers that paſſed by that way. Hercules firſt threw their inhuman maſter to be devoured by them; and then brought the mares to Euryſtheus, who dedicated them to Juno. Their breed is ſaid to have continued till Alexander's time.

In the ninth he fetched away the girdle of the queen of the Amazons: and,

In the tenth, the oxen of Geryon out of Iberia, or Spain; in the furtheſt parts of which he erected his two pillars, as the utmoſt limits of the then known world. Theſe ten labours he atchieved, as the fable ſays, in about eight years. In this expedition he is likewiſe affirmed to have killed Antæus, a famous giant of a monſtrous ſize, who, when weary with wreſtling or labour, was immediately refreſhed by touching the earth. Pliny makes him the founder of Tangier. Hercules overcame him in wreſtling, and ſlew him; and after him the tyrant Buſiris in his way through Egypt. This bloody man uſed to ſacrifice all his gueſts and ſtrangers upon his altars; and deſigning to have done the ſame by Hercules, was ſlain by him, together with all his attendants.

His two laſt taſks were fetching Cerberus out of hell, and carrying away the Heſperian golden apples kept by a dragon; which laſt is interpreted to have been ſome fine herd of cattle kept by a ſtrong man, and brought out of Africa to the king.

Many other exploits are ſaid to have been performed by Hercules; the laſt of which was againſt Eurytus king Oechalia, who refuſed to give him Iöle his daughter, whom he had won by ſhooting againſt him and his ſons. Upon this he ſlew him and his ſons, and carried off his daughter with him. Coming ſoon after to the Cenæan promontory in Eubœa, to offer ſome ſacrifice there, he ſent his ſervant Lychas to Trachin, to his wife Dejanira, for the ſhirt and coat in which he uſed to perform that ceremony.

This princeſs had ſome time before been attempted by the centaur Neſſus, as he was ferrying her over the river Euenus; and Hercules beholding it from the ſhore, had given him a mortal wound with an arrow. The monſter finding himſelf dying, adviſed her to mix ſome oil with the blood which flowed from his wound, and to anoint her huſband's ſhirt with it, pretending that it would infallibly ſecure him from loving any other woman; and ſhe, too well apprized of his inconſtancy, had actually prepared the poiſoned ointment accordingly.

Lychas coming to her for the garments, unfortunately acquainted her with his having brought away Iöle; upon which ſhe, in a fit of jealouſy, anointed his ſhirt with the fatal mixture. This had no ſooner touched his body, than he felt the poiſon diffuſe itſelf through all his veins; the violent pain of which cauſed him to diſband his army, and to return to Trachin. His torment ſtill increaſing, he ſent to conſult the oracle for a cure; and was anſwered that he ſhould cauſe himſelf to be conveyed to mount Oeta, and there rear up a great pile of wood, and leave the reſt to Jupiter.

By the time he had obeyed the oracle, his pains being become intolerable, he dreſſed himſelf in his martial habit, flung himſelf upon the pile, and deſired the by-ſtanders to ſet fire to it; others ſay that he left the charge of it to his ſon Philoctetes, who having performed his father's command, had his bow and arrows given him as a reward for his obedience. At the ſame time Jupiter, to be as good as his word, ſent a flaſh of lightning, which conſumed both the pile and the hero; inſomuch that Iolaüs, coming to take up his bones, found nothing but aſhes; from which they concluded that he was paſſed from earth to heaven, and joined to the gods. Hercules Hereditary.

HERCULES, in aſtronomy. See there, n° 206.

HERCULES's *Pillars*, in antiquity, a name given to mount Calpe in Spain, near Gibraltar; and mount Avila on the African ſide.

HERCYNIA SILVA, (anc. geog.) the largeſt of foreſts. Its breadth was a journey of nine days to the beſt traveller. Taking its riſe at the limits of the Helvetii, Nemetes, and Raurici, it run along the Danube to the borders of the Daci and Anartes, a length of 60 days journey, according to Cæſar, who appears to have been well acquainted with its true breadth, ſeeing it occupied all Lower Germany. It may therefore be conſidered as covering the whole of Germany; and moſt of the other foreſts may be conſidered as parts of it, though diſtinguiſhed by particular names: conſequently the Hartz, in the duchy of Brunſwic, which gave name to the whole, may be conſidered as one of its parts. The name *Hartz* denotes "reſinous," or "pine-trees." By the Greeks it is called *Orcynius*, as a name common to all the foreſts in Germany; in the ſame manner as *Hercynius* was the name given by the Romans; and both from the German *Hartz*.

HERD, among hunters, an aſſemblage of black or fallow beaſts, in contradiſtinction to *flock*. See Flock.—In the hunting language there are various terms uſed for companies of the divers kinds of game. We ſay a *herd* of harts or bucks, a *bevy* of roes, a *rout* of wolves, a *richeſs* of martens, &c.

HEREDITAMENTS, whatever moveable things a perſon may have to himſelf and his heirs by way of inheritance; and which, if not otherwiſe bequeathed, deſcend to him who is next heir, and not to the executor as chattels do.

HEREDITARY, an appellation given to whatever belongs to a family by right of ſucceſſion from heir to heir.

Hereditary is alſo figuratively applied to good or ill qualities ſuppoſed to be tranſmitted from father to ſon: thus we ſay virtue and piety are hereditary qualities in ſuch a family; and that in Italy the hatred of families is hereditary. And indeed the gout, king's evil, madneſs, &c. may really be hereditary diſeaſes.

Hereditary *Right*. The grand fundamental maxim upon which the *jus coronæ*, or right of ſucceſſion to the throne of theſe kingdoms, depends, Sir William Blackſtone takes to be this: "That the crown is, by common law and conſtitutional cuſtom, hereditary; and this in a manner peculiar to itſelf: but that the right of inheritance may from time to time be changed or limited by act parliament; under which limitations the crown ſtill continues hereditary"

1. The crown is in general hereditary, or deſcendible to the next heir, on the death or demiſe of the laſt proprietor. All regal governments muſt be either hereditary

Hereditary. reditary or elective: and as there is no inſtance wherein the crown of England has ever been aſſerted to be elective, except by the regicides at the infamous and unparalelled trial of king Charles I. it muſt of conſequence be hereditary. Yet in thus aſſerting an hereditary right, a *jure divino* title to the throne is by no means intended. Such a title may be allowed to have ſubſiſted under the theocratic eſtabliſhments of the children of Iſrael in Paleſtine: but it never yet ſubſiſted in any other country; ſave only ſo far as kingdoms, like other human fabrics, are ſubject to the general and ordinary diſpenſations of Providence. Nor indeed have a *jure divino* and an hereditary right any neceſſary connexion with each other: as ſome have very weakly imagined. The titles of David and Jehu were equally *jure divino* as thoſe of either Solomon or Ahab; and yet David ſlew the ſons of his predeceſſor, and Jehu his predeceſſor himſelf. And when our kings have the ſame warrant as they had, whether it be to ſit upon the throne of their fathers, or to deſtroy the houſe of the preceding ſovereign, they will then, and not before, poſſeſs the crown of England by a right like theirs, immediately derived from heaven. The hereditary right, which the laws of England acknowledge, owes its origin to the founders of our conſtitution, and to them only. It has no relation to, nor depends upon, the civil laws of the Jews, the Greeks, the Romans, or any other nation upon earth; the municipal laws of one ſociety having no connexion with, or influence upon, the fundamental polity of another. The founders of our Engliſh monarchy might perhaps, if they had thought proper, have made it an elective monarchy; but they rather choſe, and upon good reaſon, to eſtabliſh originally a ſucceſſion by inheritance. This has been acquieſced in by general conſent, and ripened by degrees into common law; the very ſame title that every private man has to his own eſtate. Lands are not naturally deſcendible, any more than thrones: but the law has thought proper, for the benefit and peace of the public, to eſtabliſh hereditary ſucceſſion in the one as well as the other.

It muſt be owned, an elective monarchy ſeems to be the moſt obvious, and beſt ſuited of any to the rational principles of government, and the freedom of human nature: and accordingly we find from hiſtory, that, in the infancy and firſt rudiments of almoſt every ſtate, the leader, chief magiſtrate, or prince, hath uſually been elective. And, if the individuals who compoſe that ſtate could always continue true to firſt principles, uninfluenced by paſſion or prejudice, unaſſailed by corruption, and unawed by violence, elective ſucceſſion were as much to be deſired in a kingdom, as in other inferior communities. The beſt, the wiſeſt, and the braveſt man would then be ſure of receiving that crown, which his endowments have merited; and the ſenſe of an unbiaſſed majority would be dutifully acquieſced in by the few who were of different opinions. But hiſtory and obſervation will inform us, that elections of every kind (in the preſent ſtate of human nature) are too frequently brought about by influence, partiality, and artifice: and, even where the caſe is otherwiſe, theſe practices will be often ſuſpected, and as conſtantly charged upon the ſucceſsful, by a ſplenetic diſappointed minority. This is an evil to which all ſocieties are liable; as well thoſe of a private and domeſtic kind, as the great community of the public, which regulates and includes the reſt. But in the former there is this advantage, That ſuch ſuſpicions, if falſe, proceed no farther than jealouſies and murmurs, which time will effectually ſuppreſs; and, if true, the injuſtice may be remedied by legal means, by an appeal to thoſe tribunals to which every member of ſociety has (by becoming ſuch) virtually engaged to ſubmit. Whereas, in the great and independent ſociety, which every nation compoſes, there is no ſuperior to reſort to but the law of nature; no method to redreſs the infringements of that law, but the actual exertion of private force. As therefore between two nations, complaining of mutual injuries, the quarrel can only be decided by the law of arms; ſo in one and the ſame nation, when the fundamental principles of their common union are ſuppoſed to be invaded, and more eſpecially when the appointment of their chief magiſtrate is alleged to be unduly made, the only tribunal to which the complainants can appeal is that of the God of battles, the only proceſs by which the appeal can be carried on is that of a civil and inteſtine war. An hereditary ſucceſſion to the crown is therefore now eſtabliſhed, in this and moſt other countries, in order to prevent that periodical bloodſhed and miſery, which the hiſtory of ancient imperial Rome, and the more modern experience of Poland and Germany, may ſhew us are the conſequences of elective kingdoms. Hereditary.

2. But, ſecondly, as to the particular mode of inheritance, It in general correſponds with the feodal path of deſcents, chalked out by the common law in the ſucceſſion to landed eſtates; yet with one or two material exceptions. Like them, the crown will deſcend lineally to the iſſue of the reigning monarch; as it did from king John to Richard II. through a regular pedigree of ſix lineal generations: As in them the preference of males to females, and the right of primogeniture among the males, are ſtrictly adhered to. Thus Edward V. ſucceeded to the crown, in preference to Richard his younger brother, and Elizabeth his elder ſiſter. Like them, on failure of the male line, it deſcends to the iſſue female; according to the ancient Britiſh cuſtom remarked by Tacitus, *Solent fœminarum ductu bellare, et ſexum in imperiis non diſcernere.* Thus Mary I. ſucceeded to Edward VI.; and the line of Margaret queen of Scots, the daughter of Henry VII. ſucceeded, on failure of the line of Henry VIII., his ſon. But among the females, the crown deſcends by right of primogeniture to the eldeſt daughter only and her iſſue; and not, as in common inheritances, to all the daughters at once; the evident neceſſity of a ſole ſucceſſion to the throne having occaſioned the royal law of deſcents to depart from the common law in this reſpect: and therefore queen Mary, on the death of her brother, ſucceeded to the crown alone, and not in partnerſhip with her ſiſter Elizabeth. Again, the doctrine of repreſentation prevails in the deſcent of the crown, as it does in other inheritances; whereby the lineal deſcendants of any perſon deceaſed ſtand in the ſame place as their anceſtor, if living, would have done. Thus Richard II. ſucceeded his grandfather Edward III. in right of his father the black prince; to the excluſion of all his uncles, his grandfather's younger children. Laſtly,

on

Hereditary

on failure of lineal defcendants, the crown goes to the next collateral relations of the late king; provided they are lineally defcended from the blood-royal, that is, from that royal ſtock which originally acquired the crown. Thus Henry I. ſucceeded to William II. John to Richard I. and James I. to Elizabeth; being all derived from the Conqueror, who was then the only regal ſtock. But herein there is no objection (as in the caſe of common defcents) to the ſucceſſion of a brother, an uncle, or other collateral relation, of the *half*-blood; that is, where the relationſhip proceeds not from the ſame *couple* of anceſtors, (which conſtitutes a kinſman of the *whole* blood), but from a *ſingle* anceſtor only; as when two perſons are derived from the ſame father, and not from the ſame mother, or *vice verſa*: provided only, that the one anceſtor, from whom both are deſcended, be that from whoſe veins the blood-royal is communicated to each. Thus Mary I. inherited to Edward VI. and Elizabeth inherited to Mary; all born of the ſame father, king Henry VIII. but all by different mothers. See the articles CONSANGUINITY, DESCENT, and SUCCESSION.

3. The doctrine of *hereditary* right does by no means imply an *indefeaſible* right to the throne. No man will aſſert this, who has conſidered our laws, conſtitution, and hiſtory, without prejudice, and with any degree of attention. It is unqueſtionably in the breaſt of the ſupreme legiſlative authority of this kingdom, the king and both houſes of parliament, to defeat this hereditary right; and, by particular entails, limitations, and proviſions, to exclude the immediate heir, and veſt the inheritance in any one elſe. This is ſtrictly conſonant to our laws and conſtitution; as may be gathered from the expreſſion ſo frequently uſed in our ſtatute-book, of "the king's majeſty, his heirs, and ſucceſſors." In which we may obſerve, that as the word *heirs* neceſſarily implies an inheritance or hereditary right generally ſubſiſting in the royal perſon; ſo the word *ſucceſſors*, diſtinctly taken, muſt imply that this inheritance may ſometimes be broken through; or, that there may be a ſucceſſor, without being the heir of the king. And this is ſo extremely reaſonable, that without ſuch a power, lodged ſomewhere, our polity would be very defective. For, let us barely ſuppoſe ſo melancholy a caſe, as that the heir-apparent ſhould be a lunatic, an idiot, or otherwiſe incapable of reigning; how miſerable would the condition of the nation be, if he were alſo incapable of being ſet aſide! —It is therefore neceſſary that this power ſhould be lodged ſomewhere; and yet the inheritance and regal dignity would be very precarious indeed, if this power were *expreſsly* and *avowedly* lodged in the hands of the ſubject only, to be exerted whenever prejudice, caprice, or diſcontent, ſhould happen to take the lead. Conſequently it can nowhere be ſo properly lodged, as in the two houſes of parliament, by and with the conſent of the reigning king; who, it is not to be ſuppoſed, will agree to any thing improperly prejudicial to the rights of his own deſcendants. And therefore in the king, lords, and commons, in parliament aſſembled, our laws have expreſsly lodged it.

4. But, fourthly, However the crown may be limited or transferred, it ſtill retains its deſcendible quality, and becomes hereditary in the wearer of it. And hence in our law the king is ſaid never to die in his political capacity; though, in common with other men, he is ſubject to mortality in his natural: becauſe immediately upon the natural death of Henry, William, or Edward, the king ſurvives in his ſucceſſor. For the right of the crown veſts, *eo inſtanti*, upon his heir; either the *hæres natus*, if the courſe of deſcent remains unimpeached, or the *hæres factus*, if the inheritance be under any particular ſettlement. So that there can be no *interregnum*; but, as Sir Matthew Hale obſerves, the right of ſovereignty is fully inveſted in the ſucceſſor by the very deſcent of the crown. And therefore, however acquired, it becomes in him abſolutely hereditary, unleſs by the rules of the limitation it is otherwiſe ordered and determined: In the ſame manner as landed eſtates, to continue our former compariſon, are by the law hereditary, or deſcendible to the heirs of the owners; but ſtill there exiſts a power, by which the property of thoſe lands may be tranſferred to another perſon. If this transfer be made ſimply and abſolutely, the lands will be hereditary in the new owner, and deſcend to his heir at law: but if the transfer be clogged with any limitations, conditions, or entails, the lands muſt deſcend in that channel, ſo limited and preſcribed, and no other. See SUCCESSION.

HEREDITAS JACENS, in Scots law. An eſtate is ſaid to be *in hereditate jacente*, after the proprietor's death till the heir's entry.

HEREFORD, which in Saxon ſignifies *the ford of the army*, the capital of Herefordſhire in England, ſituated in W. Lon. 2. 35. N. Lat. 52. 6. It is ſuppoſed to have riſen out of the ruins of Kenchester, in its neighbourhood, which Cambden believes to have been the *Ariconium* of Antoninus. It is very pleaſantly ſituated among meadows and corn-fields, and is almoſt encompaſſed with rivers. It ſeems to have owed its riſe, or at leaſt its increaſe, to the building and dedicating a church there to Ethelbert king of the Eaſt-Angles, who was murdered in the neighbourhood and afterwards taken into the catalogue of martyrs; ſoon after it became a biſhop's ſee, and in conſequence of that a conſiderable place. In 1055 it was ſacked, the cathedral deſtroyed, and its biſhop Leofgar carried away captive by Gryffin prince of South-Wales, and Algar, an Engliſhman, who had rebelled againſt Edward the Confeſſor. Harold fortified it with a broad and high rampart; and it appears by Doomſday-book, that there were no more than 300 men within and without the wall. A very large and ſtrong caſtle was built by the Normans along the Wye, and the city walled round. The preſent ſtately cathedral was founded in the reign of Henry I. by biſhop Reinelm, but enlarged and beautified by his ſucceſſors. It ſuffered much in the barons wars; and was often taken and retaken in the war between king Charles I. and the parliament. This city is pretty large, and had once ſix churches; but two were deſtroyed in the civil wars. It is not very populous nor well built, many of the houſes being old. Its manufactures are gloves and other leathern goods; and its corporation conſiſts of a mayor, ſix aldermen, a high-ſteward, deputy ſteward, and town-clerk, who have a ſword-bearer, and four ſerjeants at mace. Each of the companies enjoys diſtinct laws and privileges by their charter, and each has its hall. The city gave

long

Hereditary
Hereford

long the title of *earl* to the noble family of the Bohuns; then of *duke* to Henry of Lancaſter, afterwards Henry IV. king of England; after him, of *earl* to Stafford, earl of Buckingham; then of *viſcount* to D'Evereux, earl of Eſſex, which a collateral branch of this family ſtill enjoys, and is thereby the premier viſcount of England.

HEREFORDSHIRE, a county of England, nearly of a circular form, bounded on the eaſt by Worceſter and Glouceſter, on the ſouth by Monmouthſhire, on the weſt by Radnorſhire and Brecknockſhire, and on the north by Shropſhire. Its length from north to ſouth is 35 miles, its breadth from eaſt to weſt 30, and its circumference 108. It contains 660,000 acres, 11 hundreds, one city, eight market-towns, 176 pariſhes, and 95,000 inhabitants. The members it ſends to parliament are eight, namely, two for the county, two for Hereford city, two for Lempſter, and two for Weobly.

The air of this county is allowed to be as pleaſant, ſweet, and wholeſome, as that of any other in England, there being nothing either in the ſoil or ſituation to render it otherwiſe. The ſoil throughout is excellent, and inferior to none, either for grain, fruit, or paſture, ſupplying the inhabitants plentifully with all the neceſſaries of life: but that by which it is diſtinguiſhed from moſt others, is its fruit, eſpecially apples, of which it produces ſuch quantities, that the cyder made of them is not only ſufficient for their own conſumption, though it is their ordinary drink, but alſo in a great meaſure for that of London and other parts. That in particular which is made from the apple called *redſtreak*, is much admired, and has a body almoſt equal to that of white-wine. The county is well ſupplied with wood and water; for, beſides leſſer ſtreams, there are the rivers Frome, Loden, Lug, Wye, Wadel, Arrow, Dare, and Monow; the laſt of which is large, and all of them are well ſtored with fiſh, particularly the Wye, which breeds ſalmon. It lies in the dioceſe of Hereford, and Oxford circuit.

HERENHAUSEN, a palace of Germany near Hanover, belonging to the king of Great Britain. Here are lodgings for all the court; and a garden of vaſt extent, in which are fine waterworks, a labyrinth, and many other curioſities worthy the obſervation of a traveller.

HERENTHALS, a town of Brabant in the Auſtrian Netherlands, in the quarter of Antwerp; ſeated on the river Nethe, in E. Long. 4. 51. N. Lat. 51. 9.

HERESY, in law, an offence againſt Chriſtianity, conſiſting in a denial of ſome of its eſſential doctrines, publicly and obſtinately avowed; being defined, "*ſententia rerum divinarum humano ſenſu excogitata, palam docta et pertinaciter defenſa.*" And here it muſt alſo be acknowledged that particular modes of belief or unbelief, not tending to overturn Chriſtianity itſelf, or to ſap the foundations of morality, are by no means the object of coercion by the civil magiſtrate. What doctrines ſhall therefore be adjudged hereſy, was left by our old conſtitution to the determination of the eccleſiaſtical judge; who had herein a moſt arbitrary latitude allowed him. For the general definition of an heretic given by Lyndewode, extends to the ſmalleſt deviations from the doctrines of holy church: "*hæreticus eſt qui dubitat de fide catholica, et qui negligit ſervare ea, quæ Romana eccleſia ſtatuit, ſeu ſervare dereverat.*" Or, as the ſtatute 2 Hen. IV. c. 15. expreſſes it in Engliſh, "teachers of erroneous opinions, contrary to the faith and bleſſed determinations of the holy church." Very contrary this to the uſage of the firſt general councils, which defined all heretical doctrines with the utmoſt preciſion and exactneſs. And what ought to have alleviated the puniſhment, the uncertainty of the crime, ſeems to have enhanced it in thoſe days of blind zeal and pious cruelty. It is true, that the ſanctimonious hypocriſy of the canoniſts went at firſt no farther than enjoining penance, excommunication, and eccleſiaſtical deprivation, for hereſy; tho' afterwards they proceeded boldly to impriſonment by the ordinary, and confiſcation of goods *in pios uſus*. But in the mean time they had prevailed upon the weakneſs of bigotted princes to make the civil power ſubſervient to their purpoſes, by making hereſy not only a temporal, but even a capital, offence: the Romiſh eccleſiaſtics determining, without appeal, whatever they pleaſed to be hereſy, and ſhifting off to the ſecular arm the odium and drudgery of executions; with which they themſelves were too tender and delicate to intermeddle. Nay, they pretended to intercede and pray, on behalf of the convicted heretic, *ut citra mortis periculum ſententia circa eum moderetur*: well knowing that at the ſame time they were delivering the unhappy victim to certain death. Hence the capital puniſhments inflicted on the ancient Donatiſts and Manichæans by the emperors Theodoſius and Juſtinian: hence alſo the conſtitution of the emperor Frederic mentioned by Lyndewode, adjudging all perſons without diſtinction to be burnt with fire who were convicted of hereſy by the eccleſiaſtical judge. The ſame emperor, in another conſtitution, ordained, that if any temporal lord, when admoniſhed by the church, ſhould neglect to clear his territories of hereties within a year, it ſhould be lawful for good catholics to ſeiſe and occupy the lands, and utterly to exterminate the hereticaſ poſſeſſors. And upon this foundation was built that arbitrary power, ſo long claimed and ſo fatally exerted by the Pope, of diſpoſing even of the kingdoms of refractory princes to more dutiful ſons of the church. The immediate event of this conſtitution was ſomething ſingular, and may ſerve to illuſtrate at once the gratitude of the holy ſee, and the juſt puniſhment of the royal bigot; for, upon the authority of this very conſtitution, the pope afterwards expelled this very emperor Frederic from his kingdom of Sicily, and gave it to Charles of Anjou. Hereſy.

Chriſtianity being thus deformed by the dæmon of perſecution upon the continent, we cannot expect that our own iſland ſhould be entirely free from the ſame ſcourge. And therefore we find among our ancient precedents a writ *de hæretico comburendo*, which is thought by ſome to be as ancient as the common law itſelf. However, it appears from thence, that the conviction of hereſy by the common law was not in any petty eccleſiaſtical court, but before the archbiſhop himſelf in a provincial ſynod; and that the delinquent was delivered over to the king to do as he ſhould pleaſe with him: ſo that the crown had a controul over the ſpiritual power, and might pardon the convict by iſſuing no proceſs againſt him; the writ *de hæretico comburendo* being not a writ of courſe, but iſſuing only by the

Heresy. the special direction of the king in council.

But in the reign of Henry IV. when the eyes of the Christian world began to open, and the seeds of the Protestant religion (though under the opprobious name of *lollardy*) took root in this kingdom; the clergy, taking advantage from the king's dubious title to demand an increase of their own power, obtained an act of parliament, which sharpened the edge of persecution to its utmost keenness. For, by that statute, the diocesan alone, without the intervention of a synod, might convict of heretical tenets; and unless the convict abjured his opinions, or if after abjuration he relapsed, the sheriff was bound *ex officio*, if required by the bishop, to commit the unhappy victim to the flames, without waiting for the consent of the crown. By the statute 2 Hen. V. c. 7. lollardy was also made a temporal offence, and indictable in the king's courts; which did not thereby gain an exclusive, but only a concurrent jurisdiction with the bishop's consistory.

Afterwards, when the final reformation of religion began to advance, the power of the ecclesiastics was somewhat moderated: for though what heresy *is*, was not then precisely defined, yet we are told in some points what it *is not:* the statute 25 Hen. VIII. c. 14. declaring, that offences against the see of Rome are not heresy; and the ordinary being thereby restrained from proceeding in any case upon mere suspicion; that is, unless the party be accused by two credible witnesses, or an indictment of heresy be first previously found in the king's courts of common law. And yet the spirit of persecution was not then abated, but only diverted into a lay channel. For in six years afterwards, by statute 31 Hen. VIII. c. 14. the bloody law of the six articles was made, which established the six most contested points of popery, transubstantiation, communion in one kind, the celibacy of the clergy, monastic vows, the sacrifice of the mass, and auricular confession; which points were "determined and resolved by the most godly study, pain, and travail of his majesty: for which his most humble and obedient subjects, the lords *spiritual* and temporal and the commons, in parliament assembled, did not only render and give unto his highness their most high and hearty thanks;" but did also enact and declare all oppugners of the first to be heretics, and to be burnt with fire; and of the five last to be felons, and to suffer death. The same statute established a new and mixed jurisdiction of clergy and laity for the trial and conviction of heretics; the reigning prince being then equally intent on destroying the supremacy of the bishops of Rome, and establishing all other their corruptions of the Christian religion.

Without perplexing this detail with the various repeals and revivals of these sanguinary laws in the two succeeding reigns, let us proceed to the reign of queen Elizabeth; when the reformation was finally established with temper and decency, unsullied with party-rancour, or personal caprice and resentment. By statute 1 Eliz. c. 1. all former statutes relating to heresy are repealed, which leaves the jurisdiction of heresy as it stood at common law; *viz.* as to the infliction of common censures, in the ecclesiastical courts; and, in case of burning the heretic, in the provincial synod only. Sir Matthew Hale is indeed of a different opinion, and holds that such power resided in the diocesan also; tho' he agrees, that in either case the writ *de haretico comburendo* was not demandable of common right, but grantable or otherwise merely at the king's discretion. But the principal point now gained was, that by this statute a boundary is for the first time set to what shall be accounted heresy; nothing for the future being to be so determined, but only such tenets, which have been heretofore so declared, 1. By the words of the canonical scriptures; 2. By the first four general councils, or such others as have only used the words of the holy Scriptures; or, 3. Which shall hereafter be so declared by the parliament, with the assent of the clergy in convocation. Thus was heresy reduced to a greater certainty than before; though it might not have been the worse to have defined it in terms still more precise and particular: as a man continued still liable to be burnt, for what perhaps he did not understand to be heresy, till the ecclesiastical judge so interpreted the words of the canonical scriptures.

Heresy ‖ Heretic.

For the writ *de haretico comburendo* remained still in force; and we have instances of its being put in execution upon two Anabaptists in the seventeenth of Elizabeth, and two Arians in the ninth of James I. But it was totally abolished, and heresy again subjected only to ecclesiastical correction, *pro salute animæ*, by virtue of the statute 29 Car. II. c. 9.: for, in one and the same reign, our lands were delivered from the slavery of military tenures; our bodies from arbitrary imprisonment by the *habeas corpus* act; and our minds from the tyranny of superstitious bigotry, by demolishing this last badge of persecution in the English law.

Every thing is now as it should be, with respect to the spiritual cognizance, and spiritual punishment, of heresy: unless perhaps that the crime ought to be more strictly defined, and no prosecution permitted, even in the ecclesiastical courts, till the tenets in question are by proper authority previously declared to be heretical. Under these restrictions, it seems necessary for the support of the national religion, that the officers of the church should have power to censure heretics; yet not to harrass them with temporal penalties, much less to exterminate or destroy them. The legislature hath indeed thought it proper, that the civil magistrate should again interpose, with regard to one species of heresy, very prevalent in modern times; for by statute 9 & 10 W. III. c. 32. if any person educated in the Christian religion, or professing the same, shall by writing, printing, teaching, or advised speaking, deny any one of the persons in the holy Trinity to be God, or maintain that there are more Gods than one, he shall undergo the same penalties and incapacities which were just now mentioned to be inflicted on apostacy by the same statute.

HERETABLE RIGHTS, in Scots law, all rights affecting lands, houses, &c. or any immoveable subject.

HERETAGE, in Scots law, lands, houses, or any immoveable subject, in contradistinction to moveables or moveable subjects. It also sometimes signifies such immoveable property as a person succeeds to as heir to another, in contradistinction to that which he himself purchases or acquires in any other manner, called *conquest*.

HERETIC, a general name for all such persons under any religion, but especially the Christian, as professes or teach religious opinions contrary to the established

Herforden ‖ Hermannia

blifhed faith, or to what is made the ſtandard of orthodoxy. See HERESY.

HERFORDEN, or HERWARDEN, a free and imperial town of Germany, in the circle of Weſtphalia, and capital of the county of Ravensberg. Here is a famous nunnery belonging to the Proteſtants of the conſeſſion of Augſburg, whoſe abbeſs is a princeſs of the empire, and has a voice and place in the diet. It is ſeated on the river Aa. E. Long. 8. 47. N. Lat. 52. 12.

HERGUNDT, a town of Upper Hungary, remarkable for its rich mines of vitriol. Thoſe who work in the mines have built a ſubterranèous town, which has a great number of inhabitants. E. Long. 18. 15. N. Lat. 48. 30.

HERISSON, in fortification, a beam armed with a great number of iron ſpikes with their points outwards, and ſupported by a pivot on which it turns. Theſe ſerve as a barrier to block up any paſſage, and are frequently placed before the gates, and more eſpecially the wicket-doors, of a town or fortreſs, to ſecure thoſe paſſages which muſt of neceſſity be often opened and ſhut.

HERMÆA, in antiquity, ancient Greek feſtivals in honour of the god Hermes or Mercury. One of theſe was celebrated by the Pheneatæ in Arcadia; a ſecond by the Cyllenians in Elis; and a third by the Tanagræans, where Mercury was repreſented with a ram upon his ſhoulder, becauſe he was ſaid to have walked thro' the city in that poſture in time of a plague, and to have cured the ſick; in memory of which, it was cuſtomary at this feſtival for one of the moſt beautiful youths in the city to walk round the walls with a ram upon his ſhoulder.—A fourth feſtival of the ſame name was obſerved in Crete, when it was uſual for the ſervants to ſit down at the table while their maſters waited; a cuſtom which was alſo obſerved at the Roman Saturnalia.

HERMAN (Paul), a famous botaniſt in the 17th century, was born at Hall in Saxony. He practiſed phyſic in the Iſle of Ceylon, and was afterwards made profeſſor of botany at Leyden, where he died in 1695. He wrote a catalogue of the plants in the public garden at Leyden, and a work intitled *Floræ Lugduno-Batavæ flores.*

HERMANN (James), a learned mathematician of the academy at Berlin, and a member of the academy of ſciences at Paris, was born at Baſil in 1678. He was a great traveller, and for ſix years was profeſſor of mathematics at Padua. He afterwards went to Muſcovy, being invited thither by the Czar in 1724. At his return to his native country, he was made profeſſor of morality and natural law at Baſil; and died there in 1733. He wrote ſeveral mathematical works.

HERMANNIA, in botany; a genus of the pentandria order, belonging to the monodelphia claſs of plants.

Species. 1. The lavendulifolia, hath a ſhrubby ſtalk and ſlender branches, very buſhy, about a foot and an half high, ſmall, ſpear-ſhaped, obtuſe and hairy leaves, with cluſters of ſmall yellow flowers along the ſides of the branches, continuing from June to Autumn. 2. The althæifolia hath a ſhrubby ſtalk, and ſoft woolly branches, growing two feet high, with numerous yellow flowers in looſe ſpikes growing at the end of the branches, and making their appearance in July. 3. The groſſularifolia hath a ſhrubby ſtalk and ſpreading branches, growing three or four feet high, with bright yellow flowers coming out in great numbers at the ends of all the ſhoots and branches in April or May. 4. The alnifolia hath a ſhrubby ſtalk and branches growing irregularly four or five feet high, with pale yellow flowers in ſhort ſpikes from the ſides and ends of the branches, appearing in April or May. 3. The hyſſopifolia hath a ſhrubby upright ſtalk, branching out laterally ſix or ſeven feet high, with pale yellow flowers in cluſters from the ſides of the branches, appearing in May and June.

Hermanſtadt ‖ Hermaphrodite.

Culture. All theſe plants are natives of Africa, and therefore muſt be kept in a green-houſe during the winter in this country. They are propagated by cuttings of their young ſhoots, which may be planted in pots of rich earth any time from April to July.

HERMANSTADT, a handſome, populous, and ſtrong town of Hungary, capital of Tranſilvania, with a biſhop's ſee. It is the reſidence of the governor of the province; and is ſeated on the river Ceben, in E. Long. 23. 40. N. Lat. 46. 25.

HERMANT (Godfrey), a learned doctor of the Sorbonne, born at Beauvais in 1917. He wrote many excellent works; the principal of which are, 1. The lives of St Athanaſius, St Baſil, St Gregory Nazianzen, St Chryſoſtom, and St Ambroſe. 2. Four pieces in defence of the rights of the univerſity of Paris againſt the Jeſuits. 3. A French tranſlation of St Chryſoſtom's treatiſe of Providence, and St Baſil's Aſcetics. 4. Extracts from the councils; publiſhed after his death, under the title of *Clavis diſciplinæ eccleſiaſticæ.* He died ſuddenly at Paris in 1690.

HERMAPHRODITE, is generally underſtood to ſignify a human creature poſſeſſed of both ſexes, or who has the parts of generation both of male and female. The term however is applied alſo to other animals, and even to plants.—The word is formed of the Greek Ἑρμαφρόδιτος, a compound of Ἑρμῆς, *Mercury*, and Ἀφροδίτη, *Venus*; *q. d.* a mixture of Mercury and Venus, *i. e.* of male and female. For it is to be obſerved, *Hermaphroditus* was originally a proper name, applied by the heathen mythologiſts to a fabulous deity, whom ſome repreſent as a ſon of *Hermes*, Mercury, and *Aphrodite*, Venus; and who, being deſperately in love with the nymph Salmaſis, obtained of the gods to have his body and hers united into one. Others ſay, that the god Hermaphroditus was conceived as a compoſition of Mercury and Venus, to exhibit the union between eloquence, or rather commerce, whereof Mercury was god, with pleaſure, whereof Venus was the proper deity. Laſtly, others think this junction intended to ſhew that Venus, (pleaſure,) was of both ſexes; as, in effect, the poet Calvus call Venus a god.

Poſtentemque Deum Venerem.

As alſo Virgil, *Æneid.* lib. ii.

Diſcedo, ac ducente Deo flammam inter et hoſtes
Expedior————

M. Spon obſerves, Heſychius calls Venus *Aphroditos*: and Theophraſtus affirms, that Aphroditos, or Venus, is *Hermaphroditus*; and that in the iſland of Cyprus ſhe has a ſtatue, which repreſents her with a beard like a man.—The Greeks alſo call *hermaphrodites* ἀνδρογυνοι, *androgyni*, *q. d.* men-women. See the article ANDROGYNES.

Hermaphrodite.

The beſt treatiſe that hath appeared on this ſubject is that of Mr Hunter, in the 69th volume of the Philoſophical Tranſactions. He divides hermaphrodites into *natural*, and *unnatural* or monſtrous. The firſt belongs to the more ſimple orders of animals, of which there are a much greater number than of the more perfect. The unnatural takes place in every tribe of animals having diſtinct ſexes, but is more common in ſome than in others. The human ſpecies, our author imagines, has the feweſt; never having ſeen them in that ſpecies, nor in dogs; but in the horſe, ſheep, and black cattle, they are very frequent.

From Mr Hunter's account, however, it doth not appear that ſuch a creature as a perfect hermaphrodite has ever exiſted. All the hermaphrodites which he had the opportunity of ſeeing had the appearance of females, and were generally ſaved as ſuch. In the horſe they are very frequent; and in the moſt perfect of this kind he ever ſaw, the teſticles had come down out of the abdomen into the place where the udder ſhould have been, and appeared like an udder, not ſo pendulous as the ſcrotum in the male of ſuch animals. There were alſo two nipples, of which horſes have no perfect form; being blended in them with the ſheath or prepuce, of which there was none here. The external female parts were exactly ſimilar to thoſe of a perfect female; but inſtead of a common-ſized clitoris, there was one about five or ſix inches long; which, when erect, ſtood almoſt directly backwards.

A foal aſs very ſimilar to the above was killed, and the following appearances were obſerved on diſſection. The teſticles were not come down as in the former, poſſibly becauſe the creature was too young. It had alſo two nipples; but there was no penis paſſing round the pubes to the belly, as in the perfect male aſs. The external female parts were ſimilar to thoſe of the ſheaſs. Within the entrance of the vagina was placed the clitoris; but much longer than that of a true female, being about five inches long. The vagina was open a little further than the opening of the urethra into it, and then became obliterated; from thence, up to the fundus of the uterus, there was no canal. At the fundus of the common uterus it was hollow, or had a cavity in it, and then divided into two, viz. a right and a left, called the *horns* of the uterus, which were alſo pervious. Beyond the termination of the two horns were placed the ovaria, as in the true female; but the Fallopian tubes could not be found.—From the broad ligaments, to the edges of which the horns of the uterus and ovaria were attached, there paſſed towards each groin a part ſimilar to the round ligaments in the female, which were continued into the rings of the abdominal muſcles; but with this difference, that there were continued with them a proceſs or theca of the peritonæum, ſimilar to the tunica vaginalis communis in the male aſs; and in theſe thecæ were found the teſticles, but no vaſa deferentia could be obſerved paſſing from them.

In moſt ſpecies of animals, the production of hermaphrodites appears to be the effect of chance; but in the black cattle it ſeems to be an eſtabliſhed principle of their propagation. It is a well-known fact, and, as far as hath yet been diſcovered, appears to be univerſal, that when a cow brings forth two calves, one of them a bull, and the other a cow to appearance, the cow is unfit for propagation, but the bull-calf becomes a very proper bull. They are known not to breed; they do not even ſhew the leaſt inclination for the bull, nor does the bull ever take the leaſt notice of them. Among the country people in England, this kind of calf is called a *free martin*; and this ſingularity is juſt as well known among the farmers as either cow or bull. When they are preſerved, it is for the purpoſes of an ox or ſpayed heifer; viz. to yoke with the oxen, or fatten for the table. They are much larger than either the bull or the cow, and the horns grow longer and bigger, being very ſimilar to thoſe of an ox. The bellow of a free-martin is alſo ſimilar to that of an ox, and the meat is ſimilar to that of the ox or ſpayed heifer, viz. much finer in the fibre than either the bull or cow; and they are more ſuſceptible of growing fat with good food. By ſome they are ſuppoſed to exceed the ox and heifer in delicacy of taſte, and bear a higher price at market; this, however, does not always hold, and Mr Hunter gives an inſtance of the contrary. The Romans, who called the bull *taurus*, ſpoke alſo of *tauræ* in the feminine gender different from cows. Stephens obſerves, that it was thought they meant by this word *barren cows*, who obtained the name becauſe they did not conceive any more than bulls. He alſo quotes a paſſage from Columella, *lib.* vi. *cap.* 22. "And, like the *tauræ*, which occupy the place of fertile cows, ſhould be rejected or ſent away." He likewiſe quotes Varro, *De re ruſtica*, lib. ii. cap. 5. "The cow which is barren is called *taura*." From which we may reaſonably conjecture, that the Romans had not the idea of the circumſtances of their production.

Hermaphrodite.

Of theſe creatures Mr Hunter diſſected three, and the following appearances were obſerved in the moſt perfect of them.—The external parts were rather ſmaller than in the cow. The vagina paſſed on as in the cow to the opening of the urethra, and then it began to contract into a ſmall canal, which paſſed on to the diviſion of the uterus into the two horns; each horn paſſing along the edge of the broad ligament laterally towards the ovaria. At the termination of theſe horns were placed both the ovaria and teſticles, both of which were nearly about the ſize of a ſmall nutmeg. No Fallopian tubes could be found. To the teſticles were vaſa deferentia, but imperfect. The left one did not come near the teſticle; the right only came cloſe to it, but did not terminate in the body called *epididymis*. They were both pervious, and opened into the vagina near the opening of the urethra.—On the poſterior ſurface of the bladder, or between the uterus and bladder, were the two bags called the *veſiculæ ſeminales* in the male, but much ſmaller than what they are in the bull: the ducts opened along with the vaſa deferentia.

Concerning hermaphrodites of the human ſpecies, much has been wrote, and many laws enacted about them in different nations; but the exiſtence of them is ſtill diſputed. Dr Parſons has given us a treatiſe on the ſubject, in which he endeavours to explode the notion as a vulgar error. According to him, all the hermaphrodites that have appeared, were only women whoſe clitoris from ſome cauſe or other was overgrown; and,

Hermaphrodite || Hermes.

and, in particular, that this was the case with an Angola woman shewn at London as an hermaphrodite some time ago.

Among the reptile tribe, indeed, such as worms, snails, leeches, &c. hermaphrodites are very frequent.

HERMAPHRODITE *Flowers*, in botany. These are so called by the sexualists on account of their containing both the antheræ and stigma, the pretended organs of generation, within the same calix and petals. Of this kind are the flowers of all the classes in Linnæus's sexual method, except the classes *monœcia* and *diœcia*; in the former of which, male and female flowers are produced on the same root; in the latter, in distinct plants from the same seed.—In the class *polygamia*, there are always hermaphrodite flowers mixed with male or female, or both, either on the same or distinct roots. In the plantain-tree the flowers are all hermaphrodite; in some, however, the antheræ or male organ, in others the stigma or female organ, proves abortive. The flowers in the former case are styled *female hermaphrodites*; in the latter, *male hermaphrodites*.—Hermaphrodites are thus as frequent in the vegetable kingdom as they are rare and scarce in the animal one.

HERMAS, an ecclesiastical author of the first century; and, according to Origen, Eusebius, and Jerome, the same whom St Paul salutes in the end of his epistle to the Romans. He wrote a book in Greek some time before Domitian's persecution, which happened in the year 95. This work is entitled *The Pastor*, from his representing an angel speaking to him in it under the form of a shepherd. The Greek text is lost, but a very ancient Latin version of it is still extant. Some of the fathers have considered this book as canonical. The best edition of it is that of 1698, where it is to be found among the other apostolical fathers, illustrated with the notes and corrections of Cotelerius and Le Clerc. With them it was translated into English by Archbishop Wake, the best edition of which is that of 1710.

HERMES, THOTH, or *Mercury*, one of the secondary gods of Egypt, who received divine honours on account of his useful and extraordinary talents.

There is no personage in all antiquity more renowned than the Egyptian Hermes, who was furnamed *Trismegistus*, or *Thrice-illustrious*. He was the soul of Osiris's counsel and government; and is called by Sir Isaac Newton, his *secretary*. "Osiris," says he, "using the advice of his secretary Thoth, distributed Egypt into 36 nomes; and in every nome erects a temple, and appoints the several gods, festivals, and religions of the several nomes. The temples were the sepulchres of his great men, where they were to be buried and worshipped after death, each in his own temple, with ceremonies and festivals appointed by him; while he and his queen, by the names of *Osiris* and *Isis*, were to be worshipped in all Egypt: these were the temples seen and described by Lucian, who was himself an Egyptian, 1100 years after, and to be of one and the same age: this was the original of the several nomes of Egypt, and of the several gods and several religions of those nomes." And Diodorus Siculus tells us, that Mercury was honoured by Osiris, and afterwards worshipped by the Egyptians, as a person endowed with extraordinary talents for every thing that was conducive to the good of society. He was the first who out of the coarse and rude dialects of his time formed a regular language, and gave appellatives to the most useful things: he likewise invented the first characters or letters, and even regulated the harmony of words and phrases: he instituted several rites and ceremonies relative to the worship of the gods, and communicated to mankind the first principles of astronomy. He afterwards suggested to them as amusements, wrestling and dancing; and invented the lyre, to which he gave three strings in allusion to the seasons of the year: for these three strings producing three different sounds, the grave, the mean, and the acute, the grave answered to winter, the mean to spring, and the acute to summer. Hermes.

Among the various opinions of the several ancient writers who have mentioned this circumstance, and confined the invention to the Egyptian Mercury, that of Apollodorus is the most intelligible and probable. "The Nile, (says this writer), after having overflowed the whole country of Egypt, when it returned within its natural bounds, left on the shore a great number of dead animals of various kinds; and among the rest a tortoise, the flesh of which being dried and wasted by the sun, nothing was left within the shell but nerves and cartilages; and these being braced and contracted by desiccation, were rendered sonorous. Mercury, in walking along the banks of the Nile, happening to strike his foot against the shell of this tortoise, was so pleased with the sound it produced, that it suggested to him the first idea of a lyre, which he afterwards constructed in the form of a tortoise, and strung it with the dried sinews of dead animals." See LYRE.

It is generally imagined that there were two Thoths or Mercuries in Egypt, who lived at very remote periods, but both persons of great abilities. The Egyptians themselves distinguish two Thoths or Hermeses; and yet the histories of the first and second are so much confounded together, as those of Osiris and Sesostris. *Div. Leg.* book iv. sect 5.

The Greek Christians had so high an opinion of the antiquity of the first Egyptian Hermes, who lived at Sais, that they supposed him and the antedeluvian patriarch Enoch to have been the same person, and give to both the same inventions. We are told likewise, that Manetho extracted his history and dynasties of the Egyptians from certain pillars in Egypt, on which inscriptions had been made by Thoth or the first Mercury, in the sacred letters before the flood! Vid. Dodwell *Dissert. de Sachon. Fabric. Bib. Gr. Stillingfleet. Orig. Sacr. et alios.* Chronology, p. 21.

No less than 42 different works are attributed to the Egyptian Hermes by ancient writers; of these the learned and exact Fabricius has collected all the titles. It was usual for the Egyptians, who had the highest veneration for this personage, after his apotheosis, to have his works, which they regarded as their bible, carried about in processions with great pomp and ceremony; and the first that appeared in these solemnities was the chanter, who had two of them in his hands, while others bore symbols of the musical art. It was the business of the chanters to be particularly versed in the two first books of Mercury; one

Hermetical || Hermit.

of which contained the hymns to the gods; and the other, maxims of government: 36 of theſe books comprehended a complete ſyſtem of Egyptian philoſophy; the reſt were chiefly upon the ſubjects of medicine and anatomy.

Theſe books upon theology and medicine are aſcribed by Marſham to the ſecond Mercury, the ſon of Vulcan, who, according to Euſebius, lived a little after Moſes; and this author, upon the authority of Manetho, cited by Syncellus, regarded the ſecond Mercury as the Hermes furnamed *Triſmegiſtus*. Enough has been ſaid, however, to prove, that the Egyptian Mercuries, both as to the time when they flouriſhed, and their attributes, were widely different from the Grecian Mercury, the ſon of Jupiter and Maia. See MERCURY.

HERMETICAL PHILOSOPHY, that which undertakes to ſolve the various phenomena of nature, from the chemical principles ſalt, ſulphur, and mercury.

HERMETICAL *Seal*, among chemiſts, a method of ſtopping glaſs-veſſels uſed in chemical operations, ſo cloſely, that the moſt ſubtil ſpirit cannot eſcape thro' them.

It is commonly done by heating the neck of the veſſel in a flame till ready to melt, and then twiſting it cloſely together with a pair of pincers. Or veſſels may be hermetically ſealed by ſtopping them with a glaſs plug, or by putting one ovum philoſophorum over another.

HERMIONE (anc. geog.), a conſiderable city of Argolis. It was in ruins, except a few temples, in the time of Pauſanias; who ſays that the new city was at the diſtance of four ſtadia from the promontory on which the temple of Neptune ſtood. It gave name to the Sinus Hermionicus, a part of the Sinus Argolicus.

HERMIT, or EREMIT, *Eremita*, a devout perſon retired into ſolitude, to be more at leiſure for prayer and contemplation, and to diſencumber himſelf of the affairs of this world.—The word is formed from the Greek ἐρημος, *deſart*, or *wilderneſs*; and, according to the etymology, ſhould rather be wrote *Eremit*.

Paul furnamed the *hermit* is uſually reckoned the firſt hermit; though St Jerome at the beginning of the life of that ſaint ſays, it is not known who was the firſt.—Some go back to John the Baptiſt, others to Elias: others make St Anthony the founder of the eremitical life; but others think that he only rekindled and heightened the fervour thereof, and hold that the diſciples of that ſaint owned St Paul of Thebes for the firſt that practiſed it. The perſecutions of Decius and Valerian are ſuppoſed to have been the occaſion.—A hermit is not reputed a religious, unleſs he have made the vows.

HERMIT (Gaytier Peter the), a French officer of Amiens in Picardy, who quitted the military profeſſion, and commenced hermit and pilgrim. Unfortunately, he travelled to the Holy Land about the year 1093; and making a melancholy recital of the deplorable ſituation of a few Chriſtians in that country to Pope Urban II. and at the ſame time enthuſiaſtically lamenting that Infidels ſhould be in poſſeſſion of the famous city where the Author of Chriſtianity firſt promulgated his ſacred doctrines, Urban gave him a fatal commiſſion to excite all Chriſtian princes to a general war againſt the Turks and Saracens the poſſeſſors of the Holy Land. See CRUSADES.

Hermogenes || Hernandria.

HERMOGENES, the firſt and moſt celebrated architect of antiquity, was, according to Vitruvius, born at Alabada, a city in Caria. He built a temple of Diana at Magneſia; another of Bacchus at Tros; and was the inventor of ſeveral parts of architecture. He compoſed a book on the ſubject, which is loſt.

HERMOGENES *Tarſenſis*, a rhetorician and orator, and who was in every reſpect a prodigy. At 17 years of age he publiſhed his ſyſtem of rhetoric, and at 20 his philoſophic ideas: but at 25 he forgot every thing he had known. It is ſaid, that, his body being opened after his death, his heart was found of an extraordinary ſize, and all over hairy. He died about 168 B. C.

HERMON, or AERMON (anc. geog.), a mountain of the Amorites, called *Sanior* by the Phœnicians, and *Sanir* or *Senir* by the Amorites on the eaſt of Jordan. It is alſo called *Sion*, (Moſes); but muſt not be confounded with the Sion of Jeruſalem. By the Sidonians it was called *Scirion*; in the vulgate, it is called *Sarion*. Joſhua informs us, that it was the dominion of Og king of Baſhan; which muſt be underſtood of its ſouth ſide. It is never particularly mentioned by profane writers; being comprifed under the appellation *Libanus*, or *Antilibanus*, with which mountain it is joined to the eaſt. It is alſo called *Hermonim* plurally, Pſalm xlii. 6. becauſe it was extenſive, and contained ſeveral mountains.

HERMUS, (anc. geog.), a river of Ionia; which riſing near Dorylæum, a town of Phrygia, in a mountain ſacred to Dindymene or Cybele, touched Myſia, and ran through the Regio Combuſta, then through the plains of Smyrna down to the ſea, carrying along with it the Pactolus, Hyllus, and other leſs noble rivers. Its waters were ſaid to roll down gold, by Virgil and other poets.

HERNANDRIA, JACK-IN-A-BOX TREE; a genus of the triandria order, belonging to the monœcia claſs of plants.

Species. 1. The ſonora, or common jack-in-a-box, is a native of the Weſt Indies. It grows 20 or 30 feet high; and is garniſhed with broad peltated leaves, and monœcious flowers, ſucceeded by a large ſwollen hollow fruit formed of the calix; having a hole or open at the end, and a hard nut within. The wind blowing into the cavity of this fruit makes a very whiſtling and rattling noiſe, whence comes the name. 2. The ovigera grows many feet high, garniſhed with large oval leaves not peltated; and monœcious flowers, ſucceeded by a ſwollen fruit open at the end, and a nut within.

Culture. Both theſe plants being tender exotics, muſt be planted in pots of rich earth, and always kept in a hot-houſe; in which, notwithſtanding all the care that can be taken, they ſeldom flower, and never grow beyond the height of common ſhrubs, tho' in the places where they are natives they arrive at the height of trees. They are propagated by ſeeds procured from the Weſt Indies.

HERNIA, in medicine. See (the *Index* ſubjoined to) MEDICINE, and SURGERY.

HER-

Herniaria
||
Herodians.

HERNIARIA, RUPTURE-WORT; a genus of the digynia order, belonging to the pentandria claſs of plants.

Species. There are four ſpecies, of which the only remarkable one is the glabra, or ſmooth rupture-wort, a native of many parts of England. It is a low trailing plant, with leaves like the ſmaller chickweed; the flowers come out in cluſters from the ſide of the ſtalks at the joints, and are of a yelloviſh green colour.

Uſes, &c. This plant is a little ſaltiſh and aſtringent. The juice takes away ſpecks in the eye. Cows, ſheep, and horſes, eat the plant; goats and ſwine refuſe it.

HERO, in Pagan mythology, a great and illuſtrious perſon, of a mortal nature, though ſuppoſed by the populace to partake of immortality, and after his death to be placed among the number of the gods. The word is formed of the Latin *heros*, and that of the Greek ἥρως, *ſemi-deus*, "demi-god."

HERO, in fabulous hiſtory, a famous prieſteſs of Venus, lived at Abydos, in a tower ſituated on the banks of the Helleſpont. She being beloved by Leander, who lived at Seſtos on the other ſide of the ſtreight, he every night ſwam over to viſit her, being directed by a light fixed on the tower. But the light being put out in a ſtormy night, the youth miſſed his way, and was drowned; on which Hero threw herſelf into the ſea, and periſhed.

HERO, the name of two celebrated Greek mathematicians; the one called the *old*, and the other the *young*, *Hero*. The younger was a diſciple of Cteſibius. They are known by two works tranſlated into Latin by Barochius: *Spiralium liber*, by Hero ſenior; and *Tractat. artis et machin. militar.* by Hero junior. They flouriſhed about 130 and 100 B. C.

HEROD, falſly ſtyled the *Great*, king and execrable tyrant of Judæa; who, on the ſtrength of a miſinterpreted prophecy, cauſed all the male children of Bethlehem and its neighbourhood, to be maſſacred by his ſoldiers at the time of the birth of Chriſt, in the vain hope of deſtroying the Saviour of mankind. He died, eaten with worms, two or three years after the birth of our Saviour, at the age of 71, after a reign of 40 years. He had ordered that all the perſons of quality, whom he kept in priſon, ſhould be maſſacred the moment the breath was out of his body, in order that every conſiderable family in the kingdom might ſhed tears at his death; but that inhuman order was not executed.

HERODIAN, an eminent Greek hiſtorian, who ſpent the greateſt part of his life at Rome, flouriſhed in the third century, in the reigns of Severus, Caracalla, Heliogabalus, Alexander, and Maximin. His hiſtory begins from the death of Marcus Aurelius the philoſopher; and ends with the death of Balbinus and Maximin, and the beginning of the reign of Gordian. It is wrote in very elegant Greek; and there is an excellent tranſlation of it into Latin, by Angelus Politianus. Herodian has been publiſhed by Henry Stephens in 4to, in 1581; by Boecler, at Straſburg, in 1662, 8vo; and by Hudſon, at Oxford, in 1699, 8vo.

HERODIANS, a ſect among the Jews at the time of our Saviour; mentioned Math. xxii. 16. Mark iii. 6.

The critics and commentators are very much divided with regard to the Herodians. St Jerom, in his Dialogue againſt the Luciferians, takes the name to have been given to ſuch as owned Herod for the Meſſiah; and Tertullian and Epiphanius are of the ſame opinion. But the ſame Jerom, in his Comment on St Matthew, treats this opinion as ridiculous; and maintains, that the Phariſees gave this appellation by way of ridicule to Herod's ſoldiers who paid tribute to the Romans; agreeable to which the Syrian interpreters render the word by *the domeſtics of Herod*, i. e. "his courtiers." M. Simon, in his notes on the 22d chapter of Matthew, advances a more probable opinion. The name *Herodian* he imagines to have been given to ſuch as adhered to Herod's party and intereſt; and were for preſerving the government in his family, about which were great diviſions among the Jews.—F. Hardouin will have the Herodians and Sadducees to have been the ſame. Herodotus.

HERODOTUS, an ancient Greek hiſtorian of Halicarnaſſus in Caria, ſon of Lyxus and Dryo, was born in the firſt year of the 74th Olympiad, that is, about 484 B. C. The city of Halicarnaſſus being at that time under the tyranny of Lygdamis grandſon of Artemiſia queen of Caria, Herodotus quitted his country and retired to Samos; from whence he travelled over Egypt, Greece, Italy, &c. and in his travels acquired the knowledge of the hiſtory and origin of many nations. He then began to digeſt the materials he had collected into order, and compoſed that hiſtory which has preſerved his name among men ever ſince. He wrote it in the iſle of Samos, according to the general opinion.—Lucian informs us, that when Herodotus left Caria to go into Greece, he began to conſider with himſelf,

> What he ſhould do to be for ever known
> And make the age to come his own,

in the moſt expeditious way, and with as little trouble as poſſible. His hiſtory, he preſumed, would eaſily procure him fame, and raiſe his name among the Grecians in whoſe favour it was written: but then he foreſaw that it would be very tedious to go through the ſeveral cities of Greece, and recite it to each reſpective city; to the Athenians, Corinthians, Argives, Lacedemonians, &c. He thought it moſt proper therefore to take the opportunity of their aſſembling all together; and accordingly recited his work at the Olympic games, which rendered him more famous than even thoſe who had obtained the prizes. None were ignorant of his name, nor was there a ſingle perſon in Greece who had not ſeen him at the Olympic games, or heard thoſe ſpeak of him who had ſeen him there.

His work is divided into nine books; which, according to the computation of Dionyſius Halicarnaſſenſis, contain the moſt remarkable occurrences within a period of 240 years; from the reign of Cyrus the firſt king of Perſia, to that of Xerxes when the hiſtorian was living. Theſe nine books are called after the names of the nine muſes, each book being diſtinguiſhed by the name of a muſe; and this has given birth to two diſquiſitions among the learned: 1. Whether they were ſo called by Herodotus himſelf; and, 2. For what reaſon they were ſo called. As to the firſt, it is generally agreed that Herodotus did not impoſe theſe names himſelf; but it is not agreed why they were impoſed

Heroic, Heron.

imposed by others. Lucian tells us, that these names were given them by the Grecians at the Olympic games, when they were first recited, as the best compliment that could be paid the man who had taken pains to do them so much honour. Others have thought that the names of the *muses* have been fixed upon them by way of reproach; and were designed to intimate, that Herodotus, instead of true history, had written a great deal of fable. But, be this as it will, it is certain, that, with regard to the truth of his history, he is accused by several authors; and, on the other hand, he has not wanted persons to defend him. Aldus Manutius, Joachim Camerarius, and Henry Stephens, have written apologies for him; and, among other things, have very justly observed, that he seldom relates any thing of doubtful credit without producing the authority on which his narration is founded; and, if he has no certain authority to fix it upon, uses always the terms *ut ferunt, ut ego audivi*, &c.

There is ascribed also to Herodotus, but falsely, a Life of Homer, which is usually printed at the end of his work.—He wrote in the Ionic dialect, and his style and manner have ever been admired by all people of taste. There have been several editions of the works of this historian; two by Henry Stephens, one in 1570, and the other in 1592; one by Gale at London in 1679; and one by Gronovius at Leyden in 1715, which is the last and best, though not the best printed.

HEROIC POEM, that which describes some extraordinary enterprise; being the same with EPIC poem.

HEROIC *Verse*, that wherein heroic poems are usually composed, or it is that proper for such poems. In the Greek and Latin, hexameter verses are usually denominated heroic verses, as being those only used by mer, Virgil, &c. See POETRY, n° 116—124.

HERON, in ornithology. See ARDEA.

This bird is a very great devourer of fish, and will do more mischief to a pond than even an otter Some say that an heron will destroy more fish in a week than an otter will in three months; but that seems carrying the matter too far. People who have kept herons, have had the curiosity to number out the fish they fed them with into a tub of water; and counting them again afterwards, it has been found, that a heron will eat 50 moderate sized dace and roaches in a day. It has been found, that in carp-ponds visited by this bird, one heron will eat up 1000 store carp in a year, and will hunt them so close that very few can escape. The readiest method of destroying this mischievous bird is by fishing for him in the manner of pike, with a baited hook. When the haunt of the heron is found out, three or four small roach or dace are to be procured, and each of them is to be baited on a wire with a strong hook at the end; entering the wire just under the gills, and letting it run just under the skin to the tail: the fish will live in this condition five or six days, which is a very essential thing; for if it is dead, the heron will not touch it. A strong line, about two yards long, is then to be prepared of silk and wire twisted together; tie this to the wire that holds the hook; and to the other end there is to be tied a stone of about a pound weight. Let three or four of these baits be sunk in different shallow parts of the pond, and in a night or two the heron will not fail of being taken by one or other of them.—When hawking was in use, the heron afforded a great deal of sport to people who loved that diversion. There is but very little art in this flight of the hawk; but as both birds are large and courageous, the fight is finer than in the flight of smaller birds that make no resistance.

Herpes ‖ Herse.

HERPES, in medicine, a bilious pustule, which breaking out in different manners upon the skin, accordingly receives different denominations. See (the *Index* subjoined to) MEDICINE.

HERRERA TORDESILLAS (Anthony), a Spanish historian, was secretary to Vespasian Gonzaga viceroy of Naples, and afterwards historiographer of the Indies, under king Philip II. who allowed him a considerable pension. He wrote a general history of the Indies, in Spanish, from 1492 to 1554; and of the world (not so much esteemed), from 1554 to 1598. He died in 1625, aged about 66.

HERRERA (Ferdinand de), an eminent Spanish poet, of the 16th century, was born at Seville, and principally succeeded in the lyric kind. Besides his poems, he wrote notes on Garcilasso de la Vega, and an account of the war of Cyprus and the battle of Lepanto, &c.

HERRING, in ichthyology. See CLUPEA.

HERRING (Thomas), archbishop of Canterbury, was the son of the rev. Mr John Herring, rector of Walsoken in Norfolk, where he was born in 1693. He was educated at Jesus-college, Cambridge; was afterwards chosen fellow of Corpus Christi college, and continued a tutor there upwards of seven years. Having entered into priest's orders in 1719, he was successively minister of Great Shelford, Stow cum Qui, and Trinity, in Cambridge; chaplain to Dr Fleetwood, bishop of Ely; rector of Rettingdon in Essex, and of Barly in Hertfordshire; preacher to the Society of Lincoln's Inn, chaplain in ordinary to his late majesty, rector of Blechingly in Surry, and dean of Rochester. In 1737 he was consecrated bishop of Bangor, and in 1743 translated to the archiepiscopal see of York. When the late rebellion broke out in Scotland, and the king's troops were defeated by the Highlanders at Prestonpans, he distinguished himself by removing the general panic, and awakening the nation from its lethargy. He convened the nobility, gentry, and clergy of his diocese; and addressed them in a noble speech, which had such an effect upon his auditory, that a subscription ensued, to the amount of forty thousand pounds; and the example was followed by the nation in general. On the death of Dr Potter in 1747, he was translated to the see of Canterbury; but in 1753, was seized with a violent fever, which brought him to the brink of the grave; and after languishing about four years, he died on the 13th of March 1757. He expended upwards of six thousand pounds in repairing and adorning the palaces of Croydon and Lambeth. This worthy prelate, in a most eminent degree, possessed the virtues of public life; his mind was filled with unaffected piety and benevolence, he was an excellent preacher, and a true friend to religious and civil liberty. After his death was published a volume of his sermons on public occasions.

HERSE, in fortification, a lattice, or portcullis, in form of an harrow, beset with iron-spikes. The word *herse* is French, and literally signifies "harrow;" being

Hefe ‖ Hefbon.

being formed of the Latin *herpex* (or *irpex*), which denotes the fame.

It is ufually hung by a rope faftened to a moulinet; to be cut, in cafe of furprize, or when the firft gate is broken with a petard, that the herfe may fall, and ftop up the paffage of the gate or other entrance of a fortrefs.

The herfe is otherwife called a *farrafin*, or *cataract*; and when it conftits of ftraight ftakes, without any crofs-pieces, it is caled *orgues*.

HERSE, is alfo a harrow, which the befieged, for want of chevaux de frife, lay in the way, or in breaches, with the points up, to incommode the march as well of the horfe as of the infantry.

HERSILLON, in the military art, a fort of plank, or beam, ten or twelve feet long, whofe two fides are drove full of fpikes or nails, to incommode the march of the infantry or cavalry. The word is a diminutive of *herfe*; the herfillon doing the office of a little herfe. See HERSE.

HERTZBERG, a conftderable town of Germany, in the electorate of Saxony, and on the confines of Lufatia. E. Lon. 13. 37. N. Lat. 51. 42.

HERVEY (James), a late divine of examplary piety, was born in 1714, and fucceeded his father in the livings of Weton Favell and Collingtree in Northamptonfhire. Thefe being within five miles of each other, he attended alternately with his curate; till being confined by his ill health, he refided conftantly at Weton; where he diligently purfued the labours of the miniftry and his ftudy, under the difadvantage of a weak conftitution. He was remarkably charitable; and defired to die juft even with the world, and to be, as he termed it, his own executor. This excellent divine died on Chriftmas-day 1758, leaving the little he poffeffed to buy warm cloathing for the poor in that fevere feafon.—No work is more generally or defervedly known than his *Meditations and Contemplations*: containing, Meditations among the tombs, reflections on a flower-garden, a defcant on creation, contemplations on the night and ftarry heavens, and a winter-piece. The fublime fentiments in thefe pieces have the peculiar advantage of being conveyed in a flowing elegant language, and they have accordingly gone through many editions. He publifhed befides, *Remarks on lord Bolingbroke's letters on hiftory*; *Theron and Afpafio, or a feries of dialogues and letters on the moft important fubjects*; fome fermons, and other tracts.

HERVEY *Iland*, one of the fouth-fea iflands, difcovered by captain Cook September 23d 1773, who gave it that name in honour of the earl of Briftol. It is a low ifland, fituated in W. Lon. 158. 54. S. Lat. 19. 8.

HESBON, ESEBON, or *Hefebon*, (anc. geog.), the royal city of the Amorites, in the tribe of Reuben, according to Mofes: Though in Joftua xxi. 39. where it is reckoned among the Levitical cities, it is put in the tribe of Gad; which argues its fituation to be on the confines of both. It is thus determined by Jerome, who fays, that in his time it was called *Eftus*. A conftderable city, in the mountains of Arabia, which lie over againft Jericho, diftant 20 miles from the Jordan; not indeed in the fame latitude with Jericho, but fomewhat more to the north, becaufe fituated on the borders of the Gadites; and called a city of Arabia, becaufe the Arabs were at that time poffeffed of the Lower Petræa. Hefiod.

HESIOD, a very ancient Greek poet; but whether cotemporary with Homer, or a little older or younger than him, is not yet agreed among the learned; nor is there light enough in antiquity to fettle the matter exactly. His father, as he tells us in his *Opera et dies*, was an inhabitant of Cuma, one of the Eolian ifles, now called *Taie Nova*; and removed from thence to Afcra, a little village of Bœotia, at the foot of mount Helicon, where Hefiod was probably born, and called, as he often is, *Afcræus*, from it. Of what quality his father was, is nowhere faid; but that he was driven by his misfortunes from Cumæ to Afcra, Hefiod himfelf informs us. His father feems to have profpered better at Afcra than he did in his own country; yet Hefiod could arrive at no higher fortune than keeping fheep on the top of mount Helicon. Here the mufes met with him, and entered him into their fervice:

Erewhile as they the fhepherd-fwain behold,
Feeding beneath the facred mount his fold,
With love of charming fong his breaft they fir'd,
There me the heav'nly mufes firft infpir'd;
There, when the maids of Jove the filence broke,
To Hefiod thus, the fhepherd-fwain, they fpoke, &c.

To this account, which is to be found in the beginning of his *Generatio Deorum*, Ovid alludes in thefe two lines:

Nec mihi funt vifæ Clio, Cliufque forores.
Servanti pecudes vallibus Afcra tuis.

Nor Clio nor her fifters have I feen,
As Hefiod faw them in th' Afcræan green.

On the death of the father, an eftate was left, which ought to have been equally divided between the two brothers Hefiod and Perfes; but Perfes defrauded him in the divifion, by corrupting the judges. Hefiod was fo far from refenting this injuftice, that he expreffes a concern for thofe miftaken mortals who place their happinefs in riches only, even at the expence of their virtue. He lets us know, that he was not only above want, but capable of affifting his brother in time of need; which he often did, though he had been fo ill ufed by him. The laft circumftance he mentions relating to himfelf is his conqueft in a poetical contention. Archidamus, king of Eubœa, had inftituted funeral games in honour of his own memory, which his fons afterwards took care to have performed. Here Hefiod was a competitor for the prize in poetry; and won a tripod, which he confecrated to the mufes.

Hefiod having entered himfelf in the fervice of the mufes, left off the paftoral life, and applied himfelf to the ftudy of arts and learning. When he was grown old, for it is agreed by all that he lived to a very great age, he removed to Locris, a town about the fame diftance from mount Parnaffus as Afcra was from Helicon. His death was tragical. The man with whom he lived at Locris, a Milefian born, raviffed a maid in the fame houfe; and though Hefiod was entirely ignorant of the fact, yet being maliciouffy accufed to her brothers as an accomplice, he was injurioufly flain with the raviffer, and thrown into the fea.

The *Theogony*, and *Works and Days*, are the only undoubted

Hefper & Hefperis.

undoubted pieces of this poet now extant: though it is ſuppoſed that theſe poems have not deſcended perfect and finiſhed to the preſent time. A good edition of Heſiod's works was publiſhed by Mr Le Clerc at Amſterdam in 1701.

HESPER, an apellation given to the planet Venus when ſhe ſets after the ſun. See HESPERUS.

HESPERIA, an ancient name of Italy; ſo called by the Greeks from its weſtern ſituation. *Heſperia* was alſo an appellation of Spain; but with the epithet *ultima* (Horace), to diſtinguiſhed it from Italy, which is called *Heſperia magna* (Virgil), from its extent of empire.

HESPERI CORNU, called the *Great Bay* by the author of Hanno's Periplus: but moſt interpreters, following Mela, underſtand a promontory; ſome Cape Verd, others *Palmas Cape:* Voſſius takes it to be the former, ſince Hanno did not proceed ſo far as the latter cape.

HESPERIDEÆ (from the *Heſperides*, whoſe orchards are ſaid to have produced golden apples), *golden* or *precious fruit:* The name of the 19th order in Linnæus's fragments of a natural method. See BOTANY, p. 1308.

HESPERIDES, in the ancient mythology, were the daughters of Heſper, or Heſperus, brother of Atlas. The Heſperides were three in number, Ægle, Arethuſa, and Heſperthuſa.—Heſiod, in his Theogony, makes them the daughters of Nox, night; and ſeats them in the ſame place with the Gorgons, viz. at the extremities of the weſt, near mount Atlas: it is on that account he makes them the daughters of Night, by reaſon the ſun ſets there.

The Heſperides are repreſented by the ancients, as having the keeping of certain golden apples, on t'other ſide the ocean. The poets give them a dragon to watch the garden where the fruit grows: this dragon Hercules ſlew, and carried off the apples.

Pliny and Solinus will have the dragon to be no other than an arm of the ſea, wherewith the garden was incompaſſed, and which defended the entrance thereof. And Varro ſuppoſes that the golden apples were nothing but ſheep. Others, with more probability, ſay they were oranges.

HESPERIDUM INSULÆ, (anc. geog.), iſlands near the Heſperi Cornu; but the accounts of them are ſo much involved in fable, that nothing certain can be affirmed of them.

HESPERIS, ROCKET, *Dame's violet*, or *queen's gilliflower;* a genus of the ſiliquoſa order, belonging to the tetradynamia claſs of plants.

Species 1. The matronalis, or common ſweet ſcented garden rocket hath fibrous roots, crowned with a tuft of long, ſpear-ſhaped, rough leaves; upright, ſingle, hairy ſtalks two feet high; garniſhed with oval, lanceolate, ſlightly indented, cloſe-ſitting leaves; and the ſtalk and branches terminated by large and long ſpikes of ſweet-ſcented flowers of different colours and properties in the varieties, of which there are a great number. All the varieties of this ſpecies are ſo remarkable for imparting a fragrant odour, that the ladies were fond of having them in their apartments. Hence they derived the name of *dame's violet;* and, bearing ſome reſemblance to a ſtock-gilliflower, were ſometimes alſo called *queen's gilliflower;* but are now moſt commonly called *rocket*. 2. The inodora, or ſcentleſs rocket, hath a fibrous root; upright, round, firm ſtalks, two feet high, garniſhed with ſpear-ſhaped, acute-pointed, ſharply indented, cloſe-ſitting leaves; and all the branches terminated by large ſpikes of ſcentleſs flowers, with obtuſe petals, of different colours and properties in the varieties. This ſpecies makes a fine appearance, but hath no ſcent. 3. The triſtis, or dull-flowered night-ſmelling rocket, hath fibrous roots; upright, branching, ſpreading, briſtly ſtalks, two feet high; ſpear-ſhaped pointed leaves; and ſpikes of pale purple flowers, of great fragrance in the evening.

Heſperis, Heſſe.

Culture. All the ſpecies are hardy, eſpecially the firſt and ſecond, which proſper in any of the open borders, and any common garden-ſoil; but the third, being rather impatient of a ſevere froſt, and of much moiſture in winter, ſhould have a dry warm ſituation, and a few may be placed in pots to be ſheltered in caſe of inclement weather. They may be propagated either by ſeeds, by offsets, or by cuttings of the ſtalks.

HESPERUS, in fabulous hiſtory, ſon of Cephalus by Aurora, as fair as Venus, was changed into a ſtar, called *Lucifer* in the morning, and *Heſperus* in the evening. See HESPER.

HESSE, a country of Germany, in the circle of the Upper Rhine; bounded on the ſouth by the biſhopric of Fulda; on the eaſt, by the principality of Hersfeld, Thuringia, and Eichsfeld, as alſo by that of Calenburg; on the north, by the biſhopric of Paderborn, and Waldeck, the duchy of Weſtphalia, and the county of Witgenſtein; and on the weſt, by Naſſau-Dillenburg, the county of Solms, and Upper-Iſenburg. In the above limits, the county of Katzenellnbogen and ſome other territories are not included. The whole country, in its utmoſt length, is near 100 miles, and in ſome places near as much in breadth. The air is cold, but wholeſome; and the ſoil fruitful in corn, wine, wood, and paſture. The country abounds alſo in cattle, fiſh, and game; ſalt-ſprings, baths, and mineral waters. The hills, which are many, yield ſilver, copper, lead, iron, alum, vitriol, pit-coal, ſulphur, boles, a porcelain earth, marble, and alabaſter. In the Eder, gold is ſometimes found; and at Frankenberg a gold mine was formerly wrought. Beſides many leſſer ſtreams, Heſſe is watered by the following rivers, viz. the Lahn, the Fulda, the Eder or Schwalm, the Werra or Weſer, and Diemel. The Rhine alſo and the Mayne paſs through the country of Katzenellnbogen. This country, like moſt others in Germany, has its ſtates, conſiſting of the *prelates*, as they are called, the nobility, and the towns. The diets are divided into general and particular, and the latter into the greater and ſmaller committees. The houſe of Heſſe is divided into two principal branches, viz. Caſſel and Darmſtadt, of which Philipſdale, Rhinfels, and Homburg, are collateral branches; the two firſt of Heſſe-Caſſel, and the laſt of Heſſe-Darmſtadt. Their rights and privileges are very conſiderable. In particular, they have ſeveral votes at the diets of the empire; and cauſes, not exceeding 1000 florins, are determined by the courts of the country, without appeal. The princes of Heſſe-Caſſel are not of age till they are 25, but thoſe of Heſſe-Darmſtadt are ſo at 18. The right of primogeniture hath been eſtabliſhed in both

Heſſe || Heterogeneous.

both houſes. The revenues of Darmſtadt are ſaid to amount to near 100,000l. a year, and thoſe of Heſſe-Caſſel to near 200,000l. The ſmall county of Schaumberg alone yields a revenue of 10,000l. and that of Katzenellnbogen, with the foreſts of Richardſwalde, it is ſaid, was farmed near 200 years ago at 12,000l. The prince of Heſſe-Caſſel has 40 or 50,000 men in his dominions fit to bear arms; and the troops that he hires out have often brought him in large ſums, eſpecially from Great Britain. The branches of Caſſel, Homburg, and Philipſdale, are Calviniſts; that of Darmſtadt, Lutherans; and that of Rhinfeldts, Roman-catholics. The preſent prince of Heſſe-Caſſel, indeed, in the year 1749, embraced the Roman-catholic religion; but in 1754 drew up, and confirmed by oath, an inſtrument, of which all the Proteſtant princes are guarantees, declaring, that the eſtabliſhed religion of his dominions ſhould continue in every reſpect as before, and that his children ſhould be brought up and inſtructed therein. Here, as in the other Proteſtant Lutheran countries of Germany, are conſiſtories, ſuperintendants, and inſpectors of the church. In the whole landgraviate are three univerſities, beſides Latin ſchools and gymnaſia, for the education of youth. The manufactures of Heſſe are linen cloth, hats, ſtockings, gloves, paper, goldſmiths wares, and at Caſſel a beautiful porcelain is made. They have alſo the fineſt wool in Germany; but are reproached with want of induſtry, in exporting inſtead of manufacturing it themſelves.—This is ſuppoſed to have been the country of the ancient Catti, mentioned by Tacitus, &c. who, in after-ages, were called *Chatti*, *Chaſſi*, *Haſſi*, and *Heſſi*. The two chief branches of Caſſel and Darmſtadt have many rights and privileges in common, which we have not room to ſpecify. Both of them have a ſeat and vote in the college of princes at the diet of the empire, and thoſe of this circle. Each of theſe princes, beſides their guards and militia, maintains a conſiderable body both of horſe and foot.

HESYCHIUS, the moſt celebrated of all the ancient Greek grammarians whoſe works are now extant, was a Chriſtian; and, according to ſome, the ſame with Helychius patriarch of Jeruſalem, who died in 609. He wrote a Greek lexicon; which, in the opinion of Caſaubon, is the moſt learned and uſeful work of that kind produced by the ancients. Schrevelius publiſhed a good edition of it in 1668, in 4to. with notes; but the beſt is that of John Alberti, printed at Leyden in 1746, in two vols folio.

HETEROCLITE, among grammarians, one of the three variations in irregular nouns, and defined by Mr Ruddiman, a noun that varies in its declenſion; as *hoc vas*, *vaſis*; *hæc vaſa*, *vaſorum*.

HETERODOX, in polemical theology, any thing contrary to the faith and doctrines of a church.

HETEROGENEITY, in phyſiology, that quality or property of bodies which denominates a thing heterogeneous.

HETEROGENEOUS, or HETEROGENEAL, ſomething that conſiſts of parts of diſſimilar kinds, in oppoſition to *homogeneous*.

HETEROGENEOUS *Light*, is, by Sir Iſaac Newton, ſaid to be that which conſiſts of rays of different degrees of refrangibility: thus the common light of the ſun or clouds is heterogeneous, being a mixture of all forts of rays.

HETEROGENEOUS *Nouns*, one of the three variations in irregular nouns; or ſuch as are of one gender in the ſingular number, and of another in the plural. —Heterogeneous, under which are comprehended mixed nouns, are ſix-fold. 1. Thoſe which are of the maſculine gender in the ſingular number, and neuter in the plural; as *hic tartarus*, *hæc tartara*. 2. Thoſe which are maſculine in the ſingular number, but maſculine and neuter in the plural; as *hic locus*, *hi loci*, & *hæc loca*. 3. Such as are feminine in the ſingular number, but neuter in the plural; as *hæc carbaſus*, & *hæc carbaſa*. 4. Such nouns as are neuter in the ſingular number, but maſculine in the plural; as *hoc cælum*, *hi cæli*. 5. Such as are neuter in the ſingular, but neuter and maſculine in the plural; as *hoc raſtrum*, *hi raſtri*, & *hæc raſtra*; and, 6. Such as are neuter in the ſingular, but feminine in the plural number; as *hoc epulum*, *hæ epulæ*. Heterofcii, Hevelius.

HETEROSCII, in geography, a term of relation, denoting ſuch inhabitants of the earth as have their ſhadows falling but one way, as thoſe who live between the tropics and polar circles; whoſe ſhadows at noon in north latitude are always to the northward, and in ſouth latitude to the ſouthward.

HEVELIUS, or HEVELKE, (John), an eminent aſtronomer, was born at Dantzic in 1611. He ſtudied in Germany, England, and France, and every where obtained the eſteem of the learned. He was the firſt that diſcovered a kind of libration in the moon, and made ſeveral important obſervations on the other planets. He alſo diſcovered ſeveral fixed ſtars, which he named the *firmament of Sobieſki*, in honour of John III. king of Poland. His wife was alſo well ſkilled in aſtronomy, and made a part of the obſervations publiſhed by her huſband. In 1673, he publiſhed, A deſcription of the inſtruments with which he made his obſervations, under the title of *Machina Cæleſtis*: and in 1679, he publiſhed the ſecond part of this work; but in September the ſame year, while he was at a ſeat in the country, he had the misfortune to have his houſe at Dantzic burnt down. By this calamity he is ſaid to have ſuſtained a loſs of ſeveral thouſand pounds; having not only his obſervatory and all his valuable inſtruments and apparatus deſtroyed; but alſo a great number of copies of his *Machina Cæleſtis*; which accident has made this ſecond part very ſcarce, and conſequently very dear. In the year 1690 were publiſhed, "Firmamentum Sobieſcianum," and "Prodomus aſtronomicæ & novæ tabulæ ſolares, una cum catalogo fixarum," in which he lays down the neceſſary preliminaries for taking an exact catalogue of the ſtars. But both theſe works are poſthumous; for Hevelius died in 1687, on his birth-day, aged 76. He was a man greatly eſteemed by his countrymen, not only on account of his great reputation and ſkill in aſtronomy, but as a very excellent and worthy magiſtrate. He was made a burgomaſter of Dantzic; which office he is ſaid to have executed with the utmoſt integrity and applauſe. He was alſo very highly eſteemed by foreigners; and not only by thoſe ſkilled in aſtronomy and the ſciences, but by foreign princes and potentates: as appears abundantly from a collection of their letters which were printed at Dantzic in the year 1683.

Heurnius ‖ Hexham.

HEURNIUS, or VAN HEURN, (John), a learned phyſician, was born at Utrecht, in 1543; and ſtudied at Louvain, Paris, Padua, and Pavia. At his return to his native country he became magiſtrate of Amſterdam; after which he was profeſſor of phyſic at Leyden, and rector of the univerſity of that city, where he died in 1601. He wrote, among other works, ſeveral treatiſes on the diſeaſes of different parts of the body, and ſeveral commentaries on the works of Hippocrates.—*Otho Heurnius*, his ſon, was alſo profeſſor of phyſic at Leyden, and wrote ſome books.

HEUSDEN, a ſtrong town of the United Provinces in Holland, ſeated on the river Maeſe among marſhes, with a handſome caſtle, in E. Long. 5. 3. N. Lat. 51. 47.

HEWSON (William), a very ingenious anatomiſt, was born in 1739. He became aſſiſtant to Dr Hunter, and was afterwards in partnerſhip with him; but, on their diſagreement, read anatomical lectures at his own houſe (in which he was ſeconded by Mr Falconer). He wrote *Inquiries into the properties of the blood, and the lymphatic ſyſtem*, 2 vols; and diſputed with Dr Monro the diſcovery of the lymphatic ſyſtem of veſſels in oviparous animals. He died in 1774.

HEXACHORD, in ancient muſic, a concord called by the moderns a *ſixth*.

HEXAGON, in geometry, a figure of ſix ſides and angles; and if theſe ſides and angles are equal, it is called a *regular hexagon*.

HEXAHEDRON, in geometry, one of the five platonic bodies, or regular ſolids, being the ſame with a cube.

HEXAMETER, in ancient poetry, a kind of verſe conſiſting of ſix feet; the firſt four of which may be indifferently either ſpondees or dactyls; the fifth is generally a dactyl, and the ſixth always a ſpondee. Such is the following verſe of Horace:

1 2 3 4 5 6

Aut prodeſſe volunt, aut\ delectare poetæ.

HEXANDRIA, in botany, (from ἑξ. "ſix;" and ἀνηρ. "a man;") the name of the ſixth claſs in Linnæus's ſexual method, conſiſting of plants with hermaphrodite flowers, which are furniſhed with ſix ſtamina or male organs, that are of an equal length. See BOTANY, p. 1292.

HEXASTYLE, in architecture, a building with ſix columns in front.

HEXHAM, a town of Northumberland. It is commonly reckoned to be the *Alexodunum* of the Romans, where the firſt cohort of the Spaniards were in garriſon. It was made a biſhop's ſee by Etheldreda, wife of king of Egfred, in the year 675. Its firſt biſhop, St Wilfred, built here a moſt magnificent cathedral and monaſtery, and it was poſſeſſed by ſeven biſhops ſucceſſively; but being very much infeſted by the Danes, the ſee was removed to York. The town is at preſent well built, and its market is pretty good for corn. There was a remarkable and bloody battle fought near this town, between the houſes of Lancaſter and York, wherein the former were defeated, chiefly by the extraordinary bravery and conduct of John Nevil, lord Montacute, who was for that reaſon created earl of Northumberland. W. Long. 1. 37. N. Lat. 55. 5.

HEYDON, a little, pleaſant, well-built town of Yorkſhire, in that part called *Holderneſſe*, ſeated on a river that falls into the Humber. It has now but one church, tho' there are the remains of two more; and had formerly a conſiderable trade, which is now loſt, on account of its being ſo near Hull. The houſes being rebuilt, adds to the beauty of the place. It is a corporation; and is governed by a mayor, a recorder, nine aldermen, and two bailiffs, who have the power of chooſing ſheriffs, and are juſtices of the peace. It ſends two members to parliament. W. Long. 0. 55. N. Lat. 53. 46.

Heydon ‖ Heywood.

HEYDON (John), who ſometimes aſſumed the name of *Eugenius Theodidactus*, was a great pretender to ſkill in the Roſicrucian philoſophy and the celeſtial ſigns, in the reign of king Charles I.; and wrote a conſiderable number of chemical and aſtrological works, with very ſingular titles. This ridiculous author was much reſorted to by the duke of Buckingham, who was infatuated with judicial aſtrology. He employed him to calculate the king's and his own nativity, and was aſſured that his ſtars had promiſed him great things. The duke alſo employed Heydon in ſome treaſonable and ſeditious practices, for which he was ſent to the tower. He loſt much of his former reputation by telling Richard Cromwell and Thurloe, who went to him diſguiſed like cavaliers, That Oliver would infallibly be hanged by a certain time; which he out-lived ſeveral years.

HEYLIN (Dr Peter), an eminent Engliſh writer, was born at Burford, in Oxfordſhire, in 1600. He ſtudied at Hart-hall, Oxford; where he took his degrees in arts and divinity, and became an able geographer and hiſtorian. He was appointed one of the chaplains in ordinary to king Charles I. was preſented to the rectory of Hemingford in Huntingtonſhire, made a prebendary of Weſtminſter, and obtained ſeveral other livings: but of theſe he was deprived by the parliament, who alſo ſequeſtered his eſtate; by which means he and his family were reduced to great neceſſity. However, upon the reſtoration, he was reſtored to his ſpiritualities; but never roſe higher than to be ſubdean of Weſtminſter. He died in 1662; and was interred in St Peter's church in Weſtminſter, where he had a neat monument erected to his memory. His writings are very numerous: the principal of which are, 1. *Microcoſmus*, or a deſcription of the great world. 2. *Coſmographia*. 3. The hiſtory of St George. 4. *Eccleſia vindicata*, or the church of England juſtified. 5. Hiſtorical and miſcellaneous tracts, &c.

