ENCYCLOPÆDIA BRITANNICA;

OR, A

DICTIONARY

OF

ARTS, SCIENCES, &c.

On a PLAN entirely NEW:

BY WHICH,

THE DIFFERENT SCIENCES AND ARTS

Are digested into the FORM of Distinct

TREATISES OR SYSTEMS,

COMPREHENDING

The HISTORY, THEORY, and PRACTICE, of each, according to the Latest Discoveries and Improvements;

AND FULL EXPLANATIONS ARE GIVEN OF THE

VARIOUS DETACHED PARTS OF KNOWLEDGE,

WHETHER RELATING TO

NATURAL and ARTIFICIAL Objects, or to Matters ECCLESIASTICAL, CIVIL, MILITARY, COMMERCIAL, *&c.*

TOGETHER WITH

A DESCRIPTION of all the Countries, Cities, principal Mountains, Seas, Rivers, *&c.* throughout the World; a General HISTORY, *Ancient* and *Modern*, of the different Empires, Kingdoms, and States; and an Account of the LIVES of the most Eminent Persons in every Nation, from the earliest ages down to the present times.

THE WHOLE COMPILED FROM
THE WRITINGS OF THE BEST AUTHORS, IN SEVERAL LANGUAGES; THE MOST APPROVED DICTIONARIES, AS WELL OF GENERAL SCIENCE AS OF PARTICULAR BRANCHES; THE TRANSACTIONS, JOURNALS, AND MEMOIRS, OF LEARNED SOCIETIES, BOTH AT HOME AND ABROAD; THE MS. LECTURES OF EMINENT PROFESSORS ON DIFFERENT SCIENCES; AND A VARIETY OF ORIGINAL MATERIALS, FURNISHED BY AN EXTENSIVE CORRESPONDENCE.

The SECOND EDITION; greatly Improved and Enlarged.

ILLUSTRATED WITH ABOVE TWO HUNDRED COPPERPLATES.

VOL. V.

INDOCTI DISCANT, ET AMENT MEMINISSE PERITI.

EDINBURGH:
Printed for J. BALFOUR and Co. W. GORDON, J. BELL, J. DICKSON, C. ELLIOT, W. CREECH, J. M'CLIESH, A. BELL, J. HUTTON, and C. MACFARQUHAR.
MDCCLXXX.

A NEW

Dictionary of Arts, Sciences, &c.

G.

G, Gabara.

G, THE seventh letter, and fifth conſonant, of our alphabet; tho' in the alphabets of all the oriental languages, the Hebrew, Phœnician, Chaldee, Syriac, Samaritan, Arabic, and even Greek, *G* is the third letter. See LETTER.

The Hebrews call it *ghimel*, or *gimel*, *q. d.* "camel;" by reaſon it reſembles the neck of that animal; and the ſame appellation it bears in the Samaritan, Phœnician, and Chaldee: in the Syriac it is called *gamel*, in Arabic *giim*, and in Greek *gamma*.

The letter G is of the mute kind, and cannot be any way ſounded without the help of a vowel. It is formed by the reflexion of the air againſt the palate, made by the tongue as the air paſſes out of the throat: which Martianus Capella expreſſes thus, *G ſpiritus cum palato;* ſo that G is a palatal letter.

The form of our *G* is taken from that of the Latins, who borrowed it from the Greeks; the Latin *G* being certainly a corruption of the Greek gamma, Γ, as might eaſily be ſhewn, had our Printers all the characters and forms of this letter which we meet withal in the Greek and Latin MSS thro' which the letter paſſed from Γ to *G*.

In Engliſh it has a hard and ſoft ſound: hard, as in the words *game*, *gun*, &c.; and ſoft, as in the words *geſture*, *giant*, &c. At the end of words, *gh* is pronounced like *f*, as in the words *rough*, *tough*, &c. The letter *g* is alſo uſed in many words where the ſound is not perceived, as in *ſign*, *reign*, &c.

As a numeral, G was anciently uſed to denote 400; and with a daſh over it thus $\overline{G}$, 40,000. In muſic, it is the character or mark of the treble cleff; and from its being placed at the head, or marking the firſt ſound, in Guido's ſcale, the whole ſcale took the name *gamut*. See the articles CLEFF and GAMUT.

As an abbreviature, G. ſtands for *Gaius*, *Gellius*, *gens*, *genius*, &c. G. G. for *gemina*, *geſſit*, *geſſerunt*. &c. G. C. for *genio civitatis* or *Cæſaris*. G. L. for *Gaius libertus*, or *genio loci*. G. V. S. for *genio urbis ſacrum*. G. B. for *genio bono*. And G. T. for *genio tutelari*.

GABARA, or GABBARA, in antiquity, the dead bodies which the Egyptians embalmed, and kept in their houſes, eſpecially thoſe of ſuch of their friends as died with the reputation of great piety and holineſs, or as martyrs. See EMBALMING, and MUMMY.

Gabel ꝛ God.

GABEL, *(Gabella, Gablum, Gablagium)*, in French *Gabelle*, i. e. *Vectigal*, hath the ſame ſignification among the ancient Engliſh writers, that *gabelle* hath in France. It is a tax; but hath been variouſly uſed, as for a rent, cuſtom, ſervice, &c. And where it was a payment of rent, thoſe who payed it were termed *gablatores*. When the word *gabel* was formerly mentioned without any addition to it, it ſignified the tax on ſalt, though afterwards it was applied to all other taxes.

GABIONS, in fortification, baſkets made of oziertwigs, of a cylindrical form, ſix feet high, and four wide; which, being filled with earth, ſerve as a ſhelter from the enemy's fire.

GABLE, or GABLE-*End* of a houſe (from *gaval*, Welſh), is the upright triangular end, from the cornice or eaves, to the top of the houſe.

GABRIEL, the name of one of the principal angels in heaven. It ſignifies *the ſtrength of God*. There are a few events, in which this exalted being was concerned, recorded in ſcripture. He was ſent to the prophet Daniel, to explain to him the viſion of the ram and goat, and the myſtery of the ſeventy weeks, which had been revealed to him. He was ſent to Zecharias, to declare to him the future birth of John the baptiſt. Six months after, he was ſent to Nazareth, to the Virgin Mary, to warn her of the birth of Jeſus Chriſt.

The Orientaliſts add ſeveral particulars to what the ſcriptures inform us concerning the angel Gabriel. The Mahometans call him the *faithful ſpirit;* and the Perſians, by way of metaphor, the *peacock of heaven*. We read, in the ſecond chapter of the Koran, that *whoſoever is an enemy to Gabriel, ſhall be confounded*. It was Gabriel, they believe, who brought to Mahomet, their falſe prophet, the revelations which he publiſhed; and it was he, who conducted him to heaven mounted upon the animal Borak.

GAD, among miners, a ſmall punch of iron, with a long wooden handle, uſed to break up the ore.

One of the miners holds this in his hand, directing the point to a proper place, while the other drives it into the vein, by ſtriking it with a ſledge-hammer.

Gad, Gadus.

GAD-*Bee*, or *Gad-fly*, in natural hiſtory, the common name for a winged inſect, called alſo the *dun-fly* or *ox-fly*; a creature very troubleſome to cows, horſes, &c. This creature examined by the microſcope hath ſome peculiarities worthy of obſervation. It has, like the gnat, a long proboſcis, with a ſharp dart or two darts ſheathed within it; the uſe of theſe darts is to penetrate the fleſh of animals for the ſucking their blood, whereas the proboſcis can only ſerve to ſuck the dews from flowers, &c.

The eggs of this fly are laid in the waters, and there produce a very remarkable ſort of maggot. It is a brown one of a long flatted figure, with a pencil of down-hairs at its tail, which it ſpreads into a circular form on the ſurface of the water, while its head is ſunk down in ſearch of food. When the creature would deſcend towards the bottom, theſe hairs are made to approach one another in an oval form; and in this ſtate they incloſe a bubble of air, by means of which it is able to riſe again; and if this bubble by any accident eſcapes, the creature immediately ſqueezes out of its own body another to ſupply its place. The ſnout of this maggot hath three diviſions; whence are thruſt out three little pointed bodies like ſerpents tongues. Theſe maggots are very common on the ſurface of ditch-water; and the motion of their inteſtines is very ſingular and obſervable.

GADUS, in ichthyology, a genus of fiſhes belonging to the order of jugulares. The head is ſmooth; there are ſeven cylindrical rays in the branchioſtege membrane; the body is oblong, with deciduous ſcales; the whole fins are covered with the common ſkin of the fiſh; the rays of the back-fins are blunt, and thoſe of the breaſt are ſharp. There are 17 ſpecies, principally diſtinguiſhed by their cirri and the number of back-fins. The moſt remarkable are,

1. The *morhua*, or COMMON COD, is found only in the northern parts of the world; it is, as Rondeletius calls it, an ocean fiſh, and never met with in the Mediterranean ſea. It affects cold climates, and ſeems confined between the latitudes 66° and 50°: what are caught north and ſouth of thoſe degrees being either few in quantity or bad in quality. The Greenland fiſh are ſmall, and emaciated through want of food; being very voracious, and having in thoſe ſeas a ſcarcity of proviſion. This locality of ſituation is common to many other ſpecies of this genus, moſt of them being inhabitants of the cold ſeas, or ſuch as lie within regions that can juſt claim the title of *temperate*. There are nevertheleſs certain ſpecies found near the Canary-iſlands, called *cherry*, of which we know no more than the name; but which, according to Captain Glaſs, are better taſted than the Newfoundland kind. The Cod.

The great rendezvous of the cod-fiſh is on the banks of Newfoundland, and the other ſand-banks that lie off the coaſts of Cape Breton, Nova Scotia, and New England. They prefer thoſe ſituations, by reaſon of the quantity of worms produced in thoſe ſandy bottoms, which tempt them to reſort there for food: but another cauſe of the particular attachment the fiſh have to theſe ſpots, is their vicinity to the polar ſeas, where they return to ſpawn: there they depoſit their roes in full ſecurity; but want of food forces them, as ſoon as the firſt more ſouthern ſeas are open, to repair thither for ſubſiſtence. Few are taken north of Iceland, but on the ſouth and weſt coaſts they abound: they are again found to ſwarm on the coaſts of Norway, in the Baltic, off the Orkney and the Weſtern iſles; after which their numbers decreaſe, in proportion as they advance towards the ſouth, when they ſeem quite to ceaſe before they reach the mouth of the Straits of Gibraltar. Gadus.

Before the diſcovery of Newfoundland, the greater fiſheries of cod were on the ſeas of Iceland, and off our Weſtern iſles, which were the grand reſort of ſhips from all the commercial nations; but it ſeems that the greateſt plenty was met with near Iceland. The Engliſh reſorted thither before the year 1415: for we find that Henry V. was diſpoſed to give the king of Denmark ſatisfaction for certain irregularities committed on thoſe ſeas by his ſubjects. In the reign of Edward IV. the Engliſh were excluded from the fiſhery by treaty; and forbidden to reſort there under pain of forfeiture of life and goods. Notwithſtanding this, that monarch afterwards gave licence to a ſhip of Hull to ſail to Iceland, and there relade fiſh and other goods, without regard to any reſtrictions to the contrary. The right of the Engliſh in latter times was far from being confirmed: for we find queen Elizabeth condeſcending to aſk permiſſion to fiſh in thoſe ſeas from Chriſtian IV. of Denmark; yet afterwards ſhe ſo far repented her requeſt, as to inſtruct her ambaſſadors at that court to inſiſt on the right of a free and univerſal fiſhery. In the reign of her ſucceſſor, however, they had not ſewer than 150 ſhips employed in the Iceland fiſhery; which indulgence might ariſe from the marriage of James with a princeſs of Denmark. But the Spaniſh, the French, and the Bretons, had much the advantage of the Engliſh in all fiſheries at the beginning, as appears by the ſtate of that in the ſeas of Newfoundland in the year 1578, when the number of ſhips belonging to each nation ſtood thus:

Spaniards, 100, beſides 20 or 30 that came from Biſcay to take whale for train, being about five or ſix thouſand tons.
Portugueſe 50, or three thouſand tons.
French and Bretons 150, or ſeven thouſand tons.
Engliſh, from 30 to 50.

The increaſe of ſhipping that reſort to thoſe fertile banks, is now unſpeakable. Britain ſtill enjoys the greateſt ſhare; which ought to be eſteemed our chiefeſt treaſure, as it brings wealth to individuals, and ſtrength to the ſtate. See FISHERY.

All this immenſe fiſhery is carried on by the hook and line only. We have been informed that they fiſh from the depth of 16 to 60 fathoms, according to the inequality of the bank, which is reprefented as a vaſt mountain, under water, above 500 miles long, and near 300 broad; and that ſeamen know when they approach it by the great ſwell of the ſeas and the thick miſts that impend over it. The bait is herring, a ſmall fiſh called a *capelin*, a ſhell-fiſh called *clams*, and bits of ſea-fowl; and with theſe are caught fiſh ſufficient to find employ for near 15,000 Britiſh ſeamen, and to afford ſubſiſtance to a much more numerous body of people at home, who are engaged in the various manufactures which ſo vaſt a fiſhery demands.

The food of the cod is either ſmall fiſh, worms, teſtaceous or cruſtaceous animals, ſuch as crabs, large whelks, &c.; and their digeſtion is ſo powerful, as to diſſolve

Gadus. diſſolve the greateſt part of the ſhells they ſwallow. They are very voracious, and catch at any ſmall body they perceive moved by the water, even ſtones and pebbles, which are often found in their ſtomachs.

Fiſhermen are well acquainted with the uſe of the air-bladder or ſound of the cod; and are very dexterous in perforating this part of a live fiſh with a needle, in order to diſengage the incloſed air: for without this operation it could not be kept under water in the well-boats, and brought freſh to market. The ſounds of the cod ſalted is a delicacy often brought from Newfoundland. Iſinglaſs is alſo made of this part by the Iceland fiſhermen: a proceſs which deſerves the attention of the natives of the north of Scotland, where theſe fiſh are pleutiful. It is given under the article ICHTHYOCOLLA.

The Cod.

Providence hath kindly ordained, that this fiſh, ſo uſeful to mankind, ſhould be ſo very prolific as to ſupply more than the deficiencies of the multitudes annually taken. Leuwenhoeck counted 9,384,000 eggs in a cod-fiſh of a middling ſize; a number, ſure, that will baffle all the efforts of man, or the voracity of the inhabitants of the ocean, to exterminate, and which will ſecure to all ages an inexhauſtible ſupply of grateful proviſion.

In our ſeas they begin to ſpawn in January, and depoſite their eggs in rough ground, among rocks. Some continue in roe till the beginning of April. The cod-fiſh in general recover quicker after ſpawning than any other fiſh, therefore it is common to take ſome good ones all the ſummer. When they are out of ſeaſon, they are thin-tailed and louſy; and the lice chiefly fix themſelves on the inſide of their mouths.

The fiſh of a middling ſize are moſt eſteemed for the table; and are choſen by their plumpneſs and roundneſs, eſpecially near the tail, by the depth of the ſulcus or pit behind the head, and by the regular undulated appearance of the ſides, as if they were ribbed. The glutinous parts about the head loſe their delicate flavour after it has been 24 hours out of the water, even in winter, in which theſe and other fiſh of this genus are in higheſt ſeaſon.

The largeſt that we ever heard of taken on our coaſts, weighed 78 pounds: the length was five feet eight inches; and the girth round the ſhoulders, five feet. It was taken at Scarborough in 1755, and was ſold for one ſhilling. But the general weight of theſe fiſh in the Yorkſhire ſeas, is from 14 to 40 pounds. This ſpecies is ſhort in proportion to its bulk, the belly being very large and prominent.

The jaws are of an equal length, and at the end of the lower is a ſmall beard; the teeth are diſpoſed in the palate as well as in the jaws.

The colour of this fiſh is cinereous on the back and ſides, and commonly ſpotted with yellow: the belly is white; but they vary much, not only in colour but in ſhape, particularly that of the head. The ſide line is white and broad, ſtraight till it reaches oppoſite the vent, when it bends towards the tail. Codlings are often taken of a yellow, orange, and even red colour, while they remain among the rocks; but, on changing their place, aſſume the colour of other cod-fiſh.

2. The *Eglefinus*, or HADDOCK. Large haddocks begin to be in roe in the middle of November, and continue ſo till the end of January; from that time till May they are very thin tailed, and much out of ſeaſon. In May they begin to recover; and ſome of the middling-ſized fiſh are then very good, and continue improving till the time of their greateſt perfection. The ſmall ones are extremely good from May till February, and ſome even in February, March, and April, viz. thoſe which are not old enough to breed. Gadus.

The Haddock.

The fiſhermen aſſert, that in rough weather haddocks ſink down into the ſand and ooze in the bottom of the ſea, and ſhelter themſelves there till the ſtorm is over; becauſe in ſtormy weather they take none, and thoſe that are taken immediately after a ſtorm are covered with mud on their backs.

In ſummer they live on young herrings and other ſmall fiſh; in winter, on the ſtone-coated worms *, which the fiſhermen call *haddock-meat*.

* a ſpecies of *Serpula*.

The grand ſhoal of haddocks comes periodically on the Yorkſhire coaſts. It is remarkable that they appeared in 1766 on the 10th of December, and exactly on the ſame day in 1767: theſe ſhoals extended from the ſhore near three miles in breadth, and in length from Flamborough-head to Tinmouth-caſtle, and perhaps much farther northwards. An idea may be given of their numbers by the following fact: Three fiſhermen, within the diſtance of a mile from Scarborough harbour, frequently loaded their coble or boat with them twice a-day, taking each time about a ton of fiſh: when they put down their lines beyond the diſtance of three miles from the ſhore, they caught nothing but dog-fiſh, which ſhows how exactly theſe fiſh keep their limits.

The beſt haddocks were ſold from eightpence to a ſhilling *per* ſcore; and the poor had the ſmaller ſort at a penny and ſometimes a halfpenny *per* ſcore.

The large haddocks quit the coaſt as ſoon as they go out of ſeaſon, and leave behind great plenty of ſmall ones. It is ſaid that the large ones viſit the coaſts of Hamburgh and Jutland in the ſummer.

It is no leſs remarkable than providential, that all kinds of fiſh (except mackrel) which frequent the Yorkſhire coaſt, approach the ſhore, and as it were offer themſelves to us, generally remaining there as long as they are in high ſeaſon, and retire from us when they become unfit for uſe. It is the commoneſt ſpecies in the London markets. They do not grow to a great bulk, one of 14 pounds being of an uncommon ſize, but thoſe are extremely coarſe; the beſt for the table weighing from two to three pounds.

The body of the haddock is long: the head ſlopes down to the noſe: the ſpace between the hind-part of the firſt dorſal-fin is rigid: on the chin is a ſhort beard. On the back are three fins reſembling thoſe of the common cod-fiſh: on each ſide beyond the gills is a large black ſpot. Superſtition aſſigns this mark to the impreſſion St Peter left with his finger and thumb when he took the tribute out of the mouth of a fiſh of this ſpecies, which has been continued to the whole race of haddocks ever ſince that miracle. The lateral line is black: the tail is forked. The colour of the upper part of the body is duſky or brown; the belly and lower part of the ſides ſilvery.

3. The *Barbatus*, or POUT, never grows to a large ſize, ſeldom exceeding a foot in length. It is diſtinguiſhed from all others by its great depth; one of the ſize abovementioned being near four inches deep in

Gadus. in the broadeſt part. The back is very much arched, and carinated: the colour of the fins and tail are black: at the bottom of the pectoral fins is a black ſpot. The lateral line is white, broad, and crooked. The tail is even at the end, and of a duſky colour. The colour of the body is white, but more obſcure on the back than the belly, and tinged with yellow.—It is called at Scarborough a *keg*, and is a very delicate fiſh.

4. The *Minutus*, or POOR, is the only ſpecies of cod-fiſh with three dorſal fins that we (at this time) are aſſured is found in the Mediterranean ſea. It is taken near Marſeilles, and ſometimes in ſuch quantities as to become a nuſance; for no other kinds of fiſh The Poor-fiſh. are taken during their ſeaſon. It is eſteemed good, but incapable of being ſalted or dried: Belon ſays, that when it is dried in the ſun, it grows as hard as horn. It is the ſmalleſt ſpecies yet diſcovered, being little more than ſix inches long. On the chin is a ſmall beard: the eyes are covered with a looſe membrane: on the gill-covers and the jaws, there are, on each ſide, nine punctures. The colour on the back is a light brown; on the belly a dirty white.—We owe the diſcovery of this kind in our ſeas to the Reverend Mr Jago.

5. The *Carbonarius*, or COAL-FISH, takes its name from the black colour that it ſometimes aſſumes. Belon calls it the *colliſch*, imagining that it was ſo named by the Engliſh, from its producing the Ichthyocolla; but Geſner gives the true etymology. Theſe fiſh are common on moſt of our rocky and deep coaſts, but The Coal-fiſh. particularly thoſe of the north of Great Britain. They ſwarm about the Orkneys, where the fry are the great ſupport of the poor. The young begin to appear on the Yorkſhire coaſt the beginning of July in vaſt ſhoals, and are at that time about an inch and an half long. In Auguſt they are from three to five inches in length, and are taken in great numbers with the angling rod: they are then eſteemed a very delicate fiſh; but grow ſo coarſe when they are a year old, that few people will eat them. Fiſh of that age are from eight to fifteen inches long, and begin to have a little blackneſs near the gills and on the back, and the blackneſs increaſes as they grow older.

The fry is known by different names in different places: they are called at Scarborough *parrs*, and when a year old, *billets*. About nine or ten years ago ſuch a glut of parrs viſited that part, that for ſeveral weeks it was impoſſible to dip a pail into the ſea without taking ſome.

Though this fiſh is ſo little eſteemed when freſh, yet it is ſalted and dried for ſale. It is of a more elegant form than the cod-fiſh: they generally grow to the length of two feet and an half, and weigh about 28 or 30 pounds at moſt. The head is ſmall; the under-jaw a little longer than the upper: the tail is broad and forked. They vary in colour: ſome have their back, noſe, dorſal fins, and tail, of a deep black: the gill-covers, ſilver and black; the ventral and anal fins, white; the belly of the ſame colour. Others are duſky, others brown; but, in all, the lateral line is ſtraight and white, and the lower part of the ventral and anal fins white.

6. The *Pollachius*, or POLLACK, is common on many of our rocky coaſts: during ſummer they are ſeen in great ſhoals frolicking on the ſurface of the water, and flinging themſelves into a thouſand forms. They are Gadus. at that time ſo wanton as to bite at any thing that appears on the top of the waves, and are often taken with a gooſe-feather fixed to the hook. They are The Pollack. very ſtrong, being obſerved to keep their ſtation at the feet of the rocks in the moſt turbulent and rapid ſea. They are a good eating fiſh. They do not grow to a very large ſize; at leaſt the biggeſt ſeldom exceed ſix or ſeven pounds: but ſome have been taken in the ſea near Scarborough, which they frequent during winter, that weighed near 28 pounds. They are there called *leets*.

The under jaw is longer than the upper; the head and body riſes pretty high, as far as the firſt dorſal fin. The ſide line is incurvated, riſing towards the middle of the back, then ſinking and running ſtraight to the tail; it is broad, and of a brown colour. The colour of the back is duſky, ſometimes inclining to green: the ſides beneath the lateral line marked with lines of yellow; the belly white.

7. The *merlangus*, or WHITING. Theſe fiſh appear The in vaſt ſhoals in our ſeas in the ſpring, keeping at the Whiting. diſtance of about half a mile to that of three from the ſhore. They are caught in vaſt numbers by the line, and afford excellent diverſion. They are the moſt delicate, as well as the moſt wholeſome, of any of the genus: but they do not grow to a large ſize, the biggeſt not exceeding 20 inches; and even that is very uncommon, the uſual length being 10 or 12; tho' it is ſaid, that whitings, from four to eight pounds in weight, have been taken in the deep water at the edge of the Dogger-Bank.—It is a fiſh of an elegant make: the upper jaw is the longeſt; the eyes large, the noſe ſharp; the teeth of the upper jaw long, and appear above the lower when cloſed. The colour of the head and back is a pale brown; the lateral line white, and crooked; the belly and ſides ſilvery, the laſt ſtreaked lengthwiſe with yellow.

8. The *merlucius*, or HAKE, is found in vaſt abundance on many of our coaſts, and of thoſe of Ireland. The Hake. There was formerly a vaſt ſtationary fiſhery of hake on the Nymph Bank off the coaſt of Waterford, immenſe quantities appearing there twice a-year; the firſt ſhoal coming in June, during the mackrel-ſeaſon; the other in September, at the beginning of the herring-ſeaſon, probably in purſuit of thoſe fiſh: it was no unuſual thing for ſix men with hooks and lines to take a thouſand hake in one night, beſides a conſiderable quantity of other fiſh. Theſe were ſalted and ſent to Spain, particularly to Bilboa. We are at this time uninformed of the ſtate of this fiſhery; but find that Mr Smith, who wrote the hiſtory of the county of Waterford, complains even in his time (1746) of its decline. Many of the gregarious fiſh are ſubject to change their ſituations, and deſert their haunts for numbers of years, and then return again. Mr Smith inſtances the loſs of the haddock on the Waterford ſhores, where they uſed to ſwarm; and we can bring the capriciouſneſs of the herrings, which ſo frequently quit their ſtations, as another example.—Sometimes the irregular migration of fiſh is owing to their being followed and haraſſed by an unuſual number of fiſh of prey, ſuch as the ſhark-kind; ſometimes to deficiency of the ſmaller fiſh, which ſerved them as food; and laſtly, in many places to the cuſtom of trawling, which not only demoliſhes a quantity of their

Gadus.

their ſpawn, which is depoſited in the ſand, but alſo deſtroys or drives into deeper waters numberleſs worms and inſects, the repaſt of many fiſh.—The hake is in England eſteemed a very coarſe fiſh, and is feldom admitted to table either freſh or ſalted. When cured, it is known by the name of *Poor John*. Theſe fiſh are from a foot and an half to near twice that length: they are of a ſlender make, of a pale aſh-colour on their backs, and of a dirty white on their bellies.

10. The *molva*, or LING, takes its Engliſh name from its length, being corrupted from the word *long*. It abounds about the Scilly Iſles, on the coaſts of Scarborough, and thoſe of Scotland and Ireland, and forms a conſiderable article of commerce. This branch of trade was conſiderable ſo long agoas the reign of Edward III. an act for regulating the price of lob, *ling*, and cod, being made in his 31ſt year.

The Ling.

In the Yorkſhire ſeas they are in perfection from the beginning of February to the beginning of May, and ſome till the end of that month. In June they ſpawn, depoſiting their eggs in the ſoft ouzy ground of the mouth of the Tees: at that time the males ſeparate from the females, and reſort to ſome rocky ground near Flamborough-head, where the fiſhermen take great numbers without ever finding any of the female or roed fiſh among them.

While a ling is in ſeaſon its liver is very white, and abounds with a fine-flavoured oil; but as ſoon as the fiſh goes out of ſeaſon, the liver becomes red as that of a bullock, and affords no oil. The ſame happens to the cod and other fiſh in a certain degree, but not ſo remarkably as in the ling. When the fiſh is in perfection, a very large quantity of oil may be melted out of the liver by a ſlow fire; but if a violent ſudden heat be uſed for that purpoſe, they yield very little. The oil, which nature hoards up in the cellular membraues of the fiſhes, returns into their blood, and ſupports them in the engendering ſeaſon, when they purſue the buſineſs of generation with ſo much eagerneſs as to neglect their food.

Vaſt quantities of ling are ſalted for exportation, as well as for home-conſumption. When it is cut or ſplit for curing, it muſt meaſure 26 inches or upwards from the ſhoulder to the tail: if leſs than that, it is not reckoned a ſizeable fiſh, and conſequently not entitled to the bounty on exportation; ſuch are called *drizzles*, and are in ſeaſon all ſummer.

The uſual ſize of a ling is from three to four feet; but they have been heard of ſeven feet long. The body is very ſlender; the head flat; the upper jaw the longeſt; the teeth in that jaw ſmall and very numerous; in the lower, few, ſlender, and ſharp: on the chin is a ſmall beard. They vary in colour, ſome being of an olive hue on the ſides and back, others cinereous; the belly white. The ventral fins white: the dorſal and anal edged with white. The tail marked near the end with a tranſverſe black bar, and tipt with white.

The Burbot.

11. The *lota*, or BURBOT, is found in the Trent; but in greater plenty in the river Witham, and in the great eaſt fen in Lincolnſhire. It is a very delicate fiſh for the table, though of a diſguſting appearance when alive. It is very voracious, and preys on the fry and leſſer fiſh. It doues not often take a bait, but is generally caught in weels. It abounds in the lake of Geneva, where it is called *lota*; and it is alſo met with in the Lago Magiore, and Lugano. The largeſt taken in our waters weigh between two and three pounds, but abroad they are ſometimes found of double that weight. Their body has ſome reſemblance to that of an eel, only ſhorter and thicker; and its motions alſo reſemble thoſe of that fiſh: they are befides very ſmooth, ſlippery, and ſlimy. The head is very ugly, being flat, and ſhaped like that of a toad: the teeth are very ſmall, but numerous. On the end of the noſe are two ſmall beards; on the chin another. The colour varies: ſome are duſky, others are of a dirty green, ſpotted with black, and oftentimes with yellow; and the belly in ſome is white; but the real colours are frequently concealed by the ſlime. Gadus ‖ Gaffarel.

12. The *muſtela*, or FIVE-BEARDED COD, very much reſembles the former.

The beards on the upper jaw are four, viz. two at the very end of the noſes and two a little above them: on the end of the lower jaw is a ſingle one. The fiſh are of a deep olive brown, their belly whitiſh. They grow to the ſame ſize as the former.—The Corniſh fiſhermen are ſaid to whiſtle, and make uſe of the words *bod*, *bod*, *veau*, when they are deſirous of taking this fiſh, as if by that they facilitated the capture. In the ſame manner the Sicilian fiſhermen repeat their *mamaſſu di pajanu*, &c. when they are in purſuit of the ſword-fiſh.

The Tuſk.

13. The TORSK, or, as it is called in the Shetlands, *tuſk* and *briſnak*, is a northern fiſh; and as yet undiſcovered lower than about the Orkneys, and even there it is rather ſcarce. In the ſeas about Shetland, it ſwarms, and forms (barrelled or dried) a conſiderable article of commerce. The length is about 20 inches, the greateſt depth four and a half. The head is ſmall; the upper jaw a little longer than the lower; both jaws furniſhed with multitudes of ſmall teeth: on the chin is a ſmall ſingle beard: from the head to the dorſal fin is a deep furrow. The colour of the head is duſky: the back and ſides yellow; belly white; edges of the dorſal, anal, and caudal fins, white; the other parts duſky; the pectoral-fins brown.

GAFF, a ſort of boom or pole, frequently uſed in ſmall ſhips, to extend the upper edge of the mizen; and always employed for the ſame purpoſe on thoſe ſails whoſe foremoſt edges are joined to the maſt by hoops or lacings, and which are uſually extended by a boom below. Such are the main-ſails of all ſloops, brigs, and ſchooners.

GAFFAREL (James), a French divine, and very learned writer, born about 1601. He acquired great ſkill in the oriental and ſeveral other languages; and was particularly verſant in the cabbaliſtic and occult ſciences, which he learnedly expoſed and refuted. Cardinal Richlieu made choice of him for his library-keeper, and ſent him into Italy to collect the beſt manuſcripts and books. He publiſhed a book, intitled *Curioſitez Inouies*, i. e. Unheard-of Curioſities. It is ſaid the cardinal deſigned to employ him in his grand project for the re-union of religions. He died in 1681, aged 80. He had been labouring for many years, and had almoſt finiſhed, a hiſtory of the ſubterranean worlds; containing an account of the caves, grottoes, vaults, catacombs, and mines, he had met with in 30 years travels.

GA-

Gagates
Gage.

GAGATES, or JET. See JET.

GAGE, in our ancient cuſtoms, ſignifies a pledge, or pawn, given by way of ſecurity. The word is only properly uſed in ſpeaking of moveables; for immoveables, *hypotheca* is uſed.

If the gage periſh, the perſon who received it is not to anſwer for it, but only for extreme negligence. &c.

GAGE, is alſo uſed for a challenge, to combat: See CARTEL. In which ſenſe, it was a pledge, which the accuſer or challenger caſt on the ground, and the other took up as accepting the challenge: it was uſually a glove, gauntlet, chapcroon, or the like. See COMBAT, and DUEL.

GAGE is only now retained as a ſubſtantive. As a verb, the *G* is changed into *W*, and of *gage* is formed *wage*; as, to wage law; to wage deliverance, *q. d.* to give ſecurity a thing ſhall be delivered. See WAGE.

If a perſon who has diſtrained be ſued for not having delivered what he had taken by diſtreſs, he ſhould wage, or gage, or gager, deliverance; that is, put in ſurety that he will deliver them.

Mort-GAGE, is that which is left in the hands of the proprietor, ſo that he reaps the fruits thereof.

In oppoſition to *vif-gage*, where the fruits or revenues are reaped by the creditor, and reckoned on the foot of the debt, which diminiſhes in proportion thereto. The ſecond acquits or diſcharges itſelf; the firſt does not.

GAGE, in the ſea-language. When one ſhip is to windward of another, ſhe is ſaid to have the weather-gage of her. They likewiſe call the number of feet that a veſſel ſinks in the water, the ſhip's *gage*: this they find by driving a nail into a pike near the end, and putting it down beſide the rudder till the nail catch hold under it; then as many feet as the pike is under water, is the ſhip's gage.

GAGE, among letter-founders, a piece of box, or other hard wood, variouſly notched; the uſe of which is to adjuſt the dimenſions, ſlopes, &c. of the different ſorts of letters. See FOUNDERY.

Sliding-GAGE, a tool uſed by mathematical inſtrument-makers, for meaſuring and ſetting off diſtances.

Sea-GAGE, an inſtrument invented by Dr Hales and Dr Defaguliers, for finding the depth of the ſea; the deſcription whereof is this. AB (Plate CXV. fig. 1. n° 1.) is the gage-bottle, in which is cemented the gage-tube *Ff* in the braſs cap at G. The upper end of tube F is hermetically ſealed, and the open lower end *f* is immerſed in mercury, marked C, on which ſwims a ſmall thickneſs or ſurface of treacle. On the top of the bottle is ſcrewed a tube of braſs HG, pierced with ſeveral holes to admit the water into the bottle AB. The body K is a weight hanging by its ſhank L, in a ſocket N, with a notch on one ſide at *m*, in which is fixed the catch *l* of the ſpring S, and, paſſing through the hole L, in the ſhank of the weight K, prevents its falling out when once hung on. On the top, in the upper part of the braſs tube at H, is fixed a large empty ball, or full-blown bladder, I, which muſt not be ſo large, but that the weight K may be able to ſink the whole under water.

The inſtrument, thus conſtructed, is uſed in the following manner. The weight K being hung on, the gage is let fall into deep water, and ſinks to the bottom: the ſocket N is ſomewhat longer than the ſhank L; and therefore, after the weight K comes to the bottom, the gage will continue to deſcend, till the lower part of the ſocket ſtrikes againſt the weight: this gives liberty to the catch to fly out of the hole L, and let go the weight K: when this is done, the ball or bladder I, inſtantly buoys up the gage to the top of the water. While the gage is under water, the water having free acceſs to the treacle and mercury in the bottle, will by its preſſure force it up into the tube *Ff*, and the height to which it has been forced by the greateſt preſſure, viz. that at the bottom, will be ſhewn by the mark in the tube which the treacle leaves behind it, and which is the only uſe of the treacle. This ſhews into what ſpace the whole air in the tube *Ff* is compreſſed; and conſequently the height or depth of the water which by its weight produced that compreſſion, which is the thing required. Gage.

If the gage-tube *Ff* be of glaſs, a ſcale might be drawn on it with the point of a diamond, ſhewing, by inſpection, what height the water ſtands above the bottom. But the length of 10 inches is not ſufficient for fathoming depths at ſea, ſince that, when all the air in ſuch a length of tube is compreſſed into half an inch, the depth of water is no more than 634 feet, which is not half a quarter of a mile.

If, to remedy this, we make uſe of a tube 50 inches long, which for ſtrength may be a muſket-barrel, and ſuppoſe the air compreſſed into an hundredth part of half an inch; then by ſaying, as 1 : 99 :: 400 : 39600 inches, or 3300 feet; even this is but little more than half a mile, or 2640 feet. But ſince it is reaſonable to ſuppoſe the cavities of the ſea bear ſome proportion to the mountainous parts of the land, ſome of which are more than three miles above the earth's ſurface; therefore, to explore ſuch great depths, the doctor contrived a new form for his ſea-gage, or rather for the gage-tube in it, as follows. BCDF (*ibid.* n° 2.) is a hollow metalline globe communicating on the top with a long tube AB, whoſe capacity is a ninth part of that globe. On the lower part at D, it has alſo a ſhort tube DE, to ſtand in the mercury and treacle. The air contained in the compound gage-tube is compreſſed by the water as before; but the degree of compreſſion, or height to which the treacle has been forced, cannot there be ſeen through the tube; therefore, to anſwer that end, a ſlender rod of metal or wood, with a knob on the top of the tube AB, will receive the mark of the treacle, and ſhew it when taken out.

If the tube AB be 50 inches long, and of ſuch a bore that every inch in length ſhould be a cubic inch of air, and the contents of the globe and tube together 500 cubic inches; then, when the air is compreſſed within an hundredth part of the whole, it is evident the treacle will not approach nearer than 5 inches of the top of the tube, which will agree to the depth of 3300 feet of water as above. Twice this depth will compreſs the air into half that ſpace nearly, viz. $2\frac{1}{2}$ inches, which correſpond to 6600, which is a mile and a quarter. Again, half that ſpace, or $1\frac{1}{4}$ inch, will ſhew double the former depth, viz. 13200 feet, or $2\frac{1}{2}$ miles; which is probably very nearly the greateſt depth of the ſea.

Wind-GAGE, an inſtrument for meaſuring the force of the wind upon any given ſurface. It was invented by Dr Lind, who gives the following deſcription of it

Gage. of it, Phil. Trans. Vol. LXV.

Pl. CXLII. fig. 1. This instrument consists of two glass tubes AB, CD, of five or six inches in length. Their bores, which are so much the better for being equal, are about four tenths of an inch in diameter. They are connected together like a siphon by a small bent glass-tube *a b*, the bore of which is about one tenth of an inch in diameter. On the upper end of the leg AB there is a tube of latten brass, which is kneed, or bent perpendicularly outwards, and has its mouth open towards F. On the other leg CD, is a cover with a round hole G in the upper part of it, two tenths of an inch in diameter. This cover and the kneed tube are connected together by a slip of brass *e d*, which not only gives strength to the whole instrument, but also serves to hold the scale HI. The kneed tube and cover, are fixed on with hard cement or sealing wax. To the same tube is soldered a piece of brass *e*, with a round hole in it to receive the steel spindle KL; and at *f* there is just such another piece of brass soldered to the brass-hoop *g b*, which surrounds both legs of the instrument. There is a small shoulder on the spindle at *f*, upon which the instrument rests, and a small nut at *i*, to prevent it from being blown off the spindle by the wind. The whole instrument is easily turned round upon the spindle by the wind, so as always to present the mouth of the kneed tube towards it. The end of the spindle has a screw on it; by which it may be screwed into the top of a post or a stand made on purpose. It has also a hole at L, to admit a small lever for screwing it into wood with more readiness and facility. A thin plate of brass *k* is soldered to the kneed tube, about half an inch above the round hole G, so as to prevent rain from falling into it. There is likewise a crooked tube A B (fig. 2.) to be put occasionally upon the mouth of the kneed tube F, in order to prevent rain from being blown into the mouth of the wind-gage when it is left out all night, or exposed in the time of rain.

The force or momentum of the wind may be ascertained by the assistance of this instrument, by filling the tubes half full of water, and pushing the scale a little up or down, till the o of the scale, when the instrument is held up perpendicularly, be on a line with the surface of the water in both legs of the wind-gage. The instrument being thus adjusted, hold it up perpendicularly, and, turning the mouth of the kneed tube towards the wind, observe how much the water is depressed by it in the one leg, and raised in the other. The sum of the two is the height of a column of water, which the wind is capable of sustaining at that time; and every body that is opposed to that wind will be pressed upon by a force equal to the weight of a column of water, having its base equal to the altitude of the column of water sustained by the wind in the wind-gage. Hence the force of the wind upon any body where the surface opposed to it is known, may be easily found; and a ready comparison may be made betwixt the strength of one gale of wind and that of another.

The force of the wind may be likewise measured with this instrument, by filling it until the water runs out at the hole G. For if we then hold it up to the wind as before, a quantity of water will be blown out; and if both legs of the instrument are of the same bore, the height of the column sustained will be equal to double the column of water in either leg, or the sum of what is wanting in both legs. But if the legs are of unequal bores, neither of these will give the true height of the column of water which the wind sustained. But the true height may be obtained by the following formulæ. Gage.

Suppose that after a gale of wind which had blown the water from A to B (fig. 3.) forcing it at the same time through the other tube out at E, the surface of the water should be found standing at some level D G, and it were required to know what was the height of the column EF or AB, which the wind sustained. In order to obtain this, it is only necessary to find the height of the columns DB or GF, which are constantly equal to one another; for either of these added to one of the equal columns AD, EG, will give the true height of the column of water which the wind sustained.

1. Let the diameters AC, EH, of the tubes, be respectively represented by *c d*; and let a=AD, or EG, and x=DB, or GF: Then it is evident that the column DB, is to the column EG, as $c^4 x$ to $d^4 a$. But these columns are equal. Therefore $c^4 x = d^4 a$; and consequently, $x = \frac{d^4 a}{c^4}$.

2. But if at any instant of time whilst the wind was blowing, it was observed, that, when the water stood at E, the top of the tube out of which it is forced, it was depressed in the other to some given level BF, the altitude at which it would have stood in each had it immediately subsided, may be found in the following manner.—Let b=AB or EF. Then it is evident that the column DB, is equal to the difference of columns EF, GF. But the difference of these columns is as $d^4 b - d^4 x$; and consequently $x = \frac{d^4 b}{c^4 + d^4}$.

For the cases when the wind blows in at the narrow leg of the instrument: Let AB=EF=b, EG, or AD=a, GF=DB=x, and the diameters EH, GA, respectively =d, c, as before. Then it is evident, that the column AD, is to the column GF as $a c^4$ to $d^4 x$. But these columns are equal; therefore $d^4 x = a c^4$; and consequently $x = \frac{a c^4}{d^4}$. It is also evident, that the column AD is equal to the difference of the columns AB, DB; but the difference of these columns is as $b c^4 \quad c^4 x$. Therefore $d^4 x = b c^4 - c^4 x$. Whence we get $x = \frac{b c^4}{a + c^4}$.

The use of the small tube of communication *a b* (fig. 1.), is to check the undulation of the water, so that the height of it may be read off from the scale with ease and certainty. But it is particularly designed to prevent the water from being thrown up to a much greater or less altitude, than the true height of the column which the wind is able at that time to sustain, from its receiving a sudden impulse whilst it is vibrating either in its ascent or descent. As in some cases the water in this instrument might be liable to freeze, and thus break the tubes, Dr Lind recommends a saturated solution of sea-salt to be used instead of it, which does not freeze till Fahrenheit's thermometer falls to 0.

Gaieta || Galatia.

GAIETA, an ancient, handſome, and ſtrong town of Italy, in the kingdom of Naples, and in the Terra di Lavoro, with a fort, citadel, harbour, and biſhop's ſee. It was taken by the Auſtrians in 1707, and by the Spaniards in 1734. It is ſeated at the foot of a mountain near the ſea, in E. Long. 13. 37. N. Lat. 41. 30.

GAINSBOROUGH, a town of Lincolnſhire in England, ſeated on the river Trent near the ſea. It is a large well built town, with a pretty good trade, and has the title of an earldom. W. Long. 0. 40. N. Lat. 53. 26.

GALACTITES, in the hiſtory of foſſils, a ſubſtance much reſembling the morochthus or French chalk, in many reſpects; but different from it in colour. The ancients found it in the Nile, and in ſome rivers in Greece, and uſed it in medicine as an aſtringent, and for defluxions and ulcers of the eyes. At preſent it is common in Germany, Italy, and ſome parts of France, and is wholly overlooked, being eſteemed a worſe kind of morochthus. See MOROCHTHUS.

GALANGALS, in the materia medica. See KÆMPFERIA.

GALANTHUS, the SNOW-DROP; a genus of the monogynia order, belonging to the hexandria claſs of plants. There is but one ſpecies, viz. the nivalis; which is a bulbous-rooted flowery perennial, riſing but a few inches in height, and adorned at top with ſmall tripetalous flowers of a white colour. There are three varieties, viz. the common ſingle flowered ſnow-drop, the ſemi-double ſnow-drop, and the double ſnow-drop. They are beautiful little plants; and are much valued on account of their early appearance, often adorning the gardens in January or February, when ſcarce any other flower is to be ſeen. They frequently burſt forth when the ground is covered with ſnow, and continue very often till the beginning of March, making a very ornamental appearance, eſpecially when diſpoſed in cluſters towards the fronts of the borders, &c. The ſingle kind comes firſt into bloom, then the ſemi-double, and after that the double. They will ſucceed any where, and multiply exceedingly by off-ſets from the roots.

GALATA, a great ſuburb belonging to Conſtantinople, oppoſite to the ſeraglio, on the other ſide of the harbour. It is here the Greeks, Armenians, Franks, Chriſtians, and Jews inhabit, and are allowed the exerciſe of their reſpective worſhips.

GALATEA, in fabulous hiſtory, a nymph and marine deity, the daughter of Nereus and Doris. She was beloved by Polyphemus, whom ſhe deſpiſed for the ſhepherd Acis; at which that Cyclops was ſo enraged, that he cruſhed Acis to pieces with a rock. See ACIS.

GALATIA, the ancient name of a province of Aſia Minor, now called *Amaſia*. It was bounded on the eaſt by Cappadocia, on the weſt by Bithynia, on the ſouth by Pamphylia, and on the north by the Euxine Sea. It was reduced under the ſubjection of the Romans in the time of Auguſtus, and is now in the hands of the Turks. Here St. Paul founded a church, to which he directed that epiſtle which is ſtill known by the name of the *Epiſtle to the Galatians*, and was written to reclaim them from the obſervation of Jewiſh ordinances, into which they had been ſeduced by ſome falſe teachers. Galaxy, Galbanum.

GALAXY, in aſtronomy, that long, white, luminous track, which ſeems to encompaſs the heavens like a ſwath, ſcarf, or girdle: and which is eaſily perceivable in a clear night, eſpecially when the moon does not appear. The Greeks call it Γαλαξίας, *Galaxy*, of Γαλα, γαλακτος, *Milk*; on account of its colour and appearance: the Latins, for the ſame reaſons, call it *via lactea*; and we, the *milky way*. It paſſes between Sagittary and Gemini, and divides the ſphere into two parts; it is unequally broad; and in ſome parts is ſingle, in others double.

The ancient poets, and even philoſophers, ſpeak of the *Galaxy*, as the road, or way, by which the heroes went to heaven.

Ariſtotle makes it a kind of meteor, formed of a crowd of vapours, drawn into that part by certain large ſtars diſpoſed in the region of the heavens auſwering hereto.

Others, finding that the *Galaxy* was ſeen all over the globe, that it always correſponded to the ſame fixed ſtars, and that it tranſcended the height of the higheſt planets, ſet aſide Ariſtotle's opinion, and placed the *Galaxy* in the firmament, or region of the fixed ſtars, and concluded it to be nothing but an aſſemblage of an infinite number of minute ſtars.

Since the invention of the teleſcope, this opinion has been abundantly confirmed. By directing a good teleſcope to any part of the milky way; where, before, we only ſaw a confuſed whiteneſs, we now deſery an innumerable multitude of little ſtars, ſo remote, that a naked eye confounds them. See ASTRONOMY, n° 28.

GALBANUM, in pharmacy, a gum iſſuing from the ſtem of an umbelliferous plant growing in Perſia and many parts of Africa.

It is ſometimes met with in the ſhops, in looſe granules, called *drops* or *tears*; and ſometimes in large maſſes, formed of a number of theſe blended together; but in theſe maſſes ſome accidental foulneſs is often mixed with the gum. The ſingle drops uſually approach to a roundiſh, oblong, pear-like form. Galbanum is ſoft like wax, and, when freſh drawn, white; but it afterwards becomes yelloviſh or reddiſh: it is of a ſtrong ſmell, of an acrid and bitteriſh taſte; it is inflammable in the manner of a reſin, and ſoluble in water like a gum.

In medical virtue, and ſenſible qualities, it reſembles the gum ammoniacum; but is leſs efficacious than it in aſthmas, though more efficacious in hyſteric diſorders. When aſſa fetida is too ſtrong, galbanum may be tried; and, if it diſagrees, give ammoniacum.

A mixture of ſpirit of wine two parts, with one part water, diſſolves all but the impurities, which are commonly in conſiderable quantities.