HEYWOOD (John), one of our moſt ancient dramatic poets, was born at North-Mims, near St Alban's in Hertfordſhire, and educated at Oxford. From thence he retired to the place of his nativity; where he had the good fortune to become acquainted with Sir Thomas More, who, it ſeems, had a ſeat in that neighbourhood. This patron of genius introduced our comic poet to the princeſs Mary, and afterwards to her father Henry, who, we are told, was much delighted with his wit, and ſkill in muſic, and by whom he was frequently rewarded. When his former patroneſs, queen Mary, came to the crown, Heywood became a favourite at court, and continued often to entertain her majeſty, *exerciſing his fancy before her, even to the time that ſhe lay languiſhing on her death-bed.*

Heywood, Hiatus.

bed. On the acceſſion of Elizabeth, being a zealous Papiſt, he thought fit to decamp, with other favourites of her deceaſed majeſty. He ſettled at Mechlin in Flanders, where he died in the year 1565.—John Heywood was a man of no great learning, nor were his poetical talents by any means extraordinary; but he poſſeſſed talents of more importance in the times in which he lived, namely, the talents of a jeſter. He wrote ſeveral plays; 500 epigrams; *A dialogue in verſe concerning Engliſh proverbs*; and, *The ſpider and fly, a parable*, a thick 4to. Before the title of this laſt work is a whole-length wooden print of the author; who is alſo repreſented at the head of every chapter in the book, of which there are 77.—He left two ſons, who both became Jeſuits and eminent men: viz. Ellis Heywood, who continued ſome time at Florence under the patronage of cardinal Pole, and became ſo good a maſter of the Italian tongue, as to write a treatiſe in that language, entitled *Il Moro*; he died at Louvain about the year 1572. His other ſon was Jaſper Heywood, who was obliged to reſign a fellowſhip at Oxford on account of his immoralities: he tranſlated three tragedies of Seneca, and wrote various poems and deviſes; ſome of which were printed in a volume, intitled, *The paradiſe of dainty deviſes*, 4to. 1573. He died at Naples in 1597

Heywood (Eliza), one of the moſt voluminous novel writers this iſland ever produced; of whom we know no more than that her father was a tradeſman, and that ſhe was born about the year 1696. In the early part of her life, her pen, whether to gratify her own diſpoſition or the prevailing taſte, dealt chiefly in licentious tales, and memoirs of perſonal ſcandal: the celebrated Atalantis of Mrs Manley ſerved her for a model; and *The court of Carimania*, *The new Utopia*, with ſome other pieces of a like nature, were the copies her genius produced. She alſo attempted dramatic writing and performance, but did not ſucceed in either. Whatever it was that provoked the reſentment of Pope, he gave full ſcope to it by diſtinguiſhing her as one of the prizes to be gained in the games introduced in honour of Dullneſs, in his Dunciad. Neverthelefs, it ſeems undeniable, that there is much ſpirit, and much ingenuity, in her manner of treating ſubjects, which the friends of virtue may perhaps wiſh ſhe had never meddled with at all. But, whatever offence ſhe may have given to delicacy or morality in her early works, ſhe appears to have been ſoon convinced of, and endeavoured to atone for in the latter part of her life; as no author then appeared a greater advocate for virtue. Among her riper productions may be ſpecified, *The female Spectator*, 4 vols; *The hiſtory of Miſs Betſy Thoughtleſs*, 4 vols; *Jemmy and Jenny Jeſſamy*, 3 vols; *The inviſible ſpy*, 4 vols; with a pamphlet, intitled, *A preſent for a ſervant-maid*. She died in 1759.

HIATUS, properly ſignifies an opening, chaſm, or gap; but it is particularly applied to thoſe verſes where one word ends with a vowel, and the following word begins with one, and thereby occaſions the mouth to be more open, and the ſound to be very harſh.

The term *hiatus* is alſo uſed in ſpeaking of manuſcripts, to denote their defects, of the parts that have been loſt or effaced.

HIBISCUS, Syrian mallow; a genus of the polyandria order, belonging to the monodelphia claſs of plants. Hibiſcus.

Species. Of this genus there are 25 ſpecies; the moſt remarkable are, 1. The Syriacus, commonly called *althæa frutex*, is a native of Syria. It riſes with ſhrubby ſtalks to the height of eight or ten feet, ſending out many woody branches covered with a ſmooth grey bark, garniſhed with oval ſpear-ſhaped leaves, whoſe upper parts are frequently divided into three lobes. The flowers come out from the wings of the ſtalk at every joint of the ſame year's ſhoot. They are large, and ſhaped like thoſe of the mallow, having five large roundiſh petals which join at their baſe, ſpreading open at the top, in ſhape of an open bell. Theſe appear in Auguſt; and if the ſeaſon is not too warm, there will be a ſucceſſion of flowers till September. The flowers are ſucceeded by ſhort capſules, with five cells, filled with kidney-ſhaped ſeeds; but unleſs the ſeaſon proves warm, they will not ripen in this country. Of this ſpecies there are four or five varieties, differing in the colour of their flowers: the moſt common hath pale purple flowers with dark bottoms; another hath bright purple flowers with black bottoms; a third hath white flowers with purple bottoms; and a fourth, variegated flowers with dark bottoms. There are alſo two with variegated leaves, which are by ſome much eſteemed. All theſe varieties are very ornamental in a garden. 2. The Chinenſis is a native of the Eaſt Indies, whence it has got the name of *China roſe*; but the ſeeds having been carried by the French to their Weſt India ſettlements, it hath thence obtained the name of *Martinico roſe*. Of this there are the double and ſingle flowering kinds; the ſeeds of the firſt frequently produce plants that have only ſingle flowers, but the latter ſeldom vary to the double kind. The plant has a ſoft ſpungy ſtem, which by age becomes ligneous and pithy. It riſes to the height of 12 or 14 feet, ſending out branches towards the top, which are hairy, garniſhed with heart-ſhaped leaves, cut into five acute angles on their borders, and ſlightly ſawed on their edges; of a lucid green on their upper ſide, but pale below. The flowers are produced from the wings of the leaves; the ſingle are compoſed of five petals which ſpread open, and are at firſt white, but afterwards change to a bluſh roſe colour, and as they decay turn purple. In the Weſt Indies, all theſe alterations happen on the ſame day, and the flowers themſelves are of no longer duration; but in Britain the changes are not ſo ſudden. The flowers are ſurrounded by ſhort, thick, blunt, capſules, which are very hairy; having five cells, which contain many ſmall kidney-ſhaped ſeeds, having a fine plume of fibrous down adhering to them. 3. The almoſchus, or muſk, is a native of the Weſt Indies, where the French cultivate great quantities of it. The plant riſes with an herbaceous ſtalk three or four feet high, ſending out two or three ſide-branches, garniſhed with large leaves cut into ſix or ſeven acute angles, ſawed on their edges, having long footſtalks, and placed alternately. The ſtalks and leaves of this ſort are very hairy. The flowers come out from the wings of the leaves upon pretty long footſtalks which ſtand erect. They are large, of a ſulphur colour, with purple bottoms; and are ſucceeded by pyramidal five-cornered capſules, which open in five cells, filled with large kidney-ſhaped ſeeds of a

Hibiscus. very musky odour. 4. The tiliaceus, or mahoe-tree, is a native of both the Indies. It rises with a woody, pithy stem, to the height often feet, dividing into several branches towards the top, which are covered with a woolly down, garnished with heart-shaped leaves ending in acute points. They are of a lucid green on their upper side, and hoary on the under side, full of large veins, and are placed alternately. The flowers are produced in loose spikes at the end of the branches, and are of a whitish-yellow colour. They are succeeded by short acuminated capsules, opening in five cells, filled with kidney-shaped seeds. 5. The javanica grows naturally on the coast of Malabar. It rises with a woody stalk 12 or 14 feet high, dividing into many small branches towards the top, garnished with oval sawed leaves ending in acute points, of a lucid green above, but pale on their under side, placed without order. The flowers come out from the sides of the branches at the wings of the leaves on pretty long footstalks. They are composed of many oblong roundish petals of a red colour, which expand like the rose; the flowers being as large when fully blown as the common red rose, and as double. 6. The gossypifolius, with a cotton leaf, is a native of the West Indies, and rises with an herbaceous stem three feet high, sending out several lateral branches, which are garnished with smooth leaves divided into five lobes. The flowers come out at the side of the branches. They are of a dirty white, with dark purple bottoms, and are succeeded by obtuse seed-vessels divided into five cells, which are filled with kidney-shaped seeds. 7. The trionum, Venice mallow, or flower of an hour, is a native of some parts of Italy, and has long been cultivated in the gardens of this country. It rises with a branching stalk a foot and an half high, having many short spines, which are soft, and do not appear unless closely viewed: the leaves are divided into three lobes, which are deeply jagged almost to the midrib. The flowers come out at the joints of the stalks, upon pretty long footstalks. They have a double empalement; the outer being composed of ten long narrow leaves, which join at their base: the inner is of one thin leaf swollen like a bladder, cut into five acute segments at the top, having many longitudinal purple ribs, and is hairy. Both these are permanent, and include the capsule after the flower is past. The flower is composed of five obtuse petals, which spread open at the top; the lower part forming an open bell-shaped flower. These have dark purple bottoms, but are of a pale sulphur-colour above. In hot weather the flowers continue but a few hours open; however, there is a succession of flowers that open daily for a considerable time. 8. The sicifolia, or ketmia of the Brasils, with a fig-leaf, is common in the West Indies. It rises with a soft herbaceous stalk from three to five feet high, dividing upward into many branches garnished with hand-shaped leaves, divided into five lobes. The flowers are produced from the wings of the stalks; they are of a pale sulphur colour with dark purple bottoms, but are of a very short duration; opening in the morning with the rising sun, and fading long before noon in hot weather. They are succeeded by capsules of very different forms, in the different varieties. In some, the capsules are not thicker than a man's finger, and five or six inches long; in others, they are very thick, and not more than two or three inches long; in some plants they grow erect, in others they are inclined, &c.

Culture. The first fort may be propagated either by seeds or cuttings. The seeds may be sown in pots filled with light earth about the latter end of March, and the young plants transplanted about the same time next year. They will succeed in the full ground; but must be covered in winter whilst young, otherwise they are apt to be destroyed. The second fort is propagated by seeds, which must be sown in a hot-bed. The young plants are to be transplanted into small separate pots, and treated like other tender vegetables, only allowing them a good share of air. The third fort is annual in this country, though biennial in those places where it is native. It is propagated by seeds, and must be treated in the manner directed for Amaranth. The fourth, fifth, sixth, and eighth sorts require the same treatment with the third. The seventh is propagated by seeds, which should be sown where the plants are designed to remain, for they do not bear transplanting well. They require no other culture than to be kept free from weeds, and thinned where they are too close; and if the seeds are permitted to scatter, the plants will come up fully as well as if they had been sown. Hibiscus Hickes.

Uses. The third sort is cultivated in the West Indies by the French, for the sake of its seeds. These are annually sent to France in great quantities, and form a considerable branch of trade, but the purposes which they answer are not certainly known. The flowers of the fifth kind are used by the Indian women of Malabar for colouring their hair and eyebrows of a black that will not wash off. The Europeans there use it for blacking their shoes, and thence have named it the *shoe-flower*. The green pods of the sixth fort have the taste of sorrel, and are used by the West Indians for giving an acid taste to their viands. The eighth fort is also cultivated by the West Indians for the sake of its pods. These they gather green to put into their soups; and having a soft viscous juice, they add a thickness to the soup which renders it very palatable.

HICETAS of Syracuse, an ancient philosopher and astronomer, who taught that the sun and stars were motionless, and that the earth moved round them. This is mentioned by Cicero, and probably gave the first hint of the true system to Copernicus. He flourished 344 B. C.

HICKES (George), an English divine of extraordinary parts and learning, born in 1642. In 1681 he was made king's chaplain, and two years after dean of Worcester. The death of Charles II. stopped his farther preferment; for, though his church principles were very high, he manifested too much zeal against Popery to be any favourite with James II. On the revolution, he with many others was deprived for refusing to take the oaths to king William and queen Mary; and soon after, archbishop Sancroft and his colleagues considering how to maintain epifcopal succession among those who adhered to them, Dr Hickes carried over a list of the deprived clergy to king James; and with his sanction a private consecration was performed, at which it is said lord Clarendon was present. Among others, Dr Hickes was consecrated suffragan bishop of Thetford, and died in 1715.—He wrote, 1. *Institutiones Grammaticæ Anglo-Saxonicæ, et Mœso-Gothicæ,*

Hickup || Hieracium.

thicæ. 2. *Antiqua literatura feptentrionalis.* 3. Two treatifes, one of the Chriſtian prieſthood, the other of the dignity of the epiſcopal order. 4. Jovian, or an anſwer to Julian the apoſtate. 5. Sermons; with many temporary controverſial pieces on politics and religion.

HICKUP, or HICCOUGH, a ſpaſmodic affection of the ſtomach, œſophagus, and muſcles ſubſervient to deglutition, ariſing ſometimes from ſome particular injury done to the ſtomach, œſophagus, diaphragm, &c. and ſometimes from a general affection of the nervous ſyſtem. See (the *Index* ſubjoined to) MEDICINE.

HIDAGE *(Hidagium)*, was an extraordinary tax payable to the kings of England for every hyde of land. This taxation was levied not only in money, but in proviſion, armour, &c.; and when the Danes landed in Sandwich in 994, king Ethelred taxed all his lands by hides; ſo that every 310 hides found one ſhip furniſhed, and every eight hides furniſhed one jack and one ſaddle, to arm for the defence of the kingdom, &c.—Sometimes the word *hidage* was uſed for the being quit of that tax: which was alſo called *hidegild*; and interpreted, from the Saxon, a "price, or ranſom paid to ſave one's ſkin or hide from beating."

HIDE, the ſkin of beaſts; but the word is particularly applied to thoſe of large cattle, as bullocks, cows, horſes, &c.

Hides are either raw or green, juſt as taken off the carcaſe, ſalted, or ſeaſoned with ſalt, alum, and ſaltpetre, to prevent their ſpoiling; or curried and tanned. See TANNING.

HIDE *of Land*, was ſuch a quantity of land as might be ploughed with one plough within the compaſs of a year, or as much as would maintain a family; ſome call it 60, ſome 80, and others 100 acres.

HIDE-*Bound*. See FARRIERY, §. xix.

HIERACIUM, HAWKWEED; a genus of the order of polygamia æqualis, belonging to the ſyngeneſia claſs of plants.

Species. 1. The aurantiacum, commonly called *grim the collier*, hath many oblong oval entire leaves, crowning the root; an upright, ſingle, hairy, and almoſt leafleſs ſtalk, a foot high, terminated by reddiſh orange-coloured flowers in a corymbus. Theſe flowers have dark oval aſh-coloured calyces; whence the name of *grim the collier*. 2. The piloſella or mouſe-ear, hath bloſſoms red on the outſide, and pale yellow within; the cups ſet thick with black hairs. The flowers open at eight in the morning, and cloſe about two in the afternoon. 3. The umbellatum grows to the height of three feet, with an erect and firm ſtalk, terminated with an umbel of yellow flowers.

Culture. The firſt is the only ſpecies cultivated in gardens. It is propagated by ſeeds, or parting the roots. The ſeed may be ſown in autumn or ſpring. In June, when the plants are grown two or three inches high, they may be picked out and planted in beds, where they muſt remain till the next autumn, and then tranſplanted where they are to remain.

Properties. The ſecond ſpecies is common in dry paſtures in England; it has a milky juice, but is leſs bitter and aſtringent than is uſual with plants of that claſs. It is reckoned hurtful to ſheep. An inſect of the cochineal genus, *(Coccus Polonicus)* is often found at the roots, *(Act. Upſal.* 1752.) Goats eat it; ſheep are not fond of it; horſes and ſwine refuſe it.—The third ſpecies is a native of Scotland, and grows in rough ſtony places, but is not very common. The flowers are ſometimes uſed for dying yarn of a fine yellow colour. Hieracites || Hieroglyphics.

HIERACITES, in church-hiſtory, Chriſtian heretics in the third century: ſo called from their leader Hierax, a philoſopher of Egypt; who taught that Melchiſedek was the Holy Ghoſt, denied the reſurrection, and condemned marriage.

HIERANOSIS, or MORBUS SACER. See (the *Index* ſubjoined to) MEDICINE.

HIERA PICRA. See PHARMACY, n° 826.

HIERARCHY, among divines, denotes the ſubordination of angels.

Some of the rabbins reckon four, others ten, orders or ranks of angels; and give them different names according to their different degrees of power and knowledge.

HIERARCHY, likewiſe denotes the ſubordination of the clergy, eccleſiaſtical polity, or the conſtitution and government of the Chriſtian church conſidered as a ſociety.

HIERES, the name of ſome ſmall iſlands lying near the coaſt of Provence in France, oppoſite to the towns of Hieres and Toulon, where the Engliſh fleet lay many months in 1744, and blocked up the French and Spaniſh fleets in the harbour of Toulon.

HIERES, a town of Provence in France, ſeated on the Mediterranean ſea. It is a pretty little town, and was formerly a colony of the Marſilians; and pilgrims uſed to embark here for the holy land. But its harbour being now choaked up, it is conſiderable only for its ſalt-works. E. Long. 6. 13. N. Lat. 43. 7.

HIERO I. and II. kings of Syracuſe. See SYRACUSE.

HIEROCLES, a cruel perſecutor of the Chriſtians, and a violent promoter of the perſecution under Diocleſian, flouriſhed in 302. He wrote ſome books againſt the Chriſtian religion; in which he pretends ſome inconſiſtencies in the Holy Scriptures, and compares the miracles of Apollonius Tyanæus to thoſe of our Saviour. He was refuted by Lactantius and Euſebius. The remains of his works were collected into one volume octavo, by biſhop Pearſon; and publiſhed in 1654, with a learned diſſertation prefixed to the work.

HIEROCLES, a Platonic philoſopher of the fifth century, taught at Alexandria, and was admired for his eloquence. He wrote ſeven books upon Providence and Fate; and dedicated them to the philoſopher Olympiodorus, who by his embaſſies did the Romans great ſervices under the emperors Honorius and Theodoſius the younger. But theſe books are loſt, and we only know them by the extracts in Photius. He wrote alſo a Commentary upon the golden verſes of Pythagoras; which is ſtill extant, and has been ſeveral times publiſhed with thoſe verſes.

HIEROGLYPHICS, in antiquity, myſtical characters, or ſymbols, in uſe among the Egyptians, and that as well in their writings as inſcriptions; being the figures of various animals, the parts of human bodies, and mechanical inſtruments.

The word is compoſed of the Greek ἱερὸς, *ſacer*, "holy," and γλυφειν, *ſculpere*, "to engrave;" it being the cuſtom to have the walls, doors, &c. of their temples, obeliſks, &c. engraven with ſuch figures.

After

Hieroglyphics.

After Hermes, and the Egyptian prieſts who ſucceeded, had, by long ſtudy and ſpeculation, formed a ſyſtem of theology, and natural philoſophy, in which God, the ſupreme cauſe of all, was the univerſal ſoul diffuſed through the whole creation, they endeavoured to expreſs the divine attributes and operations of the Deity, in the works of nature, by the properties and powers of living animals, and other natural productions, as the proper ſymbols of ſuch amazing cauſes.

In order to chooſe the moſt proper ſymbols, and, at the ſame time, the moſt expreſſive of the divine attributes, and of the effects of Divine Providence in every part of the univerſe, they ſtudied with great application and care, not only the peculiar properties of thoſe animals, birds, and fiſhes, herbs and plants, which Egypt produced, but alſo the geometrical properties of lines and figures; and by a regular connection of theſe in various orders, attitudes, and compoſitions, they formed the whole ſyſtem of their theology and philoſophy, which was hidden under hieroglyphic figures and characters, known only to themſelves, and to thoſe who were initiated into their myſteries.

In this ſyſtem their principal hero-gods, Oſiris and Iſis, theologically repreſented the Supreme Being, and univerſal nature; and phyſically ſignified the two great celeſtial luminaries, the ſun and moon, by whoſe influence all nature was actuated. In like manner, the inferior heroes repreſented the ſubordinate gods, who were the miniſters of the ſupreme ſpirit; and phyſically they denoted the inferior mundane elements and powers. Their ſymbols repreſented, and comprehended under them, the natural productions of the Deity; and the various beneficial effects of Divine Providence, in the works of creation: and alſo the order and harmony, the powers and mutual influence of the ſeveral parts of the univerſal ſyſtem.

This is the ſum and ſubſtance of the Egyptian learning, ſo famed in ancient times throughout the world. And in this general ſyſtem, the particular hiſtory of their hero-gods was contained, and applied to phyſical cauſes, and theological ſcience. The hieroglyphic ſyſtem was compoſed with great art and ſagacity; and was ſo univerſally eſteemed and admired, that the moſt learned philoſophers of other nations came into Egypt on purpoſe to be inſtructed in it, and to learn the philoſophy and theology conveyed by theſe appoſite ſymbols.

In this hieroglyphic ſyſtem the hero-gods not only repreſented, and were ſymbols of, the ſupreme God, and ſubordinate deities; but they had each their animal ſymbol, to repreſent their peculiar powers, energy, and adminiſtration: and their figures were compounded of one part or other of their ſymbols, to expreſs more ſenſibly the natural effects of divine energy attributed to them.

Thus Oſiris, when he repreſented the power and all-ſeeing providence of the Supreme Being, had a human body with a hawk's head, and a ſceptre in his hand, and decorated with the other regalia or enſigns of royalty. Under the ſame form alſo he repreſented the ſun, the great celeſtial luminary; and, as it were, the ſoul of the world: his ſymbol now was a bull, and the ſcarabæus or beetle, which expreſſed the ſun's motion, by rolling balls of dung, containing its ſeed, backwards, or from eaſt to weſt, his face being towards the eaſt. The ſymbolic bull was likewiſe of a particular form and make, to denote the various influences of the ſun. Hieroglyphics.

Oſiris was alſo delineated ſometimes with a bull's, and ſometimes with a lion's head, to repreſent the heat, vigour, and influence of the ſun, eſpecially in the inundation of the Nile, when the ſun was in the celeſtial ſign Leo; and likewiſe to expreſs the ſolar influence in all the productions of nature. And it is alſo obſervable, that the bull and lion were parts of the Jewiſh cherub's ſymbol; and as the one was the head of the wild, and the other of the tame beaſts, they repreſented, in conjunction, the animal-creation; while the other two parts, namely, the eagle and human figure, repreſented the aërial, rational creation.

Iſis was formed with many beaſts, to repreſent the earth, the univerſal mother; and with a cornucopia in her hand, denoting the nutritive and productive powers of nature: her ſymbol was a cow, part black and part white, to repreſent the enlightened and dark parts of the moon.

Pan had the horns and feet, and ſometimes alſo the head, of a goat, which was his ſymbol, to ſhew the generative power of nature, over which he preſided. At the ſame time, he ſymbolically repreſented univerſal nature, the cauſe of all things.

Hermes had a dog's head, which was his ſymbol, to denote his ſagacity in the invention of arts and ſciences; eſpecially in his watchful diligence in the culture of religious rites and ſacred knowledge: at the ſame time he ſymbolically repreſented the Divine Providence, and was worſhipped as the chief counſellor of Saturn and Oſiris; he who communicated the will of the gods to men, and by whom their ſouls were conducted into the other world. He was likewiſe repreſented by the ibis, and with the head of this bird, which was at the ſame time his ſymbol, to ſignify his conveying literature to the Egyptians, which they believed was done under the form of this bird, and confined to their nation only, as the ibis was known to live no where but in Egypt.

Ammon repreſented the deity called *Amun*, and his ſymbol was a ram. He was alſo delineated with a ram's head and horns, to denote the creative power of God, and his beneficial and diffuſive influence through the works of nature, making every thing fruitful, to produce and multiply its kind; and cheriſhing and preſerving them by the warmth of the ſun, and an internal vital heat and vigour.

The univerſal ſoul itſelf was beautifully repreſented by a winged globe, with a ſerpent emerging from it. The globe denoted the infinite divine eſſence, whoſe centre, to uſe the expreſſion in the Hermetic writings, was every where, and circumference no where. The wings of the hawk repreſented the divine all-comprehenſive intellect: and the ſerpent denoted the vivifying power of God, by which life and exiſtence are given to all things.

Typhon repreſented the moſt powerful dæmon, or evil genius; who was continually at war with Oſiris and Iſis, the moſt benevolent geniuſes of Egypt. His ſymbol was an hippopotamus, or river-horſe, a very treacherous and cruel animal.

Orus

Hieroglyphics. Orus was a principal deity of the Egyptians; and, according to his heiroglyphic forms and habits, fignified fometimes the fun, and fometimes the harmony of the whole mundane fyftem. At the fame time, being the offspring of Ofiris and Ifis, he was always repreſented young. He alſo repreſented the order and fitneſs of the ſeveral parts of the external ſenſible world, formed by the wiſdom of Divine Providence, expreſſed by Ifis; and by the intellect, power, and goodneſs of the ſupreme God, repreſented by Oſiris. Hence, and alſo becauſe Oſiris and Iſis repreſented phyſically the ſun and moon, who, by their diffuſive light, heat, and influence, preſerve the viſible ſyſtem, Orus was called their offspring.

To expreſs the hieroglyphic mean of Orus, as repreſenting the world, he was repreſented with a ſtaff, upon the top of which was the head of the upupa, to ſignify, by the variegated feathers of that bird, the beautiful variety of the creation. In one of his hands he held a lituus, to denote the harmony of the ſyſtem; and a gnomon in the other, to ſhew the perfect proportions of its parts. Behind him was a triangle inſcribed in a circle, to ſignify that the world was made by the unerring wiſdom of God. He had alſo ſometimes a cornucopia in his hand, to denote the fertility and productions of the earth.

Harpocrates was deſcribed holding one of his fingers on his lips, to denote the myſterious and ineffable nature of God; and that the knowledge of him was to be ſearched after, with profound and ſilent meditation, and, at the ſame time, that they are not to be uttered or divulged.

Upon the whole, almoſt all the Egyptian deities and ſymbols centered in two, namely, Oſiris and Iſis; who repreſented, under various hieroglyphic forms, both the celeſtial and terreſtrial ſyſtem, together with all the divine attributes, operations, and energy, which created, animated, and preſerved them.

The Egyptians likewiſe concealed their moral philoſophy under hieroglyphic ſymbols; but theſe were not the ſubjects of the hieroglyphics delineated on obeliſks. And as hieroglyphic and ſymbolical figures were very ancient in Egypt, and firſt invented, at leaſt formed into a ſyſtem, there; ſo they were thence carried into other countries, and imitated in all religious myſteries as well as in political and moral ſcience.

The preceding ſymbolical figures making the ſubſtance of hieroglyphics, and all belonging to Oſiris, his family, and contemporaries, they were probably formed into a ſyſtem ſoon after the death of thoſe herogods, by ſome who had been inſtructed, in the art of hieroglyphics, by Hermes the inventor of them. The firſt he formed himſelf; and the others were probably added by his learned ſucceſſors, who had been inſtructed by him in all his myſterious learning.

This hieroglyphic ſyſtem was, in its beginning, more ſimple, and leſs compounded, than afterwards; for it had been improving for ſeveral ages before it appeared on the obeliſks of the temples. And hence we may infer the time of the firſt Egyptian hieroglyphic ſymbols; for, in all probability, they were not older than the time of the famous Hermes, who flouriſhed in the reign, and ſome time after the death, of Oſiris.

The hieroglyphic ſymbols were, in early times, carried into Greece; and gave the firſt occaſion to the fables of the poets, with regard to the metamorphoſes of the gods, which they improved from inventions of their own; and from the knowledge of them, the Greeks aſcribed peculiar arts and inventions to their gods, whoſe names they firſt received from Egypt.

But beſides the hieroglyphics in common uſe among the people, the Egyptian prieſts had certain myſtical characters, in which they wrapped up and concealed their doctrines from the vulgar. It is ſaid that theſe ſomething reſembled the Chineſe characters, and that they were alſo the invention of Hermes. Sir John Marſham conjectures, that the uſe of theſe hieroglyphical figures of animals introduced the ſtrange worſhip paid them by that nation: for as theſe figures were made choice of according to the reſpective qualities of each animal, to expreſs the qualities and dignity of the perſons repreſented by them, who were generally their gods, princes, and great men, and being placed in their temples as the images of their deities, hence they came to pay a ſuperſtitious veneration to the animals themſelves.

Hierogrammatists || High.

HIEROGRAMMATISTS, i. e. *holy regiſters*, were an order of prieſts among the ancient Egyptians, who preſided over learning and religion. They had the care of the hieroglyphics, and were the expoſitors of religious doctrines and opinions. They were looked upon as a kind of prophets; and it is pretended that one of them predicted to an Egyptian king, that an Iſraelite (meaning Moſes), eminent for his qualifications and atchievements, would leſſen and depreſs the Egyptian monarchy.

HIEROMANCY, in antiquity, that part of divination which predicted future events from obſerving the various things offered in ſacrifice. See Divination and Sacrifice.

HIEROMNEMON, the name of an officer in the Greek church, whoſe principal function it was to ſtand behind the patriarch at the ſacraments and other ceremonies of the church, and to ſhew him the prayers, pſalms, &c. in the order in which they were to be rehearſed.

HIERONYMUS. See Jerome.

HIEROPHANTES, in Grecian antiquity, the name by which the Athenians called thoſe prieſts and prieſteſſes who were appointed by the ſtate to have the ſupervifal of things ſacred, and to take care of the ſacrifices.

HIEROPHYLAX, an officer in the Greek church, who was guardian or keeper of the holy utenſils, veſtments, &c. anſwering to our *ſacriſta* or veſtry-keeper.

HIGH, a term of relation, importing one thing's being ſuperior or above another: thus we ſay, a *high* mountain, the *high* court of parliament, *high* relievo, &c.

High, in muſic, is ſometimes uſed in the ſame ſenſe with *loud*, and ſometimes in the ſame ſenſe with *acute*.

High *Dutch*, is the German tongue in its greateſt purity, &c. as ſpoken in Miſnia, &c.

High *Operation*, in chirurgery, is a method of extracting the ſtone; thus called, becauſe the ſtone is taken out at the upper part of the bladder. See Surgery.

High Highlanders.

HIGH *Way*, a free paſſage for the king's ſubjects; on which account it is called *the king's high-way*, though the freehold of the ſoil belong to the owner of the land. Thoſe ways that lead from one town to another, and ſuch as are drift or cart ways, and are for all travellers in great roads, or that communicate with them, are high-ways only; and as to their reparation, are under the care of ſurveyors.

HIGHAM FERRERS, an ancient borough of Northamptonſhire in England, which has its name from the family of the Ferrers, to whom it formerly belonged, and who had a caſtle in its neighbourhood. It ſends one member to parliament. E. Lon. 1. 40. N. Lat. 52. 20.

HIGHGATE, a village five miles north of London. It has its name from its high ſituation, and from a gate ſet up there about 400 years ago, to receive toll for the biſhop of London, when the old miry road from Gray's-inn lane to Barnet was turned through the biſhop's park. There was a hermitage where the chapel now ſtands; and one of the hermits cauſed a cauſeway to be made between Highgate and Iſlington, with gravel dug out of the top of the hill, where there is now a pond. Near the chapel, in 1562, lord chief baron Cholmondely built and endowed a free ſchool, which was enlarged, in 1570, by Edwin Sandys, biſhop of Loudon.—This village is a noted and airy retirement for the gentry and wealthy citizens; and is a place of good accommodation, beſides its affording a delightful and pleaſant proſpect over the city and adjacent country.

HIGHLANDERS, the inhabitants of the mountainous parts of Scotland, to the north and north-weſt, including thoſe of the Hebrides or Weſtern Iſles.—They are a branch of the ancient Celtæ; and undoubtedly the deſcendants of the firſt inhabitants of Britain, as appears from the many monuments of their language ſtill retained in the moſt ancient names of places in all parts of the iſland. The Highlanders, or, as they are often termed by ancient authors, the *Caledonians*, were always a brave, warlike, and hardy race of people; and, in the remoteſt times, ſeem to have poſſeſſed a degree of refinement in ſentiment and manners, then unknown to the other nations that ſurrounded them. This appears not only from their own traditions and poems, but alſo from the teſtimony of many ancient authors. This civilization was probably owing in a great meaſure to the order of the Bards, or Druids, and ſome other inſtitutions peculiar to this people.

The ancient Highlanders lived in the hunting ſtate till ſome time after the æra of Fingal, who was one of their kings, towards the cloſe of the third century. For ſome ages after that, they turned their chief attention to the paſtoral life, which afforded a leſs precarious ſubſiſtence. Till of late, agriculture in moſt parts of the Highlands, made but little progreſs.

The Highlanders always enjoyed a king and government of their own, till Kenneth M'Alpin, (anno 845,) after having ſubdued the Pictiſh kingdom, transferred thither the ſeat of royalty. This event proved very unfavourable to the virtues of the Highlanders, which, from this period, began to decline. The country, no longer awed by the preſence of the ſovereign, fell into anarchy and confuſion. The chiefs tains began to extend their authority, to form factions, and to foment diviſions and feuds between contending clans. The laws were either too feeble to bind them, or too remote to take notice of them. Hence ſprung all thoſe evils which long diſgraced the country, and diſturbed the peace of its inhabitants. Robbery or plunder, providing it was committed on any one of an adverſe clan or tribe, was countenanced and authoriſed; and their reprifals on one another were perpetual. Thus quarrels were handed down from one generation to another, and the whole clan were bound in honour to eſpouſe the cauſe of every individual that belonged to it. By this means the genius of the people was greatly altered; and the Highlanders of a few ages back were almoſt as remarkable for their irregular and diſorderly way of life, as their predeceſſors were for their civilization and virtue. It is from not attending to this diſtinction between the ancient Highlanders and their poſterity in later times, that many have doubted the exiſtence of thoſe exalted virtues aſcribed by their poets to the more ancient inhabitants of the country. But now that the power of the chieftains is again aboliſhed, law eſtabliſhed, and property ſecured, the genius of the people (where it is not hindered by ſome other extraneous cauſe) begins again to ſhew itſelf in its genuine colours; and many of their ancient virtues begin to ſhine with conſpicuous luſtre. Juſtice, generoſity, honeſty, friendſhip, peace and love, are perhaps nowhere more cultivated than among this people. But one of the ſtrongeſt features which marked the character of the Highlanders in every age, was their hoſpitality and benevolence to ſtrangers. At night the traveller was always ſure to find a hearty welcome in whatever houſe he ſhould go to; and the hoſt thought himſelf happier in giving the entertainment, than the gueſt in receiving it. Even with regard to their enemies, the laws of hoſpitality were obſerved with the moſt ſacred regard. They who fought againſt each other in the day, could in the night feaſt, and even ſleep together, in the ſame houſe. From the ſame principle, they were, in moſt other caſes, ſo faithful to their truſt, that they rarely betrayed any confidence repoſed in them. A promiſe they thought as binding as an oath, and held it equally inviolable and ſacred.

Highlanders.

The Caledonians in all ages have been much addicted to poetry and muſic. The poems of Oſſian, ſo univerſally repeated, and ſo highly eſteemed by every Highlander, are a ſtrong proof of the early proficiency of this people in the poetical art. Even to this day, notwithſtanding the many diſadvantages they labour under, the moſt illiterate of either ſex diſcover frequently a genius for poetry, which often breaks forth in the moſt natural and ſimple ſtrains, when love, grief, joy, or any other ſubject of ſong, demands it. Wherever their circumſtances are ſo eaſy as to allow them any reſpite from toil, or any cheerfulneſs of ſpirits, a good portion of their time, eſpecially of the winter-nights, is ſtill devoted to the ſong and tale. This laſt ſpecies of compoſition is chiefly of the novel-kind, and is handed down by tradition like their poems. It was the work of the bards; and proved, while they exiſted, no contemptible entertainment. But ſince the extinction of that order, both the Galic poems and tales

Highlander tales are, in a great meaſure, either loſt or adulterated. —The genius and character of the Galic poetry is well known. It is tender, ſimple, beautiful, and ſublime.

Among the ancient Highlanders, the harp was the chief inſtrument of muſic. It ſuited the mildneſs of their manners, and was well adapted to the peace and quiet which they enjoyed under their own kings. In a later period, however, when the conſtant quarrels of their chiefs, and the endleſs feuds of contending clans, turned all their thoughts to war, it was forced to give place to the bag-pipe, an inſtrument altogether of the martial kind, and therefore well ſuited to the ſtate of the country at that time. But ever ſince the cauſe which had brought this inſtrument in vogue has ceaſed to operate, the attention to it has been on the decline; ſo that the harp, with very little encouragement, might again reſume the ſeat from which it was once expelled. —The moſt, and eſpecially the oldeſt of the Highland muſic, having been compoſed to the harp, is of a ſoft, tender, and elegiac caſt, as beſt ſuited the genius of that inſtrument. Theſe pieces are generally expreſſive of the paſſions of love and grief. Other pieces, which were compoſed in their ſtate of war, and adapted to a different inſtrument, are altogether bold and martial. And many are of a ſprightly and cheerful caſt, the offspring of mirth, and the ſport of fancy in the ſeaſon of feſtivity. Many of theſe laſt are of the chorus kind; and are ſung in almoſt all the exerciſes in which a number of people are engaged, ſuch as rowing, reaping, fulling, &c. The time of theſe pieces is adapted to the exerciſes to which they are reſpectively ſung. They greatly forward the work, and alleviate the labour. The particular muſick which is generally uſed by the Highlanders in their dances is well known by the name of *Strathſpey reels*.

The language of the Highlanders is ſtill the Galic; which, with many of their cuſtoms and manners, has been ſecured to them by their mountains and faſtneſſes, amidſt the many revolutions which the reſt of the iſland has undergone in ſo long a courſe of ages. The Galic ſeems to be the oldeſt and pureſt dialect which remains of the Celtic, as appears from its approaching the neareſt to the names of places, &c. which that language left in moſt countries where it prevailed, and from its moſt obvious affinity to thoſe tongues, ancient or modern, which have been in any meaſure derived from the old Celtic. The Galic has all the marks of an original and primitive language. Moſt of the words are expreſſive of ſome property or quality of the objects which they denote. This, together with the variety of its ſounds (many of which, eſpecially of thoſe that expreſs the ſoft and mournful paſſions, are peculiar to itſelf), renders it highly adapted for poetry. It is generally allowed to have been the language of court, in Scotland, till the reign of Malcom Canmore. The Galic epithet of *Can-more*, or "large head," by which this king is diſtinguiſhed, ſeems to intimate ſo much. In ſome particular parliaments at leaſt, it was ſpoken much later, as in that held by Robert the Bruce at Ardchattan. That it has been formerly a good deal cultivated, appears from the ſtyle and complexion of its poems and tales, and from ſeveral ancient MSS. that have come down to the preſent times. To ſtrangers the Galic has a forbidding aſpect, on account of the number of its quieſcent conſonants (which are retained to mark the derivation of words and their variation in caſe and tenſe), but its ſound is abundantly muſical and harmonious; and its genius ſtrong and maſculine. Its alphabet conſiſts of 18 letters, of which one is an aſpirate, 12 are conſonants, and five are vowels. Highlander. Hilarius.

The Highlanders are beginning of late to apply to learning, agriculture, and eſpecially to commerce, for which their country, every where indented with arms of the ſea, is peculiarly favourable. Cattle is the chief ſtaple of the country; but it produces more grain than would ſupply its inhabitants, if ſo much of it were not conſumed in whiſky. The natives are beginning to avail themſelves of their mines, woods, wool, and fiſheries; and by a vigorous application, with the due encouragement of government, may become a proſperous and uſeful people.

The Highlanders are of a quick and penetrating genius, ſtrongly tinctured with a curioſity or thirſt of knowledge, which diſpoſes them to learn any thing very readily. They are active and induſtrious, where oppreſſion does not diſcourage them by ſecluding even the hope of thriving. They are remarkably bold and adventurous, which qualifies them for being excellent ſeamen and ſoldiers. They are generally of a middle ſize, rather above it than otherwiſe; their eyes are briſk and lively, their features diſtinctly marked, and their perſons tight and well made. Their countenance is open and ingenuous, and their temper frank and communicative.

HIGHNESS, a quality, or title of honour given to princes.—The kings of England and Spain had formerly no other title but that of *highneſs*; the firſt till the time of James I. and the ſecond till that of Charles V. The petty princes of Italy began firſt to be complimented with the title of *highneſs* in the year 1630.—The duke of Orleans aſſumed the title of *royal highneſs* in the year 1631, to diſtinguiſh himſelf from the other princes of France.

The duke of Savoy, late king of Sardinia, bore the title of *royal highneſs*, on account of his pretenſions to the kingdom of Cyprus.—It is ſaid that duke only took the title of *royal highneſs*, to put himſelf above the duke of Florence, who was called *great duke*; but the great duke afterwards aſſumed the title of *royal highneſs*, to put himſelf on a level with the duke of Savoy.

The prince of Conde firſt took the title of *moſt ſerene highneſs*, leaving that of ſimple *highneſs* to the natural princes.

HILARIA, an ancient Roman feſtival, obſerved on the eighth of the kalends of April, or the 25th day of March, in honour of the goddeſs Cybele. It was ſo called from the various expreſſions of joy and mirth on this occaſion.

HILARIUS, an ancient father of the Chriſtian church, who flouriſhed in the 4th century. He was born, as St Jerome informs us, at Poictiers, of a good family; who gave him a liberal education in the Pagan religion, and which he did not forſake till he was arrived at maturity. He was advanced to the biſhopric of Poictiers in the year 355, according to Baronius; and became a moſt zealous champion for the orthodox faith, particularly againſt the Arians, who

Hilarodi || Hill.

were at that time gaining ground in France. He aſſembled ſeveral councils there, in which the determinations of the ſynods of Rimini and Seleucia were condemned. He wrote a treatiſe concerning ſynods; and a famous work in 12 books on the Trinity, which is much admired by the orthodox believers. He died in the latter end of the year 367. His works have been many times publiſhed; but the laſt and beſt edition of them was given by the Benedictines at Paris in 1693.

HILARODI, in the ancient muſic and poetry, a ſort of poets among the Greeks, who went about ſinging little gay poems or ſongs, ſomewhat graver than the Ionic pieces, accompanied with ſome inſtrument. From the ſtreets they were at length introduced into tragedy, as the magodi were into comedy. They appeared dreſſed in white, and were crowned with gold. At firſt they wore ſhoes; but afterwards they aſſumed the crepida, being only a ſole tied over with a ſtrap.

HILARY-TERM. See TERM.

HILDESHEIM, a ſmall diſtrict of Germany, in the circle of Lower Saxony. It lies between the duchies of Lunenburg and Brunſwick; and may be about 25 miles from eaſt to weſt, and 36 from north to ſouth. It is watered by the rivers Leine and Innerſty. The ſoil is fertile; and its principal places are Peine, Sarſted, Bruggen, and Alveld. Hildeſheim, from whence it takes its name, is governed as an imperial city. Its biſhop is now elector of Cologne.

HILDESHEIM, a ſtrong city of Germany, in Lower Saxony, with a Roman-catholic biſhop's ſee, whoſe biſhop is ſovereign. It is a free imperial city, tho' in ſome things dependent on the biſhop. It is a large town, well built and fortified. It is divided into the Old Town and the New, which have each their ſeparate council. It is ſeated on the river Irneſt, in E. Long. 10. 0. N. Lat. 52. 17.

HILL, a term denoting any conſiderable eminence on the earth's ſurface. It is ſometimes ſynonimous with the word *mountain*; though generally it denotes only the leſſer eminences, the word *mountain* being particularly applied to the very largeſt. See MOUNTAIN.

HILL (Aaron), a poet of conſiderable eminence, the ſon of a gentleman of Malmeſbury-abbey in Wiltſhire, was born in 1685. His father's imprudence having cut off his paternal inheritance, he left Weſtminſter ſchool at 14 years of age; and embarked for Conſtantinople, to viſit lord Paget the Engliſh ambaſſador there, who was his diſtant relation. Lord Paget received him with ſurprize and pleaſure, provided him a tutor, and ſent him to travel: by which opportunity he ſaw Egypt, Paleſtine, and a great part of the eaſt; and returning home with his noble patron, viſited moſt of the courts of Europe. About the year 1709, he publiſhed his firſt poem intitled *Camillus*, in honour of the earl of Peterborough who had been general in Spain; and being the ſame year made maſter of Drury-lane theatre, he wrote his firſt tragedy, *Elfrid, or the fair Inconſtant*. In 1710, he became maſter of the opera-houſe in the Hay-market; when he wrote an opera called *Rinaldo*, which met with great ſucceſs, being the firſt that Mr Handel ſet to muſic after he came to England. Unfortunately for Mr Hill, he was a projector as well as poet, and in 1715 obtained a patent for extracting oil from beech-nuts; which undertaking, whether good or bad, miſcarried after engaging three years of his attention. He was alſo concerned in the firſt attempt to ſettle the colony of Georgia; from which he never reaped any advantage: and in 1728 he made a journey into the Highlands of Scotland, on a ſcheme of applying the woods there to ſhip-building; in which alſo he loſt his labour. Hill.

Mr Hill ſeems to have lived in perfect harmony with all the writers of his time, except Mr Pope, with whom he had a ſhort paper-war, occaſioned by that gentleman's introducing him in the Dunciad, as one of the competitors for the prize offered by the goddeſs of Dullneſs, in the following lines.

> "Then *Hill* eſſay'd; ſcarce vaniſh'd out of ſight,
> "He buoys up an inſtant, and returns to light;
> "He bears no token of the ſabler ſtreams,
> "And mounts far off among the Swans of Thames."

This, though far the gentleſt piece of ſatire in the whole poem, and conveying at the ſame time an oblique compliment, roufed Mr Hill to take ſome notice of it; which he did by a poem written during his perigrination in the north, intitled, "The progreſs of wit, a caveat for the uſe of an eminent writer;" which he begins with the following eight lines, in which Mr Pope's too well known diſpoſition is elegantly, yet very ſeverely, characterized:

> "Tuneful *Alexis* on the Thames' fair ſide,
> "The Ladies play-thing and the Muſes pride;
> "With merit popular, with wit polite,
> "Eaſy tho' vain, and elegant tho' light;
> "Deſiring and *deſerving* others praiſe,
> "Poorly *accepts* a Fame he ne'er *repays*:
> "Unborn to cheriſh, *ſneakingly approves*;
> "And wants the ſoul to *ſpread* the worth *he loves*."

The *ſneakingly approves*, in the laſt couplet, Mr Pope was much affected by; and indeed, thro' their whole controverſy afterwards, in which it was generally thought that Mr Hill had much the advantage, Mr Pope ſeems rather to expreſs his repentance by denying the offence, than to vindicate himſelf ſuppoſing it to have been given.

Beſides the above poems, Mr Hill, among many others, wrote one, called *The northern ſtar*, upon the actions of Czar Peter the Great; for which he was ſeveral years afterwards complimented with a gold medal from the empreſs Catharine, according to the Czar's deſire before his death. He likewiſe altered ſome of Shakeſpeare's plays, and tranſlated ſome of Voltaire's. His laſt production was *Merope*; which was brought upon the ſtage in Drury-lane by Mr Garrick. He died on the eighth of February 1749, as it is ſaid, in the very minute of the earthquake; and after his deceaſe four volumes of his works in proſe and verſe were publiſhed in octavo, and his dramatic works in two volumes.

HILL (Sir John), a voluminous writer, was originally bred an apothecary; but his marrying early, and without a fortune, made him very ſoon look round for other reſources than his profeſſion. Having, therefore, in his apprenticeſhip, attended the botanical lectures of the company, and being poſſeſſed of quick natural parts, he ſoon made himſelf acquainted with the theoretical as well as practical parts of botany; from

Hill, Hillel.

from whence being recommended to the late duke of Richmond and lord Petre, he was by them employed in the inſpection and arrangement of their botanic gardens. Aſſiſted by the liberality of theſe noblemen, he executed a ſcheme of travelling over the kingdom, to collect the moſt rare and uncommon plants; which he afterward publiſhed by ſubſcription: but after great reſearches and uncommon induſtry, this undertaking turned out by no means adequate to his expectation. The ſtage next preſented itſelf, as a foil in which genius might ſtand a chance of flouriſhing: but after two or three unſucceſsful attempts, it was found he had no pretenſions either to the ſock or buſkin; which once more reduced him to his botanical purſuits, and his buſineſs as an apothecary. At length, about the year 1746, he tranſlated from the Greek a ſmall tract, written by Theophraſtus, *On gems*, which he publiſhed by ſubſcription; and which, being well executed, procured him friends, reputation, and money. Encouraged by this, he engaged in works of greater extent and importance. The firſt he undertook was *A general natural hiſtory*, in 3 vols folio. He next engaged, in conjunction with George Lewis Scott, eſq; in furniſhing a *Supplement to Chambers's Dictionary*. He at the ſame time ſtarted the Britiſh Magazine; and while he was engaged in a great number of theſe and other works, ſome of which ſeemed to claim the continued attention of a whole life, he carried on a daily eſſay, under the title of *Inſpector*. Amidſt this hurry of buſineſs, Mr Hill was ſo laborious and ready in all his undertakings, and was withal ſo exact an oeconomiſt of his time, that he ſcarcely ever miſſed a public amuſement for many years: where, while he relaxed from the ſeverer purſuits of ſtudy, he gleaned up articles of information for his periodical works. It would not be eaſy to trace Mr Hill, now Dr Hill, (for he procured a diploma from the college of St Andrews,) through all his various purſuits in life. A quarrel he had with the Royal Society, for being refuſed as a member, which provoked him to ridicule that learned body, in *A review of the works of the Royal Society of London*, 4to, 1751; together with his over-writing himſelf upon all ſubjects without reſerve; made him ſink in the eſtimation of the public nearly in the ſame pace as he had aſcended. He found as uſual, however, reſources in his own invention. He applied himſelf to the preparation of certain ſimple medicines: ſuch as the eſſence of waterdock, tincture of valerian, balſam of honey, &c. The well-known ſimplicity of theſe medicines, made the public judge favourably of their effects, inſomuch that they had a rapid ſale, and once more enabled the doctor to figure in that ſtyle of life ever ſo congenial to his inclination. Soon after the publication of the firſt of theſe medicines, he obtained the patronage of the earl of Bute, through whoſe intereſt he acquired the management of the royal gardens at Kew, with an handſome ſalary: and to wind up the whole of an extraordinary life, having, a little before his death, ſeized an opportunity to introduce himſelf to the knowledge of the king of Sweden, that monarch inveſted him with one of the orders of his court, which title he had not the happineſs of enjoying above two years. He died toward the cloſe of the year 1775.

HILLEL, ſenior, of Babylon, preſident of the ſanhedrim of Jeruſalem. He formed a celebrated ſchool there, in which he maintained the oral traditions of the Jews againſt Shamai, his colleague, whoſe diſciples adhered only to the written law; and this controverſy gave riſe to the ſects of Phariſees and Scribes. He was likewiſe one of the compilers of the Talmud. He alſo laboured much at giving a correct edition of the ſacred text; and there is attributed to him an ancient manuſcript bible, which bears his name. He flouriſhed about 30 years B. C. and died in a very advanced age. Hillel & Hippocrates

HILLEL, the naſi, or prince, another learned Jew, the grandſon of Judas Hakkadoſh, or the Saint, the author of the Miſhna, lived in the fourth century. He compoſed a cycle; and was one of the principal doctors of the Gamara. The greateſt number of the Jewiſh writers attribute to him the correct edition of the Hebrew text which bears the name of *Hillel*, which we have already mentioned in the preceding article. There have been ſeveral other Jewiſh writers of the ſame name.

HILUM, among botaniſts, denotes the eye of a bean.

HIN, a Hebrew meaſure of capacity for things liquid, containing the ſixth part of an ephah, or one gallon two pints Engliſh meaſure.

HIND, a female ſtag in the third year of its age. See CERVUS.

HINDON, a ſmall town of Wiltſhire in England, which ſends two members to parliament. It is ſituated in E. Long. 2. 14. N. Lat. 51. 12.

HINE, or HIND, a huſbandman's ſervant. Thus the perſon who overſees the reſt, is called the maſter's hine.

HIPPARCHUS, a great aſtronomer, born at Nice in Bithynia, flouriſhed between the 154th and 163d Olympiads. His commentary upon Aratus's phenomena is ſtill extant. Rohault was very much miſtaken when he aſſerted, that this aſtronomer was not acquainted with the particular motion of the fixed ſtars from weſt to eaſt, by which their longitude changes. By foretelling eclipſes, he taught mankind not to be frightened at them, and that even the gods were bound by laws. Pliny, who tells this, admires him for making a review of all the ſtars; by which his deſcendants would be enabled to diſcover whether they are born and die, whether they change their place, and whether they increaſe and decreaſe.

HIPPOBOSCA, or HORSE-FLY, in zoology, a genus of inſects, belonging to the order of diptera. The beak conſiſts of two valves, is cylindrical, obtuſe, and hanging; and the feet have ſeveral claws. There are four ſpecies, diſtinguiſhed by their wings, &c. The equina is very troubleſome to horſes.

HIPPOCAMPUS, in ichthyology. See SYNGNATHUS.

HIPPOCENTAUR, in antiquity, a fabulous animal, half man and half horſe.

What gave riſe to the fable of Hippocentaurs was this. The Theſſalians are ſaid to have been the firſt inventors of the art of breaking horſes; and being firſt ſeen on horſeback, they ſeemed to make but one body with the horſes; whence the fable took its riſe.

HIPPOCRATES, the greateſt phyſician of anti-

Hippocrates Hippocrepis

quity, was born in the island of Cos in the 80th Olympiad, and flourished at the time of the Peloponnesian war. He was the first that we know of who laid down precepts concerning physic; and, if we may believe the author of his life, who goes under the name of *Soranus*, drew his original from Hercules and Æsculapius. He was first a pupil of his own father Heraclides, then of Herodicus, then of Gorgias of Leontinum the orator, and, according to some, of Democritus of Abdera. After being instructed in physic, and in the liberal arts, and losing his parents, he left his own country, and practised physic all over Greece; where he was so much admired for his skill, that he was publicly sent for with Euryphon, a man superior to him in years, to Perdiccas king of Macedonia, who was then thought to be consumptive. But Hippocrates, as soon as he arrived, pronounced the disease to be entirely mental, as in truth it was. For upon the death of his father Alexander, Perdiccas fell in love with Philas, his father's mistress; and this Hippocrates discerning by the great change her presence always wrought upon him, a cure was soon effected.

Being intreated by the people of Abdera to come and cure Democritus of a supposed madness, he went; but, upon his arrival, instead of finding Democritus mad, he found all his fellow-citizens so, and Democritus the only wise man among them. He heard many lectures, and learned much philosophy from him; which has made Cornelius Celsus and some others imagine, that Hippocrates was the disciple of Democritus, though it is probable they never saw each other till this interview which was occasioned by the Abderites. Hippocrates had also public invitations to other countries. Thus, when a plague invaded the Illyrians and Pæonians, the kings of those countries begged him to come to their relief: he did not go; but learning from the messengers the course of the winds there, he concluded that the distemper would come to Athens; and, foretelling what would happen, applied himself to take care of the city and the students. He was indeed such a lover of Greece, that when his fame had reached as far as Persia, and upon that account Artaxerxes had intreated him by his governor of the Hellespont, with a promise of great rewards, to come to him, he refused to go. He also delivered his own country from a war with the Athenians, that was just ready to break out, by prevailing with the Thessalians to come to their assistance, for which he received very great honours from the Coans. The Athenians also conferred great honours upon him: they admitted him next to Hercules in the Eleusinian ceremonies; gave him the freedom of the city; and voted a public maintenance for him and his family in the prytaneum or council-house at Athens, where none were maintained at the public charge but such as had done signal service to the state. He died among the Larissæans, some say in his 90th year, some in his 85th, others in his 104th, and some in his 109th. The best edition of his works is, that of Foesius, in Greek and Latin. Hippocrates wrote in the Ionan dialect. His aphorisms, prognostics, and all that he has written on the symptoms of diseases, justly pass for master-pieces. See *History* of MEDICINE.

HIPPOCREPIS, COMMON HORSE-SHOE VETCH; a genus of the decandria order, belonging to the diadelphia class of plants. There are three species, two natives of the warm parts of Europe, and one of Britain. They are all low herbaceous trailing plants, with yellow flowers. They are propagated by seeds; but having, no great beauty are seldom kept in gardens.

Hippodrome ‖ Hippomanes.

HIPPODROME, in antiquity, the course where horse-races were performed.

HIPPOGLOSSUS, in ichthyology; a species of PLEURONECTES.

HIPPOMANE, the MANCHINEEL-TREE; a genus of the adelphia order, belonging to the monœcia class of plants.

Species. 1. The mancinella, with oval sawed leaves, is a native of all the West India islands. It hath a smooth brownish bark; the trunk divides upward into many branches, garnished with oblong leaves about three inches long. The flowers come out in short spikes at the end of the branches, but make no great appearance, and are succeeded by fruit of the same shape and size with a golden pippin. The tree grows to the size of a large oak. 2. The biglandulosa, with oblong bay leaves, is a native of South America; and grows to as large a size as the first, from which it differs mostly in the shape of its leaves. 3. The spinosa, with holly leaves, is a native of Campeachy, and seldom rises above 20 feet high; the leaves greatly resemble those of the common holly, and are set with sharp prickles at the end of each indenture. They are of a lucid green, and continue all the year.

Culture. These plants being natives of very warm climates, cannot be preserved in this country without a stove; nor can they by any means be made to rise above five or six feet high even with that assistance. They are propagated by seeds; but must have very little moisture, or they will certainly be killed by it.

Properties. These trees have a very poisonous quality, abounding with an acrid milky juice of a highly caustic nature. Strangers are often tempted to eat the fruit of the first species; the consequences of which are, an inflammation of the mouth and throat, pains in the stomach, &c. which are very dangerous unless remedies are speedily applied. The wood is much esteemed for making cabinets, book-cases, &c. being very durable, taking a fine polish, and not being liable to become worm-eaten: but as the trees abound with a milky caustic juice already mentioned, fires are made round their trunks, to burn out this juice; otherwise those who fell the trees would be in danger of losing their sight by the juice flying in their eyes. This juice raises blisters on the skin wherever it falls, turns linen black, and makes it fall out in holes. It is also dangerous to work the wood after it is sawn out; for if any of the saw-dust happens to get into the eyes of the workmen, it causes inflammations and the loss of sight for some time; to prevent which, they generally cover their faces with fine lawn during the time of working the wood.

HIPPOMANES, a sort of poison famous among the ancients as an ingredient in amorous philters or love-charms. The word is Greek, ἱππομανὲς, composed of ἵππος, "a horse," and μανία, "fury, or madness."

Authors are not agreed about the nature of the Hippomanes. Pliny describes it as a blackish caruncle found

Hippophae Hippopotamus.

found on the head of a new-born colt; which the dam bites off and eats as soon as she is delivered. He adds, that if she is prevented herein by any one's cutting it off before, she will not take to nor bring up the young. Virgil, and after him Servius and Columella, describe it as a poisonous matter trickling from the pudendum of a mare when proud, or longing for the horse. At the end of Mr Bayle's Dictionary is a very learned dissertation on the *hippomanes*, and all its virtues both real and pretended.

HIPPOPHAE, SEA-BUCKTHORN; a genus of the tetrandria order, belonging to the dioecia class of plants.

Species. 1. The rhamnoides hath a shrubby stem, branching irregularly eight or ten feet high, having a dark brown bark. It is armed with a few thorns; hath spear-shaped, narrow, sessile leaves, of a dark green above, and hoary underneath. 2. The canadensis hath a shrubby brown stem, branching eight or ten feet high, with oval leaves, and male and female flowers on different plants.

Culture, &c. Both these species are very hardy, and may be propagated in abundance by suckers from the roots, by layers, and by cuttings of their young shoots. They are retained in gardens, on account of their two-coloured leaves in summer; and in winter, on account of the appearance of the young shoots, which are covered with turgid, irregular, scaly buds. Goats, sheep, and horses, eat the first species; cows refuse it.

HIPPOPOTAMUS, the RIVER-HORSE; a genus of quadrupeds, belonging to the order of belluae; the characters of which are these: it has six fore-teeth in the upper jaw, disposed in pairs at a distance from each other; and four prominent fore-teeth in the under jaw, the intermediate ones being longest: the dog-teeth are solitary and obliquely truncated; and the feet are hoofed on the edges.

There is but one species of hippopotamus, viz. the amphibius, or river-horse. The history of this quadruped, though next to the elephant in magnitude, is far from being sufficiently delineated. The best description hitherto given of him is that of Frederic Zerenghi, an Italian surgeon, published in the year 1603. Zerenghi killed two of them (a male and a female) on the banks of the Nile, preserved their skins, and brought them to Rome. Every skin took 400 pounds of salt in curing. He says, the skin of the hippopotamus is about an inch thick, extremely hard, impenetrable by a common musket-ball; and there are only a few short white hairs scattered very thin over it. The teeth are not protruded out of the mouth, as is commonly believed; for, when the mouth is shut, although the teeth be extremely large, they are entirely covered by the lips. The dimensions of the female, of which Zerenghi gives a figure, are as follow: from the point of the muzzle to the origin of the tail, between 11 and 12 feet; the circumference of the body, about 10 feet; the height of the body, $4\frac{1}{2}$ feet; the circumference of the leg, near the shoulder, 2 feet 9 inches, lower down 1 foot $9\frac{1}{2}$ inches; the height of the legs about $1\frac{1}{2}$ foot; the length of the feet from the extremity of the claws, $4\frac{1}{2}$ inches: the claws are nearly of an equal length and breadth, and are somewhat more than two inches; each toe is furnished with a claw, and each foot has four toes. The tail is about one foot long, more than a foot in circumference near the origin, and about 3 inches near the point. The tail is not round, but flattish. The head, from the extremity of the lips to the neck, is about 2 feet 4 inches, and the circumference 5 feet 8 inches. The ears are about 3 inches long, and nearly as broad; they are a little pointed, and covered in the interior side with short white hair. The mouth, when open, is about $1\frac{1}{4}$ foot wide, and furnished with 44 teeth of different figures. Their teeth are of such a hard substance, that they give fire with steel. These dimensions are taken from a female hippopotamus; but the male is generally about one third larger. Hippopotamus.

With such powerful arms, and such a prodigious strength of body, the hippopotamus might render himself formidable to every other animal. But he is naturally of a mild disposition; and besides, his body is so heavy, and his motions so slow, that he cannot overtake any other quadruped. He swims swifter than he runs, and preys upon fishes. He dives in the water, and can stay very long under. He has no membrane betwixt his toes, as the castor or the otter; and he only swims easily in consequence of the great bulk of his belly, which makes him nearly of an equal specific gravity with the water. Moreover, he often keeps himself at the bottom, and walks upon the channel with the same freedom as upon dry land. Besides preying upon fishes, crocodiles, &c. he frequently goes out of the water, and feeds upon sugar-canes, rushes, millet, rice, roots, &c. These he devours in large quantities, and often does great damage in the cultivated field. But as he is more timid on land than in the water, he is easily driven away. His legs are so short, that he cannot escape by flight when at a distance from the river. He generally flies when approached by people in boats; but, if they wound him, he returns with fury, attacks the boats with his teeth, and frequently oversets them.

This animal seems to be confined principally to the rivers of Africa. The male and female generally go together, and the female is said to produce but one at a time.

Concerning this creature Mr Hasselquist relates the following particulars, which he says he had from a credible person who lived 12 years in Egypt.

" 1. The hide of a full-grown hippopotamus is a load for a camel.

" 2. The river-horse is an inveterate enemy to the crocodile, and kills it whenever he meets it. This, with some other reasons, contributes much to the extirpation of the crocodile; which, otherwise, considering the many eggs they would lay, would utterly destroy Egypt.

3. " The river-horse never appears below the cataracts in Egypt; wherefore the inhabitants of Upper Egypt only can give an account of it; and as very few Europeans, none at least who understood natural history, have travelled into those parts of Egypt, we know little of the history of this animal; such as have travelled in India, have had better opportunities of informing themselves in this matter. The Egyptians very seldom bring the hide of it to Cairo; and it is impossible to bring thither the living animal. A hide has been sent to France, which, I am informed, is preferved in the royal menagerie.

4. " The

Hippopotamus ‖ Hirch-horn

4. " The river-horſe does much damage to the Egyptians in thoſe places he frequents. He goes on ſhore, and in a ſhort ſpace of time deſtroys an entire field of corn or clover, not leaving the leaſt verdure as he paſſes: for he is voracious, and requires much to fill his great belly. They have a curious manner of freeing themſelves, in ſome meaſure, from this deſtructive animal. They remark the places he frequents moſt, and there lay a large quantity of peaſe: when the beaſt comes on ſhore, hungry and voracious, he falls to eating what is neareſt him; and filling his belly with the peaſe, they occaſion an inſupportable thirſt: he then returns immediately into the river, and drinks upon theſe dry peas large draughts of water, which ſuddenly cauſes his death; for the peaſe ſoon begin to ſwell with the water, and not long after the Egyptians find him dead on the ſhore, blown up, as if killed with the ſtrongeſt poiſon.

5. " The oftener the river-horſe goes on ſhore, the better hopes have the Egyptians of a ſufficient ſwelling or increaſe of the Nile.

6. " The Egyptians ſay, they can almoſt diſtinguiſh the food of this animal in his excrement."

Mr Pennant in his Synopſis, p. 80. treats the enmity of the hippopotamus and crocodile as a vulgar error; an eye-witneſs, he tells us, declaring he had ſeen them ſwimming together without any diſagreement. " They are (ſays he) capable of being tamed. Belon ſays, he has ſeen one ſo gentle as to be let looſe out of a ſtable, and fed by its keeper, without attempting to injure any one. They are generally taken in pitfalls, and the poor people eat the fleſh. In ſome parts, the natives place boards full of ſharp irons in the corn-grounds; which theſe beaſts ſtrike into their feet, and ſo become an eaſy prey. Sometimes they are ſtruck in the water with harpoons faſtened to cords, and 10 or 12 canoes are employed in the chace. The teeth are moſt remarkably hard, even harder than ivory, and much leſs ſubject to turn yellow. Des Marchais ſays, that the dentiſts prefer them for the making of falſe teeth. The ſkin when dried is uſed to make bucklers, and is of impenetrable hardneſs. It is the *behemath* of Job, and was known to the Romans. An ancient writer aſſerts, that theſe animals were found in the Indus; which is not confirmed by any modern traveller."

HIPPURIS, MARE'S-TAIL; a genus of the monandria order, belonging to the monogynia claſs of plants. There is only one ſpecies, a native of Britain, and which grows in ditches and ſtagnant waters. The flower of this plant is ſound at the baſe of each leaf, and is as ſimple as can be conceived; there being neither empalement nor bloſſom; and only one chive, one pointal, and one ſeed. It is a very weak aſtringent. Goats eat it; cows, ſheep, horſes, and ſwine, refuſe it.

HIRAM, a king of Tyre, cotemporary with Solomon, whom he ſupplied with cedar, gold, ſilver, and other materials for building the temple. He died 1000 years B. C.

HIRAM of Tyre, an artiſt who aſſiſted in the conſtruction of Solomon's temple, and other public buildings at Jeruſalem, flouriſhed 1015. B. C.

HIRCANIA, (anc. geog.) See HYRCANIA.

HIRCH-HORN, a town of Germany, in the circle of the lower Rhine, with a ſtrong caſtle. It is ſeated on the ſide of a hill on the river Neckar, and belongs to the elector Palatine. E. Long. 9. 0. N. Lat. 49. 28.

Hire ‖ Hirudo.

HIRE (Philip de la), an eminent French mathematician and aſtronomer, born at Paris in 1640. His father, who was painter in ordinary to the king, deſigned him for the ſame profeſſion: but he devoted himſelf to mathematical ſtudies, and was nominated together with M. Picard to make the neceſſary obſervations for a new map of France by the directions of M. Colbert. In 1683, he was employed in continuing the famous meridian line begun by M. Picard; and was next engaged in conſtructing thoſe grand aqueducts which were projected by Lewis XIV. He died in 1718, after having wrote a great number of works, beſides ſeveral occaſional papers diſperſed in journals, and in memoirs of the Academy of Sciences.

HIRING, in law. See BORROWING *and Hiring*.

HIRSBERG, a town of Sileſia, in the territory of Jauer, famous for its mineral baths. It is ſeated on the river Boſar, in E. Long. 17. 50. N. Lat. 50. 50.

HIRSCHFELD, a town of Germany in the circle of the upper Rhine, and capital of a principality of the ſame name, depending on a famous abbey which was ſecularized in favour of the houſe of Caſſel. It is ſeated on the river Fulda, in E. Long. 9. 52. N. Lat. 51. 46.

HIRUDO, the LEECH; a genus of inſects belonging to the order of vermes inteſtina. The body moves either forward or backward. There are nine ſpecies, principally diſtinguiſhed by their colour. The moſt remarkable are the following.

1. The medicinalis, or common leech, hath an oblong brown body, marked with ſix yellow ſpots, and is an inhabitant of ponds, ditches, and other ſtagnant waters. This animal is well known for the purpoſe of bleeding, children eſpecially. This practice is as old as the days of Pliny, who gives the creature the name of *hirudo ſanguiſuga*. In his time, leeches were uſed inſtead of cupping-glaſſes for perſons of plethoric habits, and thoſe who were troubled with the gout in the feet. He aſſerts, that if they left their head in the wound, as was ſometimes the caſe, the wound was incurable; and he informs us, that Meſſalinus, a perſon of conſular dignity, loſt his life by ſuch an accident. Some imagine, that leeches have a poiſonous quality, becauſe the wound they make is not always eaſily healed; but this depends on the habit of the body, and will alſo happen when the lancet is uſed. To make leeches faſten ſoon, keep them hungry, and rub the part to which they are to be applied with warm milk or blood. If they ſtick longer than is thought convenient, they muſt not be pulled off; but if their heads are touched with common ſalt, they ſoon fall off of themſelves. If they are thought not to have drawn a ſufficient quantity of blood, apply cloths wrung out of warm water upon the orifice; or, if convenient, put the part into warm water; and thus the bleeding may be prolonged. They are to be kept in bottles not quite filled with water, which ought to be renewed every three or four days at fartheſt. A little ſugar may be added to the water in which they are kept. For the caſes in which the application of leeches is adviſable, ſee (the *Index* ſubjoined to) MEDICINE.

2. To

Hirudo, Hirundo.

2. The ſanguiſuga, or horſe-leech, hath a depreſſed body; in the bottom of the mouth are certain great ſharp tubercles or whitiſh caruncles. The ſlendereſt part is about the mouth, and the thickeſt about the tail. The tail itſelf is very ſlender; the belly of a yellowiſh green; the back duſky. This ſpecies is alſo a blood-ſucker, though not uſed in medicine. The inſtruments with which both ſpecies perforate the ſkin, are found, on a nice diſſection, to be a number of very fine teeth diſpoſed in a regular order on three ribs, or jaws, placed between the aperture of the lips and the bottom of the mouth; each of them along a ſtrong muſcle of its own length. Hence the wound made by leeches conſiſts of three cuts proceeding like radii from a centre, and making equal angles with each other. This ſtructure of the wound is moſt diſtinctly ſeen when the ſwelling has gone down, and the ſkin is clean, which is uſually on the fourth day.—Leeches are able to live in oil; and when taken out of this liquid and put into water again, they throw off a tender ſkin or film, of the regular ſhape of the whole body. Their being able to live in this fluid ſhews, that they reſpire by the mouth: which is alſo further proved, by gently warming the water in which they are kept; for then the animals being uneaſy, breathe hard, and very viſibly. Theſe animals may in ſome ſhape anſwer the purpoſes of barometers; for when preferred in glaſſes, they predict bad weather by their great reſtleſneſs and change of place.

3. The geometra, or geometrical leech, is a native of the ſame places with the two former. It hath a filiform body, greeniſh, ſpotted with white; both ends dilatable, and equally tenacious. It moves as if meaſuring the ſpaces it paſſes over like a compaſs, whence its name. It is found on trout and other fiſh after the ſpawning ſeaſon.

4. The muricata, or tuberculated leech, hath a taper body, rounded at the greater extremity, and furniſhed with two ſmall horns; ſtrongly annulated and tuberculated upon the rings; the tail dilated. It inhabits the ſea, adheres ſtrongly to fiſh, and leaves a black mark on the ſpot.

5. The myxine, or hag, is about eight inches long, with a ſlender body, carinated beneath, and an adipoſe or rayleſs fin round the tail, and under the belly. It inhabits the ocean; enters the mouths of fiſh, when on the hooks of lines that remain a whole tide under water; and devours the whole, except the ſkin and bones. The Scarbourough fiſhermen often take it in the *robbed fiſh*, on drawing up their lines. Linnæus attributes to it the property of turning water into glue.

HIRUNDO, in ornithology, a genus of birds of the order of paſſeres. There are twelve ſpecies, chiefly diſtinguiſhed by their colour. The moſt remarkable are,

1. The domeſtica, or chimney-ſwallow, appears in Great Britain near 20 days before the martin, or any other of the ſwallow tribe. They leave us the latter end of September; and for a few days previous to their departure, they aſſemble in vaſt flocks on houſe-tops, churches, and even trees, from whence they take their flight. It is now known that ſwallows take their winter-quarters in Senegal, and poſſibly they may be found along the whole Morocco ſhore. We are indebted to M. Adanſon for this diſcovery, who firſt obſerved them in the month of October, after their migration out of Europe, on the ſhores of that kingdom: but whether it was this ſpecies alone, or all the European kinds, he is ſilent. Hirundo.

The name of *chimney-ſwallow* may almoſt be confined to Great Britain; for in ſeveral other countries they chooſe different places for their neſts. In Sweden, they prefer barns; ſo are ſtyled there *ladu-ſwala*, or the *barn-ſwallow*: and in the hotter climates, they make their neſts in porches, gate-ways, galleries, and open halls.

The houſe-ſwallow is diſtinguiſhed from all others by the ſuperior forkineſs of its tail, and by the red ſpot on the forehead and under the chin. The crown of the head, the whole upper-part of the body, and the coverts of the wings, are black, gloſſed with a rich purpliſh blue, moſt reſplendent in the male: the breaſt and belly white, that of the male tinged with red: the tail is black; the two middle feathers are plain, the others marked tranſverſely near their ends with a white ſpot. The exterior feathers of the tail are much longer in the male than in the female.

Its food is the ſame with the others of its kind, viz. inſects. For the taking of theſe, in their ſwifteſt flight, nature hath admirably contrived their ſeveral parts: their mouths are very wide to take in flies, &c. in their quickeſt motion; their wings are long, and adapted for diſtant and continual flight; and their tails are forked, to enable them to turn the readier in purſuit of their prey. This ſpecies, in our country, builds in chimneys; and makes its neſt of clay mixed with ſtraw, leaving the top quite open. It lines the bottom with feathers and graſſes: and uſually lays from four to ſix eggs, white ſpeckled with red; but, by taking away one of the eggs daily, it will ſucceſſively lay as far as 19, as Dr Liſter has experienced. It breeds earlier than any other ſpecies. The firſt brood are obſerved to quit the neſt the laſt week in June, or the firſt in July; the laſt brood towards the middle or end of Auguſt. The neſt being fixed five or ſix feet deep within the chimney, it is with difficulty that the young can emerge. They even ſometimes fall into the rooms below: but as ſoon as they ſucceed, they perch for a few days on the chimney-top, and are there fed by their parents. Their next eſſay is to reach ſome leaſleſs bough, where they ſit in rows, and receive their food. Soon after they take to the wing, but ſtill want ſkill to take their own prey. They hover near the place where their parents are in chaſe of flies, attend their motions, meet them, and receive from their mouths the offered ſuſtenance.—It has a ſweet note, which it emits in Auguſt and September, perching on houſe-tops.

2. The urbica, or martin, is inferior in ſize to the former, and its tail much leſs forked. The head and upper-part of the body, except the rump, is black gloſſed with blue: the breaſt, belly, and rump, are white: the feet are covered with a ſhort white down. This is the ſecond of the ſwallow-kind that appears in our country. It builds under the eaves of houſes, with the ſame materials, and in the ſame form, as the houſe-ſwallow; only its neſt is covered above, having only a ſmall hole for admittance. It will alſo build againſt the ſides of high cliffs over the ſea. For the time

Hirundo. time that the young keep the neſt, the old one feeds them, adhering by the claws to the outſide; but as ſoon as they quit it, ſhe feeds them flying, by a motion quick and almoſt imperceptible to thoſe who are not uſed to obſerve it.

It is a later breed than the preceding by ſome days, but both will lay twice in the ſeaſon; and the latter brood of this ſpecies have been obſerved to come forth ſo late as the 18th of September; yet that year (1766) they entirely quitted our ſight by the 5th of October: not but that they ſometimes continue here much later; the martins and red-wing thruſhes having been ſeen flying in view on the 7th of November. Neſtlings have been remarked in Hampſhire as late as the 21ſt of October, 1772.

3. The riparia, or ſand-martin, is the leaſt of the genus that frequents Great Britain. The head and whole upper-part of the body are mouſe-coloured; the throat white, encircled with a mouſe-coloured ring; the belly white; the feet ſmooth and black.—It builds in holes in ſand-pits, and in the banks of rivers, penetrating ſome feet deep into the bank, boring through the ſoil in a wonderful manner with its feet, claws, and bill. It makes its neſt of hay, ſtraw, &c. and lines it with feathers: it lays five or ſix white eggs. It is the earlieſt of the ſwallow-tribe in bringing out its young.

4. The apus, or ſwift, is the largeſt of our ſwallows; but the weight is moſt diſproportionately ſmall to its extent of wing of any bird: the former being ſcarce one ounce, the latter 18 inches. The length near eight. The feet of this bird are ſo ſmall, that the action of walking and riſing from the ground is extremely difficult; ſo that nature hath made it full amends, by furniſhing it with ample means for an eaſy and continual flight. It is more on the wing than any other ſwallows; its flight is more rapid, and that attended with a ſhrill ſcream. It reſts by clinging againſt ſome wall, or other apt body; from whence Klein ſtyles this ſpecies *hirundo muraria*. It breeds under the eaves of houſes, in ſteeples, and other lofty buildings; makes its neſt of graſſes and feathers; and lays only two eggs, of a white colour. It is entirely of a gloſſy dark ſooty colour, only the chin is marked with a white ſpot: but by being ſo conſtantly expoſed to all weathers, the gloſs of the plumage is loſt before it retires. A pair of theſe birds were found adhering by their claws, and in a torpid ſtate, in Feb. 1766, under the roof of Longnor-chapel, Shropſhire: on being brought to a fire, they revived, and moved about the room. The feet are of a particular ſtructure, all the toes ſtanding foreward; the leaſt conſiſts of only one bone; the others of an equal number, viz. two each; in which they differ from thoſe of all other birds.

This appears in our country about 14 days later than the ſand-martin; but differs greatly in the time of its departure, retiring invariably about the 10th of Auguſt, being the firſt of the genus that leaves us.

The fabulous hiſtory of the *manucodiata*, or *bird of paradiſe*, is, in the hiſtory of this ſpecies, in great meaſure verified. It was believed to have no feet; to live upon the celeſtial dew; to float perpetually on the atmoſphere; and to perform all its functions in that element.

The ſwift actually performs what has been in theſe enlightened times diſproved of the former, except the ſmall time it takes in ſleeping, and what it devotes to incubation; every other action is done on wing. The materials of its neſt it collects either as they are carried about by the winds, or picks them up from the ſurface in its ſweeping flight. Its food is undeniably the inſects that fill the air. Its drink is taken in tranſient ſips from the water's ſurface. Even its amorous rites are performed on high. Few perſons who have attended to them in a fine ſummer's morning, but muſt have ſeen them make their aërial courſes at a great height, encircling a certain ſpace with an eaſy ſteady motion. On a ſudden they fall into each others embraces, then drop precipitate with a loud ſhriek for numbers of yards. This is the critical conjuncture; and to be no more wondered at, than that inſects (a familiar inſtance) ſhould diſcharge the ſame duty in the ſame element. Hirundo.

Theſe birds and ſwallows are inveterate enemies to hawks. The moment one appears, they attack him immediately: the ſwifts ſoon deſiſt; but the ſwallows purſue and perſecute thoſe rapacious birds, till they have entirely driven them away.

Swifts delight in ſultry thundery weather, and ſeem thence to receive freſh ſpirits. They fly at thoſe times in ſmall parties with particular violence; and as they paſs near ſteeples, towers, or any edifices where their mates perform the office of incubation, emit a loud ſcream, a fort of ſerenade, as Mr White ſuppoſes, to their reſpective females.

Concerning the diſappearance of ſwallows in the winter, Mr Pennant hath given the following diſſertation.

"There are three opinions among naturaliſts concerning the manner the ſwallow-tribes diſpoſe of themſelves after their diſappearance from the countries in which they make their ſummer reſidence. Herodotus mentions one ſpecies that reſides in Egypt the whole year: Proſper Alpinus aſſerts the ſame; and Mr Loten, late governor of Ceylon, aſſured us, that thoſe of Java never remove. Theſe excepted, every other known kind obſerve a periodical migration, or retreat. The ſwallows of the cold Norway, and of North America, of the diſtant Kamtſchatka, of the temperate parts of Europe, of Aleppo, and of the hot Jamaica, all agree in this one point.

"In cold countries, a defect of inſect-food on the approach of winter, is a ſufficient reaſon for theſe birds to quit them: but ſince the ſame cauſe probably does not ſubſiſt in the warm climates, recourſe ſhould be had to ſome other reaſon for their vaniſhing.

"Of the three opinions, the firſt has the utmoſt appearance of probability; which is, that they remove nearer the ſun, where they can find a continuance of their natural diet, and a temperature of air ſuiting their conſtitutions. That this is the caſe with ſome ſpecies of European ſwallows, has been proved beyond contradiction (as above cited) by M. Adanſon. We often obſerve them collected in flocks innumerable on churches, on rocks, and on trees, previous to their departure hence: and Mr Collinſon proves their return here in perhaps equal numbers, by two curious relations of undoubted credit; the one communicated to him by Mr Wright, maſter of a ſhip; the other by the

Hirundo. the late Sir Charles Wager; who both described (to the same purpose) what happened to each in their voyages. "Returning home, (says Sir Charles), in "the spring of the year, as I came into sounding in "our channel, a great flock of swallows came and "settled on all my rigging; every rope was covered; "they hung on one another like a swarm of bees; "the decks and carving were filled with them. They "seemed almost famished and spent, and were only "feathers and bones; but, being recruited with a "night's rest, took their flight in the morning." This vast fatigue proves that their journey must have been very great, considering the amazing swiftness of these birds: in all probability they had crossed the Atlantic ocean, and were returning from the shores of Senegal, or other parts of Africa; so that this account from that most able and honest seaman, confirms the later information of M. Adanson.

"Mr White, on Michaelmas day 1768, had the good fortune to have ocular proof of what may reasonably be supposed an actual migration of swallows. Travelling the morning very early between his house and the coast, at the beginning of his journey he was environed with a thick fog; but on a large wild heath the mist began to break, and discovered to him numberless swallows, clustered on the standing bushes, as if they had roosted there: as soon as the sun burst out, they were instantly on wing, and with an easy and placid flight proceeded towards the sea. After this he saw no more flocks, only now and then a straggler.

In Kalm's voyage to America, is a remarkable instance of the distant flight of swallows; for one lighted on the ship he was in, September 2d, when he had passed over only two thirds of the Atlantic ocean. His passage was uncommonly quick, being performed from Deal to Philadelphia in less than six weeks; and when this accident happened, he was fourteen days sail from Cape Finlopen.

"This rendevouz of swallows about the same time of year is very common on the willows, in the little isles in the Thames. They seem to assemble for the same purpose as those in Hampshire, notwithstanding no one yet has been eye-witness of their departure. On the 26th of September 1775, two gentlemen who happened to lie at Maidenhead Bridge, furnished at least a proof of the multitudes there assembled: they went by torch-light to an adjacent isle, and in less than half an hour brought ashore fifty dozen; for they had nothing more to do than to draw the willow-twigs through their hands, the birds never stirring till they were taken.

"The northern naturalists will perhaps say, that this assembly met for the purpose of plunging into their subaqueous winter-quarters: but were that the case, they would never escape discovery in a river perpetually fished as the Thames, as some of them must inevitably be brought up in the nets that harrass that water.

"The second notion has great antiquity on its side. Aristotle and Pliny give it as their belief, that swallows do not remove very far from their summer habitation, but winter in the hollows of rocks, and during that time lose their feathers. The former part of their opinion has been adopted by several ingenious men; and of late, several proofs have been brought of some species, at least, having been discovered in a torpid state. Hirundo.
Mr Collinson favoured us with the evidence of three gentlemen, eye-witnesses to numbers of sand martins being drawn out of a cliff on the Rhine, in the month of March 1762. And the honourable Daines Barrington communicated to us the following fact, on the authority of the late lord Belhaven, That numbers of swallows have been found in old dry walls, and in sand-hills near his Lordship's seat in East Lothian; not once only, but from year to year; and that when they were exposed to the warmth of a fire, they revived. We have also heard of the same annual discoveries near Morpeth, in Northumberland, but cannot speak of them with the same assurance as the two former: neither in the two last instances are we certain of the particular species.

"Other witnesses crowd on us to prove the residence of those birds in a torpid state during the severe season.

"First, In the chalky cliffs of Sussex; as was seen on the fall of great fragment some years ago.

"Secondly, In a decayed hollow tree that was cut down, near Dolgelli, in Merionethshire.

"Thirdly, In a cliff near Whitby, Yorkshire; where, on digging out a fox, whole bushels of swallows were found in a torpid condition. And,

"Lastly, the reverend Mr Conway, of Sychton, Flintshire, was so obliging as to communicate the following fact: A few years ago, on looking down an old lead-mine in that county, he observed numbers of swallows clinging to the timbers of the shaft, seemingly asleep; and on flinging some gravel on them, they just moved, but never attempted to fly or change their place: this was between All Saints and Christmas.

"These are doubtless the lurking places of the later hatches, or of those young birds, who are incapable of distant migrations. There they continue insensible and rigid; but like flies may sometimes be reanimated by an unseasonable hot day in the midst of winter: for very near Christmas a few appeared on the mouldiug of a window of Merton college, Oxford, in a remarkably warm nook, which prematurely set their blood in motion, having the same effect as laying them before the fire at the same time of year. Others have been known to make this premature appearance; but as soon as the cold natural to the season returns, they withdraw again to their former retreats.

"I shall conclude with one argument drawn from the very late hatches of two species.

"On the 23d of October 1767, a martin was seen in Southwark, flying in and out of his nest: and on the 29th of the same month, four or five swallows were observed hovering round and settling on the county hospital at Oxford. As these birds must have been of a late hatch, it is highly improbable that at so late a season of the year, they would attempt, from one of our midland counties, a voyage almost as far as the equator to Senegal or Goree: we are therefore confirmed in our notion, that there is only a partial migration of these birds; and that the feeble late hatches conceal themselves in this country.

"The above are circumstances we cannot but assent to, though seemingly contradictory to the common course of nature in regard to other birds. We

Hirundo. must, therefore, divide our belief relating to theſe two ſo different opinions; and conclude, that one part of the ſwallow-tribe migrate, and that others have their winter-quarters near home. If it ſhould be demanded, why ſwallows alone are found in a torpid ſtate, and not the other many ſpecies of ſoft-billed birds, which likewiſe diſappear about the ſame time? the following reaſon may be aſſigned:

"No birds are ſo much on the wing as ſwallows, none fly with ſuch ſwiftneſs and rapidity, none are obliged to ſuch ſudden and various evolutions in their flight, none are at ſuch pains to take their prey, and, we may add, none exert their voice more inceſſantly: all theſe occaſion a vaſt expence of ſtrength and of ſpirits, and may give ſuch a texture to the blood as other animals cannot experience; and ſo diſpoſe, or we may ſay neceſſitate, this tribe of birds, or part of them at leaſt, to a repoſe more laſting than that of any others.

"The third notion is, even at firſt ſight, too amazing and unnatural to merit mention, if it was not that ſome of the learned have been credulous enough to deliver for fact, what has the ſtrongeſt appearance of impoſſibility; we mean the relation of ſwallows paſſing the winter immerſed under ice, at the bottom of lakes, or lodged beneath the water of the ſea at the foot of rocks. The firſt who broached this opinion, was Olaus Magnus, archbiſhop of Upſal, who very gravely informs us, that theſe birds are often found in cluſtered maſſes at the bottom of the northern lakes, mouth to mouth, wing to wing, foot to foot; and that they creep down the reeds in autumn, to their ſubaqueous retreats: That when old fiſhermen diſcover ſuch a maſs, they throw it into the water again; but when young inexperienced ones take it, they will, by thawing the birds at a fire, bring them indeed to the uſe of their wings, which will continue but a very ſhort time, being owing to a premature and forced revival.

"That the good archbiſhop did not want credulity in other inſtances, appears from this, that after having ſtocked the bottoms of the lakes with birds, he ſtores the clouds with mice, which ſometimes fall in plentiful ſhowers on Norway and the neighbouring countries.

"Some of our own countrymen have given credit to the ſubmerſion of ſwallows; and Klein patroniſes the doctrine ſtrongly, giving the following hiſtory of their manner of retiring, which he received from ſome countrymen and others. They aſſerted, that ſometimes the ſwallows aſſembled in numbers on a reed, till it broke and ſunk with them to the bottom; and their immerſion was preceded by a dirge of a quarter of an hour's length: That others would unite in laying hold of a ſtraw with their bills, and ſo plunge down in ſociety. Others again would form a large maſs, by clinging together with their feet, and ſo commit themſelves to the deep.

"Such are the relations given by thoſe that are fond of this opinion; and though delivered without exaggeration, muſt provoke a ſmile. They aſſign not the ſmalleſt reaſon to account for theſe birds being able to endure ſo long a ſubmerſion without being ſuffocated, or without decaying, in an element ſo unnatural to ſo delicate a bird; when we know that the otter, the corvorant, and the grebes, ſoon periſh, if caught under ice, or entangled in nets: and it is well known, that thoſe animals will continue much longer under water than any others to whom nature hath denied that particular ſtructure of heart neceſſary for a long reſidence beneath that element. Though entirely ſatisfied in our own mind of the impoſſibility of theſe relations; yet, deſirous of ſtrengthening our opinion with ſome better authority, we applied to that able anatomiſt, Mr John Hunter; who was ſo obliging as to inform us, that he had diſſected many ſwallows, but found nothing in them different from other birds as to the organs of reſpiration: That all thoſe animals which he had diſſected of the claſs that ſleep during winter, ſuch as lizards, frogs, &c. had a very different conformation as to thoſe organs: That all theſe animals, he believes, do breathe in their torpid ſtate; and, as far as his experience reaches, he knows they do: and that therefore he eſteems it a very wild opinion, that terreſtrial animals can remain any long time under water without drowning." Hirundo.

To this reaſoning of Mr Pennant's, however, the following anſwer hath appeared in Kalm's travels in North America.—"It has been a ſubject of conteſt among naturaliſts, to determine the winter-retreat of ſwallows. Some think they go to warmer climates when they diſappear in the northern countries: others ſay, they creep into hollow trees, and holes in clefts of rocks, and lie there all the winter in a torpid ſtate: and others affirm, that they make their retreat into water, and revive again in ſpring. The two firſt opinions have been proved, and it ſeems have found credit; the laſt has been treated as ridiculous, and almoſt as an old woman's tale. Natural hiſtory, as all other hiſtories, depends not always upon the intrinſic degree of probability, but upon facts founded on the teſtimony of people of noted veracity.—Swallows are ſeldom ſeen ſinking down into the water; ſwallows have not ſuch organs as frogs or lizards, which are torpid during winter; *ergo*, ſwallows live not, and cannot live, under water.—This way of arguing, I believe, would carry us, in a great many caſes, too far; for, though it is not clear to every one, it may however be true; and lizards and frogs are animals of a claſs widely different from that of birds, and muſt therefore of courſe have a different ſtructure; hence it is they are claſſed ſeparately. The bear and the marmot are in winter in a torpid ſtate, and have however not ſuch organs as lizards and frogs; and nobody doubts of their being, during ſome time, in the moſt rigid climates, in a torpid ſtate: for the Alpine nations hunt the marmots frequently, by digging their holes up; and find them ſo torpid, that they cut their throats, without their reviving or giving the leaſt ſign of life during the operation; but when the torpid marmot is brought into a warm room, and placed before the fire, it revives from its lethargy. The queſtion muſt therefore be decided by facts; nor are theſe wanting here. Dr Wallerius, the celebrated Swediſh chemiſt, informs us, That he has ſeen, more than once, ſwallows aſſembling on a reed, till they were all immerſed and went to the bottom; this being preceded by a dirge of a quarter of an hour's length. He atteſts likewiſe, that he had ſeen a ſwallow caught during winter out of a lake with a net, drawn, as is com-

Hirundo. common in northern countries, under the ice; this bird was brought into a warm room, revived, fluttered about, and soon after died. Hirundo, Hispaniola.

"Mr Klein applied to many fermiers generaux of the king of Pruſſia's domains, who had great lakes in their diſtricts, the fiſhery in them being a part of the revenue. In winter the fiſhery thereon is the moſt conſiderable under the ice, with nets ſpreading more than 200 or 300 fathoms, and they are often wound by ſcrews and engines on account of their weight. All the people queſtioned made affidavits upon oath before the magiſtrates. Firſt, The mother of the counteſs Lehndorf ſaid, that ſhe had ſeen a bundle of ſwallows brought from the Friſh-Haff, (a lake communicating with the Baltic at Pillaw), which, when brought into a moderately warm room, revived and fluttered about. Secondly, Count Schileben gave an inſtrument on ſtamped paper, importing, that by fiſhing on the lake belonging to his eſtate of Gerdauen in winter, he ſaw ſeveral ſwallows caught in the net, one of which he took up with his hand, brought it into a warm room, where it lay about an hour, when it began to ſtir, and half an hour after it flew about in the room. Thirdly, Fermier-general (Amtman) Witkouſki made affidavit, that, in the year 1740, three ſwallows were brought up with the net in the great poud at Didlacken; in the year 1741, he got two ſwallows from another part of the pond, and took them home (they being all caught in his preſence;) after an hour's ſpace they revived all in a warm room, fluttered about, and died in three hours after. Fourthly, Amtman Bönke ſays, that having had the eſtate Kleſkow in farm, he had ſeen nine ſwallows brought up in the net from under the ice, all which he took into a warm room, where he diſtinctly obſerved how they gradually revived; but a few hours after they all died. Another time his people got likewiſe ſome ſwallows in a net, but he ordered them to be again thrown into the water. Fifthly, Andrew Rutta, a maſter fiſherman at Oletſko, made affidavit, in 1747, that 22 years ago, two ſwallows were taken up by him in a net, under the ice, and, being brought into a warm room, they flew about.—Sixthly, Jacob Koſiulo, a maſter fiſherman at Stradauen, made affidavit, that, in 1736, he brought up in winter, in a net, from under the ice of the lake at Raſki, a ſeemingly dead ſwallow, which revived in half an hour's time in warm room, and he ſaw, in a quarter of an hour after, the bird grow weaker, and ſoon after dying. Seventhly, I can reckon myſelf among the eye-witneſſes of this paradoxon of natural hiſtory. In the year 1735, being a little boy, I ſaw ſeveral ſwallows brought in winter by fiſhermen, from the river Viſtula, to my father's houſe; where two of them were brought into a warm room, revived, and flew about. I ſaw them ſeveral times ſettling on the warm ſtove (which the northern nations have in their rooms); and I recollect well, that the ſame forenoon they died, and I had them, when dead, in my hand. In the year 1754, after the death of my uncle Godefroy Wolf, captain in the Poliſh regiment of footguards; being myſelf one of his heirs, I adminiſtered for my co-heirs, ſeveral eſtates called the *Staroſty of Diſchau*, in Poliſh Pruſſia, which my late uncle farmed under the king. In January, the lake of Lybſtaw, belonging to theſe eſtates, being covered with ice, I ordered the fiſhermen to fiſh therein, and in my preſence ſeveral ſwallows were taken, which the fiſhermen to fiſh therein, and in my preſence ſeveral ſwallows threw in again; but one I took up to myſelf, brought it home, which was five miles from thence, and it revived, but died about an hour after its reviving.

"Theſe are facts, atteſted by people of the higheſt quality, by ſome in public offices, and by others who, tho' of a low rank, however made theſe affidavits upon oath. It is impoſſible to ſuppoſe indiſcriminately, that they were prompted, by views of intereſt, to aſſert as a fact, a thing which had no truth in it. It is therefore highly probable, or rather inconteſtably true, that ſwallows retire in the northern countries during winter, into the water, and ſtay there in a torpid ſtate, till the return of warmth revives them again in ſpring. The queſtion therefore, I believe, ought for the future to be thus ſtated: The ſwallows in Spain, Italy, France, and perhaps ſome from England, remove to warmer climates; ſome Engliſh ones, and ſome in Germany and other mild countries, retire into clefts and holes in rocks, and remain there in a torpid ſtate. In the colder northern countries the ſwallows immerſe in the ſea, in lakes, and rivers; and remain in a torpid ſtate, under ice, during winter. There are ſtill ſome objections to this latter aſſertion, which we muſt remove. It is ſaid, Why do not rapacious fiſh, and aquatic quadrupeds and birds, devour theſe ſwallows? The anſwer is obvious. Swallows chooſe only ſuch places in the water for their winter-retreat, as are near reeds and ruſhes; ſo that ſinking down there between them and their roots, they are by them ſecured againſt the rapaciouſneſs of their enemies. But others object, Why are not theſe birds caught in ſuch waters as are continually harraſſed by nets? I believe the ſame anſwer which has been made to the firſt objection will ſerve for this likewiſe. Fiſhermen take care to keep off with their nets from places filled with reeds and ruſhes, for fear of entangling and tearing their net; and thus the ſituation of ſwallows under water, is the reaſon that they are ſeldom diſturbed in their ſilent winter-retreats. What confirms this opinion ſtill more is, that ſwallows were never caught in Pruſſia, according to the above-mentioned affidavits, but with thoſe parts of the net which paſſed near to the reeds and ruſhes; and ſometimes the ſwallows were yet faſtened with their feet to a reed, when they were drawn up by the net. As to the argument taken from their being ſo long under water without corruption, I believe, there is a real difference between animals ſuffocated in water and animals being torpid therein. We have examples of things being a long time under water; to which we may add the intenſe cold of theſe northern regions, which preſerves them. Who would have thought it, that ſnails and polypes may be diſſected, and could reproduce the parts ſevered from their body, if it was not a fact? Natural hiſtory ought to be ſtudied as a collection of facts, not as the hiſtory of our gueſſes or opinions. Nature varies in an infinite manner; and Providence has diverſified the inſtinct of animals and their œconomy, and adapted it to the various ſeaſons and climates."

HISPANIOLA, called alſo St Domingo, the

Hiſpaniola. largeſt of the Antilles or Caribbee iſlands, extending about 420 miles from eaſt to weſt, and 120 in breadth from north to ſouth; lying between 17° 37′ and 20° of N. Lat. and between 67° 35′ and 74° 15′ W. Long. The climate is hot, but not reckoned unwholeſome; and ſome of the inhabitants are ſaid to arrive at the age of 120. It is ſometimes refreſhed by breezes and rains; and its ſalubrity is likewiſe in a great meaſure owing to the beautiful variety of hills and valleys, woods and rivers, which every where preſent themſelves. It is indeed reckoned by far the fineſt and moſt pleaſant iſland of the Antilles, as being the beſt accommodated to all the purpoſes of life when duly cultivated.

This iſland, famous for being the earlieſt ſettlement of the Spaniards in the new world, was at firſt in high eſtimation for the quantity of gold it ſupplied: this wealth diminiſhed with the inhabitants of the country, whom they obliged to dig it out of the bowels of the earth; and the ſource of it was entirely dried up, when they were exterminated, which was quickly done, by a ſeries of the moſt ſhocking barbarities that ever diſgraced the hiſtory of any nation. Benzoni relates, that of two millions of inhabitants, contained in the iſland when diſcovered by Columbus in 1492, ſcarce 153 were alive in 1545. A vehement deſire of opening again this ſource of wealth inſpired the thought of getting ſlaves from Africa; but, beſides that theſe were found unfit for the labours they were deſtined to, the multitude of mines, which then began to be wrought on the continent, made thoſe of Hiſpaniola no longer of any importance. An idea now ſuggeſted itſelf, that their negroes, which were healthy, ſtrong, and patient, might be uſefully employed in huſbandry; and they adopted, through neceſſity, a wiſe reſolution, which, had they known their own intereſt, they would have embraced by choice.

The produce of their induſtry was at firſt extremely ſmall, becauſe the labourers were few. Charles V. who, like moſt ſovereigns, preferred his favourites to every thing, had granted an excluſive right of the ſlave-trade to a Flemiſh nobleman, who made over his privilege to the Genoeſe. Thoſe avaricious republicans conducted this infamous commerce as all monopolies are conducted; they reſolved to ſell dear, and they ſold but few. When time and competition had fixed the natural and neceſſary price of ſlaves, the number of them increaſed. It may eaſily be imagined, that the Spaniards, who had been accuſtomed to treat the Indians as beaſts, did not entertain a higher opinion of theſe negro Africans, whom they ſubſtituted in their place. Degraded ſtill further in their eyes by the price they had paid for them, even religion could not reſtrain them from aggravating the weight of their ſervitude. It became intolerable, and theſe wretched ſlaves made an effort to recover the unalienable rights of mankind. Their attempt proved unſucceſsful; but they reaped this benefit from their deſpair, that they were afterwards treated with leſs inhumanity.

This moderation (if tyranny cramped by the apprehenſion of revolt can deſerve that name) was attended with good conſequences. Cultivation was purſued with ſome degree of ſucceſs. Soon after the middle of the 16th century, the mother-country drew annually from this colony ten million weight of ſugar, Hiſpaniola. a large quantity of wood for dying, tobacco, cocoa, caſſia, ginger, cotton, and peltry in abundance. One might imagine, that ſuch favourable beginnings would give both the deſire and the means of carrying them further; but a train of events, more fatal each than the other, ruined theſe hopes.

The firſt misfortune aroſe from the depopulation of the iſland. The Spaniſh conqueſts on the continent ſhould naturally have contributed to promote the ſucceſs of an iſland, which nature ſeemed to have formed to be the centre of that vaſt dominion ariſing around it, to be the ſtaple of the different colonies. But it fell out quite otherwiſe: on a view of the immenſe fortunes raiſing in Mexico, and other parts, the richeſt inhabitants of Hiſpaniola began to deſpiſe their ſettlements, and quitted the true ſource of riches, which is on the ſurface of the earth, to go and ranſack the bowels of it for veins of gold, which are quickly exhauſted. The government endeavoured in vain to put a ſtop to this emigration; the laws were always either artfully cluded, or openly violated.

The weakneſs, which was a neceſſary conſequence of ſuch a conduct, leaving the coaſts without defence, encouraged the enemies of Spain to ravage them. Even the capital of this iſland was taken and pillaged by that celebrated Engliſh ſailor, Sir Francis Drake. The cruizers of leſs conſequence contented themſelves with intercepting veſſels in their paſſage through thoſe latitudes, the beſt known at that time of any in the new world. To complete theſe misfortunes, the Caſtilians themſelves commenced pirates. They attacked no ſhips but thoſe of their own nation; which were more rich, worſe provided, and worſe defended, than any others. The cuſtom they had of fitting out ſhips clandeſtinely, in order to procure ſlaves, prevented them from being known; and the aſſiſtance they purchaſed from the ſhips of war, commiſſioned to protect the trade, inſured to them impunity.

The foreign trade of the colony was its only reſource in this diſtreſs; and that was illicit: but as it continued to be carried on, notwithſtanding the vigilance of the governors, or, perhaps, by their connivance, the policy of an exaſperated and ſhort-ſighted court exerted itſelf in demoliſhing moſt of the ſea-ports, and driving the miſerable inhabitants into the inland country. This act of violence threw them into a ſtate of dejection; which the incurſions and ſettlement of the French on the iſland afterwards carried to the utmoſt pitch. The latter, after having made ſome unſucceſsful attempts to ſettle on the iſland, had part of it yielded to them in 1697, and now enjoy by far the beſt ſhare.

Spain, totally taken up with that vaſt empire which ſhe had formed on the continent, uſed no pains to diſſipate this lethargy. She even refuſed to liſten to the ſolicitations of her Flemiſh ſubjects, who earneſtly preſſed that they might have permiſſion to clear thoſe fertile lands. Rather than run the riſk of ſeeing them carry on a contraband trade on the coaſts, ſhe choſe to bury in oblivion a ſettlement which had been of conſequence, and was likely to become ſo again.

This colony, which had no longer any intercourſe with the mother-country but by a ſingle ſhip, of no great burthen, that arrived from thence every third year, conſiſted

Hiſpaniola, Hiſtory.

conſiſted, in 1717, of 18410 inhabitants, including Spaniards, Meſtees, Negroes, or Mulattoes. The complexion and character of theſe people differed according to the different proportions of American, European, and African blood they had received from that natural and tranſient union which reſtores all races and conditions to the ſame level. Theſe demi-ſavages, plunged in the extreme of ſloth, lived upon fruits and roots, dwelt in cottages without furniture, and moſt of them without clothes. The few among them, in whom indolence had not totally ſuppreſſed the ſenſe of decency, and taſte for the conveniences of life, purchaſed clothes of their neighbours the French, in return for their cattle, and the money ſent to them for the maintenance of two hundred ſoldiers, the prieſts, and the government. It does not appear that the company, formed at Barcelona in 1757, with excluſive privileges for the re-eſtabliſhment of St Domingo, hath as yet made any conſiderable progreſs. They ſend out only two ſmall veſſels annually, which are freighted back with ſix thouſand hides, and ſome other commodities of little value. See St Domingo.

Hiſtoriographer, Hiſtory.

HISTORIOGRAPHER, a profeſſed hiſtorian, or writer of hiſtory.

HISTORY.

HISTORY, in general, ſignifies an account of ſome remarkable facts which have happened in the world, arranged in the true order in which they actually took place, together with the cauſes to which they were owing, and the different effects they have produced, as far as can be diſcovered.—The word is Greek, ἱστορία; and literally denotes a ſearch of curious things, or a deſire of knowing, or even a rehearſal of things we have ſeen; being formed from the verb ἱστορεῖν, which properly ſignifies to know a thing by having ſeen it. But the idea is now much more extenſive, and is applied to the knowledge of things taken from the report of others. The origin is from the verb ἴστημι, "I know;" and hence it is, that among the ancients ſeveral of their great men were called *polyhiſtores*, i. e. perſons of various and general knowledge.

Sometimes, however, the word hiſtory is uſed to ſignify a deſcription of things, as well as an account of facts. Thus Theophraſtus calls his work, in which he has treated of the nature and properties of plants, an *hiſtory of plants*; and we have a treatiſe of Ariſtotle, intitled an *hiſtory of animals*; and to this day the deſcriptions of plants, animals, and minerals, are called by the general name of *natural hiſtory*.

1 History how divided.

But what chiefly merits the name of hiſtory, and what is here conſidered as ſuch, is an account of the principal tranſactions of mankind ſince the beginning of the world; and which naturally divides itſelf into two parts, namely, *civil* and *eccleſiaſtical*. The firſt contains the hiſtory of mankind in their various relations to one another, and their behaviour, for their own emolument, or that of others, in common life; the ſecond conſiders them as acting, or pretending to act, in obedience to what they believe to be the will of the Supreme Being.—Civil hiſtory, therefore, includes an account of all the different ſtates that have exiſted in the world, and likewiſe of thoſe men who in different ages of the world have moſt eminently diſtinguiſhed themſelves either for their good or evil actions. This laſt part of civil hiſtory is uſually termed Biography.

Hiſtory is now conſidered as a very conſiderable branch of polite literature: few accompliſhments are more valued than an accurate knowledge of the hiſtories of different nations; and ſcarce any literary production is more regarded than a well-written hiſtory of any nation.

2 Of the ſtudy of hiſtory.

With regard to the ſtudy of hiſtory, we muſt conſider, that all the revolutions which have happened in the world, have been owing to two cauſes. 1. The connections between the different ſtates exiſting together in the world at the ſame time, or their different ſituations with regard to one another; and, 2. The different characters of the people who in all ages conſtituted theſe ſtates, their different geniuſes and diſpoſitions, &c. by which they were either prompted to undertake ſuch and ſuch actions of themſelves, or were eaſily induced to it by others. The perſon who would ſtudy hiſtory, therefore, ought in the firſt place to make himſelf acquainted with the ſtate of the world in general in all different ages; what nations inhabited the different parts of it; what their extent of territory was; at what particular time they roſe, and when they declined. He is then to inform himſelf of the various events which have happened to each particular nation; and, in ſo doing, he will diſcover many of the cauſes of thoſe revolutions, which before he only knew as facts. Thus, for inſtance, a perſon may know the Roman hiſtory from the time of Romulus, without knowing in the leaſt why the city of Rome happened to be built at that time. This cannot be underſtood without a particular knowledge of the former ſtate of Italy, and even of Greece and Aſia; ſeeing the origin of the Romans is commonly traced as high as Æneas, one of the heroes of Troy. But when all this is done, which indeed requires no ſmall labour, the hiſtorian hath yet to ſtudy the genius and diſpoſitions of the different nations, the characters of thoſe who were the principal directors of their actions, whether kings, miniſters, generals, or prieſts; and when this is accompliſhed, he will diſcover the cauſes of thoſe tranſactions in the different nations which have given riſe to the great revolutions above mentioned: after which, he may aſſume the character of one who is perfectly verſed in hiſtory.

The firſt *outline* of hiſtory, as it may be called, is moſt eaſily obtained by the inſpection of an hiſtorical chart; and that ſubjoined to the preſent treatiſe, will anſwer the purpoſe as well as any. Along with this it will be proper to peruſe a ſhort abridgment of general hiſtory, from the creation of the world to the preſent time; but in this way there have been but very few attempts attended with any tolerable ſucceſs. The following is collected from reſpectable authorities, and may ſerve to help the ideas of the reader on this ſubject.

Sect.

Civil History.

Sect. I. *Civil History.*

HISTORY, tho' seemingly incapable of any natural division, will yet be found, on a nearer inspection, to resolve itself into the following periods, at each of which a great revolution took place, either with regard to the whole world, or a very considerable part of it. 1. The creation of man. 2. The flood. 3. The beginning of profane history, *i. e.* when all the fabulous relations of heroes, demi-gods, &c. were expelled from historical narrations, and men began to relate facts with some regard to truth and credibility. 4. The conquest of Babylon by Cyrus, and the destruction of the Babylonian empire. 5. The reign of Alexander the Great, and the overthrow of the Persian empire. 6. The destruction of Carthage by the Romans, when the latter had no longer any rival capable of opposing their designs. 7. The reign of the emperor Trajan, when the Roman empire was brought to its utmost extent. 8. The division of the empire under Constantine. 9. The destruction of the Western empire by the Heruli, and the settlement of the different European nations. 10. The rise of Mahomet, and the conquests of the Saracens and Turks. 11. The crusades, and all the space intervening between that time and the present.

3 Civil history how divided.

Concerning the number of years which have elapsed since the creation of the world, there have been many disputes. The compilers of the Universal History determine it to have taken place in the year 4305 B. C. so that, according to them, the world is now in the 6085th year of its age. Others think it was created only 4000 years B. C. so that it hath not yet attained its 6000th year. Be this as it will, however, the whole account of the creation rests on the truth of the Mosaic history; and which we must of necessity accept, because we can find no other which does not either abound with the grossest absurdities, or lead us into absolute darkness. The Chinese and Egyptian pretensions to antiquity are so absurd and ridiculous, that the bare reading must be a sufficient confutation of them to every reasonable person. See the articles CHINA and EGYPT. Some historians and philosophers are inclined to discredit the Mosaic accounts, from the appearances of volcanoes, and other natural phænomena: but their objections are by no means sufficient to invalidate the authority of the sacred writings; not to mention that every one of their own systems is liable to insuperable objections. See the article EARTH. It is therefore reasonable for every person to accept of the Mosaic account of the creation as truth: but an historian is under an absolute necessity of doing it, because, without it, he is quite destitute of any standard or scale by which he might reduce the chronology of different nations to any agreement; and, in short, without receiving this account as true, it would be in a manner impossible at this day to write a general history of the world.

4 Mosaic account of the creation the only probable one.

5 History from the creation to the flood.

1. The transactions during the first period, viz. from the creation to the flood, are very much unknown, nothing indeed being recorded of them but what is to be found in the first six chapters of Genesis. In general, we know, that men were not at that time in a savage state; they had made some progress in the arts, had invented music, and found out the method of working metals. They seem also to have lived in one vast community, without any of these divisions into different nations which have since taken place, and which evidently proceeded from the confusion of languages. The most material part of their history, however, is, that having once begun to transgress the divine commands, they proceeded to greater and greater lengths of wickedness, till at last the Deity thought proper to send a flood on the earth, which destroyed the whole human race except eight persons, viz. Noah and his family. This terrible catastrophe happened, according to the Hebrew copy of the Bible, 1656 years after the creation; according to the Samaritan copy, 1307. For the different conjectures concerning the natural causes of the flood, see the article DELUGE.

Civil History.

6 From the flood to the beginning of profane history.

2. For the history of the second period we must again have recourse to the Scriptures, almost as much as for that of the first. We now find the human race reduced to eight persons possessed of nothing but what they had saved in the ark, and the whole world to be stored with animals from those which had been preserved along with these eight persons. In what country their original settlement was, no mention is made. The ark is supposed to have rested on Mount Ararat in Armenia *; but it is impossible to know whether Noah and his sons made any stay in the neighbourhood of this mountain or not. Certain it is, that, some time after, the whole or the greatest part of the human race were assembled in Babylonia, where they engaged in building a tower. This gave offence to the Deity; so that he punished them by confounding their language; whence the division of mankind into different nations.

* See *Ararat.*

7 Nations descended from Japhet.

According to a common opinion, Noah when dying left the whole world to his sons, giving Asia to Shem, Africa to Ham, and Europe to Japhet. But this hath not the least foundation in Scripture. By the most probable accounts, Gomer the son of Japhet was the father of the Gomerians or Celtes; that is, all the barbarous nations who inhabited the northern parts of Europe under the various names of *Gauls*, *Cimbrians*, *Goths*, &c. and who also migrated into Spain, where they were called *Celtiberians*. From Magog, Meshech, and Tubal, three of Gomer's brethren, proceeded the Scythians, Sarmatians, Tartars, and Moguls. The three other sons of Japhet, Madai, Javan, and Tiras, are said to have been the fathers of the Medes, the Ionians, Greeks, and Thracians.

8 From Shem

The children of Shem were Elam, Asshur, Arphaxad, Lud, and Aram. The first settled in Persia, where he was the father of that mighty nation: The descendants of Asshur peopled Assyria, (now *Curdestan*): Arphaxad settled in Chaldæa. Lud is supposed by Josephus to have taken up his residence in Lydia; though this is much controverted. Aram, with more certainty, is thought to have settled in Mesopotamia and Syria.

9 From Ham

The children of Ham were Cush, Mizraim, Phut, and Canaan. The first is thought to have remained in Babylonia, and to have been king of the south-eastern parts of it afterwards called *Khuzestan*. His descendants are supposed to have removed into the eastern parts of Arabia; from whence they by degrees migrated into the corresponding part of Africa. The second peopled Egypt, Ethiopia, Cyrenaica, Libya, and

Civil History.

and the reſt of the northern parts of the ſame continent. The place where Phut ſettled is not known: but Canaan is univerſally allowed to have ſettled in Phœnicia; and to have founded thoſe nations who inhabited Judæa, and were afterwards exterminated by the Jews.

Almoſt all the countries of the world, at leaſt of the eaſtern continent, being thus furniſhed with inhabitants, it is probable that for many years there would be few or no quarrels between the different nations. The paucity of their numbers, their diſtance from one another, and their diverſity of language, would contribute to keep them from having much communication with each other. Hence, according to the different circumſtances in which the different tribes were placed, ſome would be more civilized, and others more barbarous. In this interval, alſo, the different nations probably acquired different characters, which afterwards they obſtinately retained, and manifeſted on all occaſions; hence the propenſity of ſome nations to monarchy, as the Aſiatics, and the enthuſiaſtic deſire of the Greeks for liberty and republicaniſm, &c.

10 Foundation of the kingdoms of Babylonia, Aſſyria, &c

The beginning of monarchical government was very early; Nimrod, the ſon of Cuſh, having found means to make himſelf king of Babylonia. In a ſhort time Aſſhur emigrated from the new kingdom; built Nineveh, afterwards capital of the Aſſyrian empire; and two other cities called *Rezen* and *Rehoboth*, concerning the ſituation of which we are now much in the dark. Whether Aſſhur at this time ſet up as a king for himſelf, or whether he held theſe cities as vaſſal to Nimrod, is now unknown. It is probable, however, that about the ſame time various kingdoms were founded in different parts of the world; and which were great or ſmall, according to different circumſtances. Thus the ſcripture mentions the kings of Egypt, Gerar, Sodom, Gomorrah, &c. in the time of Abraham; and we may reaſonably ſuppoſe, that theſe kings reigned over nations which had exiſted for ſome conſiderable time before.

11 Migration of the Iſraelites from Egypt

The firſt conſiderable revolution we read of is the migration of the Iſraelites out of Egypt, and their eſtabliſhment in the land of Canaan. For the hiſtory of theſe tranſactions we muſt refer to the Old Teſtament, where the reader will ſee that it was attended with the moſt terrible cataſtrophe to the Egyptians, and with the utter extermination of ſome nations, the deſcendants of Ham, who inhabited Judæa. Whether the overthrow of Pharaoh in the Red Sea could affect the Egyptian nation in ſuch a manner as to deprive them of the greateſt part of their former learning, and to keep them for ſome ages after in a barbarous ſtate, is not eaſily determined; but unleſs this was the caſe, it ſeems exceedingly difficult to account for the total ſilence of their records concerning ſuch a remarkable event, and indeed for the general confuſion and uncertainty in which the early hiſtory of Egypt is involved. The ſettlement of the Jews in the promiſed land of Canaan is ſuppoſed to have happened about 1491 B. C.

12 Hiſtory of the Greeks.

For near 200 years after this period, we find no accounts of any other nations than thoſe mentioned in ſcripture. About 1280 B. C. the Greeks began to make other nations feel the effects of that enterpriſing and martial ſpirit for which they were ſo remarkable, and which they had undoubtedly exerciſed upon one another long before. Their firſt enterpriſe was an invaſion of Colchis (now *Mingrelia*), for the ſake of the golden fleece. Whatever was the nature of this expedition, it is probable they ſucceeded in it; and it is likewiſe probable, that it was this ſpecimen of the riches of Aſia which inclined them ſo much to Aſiatic expeditions ever after. All this time we are totally in the dark about the ſtate of Aſia and Africa, except in ſo far as can be conjectured from Scripture. The ancient empires of Babylon, Aſſyria, and Perſia, probably ſtill continued in the former continent, and Egypt and Ethiopia ſeem to have been conſiderable kingdoms in the latter.

Civil History.

About 1184 years B. C. the Greeks again diſtinguiſhed themſelves by their expedition againſt Troy, a city of Phrygia Minor; which they plundered and burnt, maſſacring the inhabitants with the moſt unrelenting cruelty. Æneas, a Trojan prince, eſcaped with ſome followers into Italy, where he became the remote founder of the Roman empire. At this time Greece was divided into a number of ſmall principalities, moſt of which ſeem to have been in ſubjection to Agamemnon king of Mycenæ. In the reign of Atreus, the father of this Agamemnon, the Heraclidæ, or deſcendants of Hercules, who had been formerly baniſhed by Euriſtheus, were again obliged to leave this country. Under their champion Hyllus, they claimed the kingdom of Mycenæ as their right, pretending that it belonged to their great anceſtor Hercules, who was unjuſtly deprived of it by Euryſtheus *. The controverſy was decided by ſingle combat; but Hyllus being killed, they departed as had been before agreed, under a promiſe of not making any attempt to return for 50 years. About the time of the Trojan war alſo, we find the Lydians, Myſians, and ſome other nations of Aſia Minor, firſt mentioned in hiſtory. The names of the Greek ſtates mentioned during this uncertain period are, 1. Sicyon. 2. Leleg. 3. Meſſina. 4. Athens. 5. Crete. 6. Argos. 7. Sparta. 8. Pelaſgia. 9. Theſſaly. 10. Attica. 11. Phocis. 12. Locris. 13. Ozela. 14. Corinth. 15. Eleuſina. 16. Elis. 17. Pilus. 18. Arcadia. 19. Egina. 20. Ithaca. 21. Cephalone. 22. Phthia. 23. Phocidia. 24. Ephyra. 25. Eolia. 26. Thebes. 27. Caliſta. 28. Etolia. 29. Doloppa. 30. Oechalia. 31. Mycenæ. 32. Eubœa. 33. Mynia. 34. Doris. 35. Phera. 36. Iola. 37. Trachina. 38. Thraſprocia. 39. Myrmidonia. 40. Salamine. 41. Scyros. 42. Hyperia or Melité. 43. The Vulcanian iſles. 44. Megara. 45. Epirus. 46. Achaia. 47. The iſles of the Egean Sea. Concerning many of theſe, we know nothing beſides their names; the moſt remarkable particulars concerning the reſt may be found under their reſpective articles.

* See *Hercules*.

13 Of the Jews.

About 1048 B. C. the kingdom of Judæa under the king David approached its utmoſt extent of power. In its moſt flouriſhing condition, however, it never was remarkable for the largeneſs of its territory. In this reſpect it ſcarce exceeded the kingdom of Scotland; though, according to the accounts given in Scripture, the magnificence of Solomon was ſuperior to that of the moſt potent monarchs on earth. This extraordinary wealth was owing partly to the ſpoils amaſſed by king David in his conqueſts over his various enemies, and partly to the commerce with the Eaſt Indies which

Civil History.

which Solomon had eſtabliſhed. Of this commerce he owed his ſhare to the friendſhip of Hiram king of Tyre, a city of Phœnicia, whoſe inhabitants were now the moſt famed for commerce and ſkill in maritime affairs of any in the whole world.

After the death of Solomon, which happened about 975 B. C. the Jewiſh empire began to decline, and ſoon after many powerful ſtates aroſe in different parts of the world. The diſpoſition of mankind in general ſeems now to have taken a new turn, not eaſily accounted for. In former times, whatever wars might have taken place between neighbouring nations, we have no account of any extenſive empire in the whole world, or that any prince undertook to reduce far diſtant nations to his ſubjection. The empire of Egypt indeed is ſaid to have been extended immenſely to the eaſt, even before the days of Seſoſtris. Of this country, however, our accounts are ſo imperfect, that ſcarce any thing can be concluded from them. But now, as it were all at once, we find almoſt every nation aiming at univerſal monarchy, and refuſing to ſet any bounds whatever to its ambition. The firſt ſhock given to the Jewiſh grandeur was the diviſion of the kingdom into two through the imprudence of Rehoboam. This rendered it more eaſily a prey to Shiſhak king of Egypt; who five years after came and pillaged Jeruſalem, and all the fortified cities of the kingdom of Judah. The commerce to the Eaſt Indies was now diſcontinued, and conſequently the ſources of wealth in a great meaſure ſtopped; and this, added to the perpetual wars between the kings of Iſrael and Judah, contributed to that remarkable and ſpeedy decline which is now ſo eaſily to be obſerved in the Jewiſh affairs.

Whether this king Shiſhak was the Seſoſtris of profane writers or not, his expedition againſt Jeruſalem as recorded in Scripture ſeems very much to reſemble the deſultory conqueſts aſcribed to Seſoſtris. His infantry is ſaid to have been innumerable, compoſed of different African nations; and his cavalry 60,000, with 1200 chariots; which agrees pretty well with the mighty armament aſcribed to Seſoſtris, and of which an account is given under the article EGYPT, n° 2. There indeed his cavalry are ſaid to have been only 24,000; but the number of his chariots are increaſed to 27,000; which laſt may not unreaſonably be reckoned an exaggeration, and theſe ſupernumerary chariots may have been only cavalry: but, unleſs we allow Seſoſtris to be the ſame with Shiſhak, it ſeems impoſſible to fix on any other king of Egypt that can be ſuppoſed to have undertaken this expedition in the days of Solomon.

Though the Jews obtained a temporary deliverance from Shiſhak, they were quickly after attacked by new enemies. In 941 B. C. one Zerah, an Ethiopian, invaded Judæa with an army of a million of infantry and 300 chariots; but was defeated with great
14 Of the Syrians. ſlaughter by Aſa king of Judah, who engaged him with an army of 580,000 men. About this time alſo we find the Syrians grown a conſiderable people, and bitter enemies both to the kings of Iſrael and Judah; aiming in fact at the conqueſt of both nations. Their kingdom commenced in the days of David, under Hadadezer, whoſe capital was Zobah, and who probably was at laſt obliged to become David's tributary, after having been defeated by him in ſeveral engagements. Before the death of David, however, one Rezon, who it ſeems had rebelled againſt Hadadezer, having found means to make himſelf maſter of Damaſcus, erected there a new kingdom, which ſoon became very powerful. The Syrian princes being thus in the neighbourhood of the two rival ſtates of Iſrael and Judah (whoſe capitals were Samaria and Jeruſalem), found it an eaſy matter to weaken them both, by pretending to aſſiſt the one againſt the other; but a detail of the tranſactions between the Jews and Syrians is only to be found in the Old Teſtament, to which we refer. In 740 B. C. however, the Syrian empire was totally deſtroyed by Tiglath Pileſer king of Aſſyria; as was alſo the kingdom of Samaria by Shalmaneſer his ſucceſſor, in 721. The people were either maſſacred, or carried into captivity into Media, Perſia, and the countries about the Caſpian ſea.

Civil History.

15 Of the Weſtern nations.

While the nations of the eaſt were thus deſtroying each other, the foundations of very formidable empires were laid in the weſt, which in proceſs of time were to ſwallow up almoſt all the eaſtern ones. In Africa, Carthage was founded by a Tyrian colony, about 869 B. C. according to thoſe who aſcribe the higheſt antiquity to that city; but, according to others, it was founded only in 769 or 770 B. C. In Europe a very conſiderable revolution took place about 900 B. C. The Heraclidæ, whom we have formerly ſeen expelled from Greece by Atreus the father of Agamemnon, after ſeveral unſucceſsful attempts, at laſt conquered the whole Peloponneſus. From this time the Grecian ſtates became more civilized, and their hiſtory becomes leſs obſcure. The inſtitution, or rather the revival and continuance, of the Olympic games, in 776 B. C. alſo greatly facilitated the writing not only of their hiſtory, but that of other nations; for as each Olympiad conſiſted of four years, the chronology of every important event became indubitably fixed by referring it to ſuch and ſuch an Olympiad. In 748 B. C. or the laſt year of the ſeventh Olympiad, the foundations of the city of Rome were laid by Romulus; and, 43 years after, the Spartan ſtate was new modelled, and received from Lycurgus thoſe laws, by obſerving of which it afterwards arrived at ſuch a pitch of ſplendor.

16 State of the world at the beginning of the third general period.

3. With the beginning of the 28th Olympiad, or 568 B. C. commences the third general period above mentioned, when profane hiſtory becomes ſomewhat more clear, and the relations concerning the different nations may be depended upon with ſome degree of certainty. The general ſtate of the world was at that time as follows.—The northern parts of Europe were either thinly inhabited, or filled with unknown and barbarous nations, the anceſtors of thoſe who afterwards deſtroyed the Roman empire. France and Spain were inhabited by the Gomerians or Celtes. Italy was divided into a number of petty ſtates ariſing partly from Gauliſh, and partly from Grecian colonies; among which the Romans had already become formidable. They were governed by their king Servius Tullius; had increaſed their city by the demolition of Alba Longa, and the removal of its inhabitants to Rome; and had enlarged their dominions by ſeveral cities taken from their neighbours. Greece was alſo divided into a number of ſmall ſtates, among which

Civil History.

which the Athenians and Spartans, being the moſt remarkable, were rivals to each other. The former had, about 599 B. C. received an excellent legiſlation from Solon, and were enriching themſelves by navigation and commerce: the latter were become formidable by the martial inſtitutions of Lycurgus; and, having conquered Meſſina, and added its territory to their own, were juſtly eſteemed the moſt powerful people in Greece. The other ſtates of moſt conſideration were Corinth, Thebes, Argos, and Arcadia.—In Aſia great revolutions had taken place. The ancient kingdom of Aſſyria was deſtroyed by the Medes and Babylonians, its capital city Nineveh utterly ruined, and the greateſt part of its inhabitants carried to Babylon. Nay, the very materials of which it was built were carried off, to adorn and give ſtrength to that ſtately metropolis, which was then undoubtedly the firſt city in the world. Nebuchadnezzar, a wiſe and valiant prince, now ſat on the throne of Babylon. By him the kingdom of Judæa was totally overthrown in 587 B. C. Three years before this, he had taken and razed the city of Tyre, and overrun all the kingdom of Egypt. He is even ſaid by Joſephus to have conquered Spain, and reigned there nine years, after which he abandoned it to the Carthaginians; but this ſeems by no means probable. The extent of the Babylonian empire is not certainly known: but, from what is recorded of it, we may conclude, that it was not at all inferior even in this reſpect to any that ever exiſted; as the Scripture tells us it was ſuperior in wealth to any of the ſucceeding ones. We know that it comprehended Phœnicia, Paleſtine, Syria, Babylonia, Media, and Perſia, and not improbably India alſo; and from a conſideration of this vaſt extent of territory, and the riches with which every one of theſe countries abounded, we may form ſome idea of the wealth and power of this monarch. When we conſider alſo, that the whole ſtrength of this mighty empire was employed in beautifying the metropolis, we cannot look upon the wonders of that city as related by Herodotus to be at all incredible. See BABYLON; and ARCHITECTURE, n° 13. As to what paſſed in the republic of Carthage about this time, we are quite in the dark; there being a chaſm in its hiſtory for no leſs than 300 years.

17 Fourth period. Hiſtory of the Babylonian empire.

4. The fourth general period of hiſtory, namely, from the end of the fabulous times to the conqueſt of Babylon by Cyrus, is very ſhort, including no more than 31 years. This ſudden revolution was occaſioned by the miſconduct of Evil-merodach Nebuchadnezzar's ſon, even in his father's life-time. For having, in a great hunting match on occaſion of his marriage, entered the country of the Medes, and ſome of his troops coming up at the ſame time to relieve the garriſons in thoſe places, he joined them to thoſe already with him, and without the leaſt provocation began to plunder and lay waſte the neighbouring country. This produced an immediate revolt, which quickly extended over all Media and Perſia. The Medes, headed by Aſtyages and his ſon Cyaxares, drove back Evil-merodach and his party with great ſlaughter; nor doth it appear that they were afterwards reduced even by Nebuchadnezzar himſelf. The new empire continued daily to gather ſtrength; and at laſt Cyrus, Aſtyages's grandſon, a prince of great prudence and valour, being made generaliſſimo of the Median and Perſian forces, took Babylon itſelf, in the year 538 B. C. as related under the article BABYLON.

Civil History.

18 Of the Romans, Greeks, Lydians, and Perſians.

During this period the Romans increaſed in power under the wiſe adminiſtration of their king Servius Tullius, who, though a pacific prince, rendered his people more formidable by a peace of 20 years than his predeceſſors had done by all their victories. The Greeks, even at this early period, began to interfere with the Perſians, on account of the Ionians or Grecian colonies in Aſia Minor. Theſe had been ſubdued by Cræſus king of Lydia about the year 562, the time of Nebuchadnezzar's death. Whether the Lydians had been ſubdued by the Babyloniſh monarch or not, is not now to be aſcertained; though it is very probable that they were either in ſubjection to him, or greatly awed by his power, as before his death nothing conſiderable was undertaken by them. It is indeed probable, that during the infanity of Nebuchadnezar, ſpoken of by Daniel, the affairs of his kingdom would fall into confuſion; and many of thoſe princes whom he formerly retained in ſubjection would ſet up for themſelves. Certain it is, however, that if the Babylonians did not regard Cræſus as their ſubject, they looked upon him to be a very faithful ally; inſomuch that they celebrated an annual feaſt in commemoration of a victory obtained by him over the Scythians. After the death of Nebuchadnezzar, Cræſus ſubdued many nations in Aſia Minor, and among the reſt the Ionians, as already related. They were, however, greatly attached to his government; for though they paid him tribute, and were obliged to furniſh him with ſome forces in time of war, they were yet free from all kind of oppreſſion. When Cyrus therefore was proceeding in his conqueſts of different parts of the Babyloniſh empire, before he proceeded to attack the capital, the Ionians refuſed to ſubmit to him, though he offered them very advantageous terms. But ſoon after, Cræſus himſelf being defeated and taken priſoner, the Ionians ſent ambaſſadors to Cyrus, offering to ſubmit on the terms which had formerly been propoſed. Theſe terms were now refuſed; and the Ionians, being determined to reſiſt, applied to the Spartans for aid. Though the Spartans at that time could not be prevailed upon to give their countrymen any aſſiſtance, they ſent ambaſſadors to Cyrus with a threatening meſſage; to which he returned a contemptuous anſwer, and then forced the Ionians to ſubmit at diſcretion, five years before the taking of Babylon. Thus commenced the hatred between the Greeks and Perſians; and thus we ſee, that in the two firſt great monarchies the ſeeds of their deſtruction were ſown even before the monarchies themſelves were eſtabliſhed. For while Nebuchadnezzar was raiſing the Babyloniſh empire to its utmoſt height, his ſon was deſtroying what his father built up; and at the very time when Cyrus was eſtabliſhing the Perſian monarchy, by his ill-timed ſeverity to the Greeks he made that warlike people his enemies, whom his ſucceſſors were by no means able to reſiſt, and who would probably have overcome Cyrus himſelf, had they united in order to attack him. The tranſactions of Africa during this period are almoſt entirely unknown; though we can-

Civil History.

not doubt that the Carthaginians enriched themſelves by means of their commerce, which enabled them afterwards to attain ſuch a conſiderable ſhare of power.

19 Fifth general period. Hiſtory of the Jews, Babylonians, Egyptians, &c.

5. Cyrus having now become maſter of all the eaſt, the Aſiatic affairs continued for ſome time in a ſtate of tranquillity. The Jews obtained leave to return to their own country, rebuild their temple, and again eſtabliſh their worſhip, of all which an account is given in the ſacred writings, though undoubtedly they muſt have been in a ſtate of dependance on the Perſians from that time forward. Cambyſes the ſucceſſor of Cyrus added Egypt to his empire, which had either not ſubmitted to Cyrus, or revolted ſoon after his death. He intended alſo to have ſubdued the Carthaginians; but as the Phœnicians refuſed to ſupply him with ſhips to fight againſt their own countrymen, he was obliged to lay this deſign aſide.

In 517 B. C. the Babylonians finding themſelves grievouſly oppreſſed by their Perſian maſters, reſolved to ſhake off the yoke, and ſet up for themſelves. For this purpoſe, they took care to ſtore their city with all manner of proviſions; and when Darius Hyſtaſpes, then king of Perſia, advanced againſt them, they took the moſt barbarous method that can be imagined of preventing an unneceſſary conſumption of thoſe proviſions, which they had ſo carefully amaſſed. Having collected all the women, old men, and children, into one place, they ſtrangled them without diſtinction, whether wives, fathers, mothers, brothers, or ſiſters; every one being allowed to ſave only the wife he liked beſt, and a maid ſervant to do the work of the houſe. This cruel policy did not avail them: their city was taken by treachery (for it was impoſſible to take it by force); after which the king cauſed the walls of it to be beat down from 200 to 50 cubits height, that their ſtrength might no longer give encouragement to the inhabitants to revolt. Darius then turned his arms againſt the Scythians; but finding that expedition turn out both tedious and unprofitable, he directed his courſe eaſtward, and reduced all the country as far as the river Indus. In the mean time, the Ionians revolted; and being aſſiſted by the Greeks, a war commenced between the two nations, which was not thoroughly extinguiſhed but by the deſtruction of the Perſian empire in 330 B. C. The Ionians, however, were for this time obliged to ſubmit, after a war of ſix years; and were treated with great ſeverity by the Perſians. The conqueſt of Greece itſelf was then projected: but the expeditions for that purpoſe ended moſt unfortunately for the Perſians, and encouraged the Greeks to make repriſals on them, in which they ſucceeded according to their utmoſt wiſhes; and had it only been poſſible for them to have agreed among themſelves, the downfal of the Perſian empire would have happened much ſooner than it did. See ATHENS, SPARTA, MACEDON, and PERSIA.

In 459 B. C. the Egyptians made an attempt to recover their liberty, but were reduced after a war of ſix years. In 413 B. C. they revolted a ſecond time: and being aſſiſted by the Sidonians, drew upon the latter that terrible deſtruction foretold by the prophets; while they themſelves were ſo thoroughly humbled, that they never after made any attempt to recover their liberty.

Civil History.

The year 403 B. C. proved remarkable for the revolt of Cyrus againſt his brother Artaxerxes Mnemon; in which, through his own raſhneſs, he miſcarried, and loſt his life at the battle of Cunaxa in the province of Babylon. Ten thouſand Greek mercenaries, who ſerved in his army, made their way back into Greece, tho' ſurrounded on all ſides by the enemy, and in the heart of a hoſtile country. In this retreat they were commanded by Xenophon, who has received the higheſt praiſes on account of his conduct and military ſkill in bringing it to a happy concluſion. Two years after, the invaſions of Ageſilaus king of Sparta threatened the Perſian empire with total deſtruction; from which however it was relieved by his being recalled in order to defend his own country againſt the other Grecian ſtates; and after this the Perſian affairs continued in a more proſperous way till the time of Alexander.

20 Xenophon's retreat.

&c.

21 Hiſtory of the Greeks.

During all this time, the volatile and giddy temper of the Greeks, together with their enthuſiaſtic deſire of romantic exploits, were preparing fetters for themſelves, which indeed ſeemed to be abſolutely neceſſary to prevent them from deſtroying one another. A zeal for liberty was what they all pretended; but on every occaſion it appeared that this love of liberty was only a deſire of dominion. No ſtate in Greece could bear to ſee another equal to itſelf; and hence their perpetual conteſts for pre-eminence, which could not but weaken the whole body, and render them an eaſy prey to an ambitious and politic prince, who was capable of taking advantage of thoſe diviſions. Being all equally impatient of reſtraint they never could bear to ſubmit to any regular government; and hence their determinations were nothing but the deciſions of a mere mob, of which they had afterwards almoſt conſtantly reaſon to repent. Hence alſo their baſe treatment of thoſe eminent men whom they ought moſt to have honoured, as Miltiades, Ariſtides, Themiſtocles, Alcibiades, Socrates, Phocion, &c. The various tranſactions between the Grecian ſtates, though they make a very conſiderable figure in particular hiſtory, make none at all in a general ſketch of the hiſtory of the world. We ſhall therefore only obſerve, that in 404 B. C. the Athenian power was in a manner totally broken by the taking of their city by the Spartans. In 370, that of the Spartans received a ſevere check from the Thebans at the battle of Leuctra; and, eight years after, was ſtill further reduced by the battle of Mantinea. Epaminondas, the great enemy of the Spartans, was killed; but this only proved a more ſpeedy means of ſubjugating all the ſtates to a foreign, and at that time deſpicable, power. The Macedonians, a barbarous nation, lying to the north of the ſtates of Greece, were, two years after the death of Epaminondas reduced to the loweſt ebb by the Illyrians, another nation of barbarians in the neighbourhood. The king of Macedon being killed in an engagement, Philip, his brother, departed from Thebes, where he had ſtudied the art of war under Epaminondas, in order to take poſſeſſion of his kingdom. Being a man of great prudence and policy, he quickly ſettled his own affairs; vanquiſhed the Illyrians; and, being no ſtranger to the weakened ſituation of Greece, began almoſt immediately to meditate the conqueſt of it. The particulars of this enterprize are related under the article MACEDON: here it is ſufficient

Civil History.

ficient to take notice, that by firſt attacking thoſe he was ſure he could overcome, by corrupting thoſe whom he thought it dangerous to attack, by ſometimes pretending to aſſiſt one ſtate and ſometimes another, and by impoſing upon all as beſt ſerved his turn, he at laſt put it out of the power of the Greeks to make any reſiſtance, at leaſt ſuch as could keep him from gaining his end. In 338 B. C. he procured himſelf to be elected general of the Amphictyons, or council of the Grecian ſtates, under pretence of ſettling ſome troubles at that time in Greece; but having once obtained liberty to enter that country with an army, he quickly convinced the States that they muſt all ſubmit to his will. He was oppoſed by the Athenians and Thebans; but the inteſtine wars of Greece had cut off all her great men, and no general was now to be found capable of oppoſing Philip with ſucceſs.

The king of Macedon, being now maſter of all Greece, projected the conqueſt of Aſia. To this he was encouraged by the ill ſucceſs which had attended the Perſians in their expeditions againſt Greece, the ſucceſſes of the Greeks in their invaſions, and the retreat of the ten thouſand under Xenophon. All theſe events ſhewed the weakneſs of the Perſians, their vaſt inferiority to the Greeks in military ſkill, and how eaſily their empire might be overthrown by a proper union amoug the ſtates.

22 Conqueſt of Perſia by Alexander.

Philip was preparing to enter upon his grand deſign, when he was murdered by ſome aſſaſſins. His ſon Alexander was poſſeſſed of every quality neceſſary for the execution of ſo great a plan; and his impetuoſity of temper made him execute it with a rapidity unheard of either before or ſince. It muſt be confeſſed, indeed, that the Perſian empire was now ripe for deſtruction, and could not in all probability have withſtood an enemy much leſs powerful than Alexander. The Aſiatics have in all ages been much inferior to the European nations in valour and military ſkill. They were now ſunk in luxury and effeminacy; and what was worſe, they ſeem at this period to have been ſeized with that infatuation and diſtraction of counſels which ſcarce ever fails to be a forerunner of the deſtruction of any nation. The Perſian miniſters perſuaded their ſovereign to reject the prudent advice that was given him, of diſtreſſing Alexander by laying waſte the country, and thus forcing him to return for want of proviſions. Nay, they even prevented him from engaging the enemy in the moſt proper manner, by dividing his forces; and perſuaded him to put Charidemus the Athenian to death, who had promiſed, with 100,000 men, of whom one third were mercenaries, to drive the Greeks out of Aſia. In ſhort, Alexander met with only two checks in his Perſian expedition. The one was from the city of Tyre, which for ſeven months reſiſted his utmoſt efforts; the other was from Memnon the Rhodian, who had undertaken to invade Macedonia. The firſt of theſe obſtacles Alexander at laſt got over, and treated the governor and inhabitants with the utmoſt cruelty. The other was ſcarce felt; for Memnon died after reducing ſome of the Grecian iſlands, and Darius had no other general capable of conducting the undertaking. The power of the Perſian empire was totally broke by the victory gained over Darius at Arbela in 331 B. C. and next year a total end was put to it by the murder of the king by Beſſus one of his ſubjects.

Civil History.

The ambition of Alexander was not to be ſatisfied with the poſſeſſion of the kingdom of Perſia, or indeed of any other on earth. Nothing leſs then the total ſubjection of the world itſelf ſeemed ſufficient to him; and therefore he was now prompted to invade every country of which he could only learn the name, whether it had belonged to the Perſians or not. In conſequence of this diſpoſition, he invaded and reduced Hyrcania, Bactria, Sogdia, and all that vaſt tract of country now called *Bukharia*. At laſt, having entered India, he reduced all the nations to the river Hyphaſis, one of the branches of the Indus. But when he would have proceeded farther, and extended his conqueſts quite to the eaſtern extremities of Aſia, his troops poſitively refuſed to follow him farther, and he was conſtrained to return. In 323, this mighty conqueror died of a fever; without having time to ſettle the affairs of his vaſt extended empire, or even to name his ſucceſſor.

23 His conqueſt of other nations.

24 History of the Romans.

While the Grecian empire thus ſuddenly ſprung up in the eaſt, the rival ſtates of Rome and Carthage were making conſiderable advances in the weſt. The Romans were eſtabliſhing their empire on the moſt ſolid foundations; to which their particular ſituation naturally contributed. Being originally little better than a parcel of lawleſs banditti, they were deſpiſed and hated by the neighbouring ſtates. This ſoon produced wars; in which, at firſt from accidental circumſtances, and afterwards from their ſuperior valour and conduct, the Romans proved almoſt conſtantly victorious. The jealouſies which prevailed among the Italian ſtates, and their ignorance of their true intereſt, prevented them from combining againſt that aſpiring nation, and cruſhing it in its infancy, which they might eaſily have done; while in the mean time the Romans, being kept in a ſtate of continual warfare, became at laſt ſuch expert ſoldiers, that no other ſtate on earth could reſiſt them. During the time of their kings they had made a very conſiderable figure among the Italian nations; but after their expulſion, and the commencement of the republic, their conqueſts became much more rapid and extenſive. In 501 B. C. they ſubdued the Sabines; eight years after, the Latins; and in 399 the city of Veii, the ſtrongeſt in Italy excepting Rome itſelf, was taken after a ſiege of ten years. But in the midſt of their ſucceſſes a ſudden irruption of the Gauls had almoſt put an end to their power and nation at once. The city was burnt to the ground in 383 B. C. and the capitol on the point of being ſurprized, when the Gauls, who were climbing up the walls in the night, were accidentally diſcovered and repulſed *. In a ſhort time Rome was rebuilt with much greater ſplendor than before, but now a general revolt and combination of the nations formerly ſubdued took place. The Romans, however, ſtill got the better of their enemies; but, even at the time of the celebrated Camillus's death, which happened about 352 B. C. their territories ſcarce extended ſix or ſeven leagues from the capital. The republic from the beginning was agitated by thoſe diſſenſions which at laſt proved its ruin. The people had been divided by Romulus into two claſſes, namely *Patricians* and *Plebeians*, anſwer-

* See *Rome*.

Civil History.

ing to our nobility and commonalty. Between these two bodies were perpetual jealousies and contentions; which retarded the progress of the Roman conquests, and revived the hopes of the nations they had conquered. The tribunes of the people were perpetually opposing the consuls and military tribunes. The senate had often recourse to a dictator endowed with absolute power; and then the valour and experience of the Roman troops made them victorious: but the return of domestic seditions gave the subjugated nations an opportunity of shaking off the yoke. Thus had the Romans continued for near 400 years, running the same round of wars with the same enemies, and reaping very little advantage from their conquests, till at last matters were compounded by choosing one of the consuls from among the plebeians; and from this time chiefly we may date the prosperity of Rome, so that by the time that Alexander the Great died they were held in considerable estimation among foreign nations.

25 Of the Carthaginians, and of Sicily.

The Carthaginians in the mean time continued to enrich themselves by commerce; but, being less conversant in military affairs, were by no means equal to the Romans in power, though they excelled them in wealth. A new state, however, makes its appearance during this period; which may be said to have taught the Carthaginians the art of war, and by bringing them into the neighbourhood of the Romans proved the first source of contention between these two powerful nations. This was the island of Sicily. At what time people were first settled on it, is not now to be ascertained. The first inhabitants we read of were called *Sicani*, *Siculi*, *Læstrigones*, &c. but of these we know little or nothing. In the second year of the seventeenth Olympiad, or 710 B. C. some Greek colonies are said to have arrived on the island, and in a short time founded several cities, of which Syracuse was the chief. The Syracusans at last subdued the original inhabitants; though it doth not appear that the latter were ever well affected to their government, and therefore were on all occasions ready to revolt. The first considerable prince, or (as he is called by the Greeks) *tyrant* of Syracuse, was Gelon, who obtained the sovereignty about the year 483 B. C. At what time the Carthaginians first carried their arms into Sicily, is not certainly known; only we are assured, that they possessed some part of the island as early as 505 B. C. For in the time of the first consuls, the Romans and Carthaginians entered into a treaty chiefly in regard to matters of navigation and commerce; by which it was stipulated, that the Romans who should touch at Sardinia, or that part of Sicily which belonged to Carthage, should be received there in the same manner as the Carthaginians themselves. Whence it appears, that the dominion of Carthage already extended over Sardinia and part of Sicily: but in 28 years after, they had been totally driven out by Gelon; which probably was the first exploit performed by him. This appears from his speech to the Athenian and Spartan ambassadors who desired his assistance against the forces of Xerxes king of Persia. The Carthaginians made many attempts to regain their possessions in this island, which occasioned long and bloody wars between them and the Greeks, as related under the articles CARTHAGE and SICILY. This island also proved the scene of much slaughter and bloodshed in the wars of the Greeks with one another *. Before the year 323 B. C. however, the Carthaginians had made themselves masters of a very considerable part of the island; from whence all the power of the Greeks could not dislodge them. It is proper also to observe, that after the destruction of Tyre by Alexander the Great, almost all the commerce in the western part of the world fell to the share of the Carthaginians. Whether they had at this time made any settlements in Spain, is not known. It is certain, that they traded to that country for the sake of the silver, in which it was very rich; as they probably also did to Britain, for the tin with which it abounded.

Civil History.

* See *Athens* and *Sparta*.

26 Sixth period. History of the Macedonian empire.

6. The beginning of the sixth period presents us with a state of the world entirely different from the foregoing. We now behold all the eastern part of the world, from the confines of Italy to the river Indus, and beyond it, newly united into one vast empire, and at the same time ready to fall to pieces for want of a proper head; the western world filled with fierce and savage nations, whom the rival republics of Carthage and Rome were preparing to enslave as fast as they could. The first remarkable events took place in the Macedonian empire.—Alexander, as already observed, had not distinctly named any successor; but he had left behind him a victorious, and, we may say, invincible army, commanded by most expert officers, all of them ambitious of supreme authority. It is not to be supposed that peace could long be preserved in such a situation. For a number of years, indeed, nothing was to be seen or heard of but the most horrid slaughters, and wickedness of every kind; until at last the mother, wives, children, brothers, and even sisters, of Alexander were cut off; not one of the family of that great conqueror being left alive. When matters were a little settled, four new empires, each of them of no small extent, had arisen out of the empire of Alexander. Cassander, the son of Antipater, had Macedonia, and all Greece; Antigonus, Asia-Minor; Seleucus had Babylon, and the eastern provinces; and Ptolemy Lagus, Egypt, and the western ones. One of these empires, however, quickly fell; Antigonus being defeated and killed by Seleucus and Lysimachus at the battle of Ipsus, in 301 B C. The greatest part of his dominions then fell to Seleucus: but several provinces took the opportunity of these confusions to shake off the Macedonian yoke altogether; and thus were formed the kingdoms of Pontus, Bithynia, Pergamus, Armenia, and Cappadocia. The two most powerful and permanent empires, however, were those of Syria founded by Seleucus, and Egypt by Ptolemy Lagus. The kings of Macedon, though they did not preserve the same authority over the Grecian states that Alexander, Antipater, and Cassander, had done, yet effectually prevented them from those outrages upon one another, for which they had formerly been so remarkable. Indeed, it is somewhat difficult to determine, whether their condition was better or worse than before they were conquered by Philip; since, though they were now prevented from destroying one another, they were most grievously oppressed by the Macedonian tyrants.

While the eastern parts of the world were thus deluged with blood, and the successors of Alexander were

Civil History.

27 Of the Romans and Carthaginians.

were pulling to pieces the empire which he had eſtabliſhed; the Romans and Carthaginians proceeded in their attempts to enſlave the nations of the weſt. The Romans, ever engaged in war, conquered one city and ſtate after another, till, about the year 253 B C. they had made themſelves maſters of almoſt the whole of Italy. During all this time they had met only with a ſingle check in their conqueſts; and that was the invaſion of Pyrrhus, king of Epirus. That ambitious and fickle prince had projected the conqueſt of Italy, which he fancied would be an eaſy matter. Accordingly, in 271 B. C. he entered that country, and maintained a war with the Romans for ſix years; till at laſt, being utterly defeated by Curius Dentatus, he was obliged to return.

The Romans had no ſooner made themſelves maſters of Italy, than they wanted only a pretence to carry their arms out of it; and this pretence was ſoon found out. Being invited into Sicily to aſſiſt the Mamertines againſt Hiero king of Syracuſe and the Carthaginians, they immediately commenced a war with the latter, which continued with the utmoſt fury for 23 years. The war ended greatly to the diſadvantage of the Carthaginians, chiefly owing to the bad conduct of their generals; none of whom, Hamilcar Barcas alone excepted, ſeem to have been poſſeſſed of any degree of military ſkill; and the ſtate had ſuffered too many misfortunes before he entered upon the command, for him or any other to retrieve it at that time. The conſequence of this war was the entire loſs of Sicily to the Carthaginians; and ſoon after, the Romans ſeized on the iſland of Sardinia.

Hamilcar perceiving that there was now no alternative, but that in a ſhort time either Carthage muſt conquer Rome, or Rome would conquer Carthage, bethought himſelf of a method by which his country might become equal to that haughty republic. This was by reducing all Spain, in which the Carthaginians had already conſiderable poſſeſſions, and from the mines of which they drew great advantages. He had, therefore, no ſooner finiſhed the war with the mercenaries, which ſucceeded that with the Romans, than he ſet about the conqueſt of Spain. This, however, he did not live to accompliſh, though he made great progreſs in it. His ſon Aſdrubal continued the war with ſucceſs; till at laſt, the Romans, jealous of his progreſs, perſuaded him to enter into a treaty with them, by which he engaged himſelf to make the river Iberus the boundary of his conqueſts. This treaty probably was never ratified by the ſenate of Carthage; nor, though it had, would it have been regarded by Hannibal, who ſucceeded Aſdrubal in the command, and had ſworn perpetual enmity with the Romans. The tranſactions of the ſecond Punic war are perhaps the moſt remarkable which the hiſtory of the world can afford. Certain it is, that nothing can ſhew more clearly the ſlight foundations upon which the greateſt empires are built. We now ſee the Romans, the nation moſt remarkable for their military ſkill in the whole world, and who, for more than 500 years, had been conſtantly victorious, unable to reſiſt the efforts of one ſingle man. At the ſame time we ſee this man, though evidently the firſt general in the world, loſt ſolely for want of a ſlight ſupport. In former times, the republic of Carthage ſupplied her generals in Sicily with hundreds of thouſands, though their enterprizes were almoſt conſtantly unſucceſsful; but now Hannibal, the conqueror of Italy, was obliged to abandon his deſign, merely for want of 20 or 30,000 men. That degeneracy and infatuation, which never fails to overwhelm a falling nation, or rather which is the cauſe of its fall, had now infected the counſels of Carthage, and the ſupplies were denied. Neither was Carthage the only infatuated nation at this time. Hannibal, whoſe prudence never forſook him either in proſperity or adverſity, in the height of his good fortune had concluded an alliance with Philip king of Macedon. Had that prince ſent an army to the aſſiſtance of the Carthaginians in Italy immediately after the battle of Cannæ, there can be no doubt but the Romans would have been forced to accept of that peace which they ſo haughtily refuſed †; and indeed, this offer of peace in the midſt of ſo much ſucceſs, is an inſtance of moderation which perhaps does more honour to the Carthaginian general, than all the military exploits he performed. Philip, however, could not be rouſed from his indolence, nor ſee that his own ruin was connected with that of Carthage. The Romans had now made themſelves maſters of Sicily: after which they recalled Marcellus, with his victorious army, to be employed againſt Hannibal; and the conſequence at laſt was, that the Carthaginian armies, unſupported in Italy, could not conquer it, but were recalled into Africa, which the Romans had invaded. The ſouthern nations ſeem to have been as blind to their own intereſt as the northern ones. They ought to have ſeen, that it was neceſſary for them to preſerve Carthage from being deſtroyed; but, inſtead of this, Maſiniſſa king of Numidia allied with the Romans, and by his means Hannibal was overcome at the battle of Zama, * which finiſhed the ſecond Punic war, in 188 B C.

† See *Carthage*, n° 125.

* See *Zama*.

28 Of Egypt and Syria.

The event of the ſecond Punic war determined the fate of almoſt all the other nations in the world. All this time, indeed, the empires of Egypt, Syria, and Greece, had been promoting their own ruin by mutual wars and inteſtine diviſions. The Syrian empire was now governed by Antiochus the Great, who ſeems to have had little right to ſuch a title. His empire, though diminiſhed by the defection of the Parthians, was ſtill very powerful; and to him Hannibal applied, after he was obliged to leave his country, as related under CARTHAGE, n° 152. Antiochus, however, had not ſufficient judgment to ſee the neceſſity of following that great man's advice; nor would the Carthaginians be prevailed upon to contribute their aſſiſtance againſt the nation which was ſoon to deſtroy them without any provocation. The pretence for war on the part of the Romans was, that Antiochus would not declare his Greek ſubjects in Aſia to be free and independent ſtates; a requiſition which neither the Romans nor any other nation had a right to make. The event of all was, that Antiochus was every-where defeated, and forced to conclude a peace upon very diſadvantageous terms.

29 Of Greece.

In Europe, matters went on in the ſame way; the ſtates of Greece, weary of the tyranny of the Macedonians, entered into a reſolution of recovering their liberties.

Civil History.

liberties. For this purpose was framed the Achæan League †; but, as they could not agree among themselves, they at last came to the imprudent determination of calling in the Romans, to defend them against Philip king of Macedon. This produced a war, in which the Romans were victorious. The Macedonians, however, were still formidable; and, as the intention of the Romans to enslave the whole world could no longer be doubted, Perseus, the successor of Philip, renewed the war. Through his own cowardice he lost a decisive engagement, and with it his kingdom, which submitted to the Romans in 167 B. C.

† See *Greece*

30 Destruction of Carthage and Corinth.

Macedon being thus conquered, the next step was utterly to exterminate the Carthaginians; whose republic, notwithstanding the many disasters that had befallen it, was still formidable. It is true, the Carthaginians were giving no offence; nay, they even made the most abject submissions to the republic of Rome: but all was not sufficient. War was declared a third time against that unfortunate state; there was now no Hannibal to command their armies, and the city was utterly destroyed 146 B. C. The same year the Romans put an end to the liberties they had pretended to grant the cities of Greece, by the entire destruction of CORINTH. See that article.

31 History of Egypt, Syria, and Judæa.

After the death of Antiochus the Great, the affairs of Syria and Egypt went on from bad to worse. The degenerate princes which filled the thrones of those empires, regarding only their own pleasures, either spent their time in oppressing their subjects, or in attempting to deprive each other of their dominions, by which means they became a more easy prey to the Romans. So far indeed were they from taking any means to secure themselves against the overgrown power of that republic, that the kings both of Syria and Egypt sometimes applied to the Romans as protectors. Their downfal, however, did not happen within the period of which we now treat.—The only other transaction which makes any considerable figure in the Syrian empire, is the oppression of the Jews by Antiochus Epiphanes. After their return from the Babylonish captivity, they continued in subjection to the Persians till the time of Alexander. From that time they were subject to the kings of Egypt or Syria, as the fortune of either happened to prevail. Egypt being reduced to a low ebb by Antiochus Epiphanes, the Jews fell under his dominion, and being severely treated by him, imprudently shewed some signs of joy on a report of his death. This brought him against them with a powerful army; and in 170 B. C. he took Jerusalem by storm, committing the most horrid cruelties on the inhabitants, insomuch that they were obliged to hide themselves in caverns and in holes of rocks to avoid his fury. Their religion was totally abolished, their temple profaned, and an image of Jupiter Olympius set up on the altar of burnt-offerings; which profanation is thought to be the *abomination of desolation* mentioned by the prophet Daniel. This revolution, however, was of no long continuance. In 167 B. C. Mattathias restored the true worship in most of the cities of Judea; and, in 165, the temple was purified, and the worship there restored by Judas Maccabæus. This was followed by a long series of wars between the Syrians and Jews, in which the latter were almost always victorious; and before these wars were finished, the destruction of Carthage happened, which puts an end to the sixth general period formerly mentioned.

Civil History.

32 Seventh period. General state of the world.

7. The beginning of the seventh period presents us with a view of the ruins of the Greek empire in the declining states of Syria and Egypt; both of them much circumscribed in bounds. The empire of Syria at first comprehended all Asia to the river Indus, and beyond it; but in 312 B. C. most of the Indian provinces were by Seleucus ceded to one *Sandrocottus*, or *Androcottus*, a native, who in return gave him 500 elephants. Of the empire of Sandrocottus we know nothing farther than that he subdued all the countries between the Indus and the Ganges; so that from this time we may reckon the greatest part of India independent on the Syro-Macedonian princes. In 250 B. C. however, the empire sustained a much greater loss by the revolt of the Parthians and Bactrians from Antiochus Theus. The former could not be subdued; and as they held in subjection to them the vast tract which now goes under the name of *Persia*, we must look upon their defection as an irreparable loss. Whether any part of their country was afterwards recovered by the kings of Egypt or Syria, is not very certain; nor is it of much consequence, since we are assured that in the beginning of the seventh period, i. e. 146 B. C. the Greek empires of Syria and Egypt were reduced by the loss of India, Persia, Armenia, Pontus, Bithynia, Cappadocia, Pergamus, &c. The general state of the world in 146 B. C. therefore was as follows. In Asia were the empires of India, Parthia, and Syria, with the lesser states of Armenia, Pontus, &c. above-mentioned; to which we must add that of Arabia, which, during the sixth period, had grown into some consequence, and had maintained its independency from the days of Ishmael the son of Abraham. In Africa were the kingdoms of Egypt and Ethiopia; the Carthaginian territories, now subject to the Romans; and the kingdoms of Numidia, Mauritania, and Getulia, ready to be swallowed up by the same ambitious and insatiable power, now that Carthage was destroyed, which served as a barrier against it. To the south lay some unknown and barbarous nations, secure by reason of their situation and insignificance, rather than their strength, or distance from Rome. In Europe we find none to oppose the progress of the Roman arms, except the Gauls, Germans, and some Spanish nations. These were brave indeed; but, through want of military skill, incapable of contending with such masters in the art of war as the Romans then were.

33 Conquests of the Romans.

The Spaniards had indeed been subdued by Scipio Africanus in the time of the second Punic war: but, in 155 B. C. they revolted; and, under the conduct of one Viriathus, formerly a robber, held out for a long time against all the armies the Romans could send into Spain. Him the Consul Cæpio caused to be murdered about 138 B. C. because he found it impossible to reduce him by force. The city of Numantia defied the whole Roman power for six years longer; till at last, by dint of treachery, numbers, and perseverance, it was not taken, but the inhabitants, reduced to extremity by famine, set fire to their houses, and perished in the flames, or killed one another, so that not one remained to grace the triumph of the

Civil History.

the conqueror; and this for the preſent quieted the reſt of the Spaniards.—About the ſame time Attalus, king of Pergamus, left by will the Roman people heirs to all his goods; upon which they immediately ſeized on his kingdom as part of thoſe goods, and reduced it to a Roman province, under the name of *Aſia Proper*. Thus they continued to enlarge their dominions on every ſide, without the leaſt regard to juſtice, to the means they employed, or to the miſeries they brought upon the conquered people. In 122 B. C. the Baleric iſlands, now called *Majorca*, *Minorca*, and *Ivica*, were ſubdued, and the inhabitants exterminated; and, ſoon after, ſeveral of the nations beyond the Alps were obliged to ſubmit.

In Africa the crimes of Jugurtha ſoon gave this ambitious republic an opportunity of conquering the kingdoms of Numidia and Mauritania: and indeed this is almoſt the only war in which we find the Romans engaged, where their pretenſions had the leaſt colour of juſtice; though in no caſe whatever could a nation ſhew more degeneracy than the Romans did on this occaſion. The particulars of this war are related under the articles NUMIDIA and ROME. The event of it was the total reduction of the former about the year 105 B. C. but Mauritania and Getulia preſerved their liberty for ſome time longer.

In the eaſt, the empire of Syria continued daily to decline; by which means the Jews not only had an opportunity of recovering their liberty, but even of becoming as powerful, or at leaſt of extending their dominions as far, as in the days of David and Solomon. This declining empire was ſtill farther reduced by the civil diſſenſions between the two brothers Antiochus Grypus and Antiochus Cyzicenus; during which the cities of Tyre, Sidon, Ptolemais, and Gaza, declared themſelves independent, and in other cities tyrants ſtarted up who refuſed allegiance to any foreign power. This happened about 100 B. C.; and 17 years after, the whole was reduced by Tigranes, king of Armenia. On his defeat by the Romans, the latter reduced Syria to a province of their empire. The kingdom of Armenia itſelf, with thoſe of Pontus, Cappadocia, and Bithynia, ſoon ſhared the ſame fate; Pontus, the moſt powerful of them all, being ſubdued about 64 B. C.—The kingdom of Judæa alſo was reduced under the ſame power much about this time. This ſtate owed the loſs of its liberty to the ſame cauſe that had ruined ſeveral others, namely, calling in the Romans as arbitrators between two contending parties. The two ſons of Alexander Jannæus (Hyrcanus and Ariſtobulus) contended for the kingdom. Ariſtobulus, being defeated by the party of Hyrcanus, applied to the Romans. Pompey the Great, who acted as ultimate judge in this affair, decided it againſt Ariſtobulus, but at the ſame time deprived Hyrcanus of all power as a king; not allowing him even to aſſume the regal title, or to extend his territory beyond the ancient borders of Judæa. To ſuch a length did Pompey carry this laſt article, that he obliged him to give up all thoſe cities in Cœloſyria and Phœnicia which had been gained by his predeceſſors, and added them to the newly acquired Roman province of Syria.

Thus the Romans became maſters of all the eaſtern parts of the world, from the Mediterranean ſea to the borders of Parthia. In the weſt, however, the Gauls were ſtill at liberty, and the Spaniſh nations bore the Roman yoke with great impatience. The Gauls infeſted the territories of the republic by their frequent incurſions, which were ſometimes very terrible; and tho' ſeveral attempts had been made to ſubdue them, they always proved inſufficient till the time of Julius Cæſar. By him they were totally reduced, from the river Rhine to the Pyrenæan mountains, and many of their nations almoſt exterminated. He carried his arms alſo into Germany and the ſouthern parts of Britain; but in neither of theſe parts did he make any permanent conqueſts. The civil wars between him and Pompey gave him an opportunity of ſeizing on the kingdom of Mauritania and thoſe parts of Numidia which had been allowed to retain their liberty. The kingdom of Egypt alone remained, and to this nothing belonged except the country properly ſo called. Cyrenaica was bequeathed by will to the Romans about 58 B. C.; and about the ſame time the iſland of Cyprus was ſeized by them without any pretence, except a deſire of poſſeſſing the treaſures of the king.—The kingdom of Egypt continued for ſome time longer at liberty; which in ſome meaſure muſt be aſcribed to the internal diſſenſions of the republic, but more eſpecially to the amours of Pompey, Julius Cæſar, and Marc Antony, with the famous Cleopatra queen of Egypt. The battle of Actium, however, determined the fate of Antony, Cleopatra, and Egypt itſelf; which laſt was reduced to a Roman province, about 9 B. C.

34
Origin and progreſs of the civil wars in Rome.

While the Romans thus employed all means to reduce the world to their obedience, they were making one another feel the ſame miſeries at home, which they inflicted upon other nations abroad. The firſt civil diſſenſions took their riſe at the ſiege of Numantia in Spain. We have already obſerved, that this ſmall city reſiſted the whole power of the Romans for ſix years. Once they gave them a moſt terrible and ſhameful defeat, wherein 30,000 Romans fled before 4000 Numantines. Twenty thouſand were killed in the battle, and the remaining ten thouſand ſo ſhut up, that there was no poſſibility of eſcaping. In this extremity they were obliged to negotiate with the enemy, and a peace was concluded upon the following terms: 1. That the Numantines ſhould ſuffer the Romans to retire unmoleſted; and, 2. That Numantia ſhould maintain its independence, and be reckoned among the Roman allies.—The Roman ſenate, with an injuſtice and ingratitude hardly to be matched, broke this treaty, and in return ordered the commander of their army to be delivered up to the Numantines: but they refuſed to accept of him, unleſs his army was delivered along with him; upon which the war was renewed, and ended as already related. The fate of Numantia, however, was ſoon revenged. Tiberius Sempronius Gracchus, brother-in-law to Scipio Africanus the ſecond, had been a chief promoter of the peace with the Numantines already mentioned, and of conſequence had been in danger of being delivered up to them along with the commander in chief. This diſgrace he never forgot; and, in order to revenge himſelf, undertook the cauſe of the Plebeians againſt the Patricians, by whom the former were greatly oppreſſed. He began with reviving an old law, which had enacted

Civil History.

enacted that no Roman citizen ſhould poſſeſs more than 500 acres of land. The overplus he deſigned to diſtribute among thoſe who had no lands, and to reimburſe the rich out of the public treaſury. This law met with great oppoſition, bred many tumults, and at laſt ended in the death of Gracchus and the perſecution of his friends, ſeveral hundreds of whom were put to cruel deaths without any form of law.

The diſturbances did not ceaſe with the death of Gracchus. New conteſts enſued on account of the Sempronian law, and the giving to the Italian allies the privilege of Roman citizens. This laſt not only produced great commotions in the city, but occaſioned a general revolt of the ſtates of Italy againſt the republic of Rome. This rebellion was not quelled without the utmoſt difficulty: and in the mean time, the city was deluged with blood by the contending factions of Sylla and Marius; the former of whom ſided with the patricians, and the latter with the plebeians. Theſe diſturbances ended in the perpetual dictatorſhip of Sylla, about 80 B. C.

From this time we may date the loſs of the Roman liberty; for though Sylla reſigned his dictatorſhip two years after, the ſucceeding conteſts between Cæſar and Pompey proved equally fatal to the republic. Theſe conteſts were decided by the battle of Pharſalia, by which Cæſar became in effect maſter of the empire in 43 B. C. Without loſs of time, he then croſſed over into Africa; totally defeated the republican army in that continent; and, by reducing the country of Mauritania to a Roman province, completed the Roman conqueſts in theſe parts. His victory over the ſons of Pompey at Munda 40 B. C. ſecured him from any further apprehenſions of a rival. Being therefore ſole maſter of the Roman empire, and having all the power of it at his command, he projected the greateſt ſchemes; tending, according to ſome, not leſs to the happineſs than to the glory of his country: when he was aſſaſſinated in the ſenate-houſe, in the 56th year of his age, and 39 B. C.

Without inveſtigating the political juſtice of this action, or the motives of the perpetrators; it is impoſſible not to regret the death of this great man, when we contemplate his virtues, and the deſigns which he is ſaid to have formed: (See ROME.) Nor is it poſſible to juſtify, from ingratitude at leaſt, even the moſt virtuous of the conſpirators, when we conſider the obligations under which they lay to him. And as to the meaſure itſelf, even in the view of expediency, it ſeems to be generally condemned. In fact, from the tranſactions which had long preceded, as well as thoſe which immediately followed, the murder of Cæſar, it is evident, that Rome was incapable of preſerving its liberty any longer, and that the people had become unfit for being free. The efforts of Brutus and Caſſius were therefore unſucceſsful, and ended in their own deſtruction and that of great numbers of their followers in the battles of Philippi. The defeat of the republicans was followed by numberleſs diſturbances, murders, proſcriptions, &c. till at laſt Octavianus, having cut off all who had the courage to oppoſe him, and finally got the better of his rivals by the victory at Actium, put an end to the republic in the year 27 B. C.

35 Octavianus puts an end to the republic.

The deſtruction of the Roman commonwealth proved advantageous to the few nations of the world who ſtill retained their liberty. That outrageous deſire of conqueſt, which had ſo long marked the Roman character, now in a great meaſure ceaſed; becauſe there was now another way of ſatisfying the deſires of ambitious men, namely, by courting the favour of the emperor. After the final reduction of the Spaniards, therefore, and the conqueſt of the countries of Mæſia, Pannonia, and ſome others adjacent to the Roman territories, and which in a manner ſeemed naturally to belong to them, the empire enjoyed for ſome time a profound peace.

The only remarkable tranſactions which took place during the remainder of the period of which we treat were the conqueſt of Britain by Claudius and Agricola, and the deſtruction of Jeruſalem by Veſpaſian and Titus. The war with the Jews began A. D. 67; and was occaſioned by their obſtinately claiming the city of Cæſarea, which the Romans had added to the province of Syria. It ended in 73, with the moſt terrible deſtruction of their city and nation; ſince which time they have never been able to aſſemble as a diſtinct people. The ſouthern parts of Britain were totally ſubdued by Agricola about ten years after.

In the 98th year of the Chriſtian æra, Trajan was created emperor of Rome; and being a man of great valour and experience in war, carried the Roman conqueſts to their utmoſt extent. Having conquered the Dacians, a German nation beyond the Danube, and who had of late been very troubleſome, he turned his arms eaſtward; reduced all Meſopotamia, Chaldæa, Aſſyria; and having taken Cteſiphon, the capital of the Parthian empire, appointed them a king, which he thought would be a proper method of keeping that warlike people in ſubjection. After this, he propoſed to return to Italy, but died by the way; and with his reign the ſeventh general period abovementioned is concluded.

36 Eighth period General ſtate of the world.

8. The beginning of the eighth period preſents us with a view of one vaſt empire, in which almoſt all the nations of the world were ſwallowed up. This empire comprehended the beſt part of Britain, all Spain, France, the Netherlands, Italy, part of Germany, Egypt, Barbary, Bildulgerid, Turky in Europe, Turky in Aſia, and Perſia. The ſtate of India at this time is unknown. The Chineſe lived in a remote part of the world, unheard of and unmoleſted by the weſtern nations who ſtruggled for the empire of the world. The northern parts of Europe and Aſia were filled with barbarous nations, already formidable to the Romans, and who were ſoon to become more ſo. The vaſt empire of the Romans, however, had no ſooner attained its utmoſt degree of power, than, like others before it, it began to decline. The provinces of Babylonia, Meſopotamia, and Aſſyria, almoſt inſtantly revolted, and were abandoned by Adrian the ſucceſſor of Trajan in the empire. The Parthians having recovered their liberty, continued to be very formidable enemies, and the barbarians of the northern parts of Europe continued to increaſe in ſtrength; while the Romans, weakened by inteſtine diviſions, became daily leſs able to reſiſt them. At different times, however, ſome warlike emperors aroſe, who put a ſtop to the incurſions of theſe barbarians; and about the year 215, the Parthian empire was totally overthrown by the Perſians,

sians, who had long been subject to them. This revolution proved of little advantage to the Romans. The Persians were enemies still more troublesome than the Parthians had been; and though often defeated, they still continued to infest the empire on the east, as the barbarous nations of Europe did on the north. In 260, the defeat and captivity of the emperor Valerian by the Persians, with the disturbances which followed, threatened the empire with utter destruction. Thirty tyrants seized the government at once, and the barbarians pouring in on all sides in prodigious numbers ravaged almost all the provinces of the empire. By the vigorous conduct of Claudius, Aurelian, Tacitus, Probus, and Carus, the empire was restored to its former lustre; but as the barbarians were only repulsed, and never thoroughly subdued, this proved only a temporary relief. What was worse, the Roman soldiers, grown impatient of restraint, commonly murdered those emperors who attempted to revive among them the ancient military discipline which alone could ensure the victory over their enemies. Under Diocletian, the disorders were so great, that though the government was held by two persons, they found themselves unable to bear the weight of it, and therefore took other two partners in the empire. Thus was the Roman empire divided into four parts; which by all historians is said to have been productive of the greatest mischiefs. As each of the four sovereigns would have as many officers both civil and military, and the same number of forces that had been maintained by the state when governed only by one emperor, the people were not able to pay the sums necessary for supporting them. Hence the taxes and imposts were increased beyond measure, the inhabitants in several provinces reduced to beggary, the land left untilled for want of hands, &c. An end was put to these evils when the empire was again united under Constantine the Great; but in 330 a mortal blow was given to it by removing the imperial seat to Byzantium, now Constantinople, and making it equal to Rome. The introduction and establishment of Christianity, already corrupted with the grossest superstitions, proved also a most grievous detriment to the empire. Instead of that ferocious and obstinate valour in which the Romans had so long been accustomed to put their trust, they now imagined themselves secured by signs of the cross, and other external symbols of the Christian religion. These they used as a kind of magical incantations, which undoubtedly proved at all times ineffectual, and hence also in some measure proceeded the great revolution which took place in the next period.

37 Ninth period. Destruction of the western empire.

9. The ninth general period shews us the decline and miserable end of the western part of the Roman empire. We see that mighty empire, which formerly occupied almost the whole world, now weakened by division, and surrounded by enemies. On the east, the Persians; on the north, the Scythians, Sarmatians, Goths, and a multitude of other barbarous nations, watched all occasions to break into it; and miscarried in their attempts, rather through their own barbarity, than the strength of their enemies. The devastations committed by those barbarians when they made their incursions are incredible, and the relation shocking to human nature. Some authors seem much inclined to favour them; and even insinuate, that barbarity and ignorant ferocity were their chief, if not their only faults: but from their history it plainly appears, that not only barbarity and the most shocking cruelty, but the highest degrees of avarice, perfidy, and difregard to the most solemn promises, were to be numbered among their vices. It was ever a sufficient reason for them to make an attack, that they thought their enemies could not resist them. Their only reason for making peace, or for keeping it, was because their enemies were too strong; and their only reason for committing the most horrid massacres, rapes, and all manner of crimes, was, because they had gained a victory. The Romans, degenerate as they were, are yet to be esteemed much better than these savages; and therefore we find not a single province of the empire that would submit to the barbarians, while the Romans could possibly defend them.

Some of the Roman emperors indeed withstood this inundation of savages; but as the latter grew daily more numerous, and the Romans continued to weaken themselves by their intestine divisions, they were at last obliged to take large bodies of barbarians into their pay, and teach them their military discipline, in order to drive away their countrymen, or others who invaded the empire. This at last proved its total destruction; for, in 476, the barbarians who served in the Roman armies, and were dignified with the title of *allies*, demanded the third part of the lands of Italy as a reward for their services: but meeting with a refusal, they revolted, and made themselves masters of the whole country, and of Rome itself, which from that time ceased to be the head of an empire of any consequence.

38 General state of the world.

This period exhibits a most unfavourable view of the western parts of the world: The Romans, from the height of grandeur, sunk to the lowest slavery, nay, in all probability, almost exterminated; the provinces they formerly governed, inhabited by human beings scarce a degree above the brutes; every art and science lost; and the savage conquerors even in danger of starving for want of a sufficient knowledge of agriculture, having now no means of supplying themselves by plunder and robbery as before. Britain had long been abandoned to the mercy of the Scots and Picts; and in 450 the inhabitants had called in the Saxons to their assistance, whom they soon found worse enemies than those against whom they had implored their aid. Spain was held by the Goths and Suevians; Africa (that is, Barbary and Bildulgerid,) by the Vandals; the Burgundians, Goths, Franks, and Alans, had erected several small states in Gaul; and Italy was subjected to the Heruli under Odoacer, who had taken upon him the title of *king of Italy*. In the east, indeed, matters wore an aspect somewhat more agreeable. The Roman empire continued to live in that of Constantinople, which was still very extensive. It comprehended all Asia-Minor and Syria, as far as Persia; in Africa, the kingdom of Egypt; and Greece in Europe. The Persians were powerful, and rivalled the emperors of Constantinople; and beyond them lay the Indians, Chinese, and other nations, who, unheard-of by the inhabitants of the more western parts, enjoyed peace and liberty.

The Constantinopolitan empire continued to decline

Civil History.

by reaſon of its continual wars with the Perſians, Bulgarians, and other barbarous nations; to which alſo ſuperſtition and relaxation of military diſcipline largely contributed. The Perſian empire alſo declined, from the ſame cauſes, together with the inteſtine broils from which it was feldom free more than that of Conſtantinople. The hiſtory of the eaſtern part of the world during this period, therefore, conſiſts only of the wars between theſe two great empires, of which an account is given under the articles CONSTANTINOPLE and PERSIA; and which were productive of no other conſequence than that of weakening them both, and making them a more eaſy prey to thoſe enemies who were now as it were in embryo, but ſhortly about to erect an empire almoſt as extenſive as that of the Greeks or Romans.

39 Hiſtory of Italy.

Among the weſtern nations, the revolutions, as might naturally be expected from the character of the people, ſucceeded one another with rapidity. The Heruli under Odoacer were driven out by the Goths under Theodoric. The Goths were expelled by the Romans; and, while the two parties were contending, both were attacked by the Franks, who carried off an immenſe booty. The Romans were in their turn expelled by the Goths: the Franks again invaded Italy, and made themſelves maſters of the province of Venetia; but at laſt the ſuperior fortune of the emperor of Conſtantinople prevailed, and the Goths were finally ſubdued in 553. Narſes, the conqueror of the Goths, governed Italy as a province of the eaſtern empire till the year 568, when Longinus his ſucceſſor made conſiderable alterations. The Italian provinces had, ever ſince the time of Conſtantine the Great, been governed by *conſulares*, *correctores*, and *præſides*; no alteration having been made either by the Roman emperors or the Gothic kings. But Longinus, being inveſted with abſolute power by Juſtinian, ſuppreſſed thoſe magiſtrates; and, inſtead of them, placed in each city of note a governor, whom he diſtinguiſhed with the title of *duke*. The city of Rome was not more honoured than any other; for Longinus, having aboliſhed the very name of *ſenate* and *conſuls*, appointed a *duke* of Rome as well as of other cities. To himſelf he aſſumed the title of *exarch*; and, reſiding at Ravenna, his government was ſtyled the *exarchate of Ravenna*. But while he was eſtabliſhing this new empire, the greateſt part of Italy was conquered by the Lombards.