Great part of the virtue of galbanum conſiſts in its eſſential oil, and is carried up in diſtillation either with water or with ſpirit, whence great care is required in purifying it. For making of plaſters, and ſuch like inferior purpoſes, the beſt method is to expoſe it in winter to a ſharp froſt, and whilſt it is brittle to powder it; thus the impurities may in ſome meaſure be ſeparated

Gale. rated in the fearce: for internal uſes, it is beſt managed by including it in a bladder, and keeping it in hot water, until it is ſoft enough to be ſtrained by preſſure through an hempen cloth.

Beſides the eſſential oil yielded by diſtillation with water, an empyreumatic oil is obtained by diſtilling in a retort without mixture. This empyreumatic oil is of a fine blue colour, but changes in the air to a purple.

GALE, in the ſea language, a term of various import. When the wind blows not ſo hard but that a ſhip may carry her top-ſails a-trip, (that is, hoiſted up to to the higheſt) then they ſay it is a loom-gale. When it blows very ſtrong, they ſay it is a ſtiff, ſtrong, or freſh gale. When two ſhips are near one another at ſea, and there being but little wind blowing, one of them finds more of it than the other, they ſay that the one ſhip gales away from the other.

GALE (Dr John), an eminent and learned miniſter among the Baptiſts, was born at London in 1680. He ſtudied at Leyden, where he diſtinguiſhed himſelf very early, and afterwards at Amſterdam, under Dr Limborch. He was choſen miniſter of the Baptiſt congregation at Barbican; where his preaching, being chiefly practical, was greatly reſorted to by people of all perſuaſions. Four volumes of his ſermons were publiſhed after his death, which happened in 1721. His *Reflections on Dr Wall's Hiſtory of Infant-baptiſm*, is the beſt defence of the Baptiſts ever publiſhed, and the reading of that performance induced the learned Mr William Whiſton and Dr Foſter to become Baptiſts.

GALE (Theophilus), an eminent nonconformiſt miniſter, born in 1628. He was invited to Wincheſter in 1657; and continued a ſtated preacher there, until the re-eſtabliſhment of the church by Charles II. when he rather choſe to ſuffer the penalties of the act of conformity, than ſubmit to it contrary to his conſcience. He was afterwards engaged by Philip lord Wharton as tutor to his ſons, whom he attended to an academy at Caen in Normandy; and when this duty was fulfilled, he became paſtor over a congregation of private conventiclers in Holborn. He died in 1678; and is principally known by an elaborate work, entitled, the *Court of the Gentiles*, calculated to ſhew, that the Pagan philoſophers derived their moſt ſublime ſentiments from the Scriptures.

GALE (Dr Thomas), a learned divine, born at Scruton in Yorkſhire, in the year 1636, was educated at Cambridge, and at length became profeſſor of the Greek language in that univerſity. He was afterwards choſen head maſter of St Paul's ſchool, London; and was employed by the city in writing thoſe elegant inſcriptions on the monument erected in memory of the conflagration in 1666. In 1676 he was collated to a prebend in the cathedral of St Paul's; and was likewiſe elected a fellow of the Royal Society, to which he preſented a Roman urn with its aſhes. About the year 1697, he gave to the new library of Trinity college, in Cambridge, a great number of Arabic manuſcripts; and in 1697, was admitted dean of York. He died in that city, in 1702; and was interred in the cathedral, where a monument, with a Latin inſcription, was erected to his memory. He was a learned divine, a great hiſtorian, one of the beſt Greek ſcholars of his age, and maintained a correſpondence with the moſt learned men abroad as well as at home. He publiſhed, 1. *Hiſtoriæ Poeticæ Antiqui Scriptores*, octavo. 2. *Opuſcula Mythologica, Ethica, & Phyſica*, in Greek and Latin, octavo. 3. *Herodoti Hiſtoria*, folio. 4. *Hiſtoricæ Anglicanæ Scriptores quinque*, in folio. *Hiſtoriæ Britannicæ, Saxonicæ, Anglo-Daniceæ, Scriptores quindecim*, in folio. 6. *Rhetores Selecti*, &c. Galeaſſe, Galen.

GALEASSE, a large low built veſſel, uſing both ſails and oars, and the biggeſt of all the veſſels that make uſe of the latter. It may carry twenty guns, and has a ſtern capable of lodging a great number of marines. It has three maſts, which are never to be lowered or taken down. It has alſo thirty-two benches of rowers; and to each bench ſix or ſeven ſlaves, who ſit under cover. This veſſel is at preſent uſed only by the Venetians.

GALEN (Claudius), in Latin, *Galenus*, prince of the Greek phyſicians, after Hippocrates, was born at Pergamus in the Leſſer Aſia, about the year 131. His father was poſſeſſed of a conſiderable fortune; was well verſed in polite literature, philoſophy, aſtronomy, and geometry; and was alſo well ſkilled in architecture. He himſelf inſtructed his ſon in the firſt rudiments of learning, and afterwards procured him the greateſt maſters of the age in philoſophy and eloquence. Galen having finiſhed his ſtudies under their care, choſe phyſic for his profeſſion, and chiefly ſtudied the works of Hippocrates. Having at length exhauſted all the ſources of literature that were to be found at home, he reſolved to travel, in order to converſe with the moſt able phyſicians in all parts, intending at the ſame time to take every opportunity of inſpecting on the ſpot the plants and drugs of the countries through which he paſſed. With this view he went to Alexandria, and ſtaid ſome years in that metropolis of Egypt: from thence he travelled through Cilicia; paſſed through Paleſtine; viſited the iſles of Crete and Cyprus; and made two voyages to Lemnos, in order to examine the Lemnian earth, which was then eſteemed an admirable medicine. With the ſame view he went into the Lower Tyria, in order to obtain a thorough inſight into the nature of the opobalſamum, or balm of Gilead; and having completed his deſign, returned home by the way of Alexandria.

Galen had been four years at Pergamus, where his practice was attended with extraordinary applauſe, when ſome ſeditious commotions induced him to go to Rome, where he reſolved to ſettle: but the proofs he gave of his ſuperior ſkill, added to the reſpect ſhewn him by ſeveral perſons of very high rank, created him ſo many enemies among his brethren of the faculty, that he was obliged to quit the city, after having reſided there four or five years. But he had not long returned to Pergamus, when he was recalled by the emperors Aurelius and Verus. After their death, he retired to his native country; where he died, about the year 200. He wrote in Greek; and is ſaid to have compoſed two hundred volumes, which were unhappily burnt in the temple of Peace. The beſt editions of thoſe that remain, are, that printed at Baſil, in 1538, in five volumes, and that of Veniee, in 1625, in ſeven volumes. Galen was of a weak and delicate conſtitution, as he himſelf aſſerts: but he nevertheleſs, by his temperance and ſkill in phyſic, arrived to a great age; for it was his maxim, always to riſe from table with

Galenic || Galileo.

some degree of appetite. He is juſtly conſidered as the greateſt phyſician of antiquity, next to Hippocrates; and he performed ſuch ſurpriſing cures, that he was accuſed of magic.

GALENIC, or GALENICAL, in pharmacy; a manner of treating diſeaſes, founded on the principles of Galen.

The diſtinction of *galenical* and *chemical*, was occaſioned by a diviſion of the practitioners of medicine into two ſects, which happened on the introduction of chemiſtry into medicine. Then the chemiſts, arrogating to themſelves every kind of merit and ability, ſtirred up an oppoſition to their pretenſions, founded on the invariable adherence of the other party to the ancient practice. And though this diviſion into the two ſects of galeniſts and chemiſts has long ceaſed, yet the diſtinction of medicines, which reſulted from it, is ſtill retained.

Galenical medicines are thoſe which are formed by the eaſier preparations of herbs, roots, *&c.* by infuſion, decoction, *&c.* and by combining and multiplying ingredients; while thoſe of chemiſtry draw their more intimate and remote virtues by means of fire and elaborate preparations, as calcination, digeſtion, fermentation, *&c.*

GALEON. See GALLION.

GALICIA, a province of Spain, bounded on the north and weſt by the ocean, on the ſouth by Portugal, and on the eaſt by Aſturias and the kingdom of Leon. The air is temperate along the coaſt; but, in other places, it is cold and moiſt. It is but thin of people, and the produce is wine, flax, and citrons; here alſo are good paſtures, copper, and lead; the foreſts yield wood for building of ſhips. St. Jago di Compoſtella is the capital town.

GALILEE, once a province of Judea, now of Turky in Aſia, was bounded by mount Lebanon on the north, by the river Jordan and the ſea of Galilee on the eaſt, by the Chiſon on the ſouth, and by the Mediterranean on the weſt. It was the ſcene of many of our Saviour's miracles; but the bounds of the country are not now well known, nor yet the places where many of the towns ſtood.

GALILEANS, a ſect of the Jews. Their founder was one Judas, a native of Galilee, from which place they derived their name. Their chief, eſteeming it an indignity for the Jews to pay tribute to ſtrangers, raiſed up his countrymen againſt the edict of the emperor Auguſtus, which had ordered a taxation or enrolment of all the ſubjects of the Roman empire.

They pretended that God alone ſhould be owned as Maſter and Lord, and in other reſpects were of the opinion of the Phariſees; but, as they judged it unlawful to pray for infidel princes, they ſeparated themſelves from the reſt of the Jews, and performed their ſacrifices apart.

GALILEO (Galilei), the famous mathematician and aſtronomer, was the ſon of a Florentine nobleman, and born in the year 1564. He had from his infancy a ſtrong inclination to philoſophy and the mathematics; and made prodigious progreſs in theſe ſciences. In 1592, he was choſen profeſſor of mathematics at Padua; and during his abode there he *invented*, it is ſaid, the teleſcope; or, according to others, improved that inſtrument, ſo as to make it fit for aſtronomical obſervations: (See ASTRONOMY, p. 749, col. 1.) In 1611, Coſmo II. grand duke of Tuſcany ſent for him to Piſa, where he made him profeſſor of mathematics, with a handſome ſalary; and ſoon after inviting him to Florence, gave him the office and title of *principal philoſopher and mathematician to his highneſs*. Galileo.

He had been but a few years at Florence, before he was convinced by ſad experience, that Ariſtotle's doctrine, however ill-grounded, was held too ſacred to be called in queſtion. Having obſerved ſome ſolar ſpots in 1612, he printed that diſcovery the following year at Rome; in which, and in ſome other pieces, he ventured to aſſert the truth of the Copernican ſyſtem, and brought ſeveral new arguments to confirm it. For theſe he was cited before the inquiſition; and, after ſome months impriſonment, was releaſed upon a ſimple promiſe, that he would renounce his heretical opinions, and not defend them by word or writing. But having afterwards, in 1632, publiſhed at Florence his "Dialogues of the two greateſt ſyſtems of the world, the Ptolemaic and Copernican," he was again cited before the inquiſition, and committed to the priſon of that eccleſiaſtical court at Rome. In June 32d N. S. that year, the congregation convened; and in his preſence pronounced ſentence againſt him and his books, obliging him to abjure his errors in the moſt ſolemn manner; committed him to the priſon of their office during pleaſure; and enjoined him, as a ſaving penance, for three years to come and repeat once a-week the ſeven penitential pſalms: reſerving to themſelves, however, the power of moderating, changing, or taking away altogether or in part, the abovementioned puniſhment and penance. On this ſentence, he was detained a priſoner till 1634; and his "Dialogues of the ſyſtem of the world" were burnt at Rome.

He lived ten years after this, ſeven of which were employed in making ſtill further diſcoveries with his teleſcope. But by the continual application to that inſtrument, added to the damage he received in his ſight from the nocturnal air, his eyes grew gradually weaker, till he became totally blind in 1639. He bore this calamity with patience and reſignation, worthy of a great philoſopher. The loſs neither broke his ſpirit, nor hindered the courſe of his ſtudies. He ſupplied the defect by conſtant meditation; whereby he prepared a large quantity of materials, and began to dictate his own conceptions; when, by a diſtemper of three months continuance, waſting away by degrees, he expired at Arcetti near Florence, in January 1642, N. S. in the 78th year of his age.

Among various uſeful inventions of which Galileo was the author, is that of the ſimple pendulum, which he had made uſe of in his aſtronomical experiments. He had thoughts of applying it to clocks; but did not execute it: the glory of that invention was reſerved for Vicenzio his ſon, who made the experiment at Venice in 1649; and M. Huygen's afterwards carried this invention to perfection.—He wrote a great number of treatiſes, ſeveral of which were publiſhed in a collection by Signor Mendeſſi, under the title of *L'opera di Galileo Galilei Lynceo*. Some of theſe, with others of his pieces, were tranſlated into Engliſh and publiſhed by Thomas Saliſbury, Eſq; in his mathema-

ti-

Gall. tical collections, &c. in two volumes folio. A volume also of his letters to several learned men, and solutions of several problems, were printed at Bologna in quarto. Besides these, he wrote many others, which were unfortunately lost through his wife's devotion; who, solicited by her confessor, gave him leave to perufe her husband's manuscripts, of which he tore and took away as many as he said were not fit to be published.

GALL, in the animal œconomy. See BILE.

A great number of experiments have been made upon the gall of different animals, but few conclusions can be drawn from them with any certainty. Dr Percival, however, hath shewn, that putrid bile may be perfectly corrected and sweetened by an admixture of the vegetable acids, vinegar and juice of lemons. These, he observes, have this effect much more completely than the mineral ones: and hence, he thinks, arises the great usefulness of the vegetable acids in autumnal diseases; which are always attended with a putrescent dispositiou of the bile, owing to the heat of the preceding summer. On this occasion he takes notice of a common mistake among physicians, who frequently prescribe elixir of vitriol in those diseases, where vinegar or lemon juice would be much more effectual.

From this effect of acids on the gall, he also thinks, we may see why the immoderate use of acids is so pernicious to digestion. It is necessary to health that the gall should be in some degree acrid and alkalescent: but as acids have the property of rendering it perfectly mild and sweet, they must be proportionably pernicious to the due concoction and assimilation of the food; which without an acrid bile cannot be accomplished. Hence the body is deprived of its proper nourishment and support, the blood becomes vapid and watery, and a fatal cachexy unavoidably enfues. This hath been the case with many unfortunate persons, who, in order to reduce their excessive corpulency, have indulged themselves in the too free use of vinegar. From the mild state of the gall in young children, Dr Percival also thinks it is, that they are so much troubled with acidities.

GALL-*Bladder*. See ANATOMY, n° 358.

GALL, in natural history, denotes any protuberance or tumour produced by the puncture of insects on plants and trees of different kinds.

These galls are of various forms and sizes, and no less different with regard to their internal structure. Some have only one cavity, and others a number of small cells communicating with each other. Some of them are as hard as the wood of the tree they grow on, whilst others are soft and spongy; the first being termed *gall-nuts*, and the latter *berry-galls* or *apple-galls*.

The general history of the gall is this. An insect of the fly kind is instructed by nature to take care for the safety of her young, by lodging her eggs in a woody substance, where they will be defended from all injuries: she for this purpose wounds the leaves or tender branches of a tree; and the lacerated vessels, discharging their contents, soon form tumours about the holes thus made. The external coat of this excrescence is dried by the air; and grows into a figure which bears some resemblance to the bow of an arch, or the roundness of a kernel. This little ball receives its nutriment, growth, and vegetation, as the other parts of the tree, by slow degrees, and is what we call the *gall-nut*. The worm that is hatched under this spacious vault, finds in the substance of the ball, which is as yet very tender, a substistence suitable to its nature; gnaws and digests it till the time comes for its transformation to a nymph, and from that state of existence changes into a fly. After this, the insect, perceiving itself duly provided with all things requisite, disengages itself soon from its confinement, and takes its flight into the open air. The case, however, is not similar with respect to the gall-nut that grows in autumn. The cold weather frequently comes on before the worm is transformed into a fly, or before the fly can pierce through its inclosure. The nut falls with the leaves: and although you may imagine that the fly which lies within is lost, yet in reality it is not so; on the contrary, its being covered up so close, is the means of its preservation. Thus it spends the winter in a warm house, where every crack and cranny of the nut is well stopped up; and lies buried as it were under a heap of leaves, which preserves it from the injuries of the weather. This apartment, however, though so commodious a retreat in the winter, is a perfect prison in the spring. The fly, roused out of its lethargy by the first heats, breaks its way through, and ranges where it pleases. A very small aperture is sufficient, since at this time the fly is but a diminutive creature. Besides, the ringlets whereof its body is composed, dilate and become pliant in the passage.

Oak-galls put, in a very small quantity, into a solution of vitriol in water, though but a very weak one, give it a purple or violet colour: which, as it grows stronger, becomes black; and on this property depends the art of making our writing-ink, as also the arts of dying and dressing leather, and other manufactures. See INK.

GALLS are very strong astringents, and give out their astringent virtue very readily both to water and spirit. From two ounces of galls, 14 drachms of astringent extract were obtained by water, and between 12 and 13 with spirit. In medicine they are rarely used.

GALL (St), a considerable town in Switzerland, and in the Upper Thurgow, with a rich and celebrated abbey, whose abbot is a prince of the empire. This place has for some time been a republic, in alliance with the Cantons. It is not very large; but is well built, neat, populous. It contains about 10,000 inhabitants, who are chiefly employed in the linen manufacture; and make annually, it is said, 40,000 pieces of linen, of 200 ells each; which renders it one of the richest towns in Switzerland. The inhabitants are Protestants; for which reason there are often great contests between them and the abbey, about religious affairs. It is seated in a narrow barren valley, between two mountains, and upon two small streams. E. Long. 29. 5. N. Lat. 47. 38.

Gall, Galland.

GALLAND (Athony), a learned antiquarian, member of the Academy of Inscriptions, and professor of Arabic in the Royal College of Paris, was born of poor parents at Rollo, a village in Picardy. Having studied at the Sorbonne and other universities, he travelled into the east; where he acquired great skill in the Arabic tongue, and in the manners of the Mahometans. He wrote several works; the principal of which are, 1. An account of the death of Sultan Oſman,

Gallant ‖ Galley.

man, and the coronation of the fultan Muſtapha. 2. A collection of maxims, drawn from the works of the Orientals. 3. A treatiſe on the origin of coffee. 4. The Arabian nights entertainments, &c.

GALLANT, or GALANT, a French term adopted into our language, and ſignifying polite, civil, and well-bred, with a diſpoſition to pleaſe, particularly the ladies. It alſo ſignifies brave or courageous.

GALLERY, in architecture, a covered place in a houſe, much longer than broad, and uſually in the wings of a building; its uſe being chiefly to walk in.

GALLERIES, in gardening, are certain ornaments made with trees of different kinds; which are very common in all the French gardens, but are ſeldom introduced into the Britiſh ones, eſpecially ſince the taſte for clipped trees has been exploded. For thoſe, however, who may ſtill chooſe to have them, Mr Miller gives the following directions.

In order to make a gallery in a garden with portico's and arches, a line muſt firſt be drawn of the length you deſign the gallery to be; which being done, it is to be planted with hornbeam, as the foundation of the gallery. The management of galleries is not difficult. They require only to be digged round about; and ſheared a little when there is occaſion. The chief curioſity required is in the ordering the forepart of the gallery, and in forming the arches. Each pillar of the porticoes or arches ought to be four feet diſtant from another, and the gallery 12 feet high and 10 feet wide, that there may be room for two or three perſons to walk abreaſt. When the hornbeams are grown to the height of three feet, the diſtance of the pillars well regulated, and the ground-work of the gallery finiſhed, the next thing to be done is to form the frontiſpiece; to perform which, you muſt ſtop the hornbeam between two pillars for that purpoſe, which forms the arch. As it grows, you muſt with your ſheers cut off thoſe boughs which outſhoot the others. In time they will grow ſtrong, and may be kept in form by the ſheers. Portico-galleries may be covered with lime-trees.

GALLERY, in fortification, a covered walk a-croſs the ditch of a town, made of ſtrong beams, covered over with planks, and loaded with earth: ſometimes it is covered with raw hides, to defend it from the artificial fires of the beſieged.

GALLERY *of a Mine*, is a narrow paſſage or branch of a mine carried on under ground to a work deſigned to be blown up. See MINE.

GALLERY, in a ſhip, that beautiful frame, which is made in the form of a balcony, at the ſtern of a ſhip without board; into which there is a paſſage out of the admiral's or captain's cabbin, and is for the ornament of the ſhip.

GALLEY, a kind of low flat-built veſſel, furniſhed with one deck, and navigated with ſails and oars, particularly in the Mediterranean. By the Greek authors under the eaſtern empire, this kind of veſſel was called γαλαια and γαλια; and by the Latin authors of the ſame time, *galea*; whence, according to ſome, the modern denomination. Some ſay it was called *galea*, on account of a caſk or helmet which it carried on its prow, as Ovid atteſts, *de Triſtib.* The French call it *galere*; by reaſon, they ſay, that the top of the maſts is uſually cut in the form of a hat, which the Italians call *galero*. Others derive both *galea*, and *galere*, from a fiſh by the Greeks called γαλεωτης, or ϛιφιας, and by us the *ſword-fiſh*, which this veſſel reſembles. Laſtly, others derive the *galley*, *galea*, *galere*, *galeaſſe*, &c. from the Syriac and Chaldee *gaul*, and *gallin*, a man expoſed on the water in a veſſel of wood. Galley, Gall.

The largeſt ſort of theſe veſſels is employed only by the Venetians. They are commonly 162 feet long above, and 133 feet by the keel; 32 feet wide, with 23 feet length of ſtern-poſt. They are furniſhed with three maſts, and 32 banks of oars; every bank containing two oars, and every oar being managed by ſix or ſeven ſlaves, who are uſually chained thereto. In the fore part they have three little batteries of cannon, of which the loweſt is of two 36 pounders, the ſecond of two 24 pounders, and the uppermoſt of two 2 pounders: three 18 pounders are alſo planted on each quarter. The complement of men for one of theſe galleys is 1000 or 1200. They are eſteemed extremely convenient for bombarding or making a deſcent upon an enemy's coaſt, as drawing but little water; and having by their oars frequently the advantage of a ſhip of war, in light winds or calms, by cannonading the latter near the ſurface of the water; by ſcouring her whole length with their ſhot, and at the ſame time keeping on her quarter or bow, ſo as to be out of the direction of her cannon.

The galleys next in ſize to theſe, which are alſo called *half-galleys*, are from 120 to 130 feet long, 18 feet broad, and 9 or 10 feet deep. They have two maſts, which may be ſtruck at pleaſure; and are furniſhed with two large lateen ſails, and five pieces of cannon. They have commonly 25 banks of oars, as deſcribed above. A ſize ſtill leſs than theſe are called *quarter-galleys*, carrying from 12 to 16 banks of oars. There are very few galleys now beſides theſe in the Mediterranean, which are found by experience to be of little utility except in fine weather; a circumſtance which renders their ſervice extremely precarious. They generally keep cloſe under the ſhore, but ſometimes venture out to ſea to perform a ſummer cruiſe.

GALLEY-*Worm*, in zoology, an inſect known by moſt writers under the name of *Iulus*. It is a land-inſect, with a long body, compoſed of a great number of rings, and furniſhed with many feet. It is found very frequently in gardens; and, when touched, has the power of rolling itſelf up into a ball. This animal is very common among us, and is by ſome referred to the ſcolopendræ, but improperly: for though they agree in the great number of legs, ours is a harmleſs animal; whereas the ſcolopendræ are miſchievous creatures, armed with dangerous forceps. It is ſuppoſed by Liſter, that this ſort of animal, common with us, would on diſtillation yield the ſame ſort of animal-acid that is procured from the ant. The reaſon of the conjecture is, that the ant and this creature agree in emitting a ſharp and pungent ſmell on being bruiſed; but theſe are not eaſily procured in ſufficient plenty to make the experiment, as they are not gregarious like the ants.

GALLI, in antiquity, the prieſts of the goddeſs Cybele. They were eunuchs; and took their name from Gallus, a river in Phrygia.

When a youth was to be initiated into this order, the cuſtom was to throw off his cloaths, to run crying aloud into the midſt of the troop, and then drawing a ſword to caſtrate himſelf: after this, he ran about the ſtreets,

Gallican Galliot.

ſtreets, carrying in his hands the marks of his mutilation; which he was to throw into a houſe, and in that houſe to put on a woman's dreſs.

GALLICAN, any thing belonging to France: thus the term *Gallican church* denotes the church of France, or the aſſembly of the clergy of that kingdom.

GALLICISM, a mode of ſpeech peculiar to the French language, and contrary to the rules of grammar in other languages.

GALLINÆ, in ornithology, an order of birds. See Zoology.

GALLINACIOUS, an appellation given to the birds of the order of the gallinæ.

GALLING, or Excoriation, in medicine. See Excoriation.

Galling *of a Horſe's back*; a diſorder occaſioned by heat, and the chafing or pinching of the ſaddle.

In order to prevent it, ſome take a hind's ſkin well garniſhed with hair, and fit it neatly under the pannel of the ſaddle, ſo that the hairy ſide may be next the horſe.

When a horſe's back is galled upon a journey, take out a little of the ſtuffing of the pannel over the ſwelling, and ſew a piece of ſoft white leather on the inſide of the pannel: anoint the part with ſalt butter, and every evening wipe it clean, rubbing it till it grow ſoft, anointing it again with butter, or, for want of that, with greaſe: waſh the ſwelling, or hurt, every evening with cold water and ſoap; and ſtrew it with ſalt, which ſhould be left on till the horſe be ſaddled in the morning.

GALLION, or Galleon, in naval affairs, a ſort of ſhips employed in the commerce of the Weſt Indies. The Spaniards ſend annually two fleets; the one for Mexico, which they call the *flota*; and the other for Peru, which they call the *gallions*. See Flota.

By a general regulation made in Spain, it has been eſtabliſhed, that there ſhould be twelve men of war, and five tenders, annually fitted out for the armada or galleons; eight ſhips of ſix hundred tons burden each, and three tenders, one of an hundred tons, for the iſland Margarita, and two of eighty each, to follow the armada; for the New Spain fleet, two ſhips of ſix hundred tons each, and two tenders of eighty each; and for the Honduras fleet, two ſhips of five hundred tons each: and, in caſe no fleet happened to ſail any year, three gallions and a tender ſhould be ſent to New Spain for the plate.

They are appointed to ſail from Cadiz in January, that they may arrive at Porto-Bello about the middle of April; where, the fair being over, they may take aboard the plate, and be at Havannah with it about the middle of June; where they are joined by the flota, that they may return to Spain with the greater ſafety.

GALLIOT, a ſmall galley deſigned only for chace, carrying but one maſt and two pattereroes; it can both ſail and row, and has 16 or 20 oars. All the ſeamen on board are ſoldiers, and each has a muſket by him on quitting his oar.

GALLIPOLI, a ſea-port town of Italy, in the kingdom of Naples, and in the Terra-di-Otrante, with a biſhop's ſee, a fort, and a harbour. It is ſeated on a rock, ſurrounded by the ſea, and which is joined to the firm land by a bridge. E. Long. 18. 10. N. Lat. 40. 20.

Gallipoli, a ſea-port town of Turky in Europe, in the province of Romania, ſeated at the mouth of the ſea of Marmora, with a good harbour, and a biſhop's ſee. It contains about 10,000 Turks, 3500 Grecks, beſides a great number of Jews. The bazar, or bezeſtein, the place where merchandizes are ſold, is a handſome ſtructure, with domes covered with lead. It is an open place, and has no other defence than a paltry ſquare caſtle. The houſes of the Greeks and Jews have doors not above three feet and a half high, to prevent the Turks riding into their houſes. E. Long. 26. 59. N. Lat. 40. 30. Gallipoli Gallon.

GALLIUM, lady's bed-straw; a genus of the monogynia order, belonging to the tetrandria claſs of plants. There are a great many ſpecies, of which the moſt remarkable is the verum, or yellow lady's bed-ſtraw. It grows commonly in dry ground, and on road-ſides. The flowers will coagulate boiling milk; and the beſt Cheſhire cheeſe is ſaid to be prepared with them. The French preſcribe them in hyſteric and epileptic caſes. Boiled in alum-water, they tinge wool yellow. The roots dye a red not inferior to madder; for which purpoſe they are uſed in the iſland of Jura.—In the Edinburgh medical commentaries we have accounts of ſome violent ſcorbutic complaints being cured by the juice of this plant.—Sheep and goats eat the plant; horſes and ſwine refuſe it; cows are not fond of it.

GALLO, an iſland of the South Sea, near the ſea-coaſt of Peru, in South America, which was the firſt place poſſeſſed by the Spaniards when they attempted the conqueſt of Peru; it is alſo the place where the bucaneers uſed to come for wood and water, and to refit their veſſels, when they were in theſe parts. W. Long. 50. 0. N. Lat. 2. 30.

GALLOIS (John), born at Paris in 1632, was an univerſal ſcholar; but chiefly noted for having been, in conjunction with M. de Sallo who formed the plan, the firſt publiſher of the *Journal des Sçavans*. The firſt journal was publiſhed January 5th 1665; but theſe gentlemen criticiſed new works ſo rigorouſly, that the whole tribe of authors united and cried it down. De Sallo declined entirely after the publication of the third number: but Gallois ventured to ſend out a fourth, on January 4th 1666; though not without a moſt humble advertiſement at the beginning, wherein it was declared, that the author "would not preſume to criticiſe, but ſimply give an account of the books." This, with the protection of Mr Colbert, who was greatly taken with the work, gradually reconciled the public to it: and thus began literary journals, which have been continued from that time to this, under various titles, and by various writers. Gallois continued his journal to the year 1674, when more important occupations obliged him to turn it over to other hands. M. Colbert had taken him into the houſe to teach him Latin; and when he loſt his patron in 1683, he was firſt made librarian to the king, and then Greek profeſſor in the royal college. He died in 1707.

GALLON, a meaſure of capacity both for dry and liquid things, containing four quarts. But theſe quarts, and conſequently the gallon itſelf, are different, according

Galloway || Gama.

cording to the quality of the thing measured: For inſtance, the wine-gallon contains 231 cubic inches, and holds eight pounds averdupois of pure water; the beer and ale gallon contains 281 ſolid inches, and holds ten pounds three ounces and a quarter averdupois of water; and the gallon for corn, meal, &c. 272¾ cubic inches, and holds nine pounds thirteen ounces of pure water.

GALLOWAY, a county of Scotland, which gives the title of earl to a branch of the noble family of Stuart. It is divided into two diſtricts; the weſtern, called *Upper Galloway*, being the ſame with Wigtonſhire; and the eaſtern, or ſtewartry of Kirkudbright, called *Lower Galloway*. See KIRCUDBRIGHT and WIGTONSHIRE.

GALWAY, or GALLOWAY, a county of Ireland, which is 82 miles in length, and 42 in breadth, bounded by the counties of Clare, Tipperary, King's County, Roſcommon, and the ſea. The river Shannon waſhes the frontiers of the eaſt and ſouth-eaſt, and forms a lake ſeveral miles in length. There is another great lake, called *Corbis*, or *Carib*, which is near 20 miles long, and five broad. The county contains 15,420 houſes, 136 pariſhes, 17 baronies, and 13 boroughs; and ſends eight members to parliament. The capital town is of the ſame name.

GALWAY, a town of Ireland, in the county of the ſame name, and province of Connaught, of which it is the capital. It is ſurrounded with ſtrong walls, has large ſtraight ſtreets, and the houſes are generally well built with ſtone. It has a good trade into foreign parts, on account of its harbour, which is defended by a fort. It is ſeated on the bay of Galway on the weſtern ocean, 30 miles weſt of Athlone, and 100 weſt of Dublin. W. Long. 9. 10. N. Lat. 53. 12.

GALLOWS, an inſtrument of puniſhment, whereon perſons convicted capitally of felony, &c. are executed by hanging.

Among our anceſtors it was called *furca*, "fork;" a name by which it is ſtill denominated abroad, particularly in France and Italy. In this latter country, the reaſon of the name ſtill ſubſiſts; the gallows being a real fork drove into the ground, acroſs the legs whereof is laid a beam, to which the rope is tied. See FURCA.

GALLUS (Cornelius), an ancient Roman poet, born at Forum Julium, now called *Freſus*, in France. He was a particular favourite with Auguſtus Cæſar, who made him governor of Egypt: but his maladminiſtration there occaſioned his baniſhment, and the loſs of his eſtate; for grief of which he put an end to his own life. He wrote four books of love-elegies; and Virgil has complimented him in many places.

GALLUS, or *Cock*, in ornithology. See PHASIANUS.

GALLY, in printing, a frame into which the compoſitor empties the lines out of his compoſing-ſtick, and in which he ties up the page when it is completed.

The gally is formed of an oblong ſquare board, with a ledge on three ſides, and a groove to admit a falſe bottom called a *gally-ſlice*.

GAMA (Vaſco de), a Portugueſe admiral, celebrated for his diſcovery of the Eaſt Indies by the Cape of Good Hope, was born at Synes; and, in 1497, was ſent to the Indies by king Emanuel: he returned in 1502, and ſailed thither again with 13 veſſels richly laden. He was made viceroy of the Indies by king John III.; and died at Cochin, on the 24th of December 1525. Don Stephen and Don Chriſtopher de Gama, his ſons, were alſo viceroys of the Indies, and celebrated in hiſtory. Gambia || Game.

GAMBIA, a large river of Negroeland in Africa, generally ſuppoſed to be a branch of the Niger. See NILE, NIGER, and SENEGAL.

GAMBOGE, is a concreted vegetable juice, the produce of two trees, both called by the Indians *caracapulli*, and is partly of a gummy and partly of a reſinous nature. It is brought to us either in form of orbicular maſſes, or of cylindrical rolls of various ſizes; and is of a denſe, compact, and firm texture, and of a beautiful yellow. It is chiefly brought to us from Cambaja, in the Eaſt Indies, called alſo *Cambodja*, and *Cambogia*; and from thence it has obtained its names of *cambadium*, *cambogium*, and *gambogium*.

As a pigment, it makes a beautiful yellow, which is much uſed by the painters. Dr Lewis ſays, that it makes a beautiful and durable citron-yellow ſtain upon marble, whether rubbed in ſubſtance on the hot ſtone, or applied, as dragon's-blood ſometimes is, in form of a ſpirituous tincture. When it is applied on cold marble, the ſtone is afterwards to be heated, to make the colour penetrate.

Gamboge is commonly called a *gum*, but improperly. It appears to be wholly reſinous or ſulphureous; ſince ſpirit of wine diſſolves it almoſt entirely, and water, though it ſeparates its parts and keeps them ſuſpended, yet does not diſſolve them at all, nor is by any means a ſolvent for it. It is alſo very inflammable, and melts with a very gentle heat. If mixed with an equal quantity of ſalt of tartar, it readily diſſolves in common water by a few hours digeſtion. This ſolution, if kept over the fire, ſoon becomes a ſort of ſmooth glue or jelly. This is ſometimes done with a view to correct the deleterious qualities of gamboge taken inwardly, in which caſe it occaſions violent vomitings and purgings. But the moſt effectual method of correcting this and other reſinous purgatives, is by triturating them well with three or four times their weight of white ſugar, by which means they are rendered ſoluble in water, and incapable of adhering to the villous coats of the inteſtines.

GAME, in general, ſignifies any diverſion, or ſport, that is performed with regularity, and reſtrained to certain rules. See GAMING.

Games are uſually diſtinguiſhed into thoſe of exerciſe and addreſs, and thoſe of hazard. To the firſt belong cheſs, tennis, billiards, &c. and to the latter thoſe performed with cards or dice, as back-gammon, ombre, picquet, whiſt, &c. See BACK-*Gammon*, &c.

GAMES, in antiquity, were public diverſions, exhibited on ſolemn occaſions. Such, among the Greeks, were the Olympic, Pythian, Iſthmian, Nemean, &c. games; and, among the Romans, the Apollinarian, Circenſian, Capitoline, &c. games. See OLYMPIC, PYTHIAN, &c.

GAME, in law, ſignifies birds, or prey, taken or killed by fowling or hunting.

The property of ſuch animals *feræ naturæ* as are known under the denomination of *game*, with the right of

Game. of purſuing, taking, and deſtroying them, is veſted in the king alone, and from him derived to ſuch of his ſubjects as have received the grants of a chace, a park, or a free warren. Game.

By the law of nature, indeed, every man, from the prince to the peaſant, has an equal right of purſuing, and taking to his own uſe, all ſuch creatures as are *feræ naturæ*, and therefore the property of nobody, but liable to be ſeiſed by the firſt occupant. But it follows from the very end and conſtitution of ſociety, that this natural right, as well as many others belonging to man as an individual, may be reſtrained by poſitive laws enacted for reaſons of ſtate, or for the ſuppoſed benefit of the community. This reſtriction may be either with reſpect to the *place* in which this right may, or may not, be exerciſed; with reſpect to the *animals* that are the ſubjects of this right; or with reſpect to the *perſons* allowed or forbidden to exerciſe it. And, in conſequence of this authority, we find that the municipal laws of many nations have exerted ſuch power of reſtraint; have in general forbidden the entering on another man's grounds, for any cauſe, without the owner's leave; have extended their protection to ſuch particular animals as are uſually the objects of purſuit; and have inveſted the prerogative of hunting and taking ſuch animals, in the ſovereign of the ſtate only, and ſuch as he ſhall authorize. Many reaſons have concurred for making theſe conſtitutions: as, 1. For the encouragement of agriculture and improvement of lands, by giving every man an excluſive dominion over his own ſoil. 2. For the preſervation of the ſeveral ſpecies of theſe animals, which would ſoon be extirpated by a general liberty. 3. For prevention of idleneſs and diſſipation in huſbandmen, artificers, and others of lower rank; which would be the unavoidable conſequence of univerſal licence. 4. For prevention of popular inſurrections and reſiſtance to the government, by diſarming the bulk of the people: which laſt is a reaſon oftener meant than avowed, by the makers of foreſt or game laws. Nor, certainly, in theſe prohibitions is there any *natural* injuſtice, as ſome have weakly enough ſuppoſed: ſince, as Puffendorf obſerves, the law does not hereby take from any man his preſent property, or what was already his own; but barely abridges him of one means of acquiring a future property, that of occupancy; which indeed the law of nature would allow him, but of which the laws of ſociety have in moſt inſtances very juſtly and reaſonably deprived him. *Blackſt. Comment.*

Yet, however defenſible theſe proviſions in general may be, on the footing of reaſon, or juſtice, or civil policy, we muſt, notwithſtanding, acknowledge, that, in their preſent ſhape, they owe their immediate original to ſlavery. It is not till after the irruption of the northern nations into the Roman empire, that we read of any other prohibitions, than that natural one of not ſporting on any private grounds without the owner's leave.

With regard to the riſe and original of our preſent civil prohibitions, it will be found, that all foreſt and game laws were introduced into Europe at the ſame time, and by the ſame policy, as gave birth to the feodal ſyſtem; when thoſe ſwarms of barbarians iſſued from their northern hive, and laid the foundation of moſt of the preſent kingdoms of Europe, on the ruins of the weſtern empire. For when a conquering general came to ſettle the œconomy of a vanquiſhed country, and to part it out among his ſoldiers or feudatories, who were to render him military ſervice for ſuch donations; it behoved him, in order to ſecure his new acquiſitions, to keep the *ruſtici* or natives of the country, and all who were not his military tenants, in as low a condition as poſſible, and eſpecially to prohibit them the uſe of arms. Nothing could do this more effectually than a prohibition of hunting and ſporting: and therefore it was the policy of the conqueror to reſerve this right to himſelf, and ſuch on whom he ſhould beſtow it; which were only his capital feudatories, or greater barons. And, accordingly, we find, in the feudal conſtitutions, one and the ſame law prohibiting the *ruſtici* in general from carrying arms, and alſo proſcribing the uſe of nets, ſnares, or other engines for deſtroying the game. This excluſive privilege well ſuited the martial genius of the conquering troops, who delighted in a ſport which in its purſuit and ſlaughter bore ſome reſemblance to war. *Vita omnis* (ſays Cæſar, ſpeaking of the ancient Germans) *in venationibus atque in ſtudiis rei militaris conſiſtit.* And Tacitus in like manner obſerves, that *quoties bella non inuent, multum venatibus, plus per otium tranſigunt.* And indeed, like ſome of their modern ſucceſſors, they had no other amuſement to entertain their vacant hours; they deſpiſing all arts as effeminate, and having no other learning, than was couched in ſuch rude ditties as were ſung at the ſolemn carouſals which ſucceeded theſe ancient huntings. And it is remarkable, that, in thoſe nations where the feodal policy remains the moſt uncorrupted, the foreſt or game laws continue in their higheſt rigour. In France, all game is properly the king's; and in ſome parts of Germany it is death for a peaſant to be found hunting in the woods of the nobility.

With us in Britain, alſo, hunting has ever been eſteemed a moſt princely diverſion and exerciſe. The whole iſland was repleniſhed with all ſorts of game in the times of the Britons; who lived in a wild and paſtoral manner, without incloſing or improving their grounds; and derived much of their ſubſiſtence from the chaſe, which they all enjoyed in common. But, when huſbandry took place under the Saxon government, and lands began to be cultivated, improved, and incloſed, the beaſts naturally fled into the woody and deſart tracts; which were called the *foreſts*, and, having never been diſpoſed of in the firſt diſtribution of lands, were therefore held to belong to the crown. Theſe were filled with great plenty of game, which our royal ſportſmen reſerved for their own diverſion, on pain of a pecuniary forfeiture for ſuch as interfered with their ſovereign. But every freeholder had the full liberty of ſporting upon his own territories, provided he abſtained from the king's foreſts.

However, upon the Norman conqueſt, a new doctrine took place; and the right of purſuing and taking all beaſts of chaſe or *venary*, and ſuch other animals as were accounted *game*, was then held to belong to the king, or to ſuch only as were authoriſed under him. And this, as well upon the principles of the feodal law, that the king is the ultimate proprietor of all the lands in the kingdom, they being all held of him as the chief lord, or lord paramount of the fee;

Game. and that therefore he has the right of the univerſal ſoil, to enter thereon, and to chaſe and take ſuch creatures at his pleaſure: as alſo upon another maxim of the common law, that theſe animals are *bona vacantia*, and, having no other owner, belong to the king by his prerogative. As therefore the former reaſon was held to veſt in the king a *right* to purſue and take them any where; the latter was ſuppoſed to give the king, and ſuch as he ſhould authorize, a *ſole* and *excluſive* right.

This right, thus newly veſted in the crown, was exerted with the utmoſt rigour, at and after the time of the Norman eſtabliſhment; not only in the ancient foreſts, but in the new ones which the conqueror made, by laying together vaſt tracts of country, depopulated for that purpoſe, and reſerved ſolely for the king's royal diverſion; in which were exerciſed the moſt horrid tyrannies and oppreſſions, under colour of foreſt-law, for the ſake of preſerving the beaſts of chaſe; to kill any of which, within the limits of the foreſt, was as penal as the death of a man. And, in purſuance of the ſame principle, king John laid a total interdict upon the *winged* as well as the *fourfooted* creation: *capturam avium per totam Angliam interdixit* *. The cruel and inſupportable hardſhips, which theſe foreſt-laws created to the ſubject, occaſioned our anceſtors to be as zealous for their reformation, as for the relaxation of the feodal rigours and the other exactions introduced by the Norman family; and accordingly we find the immunities of *carta de foreſta* as warmly contended for, and extorted from the king with as much difficulty, as thoſe of *magna carta* itſelf. By this charter, confirmed in parliament †, many foreſts were diſafforeſted, or ſtripped of their oppreſſive privileges, and regulations were made in the regimen of ſuch as remained; particularly killing the king's deer was made no longer a capital offence, but only puniſhed by a fine, impriſonment, or abjuration of the realm. And by a variety of ſubſequent ſtatutes, together with the long aquieſcence of the crown without exerting the foreſt-laws, this prerogative is now become no longer a grievance to the ſubject.

* *M. Paris, 303.*

† 9 Hen. III.

But, as the king reſerved to himſelf the *foreſts* for his own excluſive diverſion, ſo he granted out from time to time other tracts of lands to his ſubjects under the names of *chaſes* or *parks*; or gave them licence to make ſuch in their own grounds; which indeed are ſmaller foreſts in the hands of a ſubject, but not governed by the foreſt-laws; and by the common law no perſon is at liberty to take or kill any beaſts of chaſe, but ſuch as hath an ancient chaſe or park; unleſs they be alſo beaſts of pvey.

As to all inferior ſpecies of game, called *beaſts and fowls of warren*; the liberty of taking or killing them is another franchiſe or royalty, derived likewiſe from the crown, and called *free-warren*; a word which ſignifies preſervation or cuſtody: as the excluſive liberty of taking and killing fiſh in a public ſtream or river is called a *free fiſhery*; of which, however, no new franchiſe can at preſent be granted, by the expreſs proviſion of *magna carta*, c. 16. The principal intention of granting a man theſe franchiſes or liberties was in order to protect the game, by giving him a ſole and excluſive power of killing it himſelf, provided he prevented other perſons. And no man, but he who has a chaſe or free warren, by grant from the crown, or preſcription, which ſuppoſes one, can juſtify hunting or ſporting upon another man's ſoil; nor indeed, in thorough ſtrictneſs of common law, either hunting or ſporting at all. Game.

However novel this doctrine may ſeem, it is a regular conſequence from what has been before delivered; that the ſole right of taking and deſtroying game belongs excluſively to the king. This appears, as well from the hiſtorical deduction here made, as becauſe he may grant to his ſubjects an excluſive right of taking them; which he could not do, unleſs ſuch a right was firſt inherent in himſelf. And hence it will follow, that no perſon whatever, but he who has ſuch derivative right from the crown, is by common law entitled to take or kill any beaſts of chaſe, or other game whatſoever. It is true, that, by the acquieſcence of the crown, the frequent grants of free-warren in ancient times, and the introduction of new penalties of late by certain ſtatutes for preſerving the game, this excluſive prerogative of the king is little known or conſidered; every man, that is exempted from theſe modern penalties, looking upon himſelf as at liberty to do what he pleaſes with the game: whereas the contrary is ſtrictly true, that no man, however well *qualified* he may vulgarly be eſteemed, has a right to encroach on the royal prerogative by the killing of game, unleſs he can ſhew a particular grant of free-warren; or a preſcription, which preſumes a grant; or ſome authority under an act of parliament. As for the latter, there are but two inſtances wherein an expreſs permiſſion to kill game was ever given by ſtatute; the one by 1 Jac. I. *c.* 27. altered by 7 Jac. I. *c.* 11. and virtually repealed by 22 and 23 Car. II. *c.* 25. which gave authority, ſo long as they remained in force, to the owners of free-warren, to lords of manors, and to all freeholders having 40*l. per annum* in lands of inheritance, or 80*l.* for life or lives, or 400*l.* perſonal eſtate, (and their ſervants), to take partridges and pheaſants upon their own, or their maſter's, free-warren, inheritance, or freehold: the other by 5 Ann. *c.* 14. which empowers lords and ladies of manors to appoint gamekeepers, to kill game for the uſe of ſuch lord or lady; which with ſome alteration ſtill ſubſiſts; and plainly ſuppoſes ſuch power not to have been in them before. The truth of the matter is, that theſe game-laws do indeed *qualify* nobody, except in the inſtance of a gamekeeper, to kill game: but only to ſave the trouble and formal proceſs of an action by the perſon injured, who perhaps too might remit the offence, theſe ſtatutes inflict *additional* penalties, to be recovered either in a regular or ſummary way, by any of the king's ſubjects, from certain perſons of inferior rank who may be found offending in this particular. But it does not follow that perſons, excuſed from theſe additional penalties, are therefore *authoriſed* to kill game. The circumſtance of having 100*l. per annum*, and the reſt, are not properly qualifications, but exemptions. And theſe perſons, ſo exempted from the penalties of the game-ſtatutes, are not only liable to actions of treſpaſs by the owners of the land; but alſo, if they kill game within the limits of any royal franchiſe, they are liable to the actions of ſuch who may have the right of chaſe or free-warren therein.

Upon the whole, it appears, that the king, by his pre-

Game & Gaming.

* See these articles.

prerogative, and such persons as have, under his authority, the royal FRANCHISE of CHACE, PARK, or *Free-*WARREN *, are the *only* persons who may acquire any property, however fugitive and transitory, in these animals *feræ naturæ*, while living; which is said to be vested in them *propter privilegium*. And it must also be observed, that such persons as may thus lawfully hunt, fish, or fowl, *ratione privilegii*, have only a qualified property in these animals: it not being absolute or permanent, but lasting only so long as the creatures remain within the limits of such respective franchise or liberty, and ceasing the instant they voluntarily pass out of it. It is held indeed, that if a man starts any game within his own grounds, and follows it into another's, and kills it there, the property remains in himself, And this is grounded on reason and natural justice: for the property consists in the possession; which possession commences by the finding it in his own liberty, and is continued by the immediate pursuit. And so, if a stranger starts game in one man's chase or free-warren, and hunts it into another liberty, the property continues in the owner of the chase or warren; this property arising from privilege, and not being changed by the act of a mere stranger. Or if a man starts game on another's private grounds, and kills it there, the property belongs to him in whose ground it was killed, because it was also started there; this property arising *ratione soli*. Whereas if, after being started there, it is killed in the grounds of a third person, the property belongs not to the owner of the first ground, because the property is local; nor yet to the owner of the second, because it was not started in his soil; but it vests in the person who started and killed it, tho' guilty of a trespass against both the owners. See the article *Game*-LAWS.