40 Of France.

In France a conſiderable revolution alſo took place. In 487, Clovis, the founder of the preſent French monarchy, poſſeſſed himſelf of all the countries lying between the Rhine and the Loire. By force or treachery, he conquered all the petty kingdoms which had been erected in that country; his dominions had been divided, re-united, and divided again; and were on the point of being united a ſecond time, when the great impoſtor Mahomet began to make a figure in the world.

41 Of Spain.

In Spain, the Viſigoths erected a kingdom, ten years before the conqueſt of Rome by the Heruli. This kingdom they had extended eaſtward, about the ſame time that Clovis was extending his conqueſts to the weſt; ſo that the two kingdoms met at the river Loire. The conſequence of this approach of ſuch barbarous conquerors towards each other, was an immediate war. Clovis proved victorious, and ſubdued great part of the country of the Viſigoths, which put a final ſtop to their conqueſts on that ſide.

Civil History.

Another kingdom had been founded in the weſtern parts of Spain by the Suevi, a conſiderable time before the Romans were finally expelled from that country. In 409 this kingdom was entirely ſubverted by Theodoric king of the Goths; and the Suevi were ſo pent up in a ſmall diſtrict of Luſitania and Galicia, that it ſeemed impoſſible for them to recover themſelves. During the abovementioned period, however, while the attention of the Goths was turned another way, they had found means again to erect themſelves into an independent ſtate, and to become maſters of conſiderably-extended territories. But this ſucceſs proved of ſhort duration. In 584 the Goths attacked them; totally deſtroyed their empire a ſecond time; and thus became maſters of all Spain, except ſome ſmall part which ſtill owned ſubjection to the emperors of Conſtantinople. Of this part, however, the Goths became maſters alſo in the year 623; which concludes the 9th general period.

42 Of Africa.

Africa, properly ſo called, had changed its maſters three times during this period. The Vandals had expelled the Romans, and erected an independent kingdom, which was at laſt overturned by the emperors of Conſtantinople; and from them the greateſt part of it was taken by the Goths in 620.

43 Tenth general period. Conqueſts of the Saracens.

10. At the commencement of the tenth general period, (which begins with the flight of Mahomet in the year 622, from whence his followers date their æra, called the *Hegira*), we ſee every thing prepared for the great revolution which was now to take place: the Roman empire in the weſt annihilated; the Perſian empire and that of Conſtantinople weakened by their mutual wars and inteſtine diviſions; the Indians and other eaſtern nations unaccuſtomed to war, and ready to fall a prey to the firſt invader; the ſouthern parts of Europe in a diſtracted and barbarous ſtate; while the inhabitants of Arabia, from their earlieſt origin, accuſtomed to war and plunder, and now united by the moſt violent ſuperſtition and enthuſiaſtic deſire of conqueſt, were like a flood pent up, and ready to overwhelm the reſt of the world.—The northern nations of Europe and Aſia, however formidable in after-times, were at preſent unknown, and peaceable, at leaſt with reſpect to their ſouthern neighbours; ſo that there was in no quarter of the globe any power capable of oppoſing the conqueſts of the Arabs. With amazing celerity, therefore, they over-ran all Syria, Paleſtine, Perſia, Bukharia, and India, extending their conqueſts farther to the eaſtward than ever Alexander had done. On the weſt ſide their empire extended over Egypt, Barbary, and Spain, together with the iſlands of Sicily, Sardinia, Majorca, Minorca, &c. and many of the Archipelago iſlands: nor were the coaſts of Italy itſelf free from their incurſions; nay, they are even ſaid to have reached the diſtant and barren country of Iceland. At laſt this great empire, as well as others, began to decline. Its ruin was very ſudden, and owing to its internal diviſions. Mahomet had not taken care to eſtabliſh the apoſtleſhip in his family, or to give any particular directions about a ſucceſſor. The conſequence of this was, that the caliphat, or ſucceſſion

to

Civil History.

to the apostleship, was seized by many usurpers in different parts of the empire; while the true caliphs, who resided at Bagdad, gradually lost all power, and were regarded only as a kind of high-priests. Of these divisions the Turks took advantage to establish their authority in many provinces of the Mohammedan empire: but as they embraced the same religion with the Arabs, and were filled with the same enthusiastic desire of conquest, it is of little consequence to distinguish between them; as indeed it signified little to the world in general whether the Turks or Saracens were the conquerors, since both were cruel, barbarous, ignorant, and superstitious.

44 Of the Pope's temporal power.

While the barbarians of the east were thus grasping at the empire of the whole world, great disturbances happened among the no less barbarous nations of the west. Superstition seems to have been the ruling motive in both cases. The Saracens and Turks conquered for the glory of God, or of his apostle Mahomet and his successors; the western nations professed an equal regard for the divine glory, but which was only to be perceived in the respect they paid to the Pope and clergy. Ever since the establishment of Christianity by Constantine, the bishops of Rome had been gradually extending their power, and attempting not only to render themselves independent, but even to assume an authority over the emperors themselves. The destruction of the empire was so far from weakening their power, that it afforded them opportunities of greatly extending it, and becoming judges of the sovereigns of Italy themselves, whose barbarity and ignorance prompted them to submit to their decisions. All this time, however, they themselves had been in subjection to the emperors of Constantinople; but on the decline of that empire, they found means to get themselves exempted from this subjection. The principal authority in the city of Rome was then engrossed by the bishop; though of right it belonged to the duke appointed by the exarch of Ravenna. But tho' they had now little to fear from the eastern emperors, they were in great danger from the ambition of the Lombards, who aimed at the conquest of all Italy. This aspiring people the bishops of Rome determined to check; and therefore, in 726, when Luitprand king of the Lombards had taken Ravenna and expelled the exarch, the pope undertook to restore him. For this purpose he applied to the Venetians, who are now first mentioned in history as a state of any consequence; and by their means the exarch was restored. Some time before, a quarrel had happened between the pope (Gregory II.) and Leo emperor of the east, about the worship of images. Leo, who it seems, in the midst of so much barbarism, had still preserved some share of common sense and reason, reprobated the worship of images in the strongest terms, and commanded them to be destroyed throughout his dominions. The pope, whose cause was favoured by the most absurd superstitions, and by these only, refused to obey the emperor's commands. The exarch of Ravenna, as a subject of the emperor, was ordered to force the pope to a compliance, and even to seize or assassinate him in case of a refusal. This excited the pious zeal of Luitprand to assist the pope, whom he had formerly designed to subdue: the exarch was first excommunicated, and then torn in pieces by the enraged multitude: the duke of Naples shared the same fate; and a vast number of the *Iconoclasts*, or Image-breakers, as they were called, were slaughtered without mercy: and to complete all, the subjects of the exarchate, at the instigation of the pope, renounced their allegiance to the emperor.

Leo was no sooner informed of this revolt, than he ordered a powerful army to be raised, in order to reduce the rebels, and take vengeance on the pope. Alarmed at these warlike preparations, Gregory looked round for some power on which he might depend for protection. The Lombards were possessed of sufficient force, but they were too near and too dangerous neighbours to be trusted; the Venetians, though zealous Catholics, were as yet unable to withstand the force of the empire; Spain was over-run by the Saracens: the French seemed, therefore, the only people to whom it was advisable to apply for aid; as they were able to oppose the emperor, and were likewise enemies to his edict. Charles Martel, who at that time governed France as mayor of the palace, was therefore applied to; but before a treaty could be concluded, all the parties concerned were removed by death. Constantine Copronymus, who succeeded Leo at Constantinople, not only persisted in the opposition to image-worship, begun by his predecessor, but prohibited also the invocation of saints. Zachary, who succeeded Gregory III. in the pontificate, proved as zealous an adversary as his predecessors. Pepin, who succeeded Charles Martel in the sovereignty of France, proved as powerful a friend to the pope as his father had been. The people of Rome had nothing to fear from Constantinople; and therefore drove out all the emperor's officers. The Lombards, awed by the power of France, for some time allowed the pope to govern in peace the dominions of the Exarchate; but in 752, Astolphus, king of Lombardy, not only reduced the greatest part of the pope's territories, but threatened the city of Rome itself. Upon this an application was made to Pepin, who obliged Astolphus to restore the places he had taken, and gave them to the pope, or, as he said, to St Peter. The Greek emperor, to whom they of right belonged, remonstrated to no purpose. The pope from that time became possessed of considerable territories in Italy; which, from the manner of their donation, go under the name of *St Peter's Patrimony*. It was not however before the year 774 that the pope was fully secured in these new dominions. This was accomplished when the kingdom of the Lombards was totally destroyed by Charlemagne, who was thereupon crowned king of Italy. Soon after this monarch made himself master of all the Low Countries, Germany, and part of Hungary; and in the year 800, was solemnly crowned emperor of the west by the pope.

45 General state of the world.

Thus was the world once more shared among three great empires. The empire of the Arabs or Saracens extended from the river Ganges to Spain, comprehending almost all of Asia and Africa which has ever been known to Europeans, the kingdoms of China and Japan excepted. The eastern Roman empire was reduced to Greece, Asia Minor, and the provinces adjoining to Italy. The empire of the west under Charlemagne, comprehended France, Germany, and the greatest part of Italy. The Saxons, however, as yet

poſſeſſed Britain unmoleſted by external enemies, tho' the ſeven kingdoms erected by them were engaged in perpetual conteſts. The Venetians alſo enjoyed a nominal liberty; though it is probable, that their ſituation would render them very much dependent on the great powers which ſurrounded them. Of all nations on earth, the Scots and Picts, and the remote ones of China and Japan ſeem to have enjoyed, from their ſituation, the greateſt ſhare of liberty; unleſs, perhaps, we except the Scandinavians, who, under the names of *Danes* and *Normans*, were ſoon to infeſt their ſouthern neighbours. But of all the European potentates, the popes certainly exerciſed the greateſt authority; ſince even Charlemagne himſelf ſubmitted to accept the crown from their hands, and his ſucceſſors made them the arbiters of their differences.

Matters, however, did not long continue in this ſtate. The empire of Charlemagne, was, on the death of his ſon Lewis, divided among his three children. Endleſs diſputes and wars enſued among them, till at laſt the ſovereign power was ſeized by Hugh Capet in 987. The Saxon heptarchy was diſſolved in 827, and the whole kingdom of England reduced under one head. The Danes and Normans began to make depredations, and infeſt the neighbouring ſtates. The former conquered the Engliſh Saxons, and ſeized the government, but were in their turn expelled by the Normans in 1066. In Germany and Italy the greateſt diſturbances aroſe from the conteſts between the popes and the emperors. To all this, if we add the internal conteſts which happened through the ambition of the powerful barons of every kingdom, we can ſcarce form an idea of times more calamitous than thoſe of which we now treat. All Europe, nay, all the world, was one great field of battle; for the empire of the Mahometans was not in a more ſettled ſtate than that of the Europeans. Caliphs, ſultans, emirs, &c. waged continual war with each other in every quarter; new ſovereignties every day ſprung up, and were as quickly deſtroyed. In ſhort, thro' the ignorance and barbarity with which the whole world was overſpread, it ſeemed in a manner impoſſible that the human race could long continue to exiſt; when happily the cruſades, by directing the attention of the Europeans to one particular object, made them in ſome meaſure ſuſpend their ſlaughters of one another.

46 Eleventh period. The cruſades.

11. The cruſades originated from the ſuperſtition of the two grand parties into which the world was at that time divided, namely, the Chriſtians and Mahometans. Both looked upon the ſmall territory of Paleſtine, which they called the *Holy Land*, to be an invaluable acquiſition, for which no ſum of money could be an equivalent; and both took the moſt unjuſtifiable methods to accompliſh their deſires. The ſuperſtition of Omar the ſecond caliph had prompted him to invade this country, part of the territories of the Greek emperor, who was doing him no hurt; and now when it had been ſo long under the ſubjection of the Mahometans, a ſimilar ſuperſtition prompted the pope to ſend an army for the recovery of it. The cruſaders accordingly poured forth in multitudes, like thoſe with which the kings of Perſia formerly invaded Greece; and their fate was pretty ſimilar. Their impetuous valour at firſt, indeed, carried every thing before them: they recovered all Paleſtine, Phœnicia, and part of Syria, from the infidels; but their want of conduct ſoon loſt what their valour had obtained, and very few of that vaſt multitude which had left Europe ever returned to their native countries. A ſecond, a third, and ſeveral other cruſades, were preached, and were attended with a like ſucceſs in both reſpects; vaſt numbers took the croſs, and repaired to the Holy Land, which they polluted by the moſt abominable maſſacres and treacheries, and from which very few of them returned. In the third cruſade Richard I. of England was embarked, who ſeems to have been the beſt general that ever went into the eaſt; but even his valour and ſkill were not ſufficient to repair the faults of his companions, and he was obliged to return even after he had entirely defeated his antagoniſts, and was within ſight of Jeruſalem.

47 Conqueſts of the Moguls.

But while the Chriſtians and Mahometans were thus ſuperſtitiouſly contending for a ſmall territory in the weſtern parts of Aſia, the nations in the more eaſterly parts were threatened with total extermination. Jenghiz Kan, the greateſt, as well as the moſt bloody, conqueror that ever exiſted, now makes his appearance. The rapidity of his conqueſts ſeemed to emulate thoſe of Alexander the Great; and the cruelties he committed were altogether unparallelled. It is worth obſerving, that Jenghiz Khan and all his followers were neither Chriſtians nor Mahometans, but ſtrict deiſts. For a long time even the ſovereign had not heard of a temple or any particular place on earth appropriated by the Deity to himſelf, and treated the notion with ridicule when it was firſt mentioned to him.

The Moguls, over whom Jenghiz Khan aſſumed the ſovereignty, were a people of Eaſt Tartary, divided into a great number of petty governments as they are at this day, but who owned a ſubjection to one ſovereign whom they called *Vang-khan*, or the Great Khan. Temujin, afterwards *Jenghiz-Khan*, was one of theſe petty princes, but unjuſtly deprived of the greateſt part of his inheritance at the age of 13, which he could not recover till he arrived at that of 40. This correſponds with the year 1201, when he totally reduced the rebels, and as a ſpecimen of his lenity cauſed 70 of their chiefs to be thrown into as many caldrons of boiling water. In 1202, he defeated and killed Vang-khan himſelf (known to the Europeans by the name of *Preſter John of Aſia*); and poſſeſſing himſelf of his vaſt dominions, became from thenceforward altogether irreſiſtible. In 1206, having ſtill continued to enlarge his dominions, he was declared khan of the Moguls and Tartars; and took upon him the title of *Jenghiz Khan*, or *The moſt Great Khan of khans*. This was followed by the reduction of the kingdom of Hya in China, Tangut, Kitay, Turkeſtan, Karazm (the kingdom of Gazna founded by Mahmud Gazni), Great Bukharia, Perſia, and part of India; and all theſe vaſt regions were reduced in 26 years. The devaſtations and ſlaughters with which they were accompanied are unparallelled, no fewer than 14,470,000 perſons being computed to have been maſſacred by Jenghiz Khan during the laſt 22 years of his reign. In the beginning of 1227 he died, thereby freeing the world from a moſt bloody tyrant. His ſucceſſors completed the conqueſt of China and Korea; but were foiled in their attempts on Cochinchina, Tong-king, and Japan. On the weſtern ſide the Tartar

Civil History.

Tartar dominions were not much enlarged till the time of Hulaku, who conquered Media, Babylonia, Meſopotamia, Aſſyria, Syria, Georgia, Armenia, and almoſt all Aſia Minor; putting an end to the empire of the Saracens by the taking of Bagdad in 1258.

The empire of Jenghiz Khan had the fate of all others. Being far too extenſive to be governed by one head, it ſplit into a multitude of ſmall kingdoms, as it had been before his time. All theſe princes, however, owned allegiance to the family of Jenghiz Khan till the time of Timur Bek, or Tamerlane. The Turks, in the mean time, urged forward by the inundation of Tartars who poured in from the eaſt, were forced upon the remains of the Greek empire; and at the time of Tamerlane above-mentioned, they had almoſt confined this once mighty empire within the walls of Conſtantinople.

48 Of Tamerlane.

In the year 1335 the family of Jenghiz Khan becoming extinct in Perſia, a long civil war enſued, during which Timur Bek, one of the petty princes among which the Tartar dominions were divided, found means to aggrandize himſelf in a manner ſimilar to what Jenghiz Khan had done about 150 years before. Jenghiz Khan, indeed, was the model whom he propoſed to imitate; but it muſt be allowed that Timur was more merciful than Jenghiz Khan, if indeed the word can be applied to ſuch inhuman tyrants. The plan on which Jenghiz Khan conducted his expeditions was that of total extermination. For ſome time he utterly extirpated the inhabitants of thoſe places which he conquered, deſigning to people them anew with his Moguls; and in conſequence of this reſolution, he would employ his army in beheading 100,000 priſoners at once. Timur's cruelty, on the other hand, ſeldom went farther than the pounding of 3 or 4000 people in large mortars, or building them among bricks and mortar into a wall. We muſt obſerve, however, that Timur was not a Deiſt, but a Mahometan, and conquered expreſsly for the purpoſe of ſpreading the Mahometan religion; for the Moguls had now adopted all the ſuperſtitions and abſurdities of Mahomet. Thus was all the eaſtern quarter of the world threatened anew with the moſt dreadful devaſtations, while the weſtern nations were exhauſting themſelves in fruitleſs attempts to regain the Holy Land. The Turks were the only people who ſeem at this period to have been gathering ſtrength, and by their perpetual encroachments threatened to ſwallow up the weſtern nations, as the Tartars had done the eaſtern ones.

In 1362, Timur invaded Bukharia, which he reduced in five years. He proceeded in his conqueſts, though not with the ſame celerity as Jengiz Khan, till the year 1387, when he had ſubdued all Perſia, Armenia, Georgia, Karazm, and great part of Tartary. After this he proceeded weſtward, ſubduing all the countries to the Euphrates: made himſelf maſter of Bagdad; and even entered Ruſſia, where he pillaged the city of Moſcow. From thence he turned his arms to the eaſt, and totally ſubdued India. In 1393, he invaded and reduced Syria; and having turned his arms againſt the Turks, forced their ſultan Bajazet to raiſe the ſiege of Conſtantinople. This brought on an engagement, in which Bajazet was entirely defeated and taken priſoner; which broke the power of the Turks to ſuch a degree, that they were not for ſome time able to recover themſelves. At laſt this great conqueror died in the year 1405, while on his way to conquer China, as Jenghiz Khan had done before him.

49 State of the world ſince that time.

The death of Timur was followed almoſt immediately by the diſſolution of his empire. Moſt of the nations he had conquered, recovered their liberty. The Turks had now no further obſtacle to their conqueſt of Conſtantinople. The weſtern nations having exhauſted themſelves in the *holy wars*, as they were called, had loſt that inſatiable thirſt after conqueſt which for ſo long time poſſeſſed the minds of men. They had already made conſiderable advances in civilization, and began to ſtudy the arts of peace. Gunpowder was invented, and its application to the purpoſes of war already known; and, though no invention threatened to be more deſtructive, perhaps none was ever more beneficial to the human race. By the uſe of fire-arms, nations are put more on a level with each other than formerly they were; war is reduced to a regular ſyſtem, which may be ſtudied with as much ſucceſs as any other ſcience. Conqueſts are not now to be made with the ſame eaſe as formerly; and hence the laſt ages of the world have been much more quiet and peaceable than the former ones. In 1453, the conqueſt of Conſtantinople by the Turks fixed that wandering people to one place; and though now they poſſeſs very large regions both in Europe, Aſia, and Africa, an effectual ſtop hath long been put to their further progreſs.

About this time alſo, learning began to revive in Europe, where it had been long loſt; and the invention of PRINTING, which happened about the ſame time, rendered it in a manner impoſſible for barbariſm ever to take place in ſuch a degree as formerly. All nations of the world, indeed, ſeem now at once to have laid aſide much of their former ferocity; and, though wars have by no means been uncommon, they have not been carried on with ſuch circumſtances of fury and ſavage cruelty as before. Inſtead of attempting to enrich themſelves by plunder, and the ſpoils of their neighbours, mankind in general have applied themſelves to commerce, the only true and durable ſource of riches. This ſoon produced improvements in navigation; and theſe improvements led to the diſcovery of many regions formerly unknown. At the ſame time, the European powers being at laſt thoroughly ſenſible, that extenſive conqueſts could never be permanent, applied themſelves more to provide for the ſecurity of thoſe dominions which they already poſſeſſed, than to attempt the conqueſt of one another: and this produced the policy to which ſo much attention was lately paid, namely, the *preſerving of the balance of Europe;* that is, preventing any one of the nations from acquiring ſufficient ſtrength to overpower another.

In the end of the 15th century, the vaſt continent of America was diſcovered; and, almoſt at the ſame time, the paſſage to the Eaſt-Indies by the Cape of Good-Hope. The diſcovery of theſe rich countries gave a new turn to the ambition of the Europeans. To enrich themſelves, either by the gold and ſilver produced in theſe countries, or by traffic with the natives, now became the object. The Portugueſe had the

Civil History.

the advantage of being the firſt diſcoverers of the eaſtern, and the Spaniards of the weſtern countries. The former did not neglect ſo favourable an opportunity of enriching themſelves by commerce. Many ſettlements were formed by them in the Eaſt-India iſlands, and on the continent; but their avarice and perfidious behaviour towards the natives, proved at laſt the cauſe of their total expulſion. The Spaniards enriched themſelves by the vaſt quantities of the precious metals imported from America, which were not obtained but by the moſt horrid maſſacres committed on the natives, and of which an account is given under the different names of the American countries. Theſe poſſeſſions of the Spaniards and Portugueſe ſoon excited other European nations to make attempts to ſhare with them in their treaſures, by planting colonies in different parts of America, and making ſettlements in the Eaſt-Indies: and thus has the rage of war in ſome meaſure been transferred from Europe to theſe diſtant regions; and, after various conteſts, the Britiſh at laſt obtained a great ſuperiority both in America and the Eaſt-Indies.

In Europe the only conſiderable revolutions which happened during this period, were, The total expulſion of the Moors or Saracens from Spain, by the taking of Grenada in 1491; the union of the kingdoms of Arragon and Caſtile, by the marriage of Ferdinand and Iſabella; and the revolt of the ſtates of Holland from the Spaniards. After much contention and bloodſhed, theſe laſt obtained their liberty, and were declared a free people in 1609; ſince which time they have continued an independent and very conſiderable nation of Europe.

The European nations at the beginning of the 17th century were, Sweden, Muſcovy, Denmark, Poland, Britain, Germany, Holland, France, Spain, Portugal, Italy, and Turky in Europe. Of theſe the Ruſſians, though the moſt barbarous, were by far the moſt conſiderable, both in regard to numbers and the extent of their empire; but their ſituation made them little feared by the others, who lay at a diſtance from them. The kingdom of Poland, which was firſt ſet up in the year 1000, proved a barrier betwixt Ruſſia and Germany; and at the ſame time the policy abovementioned of keeping up the balance of power in Europe, rendered it probable that no one European nation, whatever wars it might be engaged in, would have been totally deſtroyed, or ceaſed to exiſt as a diſtinct kingdom. The late diſmemberment of Poland, however, or its partition between the three powers Ruſſia, Hungary, and Pruſſia, ſeems to be a ſtep very unfavourable to the liberties of Europe in general. The revolt of the Britiſh colonies in America, muſt be a conſiderable diminution of the ſtrength of Great Britain: the advantage taken by France and Spain of an event ſo favourable to their ambition, the duplicity and evaſions of her allies, and the unconcerned or unfriendly aſpect of the other powers, ſeem to indicate a total diſregard of that equilibrium formerly ſo much and ſo wiſely attended to.

In Aſia nothing of importance hath happened ſince the taking of Conſtantinople by the Turks. That continent is now divided among the following nations. The moſt northerly part, called *Siberia*, extending to the very extremity of the continent, is under the power of Ruſſia. To the ſouthward, from Aſia Minor to China and Korea, are the Tartars, formidable indeed from their numbers, but, by reaſon of their barbarity and want of union, incapable of attempting any thing. The Turks poſſeſs the Weſtern part of the continent called *Aſia Minor*, to the river Euphrates. The Arabs are again confined within their own peninſula; which they poſſeſs, as they have ever done, without owning ſubjection to any foreign power. To the eaſt of Turky in Aſia lies Perſia, now more confined in its limits than before; and to the eaſtward of Perſia lies India, or the kingdom of the Mogul, comprehending all the country from the Indus to the Ganges, and beyond that river. Still farther to the eaſt lie the kingdoms of Siam, Pegu, Thibet, and Cochin-China, little known to the Europeans. The vaſt empire of China occupies the moſt eaſterly part of the continent, while that of Japan comprehends the iſlands which go by that name, and which are ſuppoſed to lie at no great diſtance from the weſtern coaſts of America.

Civil History.

In Africa the Turks poſſeſs Egypt, which they conquered in 1517, and have a nominal juriſdiction over the ſtates of Barbary. The interior parts are filled with barbarous and unknown nations, as they have always been. On the weſtern coaſts are many ſettlements of the European nations, particularly the Britiſh and Portugueſe, and the ſouthern extremity is poſſeſſed by the Dutch. The eaſtern coaſts are almoſt totally unknown. The Aſiatic and African iſlands are either poſſeſſed by the Europeans, or inhabit ed by ſavage nations.

Sect. II. *Eccleſiaſtical Hiſtory.*

50 Revolutions in religion ſeldom happen.

The hiſtory of religion, among all the different nations that have exiſted in the world, is a ſubject no leſs important and intereſting than that of civil hiſtory. It is, however, leſs fertile of great events, affords an account of fewer revolutions, and is much more uniform, than civil hiſtory. The reaſon of this is plain. Religion is converſant about things which cannot be ſeen; and which of conſequence cannot ſuddenly and ſtrongly affect the ſenſes of mankind, as natural things are apt to do. The expectation of worldly riches can eaſily induce one nation to attack another; but it is not eaſy to find any thing which will induce a nation to change its religion. The inviſible nature of ſpiritual things, the prejudice of habit and of early education, all ſtand in the way of changes of this kind. Hence the revolutions in religion have been but few, and the duration of almoſt any religion, of longer ſtanding than the moſt celebrated empires; the changes which have happened, in general have acquired a long time to bring them about, and hiſtory ſcarce affords an inſtance of the religion of any nation being eſſentially and ſuddenly changed for another.

With regard to the origin of religion, we muſt have recourſe to the Scriptures; and are as neceſſarily conſtrained to adopt the account there given, as we are to adopt that of the creation given in the ſame book; namely, becauſe no other hath made its appearance which ſeems in any degree rational, or conſiſtent with itſelf.—In what manner the true religion given

given to Adam was falſified or corrupted by his deſcendants before the flood, doth not clearly appear from Scripture. Idolatry is not mentioned: nevertheleſs we are aſſured that the inhabitants of the world were then exceedingly wicked; and as their wickedneſs did not conſiſt in worſhipping falſe gods, it may be concluded that they worſhipped none at all; i. e. that the crime of the antediluvians was deiſm or atheiſm.

51 Origin of idolatry.

After the flood, idolatry quickly made its appearance; but what gave riſe to it, is not certainly known. This ſuperſtition indeed ſeems to be natural to man, eſpecially when placed in ſuch a ſituation that he hath little opportunity of inſtruction, or of improving his rational faculties. This ſeems alſo probable from a caution given to the Jews, leſt, when they looked up to the ſun, moon, and ſtars, and the reſt of the hoſt of heaven, they ſhould be *driven to worſhip them*. The origin of idolatry among the Syrians and Arabians, and alſo in Greece, is therefore accounted for with great probability in the following manner by the author of *The Ruins of Balbec*. "In thoſe uncomfortable deſarts, where the *day* preſents nothing to the view but the uniform, tedious, and melancholy proſpect of barren ſands, the *night* diſcloſes a moſt delightful and magnificent ſpectacle, and appears arrayed with charms of the moſt attractive kind. For the moſt part unclouded and ſerene, it exhibits to the wondering eye the hoſt of heaven in all their variety and glory. In the view of this ſtupendous ſcene, the tranſition from admiration to idolatry was too eaſy to uninſtructed minds; and a people whoſe climate offered no beauties to contemplate but thoſe of the firmament, would naturally look thither for the objects of their worſhip. The form of idolatry in Greece was different from that of the Syrians, which perhaps may be attributed to that ſmiling and variegated ſcene of mountains, valleys, rivers, woods, groves, and fountains, which the tranſported imagination, in the midſt of its pleaſing aſtoniſhment, ſuppoſed to be the ſeats of inviſible deities."

A difficulty, however, ariſes on this ſuppoſition; for if idolatry is naturally produced in the mind of uninſtructed and ſavage man, from a view of the creation, why hath not idolatry of ſome kind or other taken place among all the different nations of the world. This certainly hath not been the caſe; of which the moſt ſtriking examples are the Perſians of old, and the Moguls in more modern times. Both theſe nations were ſtrict Deiſts: ſo that we muſt allow ſome other cauſes to concur in producing idolatry beſides thoſe already mentioned; and of theſe cauſes an imperfect and obſcure notion of the true religion ſeems to be the moſt probable.

52 General account of the Heathen ſuperſtitions.

Though idolatry, therefore, was formerly very prevalent, it neither extended over the whole earth, nor were the ſuperſtitions of the idolaters all of one kind. Every nation had its reſpective gods, over which one more excellent than the reſt was ſaid to preſide; yet in ſuch a manner, that this ſupreme deity himſelf was controuled by the rigid empire of the fates, or by what philoſophers called *eternal neceſſity*. The gods of the eaſt were different from thoſe of the Gauls, the Germans, and the other northern nations. The Grecian divinities differed widely from thoſe of the Egyptians, who deified plants, animals, and a great variety of the productions both of nature and art. Each people alſo had their own particular manner of worſhipping and appeaſing their reſpective deities, entirely different from the ſacred rites of other countries. All this variety of religions, however, produced neither wars nor diſſenſions among the different nations; each nation ſuffered its neighbours to follow their own method of worſhip, without diſcovering any diſpleaſure on that account. There is nothing ſurpriſing in this mutual toleration, when we conſider, that they all looked upon the world as one great empire, divided into various provinces, over each of which a certain order of divinities preſided; for which reaſon they imagined that none could behold with contempt the gods of other nations, or force ſtrangers to pay homage to theirs.—The Romans exerciſed this toleration in the moſt ample manner; for though they would not allow any change to be made in the religions that were publicly profeſſed in the empire, nor any new form of worſhip to be openly introduced, yet they granted to their citizens a full liberty of obſerving in private the ſacred rites of other nations, and of honouring foreign deities as they thought proper.

The heathen deities were honoured with rites and ſacrifices of various kinds, according to their reſpective natures and offices. Their rites were abſurd and ridiculous; while the prieſts, appointed to preſide over this ſtrange worſhip, abuſed their authority, by deceiving and impoſing upon the people in the groſſeſt manner.

52 State of religion at the appearance of Chriſt.

From the time of the flood to the coming of Chriſt, idolatry prevailed among almoſt all the nations of the world, the Jews alone excepted; and even they were on all occaſions ready to run into it, as is evident from their hiſtory in the Old Teſtament. At the time of Chriſt's appearance, the religion of the Romans, as well as their empire, extended over a great part of the world. Some people there were among the heathens who perceived the abſurdities of that ſyſtem; but being deſtitute of means, as well as of abilities, to effect a reformation, matters went on in their old way. Though there were at that time various ſects of philoſophers, yet all of them proceeded upon falſe principles, and conſequently could be of no ſervice to the advancement or reformation of religion. Nay, ſome, among whom were the Epicureans and Academics, declared openly againſt every kind of religion whatever.

Two religions at this time flouriſhed in Paleſtine, viz. The Jewiſh and Samaritan; between whoſe reſpective followers reigned the moſt violent hatred and contempt. The difference between them ſeems to have been chiefly about the place of worſhip; which the Jews would have to be in Jeruſalem, and the Samaritans on Mount Gerizzim. But though the Jews were certainly right as to this point, they had greatly corrupted their religion in other reſpects. They expected a Saviour indeed, but they miſtook his character; imagining that he was to be a powerful and warlike prince, who ſhould ſet them free from the Roman yoke, which they bore with the utmoſt impatience. They alſo imagined that the whole of religion conſiſted in obſerving the rites of Moſes, and ſome others which they had added to them, without the leaſt regard to what is commonly called *morality* or *virtue*;

Eccleſiaſtical Hiſtory.

as is evident from the many charges our Saviour brings againſt the Phariſees, who had the greateſt reputation for ſanctity among the whole nation. To theſe corrupt and vicious principles they added ſeveral abſurd and ſuperſtitious notions concerning the divine nature, invisible powers, magic, &c. which they had partly imbibed during the Babylonian captivity, and partly derived from their neighbours in Arabia, Syria, and Egypt. The principal ſects among them were the ESSENES or Eſſenians, PHARISEES, and SADDUCEES. The Samaritans, according to the moſt general opinion had corrupted their religion ſtill more than the Jews.

When the true religion was preached by the Saviour of mankind, it is not to be wondered at if he became on that account obnoxious to a people ſo deeply ſunk in corruption and ignorance as the Jews then were. It is not here requiſite to enter into the particulars of the doctrine advanced by him, or of the oppoſition he met with from the Jews; as a full account of theſe things, and likewiſe of the preaching of the goſpel by the Apoſtles, may be found in the New Teſtament.—The rapid progreſs of the Chriſtian religion, under theſe faithful and inſpired miniſters, ſoon alarmed the Jews, and raiſed various perſecutions againſt its followers. The Jews, indeed, ſeem at firſt to have been every where the chief promoters of perſecution; for we find that they officiouſly went from place to place, where-ever they heard of the increaſe of the goſpel, and by their calumnies and falſe ſuggeſtions endeavoured to excite the people againſt the Apoſtles. The Heathens, however, though at firſt they ſhowed no very violent ſpirit of perſecution againſt the Chriſtians, ſoon came to hate them as much as the Jews themſelves. Tacitus acquaints us with the cauſes of this hatred, when ſpeaking of the firſt general perſecution under Nero. That inhuman emperor having, as was ſuppoſed, ſet fire to the city of Rome, to avoid the imputation of this wickedneſs, transferred it on the Chriſtians. Our author informs us that they were already abhorred on account of their many and enormous crimes. "The author of this name *(Chriſtians)*," ſays he, "was CHRIST, who, in the reign of Tiberius, was executed under Pontius Pilate, procurator of Judæa. The peſtilent ſuperſtition was for a while ſuppreſſed: but it revived again, and ſpread, not only over Judæa, where this evil was firſt broached; but reached Rome, whither from every quarter of the earth is conſtantly flowing whatever is hideous and abominable amongſt men, and is there readily embraced and practiſed. Firſt, therefore, were apprehended ſuch as openly avowed themſelves to be of that ſect; then by them were diſcovered an immenſe multitude; and all were convicted, not of the crime of burning Rome, but of hatred and enmity to mankind. Their death and tortures were aggravated by cruel deriſion and ſport; for they were either covered with the ſkins of wild beaſts and torn in pieces by devouring dogs, or faſtened to croſſes, or wrapped up in combuſtible garments, that, when the day-light failed, they might, like torches, ſerve to diſpel the darkneſs of the night. Hence, towards the miſerable ſufferers, however guilty and deſerving the moſt examplary puniſhment, compaſſion aroſe; ſeeing they were doomed to periſh, not with a view to the public good, but to gratify the cruelty of one man."

53 Tacitus's account of the firſt perſecution by Nero.

That this account of Tacitus is downright miſrepreſentation and calumny, muſt be evident to every one who reads it. It is impoſſible that any perſon can be convicted of hatred and enmity to mankind, without ſpecifying a number of facts by which this hatred ſhewed itſelf. The burning of Rome would indeed have been a very plain indication of enmity to mankind; but of this Tacitus himſelf clears them, and mentions no other crime of which they were guilty. It is probable, therefore, that the only reaſon of this charge againſt the Chriſtians, was their abſolute refuſal to have any ſhare in the Roman worſhip, or to countenance the abſurd ſuperſtitions of Paganiſm in any degree.

54 Second perſecution.

The perſecution under Nero was ſucceeded by another under Domitian, during which the Apoſtle John was baniſhed to Patmos, where he ſaw the viſions, and wrote the book called his *Revelation*, which completes the canon of Scripture. This perſecution commenced in the 95th year of the Chriſtian æra; and John is ſuppoſed to have wrote his Revelation the year after, or in the following one.

During the firſt century, the Chriſtian religion ſpread over a great number of different countries; but as we have now no athentic records concerning the travels of the apoſtles, or the ſucceſs which attended them in their miniſtry, it was impoſſible to determine how far the goſpel was carried during this period. We are, however, aſſured, that even during this early period many corruptions were creeping in, the progreſs of which was with difficulty prevented even by the apoſtles themſelves. Some corrupted their profeſſion by a mixture of Judaiſm, others by mixing it with the oriental philoſophy; while others were already attempting to deprive their brethren of liberty, ſetting themſelves up as eminent paſtors, in oppoſition even to the apoſtles, as we learn from the epiſtles of St Paul, and the third epiſtle of St John. Hence aroſe the ſects of the Gnoſtics, Cerinthians, Nicolaitans, Nazarenes, Ebionites, &c. with which the church was troubled during this century.

Concerning the ceremonies and method of worſhip uſed by the Chriſtians of the firſt century, it is impoſſible to ſay any thing with certainty. Neither is the church order, government, and diſcipline, during this period, aſcertained with any degree of exactneſs. Each of thoſe parties, therefore, which exiſt at this day, contends with the greateſt earneſtneſs for that particular mode of worſhip which they themſelves have adopted, and ſome of the moſt bigotted would willingly monopoliſe the word *church* in ſuch a manner as to exclude from all hope of ſalvation every one who is not attacked to their particular party. It doth not however appear that, excepting baptiſm, the Lord's ſupper, and anointing the ſick with oil, any external ceremonies or ſymbols were properly of divine appointment. According to Dr Moſheim, "there are ſeveral circumſtances which inclines us to think, that the friends and apoſtles of our bleſſed Lord either tolerated through neceſſity, or appointed for wiſe reaſons, many other external rites in various places. At the ſame time, we are not to imagine, that they ever conferred upon any perſon a perpetual, indelible, pontifical authority,

Eccleſiaſtical Hiſtory.

Eccleſiaſtical Hiſtory.

thority, or that they enjoined the ſame rites in all churches. We learn on the contrary, from authentic records, that the Chriſtian worſhip was, from the beginning, celebrated in a different manner in different places; and that, no doubt, by the orders, or at leaſt with the approbation, of the apoſtles and their diſciples. In thoſe early times, it was both wiſe and neceſſary to ſhew, in the eſtabliſhment of outward forms of worſhip, ſome indulgence to the ancient opinions, manners, and laws, of the reſpective nations to whom the goſpel was preached.'

55 Hiſtory of the ſecond century.

The ſecond century commences with the third year of the emperor Trajan. The Chriſtians were ſtill perſecuted; but as the Roman emperors were for the moſt part of this century princes of a mild and moderate turn, they perſecuted leſs violently than formerly. Marcus Aurelius, notwithſtanding the clemency and philoſophy for which he is ſo much celebrated, treated the Chriſtians worſe than Trajan, Adrian, or even Severus himſelf did, who was noted for his cruelty. This reſpite from rigorous perſecution proved a very favourable circumſtance for the ſpreading of the Chriſtian religion; yet it is by no means eaſy to point out the particular countries through which it was diffuſed. We are, however, aſſured, that, in the ſecond century, Chriſt was worſhipped as God almoſt through the whole eaſt; as alſo among the Germans, Spaniards, Celts, and many other nations: but which of them received the goſpel in the firſt century, and which in the ſecond, is a queſtion unanſwerable at this diſtance of time. The writers of this century attribute the rapid progreſs of Chriſtianity chiefly to the extraordinary gifts that were imparted to the firſt Chriſtians, and the miracles which were wrought at their command; without ſuppoſing that any part of the ſucceſs ought to be aſcribed to the intervention of human means, or ſecondary cauſes. Many of the moderns, however, are ſo far from being of this opinion, that they are willing either to deny the authenticity of all miracles ſaid to have been wrought ſince the days of the apoſtles, or to aſcribe them to the power of the devil. To enter into the particulars of this controverſy is foreign to our preſent purpoſe; for which reaſon we muſt refer to the writers of polemic divinity, who have largely treated of this and other points of a ſimilar nature.

56 Ceremonies multiplied.

The corruptions which had been introduced in the firſt century, and which were almoſt coeval with Chriſtianity itſelf, continued to gain ground in the ſecond. Ceremonies, in themſelves futile and uſeleſs, but which muſt be conſidered as highly pernicious when joined to a religion incapable of any other ornament than the upright and virtuous conduct of its profeſſors, were multiplied for no other purpoſe than to pleaſe the ignorant multitude. The immediate conſequence of this was, that the attention of Chriſtians was drawn aſide from the important duties of morality; and they were led to imagine, that a careful obſervance of the ceremonies might make amends for the neglect of moral duties. This was the moſt pernicious opinion that could poſſibly be entertained; and was indeed the very foundation of that enormous ſyſtem of eccleſiaſtical power which afterwards took place, and held the whole world in ſlavery and barbariſm for many ages.

57 Myſteries introduced.

Another miſchief was the introduction of *myſteries*, as they were called, into the Chriſtian religion; that is, inſinuating, that ſome parts of the worſhip in common uſe had a hidden efficacy and power, far ſuperior to the plain and obvious meaning aſſigned to them by the vulgar: and by paying peculiar reſpect to theſe *myſteries*, the pretended teachers of the religion of Jeſus accommodated their doctrines to the taſte of their heathen neighbours, whoſe religion conſiſted in a heap of myſteries, of which nobody knew the meaning.

58 The teachers aſſume a power over the people.

By theſe, and other means of a ſimilar kind, the Chriſtian paſtors greatly abridged the liberty of their flock. Being maſters of the ceremonies and myſteries of the Chriſtian religion, they had it in their power to make their followers worſhip and believe whatever they thought proper, and this they did not fail to make uſe of for their own advantage. They perſuaded the people, that the miniſters of the Chriſtian church ſucceeded to the character, rights, and privileges, of the Jewiſh prieſthood; and accordingly, the biſhops conſidered themſelves as inveſted with a rank and character ſimilar to thoſe of the high-prieſt among the Jews, while the preſbyters repreſented the prieſts, and the deacons the Levites. This notion, which was firſt introduced in the reign of Adrian, proved a ſource of very conſiderable honour and profit to the clergy.

59 Form of church government.

The form of eccleſiaſtical government was in this century rendered permanent and uniform. One inſpector or biſhop preſided over each Chriſtian aſſembly, to which office he was elected by the voices of the whole people. To aſſiſt him in his office, he formed a council of preſbyters, which was not confined to any ſtated number. To the biſhops and preſbyters the miniſters or *deacons* were ſubject; and the latter were divided into a variety of claſſes, as the different exigencies of the church required. During a great part of this century, the churches were independent of each other; nor were they joined together by aſſociation, confederacy, or any other bonds but thoſe of charity. Each aſſembly was a little ſtate governed by its own laws; which were either enacted, or at leaſt approved of, by the ſociety. But, in proceſs of time, all the Chriſtian churches of a province were formed into one large eccleſiaſtical body, which, like confederate ſtates, aſſembled at certain times, in order to deliberate about the common intereſts of the whole. This inſtitution had its origin among the Greeks; but in a ſhort time it became univerſal, and ſimilar aſſemblies were formed in all places where the goſpel had been planted. Theſe aſſemblies, which conſiſted of the deputies or commiſſioners from ſeveral churches, were called *ſynods* by the Greeks, and *councils* by the *Latins*; and the laws enacted in theſe general meetings were called *canons*, i. e. *rules*.

60 Changes produced by the inſtitution of councils.

Theſe councils, of which we find not the ſmalleſt trace before the middle of this century, changed the whole face of the church, and gave it a new form; for by them the ancient privileges of the people were conſiderably diminiſhed, and the power and authority of the biſhops greatly augmented. The humility indeed, and prudence, of theſe pious prelates hindered them from aſſuming all at once the power with which they were afterwards inveſted. At their firſt appearance in theſe general councils, they acknowledged that they were no more than the delegates of their reſpective

Eccleſiaſtical Hiſtory.

churches, and that they acted in the name and by the appointment of their people. But they ſoon changed this humble tone; imperceptibly extended the limits of their authority; turned their influence into dominion, their counſels into laws; and at length openly aſſerted, that Chriſt had empowered them to preſcribe to his people *authoritative rules* of *faith* and *manners*. Another effect of theſe councils was the gradual abolition of that perfect equality which reigned among all biſhops in the primitive times. For the order and decency of theſe aſſemblies required, that ſome one of the provincial biſhops met in council ſhould be inveſted with a ſuperior degree of power and authority; and hence the rights of Metropolitans derive their origin. In the mean time, the bounds of the church were enlarged; the cuſtom of holding councils was followed wherever the ſound of the goſpel had reached; and the univerſal church had now the appearance of one vaſt republic formed by a combination of a great number of little ſtates. This occaſioned the creation of a new order of eccleſiaſtics, who were appointed in different parts of the world as heads of the church, and whoſe office it was to preſerve the conſiſtence and union of that immenſe body, whoſe members were ſo widely diſperſed throughout the nations. Such was the nature and office of the *Patriarchs*; among whom, at length, ambition, being arrived at its moſt inſolent period, formed a new dignity, inveſting the biſhop of Rome with the title and authority of the *prince of the patriarchs*.

6. Account of the Aſcetics.

During the ſecond century, all the ſects continued which had ſprung up in the firſt, with the addition of ſeveral others, the moſt remarkable of which were the *Aſcetics*. Theſe owed their riſe to an error propagated by ſome doctors of the church, who aſſerted that Chriſt had eſtabliſhed *a double rule of ſanctity and virtue* for two different orders of Chriſtians. Of theſe rules, one was ordinary, the other extraordinary; the one of a lower dignity, the other more ſublime: the firſt for perſons in the active ſcenes of life; the other for thoſe who, in a ſacred retreat, aſpired after the glory of a celeſtial ſtate. In conſequence of this ſyſtem, they divided into two parts all thoſe moral doctrines and inſtructions, which they had received either by writing or tradition. One of theſe diviſions they called *precepts*, and the other *counſels*. They gave the name of *precepts* to thoſe laws that were univerſally obligatory upon all orders of men; and that of *counſels* to thoſe which related to Chriſtians of a more ſublime rank, who propoſed to themſelves great and glorious ends, and breathed after an intimate communion with the Supreme Being.—Thus were produced all at once a new ſet of men, who made pretenſions to uncommon ſanctity and virtue, and declared their reſolution of obeying all the *precepts* and *counſels* of Chriſt, in order to their enjoyment of communion with God here; and alſo that, after the diſſolution of their mortal bodies, they might aſcend to him with the greater facility, and find nothing to retard their approach to the centre of happineſs and perfection. They looked upon themſelves as prohibited from the uſe of things which it was lawful for other Chriſtians to enjoy, ſuch as wine, fleſh, matrimony, and commerce. They thought it their indiſpenſable duty to extenuate their body by watchings, abſtinence, labour, and hunger. They looked for felicity in ſolitary retreats, and deſart places; where, by fervent and aſſiduous efforts of ſublime meditation, they raiſed the ſoul above all external objects, and all ſenſual pleaſures. They were diſtinguiſhed from other Chriſtians, not only by their title of *Aſcetics*, Σπουδαιοι, Εκλεκτοι, and philoſophers, but alſo by their garb. In this century, indeed, thoſe who embraced ſuch an auſtere kind of life, ſubmitted themſelves to all theſe mortifications in private, without breaking aſunder their ſocial bands, or withdrawing themſelves from mankind; but in proceſs of time they retired into deſarts, and, after the example of the Eſſenes and Therapeutæ, they formed themſelves into certain companies.

Eccleſiaſtical Hiſtory.

This auſtere ſect aroſe from an opinion which has been more or leſs prevalent in all ages and in all countries, namely, That religion conſiſts more in prayers, meditations, and a kind of ſecret intercourſe with God, than in fulfilling the ſocial duties of life in acts of benevolence and humanity to mankind. Nothing can be more evident than that the Scripture reckons the fulfilling of theſe infinitely ſuperior to the obſervance of all the ceremonies that can be imagined: yet it ſomehow or other happens, that almoſt every body is more inclined to obſerve the ceremonial part of devotion, than the moral; and hence, according to the different humours or conſtitutions of different perſons, there have been numberleſs forms of Chriſtianity, and the moſt virulent contentions among thoſe who profeſſed themſelves followers of the Prince of Peace. It is obvious, that if the moral conduct of Chriſtians was to be made the ſtandard of faith, inſtead of ſpeculative opinions, all theſe diviſions muſt ceaſe in a moment; but while Chriſtianity, or any part of it, is made to conſiſt in ſpeculation, or the obſervance of ceremonies, it is impoſſible there can be any end of ſects or hereſies. No opinion whatever is ſo abſurd, but ſome people have pretended to argue in its defence; and no ceremony ſo inſignificant, but it hath been explained and ſanctified by hot-headed enthuſiaſts: and hence ceremonies, ſects, and abſurdities, have been multiplied without number, to the prejudice of ſociety and of the Chriſtian religion.—This ſhort relation of the riſe of the Aſcetic ſect will alſo ſerve to account for the riſe of any other; ſo that we apprehend it is needleſs to enter into particulars concerning the reſt, as they all took their origin from the ſame general principle variouſly modified, according to the different diſpoſitions of mankind.

The Aſcetic ſect began firſt in Egypt, from whence it paſſed into Syria and the neighbouring countries. At length it reached the European nations: and hence that train of auſtere and ſuperſtitious vows and rites which totally obſcured, or rather annihilated, Chriſtianity; the celibacy of the clergy, and many other abſurdities of the like kind.—The errors of the Aſcetics, however, did not ſtop here. In compliance with the doctrines of ſome Pagan philoſophers, they affirmed that it was not only lawful, but even praiſe-worthy to deceive, and to uſe the expedient of a lie, in order to advance the cauſe of piety and truth; and hence the *pious frauds* for which the church of Rome hath been ſo notorious, and with which ſhe hath been ſo often and juſtly reproached.

As Chriſtians thus deviated more and more from the

Eccleſiaſtical Hiſtory.

the true practice of their religion, they became more zealous in the external profeſſion of it. Anniverſary feſtivals were celebrated in commemoration of the death and reſurrection of Chriſt, and of the effuſion of the Holy Ghoſt on the apoſtles. Concerning the days on which theſe feſtivals were to be kept, there aroſe violent conteſts. The Aſiatic churches in general differed in this point from thoſe of Europe; and towards the concluſion of the century, Victor, biſhop of Rome, took it in his head to force the eaſtern churches to follow the rules laid down by the weſtern ones. This they abſolutely refuſed to comply with: upon which Victor cut them off from communion with the church of Rome; though, by means of the interceſſion of ſome prudent people, the difference was made up for the preſent.

63 Conteſts concerning feſtivals.

64 Third century.

During moſt of the third century, the Chriſtians were allowed to enjoy their religion, ſuch as it was, without moleſtation. The emperors Maximinus and Decius, indeed, made them feel all the rigours of a ſevere perſecution; but their reigns were ſhort, and from the death of Decius to the time of Dioclesian the church enjoyed tranquillity. Thus vaſt multitudes were converted; but at the ſame time, the doctrine grew daily more corrupt, and the lives of profeſſed Chriſtians more wicked and ſcandalous. New ceremonies were invented in great numbers, and an unaccountable paſſion now prevailed for the oriental ſuperſtitions concerning demons; whence proceeded the whole train of exorciſms, ſpells, and fears for the apparition of evil ſpirits, which to this day are nowhere eradicated. Hence alſo the cuſtom of avoiding all connections with thoſe who were not baptized, or who lay under the penalty of excommunication, as perſons ſuppoſed to be under the dominion of ſome evil ſpirit. And hence the rigour and ſeverity of that diſcipline and penance impoſed upon thoſe who had incurred, by their immortalities, the cenſures of the church.—Several alterations were now made in the manner of celebrating the Lord's ſupper. The prayers uſed on this occaſion were lengthened, and the ſolemnity and pomp with which it was attended were conſiderably increaſed. Gold and ſilver veſſels were uſed in the celebration; it was thought eſſential to ſalvation, and for that reaſon adminiſtered even to infants.—Baptiſm was celebrated twice a-year to ſuch as, after a long courſe of trial and preparation, offered themſelves candidates. The remiſſion of ſins was thought to be its immediate conſequence; while the biſhop, by prayer and impoſition of hands, was ſuppoſed to confer thoſe ſanctifying gifts of the Holy Ghoſt, that are neceſſary to a life of righteouſneſs and virtue. An evil demon was ſuppoſed naturally to reſide in every perſon, who was the author and ſource of all the corrupt diſpoſitions and unrighteous actions of that perſon. The driving out of this demon was therefore an eſſential requiſite for baptiſm; and, in conſequence of this opinion, the baptized perſons returned home clothed in white garments, and adorned with crowns, as ſacred emblems, the former of their inward purity and innocence, and the latter of their victory over ſin and the world.—Faſting began now to be held in more eſteem than formerly. A high degree of ſanctity was attributed to this practice; it was even looked upon as indiſpenſably neceſſary, from a notion that the demons directed their force chiefly againſt thoſe who pampered themſelves with delicious fare, and were leſs troubleſome to the lean and hungry who lived under the ſeverities of a rigorous abſtinence.—The ſign of the croſs alſo was ſuppoſed to adminiſter a victorious power over all ſorts of trials and calamities; and was more eſpecially conſidered as the ſureſt defence againſt the ſnares and ſtratagems of malignant ſpirits; for which reaſon, no Chriſtian undertook any thing of moment, without arming himſelf, as he imagined, with the power of this triumphant ſign.—The hereſies which troubled the church during this century, were the Gnoſtics, (whoſe doctrines were new-modelled and improved by Manes, from whom they were afterwards chiefly called *Manicheans*); the HIERACITES, NOETIANS, SABELLIANS, and NOVATIANS; for a particular account of which, ſee thoſe articles.

Eccleſiaſtical Hiſtory.

65 Fourth century.

The fourth century is remarkable for the eſtabliſhment of Chriſtianity by law in the Roman empire; which, however, did not take place till the year 324. In the beginning of the century, the empire was governed by four chiefs, viz. Dioclesian, Maximian, Conſtantius Chlorus, and Galerius, under whom the church enjoyed a perfect toleration. Dioclesian, tho' much addicted to ſuperſtition, had no ill-will againſt the Chriſtians; and Conſtantius Chlorus, having abandoned polytheiſm, treated them with condeſcenſion and benevolence. This alarmed the Pagan prieſts, whoſe intereſts were ſo cloſely connected with the continuance of the ancient ſuperſtitions; and who apprehended, not without reaſon, that the Chriſtian religion would at length prevail throughout the empire. To prevent the downfal of the Pagan ſuperſtition, therefore, they applied to Dioclesian and Galerius Cæſar; by whom a moſt bloody perſecution was commenced in the year 303, and continued till 311. An aſylum, however, was opened for the Chriſtians in the year 304. Galerius having dethroned Dioclesian and Maximian, declared himſelf emperor in the eaſt; leaving all the weſtern provinces, to which great numbers of Chriſtians reſorted to avoid the cruelty of the former, to Conſtantius Chlorus. At length Galerius, being overtaken with an incurable and dreadful diſeaſe, publiſhed an edict ordering the perſecution to ceaſe, and reſtoring freedom to the Chriſtians, whom he had moſt inhumanly oppreſſed for eight years. Galerius died the ſame year: and in a ſhort time after, when Conſtantine the Great aſcended the throne, the Chriſtians were freed from any farther uneaſineſs, by his abrogating all the penal laws againſt them; and afterwards iſſuing edicts, by which no other religion than the Chriſtian was tolerated throughout the empire.

66 Chriſtianity eſtabliſhed by Conſtantine.

67 Increaſe of its corruptions.

This event however, ſo favourable to the outward peace of the church, was far from promoting its internal harmony, or the reformation of its leaders. The clergy, who had all this time been augmenting their power at the expence of the liberty of the people, now ſet no bounds to their ambition. The biſhop of Rome was the firſt in rank, and diſtinguiſhed by a fort of pre-eminency above the reſt of the prelates. He ſurpaſſed all his brethren in the magnificence and ſplendor of the church over which he preſided; in the riches of his revenues and poſſeſſions; in the number and variety of his miniſters; in his credit with the people, and in his ſumptuous

Eccleſiaſtical Hiſtory.

and ſplendid manner of living. Hence it happened that when a new pontiff was to be choſen by the preſbyters and people, the city of Rome was generally agitated with diſſenſions, tumults, and cabals, which often produced fatal conſequences. The intrigues and diſturbances which prevailed in that city in the year 366, when, upon the death of Liberius, another pontiff was to be choſen in his place, are a ſufficient proof of what we have advanced. Upon this occaſion, one faction elected Damaſus to that high dignity; while the oppoſite party choſe Urſicinus, a deacon of the vacant church, to ſucceed Liberius. This double election gave riſe to a dangerous ſchiſm, and to a ſort of civil war within the city of Rome; which was carried on with the utmoſt barbarity and fury, and produced the moſt cruel maſſacres and deſolations. The inhuman conteſt ended in the victory of Damaſus; but whether his cauſe was more juſt than that of Urſicinus, is not ſo eaſily determined.

Notwithſtanding the pomp and ſplendor which ſurrounded the Roman ſee, it is certain that the biſhops of Rome had not yet acquired that pre-eminence of power and juriſdiction which they afterwards enjoyed. In the eccleſiaſtical commonwealth, indeed, they were the moſt eminent order of citizens; but ſtill they were citizens as well as their brethren, and ſubject, like them, to the laws and edicts of the emperors. All religious cauſes of extraordinary importance were examined and determined, either by judges appointed by the emperors, or in councils aſſembled for that purpoſe; while thoſe of inferior moment were decided in each diſtrict by its reſpective biſhop. The eccleſiaſtical laws were enacted either by the emperor or councils. None of the biſhops acknowledged that they derived their authority from the permiſſion and appointment of the biſhop of Rome, or that they were created biſhops by the favour of the *apoſtolic ſee*. On the contrary, they all maintained that they were the ambaſſadors and miniſters of Jeſus Chriſt, and that their authority was derived from above. It muſt, however, be obſerved, that even in this century, ſeveral of thoſe ſteps were laid, by which the biſhops of Rome mounted afterwards to the ſummit of eccleſiaſtical power and deſpotiſm. This happened partly by the imprudence of the emperors, partly by the dexterity of the Roman prelates themſelves, and partly by the inconſiderate zeal and precipitate judgment of certain biſhops.—The imprudence of the emperor, and precipitation of the biſhops, were remarkably diſcovered in the following event, which favoured extremely the ambition of the Roman pontiff. About the year 372, Valentinian enacted a law, empowering the biſhop of Rome to examine and judge other biſhops, that religious diſputes might not be decided by any profane or ſecular judges. The biſhops, aſſembled in council at Rome in 378, not conſidering the fatal conſequences that muſt ariſe from this imprudent law both to themſelves and to the church, declared their approbation in the ſtrongeſt terms, and recommended the execution of it in their addreſs to the emperor Gratian. Some think, indeed, that this law empowered the Roman biſhop to judge only the biſhops within the limits of his juriſdiction; others, that his power was given only for a certain time, and for a particular purpoſe. This laſt notion ſeems the moſt probable; but ſtill this privilege muſt have been an excellent inſtrument in the hands of facerdotal ambition.

Eccleſiaſtical Hiſtory.

By the removal of the ſeat of empire to Conſtantinople, the emperor raiſed up, in the biſhop of this new metropolis, a formidable opponent to the biſhop of Rome, and a bulwark which threatened a vigorous oppoſition to his growing authority. For as the emperor, in order to render Conſtantinople a ſecond Rome, enriched it with all the rights and privileges, honours and ornaments, of the ancient capital of the world; ſo its biſhop, meaſuring his own dignity and rank by the magnificence of the new city, and its eminence as the reſidence of the emperor, aſſumed an equal degree of dignity with the biſhop of Rome, and claimed a ſuperiority over the reſt of the epiſcopal order. Nor did the emperors diſapprove of theſe high pretenſions, ſince they conſidered their own dignity as connected in a certain meaſure with that of the biſhop of their imperial city. Accordingly, in a council held at Conſtantinople, in the year 381, by the authority of Theodoſius the Great, the biſhop of that city was, during the abſence of the biſhop of Alexandria, and againſt the conſent of the Roman prelate, placed by the third canon of that council in the firſt rank after the biſhop of Rome, and conſequently above thoſe of Alexandria and Antioch. Nectarius was the firſt biſhop who enjoyed theſe new honours accumulated upon the ſee of Conſtantinople. His ſucceſſor, the celebrated John Chryſoſtom, extended ſtill farther the privileges of that ſee, and ſubmitted to its juriſdiction all Thrace, Aſia, and Pontus; nor were the ſucceeding biſhops of that imperial city deſtitute of a fervent zeal to augment their privileges, and extend their dominion. By this unexpected promotion, the moſt diſagreeable effects were produced. The biſhops of Alexandria were not only filled with the moſt inveterate hatred againſt thoſe of Conſtantinople, but a contention was excited between the biſhops of Rome and Conſtantinople; which, after being carried on for many ages, concluded at laſt in the ſeparation of the Greek and Latin churches.

63 Biſhops of Rome and Conſtantinople rival each other.

Conſtantine the Great, in order to prevent civil commotions, and to fix his authority on a ſtable and ſolid foundation, made ſeveral changes not only in the laws of the empire, but alſo in the form of the Roman government. And as there were many important reaſons which induced him to ſuit the adminiſtration of the church to theſe changes in the civil conſtitution, this neceſſarily introduced among the biſhops new degrees of eminence and rank. The four biſhops, of Rome, Conſtantinople, Antioch, and Alexandria, were diſtinguiſhed by a certain degree of pre-eminence over the reſt. Theſe four prelates anſwered to the four prætorian prefects created by Conſtantine; and it is poſſible, that even in this century they were diſtinguiſhed by the Jewiſh title of *patriarchs*. After theſe followed the *exarchs*, who had the inſpection over ſeveral provinces, and anſwered to the appointment of certain civil officers who bore the ſame title. In a lower claſs were the *metropolitans*, who had only the government of one province; under whom were the *archbiſhops*, whoſe inſpection was confined to certain diſtricts. In this gradation the *biſhops* brought up the rear; but the ſphere of their authority was not in all places equally extenſive; being in ſome conſiderably ample, and in others confined

69 Form of church-government eſtabliſhed by Conſtantine.

Eccleſiaſtical Hiſtory.

fined within narrow limits. To theſe various eccleſiaſtical orders we might add that of the *chorepiſcopi*, or ſuperintendants of the country-churches; but this laſt order was in moſt places ſuppreſſed by the biſhops, with a deſign to extend their own authority, and enlarge the ſphere of their power and juriſdiction. The adminiſtration of the church itſelf was divided by Conſtantine into an *external* and *internal* inſpection. The latter, which was committed to biſhops and councils, related to religious controverſies, the forms of divine worſhip, the offices of prieſts, the vices of the eccleſiaſtical orders, &c. The external adminiſtration of the church the emperor aſſumed to himſelf. This comprehended all thoſe things which related to the outward ſtate and diſcipline of the church; it likewiſe extended to all conteſts that ſhould ariſe between the miniſters of the church, ſuperior as well as inferior, concerning their poſſeſſions, their reputation, their rights and privileges, their offences againſt the laws, &c. but no controverſies that related to matters purely ſpiritual were cogniſable by this external inſpection. In conſequence of this artful diviſion of the eccleſiaſtical government, Conſtantine and his ſucceſſors called councils, preſided in them, appointed the judges of religious controverſies, terminated the differences which aroſe between the biſhops and the people, fixed the limits of the eccleſiaſtical provinces, took cognizance of the civil cauſes that ſubſiſted between the miniſters of the church, and puniſhed the crimes committed againſt the laws by the ordinary judges appointed for that purpoſe; giving over all cauſes purely eccleſiaſtical to the biſhops and councils. But this famous diviſion of the adminiſtration of the church was never explained with ſufficient accuracy; ſo that, both in the fourth and fifth centuries, there are frequent inſtances of the emperors determining matters purely eccleſiaſtical, and likewiſe of biſhops and councils determining matters which related merely to the external form and government of the church.

70 Scandalous lives of the clergy.

After the time of Conſtantine many additions were made by the emperors and others to the wealth and honours of the clergy; and theſe additions were followed by a proportionable increaſe of their vices and luxury, particularly among thoſe who lived in great and opulent cities. The biſhops, on the one hand, contended with each other in the moſt ſcandalous manner concerning the extent of their reſpective juriſdictions; while, on the other, they trampled on the rights of the people, violated the privileges of the inferior miniſters, and imitated in their conduct and in their manner of living the arrogance, voluptuouſneſs, and luxury of magiſtrates and princes. This pernicious example was ſoon followed by the ſeveral eccleſiaſtical orders. The preſbyters, in many places, aſſumed an equality with the biſhops in point of rank and authority. Many complaints are alſo made by the authors of this century about the vanity and effeminacy of the deacons. Thoſe more particularly of the preſbyters and deacons who filled the firſt ſtations of theſe orders, carried their pretenſions to an extravagant length, and were offended at the notion of being placed on an equality with their colleagues. For this reaſon they not only aſſumed the titles of *arch-preſbyters* and *arch-deacons*, but alſo claimed a degree of authority and power much ſuperior to that which was veſted in the other members of their reſpective orders.

Eccleſiaſtical Hiſtory.

71 Conteſts between the biſhops of Rome and Conſtantinople.

In the fifth century, the biſhops of Conſtantinople having already reduced under their juriſdiction all the Aſiatic provinces, began to graſp at ſtill further acceſſions of power. By the 28th canon of the council held at Chalcedon in 451, it was reſolved, that the ſame ſame rights and honours which had been conferred on the biſhop of Rome were due to the biſhop of Conſtantinople, on account of the equal dignity and luſtre of the two cities in which theſe prelates exerciſed their authority. The ſame council confirmed alſo, by a ſolemn act, the biſhop of Conſtantinople in the ſpiritual government of thoſe provinces over which he had uſurped the juriſdiction. Leo the Great, biſhop of Rome, oppoſed with vehemence the paſſing of theſe laws; and his oppoſition was ſeconded by that of ſeveral other prelates. But their efforts were vain, as the emperors threw in their weight into the balance, and thus ſupported the deciſions of the Grecian biſhops. In conſequence, then, of the deciſions of this famous council, the biſhop of Conſtantinople began to contend obſtinately for the ſupremacy with the Roman pontiff, and to cruſh the biſhops of Antioch and Alexandria. About the ſame time, Juvenal, biſhop of Jeruſalem, attempted to withdraw himſelf and his church from the juriſdiction of the biſhop of Cæſarea, and aſpired after a place among the firſt prelates of the Chriſtian world. The high degree of veneration and eſteem in which the church of Jeruſalem was held among all other Chriſtian ſocieties (on account of its rank among the apoſtolical churches, and its title to the appellation of *mother-church*, as having ſucceeded the firſt Chriſtian aſſembly formed by the Apoſtles), was extremely favourable to the ambition of Juvenal, and rendered his project much more practicable than it would otherwiſe have been. Encouraged by this, and likewiſe by the protection of Theodoſius the younger, this aſpiring prelate not only aſſumed the dignity of patriarch of all Paleſtine, a rank which rendered him independent of all ſpiritual authority; but alſo invaded the rights of the biſhop of Antioch, and uſurped his juriſdiction over the provinces of Phœnicia and Arabia. Hence aroſe a warm conteſt between Juvenal and Maximus biſhop of Antioch; which the council of Chalcedon decided, by reſtoring to the latter the provinces of Phœnicia and Arabia, and confirming the former in the ſpiritual poſſeſſion of all Paleſtine and in the high rank which he had aſſumed in the church.

In 588, John, biſhop of Conſtantinople, ſurnamed the *Faſter*, either by his own authority or that of the emperor Mauritius, ſummoned a council at Conſtantinople to inquire into an accuſation brought againſt Gregory, biſhop of Antioch; and upon this occaſion aſſumed the title of *oecumenical* or *univerſal biſhop*. This title had been formerly enjoyed by the biſhops of Conſtantinople without any offence; but now, Gregory the Great, at that time biſhop of Rome, ſuſpecting that John was aiming at the ſupremacy over all the churches, oppoſed his claim with the greateſt vigour. For this purpoſe he applied by letters to the emperor, and others, whom he thought capable of aſſiſting him in his oppoſition: but all his efforts were without effect; and the biſhops of Conſtantinople were allowed to enjoy the diſputed title, though not in the ſenſe which had alarmed the Roman pontiff.

Gregory,

Ecclesiastical History.

Gregory, however, adhered tenaciously to his purpose, raised new tumults and dissensions among the clergy, and aimed at nothing less than an unlimited supremacy over the Christian church. This ambitious design succeeded in the West; while, in the Eastern provinces, his arrogant pretensions were scarcely respected by any but those who were at enmity with the bishop of Constantinople. How much the people were at this time deluded by the Roman pontiffs, appears from the expression of Ennodius, one of the flatterers of Symmachus, (who was a prelate of but ambiguous fame) that the Roman pontiff was constituted *judge in the place of God*, which he filled as the vicegerent of the most high. On the other hand it is certain, from a variety of the most authentic records, that both the emperors and the nations in general, were far from being disposed to bear with patience the yoke of servitude which the see of Rome was arrogantly imposing on the whole church.

72 Origin of the supremacy of the pope.

In the beginning of the seventh century, according to the most learned historians, Boniface III. engaged Phocas, emperor of Constantinople, to take from the bishop of that metropolis, the title of *œcumenical* or *universal bishop*, and to confer it upon the Roman pontiff; and thus was first introduced the supremacy of the pope. The Roman pontiffs used all methods to maintain and enlarge this authority and pre-eminence which they had acquired from one of the most odious tyrants that ever disgraced the annals of history.

In the eighth century, the power of the bishop of Rome, and of the clergy in general, increased prodigiously. The chief cause of this, besides the superstition of the people, was the method at that time used by the European princes to secure themselves on their thrones. All these princes being then employed either in usurpation or in self-defence, and the whole continent being in the most unsettled and barbarous condition, they endeavoured to attach warmly to their interests those whom they considered as their friends and clients. For this purpose they distributed among them extensive territories, cities, and fortresses, with the various rights and privileges belonging to them; reserving only to themselves the supreme dominion, and the military service of these powerful vassals. For this reason it was by the European princes reckoned a high instance of political prudence to distribute among the bishops and other Christian doctors the same sort of donations which had formerly been given to their generals and clients. By means of the clergy, they hoped to check the seditious and turbulent spirits of their vassals, and to maintain them in their obedience by the influence and authority of their bishops, whose commands were highly respected, and whose spiritual thunderbolts, rendered formidable by ignorance, struck terror into the boldest and most resolute hearts.

This prodigious accession to the opulence and authority of the clergy in the west, began at their head, viz. the Roman pontiff; from whence it spread gradually among the inferior sacerdotal orders. The barbarous nations who had received the gospel, looked upon the bishop of Rome as the successor of their chief druid or high priest: and as this tremendous druid had enjoyed, under the darkness of Paganism, a kind of boundless authority; so these barbarous nations thought proper to confer upon the chief bishop, the same authority which had belonged to the chief druid. The Pope received these august privileges with great pleasure; and left, upon any change of affairs, attempts should be made to deprive him of them, he strengthened his title to these extraordinary honours by a variety of passages drawn from ancient history, and, what is still more astonishing, by arguments of a religious nature. This swelled the Roman druid to an enormous size; and gave to the see of Rome that high pre-eminence and despotic authority in civil and political matters, that were unknown to former ages. Hence, among other unhappy circumstances, arose that monstrous and pernicious opinion, that such persons as were excluded from the communion of the church by the pontiff himself, or any of the bishops, forfeited thereby, not only their civil rights and advantages as citizens, but even the common claims and privileges of humanity. This horrid opinion, which was a fatal source of wars, massacres, and rebellions, without number, and which contributed more than any thing else to confirm and augment the papal authority, was borrowed by the clergy from the Pagan superstitions.—Though excommunication, from the time of Constantine the Great, was in every part of the Christian world attended with many disagreeable effects; yet its highest terrors were confined to Europe, where its aspect was truly formidable and hideous. It acquired also, in the eighth century, new accessions of terror; so that from that period the excommunication practised in Europe differed entirely from that which was in use in other parts of Christendom. Excommunicated persons were indeed considered in all places as objects of hatred both to God and man: but they were not, on that account, robbed of the privileges of citizens, nor of the rights of humanity; much less were those kings and princes, whom an insolent bishop had thought proper to exclude from the communion of the church, supposed to forfeit on that account their crowns or their territories. But from this century it was quite otherwise in Europe. Excommunication received that infernal power which dissolved all connections; so that those whom the bishops, or their chief, excluded from church communion, were degraded to a level with the beasts. The origin of this unnatural and horrid power was as follows. On the conversion of the barbarous nations to Christianity, these ignorant proselytes confounded the excommunication in use among Christians with that which had been practised in the times of Paganism, and which was attended with all the dreadful effects above-mentioned. The Roman pontiffs, on the other hand, were too artful not to encourage this error; and therefore employed all sorts of means to gain credit to an opinion so well calculated to gratify their ambition, and to aggrandize in general the episcopal order.

The annals of the French nation furnish us with the following instance of the enormous power which was at this time vested in the Roman pontiff. Pepin, who was mayor of the palace to Childeric III. king of France, and who in the exercise of that high office was possessed in reality of the royal power and authority, aspired to the titles and honours of majesty also, and formed a scheme of dethroning his sovereign. For this purpose he assembled the states in 751; and though

73 He becomes a temporal prince.

Eccleſiaſtical Hiſtory.

though they were devoted to the intereſts of this ambitious uſurper, they gave it as their opinion that the biſhop Rome was previouſly to be conſulted whether the execution of ſuch a ſcheme was lawful or not. In conſequence of this, ambaſſadors were ſent by Pepin to Zachary, the reigning pontiff, with the following queſtion, "Whether the divine law did not permit a valiant and warlike people to dethrone a puſillanimous and indolent prince who was incapable of diſcharging any of the functions of royalty; and to ſubſtitute in his place one more worthy to rule, and who had already rendered moſt important ſervices to the ſtate?' The ſituation of Zachary, who ſtood much in need of the ſuccours of Pepin againſt the Greeks and Lombards, rendered his anſwer ſuch as the uſurper deſired: and when this favourable deciſion of the Roman oracle was publiſhed in France, the unhappy Childeric was ſtripped of his royalty without the leaſt oppoſition; and Pepin, without the ſmalleſt reſiſtance, ſtepped into the throne of his maſter and his ſovereign. This deciſion was ſolemnly confirmed by Stephen II. the ſucceſſor of Zachary; who undertook a journey into France in the year 754, in order to ſolicit aſſiſtance againſt the Lombards. The pontiff at the ſame time diſſolved the obligation of the oath of fidelity and allegiance which Pepin had ſworn to Childeric and violated by his uſurpation in the year 751; and to render his title to the crown as ſacred as poſſible, Stephen anointed and crowned him, with his wife and two ſons, for the ſecond time. This complaiſance of the Pope was rewarded with the exarchate of Ravenna and all its dependencies, as we have already related. See CIVIL HISTORY, n° 44.; and *Hiſtory of* ITALY.

74 His power ſtill increaſes.

In the ſucceeding centuries, the Roman pontiffs continued to increaſe their power by every kind of artifice and fraud which can diſhonour the heart of man; and, by continually taking advantages of the civil diſſenſions which prevailed throughout Italy, France, and Germany, their influence in civil affairs aroſe to an enormous height. The increaſe of their authority in religious matters was not leſs rapid. The wiſeſt and moſt impartial among the Roman Catholic writers acknowledge, that, from the time of Lewis the Meek, the ancient rules of eccleſiaſtical government were gradually changed in Europe by the counſels and inſtigation of the church of Rome, and new laws ſubſtituted in their place. The European princes ſuffered themſelves to be diveſted of the ſupreme authority in religious matters which they had derived from Charlemagne; the power of the biſhops was greatly diminiſhed, and even the authority of both provincial and general councils began to decline. The popes, elated with their overgrown proſperity, and become arrogant beyond meaſure by the daily acceſſions that were made to their authority, were eagerly bent upon eſtabliſhing the maxim, That the biſhop of Rome was conſtituted and appointed by Jeſus Chriſt, ſupreme legiſlator and judge of the church univerſal; and that therefore the biſhops derived all their authority from him. This opinion, which they inculcated with the utmoſt zeal and ardour, was oppoſed in vain by ſuch as were acquainted with the ancient eccleſiaſtical conſtitutions, and the government of the church in the earlier ages. In order to gain credit to this new eccleſiaſtical code, and to ſupport the pretenſions of the popes to ſupremacy, it was neceſſary to produce the authority of ancient deeds, in order to ſtop the mouths of ſuch as were diſpoſed to ſet bounds to their uſurpations. The biſhops of Rome were aware of this; and as thoſe means were looked upon as the moſt lawful that tended beſt to the accompliſhment of their purpoſes, they employed ſome of their moſt ingenious and zealous partiſans in forging conventions, acts of councils, epiſtles, and ſuch-like records, by which it might appear, that, in the firſt ages of the church, the Roman pontiffs were clothed with the ſame ſpiritual majeſty and ſupreme authority which they now aſſumed. There were not, however, wanting among the biſhops ſome men of prudence and ſagacity, who ſaw through theſe impious frauds, and perceived the chains that were forging both for them and the church. The French biſhops diſtinguiſhed themſelves eminently in this reſpect: but their oppoſition was ſoon quaſhed; and as all Europe was ſunk in the groſſeſt ignorance and darkneſs, none remained who were capable of detecting theſe odious impoſtures, or diſpoſed to ſupport the expiring liberty of the church.

Eccleſiaſtical Hiſtory.

75 Extreme inſolence of the popes.

This may ſerve as a general ſpecimen of the characters and behaviour of the pretended vicegerents of Jeſus Chriſt, to the 16th century. In the 11th century indeed, their power ſeems to have riſen to its utmoſt height. They now received the pompous titles of *Maſters of the world*, and *Popes*, i. e. *Univerſal Fathers*. They preſided every where in the councils by their legates, aſſumed the authority of ſupreme arbiters in all controverſies that aroſe concerning religion or church-diſcipline, and maintained the pretended rights of the church againſt the encroachments and uſurpations of kings and princes. Their authority, however, was confined within certain limits: for, on the one hand, it was reſtrained by ſovereign princes, that it might not arrogantly aim at civil dominion; and on the other, it was oppoſed by the biſhops themſelves, that it might not ariſe to a ſpiritual deſpotiſm, and utterly deſtroy the privileges and liberty of ſynods and councils. From the time of Leo IX. the popes employed every method which the moſt artful ambition could ſuggeſt to remove thoſe limits, and to render their dominion both deſpotic and univerſal. They not only aſpired to the character of ſupreme legiſlators in the church, to an unlimited juriſdiction over all ſynods and councils whether general or provincial, to the ſole diſtribution of all eccleſiaſtical honours and benefices; as divinely authoriſed and appointed for that purpoſe; but they carried their inſolent pretenſions ſo far, as to give themſelves out for lords of the univerſe, arbiters of the fate of kingdoms and empires, and ſupreme rulers over the kings and princes of the earth. Hence we find inſtances of their giving away kingdoms, and abſolving ſubjects from their allegiance to their ſovereigns, among which the hiſtory of John king of England is very remarkable. At laſt, they plainly aſſumed the whole earth as their property, as well where Chriſtianity was preached as where it was not; and therefore, on the diſcovery of America and the Eaſt Indies, the pope, by virtue of this ſpiritual property, granted to the Portugueſe a right to all the countries lying eaſtward, and to the Spaniards all thoſe lying to the weſtward of Cape Non in Africa, which they were able to conquer by force of arms; and that nothing might be wanting to

Eccleſiaſtical Hiſtory.

to complete their character, they pretended to be lords of the future world alſo, and to have a power of reſtraining even the Divine Juſtice itſelf, and remitting that puniſhment which the Deity hath denounced againſt the workers of iniquity.

76 Chriſtianity greatly corrupted. Invocations of ſaints, relics, purgatory, &c. introduced.

All this time, the powers of ſuperſtition reigned triumphant over thoſe remains of Chriſtianity which had eſcaped the corruptions of the firſt four centuries. In the fifth century began the invocation of the happy ſouls of departed ſaints. Their aſſiſtance was intreated by many fervent prayers, while none ſtood up to oppoſe this prepoſterous kind of worſhip. The images of thoſe who during their lives had acquired the reputation of uncommon ſanctity, were now honoured with a particular worſhip in ſeveral places; and many imagined that this drew into the images the propitious preſence of the ſaints or celeſtial beings which they were ſuppoſed to repreſent. A ſingular and irreſiſtible efficacy was attributed to the bones of martyrs, and to the figure of the croſs, in defeating all the attempts of Satan, removing all ſorts of calamities, and in healing not only the diſeaſes of the body, but alſo thoſe of the mind. The famous Pagan doctrine concerning the *purification of departed ſouls*, by means of a certain kind of fire, *i. e.* purgatory, was alſo confirmed and explained more fully than it had formerly been; and every one knows of how much conſequence this abſurd doctrine hath been to the wealth and power of the Romiſh clergy.

In the ſixth century, Gregory the Great advanced an opinion, That all the *words* of the ſacred writings were *images* of inviſible and ſpiritual things; for which reaſon he loaded the churches with a multitude of ceremonies the moſt inſignificant and futile that can be imagined; and hence aroſe a new and moſt difficult ſcience, namely, the explication of theſe ceremonies, and the inveſtigation of the cauſes and circumſtances whence they derived their origin. A new method was contrived of adminiſtering the Lord's ſupper, with a

77 Introduction of the maſs.

magnificent aſſemblage of pompous ceremonies. This was called the *canon of the maſs*. Baptiſm, except in caſes of neceſſity, was adminiſtered only on the great feſtivals. An incredible number of temples were erected in honour of the ſaints. The places ſet apart for public worſhip were alſo very numerous: but now they were conſidered as the means of purchaſing the protection and favour of the ſaints; and the ignorant and barbarous multitude were perſuaded, that theſe departed ſpirits defended and guarded againſt evils and calamities of every kind, the provinces, lands, cities, and villages in which they were honoured with temples. The number of theſe temples was almoſt equalled by that of the feſtivals, which ſeem to have been invented in order to bring the Chriſtian religion as near the model of Paganiſm as poſſible.

78 Superſtition ſtill increaſes.

In the ſeventh century, religion ſeemed to be altogether buried under a heap of ſuperſtitious ceremonies; the worſhip of the true God and Saviour of the world was exchanged for the worſhip of bones, bits of wood (ſaid to be of the croſs), and the images of ſaints. The eternal ſtate of miſery threatened in Scripture to the wicked was exchanged for the temporary puniſhment of purgatory; and the expreſſions of faith in Chriſt by an upright and virtuous conduct, for the augmentation of the riches of the clergy by donations to the church, and the obſervance of a heap of idle ceremonies. New feſtivals were ſtill added; one in particular was inſtituted in honour of the *true croſs* on which our Saviour ſuffered; and churches were declared to be ſanctuaries to all ſuch as fled to them, whatever their crimes might have been.

Eccleſiaſtical Hiſtory

Superſtition, it would ſeem, had now attained its higheſt pitch; nor is it eaſy to conceive a degree of ignorance and degeneracy beyond what we have already mentioned. If any thing can poſſibly be imagined more contrary to true religion, it is an opinion which prevailed in the eighth century, namely, That Chriſtians might appeaſe an offended Deity by voluntary acts of mortification, or by gifts and oblations laviſhed on the church, and that people ought to place their confidence in the works and merits of the ſaints. The piety in this and ſome ſucceeding ages conſiſted in building and embelliſhing churches and chapels; in endowing monaſteries and baſilics; hunting after the relics of ſaints and martyrs, and treating them with an abſurd and exceſſive veneration; in procuring the interceſſion of the ſaints by rich oblations, or ſuperſtitious rites; in worſhipping images; in pilgrimages to thoſe places which were eſteemed holy, particularly to Paleſtine, &c. The genuine religion of Jeſus was now utterly unknown, both to clergy and people, if we except a few of its general doctrines contained in the creed. In this century alſo, the ſuperſtitious cuſtom of *ſolitary maſſes* had its origin. Theſe were celebrated by the prieſt alone in behalf of ſouls detained in purgatory, as well as upon ſome other occaſions. They were prohibited by the laws of the church, but proved a ſource of immenſe wealth to the clergy. Under Charlemagne they were condemned by a ſynod aſſembled at Mentz, as criminal effects of avarice and ſloth. A new ſuperſtition, however, ſtill ſprung up in the tenth century. It was imagined, from Rev. xx. 1. that Antichriſt was to make his appearance on the earth, that ſoon after the world itſelf would be deſtroyed. An univerſal panic enſued; vaſt numbers of people, abandoning all their connections in ſociety, and giving over to the churches and monaſteries all their worldly effects, repaired to Paleſtine, where they imagined that Chriſt would deſcend from heaven to judge the world. Others devoted themſelves by a ſolemn and voluntary oath to the ſervice of the churches, convents, and prieſthood, whoſe ſlaves they became, in the moſt rigorous ſenſe of that word, performing daily their heavy taſks; and all this from a notion that the ſupreme Judge would diminiſh the ſeverity of their ſentence, and look upon them with a more favourable and propitious eye, on account of their having made themſelves the ſlaves of his miniſters. When an eclipſe of the ſun or moon happened to be viſible, the cities were deſerted, and their miſerable inhabitants fled for refuge to hollow caverns, and hid themſelves among the craggy rocks, and under the bending ſummits of ſteep mountains. The opulent attempted to bribe the ſaints and the Deity himſelf by rich donations conferred upon the facerdotal tribe, who were looked upon as the immediate vicegerents of heaven. In many places, temples, palaces, and noble edifices both public and private, were ſuffered to decay, nay, were deliberately pulled down, from a notion that they were no longer of any uſe, as the final diſſolution of all things

was

Ecclesiastical History.

was at hand. In a word, no language is sufficient to express the confusion and despair that tormented the minds of miserable mortals upon this occasion. The general delusion was indeed opposed and combated by the discerning few, who endeavoured to dispel these terrors, and to efface the notion from which they arose in the minds of the people. But their attempts were ineffectual; nor could the dreadful apprehensions of the superstitious multitude be removed before the end of the century, and this terror became one of the accidental causes of the CROISADES.

That nothing might now be wanting to complete that Antichristian system of religion which had overspread all Europe, it was in the 11th century determined that divine worship should be celebrated in the Latin tongue, though now unknown throughout the whole continent. During the whole of this century also, Christians were employed in the rebuilding and ornamenting their churches, which they had destroyed through the superstitious fear already taken notice of.

79 Extravagant behaviour of the reputed saints.

In much the same way with what is above related, or worse if possible, matters went on till the time of the reformation. The clergy were immersed in crimes of the deepest dye; and the laity, imagining themselves able to purchase pardon of their sins for money, followed the examples of their pastors without remorse. The absurd principle formerly mentioned, namely, that religion consists in acts of austerity, and an unknown mental correspondence with God, produced the most extravagant and ridiculous behaviour in the devotees and reputed saints. They not only lived among the wild beasts, but also after the manner of these savage animals: they ran naked through the lonely deserts with a furious aspect, and all the agitations of madness and frenzy; they prolonged their wretched life by grass and wild herbs, avoided the sight and conversation of men, remained motionless in certain places for several years exposed to the rigour and inclemency of the seasons, and towards the conclusion of their lives shut themselves up in narrow and miserable huts; and all this was considered as true piety, the only acceptable method of worshipping the Deity and attaining a share in his favour.—But of all the instances of superstitious frenzy which disgraced the times we now speak of, none was held in higher veneration, or excited more the wonder of the multitude, than that of a certain order of men who were called *Stilites* by the Greeks, and *Sancti Columnares*, or Pillar-Saints, by the Latins. These were persons of a most singular and extravagant turn of mind, who stood motionless on the tops of *pillars* expressly raised for this exercise of their patience, and remained there for several years amist the admiration and applause of the stupid populace. The inventor of this strange discipline was one *Simeon* a Syrian, who began his follies by changing the agreeable employment of a shepherd for the austerities of a monkish life. He began his devotions on the top of a pillar six cubits high; but as he increased in sanctity, he also increased the height of his pillar, till, towards the conclusion of his life, he had got up on the top of a pillar 40 cubits in height. Many of the inhabitants of Syria and Palestine, seduced by a false ambition and an utter ignorance of true religion, followed the example of this fanatic, though not with the same degree of austerity. This superstitious practice began in the fifth century, and continued in the east for 600 years. The Latins, however, had too much wisdom and prudence to imitate the Syrians and Orientals in this whimsical superstition; and when a certain fanatic, or impostor, named *Wulfilaicus*, erected one of these pillars in the country of Treves, and proposed to live on it after the manner of Simeon, the neighbouring bishops ordered it to be pulled down.

The practices of austere worship and discipline in other respects, however, gained ground throughout all parts of Christendom. Monks of various kinds were to be found in every country in prodigious numbers. But though their discipline was at first exceedingly severe, it became gradually relaxed, and the monks gave into all the prevailing vices of the times. Other orders succeeded, who pretended to still greater degrees of sanctity, and to reform the abuses of the preceding ones; but these in their turn became corrupted, and fell into the same vices they had blamed in others. The most violent animosities, disputes, and hatred, also reigned among the different orders of monks; and, indeed, between the clergy of all ranks and degrees, whether we consider them as classed in different bodies, or as individuals of the same body. To enter into a detail of their wranglings and disputes, the methods which each of them took to aggrandise themselves at the expence of their neighbours, and to keep the rest of mankind in subjection, would require many volumes. We shall only observe, therefore, that even the external profession of the austere and absurd piety which took place in the fourth and fifth centuries, continued gradually to decline. Some there were, indeed, who boldly opposed the torrent of superstition and wickedness, which threatened to overflow the whole world: but their opposition proved fruitless, and all of these towards the æra of the reformation had been either silenced or destroyed: so that, at that time, the pope and clergy reigned over mankind without controul, had made themselves masters of almost all the wealth in every country of Europe, and may truly be said to have been the only *sovereigns*: the rest of the human race, even kings and princes, being only their vassals and slaves.

80 Rise of Mahometanism.

While the Popish superstition reigned thus violently in the west, the absurd doctrines of Mahomet overspread all the east. The rise of this impostor is related under the article ARABIA. His successors conquered in order to establish the religion of their apostle; and thus the very name of Christianity was extinguished in many places where it had formerly flourished. The conquests of the Tartars having intermingled them with the Mahometans, they greedily embraced the superstitions of that religion, which thus almost entirely overspread the whole continents of Asia and Africa; and, by the conquest of Constantinople by the Turks in 1453, was likewise established throughout a considerable part of Europe.

81 State of religion in the beginning of the 16th century and since that time.

About the beginning of the 16th century, the Roman pontiffs lived in the utmost tranquillity; nor had they, according to the appearance of things at that time, any reason to fear an opposition to their authority in any respect, since the commotions which had been

Ecclesiastical History.

been raised by the Waldenses, Albigenses, &c. were now entirely suppressed. We must not, however, conclude, from this apparent tranquillity and security of the pontiffs and their adherents, that their measures were universally applauded. Not only private persons, but also the most powerful princes and sovereign states, exclaimed loudly against the tyranny of the popes, and the unbridled licentiousness of the clergy of all denominations. They demanded, therefore, a reformation of the church in its head and members, and a general council to accomplish that necessary purpose. But these complaints and demands were not carried to such a length as to produce any good effect; since they came from persons who never entertained the least doubt about the supreme authority of the pope in religious matters, and who of consequence, instead of attempting themselves to bring about that reformation which was so ardently desired, remained entirely inactive, or looked for redress to the court of Rome, or to a general council. But while the so much desired reformation seemed to be at such a great distance, it suddenly arose from a quarter whence it was not at all expected. A single person, Martin Luther, a monk of the order of St Augustine, ventured to oppose himself to the whole torrent of papal power and despotism. This bold attempt was first made public on the 30th of September 1517; and notwithstanding all the efforts of the Pope and his adherents, the doctrines of Luther continued daily to gain ground. Others, encouraged by his success, lent their assistance in the work of Reformation; which at last produced new churches, founded upon principles quite different from that of Rome, and which still continue. But for a particular account of the transactions of the first Reformers, the opposition they met with, and the final settlement of the reformed churches in different nations in Europe, see the articles Luther and Reformation.

The state of religion in other parts of the world seems as yet to be but little altered. Asia and Africa are sunk in the grossest superstitions either of the Mahommedan or Pagan kinds. The southern continent of America belonging to the Spaniards, continues immersed in the most absurd superstitions of Popery. The northern continent, being mostly peopled with colonies from Great Britain, professes the reformed religion. At the same time it must be owned, that some kind of reformation hath taken place even in Popery and Mahommedanism themselves. The Popes have no longer that authority over states and princes, even those most bigotted to Popery, which they formerly had. Neither are the lives either of the clergy or laity so corrupt as they were before. The increase of learning in all parts of the world hath contributed to cause men open their eyes to the light of reason, and this hath been attended with a proportional decrease of superstition. Even in Mahommedan countries, that furious enthusiasm which formerly emboldened the inhabitants to face the greatest dangers, hath now almost vanished; so that the credit of Mahomet himself seems to have sunk much in the estimation of his followers. This is to be understood even of the most ignorant and bigotted multitude; and the sensible part of the Turks are said to incline much towards Deism. With regard to those nations which still profess Paganism, the intercourse of Europeans with them is so small, that it is impossible to say any thing concerning them. As none of them are in a state of civilization, however, it may be conjectured, that their religion is of the same unpolished cast with their manners, and that it consists of a heap of barbarous superstitions which have been handed down among them from time immemorial, and which they continue to observe without knowing why or wherefore.

Composition of History.

Sect. III. *Of the Composition of History.*

Cicero has given us the whole art of composing history, in a very short and comprehensive manner. We shall first transcribe what he says, and then consider the several parts of it in their proper order. "No one is ignorant (says he), that the first law in writing history is, Not to dare to say any thing that is false; and the next, Not to be afraid to speak the truth: that on the one hand there be no suspicion of affection, nor of prejudice on the other. These foundations are what all are acquainted with. But the superstructure consists partly in things, and partly in the style or language. The former require an order of times, and descriptions of places. And because in great and memorable events, we are desirous to know first their causes, then the actions themselves, and lastly their consequences; the historian should take notice of the springs or motives, that occasioned them; and, in mentioning the facts themselves, should not only relate what was done or said, but likewise in what manner; and, in treating upon their consequences, shew if they were the effects of chance, wisdom, or imprudence. Nor should he only recite the actions of great and eminent persons, but likewise describe their characters. The style ought to be fluent, smooth, and even, free from that harshness and poignancy which is usual at the bar." Thus far Cicero. An history written in this manner, and furnished with all these properties, must needs be very entertaining, as well as instructive. And perhaps few have come nearer this plan than Tacitus; though his subject is attended with this unhappy circumstance, or at least unpleasant one, that it affords us examples rather of what we ought to avoid, than what to imitate. But it is the business of the historian, as well as of the philosopher, to represent both virtues and vices in their proper colours; the latter doing it by precepts, and the former by examples. Their manner is different; but the end and design of both is, or should be, the same: And therefore history has not improperly been said by some to be moral philosophy, exemplified in the lives and actions of mankind.

82 Cicero's rules. *De Orat. Lib. ii. c. 15.*

We shall reduce these several things mentioned by Cicero to three heads, Matter, Order, and Style; and treat upon each of them separately. But as Truth is the basis and foundation of all history, it will be necessary to consider that in the first place.

Art. I. Of Truth in History.

83 Of historic truth.

Truth is, as it were, the very life and soul of history, by which it is distinguished from fable or romance. An historian therefore ought not only to be a man of probity, but void of all passion or bias. He must have the steadiness of a philosopher, joined with the vivacity of a poet or orator. Without the former, he-

Compoſition of Hiſtory.

he will be inſenſibly ſwayed by ſome paſſion, to give a falſe colouring to the actions or characters he deſcribes, as favour or diſlike to parties or perſons affect his mind. Whereas he ought to be of no party, nor to have either friend or foe while writing; but to preſerve himſelf in a ſtate of the greateſt indifferency to all, that he may judge of things as they really are in their own nature, and not as connected with this or that perſon or party. And with this firm and ſedate temper, a lively imagination is requiſite; without which his deſcriptions will be flat and cold, nor will he be able to convey to his readers a juſt and adequate idea of great and generous actions. Nor is the aſſiſtance of a good judgment leſs neceſſary than any of the former qualities, to direct him what is proper to be ſaid and what to be omitted, and to treat every thing in a manner ſuitable to its importance. And ſince theſe are the qualifications neceſſary for an hiſtorian, it may perhaps ſeem the leſs ſtrange, that we have ſo few good hiſtories.

But hiſtorical truth conſiſts of two parts; one is, Not not to ſay any thing we know to be falſe: Tho' it is not ſufficient to excuſe an hiſtorian in relating a falſehood, that he did not know it was ſo when he wrote it; unleſs he firſt uſed all the means in his power to inform himſelf of the truth. For then undoubtedly, an invincible error is as pardonable in hiſtory as in morality. But the generality of writers in this kind content themſelves with taking their accounts from hearſays, or tranſcribing them from others; without duly weighing the evidence on which they are founded, or giving themſelves the trouble of a ſtrict inquiry. Few will uſe the diligence neceſſary to inform themſelves of the certainty of what they undertake to relate. And as the want of this greatly abates the pleaſure of reading ſuch writers, while perſons read with diffidence; ſo nothing more recommends an hiſtorian, than ſuch induſtry. Thus we are informed of Thucydides, that when he wrote his hiſtory of the Peloponneſian war, he did not ſatisfy himſelf with the beſt accounts he could get from his countrymen the Athenians, fearing they might be partial in their own cauſe; but ſpared no expence to inform himſelf how the ſame facts were related by their enemies the Lacedemonians; that, by comparing the relations of both parties, he might better judge of the truth. And Polybius took greater pains than he, in order to write his hiſtory of the Roman affairs; for he travelled into Africa, Spain, Gaul, and other parts of the world, that by viewing the ſeveral ſcenes of action, and informing himſelf from the inhabitants, he might come at a greater certainty of the facts, and repreſent them in a juſter light. But as an hiſtorian ought not to aſſert what he knows to be falſe; ſo he ſhould likewiſe be cautious in relating things which are doubtful, and acquaint his readers with the evidence he goes upon in ſuch facts, from whence they may be able to judge how far it is proper to credit them. So Herodotus tells us what things he ſaw himſelf in his travels, and what he heard from the information of the Egyptian prieſts and others with whom he converſed. And Curtius, in the life of Alexander, ſpeaking of the affairs of India, ingenuouſly confeſſes, that he wrote more than he fully believed. "For (ſays he) I neither dare to affirm poſitively, what I doubt of; nor can I think it proper to omit what I have been told." By ſuch a conduct the author ſecures his credit, whether the things prove really true or falſe; and gives room for further inquiry, without impoſing on his readers.

Compoſition of Hiſtory.

The other branch of hiſtorical truth is, Not to omit any thing that is true, and neceſſary to ſet the matter treated of in a clear and full light. In the actions of paſt ages, or diſtant countries, wherein the writer has no perſonal concern, he can have no great inducement to break in upon this rule. But where intereſt or party is engaged, it requires no ſmall candour, as well as firmneſs of mind, conſtantly to adhere to it. Affection to ſome, averſion to others, fear of diſobliging friends or thoſe in power, will often interpoſe, and try his integrity. Beſides, an omiſſion is leſs obvious to cenſure, than a falſe aſſertion: for the one may be eaſily aſcribed to ignorance or forgetfulneſs; whereas the other will, if diſcovered, be commonly looked upon as deſign. He therefore, who in ſuch circumſtances, from a generous love to truth, is ſuperior to all motives to betray or ſtifle it, juſtly deſerves the character of a brave, as well as honeſt man. What Polybius ſays upon this head is very well worth remarking: "A good man ought to love his friends and his country, and to have a like diſpoſition with them, both towards their friends and enemies. But when he takes upon him the character of an hiſtorian, they muſt all be forgot. He muſt often ſpeak well of his enemies, and commend them when their actions deſerve it; and ſometimes blame, and even upbraid his greateſt friends, when their conduct makes it neceſſary. Nor muſt he forbear ſometimes to reprove, and at other times to commend, the ſame perſons; ſince all are liable to miſtake in their management, and there are ſcarce any perſons who are always in the wrong. Therefore, in hiſtory, all perſonal conſiderations ſhould be laid aſide, and regard had only to their actions."

What a different view of mankind and their actions ſhould we have, were theſe rules obſerved by all hiſtorians? Integrity is undoubtedly the principal qualification of an hiſtorian; when we can depend upon this, other imperfections are more eaſily paſſed over. Suetonius is ſaid to have written the lives of the firſt twelve Roman emperors with the ſame freedom wherewith they themſelves lived. What better character can be given of a writer? The ſame ingenuous temper appears in the two Grecian hiſtorians above mentioned, Thucydides and Polybius: The former of whom, though baniſhed by his countrymen the Athenians, yet expreſſes no marks of reſentment in his hiſtory, either againſt them in general, or even againſt the chief authors of it, when he has occaſion to mention them; and the latter does not forbear cenſuring, what he thought blameable in his neareſt relations and friends. But it is often no eaſy matter to know, whether an hiſtorian ſpeaks truth or not, and keeps up to the ſeveral characters here mentioned; tho' it ſeems reaſonable, upon the common principles of juſtice due to all mankind, to credit him where no marks of partiality or prejudice appear in his writings. Sometimes, indeed, a judgment may in a good meaſure be formed of the veracity of an author, from his manner of expreſſing himſelf. A certain candour and frankneſs, that is always uniform and conſiſtent with

Compoſition of Hiſtory.

itſelf runs through their writings, who have nothing in view but truth, which may be juſtly eſteemed as a very good evidence of their ſincerity. Whereas thoſe, who have partial deſigns to anſwer, are commonly more cloſe and covert; and if at other times they aſſume an air of openneſs and freedom, yet this is not conſtant and even, but ſoon followed again with the appearance of ſome bias and reſerve: for it is very difficult to act a part long together, without lying open to a diſcovery. And therefore though craft and deſign is exceeding various, and, Proteus like, aſſumes very different ſhapes; there are certain characters, by which it may often be perceived and detected. Thus, where things are uncertain by reaſon of their being reported various ways, it is partiality in an hiſtorian to give into the moſt unfavourable account, where others are as well known and equally credible. Again, it is a proof of the ſame bad temper, when the facts themſelves are certain and evident, but the deſign and motives of thoſe concerned in them are unknown and obſcure, to aſſign ſome ill principle, ſuch as avarice, ambition, malice, intereſt, or any other vitious habit, as the cauſe of them. This conduct is not only unjuſt to the perſons, whoſe actions they relate; but hurtful to mankind in general, by endeavouring to deſtroy the principal motive to virtue, which ſprings from example. Others, who affect to be more covert, content themſelves with ſuſpicions and ſly inſinuations; and then endeavour to come off, by intimating their unwillingneſs to believe them, tho' they would have their readers do ſo. And to mention no more, there are others, who, when they have loaded perſons with unjuſt calumnies and reflections, will allow them ſome ſlight commendations, to make what they have ſaid before look more credible, and themſelves leſs partial. But the honeſt and faithful hiſtorian contemns all ſuch low and mean arts; he conſiders things as they are in themſelves, and relates them as he finds them, without prejudice or affection.

Compoſition of Hiſtory.

very inſtructive, by informing them of the juſtice of Providence in puniſhing public injuries in this world, wherein ſocieties, as ſuch, are only capable of puniſhment. And therefore thoſe examples might be of uſe to caution them againſt the like practices. On the contrary, Thucydides begins his hiſtory with the unhappy ſtate of his countrymen the Athenians; and in the courſe of it plainly intimates, that they were the cauſe of the calamitous war between them and the Lacedemonians. Whereas, had he been more inclined to pleaſe and gratify his countrymen, than to write the truth, he might have ſet things in ſuch a light as to have made their enemies appear the aggreſſors. But he ſcorned to court applauſe at the expence of truth and juſtice, and has ſet a noble example of integrity to all future hiſtorians. But as all actions do not merit a place in hiſtory, it requires no ſmall judgment in an hiſtorian to ſelect ſuch only as are proper. Cicero obſerves very juſtly, that hiſtory "is conſerſant in great and memorable actions." For this reaſon, an hiſtorian ſhould always keep poſterity in view, and relate nothing which may not, upon ſome account or other, be worth the notice of after-ages. To deſcend to trivial and minute matters, ſuch as frequently occur in the common affairs of life, is below the dignity of hiſtory. Such writers ought rather to be deemed journaliſts than hiſtorians, who have no view or expectation that their works ſhould ſurvive them. But the ſkilful hiſtorian is fired with a more noble ambition. His deſign is to acquaint ſucceeding ages with what remarkable occurrences happened in the world before them; to do juſtice to the memory of great and virtuous men; and at the ſame time to perpetuate his own. Pliny the younger has ſome fine reflections upon this head, in a letter to a friend. "You adviſe me (ſays he) to write an hiſtory; and not you only, for many others have done the ſame, and I am myſelf inclined to it. Not that I believe myſelf qualified for it, which would be raſh to think, till I have tried; but becauſe I eſteem it a generous action not to ſuffer thoſe to be forgotten, whoſe memory ought to be eternized; and to perpetuate the names of others, together with one's own. For there is nothing I am ſo deſirous or ambitious of, as to be remembered hereafter; which is a thing worthy of a man, eſpecially of one who, conſcious of no guilt, has nothing to fear from poſterity. Therefore I am thinking day and night by what means, as Virgil ſays,

———My name
To raiſe aloft:

That would ſuffice me; for it is above my wiſh to add with him,

and wing my flight to fame.
But oh!

However, this is enough, and what hiſtory alone ſeems to promiſe." This was Pliny's opinion, with regard to the uſe and advantage of hiſtory; the ſubjects of which are generally matters of weight and importance. And therefore, when a prudent hiſtorian thinks it convenient to take notice of things in themſelves leſs conſiderable, he either does it with brevity, or for ſome apparent reaſon, or accounts for it by ſome juſt apology. So Dion Caſſius, when he has mentioned ſome things of leſſer moment in the life of Commodus (as indeed that emperor's life was chiefly filled up with cruelty

Lib. v. ep. 8.

Art. II. The Subject or Argument of Hiſtory.

84 Subject of hiſtory.

The *ſubject* in general is facts, together with ſuch things as are either connected with them, or may at leaſt be requiſite to ſet them in a juſt and proper light. But although the principal deſign of hiſtory be to acquaint us with facts, yet all facts do not merit the regard of an hiſtorian; but ſuch only as may be thought of uſe and ſervice for the conduct of human life. Nor is it allowable for him, like the poet, to form the plan and ſcheme of his work as he pleaſes. His buſineſs is to report things as he finds them, without any colouring or diſguiſe to make them more pleaſing and palatable to his reader, which would be to convert his hiſtory into a novel. Indeed, ſome hiſtories afford more pleaſure and entertainment than others, from the nature of the things of which they conſiſt; and it may be eſteemed the happineſs of an hiſtorian to meet with ſuch a ſubject, but it is not his fault if it be otherwiſe. Thus Herodotus begins his hiſtory with ſhewing, that the barbarians gave the firſt occaſion to the wars between them and the Greeks, and ends it with an account of the puniſhment which, after ſome ages, they ſuffered from the Greeks on that account. Such a relation muſt not only be very agreeable to his countrymen the Grecians, for whoſe ſakes it was written; but likewiſe

Compoſition of Hiſtory.

cruelty and folly), makes this excuſe for himſelf: "I would not have it thought that I deſcend below the gravity of hiſtory in writing theſe things. For, as they were the actions of an emperor, and I was preſent and ſaw them all, and both heard and converſed with him, I did not think it proper to omit them." He ſeems to think thoſe actions, when performed by an emperor, might be worth recording, which, if done by a perſon of inferior rank, would ſcarce have deſerved notice. Nor does he appear to have judged amiſs, if we conſider what an influence the conduct and behaviour of princes, even in the common circumſtances of life, have upon all beneath them; which may ſometimes render them not unworthy the regard of an hiſtorian, as examples either for imitation, or caution.

But, although facts in general are the proper ſubject of hiſtory, yet they may be differently conſidered with regard to the extent of them, as they relate either to particular perſons, or communities of men. And from this conſideration, hiſtory has been diſtinguiſhed into three ſorts, viz. *biography*, *particular*, and *general hiſtory*. The lives of ſingle perſons is called *biography*. By *particular hiſtory* is meant that of particular ſtates, whether for a ſhorter or longer ſpace of time. And *general hiſtory* contains an account of ſeveral ſtates exiſting together in the ſame period of time.

85 Different kinds of hiſtory.

1. The ſubjects of *biography* are the lives either of public or private perſons; for many uſeful obſervations in the conduct of human life may be made from juſt accounts of thoſe who have been eminent and beneficial to the world in either ſtation. Nay, the lives of vitious perſons are not without their uſe, as warnings to others, by obſerving the fatal conſequences which ſooner or later generally follow ſuch practices. But, for thoſe who expoſed their lives, or otherwiſe employed their time and labour for the ſervice of their fellow-creatures, it ſeems but a juſt debt that their memories ſhould be perpetuated after them, and poſterity acquainted with their benefactors. The expectation of this was no ſmall incentive to virtue in the Pagan world. And perhaps every one, upon due reflection, will be convinced how natural this paſſion is to mankind in general. And it was for this reaſon, probably, that Virgil places not only his heroes, but alſo the inventors of uſeful arts and ſciences, and other perſons of diſtinguiſhed merit, in the Elyſian fields, where he thus deſcribes them:

> Here patriots live, who, for their country's good,
> In fighting fields were prodigal of blood:
> Prieſts of unblemiſh'd lives here make abode,
> And poets worthy their inſpiring god;
> And ſearching wits of more mechanic parts,
> Who grac'd their age with new-invented arts;
> Thoſe who to worth their bounty d'd extend,
> And thoſe who knew that bounty to commend:
> The heads of theſe with holy fillets bound,
> And all their temples were with garlands crown'd.
>
> ÆNEID, l. vi. v. 66.

In the lives of public perſons, their public characters are principally, but not ſolely, to be regarded. The world is inquiſitive to know the conduct of princes and other great men, as well in private as public. And both, as has been ſaid, may be of ſervice, conſidering the influence of their examples. But to be over-inquiſitive in ſearching into the weakneſſes and infirmities of the greateſt or beſt of men, is, to ſay no more of it, but a needleſs curioſity. In the writers of this kind, Plutarch is juſtly allowed to excel.

But it has been a matter of diſpute among the learned, whether any one ought to write his own hiſtory. It may be pleaded in favour of this, that no one can be ſo much maſter of the ſubject as the perſon himſelf: and beſides, there are many inſtances, both ancient and modern, to juſtify ſuch a conduct. But on the other hand it muſt be owned, that there are many inconveniencies which attend it, ſome of which are mentioned by Cicero. "If (ſays he) there is any thing commendable, perſons are obliged to ſpeak of themſelves with greater modeſty, and to omit what is blameable in others. Beſides, what is ſaid is not ſo ſoon credited, and has leſs authority; and after all, many will not ſtick to cenſure it." And Pliny ſays very well to the ſame purpoſe, "Thoſe who proclaim their own virtues, are thought not ſo much to proclaim them becauſe they did them, as to have done them that they might proclaim them. So that which would have appeared great if told by another, is loſt when related by the party himſelf. For when men cannot deny the fact, they reflect upon the vanity of its author. Wherefore, if you do things not worth mentioning, the actions themſelves are blamed; and if the things you do are commendable, you are blamed for mentioning them." Theſe reflections will be generally allowed to be very juſt; and yet conſidering how natural it is for men to love themſelves, and to be inclined in their own favour, it ſeems to be a very difficult taſk for any one to write an impartial hiſtory of his own actions. There is ſcarce any treatiſe of this kind that is more celebrated than Cæſar's Commentaries. And yet Suetonius tells us, that "Aſinius Pollio (who lived at that time,) thought they were neither written with due care nor integrity: that Cæſar was often too credulous in his accounts of what was done by other perſons; and miſrepreſented his own actions, either deſignedly, or through forgetfulneſs: and therefore he ſuppoſes he would have reviſed and corrected them." However, at ſome times it may doubtleſs be juſtifiable for a perſon to be his own hiſtorian. Plutarch mentions two caſes wherein it is allowable for a man to commend himſelf, and be the publiſher of his own merits. Theſe are, when the doing of it may be of conſiderable advantage, either to himſelf or others. It is indeed leſs invidious for other perſons to undertake the province. And eſpecially for a perſon to talk or write of his own virtues, at a time when vice and a general corruption of manners prevails, let what he ſays be ever ſo true, it will be apt at leaſt to be taken as a reflection upon others. "Anciently (ſays Tacitus), many wrote their own lives, rather as a teſtimony of their conduct, than from pride." Upon which he makes this judicious remark: "That the more virtue abounds, the ſooner the reports of it are credited." But the antient writers had a way of taking off the reader's attention from themſelves, in recording their own actions, and ſo rendering what they ſaid leſs invidious: and that was, by ſpeaking of themſelves in the third perſon, and not in the firſt. Thus Cæſar never ſays, "I

Ad Fam. lib. v. *ep.* 12.

Lib. viii. *ep.* 1.

Compositi-on of Hiſtory.

"*I* did," or "*I* ſaid, this or that;" but always, "*Cæſar* did, or ſaid, ſo and ſo." Why the moderns have not more choſen to follow them in this, we know not, ſince it ſeems leſs exceptionable.

2. In a continued hiſtory of *particular* ſtates, ſome account may be given of their original, and founders; the nature of their ſoil, and ſituation; what advantages they have for their ſupport or improvement, either within themſelves, by foreign traffic, or conqueſts; with the form of their government. Then notice ſhould be taken of the methods by which they increaſed in wealth or power, till they gradually advanced to their higheſt pitch of grandeur; whether by their virtue, the goodneſs of their conſtitution, trade, induſtry, wars, or whatever cauſe. After this the reaſons of their declenſion ſhould be ſhewn, what were the vices that principally occaſioned it, (for that is generally the caſe), whether avarice, ambition, luxury, diſcord, cruelty, or ſeveral of theſe in conjunction. And laſtly, where that has been their unhappy fate, how they received their final ruin and ſubverſion. Moſt of theſe things Livy had in view, when he wrote his hiſtory of the Roman ſtate, as he acquaints his readers in the preface. "The accounts (ſays he) of what happened either before, or while the city was building, conſiſting rather of poetical fables than any certain records of facts, I ſhall neither aſſert nor confute them. Let antiquity be allowed to make the origin of their cities more venerable, by uniting things human and divine. But if any nation may be ſuffered to fetch their origin from the gods, ſuch is the military glory of the Romans, that when they repreſent Mars as the father of their founder, other nations may as eaſily acquieſce in this, as they do in their government. But I lay no great ſtreſs upon theſe things, and others of the like nature, whatever may be thought of them. What I am deſirous every one ſhould carefully attend to, are our lives and manners; by what men, and what arts, civil and military, the empire was both acquired and enlarged: then let him obſerve, how our manners gradually declined with our diſcipline; afterwards grew worſe and worſe; and at length ſo far degenerated, that at preſent we can neither bear with our vices, nor ſuffer them to be remedied. This is the chief benefit and advantage to be reaped from hiſtory, to fetch inſtructions from eminent examples of both kinds; in order to imitate the one, which will be of uſe both to yourſelf and your country, and avoid the other, which are equally baſe in their riſe and event." Thus far Livy. And how well he has executed this deſign, muſt be acknowledged by all who will be at the pains to peruſe his work.

3. But as a particular hiſtory conſiſts in a number of facts relating to the ſame ſtate, ſuitably connected and laid together in a proper ſeries; ſo a *general* hiſtory is made up of ſeveral particular hiſtories, whoſe ſeparate tranſactions within the ſame period of time, or part of it, ſhould be ſo diſtinctly related as to cauſe no confuſion. Such was the hiſtory of Diodorus Siculus, which contained an account of moſt of the eminent ſtates and kingdoms in the world, though far the greateſt part of it is now unhappily loſt. Of the ſame nature is the hiſtory of Herodotus, though not ſo extenſive; to whom we are eſpecially indebted for the Perſian affairs. And to this kind may likewiſe be referred Juſtin's hiſtory, though it be only the epitome of a larger work, written by another hand. The rules proper for conducting ſuch hiſtories are much the ſame as thoſe above mentioned concerning particular hiſtories; excepting what relates to the *order*, of which we ſhall have occaſion to ſpeak hereafter.

Compoſi-tion of Hiſtory.

But the hiſtories, both of particular ſtates and thoſe which are more general, frequently contain only the affairs of ſome ſhort period of time. Thus the hiſtory of the Peloponneſian war, written by Thucydides, compriſes only what was done in the firſt twenty years of that war, which laſted ſeven years longer than his account reaches; though indeed the reaſon of that might be, becauſe Thucydides died before the war was finiſhed, otherwiſe he would very probably have continued his hiſtory to the concluſion of it. But the hiſtory of the war between the Romans and king Jugurtha in Africa, given us by Salluſt, as alſo Cæſar's hiſtories of the Gallic and civil wars, are all confined within a much leſs number of years than that of Thucydides. Nay, ſometimes one ſingle tranſaction is thought ſufficient to furniſh out an hiſtory. Such was the conſpiracy of Catiline to ſubvert the Roman ſtate, written likewiſe by Salluſt. As to more general hiſtories, Xenophon's hiſtory of Greece may be eſteemed as ſuch, which in order of time ſucceeds that of Thucydides, and contains the affairs of forty-eight years. And Polybius called his a *general hiſtory*; which, though it principally contained the Roman affairs, yet took in the moſt remarkable tranſactions of ſeveral other ſtates, for the ſpace of fifty-three years: though it has met with the ſame hard fate as that of Diodorus Siculus, ſo that only the firſt five books out of forty, of which it conſiſted at firſt, now remain entire. And to mention no more, the celebrated hiſtory of Thuanus is another inſtance of this ſort, in which the principal tranſactions of Europe for about ſixty years, chiefly in the ſixteenth century, are deſcribed with that judgment and fidelity, and in a manner ſo accurate and beautiful, that he has been thought ſcarcely inferior to any of the ancient hiſtorians. Now, in ſuch hiſtories as theſe, to go farther back than is requiſite to ſet the ſubject in a juſt light, ſeems as improper as it is unneceſſary.

The general ſubject or argument of hiſtory, in its ſeveral branches, may be reduced to theſe four heads; *narration*, *reflections*, *ſpeeches*, and *digreſſions*.

86 Of narration.

I. By *narration* is meant a deſcription of facts or actions, with ſuch things as are neceſſarily connected with them, namely, perſons, time, place, deſign, and event.

As to *actions* themſelves, it is the buſineſs of the hiſtorian to acquaint his readers with the manner in which they were performed; what meaſures were concerted on all ſides, and how they were conducted, whether with vigilance, courage, prudence, and caution, or the contrary, according to the nature of the action; as likewiſe, if any unforeſeen accidents fell out, by which the deſigned meaſures were either promoted or broken. All actions may be referred to two ſorts, military and civil. And as war ariſes from injuſtice, and injuries received, on one ſide or the other, it is fit the reader ſhould be informed who were the

Compoſition of Hiſtory.

the aggreſſors. For though war is never to be deſired, yet it is ſometimes neceſſary. In the deſcription of battles, regard ſhould be had equally to both parties, the number of forces, conduct of the generals, in what manner they engaged, what turns and changes happened in the engagement, either from accidents, courage, or ſtratagem, and how it iſſued. The like circumſtances ſhould all be obſerved in ſieges and other actions. But the moſt agreeable ſcene of hiſtory ariſes from a ſtate of peace. Here the writer acquaints us with the conſtitution of ſtates, the nature of their laws, the manners and cuſtoms of the inhabitants, the advantages of concord and unanimity, with the diſadvantages of contention and diſcord; the invention of arts and ſciences, in what manner they were improved and cultivated, and by whom; with many other things, both pleaſant and profitable in the conduct of life.

As to *perſons*, the characters of all thoſe ſhould be deſcribed who act any conſiderable part in an hiſtory. This excites the curioſity of the reader, and makes him more attentive to what is ſaid of them; as every one is more inquiſitive to hear what relates to others, in proportion to his knowledge of them. And it will likewiſe be of uſe to obſerve, how their actions agree with their characters, and what were the effects of their different qualifications and abilities.

The circumſtances of *time* and *place* are carefully to be regarded by an hiſtorian, without which his accounts of facts will be frequently very lame and imperfect. And therefore chronology and geography ſeem not improperly to have been called *the two eyes of hiſtory*. Beſides, they very much aſſiſt the memory. For it is much eaſier to remember any thing ſaid to be done at ſuch a time, and in ſuch a place, than if only related in general. Nay, the remembrance of theſe often recalls thoſe things to mind, which otherwiſe had been obliterated. By time is meant not only the year of any particular æra or period; but likewiſe the ſeaſon, as ſummer or winter; and the age of particular perſons. For it is oftentimes from hence that we are principally enabled to make a juſt eſtimate of facts. Thus Cicero commends Pompey for undertaking and finiſhing the Piratic war at a ſeaſon of the year when other generals would not have thought it ſafe to venture out at ſea. This double danger, as well from the weather as the enemy, conſidering the neceſſity of the caſe, heightens the glory of the action; ſince to have done the ſame thing in ſummer, would not have been an equal proof of the courage and intrepidity of the general. And there is nothing more ſurpriſing in the conqueſts of Alexander, than that he ſhould ſubdue ſo large a part of the world by that time he was little more than thirty years old; an age at which few other generals have been much diſtinguiſhed. Had we not known this, a conſiderable part of his character had been loſt.

Pro Leg. Man. c. 12.

The like advantages ariſe from the other circumſtances of place. And therefore, in marches, battles, and other military actions, the hiſtorian ſhould take notice of the nature of the country, the paſſes, rivers, diſtances of places, ſituation of the armies, and ſtrength of the towns, either by nature or art; from which the reader may the better form a judgment of the difficulties and greatneſs of any enterpriſe. Cæſar is generally very particular in theſe things, and ſeems to have thought it highly requiſite in order to give his readers a juſt idea of his actions. The deſcriptions of countries, cities, and rivers, are likewiſe both uſeful and pleaſant; and help us to judge of the probability of what is related concerning the temper and genius of the inhabitants, their arts, traffic, wealth, power, or whatever elſe is remarkable among them.

Compoſition of Hiſtory.

But an accurate hiſtorian goes yet further, and conſiders the *cauſes* of actions, and what were the *deſigns* and views of thoſe perſons who were principally concerned in them. Some, as Polybius has well obſerved, are apt to confound the beginnings of actions with their ſprings and cauſes, which ought to be carefully ſeparated. For the cauſes are often very remote, and to be looked for at a conſiderable diſtance from the actions themſelves. Thus, as he tells us, ſome have repreſented Hannibal's beſieging Saguntum in Spain, and paſſing the Ebro, contrary to a former agreement between the Romans and Carthaginians, as cauſes of the ſecond Punic war. But theſe were only the beginnings of it. The true cauſes were the jealouſies and fears of the Carthaginians from the growing power of the Romans; and Hannibal's inveterate hatred to them, with which he had been impreſſed from his infancy. For his father, whom he ſucceeded in the command of the Carthaginian army, had obliged him, when but nine years old, to take a moſt ſolemn oath upon an altar never to be reconciled to the Romans: and therefore he was no ſooner at the head of the army, than he took the firſt opportunity to break with them. Again, the true ſprings and cauſes of action are to be diſtinguiſhed from ſuch as are only feigned and pretended. For generally the worſe deſigns men have in view, the more ſolicitous they are to cover them with ſpecious pretences. It is the hiſtorian's buſineſs, therefore, to lay open, and expoſe to view, theſe arts of politicians. So, as the ſame judicious hiſtorian remarks, we are not to imagine Alexander's carrying over his army into Aſia to have been the cauſe of the war between him and the Perſians. That had its being long before. The Grecians had formerly two armies in Aſia, one under Xenophon, and the other commanded by Ageſilaus. Now the Aſiatics did not venture to oppoſe or moleſt either of theſe armies in their march. This made king Philip, Alexander's father, who was an ambitious prince, and aſpired after univerſal monarchy, think it might be a practicable thing to make a conqueſt of Aſia. Accordingly, he kept it in his view, and made preparations for it; but did not live to execute it. That was left for his ſon. But as king Philip could not have done this, without firſt bringing the other ſtates of Greece into it, his pretence to them was only to avenge the injuries they had all ſuffered from the Perſians; though the real deſign was an univerſal government, both over them and the Perſians, as appeared afterwards by the event. But in order to our being well aſſured of a perſon's real deſigns, and to make the accounts of them more credible, it is proper we ſhould be acquainted with his diſpoſition, manners, way of life, virtues, or vices; that by comparing his actions with theſe, we may ſee how far they agree and ſuit each other. For this reaſon Salluſt is ſo particular in his deſcription of Catiline, and Livy of Hannibal; by which it appears credible, that the one was capable of entering

Compositi-on of Hiſtory.

entering into ſuch a conſpiracy againſt his country, and the other of performing ſuch great things as are related concerning him. But if the cauſes of actions lie in the dark and unknown, a prudent hiſtorian will not trouble himſelf, or his readers, with vain and trifling conjectures, unleſs ſomething very probable offers itſelf.

Laſtly, an hiſtorian ſhould relate the *iſſue* and *event* of the actions he deſcribes. This is undoubtedly the moſt uſeful part of hiſtory; ſince the greateſt advantage ariſing from it is to teach us experience, from what has happened in the world before us. When we learn from the examples of others the happy effects of wiſdom, prudence, integrity, and other virtues, it naturally excites us to an imitation of them, and to purſue the ſame meaſures in our own conduct. And, on the contrary, by perceiving the unhappy conſequences which have followed from violence, deceit, raſhneſs, or the like vices, we are deterred from ſuch practices. But ſince the wiſeſt and moſt prudent meaſures do not always meet with the deſired ſucceſs, and many croſs accidents may happen to fruſtrate the beſt concerted deſigns; when we meet with inſtances of this nature, it prepares us for the like events, and keeps us from too great a confidence in our own ſchemes. However, as this is not commonly the caſe, but in the ordinary courſe of human affairs like cauſes uſually produce like effects; the numerous examples of the happy conſequences of virtue and wiſdom, recorded in hiſtory, are ſufficient to determine us in the choice of our meaſures, and to encourage us to hope for an anſwerable ſucceſs, though we cannot be certain we ſhall in no inſtance meet with a diſappointment. And therefore Polybius very juſtly obſerves, that "he who takes from hiſtory the cauſes, manner, and end of actions, and omits to take notice whether the event was anſwerable to the means made uſe of, leaves nothing in it but a bare amuſement, without any benefit or inſtruction." Theſe then are the ſeveral things neceſſary to be attended to in hiſtorical narrations, but the proper diſpoſition of them muſt be left to the ſkill and prudence of the writer.

86 Of reflections.

II. *Reflections* made by the writer. Some have condemned theſe, as having a tendency to bias the reader; who ſhould be left to draw ſuch concluſions from the accounts of facts, as he ſees proper. But ſince all readers are not capable of doing this for themſelves, what diſadvantage is it for the author to ſuggeſt to them ſuch obſervations as may aſſiſt them to make the beſt uſe of what they read? And if the philoſopher is allowed to draw ſuch inferences from his precepts, as he thinks juſt and proper; why has not the hiſtorian an equal right to make reflections upon the facts he relates? The reader is equally at liberty to judge for himſelf in both caſes, without danger of being prejudiced. And therefore we find, that the beſt hiſtorians have allowed themſelves this liberty. It would be eaſy to prove this by a large number of inſtances, but one or two may here ſuffice. When Salluſt has given a very diſtinct account of the deſigns of Catiline, and of the whole ſcheme of the conſpiracy, he concludes it with this reflection: "All that time the empire of the Romans ſeems to me to have been in a very unhappy ſtate. For when they had extended their conqueſts through the whole world from eaſt to weſt, and enjoyed both peace and plenty, which mankind eſteem their greateſt happineſs; ſome perſons were obſtinately bent upon their own ruin, and that of their country. For notwithſtanding two decrees were publiſhed by the ſenate, not one out of ſo great a multitude was prevailed with, by the rewards that were offered, either to diſcover the conſpiracy, or to leave the army of Catiline. So deſperate a diſeaſe, and as it were infection, had ſeized the minds of moſt people!" And it is a very handſome obſervation that Livy makes upon the ill conduct of Hannibal in quartering his army in Capua after the battle of Cannæ; by which means they loſt their martial vigour through luxury and eaſe. "Thoſe (ſays he), who are ſkilled in military affairs reckon this a greater fault in the general, than his not marching his army immediately to Rome after his victory at Cannæ; for ſuch a delay might have ſeemed only to defer the victory, but this ill ſtep deprived him of the power to gain it." The modeſty of the hiſtorian in this paſſage is worth remarking, in that he does not repreſent this as his own private opinion, and by that means undertake to cenſure the conduct of ſo great a general as Hannibal was; but as the ſenſe of thoſe who were ſkilled in ſuch affairs. However, an hiſtorian ſhould be brief in his remarks; and conſider, that altho' he does not exceed his province, by applauding virtue, expreſſing a juſt indignation againſt vice, and interpoſing his judgment upon the nature and conſequences of the facts he relates; yet there ought to be a difference between his reflections, and the encomiums or declamations of an orator.

Compositi-on of Hiſtory.

Bell. Catil. c. 37.

Lib. xxiii. *c.* 18.

87 Of ſpeeches

III. *Speeches* inſerted by hiſtorians. Theſe are of two ſorts, oblique and direct. The former are ſuch, as the hiſtorian recites in his own perſon, and not in that of the ſpeaker. Of this kind is that of Hannibal in Juſtin; by which he endeavours to perſuade king Antiochus to carry the ſeat of the war againſt the Romans into Italy. It runs thus: "Having deſired liberty to ſpeak, (he ſaid,) none of the preſent counſels and deſigns pleaſed him; nor did he approve of Greece for the ſeat of the war, which might be managed in Italy to greater advantage: becauſe it was impoſſible to conquer the Romans but by their own arms, or to ſubdue Italy but by its own forces; ſince both the nature of thoſe men, and of that war, was different from all others. In other wars, it was of great importance to gain an advantage of place or time, to ravage the countries and plunder the towns; but tho' you gain ſome advantage over the Romans, or defeat them, you muſt ſtill fight with them when beaten. Wherefore, ſhould any one engage with them in Italy, it was poſſible for him to conquer them by their own power, ſtrength, and arms, as he himſelf had done. But ſhould he attempt it out of Italy, the ſource of their power, he would be as much deceived, as if he endeavoured to alter the courſe of a river, not at the fountain-head, but where its ſtreams were largeſt and deepeſt. This was his judgment in private, and what he had offered as his advice, and now repeated in the preſence of his friends; that all might know, in what manner a war ought to be carried on againſt the Romans, who were invincible abroad, but might be conquered at home. For they might ſooner be driven out of their city than their empire, and from Italy than their

Compositi-on of Hiſtory.

their provinces; having been taken by the Gauls, and almoſt ſubdued by himſelf. That he was never defeated, till he withdrew out of their country; but upon his return to Carthage, the fortune of the war was changed with the place." He ſeems to intimate by this ſpeech, that the Romans were like ſome fierce and impetuous animals, which are no otherwiſe to be ſubdued than by wounding them in ſome vital part. In ſpeeches related after this manner, we are not neceſſarily to ſuppoſe the hiſtorian gives us the very words in which they were at firſt delivered, but only the ſenſe. But, in direct ſpeeches, the perſon himſelf is introduced as addreſſing his audience; and therefore, the words, as well as the ſenſe, are to be ſuited to his character. Such is the ſpeech of Eumenes, one of Alexander's captains and ſucceſſors, made to his ſoldiers when they had traiterouſly bound him in chains, in order to deliver him up to his enemy Antigonus, as we have it in the ſame writer. "You ſee, ſoldiers, (ſays he), the habit and ornaments of your general, which have not been put upon me by mine enemies; that would afford me ſome comfort: it is by you, that of a conqueror I am become conquered, and of a general a captive; though you have ſworn to be faithful to me four times within the ſpace of a year. But I omit that, ſince reflections do not become perſons in calamity. One thing I intreat, that, if Antigonus muſt have my life, you would let me die among you. For it no way concerns him, how, or where I ſuffer, and I ſhall eſcape an ignominious death. If you grant me this, I free you from your oath, with which you have been ſo often engaged to me. Or, if ſhame reſtrains you from offering violence to me at my requeſt, give me a ſword, and ſuffer your general to do that for you without the obligation of an oath, which you have ſworn to do for your general."

Lib. xxxi. *c.* 5.

Lib. xiv. *c.* 4.

But this likewiſe is a matter in which critics have been divided in their ſentiments; whether any, or what kind, of ſpeeches ought to be allowed in hiſtory. Some have thought all ſpeeches ſhould be excluded. And the reaſon given for that opinion is this; that it breaks the thread of the diſcourſe, and interrupts the reader, when he is deſirous to come to the end of an action, and know how it iſſued. This is true indeed, when ſpeeches are either very long, or too frequent; but otherwiſe they are not only entertaining, but likewiſe inſtructive. For it is of ſervice to know the ſprings and reaſons of actions; and theſe are frequently opened and explained in the ſpeeches of thoſe by whom they were performed. Others therefore have not been againſt all ſpeeches in general, but only direct ones. And this was the opinion of Trogus Pompeius, as Juſtin informs us; though he did not think fit to follow him in that opinion, when he abridged him, as we have ſeen already by the ſpeech of king Eumenes. The reaſon offered againſt direct ſpeeches is, becauſe they are not true, and truth is the foundation of all hiſtory, from which it never ought to depart. Such ſpeeches, therefore, are ſaid to weaken the credit of the writer; ſince he, who will tell us, that another perſon ſpoke ſuch things, which he does not know that he ever did ſpeak, and in ſuch language as he could not uſe, may take the ſame liberty in repreſenting his actions. Thus, for example, when Livy gives us the ſpeeches of Romulus, the Sabine women, Brutus, and others, in the

Lib. xxxviii. *c.* 3.

Compoſition of Hiſtory.

firſt ages of the Roman ſtate, both the things themſelves are imaginary, and the language wholly diſagreeable to the times in which thoſe perſons lived. Accordingly we find, that when ſeveral hiſtorians relate ſome particular ſpeech of the ſame perſon, they widely differ both in the ſubject-matter and expreſſions. So the ſpeech of Veturia, by which ſhe diſſuaded her ſon Coriolanus from beſieging Rome when he came againſt it with an army of Volſcians to avenge the injuries he had received, is very differently related by Livy, Dionyſius of Halicarnaſſus, and Plutarch. Such fictitious ſpeeches therefore are judged more fit for poets, who are allowed a greater liberty to indulge their fancy than hiſtorians. And if any direct ſpeeches are to be inſerted, they ſhould be ſuch only as were really ſpoken by the perſons to whom they are aſcribed, where any ſuch have been preſerved. Theſe have been the ſentiments of ſome critics, both ancient and modern. However, there is ſcarce an ancient hiſtorian now extant, either Greek or Latin, who has not ſome ſpeeches, more or leſs, in his works; and thoſe not only oblique, but alſo direct. They ſeem to have thought it a neceſſary ornament to their writings; and even where the true ſpeeches might be come at, have choſen rather to give them in their own words, in order, probably, to preſerve an equality in the ſtyle. Since therefore the beſt and moſt faithful hiſtorians have generally taken this liberty, we are to diſtinguiſh between their accounts of facts, and their ſpeeches. In the former, where nothing appears to the contrary, we are to ſuppoſe they adhere to truth, according to the beſt information they could get; but in the latter, that their view is only to acquaint us with the cauſes and ſprings of actions, which they choſe to do in the form of ſpeeches, as a method moſt ornamental to the work, and entertaining to the reader: Though the beſt hiſtorians are cautious of inſerting ſpeeches, but where they are very proper, and upon ſome ſolemn and weighty occaſions. Thucydides is ſaid to have been the firſt who brought complete and finiſhed ſpeeches into hiſtory, thoſe of Herodotus being but ſhort and imperfect. And tho' Dionyſius of Halicarnaſſus, in his cenſure upon Thucydides, ſeems then to have diſliked that part of his conduct; yet he afterwards thought fit to imitate it in his *Antiquities of Rome*, where we find many, not only oblique, but alſo direct, ſpeeches.

Lib. iii. *c.* 40. *Ant. Rom. lib.* viii. *c.* 46. *In Coriolano.*

See Voſſ. *Ars Hiſt. c.* 20.

What has been ſaid of ſpeeches, may likewiſe be underſtood of letters, which we ſometimes meet with in hiſtories; as that of Alexander to Darius in Q. Curtius, thoſe of Tiberius and Druſus in Tacitus, and many others. Some letters are wholly fictitious; and in others perhaps the hiſtorian repreſents the ſubſtance of what was really ſaid, but gives it his own dreſs. Thus we find, that ſhort letter of Lentulus to Catiline, at the time of his conſpiracy, differently related by Cicero and Salluſt. The reaſon of which ſeems to be this: That as Cicero recited it publicly to the people of Rome, in his third oration againſt Catiline, it is reaſonable to imagine, he did it in the very words of the letter, which he had by him; whereas Salluſt, as an hiſtorian, might think it ſufficient to give the ſenſe of it in his own words.

Compoſition of Hiſtory.

terrupt the courſe of the hiſtory, and divert the reader from the main deſign of the work. But now and then to introduce a beautiful deſcription, or ſome remarkable incident, which may give light to the ſubject, is ſo far from an interruption, that it is rather a relief to the reader, and excites him to go on with greater pleaſure and attention. See further on this head, ORATORY, n° 37.

ART. III. Of ORDER.

89 Of order.

SINCE moſt hiſtories conſiſt of an introduction and the body of the work, in each of which ſome order is requiſite, we ſhall ſpeak to them ſeparately.

1. The deſign of the introduction is the ſame here as in orations. For the hiſtorian propoſes three things by his introduction, which may be called its parts; to give his reader ſome general view of the ſubject, to engage his attention, and to poſſeſs him with a candid opinion of himſelf and his performance. Some have thought this laſt unneceſſary for an hiſtorian. But if we conſider how differently mankind are apt to judge of the ſame perſons and actions, it ſeems as requiſite for an hiſtorian to be well eſteemed as an orator. And therefore we find ſome of the beſt hiſtorians have not omitted this part. Livy's introduction has been very much applauded by the learned, as a maſter-piece in its kind. It begins with an account of his deſign. "Whether (ſays he) it may anſwer any valuable end for me to write the hiſtory of the Roman affairs from the beginning of the city, I neither am certain, nor, if I was, ſhould I venture to declare it." Soon after he endeavours to prepare the reader's attention, by repreſenting the grandeur and uſefulneſs of the ſubject in the following words: "Either I am prejudiced in favour of my ſubject, or there never was any ſtate greater, more virtuous, and fruitful of good examples, or in which avarice and luxury had a later admittance, or poverty and thriftineſs were either more highly or longer eſteemed, they always coveting leſs, the leſs they enjoyed." And then he preſently proceeds to ingratiate himſelf with his readers, and gain their favourable opinion: "Although my name is obſcure in ſo great a number of writers, yet it is a comfort, that they cloud it by their fame and character. But I ſhall gain this advantage by my labour, that I ſhall be diverted for a time from the proſpect of thoſe evils which the age has ſeen for ſo many years; while my mind is wholly intent upon former times, free from all that care which gives the writer an uneaſineſs, though it cannot bias him againſt the truth." In this paſſage we ſee he endeavours to gain the good eſteem of his readers from two very powerful motives, modeſty, and a ſtrict regard to truth. It may ſcarce ſeem neceſſary to obſerve, that thoſe introductions are eſteemed the beſt which are moſt natural; that is, ſuch as are taken from the ſubject-matter of the hiſtory itſelf, and cloſely connected with it. Such are thoſe of Herodotus, Thucydides, Livy, Tacitus, and others. And therefore Salluſt is greatly blamed by Quintilian on the account of his introductions, which are ſo general, that they might ſuit other hiſtories as well as thoſe to which they are prefixed. Introductions ſhould likewiſe be proportioned to the length of the work. We meet with ſome few hiſtories, in which the writers immediately enter upon their ſubject, without any introduction; as Xenophon in his Expedition of the younger Cyrus, and Cæſar in his Commentaries of the Gallic and Civil Wars. But the latter does not profeſs to write a juſt hiſtory; and therefore left himſelf more at liberty, as well in this reſpect as in ſome others. Compoſition of Hiſtory.

2. But order is principally to be regarded in the body of the work. And this may be managed two ways; either by attending to the time in a chronological ſeries, or the different nature and circumſtances of the things contained in the hiſtory. However, as theſe two methods do not equally ſuit all ſubjects, we ſhall a little conſider to what kind of hiſtories each of them ſeems more properly adapted. All hiſtory then, as we have obſerved already, may be reduced to three ſorts; *biography*, the *hiſtory of particular ſtates*, and the *general hiſtory of ſeveral ſtates* exiſting at the ſame time.

In biography, or the lives of particular perſons, moſt writers follow the order of time; though ſome reduce them to certain general heads, as their virtues and vices, or their public and private character. Plutarch and Cornelius Nepos have taken the former method, and Suetonius the latter.

As to the hiſtory of particular ſtates, the order of time is generally beſt, as being moſt natural and eaſy. And therefore it has uſually been obſerved by the beſt hiſtorians, as Thucydides, Livy, and others. Tacitus, indeed, wrote two diſtinct works; one of which he called *Annals*, and the other *Hiſtories*. And, as in both he has kept to the order of time, critics have been at a loſs to aſſign any other reaſon for theſe different titles, unleſs that in the former work he confines himſelf more cloſely to the facts themſelves, and does not treat ſo largely upon the cauſes, manner, or event of them, as he has done in the latter. And even in the circumſtances of facts, there is a certain order proper to be obſerved, for rendering the account more plain and intelligible. Thus, for inſtance, in the deſcription of a battle or ſiege, the time ſhould firſt be known, then the chief perſon or perſons who conducted it, then the number of forces and other requiſites, afterwards the nature of the place, then the action itſelf, and laſtly the event. But ſometimes it is neceſſary to add the time in which ſeveral of the other circumſtances happened, eſpecially in actions of any conſiderable length. Where the order of theſe circumſtances is confuſed, it perplexes the account, and renders it both leſs entertaining to the reader, and more difficult to remember.

In a general hiſtory, the order of time cannot always be preſerved; though, where the actions of different communities have reſpect to one as the principal, they ſhould all, as far as poſſible, be referred to the tranſactions of that ſtate. But even here the ſeveral affairs of thoſe different ſtates ought to be related ſeparately, which will neceſſarily occaſion the anticipating ſome things, and poſtponing others, ſo that they cannot all ſtand in the order of time in which they were performed. However, Vellelius Paterculus ſays very juſtly with regard to this ſubject, That "every entire action, placed together in one view, is much better apprehended than if divided by different times." In this caſe, therefore, for better preſerving the chronology, it is uſual with hiſtorians, when they have finiſhed any particular narrative, in paſſing to the next,

Compositon of Hiſtory.

next, to expreſs the time by ſome ſhort and plain tranſition; and ſometimes to apologize for themſelves, by aſſigning the reaſons of their conduct. So Polybius, whole hiſtory is of this kind, ſays concerning himſelf: "As in writing the actions of each year, in in the order of time, I endeavour to repreſent the affairs of the ſame nation together in one ſummary view, it is plain that inconvenience muſt of courſe attend this way of writing." Curtius profeſſes only to write the actions of Alexander king of Macedon; but his hiſtory contains in it the principal affairs of the greateſt ſtates in the world during that period. Now although, in the courſe of thoſe tranſactions, the war between Archelaus governor of Macedonia, and Agis king of Sparta, happened before the battle of Alexander at Arbela; yet the hiſtorian not only relates that battle firſt, but carries on the account of Alexander's affairs in Aſia to the death of Darius without interruption; for which he gives this reaſon: "If I ſhould relate the affairs of Alexander, which happened in the mean time, either in Greece, or Illyrium and Thrace, each in their proper order and time, I muſt interrupt the affairs of Aſia; which it is much better to repreſent together in one continued ſeries as they fell out, to the flight and death of Darius." Such anachroniſms, therefore, are nothing more than what neceſſarily ariſe ſometimes from the nature of the ſubject: As every thing, the more complex it is, and contains under it a greater number of parts, is more difficult to be digeſted in a regular order. But in an hiſtory compoſed of ſeveral ſtates, whoſe affairs are independent of one another, the actions of each nation muſt neceſſarily be ſeparated, in order to repreſent them in a juſt view, and prevent confuſion. This is the method which Herodotus has taken, as likewiſe Diodorus Siculus and Juſtin. Now both the pleaſure and benefit which ſuch hiſtories afford, ariſe from obſerving the conduct of each ſtate ſeparately in the courſe of their affairs, and then comparing one with the other. And as the order of time muſt frequently be interrupted, it is not unuſual to continue the chronology at proper diſtances in relating the affairs of each nation; which preſerves an unity in the whole, and connects it in one conſiſtent body.

Lib. v. init.

The diviſion of hiſtories into books was deſigned only for the better diſtinction of the ſubject and eaſe of the reader. And the dividing theſe books again into chapters, is rather a practice of later editors, (founded, as they have thought, on the ſame reaſons), than countenanced by the example of ancient writers.

ART. IV. Of STYLE.

89 Of ſtyle.

AN hiſtorical ſtyle is ſaid to be of a middle nature, between that of a poet and an orator, differing from both not only in the ornamental parts, but likewiſe in the common idioms and forms of expreſſion.

De Clar. Orat. c. 75.

Cicero obſerves, that "nothing is more agreeable in hiſtory than brevity of expreſſion, joined with purity and perſpicuity." Purity indeed is not peculiar to hiſtory, but yet it is abſolutely neceſſary. For no one will ever think him fit to write an hiſtory who is not maſter of the language in which he writes. And therefore, when Albinus had written an hiſtory of the Roman affairs in Greek, and apologized for any ſlips or impropriety that might be found in the language upon the account of his being a Roman, Cato called him a trifler, for chooſing to do that which, after he had done it, he was obliged to aſk pardon for doing. Nor is perſpicuity leſs requiſite in an hiſtorical ſtyle. The nature of the ſubject plainly directs to this. For as hiſtory conſiſts principally in narration, clearneſs and perſpicuity is nowhere more neceſſary than in a relation of facts. But theſe two properties are to be accompanied with brevity, ſince nothing is more diſagreeable than a long and tedious narrative. And in this reſpect an hiſtorical ſtyle differs both from that of poetry and oratory. For the poet frequently heightens and enlarges his deſcriptions of facts, by dwelling upon every circumſtance, placing it in different views, and embelliſhing it with the fineſt ornaments of wit and language, to render his images more agreeable. And the orator often does the like, with a deſign to ſtrike the paſſions. But ſuch colouring is not the buſineſs of an hiſtorian, who aims at nothing more than a juſt and faithful repreſentation of what he relates, in a way beſt ſuited to its nature, and in ſuch language as is moſt proper to ſet it in a plain and eaſy light.

Compoſition of Hiſtory.

Gell. Lib. xi. c. 8.

Again, Cicero, treating of an hiſtorical ſtyle, ſays: "It ought to be fluent, ſmooth, and even, free from that harſhneſs and poignancy which is uſual at the bar." The properties here mentioned diſtinguiſh this ſtyle from that of judicial diſcourſes, in which the orator often finds it neceſſary to vary his manner of ſpeaking, in order to anſwer different views, either of purſuing an argument, preſſing an adverſary, addreſſing a judge, or recommending the merits of his cauſe. This occaſions an inequality in his ſtyle, while he ſpeaks ſometimes directly, at other times by way of queſtion, and intermixes ſhort and conciſe expreſſions with round and flowing periods. But the hiſtorian has no neceſſity for ſuch variations in his ſtyle. It is his province to eſpouſe no party, to have neither friend nor foe, but to appear wholly diſintereſted and indifferent to all; and therefore his language ſhould be ſmooth and equal in his relations of perſons and their actions.

De Orat. lib. ii. c. 15, 20.

But further: Dionyſius makes "decency a principal virtue in an hiſtorian;" which he explains by ſaying, that "he ought to preſerve the characters of the perſons, and dignity of the actions of which he treats." And to do this it ſeems neceſſary that an hiſtorical ſtyle ſhould be animated with a good degree of life and vigour; without which neither the characters of eminent perſons, nor their remarkable actions, which make up the main buſineſs of hiſtory, can be duly repreſented. For even things in themſelves great and excellent, if related in a cold and lifeleſs manner, often do not affect us in a degree ſuitable to their dignity and importance. And this ſeems particularly neceſſary in ſpeeches, in order to repreſent what every one ſays, according to his different country, age, temper, and ſtation of life, in the ſame manner we may ſuppoſe he either really did, or would have ſpoken himſelf on that occaſion. Beſides, there are ſome ſcenes of action which require very pathetic and moving language, to repreſent them agreeably to their nature. And, in deſcriptions, the moſt beautiful tropes and lively figures are often neceſſary to ſet the ideas of things in a proper light. From whence it appears,

Epiſt. ad Cn. Pomp. init.

Compoſition of Hiſtory.

that painting and imagery make up no ſmall part of the hiſtorian's province, though his colours are not ſo ſtrong and glittering as thoſe either of the poet or orator. He ought, therefore, to be well acquainted with the manners of men and the nature of the paſſions, ſince he is often obliged to deſcribe both; in the former of which Herodotus excels, and Thucydides in the latter, as Dionyſius has obſerved.

Now from theſe ſeveral properties laid down by ancient writers, as requiſite for an hiſtorical ſtyle, it ſeems upon the whole to agree beſt with the middle character. And this will further appear, by what they ſay relating to the ornamental parts of ſtyle; namely, compoſition and dignity. As to the former of theſe, which reſpects the ſtructure of ſentences, and the ſeveral parts of them, Demetrius remarks, that, "An hiſtorical period ought neither to riſe very high, nor ſink very low, but to preſerve a medium." This ſimplicity, (he ſays,) "becomes the gravity and credit of hiſtory; and diſtinguiſhes it from oratory on the one hand, and dialogue on the other." His meaning is, that hiſtorical periods ſhould neither be ſo full and ſonorous, as is frequent in oratory; nor yet ſo ſhort and flat, as in dialogue. the former of which, as he ſays, require a ſtrong voice to pronounce them; and the latter have ſcarce the appearance of periods. So that, according to this judicious writer, the periods beſt ſuited for hiſtory are thoſe which, being of a moderate length, will admit of a juſt riſe and cadency, and may be pronounced with eaſe. And Dionyſius tells us, that "Hiſtory ſhould flow ſmooth and even, every where conſiſtent with itſelf, without roughneſs or chaſms in the ſound." This relates to the harmony of periods, which ariſes from ſuch a poſition of the words as renders the ſound pleaſant and agreeable, and, as he thinks, ought to be attended to in hiſtory. And as to dignity, which reſpects the uſe of tropes and figures, the ſame author ſays, that "Hiſtory ſhould be embelliſhed with ſuch figures, as are neither vehement, nor carry in them the appearance of art." This is agreeable to what Cicero obſerves, in comparing Xenophon and Caliſthenes, two Greek hiſtorians. "Xenophon the Socratic, (ſays he), was the firſt philoſopher, and after him Caliſthenes the ſcholar of Ariſtotle, who wrote an hiſtory; the latter almoſt like a rhetorician; but the ſtyle of the former is more moderate, and has not the force of an orator, leſs vehement perhaps, but in my opinion more ſweet and pleaſant." The difference between theſe two writers, with regard to their ſtyle, conſiſted chiefly in the choice of their figures, which in Xenophon were more gentle and moderate, and therefore in the judgment of Cicero more agreeable to hiſtory. Now theſe ſeveral properties relating to the ornaments of language, as well as thoſe before mentioned, which by ancient writers have been thought requiſite for hiſtory, are all ſuited to the middle ſtyle, as we have elſewhere ſhewn at large. See ORATORY, n° 99—21.

Compoſition of Hiſtory.

De Orat. lib. ii. *c.* 14.

But notwithſtanding this general account of the ſeveral properties which conſtitute an hiſtorical ſtyle, it admits of conſiderable varieties from the different nature and dignity of the ſubject. The lives of particular perſons do not require that ſtrength and majeſty of expreſſion, nor all thoſe ornaments of language, as an hiſtory of the Roman empire. And accordingly we find the ſtyle of Nepos and Suetonius very different from that of Livy. The former is ſmooth and eaſy, ſcarce riſing above the low character; but the latter often approaches near to the ſublime. And other hiſtorians again have kept a medium between theſe. Upon the whole, therefore, we may conclude, that the middle ſtyle is the proper character for hiſtory, tho' hiſtorians may ſometimes ſink into the low character, and at other times riſe to the grandeur and magnificence of the ſublime, from the different nature of their ſubject, or ſome particular parts of it. For that is to be eſteemed the proper character of any writing, which in the general beſt ſuits it. And this diſtinction may help us in ſome meaſure to reconcile the ſentiments of writers upon this head who ſeem to attribute different characters to an hiſtorical ſtyle, or at leaſt to judge where the truth lies; ſince a variety of ſtyle is not only requiſite in different ſubjects, but likewiſe in different parts of the ſame work.

Hoadley. sermon at the funeral of Mr Bennet, in which Dr Atterbury had, in the opinion of Mr Hoadley, laid down some dangerous propositions. Two years after, Mr Hoadley again entered the lists against this formidable antagonist; and in his *exceptions* against a sermon published by Dr Atterbury, intitled "The Power of Charity to cover Sin," he attacked the doctor with his usual strength of reasoning, and dispassionate inquiry.—In 1709, another dispute arose between these two learned combatants, concerning the doctrine of non-resistance, occasioned by a performance of Mr Hoadley's, intitled "The Measures of Obedience;" some positions in which, Dr Atterbury endeavoured to confute in his elegant Latin sermon, preached that year before the London clergy. In this debate Mr Hoadley signalized himself in so eminent a degree, that the honourable house of commons gave him a particular mark of their regard, by representing, in an address to the queen, the signal services he had done to the cause of civil and religious liberty.—The principles, however, which he espoused being repugnant to the general temper of those times, drew on him the virulence of a party; yet it was at this period (1710, when, as he himself expressed it, *fury seemed to be let loose upon him*), that the late Mrs Howland presented him to the rectory of Streatham in Surry, unasked, unapplied to, and without his either having seen her or been seen by her. Soon after the accession of king George I. Mr. Hoadley was consecrated to the see of Bangor; and 1717 having broached some opinions concerning the nature of Christ's kingdom, *&c.* he again became the object of popular clamour. At this juncture he was distinguished by another particular mark of the royal regard, by means of which the convocation was successively prorogued, and it was not permitted to sit, nor do any business, till that resentment was entirely subsided. In 1721, he was translated to Hereford; and from thence, in 1723, to Salisbury. In 1734, he was translated to Winchester (on the demise of Dr Willis), and published his *Plain Account of the Sacrament:* a performance which served as a butt for his adversaries to shoot at, yet impartially owns it to be clear, rational, and manly, wrote with great candour and judgment, and suited to the capacity of every serious and considerate inquirer after truth.—His latter days were embittered by a most vile instance of fraud and ingratitude. The bishop took a French priest, who pretended to abjure his religion, under his protection, with no other recommendation than that of his necessities; in return for which act of humanity, the priest found an opportunity of getting the bishop's name wrote by his own hand, and causing a note of some thousand pounds to be placed before it, offered it in payment. But the bishop denying it to be his, it was brought before a court of justice, and was there found to be a gross imposition. The ungrateful villain had now recourse to a pamphlet, in which he charged the bishop with being a drunkard, and alleged that he had the note of him when he was in liquor. To this calumny the bishop made a full and nervous answer; in which he exposed the man's falsehood, and solemnly averred that he was never drunk in his whole life. The world with becoming ardour embraced his defence, and he had the happiness to find himself perfectly acquitted even of any suspicion of such a charge. As a writer, he possessed uncommon abilities. His sermons (published in 1754 and 1755) are esteemed inferior to few writings in the English language, for plainness and perspicuity, energy and strength of reasoning, and a free and masterly manner. In private life, he was naturally facetious, easy, and complying, fond of company, yet would frequently leave it for the purposes of study or devotion. He was every where happy; and particularly in his own family, where he took all opportunities of instructing by his influence and example. He died in 1761, aged 83. Besides the works already mentioned, he wrote, 1. Terms of Acceptance, 8vo. 2. Reasonableness of Conformity. 3. On the Sacrament.—His tracts and pamphlets are extremely numerous; and the reader may see a complete catalogue of them in his life inserted in the supplement to the Biographia Britannica. Hoadley Hobbes.

HOADLEY (Benjamin), M. D. son of the former, was born in 1706, and studied at Bennet college Cambridge, under the tuition of Dr Herring afterwards archbishop of Canterbury. He took his degree in physic; and particularly applying himself to mathematical and philosophical studies, was, when very young, admitted a member of the royal society. He was made register of Hereford, while his father filled that see, and was early appointed physician to his majesty's household, but died at his house in Chelsea in 1757. He wrote, 1. Three Letters on the organs of respiration, 4to. 2. The Suspicious Husband, a comedy. 3. Observations on a series of electrical experiments; and, 4. *Oratio anniversaria, in Theatro Col. Med. Londin. ex Harvei instituto habita die*, Octob. 1742.

HOAR-HOUND, in botany. See MARUBIUM.

HOARSENESS, in medicine, a diminution of the voice, commonly attended with a preternatural asperity and roughness thereof. The parts affected are the aspera arteria and larynx. For its causes and cure, see (the *Index* subjoined to) MEDICINE.

HOBBES (Thomas), a famous writer, born at Malmsbury in 1588, was the son of a clergyman. He completed his studies at Oxford, and was afterwards governor to the eldest son of William Cavendish earl of Devonshire. He travelled through France and Italy with that young nobleman, and at length applied himself entirely to the study of polite literature. He translated Thucydides into English; and published his translation in 1628, in order to shew his countrymen, from the Athenian history, the disorders and confusions of a democratical government. In 1626, his patron the earl of Devonshire died; and in 1628, his son died also: which loss affected Mr Hobbes to such a degree, that he very willingly accepted an offer made him of going abroad a second time with the son of Sir Gervase Clifton; whom he accordingly accompanied into France, and staid there some time. But, while he continued there, he was solicited to return to England, and to resume his concern for the hopes of that family to whom he had attached himself so early, and to which he owed so many and so great obligations.

In 1631, the countess dowager of Devonshire desired to put the young earl under his care, who was then about the age of 13. This was very suitable to Mr

Hobbes. Mr Hobbes's inclinations, who diſcharged that truſt with great fidelity and diligence. In 1634, he republiſhed his tranſlation of Thucydides, and prefixed to it a dedication to that young nobleman, in which he gives a large character of his father, and repreſents in the ſtrongeſt terms the obligations he was under to that illuſtrious family. The ſame year he accompanied his noble pupil to Paris, where he applied his vacant hours to the ſtudy of natural philoſophy, and more eſpecially to the perfect underſtanding of mechaniſm, and the cauſes of animal motion. He had frequent converſations upon theſe ſubjects with father Marin Merſenne; a man deſervedly famous, and who kept up a correſpondence with almoſt all the learned in Europe. From Paris he attended his pupil into Italy, where at Piſa he became known to that great aſtronomer Galileo Galilei, who communicated to him his notions very freely; and after having ſeen all that was remarkable in that country, he returned with the earl of Devonſhire into England; afterwards, foreſeeing the civil wars, he went to ſeek a retreat at Paris, where, by the good offices of his friend father Merſenne, he became known to the famous Renatus des Cartes, and afterwards held a correſpondence with him upon ſeveral mathematical ſubjects, as appears from the letters of Mr Hobbes publiſhed in the works of Des Cartes. But when this philoſopher printed afterwards his Meditations, wherein he attempted to eſtabliſh points of the higheſt conſequence from innate ideas, Mr Hobbes took the liberty of diſſenting from him; as did alſo the French king's mathematical profeſſor, the illuſtrious Peter Gaſſendi, with whom Mr Hobbes contracted a very cloſe friendſhip, which was not interrupted till the death of the former. In 1642, Mr Hobbes printed a few copies of his famous book *De Cive*, which, in proportion as it became known, raiſed him many adverſaries, who charged him with inſtilling principles which had a dangerous tendency.

Among many illuſtrious perſons who, upon ſhipwreck of the royal cauſe, retired to France for ſafety, was Sir Charles Cavendiſh, brother to the duke of Newcaſtle: and this gentleman, being ſkilled in every branch of the mathematics, proved a conſtant friend and patron to Mr Hobbes; who, by embarking in 1645 in a controverſy about ſquaring the circle, was grown ſo famous for it, that in 1647 he was recommended to inſtruct Charles prince of Wales, afterwards king Char. II. in that kind of learning. His care in the diſcharge of this office gained him the eſteem of that prince in a very high degree: and though he afterwards withdrew his public favour to Mr Hobbes on account of his writings, yet he always retained a ſenſe of the ſervices he had done him; ſhewed him various marks of his favour after he was reſtored to his dominions; and, as ſome ſay, had his picture hanging in his cloſet. This year alſo was printed in Holland, by the care of M. Sorbiere, a ſecond and more complete edition of his book *De Cive*; to which are prefixed two Latin letters to the editor, the one by Mr Gaſſendi, the other by father Merſenne, in commendation of it: and in 1650 was publiſhed at London a ſmall treatiſe of Mr Hobbes's, intitled, "Human Nature;" and another, "*De corpore politico*, or of the elements of the law."

All this time Mr Hobbes had been digeſting with great care and pains his religious, political, and moral principles, into a complete ſyſtem, which he called the *Leviathan*, and which was printed in Engliſh at London in 1650 and 1651. After the publication of his Leviathan he returned to England, and paſſed the ſummer commonly at his patron the earl of Devonſhire's ſeat in Derbyſhire, and ſome of his winters in town, where he had for his intimate friends ſome of the greateſt men of the age. Hobbes.

In 1660, upon the reſtoration, he quitted the country, and came up to London, where he obtained from the king aſſurance of protection, and had an annual penſion of L. 100 ſettled upon him out of the privy purſe. Yet this did not render him entirely ſafe: for, in 1666, his *Leviathan* and his treatiſe *De Cive* were cenſured by parliament, which alarmed him very much; as did alſo the bringing in of a bill into the houſe of commons to puniſh atheiſm and profaneneſs. When this ſtorm was a little blown over, he began to think of procuring a beautiful edition of his pieces, that were in Latin; but finding this impracticable in England, he cauſed it to be undertaken abroad, where they were publiſhed in quarto in 1668, from the preſs of John Bleau. In 1669, he was viſited by Coſmo de Medicis, then prince, afterwards duke of Tuſcany, who gave him ample marks of his eſteem and reſpect; and having received his picture, and a complete collection of his writings, cauſed them to be repoſited, the former among his curioſities, the latter in his noble library at Florence. The like viſits he received from foreign ambaſſadors and other ſtrangers of diſtinction; who were curious to ſee a perſon whoſe ſingular opinions and numerous writings had made ſo much noiſe all over Europe. In 1672, he wrote his own life in Latin verſe, when, as he obſerves, he had completed his 84th year: and, in 1674, he publiſhed in Engliſh verſe four books of Homer's Odyſſey, which was ſo well received, that it encouraged him to undertake the whole Iliad and Odyſſey, which he likewiſe performed and publiſhed in 1675. About this time, he took his leave of London, and went to ſpend the remainder of his days in Derbyſhire; where, however, he did not remain inactive, notwithſtanding his advanced age; but publiſhed from time to time ſeveral pieces, to be found in the collection of his work. He died in 1679, aged 92.

As to his character and manners, they are thus deſcribed by Dr White Kennet, in his Memoirs of the Cavendiſh family. "The earl of Devonſhire (ſays he) for his whole life entertained Mr Hobbes in his family, as his old tutor, rather than as his friend or confident. He let him live under his roof in eaſe and plenty, and in his own way, without making uſe of him in any public, or ſo much as domeſtic affairs. He would often expreſs an abhorrence of ſome of his principles in policy and religion; and both he and his lady would frequently put off the mention of his name, and ſay, 'He was a humouriſt, and nobody could account for him.' There is a tradition in the family, of the manners and cuſtoms of Mr Hobbes, ſomewhat obſervable. His profeſſed rule of health was to dedicate the morning to his exerciſe, and the afternoon to his ſtudies. And therefore, at his firſt riſing, he walked out, and climbed any hill within his reach; or if the weather was not dry, he fatigued himſelf within doors by ſome exerciſe or other, to be in a ſweat: recommending

Hobbes.

mending that practice upon this opinion, that an old man had more moisture than heat, and therefore by such motion heat was to be acquired and moisture expelled. After this, he took a comfortable breakfast; and then went round the lodgings to wait upon the earl, the countess, and the children, and any considerable strangers, paying some short addresses to all of them. He kept these rounds till about 12 o'clock, when he had a little dinner provided for him, which he eat always by himself without ceremony. Soon after dinner he retired to his study, and had his candle with 10 or 12 pipes of tobacco laid by him; then shutting his door, he fell to smoking, thinking, and writing, for several hours. He retained a friend or two at court, and especially the lord Arlington, to protect him if occasion should require. He used to say, that it was lawful to make use of ill instruments to do ourselves good: 'If I were cast (says he) into a deep pit, and the devil should put down his cloven foot, I would take hold of it to be drawn out by it.' After the restoration, he watched all opportunities to ingratiate himself with the king and his prime ministers; and looked upon his pension to be more valuable, as an earnest of favour and protection, than upon any other account. His future course of life was to be free from danger. He could not endure to be left in an empty house. Whenever the earl removed, he would go along with him, even to his last stage, from Chatsworth to Hardwick. When he was in a very weak condition, he dared not be left behind, but made his way upon a feather-bed in a coach, though he survived the journey but a few days. He could not bear any discourse of death, and seemed to cast off all thoughts of it: he delighted to reckon upon longer life. The winter before he died, he made a warm coat, which he said must last him three years, and then he would have such another. In his last sickness his frequent questions were, Whether his disease was curable? and when intimations were given, that he might have ease, but no remedy, he used this expression, 'I shall be glad to find a hole to creep out of the world at;' which are reported to have been his last sensible words; and his lying some days following in a silent stupefaction, did seem owing to his mind more than to his body."

The reverend Mr Granger observes, that Hobbes's style is incomparably better than that of any other writer in the reign of Charles I. and was for its uncommon strength and purity scarcely equalled in the succeeding reign. "He has in translation (says he) done Thucydides as much justice as he has done injury to Homer; but he looked upon himself as born for much greater things than treading in the steps of his predecessors. He was for striking out new paths in science, government, and religion; and for removing the land-marks of former ages. His ethics have a strong tendency to corrupt our morals, and his politics to destroy that liberty which is the birthright of every human creature. He is commonly represented as a sceptic in religion, and a dogmatist in philosophy; but he was a dogmatist in both. The main principles of his Leviathan are as little founded in moral or evangelical truths, as the rules he has laid down for squaring the circle are in mathematical demonstration. His book on human nature is esteemed the best of his works.

HOBBY, the name of a hawk called by some authors *subbuteo*. See FALCO.

Hobby ‖ Hæmatopus.

It is a hawk of the lure, and not of the fist; and is very like the saker, only much less. It makes excellent sport with net and spaniels; for when the birds see the hobby, they dare not commit themselves to the wing, but lie close to the ground, and so are taken in nets.

HODY (Humphry), a learned English divine, was born in 1659. At 21 years of age, he published his celebrated *Dissertation against Aristæus's history of the 70 interpreters*; which was received with great applause by all the learned, Isaac Vossius excepted, who could not bear to have his opinions opposed by such a youth. Twenty years after, he treated the subject more fully in his *De Bibliorum textibus originalibus, versionibus Græcis & Latina vulgata, libri IV*. In 1689, he wrote the *Prolegomena* to John Malala's Chronicle, printed at Oxford; and the year after was made chaplain to Dr Stillingfleet, bishop of Worcester. The deprivation of the nonjuring bishops engaged him in a controversy with Mr Dodwell; which recommended him to archbishop Tillotson, to whom, and his successor Dr Tenison, he was domestic chaplain. In 1698, he was made regius professor of the Greek tongue at Oxford, and archdeacon of Oxford in 1704. On occasion of the controversy about the convocation, he in 1701 published *A history of English councils and convocations, and of the clergy's sitting in parliament, &c.* He died in 1706, leaving in MS. *An account of those learned Greeians who retired to Italy on the taking of Constantinople, &c.* which was published in 1742 by Dr Jebb.

HOE, in country affairs, a tool made like a cooper's adze, to cut up weeds in gardens, &c. This tool is commonly called the *hand-hoe*.

HOEING, according to Tull, is the breaking and dividing the soil by tillage, whilst the corn and other plants are growing thereon.—It differs from common tillage (which is always performed before the corn or plants are sown or planted), in the time of performing it, and it is much more beneficial to the crops than any other tillage. See AGRICULTURE, n° 171—175.

HOEMATOPUS, in ornithology, a genus of birds, of the order of grallæ. It has a long compressed bill, with the end cuneated; the nostrils are linear, and the feet have only three toes. There is but one species, the ostralegus, sea-pie, or oyster-catcher. They are very common on most of our coasts, feeding on marine insects, oysters, limpets, &c. Their bills, which are compressed sideways, and end obtusely, are very fit instruments to insinuate between the limpet and the rock to which these shells adhere; which they do with great dexterity, to get at the fish. On the coast of France, where the tides recede so far as to leave the beds of oysters bare, these birds feed on them, forcing the shells open with their bills. They keep in summer-time in pairs, laying their eggs on the bare ground: they lay four of a whitish-brown hue, thinly spotted and stripped with black; and when any one approaches their young, they make a loud and shrill noise. In winter, they assemble in vast flocks, and are very wild. The head, neck, scapulars, and coverts of the wings, of this bird are of a fine black;

in

Hoffman || Hogarth.

in some the neck is marked with white; the wings dusky, with a broad transverse band of white; the bill three inches long, and of a rich orange colour.

HOFFMAN, the name of several eminent physicians; of whom Maurice Hoffman, and John Maurice Hoffman his son, practised at Altorf. Maurice died in 1698, leaving behind him many works; and was succeeded by his son John Maurice, who wrote as well as his father, and died in 1727, highly esteemed by the faculty.—Frederic Hoffman, probably of the same family, was born at Magdeburg in 1660. The principal known circumstances of his life are, his journey into Holland and England, where he became intimately acquainted with Paul Herman, and Robert Boyle; never taking any fees, being supported by his annual stipend; his curing the emperor Charles VI. and Frederic I. king of Prussia of inveterate diseases; to which may be added, his accurate knowledge of the nature and virtues of mineral waters. He survived his 80th year; and his works, which are in great esteem, were printed in six volumes folio at Geneva, in 1740.

HOG, in zoology. See Sus.

Hog's *Dung* is, by Mortimer, reckoned one of the richest manures we are acquainted with, and the next in value to sheep's dung, and is found to be equal in virtue to twice the quantity of any other dung except this. The ancients seem to have been displeased with it, on account of its breeding weeds; but this is only accusing it of being too rich, for any dung will do this when laid too thick. It is an excellent manure for pasture-grounds, and excels all other kinds of dung for trees. The farmers who use this dung for their lands, generally take care to save it, by well-paving the styes; and increase the quantity by throwing in bean-stalks, stubble, and many other things of a like nature: and, by good management of this kind, many farmers have procured 50 or 60 loads of excellent manure a-year out of a small stye. The very best way of using this dung is, by mixing it with horse-dung; and for this reason, it is best to have the stye near the stable, that the two cleansings may be mixed in one heap, and used together.

They have in many parts of Staffordshire a poor, light, shallow land, on which they sow a kind of white pea: the land is neither able to bear this nor any thing else to advantage for their reaping; but, when the peas are ripe, they turn in as many hogs as the quantity of pease will fatten, suffering them to live at large, and to remain there day and night: in consequence of this, the land will produce good crops of hay for several years afterwards; or, if too poor for that, it will at worst raise grass enough to make it good pasture-ground.

HOGARTH (William), an excellent moral painter, was born in London, in the parish of St Bartholomew. His father, being poor, put him apprentice to an engraver of pewter-pots; and in this humble situation he passed through his time, without seeming to have any higher views. His apprenticeship was however no sooner expired, than he pursued every method of improving himself in the art of drawing, of which his former master had given him but a rude idea. This ambition was productive of distress; and while he spent his time in preparing for his future excellence, he felt all the contempt that indigence could produce. Being one day arrested by his landlady for the trifling sum of 20 shillings, and being bailed by one of his friends; in order to be revenged on her, he drew her picture in caricatura, and in that single figure gave marks of the dawn of a superior genius. The first piece in which he distinguished himself as a painter, was in the figures of the Wandsworth assembly; which are drawn from the life, without any circumstances of his burlesque manner. His next piece was his Pool of Bethesda, which he presented to St Bartholomew's hospital. His being afterwards employed to draw designs for a new edition of Hudibras, proved the first opportunity of signalizing himself in that style. The Harlot's Progress was the first of his burlesque pictures, or rather life-pictures; for it is unjust to give them the character either of burlesque or grotesque pieces, since both the one and the other convey to us a departure from nature, to which Hogarth almost always strictly adhered. The ingenious Abbé du Bos has often complained, that no history-painter of his time went through a series of actions, and thus, like an historian, painted the successive fortunes of an hero from the cradle to the grave. What du Bos wished to see done, Hogarth performed. In the above piece, he lanches out his young adventurer a simple girl upon the town, and conducts her through all the vicissitudes of wretchedness, to a premature death. This was painting to the reason and to the heart; none had ever before made the art subservient to the purposes of morality and instruction: a book like this is fitted to every foil and every observer, and he that runs may read. The Rake's Progress succeeded the former; which, though not equal to it, came short only of that single excellence, in which no other could come near him in that way. It consists of eight prints; and, like the former, it exhibits a complete history adapted to answer the most moral purposes: as is also his marriage A-la-mode, in six prints; and The Effects of Idleness and Industry, exemplified in the conduct of two fellow-apprentices, in 12 prints, &c.—Mr Hogarth travelled with several of his companions to Paris; but had no sooner landed at Calais, than, attempting to draw the gate of that city, he was taken into custody, on suspicion of his being a spy. He was soon set at liberty: but the resentment he felt on this occasion, induced him to design the satyrical print called *the Gate of Calais;* and he never after drew a Frenchman but in caricatura. The last remarkable circumstance of his life was his contest with Mr Churchill. It is said that both met at Westminster-hall; Hogarth to take by his eye a ridiculous likeness of the poet, and Churchill to furnish a description of the painter. But Hogarth's print of the poet was not much esteemed, and the poet's letter to him was but little admired. Some pretend, indeed, to say that it broke the painter's heart; but this we can from good authority say is not true. Indeed the report falls of itself; for we may as well say, that Hogarth's pencil was as efficacious as the poet's pen, since neither long survived the contest. Hogarth.

The following character of this artist is given by Mr Gilpin in his *Essay on Prints*. "The works of this

Hogarth. this master abound in true humour; and satire, which is generally well-directed: they are admirable moral lessons, and a fund of entertainment suited to every taste; a circumstance, which shews them to be just copies of nature. We may consider them too as valuable repositories of the manners, customs, and dresses of the present age. What a fund of entertainment would a collection of this kind afford, drawn from every period of the history of Britain?—How far the works of Hogarth will bear a *critical examination*, may be the subject of a little more inquiry.

"In *design*, Hogarth was seldom at a loss. His invention was fertile; and his judgment accurate. An improper incident is rarely introduced; a proper one rarely omitted. No one could tell a story better; or make it, in all its circumstances, more intelligible. His genius, however, it must be owned, was suited only to *low* or *familiar* subjects. It never soared above *common* life: to subjects naturally sublime, or which, from antiquity or other accidents, borrowed dignity, he could not rise.

"In *composition* we see little in him to admire. In many of his prints the deficiency is so great, as plainly to imply a want of all principle; which makes us ready to believe, that when we do meet with a beautiful group, it is the effect of chance. In one of his minor works, the Idle Prentice, we seldom see a crowd more beautifully managed than in the last print. If the sheriff's officers had not been placed in a line, and had been brought a little lower in the picture, so as to have formed a pyramid with the cart, the composition had been unexceptionable; and yet the first print of this work is such a striking instance of disagreeable composition, that it is amazing how an artist who had any idea of beautiful forms, could suffer so unmasterly a performance to leave his hands.

"Of the *distribution of light* Hogarth had as little knowledge as of *composition*. In some of his pieces we see a good effect; as in the *Execution* just mentioned: in which, if the figures at the right and left corners had been *kept down* a little, the light would have been beautifully distributed on the fore-ground, and a fine secondary light spread over part of the crowd. But at the same time there is so obvious a deficiency in point of effect, in most of his prints, that it is very evident he had no principles.

"Neither was Hogarth a master in *drawing*. Of the muscles and anatomy of the head and hands he had perfect knowledge; but his trunks are often badly moulded, and his limbs ill set on: yet his figures, upon the whole, are inspired with so much life and meaning, that the eye is kept in good-humour, in spite of its inclination to find fault.

"The author of the *Analysis of beauty*, it might be supposed, would have given us more instances of *grace* than we find in the works of Hogarth; which shews strongly, that theory and practice are not always united. Many opportunities his subjects naturally afford of introducing graceful attitudes; and yet we have very few examples of them. With instances of picturesque grace his works abound.

"Of his *expression*, in which the force of his genius lay, we cannot speak in terms too high. In every mode of it he was truly excellent. The passions he thoroughly understood; and all the effects which they produce in every part of the human frame: he had the happy art also of conveying his ideas with the same precision with which he conceived them.—He was excellent too in expressing any humorous oddity which we often see stamped upon the human face. All his heads are cast in the very mould of nature. Hence that endless variety, which is displayed through his works; and hence it is, that the difference arises between *his* heads, and the affected caricaturas of those masters who have sometimes amused themselves with patching together an assemblage of features from their own ideas. Such are Spaniolet's; which, though admirably executed, appear plainly to have no archetypes in nature. Hogarth's, on the other hand, are collections of natural curiosities. The *Oxford-heads*, the *Physician's-arms*, and some of his other pieces, are exactly of this humorous kind. They are truly comic, though ill-natured effusions of mirth: more entertaining than Spaniolet's, as they are pure nature; but less innocent, as they contain ill-directed ridicule.—But the species of expression in which this master perhaps most excels, is that happy art of catching those peculiarities of art and gesture which the ridiculous part of every profession contract, and which for that reason become characteristic of the whole. His counsellors, his undertakers, his lawyers, his usurers, are all conspicuous at sight. In a word, almost every profession may see in his works, that particular species of affectation which they should most endeavour to avoid.

"The *execution* of this master is well suited to his subjects, and manner of treating them. He etches with great spirit, and never gives one unnecessary stroke."

HOGSHEAD, in commerce, a measure of capacity containing 63 gallons.

HOGUE, a town and cape on the north-west point of Normandy in France; near which admiral Rook burnt the French admiral's ship called the *Rising Sun*, with 12 more large men of war, the day after the victory obtained by admiral Russell near Cherburgh, in May 1692. W. Long. 2. 0. N. Lat. 49. 50.

HOKE-TIDE, a solemn festival celebrated for many ages in England, in memory of the great slaughter of the Danes in the time of king Ethelred, they having been in that reign almost all destroyed in one day in the different parts of the kingdom, and that principally by the women. This is still kept up in some counties, and the women bear the principal sway in it, stopping all passengers with ropes and chains, and exacting some small matter to make merry with.

HOLBEIN (Hans), a celebrated painter, born at Basil in Switzerland in 1498, learned the rudiments of his art from his father, who was a painter; but soon shewed his superior genius. In the town-house of Basil he painted our Saviour's Passion; and in the fish-market of the same city, Death's dance, and a dance of peasants, which were extremely admired; and Erasmus was so pleased with them, that he desired him to draw his picture, and was ever after his friend. He staid some years longer at Basil, till his necessities, occasioned by his own extravagance and an increasing family, made him comply with Erasmus's persuasions to go to England. In his journey he staid some days at Strasburg, where it is said he applied to

Hogarth || Holbein.