GAME-*Cock*, a fighting cock, or one kept for sport; a barbarous practice, which is a disgrace to any civilized nation. See COCK-*Fighting*.

GAMELIA, in Grecian antiquity, a nuptial feast, or rather sacrifice, held in the ancient Greek families on the day before a marriage; thus called, from a custom they had of shaving themselves on this occasion, and presenting their hair to some deity to whom they had particular obligations.

GAMELION, in the ancient chronology, was the eighth month of the Athenian year, containing 29 days, and answering to the latter part of our January and beginning of February. It was thus called, as being, in the opinion of the Athenians, the most proper season of the year for marriage.

GAMING, the art of playing or practising any game, particularly those of hazard; as cards, dice, tables, &c.

Gaming has at all times been looked upon as a thing of pernicious consequence to the commonwealth; and is therefore severely prohibited by law. It is considered as a practice generally intended to supply, or retrieve, the expences occasioned by LUXURY: it being a kind of tacit confession, that the company engaged therein do, in general, exceed the bounds of their respective fortunes; and therefore they cast lots to determine upon whom the ruin shall at present fall, that the rest may be saved a little longer. But, taken in any light, it is an offence of the most alarming nature; tending, by necessary consequence, to promote public idleness, theft, and debauchery, among those of a lower class; and, among persons of a superior rank, it hath frequently been attended with the sudden ruin and desolation of ancient and opulent families, an abandoned prostitution of every principle of honour and virtue, and too often hath ended in self-murder. To restrain this pernicious vice among the inferior sort of people, the statute 33 Hen. VIII. *c.* 9. was made; which prohibits, to all but gentlemen, the games of tennis, tables, cards, dice, bowls, and other unlawful diversions there specified, unless in the time of Christmas, under pecuniary pains and imprisonment. And the same law, and also the statute 30 Geo. II. *c.* 24. inflict pecuniary penalties, as well upon the master of any public house wherein servants are permitted to game, as upon the servants themselves who are found to be gaming there. But this is not the principal ground of modern complaint: it is the gaming in high life, that demands the attention of the magistrate; a passion to which every valuable consideration is made a sacrifice, and which we seem to have inherited from our ancestors the ancient Germans; whom Tacitus describes to have been bewitched with the spirit of play to a most exorbitant degree. "They addict themselves, (says he,) "to dice (which is wonderful) when sober, and as a serious employment; with such a mad desire of winning or losing, that, when stript of every thing else, they will stake at last their liberty, and their very selves. The loser goes into a voluntary slavery; and, though younger and stronger than his antagonist, suffers himself to be bound and sold. And this perseverance in so bad a cause they call the point of honour: *ea est in re prava pervicacia, ipsi fidem vocant.*" One would almost be tempted to think Tacitus was describing a modern Englishman. When men are thus intoxicated with so frantic a spirit, laws will be of little avail: because the same false sense of honour, that prompts a man to sacrifice himself, will deter him from appealing to the magistrate. Yet it is proper that laws should be, and be known publicly, that gentlemen may consider what penalties they wilfully incur, and what a confidence they repose in sharpers; who, if successful in play, are certain to be paid with honour, or, if unsuccessful, have it in their power to be still greater gainers by informing. For, by stat. 16 Car. II. *c.* 7. if any person by playing or betting shall lose more than 100 *l.* at one time, he shall not be compellable to pay the same; and the winner shall forfeit treble the value, one moiety to the king, the other to the informer. The statute 9 Ann. *c.* 14. enacts, that all bonds and other securities, given for money won at play, or money lent at the time to play withal, shall be utterly void: that all mortgages and incumbrances of lands, made upon the same consideration, shall be and enure to the heir of the mortgager: that, if any person at one time loses 10 l. at play, he may sue the winner, and recover it back by action of debt at law; and, in case the loser does not, any other person may sue the winner for treble the sum so lost; and the plaintiff in either case may examine the defendant himself upon oath: and that in any of these suits no privilege of parliament shall be allowed. The statute farther enacts, that if any person cheats at play, and at one time wins more than 10 l. or any valuable thing, he may be indicted thereupon, and shall forfeit five times the value, shall

Gaming.

Gaming. be deemed infamous, and ſuffer ſuch corporal puniſhment as in caſe of wilful perjury. By ſeveral ſtatutes of the reign of king George II. all private lotteries by tickets, cards, or dice, (and particularly the games of faro, baſſet, ace of hearts, hazard, paſſage, rolly polly, and all other games with dice, except backgammon) are prohibited under a penalty of 200 l. for him that ſhall erect ſuch lotteries, and 50 l. a-time for the players. Public lotteries, unleſs by authority of parliament, and all manner of ingenious devices, under the denomination of *ſales* or otherwiſe, which in the end are equivalent to lotteries, were before prohibited by a great variety of ſtatutes under heavy pecuniary penalties. But particular deſcriptions will ever be lame and deficient, unleſs all games of mere chance are at once prohibited; the invention of ſharpers being ſwifter than the puniſhment of the law, which only hunts them from one device to another. The ſtat. 13 Geo. II. *c.* 19. to prevent the multiplicity of horſe-races, another fund of gaming, diverts, that no plates or matches under 50 l. value ſhall be run, upon penalty of 200 l. to be paid by the owner of each horſe running, and 100 l. by ſuch as advertiſe the plate. By ſtatute 18 Geo. II. *c.* 34. the ſtatute 9 Ann. is farther enforced, and ſome deficiencies ſupplied: the forfeitures of that act may now be recovered in a court of equity; and, moreover, if any man be convicted, upon information or indictment, of winning or loſing at any ſitting 20 l. or 20 l. within 24 hours, he ſhall forfeit five times the ſum. Thus careful has the legiſlature been to prevent this deſtructive vice: which may ſhew that our laws againſt gaming are not ſo deficient, as ourſelves and our magiſtrates in putting thoſe laws in execution.

Chance, or Hazard, in GAMING. Hazard, or chance, is a matter of mathematical conſideration, becauſe it admits of more and leſs. Gameſters either ſet out upon an equality of chance, or are ſuppoſed to do ſo. This equality may be altered in the courſe of the game, by the greater good-fortune or addreſs of one of the gameſters, whereby he comes to have a better chance, ſo that his ſhare in the ſtakes is proportionably better than at firſt. This more and leſs runs thro' all the ratios between equality and infinite difference, or from an infinitely little difference till it come to an infinite great one, whereby the game is determined. The whole game, therefore, with regard to the iſſue of it, is a chance of the proportion the two ſhares bear to each other.

The probability of an event is greater or leſs, according to the number of chances by which it may happen, compared with the number of all the chances by which it may either happen or fail.

M. de Moivre, in a treatiſe *de Menſura Sortis*, has computed the variety of chances in ſeveral caſes that occur in gaming, the laws of which may be underſtood by what follows.

Suppoſe p the number of caſes in which an event may happen, and q the number of caſes wherein it may not happen, both ſides have the degree of probability, which is to each other as p to q.

If two gameſters, A and B, engage on this footing, that, if the caſes p happen, A ſhall win; but if q happen, B ſhall win, and the ſtake be a; the chance of A will be $\frac{p\,a}{q+p}$, and that of B $\frac{q\,a}{p+q}$; conſequently, if they ſell the expectancies, they ſhould have that for them reſpectively. Gaming.

If A and B play with a ſingle die, on this condition, that, if A throw two or more aces at eight throws, he ſhall win; otherwiſe B ſhall win; What is the ratio of their chances? Since there is but one caſe wherein an ace may turn up, and five wherein it may not, let $a=1$, and $b=5$. And, again, ſince there are eight throws of the die, let $n=8$; and, you will have $\overline{a+b}^n - b^n - nab^n - 1$, to $b^n + nab^n - 1$: that is, the chance of A will be to that of B, as 663991 to 10156525, or nearly as 2 to 3.

A and B are engaged at ſingle quoits; and, after playing ſome time, A wants 4 of being up, and B 6; but B is ſo much the better gameſter, that his chance againſt A upon a ſingle throw would be as 3 to 2; What is the ratio of their chances? Since A wants 4, and B 6, the game will be ended at nine throws; therefore, raiſe $a+b$ to the ninth power, and it will be $a^9+9\,a^8b+36\,a^7bb+84\,a^6b^3+126\,a^5b^4+126\,a^4b^5$, to $84\,a^3b^6+36\,aab^7+6ab^8+b^9$: call a 3, and b 2, and you will have the ratio of chances in numbers, viz. 1759077 to 194048.

A and B play at ſingle quoits, and A is the beſt gameſter, ſo that he can give B 2 in 3: What is the ratio of their chances at a ſingle throw? Suppoſe the chances as z to 1, and raiſe $z+1$ to its cube, which will be z^3+3z^2+3z+1. Now ſince A could give B 2 out of 3, A might undertake to win three throws running; and, conſequently, the chances in this caſe will be as z^3 to $3z^2+3z+1$. Hence $z^3=3z^2+3z+1$; or $2z^3=z^3+3z^2-3z+1$. And, therefore, $z\sqrt[3]{2}=z+1$; and, conſequently, $z=\frac{1}{\sqrt[3]{2}-1}$. The chances, therefore, are $\frac{1}{\sqrt[3]{2}-1}$ and 1, reſpectively.

Again, ſuppoſe I have two wagers depending, in the firſt of which I have 3 to 2 the beſt of the lay, and in the ſecond 7 to 4; What is the probability I win both wagers?

1. The probability of winning the firſt is $\frac{3}{5}$, that is the number of chances I have to win, divided by the number of all the chances: the probability of winning the ſecond is $\frac{7}{11}$: therefore, multiplying theſe two fractions together, the product will be $\frac{21}{55}$, which is the probability of winning both wagers. Now, this fraction being ſubtracted from 1, the remainder is $\frac{34}{55}$, which is the probability I do not win both wagers: therefore the odds againſt me are 34 to 21.

2. If I would know what the probability is of winning the firſt, and loſing the ſecond, I argue thus: the probability of winning the firſt is $\frac{3}{5}$, the probability of loſing the ſecond is $\frac{4}{11}$: therefore multiplying $\frac{3}{5}$ by $\frac{4}{11}$, the product $\frac{12}{55}$ will be the probability of my winning the firſt, and loſing the ſecond; which being ſubtracted from 1, there will remain $\frac{43}{55}$, which is the probability I do not win the firſt, and at the ſame time loſe the ſecond.

3. If I would know what the probability is of winning the ſecond, and at the ſame time loſing the firſt, I ſay thus: The probability of winning the ſecond is $\frac{7}{11}$; the probability of loſing the firſt is $\frac{2}{5}$: therefore, multiplying theſe two fractions together, the product $\frac{14}{55}$ is the probability I win the ſecond, and alſo loſe the firſt.

4. If

Gaming. 4. If I would know what the probability is of losing both wagers, I say, the probability of losing the firſt is $\frac{5}{6}$, and the probability of loſing the ſecond $\frac{4}{7}$: therefore the probability of loſing them both is $\frac{20}{42}$; which, being ſubtracted from 1, there remains $\frac{22}{42}$: therefore, the odds of loſing both wagers is 47 to 8.

This way of reaſoning is applicable to the happening or failing of any events that may fall under conſideration. Thus if I would know what the probability is of miſſing an ace four times together with a die, this I conſider as the failing of four different events. Now the probability of miſſing the firſt is $\frac{5}{6}$, the ſecond is alſo $\frac{5}{6}$, the third $\frac{5}{6}$, and the fourth $\frac{5}{6}$; therefore the probability of miſſing it four times together is $\frac{5}{6}\times\frac{5}{6}\times\frac{5}{6}\times\frac{5}{6}=\frac{625}{1296}$; which being ſubtracted from 1, there will remain $\frac{671}{1296}$ for the probability of throwing it once or oftener in four times: therefore the odds of throwing an ace in four times, is 671 to 625.

But if the flinging of an ace was undertaken in three times, the probability of miſſing it three times would be $\frac{5}{6}\times\frac{5}{6}\times\frac{5}{6}=\frac{125}{216}$; which being ſubtracted from 1, there will remain $\frac{91}{216}$ for the probability of throwing it once or oftener in three times: therefore the odds againſt throwing it in three times are 125 to 91. Again, ſuppoſe we would know the probability of throwing an ace once in four times, and no more: ſince the probability of throwing it the firſt time is $\frac{1}{6}$, and of miſſing it the other three times, is $\frac{5}{6}\times\frac{5}{6}\times\frac{5}{6}$, it follows, that the probability of throwing it the firſt time, and miſſing it the other three ſucceſſive times, is $\frac{1}{6}\times\frac{5}{6}\times\frac{5}{6}\times\frac{5}{6}=\frac{125}{1296}$; but becauſe it is poſſible to hit it every throw as well as the firſt, it follows, that the probability of throwing it once in four throws, and miſſing it the other three, is $\frac{4\times125}{1296}=\frac{500}{1296}$; which being ſubtracted from 1, there will remain $\frac{796}{1296}$ for the probability of throwing it once, and no more, in four times. Therefore, if one undertake to throw an ace once, and no more, in four times, he has 500 to 796 the worſt of the lay, or 5 to 8 very near.

Suppoſe two events are ſuch, that one of them has twice as many chances to come up as the other; what is the probability, that the event, which has the greater number of chances to come up, does not happen twice before the other happens once, which is the caſe of flinging 7 with two dice before 4 once? Since the number of chances is as 2 to 1, the probability of the firſt happening before the ſecond is $\frac{2}{3}$, but the probability of its happening twice before it is but $\frac{2}{3}\times\frac{2}{3}$ or $\frac{4}{9}$: therefore it is 5 to 4 ſeven does not come up twice before four once.

But, if it were demanded, what muſt be the proportion of the facilities of the coming up of two events, to make that which has the moſt chances come up twice, before the other comes up once? The anſwer is, 12 to 5 very nearly: whence it follows, that the probability of throwing the firſt before the ſecond is $\frac{12}{17}$, and the probability of throwing it twice is $\frac{12}{17}\times\frac{12}{17}$, or $\frac{144}{289}$; therefore the probability of not doing it is $\frac{145}{289}$: therefore the odds againſt it are as 145 to 144, which comes very near an equality.

Suppoſe there is a heap of thirteen cards of one colour, and another heap of thirteen cards of another colour; What is the probability, that, taking one card at a venture out of each heap, I ſhall take out the two aces? Gaming ‖ Gander.

The probability of taking the ace out of the firſt heap is $\frac{1}{13}$, the probability of taking the ace out of the ſecond heap is $\frac{1}{13}$; therefore the probability of taking out both aces is $\frac{1}{13}\times\frac{1}{13}=\frac{1}{169}$, which being ſubtracted from 1, there will remain $\frac{168}{169}$: therefore the odds againſt me are 168 to 1.

In caſes where the events depend on one another, the manner of arguing is ſomewhat altered. Thus, ſuppoſe that out of one ſingle heap of thirteen cards of one colour I ſhould undertake to take out firſt the ace; and, ſecondly, the two: though the probability of taking out the ace be $\frac{1}{13}$, and the probability of taking out the two be likewiſe $\frac{1}{13}$; yet, the ace being ſuppoſed as taken out already, there will remain only twelve cards in the heap, which will make the probability of taking out the two to be $\frac{1}{12}$; therefore the probability of taking out the ace, and then the two, will be $\frac{1}{13}\times\frac{1}{12}$.

In this laſt queſtion the two events have a dependence on each other, which conſiſts in this, that one of the events being ſuppoſed as having happened, the probability of the other's happening is thereby altered. But the caſe is not ſo in the two heaps of cards.

If the events in queſtion be n in number, and be ſuch as have the ſame number a of chances by which they may happen, and likewiſe the ſame number b of chances by which they may fail, raiſe $a+b$ to the power n. And if A and B play together, on condition that if either one or more of the events in queſtion happen, A ſhall win, and B loſe, the probability of A's winning will be $\frac{\overline{a+b}^n-b^n}{\overline{a+b}^n}$; and that of B's winning will be $\frac{b^n}{\overline{a+b}^n}$; for when $a+b$ is actually raiſed to the power n, the only term in which a does not occur is the laſt b^n: therefore all the terms but the laſt are favourable to A.

Thus if $n=3$, raiſing $a+b$ to the cube $a^3+3a^2b+3ab^2+b^3$, all the terms but b^3 will be favourable to A; and therefore the probability of A's winning will be $\frac{a^3+3a^2b+3ab^2}{\overline{a+b}^3}$, or $\frac{\overline{a+b}^3-b^3}{\overline{a+b}^3}$; and the probability of B's winning will be $\frac{b^3}{\overline{a+b}^3}$. But if A and B play on condition, that if either two or more of the events in queſtion happen, A ſhall win; but in caſe one only happen, or none, B ſhall win; the probability of A's winning will be $\frac{\overline{a+b}^n-nab^{n-1}-b^n}{\overline{a+b}^n}$; for the only two terms in which aa does not occur, are the two laſt, *viz.* nab^{n-1} and b^n.

GAMMONING, among ſeamen, denotes ſeveral turns of rope taken round the bowſprit, and reeved through holes in knees of the head, for the greater ſecurity of the bowſprit.

GAMMUT, in muſic, a ſcale whereon we learn to ſound the muſical notes, *ut, re, mi, fa, ſol, la*, in their ſeveral orders and diſpoſitions. See MUSIC.

GANDER, in ornithology, the male of the gooſe-kind; one of which, it is ſaid, will ſerve five geeſe *. * See *Anas*.

GANG-

Gang ‖ Gaol.

GANG-WAY, is the ſeveral paſſages or ways from one part of the ſhip to the other; and whatſoever is laid in any of thoſe paſſages, is ſaid to lie in the gang-way.

GANGANELLI. See CLEMENT XIV.

GANGES, a large and celebrated river of India. It has its ſource in the mountains which border on Little Thibet, in 96 degrees of longitude, and 35. 45. of latitude. It croſſes ſeveral kingdoms, running from north to ſouth; and falls into the bay of Bengal, by ſeveral mouths. The waters are loweſt in April and May, and higheſt before the end of September. It overflows yearly like the Nile; and renders the kingdom of Bengal as fruitful as that of the Delta in Egypt. The people in theſe parts hold the water of this river in high veneration; and it is viſited annually by a prodigious number of pilgrims from all parts of India. The Engliſh have ſeveral ſettlements on this river, which will be taken notice of in their proper places. The greateſt happineſs that many of the Indians wiſh for, is to die in this river.

GANGLION, in anatomy, denotes a knot frequently found in the courſe of the nerves, and which is not morbid; for wherever any nerve ſends out a branch, or receives one from another, or where two nerves join together, there is generally a ganglion or plexus, as may be ſeen at the beginning of all the nerves of the medulla ſpinalis, and in many other places of the body.

GANGLION, in ſurgery, a hard tubercle, generally moveable, in the external or internal part of the carpus, upon the tendons or ligaments in that part; uſually without any pain to the patient.

GANGRENE, a very great and dangerous degree of inflammation, wherein the parts affected begin to corrupt, and put on a ſtate of putrefaction. See (the *Index* ſubjoined to) MEDICINE, and SURGERY.

GANNET, or SOLAND *Goſe*, in ornithology. See PELICANUS.

GANTLET, or GAUNTLET, a large kind of glove made of iron, and the fingers covered with ſmall plates. It was formerly worn by the cavaliers, when armed at all points.

GANYMEDE, in the ancient mythology, ſon of a king of Troy, was the moſt beautiful boy in the world. Jupiter was charmed with him, and made him his cup-bearer in the room of Hebe. Some ſay that he cauſed him to be carried away by an eagle, and others affirm he was himſelf the raviſher under the form of that bird. He deified this youth; and, to comfort his father, made a preſent to him of ſome of thoſe very ſwift horſes that the gods rode upon.

GAOL (*Gaola*, Fr. *Geole*, i. e. *Cavea*, "a cage for birds"), is uſed metaphorically for a priſon. It is a ſtrong place or houſe for keeping of debtors, &c. and wherein a man is reſtrained of his liberty to anſwer an offence done againſt the laws: and every county hath two gaols, one for debtors, which may be any houſe where the ſheriff pleaſes; the other for the peace and matters of the crown, which is the county gaol.

If a gaol be out of repair, or inſufficient, &c. juſtices of peace, in their quarter ſeſſions, may contract with workmen for the rebuilding or repairing it; and by their warrant order the ſum agreed on for that purpoſe, to be levied on the ſeveral hundreds, and other diviſions in the county by a juſt rate, 11 & 12 Will. III. c. 19. See PRISON.

GAOL-*Delivery*. The adminiſtration of juſtice being originally in the crown, in former times our kings in perſon rode through the realm once in ſeven years, to judge of and determine crimes and offences; afterwards *juſtices in eyre* were appointed; and ſince, *juſtices of aſſiſe* and *gaol-delivery*, &c. A commiſſion of gaol-delivery, is a patent in nature of a letter from the king to certain perſons, appointing them his juſtices, or two or three of them, and authoriſing them to deliver his *gaol*, at ſuch a place, of the priſoners in it: for which purpoſe it commands them to meet at ſuch a place, at the time they themſelves ſhall appoint; and informs them, that, for the ſame purpoſe, the king hath commanded his ſheriff of the ſame county to bring all the priſoners of the goal, and their attachments, before them at the day appointed.

The juſtices of gaol-delivery are empowered by the common law to proceed upon indictments of felony, treſpaſs, &c. and to order to execution or reprieve: they may likewiſe diſcharge ſuch priſoners, as on their trials are acquitted, and thoſe againſt whom, on proclamation being made, no evidence has appeared: they have authority to try offenders for treaſon, and to puniſh many particular offences, by ſtatute 2 *Hawk.* 24. 2 *Hale's hiſt. Placit. Cor.* 35.

GAOLER, the keeper of a gaol or priſon. Sheriffs are to make ſuch gaolers for whom they will be anſwerable: but if there be any default in the gaoler, an action lies againſt him for an eſcape, &c. yet the ſheriff is moſt uſually charged; 2 *Inſt.* 592. Where a gaoler kills a priſoner by hard uſage, it is felony; 3 *Inſt.* 52. No fee ſhall be taken by gaolers, but what is allowed by law, and ſettled by the judges, who may determine petitions againſt their extortions, &c. 2 Geo. II. c. 22.

GAONS, a certain order of Jewiſh doctors, who appeared in the Eaſt, after the cloſing of the talmud. The word *Gaons* ſignifies Excellent, Sublime; as in the divinity-ſchools we formerly had Irrefragable, Sublime, Reſolute, Angelic, and Subtile doctors. The Gaons ſucceeded the Seburæans, or Opiners, about the beginning of the ſixth century. Chanan Meiſchtia was the head, and firſt of the excellents. He reſtored the academy of Pandebita, which had been ſhut up for 30 years.

GAR-FISH, HORN-*fiſh*, or *Sea-needle*. See ESOX.

Gaol ‖ Garamond

GARAMOND (Claude), a very ingenious letter-founder, was born at Paris; where he began, in the year 1510, to found his printing types free from all the remains of the Gothic, or (as it is generally called) the *black letter*, and brought them to ſuch perfection, that he had the glory of ſurpaſſing all who went before him, and of being ſcarcely ever excelled by his ſucceſſors in that uſeful art. His types were prodigiouſly multiplied; both by the great number of matrices he ſtruck, and the types formed in reſemblance of his in all parts of Europe. Thus in Italy, Germany, England, and Holland, the bookſellers, by way of recommending their books, diſtinguiſhed the type by his name; and in particular the ſmall Roman was, by way of excellence, known among the printers of theſe nations by the name of *Garamond's ſmall Roman*.

Garaſſe ‖ Garden.

By the ſpecial command of king Francis I. he founded three ſizes of Greek types for the uſe of Robert Stephens, who with them printed all his beautiful editions of the New Teſtament, and other Greek authors. He died at Paris, in 1561

GARASSE (Francis), a remarkable jeſuitical writer, the firſt author of that irreconcilable enmity that ſtill ſubſiſts between the Jeſuits and Janſeniſts in the church of Rome, was born at Angouleſme in 1585; and entered the Jeſuits college in 1600. As he had a quick imagination, a ſtrong voice, and a peculiar turn to wit, he became a popular preacher in the chief cities of France; but not content with this honour, he diſtinguiſhed himſelf ſtill more by his writings, which were bold, licentious, and produced much controverſy. The moſt conſiderable in its conſequences, was intitled *La ſomme theologique des veritez capitales de la religion Chretienne*; which was firſt attacked by the abbot of St Cyran, who, obſerving in it a prodigious number of falſifications of the Scriptures and of the fathers, beſide many heretical and impious opinions, conceived the honour of the church required him to undertake a refutation. Accordingly he publiſhed a full anſwer to it; while Garaſſe's book was alſo under examination of the doctors of the Sorbonne, by whom it was afterwards condemned. Garaſſe replied to St Cyran; but the two parties of Jeſuits and Janſeniſts, of whom theſe were reſpectively the champions, grew to an implacable animoſity againſt each other, that is not even now likely to ſubſide. The Jeſuits were forced to remove their brother to a diſtance from Paris; where, probably weary of his inactive obſcurity, when the plague raged at Poictiers in 1631, he begged leave of his ſuperior to attend the ſick, in which charitable office he caught the diſorder, and died.

GARBE, in heraldry, a ſheaf of any kind of grain, borne in ſeveral coats of arms, and ſaid to repreſent ſummer, as a bunch of grapes does autumn.

GARBLE, a word uſed to ſignify the action of ſeparating the droſs and duſt from ſpice, drugs, &c. *Garbling* is the cleanſing and purifying the good from the bad; and may come from the Italian *garbo*, i. e. finery or neatneſs: and hence, probably, we ſay, when we ſee a man in a neat habit, that he is in handſome *garb*.

GARCILASSO (de la Vega), a celebrated Spaniſh poet, born of a noble family at Toledo, in 1500. He was educated near the emperor Charles V. who had a particular regard for him, and whom he attended in all his military expeditions; acquiring as much renown by his courage as by his poetry. In Provence he commanded a battalion; and was killed in the 36th year of his age, by a ſtone thrown at his head by a country-maid from a turret. He had ſtrong natural talents for poetry; and not only extended the bounds, but introduced new beauties, into that of the Spaniſh language.—We muſt not confound this poet with another perſon of the ſame name, a native of Cuſco, who wrote in Spaniſh, a Hiſtory of Florida, and of Peru and the Incas.

GARDANT, or GUARDANT, in heraldry, denotes any beaſt full-faced, and looking right forward.

GARDEN, a plot of ground, cultivated, and properly ornamented with a variety of plants, flowers, fruits, &c. See GARDENING.

Garden.

Gardens are uſually diſtinguiſhed into flower-garden, fruit-garden, and kitchen-garden: the firſt of which, being deſigned for pleaſure and ornament, is to be placed in the moſt conſpicuous part, that is, next to the back-front of the houſe; and the two latter, being deſigned for uſe, ſhould be placed leſs in ſight. But though the fruit and kitchen-gardens are here mentioned as two diſtinct gardens, yet they are now uſually in one; and that with good reaſon, ſince they both require a good ſoil and expoſure, and equally require to be placed out of the view of the houſe. See KITCHEN-*Garden*.

In the choice of a place proper for a garden, the moſt eſſential points to be conſidered are the ſituation, the ſoil, the expoſure, water, and proſpect.

1ſt, As to the ſituation, it ought to be ſuch a one as is wholeſome. and in a place neither too high nor too low; for if a garden be too high, it will be expoſed to the winds, which are very prejudicial to trees; and if it be too low, the dampneſs, the vermin, and the venomous creatures that breed in ponds and marſhy places, add much to their inſalubrity. The moſt happy ſituation is on the ſide of a hill, eſpecially if the ſlope be eaſy, and in a manner imperceptible; if a good deal of level ground be near the houſe; and if it abounds with ſprings of water: for, being ſheltered from the fury of the winds, and the violent heat of the ſun, a temperate air will be there enjoyed; and the water that deſcends from the top of the hill, either from ſprings or rain, will not only ſupply fountains, canals, and caſcades for ornament, but, when it has performed its office, will water the adjacent valleys, and, if it be not ſuffered to ſtagnate, will render them fertile and wholeſome. Indeed, if the declivity of the hill be too ſteep, and the water be too abundant, a garden on the ſide of it may frequently ſuffer, by having trees torn up by torrents and floods; and by the tumbling down of the earth above, the walls may be demoliſhed, and the walks ſpoiled. It cannot, however, be denied, that the ſituation on a plain or flat has ſeveral advantages which the higher ſituation has not: for floods and rain commit no damage; there is a continued proſpect of champaigns, interſected by rivers, ponds, and brooks, meadows, and hills covered with woods or buildings; beſides, the level ſurface is leſs tireſome to walk on, and leſs chargeable than that on the ſide of an hill, ſince terrace-walks and ſteps are not there neceſſary: but the greateſt diſadvantage of flat gardens, is the want of thoſe extenſive proſpects which riſing grounds afford.

2dly, A good earth or ſoil is next to be conſidered; for it is ſcarce poſſible to make a fine garden in a bad ſoil. There are indeed ways to meliorate ground, but they are very expenſive; and ſometimes, when the expence has been beſtowed of laying good earth three feet deep over the whole ſurface, a whole garden has been ruined, when the roots of the trees have come to reach the natural bottom. To judge of the quality of the ſoil, obſerve whether there be any heath, thiſtles, or ſuch-like weeds growing ſpontaneouſly in it; for they are certain ſigns that the ground is poor. Or if there be large trees growing thereabouts, obſerve, whether they grow crooked, ill-ſhaped, and grubby, and whether they are of a faded green, and full of moſs,

Garden. moſs, or infeſted with vermin; if this be the caſe, the place is to be rejected: but, on the contrary, if it be covered with good graſs fit for paſture, you may then be encouraged to try the depth of the ſoil. To know this, dig holes in ſeveral places, ſix feet wide, and four deep; and if you find three feet of good earth, it will do very well; but leſs than two will not be ſufficient. The quality of good ground is, neither to be ſtony, nor too hard to work; neither too dry, too moiſt, nor too ſandy and light; nor too ſtrong and clayey, which is the worſt of all for gardens.

3dly, The next requiſite is water; the want of which is one of the greateſt inconveniencies that can attend a garden, and will bring a certain mortality upon whatever is planted in it, eſpecially in the greater droughts that often happen in a hot and dry ſituation in ſummer; beſides its uſefulneſs in fine gardens for making fountains, canals, caſcades, &c. which are the greateſt ornaments of a garden.

4thly, The laſt thing to be conſidered, is the proſpect of a fine country; and though this is not ſo abſolutely neceſſary as water, yet it is one of the moſt agreeable beauties of a fine garden: beſides, if a garden be planted in a low place that has no kind of proſpect, it will not only be diſagreeable, but unwholeſome.

In the laying out and planting of gardens the beauties of nature ſhould always be ſtudied; for the nearer a garden approaches to nature, the longer it will pleaſe. The area of a handſome garden, may take up thirty or forty acres, but not more; and the following rules ſhould be obſerved in the diſpoſition of it. There ought always to be a deſcent of at leaſt three ſteps from the houſe to the garden; this will render the houſe more dry and wholeſome, and the proſpect on entering the garden more extenſive. The firſt thing that ought to preſent itſelf to view, ſhould be an open lawn of graſs, which ought to be conſiderably broader than the front of the building; and if the depth be one half more than the width, it will have a better effect: if on the ſides of the lawn there are trees planted irregularly, by way of open groves, the regularity of the lawn will be broken, and the whole rendered more like nature. For the convenience of walking in damp weather, this lawn ſhould be ſurrounded with a gravel walk, on the outſide of which ſhould be borders three or four feet wide, for flowers: and from the back of theſe the proſpect will be agreeably terminated by a ſlope of ever-green ſhrubs; which, however, ſhould never be ſuffered to exclude agreeable proſpects, or the view of handſome buildings. Theſe walks may lead through the different plantations, gently winding about in an eaſy natural manner; which will be more agreeable than either thoſe long ſtraight walks, too frequently ſeen in gardens, or thoſe ſerpentine windings, that are twiſted about into ſo many ſhort turns, as to render it difficult to walk in them: and as no garden can be pleaſing where there is a want of ſhade and ſhelter, theſe walks ſhould lead as ſoon as poſſible into plantations, where perſons may walk in private, and be ſheltered from the wind. Where the borders of the gardens are fenced with walls or pales, they ſhould be concealed with plantations of flowering ſhrubs, intermixed with laurels and other ever-greens; which will have a good effect, and at the ſame time conceal the fences, which are diſagreeable when left naked and expoſed to the ſight. Groves are the moſt agreeable parts of a garden, ſo that there cannot be too many of them; only that they muſt not be too near the houſe, nor be ſuffered to block up agreeable proſpects. To accompany parterres, groves opened in compartments, quincunxes, and arbour-work with fountains, &c. are very agreeable. Some groves of ever-greens ſhould be planted in proper places, and ſome ſquares of trees of this kind may alſo be planted among the other wood. Garden.

Narrow rivulets, if they have a conſtant ſtream, and are judiciouſly led about a garden, have a better effect than many of the large ſtagnating ponds or canals, ſo frequently made in large gardens. When wilderneſſes are intended, they ſhould not be cut into ſtars and other ridiculous figures, nor formed into mazes or labyrinths, which in a great deſign appear trifling. Buildings, ſtatues, and vaſes, appear very beautiful; but they ſhould never be placed too near each other: magnificent fountains are alſo very ornamental; but they ought never to be introduced, except there be water to keep them conſtantly running. The ſame may alſo be obſerved of caſcades and other falls of water.

In ſhort, the ſeveral parts of a garden ſhould be diverſified; but in places where the eye takes in the whole at once, the two ſides ſhould be always the ſame. In the buſineſs of deſigns, the aim ſhould be always at what is natural, great, and noble. The general diſpoſition of a garden, and of its parts, ought to be accommodated to the different ſituations of the ground, to humour its inequalities, to proportion the number and ſorts of trees and ſhrubs to each part, and to ſhut out from the view of the garden no objects that may become ornamental. And before a garden is planned out, it ought ever to be conſidered, what it will be when the trees have had 20 years growth.—But for a more extended view of this ſubject, ſee the next article.

GARDENING;

THE art of *cultivating* or *planning* gardens.—Gardening, in the perfection to which it has been lately brought in Britain, is entitled to a place of conſiderable rank among the liberal arts. It is as ſuperior to landſkip-painting, as a reality to a repreſentation: it is an exertion of fancy; a ſubject for taſte; and being releaſed now from the reſtraints of regularity, and enlarged beyond the purpoſes of domeſtic convenience, the moſt beautiful, the moſt ſimple, the moſt noble ſcenes of nature, are all within its province. For it is no longer confined to the ſpots from which it takes its name; but regulates alſo the diſpoſition and embelliſhments of a park, a farm, or a riding: and the buſineſs of a gardener is to ſelect and apply whatever is great, elegant, or characteriſtic, in any of them; to diſcover and to ſhew all the advantages of the place upon which he is employed; to ſupply its defects, to correct its faults, and to improve its beauties. For all theſe operations, Subjects and materials of gardening.

Section I. GROUND.

perations, the objects of nature are ſtill his only materials. His firſt inquiry, therefore, muſt be into the means by which thoſe effects are attained in nature, which he is to produce; and into thoſe properties in the objects of nature, which ſhould determine him in the choice and arrangement of them.

Section I. GROUND.

PART I. OF THE CONSTITUENT PARTS OF THE SCENES OF NATURE.

NATURE, always ſimple, employs but four materials in the compoſition of her ſcenes; *ground*, *wood*, *water*, and *rocks*. The cultivation of nature has introduced a fifth ſpecies, the *buildings* requiſite for the accommodation of men. Each of theſe again admits of varieties in figure, dimenſions, colour, and ſituation. Every landſkip is compoſed of theſe parts only; every beauty in a landſkip depends on the application of their ſeveral varieties.

SECT. I. *Of Ground.*

THE ſhape of ground muſt be either a *convex*, a *concave*, or a *plane*; in terms leſs technical called a *ſwell*, a *hollow*, and a *level*. By combinations of theſe are formed all the irregularities of which ground is capable; and the beauty of it depends on the degrees and the proportions in which they are blended.

2 Of a level.

Both the convex and the concave are forms in themſelves of more variety, and may therefore be admitted to a greater extent than a plane. But levels are not totally inadmiſſible. The preference unjuſtly ſhewn to them in the old gardens, where they prevailed almoſt in excluſion of every other form, has raiſed a prejudice againſt them. It is frequently reckoned an excellence in a piece of made ground, that every the leaſt part of it is uneven; but then it wants one of the three great varieties of ground, which may ſometimes be intermixed with the other two. A gentle concave declivity falls and ſpreads eaſily on a flat; the channels between ſeveral ſwells degenerate into mere gutters, if ſome breadth be not given to the bottoms by flattening them; and in many other inſtances, ſmall portions of an inclined or horizontal plane may be introduced into an irregular compoſition. Care only muſt be taken to keep them down as ſubordinate parts, and not to ſuffer them to become principal.

There are, however, occaſions on which a plane may be principal: a hanging level often produces effects not otherwiſe attainable. A large dead flat, indeed, raiſes no other idea than of ſafety: the eye finds no amuſement, no repoſe on ſuch a level: it is fatigued, unleſs timely relieved by an adequate termination; and the ſtrength of that termination will compenſate for its diſtance. A very wide plain, at the foot of a mountain, is leſs tedious than one of much leſs compaſs ſurrounded only by hillocks. A flat therefore of conſiderable extent may be hazarded in a garden, provided the boundaries alſo be conſiderable in proportion; and if, in addition to their importance, they become ſtill more intereſting by their beauty, then the facility and diſtinctneſs with which they are ſeen over a flat make the whole an agreeable compoſition. The greatneſs and the beauty of the boundary are not, however, alone ſufficient; the form of it is of ſtill more conſequence. A continued range of the nobleſt wood, or the fineſt hill, would not cure the inſipidity of a flat: a leſs important, a leſs pleaſing boundary, would be more effectual, if it traced a more varied outline; if it advanced ſometimes boldly forward, ſometimes retired into deep receſſes; broke all the ſides into parts, and marked even the plain itſelf with irregularity.

3 Deſcription of a lawn at Moor Park, (the ſeat of Sir Laur. Dundas, near Rickmanſworth in Hertfordſhire)

At Moor Park, on the back-front of the houſe, is a lawn of about thirty acres, abſolutely flat; with falls below it on one hand, and heights above it on the other. The riſing ground is divided into three great parts, each ſo diſtinct and ſo different, as to have the effect of ſeveral hills. That neareſt to the houſe ſhelves gently under an open grove of noble trees which hang on the declivity, and advance beyond it on the plain. The next is a large hill preſſing forward, and covered with wood from the top to the bottom. The third is a bold ſteep, with a thicket falling down the ſteepeſt part, which makes it appear ſtill more precipitate: but the reſt of the ſlope is bare; only the brow is crowned with wood, and towards the bottom is a little groupe of trees. Theſe heights, thus finely characteriſed in themſelves, are further diſtinguiſhed by their appendages. The ſmall, compact groupe near the foot, but ſtill on the deſcent, of the farther hill, is contraſted by a large ſtraggling clump, ſome way out upon the lawn, before the middle eminence. Between this and the firſt hill, under two or three trees which croſs the opening, is ſeen to great advantage a winding glade, which riſes beyond them, and marks the ſeparation. This deep receſs, the different diſtances to which the hills advance, the contraſt in their forms, and their accompaniments, caſt the plain on this ſide into a moſt beautiful figure. The other ſide and the end were originally the flat edge of a deſcent; a harſh, offenſive termination: but it is now broken by ſeveral hillocks, not diminutive in ſize, and conſiderable by the fine clumps which diſtinguiſh them. They recede one beyond another, and the outline waves agreeably amongſt them. They do more than conceal the ſharpneſs of the edge; they convert a deformity into a beauty, and greatly contribute to the embelliſhment of this moſt lovely ſcene: a ſcene, however, in which the flat is principal; and yet a more varied, a more beautiful landſkip, can hardly be deſired in a garden.

4 Of convex or concave ſhapes of ground.

A plain is not, however, in itſelf intereſting; and the leaſt deviation from the uniformity of its ſurface changes its nature: as long as the flat remains, it depends on the objects around for all its variety, and all its beauty. But convex and concave forms are generally pleaſing, and the number of degrees and combinations into which they may be caſt is infinite: thoſe forms only in each which are perfectly regular muſt be avoided. A ſemicircle can never be tolerable: ſmall portions of large circles blended together, or lines gently curved which are not parts of any circle, a hollow ſinking but little below a level, a ſwell very much flattened at the top, are commonly the moſt agreeable figures.

Section I. GROUND.

In ground which lies beautifully, the concave will generally prevail; within the ſame compaſs it ſhews more ſurface than a ſwell. All the ſides of the latter are not viſible at the ſame time, except in a few particular ſituations: but it is only in a few particular ſituations, that any part of a hollow is concealed; earth ſeems to have been accumulated to raiſe the one, and taken away to ſink the other. The concave, therefore, appears the lighter, and for the moſt part it is the more elegant ſhape: even the ſlopes of a ſwell can hardly be brought down, unleſs broken now and then into hollows, to take off from the heavineſs of the maſs. There are, however, ſituations where the convex form ſhould be preferred: a hollow juſt below the brow of a hill reduces it to a narrow ridge, which has a poor meagre appearance; and an abrupt fall will never ſeem to join with a concave form immediately above it: a ſharp edge divides them; and to connect them, that edge muſt be rounded, or at leaſt flattened; which is, in fact, to interpoſe a convex or a level.

5 Of the connection between the parts in ground.

In made ground, the connection is, perhaps, the principal conſideration. A ſwell which wants it is but a heap, a hollow but a hole, and both appear artificial: the one ſeems placed upon a ſurface to which it does not belong; the other, dug into it. On the great ſcale of nature, indeed, either may be ſo conſiderable in itſelf, as to make its relation to any other almoſt a matter of indifference: but, on the ſmaller ſcale of a garden, if the parts are diſjointed, the effect of the whole is loſt; and the union of all is not more than ſufficient to preſerve an idea of greatneſs and importance, to ſpots which muſt be varied, and cannot be ſpacious. Little inequalities are beſides in nature uſually well blended together: all lines of ſeparation have, in a courſe of time, been filled up; and therefore, when in made ground they are left open, that ground appears artificial.

Even where artifice is avowed, a breach in the connection offends the eye. The uſe of a foſſe is merely to provide a fence, without obſtructing the view. To blend the garden with the country is no part of the idea: the cattle, the objects, the culture, without the ſunk fence, are diſcordant to all within, and keep up the diviſion. A foſſe may open the moſt poliſhed lawn to a corn-field, a road, or a common, though they mark the very point of ſeparation. It may be made on purpoſe to ſhew objects which cannot, or ought not to be in the garden; as a church, or a mill, a neighbouring gentleman's-ſeat, a town, or a village; and yet no conſciouſneſs of the exiſtence can reconcile us to the ſight of this diviſion. The moſt obvious diſguiſe is to keep the hither above the further bank all the way; ſo that the latter may not be ſeen at a competent diſtance. But this alone is not always ſufficient: for a diviſion appears, if an uniformly continued line, however faint, be diſcernible; that line, therefore, muſt be broken. Low but extended hillocks may ſometimes interrupt it; or the ſhape on one ſide may be continued, acroſs the ſunk fence, on the other; as when the ground ſinks in the field, by beginning the declivity in the garden. Trees too without, connected with thoſe within, and ſeeming part of a clump or a grove there, will frequently obliterate every trace of an interruption. By ſuch, or other means, the line may be, and ſhould be, hid or diſguiſed; not for the purpoſe of deception, (when all is done, we are ſeldom deceived), but to preſerve the continued ſurface entire.

Section I. GROUND.

If, where no union is intended, a line of ſeparation is diſagreeable, it muſt be diſguſting when it breaks the connection between the ſeveral parts of the ſame piece of ground. That connection depends on *the junction of each part to thoſe about it*, and on the *relation of every part to the whole*. To complete the former, ſuch ſhapes ſhould be contiguous as moſt readily unite; and the actual diviſion between them ſhould be anxiouſly concealed. If a ſwell deſcends upon a level; if a hollow ſinks from it, the level is an abrupt termination, and a little rim marks it diſtinctly. To cover that rim, a ſhort ſweep at the foot of the ſwell, a ſmall rotundity at the entrance of the hollow, muſt be interpoſed. In every inſtance, when ground changes its direction, there is a point where the change is effected, and that point ſhould never appear; ſome other ſhapes, uniting eaſily with both extremes, muſt be thrown in to conceal it. But there muſt be no uniformity even in theſe connections: if the ſame ſweep be carried all round the bottom of a ſwell, the ſame rotundity all round the top of a hollow, though the junction be perfect, yet the art by which it is made is apparent, and art muſt never appear. The manner of concealing the ſeparation ſhould itſelf be diſguiſed: and different degrees of cavity and rotundity; different ſhapes and dimenſions to the little parts thus diſtinguiſhed by degrees; and thoſe parts breaking, in one place more in another leſs, into the principal forms which are to be united; produce that variety with which all nature abounds, and without which ground cannot be natural.

6 Of the relation of the parts to the whole.

THE relation of all the parts to the whole, when clearly marked, facilitates their junction with each other: for the common bond of union is then perceived, before there has been time to examine the ſubordinate connections; and if theſe ſhould be deficient in ſome niceties, the defect is loſt in the general impreſſion. But any part which is at variance with the reſt, is not barely a blemiſh in itſelf: it ſpreads diſorder as far as its influence extends; and the confuſion is in proportion as the other parts are more or leſs adapted to point out any *particular direction*, or to mark any *peculiar character* in the ground.

If, in ground all deſcending one way, a piece is twiſted another, the general fall is obſtructed by it; but if all the parts incline in the ſame direction, it is hardly credible how ſmall a declivity will ſeem to be conſiderable. An appearance even of ſteepneſs may be given to a very gentle deſcent, by raiſing hillocks upon it, which ſhall lean to the point, whither all the reſt are tending: for the eye meaſures from the top of the higheſt, to the bottom of the loweſt ground; and when the relation of the parts is well preſerved, ſuch an effect from one is transfuſed over the whole.

But they ſhould not, therefore, all lie exactly in the ſame direction: ſome may ſeem to point to it directly, others to incline very much, others but little, ſome partially, ſome entirely. If the direction be ſtrongly marked on a few principal parts, great liberties may be taken with the others, provided none of them are turned the contrary way. The general idea muſt, however, be preſerved, clear even of a doubt. A hillock which only intercepts the ſight, if it does not contribute

Section I. Ground.

tribute to the principal effect, is at the beſt an unneceſſary excreſcence; and even an interruption in the general tendency, tho' it hide nothing, is a blemiſh. On a deſcent, any hollow, any fall, which has not an outlet to lower ground, is a hole: the eye ſkips over it, inſtead of being continued along it; it is a gap in the compoſition.

There may indeed be occaſions, when we ſhould rather wiſh to check, than to promote, the general tendency. Ground may proceed too haſtily towards its point; and we have equal power to retard, or to accelerate, the fall. We can ſlacken the precipitancy of a ſteep, by breaking it into parts, ſome of which ſhall incline leſs, than the whole before inclined, to the principal direction; and by turning them quite away, we may even change the courſe of the deſcent. Theſe powers are of uſe in the larger ſcenes, where the ſeveral great parts often lie in ſeveral directions; and if they are thereby too ſtrongly contracted, or led towards points too widely aſunder, every art ſhould be exerted to bring them nearer together, to aſſimilate, and to connect them. As ſcenes increaſe in extent, they become more impatient of controul: they are not only leſs manageable, but ought to be leſs reſtrained; they require more variety and contraſt. But ſtill the ſame principles are applicable to the leaſt, and to the greateſt, tho' not with equal ſeverity: neither ought to be rent to pieces; and tho' a ſmall neglect, which would diſtract the one, may not diſturb the other, yet a total diſregard of all the principles of union is alike productive of confuſion in both.

7 Of the character of ground.

The *ſtyle* alſo of every part, muſt be accommodated to the character of the whole. For every piece of ground is diſtinguiſhed by certain properties: it is either tame or bold, gentle or rude, continued or broken; and if any variety, inconſiſtent with thoſe properties, be obtruded, it has no other effect than to weaken one idea without raiſing another. The inſipidity of a flat is not taken away by a few ſcattered hillocks; a continuation of uneven ground can alone give the idea of inequality. A large, deep, abrupt break, among eaſy ſwells and falls, ſeems at the beſt but a piece left unfiniſhed, and which ought to have been ſoftened: it is not more natural, becauſe it is more rude; nature forms both the one and the other, but ſeldom mixes them together. On the other hand, a ſmall fine poliſhed form, in the midſt of rough, miſhapen ground, though more elegant than all about it, is generally no better than a patch, itſelf diſgraced, and diſfiguring the ſcene. A thouſand inſtances might be adduced to ſhew, that the prevailing idea ought to pervade every part, ſo far at leaſt indiſpenſably as to exclude whatever diſtracts it, and as much further as poſſible to accommodate the character of the ground to that of the ſcene it belongs to.