Holbein. a very great painter for work, who took him in, and ordered him to give a ſpecimen of his ſkill. On which Holbein finiſhed a piece with great care, and painted a fly on the moſt eminent part of it; after which he privately withdrew in the abſence of his maſter, and purſued his journey, without ſaying any thing to any body. When the painter returned home, he was aſtoniſhed at the beauty and elegance of the drawing; and eſpecially at the fly, which he at firſt took for a real one, and endeavoured to remove it with his hand. He now ſent all over the city for his journeyman; but after many inquiries, diſcovered that he had been thus deceived by the famous Holbein.

Holbein having in a manner begged his way to England, preſented a letter of recommendation from Eraſmus to Sir Thomas More, and alſo ſhewed him Eraſmus's picture. Sir Thomas, who was then lord-chancellor, received him with all the joy imaginable, and kept him in his houſe between two and three years, in which time he drew Sir Thomas's picture, and thoſe of many of his relations and friends. Holbein one day happening to mention a nobleman who had ſome years before invited him to England, Sir Thomas was very ſolicitous to know who it was. Holbein ſaid that he had forgot his title, but remembered his face ſo well, that he believed he could draw his likeneſs; which he did ſo perfectly, that the nobleman it is ſaid was immediately known by it. The chancellor having now adorned his apartments with the productions of this great painter, reſolved to introduce him to Henry VIII. For this purpoſe, he invited that prince to an entertainment; having, before he came, hung up all Holbein's pieces in the great hall, in the beſt order, and placed in the beſt light. The king, on his firſt entrance into this room, was ſo charmed with the ſight, that he aſked whether ſuch an artiſt was now alive, and to be had for money? Upon this, Sir Thomas preſented Holbein to his majeſty; who immediately took him into his ſervice, and brought him into great eſteem with the nobility and gentry; by which means he drew a vaſt number of portraits.

But while he was here, there happened an affair which might have proved fatal to him, had he not been protected by the king. On the report of this painter's character, a lord of the firſt quality came to ſee him, when he was drawing a figure after the life. Holbein ſent to deſire his lordſhip to defer the honour of his viſit to another day; which the nobleman taking for an affront, broke open the door, and very rudely went up ſtairs. Holbein hearing a noiſe, came out of his chamber, and meeting the lord at his door, fell into a violent paſſion, and puſhed him backwards from the top of the ſtairs to the bottom. However, immediately reflecting on what he had done, he eſcaped from the tumult he had raiſed, and made the beſt of his way to the king. The nobleman, much hurt, though not ſo much as he pretended, was there ſoon after him; and upon opening his grievance, the king ordered Holbein to aſk his pardon. But this only irritated the nobleman the more, who would not be ſatisfied with leſs than his life; upon which the king ſternly replied, "My lord, you have not now to do "with Holbein, but with me; whatever puniſhment "you may contrive by way of revenge againſt him, "ſhall certainly be inflicted on yourſelf. Remember, "pray, my lord, that I can, whenever I pleaſe, make "ſeven lords of ſeven ploughmen, but I cannot make "one Holbein of even ſeven-lords." Holbein died of the plague at his lodgings at Whitehall, in 1554. "It is amazing (ſays De Piles), that a man born in "Switzerland, and who had never been in Italy, "ſhould have ſo good a *guſto*, and ſo fine a genius for "painting." He painted alike in every manner; in freſco, in water-colours, in oil, and in miniature. His genius was ſufficiently ſhewn in the hiſtorical ſtyle, by two celebrated compoſitions which he painted in the hall of the Stillyard company. He was alſo eminent for a rich vein of invention, which he ſhewed in a multitude of deſigns which he drew for engravers, ſtainers, jewellers, &c. and he had this ſingularity, that he painted with his left-hand.

Holcus ‖ Holiday.

HOLCUS, Indian millet or corn; a genus of the monœcia order, belonging to the polygamia claſs of plants.

Species. Of this genus there are ten ſpecies, two of which are natives of Britain. The moſt remarkable of theſe is the lanatus, or creeping ſoft-graſs of Hudſon; for the deſcription and properties of which, ſee Agriculture, n° 57. The moſt remarkable of the foreign ſpecies is the ſorghum, or Guinea-corn. The ſtalks are large, compact, and full eight feet high. In Senegal the fields are entirely covered with it. The negroes, who call it *guiarnot*, cover the ears when ripe with its own leaves to ſhelter it from the ſparrows, which are very miſchievous in that country. The grain made into bread, or otherwiſe uſed, is eſteemed very wholeſome. With this the ſlaves in the Weſt Indies are generally fed, each being allowed from a pint to a quart every day. The juice of the ſtalks is ſo agreeably luſcious, that, if prepared as the ſugar-canes, they would afford an excellent ſugar. The negroes on the coaſt of Guinea make of two kinds of millet a thick-grained pap called *couſcous*, which is their common food.

HOLD, the whole interior cavity or belly of a ſhip, or all that part of her inſide which is comprehended between the floor and the lower-deck throughout her whole length.—This capacious apartment uſually contains the ballaſt, proviſions, and ſtores of a ſhip of war, and the principal part of the cargo in a merchantman. The diſpoſition of theſe articles with regard to each other, naturally falls under conſideration in the article Stowage; it ſuffices in this place to ſay, that the places where the ballaſt, water, proviſions, and liquors are ſtowed, are known by the general name of the *hold*. The ſeveral ſtore-rooms are ſeparated from each other by *bulk-heads*, and are denominated according to the articles which they contain, the *ſail-room*, the *bread-room*, the *ſalt-room*, the *ſpirit-room*, &c.

HOLDERNESS, a peninſula in the eaſt-riding of Yorkſhire, having the German ſea on the eaſt, and the Humber on the ſouth. It has the title of an earldom.

HOLERACEÆ (from *holus*, "pot-herbs"). The name of the 12th order in Linnæus's fragments of a natural method, conſiſting of plants which are uſed for the table, and enter into the œconomy of domeſtic affairs. See Botany, p. 1307.

HOLIBUT, in ichthyology. See Pleuronectes.

HOLIDAY (Dr Barten), a learned divine and poet,

Holineſs || Holland.

poet, was the ſon of a taylor in Oxford, and born there about the year 1593. He ſtudied at Chriſt-church college, and in 1615 took orders. He was before admired for his ſkill in poetry and oratory; and now diſtinguiſhing himſelf by his eloquence and popularity as a preacher, he had two benefices conferred on him in the dioceſe of Oxford. In 1618, he went as chaplain to Sir Francis Stewart, when he accompanied count Gondamore to Spain. Afterwards he became chaplain to the king, and before the year 1626 was promoted to the archdeaconry of Oxford. In 1642 he was made doctor of divinity at Oxford; near which place he ſheltered himſelf during the time of the rebellion; but after the reſtoration returned to his archdeaconry, where he died in 1661. His works are, 1. Twenty ſermons, publiſhed at different times. 2. *Philoſophiæ polito-barbaræ ſpecimen*, quarto. 3. Survey of the world, a poem in ten books, octavo. 4. A tranſlation of the ſatires of Juvenal and Perſius. 5. Technogamia, or the marriage of the arts, a comedy.

HOLINESS, or SANCTITY; the quality which conſtitutes or denominates a perſon or thing *holy*; i. e. pure, or exempt from ſin. The word is alſo uſed in reſpect of perſons and things that are ſacred, *i. e.* ſet apart to the ſervice of God, and the uſes of religion.

HOLINESS, is alſo a title or quality attributed to the pope; as that of *majeſty* is to kings. Even kings, when writing to the pope, addreſs him under the venerable appellation of *Your Holineſs*, or, *Holy Father*; in Latin, *Sanctiſſime* or *Beatiſſime Pater*. Anciently the ſame title was given to all biſhops. The Greek emperors alſo were addreſſed under the title of *Holineſs*, in regard of their being anointed with holy oil at their coronation. De Cange adds, that ſome of the kings of England have had the ſame attribute; and that the orientals have frequently refuſed it to the pope.

HOLINSHED (Raphael), an Engliſh hiſtorian famous for the *Chronicles* under his name, was deſcended from a family that lived at Boſely in Cheſhire; but neither the time of his birth, nor ſcarcely any circumſtances of his life are known. However, he appears to have been a man of conſiderable learning, and to have had a genius particularly adapted for hiſtory. His chronicles of *England*, *Scotland*, and *Ireland*, were firſt publiſhed at London in 1570, in 2 vols folio; and then in 1587, in 3 vols. In this ſecond edition ſeveral ſheets in the 2d and 3d vols were caſtrated for containing ſome paſſages diſagreeable to queen Elizabeth and her miniſters; but the caſtrations have ſince been printed apart. Holinſhed was not the ſole compiler of this work, being aſſiſted in it by ſeveral other hands. The time of his death is unknown; but from his will, which is prefixed to Hearne's edition of *Cambden's Annals*, it appears to have happened between 1578 and 1582.

HOLLAND (Philemond), M. D. commonly called the *Tranſlator general of his age*, was educated in the univerſity of Cambridge. He was for many years a ſchoolmaſter at Coventry, where he alſo practiſed phyſic. He tranſlated Livy, Pliny's Natural Hiſtory, Plutarch's Morals, Suetonius, Ammianus Marcellinus, Xenophon's Cyropædia, and Cambden's Britannia, into Engliſh; and the geographical part of Speed's Theatre of Great Britain, into Latin. The Britannia, to which he made many uſeful additions, was the moſt valuable of his works. It is ſurpriſing, that a man of two profeſſions could find time to tranſlate ſo much; but it appears from the date of the Cyropædia, that he continued to tranſlate till he was 80 years of age. He died in 1636, aged 85. He made the following epigram upon writing a large folio with a ſingle pen: Holland.

With one ſole pen I wrote this book,
Made of a grey gooſe quill;
A pen it was when it I took,
And a pen I leave it ſtill.

HOLLAND, the largeſt of the ſeven United Provinces, divided into South and North Holland, the latter of which is alſo called *Weſt Frieſland*, is bounded on the weſt by the German ocean, or north ſea; to the eaſt by the Zuyder-ſee, the province of Utrecht, and part of Gelderland; to the ſouth by Dutch Brabant and Zealand; and to the north by the Zuyder-ſee. Its greateſt extent from north to ſouth, including the iſland of Texel, is about 90 Engliſh miles; but from eaſt to weſt its extent varies from 40 to 25. To defend it againſt the ſea, dykes have been erected at an immenſe expence, and innumerable canals cut to drain it, as being naturally very low and marſhy. Some parts of the province are very fruitful in corn; but the greater part conſiſts of rich paſtures, wherein are kept large herds of kine, which ſupply them with incredible quantities of butter and cheeſe. Of the latter, that of Edam, in North Holland, is highly eſteemed. The many rivers and canals that interſect the province are of great advantage to its commerce, but contribute to render the air foggy and unwholeſome. There is a communication by water betwixt almoſt every town and village. Towards the middle alſo of the province are great numbers of turf pits. It is ſo populous, that the number of the inhabitants is computed at 1,200,000. In point of cleanlineſs, no country ſurpaſſes, and few come up to it, eſpecially in North Holland, and that even in the villages. From the counts of Holland this province devolved, in 1436, to the dukes of Burgundy, and from them to the houſe of Auſtria, along with the other provinces. The States of Holland and Weſt Frieſland are compoſed of the nobility and deputies of the towns: of the latter there are 18 that ſend deputies to the aſſembly of the ſtates, which is held at the Hague. The grand penſionary is a perſon of great dignity and weight in this aſſembly, and his office requires extraordinary abilities. There are alſo two councils compoſed of deputies, one for South, and another for North Holland, who have the cognizance of the revenue and military affairs. The whole province ſends one deputy from among the nobleſſe to the ſtates-general, who takes precedence of all others, together with three or four more. There are two ſupreme courts of judicature for Holland and Zealand; viz. the great council of Holland and Zealand, and the hof or court of Holland. To theſe appeals lie from the towns; but the cauſes of noblemen come before them in the firſt inſtance. With reſpect to the eccleſiaſtical government, there is a ſynod held annually both in South and North Holland, of which the former contains eleven claſſes, and the latter ſix; and the miniſters of both together amount to 331. In the whole province are 37 towns, 8 boroughs, and 400 villages.

HOLLAND, one of the diviſions of Lincolnſhire in

Holland. England. It ſo much reſembles the province of that name upon the continent, in moſt reſpects, being low and marſhy, with the ſea on one ſide, and canals running through it, that it muſt either have had its name from thence, or on the ſame account. On the eaſt it has what the ancient geographers call *Æſtuarium Metaris*, now the Waſhes, which are overflowed at high water, and part of Cambridgeſhire on the ſouth. The lower part of it is full of bogs and marſhes, and has huge banks to defend it againſt the ſea and land floods. The whole diviſion ſeems to have been gained from the ſea. The ground is ſo ſoft, that horſes are worked unſhod; and it produces plenty of graſs, but little corn. Though there are no ſtones to be found in or upon the ground, yet the churches are all of ſtone. They have no freſh water but from the clouds, which is preſerved in pits: but if theſe are deep, it ſoon turns brackiſh; and if they are ſhallow, they ſoon become dry.

New Holland, the largeſt iſland in the world, reaching from 10 to 44 deg. S. lat. and between 110 and 154 of E. long. eaſt from London. It received its name from having been chiefly explored by Dutch navigators. The land firſt diſcovered in thoſe parts was called *Eendraght* (Concord) *Land*, from the name of the ſhip on board which the diſcovery was made, in 1616; 24 deg. and 25 deg. ſouth. In 1618, another part of this coaſt, nearly in 15 deg. ſouth, was was diſcovered by Zeachen, who gave it the name of *Arnheim* and *Diemen;* though a different part from what afterwards received the name of Diemen's Land from Taſman, which is the ſouthern extremity, in latitude 43 deg. In 1619, Jan Van Edels gave his name to a ſouthern part of New-Holland. Another part, ſituated between 30 and 33 deg. received the name of *Leuwen*. Peter Van Nuitz gave his name, in 1627, to a coaſt which communicates to Leuwen's Land towards the weſtward; and a part of the weſtern coaſt, near the tropic of Capricorn, bore the name of *De Witz*. In 1628, Peter Carpenter, a Dutchman, diſcovered the great gulph of Carpentaria, between 10 and 20 deg. ſouth. In 1687, Dampier, an Engliſhman, ſailed from Timor, and coaſted the weſtern parts of New-Holland. In 1699, he left England, with a deſign to explore this country, as the Dutch ſuppreſſed whatever diſcoveries had been made by them. He ſailed along the weſtern coaſt of it, from 28 to 15 deg. He ſaw the land of Eendraght and of De Wit. He then returned to Timor: from whence he went out again, examined the iſles of Papua, coaſted New-Guinea, diſcovered the paſſage that bears his name; called a great iſland which forms this paſſage, or ſtrait, on the eaſt ſide, *New-Britain;* and ſailed back to Timor along New-Guinea. This is the ſame Dampier who, between 1683 and 1891, ſailed round the world by changing his ſhips. This immenſe iſland, which many late writers have ſtyled a continent from its extent, which is more than equal to the habitable parts of the continent of Europe, has been explored on the eaſtern coaſt with great perſeverance and peril by captain Cook, in the Endeavour bark, 1770, to which he gave the name of *New South Wales*. Captain Furneaux, in the Adventure, attempted to diſcover the connection which Van Diemen's land bears to New-Holland; but the tempeſtuous weather which he had to conflict with baffled all his attempts, and he was forced (not poſſeſſing the ſame ardour as his leader) to leave that point in the ſame indeterminate ſtate as Taſman had before tranſmitted it. As this coaſt was explored to a very great extent, without much time being ſpent on any part of the country, or any friendly intercourſe being eſtabliſhed with the inhabitants, we ſhall follow the ſhip in its progreſs along the eaſtern coaſt, after deſcribing the country and its inhabitants as fully as the lights which are thrown upon them will enable us. Holland.

This country is not mountainous; but chiefly conſiſts of valleys and plains, rather barren than fruitful. The face of the country is much the beſt to the ſouthward, the trees being taller, and the herbage richer; but no underwood was ſeen any where. The whole eaſtern coaſt is well watered by brooks and ſprings, but there are no great rivers. There are but two ſorts of timber-trees, the gum-tree, and a kind of pine. Here is the palm-tree of three ſorts. Though this country affords very few eſculent plants, yet it abounds with ſuch as gratify the curioſity of the naturaliſt. Here is an animal reſembling a polecat, which the natives call *quull;* the back is brown, ſpotted with white, and the belly unmixed white. Here are many kinds of bats; alſo gulls, ſhags, ſoland geeſe or gannets of two ſorts, boobies, noddies, curlieus, ducks, pelicans of an enormous ſize, among the water-fowl; crows, parrots, paroquets, cockatoos, and other birds of the ſame kind, of exquiſite beauty, pigeons, droves, quails, buſtards, herons, cranes, hawks, and eagles, among the landbirds. Here are ſerpents, ſome of which are venomous, others harmleſs; ſcorpions, centipedes, and lizards. The moſt remarkable inſect found in this country is the ant, of which there are ſeveral ſorts. One is green, and builds its neſt upon trees: Theſe wonderful inſects form their neſts by bending down ſeveral leaves, each of which is as broad as a man's hands, and gluing the points of them together, ſo as to form a purſe. The viſcus uſed for this purpoſe is an animal-juice which nature has enabled them to elaborate. Thouſands of theſe buſy inſects were ſeen uniting all their ſtrength to hold the leaves in this poſition, while other buſy multitudes were employed within, in applying the gluten that was to prevent their returning back. "To ſatisfy ourſelves, (ſays captain Cook), that the leaves were bent and held down by the effort of theſe diminutive artificers, we diſturbed them in their work; and as ſoon as they were driven from their ſtation, the leaves on which they were employed ſprung up with a force much greater than we could have thought them able to conquer by any combination of their ſtrength. But tho' we gratified our curioſity at their expence, the injury did not go unrevenged; for thouſands immediately threw themſelves upon us, and gave us intolerable pain with their ſtings, eſpecially thoſe which took poſſeſſion of our necks and our hair, from whence they were not eaſily driven. The ſting was ſcarcely leſs painful than that of a bee; but except it was repeated, the pain did not laſt more than a minute." Another kind burrows in the root of a plant which grows on the bark of trees, in the manner of miſletoe. This root is commonly as big as a large turnip; when cut, it appears interſected by innumerable winding paſſa-

ges,

Holland. ges, all filled with these animals; but notwithstanding, the vegetation of the plant suffers no injury. The insects are very small, not more than half as big as the common red ant in England. Their stings give no pain; but, by running about on the hands, and such parts of the body where they light, produce a titillation more intolerable than pain, if not excruciating. There is still another sort, possessing no power of tormenting; they resemble the white ants of the East-Indies. These construct nests on the branches of trees, three or four times as big as a man's head: the materials of these houses seem to be formed of small parts of vegetables kneaded together with a glutinous matter, with which nature has probably furnished them. Upon breaking the outside cruft of this dwelling, innumerable cells, swarming with inhabitants, appear in a great variety of winding directions, all communicating with each other, and with several apertures that lead to other nests upon the same tree. They have also another house built upon the ground, generally at the root of a tree: it is formed like an irregularly sided cone; and sometimes is more than six feet high, and nearly as much in diameter. The outside of these is of well-tempered clay, about two inches thick; and within are the cells, which have no opening outward. Between these two dwellings, one of which is their summer and the other their winter residence, there is a communication by a large avenue, or covered way, leading to the ground, and by a subterranean passage. The structures on the ground are proof against any wet that can fall, which those on the trees are not, from the nature and thinness of their cruft or wall.—The fish here are of kinds unknown to Europe, except the mullet, and some of the shell-fish. Upon the shoals and reef are great quantities of the finest green turtle in the world, and oysters of various kinds, particularly the rock-oyster and the pearl-oyster. In the rivers and salt creeks are aligators.

This extensive country appears to be very thinly inhabited: the natives never appeared in larger companies than thirty together. The inland parts are most probably quite uninhabited, as no part of the coast which was visited had any appearance of cultivation, and the miserable natives drew their subsistence from the sea. The only tribe with which any intercourse was established, consisted of twenty-one persons; twelve men, seven women, a boy and a girl. The women were never seen but at a distance; for when the men crossed the river to the ship, they left them behind. The men are of a middle size, and in general well made, clean-limbed, and remarkably vigorous, active, and nimble: their countenances were not altogether without expression, and their voices are remarkably soft and effeminate. They encruft their bodies with dirt, which makes them appear as black as negroes; their hair, which naturally grows long and black, they crop short; their beards grow bushy and thick, but they keep them short by singing them. Neither sex have any sense of indecency in discovering their whole body. Here they perforate the cartilage that divides the nostrils from each other, through which they thrust a bone, which is as thick as a man's finger, and between five and six inches long; it reaches quite across the face, and so effectually stops up both the nostrils, that they are forced to keep their mouths wide open for breath, and snuffle so when they attempt to speak, that they are scarcely intelligible even to each other. Besides this nose-jewel, they have necklaces made of shells, very neatly cut and strung together; bracelets of small cord, wound two or three times round the upper part of their arm, and a string of plaited human hair, about as thick as a thread of yarn, tied round the waist. Besides these, some of them had gorgets of shells hanging round the neck, so as to reach cross the breast. They paint their bodies both white and red, and draw a circle of white round each eye. They have holes in their ears, but were not seen to wear any thing in them. They were so attached to their own ornaments, that they preferred them to any beads and ribbons that were offered them, though more showy, and regularly made. They received the things that were given them, but were insensible to all the signs which were made them that something was expected in return. Many of the trinkets that had been given them were afterwards found thrown negligently away in the woods, like the playthings of children, which please only while they are new. The bodies of many were marked with large scars, which appeared to be the remains of wounds that they had inflicted on themselves with some blunt instrument, and which they signified by signs to have been memorials of grief for the dead. There was no appearance of a town or village in the whole country. Their houses are formed without art or industry; some of them were just high enough for a man to stand upright in, but not large enough for him to extend his whole length in any direction: they are built with pliable rods, about as thick as a man's finger, in the form of an oven, by sticking the two ends into the ground, and covering them with palm-leaves and broad pieces of bark: the door is nothing but a large hole at one end. Under these houses or sheds they sleep, coiled up with their heels to their heads; in which position one shed will hold three or four persons: towards the northward, as the climate becomes hotter, these sheds were constructed much slighter: one side was entirely open, and none of them were more than four feet deep. These hovels were set up occasionally by a wandering hord, in any place that would furnish them for a time with subsistence, and left behind them when they removed to another spot. When they mean to continue only a night or two at one place, they sleep without any shelter except the bushes and grass, the latter of which is near two feet high. They have a vessel to hold the water they fetch from springs, made of bark, only by tying up the two ends with a withy, which not being cut off, serves for a handle. They have a small bag, about the size of a moderate cabbage-net, which the men carry upon their back by a string which passes over their heads. It generally contains a lump or two of paint and resin, some fish-hooks and lines, a shell or two, out of which their hooks are made, a few points of darts, and their usual ornaments; which is an inventory of the whole worldly treasure of the richest man among them. Their fish-hooks are very neatly made, and some of them are extremely small. For striking turtle, they have a peg of wood, which is about a foot long, and very well barbed; Holland.

Holland. bearded; this fits into a ſocket at the end of a ſtaff of light wood, about as thick as a man's wriſt, and about ſeven or eight feet long. To the ſtaff is tied one end of a looſe line, about three or four fathoms long, the other end of which is faſtened to the peg. To ſtrike the turtle, the peg is fixed into the ſocket; and when it has entered his body, and is retained there by the barb, the ſtaff flies off, and ſerves for a float to trace their victim in the water. It aſſiſts alſo to tire him, till they can overtake him with their canoes, and haul him aſhore. One of theſe pegs was found buried in the body of a turtle, which had healed up over it. Their lines are made of the fibres of a vegetable, and are from the thickneſs of a half-inch rope to the fineneſs of a hair. They are unacquainted with the uſe of nets in fiſhing; and can only catch fiſh by ſtriking them, or with a hook and line, or groping for them in the hollows of the rocks and ſhoals, which are dry at half-ebb. They bake their proviſions by the help of hot ſtones, like the inhabitants of the South-ſea iſlands. They produce fire with great facility, and ſpread it in a wonderful manner. To produce it, they take two pieces of dry, ſoft wood; one is a ſtick about eight or nine inches long, the other piece is flat. The ſtick they ſhape into an obtuſe point at one end; and preſſing it upon the other, turn it nimbly, by holding it between both their hands, as we do a chocolate-mill; often ſhifting their hands up, and then moving them down upon it, to increaſe the preſſure as much as poſſible. By this method they get fire in leſs than two minutes, and from the ſmalleſt ſpark they increaſe it with great ſpeed and dexterity. "We have often ſeen (ſays captain Cook) one of them run along the ſhore, to all appearance with nothing in his hand, who ſtooping down for a moment, at the diſtance of every fifty or an hundred yards, left fire behind him, as we could ſee, firſt by the ſmoke, and then by the flame along the driſt of wood and other litter which was ſcattered along the place. We had the curioſity to examine one of theſe planters of fire when he ſet off, and we ſaw him wrap up a ſmall ſpark in dry graſs, which, when he had run a little way, having been fanned by the air that his motion produced, began to blaze; he then laid it down in a place convenient for his purpoſe, incloſing a ſpark of it in another quantity of graſs, and ſo continued his courſe." Their weapons are ſpears or lances; ſome have four prongs pointed with bone, and barbed. To the northward, the lance has but one point; the ſhaft is made of cane, very ſtraight and light, and from eight to fourteen feet long, conſiſting of ſeveral joints, where the pieces are let into each other and bound together. The points of theſe darts are either of hard heavy wood, or bones of fiſh: thoſe points that are of wood, are alſo ſometimes armed with ſharp pieces of broken ſhells, which were ſtuck in, and at the junctures covered with reſin. The lances which are thus barbed, are indeed dreadful weapons, as they cannot be drawn out of a wound without tearing away the fleſh, or leaving the ſharp ragged ſplinters of the bone or ſhell which forms the barb behind them in the wound. The canoes to the northward are not made of bark, but of the trunk of a tree, hollowed probably by fire: none of theſe boats will carry more than four people. The only tools ſeen among them were, an adze wretchedly made of ſtone, ſome ſmall pieces of the ſame ſubſtance in form of a wedge, a wooden mallet, and ſome ſhells and fragments of coral. It is difficult to account for the ſmall number of the human ſpecies which are found diſperſed over this country; whether they are thinned by civil broils, excited by the horrid appetite for devouring each other that prevails in New Zeeland, or that their population is prevented by any other cauſes, cannot be aſcertained. Their total ignorance of every method to procure the comforts of life, both from the cultivation of the ground, and furniſhing materials for clothing and fiſhing, place them among the loweſt of the human ſpecies. Hollar Holles.

HOLLAND in commerce, a fine and cloſe kind of linen, ſo called from its being firſt manufactured in Holland.

HOLLAR (Wenceſlaus), a celebrated engraver, born at Prague, in 1607. He employed himſelf chiefly in copying portraits; and his delicate little views of many of the cities in Germany, got him ſuch reputation, that the earl of Arundel our ambaſſador at the Imperial court brought him over to England. Here he executed ſeveral plates from the fine Arundelian collection of paintings, engraved many landſcapes and views about London, and of London itſelf, as well before as after the great fire: but it being his fate to work chiefly for printſellers and bookſellers, in a ſtate of ſubordination, more for the profit of his employers than for himſelf; ſo he could not even in his old age keep clear of the encumbrances of debt. About the year 1672, he travelled northward, and took views of towns, caſtles, churches and tombs, that would prove almoſt endleſs to enumerate. Few artiſts have been able to imitate his works, and the lovers of art are always zealous to collect them. It is melancholy to add, that on the verge of his 70th year, he was attached with an execution at his lodgings in Gardener's lane, Weſtminſter; when he deſired only the liberty of dying in his bed, and that he might not be removed to any other priſon than the grave: a favour which it is uncertain whether he obtained or not. He died, however, in 1677.—The merits of this artiſt are thus characteriſed in the *Eſſay on Prints*: "Hollar gives us views of particular places, which he copies with great truth, unornamented, as he found them. If we are ſatisfied with exact repreſentations, we have them no where better than in Hollar's works: but if we expect pictures, we muſt ſeek them elſewhere. Hollar was an antiquarian, and a draughtſman; but ſeems to have been little acquainted with the principles of painting. Stiffneſs is his characteriſtic, and a painful exactneſs void of taſte. His larger views are mere plans. In ſome of his ſmaller, at the expence of infinite pains, ſomething of an effect is ſometimes produced. But in general, we conſider him as a repoſitory of curioſities, a record of antiquated dreſſes, aboliſhed ceremonies, and edifices now in ruins."

HOLLES (Thomas Pelham), duke of Newcaſtle, was born in 1693, and ſucceeded his father as baron Pelham of Loughton: by the laſt will of his uncle John Holles duke of Newcaſtle, who died in 1711, he was adopted heir to his great eſtate, and empowered to bear the arms and name of *Holles*, together with the title of *duke of Newcaſtle upon Tyne*. His power and intereſt

Holloa || Holſtein.

intereſt were now very great, and he exerted both in ſupporting George I. againſt the Tory party that oppoſed him. The whole weight of authority had for ſome time been in the hands of the tories at the acceſſion of this king, while the whigs remained without credit or influence: but this ſtate of affairs was now reverſed; and the duke of Newcaſtle, among the reſt, was diſtinguiſhed by the royal favour. He was created duke of Newcaſtle-under-Line, with remainder to the female iſſue of his brother the honourable Henry Pelham; was made lord chamberlain of the king's houſehold, and a knight of the garter; and was one of the peers commiſſioned to ſign the quadruple alliance in 1718. In 1724, he reſigned the place of lord chamberlain, and was appointed ſecretary of ſtate. It would be tedious to trace him farther through his places and honours: it need therefore only be added, that after his long ſervices to the crown, he gave way to lord Bute, who ſucceeded him in 1762 as firſt lord of the treaſury. Quitting now the fatigues of buſineſs, he lived in retirement to his death in 1768, leaving the character of a moſt diſintereſted patriot; having greatly impoveriſhed his private eſtate during his public ſervices, and retiring without accepting any penſion.

HOLLOA, in the ſea-language, an exclamation of anſwer, to any perſon who calls to another to aſk ſome queſtion, or to give a particular order. Thus, if the maſter intends to give any order to the people in the main-top, he previouſly calls, *Main-top, hoay!* to which they anſwer, *Holloa!* to ſhew that they hear him, and are ready. It is alſo the firſt anſwer in hailing a ſhip at a diſtance. See HAILING.

HOLLY, in botany. See ILEX.

Sea-HOLLY. See ERYNGIUM.

HOLM (Sax. *hulmus*, *inſula amnica*), an iſle or fenny ground, according to Bede; or a river iſland. And where any place is called by that name, and this ſyllable is joined with any other in the names of places, it ſignifies a place ſurrounded with water; as the *Flatholmes* and *Stepholmes* in the Severn near Briſtol: but if the ſituation of the place is not near the water, it may then ſignify a hilly place; *holm*, in Saxon, ſignifying alſo a hill or cliff.

HOLOCAUST, a burnt-offering, or ſacrifice, wholly conſumed by fire: of this kind was the daily ſacrifice in the Jewiſh church. This was done by way of acknowledgment, that the perſon offering and all that belonged to him were the effects of the divine bounty.

HOLOGRAPH, among civilians, a will wholly written by the hand of the teſtator.

HOLSTEIN, a duchy of Germany, bounded by the German ocean on the weſt; the Baltic, or the gulph of Lubeck, on the eaſt; the duchy of Mecklenburg, on the ſouth-eaſt; that of Bremen, with the river Elbe, on the ſouth-weſt; and Lauenburg, with the territory of Hamburg, on the ſouth. Its greateſt length is about 80 miles, and its breadth 60. The dioceſe of Eutin, and the county of Ranzau, though they make a part of the duchy of Holſtein, yet being lands belonging to the empire and circle, ſhall be deſcribed ſeparately.

A great part of this country conſiſts of rich marſh-land, which being much expoſed to inundations both from the ſea and rivers, dykes have been raiſed at a great expence, to guard and defend them. The paſtures in the marſhes are ſo rich, that cattle are bred in vaſt numbers and fattened in them, and great quantities of excellent butter and cheeſe made of their milk. They are alſo very fruitful in wheat, barley, peaſe, beans, and rape-ſeed. In the more barren, ſandy, and heathy parts of the country, large flocks of ſheep are bred and fed: nor are orchards wanting, or woods, eſpecially of oak and beech; nor turf, poultry, game, and wild-fowl. Here is a variety both of ſea and river fiſh; and the beef, veal, mutton, and lamb, are very fat and palatable. Holſtein is alſo noted for beautiful horſes. The gentry uſually farm the cows upon their eſtates to a Hollander, as he is called, who for every cow pays from ſix to ten rix-dollars; the owner providing paſture for them in ſummer, and ſtraw and hay in winter. It is no uncommon thing here, to drain the ponds and lakes once in three or four years, and ſell the carp, lampreys, pikes, and perch, found in them; then ſow them for ſeveral years after with oats, or uſe them for paſture; and after that, lay them under water again, and breed fiſh in them. There are hardly any hills in the country; but ſeveral rivers, of which the principal are the Eyder, the Stor, and the Trave. The duchy contains about 30 towns great and ſmall: moſt part of the peaſants are under villenage, being obliged to work daily for their lords, and not even at liberty to quit their eſtates. The nobility and the proprietors of manors are poſſeſſed of the civil and criminal juriſdiction, with other privileges and exemptions. Formerly there were diets, but now they ſeem to be entirely laid aſide: meetings, however, of the nobility are ſtill held at Kiel. The predominant religion here is Lutheraniſm, with ſuperintendencies as in other Lutheran countries. In ſeveral places the Jews are allowed the exerciſe of their religion. At Gluckſtadt, and Altena, are both Calviniſt and Popiſh churches; and at Kiel, a Greek Ruſſian chapel. Beſides the Latin ſchools in the towns, at Altena is a gymnaſium, and at Kiel an univerſity. Notwithſtanding this country's advantageous ſituation for commerce there are few manufactures and little trade in it.' Hamburg and Lubec ſupply the inhabitants with what they want from abroad; from whence and Altena, they export ſome grain, malt, grots, ſtarch, buck-wheat, peaſe, beans, rapeſeed, butter, cheeſe, ſheep, ſwine, horned cattle, horſes, and fiſh. The manufactures of the duchy are chiefly carried on at Altena, Kiel, and Gluckſtadt. The duchy of Holſtein, conſiſts of the ancient provinces of Holſtein, Stormar, Ditmarſh, and Wagria. It belongs partly to the king of Denmark, and partly to the dukes of Holſtein Gottorf and Ploen. Anciently the counts of Holſtein were vaſſals of the dukes of Saxony; but afterwards they received the inveſtiture of their territories from the emperor, or the biſhops of Lubec in the emperor's name, though now the inveſtiture is given by the emperor in perſon. The king of Denmark appoints a regency over his part of Holſtein and the duchy of Sleſwick, which has its office at Gluckſtadt. The ſeat of the great duke's privy council, and regency-court, together with the chief conſiſtory, which is united to it, is at Kiel: there are many

Holſtein.

Holstein || Holt.

many inferior courts and conſiſtories, from which an appeal lies to the higher. In the duchy of Holſtein, the government of the convents and nobility is alternately in the king and duke, for a year, from Michaelmas to Michaelmas. The perſon in whom the government is lodged, adminiſters it by his regency. In ſome caſes an appeal lies from this court to the Aulic council or chamber at Wetzlar: the convents, the nobility, and the proprietors of manors in the country, have a civil and criminal juriſdiction over their eſtates. The revenues of the ſovereigns ariſe principally from their demeſnes and regalia; beſides which, there is a land and ſeveral other taxes and impoſts. The duke's income, ſetting aſide his ducal patrimony, has been eſtimated at 70,000 or 80,000 pounds. The king uſually keeps here ſome regiments of foot and one of horſe. With reſpect to the duke's military force, it amounts to about 800 men. The king, on account of his ſhare in this country, ſtyles himſelf *duke of Holſtein, Stormar*, and *Ditmarſh*. The dukes, both of the royal and princely houſe, ſtyle themſelves *heirs of Norway, dukes of Sleſwick, Holſtein, Stormar*, and *Ditmarſh*, and counts of *Oldenburg* and *Delmenhorſt*. On account of Holſtein, both the king of Denmark and the grand duke have a ſeat and voice in the college of the princes of the empire, and in that of the circle. Together with Mecklenburg they alſo nominate an aſſeſſor for this circle in the Aulic chamber. The matricular aſſeſſment of the whole duchy is 40 horſe and 80 foot, or 800 florins; to the chamber of Wetzlar both princes pay 189 rix-dollars, 31 kruitzers. In 1735, duke Charles Frederic, of Holſtein Gottorf, founded an order of knighthood here, viz. that of St Anne, the enſign of which is a red croſs, enamelled, and worn pendant at a red ribbon edged with yellow.—The principal places of that part of the duchy belonging to the king of Denmark and the duke of Ploen are Gluckſtadt, Itzhoe, Rendſburg, and Ploen; and that part belonging to the great duke are Kiel, Oldenburgh, Preetz, and Altena.

HOLSTENIUS (Lucas), an ingenious and learned German, born at Hamburg in 1596, was bred a Lutheran; but being converted to popery by father Sirmond the Jeſuit, he went to Rome, and attached himſelf to cardinal Francis Barberini, who took him under his protection. He was honoured by three popes; Urban VIII. gave him a canonry of St Peter's; Innocent X. made him librarian of the Vatican; and Alexander VII. ſent him in 1655 to queen Chriſtina of Sweden, whoſe formal profeſſion of the Catholic faith he received at Inſpruck. He ſpent his life in ſtudy, and was very learned both in ſacred and profane antiquity. He died in 1661; and though he was not the author of any great works, his notes and diſſertations on the works of others have been highly eſteemed for the judgment and preciſion with which they are drawn up.

HOLT (Sir John), knight, eldeſt ſon of Sir Thomas Holt, ſerjeant at law, was born in 1642. He entered himſelf of Gray's Inn in 1658; and applied to the common law with ſo much induſtry, that he ſoon became a very eminent barriſter. In the reign of James II. he was made recorder of London, which office he diſcharged with much applauſe for about a year and a half; but loſt his place for refuſing to expound the law ſuitably to the king's deſigns. On the arrival of the prince of Orange, he was choſen a member of the convention parliament, which afforded him a good opportunity of diſplaying his abilities; ſo that as ſoon as the government was ſettled, he was made lord chief juſtice of the court of king's bench, and a privy counſellor. He continued chief juſtice for 22 years, with great repute for ſteadineſs, integrity, and thorough knowledge in his profeſſion. Upon great occaſions he aſſerted the law with intrepidity, though he thereby ventured to incur by turns the indignation of both the houſes of parliament. He died in 1709, and publiſhed ſome reports.

Holy Ghoſt || Holy-Iſland.

HOLT (Sax.) "a wood;" wherefore the names of towns beginning or ending with *holt*, as *buck-holt*, &c. denote that formerly there was great plenty of wood in thoſe places.

HOLY-GHOST, one of the perſons of the holy Trinity. See GOD and TRINITY.

Order of the HOLY-GHOST, the principal military order in France, inſtituted by Henry III. in 1569. It conſiſts of 100 knights, who are to make proof of their nobility for three deſcents. The king is the grand-maſter, or ſovereign; and as ſuch, takes an oath, on his coronation-day, to maintain the dignity of the order.

The knights wear a golden-croſs, hung about their necks by a blue ſilk ribbon, or collar. But before they receive the order of the Holy-ghoſt, that of St Michael is conferred as a neceſſary degree; and for this reaſon their arms are ſurrounded with a double collar.

HOLYHEAD, a town and cape of the iſle of Angleſea in Wales, and in the Iriſh channel, where people uſually embark for Dublin, there being three packet-boats that ſail for that city every Monday, Wedneſday, and Friday, wind and weather permitting. It has a very convenient harbour for the northern trade, when taken ſhort by contrary winds. If this was properly repaired, and warehouſes built, it would be very convenient for the Iriſh, to import ſuch of their goods as pay Engliſh duty, it being but a few hours ſail from Dublin. Beſides, the Dublin merchants might come over with the packets, to ſee their goods landed. The commodities are, butter, cheeſe, bacon, wild-fowl, lobſters, crabs, oyſters, razor-fiſh, ſhrimps, herrings, cod-fiſh, whitings, whiting-pollacks, cole-fiſh, ſeatenches, turbots, ſoles, flounders, rays, and plenty of other fiſh. On the rocks the herb grows of which they make kelp, a fixed ſalt uſed in making glaſs, and in alum works. In the neighbourhood there is a large vein of white fullers earth, and another of yellow which might be uſeful to fullers. On the iſle of Skerries, nine miles to the north, is a light-houſe, which may be ſeen 24 miles off. Large flocks of puffins are often ſeen here; they all come in one night, and depart in the ſame manner. W. Long. 4. 40. N. Lat. 53. 20.

HOLY-*Iſland*, a ſmall iſland lying on the coaſt of England, ſix miles ſouth of Berwick, in Northumberland. It is not above two miles and a quarter in length, nor much above a mile in breadth. The ſoil is rocky and full of ſtones, for which reaſon it is thinly peopled: it has but one town, with a church, and a caſtle, under which there is a commodious harbour, defended by a block-houſe.

HOLY-

Holywell || Homberg.

HOLYWELL, a town of North Wales, in the county of Flint. It is a place of great note, for the well of St Winnifrid, who is reputed a virgin martyr; and it is much frequented by people that come to bathe in it, as well as by popiſh pilgrims out of devotion. The ſpring guſhes forth with ſuch impetuoſity, that at a ſmall diſtance it turns ſeveral mills. Over the ſpring is a chapel built upon pillars, and on the windows are painted the hiſtory of St Winnifrid's life. There is a moſs about the well, which ſome fooliſhly imagine to be St Winnifrid's hair. W. Long. 3. 15. N. Lat. 54. 23.

HOLYOAK (Francis), author of the Latin dictionary, became rector of South-ham in Warwickſhire in 1604; and being greatly eſteemed, was choſen member of the convocation in the firſt year of Charles I.'s reign. He ſuffered much for the king; and died in 1653, aged 87. His ſon Thomas made enlargements to the ſaid Dictionary.

HOLYWOOD (John), or HALIFAX, or *Sacrobosco*, was, according to Leland, Bale, and Pits, born at Halifax in Yorkſhire; according to Stainhurſt, at Holywood near Dublin; and, according to Dempſter and Mackenzie, in Nithſdale in Scotland. The laſt-mentioned author informs us, that, having finiſhed his ſtudies, he entered into orders, and was made a canon regular of the order of St Auguſtin in the famous monaſtery of Holywood in Nithſdale. The Engliſh biographers, on the contrary, tell us, that he was educated at Oxford. They all agree, however, in aſſerting that he ſpent moſt of his life at Paris; where, ſays Mackenzie, he was admitted a member of the univerſity on the fifth of June in the year 1221, under the ſyndics of the Scotch nation; and ſoon after, elected profeſſor of mathematics, which he taught for many years with applauſe. We are told by the ſame author, that he died in 1256, as appears from the inſcription on his monument in the cloiſters of the convent of St Maturine at Paris. Holywood was certainly the firſt mathematician of his time. He was cotemporary with Roger Bacon, but probably older by about 20 years. He wrote, 1. *De ſphæra mundi*; often reprinted, and illuſtrated by various commentators. 2. *De anni ratione, ſeu de computo eccleſiaſtico*. 3. *De algoriſmo*, printed with *Comm. Petri Cirvilli Hiſp.* Paris 1498.

HOMAGE, in law, is the ſubmiſſion, loyalty, and ſervice, which a tenant promiſed to his lord, when he was firſt admitted to the land which he held of the lord in fee: alſo that owing to a king, or to any ſuperior.

HOMBERG (William), a celebrated phyſician, chemiſt, and philoſopher, was the ſon of a Saxon gentleman, and born in Batavia, in the Eaſt Indies, in 1652. His father afterwards ſettling at Amſterdam, William there proſecuted his ſtudies; and from thence removed to Jena, and afterwards to Leipſic, where he ſtudied the law. In 1642, he was made advocate at Magdeburg, and there applied himſelf to the ſtudy of experimental philoſophy. Some time after, he travelled into Italy; and applied himſelf to the ſtudy of medicine, anatomy, and botany, at Padua. He afterwards ſtudied at Bologna; and at Rome learned optics, painting, ſculpture, and muſic. He at length travelled into France, England, and Holland; obtained the degree of doctor of phyſic at Wittemberg; travelled into Germany and the North; viſited the mines of Saxony, Bohemia, Hungary, and Sweden; and returned to France, where he acquired the eſteem of the learned. He was on the point of returning into Germany, when M. Colbert being informed of his merit, made him ſuch advantageous offers, as induced him to fix his reſidence at Paris. M. Homberg, who was already well known for his phoſphorus, for a pneumatic machine of his own invention more perfect than that of Guericke, for his microſcopes, for his diſcoveries in chemiſtry, and for the great number and variety of his curious obſervations, was received into the academy of ſciences in 1691, and had the laboratory of that academy, of which he was one of its principal ornaments. The duke of Orleans, afterwards regent of the kingdom, at length made him his chemiſt, ſettled upon him a penſion, gave him the moſt ſuperb laboratory that was ever in the poſſeſſion of a chemiſt, and in 1704 made him his firſt phyſician. He had abjured the Proteſtant religion in 1682, and died in 1715. There are a great number of learned and curious pieces of his writing, in the memoirs of the academy of ſciences, and in ſeveral journals. He had begun to give the elements of chemiſtry in the memoirs of the academy, and the reſt were found among his papers fit for printing.

Homberg, Homer.

HOMBERG, a town of Germany, in the circle of the Upper Rhine, and laudgravate of Heſſe, ſeated ten miles north of Francfort, and gives title to one of the branches of the houſe of Heſſe, who is its ſovereign. E. Long. 8. 24. N. Lat. 50. 20.

HOMBERG, a town of Germany, in the palatinate of the Rhine, and duchy of Deuxponts. E. Long. 7. 6. N. Lat. 49. 20.

HOMER, the prince of the Greek poets, flouriſhed, according to Dr Blair, about 900 B. C. according to Dr Prieſtley 850, according to the Arundelian marbles 300, after the taking of Troy; and agreeable to them all, above 400 years before Plato and Ariſtotle. Seven cities diſputed the glory of having given him birth, viz. Smyrna, Rhodes, Colophon, Salamis, Chios, Argos, and Athens; which has been expreſſed by the following diſtich:

> *Smyrna, Rhodes, Colophon, Salamis, Chios, Argos, Athenæ;*
> *Orbis de patria certat, Homere, tua.*

We have nothing that is very certain in relation to the particulars of his life. The moſt regular account is that which goes under the name of Herodotus, and is uſually printed with his hiſtory: and though it is generally ſuppoſed to be a ſpurious piece, yet as it is ancient, was made uſe of by Strabo, and exhibits that idea which the later Greeks, and the Romans in the age of Auguſtus, entertained of Homer, we muſt content ourſelves with giving an abſtract of it.

A man of Magneſia, whoſe name was *Menalippus*, went to ſettle at Cumæ, where he married the daughter of a citizen called *Homyres*, and had by her a daughter called *Critheis*. The father and mother dying, the young woman was left under the tuition of Cleonax her father's friend, and ſuffering herſelf to be deluded was got with child. The guardian, though his care had not prevented the miſfortune, was however willing to conceal it; and therefore ſent Critheis to Smyrna, which was then building, 18 years after the founding of Cumæ, and about 168 after the taking of Troy. Critheis being near her time, went one day to a feſtival, which the town of Smyrna was celebrating

Homer.

ting on the banks of the river Meles; where her pains coming upon her, she was delivered of Homer, whom she called *Melesigenes*, because he was born on the banks of that river. Having nothing to maintain her, she was forced to spin: and a man of Smyrna called *Phemius*, who taught literature and music, having often seen Critheis, who lodged near him, and being pleased with her housewifery, took her into his house to spin the wool he received from his scholars for their schooling. Here she behaved herself so modestly and discreetly, that Phemius married her; and adopted her son, in whom he discovered a wonderful genius, and the best natural disposition in the world. After the death of Phemius and Critheis, Homer succeeded to his father-in-law's fortune and school; and was admired, not only by the inhabitants of Smyrna, but by strangers, who resorted from all parts to that place of trade. A shipmaster called *Mentes*, who was a man of learning and a lover of poetry, was so taken with Homer, that he persuaded him to leave his school, and to travel with him. Homer, who had then begun his poem of the Iliad, and thought it of great consequence to see the places he should have occasion to treat of, embraced the opportunity. He embarked with Mentes, and during their several voyages never failed carefully to note down all that he thought worth observing. He travelled into Egypt; from whence he brought into Greece the names of their gods, the chief ceremonies of their worship, and a more improved knowledge in the arts than what prevailed in his own country. He visited Africa and Spain; in his return from whence he touched at Ithaca, where he was much troubled with a rheum falling upon his eyes. Mentes being in haste to take a turn to Leucadia his native country, left Homer well recommended to Mentor, one of the chief men of the island of Ithaca, who took all possible care of him. There Homer was informed of many things relating to Ulysses, which he afterwards made use of in composing his Odyssey. Mentes returning to Ithaca, found Homer cured. They embarked together; and after much time spent in visiting the coasts of Peloponnesus and the islands, they arrived at Colophon, where Homer was again troubled with the defluxion upon his eyes, which proved so violent, that he is said to have lost his sight. This misfortune made him resolve to return to Smyrna, where he finished his Iliad. Some time after, the ill posture of his affairs obliged him to go to Cumæ, where he hoped to have found some relief. Here his poems were highly applauded: but when he proposed to immortalize their town, if they would allow him a salary, he was answered, that "there would be no end of maintaining all the Ὁμήρους, or blind men;" and hence got the name of *Homer*. He afterwards wandered through several places, and stopped at Chios, where he married, and composed his Odyssey. Some time after, having added many verses to his poems in praise of the cities of Greece, especially of Athens and Argos, he went to Samos, where he spent the winter, singing at the houses of the great men, with a train of boys after him. From Samos he went to Io, one of the Sporades, with a design to continue his voyage to Athens; but landing by the way at Chios, he fell sick, died, and was buried on the sea-shore.

The only incontestable works which Homer has left behind him are the Iliad and Odyssey. The Batrachomyomachia, or battle of the frogs and mice, has been disputed. The hymns have been disputed also, and attributed by the scholiasts to Cynæthus the rhapsodist: but neither Thucydides, Lucian, nor Pausanias, have scrupled to cite them as genuine. Many other pieces are ascribed to him: epigrams, the Eartiges, the Cecropes, the destruction of Oechalia, of which only the names are remaining.

Homer, Homicide.

Nothing was ever comparable to the clearness and majesty of Homer's style; to the sublimity of his thoughts; to the strength and sweetness of his verses. All his images are striking; his descriptions just and exact; the passions so well expressed, and nature so finely painted, that he gives to every thing motion, life, and action. But he more particularly excels in invention, and in the different characters of his heroes, which are so varied, that they affect us in an inexpressible manner. In a word, the more he is read by a person of good taste, the more he is admired. Nor are his works to be esteemed merely as entertaining poems, or as the monuments of a sublime and varied genius. He was in general so accurate with respect to costume, that he seldom mentioned persons or things that we may not conclude to have been known during the times of which he writes; and it was Mr Pope's opinion, that his account of people, princes, and countries, was purely historical, founded on the real transactions of those times, and by far the most valuable piece of history and geography left us concerning the state of Greece in that early period. His geographical divisions of that country were thought so exact, that we are told of many controversies concerning the boundaries of Grecian cities which have been decided upon the authority of his poems.

Alcibiades gave a rhetorician a box on the ear for not having Homer's writings in his school. Alexander was ravished with them, and commonly placed them under his pillow with his sword: he inclosed the Iliad in the precious casket that belonged to Darius; "in order, (said he to his courtiers,) that the most perfect production of the human mind might be inclosed in the most valuable casket in the world." And one day seeing the tomb of Achilles in Sigæa, "Fortunate hero! (cried he), thou hast had a Homer to sing thy victories!" Lycurgus, Solon, and the kings and princes of Greece, set such a value on Homer's works, that they took the utmost pains in procuring correct editions of them, the most esteemed of which is that of Aristarchus. Didymus was the first who wrote notes on Homer; and Eustathius, archbishop of Thessalonica, in the 12th century, is the most celebrated of his commentators. Mr Pope has given an elegant translation of the Iliad, adorned with the harmony of poetic numbers; and Mad. Dacier has translated both the Iliad and Odyssey in prose. But those who desire to know the several editions of Homer, and the writers who have employed themselves on the works of that great poet, may consult Fabricius, in the first volume of his *Bibliotheca Græca*.

HOMICIDE, signifies in general, the taking away of any person's life. It is of three kinds; *justifiable*, *excusable*, and *felonious*. The first has no share of guilt at all; the second very little; but the third is the highest crime against the law of nature, that man is ca-

Homicide. capable of committing.

I. Juſtifiable homicide is of divers kinds.

1. Such as is owing to ſome unavoidable *neceſſity*, without any will, intention, or deſire, and without any inadvertence or negligence, in the party killing, and therefore without any ſhadow of blame; as, for inſtance, by virtue of ſuch an office as obliges one, in the execution of public juſtice, to put a maleſactor to death, who hath forfeited his life by the laws and verdict of his country. This is an act of neceſſity, and even of civil duty; and therefore not only juſtifiable, but commendable, where the law requires it. But the law muſt *require* it, otherwiſe it is not juſtifiable: therefore wantonly to kill the greateſt of maleſactors, a felon or a traitor, attainted or outlawed, deliberately, uncompelled, and extrajudicially, is murder. And farther, if judgment of death be given by a judge not authorized by lawful commiſſion, and execution is done accordingly, the judge is guilty of murder. Alſo ſuch judgment, when legal, muſt be executed by the proper officer, or his appointed deputy; for no one elſe is *required* by law to do it, which requiſition it is that juſtifies the homicide. If another perſon doth it of his own head, it is held to be murder: even though it be the judge himſelf. It muſt farther be executed, *ſervato juris ordine*; it muſt purſue the ſentence of the court. If an officer beheads one who is adjudged to be hanged, or *vice verſa*, it is murder: for he is merely miniſterial, and therefore only juſtified when he acts under the authority and compulſion of the law. But, if a ſheriff changes one kind of puniſhment for another, he then acts by his own authority, which extends not to the commiſſion of homicide: and beſides, this licence might occaſion a very groſs abuſe of his power. The king indeed may remit part of a ſentence, as in the caſe of treaſon, all but the beheading: but this is no change, no introduction of a new puniſhment; and in the caſe of felony, where the judgment is *to be hanged*, the king (it hath been ſaid) cannot legally order even a peer to be beheaded.

Again: In ſome caſes homicide is juſtifiable, rather by the *permiſſion*, than by the abſolute *command*, of the law: either for the *advancement* of public *juſtice*, which without ſuch indemnification would never be carried on with proper vigour; or, in ſuch inſtances where it is committed for the *prevention* of ſome atrocious *crime*, which cannot otherwiſe be avoided.

2. Homicides, committed for the *advancement* of public *juſtice*, are, 1. Where an officer, in the execution of his office, either in a civil or criminal caſe, kills a perſon that aſſaults and reſiſts him. 2. If an officer, or any private perſon, attempts to take a man charged with felony, and is reſiſted; and, in the endeavour to take him, kills him.. 3. In caſe of a riot, or rebellious aſſembly, the officers endeavouring to diſperſe the mob are juſtifiable in killing them, both at common law, and by the riot act, 1 Geo. I. c. 5. 4. Where the priſoners in a gaol, or going to gaol, aſſault the the gaoler or officer, and he in his defence kills any of them, it is juſtifiable, for the ſake of preventing an eſcape. 5. If treſpaſſers in foreſts, parks, chaſes, or warrens, will not ſurrender themſelves to the keepers, they may be ſlain; by virtue of the ſtatute 21 Edward I. ſt. 2. *de maleſactoribus in parcis*, and 3 & 4 W. & M. c. 10. But, in all theſe caſes, there muſt be an apparent neceſſity on the officer's ſide; viz. that the party could not be arreſted or apprehended, the riot could not be ſuppreſſed, the priſoners could not be kept in hold, the deer-ſtealers could not but eſcape, unleſs ſuch homicide were committed: otherwiſe, without ſuch abſolute neceſſity, it is not juſtifiable. 6. If the champions in a trial by battel killed either of them the other, ſuch homicide was juſtifiable, and was imputed to the juſt judgment of God, who was thereby preſumed to have decided in favour of the truth. Homicide.

3. In the next place, ſuch homicide as is committed for the *prevention* of any forcible and atrocious *crime*, is juſtifiable by the law of nature; and alſo by the law of England, as it ſtood ſo early as the time of Bracton, and as it is ſince declared by ſtat 24 H. VIII. c. 5. If any perſon attempts a robbery or murder of another, or attempts to break open a houſe *in the night-time*, (which extends alſo to an attempt to burn it,) and ſhall be killed in ſuch attempt, the ſlayer ſhall be acquitted and diſcharged. This reaches not to any crime unaccompanied with force, as picking of pockets; or to the breaking open of any houſe *in the day-time*, unleſs it carries with it an attempt of robbery alſo. So the Jewiſh law, which puniſhed no theft with death, makes homicide only juſtifiable in caſe of *nocturnal* houſe-breaking: "if a thief be found breaking up, and he be ſmitten that he die, no blood ſhall be ſhed for him: but if the ſun be riſen upon him, there ſhall blood be ſhed for him; for he ſhould have made full reſtitution." At Athens, if any theft was committed by night, it was lawful to kill the criminal, if taken in the fact: and, by the Roman law of the twelve tables, a thief might be ſlain by night with impunity; or even by day, if he armed himſelf with any dangerous weapon: which amounts very nearly to the ſame as is permitted by our own conſtitutions. *Exodus* xxii. 2.

The Roman law alſo juſtifies homicide, when committed in defence of the chaſtity either of one's ſelf or relations: and ſo alſo, according to Selden, ſtood the law in the Jewiſh republic. The Engliſh law likewiſe juſtifies a woman killing one who attempts to raviſh her: and ſo too the huſband or father may juſtify killing a man, who attempts a rape upon his wife or daughter; but not if he takes them in adultery by conſent; for the one is forcible and felonius, but not the other. And there is no doubt but the forcibly attempting a crime, of a ſtill more deteſtable nature, may be equally reſiſted by the death of the unnatural aggreſſor. For the one uniform principle that runs through our own, and all other laws, ſeems to be this: That where a crime, in itſelf capital, is endeavoured to be committed by force, it is lawful to repel that force by the death of the party attempting. But we muſt not carry this doctrine to the ſame viſionary length that Mr Locke does; who holds, "that all manner of force without right upon a man's perſon, puts him in a ſtate of war with the aggreſſor; and, of conſequence, that, being in ſuch a ſtate of war, he may lawfully kill him that puts him under this unnatural reſtraint." However juſt this concluſion may be in a ſtate of uncivilized nature, yet the law of England, like that of every other well-regulated community, is too tender of the public peace, too careful of

Homicide. the lives of the fubjects, to adopt fo contentious a fyftem; nor will fuffer with impunity any crime to be *prevented* by death, unlefs the fame, if committed, would alfo be *punifhed* by death. Homicide.

In thefe inftances of *juftifiable* homicide, it may be obferved, that the flayer is in no kind of fault whatfoever, not even in the minuteft degree; and is therefore to be totally acquitted and difcharged, with commendation rather than blame. But that is not quite the cafe in *excufable* homicide, the very name whereof imports fome fault, fome error, or omiffion; fo trivial, however, that the law excufes it from the guilt of felony, though in ftrictnefs it judges it deferving of fome little degree of punifhment.

II. Excufable homicide is of two forts; either *per infortunium*, by misadventure; or *fe defendendo*, upon a principle of felf-preservation. We will firft fee wherein thefe two fpecies of homicide are diftinct, and then wherein they agree.

1. Homicide *per infortunium*, or misadventure, is where a man, doing a lawful act, without any intention of hurt, unfortunately kills another: as where a man is at work with a hatchet, and the head thereof flies off and kills a ftander-by; or, where a perfon, qualified to keep a gun, is fhooting at a mark, and undefignedly kills a man: for the act is lawful, and the effect is merely accidental. So where a parent is moderately correcting his child, a mafter his apprentice or fcholar, or an officer punifhing a criminal, and happens to occafion his death, it is only misadventure; for the act of correction was lawful: but if he exceeds the bounds of moderation, either in the manner, the inftrument, or the quantity of punifhment, and death enfues, it is manflaughter at leaft, and in fome cafes (according to the circumftances) murder; for the act of immoderate correction is unlawful. Thus by an edict of the emperor Conftantine, when the rigour of the Roman law with regard to flaves began to relax and foften, a mafter was allowed to chaftife his flave with rods and imprifonment, and, if death accidentally enfued, he was guilty of no crime: but if he ftruck him with a club or a ftone, and thereby occafioned his death; or if in any other yet groffer manner "*immoderate fuo jure utatur, tunc reus homicidii fit.*"

But, to proceed. A tilt or tournament, the martial diverfion of our anceftors, was however an unlawful act; and fo are boxing and fword-playing, the fucceeding amufement of their pofterity: and therefore, if a knight in the former cafe, or a gladiator in the latter, be killed, fuch killing is felony of manflaughter. But if the king command or permit fuch diverfion, it is faid to be only misadventure; for then the act is lawful: In like manner as, by the laws both of Athens and Rome, he who killed another in the *pancratium*, or public games, authorifed or permitted by the ftate, was not held to be guilty of homicide. Likewife to whip another's horfe, whereby he runs over a child and kills him, is held to be accidental in the rider, for he has done nothing unlawful; but manflaughter in the perfon who whipped him, for the act was a trefpafs, and at beft a piece of idlenefs, of inevitably dangerous confequence. And in general, if death enfues in confequence of an idle, dangerous, and unlawful fport, as fhooting or caffing ftones in a town, or the barbarous diverfion of cock-throwing; in thefe and fimilar cafes, the flayer is guilty of manflaughter, and not misadventure only; for thefe are unlawful acts.

2. Homicide in *felf-defence*, or *fe defendendo*, upon a fudden affray, is alfo excufable rather than juftifiable, by the Engliih law. This fpecies of felf-defence muft be diftinguifhed from that juft now mentioned, as calculated to hinder the perpetration of a capital crime; which is not only a matter of excufe, but of juftification. But the felf-defence which we are now fpeaking of, is that whereby a man may protect himfelf from an affault, or the like, in the courfe of a fudden brawl or quarrel, by killing him who affaults him. And this is what the law expreffes by the word *chance-medley*, or (as fome rather choofe to write it) *chaud-medley*; the former of which in its etymology fignifies a *cafual* affray, the latter an affray in the *heat* of blood or paffion: both of them of pretty much the fame import; but the former is in common fpeech too often erroneoufly applied to any manner of homicide by misadventure; whereas it appears by the ftatute 24 H. VIII. c. 5. and our ancient books, that it is properly applied to fuch killing as happens in felf-defence upon a fudden rencounter. The right of natural defence does not imply a right of attacking: for, inftead of attacking one another for injuries paft or impending, men need only have recourfe to the proper tribunals of juftice. They cannot therefore legally exercife this right of preventive defence, but in fudden and violent cafes; when certain and immediate fuffering would be the confequence of waiting for the affiftance of the law. Wherefore, to excufe homicide by the plea of felf-defence, it muft appear that the flayer had no other poffible means of efcaping from his affailant.

In fome cafes this fpecies of homicide (upon *chance-medley* in felf-defence) differs but little from manflaughter, which alfo happens frequently upon *chance-medley* in the proper legal fenfe of the word. But the true criterion between them feems to be this; when both parties are actually combating at the time when the mortal ftroke is given, the flayer is then guilty of manflaughter; but if the flayer hath not begun to fight, or (having begun) endeavours to decline any farther ftruggle, and afterwards, being clofely preffed by his antagonift, kills him to avoid his own deftruction, this is homicide excufable by felf-defence. For which reafon the law requires, that the perfon, who kills another in his own defence, fhould have retreated as far as he conveniently or fafely can, to avoid the violence of the affault, before he turns upon his affailant; and that not fictitioufly, or in order to watch his opportunity, but from a real tendernefs of fhedding his brother's blood. And though it may be cowardice, in time of war between two independent nations, to flee from an enemy; yet between two fellow-fubjects, the law countenances no fuch point of honour: becaufe the king and his courts are the *vindices injuriarum*, and will give to the party wronged all the fatisfaction he deferves. In this the civil law alfo agrees with ours, or perhaps goes rather farther; "*qui cum aliter tueri fe non poffunt, damni culpam dederint, innocii funt.*" The party affaulted muft therefore flee as far as he conveniently can, either by reafon of fome wall, ditch, or other impediment; or as far as the fiercenefs of the affault will permit him: for it may be fo fierce as not

to

Homicide. to allow him to yield a ſtep, without manifeſt danger of his life, or enormous bodily harm; and then in his defence he may kill his aſſailant inſtantly. And this is the doctrine of univerſal juſtice, as well as of the municipal law.

And, as the *manner* of the defence, ſo is alſo the *time* to be conſidered: for if the perſon aſſaulted does not fall upon the aggreſſor till the affray is over, or when he is running away, this is revenge and not defence. Neither, under the colour of ſelf-defence, will the law permit a man to ſcreen himſelf from the guilt of deliberate murder: for if two perſons, A and B, agree to fight a duel, and A gives the firſt onſet, and B retreats as far as he ſafely can, and then kills A, this is murder; becauſe of the previous malice and concerted deſign. But if A upon a ſudden quarrel aſſaults B firſt, and, upon B's returning the aſſault, A really and *bona fide* flees; and, being driven to the wall, turns again upon B and kills him; this may be *ſe defendendo*, according to ſome of our writers: tho' others have thought this opinion too favourable; inaſmuch as the neceſſity, to which he is at laſt reduced, originally aroſe from his own fault. Under this excuſe of ſelf-defence, the principal civil and natural relations are comprehended: therefore, maſter and ſervant, parent and child, huſband and wife, killing an aſſailant in the neceſſary defence of each other reſpectively, are excuſed; the act of the relation aſſiſting being conſtrued the ſame as the act of the party himſelf.

There is one ſpecies of homicide *ſe defendendo*, where the party ſlain is equally innocent as he who occaſions his death: and yet this homicide is alſo excuſable from the great univerſal principle of ſelf-preſervation, which prompts every man to ſave his own life preferable to that of another, where one of them muſt inevitably periſh. As, among others, in that caſe mentioned by lord Bacon, where two perſons, being ſhipwrecked, and getting on the ſame plank, but finding it not able to ſave them both, one of them thruſts the other from it, whereby he is drowned. He who thus preſerves his own life at the expence of another man's, is excuſable through unavoidable neceſſity, and the principle of ſelf-defence; ſince their both remaining on the ſame weak plank is a mutual, though innocent, attempt upon, and an endangering of, each other's life.

Let us next take a view of thoſe circumſtances wherein thoſe two ſpecies of homicide, by miſadventure and ſelf-defence, agree; and thoſe are in their blame and puniſhment. For the law ſets ſo high a value upon the life of a man, that it always intends ſome miſbehaviour in the perſon who takes it away, unleſs by the command or expreſs permiſſion of the law. In the caſe of miſadventure, it preſumes negligence, or at leaſt a want of ſufficient caution in him who was ſo unfortunate as to commit it; who therefore is not altogether faultleſs. And as to the neceſſity which excuſes a man who kills another *ſe defendendo*, lord Bacon entitles it *neceſſitas culpabilis*, and thereby diſtinguiſhes it from the former neceſſity of killing a thief or a malefactor. For the law intends that the quarrel or aſſault aroſe from ſome unknown wrong, or ſome provocation, either in word or deed: and ſince in quarrels both parties may be, and uſually are, in ſome fault; and it ſcarce can be tried who was originally in the wrong; the law will not hold the ſurvivor entirely guiltleſs. But it is clear, in the other caſe, that where I kill a thief who breaks into my houſe, the original default can never be upon my ſide. The law beſides may have a farther view, to make the crime of homicide more odious, and to caution men how they venture to kill another upon their own private judgment; by ordaining, that he who ſlays his neighbour, without an expreſs warrant from the law ſo to do, ſhall in no caſe be abſolutely free from guilt. Homicide.

Nor is the law of England ſingular in this reſpect. Even the ſlaughter of enemies required a ſolemn purgation among the Jews; which implies, that the death of a man, however it happens, will leave ſome ſtain behind it. And the moſaical law appointed certain cities of refuge for him "who killed his neighbour unawares; as if a man goeth into the wood with his neighbour to hew wood, and his hand fetcheth a ſtroke with the ax to cut down a tree, and the head ſlippeth from the helve, and lighteth upon his neighbour that he die, he ſhall flee unto one of thoſe cities and live." But it ſeems he was not held wholly blameleſs, any more than in the Engliſh law; ſince the avenger of blood might ſlay him before he reached his aſylum, or if he afterwards ſtirred out of it till the death of the high prieſt. In the imperial law likewiſe caſual homicide was excuſed, by the indulgence of the emperor ſigned with his own ſign manual, "*adnotatione principis*;" otherwiſe, the death of a man, however committed, was in ſome degree puniſhable. Among the Greeks, homicide by miſfortune was expiated by voluntary baniſhment for a year. In Saxony, a fine is paid to the kindred of the ſlain; which alſo, among the weſtern Goths, was little inferior to that of voluntary homicide: and in France, no perſon is ever abſolved in caſes of this nature, without a largeſs to the poor, and the charge of certain maſſes for the ſoul of the party killed.

The penalty inflicted by our laws is ſaid by Sir Edward Coke to have been anciently no leſs than death; which, however, is with reaſon denied by latter and more accurate writers. It ſeems rather to have conſiſted in a forfeiture, ſome ſay of all the goods and chattels, others of only a part of them, by way of fine or *weregild*: which was probably diſpoſed of, as in France, *in pios uſus*, according to the humane ſuperſtition of the times, for the benefit of *his* ſoul who was thus ſuddenly ſent to his account with all his imperfections on his head. But that reaſon having long ceaſed, and the penalty (eſpecially if a total forfeiture) growing more ſevere than was intended, in proportion as perſonal property has become more conſiderable, the delinquent has now, and has had as early as our records will reach, a pardon and writ of reſtitution of his goods as a matter of courſe and right, only paying for ſuing out the ſame. And, indeed, to prevent this expenſe, in caſes where the death has notoriouſly happened by miſadventure or in ſelf-defence, the judges will uſually permit (if not direct) a general verdict of acquittal.

III. Felonious homicide is an act of a very different nature from the former, being the killing of a human creature, of any age or ſex, without juſtification or excuſe. This may be done either by killing one's ſelf, or another man: for the conſideration of which, ſee the ar-

Homily ‖ Honan.

articles SELF-*Murder*, MURDER, and MANSLAUGHTER.

HOMILY, in eccleſiaſtical writers, a ſermon, or diſcourſe, upon ſome point of religion, delivered in a plain manner, ſo as to be eaſily underſtood by the common people.—The word is Greek, ὁμιλία; formed of ὁμιλῶ, *cætus*, "aſſembly, or council."

At the time of the reformation, there were ſeveral of theſe homilies made and printed, and ordered to be read in ſuch churches as were not provided with a ſufficiently learned miniſter, in order to prevent unſound doctrine being taught in remote country places.

In the primitive church, homily rather meant a conference or converſation by way of queſtion and anſwer, which made part of the office of a biſhop, till the 5th century, when the learned prieſts were allowed to preach, catechiſe, &c. in the ſame manner as the biſhops uſed to do.

There are ſtill extant ſeveral fine homilies, compoſed by the ancient fathers, particularly St Chryſoſtom and St Gregory.

De HOMINE *Replegiando*. See *Falſe*-IMPRISONMENT.

The writ *de homino replegiando* lies to replevy a man out of priſon, or out of the cuſtody of any private perſon (in the ſame manner that chattels taken in any diſtreſs may be replevied), upon giving ſecurity to the ſheriff, that the man ſhall be forthcoming to anſwer any charge againſt him. And if the perſon be conveyed out of the ſheriffs juriſdiction, the ſheriff may return that he is eloigned, *elongatus*; upon which a proceſs iſſues (called *capias in withernam*), to impriſon the defendant himſelf, without bail or mainprize, till he produces the party. But this writ is guarded with ſo many exceptions, that it is not an effectual remedy in numerous inſtances, eſpecially where the crown is concerned. See HABEAS *Corpus*.

HOMMOC, a name given by mariners to a hilloc, or ſmall eminence of land, reſembling the figure of a cone, and appearing on the ſea-coaſt of any country.

HOMO, MAN, is ranked by Linnæus under the order of primates; and characteriſed by having four parallel foreteeth both in the upper and lower jaw, and two mammæ on the breaſt. The ſpecies, according to this author, are two, viz. the homo ſapiens, and the homo troglodytes.

He ſubdivides the homo ſapiens into five varieties, viz. the American, the European, the Aſiatic, the African, and what he calls the *monſtrous*. See MAN.

The troglodytes, or orang outang, is a native of Ethiopia, Java, and Amboina. His body is white; he walks erect; and is about one half the ordinary human ſize. He generally lives about 25 years. He conceals himſelf in caves during the day, and ſearches for his prey in the night. He is ſaid to be exceedingly ſagacious, but is not endowed with the faculty of ſpeech. See TROGLODYTES, ORANG OUTANG, and SIMIA.

HOMOLOGOUS, in geometry, an appellation given to the correſponding ſides and angles of ſimilar figures, as being proportional to each other.

HONAN, a province of China, bounded on the north by that of Pecheli and Chanſi, on the weſt by Chanſi, on the ſouth by Houquang, and on the eaſt by Chantong. It is watered by the river Hoüango; and beſides the forts, caſtles, and garriſoned towns, it contains eight cities of the firſt rank, and 102 of the ſecond and third. The air of this province is very temperate and healthful, abounding with wheat, rice, paſtures, cattle, oranges of ſeveral ſorts, pomegranates, and all ſorts of European fruits. Towards the weſt it is mountainous and woody, and towards the eaſt it is all cultivated like a garden. It is well watered with fountains, brooks, and rivers, which render it very pleaſant.

Honderkooter ‖ Honey.

HONDERKOOTER (Melchior), a famous Dutch painter born at Utrecht, excelled in painting animals, and eſpecially birds. His pictures ſell at a high price, and are much ſought after. He died at Utrecht in 1695, aged 59.

HONDURAS, a province of North America in New Spain, lying on the North Sea, being about 370 miles in length, and 200 in breadth; it was diſcovered by Chriſtopher Columbus in the year 1502. The Engliſh have been poſſeſſed of the logwood country on the bay of Honduras a great while, and cut large quantities every year. The Moſquito native Americans live in the eaſtern parts; and being independant of the Spaniards, have entered into treaties with the Engliſh, and ſerve them in ſeveral capacities. This province is watered by ſeveral rivers, which enrich the country by their inundations; and it is very fertile in Indian corn. It is ſaid there are ſome mines of gold and ſilver in this province. Valadolid is the capital town.

HONE, a fine kind of white ſtone, uſed for ſetting razors, pen-knives, and the like.

HONEY, a ſweet vegetable juice, collected by the bees from the flowers of various plants, and depoſited in the cells of the comb; from which it is extracted either by ſpontaneous percolation through a ſieve in a warm place, the comb being ſeparated and laid thereon, or by expreſſion. That which runs ſpontaneouſly is purer than that which is expreſſed, a quantity of the wax and other matters being forced out along with it by the preſſure. The beſt ſort of honey is of a thick conſiſtence, a whitiſh colour inclining to yellow, an agreeable ſmell, and pleaſant taſte; both the colour and flavour are ſaid to differ in ſome degree, according to the plants which the bees collect it from. It is ſuppoſed that honey is merely the juice of the flower perſpiring, and becoming inſpiſſated thereon; and that the bee takes it up with its probocis, and carries it to be depoſited in its waxen cells, with which the young bees are to be fed in ſummer, and the old ones in winter: but it is certain, that honey can be procured by no other method of collecting this juice than by the bees. The honey wrought by the young bees, and that which is permitted to run from the comb without heat or preſſure, is white and pure, and called *virgin's honey*. The honey of old bees, and that which is forced from the comb by heat or preſſure, is yellow, from the wax. Honey produced where the air is clear and hot, is better than that where the air is variable and cold.—The honey of Narbonne in France, where roſemary abounds, is ſaid to have a very manifeſt flavour of that plant, and to be imitable by adding to other honey an infuſion of roſemary flowers.—Honey, conſidered as a medicine, is a very uſeful detergent and aperient, powerfully diſſolving viſcid

Honey-dew.

viſcid juices, and promoting the expectoration of tough phlegm: in ſome particular conſtitutions it has an inconvenience of griping, or of proving purgative; this is ſaid to be in ſome meaſure prevented by previouſly boiling the honey.

Honey-*Dew*, a ſweet ſaccharine ſubſtance founded on the leaves of certain trees, of which bees are very fond, by the huſbandmen ſuppoſed to fall from the heavens like common dew. This opinion hath been refuted, and the true origin of this and other ſaccharine dews ſhewn by the Abbe Boiſſier de Sauvages, in a memoir read before the Society of Sciences at Montpelier, "Chance (ſays the Abbe) afforded me an opportunity of ſeeing this juice in its primitive form on the leaves of the holm-oak: theſe leaves were covered with thouſands of ſmall round globules, or drops, which, without touching one another, ſeemed to point out the pore from whence each of them had proceeded. My taſte informed me that they were as ſweet as honey: the honey-dew on a neighbouring bramble did not reſemble the former, the drops having run together; owing either to the moiſture of the air which had diluted them, or to the heat which had expanded them. The dew was become more viſcous, and lay in large drops, covering the leaves; in this form it is uſually ſeen.

"The oak had at this time two ſorts of leaves; the old, which were ſtrong and firm; and the new, which were tender, and newly come forth. The honey-dew was found only on the old leaves; tho' theſe were covered by the new ones, and by that means ſheltered from any moiſture that could fall from above. I obſerved the ſame on the old leaves of the bramble, while the new leaves were quite free from it. Another proof that this dew proceeds from the leaves is, that other neighbouring trees not furniſhed with a juice of this kind, had no moiſture on them; and particularly the mulberry, which is a very particular circumſtance, for this juice is a deadly poiſon to ſilk-worms. If this juice fell in the form of a dew, miſt, or fog, it would wet all the leaves without diſtinction, and every part of the leaves, under as well as upper. Heat may have ſome ſhare in its production: for though the common heat promotes only the tranſpiration of the more volatile and fluid juices, a ſultry heat, eſpecially if reflected by clouds, may ſo far dilate the veſſel, as to produce a more viſcous juice, ſuch as the honey-dew.

"The ſecond kind of honey-dew, which is the chief reſource of bees after the ſpring-flowers and dew by tranſpiration on leaves are paſt, owes its origin to a ſmall inſect called a *vine-fretter*; the excrement ejected with ſome force by this inſect makes a part of the moſt delicate honey known in nature. See Aphis.

"Theſe vine-fretters reſt during ſeveral months on the barks of particular trees, and extract their food by piercing that bark, without hurting or deforming the tree. Theſe inſects alſo cauſe the leaves of ſome trees to curl up, and produce galls upon others. They ſettle on branches that are a year old. The juice, at firſt perhaps hard and crabbed, becomes, in the bowels of this inſect, equal in ſweetneſs to the honey obtained from the flowers and leaves of vegetables; excepting that the flowers may communicate ſome of their eſſential oil to the honey, and this may give it a peculiar flavour, as happened to myſelf by planting a hedge of roſemary near my bees at Sauvages: the honey has taſted of it ever ſince, that ſhrub continuing long in flower. Honey-dew.

"I have obſerved two ſpecies of vine-fretters, which live unſheltered on the bark of young branches; a larger and a leſſer.

"The leſſer ſpecies is of the colour of the bark upon which it feeds, generally green. It is chiefly diſtinguiſhed by two horns, or ſtrait, immoveable, fleſhy ſubſtances, which riſe perpendicularly from the lower ſides of the belly, one on each ſide. This is the ſpecies which live on the young branches of bramble and elder.

"The larger ſpecies is double the ſize of the other; is of a blackiſh colour; and inſtead of the horns which diſtinguiſh the other, have in the ſame part of the ſkin a ſmall button, black and ſhining like jet.

"The buzzing of bees in a tuft of holm-oak, made me ſuſpect that ſomething very intereſting brought ſo many of them thither. I knew that it was not the ſeaſon for expecting honey-dew, nor was it the place where it is uſually found; and was ſurprized to find the tuft of leaves and branches covered with drops which the bees collected with a humming noiſe. The form of the drops drew my attention, and led me to the following diſcovery. Inſtead of being round like drops which had fallen, each formed a ſmall longiſh oval. I ſoon perceived from whence they proceeded. The leaves covered with theſe drops of honey were ſituated beneath a ſwarm of the larger black vine-fretters; and on obſerving theſe inſects, I perceived them from time to time raiſe their bellies, at the extremity of which there then appeared a ſmall drop of an amber colour, which they inſtantly ejected from them to the diſtance of ſome inches. I found by taſting ſome of theſe drops which I had catched on my hand, that it had the ſame flavour with what had before fallen on the leaves. I afterwards ſaw the ſmaller ſpecies of vine-fretters eject their drops in the ſame manner.

"This ejection is ſo far from being a matter of indifference to theſe inſects themſelves, that it ſeems to have been wiſely inſtituted to procure cleanlineſs in each individual, as well as to preſerve the whole ſwarm from deſtruction; for preſſing as they do one upon another, they would otherwiſe ſoon be glued together, and rendered incapable of ſtirring.

"The drops thus ſpurted out fall upon the ground, if not intercepted by leaves or branches; and the ſpots they make on ſtones remain ſome time, unleſs waſhed off by rain. This is the only honey-dew that falls; and this never falls from a greater height than a branch where theſe inſects can cluſter.

"It is now eaſy to account for a phænomenon which formerly puzzled me greatly. Walking under a lime-tree in the king's garden at Paris, I felt my hand wetted with little drops, which I at firſt took for ſmall rain. The tree indeed ſhould have ſheltered me from the rain, but I eſcaped it by going from under the tree. A ſeat placed near the tree ſhone with theſe drops. And being then unacquainted with any thing of this kind, except the honey-dew found on the leaves of ſome particular trees, I was at a loſs to conceive how ſo glutinous a ſubſtance could fall from the

leaves

Honey-dew ‖ Honour.

leaves in such small drops: for I knew that rain could not overcome its natural attraction to the leaves till it became pretty large drops; but I have since found, that the lime-tree is very subject to these vine-fretters.

"Bees are not the only insects that feast upon this honey; ants are equally fond of it. Led into this opinion by what naturalists have said, I at first believed that the horns in the lesser species of these vine-fretters had in their extremity a liquor which the ants went in search of: but I soon discovered that what drew the ants after them came from elsewhere, both in the larger and lesser species, and that no liquor is discharged by the horns.

"There are two species of ants which search for these insects. The large black ants follow those which live on the oaks and chesnut; the lesser ants attend those on the elder. But as the ants are not, like the bees, provided with the means of sucking up fluids; they place themselves near the vine-fretters, in order to seize the drop the moment they see it appear upon the anus; and, as the drop remains same time on the small vine fretters before they can cast it off, the ants have leisure to catch it, and thereby prevent the bees from having any share: but the vine-fretters of the oak and chesnut being stronger, and perhaps more plentifully supplied with juice, dart the drop instantly, so that the larger ants get very little of it.

"The vine-fretters finding the greatest plenty of juice in trees about the middle of summer, afford also at that time the greatest quantity of honey; and this lessens as the season advances, so that in the autumn the bees prefer it to the flowers then in season.

"Though these insects pierce the tree to the sap in a thousand places, yet the trees do not seem to suffer at all from them, nor do the leaves lose the least of their verdure. The husbandman therefore acts injudiciously when he destroys them."

HONEY-*Guide*, a curious species of cuckow. See CUCULUS.

HONEY-*Suckle*. See LONICERA.

HONFLEUR, a considerable sea-port town of France, in Upper Normandy, with a good harbour, and trade in bone-lace. It is seated on the river Seine, in E. Long. 0. 8. N. Lat. 17. 49.

HONITON, a town of Devonshire in England, seated near the river Otter, over which there is a bridge on the road from London to Exeter. A dreadful fire happened here in July 1747, which consumed three parts of the town, and the damage was computed at 43,000 l. It sends two members to parliament; but being no corporation, a portrieve is the returning officer. It has one church, which is half a mile from the town, and a chapel within it; with about 400 houses, which are chiefly in one broad-paved street. Here is a large manufactory of bone-lace. W. Long. 3. 11. N. Lat. 50. 43.

HONOUR, a testimony of esteem or submission, expressed by words, actions, and an exterior behaviour, by which we make known the veneration and respect we entertain for any one on account of his dignity or merit. The word *honour* is also used in general for the esteem due to virtue, glory, and reputation. It is also used for *virtue* and *probity* themselves, and for an exactness in performing whatever we have promised; and in this last sense we use the term, *a man of honour*. But *honour* is more particularly applied to two different kinds of virtue; bravery in men, and chastity in women.—Virtue and Honour were deified among the ancient Greeks and Romans, and had a joint temple consecrated to them at Rome: but afterwards each of them had separate temples, which were so placed, that no one could enter the temple of Honour, without passing through that of Virtue; by which the Romans were continually put in mind, that virtue is the only direct path to true glory. Plutarch tells us, that the Romans, contrary to their usual custom, sacrificed to Honour uncovered; perhaps to denote, that wherever honour is, it wants no covering, but shews itself openly to the world.

Honour, Honours.

HONOUR, or *Rank*.—The degrees of honour which are observed in Britain, may be comprehended under these two heads, viz. *nobiles majores*, and *nobiles minores*. Those included under the first rank are, archbishops, dukes, marquises, earls, viscounts, bishops, and barons; which are all distinguished by the respective ornaments of their escutcheons: and those of the last are baronets, knights, esquires, and gentlemen. There are some authors who will have baronets to be the last under the first rank; and their reason is, because their honour is hereditary, and by patent, as that of the nobility. See COMMONALTY and NOBILITY.

HONOURS *of War*, in a siege, is, when a governor, having made a long and vigorous defence, is at last obliged to surrender the place to the enemy, for want of men and provisions, and makes it one of his principal articles to march out with the *honours of war*; that is, with shouldered arms, drums beating, colours flying, and all their baggage, &c.

Military HONOURS. All armies salute crowned heads in the most respectful manner, drums beating a march, colours and standards dropping, and officers saluting. Their guards pay no compliment, except to the princes of the blood; and even that by courtesy, in the absence of the crowned head.

To the commander in chief the whole line turns out without arms, and the camp-guards beat a march, and salute.

To generals of horse and foot, they beat a march, and salute.

Lieutenant-generals of ditto, three ruffs, and salute.

Major-generals of ditto, two ruffs, and salute.

Brigadiers of ditto, rested arms, one ruff, and salute.

Colonels of ditto, rested arms, and no beating. Centinels rest their arms to all field-officers, and shoulder to every officer.

All governors, that are not general-officers, shall, in all places where they are governors, have one ruff, with rested arms; but for those who have no commission as governors, no drum shall beat.

Lieutenant-governors shall have the main-guard turned out to them with shouldered arms.

Prussian HONOURS *of War*, chiefly imitated by most powers in Europe, are,

To the king, all guards beat the march, and all officers salute.

Field-

Honour. Field-marſhals received with the march, and ſaluted in the king's abſence.

General of horſe or foot, four ruffs; but if he commands in chief, a march and ſalute.

Mil. Diſt. Lieutenant-generals of horſe or foot, commanding or not, guards beat three ruffs.

Major-generals of horſe or foot, two ruffs.

Officers, when their guards are under arms, and a general makes a ſignal, muſt reſt to him, but not beat; when not got under arms, and a ſignal made, only ſtand by their arms.

Village-guards go under arms only to the king, field-marſhals, generals of horſe and foot, and to the general of the day.

Generals guards go under arms only to the king, field-marſhals, and the general over whom they mount.

Commanding officers of regiments and battalions, their own quarter and rear guards to turn out; but not to other field-officers, unleſs they are of the day.

Generals in foreign ſervice, the ſame.

HONOURS *paid by Centinels.* Field-marſhals; two centinels with ordered firelocks, at their tent or quarters.

Generals of horſe or foot; two centinels, one with his firelock ſhouldered, the other ordered.

Lieutenant-generals; one, with firelock ordered.

Major-generals; one, with firelock ſhouldered.

The firſt battalion of guards go under arms to the king only; not to ſtand by, nor draw up in the rear of their arms to any other; nor to give centinels to foreigners. Second and third battalions draw up behind their arms to the princes, and to field-marſhals; but when on grenadier-guards or out-poſts, they turn out, as other guards do, to the officers of the day. They give one centinel with ſhouldered arms to the princes of the blood, and to field-marſhals when they lie alone in garriſon.

Court of HONOUR. See *Court of* CHIVALRY.

Fountain of HONOUR. The king is ſo ſtyled, as being the ſource of honours, dignities, &c. See PREROGATIVE.

It is impoſſible that government can be maintained without a due ſubordination of rank; that the people may know and diſtinguiſh ſuch as are ſet over them, in order to yield them their due reſpect and obedience; and alſo that the officers themſelves, being encouraged by emulation and the hopes of ſuperiority, may the better diſcharge their functions: and the law ſuppoſes, that no one can be ſo good a judge of their ſeveral merits and ſervices, as the king himſelf who employs them. It has therefore intruſted him with the ſole power of conferring dignities and honours, in confidence that he will beſtow them upon none but ſuch as deſerve them. And therefore all degrees of nobility, of knighthood, and other titles, are received by immediate grant from the crown: either expreſſed in writing, by writs or letters patent, as in the creations of peers and baronets; or by corporeal inveſtiture, as in the creation of a ſimple knight.

From the ſame principle alſo ariſes the prerogative of erecting and diſpoſing of offices: for honours and offices are in their nature convertible and ſynonymous. All offices under the crown carry in the eye of the law an honour along with them; becauſe they imply a ſuperiority of parts and abilities, being ſuppoſed to be always filled with thoſe that are moſt able to execute them. And, on the other hand, all honours in their original had duties or offices annexed to them: an earl, *comes*, was the conſervator or governor of a county; and a knight, *miles*, was bound to attend the king in his wars. For the ſame reaſon therefore that honours are in the diſpoſal of the king, offices ought to be ſo likewiſe; and as the king may create new titles, ſo may he create new offices: but with this reſtriction, that he cannot create new offices with new fees annexed to them, nor annex new fees to old offices; for this would be a tax upon the ſubject, which cannot be impoſed but by act of parliament. Wherefore, in 13 Hen. IV. a new office being created by the king's letters patent for meaſuring cloths, with a new fee for the ſame, the letters patent were, on account of the new fee, revoked and declared void in parliament. Honour Hood.

Upon the ſame, or a like reaſon, the king has alſo the prerogative of conferring privileges upon private perſons. Such as granting place or precedence to any of his ſubjects, as ſhall ſeem good to his royal wiſdom: or ſuch as converting aliens, or perſons born out of the king's dominions, into denizens; whereby ſome very conſiderable privileges of natural-born ſubjects are conferred upon them. Such alſo is the prerogative of erecting corporations; whereby a number of private perſons are united and knit together, and enjoy many liberties, powers, and immunities in their politic capacity, which they were utterly incapable of in their natural.

Maids of HONOUR, are ſix young ladies in the houſehold of the queen and princeſs-royal; the ſalary of thoſe of a queen are 300l. per ann. each, and thoſe of a princeſs dowager of Wales, 200l.

HONOUR-*Point*, in heraldry, is that next above the centre of the eſcutcheon, dividing the upper part into two equal portions.

HONOURABLE, a title conferred on the younger ſons of earls, the ſons of viſcounts and barons; as alſo on ſuch perſons as have the king's commiſſion, and upon thoſe who enjoy places of truſt and honour.

HONOURARY, ſomething done or conferred upon any one, to do him honour. See the article HONOUR.

Honourary is ſometimes underſtood of a perſon who bears or poſſeſſes ſome poſt or title, only for the name's ſake, without doing any thing of the functions belonging to it, or receiving any advantage from it: thus we ſay, honourary counſellors, honourary fellows, &c.

Honourary is alſo uſed for a lawyer's fee, or a ſalary given to public profeſſors in any art or ſcience.

HOOD (Robin), a famous outlaw and deer-ſtealer, who chiefly harboured in Sherwood foreſt in Nottinghamſhire. He was a man of family, which by his pedigree appears to have had ſome title to the earldom of Huntingdon; and played his pranks about the latter end of the 12th century. He was famous for archery, and for his treatment of all travellers who came in his way; levying contributions on the rich, and relieving the poor. Falling ſick at laſt, and requiring to be bled, he is ſaid to have been betrayed and bled to death. He died in 1247; and was buried

Hood ‖ Hooke.

ried at Kirklees in Yorkſhire, then a Benedictine monaſtery, where his graveſtone is ſtill ſhewn.

HOOD-*Iſland*, one of the MARQUESAS *Iſlands* in the South Sea. It was diſcovered in April 1774 by captain Cook, who gave it that name from the perſon who firſt ſaw the land. It is the moſt northerly of the cluſter, and lies in S. Lat. 9. 26. W. Long. 139. 13.

HOOF, the horny ſubſtance that covers the feet of divers animals, as oxen, horſes, &c.

HOOF-*bound*, in Farriery. See there, § xlii.

HOOFT (Peter Cornelius Van), an eminent hiſtorian and poet, born at Amſterdam in 1581. He was lord of Muyden, judge of Goyland, and knight of the order of St Michael. He died at the Hague in 1647. He wrote, 1. An excellent hiſtory of the Netherlands, from the abdication of Charles V. to the year 1588. 2. Several Comedies, and other works. By theſe he acquired ſuch reputation, that the Flemings conſidered him as the Homer and Tacitus of the Netherlands.

HOOGUESTRATTEN, a town of the Netherlands in Dutch Brabant, and capital of a county of the ſame name. E. Long. 4. 41. N. Lat. 51. 25.

HOOKE (Robert), a very eminent Engliſh mathematician and philoſopher, was the ſon of Mr John Hooke miniſter of Freſhwater in the Iſle of Wight, where he was born in 1635. He very early diſcovered a genius for mechanics, by making curious toys with great art and dexterity. He was educated under Dr Buſby in Weſtminſter ſchool; where he not only acquired a competent ſhare of Greek and Latin, together with an inſight into Hebrew and ſome other Oriental languages, but alſo made himſelf maſter of a good part of Euclid's elements. About the year 1653 he went to Chriſt-church in Oxford, and in 1655 was introduced to the Philoſophical Society there; where, diſcovering his mechanic genius, he was firſt employed to aſſiſt Dr Willis in his operations in chemiſtry, and afterwards recommended to the honourable Robert Boyle, Eſq; whom he ſerved ſeveral years in the ſame capacity. He was alſo inſtructed in aſtronomy about this time by Dr Seth Ward, Savilian profeſſor of that ſcience; and from henceforward diſtinguiſhed himſelf by many noble inventions and improvements of the mechanic kind. He invented ſeveral aſtronomical inſtruments, for making obſervations both at ſea and land; and was particularly ſerviceable to Mr Boyle in completing the invention of the air-pump. Sir John Cutler having founded a mechanic ſchool in 1664, he ſettled an annual ſtipend on Mr Hooke for life, intruſting the preſident, council, and fellows, of the Royal Society to direct him with reſpect to the number and ſubject of his lectures; and on the 11th of January 1664-5, he was elected by that ſociety, curator of experiments for life, with an additional ſalary. In 1666 he produced to the Royal Society a model for rebuilding the city of London deſtroyed by fire, with which the ſociety was well pleaſed; and the lord mayor and aldermen preferred it to that of the city ſurveyor, though it happened not to be carried into execution. It is ſaid, by one part of this model of Mr Hooke's, it was deſigned to have all the chief ſtreets, as from Leaden-hall to Newgate, and the like, to lie in exact ſtraight lines, and all the other croſs-ſtreets turning out of them at right angles, with all the churches, public buildings, markets, &c. in proper and convenient places. The rebuilding of the city according to the act of parliament requiring an able perſon to ſet out the ground to the proprietors, Mr Hooke was appointed one of the ſurveyors; in which employment he got moſt of part of his eſtate, as appeared pretty evident from a large iron cheſt of money found after his death, locked down with a key in it, and a date of the time, which ſhewed it to have been ſo ſhut up above 30 years.—Mr Oldenburg, ſecretary to the Royal Society, dying in 1677, Mr Hooke was appointed to ſupply his place, and began to take minutes at the meeting in October, but did not publiſh the Tranſactions. In the beginning of the year 1687, his brother's daughter, Mrs Grace Hooke, who had lived with him ſeveral years, died; and he was ſo affected with grief at her death, that he hardly ever recovered it, but was obſerved from that time to become leſs active, more melancholy, and, if that could be, more cynical than ever. At the ſame time, a chancery ſuit in which he was concerned with Sir John Cutler, on account of his ſalary for reading the Cutlerian lectures, made him very uneaſy, and increaſed his diſorder. In 1691, he was employed in forming the plan of the hoſpital near Hoxton, founded by Robert Aſk alderman of London, who appointed archbiſhop Tillotſon one of his executors; and in December the ſame year, Hooke was created doctor of Phyſic, by a warrant from that prelate. In July 1696, the chancery ſuit with Sir John Cutler was determined in his favour, to his inexpreſſible ſatisfaction. His joy on that occaſion was found in his diary thus expreſſed; DOMSHLGISSA: that is, *Deo, Optimo, Maximo, ſit honor, laus, gloria, in ſecula ſeculorum, Amen.* "I was born on this day of July 1635, and God has given me a new birth: may I never forget his mercies to me! while he gives me breath may I praiſe him!"—In the ſame year 1696, an order was granted to him for repeating moſt of his experiments at the expence of the Royal Society, upon a promiſe of his finiſhing the accounts, obſervations, and deductions from them, and of perfecting the deſcription of all the inſtruments contrived by him; but his increaſing illneſs, and general decay, rendered him unable to perform it. He continued ſome years in this waſting condition; and thus languiſhing till he was quite emaciated, he died March 3d, 1702, at his lodgings in Greſham college, and was buried in St Helen's church, Biſhopſgate ſtreet; his corpſe being attended by all the members of the Royal Society then in London.

As to the character of Mr Hooke, it is not in all reſpects one of the moſt amiable. He made but a deſpicable figure as to his perſon, being ſhort of ſtature, very crooked, pale, lean, and of a meagre aſpect, with dark brown hair, very long, and hanging over his face uncut and lank. Suitable to his perſon, his temper was pennrious, melancholy, miſtruſtful: and, though poſſeſſed of great philoſophical knowledge, he had ſo much ambition, that he would be thought the only man who could invent or diſcover; and thus frequently laid claim to the inventions and diſcoveries of others, while he boaſted of many of his own which he never communicated. In the religious part of his character

Hooke.

Hooker. character he was ſo far exemplary, that he always expreſſed a great veneration for the Deity; and ſeldom received any remarkable benefit in life, or made any conſiderable diſcovery in nature, or invented any uſeful contrivance, or found out any difficult problem, without ſetting down his acknowledgment to God, as many places in his diary plainly ſhew. He frequently ſtudied the ſacred writings in the original; for he was acquainted with the ancient languages, as well as with all parts of the mathematics.—He wrote, 1. *Lectiones Cutlerianæ*. 2. *Micrographia*, or Deſcriptions of minute bodies made by magnifying glaſſes. 3. A deſcription of helioſcopes. 4. A deſcription of ſome mechanical improvements of lamps and water-poizes, quarto. 5. Philoſophical collections. After his death were publiſhed, 6. Poſthumous works collected from his papers by Richard Waller ſecretary to the Royal Society.

HOOKER (John), *alias* Vowell, was born in Exeter, about the year 1524, the ſecond ſon of Robert Hooker, who in 1529 was mayor of that city. He was inſtructed in grammar learning by Dr Moreman, vicar of Menhinit in Cornwall, and thence removed to Oxford; but to what college is uncertain. Having left the univerſity, he travelled to Germany, and reſided ſome time at Cologne, where he kept exerciſes in law, and probably graduated. Thence he went to Straſburg, where he ſtudied divinity under the famous Peter Martyr. He now returned to England, and ſoon after viſited France, intending to proceed to Spain and Italy; but was prevented by a declaration of war. Returning therefore again to England, he fixed his reſidence in his native city, where, having married, he was in 1554 elected chamberlain, being the firſt perſon who held that office, and in 1571 repreſented his fellow-citizens in parliament. He died in the year 1601, and was buried in the cathedral church at Exeter. He wrote, among other works, 1. Order and uſage of keeping of parliaments in Ireland. 2. The events of comets or blazing ſtars, made upon the ſight of the comet Pagonia, which appeared in November and December 1577. 3. An addition to the chronicles of Ireland from 1546 to 1568; in the ſecond volume of Holinſhed's chronicle. 4. A deſcription of the city of Exeter, and of the ſondrie aſſaults given to the ſame; Holinſh. chron. vol. iii. 5 A book of enſigns. 6. Tranſlation of the hiſtory of the conqueſt of Ireland from the Latin of Giraldus Cambrenſis; in Holinſh. chron. vol. ii. 7. *Synopſis chorographica*, or an hiſtorical record of the province of Devon; never printed.

Hooker (Richard), a learned divine, was born at Heavy-tree, near Exeter, in the year 1553. Some of his anceſtors were mayors of that city, and he was nephew to *John* Hooker the hiſtorian. By this uncle he was firſt ſupported at the univerſity of Oxford, with the addition of a ſmall penſion from Dr Jewel, biſhop of Saliſbury, who in 1561 got him admitted one of the clerks of Corpus-Chriſti college. In 1573 he was elected ſcholar. In 1577 he took the degree of maſter of arts, and was admitted fellow the ſame year. In July 1579, he was appointed deputy profeſſor of the Hebrew language. In October, in the ſame year, he was for ſome trivial miſdemeanor expelled the college, but was immediately reſtored. In 1581 he took orders; and, being appointed to preach at St Paul's croſs, he came to London, where he was unfortunately drawn into a marriage with Joan Churchman, the termagant daughter of his hoſteſs. Having thus loſt his fellowſhip, he continued in the utmoſt diſtreſs till the year 1584, when he was preſented by John Cheny, Eſq. to the rectory of Drayton-Beaucham in Buckinghamſhire. In this retirement he was viſited by Mr Edwin Sandys, and Mr George Cranmer, his former pupils. They found him, with a Horace in his hand, tending ſome ſheep in the common field, his ſervant having been ordered home by his ſweet Xantippe. They attended him to his houſe; but were ſoon deprived of his company by an order, from his wife Joan, for him to come and rock the cradle. Mr Sandys's repreſentation to his father, of his tutor's ſituation, procured him the maſterſhip of the Temple. In this ſituation he met with conſiderable moleſtation from one Travers, lecturer of the Temple, and a bigoted Puritan, who in the afternoon endeavoured to confute the doctrine delivered in the morning. From this diſagreeable ſituation he ſolicited archbiſhop Whitgift to remove him to ſome country retirement, where he might profecute his ſtudies in tranquillity. Accordingly, in 1591, he obtained the rectory of Boſcomb in Wiltſhire, together with a prebend in the church of Saliſbury, of which he was alſo made ſub-dean. In 1594 he was preſented to the rectory of Biſhopsbourne in Kent, where he died in the year 1600. He was buried in his own pariſh-church, where a monument was erected to his memory by William Cooper, Eſq. He was a meek, pious, and learned divine. He wrote, 1. Eccleſiaſtical politie, in eight books. fol. 2. A diſcourſe of juſtification, &c. with two other ſermons, Oxf. 1612, 4to. Alſo ſeveral other ſermons printed with the Eccleſiaſtical Politie.

Hooker, in naval architecture, a veſſel much uſed by the Dutch, built like a pink, but rigged and maſted like a hoy.

Hookers will lie nearer a wind than veſſels with croſs-ſails can do. They are from 50 to 200 tons burthen, and with a few hands will ſail to the Eaſt Indies.

HOOP, a piece of pliant wood, or iron, bent into a circular form, commonly uſed for ſecuring caſks, &c.

Driving a Hoop, a boyiſh exerciſe, of good effect in rendering the limbs pliable, and for ſtrengthening the nerves.

HOOPER (John), biſhop of Worceſter, and a martyr in the Proteſtant cauſe, was born in Somerſetſhire, and educated at Oxford, probably in Merton-college. In 1518 he took the degree of bachelor of arts, and afterwards became a Ciſtercian monk; but at length, diſliking his fraternity, he returned to Oxford, and there became *infected* with Lutheraniſm. In 1539 he was made chaplain and houſe-ſteward to Sir John Arundel, who afterwards ſuffered with the protector in the reign of Edward VI. But *that very catholic knight*, as Wood calls him, diſcovering his chaplain to be a heretic, Hooper was obliged to leave the kingdom. After continuing ſome time in France, he returned to England, and lived with a gentleman called *Scintlow:* but, being again diſcovered, he eſcaped in the habit of a ſailor to Ireland; thence

Hooker || Hooper.

Hooper ‖ Hop.

embarked for the continent, and fixed his abode in Switzerland.

When king Edward came to the crown, Mr Hooper returned once more to his native country. In 1550, by his old patron Sir John Arundel's intereſt with the earl of Warwick, he was conſecrated biſhop of Glouceſter; and in 1552 was nominated to the ſee of Worceſter, which he held *in commendam* with the former. But queen Mary had ſcarce aſcended the throne, before his lordſhip was impriſoned, tried, and, not chooſing to recant, condemned to the flames. He ſuffered this terrible death at Glouceſter, on the 9th of February 1554, being then near 60 years of age. He was an avowed enemy to the church of Rome, and not perfectly reconciled to what he thought remnants of Popery in the church of England. In the former reign he had been one of Bonner's accuſers, which ſufficiently accounts for his being one of queen Mary's firſt ſacrifices to the *holy ſee*. He was a perſon of good parts and learning, as may be found in Fox's *Book of Martyrs*.

Hooper (George), a very learned writer, biſhop of Bath and Wells, was well ſkilled in mathematics, and in the eaſtern learning and languages. He ſat in thoſe ſees above 24 years, often refuſed a ſeat in the privy council, and could not be prevailed upon to accept of the biſhopric of London on the death of biſhop Compton. He wrote, 1. The church of England free from the imputation of Popery. 2. A diſcourſe concerning Lent. 3. New danger of Preſbytery. 4. An inquiry into the ſtate of the ancient meaſures. 3. *De Valentinianorum hæreſi conjecturæ*. 6. Several ſermons; and other works.

HOOPING-COUGH. See (the Index ſubjoined to) Medicine.

HOOPOE. See Upupa.

HOORNBECK (John), profeſſor of divinity in the univerſities of Leyden and Utrecht, was born at Haerlem in 1617. He underſtood the Latin, Hebrew, Chaldaic, Syriac, Rabbinical, Dutch, German, Engliſh, French, and Italian languages; and publiſhed many works, among which are, 1. A refutation of Socinianiſm, in 3 vols 4to. 2. A treatiſe for the conviction of the Jews. 3. Of the converſion of the Heathens. 4. Theological inſtitutions, &c. which are written in Latin. Mr Bayle repreſents him as a complete model of a good paſtor and divinity profeſſor.

HOP, in botany. See Humulus.

New land is found to ſucceed better with hops than old; and on this principle they are very cautious in their plantations in Kent, and look forward for the after-produce. When they make a new hop-ground, they plant it with apple-trees at a large diſtance aſunder, and with cherry-trees between: by this means, when the hops have grown ten years, which they judge as much as they will do well, they place their account in the cherry-trees, which bear large crops: theſe they gather for about 30 years, and then they cut them up, and depend upon their apple-trees only; which they find very large and ſtrong by that time.

The dry ſtalks of hops ſhould be burnt on the ground in winter, covering them with a little freſh earth as they burn. This makes together an excellent compoſt, to make the hills of. The land muſt be dug or plowed well, and laid very even; and then the places for the hills marked out by a line, and a ſtick put in every place where one is to be. A thouſand hills may be made in an acre of ground, and ſix or ſeven plants ſet on every hill. From ſix to nine feet ſhould be allowed between every hill, and the grounds in the hills ſhould be better and richer than the common earth. Some plant hops in March and April, but the moſt experienced people prefer the month of October, becauſe they will then ſtrike firm roots, and be ſtrong and vigorous againſt ſpring. The largeſt plants are to be choſen; and it is beſt to procure them from ſome rich ground, where the hills have been laid high; they ſhould be about eight or ten inches long, and have three or four joints or buds a-piece; the holes for planting them are to be dug eight or ten inches deep, and about a foot over; and in each of theſe holes four plants are to be ſet, one in each corner: they may be covered an inch deep over the top, if planted in October; but in ſpring, when they have ſhot from the joints, then they muſt not be buried: after this, the ground muſt be carefully kept clear of weeds. Hop.

Dreſſing of Hops. This is preparing the ground in winter and ſpring for the making a good ſummer-crop. In doing this, the hills upon which the plants ſtand muſt be all pulled down, and undermined on every ſide, till the ſpade comes near the principal root; then ſhake off or remove with the hand the looſe mould from the upper or looſe roots, that you may ſee where the new rots grow out of the old ſets. The old ſets are to be carefully preſerved, but the other roots may be cut away. Whatever time the hills are pulled down, the roots muſt not be cut till March. When the young hops are dreſſed for the firſt time, all the roots are to be cut away that grew the year before, and the ſets are to be cut off within one inch of the ſame; and every year after, they muſt be cut as cloſe as may be to the old roots; but to a weak hop, ſome of the ſhoots are to be left at the dreſſing. Thoſe roots of the plant which grow downwards, are never to be injured, but only thoſe which run horizontally are to be cut. The old roots and the young ones may be eaſily diſtinguiſhed, in that the old ones are always red, and the young white. If there are by accident any wild hops got among the reſt, the places where they grow are to be marked with ſticks, or otherwiſe, at the time of their being gathered; and after this, at the time of dreſſing the ground, that whole hill is to be deſtroyed, and a new one made with new plants in the room of it. When the roots are cut and dreſſed, the rich compoſt is to be put to them; and the hills muſt not be made too high at firſt, leſt they hinder the young ſhoots.

Gathering and drying of Hops. Hops blow in the latter end of July; in the beginning of Auguſt they bell; and they are ſometimes ripe at the beginning of September, ſometimes later. When they begin to change colour, are eaſily pulled to pieces, and their ſeeds look brown within them, they are ripe; and they are then to be gathered as quick as poſſible, for the leaſt blaſt of wind will hurt them at this time.

The manner of gathering hops, is to take down four hills ſtanding together in the midſt of the garden, and to cut the roots even with the ground, then lay the ground level; and when it is ſwept clean, it makes

Hop. a floor, on which the hops may be laid and picked. The hop-plants are firſt unwound from the poles, and then the people ſit round and pick off the hops into baſkets.

Care ſhould be taken to dry the hops as faſt as they are picked, for in lying undried they are apt to heat and change colour very quickly. If the quantity picked be ſo large, that the kiln in which they are to be dried is over-ſtocked, they muſt be ſpread thin upon a floor, and they will keep two or three days in that manner without any harm. Indeed, where the quantity is but ſmall, there is no need to have recourſe to the kiln at all; for they will dry much better than any other way, by being laid thin upon a floor, and often turned. The drying of hops is the moſt material part of their manufacture: for if they be ill dried, they loſe all their agreeable flavour; and great caution ſhould be uſed, that they be all equally dried.

Bagging of Hops, a term uſed by the farmers, who cultivate hops, for the laſt thing they have to do with them in order to bring them to market; that is, the putting them up in large bags of coarſe cloth, for carriage. When the hops have been picked and dried in the ooſt, or tin-floor, they are ſo brittle that they would break to pieces and be ſpoiled if they were immediately to be put up; they are therefore to lie together three weeks, or thereabouts, that they may become tough: if they are covered from the air by blankets in the heap, they may be bagged much ſooner than if left open.

The manner of bagging them is this. A hole is made in an upper-floor, ſo large that a man may eaſily go up and down it; then a hoop is fitted to the mouth of the bag, and ſo firmly ſewed on, that it cannot be torn off; the bag is then let down through the hole, and the hoop remaining above, ſtops it from being pulled quite through, being larger than the hole: a few hops are to be firſt thrown into the bag, and a perſon below is to take up a parcel of theſe in each corner of the bag, tying it with a packthread; this makes a ſort of taſſel, by which the bags are afterwards the eaſier managed and turned about. When this is done, one man muſt go down into the bag, and, while another caſts in the hops, he muſt tread them down equally every way with his feet; when the bag is in this manner filled, it is to be ripped from the hoop, and ſewed up, leaving two taſſels at the corners, as at the bottom. A bag of hops thus prepared, may be kept for ſeveral years in a dry place.

Uſes, &c. The tops of this plant, being of a cooling quality, are eaten, when boiled, as an emollient. A decoction of hop-flowers is alſo accounted an antidote againſt poiſon; cures the itch, as well as the ſyrup thereof; and is eſteemed excellent in choleric and peſtilential fevers. The heads and tendrils are good in the ſcurvy and moſt cutaneous diſeaſes. Juleps and apozems are alſo prepared with hops for hypochondriacal and hyſterical affections, and to promote the menſes: but the chief uſe of this plant conſiſts in preſerving beer and other malt-liquors (in which the flower of this plant is a principal ingredient) from turning ſour, and rendering it wholeſome and grateful to the taſte, &c.

Hops were introduced about 250 years ago, from Flanders, and from that time have been aſſiduouſly cultivated in this kingdom. The duties ariſing from them are reckoned about 55,000 l. *per annum*, for which reaſon all public brewers are enjoined under a ſevere penalty to uſe no other bitter than hops. Hop ‖ Horapollo.

The benefits derived from hops are ſubject to great uncertainty, no plant being more expoſed to accidents; and, independent of this, too great fertility is to the induſtrious owner ſometimes as fatal as too ſlender a crop. But thoſe who have money, and of courſe are able to wait for a market, avail themſelves of both. The great hop-planter, if a man of ſkill and ſubſtance, ſeldom fails of making, or rather earning a large eſtate. He is continually attentive to his grounds; and by that attention provides for the accurate culture of them, at a ſmall, or at leaſt a moderate expence. In a common year, his profits are conſiderable. In a year of plenty, he lays by a ſtock; and when, in the courſe of four or five years, crops in general fail, his ſtock fetches a large price, and he has a ſure ſale. It hath been computed by thoſe who are eſteemed the beſt judges, that in an acre of hops, producing to the value of 30 l. one moiety goes clear into the pocket of the proprietor, and that the other moiety of it goes in diſcharge of the rent, tythe, and all other expences, except the duty by excife, which is, however, drawn back on exportation. The duties on hops imported are ſo high as to prevent their coming in, except in a time of extreme ſcarcity, when the brewery might be otherwiſe injured; and in many other reſpects proviſions have been made by law to render the proprietors of ſo precarious a commodity as ſafe as poſſible.—The deſtroying hops while growing, hath been made felony without benefit of clergy.

HOPKINS (Ezekiel), biſhop of Derry in Ireland, was the ſon of an obſcure clergyman in Devonſhire; and was for ſome time a choriſter of Magdalen college, Oxford, and uſher of the adjoining ſchool. He was afterwards a Preſbyterian miniſter, and was extolled as an excellent preacher. John, lord Roberts, happening to hear him preach, was ſo pleaſed with his perſon, his diſcourſe, and his manner, that he retained him as his chaplain, when he was ſent in quality of lord lieutenant into Ireland, and preferred him to the deanery of Raphoe; and, on his being recalled, ſo ſtrongly recommended him to his ſucceſſor, that he was ſoon preferred to the biſhopric at Raphoe, whence he was tranſlated to Derry. During the war under the earl of Tyrconnel, at the revolution, he withdrew into England; and was choſen miniſter of St Mary, Aldermanbury, in London, where he died in 1690. His ſermons, his expoſition of the ten commandments, and that of the Lord's prayer, are much eſteemed. His works were printed together in 1710, folio. He was the father of Mr Charles Hopkins, ſeveral of whoſe poetical pieces are in Dryden's Miſcellanies.

HOR, a mountain, or mountainous tract of Arabia Petræa, ſituated in that circuit which the Iſraelites took to the ſouth and ſouth-eaſt of Edom in their way to the borders of Moab: on this mountain Aaron died. The inhabitants were called *Horites*. This tract was alſo called *Seir*, either from a native Horite, or from Eſau, by way of anticipation from his hairy habit of body; whoſe poſterity drove out the Horites.

HORAPOLLO, or Horus Apollo, a grammarian of Panaplus in Egypt, according to Suidas, who

Horatii & Hord.

who firſt taught at Alexandria, and then at Conſtantinople under the reign of Theodoſius. There are extant under his name, two books on the hieroglyphics of the Egyptians; which Aldus firſt publiſhed in Greek in 1505, in folio; and they have often been publiſhed ſince, with a Latin verſion and notes. It is not certain, however, that the grammarian of Alexandria was the author of theſe books; they being rather thought to belong to another Horapollo of more ancient date: on which head, ſee *Fabricius's Bibliotheca Græca*.

HORATII, three Roman brothers, who, under the reign of Tullus Hoſtilius, fought againſt the three Curiatii, who bejonged to the Albanian army. Two of the Horatii were firſt killed; but the third, by his addreſs, ſucceſſively ſlew the three Curiatii, and by this victory rendered the city of Alba ſubject to the Romans. See ROME.

HORATIUS, ſurnamed *Cocles* from his loſing an eye in combat, was nephew to the conſul Horatius Pulvillus, and deſcended from one of the three brothers who fought againſt the Curiatii. Porſenna, laying ſiege to Rome, drove the Romans from Janiculum; and purſued them to the wooden bridge over the Tiber, which joined the city to Janiculum. Largius, Herminius, and Horatius Cocles, ſuſtained the ſhock of the enemy on the bridge, and prevented their entering the city with the Romans; but Largius and Herminius having paſſed the bridge, Horatius Cocles was left alone, and repulſed the enemy till the bridge was broken under him: he then threw himſelf armed into the Tyber, ſwam acroſs the river, and entered Rome in triumph.

HORATIUS (Quintus Flaccus), the moſt excellent of the Latin Poets of the lyric and ſatyrical kind, and the moſt judicious critic in the reign of Auguſtus, was the grandſon of a freedman, and was born at Venuſium, 64 B. C. He had the beſt maſters in Rome, after which he completed his education at Athens. Having taken up arms, he embraced the party of Brutus and Caſſius, but left his ſhield at the battle of Philippi. Some time after, he gave himſelf up entirely to the ſtudy of polite literature and poetry. His talents ſoon made him known to Auguſtus and Mecænas, who had a particular eſteem for him, and loaded him with favours. Horace alſo contracted a ſtrict friendſhip with Agrippa, Pollio, Virgil, and all the other great men of his time. He lived without ambition, and led a tranquil and agreeable life with his friends; but was ſubject to a defluxion in his eyes. He died at the age of 57. There are ſtill extant his Odes, Epiſtles, Satires, and Art of Poetry; of which there have been a great number of editions. The beſt are thoſe of the Louvre, in 1642, folio; of Paris, 1691, quarto; of Cambridge, 1699; and that with Bentley's emendations, printed at Cambridge in 1711.

HORD, in geography, is uſed for a company of wandering people, which have no ſettled habitation, but ſtroll about, dwelling in waggons, or under tents, to be ready to ſhift as ſoon as the herbage, fruit, and the preſent province, is eaten bare: ſuch are ſeveral tribes of the Tartars, particularly thoſe who inhabit beyond the Wolga, in the kingdom of Aſtracan and Bulgaria.

A hord conſiſts of 50 or 60 tents, ranged in a circle, and leaving an open place in the middle. The inhabitants in each hord uſually form a military company or troop, the eldeſt whereof is commonly the captain, and depends on the general or prince of the whole nation.

Hordeum & Horizon

HORDEUM, BARLEY, in botany, a genus of the triandria digynia claſs. The involucrum conſiſts of ſix leaves, and contains three flowers. There are eight ſpecies; only one of which, viz. the murinum, or wall-barley-graſs, is a native of Britain. The native place of the vulgare, or common barley cultivated in our fields, is not known. For the culture, &c. of common barley, ſee AGRICULTURE, n° 118,—122.

HORDICALIA, or HORDICIDIA, in antiquity, a religious feaſt held among the Romans, wherein they ſacrificed cattle big with young. This feaſt fell on April 15. on which day they ſacrificed 30 cows with calf to the goddeſs Tellus or the Earth; part of them were ſacrificed in the temple of Jupiter. The calves taken out of their bellies were burnt to aſhes at firſt by the pontifices, afterwards by the eldeſt of the veſtal virgins.

HOREB, or OREB, a mountain of Arabia Petræa, contiguous to and on the ſouth ſide of mount Sinai; the ſcene of many miraculous appearances.

HOREHOUND, BALLOTA, or *Stachys*, in botany. See MARRUBIUM.

HORIZON, or HORISON, in geography and aſtronomy, a great circle of the ſphere, dividing the world into two parts or hemiſpheres; the one upper and viſible, the other lower and hid. The word is pure Greek, ὁρίζων, which literally ſignifies "bounding or terminating the ſight;" being formed of ὁρίζω, *termino, definio*, "I bound, I limit;" whence it is alſo called *finitor*, "finiſher."

The horizon is either *rational* or *ſenſible*.

Rational, true, or *aſtronomical* HORIZON, which is alſo called ſimply and abſolutely *the horizon*, is a great circle, whoſe plane paſſes thro' the centre of the earth, and whoſe poles are the zenith and nadir. It divides the ſphere into two equal parts, or hemiſpheres.

Senſible, viſible, or *apparent* HORIZON, is a leſſer circle of the ſphere, which divides the viſible part of the ſphere from the inviſible. Its poles, too, are the zenith and nadir: and conſequently the *ſenſible horizon* is parallel to the *rational*; and it is cut at right angles, and into two equal parts, by the verticals.—The *ſenſible horizon* is divided into *eaſtern* and *weſtern*. The *eaſtern* or *ortive* horizon, is that part of the horizon wherein the heavenly bodies riſe. The *weſtern* or *occidual* horizon, is that wherein the ſtars ſet. The altitude or elevation of any point of the ſphere, is an arch of a vertical circle intercepted between it and the ſenſible horizon.

By *ſenſible horizon* is alſo frequently meant a circle, which determines the ſegment of the ſurface of the earth, over which the eye can reach; called alſo the *phyſical horizon*. In this ſenſe we ſay, a ſpacious *horizon*, a narrow ſcanty *horizon*.

HORIZONTAL, ſomething that relates to the horizon, is taken in the horizon, or on a level with the horizon.—We ſay, a *horizontal plane*, *horizontal line*, &c.

HORIZONTAL *Dial*, is that drawn on a parallel to the horizon; having its gnomon, or ſtyle, elevated ac-

orizontal || Horn.

according to the altitude of the pole of the place it is deſigned for. Horizontal dials are, of all others, the moſt ſimple and eaſy. The manner of deſcribing them, ſee under the article DIAL.

HORIZONTAL *Line*, in perſpective, is a right line drawn through the principal point, parallel to the horizon: or, it is the interſection of the horizontal and perſpective planes. See PERSPECTIVE.

HORIZONTAL *Plane*, is that which is parallel to the horizon of the place, or nothing inclined thereto.

The buſineſs of levelling, is to find whether two points be in the horizontal plane; or how much the deviation is. See LEVELLING.

HORIZONTAL *Plane*, in perſpective, is a plane parallel to the horizon, paſſing through the eye, and cutting the perſpective plane at right angles.

HORIZONTAL *Projection*. See GEOGRAPHY, n° 16, 19.

HORIZONTAL *Range*, or *Level Range*, of a piece of ordnance, is the line it deſcribes, when directed parallel to the horizon or horizontal line. See GUNNERY, *paſſim*.

HORIZONTAL *Moon*. See ASTRONOMY, n° 172.

HORMINUM, CLARY; a genus of the gymnoſpermia order, belonging to the didynamia claſs of plants. There are ſeveral ſpecies; the moſt remarkable of which is the verbenaceum, or common wild clary. It grows naturally on ſandy and gravelly ground in many parts of Britain. It has ſometimes been called *oculus Chriſti*, from the ſuppoſed virtues of its ſeeds in clearing the ſight, which it does by its viſcous covering; for when any thing happens to fall into the eye, if one of the ſeeds is put in at one corner, and the eyelid kept cloſe over it, moving the ſeed gently along the eye, whatever happens to be there will ſtick to it, and ſo be brought out. The virtues of this are ſuppoſed to be the ſame as thoſe of the garden clary, but not quite ſo powerful.

HORN, in phyſiology, a hard ſubſtance growing on the heads of divers animals, particularly the cloven-footed quadrupeds; and ſerving them both as weapons of offence and defence.

The horn of animals is of the ſame nature as their gelatinous matter; and is only that matter charged with a leſs quantity of water, and a larger quantity of earth, and ſufficiently condenſed to have a firm and ſolid conſiſtence. By digeſting horn with water in Papin's digeſter, it may be entirely converted into jelly.

Horn is a perfectly animaliſed matter, and furniſhes in diſtillation the ſame principles as all animal-matters; that is, at firſt a pure phlegm, with a degree of heat not exceeding that of boiling water; then a volatile alkaline ſpirit, which becomes more and more penetrating and ſtrong; a fetid, light, and thin oil; a concrete volatile ſalt, which forms ramifications upon the ſides of the receiver; much air; fetid oil, which becomes more and more black and thick; and laſtly, it leaves in the retort a conſiderable quantity of almoſt incombuſtible coal, from which, after its incineration, ſcarcely any fixed alkali can be obtained.

Animal oil, and particularly that which is drawn firſt in the diſtillation of horn, is ſuſceptible of acquiring great thinneſs and volatility by repeated diſtillations, and is then called the *oil of dippel*.

The horns of ſtags, and of other animals of that kind, are the moſt proper to furniſh the animal oil to be rectified in the manner of dippel; becauſe they yield the largeſt quantity. Theſe horns alſo differ from the horns of other animals in this, that they contain a larger quantity of the ſame kind of earth which is in bones; hence they ſeem to poſſeſs an intermediate nature betwixt horns and bones. Horn.

Hart's-HORN. See HART'S-*Horn*.

Hart's-HORN *calcined to Whiteneſs*. The phlogiſton of the coal of hart's-horn, although very difficultly combuſtible, may nevertheleſs be burnt with more eaſe than the coal of other horns, and with nearly the ſame facility as bones may. This coal, by being calcined with a long-continued and ſtrong fire, is changed into a very white earth called *hart's-horn calcined to whiteneſs*. This earth is employed in medicine as an abſorbent. It is given in dyſenteries and labour-pains which are ſuppoſed to be cauſed by acrid and ill-digeſted matters. Hart's-horn calcined to whiteneſs and levigated, is the baſis of Sydenham's white decoction, which is commonly preſcribed in theſe diſeaſes.

Hart's-HORN *prepared philoſophically*. This name is given to hart's-horn deprived by water of almoſt all its gelatinous part, ſo that its becomes brittle; and when its outer part is taken off, it is thus rendered very white, and is applicable to the ſame uſes as that which is calcined by fire.

Dyeing of HORN—Black is performed by ſteeping braſs in aqua-fortis till it be returned green: with this the horn is to be waſhed once or twice, and then put into a warmed decoction of logwood and water. Green is begun by boiling it, &c. in alum-water; then with verdigriſe, ammoniac, and white-wine vinegar; keeping it hot therein till ſufficiently green. Red is begun by boiling it in alum-water, and finiſhed by decoction in a liquor compounded of quick-lime ſteeped in rain-water, ſtrained, and to every pint an ounce of Brazil-wood added. In this decoction the bone, &c. is to be boiled till ſufficiently red.

Dr Lewis informs us that horns receive a deep black ſtain from ſolution of ſilver. It ought to be diluted to ſuch a degree as not ſenſibly to corrode the ſubject; and applied two or three times, if neceſſary, at conſiderable intervals, the matter being expoſed as much as poſſible to the ſun, to haſten the appearance and deepening of the colour.

Dyeing or ſtaining HORN *to imitate Tortoiſe-ſhell*.—The horn to be dyed muſt be firſt preſſed into proper plates, ſcales, or other flat form; and the following mixture prepared. Take of quick-lime two parts, and of litharge one part; temper them together to the conſiſtence of a ſoft paſte with ſoap-ley. Put this paſte over all the parts of the horn, except ſuch as are proper to be left tranſparent, in order to give it a nearer reſemblance of the tortoiſe-ſhell. The horn muſt remain in this manner covered with the paſte till it be thoroughly dry; when, the paſte being bruſhed off, the horn will be found partly opaque and partly tranſparent, in the manner of tortoiſe-ſhell; and when put over a foil, of the kind of latten called *aſſidue*, will be ſcarcely diſtinguiſhable from it. It requires ſome degree of fancy and judgment to diſpoſe of the paſte in ſuch a manner as to form a variety of tranſparent parts, of different magnitudes and figures, to look like the effect of nature: and it will be an improvement to add ſemi-

Horn || Hornecк.

semi-transparent parts; which may be done by mixing whiting with some of the paste to weaken its operation in particular places; by which spots of a reddish brown will be produced, which if properly interspersed, especially on the edges of the dark parts, will greatly increase both the beauty of the work, and its similitude with the real tortoise-shell.

HORN is also a sort of musical instrument of the wind kind; chiefly used in hunting, to animate and bring together the dogs and the hunters. The term anciently was, *wind a horn*; all horns being in those times compassed: but since straight horns are come in fashion, they say *blow a horn*, and sometimes *sound a horn*.—There are various lessons on a horn; as the recheat, double recheat, royal recheat, running or farewell recheat, &c. See RECHEAT.

Cape-HORN. See *Terra del* FUEGO.

HORN-*Beam*, in botany. See CARPINUS.

HORN-*Blend*, is a black or green indurated bole or clay, consisting of scaly particles, which are distinguishable from those of mica, by being less shining, thicker, and rectangular. It is generally found amongst iron ores, and sometimes intermixed with mica, forming a compact stone.

Human HORNS. In Dr Charles Leigh's natural history of Lancashire, Cheshire, and the Peak in Derbyshire, is the print of a woman with two horns on her head. When she was 28 years of age an excrescence grew upon her head like a wen, which continued 30 years, and then grew into two horns. After four years she cast them, and in their place grew two others. After four years she cast these also; and the horns which were on her head in 1668 (the time when the account was written) were then loose. Her picture and one of her horns are in Ashmole's museum. In the university library at Edinburgh is preserved a horn which was cut from the head of Elizabeth Love, in the 50th year of her age. It grew three inches above the ear, and was growing seven years.

HORN-*Fish*, *Gar-fish*, or *Sea-Needle*. See ESOX.

HORN-*Work*, in fortification, an outwork composed of two demi-bastions joined by a curtin. See FORTIFICATION.

HORNBY, a town of Lancashire in England, seated on a branch of the river Lune, and beautified with a handsome parochial chapel. The ruins of a decayed castle are still to be seen here. W. Long. 2. 20. N. Lat. 54. 6.

HORN-CASTLE, a town of Lincolnshire in England. It had a castle, as the name imports; from the architecture of which, and the Roman coins that are sometimes dug up here, it is thought to have been a camp or station of the Romans. The town is well built, and is almost surrounded with water. W. Long. 0. 2. N. Lat. 31. 20.

HORNDON, a town in Essex, in England. It stands near a rivulet, that at a small distance from hence falls into the Thames, which is there called the *Hope*. E. Long. 0. 30. N. Lat. 51. 20.

HORNECK (Dr Anthony), a learned and pious divine, was born at Baccharach, in the Lower Palatinate, in 1641. He studied divinity under Dr Spanheim at Heidelberg; and afterwards coming to England, completed his studies at Oxford, and became vicar of Allhallows in that city. In 1665, he removed into the family of the duke of Albemarle; and was tutor to his grace's son, then lord Torrington. The duke presented him to the rectory of Doulton in Devonshire, and procured for him a prebend in Exeter. He was afterwards chosen preacher of the Savoy. In 1693, he was collated to a prebend in Westminster, and the same year admitted to a prebend in the cathedral of Wells. He published, 1. The great law of consideration. 2. The happy ascetick. 3. Delight and judgment. 4. The fire of the altar. 5. The exercise of prayer. 6. The crucified Jesus. 7. Several sermons, and other works. He died in 1696, and was interred in Westminster abbey, where a monument is erected to his memory.

Horne || Horn

HORNERS, those people whose business it is to prepare various utensils of the horns of cattle. The horners were a very ancient and considerable fraternity in the city of London some hundred years ago. In the reign of Edward IV. they complained to parliament, that by foreigners buying up the horns in England, they were in danger of being ruined, and this business lost to the nation. For this reason was made the statute 6 Edw. IV. by which the sale of horns to foreigners, (except such as the said horners refused), was prohibited; and the wardens had power granted them to search all the markets in London and 24 miles round, and to inspect Sturbridge and Ely fairs, to prevent such practices and to purchase horns at stated prices. But on plausible pretences this law was repealed in the reign of James I. and thereupon the old evil revived. The horners again applied to parliament, and king Edward's statute was renewed (excepting as to the inspection of the fairs,) and still remains in force. The importation of unwrought horns into this country is also prohibited. In 1750, there were exported to Holland 514,500 lantern-leaves, besides powder-flasks. There was formerly a duty of 20 shillings a thousand, under which in 1682 were exported 76,650; but in the reign of George I. this duty was taken off, and these and all other manufactures made of horns may be exported free. The present company of horners were incorporated January 12th 1638; and consist of a master, two wardens, and nine assistants, without livery or hall. They have a warehouse in Spitalfields, to which the horns are sent as brought from town and country markets, and thence regularly divided, the widows and orphans of deceased members having equal shares.

HORNET, in zoology, a very bold and venomous insect of the flying kind. It greatly resembles the wasp; only it is twice as large, and the head is of a longer and slenderer shape, and the eyes formed somewhat in the figure of a half moon. They build under ground, and in winter hide themselves in hollow trees. They feed on flesh, and when very hungry will seize upon a small bird. Mouffet relates, that they have been seen singly to purfue and kill a sparrow, and afterwards feed on its flesh.—Mr Evelyn informs us, that they are very pernicious to trees, and will peel them round to the very timber, as if they had been unbarked by cattle. They are destroyed by stopping up their entrances with tar or goose-dung, or conveying the fumes of brimstone into their cells.

HORNET-*Fly*, in natural history, a very large two-winged fly, which has the shape and colours of the hor-

Horning Horse.

hornet, and is at firſt ſight ſcarce to be diſtinguiſhed from it. The principal colour of the body of this fly is yellow; but it has two long and large black lines placed tranſverſely upon it, and has a black corcelet and a yellow head. Theſe lay, at a proper ſeaſon, a large number of oblong white eggs, which hatch into large and long worms, whoſe chief food is the worms and nymphs of the humble bees. The worm of this fly is continually found in the neſts of theſe bees, where it never meddles with the wax or honey, but preys only upon the young offspring of the creature.

HORNING, in Scots law, a writing iſſuing from the ſignet, in his majeſty's name, at the inſtance of a creditor againſt his debtor, commanding him to pay or perform within a certain time.

HORNSEY, a town in Yorkſhire, in England. It is almoſt ſurrounded by a ſmall arm of the ſea; and the church having a high ſteeple, is a noted ſea-mark. Not many years ago there was a ſtreet here called *Hornſey beck*, which was waſhed away by the ſea, except a houſe or two. E. Long. 0. 6. N. Lat. 54. 0.

HOROLOGIUM, a general name for inſtruments to meaſure the hours, as a watch, clock, dial, &c. See DIAL and WATCH.

HOROSCOPE, in aſtrology, is the degree of the aſcendant, or the ſtar that riſes above the horizon at a certain moment, which is obſerved in order to predict ſome future event, as the ſucceſs of a deſign, the fortune of a perſon who was at that inſtant born, &c.

HOROSCOPY. See DIVINATION, n° 2.

HORROX (Jeremiah), an eminent Engliſh aſtronomer in the 17th century, was born at Texteth near Liverpool in Lancaſhire in 1619. He died, to the great loſs of that ſcience and of the world, in the 23d year of his age, after he had juſt finiſhed his *Venus in ſole viſa*; which, with ſome other works, were publiſhed by Dr Wallis, in quarto.

HORROR, ſtrictly ſignifies ſuch an exceſs of fear as makes a perſon tremble.—In medicine, it denotes a ſhivering and ſhaking of the whole body, coming by fits. It is common at the beginning of all fevers, but is particularly remarkable in thoſe of the intermittent kind. See (*Index* ſubjoined to) MEDICINE.

HORSE, in zoology. See the article EQUUS.

Hunting-HORSE, a name given to a horſe qualified to carry a perſon in the chaſe. The ſhape of the horſe deſigned for this ſervice ſhould be ſtrong, and well knit together, as the jockeys expreſs it. Irregular or unequal ſhapes in theſe creatures are always a token of weakneſs. The inequalities in ſhape, which ſhew a horſe improper for the chace, are the having a large head and a ſmall neck, a large leg and a ſmall foot, &c. The head of a hunting horſe indeed ſhould always be large, but the neck ſhould alſo be thick and ſtrong to ſupport it. The head ſhould be lean, the noſtrils wide, and the wind-pipe ſtrait. In order to his behaving well in the field, he ought to have great care and indulgence in the ſtable; to have as much reſt and quiet as may be; to be kept well ſupplied with good meat, clean litter, and freſh water by him; he ſhould be often dreſſed, and ſuffered to ſleep as much as he pleaſes. He ſhould be fed in ſuch a manner as that his dung may be rather ſoft than hard, and it muſt be of a bright and clean colour. All this may be eaſily managed by the continual obſervance and change of his food as occaſion requires. After his uſual ſcowerings, he ſhould have exerciſe, and maſhes of ſweet malt; and bread and beans, or wheat and beans mixed together, are to be his beſt food, and beans and oats his worſt. Horſe.

There is a general practice among grooms, of giving their hunting horſes wheat-ſtraw, as ſoon as they take them up from the graſs. They ſay they do this to take up their bellies; but there ſeems to be much reaſon for diſapproving ſuch a practice. The change is very violent, and the nature of the ſtraw ſo heating and drying, that there ſeems great reaſon to fear, that the aſtringent nature of it would be prejudicial more than at firſt is perceived. It is always found, that the dung is hard after this food, and is voided with pain and difficulty, which is in general very wrong for this kind of horſes. It is better, therefore, to avoid this ſtraw-feeding; and to depend upon moderate airing, warm clothing, good old hay, and old corn, than to have recourſe to any thing of this kind.

It is a rule with all ſtaunch ſportſmen, that no horſe ſhould be uſed in hunting till he is five years old. Some will hunt them at four: but the horſe at this time is not come up to his true ſtrength and courage; and will not only fail at any tough trials, but will be ſubject to ſtrains and accidents of that kind, much more than if he was kept for another year, when his ſtrength would be more confirmed.

Management of a HORSE *upon and after a Journey.* See that his ſhoes be not too ſtrait, or preſs his feet, but be exactly ſhaped; and let him be ſhod ſome days before you begin a journey, that they may be ſettled to his feet.

Obſerve that he is furniſhed with a bitt proper for him, and by no means too heavy, which may incline him to carry low, or to reſt upon the hand when he grows weary, which horſemen call *making uſe of his fifth leg*. Sportſm. Bitt.

The mouth of the bitt ſhould reſt upon his bars about half a finger's-breadth from his tuſhes, ſo as not to make him frumble his lips; the curb ſhould reſt in the hollow of his beard a little above the chin; and if it gall him, you muſt defend the place with a piece of buff, or other ſoft leather.

Take notice that the ſaddle do not reſt upon his withers, reins, or back-bone, and that one part of it do not preſs his back more than another.

Some riders gall a horſe's ſides below the faddle with their ſtirrup-leathers, eſpecially if he be lean; to hinder it, you ſhould fix a leather-ſtrap between the points of the fore and hind-bows of the ſaddle, and make the ſtirrup-leather paſs over them.

Begin your journey with ſhort marches, eſpecially if your horſe has not been exerciſed for a long time: ſuffer him to ſtale as often as you find him inclined; and not only ſo, but invite him to it: but do not excite your mares to ſtale, becauſe their vigour will be thereby diminiſhed.

It is adviſable to ride very ſoftly, for a quarter or half an hour before you arrive at the inn, that the horſe not being too warm, nor out of breath, when put into the ſtable, you may unbridle him: but if your buſineſs obliges you to put on ſharply, you muſt

Horſe. then (the weather being warm) let him be walked in a man's hand, that he may cool by degrees; otherwiſe, if it be very cold, let him be covered with cloths, and walked up and down in ſome place free from wind; but in caſe you have not the conveniency of a ſheltered walk, ſtable him forthwith, and let his whole body be rubbed and dried with ſtraw.

Although ſome people will have their horſes legs rubbed down with ſtraw as ſoon as they are brought into the ſtable, thinking to ſupple them by that means; yet it is one of the greateſt errors that can be committed, and produces no other effects than to draw down into the legs thoſe humours that are always ſtirred up by the fatigue of the journey: not that the rubbing of horſes legs is to be diſallowed; on the contrary, we highly approve of it, only would not have it done at their firſt arrival, but when they are perfectly cooled.

Being come to your inn, as ſoon as your horſe is partly dried, and ceaſes to beat in the flanks, let him be unbridled, his bitt waſhed, cleanſed, and wiped, and let him eat his hay at pleaſure.

If your horſe be very dry, and you have not given him water on the road, give him oats waſhed in good mild ale.

The duſt and ſand will ſometimes ſo dry the tongues and mouths of horſes, that they loſe their appetites: in ſuch caſe, give them bran well moiſtened with water to cool and refreſh their mouths; or waſh their mouths and tongues with a wet ſponge, to oblige them to eat.

The foregoing directions are to be obſerved after moderate riding; but if you have rid exceſſively hard, unſaddle your horſe, and ſcrape off the ſweat with a ſweating-knife, or ſcraper, holding it with both hands, and going always with the hair; then rub his head and ears with a large hair-cloth, wipe him alſo between the fore-legs and hind-legs; in the mean while, his body ſhould be rubbed all over with ſtraw, eſpecially under his belly and beneath the ſaddle, till he is thoroughly dry.

That done, ſet on the ſaddle again, cover him; and if you have a warm place, let him be gently led up and down in it, for a quarter of an hour; but if not, let him dry where he ſtands.

Or you may unſaddle him immediately; ſcrape off the ſweat; let the oſtler take a little vinegar in his mouth, and ſquirt it into the horſe's; then rub his head, between the fore and hind-legs, and his whole body, till he is pretty dry: let him not drink till thoroughly cool and has eaten a few oats; for many, by drinking too ſoon, have been ſpoiled. Set the ſaddle in the ſun or by a fire, in order to dry the pannels.

When horſes are arrived in an inn, a man ſhould, before they are unbridled, lift up their feet, to ſee whether they want any of their ſhoes, or if thoſe they have do not reſt upon their ſides; afterwards he ſhould pick and clear them of the earth and gravel, which may be got betwixt their ſhoes and ſoles.

If you water them abroad, upon their return from the river, cauſe their feet to be ſtopped with cow-dung, which will eaſe the pain therein; and if it be in the evening, let the dung continue in their feet all night, to keep them ſoft and in good condition: but if your horſe have brittle feet, it will be requiſite to anoint the fore-feet, at the on-ſetting of the hoofs, with butter, oil, or hog's-greaſe, before you water him in the morning, and in dry weather they ſhould be alſo greaſed at noon. Horſe.

Many horſes, as ſoon as unbridled, inſtead of eating, lay themſelves down to reſt, by reaſon of the great pain they have in their feet, ſo that a man is apt to think them ſick: but if he looks to their eyes, he will ſee they are lively and good; and if he offers them meat as they are lying, they will eat it very willingly; yet if he handles their feet, he will find them extremely hot, which diſcovers their ſuffering in that part. You muſt therefore ſee if their ſhoes do not reſt upon their ſoles, which is ſomewhat difficult to be certainly known, without unſhoeing them; but if you take off their ſhoes, then look to the inſide of them, and you may perceive that thoſe parts which reſt upon the ſoles are more ſmooth and ſhining than the others: in this caſe you are to pare their feet in thoſe parts, and fix on their ſhoes again, anointing the hoofs, and ſtopping the ſoles, with ſcalding hot black pitch or tar.

After a long day's journey, at night feel your horſe's back, if he be pinched, galled, or ſwelled, (if you do not immediately diſcover it, perhaps you may after ſupper), there is nothing better than to rub it with good brandy and the white of an egg. If the galls are between the legs, uſe the ſame remedy; but if the oſtler rubs him well between the legs, he will ſeldom be galled in that part.

In order to preſerve horſes after travel, take theſe few uſeful inſtructions. When you are arrived from a journey, immediately draw the two heel-nails of the fore-feet; and, if it be a large ſhoe, then four: two or three days after, you may blood him in the neck, and feed him for ten or twelve days only with wet bran, without giving him any oats; but keep him well littered.

The reaſon why you are to draw the heel-nails, is becauſe the heels are apt to ſwell, and if they are not thus eaſed, the ſhoes would preſs and ſtraiten them too much: it is alſo adviſable to ſtop them with cow-dung for a while; but do not take the ſhoes off, nor pare the feet, becauſe the humours are drawn down by that means.

The following bath will be very ſerviceable for preſerving your horſe's legs. Take the dung of a cow or ox, and make it thin with vinegar, ſo as to be of the conſiſtence of thick broth; and having added a handful of ſmall ſalt, rub his fore-legs from the knees, and the hind-legs from the gambrels, chafing them well with and againſt the hair, that the remedy may ſink in and ſtick to thoſe parts, that they may be all covered over with it. Thus leave the horſe till morning, not wetting his legs, but giving him his water that evening in a pail: next morning lead him to the river, or waſh his legs in well-water, which is very good, and will keep them from ſwelling.

Thoſe perſons, who, to recover their horſes feet, make a hole in them, which they fill with moiſtened cow-dung, and keep it in their fore-feet during the ſpace of a month, do very ill; becauſe, though the continual moiſture that iſſues from the dung occaſions the growing of the hoof, yet it dries and ſhrinks

Horſe. ſhrinks it ſo exceſſively when out of that place, that it ſplits and breaks like glaſs, and the foot immediately ſtraitens. For it is certain, that cow-dung (contrary to the opinion of many people) ſpoils a horſe's hoof: it does indeed moiſten the ſole; but it dries up the hoof, which is of a different nature from it. In order, therefore, to recover a horſe's feet, inſtead of cow-dung, fill a hole with blue wet clay, and make him keep his fore-feet in it for a month.

Moſt horſes that are fatigued, or over-rid, and made lean by long journeys, have their flanks altered without being purſy, eſpecially vigorous horſes that have worked too violently.

There is no better method to recover them, than to give each of them in the morning half a pound of honey very well mingled with ſcalded bran; and when they readily eat the half pound, give them the next time a whole one, and afterwards two pounds, every day continuing this courſe till your horſes are empty, and purge kindly with it; but as ſoon as you perceive that their purging ceaſes, forbear to give them any more honey.

You may adminiſter powder of liquorice in the ſcalded bran for a conſiderable time; and to cool their blood, it will not be improper to let them have three or four gliſters.

In caſe the horſe be very lean, it is expedient to give him ſome wet bran, over and above his proportion of oats; and graſs is alſo extraordinary beneficial, if he be not purſy.

If it be a mare, put her to a horſe; and if ſhe never had a foal before, it will enlarge her belly.

Sometimes exceſſive feeding may do horſes more harm than good, by rendering them ſubject to the farcy. You ſhould therefore be cautious in giving them too great a quantity at a time, and take a little blood from them now and then.

When a horſe begins to drink it heartily, it is a certain ſign that he will recover in a ſhort time. As to the method of giving him water during a journey, obſerve the following rules:

All the while you are upon a journey, let your horſe drink of the firſt good water you come to, after ſeven o'clock in the morning if it be in ſummer-time, and after nine or ten in winter.

That is accounted good water, which is neither too quick and piercing, nor too muddy and ſtinking.

This is to be done, unleſs you would have him gallop a long time after drinking; for if ſo, you muſt forbear.

Though it is the cuſtom of England to run and gallop horſes after drinking, which we call *watering-courſes*, to bring them (as they ſay) into wind; yet, ſays M. de Solleyſel, it is the moſt pernicious practice that can be imagined for horſes, by which many are rendered purſy.

While a horſe is drinking, draw up his head five or ſix times, making him move a little between every draught; and notwithſtanding he be warm, and ſweat very much, yet if he is not quite out of breath, and you have ſtill four or five miles to ride, he will be better after drinking a little, than if he had drank none at all: it is true, indeed, that if the horſe is very warm, you ſhould, at coming out of the water, redouble your pace, to make him go at a gentle trot, to warm the water in his belly. Horſe.

You ought to let him drink after this manner during the whole time of your journey: becauſe, if when you happen to bait he be hot or ſweaty, you muſt not let him drink for a long time, as it would endanger his life; and when his bridle is taken off, his exceſſive thirſt will hinder him from eating, ſo that he will not offer to touch his meat for an hour or two, which perhaps your occaſions will not allow you for a baiting time, and not to have any food will render him unfit for travel.

If you meet with any ford before you come to your inn, ride the horſe through it two or three times, but not up to his belly: this will not only cleanſe his legs; but the coldneſs of the water will bind up the humours, and prevent them from deſcending.

If your horſe has been very warm, and you have not had the conveniency of watering him upon the road, he will, when unbridled, eat but very little; therefore he ſhould have his oats given him waſhed in ale or beer, or only ſome of them, if you intend to feed him again after he has drank.

Some are of opinion, that horſes are often ſpoiled by giving them oats before their water; becauſe they ſay, the water makes the oats paſs too ſoon, and out of the ſtomach undigeſted. But M. de Solleyſel affirms, that though it be the common cuſtom not to do it till after, yet it is proper to feed with oats both before and after, eſpecially if the horſe be warm, and has been hard rid; for they will be a great deal the better for it, and in no danger of becoming ſick.

Animated HORSE-*Hairs*, a term uſed to expreſs a ſort of long and ſlender water-worm of a blackiſh colour, and ſo much reſembling a horſe-hair that it is generally, by the vulgar, ſuppoſed to be the hair fallen from a horſe's mane into the water as he drinks, and there animated by ſome ſtrange power. Dr Liſter has at large confuted this opinion in the Philoſophical Tranſactions. See the article SETACEOUS *Worms*.

Breeding of HORSES. When the ſtallion is choſen, and all the mares intended for him are collected together, there muſt be another ſtone-horſe, to diſcover which of the mares are in heat; and, at the ſame time, contribute to inflame them. All the mares are to be brought ſucceſſively to this ſtone-horſe; which ſhould alſo be enflamed, and ſuffered frequently to neigh. As he is for leaping every one, ſuch as are not in heat keep him off, whilſt thoſe which are ſo ſuffer him to approach them. But inſtead of being allowed to ſatisfy his impulſe, he muſt be led away, and the real ſtallion ſubſtituted in his ſtead. This trial is neceſſary for aſcertaining the true time of the mare's heat, eſpecially of thoſe which have not yet had a colt; for with regard to ſuch as have recently foaled, the heat uſually begins nine days after their delivery; and on that very day they may be led to the ſtallion to be covered; and nine days after, by the experiment abovementioned, it may be known whether they are ſtill in heat. If they are, they muſt be covered a ſecond time; and thus Horſe. *Buffon's Nat. Hiſt.*

Horſe. thus ſucceſſively every ninth day while their heat continues: for when they are impregnated, their heat abates, and in a few days ceaſes entirely.

But that every thing may be done eaſily and conveniently, and at the ſame time with ſucceſs and advantage, great attention, expence and precaution are requiſite. The ſtud muſt be fixed in a good ſoil, and in a ſuitable place, proportioned to the number of mares and ſtallions intended to be uſed. This ſpot muſt be divided into ſeveral parts, incloſed with rails or ditches well fenced; in the part where the paſture is the richeſt, the mares in fold, and thoſe with colts by their ſides, are to be kept. Thoſe which are not impregnated, or have not yet been covered, are to be ſeparated, and kept with the fillies in another cloſe, where the paſture is leſs rich, that they may not grow too fat, which would obſtruct the progreſs of generation. Laſtly, the young ſtone colts, or geldings, are to be kept in the drieſt part of the fields, and where the ground is moſt unequal; that by running over the uneven ſurface, they may acquire a freedom in the motion of their legs and ſhoulders. This cloſe, where the ſtone colts are kept, muſt be very carefully ſeparated from the others, leſt the young horſes break their bounds, and enervate themſelves with the mares. If the tract be ſo large as to allow of dividing each of theſe cloſes into two parts, for putting oxen and horſes into them alternately, the paſture will laſt much longer than if continually eaten by horſes; the ox improving the fertility, whereas the horſe leſſens it. In each of theſe cloſes ſhould be a pond; ſtanding water being better than running, which often gripes them: and if there are any trees in the ground, they ſhould be left ſtanding, their ſhade being very agreeable to the horſes in great heats; but all ſtems or ſtumps ſhould be grubbed up, and all holes levelled, to prevent accidents. In theſe paſtures your horſes ſhould feed during the ſummer; but in the winter the mares ſhould be kept in the ſtable and fed with hay. The colts alſo muſt be houſed, and never ſuffered to feed abroad in winter, except in very fine weather. Stallions that ſtand in the ſtable ſhould be fed more with ſtraw than hay; and moderately exerciſed till covering time, which generally laſts from the beginning of April to the end of June. But during this ſeaſon they ſhould have no other exerciſe, and be plentifully fed, but with the ſame food as uſual. Before the ſtallion is brought to the mare, he ſhould be dreſſed, as that will greatly increaſe his ardour. The mare muſt alſo be curried, and have no ſhoes on her hind feet, ſome of them being ticklish, and will kick the ſtallion. A perſon holds the mare by the halter, and two others lead the ſtallion by long reins; when he is in a proper ſituation, another aſſiſtant carefully directs the yard, pulling aſide the mare's tail, as a ſingle hair might hurt him dangerouſly. It ſometimes happens that the ſtallion does not complete the work of generation, coming from the mare without making any injection: it ſhould therefore be attentively obſerved, whether, in the laſt moments of the copulation, the dock of the ſtallion's tail has a vibrating motion; for ſuch a motion always accompanies the emiſſion of the ſeminal lymph. If he has performed the act, he muſt on no conſideration be ſuffered to repeat it; but be led away directly to the ſtable, and there kept two days. For, however able a good ſtallion may be of covering every day during the three months, it is much better to let him be led to a mare only every other day: his produce will be greater, and he himſelf leſs exhauſted. During the firſt ſeven days, let four different mares be ſucceſſively brought to him; and the ninth day let the firſt be again brought, and ſo ſucceſſively while they continue in heat: but as ſoon as the heat of any one is over, a freſh mare is to be put in her place, and covered in her turn every nine days; and as ſeveral retain even at the firſt, ſecond, or third time, it is computed that a ſtallion, by ſuch management, may, during the three months, cover 15 or 18 mares, and beget 10 or 12 colts. Theſe animals have a very large quantity of the ſeminal lymph; ſo that a conſiderable portion of it is ſhed during the emiſſion. In the mares likewiſe is an emiſſion, or rather diſtillation of the ſeminal lymph, during the whole time they are horſing; ejecting a viſcid whitiſh lymph, called the *heats*, which ceaſe on conception. This ichor the Greeks called *hippomanes*; and pretended that philtres might be made of it, one remarkable effect of which was, to render a horſe frantic with luſt. This hippomanes is very different from that found in the fecundines of the foal, which Mr Daubenton firſt diſcovered, and has ſo accurately deſcribed its nature, origin, and ſituation. The ejection of this liquor is the moſt certain ſign of the mare's heat; but it is alſo known by the inflation of the lower part of the vulva, by her frequent neighings, and attempts to get to the horſes. After being covered, nothing more is requiſite than to lead her away to the field. The firſt foal of a mare is never ſo ſtrongly formed as the ſucceeding; ſo that care ſhould be taken to procure for her, the firſt time, a larger ſtallion, that the defect of the growth may be compenſated by the largeneſs of the ſize. Particular regard ſhould alſo be had to the difference or congruity of the faſhion of the ſtallion and the mare, in order to correct the faults of the one by the perfections of the other: eſpecially never to make any diſproportionate copulations, as of a ſmall horſe with a large mare, or a large horſe with a ſmall mare; as the produce of ſuch copulation would be ſmall, or badly proportioned. It is by gradations that we muſt endeavour to arrive at natural beauty: for inſtance, to give to a mare a little too clumſy, a well-made horſe and finely ſhaped; to a ſmall mare, a horſe a little higher; to a mare which is faulty in her forehand, a horſe with an elegant head and noble cheſt, &c. Horſe.

It has been obſerved, that horſes fed in dry and light grounds, produce temperate, ſwift, and vigorous foals, with muſcular legs and a hard hoof; while the ſame bred in marſhes and moiſt paſtures have produced foals with a large heavy head, a thick carcaſs, clumſy legs, bad hoofs, and broad feet. Theſe differences proceed from the air and food, which is eaſily underſtood; but what is more difficult to be accounted for, and ſtill more eſſential than what we have hitherto obſerved, is, to be continually croſſing the breed to prevent a degeneracy.

In coupling of horſes, the colour and ſize ſhould be ſuited to each other, the ſhape contraſted, and the breed croſſed by an oppoſition of climates: but horſes and mares foaled in the ſame ſtud ſhould never be joined. Theſe are eſſential articles; but there are others which ſhould

Horſe. ſhould by no means be neglected: as that no ſhort-docked mares be ſuffered in a ſtud, becauſe from their being unable to keep off the flies, they are much more tormented by them than others which have a long ſweeping tail; and their continual agitations from the ſtings of theſe inſects, occaſions a diminution in the quantity of their milk, and has a great influence on the conſtitution and ſize of the colt, which will be vigorous in proportion as its dam is a good nurſe. Care muſt alſo be taken, that the ſtud mares be ſuch as have been always brought up in paſtures, and never over-worked. Mares which have always been brought up in the ſtable on dry food, and afterwards turned to graſs, do not breed at firſt: ſome time is required for accuſtoming them to this new aliment.

Though the uſual ſeaſon for the heat of mares be from the beginning of April to the end of June, yet it is not uncommon to find ſome among a large number, that are in heat before that time: but it is adviſable to let this heat paſs over without giving them to the ſtallion, becauſe they would foal in winter; and the colts, beſides the inclemency of the ſeaſon, would have bad milk for their nouriſhment. Again, if the mares are not in heat till after the end of June, they ſhould not be covered that ſeaſon; becauſe the colts being foaled in ſummer, have not time for acquiring ſtrength ſufficient to repel the injuries of the following winter.

Many, inſtead of bringing the ſtallion to the mare, turn him looſe into the cloſe, where all the mares are brought together; and there leave him to chooſe ſuch as will ſtand to him. This is a very advantageous method for the mares: they will always take horſe more certainly than in the other; but the ſtallion, in ſix weeks, will do himſelf more damage than in ſeveral years by moderate exerciſe, conducted in the manner we have already mentioned.

When the mares are pregnant, and their belly begins to ſwell, they muſt be ſeparated from thoſe that are not, leſt they hurt them. They uſually go 11 months and ſome days; and foal ſtanding, whereas moſt other quadrupeds lie down. Thoſe that cannot foal without great difficulty, muſt be aſſiſted; the foal muſt be placed in a proper ſituation; and ſometimes, if dead, drawn out with cords. The head of the colt uſually preſents itſelf firſt, as in all other animals: at its coming out of the matrix, it breaks the ſecundines or integuments that incloſe it, which is accompanied with a great flux of the lymph contained in them; and at the ſame time one or more ſolid lumps are diſcharged, formed by the ſediment of the inſpiſſated liquor of the allantoides. This lump, which the ancients called the *hippomenes of the colt*, is ſo far from being, as they imagined, a maſs of fleſh adhering to the head of the colt, that it is ſeparated from it by a membrane called *amnios*. As ſoon as the colt is fallen, the mare licks it, but without touching the hippomenes; which points out another error of the ancients, who affirmed that ſhe inſtantly devours it. Horſe.

The general cuſtom is, to have a mare covered nine days after her foaling, that no time may be loſt; but it is certain, that the mare having, by this means, both her preſent and future foal to nouriſh, her ability is divided, and ſhe cannot ſupply both ſo largely as ſhe might one only. It would therefore be better, in order to have excellent horſes, to let the mares be covered only every other year; they would laſt the longer, and bring foals more certainly: for, in common ſtuds, it is ſo far from being true that all mares which have been covered bring colts every year, that it is conſidered as a fortunate circumſtance if half or at moſt two thirds of them foal.

Mares, when pregnant, will admit of copulation; but it is never attended with any ſuperfœtation. They uſually breed till they are 14 or 15 years of age; and the moſt vigorous till they are above 18. Stallions, when well managed, will engender till the age of 20, and even beyond; but it muſt be obſerved, that ſuch horſes as are ſooneſt made ſtallions, are alſo the ſooneſt incapable of generation: thus the large horſes, which acquire ſtrength ſooner than the ſlender, and are therefore often uſed as ſtallions as ſoon as they are four years old, are incapable of generation before they are ſixteen.

Rearing of HORSES. See COLT.

HORSEMANSHIP;

Or, The Art of Riding, and of Training and Managing HORSES.

SECT. I. *The method of preparing horſes to be mounted.*

THOUGH all horſes are generally bought at an age when they have already been backed, they ſhould be begun and prepared for the rider with the ſame care, gentleneſs and caution, as if they had never been handled or backed, in order to prevent accidents, which might elſe ariſe from ſkittiſhneſs or other cauſes: and as it is proper that they ſhould be taught the figure of the ground they are to go upon when they are at firſt mounted, they ſhould be previouſly trotted in a *longe* on circles, without any one upon them.

The manner of doing this is as follows: Put an eaſy *saveſſon* upon the horſe's noſe, and make him go forwards round you, ſtanding quiet and holding the *longe*; and let another man, if you find it neceſſary, follow him with a whip. All this muſt be done very gently, and but a little at a time: for more horſes are ſpoiled by overmuch work, than by any other treatment whatever; and that by very contrary effects; for ſometimes it drives them into vice, madneſs, and deſpair, and often ſtupifies and totally diſpirits them. *Earl of Pembroke's Directions.*

The firſt obedience required in a horſe is going forwards: till he perform this duty freely, never even think of making him rein back, which would inevitably make him reſtive: as ſoon as he goes forwards readily, ſtop and careſs him. You muſt remember in this, and likewiſe in every other exerciſe, to uſe him to go equally well to the right and left; and when he obeys, careſs him and diſmiſs him immediately. If a horſe, that is very young, takes fright and ſtands ſtill, lead

Breaking of horses.

lead on another horse before him, which probably will induce him inſtantly to follow. Put a ſnaffle in his mouth; and when he goes freely, ſaddle him, girting him at firſt very looſe. Let the cord, which you hold, be long and looſe; but not ſo much ſo as to endanger the horſe's entangling his legs in it. It muſt be obſerved, that ſmall circles, in the beginning, would conſtrain the horſe too much, and put him upon defending himſelf. No bend muſt be required at firſt: never ſuffer him to gallop falſe; but whenever he attempts it, ſtop him without delay, and then ſet him off afreſh. If he gallops of his own accord, and true, permit him to continue it; but if he does it not voluntarily, do not demand it of him at firſt. Should he fly and jump, ſhake the cord gently upon his noſe without jerking it, and he will fall into his trot again. If he ſtands ſtill, plunges or rears, let the man who holds the whip make a noiſe with it; but never touch him, till it be abſolutely neceſſary to make him go on. When you change hands, ſtop and careſs him, and entice him by fair means to come up to you: for by preſenting yourſelf, as ſome do, on a ſudden before horſes, and frightening them to the other ſide, you run a great riſk of giving them a ſhyneſs. If he keeps his head too low, ſhake the *caveſſon* to make him raiſe it: and in whatever the horſe does, whether he walks, trots, or gallops, let it be a conſtant rule, that the motion be determined and really ſuch as is intended, without the leaſt ſhuffling, pacing, or any other irregular gait.

SECT. II. *The method of placing the rider and rendering him firm on horſeback, with ſome occaſional inſtructions for riders and the horſes.*

IT is neceſſary that the greateſt attention, and the ſame gentleneſs that is uſed in teaching the horſes, be obſerved likewiſe in teaching the rider, eſpecially at the beginning. Every method and art muſt be practiſed to create and preſerve, both in man and horſe, all poſſible feeling and ſenſibility; contrary to the uſage of moſt riding-maſters, who ſeem induſtriouſly to labour at aboliſhing theſe principles both in one and the other. As ſo many eſſential points depend upon the manner in which a man is at firſt placed on horſeback, it ought to be conſidered and attended to with the ſtricteſt care and exactneſs.

The abſurdity of putting a man, who perhaps has never before been upon a horſe, on a rough trotting horſe, on which he is obliged to ſtick with all the force of his arms and legs, is too obvious to need mentioning. This rough work, all at once, is plainly as detrimental at firſt, as it is excellent afterwards in proper time. No man can be either well or firmly ſeated on horſeback, unleſs he be maſter of the balance of his body, quite unconſtrained, with a full poſſeſſion of himſelf, and at his eaſe: none of which requiſites can he enjoy, if his attention be otherwiſe engaged; as it muſt wholely be in a raw, unſuppled, and unprepared lad, who is put at once upon a rough horſe: in ſuch a diſtreſsful ſtate, he is forced to keep himſelf on at any rate, by holding to the bridle (at the expence of the ſenſibility both of his own hand and the horſe's mouth), and by clinging with his legs, in danger of his life, and to the certain depravation of a right feeling in the horſe.

Of placing the rider.

The firſt time a man is put on horſeback, it ought to be upon a very gentle one. He never ſhould be made to trot, till he is quite eaſy in the walk; nor gallop, till he is able to trot properly. The ſame muſt be obſerved in regard to horſes: they ſhould never be made to trot till they are obedient, and their mouths are well formed on a walk; nor be made to gallop, till the ſame be effected on a trot. When he is arrived at ſuch a degree of firmneſs in his ſeat, the more he trots, and the more he rides rough horſes, the better. This is not only the beſt method, but alſo the eaſieſt and the ſhorteſt: by it a man is ſoon made ſufficiently an horſeman for a ſoldier: but by the other deteſtable methods that are commonly uſed, a man, inſtead of improving, contracts all ſorts of bad habits, and rides worſe and worſe every day; the horſe too becomes daily more and more unfit for uſe. In proceeding according to the manner propoſed, a man is rendered firm and eaſy upon the horſe, both his own and the horſe's ſenſibility is preſerved, and each in a ſituation fit to receive and practiſe all leſſons effectually.

Among the various methods that are uſed of plaing people on horſeback, few are directed by reaſon. Before you let the man mount, teach him to know, and always to examine, if the curb be well placed, (that is, when the horſe has a bit in his mouth, which at firſt he ſhould not; but only a ſnaffle, till the rider is firm in his ſeat, and the horſe alſo ſomewhat taught): likewiſe to know if the noſe-band be properly tight; the throat-band looſiſh; and the mouth-piece neither too high nor too low in the horſe's mouth, but rightly put ſo as not to wrinkle the ſkin nor to hang lax; the girts drawn moderately, but not too tight; and the crupper and the breaſt-plate properly adjuſted. A very good and careful hand may venture on a bit at firſt, and ſucceed with it full as well as by beginning with a ſnaffle alone: on colts, indeed, it is better, in all ſchools whatſoever, to avoid any preſſure on the bars juſt at firſt, which a curb, though ever ſo delicately uſed, muſt in ſome degree occaſion. When the bridle, *&c.* have been well looked to, let the man approach the horſe gently near the ſhoulder; then taking the reins and an handful of the mane in his left hand, let him put his foot ſoftly in the left-ſtirrup, by pulling it towards him, leſt he touch the horſe with his toe; then raiſing himſelf up, let him reſt a moment on it with his body upright, but not ſtiff; and after that, paſſing his right leg clear over the ſaddle without rubbing againſt any thing, let him ſeat himſelf gently down. He muſt be cautious not to take the reins too ſhort, for fear of making the horſe rear, run, or fall back, or throw up his head; but let him hold them of an equal length, neither tight nor ſlack, and with the little finger betwixt them. It is fit that horſes ſhould be accuſtomed to ſtand ſtill to be mounted, and not to ſtir till the rider pleaſes. All ſoldiers ſhould be inſtructed to mount and diſmount equally well on both ſides, which may be of great uſe in times of hurry and confuſion. Then place the man in his ſaddle, with his body rather back, and his head held up with eaſe, without ſtiffneſs; ſeated neither forwards, nor very backwards; with the breaſt puſhed out a little, and the lower part of the body likewiſe a little forwards; the thighs and legs turned in without conſtraint, and

Instructions concerning both man and horse.

of placing the rider.

and the feet in a ſtraight line, neither turned in nor out. By this poſition, the natural weight of the thighs has a proper and ſufficient preſſure of itſelf, and the legs are in readineſs to act when called upon: they muſt hang down eaſy and naturally; and be ſo placed, as not to be wriggling about, touching and tickling the horſe's ſides, but always near them in caſe they ſhould be wanted, as well as the heels.

The body muſt be carefully kept eaſy and firm, and without any rocking when in motion; which is a bad habit very eaſily contracted, eſpecially in galloping. The left elbow muſt be gently leant againſt the body, a little forwards: unleſs it be ſo reſted, the hand cannot be ſteady, but will always be checking, and conſequently have pernicious effects on the horſe's mouth. And the hand ought to be of equal height with the elbow; if it were lower, it would conſtrain and confine the motion of the horſe's ſhoulders: but, as the mouths of horſes are different, the place of the hand alſo muſt occaſionally differ: a leaning, low, heavy fore-hand requires a high hand; and a horſe that pokes out his noſe, a low one. The right-hand arm muſt be placed in ſymmetry with the left; only let the right hand be a little forwarder or backwarder, higher or lower, as occaſions may require, in order that both hands may be free: both arms muſt be a little bent at the elbow, to prevent ſtiffneſs.

A ſoldier's right hand ſhould be kept unemployed in riding; it carries the ſword, which is a ſufficient buſineſs for it.

There remains one farther obſervation, that ought not to be omitted, about the hand, that it muſt be kept clear of the body; i. e. about two inches and a half forwards from it, with the nails turned oppoſite to the belly, and the wriſt a little rounded with eaſe; a poſition not leſs graceful than ready for ſlackening, tightening, and moving the reins from one ſide to the other, as may be found neceſſary.

When the men are well placed, the more rough trotting they have without ſtirrups, the better; but with a ſtrict care always, that their poſition be preſerved very exactly. In all caſes, great care muſt be taken to hinder their clinging with their legs: in ſhort, no ſticking by hands or legs is ever to be allowed of at any time. If the motion of the horſe be too rough, ſlacken it, till the rider grows by degrees more firm: and when he is quite firm and eaſy on his horſe in every kind of motion, ſtirrups may be given him; but he muſt never leave off trotting often without any.

The ſtirrups muſt be neither ſhort nor long; but of ſuch a length, that when the rider, being well placed, puts his feet into them, (about one third of the length of each foot from the point of it,) the points may be between two and three inches higher than the heels. The rider muſt not bear upon his ſtirrups, but only let the natural weight of his legs reſt on them: For if he bear upon them, he would be raiſed above and out of his ſaddle; which ſhould never be, except in charging ſword in hand, with the body inclined forwards at the very inſtant of attacking. Spurs may be given, as ſoon as the rider is grown familiar with ſtirrups; or even long before, if his legs are well placed.

A hand ſhould always be firm, but delicate: a horſe's mouth ſhould never be ſurpriſed by any ſudden tranſition of it, either from ſlack to tight, or from tight to ſlack. Every thing in horſemanſhip muſt be effected by degrees, but at the ſame time with ſpirit and reſolution. That hand which, by giving and taking properly, gains its point with the leaſt force, is the beſt; and the horſe's mouth, under this ſame hand's directions, will alſo conſequently be the beſt, ſuppoſing equal advantages in both from nature. This principle of gentleneſs ſhould be obſerved upon all occaſions in every branch of horſemanſhip. Sometimes the right hand may be neceſſary, upon ſome troubleſome horſes, to aſſiſt the left: but the ſeldomer this is done, the better; eſpecially in a ſoldier, who has a ſword to carry, and to make uſe of.

The ſnaffle muſt on all occaſions be uppermoſt; that is to ſay, the reins of it muſt be above thoſe of the bridle, whether the ſnaffle or the bit be uſed ſeparately, or whether they be both uſed together. When the rider knows enough, and the horſe is ſufficiently prepared and ſettled to begin any work towards ſuppling, one rein muſt be ſhortened according to the ſide worked to; but it muſt never be ſo much ſhortened, as to make the whole ſtrength reſt on that rein alone: for, not to mention that the work would be falſe and bad, one ſide of the horſe's mouth would by that means be always deadened; whereas, on the contrary, it ſhould always be kept freſh by its own play, and by the help of the oppoſite rein's acting delicately in a ſomewhat ſmaller degree of tenſion; the joint effect of which produces in a horſe's mouth the proper, gentle, and eaſy degree of *appui* or bearing.

A coward and a madman make alike bad riders, and are both alike diſcovered and confounded by the ſuperior ſenſe of the creature they are mounted upon, who is equally ſpoilt by both, though in very different ways. The coward, by ſuffering the animal to have his own way, not only confirms him in his bad habits, but creates new ones in him: and the madman, by falſe and violent motions and corrections, drives the horſe, through deſpair, into every bad and vicious trick that rage can ſuggeſt.

It is very requiſite in horſemanſhip, that the hand and legs ſhould act in correſpondence with each other in every thing; the latter always ſubſervient and aſſiſtant to the former. Upon circles, in walking, trotting, or galloping, the outward leg is the only one to be uſed, and that only for a moment at a time, in order to ſet off the horſe true, or put him right if he be falſe; and as ſoon as that is done, it muſt be taken away again immediately: but if the horſe be lazy, or otherwiſe retains himſelf, both legs muſt be uſed, and preſſed to his ſides at the ſame time together. The leſs the legs are uſed in general, the better. Very delicate good riders, with horſes they have dreſſed themſelves, will ſcarcely ever want their help. By the term *outward* is underſtood the ſide which is more remote from the centre; and by *inward* is meant the ſide next to the centre. In reining back, the rider ſhould be careful not to uſe his legs, unleſs the horſe backeth on his ſhoulders; in which caſe they muſt be both applied gently at the ſame time, and correſpond with the hand. If the horſe refuſe to back at all, the rider's legs muſt be gently approached, till the horſe lifts up a leg, as if to go forwards; at which time, when that leg is in the

Inſtructions concerning both man and horſe.

the air, the rein of the ſame ſide with that leg which is lifted up, will eaſily bring that ſame leg backwards, and accordingly oblige the horſe to back; but if the horſe offers to rear, the legs muſt be inſtantly removed away. The inward rein muſt be tighter on circles, ſo that the horſe may bend and look inwards; and the outward one croſſed over a little towards it; and both held in the left hand.

Let the man and horſe begin on very ſlow motions, that they may have time to underſtand and reflect on what is taught them; and in proportion as the effects of the reins are better comprehended, and the manner of working becomes more familiar, the quickneſs of motion muſt be increaſed. Every rider muſt learn to feel, without the help of the eye, when a horſe goes falſe, and remedy the fault accordingly: this is an intelligence, which nothing but practice, application, and attention, can give, in the beginning on ſlow motions. A horſe may not only gallop falſe, but alſo trot and walk falſe. If a horſe gallops falſe, that is to ſay, if going to the right he leads with the left leg, or if going to the left he leads with the right; or in caſe he is diſunited, *i. e.* if he leads with the oppoſite leg behind to that which he leads with before; ſtop him immediately, and put him off again properly. The method of effecting this, is by approaching your outward leg, and putting your hand outwards; ſtill keeping the inward rein the ſhorter, and the horſe's head inwards, if poſſible: and if he ſhould ſtill reſiſt, then bend and pull his head outwards alſo; but replace it again, bent properly inwards, the moment he goes off true. A horſe is ſaid to be diſunited to the right, when going to the right, and conſequently leading with the right leg before, he leads with the left behind; and is ſaid to be diſunited to the left, when going to the left, and conſequently leading with the left leg before, he leads with the right behind. A horſe may at the ſame time be both falſe and diſunited; in correcting both which faults, the ſame method muſt be uſed. He is both falſe and diſunited to the right, when in going to the right he leads with the left leg before, and the right behind; notwithſtanding that hinder leg be with propriety more forward under his belly than the left, becauſe the horſe is working to the right: And he is falſe and diſunited to the left, when in going to the left he leads with the right leg before, and the left behind; notwithſtanding, as above, that hinder leg be with propriety more forward under his belly than the right, becauſe the horſe is working to the left.

In teaching men a right ſeat on horſeback, the greateſt attention muſt be given to prevent ſtiffneſs, and ſticking by force in any manner upon any occaſion: ſtiffneſs diſgraces every right work; and ſticking ſerves only to throw a man (when diſplaced) a great diſtance from his horſe by the ſpring he muſt go off with: whereas, by a proper equilibrating poſition of the body, and by the natural weight only of the thighs, he cannot but be firm and ſecure in his ſeat.

As the men become more firm, and the horſes more ſupple, it is proper to make the circles leſs; but not too much ſo, for fear of throwing the horſes forwards upon their ſhoulders.

Some horſes, when firſt the bit is put into their mouths, if great care be not taken, will put their heads very low. With ſuch horſes, raiſe your right hand with the *bridoon* in it, and play at the ſame time with the bit in the left hand, giving and taking.

Of ſuppling horſes.

On circles, the rider muſt lean his body inwards; unleſs great attention be given to make him do it, he will be perpetually loſing his ſeat outwards. It is ſcarce poſſible for him to be diſplaced, if he leans his body properly inwards.

SECT. III. *The method of ſuppling horſes with men upon them, by the* ÉPAULE en dedans, *&c. with and without a* longe, *on circles and on ſtraight lines.*

WHEN a horſe is well prepared and ſettled in all his motions, and the rider firm, it will be proper then to proceed on towards a farther ſuppling and teaching of both.

In ſetting out upon this new work, begin by bringing the horſe's head a little more inwards than before, pulling the inward rein gently to you by degrees. When this is done, try to gain a little on the ſhoulders, by keeping the inward rein the ſhorter, as before, and the outward one croſſed over towards the inward one. The intention of theſe operations is this: The inward rein ſerves to bring in the head, and procures the bend; whilſt the outward one, that is a little croſſed, tends to make that bend perpendicular, and as it ſhould be, that is to ſay, to reduce the noſe and the forehead to be in a perpendicular line with each other: it alſo ſerves, if put forwards, as well as alſo croſſed, to put the horſe forwards, if found neceſſary; which is often requiſite, many horſes being apt in this and other works rather to loſe their ground backwards than otherwiſe, when they ſhould rather advance: if the noſe were drawn in towards the breaſt beyond the perpendicular, it would confine the motion of the ſhoulders, and have other bad effects. All other bends, beſides what are above ſpecified, are falſe. The outward rein, being croſſed, not in a forward ſenſe, but rather a little backwards, ſerves alſo to prevent the outward ſhoulder from getting too forwards, and makes it approach the inward one; which facilitates the inward leg's croſſing over the outward one, which is the motion that ſo admirably ſupples the ſhoulders. Care muſt be taken, that the inward leg paſs over the outward one, without touching it; this inward leg's croſſing over muſt be helped alſo by the inward rein, which you muſt croſs towards and over the outward rein every time the outward leg comes to the ground, in order to lift and help the inward leg over it: at any other time, but juſt when the outward leg comes to the ground, it would be wrong to croſs the inward rein, or to attempt to lift up the inward leg by it; nay, it would be demanding an abſolute impoſſibility, and lugging about the reins and horſe to no purpoſe: becauſe in this caſe, a very great part of the horſe's weight reſting then upon that leg, would render ſuch an attempt not only fruitleſs, but alſo prejudicial to the ſenſibility of the mouth, and probably oblige him to defend himſelf; and moreover, it would put the horſe under a neceſſity of ſtraddling before, and alſo of leading with the wrong leg, without being productive of any ſuppling motion whatſoever.