On the ſame principle, the *proportion* of the parts may often be adjuſted. For though their ſize muſt be very much governed by the extent of the place, and a feature which would fill up a ſmall ſpot may be loſt in a large one; though there are forms of a particular caſt, which appear to advantage only within certain dimenſions, and ought not therefore to be applied where they have not room enough, or where they muſt occupy more ſpace than becomes them; yet, independent of theſe conſiderations, a character of greatneſs belongs to ſome ſcenes, which is not meaſured by their extent, but raiſed by other properties, ſometimes only by the proportional largeneſs of their parts. On the contrary, where elegance characteriſes the ſpot, the parts ſhould not only be ſmall, but diverſified beſides with ſubordinate inequalities, and little delicate touches every where ſcattered about them. Striking effects, forcible impreſſions, whatever ſeems to require effort, diſturb the enjoyment of a ſcene intended to amuſe and to pleaſe.

Section I. Ground

In other inſtances, ſimilar conſiderations will determine rather the *number* than the proportion of the parts. A place may be diſtinguiſhed by its ſimplicity, which many diviſions would deſtroy; another ſpot, without any pretenſions to elegance, may be remarkable for an appearance of richneſs: a multiplicity of objects will give that appearance, and a number of parts in the ground will contribute to the profuſion. A ſcene of gaiety is improved by the ſame means; the objects and the parts may differ in ſtyle, but they muſt be numerous in both. Sameneſs is dull: the pureſt ſimplicity can at the moſt render a place compoſed of large parts placid; the ſublimeſt ideas only make it ſtriking: it is always grave; to enliven it, numbers are wanting.

8 Of variety.

But ground is ſeldom beautiful or natural without *variety*, or even without contraſt; and the precautions which have been given, extend no farther than to prevent variety from degenerating into inconſiſtency, and contraſt into contradiction. Within the extremes, nature ſupplies an inexhauſtible fund; and variety thus limited, ſo far from deſtroying, improves the general effect: Each diſtinguiſhed part makes a ſeparate impreſſion; and all bearing the ſame ſtamp, all concurring to the ſame end, every one is an additional ſupport to the prevailing idea: that is multiplied, it is extended, it appears in different ſhapes, it is ſhewn in ſeveral lights, and the variety illuſtrates the relation.

But variety wants not this recommendation; it is always deſirable where it can be properly introduced; and an accurate obſerver will ſee in every *form* ſeveral circumſtances by which it is diſtinguiſhed from every other. If the ſcene be mild and quiet, he will place together thoſe which do not differ widely; and he will gradually depart from the ſimilitude. In ruder ſcenes, the ſucceſſion will be leſs regular, and the tranſitions more ſudden. The character of the place muſt determine the degree of difference between forms which are contiguous. Beſides diſtinctions in the ſhapes of ground, differences in their *ſituations* and their *dimenſions* are ſources of variety. The poſition will alter the effect, though the figure be the ſame; and for particular effects, a change only in the diſtance may be ſtriking. If that be conſiderable, a ſucceſſion of ſimilar ſhapes ſometimes occaſions a fine perſpective; but the diminution will be leſs marked, that is, the effect will be leſs ſenſible, if the forms are not nearly alike: we take more notice of one difference, when there is no other. Sometimes a very diſagreeable effect, produced by too cloſe a reſemblance of ſhapes, may be remedied only by an alteration in the ſize. If a ſteep deſcends in a ſucceſſion of abrupt falls, nearly equal, they have the appearance of ſteps, and are neither pleaſing nor wild; but if they are made to differ in height and length, the objection is removed: and at all times a

Section I. GROUND.

difference in the dimenſions will be found to have a greater effect than in ſpeculation we ſhould be inclined to aſcribe to it, and will often diſguiſe a ſimilarity of figure.

9 Of the lines traced by the ſeveral parts in ground.

It alſo contributes, perhaps more than any other circumſtance, to the perfection of thoſe *lines*, which the eye traces along the parts of a piece of ground, when it glances over ſeveral together. No variety of form compenſates for the want of it. An undulating line compoſed of parts all elegant in themſelves, all judiciouſly contraſted, and happily united, but equal one to another, is far from the line of beauty. A long ſtraight line has no variety at all; and a little deviation into a curve, if there be ſtill a continued uniformity, is but a trifling amendment. Though ground all falling the ſame requires every attention to its general tendency, yet the eye muſt not dart down the whole length immediately in one direction, but ſhould be inſenſibly conducted towards the principal point with ſome circuity and delay. The channels between hillocks ought never to run in ſtraight, nor even regularly curved lines; but winding gently among them, and conſtantly varying in form and in dimenſions, ſhould gradually find their way. The beauty of a large hill, eſpecially when ſeen from below, is frequently impaired by the even continuation of its brow. An attempt to break it by little knoles is ſeldom ſucceſsful; they ſeem ſeparate independent hillocks artificially put on. The intended effect may indeed be produced by a large knole deſcending in ſome places lower than in others, and rooted at ſeveral points into the hill. The ſame end may be attained by carrying ſome channel or hollow on the ſide upwards, till it cut the continued line; or by bringing the brow forward in one place, and throwing it back in another; or by forming a ſecondary ridge a little way down the ſide, and caſting the ground above it into a different though not oppoſite direction to the general deſcent. Any of theſe expedients will at leaſt draw the attention off from the defect. But if the break were to divide the line into equal parts, another uniformity would be added, without removing the former: for regularity always ſuggeſts a ſuſpicion of artifice; and artifice detected, no longer deceives. Our imaginations would induſtriouſly join the broken parts, and the idea of the continued line would be reſtored.

10 Of contraſt.

Whatever break be choſen, the poſition of it muſt be oblique to the line which is to be broken. A rectangular diviſion produces ſameneſs; there is no *contraſt* between the forms it divides: but if it be oblique, while it diminiſhes the part on one ſide, it enlarges that on the other. Parallel lines are liable to the ſame objection as thoſe at right angles: though each by itſelf be the perfect line of beauty; yet if they correſpond, they form a ſhape between them, whoſe ſides want contraſt. On the ſame principle, forms will ſometimes be introduced, leſs for their intrinſic than their occaſional merit in contraſting happily with thoſe about them: each ſets off the other; and together they are a more agreeable compoſition than if they had been more beautiful, but at the ſame time more ſimilar.

One reaſon why tame ſcenes are ſeldom intereſting, is, that though they often admit of many varieties, they allow of few, and thoſe only faint, contraſts. We may be pleaſed by the number of the former, but we can be ſtruck only by the force of the latter. Theſe ought to abound in the larger and bolder ſcenes of a garden, eſpecially in ſuch as are formed by an aſſemblage of many diſtinct and conſiderable parts thrown together: as when ſeveral riſing grounds appear one beyond another; a fine ſwell ſeen above a ſtanting ſweep which runs before it, has a beautiful effect, which a nearer reſemblance would deſtroy: and (except in particular inſtances) a cloſe ſimilarity between lines which either croſs, or face, or riſe behind one another, makes a poor, uniform, diſagreeable compoſition.

Section I. GROUND.

11 Of extraordinary effects.

The application of any of the foregoing obſervations to the ſtill greater ſcenes of nature, would carry us at preſent too far; nor could it well be made, before the other conſtituent parts of thoſe ſcenes, wood, water, rocks, and buildings, have been taken into conſideration. The rules which have been given, are chiefly applicable to ground which may be managed by a ſpade; and even there they are only general, not univerſal: few of them are without exception; very few, which, on particular occaſions, may not be diſpenſed with. Many of the above remarks are, however, ſo far of uſe in ſcenes the fartheſt from our reach, as they may aſſiſt in directing our choice of thoſe parts which are in our power to ſhew, or to conceal, though not to alter. But in converting them to this purpoſe, a caution, which has more than once been alluded to, muſt always be had in remembrance; never to ſuffer general conſiderations to interfere with *extraordinary great effects*, which riſe ſuperior to all regulations, and perhaps owe part of their force to their deviation from them. Singularity cauſes at leaſt ſurpriſe, and ſurprize is allied to aſtoniſhment. Theſe effects are not, however, attached merely to objects of enormous ſize; they frequently are produced by a greatneſs of ſtyle and character, within ſuch an extent as ordinary labour may modify, and the compaſs of a garden include. The caution therefore may not be uſeleſs within theſe narrow bounds: but nature proceeds ſtill further, beyond the utmoſt verge to which art can follow; and, in ſcenes licentiouſly wild, not content with contraſt, forces even contradictions to unite. The groteſque diſcordant ſhapes which are often there confuſedly jumbled together, might ſufficiently juſtify the remark. But the caprice does not ſtop here: to mix with ſuch ſhapes a form perfectly regular, is ſtill more extravagant; and yet the effect is ſometimes ſo wonderful, that we cannot wiſh the extravagance corrected. It is not unuſual to ſee a conical hill ſtanding out from a long, irregular, mountainous ridge, and greatly improving the view: but at Ilam ſuch a hill is thrown into the midſt of the rudeſt ſcene, and almoſt fills up an abyſs, ſunk among huge, bare, miſhapen hills, whoſe unwieldy parts, and uncouth forms, cut by the tapering lines of the cone, appear more ſavage from the oppoſition: and the effect would evidently be ſtronger, were the figure more complete; for it does not riſe quite to a point, and the want of perfect regularity ſeems a blemiſh. Whether ſuch a mixture of contrarieties would for a length of time be engaging, can be known only to thoſe who are habituated to the ſpot. It certainly at firſt ſight rivets the attention. But the conical hill is the moſt ſtriking object. In ſuch a ſituation it appears more ſtrange, more fantaſtic, than the

12 Deſcription of a hill at Ilam, near Aſhbourne in Derbyſhire.

Section I. Ground.

the rude ſhapes which are heaped about it: and together they ſuit the character of the place, where nature ſeems to have delighted to bring diſtances together; where two rivers, which are ingulphed many miles aſunder, iſſue from their ſubterraneous paſſages, the one often muddy when the other is clear, within a few paces of each other: but they appear only to loſe themſelves again; for they immediately unite their ſtreams, juſt in time to fall together into another current, which alſo runs through the garden. Such whimſical wonders, however, loſe their effect, when repreſented in a picture, or mimicked in ground artificially laid. They there want that vaſtneſs which conſtitutes their force; that reality which aſcertains the caprice. As accidents they may ſurpriſe; but they are not objects of choice.

13 Effects of wood on the form of ground.

To determine the choice to its proper objects is the purpoſe of the foregoing obſervations. Some of the principles upon which they are founded will be applicable alſo, and perhaps without further explanation, to the other conſtituent parts of the ſcenes of nature: they will there be often more obvious than in ground. But this is not a place for the compariſon; the ſubject now is ground only. It is not, however, foreign to that ſubject to obſerve, that the effects which have been recommended, may ſometimes be produced by wood alone, without any alteration in the ground itſelf: a tedious continued line may by ſuch means be broken. It is uſual for this purpoſe to place ſeveral little clumps along a brow; but if they are ſmall and numerous, the artifice is weak and apparent: an equal number of trees collected into one or two large maſſes, and dividing the line into very unequal parts, is leſs ſuſpicious, and obliterates the idea of ſameneſs with more certainty. Where ſeveral ſimilar lines are ſeen together, if one be planted, and the other bare, they become contraſts to each other. A hollow in certain ſituations, has been mentioned as a diſagreeable interruption in a continued ſurface: but, filled with wood, the heads of the trees ſupply the vacancy; the irregularity is preſerved; even the inequalities of the depth are in ſome meaſure ſhewn; and a continuation of ſurface is provided. Riſing ground may, on the other hand, be in appearance raiſed ſtill higher, by covering it with wood, of humble growth towards the bottom, and gradually taller as it aſcends. An additional mark of the inclination of falling ground may alſo be obtained, by placing a few trees in the ſame direction, which will ſtrongly point out the way; whereas plantations athwart a deſcent, bolſter up the ground, and check the fall: but obliquely croſſing it, they will often divert the general tendency; the ground will in ſome meaſure aſſume their direction, and they will make a variety, not a contradiction. Hedges, or continued plantations, carried over uneven ground, render the irregularity more conſpicuous, and frequently mark little inequalities, which would otherwiſe eſcape obſervation: or if a line of trees run cloſe upon the edge of an abrupt fall, they give it depth and importance. By ſuch means a view may be improved; by ſimilar means, in more confined ſpots, very material purpoſes may be anſwered.

Sect. II. *Of Wood.*

14 Characteriſtic differences in trees and ſhrubs.

In the above inſtances the ground is the principal conſideration: but previous to any inquiry into the greater effects of wood, when it is itſelf an object, an examination of the *characteriſtic differences* of trees and ſhrubs is neceſſary. We do not mean botanical diſtinctions: we mean apparent, not eſſential varieties; and theſe muſt be obvious and conſiderable, to merit regard in the diſpoſition of the objects they diſtinguiſh.

Section II. Wood.

Trees and ſhrubs are of different *ſhapes*, *greens*, and *growths*.

The varieties in their ſhapes may be reduced to the following heads.

Some thick with branches and foliage have almoſt *an appearance of ſolidity*; as the beech and the elm, the lilac and ſyringa. Others thin of boughs and of leaves ſeem *light and airy*; as the aſh and the arbele, the common arbor vitæ and the tamariſk.

There is a *mean betwixt the two extremes*, very diſtinguiſhable from both; as in the bladder-nut, and the aſhen-leaved maple.

They may again be divided into thoſe whoſe *branches begin from the ground*, and thoſe which *ſhoot up in a ſtem before their branches begin*. Trees which have ſome, not much clear ſtem, as ſeveral of the firs, belong to the former claſs; but a very ſhort ſtem will rank a ſhrub, ſuch as the althæa, in the latter.

Of thoſe whoſe branches begin from the ground, ſome riſe in a *conical figure*, as the larch, the cedar of Lebanon, and the holly; ſome *ſwell out in the middle of their growth, and diminiſh at both ends*, as the Weymouth pine, the mountain aſh, and the lilac: and ſome are *irregular and buſhy* from the top to the bottom, as the evergreen oak, the Virginian cedar, and Guelder roſe.

There is a great difference, between one whoſe *baſe is very large*, and another *whoſe baſe is very ſmall*, in proportion to its height: the cedar of Lebanon, and the cypreſs, are inſtances of this difference; yet in both the branches begin from the ground.

The heads of thoſe which ſhoot up into a ſtem before their branches begin, ſometimes are *ſlender cones*, as of many firs: ſometimes are *broad cones*, as of the horſe-cheſnut; ſometimes they are *round*, as of the ſtone-pine, and moſt ſorts of fruit-trees; and ſometimes *irregular*, as of the elm. Of this laſt kind there are many conſiderable varieties.

The branches of ſome grow *horizontally*, as of the oak. In others they *tend upwards*, as in the almond, and in ſeveral ſorts of broom and of willows. In others they *fall*, as in the lime, and the acacia: and in ſome of theſe laſt they *incline obliquely*, as in many of the firs; in ſome they *hang directly down*, as in the weeping willow.

Theſe are the moſt obvious great diſtinctions in the ſhapes of trees and ſhrubs. The differences between ſhades of green cannot be ſo conſiderable; but theſe alſo will be found well deſerving of attention.

Some are of a *dark green*, as the horſe-cheſnut and the yew; ſome of a *light green*, as the lime and the laurel; ſome of a *green tinged with brown*, as the Virginian cedar; ſome of a *green tinged with white*, as the arbele and the ſage tree; and ſome of a *green tinged with yellow*, as the aſhen-leaved maple and the Chineſe arbor vitæ. The variegated plants alſo are generally entitled to be claſſed with the white, or the yellow, by the ſtrong tincture of the one or the other of thoſe colours on their leaves.

Other

Section II. Wood.

Other conſiderations concerning colours will ſoon be ſuggeſted: the preſent inquiry is only into great fixed diſtinctions. Thoſe in the ſhapes and the greens of trees and ſhrubs have been mentioned: there are others, as great and as important, in their growths; but they are too obvious to deſerve mentioning. Every gradation, from the moſt humble to the moſt lofty, has, in certain ſituations, particular effects: it is unneceſſary to divide them into ſtages.

15 Variety ariſing from thoſe differences.

One principal uſe in ſettling theſe characteriſtic diſtinctions, is to point out the ſtores whence varieties may at all times be readily drawn, and the cauſes by which ſometimes inconſiſtencies may be accounted for. Trees which differ but in one of theſe circumſtances, whether of ſhape, of green, or of growth, though they agree in every other, are ſufficiently diſtinguiſhed for the purpoſe of variety: if they differ in two or three, they become contraſts; if in all, they are oppoſites, and ſeldom groupe well together. But there are intermediate degrees, by which the moſt diſtant may be reconciled: the upright branches of the almond mix very ill with the falling boughs of the weeping willow; but an interval filled with other trees, in figure between the two extremes, renders them at leaſt not unſightly in the ſame plantation. Thoſe, on the contrary, which are of one character, and are diſtinguiſhed only as the characteriſtic mark is ſtrongly or faintly impreſſed upon them, as a young beech and a birch, an acacia and a larch, all pendant, though in different degrees, form a beautiful maſs, in which unity is preſerved without ſameneſs; and ſtill finer groupes may often be produced by greater deviations from uniformity into contraſt.

Occaſions to ſhew the effects of particular ſhapes in certain ſituations will hereafter ſo frequently occur, that a further illuſtration of them now would be needleſs. But there are beſides, ſometimes in trees, and commonly in ſhrubs, ſtill *more minute varieties*,—in the turn of the branches, in the form and the ſize of the foliage, which generally catch, and often deſerve attention. Even the texture of the leaves frequently occaſions many different appearances: ſome have a ſtiffneſs, ſome an agility, by which they are more or leſs proper for ſeveral purpoſes; on many there is a gloſs, very uſeful at times to enliven, at other times too glittering for the hue of the plantation. But all theſe inferior varieties are below our notice in the conſideration of great effects: they are of conſequence only where the plantation is near to the ſight; where it ſkirts a home-ſcene, or borders the ſide of a walk: and in a ſhrubbery, which in its nature is little both in ſtyle and in extent, they ſhould be anxiouſly ſought for. The nobleſt wood is not indeed diſfigured by them; and when a wood, having ſerved as a great object to one ſpot, becomes in another the edge of a walk, little circumſtances, varying with ceaſeleſs change along the outline, will then be attended to: but where-ever theſe minute varieties are fitting, the groſſeſt taſte will feel the propriety, and the moſt curſory obſervation will ſuggeſt the diſtinctions: a detail of all would be endleſs; nor can they be reduced into claſſes. To range the ſhrubs and ſmall trees ſo that they may mutually ſet off the beauties, and conceal the blemiſhes, of each other; to aim at no effects which depend on a nicety for their ſucceſs, and which the ſoil, the expoſure, or the ſeaſon of the day, may deſtroy; to attend more to the groupes than to the individuals; and to conſider the whole as a plantation, not as a collection of plants; are the beſt general rules which can be given concerning them.

Section II. Wood.

16 Of the miſture of greens.

The different tints of greens may ſeem at firſt ſight to be rather minute varieties than characteriſtic diſtinctions: but upon experience it will be found, that from ſmall beginnings they lead to material conſequences; that they are more important on the broad expanſe, than along the narrow outline of a wood; and that by their union, or their contraſt, they produce effects not to be diſregarded in ſcenes of extent and of grandeur.

A hanging wood in autumn is enriched with colours, whoſe beauty cheers the approaches of the inclement ſeaſon they forebode: but when the trees firſt droop, while the verdure as yet only begins to fade, they are no more than ſtronger tints of thoſe colours with which the greens in their vigour are ſhaded; and which now are ſucceeded by a paler white, a brighter yellow, or a darker brown. The effects are not different; they are only more faintly impreſſed at one time than another; but when they are ſtrongeſt, they are moſt obſervable. The fall of the leaf, therefore, is the time to learn the ſpecies, the order, and the proportion of tints, which blended will form *beautiful maſſes*; and, on the other hand, to diſtinguiſh thoſe which are *incompatible* near together.

The peculiar beauty of the tints of red cannot then eſcape obſervation, and the want of them throughout the ſummer-months muſt be regretted: but that want, though it cannot perfectly, may partially be ſupplied; for plants have a *permanent* and an *accidental* colour. The permanent is always ſome ſhade of green; but any other may be the accidental colour; and there is none which ſo many circumſtances concur to produce as a red. It is aſſumed in ſucceſſion by the bud, the bloſſom, the berry, the bark, and the leaf. Sometimes it proſuſely overſpreads, at other times it dimly tinges the plant; and a *reddiſh green* is generally the hue of thoſe plants, on which it laſts long, or frequently returns.

Admitting this, at leaſt for many months in the year, among the characteriſtic diſtinctions, a large piece of red green, with a narrow edging of dark green along the further ſide of it, and beyond that a piece of light green larger than the firſt, will be found to compoſe a beautiful maſs. Another, not leſs beautiful, is a yellow green neareſt to the eye, beyond that a light green, then a brown green, and laſtly a dark green. The dark green muſt be the largeſt, the light green the next in extent, and the yellow green the leaſt of all.

From theſe combinations, the agreements between particular tints may be known. A light green may be next either to a yellow or a brown green, and a brown to a dark green, all in conſiderable quantities; and a little rim of dark green may border on a red or a light green. Further obſervations will ſhew, that the yellow and the white greens connect eaſily; but that a large quantity of the light, the yellow, or the white greens, does not mix well with a large quantity alſo of the dark green; and that to form a pleaſing maſs, either the dark green muſt

Section II. Wood.

must be reduced to a mere edging, or a brown or an intermediate green muſt be interpoſed: that the red, the brown, and the intermediate greens, agree among themſelves: and that any of them may be joined to any other tint; but that the red green will bear a larger quantity of the light than of the dark green near it, nor does it ſeem ſo proper a mixture with the white green as with the reſt.

In maſſing theſe tints, an attention muſt be conſtantly kept up to their *forms*, that they do not lie in large ſtripes one beyond another; but that either they be quite intermingled, or, which is generally more pleaſing, that conſiderable pieces of different tints, each a beautiful figure, be, in different proportions, placed near together. Exactneſs in the ſhapes muſt not be attempted, for it cannot be preſerved; but if the great outlines be well drawn, little variations, afterwards occaſioned by the growth of the plants, will not ſpoil them.

17 Effects ariſing from the diſpoſition of the greens.

A SMALL thicket is generally moſt agreeable, when it is one fine maſs of well-mixed greens: that maſs gives to the whole a *unity*, which can by no other means be ſo perfectly expreſſed. When more than one is neceſſary for the extent of the plantation, ſtill if they are too much contraſted, if the gradations from one to another are eaſy, the unity is not broken by the variety.

While the union of tints is productive of pleaſing effects, ſtrong effects may, on the other hand, be ſometimes produced by their *diſagreements*. Oppoſites, ſuch, for inſtance, as the dark and light greens, in large quantities cloſe together, break to pieces the ſurface upon which they meet; and an outline which cannot be ſufficiently varied in form, may be in appearance, by the management of its ſhades: every oppoſition of tints is a break in a continued line: the depth of receſſes may be deepened by darkening the greens as they retire; a tree which ſtands out from a plantation may be ſeparated by its tint as much as by its poſition; the appearance of ſolidity or airineſs in plants depends not ſolely on the thickneſs or thinneſs, but partly on the colour of the leaves; clumps at a diſtance, may be rendered more or leſs diſtinct by their greens; and the fine effect of a dark green tree, or groupe of trees, with nothing behind it but the ſplendor of a morning or the glow of an evening ſky, cannot be unknown to any who was ever delighted with a picture of Claude, or with the more beautiful originals in nature.

Another effect attainable by the aid of the different tints, is founded on the firſt principles of *perſpective*. Objects grow faint as they retire from the eye; a detached clump, or a ſingle tree, of the lighter greens, will, therefore, ſeem farther off than one equidiſtant of a darker hue; and a regular gradation from one tint to another will alter the apparent length of a continued plantation, according as the dark or light greens begin the gradation. In a ſtraight line this is obvious; in a broken one, the fallacy in the appearance is ſeldom detected, only becauſe the real extent is generally unknown; but experiments will ſupport the principle, if they are made on plantations not very ſmall, nor too cloſe to the eye: the ſeveral parts may then be ſhortened or lengthened, and the variety of the outline be improved by a judicious arrangement of greens.

Section II. Wood.

OTHER effects ariſing from mixtures of greens will occaſionally preſent themſelves in the *diſpoſition* of a wood, which is the next conſideration. Wood, as a general term, comprehends all trees and ſhrubs in whatever diſpoſition; but it is ſpecifically applied in a more limited ſenſe, and in that ſenſe we ſhall now uſe it.

18 Of the ſeveral ſpecies of wood.

Every plantation muſt be either a *wood*, a *grove*, a *clump*, or a *ſingle tree*.

A wood is compoſed both of trees and underwood, covering a conſiderable ſpace. A grove conſiſts of trees without underwood. A clump differs from either only in extent: it may be either cloſe or open: when cloſe, it is ſometimes called a *thicket*; when open, a *groupe of trees*; but both are equally clumps, whatever may be the ſhape or ſituation.

19 Of the ſurface of a wood diſtinguiſhed by its greatneſs.

ONE of the nobleſt objects in nature is the *ſurface of a large thick wood*, commanded from an eminence, or ſeen from below, hanging on the ſide of a hill. The latter is generally the more intereſting object. Its aſpiring ſituation gives it an air of greatneſs; its termination is commonly the horizon: and, indeed, if it is deprived of that ſplendid boundary, if the brow appears above it, (unleſs ſome very peculiar effect characteriſes that brow), it loſes much of its magnificence: it is inferior to a wood which covers a leſs hill from the top to the bottom; for a whole ſpace filled is ſeldom little: but a wood commanded from an eminence is generally no more than a part of the ſcene below; and its boundary is often inadequate to its greatneſs. To continue it, therefore, till it winds out of ſight, or loſes itſelf in the horizon, is generally deſirable: but then the varieties of its ſurface grow confuſed as it retires; while thoſe of a hanging wood are all diſtinct; the furtheſt parts are held up to the eye; and none are at a diſtance, though the whole be extenſive.

The varieties of a ſurface are eſſential to the beauty of it: a continued ſmooth ſhaven level of foliage is neither agreeable nor natural; the different growths of trees commonly break it in reality, and their ſhadows ſtill more in appearance. Theſe ſhades are ſo many tints, which, undulating about the ſurface, are its greateſt embelliſhment; and ſuch tints may be produced with more effect, and more certainty, by a judicious mixture of greens; at the ſame time an additional variety may be introduced, by grouping and contraſting trees very different in ſhape from each other: and whether variety in the greens or in the forms be the deſign, the execution is often eaſy, and ſeldom to a certain degree impoſſible. In raiſing a young wood, it may be perfect. In old woods, there are many ſpots which may be either thinned or thickened: and there the characteriſtic diſtinctions ſhould determine what to plant, or which to leave; at the leaſt will often point out thoſe which, as blemiſhes, ought to be taken away; and the removal of two or three trees will ſometimes accompliſh the deſign. The number of beautiful forms, and agreeable maſſes, which may decorate the ſurface, is ſo great, that where the place will not admit of one, another is always ready; and as no delicacy of finiſhing is required, no minute exactneſs is worth regarding, great effects will not be diſconcerted by ſmall obſtructions and little diſappointments.

The contraſts, however, of maſſes and of groupes muſt not be too ſtrong, where *greatneſs* is the character

Section II. Wood.

ter of the wood; for unity is eſſential to greatneſs: and if direct oppoſites be placed cloſe together, the wood is no longer one object; it is only a confuſed collection of ſeveral ſeparate plantations. But if the progreſs be gradual from the one to the other, ſhapes and tints widely different may aſſemble on the ſame ſurface; and each ſhould occupy a conſiderable ſpace: a ſingle tree, or a ſmall cluſter of trees, in the midſt of an extenſive wood, is in ſize but a ſpeck, and in colour but a ſpot; the groupes and the maſſes muſt be large to produce any ſenſible variety.

Yet ſingle trees in the midſt of a wood, though ſeldom of uſe to diverſify a ſurface, often deſerve particular regard as individuals, and are important to the greatneſs of the whole. The ſuperficies of a ſhrubby thicket, how extenſive ſoever, does not convey the ſame ideas of magnificence, as that of a hanging wood: and yet, at firſt ſight, the difference is not always very diſcernible. It often requires time to collect the ſeveral circumſtances in the latter, which ſuggeſt the elevation to which that broad expanſe of foliage is raiſed, the vaſtneſs of the trunks which ſupport it ſo high, the extent of the branches which ſpread it ſo far. When theſe circumſtances, all of grandeur, crowd together upon the mind, they dignify the ſpace; which, without them, might, indifferently, be the ſuperficies of a thicket or the ſurface of a wood: but a few large trees, not eminent above all about them, but diſtinguiſhed by ſome ſlight ſeparation, and obvious at a glance, immediately reſolve the doubt. They are noble objects in themſelves; become the ſituatiou; and ſerve as a meaſure to the reſt. On the ſame principle, trees which are thin of boughs and of leaves, thoſe whoſe branches tend upwards, or whoſe heads riſe in ſlender cones, have an appearance more of airineſs than of importance; and are blemiſhes in a wood, where greatneſs is the prevailing idea. Thoſe, on the contrary, whoſe branches hang directly down, have a breadth of head, which ſuits with ſuch a ſituation, though their own peculiar beauty be loſt in it.

Theſe decorations are natural graces, which never derogate from greatneſs; and a number of ſhades playing on the ſurface, over a variety of thoſe beautiful forms into which it may be caſt, enliven that ſameneſs, which, while it prevails, reduces the merit of one of the nobleſt objects in nature to that of mere ſpace. To fill that ſpace with objects of beauty, to delight the eye after it has been ſtruck, to fix the attention where it has been caught, and to prolong aſtoniſhment into admiration, are purpoſes not unworthy of the greateſt deſigns; and, in the execution, productive of embelliſhments, which in ſtyle are not unequal to ſcenes of richneſs and magnificence.

19 Of the ſurface of a romantic, and of a thin wood.

When, in a romantic ſituation, very broken ground is overſpread with wood, it may be proper, on the ſurface of the wood, to mark the inequalities of the ground. *Rudeneſs*, not greatneſs, is the prevailing idea; and a choice directly the reverſe of that which is productive of unity, will produce it. Strong contraſts, even oppoſitions, may be eligible; the aim is rather to disjoint than to connect: a deep hollow may ſink into dark greens; an abrupt bank may be ſhewn by a riſing ſtage of aſpiring trees, a ſharp ridge by a narrow line of conical ſhapes; firs are of great uſe upon ſuch occaſions; their tint, their form, their ſingularity, recommend them. Section II. Wood.

A hanging *wood of thin foreſt-trees*, and ſeen from below, is ſeldom pleaſing: thoſe few trees, are by the perſpective brought nearer together; it loſes the beauty of a thin wood, and is defective as a thick one: the moſt obvious improvement, therefore, is to thicken it. But, when ſeen from an eminence, a thin wood is often a lively and elegant circumſtance in a view; it is full of objects; and every ſeparate tree ſhews its beauty. To increaſe that vivacity, which is the peculiar excellence of a thin wood, the trees ſhould be characteriſtically diſtinguiſhed both in their tints and their ſhapes; and ſuch as for their airineſs have been proſcribed in a thick wood, are frequently the moſt eligible here. Differences alſo in their growths are a further ſource of variety; each ſhould be conſidered as a diſtinct object, unleſs where a ſmall number are grouped together; and then all that compoſe the little cluſter muſt agree: but the groupes themſelves, for the ſame reaſon as the ſeparate trees, ſhould be ſtrongly contraſted; the continued underwood is their only connection, and that is not affected by their variety.

21 Of the outline of a wood.

Though the ſurface of a wood, when commanded, deſerves all theſe attentions, yet the *outline* more frequently calls for our regard: it is alſo more in our power; it may ſometimes be great, and may always be beautiful. The firſt requiſite is irregularity. That a mixture of trees and underwood ſhould form a long ſtraight line, can never be natural; and a ſucceſſion of eaſy ſweeps and gentle rounds, each a portion of a greater or leſs circle, compoſing all together a line literally ſerpentine, is, if poſſible, worſe. It is but a number of regularities put together in a diſorderly manner, and equally diſtant from the beautiful both of art and of nature. The true beauty of an outline conſiſts more in breaks than in ſweeps; rather in angles than in rounds; in variety, not in ſucceſſion.

The outline of a wood is a continued line, and ſmall variations do not ſave it from the inſipidity of ſameneſs: one deep receſs, one bold prominence, has more effect than twenty little irregularities. That one divides the line into parts, but no breach is thereby made in its unity; a continuation of wood always remains; the form of it only is altered, and the extent is increaſed. The eye, which hurries to the extremity of whatever is uniform, delights to trace a varied line through all its intricacies, to pauſe from ſtage to ſtage, and to lengthen the progreſs. The parts muſt not, however, on that account be multiplied till they are too minute to be intereſting, and ſo numerous as to create confuſion. A few large parts ſhould be ſtrongly diſtinguiſhed in their forms, their directions, and their ſituations; each of theſe may afterwards be decorated with ſubordinate varieties; and the mere growth of the plants will occaſion ſome irregularity; on many occaſions, more will not be required.

Every variety in the outline of a wood muſt be a *prominence*, or a *receſs*. Breadth in either is not ſo important as length to the one, and depth to the other. If the former ends in an angle, the latter diminiſhes to a point; they have more force than a ſhallow dent, or a dwarf excreſcence, how wide ſoever. They are greater deviations from the continued line which they are intended to break; and their effect is to enlarge the

Section II. Wood.

the wood itſelf, which ſeems to ſtretch from the moſt advanced point, back beyond the moſt diſtant to which it retires. The extent of a large wood on a flat, not commanded, can by no circumſtance be ſo manifeſtly ſhewn, as by a deep receſs; eſpecially if that receſs wind ſo as to conceal the extremity, and leave the imagination to purſue it. On the other hand, the poverty of a ſhallow wood might ſometimes be relieved by here and there a prominence, or clumps, which by their apparent junction ſhould ſeem to be prominences from it. A deeper wood with a continued outline, except when commanded, would not appear ſo conſiderable.

An inlet into a wood ſeems to have been cut, if the oppoſite points of the entrance tally; and that ſhow of art depreciates its merit: but a difference only in the ſituation of thoſe points, by bringing one more forward than the other, prevents the appearance, though their forms be ſimilar. Other points, which diſtinguiſh the great parts, ſhould in general be ſtrongly marked: a ſhort turn has more ſpirit in it than a tedious circuity; and a line broken by angles has a preciſion and firmneſs, which in an undulated line are wanting: the angles ſhould indeed commonly be a little ſoftened; the rotundity of the plant which forms them is ſometimes ſufficient for the purpoſe; but if they are mellowed down too much, they loſe all meaning. Three or four large parts thus boldly diſtinguiſhed, will break a very long outline; more may be, and often ought to be, thrown in, but ſeldom are neceſſary: and when two woods are oppoſed on the ſides of a narrow glade, neither has ſo much occaſion for variety in itſelf as if it were ſingle: if they are very different from each other, the contraſt ſupplies the deficiency to each, and the interval between them is full of variety. The form of that interval is indeed of as much conſequence as their own: though the outlines of both the woods be ſeparately beautiful, yet if together they do not caſt the open ſpace into an agreeable figure, the whole ſcene is not pleaſing; and a figure is never agreeable, when the ſides too cloſely correſpond; whether they are exactly the ſame, or exactly the reverſe of each other, they equally appear artificial.

Every variety of outline hitherto mentioned, may be traced by the *underwood* alone; but frequently the ſame effects may be produced with more eaſe, and with much more beauty, by a *few trees* ſtanding out from the thicket, and belonging, or ſeeming to belong, to the wood, ſo as to make a part of its figure. Even where they are not wanted for that purpoſe, detached trees are ſuch agreeable objects, ſo diſtinct, ſo light, when compared to the covert about them, that ſkirting along it in ſome parts, and breaking it in others, they give an unaffected grace, which can no otherwiſe be given to the outline. They have a ſtill further effect, when they ſtretch across the whole breadth of an inlet, or before part of a receſs into the wood: they are themſelves ſhewn to advantage by the ſpace behind them, and that ſpace, ſeen between their ſtems, they in return throw into an agreeable perſpective. An inferior grace of the ſame kind may be often introduced, only by diſtinguiſhing the boles of ſome trees in the wood itſelf, and keeping down the thicket beneath them. Where even this cannot be well executed, ſtill the outline may be filled with ſuch trees and ſhrubs as ſwell out in the middle of their growth, and diminiſh at both ends; or with ſuch as riſe in a ſlender cone; with thoſe whoſe branches tend upwards; or whoſe baſe is very ſmall in proportion to their height; or which are very thin of boughs and of leaves. In a confined garden-ſcene, which wants room for the effect of detached trees, the outline will be heavy, if theſe little attentions are diſregarded.

Section II. Wood.

22 Surface and outline of a grove.

The prevailing character of a wood is generally grandeur: the principal attention therefore which it requires, is to prevent the exceſſes of that character, to diverſify the uniformity of its extent, to lighten the unwieldineſs of its bulk, and to blend graces with greatneſs. But the character of a grove is *beauty*. Fine trees are lovely objects: a grove is an aſſemblage of them; in which every individual retains much of its own peculiar elegance, and whatever it loſes is transferred to the ſuperior beauty of the whole. To a grove, therefore, which admits of endleſs variety in the diſpoſition of the trees, differences in their ſhapes and their greens are ſeldom very important, and ſometimes they are detrimental. Strong contraſts ſcatter trees which are thinly planted, and which have not the connection of underwood; they no longer form one plantation; they are a number of ſingle trees. A thick grove is not indeed expoſed to this miſchief, and certain ſituations may recommend different ſhapes and different greens for their effects upon the *ſurface*; but in the *outline* they are ſeldom much regarded. The eye attracted into the depth of the grove, paſſes by little circumſtances at the entrance; even varieties in the form of the line do not always engage the attention: they are not ſo apparent as in a continued thicket, and are ſcarcely ſeen if they are not conſiderable.

23 The interior of a grove.

But the ſurface and the outline are not the only circumſtances to be attended to. Though a grove be beautiful as an object, it is beſides delightful as a ſpot to walk or to ſit in; and the choice and the diſpoſition of the trees for effects *within*, are therefore a principal conſideration. Mere irregularity alone will not pleaſe: ſtrict order is there more agreeable than abſolute confuſion; and ſome meaning better than none. A regular plantation has a degree of beauty; but it gives no ſatisfaction, becauſe we know that the ſame number of trees might be more beautifully arranged. A diſpoſition, however, in which the lines only are broken, without varying the diſtances, is leſs natural than any; for though we cannot find ſtraight lines in a foreſt, we are habituated to them in the hedge-rows of fields: but neither in wild nor in cultivated nature do we ever ſee trees equi-diſtant from each other: that regularity belongs to art alone. The diſtances, therefore, ſhould be ſtrikingly different: the trees ſhould gather into groupes, or ſtand in various irregular lines, and deſcribe ſeveral figures: the intervals between them ſhould be contraſted both in ſhape and in dimenſions: a large ſpace ſhould in ſome places be quite open; in others the trees ſhould be ſo cloſe together, as hardly to leave a paſſage between them; and in others as far apart as the connection will allow. In the forms and the varieties of theſe groupes, theſe lines, and theſe openings, principally conſiſts the interior beauty of a grove.

24 Deſcription of a grove at Claremont, (near Eſher in Surry.)

The force of them is moſt ſtrongly illuſtrated at Claremont; where the walk to the cottage, though deſtitute of many natural advantages, and eminent for

Section II. Wood.

none; though it commands no proſpect; though the water below it is a trifling pond; though it has nothing, in ſhort, but inequality of ground to recommend it; is yet the fineſt part of the garden: for a grove is there planted in a gently curved direction, all along the ſide of a hill, and on the edge of a wood, which riſes above it. Large receſſes break it into ſeveral clumps, which hang down the declivity; ſome of them approaching, but none reaching quite to the bottom. Theſe receſſes are ſo deep as to form great openings in the midſt of the grove; they penetrate almoſt to the covert: but the clumps being all equally ſuſpended from the wood; and a line of open plantation, though ſometimes narrow, running conſtantly along the top; a continuation of grove is preſerved, and the connection between the parts is never broken. Even a groupe, which near one of the extremities ſtands out quite detached, is ſtill in ſtyle ſo ſimilar to the reſt, as not to loſe all relation. Each of theſe clumps is compoſed of ſeveral others ſtill more intimately united: each is full of groupes, ſometimes of no more than two trees, ſometimes of four or five, and now and then in larger cluſters: an irregular waving line, iſſuing from ſome little crowd, loſes itſelf in the next; or a few ſcattered trees drop in a more diſtant ſucceſſion from the one to the other. The intervals, winding here like a glade, and widening there into broader openings, differ in extent, in figure, and direction; but all the groupes, the lines, and the intervals, are collected together into large general clumps, each of which is at the ſame time both compact and free, identical and various. The whole is a place wherein to tarry with ſecure delight, or ſaunter with perpetual amuſement.

25 Grove at Eſher-place, (contiguous to Claremont.)

The grove at Eſher-place was planted by the ſame maſterly hand; but the neceſſity of accommodating the young plantation to ſome large trees which grew there before, has confined its variety. The groupes are few and ſmall; there was not room for larger or for more: there were no opportunities to form continued narrow glades between oppoſite lines; the vacant ſpaces are therefore chiefly irregular openings ſpreading every way, and great differences of diſtance between the trees are the principal variety; but the grove winds along the bank of a large river, on the ſide and at the foot of a very ſudden aſcent, the upper part of which is covered with wood. In one place, it preſſes cloſe to the covert; retires from it in another; and ſtretches in a third acroſs a bold receſs, which runs up high into the thicket. The trees ſometimes overſpread the flat below; ſometimes leave an open ſpace to the river; at other times crown the brow of a large knole, climb up a ſteep, or hang on a gentle declivity. Theſe varieties in the ſituation more than compenſate for the want of variety in the diſpoſition of the trees; and the many happy circumſtances which concur

> ——In Eſher's peaceful grove,
> Where Kent and nature vie for Pelham's love,

render this little ſpot more agreeable than any at Claremont. But though it was right to preſerve the trees already ſtanding, and not to ſacrifice great preſent beauties to ſtill greater in futurity; yet this attention has been a reſtraint; and the grove at Claremont, conſidered merely as a plantation, is in delicacy of taste, and fertility of invention, ſuperior to that at Eſher.

Both were early eſſays in the modern art of gardening: and, perhaps from an eagerneſs to ſhew the effect, the trees in both were placed too near together: though they are ſtill far ſhort of their growth, they are run up into poles, and the groves are already paſt their prime; but the temptation to plant for ſuch a purpoſe no longer exiſts, now that experience has juſtified the experiment. If, however, we ſtill have not patience to wait, it is poſſible to ſecure both a preſent and a future effect, by fixing firſt on a diſpoſition which will be beautiful when the trees are large, and then intermingling another which is agreeable while they are ſmall. Theſe occaſional trees are hereafter to be taken away; and muſt be removed in time, before they become prejudicial to the others.

The conſequence of variety in the diſpoſition, is variety in the light and ſhade of the grove; which may be improved by the choice of the trees. Some are impenetrable to the fierceſt ſun-beam; others let in here and there a ray between the large maſſes of their foliage; and others, thin both of boughs and of leaves, only chequer the ground. Every degree of light and ſhade, from a glare to obſcurity, may be managed, partly by the number, and partly by the texture, of the trees. Differences only in the manner of their growths have alſo correſponding effects: there is a cloſeneſs under thoſe whoſe branches deſcend low, and ſpread wide; a ſpace and liberty where the arch above is high; and frequent tranſitions from the one to the other are very pleaſing. Theſe ſtill are not all the varieties of which the interior of a grove is capable: trees indeed, whoſe branches nearly reach the ground, being each a ſort of thicket, are inconſiſtent with an open plantation: but though ſome of the characteriſtic diſtinctions are thereby excluded, other varieties more minute ſucceed in their place; for the freedom of paſſage throughout brings every tree in its turn near to the eye, and ſubjects even differences in foliage to obſervation. Theſe, ſlight as they may ſeem, are agreeable when they occur: it is true, they are not regretted when wanting; but a defect of ornament is not neceſſarily a blemiſh.

26 Of the forms of clumps.

It has been already obſerved, that clumps differ only in extent from woods, if they are cloſe; or from groves, if they are open: they are ſmall woods, and ſmall groves, governed by the ſame principles as the larger, after allowances made for their dimenſions. But beſides the properties they may have in common with woods or with groves, they have others peculiar to themſelves, which require examination.

They are either *independent* or *relative:* when independent, their beauty, as ſingle objects, is ſolely to be attended to; when relative, the beauty of the individuals muſt be ſacrificed to the effect of the whole, which is the greater conſideration.

The leaſt clump that can be, is of two trees; and the beſt effect they can have is, that their heads united ſhould appear one large tree: two therefore of different ſpecies, or ſeven or eight of ſuch ſhapes as do not eaſily join, can hardly be a beautiful groupe, eſpecially if it have a tendency to a circular form. Such clumps of firs, though very common, are ſeldom pleaſing; they do not compoſe one maſs, but are only a confuſed number of pinnacles. The confuſion is however avoided, by placing them in ſucceſſion, not in cluſters; and a clump of ſuch trees is therefore more agreeable when it is extended

Section II. Wood.

tended rather in length than in breadth.

Three trees together muſt form either a right line, or a triangle: to diſguiſe the regularity, the diſtances ſhould be very different. Diſtinctions in their ſhapes contribute alſo to the ſame end; and a variety in their growths ſtill more. When a ſtraight line conſiſts of two trees nearly ſimilar, and of a third much lower than they are, the even direction in which they ſtand is hardly diſcernible.

If humbler growths at the extremity can diſcompoſe the ſtricteſt regularity, the uſe of them is thereby recommended upon other occaſions. It is indeed the variety peculiarly proper for clumps: every apparent artifice affecting the objects of nature, diſguſts; and clumps are ſuch diſtinguiſhed objects, ſo liable to the ſuſpicion of having been left or placed on purpoſe to be ſo diſtinguiſhed, that, to divert the attention from theſe ſymptoms of art, irregularity in the compoſition is more important to them than to a wood or to a grove: being alſo leſs extenſive, they do not admit ſo much variety of outline: but variety of growths is moſt obſervable in a ſmall compaſs; and the ſeveral gradations may often be caſt into beautiful figures.

The extent and the outline of a wood or a grove engage the attention more than the extremities; but in clumps the laſt are of the moſt conſequence: they determine the form of the whole; and both of them are generally in ſight: great care ſhould therefore be taken to make them agreeable and different. The eaſe with which they may be compared, forbids all ſimilarity between them: for every appearance of equality ſuggeſts an idea of art; and therefore a clump as broad as it is long, ſeems leſs the work of nature than one which ſtretches into length.

Another peculiarity of clumps, is the facility with which they admit a mixture of trees and of ſhrubs, of wood and of grove; in ſhort, of every ſpecies of plantation. None are more beautiful than thoſe which are ſo compoſed. Such compoſitions are, however, more proper in compact than in ſtraggling clumps: they are moſt agreeable when they form one maſs: if the tranſitions from very lofty to very humble growths, from thicket to open plantations, be frequent and ſudden, the diſorder is more ſuited to rude than to elegant ſcenes.

27 Uſes and ſituations of independent clumps.

THE *occaſions* on which independent clumps may be applied, are many. They are often deſirable as beautiful objects in themſelves; they are ſometimes neceſſary to break an extent of lawn, or a continued line, whether of ground or of plantation; but on all occaſions a jealouſy of art conſtantly attends them, which irregularity in their figure will not always alone remove. Though elevations ſhew them to advantage, yet a hillock evidently thrown up on purpoſe to be crowned with a clump, is artificial to a degree of diſguſt: ſome of the trees ſhould therefore be planted on the ſides, to take off that appearance. The ſame expedient may be applied to clumps placed on the brow of a hill, to interrupt its ſameneſs: they will have leſs oſtentation of deſign, if they are in part carried down either declivity. The objection already made to planting many along ſuch a brow, is on the ſame principle: a ſingle clump is leſs ſuſpected of art; if it be an open one, there can be no finer ſituation for it, than juſt at the point of an abrupt hill, or on a promontory into a lake or a river. It is in either a beautiful termination, diſtinct by its poſition, and enlivened by an expanſe of ſky or of water about and beyond it. Such advantages may balance little defects in its form: but they are loſt if other clumps are planted near it; art then intrudes, and the whole is diſpleaſing.

Section II. Wood.

28 Of clumps which have a relation to each other.

BUT though a multiplicity of clumps, when each is an independent object, ſeldom ſeems natural; yet a number of them may, without any appearance of art, be admitted into the ſame ſcene, if they bear a *relation* to each other: if by their ſucceſſion they diverſify a continued outline of wood, if between them they form beautiful glades, if all together they caſt an extenſive lawn into an agreeable ſhape, the *effect* prevents any ſcrutiny into the means of producing it. But when the reliance on that effect is ſo great, every other conſideration muſt give way to the beauty of the whole. The figure of the glade, of the lawn, or of the wood, are principally to be attended to: the fineſt clumps, if they do not fall eaſily into the great lines, are blemiſhes; their connections, their contraſts, are more important than their forms.