When the horſe is thus far familiarly accuſtomed to what you have required of him, then proceed to effect by

Directions for men and horfes.

by degrees the fame croffing in his hinder legs. By bringing in the fore-legs more, you will of courfe engage the hinder ones in the fame work: if they refift, the rider muft bring both reins more inwards; and, if neceffary, put back alfo, and approach his inward leg to the horfe; and if the horfe throws out his croup too far, the rider muft bring both reins outwards, and, if abfolutely neceffary, he muft alfo make ufe of his outward leg, in order to replace the horfe properly: obferving that the croup fhould always be conffiderably behind the fhoulders, which in all actions muft go firft; and, the moment that the horfe obeys, the rider muft put his hand and leg again in their ufual pofition.

Nothing is more ungraceful in itfelf, more detrimental to a man's feat, or more deftructive of the fenfibility of a horfe's fides, than a continual wriggling unfettlednefs in a horfeman's legs, which prevents the horfe from ever going a moment together true, fteady, or determined.

A horfe fhould never be turned, without firft moving a ftep forwards: and when it is doing, the rider muft not lift his elbow, and difplace himfelf; a motion only of the hand from the one fide to the other being fufficient for that purpofe. It muft alfo be a conftant rule, never to fuffer a horfe to be ftopped, mounted or difmounted, but when he is well placed. The flower the motions are when a man or horfe is taught any thing, the better.

At firft, the figures worked upon muft be great, and afterwards made lefs by degrees, according to the improvement which the man and horfe make; and the cadenced pace alfo, which they work in, muft be accordingly augmented. The changes from one fide to the other, muft be in a bold determined trot, and at firft quite ftraight forwards, without demanding any fide-motion on two *piffes*, which is very neceffary to require afterwards when the horfe is fufficiently fuppled. By two *piffes* is meant, when the fore-parts and hinder parts do not follow but defcribes two different lines.

In the beginning, a *longe* is ufeful on circles, and alfo on ftraight lines, to help both the rider and the horfe; but afterwards, when they are grown more intelligent, they fhould go alone. At the end of the leffon, rein back; then put the horfe, by a little at a time, forwards, by approaching both legs gently to his fides, and playing with the bridle: if he rears, puth him out immediately into a full trot. Shaking the *caveffon* on the horfe's nofe, and alfo putting one's felf before him and rather near to him, will generally make him back, though he otherwife refufe to do it: and moreover a flight ufe and approaching of the rider's legs, will fometimes be neceffary in backing, in order to prevent the horfe from doing it too much upon his fhoulders; but the preffure of the legs ought to be very fmall, and taken quite away the moment that he puts himfelf enough upon his haunches. If the horfe does not back upon a ftraight line properly, the rider muft not be permitted to have recourfe immediately to his leg, and fo diftort himfelf by it; but firft try, if croffing over his hand and reins to which ever fide may be neceffary, will not be alone fufficient; which moft frequently it will; if not, then employ the leg.

After a horfe is well prepared and fettled, and goes freely on in all his feveral paces, he ought to be in all his works kept, to a proper degree, upon his haunches, with his hinder legs well placed under him; whereby he will be always pleafant to himfelf and his rider, will be light in hand, and ready to execute whatever may be demanded of him, with facility, vigour, and quicknefs. Of head to the wall, &c.

The common method that is ufed, of forcing a horfe fidewife, is a moft glaring abfurdity, and very hurtful to the animal in its conffequences; for inftead of fuppling him, it obliges him to ftiffen and defend himfelf, and often makes a creature, that is naturally benevolent, reftive, frightened, and vicious.

For horfes, who have very long and high fore-hands, and who poke out their nofes, a running fnaffle is of excellent ufe; but for fuch as bore and keep their heads low, a common one is preferable; though any horfe's head indeed may be kept up alfo with a running one, by the rider's keeping his hands very high and forwards: but whenever either is ufed alone without a bridle upon horfes that carry their heads low and that bore, it muft be fawed about from one fide to the other.

This leffon of the *epaul en dedans*, fhould be taught to fuch people as are likely to become ufeful in helping to teach men and to break horfes; and the more of fuch that can be found, the better: none others fhould ever be fuffered upon any occafion to let their horfes look any way befides the way they are going. But all horfes whatever, as likewife all men, who are defigned for the teaching others, muft go thoroughly and perfectly through this excellent leffon, under the directions of intelligent inftructors, and often practife it too afterwards; and, when that is done, proceed to and be finifhed by the leffons of head and tail to the wall.

SECT. IV. *Of the head to the wall, and of the croup to the wall.*

THIS leffon fhould be practifed immediately after that of the *epaule en dedans*, in order to place the horfe properly the way he goes, &c. The difference between the head to the wall, and the croup to the wall, conffifts in this: in the former, the fore-parts are more remote from the centre, and go over more ground; in the latter, the hinder-parts are more remote from the centre, and conffequently go over more ground: in both, as likewife in all other leffons, the fhoulders muft go firft. In riding-houfes, the head to the wall is the eafier leffon of the two at firft, the line to be worked upon being marked by the wall, not far from his head.

The motion of the legs to the right, is the fame as that of the *epaule en dedans* to the left, and fo *vice verfa*; but the head is always bent and turned differently: in the *epaule en dedans*, the horfe looks the contrary way to that which he goes; in this, he looks the way he is going.

In the beginning, very little bend muft be required; too much at once would aftonifh the horfe, and make him defend himfelf: it is to be augmented by degrees. If the horfe abfolutely refufes to obey, it is a fign that either he or his rider has not been fufficiently prepared by previous leffons. It may happen, that weaknefs or a hurt in fome part of the body, or fometimes temper, though feldom, may be the caufe of the horfe's defending himfelf: it is the rider's bufinefs to find out

Head to the wall, &c.

from whence the obſtacle ariſes; and if he finds it to be from the firſt mentioned cauſe, the previous leſſons muſt be reſumed again for ſome time; if from the ſecond, proper remedies muſt be applied; and if from the laſt cauſe, when all fair means that can be tried have failed, proper corrections with coolneſs and judgment muſt be uſed.

In practiſing this leſſon to the right, bend the horſe to the right with the right rein; helping the left leg over the right (at the time when the right leg is juſt come to the ground), with the left rein croſſed towards the right, and keeping the right ſhoulder back with the right rein towards your body, in order to facilitate the left leg's croſſing over the right; and ſo likewiſe *vice verſa* to the left, each rein helping the other by their properly mixed effects. In working to the right, the rider's left leg helps the hinder-parts on to the right, and his right leg ſtops them if they get too forwards; and ſo *vice verſa* to the left: but neither ought to be uſed, till the hand being employed in a proper manner has failed, or finds that a greater force is neceſſary to bring about what is required than it can effect alone: for the legs ſhould not only be correſponding with, but alſo ſubſervient to the hand; and all unneceſſary aids, as well as all force, ought always to be avoided as much as poſſible.

In the execution of all leſſons, the equilibre of the rider's body is of great uſe to the horſe; it ought always to go with and accompany every motion of the animal; when to the right, to the right; and when to the left, to the left.

Upon all horſes, in every leſſon and action, it muſt be obſerved, that there is no horſe but has his own peculiar appui or degree of bearing, and alſo a ſenſibility of mouth, as likewiſe a rate of his own, which it is abſolutely neceſſary for the rider to diſcover and make himſelf acquainted with. A bad rider always takes off at leaſt the delicacy of both, if not abſolutely deſtroys it. The horſe will inform his rider when he has got his proper bearing in the mouth, by playing pleaſantly and ſteadily with his bit, and by the ſpray about his chaps. A delicate and good hand will not only always preſerve a light appui, or bearing, in its ſenſibility; but alſo of a heavy one, whether naturally ſo or acquired, make a light one. The lighter this appui can be made, the better; provided that the rider's hand correſponds with it; if it does not, the the more the horſe is properly prepared, ſo much the worſe. Inſtances of this inconvenience of the beſt of appuis, when the rider is not equally taught with the horſe, may be ſeen every day in ſome gentlemen, who try to get their horſes *bitted* as they call it, without being ſuitably prepared themſelves for riding them: the conſequence of which is, that they ride in danger of breaking their necks; till at length, after much hauling about, and by the joint inſenſibility and ignorance of themſelves and their grooms, the poor animals gradually become mere ſenſeleſs unfeeling poſts; and thereby grow, what they call, *ſettled*. When the proper appui is found, and made of courſe as light as poſſible, it muſt not be kept duly fixed without any variation, but be played with; otherwiſe one equally-continued tenſion of reins would render both the rider's hand and the horſe's mouth very dull. The ſlighteſt and frequent giving and taking, is therefore neceſſary to keep both perfect.

Whatever pace or degree of quickneſs you work in, (be it ever ſo faſt, or ever ſo ſlow,) it muſt be cadenced; time is as neceſſary for an horſeman as for a muſician.

This leſſon of the head and of the tail to the wall, muſt be taught every ſoldier: ſcarce any manœuvre can be well performed without it. In cloſing and opening of files, it is almoſt every moment wanted.

To mak horſes ſta fire, &c.

Sect. V. *The method of making horſes ſtand fire, noiſes, alarms, fights,* &c.

In order to make horſes ſtand fire, the ſound of drums, and all ſorts of different noiſes, you muſt uſe them to it by degrees in the ſtable at feeding-time; and inſtead of being frightened at it, they will ſoon come to like it as a ſignal for eating.

With regard to ſuch horſes as are afraid of burning objects, begin by keeping them ſtill at a certain diſtance from ſome lighted ſtraw: careſs the horſe; and in proportion as his fright diminiſhes, approach gradually the burning ſtraw very gently, and increaſe the ſize of it. By this means he will very quickly be brought to be ſo familiar with it, as to walk undaunted even through it.

As to horſes that are apt to lie down in the water, if animating them, and attacking them vigorouſly, ſhould fail of the deſired effect, then break a ſtraw-bottle full of water upon their heads, and let the water run into their ears, which is a thing they apprehend very much.

All troop-horſes muſt be taught to ſtand quiet and ſtill when they are ſhot off from, to ſtop the moment you preſent, and not to move after firing till they are required to do it; this leſſon ought eſpecially to be obſerved in light troops: in ſhort, the horſes muſt be taught to be ſo cool and undiſturbed, as to ſuffer the rider to act upon him with the ſame freedom as if he was on foot. Patience, coolneſs, and temper, are the only means requiſite for accompliſhing this end. Begin by walking the horſe gently, then ſtop and keep him from ſtirring for ſome time, ſo as to accuſtom him by degrees not to have the leaſt idea of moving without orders: if he does, then back him; and when you ſtop him, and he is quite ſtill, leave the reins quite looſe.

To uſe a horſe to fire-arms, firſt put a piſtol or a carabine in the manger with his feed; then uſe him to the ſound of the lock and the pan; after which, when you are upon him, ſhew the piece to him, preſenting it forwards, ſometimes on one ſide, ſometimes on the other: when he is thus far reconciled, proceed to flaſh in the pan; after which, put a ſmall charge into the piece, and ſo continue augmenting it by degrees to the quantity which is commonly uſed: if he ſeems uneaſy, walk him forward a few ſteps ſlowly; and then ſtop, back, and careſs him. Horſes are often alſo diſquieted and unſteady at the claſh, and drawing, and returning of ſwords; all which they muſt be familiarized to by little and little, by frequency and gentleneſs.

It is very expedient for all cavalry in general, but particularly for light cavalry, that their horſes ſhould be very ready and expert in leaping over ditches, hedges, gates, &c. The leaps, of whatever ſort they are, which the

Of reining back, &c.

the horſes are brought to in the beginning, ought to be very ſmall ones; the riders muſt keep their bodies back, raiſe their hands a little in order to help the fore-parts of the horſe up, and be very attentive to their equilibre. It is beſt to begin at a low bar covered with furze, which pricking the horſe's legs, if he does not raiſe himſelf ſufficiently, prevents his contracting a ſluggiſh and dangerous habit of touching, as he goes over, which any thing yielding and not pricking would give him a cuſtom of doing. Let the ditches you firſt bring horſes to be narrow; and in this, as in every thing elſe, let the increaſe be made by degrees. Accuſtom them to come up to every thing which they are to leap over, and to ſtand coolly at it for ſome time; and then to raiſe themſelves gently up in order to form to themſelves an idea of the diſtance. When they leap well ſtanding, then uſe them to walk gently up to the leap, and to go over it without firſt halting at it; and after that practice is familiar to them, repeat the like in a gentle trot, and ſo by degrees faſter and faſter, till at length it is as familiar to them to leap flying on a full gallop as any other way: all which is to be acquired with with great facility by calm and ſoft means, without any hurry.

As horſes are naturally apt to be frightened at the ſight and ſmell of dead horſes, it is adviſable to habituate them to walk over and leap over carcaſes of dead horſes: and as they are particularly terrified at this ſight, the greater gentleneſs ought conſequently to be uſed.

Horſes ſhould alſo be accuſtomed to ſwim, which often may be neceſſary upon ſervice; and if the men and horſes both are not uſed to it, both may be frequently liable to periſh in the water. A very ſmall portion of ſtrength is ſufficient to guide a horſe, anywhere indeed, but particularly in the water, where they muſt be permitted to have their heads, and be no-ways conſtrained in any ſhape.

The unreaſonable rage in Britain of cutting off all extremities from horſes, is in all caſes a very pernicious cuſtom. It is particularly ſo in regard to a troop-horſe's tail. It is almoſt incredible, how much they ſuffer at the picket for want of it: conſtantly fretting, and ſweating, kicking about and laming one another, tormented, and ſtung off their meat, miſerable, and helpleſs; whilſt other horſes, with their tails on, bruſh off all flies, are cool and at their eaſe, and mend daily; whilſt the docked ones grow every hour more and more out of condition.

SECT. VI. *The method of reining back,—and of moving forwards immediately after it;—of piaffing,—of pillars,* &c.

NEVER finiſh your work by reining back with horſes that have any diſpoſition towards retaining themſelves; but always move them forwards, and a little upon the haunches alſo, after it, before you diſmount, (unleſs they retain themſelves very much indeed, in which caſe nothing at all muſt be demanded from the haunches). This leſſon of reining back, and piaffing, is excellent to conclude with, and puts an horſe well and properly on the haunches: It may be done, according as horſes are more or leſs ſuppled, either going forwards, backing, or in the ſame place: if it is done well advancing, or at moſt on the ſame ſpot, it is full ſufficient for a ſoldier's horſe: For to piaffe in backing, is rather too much to be expected in the hurry which cannot but attend ſuch numbers both of men and horſes as muſt be taught together in regiments. This leſſon muſt never be attempted at all, till horſes are very well ſuppled, and ſomewhat accuſtomed to be put together; otherwiſe it will have very bad conſequences, and create reſtiveneſs. If they refuſe to back, and ſtand motionleſs, the rider's legs muſt be approached with the greateſt gentleneſs to the horſe's ſides; at the ſame time that the hand is acting on the reins to ſolicit the horſe's backing. This ſeldom fails of procuring the deſired effect, by raiſing one of the horſe's fore-legs, which being in the air, has no weight upon it, and is conſequently very eaſily brought backwards by a ſmall degree of tenſion in the reins. When this leſſon is well performed, it is very noble and uſeful, and has a pleaſing air; it is an excellent one to begin teaching ſcholars with.

Of curing reſtiveneſs, &c

The leſſon is particularly ſerviceable in the pillars, for placing ſcholars well at firſt. Very few regimental riding-houſes have pillars, and it is fortunate they have not: for though, when properly made uſe of with ſkill, they are one of the greateſt and beſt diſcoveries in horſemanſhip; they muſt be allowed to be very dangerous and pernicious, when they are not under the direction of a very knowing perſon.

SECT. VII. *The method of curing reſtiveneſſes, vices, defences, ſtarting,* &c.

WHENEVER a horſe makes reſiſtance, one ought, before remedy or correction is thought of, to examine very minutely all the tackle about him, if any thing hurts or tickles him, whether he has any natural or accidental weakneſs, or in ſhort any the leaſt impediment in any part. For want of this precaution, many fatal diſaſters happen: the poor dumb animal is frequently accuſed falſely of being reſtive and vitious; is uſed ill without reaſon; and, being forced into deſpair, is in a manner obliged to act accordingly, be his temper and inclination ever ſo well diſpoſed. It is very ſeldom the caſe, that a horſe is really and by nature vitious; but if ſuch be found, he will deſpiſe all careſſes, and then chaſtiſements become neceſſary.

Correction, according as you uſe it, throws a horſe into more or leſs violent action, which, if he be weak, he cannot ſupport: but a vitious ſtrong horſe is to be conſidered in a very different light, being able both to undergo and conſequently to profit by all leſſons; and is far preferable to the beſt-natured weak one upon earth. Patience and attention are never failing means to reclaim ſuch a horſe: in whatſoever manner he defends himſelf, bring him back frequently with gentleneſs (not however without having given him proper chaſtiſement if neceſſary) to the leſſon which he ſeems moſt averſe to. Horſes are by degrees made obedient, through the hope of recompenſe and the fear of puniſhment: how to mix theſe two motives judiciouſly together, is a very difficult matter; it requires much thought and practice; and not only a good head, but a good heart likewiſe. The coolеſt and beſt-natured rider will always ſucceed beſt. By a dexterous uſe of the incitements above mentioned, you will gradually bring the horſe to temper and obedience; mere force, and want of ſkill and coolneſs,

Of rearing, ſtarting, &c.

would only tend to confirm him in bad tricks. If he be impatient or choleric, never ſtrike him, unleſs he abſolutely refuſe to go forwards; which you muſt reſolutely oblige him to do, and which will be of itſelf a correction, by preventing his having time to meditate and put in execution any defence by retaining himſelf. Reſiſtance in horſes, you muſt conſider, is ſometimes a mark of ſtrength and vigour, and proceeds from ſpirits, as well as ſometimes from vice and weakneſs. Weakneſs frequently drives horſes into vitiouſneſs, when any thing wherein ſtrength is neceſſary is demanded from them; nay, it inevitably muſt: great care therefore ſhould always be taken to diſtinguiſh from which of theſe two cauſes any remedy or puniſhment is thought of. It may ſometimes be a bad ſign when horſes do not at all defend themſelves, and proceed from a ſluggiſh diſpoſition, a want of ſpirit and of a proper ſenſibility. Whenever one is ſo fortunate as to meet with a horſe of juſt the right ſpirit, activity, delicacy of feeling, with ſtrength and good-nature, he cannot be cheriſhed too much; for ſuch a one is a rare and ineſtimable jewel, and, if properly treated, will in a manner do every thing of himſelf. Horſes are oftener ſpoilt by having too much done to them, and by attempts to dreſs them in too great an hurry, than by any other treatment.

If after a horſe has been well ſuppled, and there are no impediments, either natural or accidental, if he ſtill perſiſts to defend himſelf, chaſtiſements then become neceſſary: but whenever this is the caſe, they muſt not be frequent, but always firm, though always as little violent as poſſible; for they are both dangerous and very prejudicial when frequently or ſlightly played with, and ſtill more ſo when uſed too violently.

It is impoſſible, in general, to be too circumſpect in leſſons of all kinds, in aids, chaſtiſements, or careſſes. Some have quicker parts, and more cunning, than others. Many will imperceptibly gain a little every day on their rider. Various, in ſhort, are their diſpoſitions and capacities. It is the rider's buſineſs to find out their different qualities, and to make them ſenſible how much he loves them, and deſires to be loved by them; but at the ſame time that he does not fear them, and will be maſter.

Plunging is a very common defence among reſtive and vitious horſes: if they do it in the ſame place, or backing, they muſt, by the rider's legs and ſpurs firmly applied, be obliged to go forwards, and their heads kept up high. But if they do it ſtying forwards, keep them back, and ride them gently and very ſlow for a good while together. Of all bad tempers and qualities in horſes, thoſe which are occaſioned by harſh treatment and ignorant riders are the worſt.

Rearing is a bad vice, and, in weak horſes eſpecially, a very dangerous one. Whilſt the horſe is up, the rider muſt yield his hand; and when the horſe is deſcending, he muſt vigorouſly determine him forwards: if this be done at any other time but whilſt the horſe is coming down, it may add a ſpring to his rearing, and make him fall backwards. With a good hand on them, horſes ſeldom perſiſt in this vice; for they are themſelves naturally much afraid of falling backwards. If this method fails, you muſt make the horſe kick up behind, by getting ſomebody on foot to ſtrike him behind with a whip; or, if that will not effect it, by pricking him with a goad.

Plain rule for bad horſemen.

Starting often proceeds from a defect in the ſight; which therefore muſt be carefully looked into. Whatever the horſe is afraid of, bring him up to it gently; if you careſs him every ſtep he advances, he will go quite up to it by degrees, and ſoon grow familiar with all ſorts of objects. Nothing but great gentleneſs can correct this fault; for if you inflict puniſhment, the apprehenſion of chaſtiſement becomes prevalent, and cauſes more ſtarting than the fear of the object. If you let him go by the object, without bringing him up to it, you increaſe the fault, and confirm him in his fear: the conſequence of which is, he takes his rider perhaps a quite contrary way from what he was going, becomes his maſter, and puts himſelf and the perſon upon him every moment in great danger.

With ſuch horſes as are to a very great degree fearful of any objects, make a quiet horſe, by going before them, gradually entice them to approach nearer and nearer to the thing they are afraid of. If the horſe, thus alarmed, be undiſciplined and headſtrong, he will probably run away with his rider; and if ſo, his head muſt be kept up high, and the ſnaffle fawed backwards and forwards from right to left, taking up and yielding the reins of it, as alſo the reins of the bit: but this latter muſt not be fawed backwards and forwards like the ſnaffle, but only taken up and yielded properly. No man ever yet did, or ever will, ſtop a horſe, or gain any one point over him, by main force, or by pulling a dead weight againſt him.

SECT. VIII. *Rules for Bad Horſemen.*

Thomſon's Rules.

In the firſt place, every horſe ſhould be accuſtomed to ſtand ſtill when he is mounted. One would imagine this might be readily granted; yet we ſee how much the contrary is practiſed. When a gentleman mounts at a livery-ſtable, the groom takes the horſe by the bit, which he bends tight round his under jaw: the horſe ſtriving to go on, is forced back; advancing again, he frets, as he is again ſtopped ſhort, and hurt by the manner of holding him. The rider, in the mean time, mounting without the bridle, or at leaſt holding it but ſlightly, is helped to it by the groom, who being thoroughly employed by the horſe's fluttering, has at the ſame time both bridle and ſtirrup to give. This confuſion would be prevented, if every horſe was taught to ſtand ſtill when he is mounted. Forbid your groom therefore, when he rides your horſe to water, to throw himſelf over him from a horſe-block, and kick him with his leg, even before he is fairly upon him. This wrong manner of mounting, is what chiefly teaches your horſe the vitious habit againſt which we are here warning. On the other hand, a conſtant practice of mounting in the proper manner, is all that is neceſſary to prevent a horſe's going on till the rider is quite adjuſted in the ſaddle.

The next thing neceſſary therefore is, that the rider ſhould mount properly. The common method is to ſtand near the croup, or hinder part of the horſe, with the bridle held very long in the right hand. By this manner of holding the bridle before you mount, you are liable to be kicked; and when you are mounted, your horſe may go on ſome time, or play what gambols

Plain rules for bad horsemen.

bols he pleases, before the rein is short enough in your hand to prevent him. It is common likewise, for an awkward rider, as soon as his foot is in the stirrup, to throw himself with all his force to gain his seat; which he cannot do, till he hath first overbalanced himself on one side or the other: he will then wriggle into it by degrees. The way to mount with ease and safety is, to stand rather before than behind the stirrup. In this posture take the bridle short, and the mane together in your left hand, helping yourself to the stirrup with your right, so that your toe may not touch the horse in mounting. When your left foot is in the stirrup, move on your right, till you face the side of the horse, looking across over the saddle. Then with your right hand grasp the hinder part of the saddle; and with that and your left, which holds the mane and bridle, lift yourself upright on your left foot. Remain thus a mere instant on your stirrup, only so as to divide the action into two motions. While you are in this posture, you have a sure hold with both hands, and are at liberty, either to get safely down, or to throw your leg over and gain your seat. By this deliberate motion, likewise, you avoid, what every good horseman would endeavour to avoid, putting your horse into a flutter.

When you dismount, hold the bridle and mane together in your left hand, as when you mounted; put your right hand on the pommel of the saddle, to raise yourself; throw your leg back over the horse, grasp the hinder part of the saddle with your right hand, remain a moment on your stirrup, and in every respect dismount as you mounted; only what was your first motion when you mounted, becomes the last in dismounting. Remember not to bend your right knee in dismounting, lest your spur should rub against the horse.

It may be next recommended to hold your bridle at a convenient length. Sit square, and let not the purchase of the bridle pull forward your shoulder; but keep your body *even*, as it would be if each hand held a rein. Hold your reins with the whole grasp of your hand, dividing them with your little finger. Let your hand be perpendicular; your thumb will then be uppermost, and placed on the bridle. Bend your wrist a little outward; and when you pull the bridle, raise your hand toward your breast, and the lower part of the palm rather more than the upper. Let the bridle be at such a length in your hand, as, if the horse should stumble, you may be able to raise his head, and support it by the strength of your arms, and the weight of your body thrown backward. If you hold the rein too long, you are subject to fall backward, as your horse rises.

If, knowing your horse perfectly well, you think a tight rein unnecessary, advance your arm a little (but not your shoulder) towards the horse's head, and keep your usual length of rein. By this means, you have a check upon your horse, while you indulge him.

If you ride with a curb, make it a rule to hook on the chain yourself; the most quiet horse may bring his rider into danger, should the curb hurt him. If, in fixing the curb, you turn the chain to the right, the links will unfold themselves, and then oppose a farther turning. Put on the chain loose enough to hang down on the horse's under lip, so that it may not rise and press his jaw, till the reins of the bridle are moderately pulled.

Plain rules for bad horsemen.

If your horse has been used to stand still when he is mounted, there will be no occasion for a groom to hold him: but if he does, suffer him not to touch the reins, but that part of the bridle which comes down the cheek of the horse. He cannot then interfere with the management of the reins, which belongs to the rider only; and holding a horse by the curb (which is ever painful to him) is evidently improper when he is to stand still.

Another thing to be remembered is, not to ride with your arms and elbows as high as your shoulders; nor let them shake up and down with the motion of the horse. The posture is unbecoming, and the weight of the arms (and of the body too if the rider does not sit still) acts in continual jerks on the jaw of the horse, which must give him pain, and make him unquiet, if he has a tender mouth, or any spirit.

Bad riders wonder why horses are gentle as soon as they are mounted by skilful ones, tho' their skill seems unemployed: the reason is, the horse goes at his ease, yet finds all his motions watched; which he has sagacity enough to discover. Such a rider hides his whip, if he finds his horse is afraid of it; and keeps his legs from his sides, if he finds he dreads the spur.

Avoid the ungraceful custom of letting your legs shake against the sides of the horse: and as you are not to keep your arms and elbows high, and in motion; so you are not to rivet them to your sides, but let them fall easy. One may, at a distance, distinguish a genteel horseman from an awkward one: the first sits still, and appears of a piece with his horse; the latter seems flying off at all points.

It is often said with emphasis, that such a one has no *seat* on horseback; and it means, not only that he does not ride well, but that he does not sit on the right part of the horse. To have a *good seat*, is to sit on that part of the horse, which, as he springs, is the centre of motion; and from which, of course, any weight would be with most difficulty shaken. As in the rising and falling of a board placed *in equilibrio*, the centre will be always most at rest; the true seat will be found in that part of your saddle, into which your body would naturally slide, if you rode without stirrups; and is only to be preserved by a proper poise of the body, though the generality of riders imagine it is to be done by the grasp of the thighs and knees. The rider should consider himself as united to his horse in this point; and when shaken from it, endeavour to restore the balance.

Perhaps the mention of the two extremes of a bad seat may help to describe the true one. The one is, when the rider sits very far back on the saddle, so that his weight presses the loins of the horse; the other, when his body hangs forward over the pommel of the saddle. The first may be seen practised by grooms, when they ride with their stirrups affectedly short; the latter, by fearful horsemen on the least flutter of the horse. Every *good* rider has, even on the hunting saddle, as *determined* a place for his thighs, as can be determined for him by the bars of a demi-peak. Indeed there is no difference between the seat of either: only, as in the first you ride with shorter stirrups, your body will be consequently more behind your knees.

To

Plain rules for bad horsemen.

To have a good ſeat yourſelf, your ſaddle muſt ſit well. To fix a preciſe rule might be difficult: it may be a *direction*, to have your ſaddle preſs as nearly as poſſible on that part which we have deſcribed as the point of union between the man and horſe; however, ſo as not to obſtruct the motion of the horſe's ſhoulders. Place yourſelf in the middle or loweſt part of it: ſit erect; but with as little conſtraint as in your ordinary ſitting. The eaſe of action marks the gentleman: you may repoſe yourſelf, but not lounge. The ſet and ſtudied erectneſs acquired in the riding-houſe, by thoſe whoſe deportment is not eaſy, appears ungenteel and unnatural.

If your horſe ſtops ſhort, or endeavours by riſing and kicking to unſeat you, bend not your body forward, as many do in thoſe circumſtances: that motion throws the breech backward, and you off your fork or twiſt, and out of your ſeat; whereas, the advancing the lower part of your body, and bending back the upper part and ſhoulders, is the method both to keep your ſeat, and to recover it when loſt. The bending your body back, and that in a great degree, is the greateſt ſecurity in *flying* leaps; it is a ſecurity too, when your horſe leaps *ſtanding*. The horſe's riſing does not try the rider's ſeat; the laſh of his hind legs is what ought chiefly to be guarded againſt, and is beſt done by the body's being greatly inclined back. Stiffen not your legs or thighs; and let your body be pliable in the loins, like the coachman's on his box. This looſe manner of ſitting will elude every rough motion of the horſe; whereas the fixture of the knees, ſo commonly laid a ſtreſs on, will in great ſhocks conduce to the violence of the fall.

Was the cricket-player, when the ball is ſtruck with the greateſt velocity, to hold his hand firm and fixed when he receives it, the hand would be bruiſed, or perhaps the bones fractured by the reſiſtance. To obviate this accident, he therefore gradually yields his hand to the motion of the ball for a certain diſtance; and thus by a due mixture of oppoſition and obedience, catches it without ſuſtaining the leaſt injury. The caſe is exactly the ſame in riding: the ſkilful horſeman will recover his poiſe, by giving ſome way to the motion; and the ignorant horſeman will be flung out of his ſeat, by endeavouring to be fixed.

Stretch not out your legs before you; this will puſh you againſt the back of the ſaddle: neither gather up your knees, like a man riding on a pack; this throws your thighs upwards: each practice unſeats you. Keep your legs ſtraight down; and ſit not on the moſt fleſhy part of the thighs, but turn them inwards, ſo as to bring in your knees and toes: and it is more ſafe to ride with the ball of the foot preſſing on the ſtirrup, than with the ſtirrup as far back as the heel; for the preſſure of the heel being in that caſe behind the ſtirrup, keeps the thighs down.

When you find your thighs thrown upwards, widen your knees to get them and the upper part of your fork lower down on the horſe. Graſp the ſaddle with the hollow or inner part of your thighs, but not more than juſt to aſſiſt the balance of your body: this will alſo enable you to keep your ſpurs from the horſe's ſides, and to bring your toes in, without that affected and uſeleſs manner of bringing them in practiſed by many. Sink your heels ſtraight down; for while your heels and thighs keep down, you cannot fall: this (aided with the bend of the back) gives the ſecurity of a ſeat, to thoſe who bear themſelves up in their ſtirrups in a ſwift gallop, or in the alternate riſing and falling in a full trot.

Plain r for ba horſem

Let your ſeat determine the length of your ſtirrups, rather than the ſtirrups your ſeat. If more precision is requiſite, let your ſtirrups (in the hunting ſaddle) be of ſuch a length, as that, when you ſtand in them, there may be the breadth of four fingers between your ſeat and the ſaddle.

It would greatly aſſiſt a learner, if he would practiſe riding in a large circle, as directed ſect. ii. without ſtirrups; keeping his face looking on the outward part of the circle ſo as not to have a full view of the horſe's head, but juſt of that ear which is on the outward part of the circle; and his ſhoulder, which is towards the centre of the circle, very forward. By this means you learn to balance your body, and keep a true ſeat, independent of your ſtirrups: you may probably likewiſe eſcape a fall, ſhould you at any time loſe them by being accidentally ſhaken from your ſeat.

As the ſeat in ſome meaſure depends on the ſaddle, it may not be amiſs to obſerve, that becauſe a ſaddle with a high pommel is thought dangerous, the other extreme prevails, and the pommel is ſcarce allowed to be higher than the middle of the ſaddle. The ſaddle ſhould lie as near the back-bone as can be, without hurting the horſe; for the nearer you ſit to his back, the better ſeat you have. If it does ſo, it is plain the pommel muſt riſe enough to ſecure the withers from preſſure: therefore, a horſe whoſe withers are higher than common, requires a higher pommel. If, to avoid this, you make the ſaddle of a more ſtraight line, the inconvenience ſpoken of follows; you ſit too much above the horſe's back, nor can the ſaddle form a proper ſeat. There ſhould be no ridge from the button at the ſide of the pommel, to the back part of the ſaddle. That line alſo ſhould be a little concave, for your thighs to lie at eaſe. In ſhort, a ſaddle ought to be, as nearly as poſſible, as if cut out of the horſe.

When you want your horſe to move forward, raiſe his head a little, and touch him gently with your whip; or elſe, preſs the calves of your legs againſt his ſides. If he does not move faſt enough, preſs them with more force, and ſo till the ſpur juſt touches him. By this practice, he will (if he has any ſpirit) move upon the laſt preſſure of the leg. Never ſpur him by a kick; but if it be neceſſary to ſpur him briſkly, keep your heels cloſe to his ſides, and ſlacken their force as he becomes obedient.

When your horſe attempts to be vitious, take each rein ſeparate, one in each hand, and advancing your arms forward, hold him very ſhort. In this caſe, it is common for the rider to pull him hard, with his arms low. But the horſe by this means having his head low too, has it more in his power to throw out his heels: whereas, if his head be raiſed very high, and his noſe thrown out a little, which is conſequent, he can neither riſe before nor behind; becauſe he can give himſelf neither of thoſe motions, without having his head at liberty. A plank placed *in æquilibrio*, cannot riſe at one end unleſs it ſinks at the other.

If your horſe is headſtrong, pull not with one con-

ti-

Plain rules for bad horsemen.

tinued pull, but ſtop, and back him often, juſt ſhaking the reins, and making little repeated pulls till he obeys. Horſes are ſo accuſtomed to bear on the bit when they go forward, that they are diſcouraged if the rider will not let them do ſo.

If a horſe is looſe-necked, he will throw up his head at a continued pull; in which ſituation, the rider, ſeeing the front of his face, can have no power over him. When your horſe does thus, drop your hand and give the bridle play, and he will of courſe drop his head again into its proper place: while it is coming down, make a ſecond gentle pull, and you will find his mouth. With a little practice, this is done almoſt inſtantaneouſly; and this method will ſtop, in the diſtance of a few yards, a horſe, which will run away with thoſe who pull at him with all their might. Almoſt every one muſt have obſerved, that when a horſe feels himſelf pulled with the bridle, even when he is going gently, he often miſtakes what was deſigned to ſtop him, as a direction to bear on the bit and to go faſter.

Keep your horſe's head high, that he may raiſe his neck and creſt; play a little with the rein, and move the bit in his mouth, that he may not preſs on it in one conſtant and continued manner: be not afraid of raiſing his head too high; he will naturally be too ready to bring it down, and tire your arms with its weight, on the leaſt abatement of his mettle. When you feel him heavy, ſtop him, and make him go back a few paces: thus you break by degrees his propenſity to preſs on his bridle.

You ought not to be pleaſed (though many are) with a round neck, and a head drawn in towards his breaſt: let your horſe carry his head bridling in, provided he carries it high, and his neck arching upwards; but if his neck bends downwards, his figure is bad, his ſight is too near his toes, he leans on the bridle, and you have no command over him. If he goes preſſing but lightly on the bridle, he is the more ſure-footed, and goes pleaſanter; as your wriſt only may guide him. If he hangs down his head, and makes you ſupport the weight of that and his neck with your arms bearing on his fore-legs, (which is called *being on his ſhoulders*), he will ſtrike his toes againſt the ground, and ſtumble.

If your horſe is heavy upon the bit, tie him every day, for an hour or two, with his tail to the manger, and his head as high as you can make him lift it, by a rein on each poſt of the ſtall, tied to each ring of the ſnaffle bit.

Horſe-breakers and grooms have a great propenſity to bring a horſe's head *down*, and ſeem to have no ſeat without a ſtrong hold by the bridle. They know indeed, that the head ſhould yield to the reins, and the neck form an arch; but do not take the proper pains to make it an arch *upward*. A temporary effect of attempting to raiſe a horſe's head, may perhaps be making him puſh out his noſe. They will here tell you, that his head is too high already; whereas it is not the diſtance from his *noſe*, but from the *top* of his head, to the ground, which determines the head to be high or low. Beſides, although the fault is ſaid to be in the manner of carrying the head, it ſhould rather be ſaid to be in that of the neck; for if the neck was raiſed, the head would be more in the poſition of one ſet on a well formed neck.

The deſign therefore of lifting up the head, is to raiſe the neck, and *thereby* bring in the head; for even while the bridle makes the ſame line from the rider's hand to the bit, the horſe's noſe may be either drawn in, or thruſt out, according as his neck is raiſed or depreſſed. Inſtead of what has been here recommended, we uſually ſee colts broke with their heads caveſſoned very low, their necks ſtiff, and not in the leaſt ſuppled. When the breaking-tackle is left off, and they are mounted for the road, having more food and reſt, they frequently plunge, and a ſecond breaking becomes neceſſary. Then, as few gentlemen can manage their own horſes, they are put into the hands of grooms, from whom they learn a variety of bad habits.

If, on the other hand, your horſe carries his head (or rather his noſe) too high, he generally makes ſome amends by moving his ſhoulders lightly, and going ſafely. Attend to the cauſe of this fault. Some horſes have their necks ſet ſo low on their ſhoulders, that they bend firſt down, then upwards, like a ſtag's. Some have the upper line of their necks, from their ears to their withers, too ſhort. A head of this ſort cannot poſſibly bend inwards and form an arch, becauſe the vertebræ (or neck bones) are too ſhort to admit of flexure; for in long and ſhort necked horſes the number of the vertebræ is the ſame. In ſome, the jaw is ſo thick, that it meets the neck, and the head by this means has not room to bend. On the other hand, ſome have the under line from the jaw to the breaſt, ſo ſhort, that the neck cannot riſe.

In all theſe caſes you may gain a *little* by a nice hand with an eaſy bit; but no curb, martingale, or other forcible method, will *teach* a horſe to carry his head or neck in a poſture which nature has made uneaſy to him. By trying to pull in his noſe farther than he can bear, you will add a bad habit to nature. You could not indeed *contrive* a more effectual method to make him continually toſs his noſe up, and throw his foam over you.

The rule already given to ride a looſe-necked horſe, will be a proper one for all light-mouthed horſes: one caution being added, which is, always to ſearch whether his ſaddle or girths may not in ſome way pinch him; and whether the bit may not hurt his lip by being too high in his mouth: becauſe, whenever he frets from either of theſe cauſes, his head will not be ſteady.

It is a common cuſtom to be always pulling at the bridle, as if to ſet off to advantage either the ſpirit of the horſe, or the ſkill of the rider. Our horſes therefore are taught to hold their heads low, and pull ſo, as to bear up the rider from the ſaddle, ſtanding in his ſtirrups, even in the gentleſt gallop: how very improper is this, we are experimentally convinced, when we happen to meet with a horſe which gallops otherwiſe. We immediately ſay, *he canters excellently*, and find the eaſe and pleaſure of his motion. When horſes are deſigned for the race, and ſwiftneſs is the only thing conſidered, the method may be a good one.

It is not to be wondered that *dealers* are always pulling at their horſes; that they have the ſpur conſtantly in their ſides, and are at the ſame time continually checking the rein: by this means they make them bound, and champ the bit, while their rage has the

Plain rules for bad horſemen.

the appearance of ſpirit. Theſe people ride with their arms ſpread, and very low on the ſhoulders of their horſes: this method makes them ſtretch their necks, and gives a better appearance to their fore-hands; it conceals alſo a thick jaw, which, if the head was up, would prevents its yielding to the bit; it hides likewiſe the ewe-neck, which would otherwiſe ſhew itſelf. Indeed, if you have a horſe unſteady to the bit, formed with a natural heavy head, or one which carries his noſe obſtinately in the air, you muſt find his mouth where you can, and make the beſt of him.

Many horſes are taught to ſtart by whipping them for ſtarting. How is it poſſible they can know it is deſigned as a puniſhment? In the riding-houſe, you teach your horſe to riſe up before, and to ſpring and laſh out his hinder legs, by whipping him when tied between two pillars, with his head a little at liberty. If he underſtood this to be a puniſhment for doing ſo, he would not by that method learn to do it. He ſeems to be in the ſame manner *taught* to ſpring and fly when he is frightened. Moſt horſes would go quietly paſt an object they were beginning to fly from, if their riders, inſtead of gathering up their bridles, and ſhewing themſelves ſo ready, ſhould throw the reins looſe upon their necks.

When a horſe ſtarts at any thing on one ſide, moſt riders turn him out of the road, to make him go up to what he ſtarts at: if he does not get the better of his fear, or readily comply, he generally goes paſt the object, making with his hinder parts, or croup, a great circle out of the road; whereas, he ſhould learn to keep ſtraight on, without minding objects on either ſide.

If he ſtarts at any thing on the left, hold his head high, and keep it ſtraight in the road, pulling it *from* looking at the thing he ſtarts at, and keeping your right leg hard preſſed againſt his ſide, towards his flank: he will then go ſtraight along the road. By this method, and by turning his head a little more, he may be forced with his croup cloſe up to what frightened him; for as his head is pulled one way, his croup neceſſarily turns the other. Always avoid a quarrel with your horſe, if you can: if he is apt to ſtart, you will find occaſions enough to exerciſe his obedience, when what he ſtarts at lies directly in his way, and you *muſt* make him paſs; if he is not ſubject to ſtart, you ſhould not contend with him about a trifle.

It muſt be obſerved, however, that this rule in going paſt an object may perhaps be a little irregular in a managed horſe, which will always obey the leg: but even ſuch a horſe, if he is really afraid, and not reſtive, it may not be amiſs to make look another way; unleſs the object be ſomething you would particularly accuſtom him to the ſight of.

The caſe will alſo be different with a horſe whoſe fear is owing to his being not uſed to objects; but ſuch a one is not to be rode by any horſeman to whom theſe rules are directed: the ſtarting here meant ariſes merely from the horſe's being pamper'd, and ſpringing through liveline's.

The notion of the neceſſity of making a horſe go immediately up to every thing he is afraid of, and not ſuffering him to become maſter of his rider, ſeems to be in general carried too far. It is an approved and good method to conquer a horſe's fear of the ſound of a drum, by beating one near to him at the time of feeding him: this not only familiarizes the noiſe to him, but makes it pleaſant, as a fore-runner of his meat *; whereas, if he was whipped up to it, he might perhaps ſtart at it as long as he lived. Might not this be applied to his ſtarting at other things, and ſhew that it would be better to ſuffer him (provided he does not turn back) to go a little from, and avoid an object he has a diſlike to, and to accuſtom him to it by degrees, convincing him, as it were, that it will not hurt him; than to puniſh him, quarrel with him, and perhaps ſubmit to his will at laſt, while you inſiſt on his overcoming his fear in an inſtant? If he ſees a like object again, it is probable he will recollect his dread, and arm himſelf to be diſobedient.

Plain for t horſem

* See ſect. v.

We are apt to ſuppoſe, that a horſe fears nothing ſo much as his rider: but may he not, in many circumſtances, be afraid of inſtant deſtruction? of being cruſhed? of being drowned? of falling down a precipice? Is it a wonder that a horſe ſhould be afraid of a loaded waggon? may not the hanging load ſeem to threaten the falling on him? There cannot be a rule more general, than, in ſuch a caſe, to ſhew him there is room for him to paſs. This is done by turning his head a very little from the carriage, and preſſing your leg, which is fartheſt from it, againſt his ſide.

A horſe is not to ſtop without a ſign from his rider.—Is it not then probable, that when he is driven up to a carriage he ſtarts at, he conceives himſelf obliged either to attack or run againſt it? Can be underſtand the rider's ſpurring him with his face directed to it, as a ſign for him to paſs it? That a horſe is eaſily alarmed for his face and eyes, (he will even catch back his head from a hand going to careſs him); that he will not go with any force, face to face, even to another horſe, (if in his power to ſtop); and that he ſees perfectly ſideways,—may be uſeful hints for the treatment of horſes, with regard to ſtarting.

Though you ought not to whip a horſe for ſtarting, there can be no good effect from clapping his neck with your hand to encourage him. If one took any notice of his ſtarting, it ſhould be rather with ſome tone of voice which he uſually underſtood as an expreſſion of diſlike to what he is doing; for there is *oppoſition* mixed with his ſtarting, and a horſe will ever repeat what he finds has foiled his rider.

Notwithſtanding the direction above given, of not preſſing a horſe up to a carriage he ſtarts at; yet if one which you apprehend will frighten him meets you at a narrow part of the road, when you have once let him know he is to paſs it, be ſure you remain determined, and preſs him on. Do this more eſpecially when part of the carriage has already paſſed you: for if, when he is frightened, he is accuſtomed to go back, and turn round, he will certainly do it if he finds, by your hand ſlackening, and legs not preſſing, that you are irreſolute; and this at the moſt dangerous point of time, when the wheels of the carriage take him as he turns. Remember not to touch the curb-rein at this time; it will certainly check him. It is not known to every one, that the perſon who would lead a horſe by the bridle, ſhould not turn his face to him when he refuſes to follow him: if, beſides this, he raiſes his arms, ſhews his whip, or pulls the bridle with jerks, he frightens the horſe, inſtead of perſuading

Plain rules for bad horſemen.

ding him to follow; which a little patience may bring about.

Ride with a ſnaffle; and uſe your curb, if you have one, only occaſionally. Chooſe your ſnaffle full and thick in the mouth, eſpecially at the ends to which the reins are faſtened. Moſt of them are made too ſmall and long; they cut the horſe's mouth, and bend back over the bars of his jaw, working like pincers.

The management of the curb is too nice a matter to enter on here, farther than to preſcribe great caution in the uſe of it: a turn of the wriſt, rather than the weight of your arm, ſhould be applied to it. The elaſticity of a rod, when it hath hooked a fiſh, may give you ſome idea of the proper play of a horſe's head on his bridle; his ſpirit and his pliableneſs are both marked by it.

A horſe ſhould never be put to do any thing in a curb, which he is not ready at: you may force him, or pull his head any way, with a ſnaffle; but a curb acts only in a ſtraight line. It is true, that a horſe will be turned out of one track into another by a curb, but it is becauſe he knows it as a *ſignal*. When he is put to draw a chair, and does not underſtand the neceſſity he is then under of taking a larger ſweep when he turns, you frequently ſee him *reſtive*, as it is then called: but put him on a ſnaffle, or buckle the rein to that part of the bit which does not curb him; and the horſe ſubmits to be pulled about, till he underſtands what is deſired of him. Theſe directions ſuppoſe your horſe to have ſpirit, and a good mouth: if he has not, you muſt take him as he is, and ride him with ſuch a bit as you find moſt eaſy to yourſelf.

When you ride a journey, be not ſo attentive to your horſe's nice carriage of himſelf, as to your encouragement of him, and keeping him in good-humour. Raiſe his head; but if he flags, you may indulge him with bearing a little more upon the bit than you would ſuffer in an airing. If a horſe is lame, tender-footed, or tired, he naturally hangs upon his bridle. On a journey, therefore, his mouth will depend greatly on his ſtrength and the goodneſs of his feet. Be then very careful about his feet, and let not a farrier ſpoil them. You will be enabled to keep them from danger, by the directions given under the article SHOEING.

Very few, although practiſed in riding, know they have any power over a horſe, but by the bridle; or any uſe for the ſpur, except to make him go forward. A little experience will teach them a farther uſe. If the left ſpur touches him (and he is at the ſame time prevented from going forward), he has a ſign, which he will ſoon underſtand, to move ſideways to the right. In the ſame manner to the left, if the right ſpur is cloſed to him: he afterwards, through fear of the ſpur, obeys a touch of the leg; in the ſame manner as a horſe moves his croup from one ſide of the ſtall to the other, when any one ſtrikes him with his hand. In ſhort, his croup is guided by the leg, as his head is by the bridle. He will never diſobey the leg, unleſs he becomes reſtive. By this means you will have a far greater power over him: he will move ſideways, if you cloſe one leg to him; and ſtraight forward, if both: even when he ſtands ſtill, your legs hold near him will keep him on the watch; and with the ſlighteſt, unſeen motion of the bridle upwards, he will raiſe his head, and ſhew his forehand to advantage.

Plain rules for bad horſemen.

On this uſe of the legs of the rider, and guidance of the croup of the horſe, are founded all the *airs* (as the riding-maſters expreſs themſelves) which are taught in the manage; the paſſage, or ſide-motion of troopers to cloſe or open their files, and indeed all their evolutions. But the convenience of ſome degree of this diſcipline for common uſe, is the reaſon of mentioning it here. It is uſeful if a horſe is apt to ſtumble or ſtart. If to the firſt, by preſſing your legs to his flank, and keeping up his head, he is made to go light on his fore-legs, which is aiding and ſupporting him; and the ſame if he does actually ſtumble, by helping him at the very inſtant to exert himſelf, while as yet any part of him remains not irrecoverably impreſſed with the precipitate motion. Hence this uſe of the hand and legs of the rider is called *giving aids* to a horſe; for, as to holding up the weight of a heavy unactive horſe, by mere pulling, it is as impoſſible as to recover him when falling down a precipice.

A horſe is ſupported and helped by the hands and legs of his rider, in every action they require of him; hence he is ſaid to perform his *airs* by the *aids* from his rider.

The ſame manner is uſeful if a horſe ſtarts. For if when he is beginning to fly to one ſide, you leg on the ſide he is flying to, he ſtops his ſpring immediately. He goes paſt what he ſtarted at, keeping ſtraight on, or as you chooſe to direct him; and he will not fly back from any thing, if you preſs him with both legs. You keep his haunches under him, going down a hill; help him on the ſide of a bank; more eaſily avoid the wheel of a carriage; and approach more gracefully and nearer to the ſide of a coach, or horſeman. When a pampered horſe curvets irregularly, and twiſts his body to and fro, turn his head either to the right or left, or both alternately, (but without letting him move out of the track), and preſs your leg to the oppoſite ſide: your horſe cannot then ſpring on his hind-legs to one ſide, becauſe your leg prevents him; nor to the other, becauſe his head looks that way, and a horſe does not ſtart and ſpring to the ſide on which he looks. Here it may not be amiſs to obſerve the impropriety of the habit which many riders have, of letting their legs ſhake againſt the ſides of the horſe: if a horſe is taught, they are then continually preſſing him to violent action; and if he is not, they render him inſenſible and incapable of being taught. The fretting of a hot horſe will hence be exceſſive, as it can no otherwiſe be moderated, than by the utmoſt ſtillneſs of the ſeat, hands, and legs of the rider.

Colts at firſt are taught to *bear* a bit, and by degrees to *pull* at it. If they did not preſs it, they could not be guided by it. By degrees they find their necks ſtronger than the arms of a man; and that they are capable of making great oppoſition, and often of foiling their riders. Then is the time to make them ſupple and pliant in every part. The part which of all others requires moſt this pliancy, is the neck. Hence the metaphor of *ſtiff-necked* for *diſobedient*. A

horſe cannot move his head, but with the muſcles of his neck: this may be called his *helm*; it guides his courſe, changes and directs his motion.

The uſe of this pliancy in the different parts and limbs of a horſe has been already ſhewn in a former ſection. The preſent ſection being directed to the *unexperienced* horſeman, it may ſuffice to add, that *his* idea of ſuppleneſs need only be, that of an ability and readineſs in a horſe to move every limb, on a ſign given him by the hands or legs of his rider; as alſo, to bend his body, and move in a ſhort compaſs, quick and collected within himſelf, ſo as inſtantly to be able to perform any other motion.

HOR

Horſham ‖ Hortus.

HORSHAM, a town of Suſſex in England, ſeated near St Leonard's foreſt, ſending two members to parliament. W. Long. 0. 22. N. Lat. 51. 10.

HORSTIUS (James), profeſſor of medicine in the univerſity of Helmſtadt, in the 16th century. He joined devotion with the knowledge and practice of phyſic. He carefully prayed to God to bleſs his preſcriptions, and publiſhed a form of prayer upon this ſubject. He alſo wrote, 1. A treatiſe on the qualities of a good phyſician. 2. Another on the qualities of a good apothecary. 3. A treatiſe of the plague, in German. 4. A commentary *in libros Hippocratis de corde*, and other works.

HORSTIUS (Gregory), nephew of the former, called *the Æſculapius of Germany*, publiſhed ſeveral books, which are eſteemed.

HORTAGILERS, in the grand ſignior's court, upholſterers, or tapeſtry-hangers. The grand ſignior has conſtantly 400 in his retinue when he is in the camp: theſe go always a day's journey before him, to fix upon a proper place for his tent, which they prepare firſt; and afterwards thoſe of the officers, according to their rank.

HORTENSIUS (Quintus), a celebrated Roman orator, the cotemporary of Cicero, pleaded with univerſal applauſe at 19 years of age, and continued the ſame profeſſion during 48 years. But being at laſt eclipſed by Cicero, he quitted the bar, and embraced a military life; became a military tribune, prætor, and afterwards conſul, about 70 B. C. Cicero ſpeaks of him in ſuch a manner as makes us regret the loſs of his orations. Hortenſius had a wonderful memory, and delivered his orations without writing down a ſingle word, or forgetting one particular that had been advanced by his adverſaries. He died very rich, a little before the civil war, which he had endeavoured by all poſſible means to prevent.

HORTUS SICCUS, a DRY GARDEN; an appellation given to a collection of ſpecimens of plants, carefully dried and preſerved.

Take a ſpecimen of a plant in flower, and with it one of its bottom-leaves, if it have any; bruiſe the ſtalk, if too rigid; ſlit it, if too thick; ſpread out the leaves and flowers on paper; cover the whole with more paper, and lay a weight over all. At the end of 18 hours take out the plants, now perfectly flatted; lay them on a bed of dry common ſand; ſift over them more dry ſand, to the depth of two inches, and thus let them lie about three weeks: the leſs ſucculent dry much ſooner, but they take no harm afterwards. If the floor of a garret be covered in ſpring with ſand two inches deep, leaving ſpace for walking to the ſeveral parts, it will receive the collection of a whole ſummer, the covering of ſand being ſifted over every parcel as laid in. They need no farther care, from the time of laying them, till they are taken up to be

HOR

ſtuck on paper. The cement uſed is a ſolution of gum-arabic in water. Hoſanna ‖ Hoſpinian

Plants may be dried very well without ſand, by only putting them frequently into freſh quires of paper, or a few by only preſſing them between the leaves of a book; but the ſand-method preſerves the colour beſt, and is done with leaſt trouble.

HOSANNA, a Hebrew word, ſignifying *ſave now*, or *ſave, we beſeech thee*; from the frequent uſe of which, during the feaſt of tabernacles, the whole ſolemnity got the appellation of *Hoſanna Rabbi*.

HOSE, from the Saxon *Hoſa*, a ſtocking. See STOCKING.

HOSEA, a canonical book of the Old Teſtament, ſo called from the prophet of that name, its author, who was the ſon of Beri, and the firſt of the leſſer prophets. He lived in the kingdom of Samaria, and delivered his prophecies under the reign of Jeroboam II. and his ſucceſſors, kings of Iſrael; and under the reigns of Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah. His principal deſign is to publiſh the groſs idolatries of the people of Iſrael and Judah, to denounce the divine vengeance againſt them, and to foretel the captivity in Aſſyria.

In the beginning of Hoſea's prophecy, we read that the Lord directed him *to take unto him a wife of whoredoms, and children of whoredoms*; that is, to marry a woman of a bad life. This was deſigned as a figurative deſcription of the idolatry and infidelity of Samaria and the ten tribes, formerly the Lord's ſpouſe, but afterwards become adulterous and corrupt. Many interpreters, ſhocked at the irregularity of this marriage of the prophet, fancy that it only paſſed in viſion; whilſt others think, that the marriage was real, though figurative of the things it deſcribed, and which were afterwards to be performed.

HOSPINIAN (Rodolphus), one of the greateſt writers that Switzerland has given birth to. He was born in 1547, at Altorf near Zurich; obtained the freedom of Zurich; and was made proviſor of the abbey ſchool. Notwithſtanding this employment, he undertook a noble work of vaſt extent, which was a *Hiſtory of the Errors of Popery*. Though he could not complete this work according to his plan, he publiſhed ſome conſiderable parts of it: what he publiſhed on the Euchariſt, and another work called *Concordia Diſcors*, exceedingly exaſperated the Lutherans. He did not reply to them; but turning his arms againſt the Jeſuits, publiſhed *Hiſtoria Jeſuitica*, &c. Theſe writings gained him preferment; he being appointed archdeacon of Caroline church, and then miniſter of the abbey-church. He died in 1626; and there was an edition of his works publiſhed at Geneva 1681, in ſeven volumes in folio.

HOSPITAL

Hofpital. HOSPITAL (Michael de l'), chancellor of France in the 16th century, was one of the greateſt men of his age, and had raiſed himſelf by degrees. He agreed to an edict much ſeverer againſt the Proteſtants than he could have wiſhed, to prevent the introduction of the inquiſition. It was that of Romorantin. The ſpeeches he made, in order to inſpire a ſpirit of toleration, made him much ſuſpected by the Roman Catholics, and extremely odious to the court of Rome. The maxims of ſtate, upon which he regulated himſelf, were of great advantage to France, ſince he formed ſome diſciples who oppoſed, in proper time, the pernicious attempts of the leaguers, and rendered them abortive.—His pacific views being diſliked by Catharine de Medicis, who had contributed to his advancement, ſhe excluded him from the council of war, and occaſioned his diſgrace. He retired, however, of his own accord, in 1568; and ſpent the reſt of his life at his country-ſeat at Vignai, where he died in 1573, aged 68. His poems are eſteemed. He alſo publiſhed ſome excellent ſpeeches and memoirs.

HOSPITAL, popularly SPITTAL, a place or building erected, out of charity, for the reception and ſupport of the poor, aged, infirm, ſick, and otherwiſe helpleſs. The word is formed of the Latin *hoſpes*, "hoſt, ſtranger." See HOST.

In the ages of the church, the biſhop had the immediate charge of all the poor, both ſound and diſeaſed, as alſo of widows, orphans, ſtrangers, &c.—When the churches came to have fixed revenues allotted them, it was decreed, that at leaſt one fourth part thereof ſhould go to the relief of the poor; and to provide for them the more commodiouſly, divers houſes of charity were built, which are ſince denominated *hoſpitals*. They were governed wholly by the prieſts and deacons, under the inſpection of the biſhop. In courſe of time, ſeparate revenues were aſſigned for the hoſpitals; and particular perſons, out of motives of piety and charity, gave lands and money for erecting of hoſpitals. When the church-diſcipline began to relax, the prieſts, who till then had been the adminiſtrators of hoſpitals, converted them into a ſort of benefices, which they held at pleaſure, without giving account thereof to any body; reſerving the greateſt part of the income to their own uſe; ſo that the intentions of the founders were fruſtrated.—To remove this abuſe, the council of Vienne expreſsly prohibited the giving any hoſpital to ſecular prieſts in the way of a benefice; and directed the adminiſtration thereof to be given to ſufficient and reſponſible laymen, who ſhould take an oath, like that of tutors, for the faithful diſcharge thereof, and be accountable to the ordinaries.—This decree was executed and confirmed by the council of Trent.

In Britain, hoſpitals are buildings properly endowed, or otherwiſe ſupported by charitable contributions, for the reception and ſupport of the poor, aged, infirm, ſick, or helpleſs.

A charitable foundation laid thus for the ſuſtenance and relief of the poor, is to continue for ever. Any perſon ſeized of an eſtate in fee, may, by deed inrolled in chancery, erect and found an hoſpital, and nominate ſuch heads and governors therein as he ſhall think fit; and this charitable foundation ſhall be incorporated, and ſubject to the inſpection and guidance of the heads and viſitors nominated by the founder. Likewiſe ſuch corporations ſhall have, take, and purchaſe lands, ſo as not to exceed 200 l. a-year, provided the ſame be not held of the king; and to make leaſes, reſerving the accuſtomed yearly rent *. Hoſpital ‖ Hoſt.

* See *Corporation*.

HOSPITAL-*Fever*, a name given to the malignant catarrhal fever, as being frequent in hoſpitals. See (the *Index* ſubjoined to) MEDICINE.

HOSCHIUS (Sidronius), a jeſuit, who was born at Marke, in the dioceſe of Ypres, in 1596, and died at Tongres in 1653. He wrote ſome elegies and other poems in Latin, with great purity and elegance.

HOSPITALITY, the practice of entertaining ſtrangers.—Dr Robertſon ſpeaking of the middle ages, ſays, "Among people whoſe manners are ſimple, and who are ſeldom viſited by ſtrangers, hoſpitality is a virtue of the firſt rank. This duty of hoſpitality was ſo neceſſary in that ſtate of ſociety which took place during the middle ages, that it was not conſidered as one of thoſe virtues which men may practiſe or not, according to the temper of their minds and the generoſity of their hearts. Hoſpitality was enforced by ſtatutes, and thoſe who neglected the duty were liable to puniſhment. The laws of the Slavi ordained that the moveables of an inhoſpitable perſon ſhould be confiſcated, and his houſe burnt. They were even ſo ſolicitous for the entertainment of ſtrangers, that they permitted the landlord to ſteal for the ſupport of his gueſt."

HOSPITALLERS, an order of religious knights, now known by the title of *knights of Malta*. See MALTA.

HOSPITIUM, a term uſed in old writers either for an inn or a monaſtery, built for the reception of ſtrangers and travellers. See INN and MONASTERY.

HOSPODAR, a title borne by the princes of Walachia and Moldavia, who receive the inveſtiture of their principalities from the grand ſignior. He gives them a veſt and ſtandard; they are under his protection, and obliged to ſerve him, and he even ſometimes depoſes them; but in other reſpects they are abſolute ſovereigns within their own dominions.

HOST, HOSPES, a term of mutual relation, applied both to a perſon who lodges and entertains another, and to the perſon thus lodged, &c.—The word is formed of the Latin *hoſpes*, which ſome will have thus called, *quaſi hoſtium* or *oſtium petens*; for *oſtium* was anciently wrote with an aſpirate.—Thus the innkeeper ſays, he has a good *hoſt*, in ſpeaking of the traveller who lodges with him: and the traveller, again, ſays, he has a kind *hoſt*, in ſpeaking of his landlord.

It muſt be obſerved then, that it was the cuſtom among the ancients, when any ſtranger aſked for lodging, for the maſter of the houſe, and the ſtranger, each of them to ſet a foot on their own ſide of the threſhold, and ſwear they would neither of them do any harm to the other.—It was this ceremony that raiſed ſo much horror againſt thoſe who violated the law or right of hoſpitality on either ſide; inaſmuch as they were looked on as perjured.

Inſtead of *hoſpes*, the ancient Latins called it *hoſtis*; as Cicero himſelf informs us: though in courſe of time, *hoſtis* came to ſignify an enemy; ſo much was the notion of hoſpitality altered.

Hoſt || Hot-beds.

HOST, in the church of Rome, a name given to the elements uſed in the euchariſt, or rather to the conſecrated wafer; which they pretend to offer up every day, a new hoſt or ſacrifice for the ſins of mankind.—They pay adoration to the hoſt, upon a falſe preſumption that the elements are no longer bread and wine, but tranſubſtantiated into the real body and blood of Chriſt. See TRANSUBSTANTIATION.

HOSTAGE, a perſon given up to an enemy as a ſecurity for the performance of the articles of a treaty.

HOT-*Beds*, in gardening, beds made with freſh horſe-dung, or tanner's bark, and covered with glaſſes to defend them from cold winds.

By the ſkilful management of hot-beds, we may imitate the temperature of warmer climates; by which means, the ſeeds of plants brought from any of the countries within the torrid zone, may be made to flouriſh even under the poles.

The hot-beds commonly uſed in kitchen-gardens, are made with new horſe-dung mixed with the litter of a ſtable, and a few ſea-coal-aſhes, which laſt are often turned over, and the parts mixed well together, it ſhould be again caſt into a heap; where it may continue five or ſix days longer, by which time it will have acquired a due heat. Theſe hot-beds are made in the following manner: In ſome ſheltered part of the garden, dig out a trench of a length and width proportionable to the frames you intend it for; and if the ground be dry, about a foot or a foot and a half deep; but if it be wet, not above ſix inches: then wheel the dung into the opening, obſerving to ſtir every part of it with a fork, and to lay it exactly even and ſmooth on every part of the bed, laying the bottom part of heap, which is commonly free from litter, upon the ſurface of the bed: and if it be deſigned for a bed to plant out cucumbers to remain for good, you muſt make a hole in the middle of the place deſigned for each light about ten inches over, and ſix deep, which ſhould be filled with good freſh earth, thruſting in a ſtick to ſhew the places where the holes are; then cover the bed all over with the earth that was taken out of the trench, about four inches thick, and put on the frame, letting it remain till the earth be warm, which commonly happens in three or four days after the bed is made, and then the plants may be placed in it. But if your hot-bed be deſigned for other plants, there need be no holes made in the dung; but after having ſmoothed the ſurface with a ſpade, you ſhould cover the dung about three or four inches thick with good earth, putting on the frames and glaſſes as before. In making theſe beds, care muſt be taken to ſettle the dung cloſe with a fork; and if it be pretty full of long litter, it ſhould be trod down equally on every part. During the firſt week or ten days after the bed is made, you ſhould cover the glaſſes but ſlightly in the night, and in the day-time carefully raiſe them, to let out the ſteam: but as the heat abates, the covering ſhould be increaſed; and as the bed grows cold, new hot dung ſhould be added round the ſides of it.

The hot-bed made with tanner's bark, is, however, much preferable to that deſcribed above, eſpecially for all tender exotic plants and fruits, which require an even degree of warmth to be continued for ſeveral months, which cannot be effected with horſe-dung. The manner of making them is as follows: Dig a trench about three feet deep, if the ground be dry; but if wet, it muſt not be above a foot deep at moſt, and muſt be raiſed two feet above the ground. The length muſt be proportioned to the frames intended to cover it; but it ſhould never be leſs than ten or twelve feet, and the width not leſs than ſix. The trench ſhould be bricked up round the ſides to the above-mentioned height of three feet, and filled in the ſpring with freſh tanner's bark that has been lately drawn out of their vats, and has lain in a round heap, for the moiſture to drain out of it, only three or four days: as it is put in, gently beat it down equally with a dung-fork; but it muſt not be trodden, which would prevent its heating, by ſettling it too cloſe: then put on the frame, covering it with glaſſes; and in about ten days or a fortnight, it will begin to heat; at which time plunge your pots of plants or ſeed into it, obſerving not to tread down the bark in doing it. Theſe beds will continue three or four months in a good temper of heat; and if you ſtir up the bark pretty deep, and mix a load or two of freſh bark with the old when you find the warmth decline, you will preſerve its heat two or three months longer. Many lay ſome hot horſe-dung in the bottom of the trench under the bark; but this ought never to be practiſed unleſs the bed is wanted ſooner than the bark would heat of itſelf, and even then there ought only to be a ſmall quantity of dung at the bottom.

The frames which cover theſe beds, ſhould be proportioned to the ſeveral plants they are deſigned to contain. If they are to cover the ananas or pine-apple, the back part ſhould be three feet high, and the lower part fifteen inches: if the bed be intended for taller plants, the frame muſt be made of a depth proportionable to them: but if it be for ſowing of ſeeds, the frame need not be above fourteen inches high at the back, and ſeven in the front; by which means, the heat will be much greater.

HOTEL, a French term, anciently ſignifying a houſe, or dwelling place.—It is now more commonly uſed for the palaces, or houſes of the king, princes, and great lords. In this ſenſe they ſay, the *hotel de Conde*, *hotel de Conti*, *hotel du Louvre*, &c.

The grand *prevot de l'hotel*, is the firſt judge of the officers of the king's houſehold. His juriſdiction is much like that of lord ſteward of the houſehold of the king of England.

The *hotel de ville* is what we call a *town-houſe*, or *town-hall*.

HOTEL, is likewiſe uſed for a large inn, alſo for a large lodging-houſe ready furniſhed.

HOTMAN (Francis), one of the moſt learned civilians in the 16th century. He profeſſed law at Bourges: but, on account of religion, retired to Geneva, read lectures on civil law there, and publiſhed books with ſuch ſtrength againſt the perſecutors, that great promiſes were made to him to engage him not to write any more in that manner; but he did not regard their offers. He died at Baſil in 1590. His *Franco-Gallia* is well known, having been done in Engliſh by lord Molesworth. Some perſons think he

Hot-beds || Hotman

was

Hottentots. was the author of *Vindiciæ contra Tyrannos*. All his works were printed at Geneva in 1599, in 3 vols folio.

HOTTENTOTS, a people in the ſouthern part of Africa, whoſe country ſurrounds the empire of Monomotapa, in form of a horſe-ſhoe, extending, according to Magin, from the Negroeſt of Cabo as far as the Cape of Good Hope; and from thence northward to the river Magnica, or Rio de St Spirita, including Mattatan a diſtinct kingdom. According to Santus, this coaſt, beginning at the Mountains of the Moon under the tropic of Capricorn in 23° ½ S. Lat. extends north beyond the Cape to the coaſt of Zanguebar; having the Indian ſea on the eaſt, the Ethiopic on the weſt, the ſouthern ocean on the ſouth; and on the north the kingdoms of Mattatan, Monomotapa, and the coaſt of Zanguebar, or rather the Mountains of the Moon, which divide it from the reſt of the continent.

The Europeans firſt became acquainted with this country in the year 1493, when Bartholomew Diaz, a Portugueſe admiral, diſcovered the moſt ſouthern point of Africa now called the *Cape of Good Hope*, but by him *Cabo dos totos tormentos*, or Cape of all Plagues, on account of the ſtorms he met with in the neighbourhood; but John, then king of Portugal, having from the account of Diaz concluded that a paſſage to the Eaſt Indies was now diſcovered, changed the name to that of the *Cape of Good Hope*, which it ſtill retains. In 1497, it was circumnavigated by Vaſco de Gama, who made a voyage to India that way; however, it remained uſeleſs to Europeans till the year 1650, when Van Riebeck a Duch ſurgeon firſt ſaw the advantages that would accrue to the Eaſt India company in Holland, from a ſettlement at ſuch a convenient diſtance both from home and from India. The colony which he planted has ever ſince continued in the hands of the Dutch, has greatly increaſed in value, and is viſited by all the European ſhips trading to the Eaſt Indies.

The country now poſſeſſed by the Dutch is of pretty conſiderable extent, and comprehends that part of the African coaſt on the weſt called *Terra de Natal*. It is naturally barren and mountainous; but the induſtry of the Dutch hath overcome all natural difficulties, and it now produces not only a ſufficiency of all the neceſſaries of life for the inhabitants, but alſo for the refreſhment of all the Europeans who paſs and repaſs that way.

The coaſt abounds in capes, bays, and roads. Thirty leagues to the eaſt of the Cape of Good Hope, in S. Lat. 34. 21. is another Cape which runs out beyond 35°, called by the Portugueſe, who firſt doubled it, *Cabo dos Agulhas*, or the *Cape of Needles*, on account of ſome ſtrange variations in the magnetical needle obſerved as they came near it. Near this Cape is a flat ſhore, with plenty of fiſh: it begins in the weſt near a freſh-water river, and, extending 15 leagues in the main ſea, ends in the eaſt near *Fiſh-bay*. Cabo Falſo, ſo called by the Portugueſe, who returning from India miſtook it for the Cape of Good Hope, lies to the eaſtward between theſe two capes, about eight or nine leagues beyond that of Good Hope. Along the coaſts, on both ſides of the Cape of Good Hope, are many fine bays, where ſhips may ride in the greateſt ſafety. Twenty-ſeven leagues to the northweſt is Saldonha bay, ſo named from a Portugueſe captain ſhipwrecked on the coaſt. The largeſt and moſt commodious is *Table* or *Vaſel Bay*, on the ſouth, and near the mountain of that name, ſix leagues in circumference, with four-fathom water cloſe to the beach, and ſheltered from all but northweſt winds, which blow ſtraight up. Oppoſite to this bay is *Robu Eilan*, or the Iſland of Rabbits, in 34. 30. S. Lat. 67 leagues eaſt from the Cape of Good Hope. Peter Both, in 1661, diſcovered a bay, which he named *Uleeſt*, ſheltered only from north winds, in which is a ſmall iſland, and on the weſt a rivulet of freſh water extremely convenient for European mariners. Twenty-five or thirty leagues farther eaſt, Both diſcovered Marſhall Bay, afterwards named by the Portugueſe *Seno Formoſo*. Next to this is *Seno de Lago*, from its reſemblance to a lake. There are ſeveral roads in this bay, and an iſland called *Ilha dos Caos*. Cabo de S. Franciſco, and Cabo das Serras are marked upon charts between theſe two bays. Near the latter of theſe capes is Cabo de Arecito, and the iſland Contento; and ſomething more north-eaſt is St Chriſtopher's river, called *San Chriſtovano* by the Portugueſe, and by the Hottentots *Nagad*. The country beyond this river, was called by the Portugueſe, who diſcovered it on the day of our Lord's nativity, *Terra de Natal*. Between the Cape of Good Hope and Cabo das Agulhas are the Sweet, Salt, and Jagulina rivers, which run into the ſea, and Sweet-water river flows from the Table-mountain. Hottentots.

The moſt remarkable mountains in this country are Table-hill, Lion-hill, Wind-hill, and the Tiger-hills. The three firſt lie near Table-bay, and ſurround Table-valley, where the Cape-town ſtands. The firſt is the higheſt, and extends to the ſouth and a little weſt, from the centre of the valley. Kolben determined its height to be 1857 feet. Mr Forſter, who lately viſited this part of the world, informs us, that "the extremity of Africa towards the ſouth is a maſs of high mountains, of which the outermoſt are craggy, black, and barren, conſiſting of a coarſe granite, which contains no heterogeneous parts, ſuch as petrified ſhells, &c. nor any volcanic productions. The ground gradually riſes on all ſides towards the three mountains which lie round the bottom of the bay, keeping low and level only near the ſea-ſide, and growing ſomewhat marſhy in the iſthmus between Falſe and Table Bays, where a ſalt rivulet falls into the latter. The marſhy part has ſome verdure, but intermixed with a great deal of ſand. The higher grounds, which, from the ſea-ſide, have a parched and dreary appearance, are, however, covered with an immenſe variety of plants, among which are a prodigious number of ſhrubs, but ſcarce one or two ſpecies that deſerve the name of *trees*. There are alſo a few ſmall plantations wherever a little run of water moiſtens the ground. The aſcent of Table-mount is very ſteep and difficult, on account of the number of looſe ſtones which roll away under the feet of the traveller. About the middle of the mountain is a bold, grand chaſm, whoſe walls are perpendicular and often impending rocks, piled up in ſtrata. Small rills of water ooze out of crevices, or fall from precipices in drops, giving life to hundreds of plants and low ſhrubs,

Hottentots. ſhrubs in the chaſm. The ſummit of the mountain is nearly level, very barren, and bare of ſoil; ſeveral cavities, however, are filled with rain water, or contain a ſmall quantity of vegetable earth, from whence a few odoriferous plants draw their nouriſhment. Some antelopes, howling baboons, ſolitary vultures, and toads, are ſometimes to be met with on the mountain. The view from thence is very extenſive and pictureſque. The bay ſeems a ſmall pond or baſon, and the ſhips in it dwindled to little boats; the town under our feet, and the regular compartments of its gardens, look like the work of children."

Moſt accounts of this country that have been publiſhed mention a ſurpriſing phenomenon which is annually to be ſeen on the top of Table-hill from September to March; namely, a white cloud hovering on its top, and is reckoned the cauſe of thoſe terrible ſouth-eaſt winds with which the Cape is infeſted. This cloud, called by ſailors *The Devil's table-cloth*, is ſaid by ſome to appear at firſt no bigger than a barley-corn; then increaſes to the ſize of a walnut, and ſoon after covers the whole top of the mount. But, according to Mr Kolben, it is never leſs, even on its firſt appearance, than the ſize of a large ox; often bigger. It hangs in ſeveral fleeces over the Table-hill, and the Wind or Devil's-hill; which fleeces, at laſt uniting, form a large cloud that covers the ſummits of theſe two hills. After this has reſted for ſome time without change or motion, the wind burſts out ſuddenly from it with the utmoſt fury. The ſkirts of the cloud are white, but ſeem much more compact than the matter of common clouds; the upper parts are of a leaden colour. No rain falls from it, but ſometimes it diſcovers a great deal of humidity; at which times it is of a darker colour, and the wind iſſuing from it is broken, raging by fits of ſhort continuance. In its uſual ſtate, the wind keeps up its firſt fury unabated for one, two, three, or eight days; and ſometimes for a whole month together. The cloud ſeems all the while undiminiſhed, though little fleeces are from time to time detached from it, and hurried down the ſides of the hills, vaniſhing when they reach the bottom, ſo that during the ſtorm the cloud ſeems to be ſupplied with new matter. When the cloud begins to brighten up, theſe ſupplies fail, and the wind proportionably abates. At length, the cloud growing tranſparent, the wind ceaſes. During the continuance of theſe ſouth-eaſt winds, the Table-valley is torn by furious whirlwinds. If they blow warm, they are generally of ſhort duration; and in this caſe, the cloud ſoon diſappears. This wind rarely blows till after ſunſet, and never longer than till towards midnight, though the cloud remains, but then it is thin and clear: but when the wind blows cold, it is a ſure ſign that it will laſt for ſome time, an hour at noon and midnight excepted; when it ſeems to lie ſtill to recover itſelf, and then lets looſe its fury anew.

The Europeans at the Cape conſider the year as divided into two ſeaſons, which they term *monſoons*. The wet monſoon or winter, and the dry one or ſummer. The firſt begins with our ſpring in March; the latter with September, when our ſummer ends. In the ſummer monſoon reign the ſouth-eaſt winds already mentioned; which, though they clear and render the air more healthy, yet make it difficult for ſhips outward bound to enter Table-bay. In the bad ſeaſon, the Cape is much ſubject to fogs; and the north-weſt winds and rain make the inhabitants ſtay much at home. But there are frequent intermiſſions and many clear days till June and July; when it rains almoſt continually, and from thence till ſummer. The weather in winter is cold, raw, and unpleaſant; but never more rigorous than autumn in Germany. Water never freezes to above the thickneſs of half a crown; and as ſoon as the ſun appears, the ice is diſſolved. The Cape is rarely viſited by thunder and lightning, excepting a little near the turn of the ſeaſons, which never does any hurt. During the continuance of the ſouth-eaſt winds which rage in ſummer, the ſky is free of all clouds except that on the Table and Wind Hills already mentioned; but during the north-weſt winds, the air is thick, and loaded with heavy clouds big with rain. If the ſouth-eaſt winds ſhould ceaſe for any length of time, the air becomes ſickly by reaſon of the ſea-weeds driving aſhore and rotting; hence the Europeans are at ſuch times affected with head-achs and other diſorders: but, on the other hand, the violence of thoſe winds ſubjects them to inflammations of their eyes, &c. Hottentots

The natives of this country are called *Hottentots*, in their own language; a word of which it is vain to inquire the meaning, ſince the language of this country can ſcarce be learned by any other nation. The Hottentot language is indeed ſaid to be a compoſition of the moſt ſtrange and diſagreeable ſounds, deemed by many the diſgrace of ſpeech, without human ſound or articulation, reſembling rather the noiſe of irritated turkies, the chattering of magpies, hooting of owls, and depending on extraordinary vibrations, inflexions, and claſhings of the tongue againſt the palate.—If this account is true, however, it is obvious, that all the relations we have concerning the religion, &c. of the Hottentots derived from themſelves, muſt fall to the ground, as nobody can pretend to underſtand a language in itſelf unintelligible. The manners and cuſtoms of thoſe people, however, are eaſily obſervable, whether they themſelves give the relation or not; and if their language is conformable to them, it is no doubt of a nature ſufficiently wonderful.

The Hottentots, according to the moſt authentic accounts, are, of all human creatures, the moſt naſty. Human urine, the excrements of beaſts, entrails, and garbage, foot, greaſe, &c. are their ſole delight, and even uſed as ſymbols of honour and dignity. As ſoon as a child is born, they rub it all over with freſh cow-dung; which when dried they rub off, and then waſh it with the juice of the Hottentot fig. When this juice has dried up, they rub the child over with ſheep's greaſe, or melted butter; and when it has well ſoaked, they ſprinkle on the powder of Buchu (the herb SPIRÆA), which now ſticks all over like a cruſt. When her time has expired, the mother in like manner purifies herſelf firſt with cow-dung, and then with greaſe and buchu; after which ſhe is reſtored to the embraces of her huſband, who muſt previouſly undergo a purification of the ſame kind. They are of an olive colour when born: but the parents take care to make their children as black as poſſible by a daily unction with a mixture of greaſe and ſoot; a ceremony which is continued during the reſt of their lives, and

Hottentots. and which makes them appear much blacker than they really are. As ſoon as the child is born, the women break down the bridge of the noſe with their thumbs, looking upon a high noſe as a great deformity; and hence it hath been pretty generally believed among Europeans, that the Hottentots are born with flat noſes.

Every male, when arrived at the age of eight or ten years, according to Hottentot law, ought to be deprived of the left teſticle; but in caſes where the parents are poor, this ceremony is deferred till they are able to anſwer the expence. The origin of a cuſtom ſo very extraordinary would no doubt afford entertainment to the curious; but nothing ſatisfactory hath been ſaid upon the ſubject. Moſt authors are of opinion, that this is done to make them run the ſwifter; and many of the natives themſelves aſſign the ſame reaſon: but Kolben was informed by ſome of the moſt intelligent Hottentots, that it has been a law among them from time immemorial, "that no man ſhould be allowed to have carnal knowledge of a woman, till deprived of his left teſticle." Should any marry without this neceſſary mutilation, both parties would lie at the mercy of the rulers, and the woman perhaps be torn in pieces by her own ſex; among whom it is a prevailing opinion, that a man with two teſticles conſtantly begets twins. This extraordinary ceremony is performed in the following manner. The patient being daubed over with the fat of a ſheep newly killed, lies on his back on the ground at full length, with his hands and feet tied. His friends lie upon him, in order to keep him from moving. The operator then, with a common table or caſe knife, laying hold of the left teſticle, makes an orifice in the ſcrotum about an inch and an half long. Thro' this orifice he ſqueezes out the teſticle in a moment, ties up the veſſels, thruſts in a little ball of the ſize of the teſticle, compoſed of ſheep's fat and ſeveral herbs pulveriſed. He then ſtitches up the wound with a thread made of a ſheep's ſinew, and a needle in the form of an awl. The bands of the patient being then unlooſed, the operator anoints him again with the warm fat of the ſheep, turning him ſometimes on his back and ſometimes on his belly, while the poor boy is ſweating and almoſt convulſed with pain. After this, he piſſes all over him, rubbing the precious liquor into his ſkin as well as he can; and the ceremony being thus ended, the patient crawls to a little hut raiſed for the purpoſe, and in two or three days becomes as well as ever.

The next eſſential ceremony is the receiving the youth into the ſociety of men. This is performed when they have arrived at the age of 18. Before this time they are confined to the tuition of their mothers, whom they conſtantly follow, and dare not, before the performance of the ceremony, converſe even with their own fathers. The appointed time being arrived, the inhabitants are aſſembled, and the men ſeated in a circle, and the candidate ordered to ſit down without upon his hams or heels, but in ſuch a manner as not to touch the ground by at leaſt three inches. The oldeſt man then riſes, and, having obtained conſent for the youth's admiſſion, ſteps up to him and acquaints him, that he muſt thenceforward forſake his mother, and the company of the women, with every childiſh amuſement, and learn to behave as a man, both in his words and actions. The candidate then, being previouſly bedaubed with greaſe and foot, ſquats down to receive the ſmoking inundation of urine, which the orator diſcharges all over him with great formality. The old men then congratulate him on the honour done him, and add the following benedictions, "Good luck attend thee;—Live to be old;—Increaſe and multiply;—May thy beard grow ſoon." Hottentots.

This ceremony is uſually followed by the young man's marriage. All overtures of the matrimonial kind among the Hottentots, are made by the father or neareſt relation of the man, to the father or neareſt relation of the woman. The father and his ſon wait on the woman's friends; and the lover is firſt employed in preparing and preſenting the company with tobacco. They all ſmoke, and nothing is ſaid about the matter till their heads become giddy with the fume: then the father opens the buſineſs to the woman's father, and demands her for his ſon. The other leaves the room to conſult with his wife; but quickly returns with a poſitive anſwer; which is ſeldom in the negative, unleſs in caſe of a prior engagement. If the young woman does not like the match which her parents have agreed to, ſhe has only one chance to avoid it; namely, to lie down with her lover on the ground, and play with him all night at pinching, tickling, and whipping. If ſhe conquers, ſhe fairly gets rid of him; but if he ſubdues her, which is generally the caſe, ſhe muſt marry him. After this the young fellow goes to the habitation of the bride, attended by all his relations and friends, male and female, driving before them one or more oxen, according to their wealth. They are received with great joy; and the oxen being killed, they beſmear themſelves plentifully with the fat, powdering themſelves thick all over with buchu, and the women paint their cheeks, forehead, and chin, with red chalk. This being done, they perform the wedding ceremony in the following manner. The men ſquat themſelves in a circle, in the centre of which the bridegroom is ſeated in the ſame poſture. At ſome little diſtance the women do the ſame round the bride. Then the prieſt, or maſter of religious ceremonies, enters the mens circle, and coming up to the bridegroom piſſes a little on him, who with his long nails (for the Hottentots never pare their nails) makes furrows in the greaſe and buchu with which he is covered, that the urine may penetrate the better. He then does the ſame kindneſs to the bride; returning from the one to the other, till his whole ſtock is exhauſted, pronouncing all the time ſhort bleſſings to the following purpoſe: "May you live happily together; may you have a ſon before the year's end; may he be a good huntſman and a warrior."

The Hottentots have an honourable order among them, conſiſting of ſuch as have ſingly encountered and ſlain a lion, tyger, leopard, elephant, rhinoceros, or elk. The hero, after his return from the exploit to the village, retires to his own hut, where he has not ſat long, till an old man, deputed by the inhabitants of the *kraal* or village, comes to invite him to receive the honours due to his merit. The champion riſes and follows his conductor to the middle of the village, where all the men are aſſembled and waiting his arrival. He there ſquats down on a mat prepared for him; while all

Hottentots. all the old men ſquat in a circle round him. The old deputy then marches up to him, and piſſes upon him from head to foot, pronouncing certain words. If the deputy is the hero's friend, he lays him under a deluge of water; for the more plentifully he is beſprinkled, the greater is the honour; and the urine is rubbed in by the hero himſelf with the greateſt eagerneſs. The deputy then lights a pipe of tobacco, which he circulates through the company till nothing but aſhes remain in the pipe. Theſe the deputy ſhakes on the new knight, who is congratulated on the high honour he has received and the ſervice he has done his country. After this he takes three days reſt, during which his wife is forbidden to come near him. On the third day he kills a ſheep, receives his wife again, and rejoices with his friends and neighbours; wearing ever after the bladder of the beaſt he has killed, faſtened to his hair, as a mark of honour. The Hottentots expreſs greater joy at the deſtruction of a tyger than of any other wild beaſt.

The dreſs of the Hottentots is perfectly agreeable to the naſtineſs of thoſe cuſtoms already deſcribed. The ſkin of a wild beaſt, or ſheep, prepared with cowdung and greaſe, hangs like a mantle over the ſhoulders, high or low, open or cloſed, according to the ſeaſon of the year, or the cuſtoms of the tribe. The men, who have no covering but a compoſition of fat, ſoot, and dirt, in the moſt raging heats, wear cat or lamb-ſkin caps in cold and wet ſeaſons. The face and forepart of the neck are always bare; and, the pudenda excepted, which are covered with a kind of apron, they go naked from the hips downwards. Leather ſtockings, and ſandals cut out of the raw hides of oxen or elephants, are uſed occaſionally in driving their herds to paſture, or in paſſing ſands or rocks. A greaſy pouch hangs about their necks, with a knife, pipe, tobacco, and a ſmall piece of wood called *ſuſa*, burnt at both ends, as an amulet againſt witchcraft. Three ivory rings adorn the left arm; to which, on journeys, is faſtened a bag with proviſions. The *kirri* and *rackhum* ſticks (which they uſe in hunting) are in the right hand; and another is carried in the left, with the buſhy tail of a wild cat, fox, or other animal, faſtened to it for a handkerchief. The honquers or captains, who were formerly diſtinguiſhed only by fair ſkins of tygers or wild-cats, now appear at the head of the army, in councils, and on every ſolemn occaſion, with braſs crowns, and braſs-headed canes. Theſe ornaments were preſented by the Dutch to the chiefs and captains of the nations in alliance with them; and are now annexed to defend with, and are eſteemed an unalienable property and diſtinctive badge of their dignity.

Moſt writers have affirmed that the Hottentot women wear the guts of ſheep and other animals by way of ornament about their legs; but this is a miſtake. The girls from their infancy to about 12 years old, wear bulruſhes tied in rings about their legs from the knee down to the ankle. When they paſs that age, they change the matter of theſe rings, from bulruſhes to ſlips of ſheep and calf-ſkin, of the thickneſs of the little finger. They ſinge off the hair, and then turn inwards the ſide on which it grew. Some grown women have above 100 of theſe rings on the leg, ſo nicely wound about and fitted, that they look like one continued ſwathe, and by long wearing aſſume the hardneſs of wood. Theſe rings are kept from falling down by large wrappers of leather or ruſhes about the ankles; and ſerve both as an ornamental diſtinction to the ſex, and for preſerving the legs from being ſcratched or torn in the fields. Like other ſavages, the Hottentots are very fond of braſs buttons, bits of looking-glaſſes, &c. and ſome wear on their foreheads a ſmall plate of poliſhed iron in the ſhape of an half-moon. Hottentots.