A line of clumps, if the intervals be cloſed by others beyond them, has the appearance of a wood, or of a grove; and in one reſpect the ſemblance has an advantage over the reality. In different points of view, the relations between the clumps are changed, and a variety of forms is produced, which no continued wood or grove, however broken, can furniſh. Theſe forms cannot all be equally agreeable; and too anxious a ſolicitude to make them every where pleaſing, may, perhaps, prevent their being ever beautiful. The effect muſt often be left to chance; but it ſhould be ſtudiouſly conſulted from a few principal points of view; and it is eaſy to make any receſs, any prominence, any figure in the outline, by clumps thus advancing before, or retiring behind one another.

But amidſt all the advantages attendant on this ſpecies of plantation, it is often exceptionable when commanded from a neighbouring eminence: clumps below the eye loſe ſome of their principal beauties, and a number of them betray the art of which they are always liable to be ſuſpected; they compoſe no ſurface of wood, and all effects ariſing from the relations between them are entirely loſt. A proſpect ſpotted with many clumps can hardly be great: unleſs they are ſo diſtinct as to be objects, or ſo diſtant as to unite into one maſs, they are ſeldom an improvement of a view.

29 Of ſingle trees.

THE proper ſituations for ſingle trees are frequently the ſame as for clumps: the choice will often be determined, ſolely by the conſideration of proportion between the object, and the ſpot it is intended to occupy; and if the deſired effect can be attained by a ſingle tree, the ſimplicity of the means recommends it. Sometimes it will be preferred merely for variety; and may be uſed to mark one point in a ſcene in which two or three points are already diſtinguiſhed by clumps. It may occaſionally be applied to moſt of the purpoſes for which clumps are uſed; may be an independent object; may interrupt a continued line, or decorate an extent of ſpace. There is but one effect reſulting from clumps which may not to a certain degree be produced by ſingle trees: a number of them will never unite into one large maſs; but more diſtant relations may be obſerved between them. Scattered about a lawn, they

Section III. Water.

may cast it into an agreeable shape; and to produce that shape, each must be placed with an attention to the rest: they may stand in particular directions, and collectively form agreeable figures; or between several straggling trees little glades may open, full of variety and beauty. The lines they trace are fainter than those which larger plantations describe; but then their forms are their own: they are therefore absolutely free from all appearance of art; any disposition of them, if it be but irregular, is sure to be natural.

The situations of single trees is the first consideration, and differences in the distances between them their greatest variety. In shape, they admit of no choice but that which their species affords: greatness often, beauty often, sometimes mere solidity, and now and then peculiarity alone, recommends them. Their situations will also frequently determine the species. If they are placed before a continued line of wood only to break it, they should commonly be similar to the trees in that wood; they will else lose their connection, and not affect the outline which they are intended to vary: but if they are designed to be independent objects, they are as such more discernible when distinguished, both in their shapes and their greens, from any plantations about them. After all, the choice, especially in large scenes, is much confined to the trees on the spot. Young clumps from the first have some, and soon produce a considerable effect: but a young single tree for many years has none at all: and it is often more judicious to preserve one already growing, though not exactly such as might be wished, either in itself, or in its situation, than to plant in its stead another, which may be a finer object, and better placed, in a distant futurity.

Sect. III. *Of Water.*

30 Effects and species of water.

In considering the subjects of gardening, ground and wood first present themselves: water is the next; which, though not absolutely necessary to a beautiful composition, yet occurs so often, and is so capital a feature, that it is always regretted when wanting; and no large place can be supposed, a little spot can hardly be imagined, in which it may not be agreeable. It accommodates itself to every situation; is the most interesting object in a landscape, and the happiest circumstance in a retired recess; captivates the eye at a distance, invites approach, and is delightful when near: it refreshes an open exposure; it animates a shade; cheers the dreariness of a waste, and enriches the most crowded view. In form, in style, and in extent, it may be made equal to the greatest compositions, or adapted to the least: it may spread in a calm expanse to soothe the tranquillity of a peaceful scene; or, hurrying along a devious course, add splendor to a gay, and extravagance to a romantic, situation. So various are the characters which water can assume, that there is scarcely an idea in which it may not concur, or an impression which it cannot enforce. A deep stagnated pool, dank and dark with shades which it dimly reflects, befits the seat of melancholy; even a river, if it be sunk between two oaisal banks, and dull both in motion and colour, is like a hollow eye, which deadens the countenance; and over a sluggard, silent stream, creeping heavily along all together, a gloom hangs, which no art can dissipate, nor even the sunshine disperse. A gently murmuring rill, clear and shallow, just gurgling, just dimpling, imposes silence, suits with solitude, and leads to meditation: a brisker current, which wantons in little eddies over a bright sandy bottom, or babbles among pebbles, spreads cheerfulness all around: a greater rapidity, and more agitation, to a certain degree are animating; but in excess, instead of wakening, they alarm the senses: the roar and the rage of a torrent, its force, its violence, its impetuosity, tend to inspire terror; that terror which, whether as cause or effect, is so nearly allied to sublimity.

Abstracted, however, from all these ideas, from every sensation, either of depression, composure, or exertion; and considering water merely as an object; no other is so apt soon to catch, and long to fix, the attention. But it may want beauties of which we know it is capable, or the marks may be confused by which we distinguish its species; and these defects displease: to avoid them, the properties of each species must be determined.

All water is either *running*, or *stagnated:* when stagnated, it forms a *lake* or a *pool*, which differ only in extent; and a *pool* and a *pond* are the same. Running waters are either a *rivulet*, a *river*, or a *rill;* and these differ only in breadth: a *rivulet* and a *brook* are synonymous terms; a *stream* and a *current* are general names for all.

In a garden, the water is generally imitative. That which in the open country would be called a *great pond*, there assumes the name, and should be shaped as if it had the extent, of a lake; for it is large in proportion to the other parts of the place. Though sometimes a real river passes thro' a garden, yet still but a small portion of it is seen; and more frequently the semblance only of such a portion is substituted instead of the reality. In either case, the imitation is lost, if the characteristic distinctions between a lake and a river be not scrupulously preserved.

31 Differences between a lake and a river.

The characteristic property of running water is *progress;* of stagnated, is *circuity:* the one stretches into length, the other spreads over space. But it is necessary that the whole circumference of a lake be seen, or that no bounds be set to the prospect of a river: on the contrary, the latter is never more beautiful than when it is lost in a wood, or retires behind a hill from the view: the former never appears so great as when its termination is concealed; the *shape*, not the *close*, denotes the character: if the opposite shores are both concave, they seem intended to surround, and to meet; if they are nearly parallel, they shew no tendency to come together, but suggest the idea of continuation.

To make both the banks of a river in concave forms is to sin against this first principle; and yet the fault is often committed, in order to increase the expanse. But when the bold sweep of a river is thus converted into an insignificant pool, more is lost to the imagination in length, than is gained to the view in breadth; and, paradoxical as the assertion may seem, it is certainly true, that the water would appear more important were it narrower. When one bank, therefore, retires, the other, if it does not advance, should, at the least, continue its former direction; or if that should be convex, it may be straitened; but both must not together depart from the appearance of progress.

Particular occasions may, however, justify a seeming

Section III. Water.

ing deviation from the rule. To make room for an iſland, it may be proper to widen the river every way: for there the water is, in fact, intended to ſurround, and to meet; while the currents on each ſide preſerve the principal character. The ſame liberty may alſo be allowed on the influx of a collateral ſtream; and the acceſſion will account for both the breadth and for the ſhape: but the licence muſt here be uſed with moderation, leſt the wide place become principal, and divide the river into two ſtreams, the one falling into a pool, and the other iſſuing from it. Both the ſides of a lake may at all times retire; but on ſuch an acceſſion, the increaſe ſhould be chiefly on the ſhore oppoſite to the collateral ſtream, that it may appear to be a real enlargement of the lake, and not merely the mouth of a river.

A collateral ſtream ſhould, in general, keep, or ſeem to keep, for ſome way, to nearly the ſame breadth: if it diminiſhes very faſt, it muſt ſoon come to an end, and has more the appearance of a creek than of a ſtream. Whether it be the one or the other, may be matter of indifference when it falls into a lake: but a creek is ſeldom agreeable in a river; it diverts the current, its waters ſeem ſtagnated, it weakens the idea of progreſs.

All receſſes in which the current is loſt, are blemiſhes in a river. A bay is as exceptionable as a creek. Whatever be the form, if it be a receptacle, not a paſſage, it is a ſymptom that the water rather ſpreads than proceeds, and hurts the character of the river. But a head-land, which only turns or contracts the ſtream, though it make a ſort of bay, is not liable to the ſame objection. Such a bay has a vent; ſuch an obſtruction only ſtrengthens the current; they do not ſuggeſt the moſt diſtant idea of ſtagnation. It is almoſt needleſs to add, that in a lake, juſt the reverſe of a river, creeks, bays, receſſes of every kind, are always in character, ſometimes neceſſary, and generally beautiful: the objections to them in the one, are recommendations of them to the other.

32 Of a lake.

Besides the circumſtances which have been mentioned, and in which a river and a lake eſſentially differ; beſides thoſe in which they agree, and which are too obvious to require illuſtration; there are ſome peculiar to each character, and which, though common in the one, can hardly occur in the other; at leaſt, not ſo often, nor to that degree, as to become ſubjects of compariſon.

Space is eſſential to a lake; it may ſpread to any extent; and the mind, always pleaſed to expand itſelf on great ideas, delights even in its vaſtneſs. A lake cannot be too large as a ſubject of deſcription or of contemplation: but the eye receives little ſatisfaction when it has not a form on which to reſt: the ocean itſelf hardly atones by all its grandeur for its infinity; and a proſpect of it is, therefore, always moſt agreeable, when in ſome part, at no great diſtance, a reach of ſhore, a promontory, or an iſland, reduces the immenſity into ſhape. If the moſt extenſive view which can be the object of viſion, muſt be reſtrained in order to be pleaſing; if the nobleſt ideas which the creation can ſuggeſt, muſt be checked in their career, before they can be reconciled to the principles of beauty; an offence againſt thoſe principles, a tranſgreſſion of that reſtraint, will not eaſily be forgiven on a ſubject leſs than infinite: a lake whoſe bounds are out of ſight, is circumſcribed in reality, not in appearance; at the ſame time that it diſappoints the eye, it confines the imagination; it is but a waſte of waters, neither intereſting nor agreeable.

Section III. Water.

A diſtant flat coaſt, dimly and doubtfully ſeen, does not obviate the objection; but it may be the means of removing it; for elevation and diſtinctneſs give an appearance of proximity, and contract the ſpace they limit. This is the conſtant effect of a high ſhore: a low one, covered with wood, is in reality raiſed; and marked by buildings, becomes more conſpicuous; it acquires an artificial elevation and diſtinctneſs.

Theſe obſervations, though immediately relative to very large bodies of water, are ſtill applicable to imitative lakes in parks and gardens. The principles upon which they are founded are equally true in both; and though an artificial lake cannot be ſuppoſed, which ſhall be abſolutely, yet comparatively it may be extravagant. It may be ſo out of proportion to its appendages, as to ſeem a waſte of water; for all ſize is in ſome reſpects relative: if this exceeds its due dimenſions, and if a flatneſs of ſhore beyond it adds ſtill to the drearineſs of the ſcene, wood to raiſe the banks, and objects to diſtinguiſh them, will, from the ſame cauſe, produce the ſame effects as on a larger ſcale. If the length of a piece of water be too great for its breadth, ſo as to deſtroy all idea of circuity, the extremities ſhould be conſidered as too far off, and made important, to give them proximity; while at the ſame time the breadth may be favoured, by keeping down the banks on the ſides. On the ſame principle, if the lake be too ſmall, a low ſhore will, in appearance, increaſe the extent.

But it is not neceſſary that the whole ſcene be bounded: if form be impreſſed on a conſiderable part, the eye can, without diſguſt, permit a large reach to ſtretch beyond its ken; it can even be pleaſed to obſerve a tremulous motion in the horizon, which ſhews that the water has not there yet attained its termination. Still ſhort of this, the extent may be kept in uncertainty; a hill or a wood may conceal one of the extremities, and the country beyond it, in ſuch a manner as to leave room for the ſuppoſed continuation of ſo large a body of water. Opportunities to chooſe this ſhape are frequent, and it is the moſt perfect of any: the ſcene is cloſed, but the extent of the lake is undermined; a complete form is exhibited to the eye, while a boundleſs range is left open to the imagination.

But mere form will only give content, not delight: that depends upon the outline, which is capable of exquiſite beauty; and the *bays*, and the *creeks*, and the *promontories*, which are ordinary parts of that outline, together with the accidents of *iſlands*, of *inlets* and of *outlets* to rivers, are in their ſhapes and their combinations an inexhauſtible fund of variety.

A ſtraight line of conſiderable length may find a place in that variety; and it is ſometimes of ſingular uſe to prevent the reſemblance of a river in a channel formed between iſlands and the ſhore. But no figure perfectly regular ought ever to be admitted; it always ſeems artificial, unleſs its ſize abſolutely forbid the ſuppoſition. A ſemicircular bay, though the ſhape be beautiful, is not natural; and any rectilinear figure is abſo-

Section III. Water.

absolutely ugly: but if one line be curved, another may sometimes be almost straight: the contrast is agreeable; and to multiply the occasions of shewing contrasts, may often be a reason for giving several directions to a creek, and more than two sides to a promontory.

Bays, creeks, and promontories, though extremely beautiful, should not, however, be very numerous: for a shore broken into little points and hollows has no certainty of outline; it is only ragged, not diversified; and the distinctness and simplicity of the great parts are hurt by the multiplicity of subdivisions. But islands, though the channels between them be narrow, do not so often derogate from greatness: they intimate a space beyond them whose boundaries do not appear; and remove to a distance the shore which is seen in perspective between them. Such partial interruptions of the sight suggest ideas of extent to the imagination.

The inlets and the outlets of rivers have similar effects: fancy pursues the course of the stream far beyond the view; no limits are fixed to its excursions. The greatest composition therefore of water is that which is in part a lake, and in part a river; which has all the expanse of the one, and all the continuation of the other, each being strongly characterised to the very point of their junction. If that junction break into a side of the lake, the direction of the river should be oblique to the line it cuts; rectangular bisections are in this, as in all other instances, formal: but when the conflux is at an angle, so that the bank of the river coincides with one shore of the lake, they should both continue for some way in the same direction; a deviation from that line immediately at the outlet detaches the lake from the river.

32 Course of a river.

Though the windings of a river are proverbially descriptive of its course; yet without being perpetually wreathed, it may be natural. Nor is the character expressed only by the turnings. On the contrary, if they are too frequent and sudden, the current is reduced into a number of separate pools, and the idea of progress is obscured by the difficulty of tracing it. Length is the strongest symptom of continuation: long reaches are, therefore, characteristic of a river; and they conduce much to its beauty: each is a considerable piece of water; and variety of beautiful forms may be given to their outlines; but a straight one can very seldom be admitted: it has the appearance of a cut canal, unless great breadth, a bridge across it, and strong contrasts between the objects on the banks, disguise the formality. A very small curvature obliterates every idea of art and stagnation; and a greater is often mischievous: for an excess of deviation from a straight towards a circular line, shortens the view, weakens the idea of continuation, and tho' not chargeable with stiffness, yet approaches to regularity; whereas the line of beauty keeps at a distance from every figure which a rule can determine or a compass describe.

A considerable degree of roundness is, however, often becoming, where the stream changes its direction: and if the turn be effected by a sharp point of land on one side, there is the more occasion for circuity on the other. The river should also be widened under that other bank: for it is the nature of water thus driven out of its course, to dash and encroach upon the opposite shore. Where this circumstance has been attended to, the bend appears natural; and the view ending in space, gives scope to the imagination. The turn, therefore, ought generally to be larger than a right angle: if it be less, it closes immediately, and checks the idea of progress.

Section III. Water.

33 Of bridges.

To further that idea is one use of *bridges*. Though they cross, they do not close the view: the water is seen to run through them, and is supposed to continue far beyond them: such a communication between the opposite banks implies the want of any other, and gives both length and depth to the stream. The form of a lake, on the contrary, intimates, that all the several shores are, by making a certain circuit, accessible. Bridges, therefore, are inconsistent with the nature of a lake, but characteristic of a river: they are on that account used to disguise a termination: but the deception has been so often practised, that it no longer deceives; and a bolder aim at the same effect will now be more successful. If the end can be turned just out of sight, a bridge at some distance raises a belief, while the water beyond it removes every doubt, of the continuation of the river: the supposition immediately occurs, that if a disguise had been intended, the bridge would have been placed further back; and the disregard thus shewn to one deception, gains credit for the other.

To give to bridges their full effect, the connection between them and the river must be attended to: from the want of it, the single wooden arch, now much in fashion, seems to us generally misplaced. Elevated, without occasion, so much above, it is totally detached from, the river: it is often seen straddling in the air, without a glimpse of the water to account for it: and the ostentation of it as an ornamental object, diverts all that train of ideas which its use as a communication might suggest. The vastness of Walton bridge cannot without affectation be mimicked in a garden, where the magnificent idea of including the Thames under one arch is wanting, and where the structure itself reduced to a narrow scale retains no pretensions to greatness. Unless the situation make such a height necessary, or the point of view be greatly above it, or wood or rising ground instead of sky behind it, fill up the vacancy of the arch, it seems an effort without a cause, forced and preposterous.

The vulgar foot-bridge, of planks only, guarded on one hand by a common rail, and supported by a few ordinary piles, is often more proper. It is perfect as a communication, because it pretends to nothing further: it is the utmost simplicity of cultivated nature: and if the banks from which it starts be of a moderate height, its elevation preserves it from meanness. No other species so effectually characterises a river: it seems too plain for an ornament, too obscure for a disguise: it must be for use; it can be a passage only: it is therefore spoiled, if adorned; it is disfigured, if only painted of any other than a dusky colour.

But being thus incapable of all decoration and importance, it is often too humble for a great, and too simple for an elegant, scene. A stone bridge is generally more suitable to either: but in this also, an extraordinary elevation is seldom becoming, unless the grandeur compensate for the distance at which it leaves the water

Section III. Water.

water below. A gentle rise, and easy sweep, more closely preserve the relation: a certain degree of union should also be formed between the banks and the bridge; that it may seem to rise out of the banks, not barely to be imposed upon them. It ought not generally to swell much above their level; the parapet wall should be brought down near to the ground, or end against some swell; and the size and the uniformity of the abutments should be broken by hillocks or thickets about them: every expedient should be used to mark the connection of the building both with the ground from which it starts, and the water which it crosses.

In wild and romantic scenes may be introduced a ruined stone-bridge, of which some arches may be still standing, and the loss of those which are fallen may be supplied by a few planks, with a rail, thrown over the vacancy. It is a picturesque object; it suits the situation; and the antiquity of the passage, the care taken to keep it still open though the original building is decayed, the apparent necessity which thence results for a communication, give it an imposing air of reality.

In every scene of magnificence, in some where elegance chiefly prevails, a bridge with a colonnade, or other ornamental structure upon it, is characteristically proper, and it has a peculiarity which recommends it to many situations. The colonnade is alone a perfect independent object, which may belong to several species of buildings: it may, therefore, embellish a scene where no water is visible: but the sight must not be let down below the balustrade. If the arches appear, this is like other bridges shown by themselves: they may now and then be of use to mark a continuation of water, which would otherwise be doubtful; but in general they only remind us of what is wanting to the view.

In some situations, two or three bridges may be admitted into one scene; a collateral stream always, the turnings of the same stream often, afford opportunities to place them in several directions; and a greater distinction between objects is seldom required, than that between two bridges, in construction exactly alike, one of which presents the passage over it, and the other that under it, to the eye. Such a variety of beautiful forms have besides been invented for them, that, in similar positions, they may be objects in very different styles: and collateral circumstances occasion still further distinctions. A bridge, which, by means of a bend in the river, is backed with wood or rising grounds, has, in the effect, little similarity to one through which nothing can be seen but the water and the sky: and if the accident which distinguishes, immediately groupes with the bridge; if, for instance, a tree, or a little cluster of trees, stand so that the stems appear beneath, the heads above the arches; the whole is but one picturesque object, which retains no more than a distant resemblance to a bridge quite simple and unaccompanied. Amidst all this variety, two or three may easily be chosen, which, in the same landscape, so far from assimilating, will diversify the parts; and, if properly disposed, neither in a confused crowd nor in a formal succession, will not encumber the view.

A river requires a number of *accompaniments*. The changes in its course furnish a variety of situations; while the fertility, convenience, and amenity, which attend it, account for all appearances of inhabitants and improvement. Profusion of ornament on a fictitious river, is a just imitation of cultivated nature. Every species of building, every style of plantation, may abound on the banks; and whatever be their characters, their proximity to the water is commonly the happiest circumstance in their situation. A lustre is from thence diffused on all around; each derives an importance from its relation to this capital feature: those which are near enough to be reflected, immediately belong to it; those at a greater distance still share in the animation of the scene; and objects totally detached from each other, being all attracted towards the same interesting connexion, are united into one composition.

Section III. Water.

34 Accompaniments on the banks.

35 Description of the water at Blenheim.

In the front of Blenheim was a deep broad valley, which abruptly separated the castle from the lawn and the plantations before it; even a direct approach could not be made, without building a monstrous bridge over the vast hollow: but this forced communication was only a subject of raillery; and the scene continued broken into two parts, absolutely distinct from each other. This valley has been lately flooded: it is not filled; the bottom only is covered with water: the sides are still very high; but they are no longer the steeps of a chasm, they are the bold shores of a noble river. The same bridge is standing without alteration: but no extravagance remains; the water gives it propriety. Above it the river first appears, winding from behind a small thick wood, in the valley; and soon taking a determined course, it is then broad enough to admit an island filled with the finest trees: others, corresponding to them in growth and disposition, stand in groupes on the banks, intermixed with younger plantations. Immediately below the bridge, the river spreads into a large expanse: the sides are open lawn. On that furthest from the house formerly stood the palace of Henry the Second, celebrated in many an ancient ditty by the name of Fair Rosamond's Bower. A little clear spring, which rises there, is by the country people still called Fair Rosamond's Well. The spot is now marked by a single willow. Near it, is a fine collateral stream, of a beautiful form, retaining its breadth as far as it is seen, and retiring at last behind a hill from the view. The main river, having received this accession, makes a gentle bend; then continues for a considerable length in one wide direct reach; and, just as it disappears, throws itself down a high cascade, which is the present termination. On one of the banks of this reach is the garden: the steeps are there diversified with thickets and with glades; but the covert prevails, and the top is crowned with lofty trees. On the other side is a noble hanging wood in the park: it was depreciated when it sunk into a hollow, and was poorly lost in the bottom; but it is now a rich appendage to the river, falling down an easy slope quite to the water's edge, where, without overshadowing, it is reflected on the surface. Another face of the same wood borders the collateral stream, with an outline more indented and various; while a very large irregular clump adorns the opposite declivity. This clump is at a considerable distance from the principal river: but the stream is be-

Section III. Water.

belongs to, brings it down to connect with the reſt; and the other objects, which were before diſperſed, are now, by the intereſt of each in a relation which is common to all, collected into one illuſtrious ſcene. The caſtle is itſelf a prodigious pile of building; which, with all the faults in its architecture, will never ſeem leſs than a truly princely habitation; and the confined ſpot where it was placed, on the edge of an abyſs, is converted into a proud ſituation, commanding a beautiful proſpect of water, and open to an extenſive lawn, adequate to the manſion, and an emblem of its domain. In the midſt of this lawn ſtands a column, a ſtately trophy, recording the exploits of the Duke of Marlborough, and the gratitude of Britain. Between this pillar and the caſtle is the bridge, which now, applied to a ſubject worthy of it, is eſtabliſhed in all the importance due to its greatneſs. The middle arch is wider than the Rialto, but not too wide for the occaſion; and yet this is the narroweſt part of the river: but the length of the reaches is every where proportioned to their breadth: each of them is alone a noble piece of water: and the laſt, the fineſt of all, loſes itſelf gradually in a wood, which, on that ſide, is alſo the boundary of the lawn, and riſes into the horizon. All is great in the front of Blenheim: but in that vaſt ſpace no void appears; ſo important are the parts, ſo magnificent the objects. The plain is extenſive, the valley is broad, the wood is deep. Tho' the intervals between the buildings are large, they are filled with the grandeur which buildings of ſuch dimenſions and ſo much pomp diffuſe all around them; and the river, in its long varied courſe, approaching to every object, and touching upon every part, ſpreads its influence over the whole. Notwithſtanding their diſtances from each other, they all ſeem to be aſſembled about the water, which is every where a fine expanſe, whoſe extremities are undetermined. In ſize, in form, and in ſtyle, it is equal to the majeſty of the ſcene; and is deſigned in the ſpirit, is executed with the liberality, of the original donation, when this reſidence of a mighty monarch was beſtowed by a great people, as a munificent reward on the hero who had deſerved beſt of his country.

35 Of a river flowing through a wood.

In the compoſition of this ſcene, the river, both as a part itſelf, and as uniting the other parts, has a principal ſhare. But water is not loſt, though it be in ſo confined or ſo concealed a ſpot as to enter into no view; it may render that ſpot delightful. It is capable of the moſt exquiſite beauty in its form; and though not in ſpace, may yet in diſpoſition have pretenſions to greatneſs: for it may be divided into ſeveral branches, which will form a cluſter of iſlands all connected together, make the whole place irriguous, and, in the ſtead of extent, ſupply a quantity of water. Such a ſequeſtrated ſcene uſually owes its retirement to the trees and the thickets with which it abounds; but in the diſpoſition of them, one diſtinction ſhould be conſtantly attended to. A river flowing through a wood which overſpreads one continued ſurface of ground, and a river between two woods, are in very different circumſtances. In the latter caſe, the woods are ſeparate; they may be contraſted in their forms and their characters, and the outline of each ſhould be forcibly marked. In the former, no outline ought to be diſcernible; for the river paſſes between trees, not between boundaries: and though, in the progreſs of its courſe, the ſtyle of the plantations may be often changed, yet on the oppoſite banks a ſimilarity ſhould conſtantly prevail, that the identity of the wood may never be doubtful.

Section I. Water.

A river between two woods may enter into a view; and then it muſt be governed by the principles which regulate the conduct and the accompaniments of a river in an open expoſure. But, when it runs through a wood, it is never to be ſeen in proſpect: the place is naturally full of obſtructions; and a continued opening, large enough to receive a long reach, would ſeem an artificial cut. The river muſt therefore neceſſarily wind more than in croſſing a lawn, where the paſſage is entirely free: but its influence will never extend ſo far on the ſides: the buildings muſt be near the banks; and, if numerous, will ſeem crowded, being all in one track, and in ſituations nearly alike. The ſcene, however, does not want variety: on the contrary, none is capable of more. The objects are not indeed ſo different from each other as in an open view; but they are very different, and in much greater abundance: for this is the interior of a wood, where every tree is an object, every combination of trees a variety, and no large intervals are requiſite to diſtinguiſh the ſeveral diſpoſitions; the grove, the thicket, or the groupes, may prevail, and their forms and their relations may be conſtantly changed, without reſtraint of fancy, or limitation of number.

Water is ſo univerſally and ſo deſervedly admired in a proſpect, that the moſt obvious thought in the management of it, is to lay it as open as poſſible, and purpoſely to conceal it would generally ſeem a ſevere ſelf-denial: yet ſo many beauties may attend its paſſage through a wood, that larger portions of it might be allowed to ſuch retired ſcenes, than are commonly ſpared from the view, and the different parts in different ſtyles would be fine contraſts to each other. If the water at Wotton were all expoſed, a walk of near two miles along the banks would be of a tedious length, from the want of thoſe changes of the ſcene, which now ſupply through the whole extent a ſucceſſion of perpetual variety. That extent is ſo large as to admit of a diviſion into four principal parts, all of them great in ſtyle and in dimenſions, and differing from each other both in character and ſituation. The two firſt are the leaſt. The one is a reach of a river, about the third of a mile in length, and of a competent breadth, flowing through a lovely mead, open in ſome places to views of beautiful hills in the country, and adorned in others with clumps of trees, ſo large, that their branches ſtretch quite acroſs, and form a high arch over the water. The next ſeems to have been once a formal baſin, encompaſſed with plantations, and the appendages on either ſide ſtill retain ſome traces of regularity; but the ſhape of the water is free from them: the ſize is about 14 acres; and out of it iſſue two broad collateral ſtreams, winding towards a large river, which they are ſeen to approach, and ſuppoſed to join. A real junction is however impoſſible, from the difference of the levels; but the terminations are ſo artfully concealed, that the deception is never ſuſpected, and when known is not eaſily explained. The river is the third great diviſion of the water; a lake into which it falls, is the fourth. Theſe two do actually

36 Deſcription of the water at Wotton, (the ſeat of Mr Grenville) in the vale of Ayleſbury in Buckinghamſhire.

tually join: but their characters are directly oppo- site; the scenes they belong to are totally distinct; and the transition from the one to the other is very gradual: for an island near the conflux, dividing the breadth, and concealing the end of the lake, moderates for some way the space; and permitting it to expand but by degrees, raises an idea of greatness, from uncertainty accompanied with increase. The reality does not disappoint the expectation; and the island, which is the point of view, is itself equal to the scene: it is large, and high above the lake; the ground is irregularly broken; thickets hang on the sides; and towards the top is placed an Ionic portico, which commands a noble extent of water, not less than a mile in circumference, bounded on one side with wood, and open on the other to two sloping lawns, the least of an hundred acres, diversified with clumps, and bordered by plantations. Yet this lake, when full in view, and with all the importance which space, form, and situation can give, is not more interesting than the sequestered river, which has been mentioned as the third great division of the water. It is just within the verge of a wood, three quarters of a mile long, every where broad, and its course is such as to admit of infinite variety without any confusion. The banks are cleared of underwood; but a few thickets still remain, and on one side an impenetrable covert soon begins: the interval is a beautiful grove of oaks, scattered over a green sward of extraordinary verdure. Between these trees and these thickets the river seems to glide gently along, constantly winding, without one short turn, or one extended reach, in the whole length of the way. This even temper in the stream suits the scenes through which it passes; they are in general of a very sober cast; not melancholy, but grave; never exposed to a glare; never darkened with gloom; nor, by strong contrasts of light and shade, exhibiting the excess of either. Undisturbed by an extent of prospects without, or a multiplicity of objects within, they retain at all times a mildness of character; which is still more forcibly felt when the shadows grow faint as they lengthen, when a little rustling of birds in the spray, the leaping of the fish, and the fragrancy of the woodbine, denote the approach of evening; while the setting sun shoots its last gleams on a Tuscan portico, which is close to the great basin, but which from a seat near this river is seen at a distance, through all the obscurity of the wood glowing on the banks, and reflected on the surface of the water. In another still more distinguished spot is built an elegant bridge, with a colonnade upon it, which not only adorns the place where it stands, but is also a picturesque object to an octagon building near the lake, where it is shewn in a singular situation, over-arched, encompassed, and backed with wood, without any appearance of the water beneath. This building in return is also an object from the bridge; and a Chinese room, in a little island just by, is another: neither of them are considerable, and the others which are visible are at a distance, but more or greater adventitious ornaments are not required in a spot so rich as this in beauties peculiar to its character. A profusion of water pours in from all sides round upon the view; the opening of the lake appears; a glimpse is caught of the large basin; one of the collateral streams is full in sight, and the bridge itself is in the midst of the finest part of the river: all seem to communicate the one with the other. Though thickets often intercept, and groupes perplex, the view, yet they never break the connection between the several pieces of water: each may still be traced along large branches, or little catches; which in some places are over-shadowed and dim; in others glisten through a glade, or glimmer between the boles of trees in a distant perspective; and in one, where they are quite lost to the view, some arches of a stone-bridge, but partially seen among the wood, preserve their connection. However interrupted, however varied, they still appear to be parts of one whole, which has all the intricacy of number, and the greatness of unity; the variety of a stream, and the quantity of a lake; the solemnity of a wood, and the animation of water.

37
Of a rill and a rivulet.

If a large river may sometimes, a smaller current undoubtedly may often, be conducted through a wood: it seldom adorns, it frequently disfigures a prospect, where its course is marked, not by any appearance of water, but by a confused line of clotted grass, which disagrees with the general verdure. A rivulet may, indeed, have consideration enough for a home scene, though it be open; but a rill is always most agreeable when most retired from public view. Its characteristic excellencies are vivacity and variety, which require attention, leisure, and silence, that the eye may pore upon the little beauties, and the ear listen to the low murmurs of the stream without interruption. To such indulgence a confined spot only is favourable; a close copse is, therefore, often more acceptable than a high wood, and a sequestered valley at all times preferable to any open expositure: a single rill at a very little distance is a mere water-course; it loses all its charms; it has no importance in itself, and bears no proportion to the scene. A number of little streams have, indeed, an effect in any situation, but not as objects; they are interesting only on account of the character they express, the irriguous appearance which they give to the whole.

The full tide of a large river has more force than activity, and seems too unwieldy to allow of very quick transitions. But in a rill, the agility of its motion accounts for every caprice: frequent windings disguise its insignificance: short turnings shew its vivacity: sudden changes in the breadth are a species of its variety: and however fantastically the channel may be wreathed, contracted, and widened, it still appears to be natural. We find an amusement in tracing the little stream through all the intricacies of its course, and in seeing it force a passage through a narrow streight, expatiate on every opportunity, struggle with obstructions, and puzzle out its way. A rivulet, which is the mean betwixt a river and a rill, partakes of the character of both: it is not licensed to the extravagance of the one, nor under the same restraints as the other: it may have more frequent bends than the river; longer reaches than a rill: the breadth of a stream determines whether the principal beauty results from extent or from variety.

The murmurs of a rill are amongst the most pleasing circumstances which attend it. If the bed of the stream be rough, mere declivity will occasion a constant ripling noise: when the current drops down a de-

Section III. WATER.

descent, though but of a few inches, or forcibly bubbles up from a little hollow, it has a deep gurgling tone, not uniformly continued, but inceſſantly repeated, and therefore more engaging than any. The flatteſt of all, is that found rather of the ſplaſhing than the fall of water, which an even gentle ſlope, or a tame obſtruction, will produce: this is leſs pleaſing than the others; but none ſhould be entirely excluded: all in their turns are agreeable; and the choice of them is much in our power: by obſerving their cauſes, we may often find the means to ſtrengthen, to weaken, or to change them; and the addition or removal of a ſingle ſtone, or a few pebbles, will ſometimes be ſufficient for the purpoſe.

38 Of caſcades.

A rill cannot pretend to any ſound beyond that of a little water-fall: the roar of a caſcade belongs only to larger ſtreams; but it may be produced by a rivulet to a conſiderable degree, and attempts to do more have generally been unſucceſsful. A vain ambition to imitate nature in her great extravagancies betrays the weakneſs of art. Though a noble river, throwing itſelf headlong down a precipice, be an object truly magnificent, it muſt however be confeſſed, that in a ſingle ſheet of water there is a formality, which its vaſtneſs alone can cure; but the heighth, not the breadth, is the wonder: when it falls no more than a few feet, the regularity prevails; and its extent only ſerves to expoſe the vanity of affecting the ſtyle of a cataract in an artificial caſcade. It is leſs exceptionable if divided into ſeveral parts: for then each ſeparate part may be wide enough for its depth; and in the whole, variety, not greatneſs, will be the predominant character. But a ſtructure of rough, large, detached ſtones, cannot eaſily be contrived of ſtrength ſufficient to ſupport a great weight of water: it is ſometimes from neceſſity almoſt ſmooth and uniform; and then it loſes much of its effect: ſeveral little falls in ſucceſſion are preferable to one great caſcade which in figure or in motion approaches to regularity.

When greatneſs is thus reduced to number, and length becomes of more importance than breadth, a rivulet vies with a river; and it more frequently runs in a continued declivity, which is very favourable to ſuch a ſucceſſion of falls. Half the expence and labour which are ſometimes beſtowed on a river, to give it, at the beſt, a forced precipitancy, in one ſpot only, would animate a rivulet through the whole of its courſe: and, after all, the moſt intereſting circumſtance in falling waters is their animation. A great caſcade fills us with ſurpriſe: but all ſurpriſe muſt ceaſe; and the motion, the agitation, the rage, the froth, and the variety of the water, are finally the objects which engage the attention: for theſe a rivulet is ſufficient; and they may there be produced without that appearance of effort which raiſes a ſuſpicion of art.

To obviate ſuch a ſuſpicion, it may be ſometimes expedient to begin the deſcent out of ſight; for the beginning is the difficulty: if that be concealed, the ſubſequent falls ſeem but a conſequence of the agitation which characteriſes the water at its firſt appearance; and the imagination is, at the ſame time, let looſe to give ideal extent to the caſcades. When a ſtream iſſues from a wood, ſuch management will have a great effect: the bends of its courſe in an open expoſure may afford frequent opportunities for it; and ſometimes a low broad bridge may furniſh the occaſion: a little fall hid under the arch will create a diſorder; in conſequence of which, a greater caſcade below will appear very natural.

Section IV. ROCKS.

SECT. IV. *Of Rocks.*

39 Of the accompaniments of rocks.

RILLS, rivulets, and caſcades, abound among rocks: they are natural to the ſcene; and ſuch ſcenes commonly require every *accompaniment* which can be procured for them. Mere rocks, unleſs they are peculiarly adapted to certain impreſſions, may ſurpriſe, but can hardly pleaſe: they are too far removed from common life, too barren, and unhoſpitable; rather deſolate than ſolitary, and more horrid than terrible. So auſtere a character cannot be long engaging, if its rigour be not ſoftened by circumſtances which may belong either to theſe or to more cultivated ſpots: and when the drearineſs is extreme, little ſtreams and water-falls are of themſelves inſufficient for the purpoſe; an intermixture of vegetation is alſo neceſſary, and on ſome occaſions even marks of inhabitants are proper.

40 Deſcription of Middleton-dale, (near Chatſworth.)

Middleton-dale is a cleft between rocks, aſcending gradually from a romantic village, till it emerges, at about two miles diſtance, on the vaſt moor-lands of the Peake. It is a diſmal entrance to a deſart: the hills above it are bare; the rocks are of a grey colour; their ſurfaces are rugged, and their ſhapes ſavage; frequently terminating in craggy points, ſometimes reſembling vaſt unwieldy bulwarks, or riſing in heavy buttreſſes one above another; and here and there a miſhappen maſs bulging out hangs lowering over its baſe. No traces of men are to be ſeen, except in a road which has no effect on ſuch a ſcene of deſolation, and in the lime-kilns conſtantly ſmoking on the ſide; but the labourers who occaſionally attend them live at a diſtance; there is not a hovel in the dale; and ſome ſcanty withering buſhes are all its vegetation: for the ſoil between the rocks produces as little as they do; it is diſfigured with all the tinges of brown and red, which denote barrenneſs; in ſome places it has crumbled away, and ſtrata of looſe dark ſtones only appear; and in others, long lines of droſs and rubbiſh ſhoveled out of mines, have fallen down the ſteeps. In theſe mines, the veins of lead on one ſide of the dale, are obſerved always to have correſponding veins, in exactly the ſame direction, on the other: and the rocks, though differing widely in different places, yet always continue in one ſtyle for ſome way together, and ſeem to have a relation to each other. Both theſe appearances make it probable, that Middleton-dale is a chaſm rent in the mountain by ſome convulſion of nature, beyond the memory of man, or perhaps before the iſland was peopled: the ſcene, though it does not prove the fact, yet juſtifies the ſuppoſition; and it gives credit to the tales of the country people, who, to aggravate its horrors, always point to a precipice, down which they ſay that a poor girl of the village threw herſelf headlong, in deſpair, at the neglect of the man whom ſhe loved; and ſhew a cavern, where a ſkeleton was once diſcovered, but of what wretch is unknown, his bones were the only memorial left of him. All the drearineſs however of the place, which accords ſo well with ſuch traditions, abates upon the junction of another valley, the ſides of which are ſtill of rock, but mixed and crowned with fine wood; and Middleton-dale becomes

more

Section IV. Rocks.

more mild by ſharing in its beauties: near this junction a clear ſtream iſſues from under the hill, and runs down the dale, receiving as it proceeds many rills and ſprings, all as tranſparent as itſelf. The principal rivulet is full of little water-falls: they are ſometimes continued in ſucceſſion along a reach of conſiderable length, which is whitened with froth all the way; at other times the brook wreathes in frequent windings, and drops down a ſtep at every turn; or ſlopes between tufts of graſs, in a briſk, though not a precipitant deſcent; when it is moſt quiet, a thouſand dimples ſtill mark its vivacity; it is every where active, ſometimes rapid, ſeldom ſilent, but never furious or noiſy: the firſt impreſſions which it makes are of ſprightlineſs and gaiety, very different from thoſe which belong to the ſcene all around; but by dwelling upon both, they are brought nearer together; and a melancholy thought occurs, that ſuch a ſtream ſhould be loſt in watering a waſte; the wildneſs appears more forlorn which ſo much vivacity cannot enliven; as the idea of deſolation is heightened by reflecting that the

> Flower is born to bluſh unſeen,
> And waſte its ſweetneſs on the deſart air;

and that

> The nightingale attunes her notes,
> Where none are left to hear.

If ſuch a ſcene occurs within the precincts of a park or a garden, no expence ſhould be ſpared to meliorate the ſoil, wherever any ſoil can be found. Without ſome vegetation among the rocks, they are only an object of curioſity, or a ſubject of wonder: but verdure alone will give ſome relief to the drearineſs of the ſcene; and ſhrubs or buſhes, without trees, are a ſufficiency of wood: the thickets may alſo be extended by the creeping plants, ſuch as pyracantha, vines, and ivy, to wind up the ſides, or cluſter on the tops of the rocks. And to this vegetation may be added ſome ſymptoms of inhabitants, but they muſt be ſlight and few: the uſe of them is only to cheer, not to deſtroy, the ſolitude of the place; and ſuch therefore ſhould be choſen as are ſometimes found in ſituations retired from public reſort; a cottage may be lonely, but it muſt not here ſeem ruinous and neglected; it ſhould be tight and warm, with every mark of comfort about it, to which its poſition in ſome ſheltered receſs may greatly contribute. A cavity alſo in the rocks, rendered eaſy of acceſs, improved to a degree of convenience, and maintained in a certain ſtate of preſervation, will ſuggeſt ſimilar ideas of protection from the bitterest inclemencies of the ſky, and even of occaſional refreſhment and repoſe. But we may venture ſtill further: a mill is of neceſſity often built at ſome diſtance from the town which it ſupplies; and here it would at the ſame time apply the water to a uſe, and increaſe its agitation. The dale may beſides be made the haunt of thoſe animals, ſuch as goats, which are ſometimes wild, and ſometimes domeſtic; and which accidentally appearing, will divert the mind from the ſenſations, natural to the ſcene, but not agreeable if continued long without interruption. Theſe and ſuch other expedients will approximate the ſevereſt retreat to the habitations of men, and convert the appearance of a perpetual baniſhment into that of a temporary retirement from ſociety.

But too ſtrong a force on the nature of the place always fails. A winding-path, which appears to be worn, not cut, has more effect than a high road, all artificial and level, which is too weak to overbear, and yet contradicts, the general idea. The objects therefore to be introduced muſt be thoſe which hold a mean between ſolitude and population; and the inclination of that choice towards either extreme, ſhould be directed by the degree of wildneſs which prevails: for tho' that runs ſometimes to an exceſs which requires correction, at other times it wants encouragement, and at all times it ought to be preſerved: it is the predominant character of rocks, which mixes with every other, and to which all the appendages muſt be accommodated; and they may be applied ſo as greatly to increaſe it: a licentious irregularity of wood and of ground, and a fantaſtic conduct of the ſtreams, neither of which would be tolerated in the midſt of cultivation, become and improve romantic ſpots; even buildings, partly by their ſtyle, but ſtill more by their poſition, in ſtrange, difficult, or dangerous ſituations, diſtinguiſh and aggravate the native extravagancies of the ſcene.

Section IV. Rocks.

In the choice and the application of theſe accompaniments, conſiſts all our power over rocks; they are themſelves too vaſt and too ſtubborn to ſubmit to our controul; but by the addition or removal of appendages, which we can command, parts may be ſhewn or concealed, and the characters with their impreſſions may be weakened or enforced: to adapt the accompaniments accordingly, is the utmoſt ambition of art when rocks are the ſubject.

Their moſt diſtinguiſhed characters are, *dignity*, *terror*, and *fancy*: the expreſſions of all are conſtantly wild: and ſometimes a rocky ſcene is only wild, without pretenſions to any particular character.

41 Of rocks characteriſed by dignity.

That which inſpires ideas of greatneſs, as diſtinguiſhed from thoſe of terror, has leſs wildneſs in it than any. There is a compoſure in dignity, which is diſconcerted by quick tranſitions and the flutter of variety. A ſucceſſion, therefore, of nearly the ſame forms, a repetition of them one above the other, do not derogate from an effect, which depends more on the extent than the changes of the ſcene: the dimenſions which are neceſſary to produce that effect, contract the room for variety; the parts muſt be large: if the rocks are only high, they are but ſtupendous, not majeſtic; breadth is equally eſſential to their greatneſs; and every ſlender, every groteſque ſhape, is excluded.

Art may interpoſe to ſhew theſe large parts to the eye, and magnify them to the imagination, by taking away thickets which ſtretch quite acroſs the rocks, ſo as to diſguiſe their dimenſions; or by filling with wood the ſmall intervals between them, and thus, by concealing the want, preſerving the appearance of continuation.

When rocks retire from the eye down a gradual declivity, we can, by raiſing the upper ground, deepen the fall, lengthen the perſpective, and give both height and extent to thoſe at a diſtance: this effect may be ſtill increaſed by covering that upper ground with a thicket, which ſhall ceaſe, or be lowered, as it deſcends.

A thicket, on other occaſions, makes the rocks which riſe out of it ſeem larger than they are. If they ſtand upon a bank overſpread with ſhrubs, their beginning is at the leaſt uncertain; and the preſumption is,

Section IV. Rocks.

that they ſtart from the bottom.

Another uſe of this bruſhy underwood is to conceal the fragments and rubbiſh which have fallen from the ſides and the brow, and which are often unſightly. Rocks are ſeldom remarkable for the elegance of their forms; they are too vaſt, and too rude, to pretend to delicacy: but their ſhapes are often agreeable; and we can affect thoſe ſhapes to a certain degree, at leaſt we can cover many blemiſhes in them, by conducting the growth of ſhrubby and creeping plants about them.

For all theſe purpoſes mere underwood ſuffices: but for greater effects larger trees are requiſite: they are worthy of the ſcene; and not only improvements, but acceſſions to its grandeur: we are uſed to rank them among the nobleſt objects of nature; and when we ſee that they cannot aſpire to the midway of the heights around them, the rocks are raiſed by the compariſon. A ſingle tree is, therefore, often preferable to a clump: the ſize, though really leſs, is more remarkable: and clumps are beſides generally exceptionable in a very wild ſpot, from the ſuſpicion of art which attends them; but a wood is free from that ſuſpicion, and its own character of greatneſs recommends it to every ſcene of magnificence.

On the ſame principle, all the conſideration which can be, ſhould be given to the ſtreams. No number of little rills are equal to one broad river; and in the principal current, ſome varieties may be ſacrificed to importance: but a degree of ſtrength ſhould always be preſerved: the water, though it needs not be furious, ſhould not be dull; for dignity, when moſt ſerene, is not languid; and ſpace will hardly atone for want of animation.

The character, however, of greatneſs, when diveſted of terror, is placid. It does not, therefore, exclude marks of inhabitants, though it never requires them to tame its wildneſs: and without inviting, it occaſionally admits an intermixture of vegetation. It even allows of buildings intended only to decorate the ſcene: but they muſt be adequate to it, both in ſize and in character. And if cultivation is introduced, that too ſhould be conformable to the reſt: not a ſingle narrow patch cribbed out of the waſte; but the confines of a country ſhelving into the vale, and ſuggeſting the idea of extent: nothing trivial ought to find admittance. But, on the other hand, the character is not violated by a mixture of agreeableneſs with its grandeur; and far leſs is extravagance required to ſupport it: ſtrange ſhapes in extraordinary poſitions, enormous weights unaccountably ſuſtained, trees rooted in the ſides, and torrents raging at the foot of the rocks, are, at the beſt, needleſs exceſſes. There is a temperance in dignity, which is rather hurt by a wanton violence on the common order of nature. Great objects alone, great in their dimenſions and in their ſtyle, are amply ſufficient to ſatisfy and to fill the mind: when theſe fail, then, and then only, we are apt to have recourſe to wonder, in order to excite admiration.

42 Deſcription of Matlock Bath, (in Derbyſhire.)

Many of the circumſtances which have been mentioned concur at Matlock Bath, which is ſituated in a vale near three miles long, ſhut up at one end by a riſing moor, and at the other end by vaſt cliffs of rock: the entrance into it is hewn through one of them, and is indeed a noble rude portal to a ſcene of romantic magnificence. One ſide of the valley is a very high range of hill, rough with buſhes, and great blocks or ledges of ſtone. The other ſide is waſhed by the Derwent, and conſiſts chiefly of rocks; which, however, are often interrupted by ſteep declivities of green ſward, large thickets, and gentle deſcents of fine fields from the adjacent country. The rocks ſometimes form the brow, ſometimes they fix the foot, and ſometimes they break the ſides, of the hill. At the high Tor they are 123 yards above the water: in other places they are no more than an abrupt bank of a few feet to the river: for the moſt part they are nearly perpendicular, falling in ſeveral ſtages, or in one vaſt precipice, from the top to the bottom. But though ſimilar in ſhape, they are widely different in their conſtruction: in one place they are irregularly jointed, in another more uniformly ribbed, in a third they form a continued ſurface from the ſummit to the baſe, and frequently they are compoſed of enormous maſſes of ſtone heaped upon each other. From ſome ſuch ſcene probably was conceived the wild imagination in ancient mythology of the giants piling Pelion upon Oſſa: in this, all is vaſt; height, breadth, ſolidity, boldneſs of idea, and unity of ſtyle, combine to form a character of greatneſs, conſiſtent throughout, not uniform, unmixed with any littleneſs, unallayed with any extravagance. The colour of the rocks is almoſt white; and their ſplendour is enhanced in many places by ivy and ſingle yew-trees appearing amongſt them: the intervals between them are generally filled with a bruſhy underwood, which diverſifies and embelliſhes the ſcene very beautifully, but for want of large trees adds nothing to its grandeur; there are few of any note through out the vale: the beſt are in a ſmall wood near the bath; but they are not adequate to the objects around them, to the ſteeps of the hill, the loftineſs of the rocks, and the character of the Derwent. That character is, indeed, rather too ſtrong for the place: in ſize, and in the direction of its courſe, the river is exactly ſuch as might be wiſhed; but it is a torrent, in which force and fury prevail: the caſcades in it are innumerable; before the water is recovered from one fall, it is hurried down another; and its agitation being thus increaſed by repeated ſhocks, it puſhes on with reſtleſs violence to the next, where it daſhes againſt fragments of rocks, or foams among heaps of ſtones which the ſtream has driven together. The colour all along is of a reddiſh brown; even the foam is tinged with a duſky hue: and where there are no caſcades, ſtill the declivity of the bed preſerves the rapidity, and a quantity of little breakers continue the turbulence of the current. Many of theſe circumſtances are certainly great: but a more temperate river, rolling its full tide along with ſtrength and activity, without rage; falling down one noble caſcade, inſtead of many; and if animated ſometimes by reſiſtance, yet not conſtantly ſtruggling with obſtructions; would have been more conſiſtent with the ſedate ſteady dignity of theſe noble piles of rock, whoſe brightneſs, together with the verdure of a vigorous and luxuriant, though humble vegetation, and ſome appearances of culture, give to the whole an air of cheerful ſerenity, which is diſturbed by the impetuoſity of the Derwent.

43 Of rocks characteriſed by terror.

This river would be better ſuited to a ſcene characteriſed by that terror, which the combination of greatneſs with force inſpires, and which is animating and in-

Section IV. Rocks.

intereſting, from the exertion and anxiety attending it. The terrors of a ſcene in nature are like thoſe of a dramatic repreſentation: they give an alarm; but the ſenſations are agreeable, ſo long as they are kept to ſuch as are allied only to terror, unmixed with any that are horrible and diſguſting. Art may therefore be uſed to heighten them, to diſplay the objects which are diſtinguiſhed by greatneſs, to improve the circumſtances which denote force, to mark thoſe which intimate danger, and to blend with all here and there a caſt of melancholy.

Greatneſs is as eſſential to the character of terror as to that of dignity: vaſt efforts in little objects are but ridiculous; nor can force be ſuppoſed upon trifles incapable of reſiſtance. On the other hand, it muſt be allowed, that exertion and violence ſupply ſome want of ſpace. A rock wonderfully ſupported, or threatening to fall, acquires a greatneſs from its ſituation, which it has not in dimenſions; ſo circumſtanced, the ſize appears to be monſtrous: a torrent has a conſequence which a placid river of equal breadth cannot pretend to: and a tree, which would be inconſiderable in the natural ſoil, becomes important when it burſts forth from a rock.

Such circumſtances ſhould be always induſtriouſly ſought for; it may be worth while to cut down ſeveral trees, in order to exhibit one apparently rooted in the ſtone. By the removal perhaps of only a little bruſh-wood, the alarming diſpoſition of a rock, ſtrangely undermined, rivetted, or ſuſpended, may be ſhewn; and if there be any ſoil above its brow, ſome trees planted there, and impending over it, will make the object ſtill more extraordinary. As to the ſtreams, great alterations may generally be made in them: and therefore it is of uſe to aſcertain the ſpecies proper to each ſcene, becauſe it is in our power to enlarge or contract their dimenſions; to accelerate or retard their rapidity; to form, increaſe, or take away obſtructions; and always to improve, often to change, their characters.

Inhabitants furniſh frequent opportunities to ſtrengthen the appearances of force, by giving intimations of danger. A houſe placed at the edge of a precipice, any building on the pinnacle of a crag, makes that ſituation ſeem formidable, which might otherwiſe have been unnoticed: a ſteep, in itſelf not very remarkable, becomes alarming, when a path is carried aſlant up the ſide: a rail on the brow of a perpendicular fall, ſhews that the height is frequented and dangerous: and a common foot-bridge thrown over a cleft between rocks has a ſtill ſtronger effect. In all theſe inſtances, the imagination immediately tranſports the ſpectator to the ſpot, and ſuggeſts the idea of looking down ſuch a depth: in the laſt, that depth is a chaſm, and the ſituation is directly over it.

In other inſtances, exertion and danger ſeem to attend the occupations of the inhabitants:

> ——Half way down
> Hangs one that gathers ſamphire; dreadful trade!

is a circumſtance choſen by the great maſter of nature, to aggravate the terrors of the ſcene he deſcribes. Mines are frequent in rocky places: and they are full of ideas ſuited to ſuch occaſions. To theſe may ſometimes be added the operations of engines: for machinery, eſpecially when its powers are ſtupendous or its effects formidable, is an effort of art which may be accommodated to the extravagancies of nature.

A ſcene at the New Weir on the Wye, which in itſelf is truly great and awful, ſo far from being diſturbed, becomes more intereſting and important, by the buſineſs to which it is deſtined. It is a chaſm between two high ranges of hill, which riſe almoſt perpendicularly from the water; the rocks on the ſides are moſtly maſſes, and their colour is generally brown: but here and there a pale craggy ſhape ſtarts up to a vaſt height above the reſt, unconnected, broken, and bare: large trees frequently force out their way amongſt them: and many of them ſtand far back in the covert, where their natural duſky hue is deepened by the ſhadow which overhangs them. The river too, as it retires, loſes itſelf in woods, which cloſe immediately above, then riſe thick and high, and darken the water. In the midſt of all this gloom is an iron forge, covered with a black cloud of ſmoke, and ſurrounded with half-burned ore, with coal, and with cinders: the fuel for it is brought down a path, worn into ſteps narrow and ſteep, and winding among precipices: and near it is an open ſpace of barren moor, about which are ſcattered the huts of the workmen. It ſtands cloſe to the caſcade of the Weir; where the agitation of the current is increaſed by large fragments of rocks, which have been ſwept down by floods from the banks, or ſhivered by tempeſts from the brow: and the ſullen ſound, at ſtated intervals, from the ſtrokes of the great hammers in the forge, deadens the roar of the waterfall. Juſt below it, while the rapidity of the ſtream ſtill continues, a ferry is carried acroſs it: and lower down the fiſhermen uſe little round boats, called *truckles*, the remains, perhaps, of the ancient Britiſh navigation, which the leaſt motion will overſet, and the ſlighteſt touch may deſtroy. All the employments of the people ſeem to require either exertion or caution: and the ideas of force or of danger which attend them, give to the ſcene an animation unknown in a ſolitary, though perfectly compatible with the wildeſt romantic ſituations.

But marks of inhabitants muſt not be carried to the length of cultivation, which is too mild for the ruggedneſs of the place, and has beſides an air of cheerfulneſs inconſiſtent with the character of terror: a little inclination towards melancholy is generally acceptable, at leaſt to the excluſion of all gaiety; and beyond that point, ſo far as to throw juſt a tinge of gloom upon the ſcene. For this purpoſe, the objects whoſe colour is obſcure ſhould be preferred; and thoſe which are too bright may be thrown into ſhadow: the wood may be thickened, and the dark greens abound in it: if it is neceſſarily thin, yews and ſhabby firs ſhould be ſcattered about it: and ſometimes to ſhew a withering or a dead tree, it may for a ſpace be cleared entirely away. All ſuch circumſtances are acquiſitions, if they can be had without detriment to the principal character: for it muſt ever be remembered, that where terror prevails, melancholy is but a ſecondary conſideration.

Section IV. Rocks.

44 Deſcription of a ſcene near a place called Symond's Gate, between Roſs and Monmouth.

45 Of rocks characteriſed by fancy.

The different ſpecies of rocks often meet in the ſame place, and compoſe a noble ſcene, which is not diſtinguiſhed by any particular character: it is only when one eminently prevails, that it deſerves ſuch a preference as to exclude every other. Sometimes a ſpot, remarkable for nothing but its wildneſs, is highly romantic: and when this wildneſs riſes to fancy, when the

Section IV. Rocks.

the moſt ſingular, the moſt oppoſite forms and combinations are thrown together, then a mixture alſo of ſeveral characters adds to the number of inſtances which there concur to diſplay the inexhauſtible variety of nature.

46 Deſcription of Dovedale, (near Aſhbourne in Derbyſhire.)

So much variety, ſo much fancy, are ſeldom found within the ſame extent as in Dovedale. It is about two miles in length, a deep, narrow, hollow valley: both the ſides are of rock; and the Dove in its paſſage between them is perpetually changing its courſe, its motion, and appearance. It is never leſs than ten, nor ſo much as twenty yards wide, and generally about four feet deep; but tranſparent to the bottom, except when it is covered with a foam of the pureſt white, under water-falls which are perfectly lucid. Theſe are very numerous, but very different. In ſome places they ſtretch ſtraight acroſs, or aſlant the ſtream: in others, they are only partial; and the water either daſhes againſt the ſtones, and leaps over them, or, pouring along a ſteep, rebounds upon thoſe below; ſometimes it ruſhes through the ſeveral openings between them; ſometimes it drops gently down; and at other times it is driven back by the obſtruction, and turns into an eddy. In one particular ſpot, the valley almoſt cloſing, leaves hardly a paſſage for the river, which pent up, and ſtruggling for a vent, rages and roars and foams, till it has extricated itſelf from the confinement. In other parts, the ſtream, though never languid, is often gentle; flows round a little deſart iſland, glides between bits of bulruſhes, diſperſes itſelf among tufts of graſs or moſs, bubbles about a water-dock, or plays with the ſlender threads of aquatic plants which float upon the ſurface. The rocks all along the dale vary as often in their ſtructure, as the ſtream in its motion. In one place, an extended ſurface gradually diminiſhes from a broad baſe almoſt to an edge; in another, a heavy top hanging forwards, overſhadows all beneath: ſometimes many different ſhapes are confuſedly tumbled together; and ſometimes they are broken into ſlender ſharp pinnacles, which riſe upright, often two or three together, and often in more numerous cluſters. On this ſide of the dale, they are univerſally bare; on the other, they are intermixed with wood; and the vaſt height of both the ſides, with the narrowneſs of the interval between them, produces a further variety: for whenever the ſun ſhines from behind the one, the form of it is diſtinctly and completely caſt upon the other; the rugged ſurface on which it falls diverſifies the tints; and a ſtrong reflected light often glares on the edge of the deepeſt ſhadow. The rocks never continue long in the ſame figure or ſituation, and are very much ſeparated from each other: ſometimes they form the ſides of the valley, in precipices, in ſteeps, or in ſtages; ſometimes they ſeem to riſe in the bottom, and lean back againſt the hill; and ſometimes they ſtand out quite detached, heaving up in cumbrous piles, or ſtarting into conical ſhapes, like vaſt ſpars, an 100 feet high; ſome are firm and ſolid throughout, ſome are cracked, and ſome, ſplit and undermined, are wonderfully upheld by fragments apparently unequal to the weight they ſuſtain. One is placed before, one over another, and one fills, at ſome diſtance behind, an interval between two. The changes in their diſpoſition are infinite; every ſtep produces ſome new combination; they are continually croſſing, advancing, and retiring: the breadth of the valley is never the ſame 40 yards together: at the narrow paſs which has been mentioned, the rocks almoſt meet at the top, and the ſky is ſeen as through a chink between them: juſt by this gloomy abyſs, is a wider opening, more light, more verdure, more cheerfulneſs, than any where elſe in the dale. Nor are the forms and the ſituations of the rocks their only variety: many of them are perforated by large natural cavities, ſome of which open to the ſky, ſome terminate in dark receſſes, and through ſome are to be ſeen ſeveral more uncouth arches, and rude pillars, all detached, and retiring beyond each other, with the light ſhining in between them, till a rock far behind them cloſes the perſpective: the noiſe of the caſcades in the river echoes amongſt them; the water may often be heard at the ſame time gurgling near, and roaring at a diſtance; but no other ſounds diſturb the ſilence of the ſpot: the only trace of men is a blind path, but lightly and but ſeldom trodden, by thoſe whom curioſity leads to ſee the wonders they have been told of Dovedale. It ſeems, indeed, a fitter haunt for more ideal beings: the whole has the air of enchantment. The perpetual ſhifting of the ſcenes; the quick tranſitions, the total changes; then the forms all around, groteſque as chance can caſt, wild as nature can produce, and various as imagination can invent; the force which ſeems to have been exerted to place ſome of the rocks where they are now fixed immoveable, the magic by which others appear ſtill to be ſuſpended; the dark caverns, the illuminated receſſes, the fleeting ſhadows, and the gleams of light glancing on the ſides, or trembling on the ſtream; and the lonelineſs and the ſtillneſs of the place, all crowding together on the mind, almoſt realize the ideas which naturally preſent themſelves in this region of romance and of fancy.

The ſolitude of ſuch a ſcene is agreeable, on account of the endleſs entertainment which its variety affords, and in the contemplation of which both the eye and the mind are delighted to indulge: marks of inhabitants and cultivation would diſturb that ſolitude; and ornamental buildings are too artificial in a place ſo abſolutely free from reſtraint. The only accompaniments proper for it are wood and water; and by theſe ſometimes improvements may be made. When two rocks ſimilar in ſhape and poſition are near together, by ſkirting one of them with wood, while the other is left bare, a material diſtinction is eſtabliſhed between them: if the ſtreams be throughout of one character, it is in our power, and ſhould be our aim, to introduce another. Variety is the peculiar property of the ſpot, and every acceſſion to it is a valuable acquiſition. On the ſame principle, endeavours ſhould be uſed, not only to multiply, but to aggravate differences, and to increaſe diſtinctions into contraſts: but the ſubject will impoſe a caution againſt attempting too much. Art muſt almoſt deſpair of improving a ſcene, where nature ſeems to have exerted her invention.

Sect. V. *Of Buildings.*

47 Of the uſes of buildings.

Buildings are the very reverſe of rocks. They are abſolutely in our power, both the ſpecies and the ſituation; and hence ariſes the exceſs in which they often

Section V. Buildings.

often abound. The desire of doing something, is stronger than the fear of doing too much: these may always be procured by expence, and bought by those who know not how to choose; who consider profusion as ornament, and confound by number instead of distinguishing by variety.

Buildings probably were first introduced into gardens merely for convenience, to afford refuge from a sudden shower, and shelter against the wind; or, at the most, to be seats for a party; or for retirement. They have since been converted into objects, and now the original *use* is too often forgotten in the greater purposes to which they are applied: they are considered as objects only; the inside is totally neglected, and a pompous edifice frequently wants a room barely comfortable. Sometimes the pride of making a lavish display to a visitor, without any regard to the owner's enjoyments, and sometimes too scrupulous an attention to the style of the structure, occasions a poverty and dulness within, which deprives the buildings of part of their utility. But in a garden they ought to be considered both as beautiful objects, and as agreeable retreats: if a character becomes them, it is that of the scene they belong to; not that of their primitive application. A Grecian temple or Gothic church, may adorn spots where it would be affectation to preserve that solemnity within, which is proper for places of devotion: they are not to be exact models, subjects only of curiosity or study; they are also seats: and such seats will be little frequented by the proprietor; his mind must generally be indisposed to so much simplicity, and so much gloom, in the midst of gaiety, richness, and variety.

But though the interior of buildings should not be disregarded, it is by their exterior that they become *objects*; and sometimes by the one, sometimes by the other, and sometimes by both, they are entitled to be considered as *characters*.

48 Of those intended for objects.

As objects, they are designed either to *distinguish*, or to *break*, or to *adorn*, the scenes to which they are applied.

The differences between one wood, one lawn, one piece of water, and another, are not always very apparent; the several parts of a garden would, therefore, often seem similar, if they were not distinguished by buildings: but these are so observable, so obvious at a glance, so easily retained in the memory, they mark the spots where they are placed with so much strength, they attract the relation of all around with so much power, that parts thus distinguished can never be confounded together. Yet it by no means follows, that therefore every scene must have its edifice: the want of one is sometimes a variety; and other circumstances are often sufficiently characteristic: it is only when these too nearly agree, that we must have recourse to buildings for differences: we can introduce, exhibit, or contrast them as we please: the most striking object is thereby made a mark of distinction; and the force of this first impression prevents our observing the points of resemblance.

The uniformity of a view may be broken by similar means, and on the same principle: when a wide heath, a dreary moor, or a continued plain, is in prospect, objects which catch the eye supply the want of variety: none are so effectual for this purpose as buildings. Plantations or water can have no very sensible effect, unless they are large or numerous, and almost change the character of the scene: but a small single building diverts the attention at once from the sameness of the extent; which it breaks, but does not divide; and diversifies, without altering, its nature. The design, however, must not be apparent. The merit of a cottage applied to this purpose, consists in its being free from the suspicion; and a few trees near it will both enlarge the object, and account for its position. Ruins are a hackneyed device immediately detected, unless their style be singular, or their dimensions extraordinary. The semblance of an ancient British monument might be adapted to the same end, with little trouble, and great success. The materials might be brick, or even timber plastered over, if stone could not easily be procured: whatever they were, the fallacy would not be discernible; it is an object to be seen at a distance, rude, and large, and in character agreeable to a wild open view. But no building ought to be introduced, which may not in reality belong to such a situation: no Grecian temples, no Turkish mosques, no Egyptian obelisks or pyramids; none imported from foreign countries, and unusual here. The apparent artifice would destroy an effect; which is so nice as to be weakened, if objects proper to produce it are displayed with too much ostentation; if they seem to be contrivances, not accidents; and the advantage of their position appear to be more laboured than natural.

But in a garden, where objects are intended only to adorn, every species of architecture may be admitted, from the Grecian down to the Chinese; and the choice is so free, that the mischief most to be apprehended, is an abuse of this latitude in the multiplicity of buildings. Few scenes can bear more than two or three: in some, a single one has a greater effect than any number: and a careless glimpse, here and there, of such as belong immediately to different parts, frequently enliven the landskip with more spirit than those which are industriously shewn. If the effect of a partial sight, or a distant view, were more attended to, many scenes might be filled, without being crowded; a greater number of buildings would be tolerated, when they seemed to be casual, not forced; and the animation, and the richness of the objects, might be had without pretence or display.

Too fond an ostentation of buildings, even of those which are principal, is a common error; and when all is done, they are not always shewn to the greatest advantage. Though their symmetry and their beauties ought in general to be distinctly and fully seen, yet an oblique is sometimes better than a direct view: and they are often less agreeable objects when entire, than when a part is covered, or their extent is interrupted; when they are bosomed in wood, as well as backed by it; or appear between the stems of trees which rise before or above them: thus thrown into perspective, thus grouped and accompanied, they may be as important as if they were quite exposed, and are frequently more picturesque and beautiful.

But a still greater advantage arises from this management, in connecting them with the scene: they are considerable, and different from all around them; inclined therefore to separate from the rest; and yet they

Section V. BUILDINGS.

they are ſometimes ſtill more detached by the pains taken to exhibit them: that very importance which is the cauſe of the diſtinction, ought to be a reaſon for guarding againſt the independence to which it is naturally prone, and by which an object, which ought to be a part of the whole, is reduced to a mere individual. An elevated is generally a noble ſituation. When it is a point or a pinnacle, the ſtructure may be a continuation of the aſcent; and on many occaſions, ſome parts of the building may deſcend lower than others, and multiply the appearances of connection: but an edifice in the midſt of an extended ridge, commonly ſeems naked alone, and impoſed upon the brow, not joined to it. If wood, to accompany it, will not grow there, it had better be brought a little way down the declivity; and then all behind, above, and about it, are ſo many points of contact, by which it is incorporated into the landſkip.

Accompaniments are important to a building; but they loſe much of their effect, when they do not appear to be caſual. A little mount juſt large enough for it: a ſmall piece of water below, of no other uſe than to reflect it; and a plantation cloſe behind, evidently placed there only to give it relief; are as artificial as the ſtructure itſelf, and alienate it from the ſcene of nature into which it is introduced, and to which it ought to be reconciled. Theſe appendages therefore ſhould be ſo diſpoſed, and ſo connected with the adjacent parts, as to anſwer other purpoſes, tho' applicable to this; that they may be bonds of union, not marks of difference; and that the ſituation may appear to have been choſen, at the moſt, not made, for the building.

In the choice of a ſituation, that which ſhews the building beſt ought generally to be preferred: eminence, relief, and every other advantage which can be, ought to be given to an object of ſo much conſideration: they are for the moſt part deſirable; ſometimes neceſſary; and exceptionable only when, inſtead of riſing out of the ſcene, they are forced into it, and a contrivance to procure them at any rate is avowed without any diſguiſe. There are, however, occaſions, in which the moſt tempting advantages of ſituation muſt be waved; the general compoſition may forbid a building in one ſpot, or require it in another; at other times, the intereſt of the particular groupe it belongs to, may exact a ſacrifice of the opportunities to exhibit its beauties and importance; and at all times, the pretenſions of every individual object muſt give way to the greater effect of the whole.

49 Of thoſe expreſſive of characters.

THE ſame ſtructure which adorns as an object, may alſo be expreſſive as a character. Where the former is not wanted, the latter may be deſirable: or it may be weak for one purpoſe, and ſtrong for the other; it may be grave, or gay; magnificent, or ſimple; and, according to its ſtyle, may or may not be agreeable to the place it is applied to. But mere conſiſtency is not all the merit which buildings can claim: their characters are ſometimes ſtrong enough to *determine, improve, or correct*, that of the ſcene; and they are ſo conſpicuous, and ſo diſtinguiſhed, that whatever force they have is immediately and ſenſibly felt. They are fit therefore to make a firſt impreſſion; and when a ſcene is but faintly characteriſed, they give at once a caſt which ſpreads over the whole, and which the weaker parts concur to ſupport, though perhaps they were not able to produce it. Section V. BUILDINGS.

Nor do they ſtop at fixing an uncertainty, or removing a doubt; they raiſe and enforce a character already marked: a temple adds dignity to the nobleſt, a cottage ſimplicity to the moſt rural, ſcenes; the lightneſs of a ſpire, the airineſs of an open rotunda, the ſplendor of a continued colonnade, are leſs ornamental than expreſſive; others improve cheerfulneſs into gaiety, gloom into ſolemnity, and richneſs into profuſion: a retired ſpot, which might have been paſſed unobſerved, is noticed for its tranquillity, as ſoon as it is appropriated by ſome ſtructure to retreat; and the moſt unfrequented place ſeems leſs ſolitary than one which appears to have been the haunt of a ſingle individual, or even of a ſequeſtered family, and is marked by a lonely dwelling, or the remains of a deſerted habitation.

The means are the ſame, the application of them only is different, when buildings are uſed to correct the character of the ſcene; to enliven its dulneſs, mitigate its gloom, or to check its extravagance; and, on a variety of occaſions, to ſoften, to aggravate, or to counteract, particular circumſtances attending it. But care muſt be taken that they do not contradict too ſtrongly the prevailing idea: they may leſſen the drearineſs of a waſte, but they cannot give it amenity; they may abate horrors, but they will never convert them into graces; they may make a tame ſcene agreeable, and even intereſting, not romantic; or turn ſolemnity into cheerfulneſs, but not into gaiety. In theſe, and in many other inſtances, they correct the character, by giving it an inclination towards a better, which is not very different; but they can hardly alter it entirely: when they are totally inconſiſtent with it, they are at the beſt negatory.

The great effects which have been aſcribed to buildings, do not depend upon thoſe trivial ornaments and appendages, which are often too much relied on; ſuch as the furniture of a hermitage, painted glaſs in a Gothic church, and ſculpture about a Grecian temple; groteſque or bacchanalian figures to denote gaiety, and death's-heads to ſignify melancholy. Such devices are only deſcriptive, not expreſſive, of character; and muſt not be ſubſtituted in the ſtead of thoſe ſuperior properties, the want of which they acknowledge, but do not ſupply. They beſides often require time to trace their meaning, and to ſee their application; but the peculiar excellence of buildings is, that their effects are inſtantaneous, and therefore the impreſſions they make are forcible. In order to to produce ſuch effects, the general ſtyle of the ſtructure, and its poſition, are the principal conſiderations: either of them will ſometimes be ſtrongly characteriſtic alone; united, their powers are very great; and both are ſo important, that if they do not concur, at leaſt they muſt not contradict one another. The colour alſo of the buildings is ſeldom a matter of indifference: that exceſſive brightneſs which is too indiſcriminately uſed to render them conſpicuous, is apt to diſturb the harmony of the whole, ſometimes makes them too glaring as objects, and is often inconſiſtent with their characters. When theſe eſſential points are ſecured, ſubordinate circumſtances may be made to agree with them; and though minute, they may

not

Section V. BUILDINGS.

not be improper, if they are not affected; they frequently mark a correfpondence between the outfide and the infide of a building: in the latter they are not inconfiderable; they may there be obferved at leifure, and there they explain in detail the character which is more generally expreffed in the air of the whole.

To enumerate the feveral buildings which may be ufed for convenience, or diftinction, as ornaments, or as characters, would lead us far from our fubject into a treatife of architecture: for every branch of architecture furnifhes, on different occafions, objects proper for a garden; and different fpecies may meet in the fame compofition: no analogy exifts between the age and the country whence they are borrowed, and the fpot they are applied to, except in fome particular inftances; but, in general, they are naturalized to a place of the moft improved cultivated nature by their effects: beauty is their ufe; and they are conftent with each other, if all are conformable to the ftyle of the fcene, proportioned to its extent, and agreeable to its character. On the other hand, varieties more than fufficient for any particular fpot, enough for a very extenfive view, may be found in every fpecies; to each alfo belong a number of characters; the Grecian architecture can lay afide its dignity in a ruftic building; and the caprice of the Gothic is fometimes not incompatible with greatnefs: our choice therefore may be confined to the variations of one fpecies, or range through the contrafts of many, as circumftances, tafte, or other confiderations, fhall determine.

To enumerate the feveral buildings which may be ufed for convenience, or diftinction, as ornaments, or as characters, would lead us far from our fubject into a treatife of architecture: for every branch of architecture furnifhes, on different occafions, objects proper for a garden; and different fpecies may meet in the fame compofition: no analogy exifts between the age and the country whence they are borrowed, and the fpot they are applied to, except in fome particular inftances; but, in general, they are naturalized to a place of the moft improved cultivated nature by their effects: beauty is their ufe; and they are conftent with each other, if all are conformable to the ftyle of the fcene, proportioned to its extent, and agreeable to its character. On the other hand, varieties more than fufficient for any particular fpot, enough for a very extenfive view, may be found in every fpecies; to each alfo belong a number of characters; the Grecian architecture can lay afide its dignity in a ruftic building; and the caprice of the Gothic is fometimes not incompatible with greatnefs: our choice therefore may be confined to the variations of one fpecies, or range through the contrafts of many, as circumftances, tafte, or other confiderations, fhall determine.

To Species and fituations of buildings.

The choice of fituations is alfo very free. Circumftances which are requifite to particular ftructures, may often be combined happily with others, and enter into a variety of compofitions: even where they are appropriated, they may ftill be applied in feveral degrees, and the fame edifice may thereby be accommodated to very different fcenes. Some buildings which have a juft expreffion when accompanied with proper appendages, have none without them; they may therefore be characters in one place, and only objects in another. On all thefe occafions, the application is allowable, if it can be made without inconfiftency: a hermitage muft not be clofe to a road; but whether it be expofed to view on the fide of a mountain, or concealed in the depth of a wood, is almoft a matter of indifference; that it is at a diftance from public refort, is fufficient. A caftle muft not be funk in a bottom; but that it fhould ftand on the utmoft pinnacle of a hill, is not neceffary: on a lower knole, and backed by the rife, it may appear to greater advantage as an object, and be much more important to the general compofition. A tower,

" Bofom'd high in tufted trees,"

has been felected by one of our greateft poets as a fingular beauty; and the juftnefs of his choice has been fo generally acknowledged, that the defcription is become almoft proverbial: and yet a tower does not feem defigned to be furrounded by a wood; but the appearance may be accounted for: it does fometimes occur; and we are eafily fatisfied of the propriety, when the effect is fo pleafing. Many buildings, which from their fplendor beft become an open expofure, will yet be fometimes not ill beftowed on a more fe-

Section V. BUILDINGS.

queftered fpot, either to characterife or adorn it; and others, for which a folitary would in general be preferred to an eminent fituation, may occafionally be objects in very confpicuous pofitions. A Grecian temple, from its peculiar grace and dignity, deferves every diftinction; it may, however, in the depth of a wood, be fo circumftanced, that the want of thofe advantages to which it feems entitled, will not be regretted. A happier fituation cannot be devifed, than that of the temple of Pan at the fouth lodge on Enfield chace. It is of the ufual oblong form, encompaffed by a colonnade; in dimenfions, and in ftyle, it is equal to a moft extenfive landfkip: and yet by the antique and ruftic air of its Doric columns without bafes; by the chaftity of its little ornaments, a crook, a pipe, and a ferip, and thofe only over the doors; and by the fimplicity of the whole both within and without; it is adapted with fo much propriety to the thickets which conceal it from the view, that no one can wifh it to be brought forward, who is fenfible to the charms of the Arcadian fcene which this building alone has created. On the other hand, a very fpacious field, or fheep-walk, will not be difgraced by a cottage, a Dutch barn, or a hay-ftack; nor will they, though fmall and familiar, appear to be inconfiderable or infignificant objects. Numberlefs other inftances might be adduced to prove the impoffibility of reftraining particular buildings to particular fituations, upon any general principles: the variety in their forms is hardly greater than in their application.

51 Of ruins.

To this great variety muft be added the many changes which may be made by the means of *ruins*. They are a clafs by themfelves, beautiful as objects, expreffive as characters, and peculiarly calculated to connect with appendages into elegant groupes. They may be accommodated with eafe to irregularity of ground, and their diforder is improved by it. They may be intimately blended with trees and thickets; and the interruption is an advantage: for imperfection and obfcurity are their properties; and to carry the imagination to fomething greater than is feen, is their effect. They may for any of thefe purpofes be feparated into detached pieces; contiguity is not neceffary, nor even the appearance of it, if the relation be preferved; but ftraggling ruins have a bad effect, when the feveral parts are equally conficerable. There fhould be one large mafs to raife an idea of greatnefs, to attract the others about it, and to be a common centre of union to all: the fmaller pieces then mark the original dimenfions of one extenfive ftructure; and no longer appear to be the remains of feveral little buildings.

All remains excite an inquiry into the former ftate of the edifice, and fix the mind in a contemplation of the ufe it was applied to; befides the characters expreffed by their ftyle and pofition, they fuggeft ideas which would not arife from the buildings if entire. The purpofes of many have ceafed: an abbey, or a caftle, if complete, can now be no more than a dwelling; the memory of the times, and of the manners to which they are adapted, is preferved only in hiftory, and in ruins; and certain fenfations of regret, of veneration, or compaffion, attend the recollection. Nor are thefe confined to the remains of buildings which are now in difufe: thofe of an old manfion raife

Section I. Art.

reflections on the domestic comforts once enjoyed, and the ancient hospitality which reigned there. Whatever building we see in decay, we naturally contrast its present to its former state, and delight to ruminate on the comparison. It is true that such effects properly belong to real ruins; they are however produced in a certain degree by those which are fictitious: the impressions are not so strong, but they are exactly similar; and the representation, though it does not present facts to the memory, yet suggests subjects to the imagination. But, in order to affect the fancy, the supposed original design should be clear, the use obvious, and the form easy to be traced: no fragments should be hazarded without a precise meaning, and an evident connection; none should be perplexed in their construction, or uncertain as to their application. Conjectures about the form, raise doubts about the existence of the ancient structure: the mind must not be allowed to hesitate; it must be hurried away from examining into the reality, by the exactness and the force of the resemblance.

52 Description of Tintern abbey, [between Chepstowe and Monmouth.]

In the ruins of Tintern abbey, the original construction of the church is perfectly marked; and it is principally from this circumstance that they are celebrated as a subject of curiosity and contemplation. The walls are almost entire; the roof only is fallen in, but most of the columns which divided the ayles are still standing: of those which have dropped down, the bases remain, every one exactly in its place; and in the middle of the nave four lofty arches, which once supported the steeple, rise high in the air above all the rest, each reduced now to a narrow rim of stone, but completely preserving its form. The shapes even of the windows are little altered: but some of them are quite obscured, others partially shaded, by tufts of ivy; and those which are most clear, are edged with its slender tendrils, and lighter foliage, wreathing about the sides and the divisions: it winds round the pillars; it clings to the walls; and in one of the ayles clusters at the top in bunches, so thick and so large, as to darken the space below. The other ayles, and the great nave, are exposed to the sky: the floor is entirely overspread with turf; and to keep it clear from weeds and bushes, is now its highest preservation. Monkish tomb-stones, and the monuments of benefactors long since forgotten, appear above the green sward; the bases of the pillars which have fallen, rise out of it; and maimed effigies, and sculpture worn with age and weather, Gothic capitals, carved cornices, and various fragments, are scattered about, or lie in heaps piled up together. Other shattered pieces, though disjointed and mouldering, still occupy their original places; and a stair-case much impaired, which led to a tower now no more, is suspended at a great height, uncovered and inaccessible. Nothing is perfect; but memorials of every part still subsist; all certain, but all in decay; and suggesting, at once, every idea which can occur in a seat of devotion, solitude, and desolation. Upon such models, fictitious ruins should be formed: and if any parts are entirely lost, they should be such as the imagination can easily supply from those which are still remaining. Distinct traces of the building which is supposed to have existed, are less liable to the suspicion of artifice, than an unmeaning heap of confusion. Precision is always satisfactory, but in the reality it is only agreeable; in the copy, it is essential to the imitation.

Section I. Art.

A material circumstance to the truth of the imitation, is, that the ruin appear to be very old. The idea is besides interesting in itself: a monument of antiquity is never seen with indifference; and a semblance of age may be given to the representation, by the hue of the materials, the growth of ivy and other plants, and cracks and fragments seemingly occasioned rather by decay than by destruction. An appendage evidently more modern than the principal structure will sometimes corroborate the effect: the shed of a cottager amidst the remains of a temple, is a contrast both to the former and to the present state of the building; and a tree flourishing among ruins, shews the length of time they have lain neglected. No circumstance so forcibly marks the desolation of a spot once inhabited, as the prevalence of nature ever it:

"*Compos ubi Troja fuit,*"

is a sentence which conveys a stronger idea of a city totally overthrown, than a description of its remains; but in a representation to the eye, some remains must appear; and then the perversion of them to an ordinary use, or an intermixture of a vigorous vegetation, intimates a settled despair of their restoration.

Part II. Of those PROPERTIES in the OBJECTS of NATURE which should determine the CHOICE and ARRANGEMENT of them in GARDENING.

Sect. I. *Of Art.*

THE several constituent parts of the scenes of nature having now been considered, the next inquiry is into the particular principles and circumstances which may affect them when they are applied to the subjects of gardening.

It has always been supposed, that *art* must then interfere: but art was carried to excess, when from accessory it became principal, and the subject upon which it was employed was brought under regulations less applicable to that than to any other; when ground, wood, and water, were reduced to mathematical figures, and similarity and order were preferred to freedom and variety. These mischiefs, however, were occasioned, not by the use, but the perversion of art: it excluded, instead of improving upon nature, and thereby destroyed the very end it was called in to promote.

53 Of the appearance of art near the house.

So strange an abuse probably arose from an idea of some necessary correspondence between the mansion, and the scene it immediately commanded: the forms, therefore, of both were determined by the same rules; and terraces, canals, and avenues, were but so many variations of the plan of the building. The regularity thus established spread afterwards to more distant

Section I. ART.

distant quarters: there, indeed, the absurdity was acknowledged as soon as a more natural disposition appeared; but a prejudice in favour of art, as it is called, *just about the house*, still remains. If, by the term, *regularity* is intended, the principle is equally applicable to the vicinity of any other building; and every temple in the garden ought to have its concomitant formal slopes and plantations: or the conformity may be reversed, and we may as reasonably contend, that the building ought to be irregular, in order to be consistent with the scene it belongs to. The truth is, that both propositions are erroneous: architecture requires symmetry; the objects of nature freedom; and the properties of the one cannot with justice be transferred to the other. But if, by the term, no more is meant than merely *design*, the dispute is at an end: choice, arrangement, composition, improvement, and preservation, are so many symptoms of art, which may occasionally appear in several parts of a garden, but ought to be displayed without reserve near the house: nothing there should seem neglected; it is a scene of the most cultivated nature; it ought to be enriched, it it ought to be adorned; and design may be avowed in the plan, and expence in the execution.

Even regularity is not excluded: so capital a structure may extend its influence beyond its walls: but this power should be exercised only over its immediate appendages. The platform upon which the house stands, is generally continued to a certain breadth on every side; and, whether it be pavement or gravel, may undoubtedly coincide with the shape of the building. The road which leads up to the door may go off from it in an equal angle, so that the two sides shall exactly correspond: and certain ornaments, though detached, are yet rather within the province of architecture than of gardening. Works of sculpture are not, like buildings, objects familiar in scenes of cultivated nature; but vases, statutes, and termini, are usual appendages to a considerable edifice: as such, they may attend the mansion, and trespass a little upon the garden, provided they are not carried so far into it as to lose their connection with the structure. The platform and the road are also appurtenances to the house; all these may therefore be adapted to its form, and the environs will thereby acquire a degree of regularity: but to give it to the objects of nature, only on account of their proximity to others which are calculated to receive it, is, at the best, a refinement.

55 Of the approach.

Upon the same principles regularity has been required in the *approach*; and an additional reason has been assigned for it, that the idea of a seat is thereby extended to a distance. But that may be done by other means than by an avenue. A private road is easily known. If carried through grounds, or a park, it is commonly very apparent: even in a lane, here and there a bench, a painted gate, a small plantation, or any other little ornament, will sufficiently denote it: if the entrance only be marked, simple preservation will retain the impression along the whole progress. Or the road may wind through several scenes distinguished by objects, or by an extraordinary degree of cultivation; and then the length of the way, and the variety of improvements through which it is conducted, may extend the appearance of domain, and the idea of a seat, beyond the reach of any direct avenue.

Section I. ART.

An avenue being confined to one termination, and excluding every view on the sides, has a tedious sameness throughout: to be great, it must be dull; and the object to which it is appropriated, is after all seldom shewn to advantage. Buildings, in general, do not appear so large, and are not so beautiful, when looked at in front, as when they are seen from an angular station, which commands two sides at once, and throws them both into perspective. But a winding lateral approach is free from these objections; it may besides be brought up to the house without disturbing any of the views from it: but an avenue cuts the scenery directly in two, and reduces all the prospect to a narrow vista. A mere line of perspective, be the extent what it may, will seldom compensate for the loss of that space which it divides, and of the parts which it conceals.

56 Description of the approach at Caversham, [the seat of Lord Caldegan, near Reading]

The approach to Caversham, though a mile in length, and not once in sight of the house till close upon it, yet can never be mistaken for any other way than it is; a passage only through a park is not introduced with so much distinction, so precisely marked, or kept in such preservation. On each side of the entrance is an elegant lodge: the interval between them is a light open palisade, crossing the whole breadth of a lovely valley: the road is conducted along the bottom, continually winding in natural easy sweeps, and presenting at every bend some new scene to the view: at last it gently slants up the side of a little rise to the mansion, where the eminence, which seemed inconsiderable, is found to be a very elevated situation, to which the approach, without once quitting the valley, had been insensibly ascending all the way. In its progress, it never breaks the scenes through which it passes: the plantations and the glades are continued without interruption, quite across the valley: the opposite sides have a relation to each other, not answering, not contrasted, but connected: nor does the disposition ever seem to have been made with any attention to the road; but the scenes still belong purely to the park; each of them is preserved entire, and avails itself of all the space which the situation will allow. At the entrance the slopes are very gentle, with a few large hawthorns, beeches, and oaks, scattered over them: these are thickened by the perspective as the valley winds; and just at the bend, a large clump hangs on a bold ascent, from whence different groupes, growing gradually less and less till they end in single trees, stretch quite away to a fine grove which crowns the opposite brow. The road passes between the groupes, under a light and lofty arch of ash; and then opens upon a glade, broken on the left only by a single tree, and on the right by several beeches standing so close together as to be but one in appearance. This glade is bounded by a beautiful grove, which in one part spreads a perfect gloom, but in others divides into different clusters, which leave openings for the gleams of light to pour in between them. It extends to the edge, and borders for some way the side of a collateral dale, which retires slowly from the view; and in which the falls of the ground are more tame, the bottom more flattened, than in the principal valley; the banks of this also, near the junction, are more gentle than before: but on the opposite side, the steeps and the clumps still continue; and amongst them is a fine knole, from

Section I. Art.

which descend two or three groupes of large trees, feathering down to the bottom, and by the pendency of their branches favouring the declivity. To these succeeds an open space, diversified only by a few scattered trees; and in the midst of it, some magnificent beeches crowding together, overshadow the road, which is carried through a narrow darksome passage between them: soon after it rises under a thick wood in the garden up to the house, where it suddenly bursts out upon a rich and extensive prospect, with the town and the churches of Reading in full sight, and the hills of Windsor-forest in the horizon. Such a view at the end of a long avenue, would have been, at the best, but a compensation for the tediousness of the way; but here the approach is as delightful as the termination. Yet even in this, a similarity of style may be said to prevail. But it has every variety of open plantations; and these are not confusedly thrown together, but formed into several scenes, all of them particularly marked: one is characterised by a grove, the next by clumps, and others by little groupes or single trees: the plantations sometimes cover only the brow, and retire along the top from the view; sometimes they seem to be suspended on the edge or the sides of the descents; in one place they leave the bottom clear, in another they overspread the whole valley: the intervals are often little less than lawns; at other times they are no more than narrow glades between the groves, or only small openings in the midst of a plantation. The ground, without being broken into diminutive parts, is cast into an infinite number of elegant shapes, in every gradation from the most gentle slope, to a very precipitate fall: the trees also are of several kinds, and their shadows of various tints; those of the horse-chesnuts are dark; the beeches spread a broader but less gloomy obscurity; and they are often so vast, they swell out in a succession of such enormous masses, that, though contiguous, a deep shade sinks in between them, and distinguishes each immense individual: such intervals are in some places filled up with other species; the maples are of so extraordinary a size, that they do not appear inconsiderable, when close to the forest-trees; large hawthorns, some oaks, and in one part many, perhaps too many limes, the remains of former avenues, are intermixed; and amongst all these often rise the tallest ash, whose lighter foliage only chequers the turf beneath, while their peculiar hue diversifies the greens of the groupes they belong to.

57 Of regularity in the several parts of a garden.

If regularity is not entitled to a preference in the environs or approach to a house, it will be difficult to support its pretensions to a place in any more *distant parts* of a park or a garden. Formal slopes of ground are ugly: right or circular lines bounding water, do not indeed change the nature of the element; it still retains some of its agreeable properties; but the shape given to it is disgusting. Regularity in plantations is less offensive; we are habituated, as has been already observed, to straight lines of trees, in cultivated nature; a double row, meeting at the top, and forming a complete arched vista, has a peculiar effect; other regular figures have a degree of beauty: and to alter or to disguise such a disposition, without destroying a number of fine trees, which cannot well be spared, may sometimes be difficult; but it hardly ever ought to be chosen in the arrangement of a young plantation.

Regularity was, however, once thought essential to every garden, and every approach; and it yet remains in many. It is still a character, denoting the neighbourhood of a gentleman's habitation; and an avenue, as an object in a view, gives to a house, otherwise inconsiderable, the air of a mansion. Buildings which answer one another at the entrance of an approach, or on the sides of an opening, have a similar effect; they distinguish at once the precincts of a seat from the rest of the country. Some pieces of sculpture also, such as vases and termini, may perhaps now and then be used, to extend the appearance of a garden beyond its limits, and to raise the mead in which they are placed above the ordinary improvements of cultivated nature. At other times they may be applied as ornaments to the most polished lawns; the traditional ideas we have conceived of Arcadian scenes, correspond with such decorations: and sometimes a solitary urn, inscribed to the memory of a person now no more, but who once frequented the shades where it stands, is an object equally elegant and interesting. The occasions, however, on which we may, with any propriety, trespass beyond the bounds of cultivated nature, are very rare; the force of the character can alone excuse the artifice avowed in expressing it.

Section II. Picturesque Beauty.

Sect. II. *Of Picturesque Beauty.*

58 Of the different effects from the same objects in a scene and a picture.

But regularity can never attain to a great share of beauty, and to none of the species called *picturesque*; a denomination in general expressive of excellence, but which, by being too indiscriminately applied, may be sometimes productive of errors. That a subject is recommended at least to our notice, and probably to our favour, if it has been distinguished by the pencil of an eminent painter, is indisputable: we are delighted to see those objects in the reality, which we are used to admire in the representation; and we improve upon their intrinsic merit, by recollecting their effects in the picture. The greatest beauties of nature will often suggest the remembrance; for it is the business of a landskip painter to select them: and his choice is absolutely unrestrained; he is at liberty to exclude all objects which may hurt the composition; he has the power of combining those which he admits in the most agreeable manner; he can even determine the season of the year, and the hour of the day, to shew his landskip in whatever light he prefers. The works therefore of a great master, are fine exhibitions of nature, and an excellent school wherein to form a taste for beauty: but still their authority is not absolute; they must be used only as studies, not as models; for a picture and a scene in nature, though they agree in many, yet differ in some particulars, which must always be taken into consideration, before we can decide upon the circumstances which may be transferred from the one to other.

In their *dimensions* the distinction is obvious; the same objects on different scales have very different effects; those which seem monstrous on the one, may appear diminutive on the other; and a form, which is elegant in a small object, may be too delicate for a large one. Besides, in a canvas of a few feet, there is not room for every species of variety which in nature is pleasing. Though the characteristic distinction of trees may be marked, their more minute differences, which

Section II. Picturesque Beauty.

which however enrich plantations, cannot be expreſſed: and a multiplity of enclofures, catches of water, cottages, cattle, and a thouſand other circumſtances, which enliven a proſpect, are, when reduced into a narrow compaſs, no better than a heap of confuſion. Yet, on the other hand, the principal objects muſt often be more diverſified in a picture than in a ſcene: a building which occupies a conſiderable portion of the former, will appear ſmall in the latter when compared to the ſpace all around it; and the number of parts which may be neceſſary to break its ſameneſs in one, will aggravate its inſignificance in the other. A tree which preſents one rich maſs of foliage, has ſometimes a fine effect in nature; but when painted, is often a heavy lump, which can be lightened only by ſeparating the boughs, and ſhewing the ramifications between them. In ſeveral other inſtances the object is frequently affected by the proportion it bears to the actual, not the ideal, circumjacent extent.

Painting, with all its powers, is ſtill more unequal to ſome ſubjects, and can give only *a faint, if any, repreſentation* of them: but a gardener is not therefore to reject them: he is not debarred from a view down the ſides of a hill, or a proſpect where the horizon is lower than the ſtation, becauſe he never ſaw them in a picture. Even when painting exactly imitates the appearances of nature, it is often weak in conveying the *ideas* which they excite, and on which much of their effect ſometimes depends. This however is not always a diſadvantage; the appearance may be more pleaſing than the idea which accompanies it, and the omiſſion of the one may be an improvement of the other. Many beautiful tints denote diſagreeable circumſtances: the hue of a barren heath is often finely diverſified; a piece of bare ground is ſometimes overſpread with a number of delicate ſhades; and yet we prefer a more uniform verdure to all their variety. In a picture, the ſeveral tints which occur in nature may be blended, and retain only their beauty, without ſuggeſting the poverty of the ſoil which occaſions them: but in the reality, the cauſe is more powerful than the effect: we are leſs pleaſed with the ſight, than we are hurt by the reflection; and a moſt agreeable mixture of colours may preſent no other idea than of drearineſs and ſterility.

On the other hand, *utility* will ſometimes ſupply the want of beauty in the reality, but not in a picture. In the former, we are never totally inattentive to it; we are familiariſed to the marks of it; and we allow a degree of merit to an object which has no other recommendation. A regular building is generally more agreeable in a ſcene than in a picture, and an adjacent platform, if evidently convenient, is tolerable in the one; it is always a right line too much in the other. Utility is at the leaſt an excuſe, when it is real; but it is an idea never included in the repreſentation.

Many more inſtances might be alleged to prove, that the ſubjects for a painter and a gardener are not always the ſame. Some which are agreeable in the reality, loſe their effect in the imitation; and others, at the beſt, have leſs merit in a ſcene than in a picture. The term *picturesque* is therefore applicable only to ſuch objects in nature, as, after allowing for the differences between the arts of painting and of gardening, are fit to be formed into groupes, or to enter into a compoſition where the ſeveral parts have a relation to each other, and in oppoſition to thoſe which may be ſpread abroad in detail, and have no merit but as individuals.

Section III. Character.

Sect. III. *Of Character.*

59 Of emblematical characters.

Character is very reconcilcable with beauty; and, even when independent of it, has attracted ſo much regard, as to occaſion ſeveral frivolous attempts to produce it: ſtatues, inſcriptions, and even paintings, hiſtory and mythology, and a variety of devices, have been introduced for this purpoſe. The heathen deities and heroes have therefore had their ſeveral places aſſigned to them in the woods and the lawns of a garden: natural caſcades have been diſfigured with rivergods; and columns erected only to receive quotations: the compartiments of a ſummer-houſe have been filled with pictures of gambols and revels, as ſignificant of gaiety: the cypreſs, becauſe it was once uſed in funerals, has been thought peculiarly adapted to melancholy: and the decorations, the furniture, and the environs of a building, have been crowded with puerilities under pretence of propriety. All theſe devices are rather *emblematical* than expreſſive: they may be ingenious contrivances, and recall abſent ideas to the recollection; but they make no immediate impreſſion: for for they muſt be examined, compared, perhaps explained, before the whole deſign of them is well underſtood: and though an alluſion to a favourite or well-known ſubject of hiſtory, of poetry, or of tradition, may now and then animate or dignify a ſcene; yet as the ſubject does not naturally belong to a garden, the alluſion ſhould not be principal: it ſhould ſeem to have been ſuggeſted by the ſcene; a tranſitory image, which irreſiſtibly occurred; not ſought for, not laboured; and have the force of a metaphor, free from the detail of an allegory.

60 Of imitative characters.

Another ſpecies of character ariſes from direct *imitation*; when a ſcene or an object, which has been celebrated in deſcription, or is familiar in idea, is repreſented in a garden. Artificial ruins, lakes, and rivers, fall under this denomination. The air of a ſeat extended to a diſtance, and ſcenes calculated to raiſe ideas of Arcadian elegance or of rural ſimplicity, with many more which have been occaſionally mentioned or will obviouſly occur, may be ranked in this claſs. They are all repreſentations. But the materials, the dimenſions, and other circumſtances, being the ſame in the copy and the original, their effects are ſimilar in both: and if not equally ſtrong the defect is not in the reſemblance; but the conſciouſneſs of an imitation checks that train of thought which the appearance naturally ſuggeſts. Yet an over-anxious ſolicitude to diſguiſe the fallacy is often the means of expoſing it: too many points of likeneſs ſometimes hurt the deception; they ſeem ſtudied and forced; and the affectation of reſemblance deſtroys the ſuppoſition of a reality. A hermitage is the habitation of a recluſe; it ſhould be diſtinguiſhed by its ſolitude, and its ſimplicity: but if it is filled with crucifixes, hour-glaſſes, beads, and every other trinket which can be thought of, the attention is diverted from enjoying the retreat to examining the particulars: all the collateral circumſtances which agree with a character, ſeldom meet in one ſubject; and when they are induſtriouſly brought together, though each be natural, the collection is artificial.

The

Section III. Character.

The peculiar advantages which gardening has over other imitative arts, will not, however, ſupport attempts to introduce, they rather forbid the introduction of characters, to which the ſpace is not adequate. A plain ſimple field, unadorned but with the common rural appendages, is an agreeable opening: but if it is extremely ſmall, neither a hay-ſtack, nor a cottage, nor a ſtile, nor a path, nor much leſs all of them together, will give it an air of reality. A harbour or an artificial lake is but a conceit: it raiſes no idea of refuge or ſecurity; for the lake does not ſuggeſt an idea of danger: it is detached from the large body of water; and yet it is in itſelf but a poor inconſiderable baſin, vainly affecting to mimick the majeſty of the ſea. When imitative characters in gardening are egregiouſly defective in any material circumſtance, the truth of the others expoſes and aggravates the failure.

61 Of original characters.

But the art of gardening aſpires to more than imitation: it can create *original* characters, and give expreſſions to the ſeveral ſcenes ſuperior to any they can receive from alluſions. Certain properties, and certain diſpoſitions, of the objects of nature, are adapted to excite particular ideas and ſenſations: many of them have been occaſionally mentioned; and all are very well known. They require no diſcernment, examination, or diſcuſſion; but are obvious at a glance, and inſtantaneouſly diſtinguiſhed by our feelings. Beauty alone is not ſo engaging as this ſpecies of character: the impreſſions it makes are more tranſient and leſs intereſting; for it aims only at delighting the eye, but the other affects our ſenſibility. An aſſemblage of the moſt elegant forms in the happieſt ſituations is to a degree indiſcriminate, if they have not been ſelected and arranged with a deſign to produce certain expreſſions; an air of magnificence, or of ſimplicity, of cheerfulneſs, tranquillity, or ſome other general character, ought to pervade the whole; and objects pleaſing in themſelves, if they contradict that character, ſhould therefore be excluded: thoſe which are only indifferent, muſt ſometimes make room for ſuch as are more ſignificant; many will often be introduced for no other merit than their expreſſion; and ſome, which are in general rather diſagreeable, may occaſionally be recommended by it. Barrenneſs itſelf may be an acceptable circumſtance in a ſpot dedicated to ſolitude and melancholy.

The power of ſuch characters is not confined to the ideas which the objects immediately ſuggeſt; for theſe are connected with others, which inſenſibly lead to ſubjects, far diſtant, perhaps, from the original thought, and related to it only by a ſimilitude in the ſenſations they excite. In a proſpect, enriched and enlivened with inhabitants and cultivation, the attention is caught at firſt by the circumſtances which are gayeſt in their ſeaſon, the bloom of an orchard, the feſtivity of a hay-field, and the carols of harveſt-home: but the cheerfulneſs which theſe infuſe into the mind, expands afterwards to other objects than thoſe immediately preſented to the eye; and we are thereby diſpoſed to receive, and delighted to purſue, a variety of pleaſing ideas, and every benevolent feeling. At the ſight of a ruin, reflections on the change, the decay, and the deſolation before us, naturally occur; and they introduce a long ſucceſſion of others, all tinctured with that melancholy which theſe have inſpired: or if the monument revive the memory of former times, we do not ſtop at the ſimple fact which it records, but recollect many more coæval circumſtances, which we ſee, not perhaps as they were, but as they are come down to us, venerable with age, and magnified by fame. Even, without the aſſiſtance of buildings, or other adventitious circumſtances, nature alone furniſhes materials for ſcenes which may be adapted to almoſt every kind of expreſſion: their operation is general, and their conſequences infinite: the mind is elevated, depreſſed, or compoſed, as gaiety, gloom, or tranquillity, prevail in the ſcene; and we ſoon loſe ſight of the means by which the character is formed: we forget the particular objects it preſents; and giving way to their effects, without recurring to the cauſe, we follow the track they have begun, to any extent which the diſpoſition they accord with will allow. It ſuffices that the ſcenes of nature have a power to affect our imagination and our ſenſibility: for ſuch is the conſtitution of the human mind, that if once it is agitated, the emotion often ſpreads far beyond the occaſion; when the paſſions are rouſed, their courſe is unreſtrained; when the fancy is on the wing, its flight is unbounded; and, quitting the inanimate objects which firſt gave them their ſpring, we may be led by thought above thought, widely differing in degree, but ſtill correſponding in character, till we riſe from familiar ſubjects up to the ſublimeſt conceptions, and are rapt in the contemplation of whatever is great or beautiful, which we ſee in nature, feel in man, or attribute to divinity.

Section IV. Gen'ral Subject.

Sect. IV. *Of the General Subject.*

62 Difference between a farm, a garden, a park, and a riding.

The ſcenes of nature are alſo affected by the general ſubject to which they are applied, whether that be a *farm*, a *garden*, a *park*, or a *riding*. Theſe may all indeed be parts of one place; they may border on each other; they may, to a degree, be intermixed: but each is ſtill a character of ſuch force, that, whichever prevails, the propriety of all other characters, and of every ſpecies of beauty, muſt be tried by their conformity to this. And circumſtances neceſſary to one, may be inconſiſtencies in the reſt: *elegance* is the peculiar excellence of a garden, *greatneſs* of a park, *ſimplicity* of a farm, and *pleaſantneſs* of a riding. Theſe diſtinguiſhing properties will alone exclude from the one, many objects which are very acceptable in the others; but theſe are not the only properties in which they eſſentially differ.

A garden is intended to walk or to ſit in, which are circumſtances not conſidered in a riding; a park comprehends all the uſes of the other two; and theſe uſes determine the *proportional extent* of each. A large garden would be but a ſmall park; and the circumference of a conſiderable park but a ſhort riding. A farm is in ſome meaſure denominated from its ſize: if it greatly exceed the dimenſions of a garden, ſo that its bounds are beyond the reach of a walk, it becomes a riding. A farm and a garden hence appear to be calculated for indolent, a riding for active amuſements, and a park for both: ſeats, therefore, and buildings for refreſhment or indulgence, ſhould be frequent in a garden or a farm; ſhould ſometimes occur in a park; but are unneceſſary in a riding.

Within the narrow compaſs of a garden, there is not

Section IV. General Subject

not room for *diſtant effects*. On the other hand, it allows of objects which are ſtriking only in a *ſingle point of view*; for we may ſtop there to contemplate them: and an obſcure catch, or a partial glimpſe of others, are alſo acceptable circumſtances, in the leiſure of a ſeat, or even in the courſe of a loitering walk. But theſe are loſt in a riding, where the pleaſantneſs of the road, not of the ſpot, is the principal conſideration; and its greateſt improvement is a diſtant object, which may be ſeen from ſeveral points, or along a conſiderable part of the way. *Minute beauties* in general may abound in a garden; they may be frequent in a farm; in both we have opportunities to obſerve and to examine them: in a park, they are below our notice; in a riding, they eſcape it.

Proſpects are agreeable to either of the four general ſubjects, but not equally neceſſary to all. In a garden, or in a farm, ſcenes within themſelves are often ſatisfactory; and, in their retired ſpots, an opening would be improper. A park is defective, if confined to its incloſure: a perpetual ſucceſſion of home-ſcenes, through ſo large an extent, wants variety; and fine proſpects are circumſtances of greatneſs: but they are not required in every part. The place itſelf ſupplies many noble views; and theſe are not much improved by a diſtant rim, or a little peep of the country, which is inadequate to the reſt of the compoſition. A riding has ſeldom much beauty of it own; it depends on objects without for its pleaſantneſs: if it only leads now and then to a ſtriking point, and is dull all the reſt of the way, it will not be much frequented; but very moderate views are ſufficient to render its progreſs agreeable.

By concealing, therefore, much of the proſpects, we deſtroy the amuſement of a riding. The view of the country ſhould not be hurt by the improvements of the road. In a garden, on the contrary, continuation of ſhade is very acceptable; and if the views be ſometimes interrupted, they may ſtill be caught from many points: we may enjoy them there whenever we pleaſe; and they would pall if conſtantly in ſight. The beſt ſituation for a houſe is not that which has the greateſt command; a cheerful look-out from the windows is all that the proprietor deſires. He is more ſenſible to the charms of the greater proſpects, if he ſees them only occaſionally, and they do not become inſipid by being familiar: for the ſame reaſon he does not wiſh for them in every part of his garden; and temporary concealments give them freſh ſpirit whenever they appear. But the views of a riding are not viſited ſo often, as thereby to loſe any of their effect. Plantations, therefore, in a country, ſhould be calculated rather for objects to look at, than for ſhades to paſs through. In a park, they may anſwer both purpoſes: but in a garden, they are commonly conſidered as places to walk or to ſit in. As ſuch, too, they are moſt welcome in a farm: but ſtill the diſtinction between an improved and an ordinary farm being, by no circumſtance, ſo ſenſibly marked, as by the arrangement of the trees, they are more important, as objects, there than in a garden.

Though a farm and a garden agree in many particulars connected with extent, yet, in *ſtyle*, they are the two extremes. Both, indeed, are ſubjects of cultivation: but cultivation in the one is *huſbandry*, and in the other *decoration*; the former is appropriated to *profit*, the latter to *pleaſure*. Fields profuſely ornamented do not retain the appearance of a farm; and an apparent attention to produce, obliterates the idea of a garden. A park is ſometimes not much hurt by being turned to account. The uſe of a riding is to lead from one beauty to another, and be a ſcene of pleaſure all the way: made avowedly for that purpoſe only, it admits more embelliſhment and diſtinction than an ordinary road through a farm. See the articles FARM, PARK, and RIDING.

Section V. Garden.

SECT. V. *Of a Garden.*

63 Of a garden ſurrounding an incloſure.

THE gravel paths have been been mentioned † as contributing to the appearance of a garden: they are unuſual elſewhere; they conſtantly preſent the idea of a walk; and the correſpondence between their ſides, the exactneſs of the edges, the nicety of the materials and of the preſervation, appropriate them to ſpots in the higheſt ſtate of improvement. Applied to any other ſubject than a park, their effect is the ſame. A field, ſurrounded by a gravel-walk, is, to a degree, bordered by a garden; and many ornaments may be introduced as appendages to the latter, which would otherwiſe appear to be inconſiſtent with the former. When theſe accompaniments occupy a conſiderable ſpace, and are ſeparated from the field, the idea of a garden is complete as far as they extend; but if the gravel be omitted, and the walk be only of turf, a greater breadth to the border, and more richneſs in the decorations, are neceſſary to preſerve that idea.

† *See the article* PARK.

Many gardens are nothing more than ſuch *a walk round a field*; that field is often raiſed to the character of a lawn: and ſometimes the incloſure is, in fact, a paddock. Whatever it be, the walk is certainly garden: it is a ſpot ſet apart for pleaſure; it admits on the ſides a profuſion of ornament; it is fit for the reception of every elegance, and requires the niceſt preſervation: it is attended alſo with many advantages; may be made and kept without much expence; leads to a variety of points; and avails itſelf, in its progreſs, of the ſeveral circumſtances which belong to the incloſure it ſurrounds, whether they be the rural appurtenances of a farm, or thoſe more refined which diſtinguiſh a paddock.

But it has at the ſame time its inconveniencies and defects. Its approach to the ſeveral points is always circuitous, and they are thereby often thrown to a diſtance from the houſe and from each other: there is no acceſs to them acroſs the open expoſure: the way muſt conſtantly be the ſame: the view all along is into one opening, which muſt be peculiarly circumſtanced, to furniſh within itſelf a ſufficient variety: and the embelliſhments of the walk are ſeldom important; their number is limited; and the little ſpace allotted for their reception admits only of thoſe which can be accommodated to the ſcale, and will conform to the character. This ſpecies of garden, therefore, reduces almoſt to a ſameneſs all the places it is applied to: the ſubject ſeems exhauſted: no walk round a field can now be very different from ſeveral others already exiſting. At the beſt too it is but a walk: the fine ſcenery of a garden is wanting: and that in the field, which is ſubſtituted in its ſtead, is generally of an inferior character; and often defective in connection with the ſpot which commands

Section V. GARDEN.

mands it, by the intervention of the fence, or the visible difference in the preſervation.

This objection, however, has more or leſs force according to the character of the incloſure. If that be a paddock or a lawn, it may exhibit ſcenes not unworthy of the moſt elegant garden; which agreeing in ſtyle, will unite in appearance, with the walk. The other objections alſo are ſtronger or weaker in proportion to the ſpace allowed for the appendages; and not applicable at all to a broad circuit of garden, which has room within itſelf for ſcenery, variety, and character: but the common narrow walk, too indiſcriminately in faſhion, if continued to a conſiderable extent, becomes very tireſome; and the points it leads to muſt be more than ordinarily delightful, to compenſate for the fatigue of the way.

This tediouſneſs may, however, be remedied, without any extravagant enlargement of the plan, by taking in, at certain intervals, an additional breadth, ſufficient only for a little ſcene to interrupt the uniformity of the progreſs. The walk is then a communication, not between points of view, through all which it remains unaltered; but between the ſeveral parts of a garden, in each of which it is occaſionally loſt; and, when reſumed, it is at the worſt a repetition, not a continuation of the ſame idea; the eye and the mind are not always confined to one tract; they expatiate at times, and have been relieved before they return to it. Another expedient, the very reverſe of this, may now and then be put in practice: it is to contract, inſtead of enlarging, the plan; to carry the walk, in ſome part of its courſe, directly into the field, or at the moſt to ſecure it from cattle; but, to make it quite ſimple, omit all its appendages, and drop every idea of a garden. If neither of theſe, nor any other means, be uſed to break the length of the way, though the incloſure ſhould furniſh a ſucceſſion of ſcenes, all beautiful, and even contraſted to each other, yet the walk will introduce a ſimilarity between them. This ſpecies of garden, therefore, ſeems proper only for a place of a very moderate extent; if it be ſtretched out to a great length, and not mixed with other characters, its ſameneſs hurts that variety, which it is its peculiar merit to diſcover.

64 Of a garden which occupies the whole incloſure.

But the advantages attending it upon ſome, and the uſe of it on ſo many, occaſions, have raiſed a partiality in its favour; and it is often carried round a place, where *the whole incloſure is garden:* the interior openings and communications furniſh there a ſufficient range; and they do not require that number and variety of appendages, which muſt be introduced to diſguiſe the uniformity of the circuitous walk, but which often interfere with greater effects. It is at the leaſt unneceſſary in ſuch a garden; but plain gravel-walks to every part are commonly deemed to be indiſpenſable: they undoubtedly are convenient; but it muſt alſo be acknowledged, that though ſometimes they adorn, yet at other times they diſfigure, the ſcenes thro' which they are conducted. The proprietor of the place, who viſits theſe ſcenes at different ſeaſons, is moſt anxious for their beauty in fine weather; he does not feel the reſtraint to be grievous, if all of them be not at all times equally acceſſible; and a gravel-walk perpetually before him, eſpecially when it is uſeleſs, muſt be irkſome. It ought not, therefore, to be oſtentatiouſly ſhewn; on many occaſions it ſhould be induſtriouſly concealed: that it lead to the capital points is ſufficient: it can never be requiſite along the whole extent of every ſcene: it may often ſkirt a part of them, without appearing; or juſt touch upon them, and withdraw; but if it cannot be introduced at all without hurting them, it ought commonly to be omitted.

Section V. GARDEN.

The ſides of a gravel-walk muſt correſpond, and its courſe be in ſweeps gently bending all the way. It preſerves its form, though conducted through woods, or along glades, of the moſt licentious irregularity. But a graſs walk is under no reſtraint; the ſides of it may be perpetually broken, and the direction frequently changed: ſudden turns, however, are harſh; they check the idea of progreſs; they are rather diſappointments than varieties; and if they are ſimilar, they are in the worſt ſtyle of affectation. The line muſt be curved, but it ſhould not to be wreathed; if it be truly ſerpentine, it is the moſt unnatural of any. It ought conſtantly to proceed; and wind only juſt ſo much, that the termination of the view may differ at every ſtep, and the end of the walk never appear: the thickets which confine it ſhould be diverſified with ſeveral mixtures of greens; no diſtinctions in the forms of the ſhrubs or the trees will be loſt, when there are opportunities to obſerve them ſo nearly; and combinations and contraſts without number may be made, which will be there truly ornamental. Minute beauties are proper in a ſpot precluded from great effects: and yet ſuch a walk, if it be broad, is by no means inſignificant; it may have an importance which will render it more than a mere communication.

But the peculiar merit of that ſpecies of garden which occupies the whole incloſure, conſiſts in the larger ſcenes: it can make room for them both in breadth and in length; and being dedicated entirely to pleaſure, free from all other conſiderations, thoſe ſcenes may be in any ſtyle which the nature of the place will allow: a number of them is expected; all different; ſometimes contraſted; and each diſtinguiſhed by its beauty. If the ſpace be divided into little ſlips, and made only a collection of walks, it forfeits all its advantages, loſes its character, and can have no other excellence than ſuch as it may derive from ſituation: whereas, by a more liberal diſpoſition, it may be made independent of whatever is external; and though proſpects are no where more delightful than from a point of view which is alſo a beautiful ſpot, yet if in ſuch a garden they ſhould be wanting, the elegant, picturеſque, and various ſcenes within itſelf, almoſt ſupply the deficiency.

65 Deſcription of Stowe.

This is the character of the gardens at Stowe: for there the views in the country are only circumſtances ſubordinate to the ſcenes; and the principal advantage of the ſituation is the variety of the ground within the incloſure. The houſe ſtands on the brow of a gentle aſcent; part of the gardens lie on the declivity, and ſpread over the bottom beyond it: this eminence is ſeparated by a broad winding valley from another which is higher and ſteeper; and the deſcents of both are broken by large dips and hollows, ſloping down the ſides of the hills. The whole ſpace is divided into a number of ſcenes, each diſtinguiſhed with taſte and fancy; and the changes are ſo frequent, ſo ſudden, and complete, the tranſitions ſo artfully conducted, that

Section V. GARDEN.

that the ſame ideas are never continued or repeated to fatiety.

Theſe gardens were begun when regularity was in faſhion; and the original boundary is ſtill preſerved, on account of its magnificence: for round the whole circuit, of between three or four miles, is carried a very broad gravel walk, planted with rows of trees, and open either to the park or the country; a deep ſunk fence attends it all the way, and comprehends a ſpace of near four hundred acres. But in the interior ſcenes of the garden, few traces of regularity appear: where it yet remains in the plantations, it is generally diſguiſed: every ſymptom, almoſt, of formality is obliterated from the ground; and an octagon baſin in the bottom, is now converted into an irregular piece of water, which receives on one hand two beautiful ſtreams, and falls on the other down a caſcade into a lake.

In the front of the houſe is a conſiderable lawn, open to the water: beyond which are two elegant Doric pavilions, placed in the boundary of the garden, but not marking it, though they correſpond to each other; for ſtill further back, on the brow of ſome riſing grounds without the incloſure, ſtands a noble Corinthian arch, by which the principal approach is conducted, and from which all the gardens are ſeen, reclining back againſt their hills: they are rich with plantations; full of objects; and, lying on both ſides of the houſe almoſt equally, every part is within a moderate diſtance, notwithſtanding the extent of the whole.

On the right of the lawn, but concealed from the houſe, is a perfect garden-ſcene, called the *queen's amphitheatre*, where art is avowed, though formality is avoided. The fore ground is ſcooped into a gentle hollow. The plantations on the ſides, though but juſt reſcued from regularity, yet in ſtyle are contraſted to each other: they are, on one hand, chiefly thickets, ſtanding out from a wood; on the other, they are open groves, through which a glimpſe of the water is viſible. At the end of the hollow, on a little knole, quite detached from all appendages, is placed an open Ionic rotunda: beyond it, a large lawn ſlopes acroſs the view; a pyramid ſtands on the brow; the queen's pillar, in a receſs on the deſcent; and all the three buildings, being evidently intended for ornament alone, are peculiarly adapted to a garden-ſcene. Yet their number does not render it gay: the duſky hue of the pyramid, the retired ſituation of the queen's pillar, and the ſolitary appearance of the rotunda, give it an air of gravity; it is encompaſſed with wood; and all the external views are excluded; even the opening into the lawn is but an opening into an incloſure.

At the king's pillar, very near to this, is another lovely ſpot; which is ſmall, but not confined; for no termination appears: the ground one way, the water another, retire under the trees out of ſight, but nowhere meet with a boundary. The view is firſt over ſome very broken ground, thinly and irregularly planted; then between two beautiful clumps, which feather down to the bottom; and afterwards acroſs a glade, and through a little grove beyond it, to that part of the lake, where the thickets, cloſe upon the brink, ſpread a tranquillity over the ſurface, in which their ſhadows are reflected. Nothing is admitted to diſturb that quiet: no building obtrudes: for objects to fix the eye are needleſs in a ſcene, which may be comprehended at a glance; and none would ſuit the paſtoral idea it inſpires, of elegance too refined for a cottage, and of ſimplicity too pure for any other edifice.

Section V. GARDEN.

The ſituation of the rotunda promiſes a proſpect more enlarged; and in fact moſt of the objects on this ſide of the garden are there viſible: but they want both connection and contraſt; each belongs peculiarly to ſome other ſpot: they are all blended together in this, without meaning; and are rather ſhewn on a map, than formed into a picture. The water only is capital; a broad expanſe of it is ſo near as to be ſeen under the little groupes on the bank without interruption. Beyond it is a wood, which in one place leaves the lake, to run up behind a beautiful building, of three pavilions joined by arcades, all of the Ionic order: it is called *Kent's Building*. And never was a deſign more happily conceived: it ſeems to be characteriſtically proper for a garden; it is ſo elegant, ſo varied, and ſo purely ornamental: it directly fronts the rotunda, and a narrow rim of the country appears above the trees beyond it. But the effect even of this noble object is fainter here than at other points: its poſition is not the moſt advantageous; and it is but one among many other buildings, none of which are principal.

The ſcene at the temple of Bacchus is in character directly the reverſe of that about the rotunda, though the ſpace and the objects are nearly the ſame in both: but in this, all the parts concur to form one whole. The ground from every ſide ſhelves gradually towards the lake; the plantations on the further bank open to ſhew Kent's building, riſe from the water's edge towards the knole on which it ſtands, and cloſe again behind it. That elegant ſtructure, inclined a little from a front view, becomes more beautiful by being thrown into perſpective; and though at a greater diſtance, is more important than before, becauſe it is alone in the view: for the queen's pillar and the rotunda are removed far aſide; and every other circumſtance refers to this intereſting object: the water attracts, the ground and the plantations direct, the eye thither; and the country does not juſt glimmer in the offskip, but is cloſe and eminent above the wood, and connected by clumps with the garden. The ſcene all together is a moſt animated landſkip: and the ſplendor of the building; the reflection in the lake; the tranſparency of the water, and the picturesque beauty of its form, diverſified by little groupes on the brink, while on the broadeſt expanſe no more trees caſt their ſhadows than are ſufficient to vary the tints of the ſurface; all theſe circumſtances, vying in luſtre with each other, and uniting in the point to which every part of the ſcene is related, diffuſe a peculiar brilliancy over the whole compoſition.

The view from Kent's building, is very different from thoſe which have been hitherto deſcribed. They are all directed down the declivity of the lawn. This riſes up the aſcent: the eminence being crowned with lofty wood, becomes thereby more conſiderable; and the hillocks into which the general fall is broken, ſloping further out this way than any other, they alſo acquire an importance which they had not before: that, particularly, on which the rotunda is placed,

ſeems here to be a profound ſituation; and the ſtructure appears to be properly adapted to ſo open an expoſure. The temple of Bacchus, on the contrary, which commands ſuch an illuſtrious view, is itſelf a retired object, cloſe under the covert. The wood riſing on the brow, and deſcending down one ſide of the hill, is ſhewn to be deep; is high, and ſeems to be higher than it is. The lawn too is extenſive; and part of the boundary being concealed, it ſuggeſts the idea of a ſtill greater extent. A ſmall portion only of the lake indeed is viſible; but it is not here an object: it is a part of the ſpot; and neither termination being in ſight, it has no diminutive appearance: if more water had been admitted, it might have hurt the character of the place, which is ſober and temperate; neither ſolemn nor gay; great and ſimple, but elegant; above ruſticity, yet free from oſtentation.

Theſe are the principal ſcenes on one ſide of the gardens. On the other, cloſe to the lawn before the houſe, is the winding valley abovementioned: the lower part of it is aſſigned to the Elyſian fields. Theſe are watered by a lovely rivulet; are very lightſome, and very airy, ſo thinly are the trees ſcattered about them; are open at one end to more water and a larger glade; and the reſt of the boundary is frequently broken to let in objects afar off, which appear ſtill more diſtant from the manner of ſhewing them. The entrance is under a Doric arch, which coincides with an opening among the trees, and forms a kind of viſta, through which a Pembroke bridge juſt below, and a lodge built like a caſtle in the park, are ſeen in a beautiful perſpective. That bridge is at one extremity of the gardens; the queen's pillar is at another; yet both are viſible from the ſame ſtation in the Elyſian fields: and all theſe external objects are unaffectedly introduced, diveſted of their own appurtenances, and combined with others which belong to the ſpot. The temple of friendſhip alſo is in ſight, juſt without the place: and within it, are the temples of ancient virtue, and of the Britiſh worthies; the one in an elevated ſituation, the other low down in the valley, and near to the water: both are decorated with the effigies of thoſe who have been moſt diſtinguiſhed for military, civil, or literary merit; and near to the former ſtands a roſtral column, ſacred to the memory of captain Grenville, who fell in an action at ſea: by placing here the meed of valour, and by filling theſe fields with the repreſentations of thoſe who have deſerved beſt of mankind, the character intended to be given to the ſpot is juſtly and poetically expreſſed; and the number of the images which are preſented or excited, perfectly correſponds with it. Solitude was never reckoned among the charms of Elyſium; it has been always pictured as the manſion of delight and of joy: and in this imitation, every circumſtance accords with that eſtabliſhed idea. The vivacity of the ſtream which flows through the vale; the glimpſes of another approaching to join it; the ſprightly verdure of the green ſward, and every buſt of the Britiſh worthies reflected in the water; the variety of the trees: the lightneſs of the greens; their diſpoſition; all of them diſtinct objects, and diſperſed over gentle inequalities of the ground; together with the multiplicity of objects both within and without, which embelliſh and enliven the ſcene; give it a gaiety, which the imagination can hardly conceive, or the heart with to be exceeded. Section V. GARDEN.

Cloſe by this ſpot, and a perfect contraſt to it, is the alder grove; a deep receſs, in the midſt of a ſhade, which the blaze of noon cannot brighten. The water ſeems to be a ſtagnated pool, eating into its banks; and of a peculiar colour, not dirty but clouded, and dimly reflecting the dun hue of the horſe-cheſnuts and alders which preſs upon the brink: the ſtems of the latter, riſing in cluſters from the ſame root, bear one another down, and ſlant over the water. Miſhapen elms and ragged firs are frequent in the wood which encompaſſes the hollow; the trunks of dead trees are left ſtanding amongſt them; and the uncouth ſumach, and the yew, with elder, nut, and holly, compoſe the underwood: ſome limes and laurels are intermixt; but they are not many: the wood is in general of the darkeſt greens; and the foliage is thickened with ivy, which not only twines up the trees, but creeps alſo over the falls of the ground: theſe are ſteep and abrupt: the gravel-walk is covered with moſs; and a grotto at the end, faced with broken flints and pebbles, preſerves, in the ſimplicity of its materials, and the duſkineſs of its colour, all the character of its ſituation: two little rotundas near it were better away; one building is ſufficient for ſuch a ſcene of ſolitude as this, in which more circumſtances of gloom concur than were ever perhaps collected together.

Immediately above the alder-grove is the principal eminence in the gardens. It is divided by a great dip into two pinnacles; upon one of which is a large Gothic building. The ſpace before this ſtructure is an extenſive lawn: the ground on one ſide falls immediately into the dip; and the trees which border the lawn, ſinking with the ground, the houſe riſes above them, and fills the interval: the vaſt pile ſeems to be ſtill larger than it is; for it is thrown into perſpective, and between and above the heads of the trees, the upper ſtory, the porticoes, the turrets and balluſtrades, and all the ſlated roofs, appear in a noble confuſion. On the other ſide of the Gothic building, the ground ſlopes down a long-continued declivity into a bottom, which ſeems to be perfectly irriguous. Divers ſtreams wander about it in ſeveral directions: the conflux of that which runs from the Elyſian fields with another below it, is full in ſight; and a plain wooden bridge thrown over the latter, and evidently deſigned for a paſſage, impoſes an air of reality on the river. Beyond it is one of the Doric porticoes which front the houſe; but now it is alone; it ſtands on a little bank above the water, and is ſeen under ſome trees at a diſtance before it: thus grouped, and thus accompanied, it is a happy incident, concurring with many other circumſtances to diſtinguiſh this landſkip by a character of cheerfulneſs and amenity.

From the Gothic building a broad walk leads to the Grecian valley, which is a ſcene of more grandeur than any in the gardens. It enters them from the park, ſpreading at firſt to a conſiderable breadth; then winds; grows narrower, but deeper; and loſes itſelf at laſt in a thicket, behind ſome lofty elms, which interrupt the ſight of the termination. Lovely woods and groves hang all the way on the declivities: and the open ſpace is broken by detached trees; which, near the park, are cautiouſly and ſparingly introduced, left

Section V. GARDEN.

left the breadth should be contracted by them; but as the valley sinks, they advance more boldly down the sides, stretch across or along the bottom, and cluster at times into groupes and forms, which multiply the varieties of the larger plantations. Those are sometimes close coverts, and sometimes open groves: the trees rise in one upon high stems, and feather down to the bottom in another; and between them are short openings into the park or the gardens. In the midst of the scene, just at the bend of the valley, and commanding it on both sides, upon a large, easy, natural rise, is placed the temple of Concord and Victory: at one place its majestic front of six Ionic columns, supporting a pediment filled with bas relief, and the points of it crowned with statues, faces the view; at another, the beautiful colonnade, on the side, of ten lofty pillars, retires in perspective. It is seen from every part; and impressing its own character of dignity on all around, it spreads an awe over the whole: but no gloom, no melancholy attends it: the sensations it excites are rather placid; but full of respect, admiration, and solemnity: no water appears to enliven, no distant prospect to enrich, the view; the parts of the scene are large, the idea of it sublime, and the execution happy; it is independent of all adventitious circumstances, and relies on itself for its greatness.

The scenes which have been described are such as are most remarkable for beauty or character: but the gardens contain many more: and even the objects in these, by their several combinations, produce very different effects, within the distance sometimes of a few paces, from the unevenness of the ground, the variety of the plantations, and the number of the buildings. The multiplicity of the last has indeed been often urged as an objection to Stowe; and certainly, when all are seen by a stranger in two or three hours, twenty or thirty capital structures, mixed with others of inferior note, do seem too many. But the growth of the wood every day weakens the objection, by concealing them one from the other: each belongs to a distinct scene; and if they are considered separately, at different times, and at leisure, it may be difficult to determine which to take away. Yet still it must be acknowledged that their frequency destroys all ideas of silence and retirement. Magnificence and splendor are the characteristics of Stowe: it is like one of those places celebrated in antiquity, which were devoted to the purposes of religion, and filled with sacred groves, hallowed fountains, and temples dedicated to several deities; the resort of distant nations, and the object of veneration to half the heathen world: this pomp is, at Stowe, blended with beauty; and the place is equally distinguished by its amenity and its grandeur.

In the midst of so much embellishment as may be introduced into this species of garden, a plain field, or a sheep-walk, is sometimes an agreeable relief, and even wilder scenes may occasionally be admitted. These indeed are not properly parts of a garden, but they may be comprehended within the verge of it; and their proximity to the more ornamented scenes is at least a convenience, that the transition from the one to the other may be easy, and the change always in our option. For though a spot in the highest state of improvement be a necessary appendage to a seat; yet, in a place which is perfect, other characters will not be wanting: if they cannot be had on a large scale, they are acceptable on a smaller; and so many circumstances are common to all, that they may often be intermixed; they may always border on each other.

Section VI. SEASONS.

SECT. VI. *Of the Seasons.*

To every view belongs a light which shews it to advantage: every scene and every object is in its highest beauty only at particular hours of the day; and every place is, by its situation or its character, peculiarly agreeable in certain months of the year. The *seasons* thus become subjects of consideration in gardening; and when several of those circumstances which distinguish a spot more at one time than another happen to concur, it will often be worth the while to add to their number, and to exclude such as do not agree with them, for no other purpose than to strengthen their effect at that particular time. Different parts may thus be adapted to different seasons, and each in its turn will be in perfection. But if the place will not allow of such a succession, still *occasional effects* may often be secured and improved, without prejudice to the scene when they are past, and without affectation while they continue. 66 Occasional effects.

The temple of Concord and Victory at Stowe has been mentioned as one of the noblest objects that ever adorned a garden: but there is a moment when it appears in singular beauty. The setting sun shines on the long colonnade which faces the west: all the lower parts of the building are darkened by the neighbouring wood: the pillars rise at different heights out of the obscurity; some of them are nearly overspread with it, some are chequered with a variety of teints, and others illuminated almost down to their bases. The light is gently softened off by the rotundity of the columns: but it spreads in broad gleams upon the wall within them; and pours full and without interruption on all the entablature, distinctly marking every dentil. On the statues which adorn the several points of the pediment, a deep shade is contrasted to splendor: the rays of the sun linger on the side of the temple long after the front is overcast with the sober hue of evening; and they tip the upper branches of the trees, or glow in the openings between them, while the shadows lengthen across the Grecian valley.

Such an occasional effect, however transient, is so exquisitely beautiful, that it would be unpardonable to neglect it. Others may be produced at several hours of the day; and the disposition of the buildings, of the ground, the water, and the plantations, may often be accommodated to support them. There are also occasional effects in certain months, or only weeks, of the year, arising from some particular bloom, some ocupation then carrying on, or other incident, which may so far deserve attention as to recommend a choice and arrangement of objects, which at that time will improve the composition, though at another they may have no extraordinary merit.

67 Of different parts of the day.

Besides these transitory effects, there are others which may be defined and produced with more exactness, which are fixed to stated periods, and have certain properties belonging to them. Some species and situations of objects are in themselves adapted to receive or to make the impressions which characterize

Section VI. SEASONS.

the principal parts of the day: their ſplendor, their ſobriety, and other peculiarities, recommend or prohibit them upon different occaſions. The ſame conſiderations direct the choice alſo of their appendages; and in conſequence of a judicious aſſemblage and arrangement of ſuch as are proper for the purpoſe, the *ſpirit* of the morning, the *exceſs* of noon, or the *temperance* of evening, may be improved or corrected by the application of the ſcene to the ſeaſon.

In a *morning*, the freſhneſs of the air allays the force of the ſun-beams, and their brightneſs is free from glare: the moſt ſplendid objects do not offend the eye, nor ſuggeſt the idea of heat in its extreme; but they correſpond with the glitter of the dew which beſpangles all the produce of the earth, and with the cheerfulneſs diffuſed over the whole face of the creation. A variety of buildings may therefore be introduced to enliven the view: their colour may be the pureſt white, without danger of exceſs, though they face the eaſtern ſun; and thoſe which are in other aſpects ſhould be ſo contrived, that their turrets, their pinnacles, or other points, may catch glances of the rays, and contribute to illuminate the ſcene. The trees ought in general to be of the lighteſt greens, and ſo ſituated as not to darken much of the landſkip by the length of their ſhadows. Vivacity in the ſtreams, and tranſparency in a lake, are more important at this than at any other hour of the day: and an open expoſure is commonly the moſt delightful, both for the effect of particular objects, and the general character of the ſcene.

At *noon*, every expedient ſhould be uſed to correct the exceſs of the ſeaſon. The ſhades are ſhortened, they muſt therefore be thick; but open plantations are generally preferable to a cloſe covert: they afford a paſſage, or at leaſt admittance to the air; which, tempered by the coolneſs of the place, ſoft to the touch, and refreſhing at once to all the ſenſes, renders the ſhade a delightful climate, not a mere refuge from heat. Groves, even at a diſtance, ſuggeſt the ideas which they realize on the ſpot; and, by multiplying the appearances, improve the ſenſations of relief from the extremity of the weather. Grottos, caves, and cells, are on the ſame account agreeable circumſtances in a ſequeſtered receſs: and though the chill within be hardly ever tolerable, the eye catches only an idea of coolneſs from the ſight of them. Other buildings ought in general to be caſt into ſhade, that the glare of the reflection from them may be obſcured. The large expanſe of a lake is alſo too dazzling: but a broad river moving gently, and partially darkened with ſhadow, is very refreſhing; more ſo perhaps than a little rill, for the vivacity of the latter rather diſturbs the repoſe which generally prevails at mid-day. Every breeze then is ſtill; the reflexion of an aſpen-leaf ſcarcely trembles on the water; the animals remit their ſearch of food, and man ceaſes from his labour: the ſteam of heat ſeems to oppreſs all the faculties of the mind, and all the active powers of the body; and any very lively motion diſcompoſes the langnor in which we then delight to indulge. To hear, therefore, the murmurs of a brook purling underneath a thicket, or the echo of falling waters through a wood, is more agreeable than the ſight of a current; the idea conveyed by the ſound is free from any agitation: but if no other ſtream than a rill can be introduced, the refreſhment which attends the appearance of water muſt not be denied to the ſcene.

In the *evening*, all ſplendor fades: no buildings glare; no water dazzles. The calmneſs of a lake ſuits the quiet of the time: the light hovers there, and prolongs the duration of day. An open reach of a river has a ſimilar, though a fainter, effect; and a continued ſtream all expoſed, preſerves the laſt rays of the ſun along the whole length of its courſe, to beautify the landſkip: but a briſk current is not ſo conſiſtent as a lake with the tranquillity of evening. And other objects ſhould in general conform to the temper of the time. Buildings of a duſky hue are moſt agreeable to it: but a very particular effect from a ſetting ſun will recommend thoſe of a brighter colour; and they may alſo be ſometimes uſed, among other means, to correct the uniformity of twilight. No contraſt of light and ſhade can then be produced: but if the plantations, which by their ſituation are the firſt to be obſcured, be of the darkeſt greens, if the buildings which have a weſtern aſpect be of a light colour, and if the management of the lawns and the water be adapted to the ſame purpoſe, a diverſity of tints will be preſerved long after the greater effects are faded.

Section VI. SEASONS.

68
Of the ſeaſons of the year.

THE delights, however, of the morning and evening are confined to a few months of the year; at other times, two or three hours before, and as much after, noon, are all that are pleaſant; and even then the heat is ſeldom ſo extreme as to require relief from its exceſs. The diſtinctions, therefore, between the three parts of the day may in general be reckoned among the characteriſtics of ſummer. The occaſional effects which by the poſition of objects may occur at any hour, are common to all the ſeaſons of the year: and ſuch as ariſe from the accidental colours of plants, though they are more frequent and more beautiful in one ſeaſon than another, yet exiſt in all; and very agreeable groupes may be formed by an aſſemblage of them. A degree of importance may be given even to the flowers of a border, if, inſtead of being indiſcriminately mixed, they are arranged according to their heights, their ſizes, and their colours, ſo as to diſplay their beauties, and to blend or contraſt their varieties to the greateſt advantage. The bloom of ſhrubs differs from that of flowers only in the ſcale; and the tints occaſioned by the hue of the berry, the foliage, or the bark, are ſometimes little inferior to bloom. By collecting into one ſpot ſuch plants as have at the ſame time their accidental colours, conſiderable effects may be produced from the concurrence of many little cauſes.

Thoſe which ariſe from bloom are the moſt ſtriking, and the moſt certain; and they abound chiefly in the *ſpring*. Bloom is a characteriſtic of the ſeaſon; and a villa near town, which is deſigned principally for that time of the year, is not adapted to its uſe if this property be not amply provided for. In ſuch a place, therefore, ſhrubberies, with an intermixture of flowers, are peculiarly proper. In the ſummer-months, a border between the thicket and the greenſward, breaks the connexion, and deſtroys the greater effect: it ought not to be then introduced, except to enliven ſmall ſpots, and as the beſt ſpecies of parterre. But in the ſpring, the thicket is hardly formed: its principal

Section VI. SEASONS.

cipal beauty is bloom; and flowers before or among the ſhrubs, are agreeable to the character of the ſeaſon. An orchard, which, at other times, is unſightly, is then delightful; and, if a farm joins to the garden, ſhould not be forgotten. But evergreens appear in general to great diſadvantage. Moſt of them have a ruſſet or a dark hue, which ſuffers by being conſtraſted to the lively verdure of the young ſhoots on the deciduous trees. That verdure is, however, ſo light, and ſo univerſal, that effects, from a mixture of greens, can ſeldom be produced; and thoſe which depend on a depth of ſhade will often be diſappointed. But buildings, views of water, and whatever tends to animate the ſcene, accord with the ſeaſon; which is full of youth and vigour, freſh and ſprightly, brightened by the verdure of the herbage and the woods, gay with bloſſoms and flowers, and enlivened by the ſongs of the birds in all their variety, from the rude joy of the ſky-lark, to the delicacy of the nightingale.

In *ſummer*, both the buildings and the water are agreeable, not as objects only, but alſo as circumſtances of refreſhment: the pleaſantneſs, therefore, of the rooms in the former, of the ſeats and the walks near the latter, is to be regarded. The plantations alſo ſhould be calculated at leaſt as much for places of retreat, as for ornaments of the view; and a continuation of ſhade be preſerved, with very few and ſhort interruptions, through all the parts of the garden. Communications by gravel walks are of leſs conſequence: they do not ſuggeſt that idea of utility which attends them in winter or autumn; and their colour, which in ſpring is a lively contraſt to the verdure through which it winds, is in the intemperate blaze of a ſummer day glaring and painful. They ſhould, therefore, be concealed as much as poſſible; and the other conſiderations which belong to the noon-tide hour ſhould be particularly attended to, at the ſame time that the delights of the morning and the evening are alſo liberally provided for. But, excluſive of all ſuch incidental circumſtances, the ſcenes of nature in general appear at this ſeaſon to the greateſt advantage: though the bloom of the ſpring be faded, and the verdure of the herbage may be ſometimes affected by drought; yet the richneſs of the produce of the earth, and the luxuriance of the foliage in the woods; the ſenſations of refreſhment, added to the beauty of water; the ideas of enjoyment which accompany the ſight of every grove, of every building, and every delightful ſpot; the characters of rocks, heightened by their appendages, and unallayed by any diſconſolate reflections; the connexion of the ground with the plantations, the permanency of every teint, and the certainty of every effect; all concur, in ſummer, to raiſe the ſeveral compoſitions to their higheſt ſtate of perfection.

But maturity is always immediately ſucceeded by decay: flowers bloom and fade; fruits ripen and rot; the graſs ſprings and withers; and the foliage of the woods ſhoots, thickens, and falls. In the latter months of *autumn*, all nature is on the decline; it is a comfortleſs ſeaſon: not a bloſſom is left on the ſhrubs or the trees; and the few flowers which ſtill remain in the borders, dripping with wet, and ſickening even as they blow, ſeem hardly to ſurvive the leaves of the plant which are ſhrivelling beneath them. But the change of the leaf precedes the fall; and thence reſults a variety of colours, ſuperior to any which the ſpring or the ſummer can boaſt of. To ſhew and to improve that variety ſhould be principally attended to, in a place, ſuch as a ſporting ſeat, which is frequented only in autumn. It appears to advantage, whenever the ſurface of a wood can be commanded; and it may be produced to a conſiderable degree, even in a ſhrubbery, if the plants are ſo diſpoſed as to riſe in gradation one behind another. By obſerving the tints which the leaves aſſume when they change, the choice may be directed to the improvement of their variety; and by attending to the times when they fall, a ſucceſſion of theſe tranſitory beauties may be provided, from the earlieſt to the lateſt in the ſeaſon. Many ſhrubs and trees are at this time alſo covered with berries, which furniſh ſtill further varieties of colour; both evergreens and deciduous plants abound with them; and the verdure of the former is beſides a welcome ſubſtitute to that which is daily fading away. Open buildings, airy groves, views of water, and the other delights of ſummer, now loſe their charms; and more homely circumſtances of comfort and convenience are preferable to all their beauties.

Section VI. SEASONS.

A place which is the reſidence of a family all the year is very defective, if ſome portion of it be not ſet apart for the enjoyment of a fine day, for air, and exerciſe, in *winter*. To ſuch a ſpot ſhelter is abſolutely eſſential; and evergreens being the thickeſt covert, are therefore the beſt: their verdure alſo is then agreeable to the eye; and they may be arranged ſo as to produce beautiful mixtures of greens, with more certainty than deciduous trees, and with almoſt equal variety: they may be collected into a wood; and through that wood gravel-walks may be led, along openings of a conſiderable breath, free from large trees which would intercept the rays of the ſun, and winding in ſuch a manner as to avoid any draft of wind, from whatever quarter it may blow. But when a retreat at all times is thus ſecured, other ſpots may be adapted only to occaſional purpoſes; and be ſheltered towards the north or the eaſt on one hand, while they are open to the ſun on the other. The few hours of cheerfulneſs and warmth which its beams afford are ſo valuable, as to juſtify the ſacrifice even of the principles of beauty to the enjoyment of them; and therefore no objections of fameneſs or formality can prevail againſt the pleaſantneſs of a ſtraight walk, under a thick hedge or a ſouth wall. The eye may, however, be diverted from the ſkreen, by a border before it, where the aconite and the ſnowdrop, the crocus and hepatica, brought forward by the warmth of the ſituation, will be welcome harbingers of ſpring; and on the oppoſite ſide of the walk, little tufts of laurueſtines, and of variegated evergreens, may be planted. The ſpot thus enlivened by a variety of colours, and even a degree of bloom, may be ſtill further improved by a green-houſe. The entertainment which exotics afford peculiarly belongs to this part of the year; and if amongſt them be interſperſed ſome of our earlieſt flowers, they will there blow before their time, and anticipate the gaiety of the ſeaſon which is advancing. The walk may alſo lead to the ſtoves, where the climate and the plants are always the ſame. And the kitchen-garden ſhould not be far off; for that is never

quite

Conclusion. quite deſtitute of produce, and always an active ſcene: the appearance of buſineſs is alone engaging; and the occupations there are an earneſt of the happier ſeaſons to which they are preparative. By theſe expedients even the winter may be rendered cheerful in a place, where ſhelter is provided againſt all but the bittereſt inclemencies of the ſky, and agreeable objects and intereſting amuſements are contrived for every hour of tolerable weather.

69 Extent and ſtudy of gardening.

To conclude: Whatever contributes to render the ſcenes of nature delightful, is amongſt the ſubjects of gardening; and animate as well as inanimate objects, are circumſtances of beauty or character. Several of theſe have been occaſionally mentioned; others will readily occur; and nothing is unworthy of the attention of a gardener, which can tend to improve his compoſitions, whether by immediate effects, or by ſuggeſting a train of pleaſing ideas. The whole range of nature is open to him, from the parterre to the foreſt; and whatever is agreeable to the ſenſes or the imagination, he may appropriate to the ſpot he is to improve: it is a part of his buſineſs to collect into one place, the delights which are generally diſperſed thro' different ſpecies of country.

But in this application, the genius of the place muſt always be particularly conſidered: to force it, is hazardous; and an attempt to contradict it, is always unſucceſsful. The beauties peculiar to one character, cannot be transferred to its oppoſite: even where the characters are the ſame, it is difficult to copy directly from the one into the other; and by endeavouring to produce a reſemblance of a ſcene which is juſtly admired, the proper advantages of the place are often neglected for an imitation much inferior the original. The excellence of the latter probably depends on the happy application of the circumſtances to the ſubject; and the ſubjects of both are never exactly alike. The art of gardening, therefore, is not to be ſtudied in thoſe ſpots only where it has been exerciſed; though they are in this country very numerous, and very various. Yet all together they contain but a ſmall proportion of the beauties which nature exhibits: and unleſs the gardener has ſtored his mind with ideas from the infinite variety of the country at large, he will feel the want of that number which is neceſſary for choice; he will have none ready to apply to the ſubject immediately before him; and will be reduced to copy an imitation. But improved places are of ſingular uſe to direct the judgment in the choice, and the combinations, of the beauties of nature: an extenſive knowledge of them is to be acquired in the country where they caſually occur; diſcernment of their excellencies, and a taſte for the diſpoſition of them, is to be formed in places where they have been ſelected, and arranged with deſign.

Conclu.

For the particular Operations in GARDENING, ſee PLANTING, PRUNING, GRAFTING, INOCULATING, KITCHEN-*Garden*, ORCHARD, GREEN-*Houſe*, HOT-*Houſe*, INARCHING, ESPALIER, &c. and the culture and management of different plants under their reſpective names.

GAR

Gardiner || Garland.

GARDINER (Stephen), biſhop of Wincheſter, and lord chancellor of England, born at Bury St Edmunds in Suffolk, natural ſon to Richard Woodville, brother to queen Elizabeth wife to Edward IV. was learned in the canon and civil laws, and in divinity. He ſigned the divorce of Henry VIII. from Katharine of Spain; abjured the pope's ſupremacy; and writ *De vera et falſa obedientia*, in behalf of the king: yet in Edward's reign he oppoſed the reformation, and was puniſhed with impriſonment; but queen Mary coming to the throne, ſhe enlarged him. He drew up the articles of marriage between the queen and Philip of Spain, which were very advantageous to England. He was violent againſt the reformers; but on his deathbed was diſſatisfied with his life, and often repeated theſe words: *Erravi cum Petro, ſed non flevi cum Petro.* He died in 1555.

GARGARISM, (from γαργαρίζω, "to waſh the mouth;" a gargle. Its uſe is for waſhing the mouth and throat with, when inflammations, ulcerations, &c. are there. A ſmall quantity may be taken into the mouth, and moved briſkly about, and then ſpit out; or if the patient cannot do this to any advantage, the liquor may be injected by a ſyringe. When gargles are required, their uſe ſhould be more frequently repeated than is done in common practice.

GARLAND, a ſort of chaplet made of flowers, feathers, and ſometimes precious ſtones, worn on the head, in manner of a crown.—The word is formed of the French *guirlande*, and that of the barbarous Latin *garlanda*, or Italian *ghirlanda*. Menage traces its origin from *gyrus*, through *gyrulus*, to *gyrulare*, *gyrlandum*, *ghirlandum*, and at length *ghirlanda* and *guirlande*; ſo that *guirlande* and *garland* are deſcended in the ſixth or ſeventh degree from *gyrus*.—Hicks rejects this derivation, and brings the word from *gardel handa*, which in the northern languages ſignify a *noſegay artfully wrought with the hand*.

GAR

Garland || Garnet.

GARLAND alſo denotes ornaments of flowers, fruits, and leaves, intermixed; anciently much uſed at the gates of temples, where feaſts and ſolemn rejoicings were held; or at any other place where marks of public joy or gaiety were required, as at triumphal arches, tournaments, &c.

GARLIC. See ALLIUM.

GARNET, in natural hiſtory, a very beautiful gem, of a red colour, with an admixture of blue.

When pure and free from blemiſhes, it is little inferior, in appearance, to the oriental ruby, tho' only of a middle degree of hardneſs between the ſapphire and common cryſtal. It is found of various ſizes, from that of a pin's head to an inch in diameter.

Among our lapidaries and jewellers, genuine garnets are known by different names according to their different degrees of colour. 1. The garnet, ſimply ſo called, is the fineſt and moſt valuable kind, being of a very deep blood-red, with a faint admixture of blue. 2. The rock-ruby, a name very improperly given to the garnet, when it is of a very ſtrong but not deep red, and has a fairer caſt of the blue: this is a very beautiful gem. 3. The ſorane or ſerain garnet; that of a yet brighter red, approaching to the colour of native cinnabar, with a faint blue tinge. 4. The almandine, a garnet only a little paler than that called the

Garnet || Garrick.

the *rock-ruby*.

Garnets are very properly diſtinguiſhed into the oriental and occidental kinds, as being found in Europe as well as the Eaſt Indies. The oriental ones are principally brought from Calicut, Cananor, and Cambay; and the European ones are common in Italy, Hungary, and Bohemia.

Some authors have ſuppoſed the deeper-coloured garnet to be the ſame with the carbuncle of the ancients: from which it really differs; ſince, on receiving the ſun's beams, it never gives ſo true a fire-colour as the carbuncle.

GARNET-*Colour*. To give this colour to glaſs, the workmen take equal quantities of cryſtal and Rochetta fritt; and to every hundred weight of this mixture they add a pound of manganeſe, and a pound of prepared zaffre: theſe are to be powdered ſeparately, then mixed and added by degrees to the fritt while in the furnace: great care is to be taken to mix the manganeſe and zaffre very perfectly; and when the matter has ſtood 24 hours in fuſion, it may be worked.

To imitate GARNETS. The making the counterfeit garnet in paſte is done as follows.—Take prepared cryſtal two ounces, common red-lead ſix ounces, manganeſe 16 grains, zaffre three grains; mix all well, put them into a crucible, cover it with lute, and ſet it in a potter's kiln for 24 hours. Or take cryſtal two ounces, minium five ounces and a half, manganeſe 15 grains, zaffre four grains: mix them well together; and let all be baked, in a pot well luted, in a potter's kiln 24 hours.

GARONNE, a large river of France, which taking its riſe in the Pyrenean mountains, runs northweſt by the city of Thouloſe, divides the provinces of Guienne and Gaſcony, and, viſiting the city of Bourdeaux, falls into the bay of Baſcay, about 60 miles below that city. It has alſo a communication with the Mediterranean, by means of the royal canal of Lewis XIV. The tide flows up this river 20 miles above Bourdeaux.

GARRICK (David), Eſq; the great Roſcius of this age and country, who for near 40 years hath ſhone the brighteſt luminary in the hemiſphere of the ſtage, was born at the Angel Inn at Hereford, in the year 1716. His father, Captain Peter Garrick, was a French refugee, and had a troop of horſe which were then quartered in that city. This rank he maintained in the army for ſeveral years, and had a majority at the time of his death; that event, however, prevented him from ever enjoying it. Mr Garrick received the firſt rudiments of his education at the free-ſchool at Litchfield; which he afterwards completed at Rocheſter, under the celebrated Mr Colſon, ſince mathematical profeſſor at Cambridge. Dr Johnſon and he were fellow-ſtudents at the ſame ſchool; and it is a curious fact, that theſe two celebrated geniuſes came up to London, with the intention of puſhing themſelves into active life, in the ſame coach. On the 9th of March 1736, he was entered at the honourable ſociety of Lincoln's-Inn. The ſtudy of the law, however, he ſoon quitted; and followed for ſome time the employment of a wine-merchant: but that too diſguſting him, he gave way at laſt to the irreſiſtible bias of his mind, and joined a travelling company of comedians at Ipſwich in Suffolk, where he went by the name of *Lyddel*. Having in this poor ſchool of Apollo got ſome acquainrance with the theatric art, he burſt at once upon the world, in the year 1740-1, in all the luſtre of perfection, at the little theatre in Goodman's Fields, then under the direction of Henry Giffard. Garrick.

The character he firſt performed was Richard the Third; in which, like the ſun burſting from behind a cloud, he diſplayed, in the earlieſt dawn, a ſomewhat more than meridian brightneſs. His excellence dazzled and aſtoniſhed every one; and the ſeeing a young man, in no more than his 24th year, and a novice in reality to the ſtage, reaching at one ſingle ſtep to that height of perfection which maturity of years and long practical experience had not been able to beſtow on the then capital performers of the Engliſh ſtage, was a phenomenon that could not but become the object of univerſal ſpeculation and of as univerſal admiration. The theatres at the weſt end of the town were deſerted; Goodman's Fields, from being the rendezvous of citizens and citizens wives alone, became the reſort of all ranks of men; and Mr Garrick continued to act till the cloſe of the ſeaſon.

Having very advantageous terms offered him for the performing in Dublin during ſome part of the ſummer (1741), he went over thither, where he found the fame juſt homage paid to his merit which he had received from his own countrymen. To the ſervice of the latter, however, he eſteemed himſelf more immediately bound; and therefore, in the enſuing winter, engaged himſelf to Mr Fleetwood, then manager of Drury-Lane: in which theatre he continued till the year 1745, when he again went over to Ireland, and continued there the whole ſeaſon, joint manager with Mr Sheridan in the direction and profits of the theatre-royal in Smock-Alley. From thence he returned to England, and was engaged for the ſeaſon of 1746 with Mr Rich at Covent-Garden. This was his laſt performance as an hired actor: for in the cloſe of that ſeaſon, Mr Fleetwood's patent for the management of Drury-Lane being expired, and that gentleman having no inclination further to purſue a deſign by which, from his want of acquaintance with the proper conduct of it, or ſome other cauſe, he had conſiderably impaired his fortune; Mr Garrick, in conjunction with Mr Lacy, purchaſed the property of that theatre, together with the renovation of the patent; and in the winter of 1747, opened it with the greateſt part of Mr Fleetwood's company, and with the great additional ſtrength of Mr Barry, Mrs Pritchard, and Mrs Cibber, from Covent-Garden.

In this ſtation Mr Garrick continued till his retirement in the ſpring of 1776; and both by his conduct as a manager, and his unequalled merit as an actor, from year to year added to the entertainment and conſulted the taſte of the public with the greateſt aſſiduity. They were grateful in their acknowledgments; and by a well-deſerved and warm encouragement, raiſed him to a ſtate of fame, eaſe, and affluence, which he enjoyed for many years.

Were we to trace Mr Garrick through the ſeveral occurrences of his life,—a life ſo active, ſo buſy, and ſo full of occurrences as his, we ſhould ſwell this account to many pages. Suffice it to ſay, he continued in the unmoleſted enjoyment of his fame and unrivalled excellence to the moment of his retirement. His univerſality

Garrick. sality of excellence was never once attacked by competition. Tragedy, comedy, and farce, the lover and the hero, the jealous husband who suspects his wife without cause, and the thoughtless lively rake who attacks it without design, were all alike his own. Rage and ridicule, doubt and despair, transport and tenderness, compassion and contempt; love, jealousy, fear, fury, and simplicity; all took in turn possession of his features, while each of them in turn appeared to be the sole possessor of his heart. In the several characters of Lear and Hamlet, Richard, Dorilas, Romeo, and Lusignane; in his Ranger, Bayes, Drugger, Kitely, Brute, and Benedick, you saw the muscular conformations that your ideas attached to them all. In short, nature, the mistress from whom alone this great performer borrowed all his lessons, being in herself inexhaustible, this her darling son, marked out for her truest representative, found an unlimited scope for change and diversity in his manner of copying from her various productions. There is one part of theatrical conduct which ought unquestionably to be recorded to Mr Garrick's honour, since the cause of virtue and morality, and the formation of public manners, are considerably dependent upon it; and that is, the zeal with which he aimed to banish from the stage all those plays which carry with them an immoral tendency, and to prune from those which do not absolutely, on the whole, promote the interests of vice, such scenes of licentiousness and liberty, as a redundancy of wit and too great liveliness of imagination have induced some of our comic writers to indulge themselves in, and which the sympathetic disposition of our age of gallantry and intrigue has given sanction to. The purity of the English stage has certainly been much more fully established during the administration of this theatrical minister, than it had ever been during preceding managements. He seems to have carried his model, moral, chaste, and pious principles with him into the very management of the theatre itself, and rescued performers from that obloquy which stuck on the profession. Of those who were accounted blackguards, unworthy the association of the world, he made gentlemen, united them with society, and introduced them to all the domestic comforts of life. The theatre was no longer esteemed the receptacle of all vice; and the moral, the serious, the religious part of mankind did not hesitate to partake of the rational entertainment of a play, and pass a cheerful evening undisgusted with the licentiousness, and uncorrupted by the immorality, of the exhibition.

Notwithstanding the numberless and laborious avocations attendant on his profession as an actor, and his station as a manager; yet still his active genius was perpetually bursting forth in various little productions in the dramatic and poetical way, whose merit cannot but make us regret his want of time for the pursuance of more extensive and important works. It is certain, that his merit as an author is not of the first magnitude: but his great knowledge of men and manners, of stage-effect, and his happy turn for lively and striking satire, made him generally successful; and his prologues and epilogues in particular, which are almost innumerable, possess such a degree of happiness, both in the conception and execution, as to stand unequalled. His Ode on the death of Mr Pelham run through four editions in less than six weeks. His Ode on Shakespeare is a masterly piece of poetry; and when delivered by himself, was a most capital exhibition. His alterations of Shakespeare and other authors have been at times successful, and at times exploded. The cutting out the grave-diggers scene from Hamlet will never be forgot to him by the inhabitants of the gallery at Drury. Though necessary to the chasteness of the scene, they cannot bear to lose so much true sterling wit and humour; and it must be owned, that exuberances of that kind, though they hurt the uniformity, yet increase the luxuriance of the tree. Among his alterations the following are part: Every Man in his Humour, altered from Ben Johnson; Romeo and Juliet, Winter's Tale, Catherine and Petruchio, Cymbeline, Hamlet, &c. altered and made up from Shakespeare; Gamesters, a comedy, from Shirley; Isabella, from Southerne. To these we add, as original productions, The Farmer's Return, and Linco's Travels, interludes; Guardian, Lethe, Lying Valet, Miss in her Teens, Male Coquet, Irish Widow, and other comedies in two acts; Enchanter, a musical entertainment; Lilliput; the Christmas Tale as ascribed to him, and many others. At this time a complete edition of his works is preparing for the press, under the direction of his friends, and in which the whole will be ascertained.

Garrick || Garter

We now bring him to the period of his retirement in the spring of 1776; when, full of fame, with the acquirement of a splendid fortune, and growing into years, he thought proper to seek the vale of life, to enjoy that dignified and honourable ease which was compatible with his public situation, and which he had so well earned by the activity and the merits of his dramatic reign. But very short, indeed, was the period allotted to him for this precious enjoyment: for on the 20th day of January 1779, he departed this life; leaving no one rival in excellence upon earth to compensate for his loss, or a hope of our ever meeting with his like again.

GARRISON, in the art of war, a body of forces, disposed in a fortress, to defend it against the enemy, or to keep the inhabitants in subjection; or even to be subsisted during the winter-season: hence, *garrison* and *winter-quarters* are sometimes used, indifferently, for the same thing; and sometimes they denote different things. In the latter case, a garrison is a place wherein forces are maintained to secure it; and where they keep regular guard, as a frontier town, a citadel, castle, tower, &c. The garrison should be always stronger than the townsmen.

Du Cange derives the word from the corrupt Latin *garnisio*, which the latter writers use to signify all manner of munition, arms, victuals, &c. necessary for the defence of a place, and sustaining of a siege.

Winter-quarters signify a place where a number of forces are laid up in the winter season, without keeping the regular guard.

GARTER, a ligature for tying up the stocking; but particularly used for the badge of a noble order of knights, hence denominated the

Order of the GARTER, a military order of knighthood, the most noble and ancient of any lay-order in the world, instituted by Edward III. This order consists of 26 knights-companions, generally princes and peers,

Garter. peers, whereof the king of England is the fovereign or chief. They are a college or corporation, having a great and little feal.

Their officers are a prelate, chancellor, regiſter, king at arms, and uſher of the black rod. They have alſo a dean with 12 canons, and petty canons, vergers, and 26 penſioners or poor knights. The prelate is the head. This office is veſted in the biſhop of Wincheſter, and has ever been ſo. Next to the prelate is the chancellor; which office is veſted in the biſhop of Saliſbury, who keeps the ſeals, &c. The next is the regiſter, who by his oath is to enter upon the regiſtry, the ſcrutinies, elections, penalties, and other acts of the order, with all fidelity. The fourth officer is Garter and King-at-arms, being two diſtinct offices united in one perſon. Garter carries the rod and ſceptre at the feaſt of St George, the protector of this order, when the fovereign is preſent. He notifies the elections of new knights, attends the ſolemnity of their inſtallations, carries the garter to the foreign princes, &c. He is the principal officer within the college of arms, and chief of the heralds. See KING *at Arms*.

All theſe officers, except the prelate, have fees and penſions. The college of the order is ſeated in the caſtle of Windſor, with the chapel of St George, and the charter-houſe, erected by the founder for that purpoſe. The habit and enſign of the order are, a garter, mantle, cape, george, and collar. The four firſt were aſſigned the knights-companions by the founder; and the george and collar by Henry VIII. The garter (Plate CXV. fig. 2. N° 1.) challenges pre-eminence over all the other parts of the dreſs, by reaſon that from it the noble order is denominated; that it is the firſt part of the habit preſented to foreign princes, and abſent knights, who, and all other knights-elect, are therewith firſt adorned; and it is of ſo great honour and grandeur, that by the bare inveſtiture with this noble enſign, the knights are eſteemed companions of the greateſt military order in the world. It is worn on the left leg between the knee and calf, and is enamelled with this motto, HONI SOIT QVI MAL Y PENSE; i. e. *Shame to him that thinks evil hereof:* The meaning of which is, that king Edward having laid claim to the kingdom of France, retorted ſhame and defiance upon him that ſhould dare to think amiſs of the juſt enterpriſe he had undertaken, for recovering his lawful right to that crown; and that the bravery of thoſe knights whom he had elected into this order, was ſuch as would enable him to maintain the quarrel againſt thoſe that thought ill of it.

The mantle (*ibid.* N° 2.) is the chief of theſe veſtments made uſe of upon all ſolemn occaſions. The colour of the mantle is by the ſtatutes appointed to be blue. The length of the train of the mantle only diſtinguiſhes the fovereign from the knights-companions. To the collar of the mantle is fixed a pair of long ſtrings, anciently wove with blue ſilk only, but now twiſted round, and made of Venice gold and ſilk, of the colour of the robe, with knobs, or buttons, and taſſels at the end. The left ſhoulder of the mantle has, from the inſtitution, been adorned with a large garter, with the device, HONI SOIT, &c. Within this is the croſs of the order, which was ordained to be worn at all times by king Charles I. At length the Garter. ſtar was introduced, being a ſort of croſs irradiated with beams of ſilver; (*ibid.* N° 3.)

The collar (*ibid.* N° 4.) is appointed to be compoſed of pieces of gold in faſhion of garters, the ground enamelled blue, and the motto gold.

The manner of electing a knight-companion into this moſt noble order, and the ceremonies of inveſtiture, are as follow. When the fovereign deſigns to elect a companion of the garter, the chancellor belonging to this order draws up the letters, which, paſſing both under the fovereign's ſign-manual and ſignet of the order, are ſent to the perſon by Garter principal king at arms; and are in this manner, or to the ſame effect: "We, with the companions of our "moſt noble order of the garter, aſſembled in chap- "ter, holden this preſent day at our caſtle at Windſor, "conſidering the virtuous fidelity you have ſhewn, "and the honourable exploits you have done in our "ſervice, by vindicating and maintaining our right, "&c. have elected and choſen you one of the com- "panions of our order. Therefore, we require you "to make your ſpeedy repair unto us, to receive the "enſigns thereof, and be ready for your inſtallation "upon the — day of this preſent month, &c."

The garter, which is of blue velvet bordered with fine gold-wire, having commonly the letters of the motto of the ſame, is, at the time of election, buckled upon the left leg, by two of the ſenior companions, who receive it from the ſovereign, to whom it was preſented upon a velvet cuſhion, by Garter king at arms, with the uſual reverence, whilſt the chancellor reads the following admonition, enjoined by the ſtatutes: "To the honour of God omnipotent, and in "memorial of the bleſſed martyr St George, tie about "thy leg, for thy renown, this noble garter; wear "it as the ſymbol of the moſt illuſtrious order, "never to be forgotten or laid aſide; that thereby "thou mayeſt be admoniſhed to be courageous; and, "having undertaken a juſt war, in which thou ſhalt "be engaged, thou mayeſt ſtand firm, valiantly fight, "and ſucceſſively conquer."

The princely garter being then buckled on, and the words of its ſignification pronounced, the knight-elect is brought before the ſovereign, who puts about his neck, kneeling, a ſky-coloured ribbon, (*ibid.* N° 5.) whereunto is appendant, wrought in gold within the garter, the image of St George on horſeback, with his ſword drawn, encountering with the dragon. In the mean time the chancellor reads the following admonition: "Wear this ribbon about thy neck, ad- "orned with the image of the bleſſed martyr and "ſoldier of Chriſt, St George, by whoſe imitation "provoked, thou mayeſt ſo overpaſs both proſperous "and adverſe adventures, that having ſtoutly van- "quiſhed thy enemies both of body and ſoul, thou "mayeſt not only receive the praiſe of this tranſient "combat, but be crowned with the palm of eternal "victory."

Then the knight elected kiſſes the ſovereign's hand; thanks his majeſty for the great honour done him; riſes up, and ſalutes all the companions ſeverally, who return their congratulations. N° 2. (*ibid.*) exhibits a view of a knight of the garter in the habit of this order.

Garth. Since the inſtitution of this order, there have been eight emperors and twenty-eight kings, beſides numerous ſovereign princes, enrolled as companions thereof. Its origin is ſomewhat differently related. The common account is, that the counteſs of Saliſbury at a ball happening to drop her garter, the king took it up and preſented it to her with theſe words, "*Honi ſoit qui mal y penſe*;" i. e. Evil to him that evil thinks. This accident, it is ſaid, gave riſe to the order and the motto; it being the ſpirit of the times to mix love and war together: but as in the original ſtatutes of this order there is not the leaſt conjecture to countenance ſuch a feminine inſtitution, credit cannot be given to this tradition: the true motive is therefore attributed by very reſpectable hiſtorians, to a nobler origin; which is, that king Edward III. having iſſued forth his own garter for the ſignal of a battle, it ended ſo fortunately, that he thence took occaſion to inſtitute that order, not only as an incentive to honour and martial virtue, but alſo as a ſymbol of unity and ſociety.

GARTH (Sir Samuel), an excellent Engliſh poet and phyſician, was deſcended from a good family in Yorkſhire. He was admitted into the college of phyſicians at London in 1693. He at that time zealouſly promoted and encouraged the erecting of the diſpenſary for the relief of the ſick poor, by giving them advice gratis, and medicines at low rates. This work of charity having expoſed him and many other phyſicians to the envy and reſentment of ſeveral perſons of the ſame faculty as well as apothecaries, he ridiculed them, with a peculiar ſpirit and vivacity, in a poem called the *Diſpenſary*, in ſix cantos, highly eſteemed. He was one of the moſt eminent members of the famous ſociety called the *Kit-Kat Club*, which conſiſted of noblemen and gentlemen diſtinguiſhed by their excellent parts and affection to the houſe of Hanover. Upon the acceſſion of George I. he was knighted, and made phyſician in ordinary to his majeſty, and phyſician-general to the army. Nor were theſe more than juſt rewards even of his phyſical merit. He had gone through the office of cenſor of the college in 1702; and had practiſed always with great reputation, and a ſtrict regard to the honour and intereſt of the faculty, never ſtooping to proſtitute the dignity of his profeſſion, through mean and ſordid views of ſelf-intereſt, to any, even the moſt popular and wealthy apothecaries. In a ſteady adherence to this noble principle, he concurred with the much celebrated Dr Radcliffe, with whom he was alſo often joined in phyſical conſultations. He had a very extenſive practice, but was very moderate in his views of advancing his own fortune; his humanity and good-nature inclining him more to make uſe of the great intereſt he had with perſons in power, for the ſupport and encouragement of other men of letters. He choſe to live with the great in that degree of independency and freedom, which became a man poſſeſſed of a ſuperior genius, whereof he was daily giving freſh proofs to the public. One of his laſt performances in polite letters, was his tranſlation of the whole fourteenth book, and the ſtory of Cinnus in the fifteenth book, of Ovid's Metamorphoſes. Theſe, together with an Engliſh verſion of the reſt, were publiſhed in 1717; and he has prefixed an excellent preface to the whole, wherein he not only gives an idea of the work, and points out its principal beauties, but ſhews the uſes of the poem, and how it may be read to moſt profit. The diſtemper which ſeized him the enſuing year, and ended not but with his life, cauſed a general concern; which was particularly teſtified by lord Lanſdown, brother-poet, though of a different party, in ſome admirable verſes written on the occaſion. He died, after a ſhort illneſs which he bore with great patience, in January 1719. Gas.

GAS, the name given by Van Helmont, and after him by other chemiſts, to thoſe elaſtic fluids extricated from different terreſtrial ſubſtances, and which are not condenſible by cold. Of theſe a good number have been obſerved by Van Helmont: ſuch as, the *gas ventoſum*, or atmoſpherical air; the *gas ſylveſtre*, or fluid extricated during fermentations and effervescences, called by later authors, *fixed*, *factitious*, and *fixable* air; *gas pingue*, or the fluid expelled from inflammable ſubſtances by heat; *gas flammeum*, or the fluid produced in the deflagration of nitre. To theſe other authors have added *inflammable* air or gas, *nitrous-acid* gas, *marine* gas, *alkaline* gas, &c.

An account of the moſt remarkable properties of all theſe different fluids is given under the articles AIR, CHEMISTRY, DAMPS, &c. Of their compoſition very little is known with certainty. Dr Prieſtley ſome time ago diſcovered a method of procuring very pure atmoſpherical air from a mixture of nitrous acid with red lead, or with any dephlogiſticated earth, as related under the article AIR, n° 44. Hence he concluded, that the nitrous acid, and likewiſe earth, entered into the compoſition of the air we breathe. The proofs of this, however, from ſubſequent experiments, ſeem to be but ſlightly founded. It is certain, that part of the earth, which in Dr Prieſtley's firſt experiments was thought to enter into the compoſition of his dephlogiſticated air, was afterwards found to ſeparate from it, and to have been elevated merely by the force of the air extricating itſelf from the terreſtrial ſubſtance. With reſpect to the acid, the caſe is ſtill more dubious. It was found that dephlogiſticated air might be procured from red-lead and oil of vitriol; to which purpoſe the following experiment is recorded in the Appendix to the Chemical Dictionary. "Forty-eight pennyweights of red-lead were put into a long necked retort, the contents of which were ten cubic inches; and upon this red-lead, 24 pennyweights of oil of vitriol were poured. The noſe of the retort was then immerſed under water, and over it an inverted jar filled with water was placed. The mixture of oil of vitriol and red-lead became very hot, and ten cubic inches of air were ſoon thrown into the jar without the application of external heat. Upon applying the flame of a lamp to the bottom of the retort, bubbles of air paſſed copiouſly into the jars, which were ſucceſſively changed, that the air received at different times of the operation might be examined. The quantity of air which had been expelled from the above mixture of red-lead and vitriolic acid, was found to be 36 cubic inches, after the proper allowances for the air contained in the retort had been made; and this air was found to have all the properties of that procured by Dr Prieſtley from nitrous acid and red lead."

From ſome late experiments made by Dr Prieſtley him-

A. Bell Sculp.

Gas. himſelf, it appears, that very pure air may be obtained by means of the vitriolic acid, or indeed without any acid at all. In the courſe of his experiments, the doctor found, that dephlogiſticated air might be obtained from the green, blue, and white vitriols. Suſpecting, however, the purity of theſe vitriols which were prepared by others, he prepared ſome green vitriol himſelf by diſſolving clean iron-filings in the vitriolic acid diluted with water. Diſtilling the matter in a retort, he had the ſame reſults as before; the dephlogiſticated air which came over laſt, being very turbid, and exceedingly pure.—He now ſuſpected the purity of his oil of vitriol, which at preſent is generally procured from ſulphur with the addition of nitre. He therefore next employed the vitriolic acid prepared in Neumann's manner, in which no nitre is uſed: but dephlogiſticated air was ſtill produced from the combination of iron filings with this purer acid. And leſt the mixture of theſe two ſubſtances might be ſuſpected of having attracted pure air, in conſequence of their expoſure to the atmoſphere during their combination, he conducted the experiment in the following ſcrupulous manner. He diſſolved five pennyweights one grain of iron in a ſufficient quantity of pure oil of vitriol which had been carefully prepared for this purpoſe by Mr Winch, ſo as to be free from any admixture of the nitrous acid. The diſtillation was performed in the ſame retort in which the ſolution had been made, and in the continuation of the ſame proceſs; ſo that all communication with the external air was moſt effectually prevented. Conducting the proceſs with theſe attentions, and diſtilling the matter to dryneſs, the ſucceeding products were, firſt, the common air a little phlogiſticated; then a little fixed air, and much vitriolic-acid air; and laſtly, a conſiderable quantity of dephlogiſticated air. The reſiduum ſtill weighed more than the iron filings employed; and had the heat been increaſed, more air might perhaps have been procured.

Adding freſh oil of vitriol to this reſiduum, and treating it as before, but in a gun-barrel, a ſtill larger quantity of dephlogiſticated air was produced; ſo that the oil of vitirol appeared capable of generating dephlogiſticated air as often as it was mixed with iron, as well as the nitrous acid when mixed with red-lead, &c. in his former experiments.

On putting an ounce of manganeſe into a ſmall retort, with a very long narrow neck, and expoſing it to a red ſand-heat, 40 ounce-meaſures of air were expelled in different portions. Part of this, in every portion, was fixed air, and at firſt almoſt wholly ſo: but four-fifths of the laſt produce was the pureſt dephlogiſticated air. From an ounce of calaminaris without addition, 316 ounce-meaſures of gas were expelled by a red heat: the whole of this, however, was fixed air, except about four ounce-meaſures, which were nearly as good as common air.

In making ſome experiments on vegetation, the doctor diſcovered, that dephlogiſticated air was in ſome caſes produced naturally. Having obſerved bubbles of air that ſeemed to iſſue ſpontaneouſly from the roots of ſeveral plants growing in water, he was at firſt led to ſuſpect that this air had percolated through the plant; which had probably ſeized upon and retained the phlogiſton of the air, and then emitted the purer part. He found this conjecture verified with regard to the purity of the air; for, on examining ſome of it, he found that one meaſure of it, and one of nitrous air, occupied the ſpace only of one meaſure.—Soon after, he found that the plants had no ſhare in the production of this air; for, on taking them out of the vials, the remaining water continued to emit air as plentifully as when they were growing in it. He obſerved too, that the vials and other veſſels in which this pure air had been emitted from the water had their bottoms and ſides more or leſs covered with a green matter, from which the air evidently ſeemed to proceed. It appeared to him, however, that this green matter could neither be of an animal nor vegetable nature; but that it was a ſubſtance *ſui generis*; and that neither the external air nor animalcules could have any ſhare in the formation of it: for it was produced in vials cloſely corked, and in the middle veſſel of Mr Parker's apparatus *. But from ſome experiments made by others, it appears that the green matter will not be depoſited in vials cloſely corked, unleſs ſome air is included; and the quantity of the depoſit bears ſome proportion to that of the air left in the vial. In open vials completely filled, and inverted in water, the water contained in the vials has an intermediate communication with the atmoſphere, and the proceſs goes on as deſcribed above: but if that communication is ſtopped from the beginning, by inverting the vials in quickſilver (a fluid impermeable to air), no green matter or pure air is produced. * See *Air*, n° 53.

On filling a number of vials with different kinds of water, as river-water, rain-water, pump-water, which contained a conſiderable quantity of fixed air, he found that no green matter was produced in any of them, except in thoſe which contained the pump-water. Afterwards, however, he found that both the green matter and pure air was produced in great plenty from water ſtrongly impregnated with fixed air.—One meaſure of the pureſt air he ever obtained in this way, when mixed with two meaſures of nitrous air, occupied the ſpace only of 0.44 of a meaſure; "which (ſays Dr Prieſtley) is quite as pure as dephlogiſticated air is, at a medium."

The moſt remarkable circumſtance in this production of air is the inſtrumentality of the ſun's *light* independent of his mere *heat*. Concerning this, the doctor has the following obſervations:

"Whatever air is naturally contained in water, or in ſubſtances diſſolved in water, as calcareous matter, &c. becomes, after long ſtanding, but eſpecially when expoſed to the ſun, depurated, ſo as at length to become abſolutely dephlogiſticated; and that this air, being continually emitted by all water expoſed to the action of the ſun's rays, muſt contribute to the melioration of the ſtate of the atmoſphere in general.

"When water has been long kept in the ſhade, it has not generally yielded any other kind of air than it would have yielded at firſt; and though, when kept in an open veſſel, the air has been better, it has never been ſo good as when expoſed a much ſhorter time to the ſun.

"No degree of warmth will ſupply the place of the ſun's light: and though, when the water is once prepared by expoſure to the ſun, warmth will ſuffice to expel that air; yet, in this caſe, the air has never

Gas ‖ Gascoigne.

been fo pure as that which has been yielded fpontaneouſly, without additional heat. The reaſon of this may be, that, beſides the air already depurated, and on that account ready to quit its union with the water, heat expels, together with it, the air that was phlogiſticated, and held in a cloſer union with the water; which air, the *action of light*, whatever that is, would in time have depurated alſo.

" The quantity of air yielded by water ſpontaneouſly, far exceeds that which can be expelled from it by heat. If the water naturally contains fixed air, yet, in conſequence of this expoſure to the ſun's light, it is all diſſipated, and the natural reſiduum of it becomes pure dephlogiſticated air. For no fixed air at all, but the pureſt dephlogiſticated air is at length procured from it; and water impregnated with fixed air yields, after this expoſure, the greateſt quantity of dephlogiſticated air." From ſome experiments made by Dr Dobſon of Liverpool, and Mr Becket of Briſtol, it appears that air purer than the common atmoſphere can be extracted from ſea-water, and the water of the hot well at Briſtol.

A new ſpecies of inflammable gas has been diſcovered by Dr Ingenhouſz. This is procured by putting a ſingle drop of vitriolic ether into an inflammable air-piſtol, containing about ten cubic inches: it communicates to the common air contained in the piſtol, a ſtrong exploſive force. It is very remarkable, that the gravity of this inflammable gas exceeds that extracted from iron, in the proportion of 150 to 25. It is even heavier than common air, in the proportion of 150 to 138: ſo that, if too great a quantity of it contained in the air-piſtol, and the conſequent excluſion of too much of the common air, prevent it from taking fire, it will fall out, on holding the piſtol a few ſeconds inverted, with its mouth open; and, in conſequence of the entrance of a proper quantity of common air in its room, the exploſion will take place.—Another very remarkable circumſtance is, that though ether itſelf is ſo very volatile, and evaporates ſo quickly; yet this elaſtic vapour, generated from it, will remain ſome hours in an open glaſs, without ſuch diminution from evaporation, or its mixing with the atmoſphere, as to deſtroy its inflammable quality.

From theſe experiments we cannot conclude any thing with certainty. They only evince, in one caſe, the tranſmutation of the *gas ſylveſtre* of Helmont, our fixed air, into atmoſpherical air. With regard to this laſt, it ſeems alſo to be pretty plain, that, in ſome caſes, the element of *fire*, in others that of *light*, enters largely into its compoſition. But whether theſe elements are, in ſuch caſes, combined with any part of the terreſtrial matter, or whether they are only new-modelled by ſome different arrangement of their parts, muſt be determined by future experiments.

GASCOIGNE (Sir William), chief juſtice of the court of king's bench under Henry IV. A moſt learned and upright judge: who, being inſulted on the bench by the then prince of Wales, afterwards Henry V. with equal intrepidity and coolneſs committed the prince to priſon; and by this ſeaſonable fortitude, laid the foundation of the future glory of that great monarch, who, from this event, dated his reformation from the licentiouſneſs of his youth. It is not well authenticated that the prince ſtruck Sir William, as recorded by Shakeſpeare; but all authors agree, that he interrupted the courſe of juſtice, to ſcreen a lewd ſervant. Sir William died in 1413. Gaſcoigne ‖ Gaſſendi.

GASCOIGNE (George), an Engliſh poet of ſome fame in the early part of the reign of Queen Elizabeth, was born at Walthamſtow in Eſſex, of an ancient family, and educated at both univerſities, but principally at Cambrige. From thence he removed to Gray's Inn, and commenced ſtudent of the law; but, having a genius too volatile for that ſtudy, he travelled abroad, and for ſome time ſerved in the army in the Low Countries. He afterwards went to France; where he became enamoured of a Scottiſh lady, and married her. Being at length, ſays Wood, *weary of thoſe vanities*, he returned to England; and ſettled once more in Gray's Inn, where he wrote moſt of his dramatic and other poems. The latter part of his life he ſpent in his native village of Walthamſtow, where he died in the year 1578. He had the character of a polite gentleman, an eloquent and witty companion, *et vir inter poetas ſui ſeculi præſtantiſſimus*. His plays, firſt printed ſeparately, were afterwards, with ſeveral other poems, &c. reprinted in two volumes 4to. the firſt volume in 1577, the ſecond in 1587.

GASCOIN, or GASCOIGN, denotes the hinder thigh of a horſe, which begins at the ſtifle, and reaches to the ply or bending of the ham.

GASCONADE, a boaſt or vaunt of ſomething very improbable. The term has its riſe from the Gaſcoons, or people of Gaſcony in France, who it ſeems have been diſtinguiſhed for bragging and rhodomontado.

GASCONY, the moſt ſouth-weſt province of France, is bounded by Guienne on the north, by Languedoc on the eaſt, by the Pyrenees which ſeparate it from Spain on the ſouth, and by the bay of Biſcay on the weſt. It had its name from the ancient inhabitants called *Gaſcones*, or *Vaſcones*; by the moderns *Baſques*, or *Vaſques*. After theſe were ſubdued by the Franks, they had for ſome time dukes of their own, who were ſubject to the dukes of Aquitaine; but both were at laſt diſpoſſeſſed by the kings of France. The country produces corn, wine, fruits, tobacco, hemp, brandy, prunes, &c. The inhabitants are noted for a corrupt and vicious pronunciation of the French tongue, as well as their vain-glorious boaſting.

GASSENDI (Peter), one of the moſt celebrated philoſophers France has produced, was born at Chanterſier, about three miles from Digne in Provence, in 1592. When a child, he took particular delight in gazing at the moon and ſtars, as often as they appeared in clear unclouded weather. This pleaſure frequently drew him into bye-places, in order to feaſt his eye freely and undiſturbed; by which means his parents had him often to ſeek, not without many anxious fears and apprehenſions. They therefore put him to ſchool at Digne; where, in a ſhort time, he made ſuch an extraordinary progreſs in learning, that ſome perſons, who have ſeen ſpecimens of his genius, reſolved to have him removed to Aix, in order to ſtudy philoſophy under Feſay, a learned minor friar. This propoſal was ſo diſagreeable to his father, who intended to breed him up in his own way to country-buſineſs, as being more profitable than that of a ſcholar, that he would conſent to it only upon condition that he ſhould

return

Gaſſendi ‖ Gaſſero-ſteus.

return home in two years at farthest. Accordingly young Gaſſendi, at the end of the appointed time, repaired to Chanterfier: but he had not been long there, when he was invited to be profeſſor of rhetoric at Digne, before he was quite 16 years of age; and he had been engaged in that office but three years, when his maſter Feſay dying, he was made profeſſor in his room at Aix. When he had been there a few years, he compoſed his Paradoxical Exercitations; which, coming to the hands of Nicholas Peireſc, that great patron of learning joined with Joſeph Walter prior of Valette in promoting him; and he, having entered into holy orders, was firſt made canon of the church of Digne and doctor of divinity, and then obtained the wardenſhip or rectorſhip of that church. Gaſſendi's fondneſs for aſtronomy grew up with his years; and his reputation daily increaſing, he was, in 1645, appointed royal profeſſor of mathematics at Paris. This inſtitution being chiefly deſigned for aſtronomy, our author read lectures on that ſcience to a crowded audience. However, he did not hold this place long; for a dangerous cough and inflammation of the lungs obliged him, in 1647, to return to Digne for the benefit of his native air.—Gaſſendi wrote againſt the metaphyſical meditations of Des Cartes; and divided with that great man the philoſophers of his time, almoſt all of whom were Carteſians or Gaſſendians. He joined to his knowledge of philoſophy and the mathematics, an acquaintance with the languages and a profound erudition. He wrote, 1. Three volumes on Epicurus's Philoſophy; and ſix others, which contain his own philoſophy. 2. Aſtronomical works. 3. The lives of Nicholas de Peireſc, Epicurus, Copernicus, Tycho Brahe, Peurbachius, and Regiomontanus. 4. Epiſtles, and other treatiſes. All his works were collected together, and printed at Lyons in 1658, in ſix volumes folio. He died at Paris in 1655, aged 63.

GASTEROSTEUS, the STICKLE-BACK, in ichthyology, a genus of fiſhes belonging to the order of thoracici. There are three rays in the membrane of the gills; the body is carinated; and there are ſome diſtinct prickles before the back-fin. There are 11 ſpecies diſtinguiſhed by the number of prickles on the back. One of theſe ſpecies, the aculeatus, ſtickleback, banſticle, or ſharpling, is common in many of the Britiſh rivers. In the fens of Lincolnſhire, and ſome rivers that proceed from them, they are found in prodigious quantities. At Spalding there are, once in ſeven or eight years, amazing ſhoals that appear in the Weſtland, and come up the river in form of a vaſt column. They are ſuppoſed to be the multitudes that have been waſhed out of the fens by the floods of ſeveral years, and collected in ſome deep hole, till, overcharged with numbers, they are periodically obliged to attempt a change of place. The quantity is ſo great, that they are uſed to manure the land, and trials have been made to get oil from them. A notion may be had of this vaſt ſhoal, by being informed, that a man being employed by the farmer to take them, has got for a conſiderable time four ſhillings a-day by ſelling them for a half-penny per buſhel.—This ſpecies ſeldom reaches the length of two inches; it hath three ſharp ſpines on the back, that can be raiſed or depreſſed at pleaſure. The colour of the back and ſides is an olive-green; the belly white; but in ſome the lower jaws and belly are of a bright crimſon.

GAST-HOUND. See GAZE-*Hound*.

GASTRELL (Francis), biſhop of Cheſter, was born in 1662, appointed preacher to the ſociety of Lincoln's Inn in 1694, and made biſhop of Cheſter in 1714. He preached a courſe of ſermons for Boyle's lectures; engaged in the Trinitarian controverſy with Mr Collins and Dr Clarke; and publiſhed two excellent pieces, the one intitled, *Chriſtian Inſtitutes*, and the other, *A moral proof of a future ſtate*. He vindicated the rights of the univerſity of Oxford, againſt the archbiſhop of Canterbury, in the appointment of the warden of Manchester college; and oppoſed the violent proceedings againſt biſhop Atterbury in the houſe of lords, though he diſliked the biſhop as a man of arbitrary principles. He died in 1725.

GASTRIC, in general, ſomething belonging to the ſtomach.

GASTRIC *Juice*, a thin pellucid liquor, which diſtills from certain glands in the ſtomach, for the dilution, &c. of the food.

From ſome late experiments it appears, that this juice is the chief inſtrument of digeſtion; but in what manner this operation is performed by it, remains yet a ſecret. It is not poſſeſſed of any corroſive acrimony, for this would act upon all ſubſtances indiſcriminately; but the gaſtric juice is found to act only upon particular ſubſtances. The moſt remarkable particularity of this kind is, that though it very readily diſſolves animal ſubſtances when deprived of the vital principle, it abſolutely refuſes to touch thoſe which are alive. This would ſeem to favour the opinion formerly in vogue, that digeſtion was performed by means of a kind of fermentation induced into the ſubſtances ſwallowed for food; as very probably the parts of living animals may be capable of reſiſting thoſe fermentations which readily take place in dead ones. But whether or not this is the caſe, muſt be determined by future experiments.

GASTROCNEMIUS, in anatomy. See ANATOMY, *Table of the Muſcles*.

GASTROMANCY, a method of devination by water, practiſed by the ancient Greeks. See DIVINATION.

GASTROPHY, in ſurgery, the operation of ſewing up wounds of the abdomen. See SURGERY.

GATE, in architecture, a large door, leading or giving entrance into a city, town, caſtle, palace, or other conſiderable building; or a place giving paſſage to perſons, horſes, coaches, or waggons, &c. As to their proportion, the principal gates for entrance thro' which coaches and waggons are to paſs, ought never to be leſs than ſeven feet in breadth, nor more than 12, which laſt dimenſion is fit only for large buildings. The height of a gate is to be $1\frac{1}{2}$ of the breadth, and ſomewhat more; but as for common gates in inns, under which waggons go loaded with hay, ſtraw, &c. the height of them may be twice their breadth. See ARCHITECTURE.

GATES *of Hell*. This expreſſion is uſed in ſcripture, to denote figuratively, either the *grave*, or the *powers of darkneſs*, i. e. the devil and his angels.

The Mahometans uſe the expreſſion literally, and ſuppoſe that hell has ſeven gates. The firſt is that where Muſſulmans, who incur the guilt of ſin, will be tormented. The ſecond is for the Chriſtians. The third

Gaſt ‖ Gates.

third is for the Jews. The fourth for the Sabians. The fifth for the Magians, or worſhippers of fire. The ſixth for Pagans and idolaters. And the ſeventh for hypocrites, who make an outward ſhew of religion, but have none.

GATAKER (Thomas), a learned critic and divine, was born at London in 1574, and ſtudied at St John's college, Cambridge. He was afterwards choſen preacher at Lincoln's Inn; which he quitted in 1611, for the rectory of Rotherhithe in Surry. In 1620, he made a tour through the Low Countries; and, in 1624, publiſhed at London a book intitled, "Tranſubſtantiation declared by the confeſſion of the Popiſh writers to have no neceſſary foundation in God's word:" he wrote likewiſe a defence of this diſcourſe. In 1642, he was appointed one of the aſſembly of divines, and was engaged with them in writing annotations upon the bible. He died in July 1654, in the 80th year of his age. Beſides the above works, he publiſhed, 1. A diſſertation upon the ſtyle of the New Teſtament. 2. *De nomine tetragrammate.* 3. *De diphthongis, ſive bivocalibus.* 4. An edition and tranſlation of the emperor Marcus Antoninus's meditations. 5. A collection of ſermons, in folio; and many other works. His piety and charity were very exemplary; and his modeſty ſo great, that he declined all eccleſiaſtical dignity and court-preferments. His extenſive learning was admired by Salmaſius and other great men abroad; his houſe was a private ſeminary for young gentlemen of this nation, and many foreigners reſorted to him to receive advice in their ſtudies.

GAUDEN (Dr Joſeph), ſon of John Gauden vicar of Mayfield in Eſſex, was born there in 1605. At the commencement of the civil war, he was chaplain to Robert earl of Warwick; who taking part with the parliament againſt the king, was followed by his chaplain. Upon the eſtabliſhment of the preſbyterian model of church-government, he complied with the ruling powers, and was nominated one of the aſſembly of divines who met at Weſtminſter in 1643, and took the covenant; yet having offered ſome ſcruples and objections to it, his name was afterward ſtruck out of the liſt. Nor did he eſpouſe the parliament-cauſe any longer than they adhered to their firſt avowed principles of reforming only, inſtead of deſtroying, monarchy and epiſcopacy. In this ſpirit he was one of thoſe divines who ſigned a proteſtation to the army, againſt the violent proceedings that affected the life of the king: and a few days after his execution publiſhed the famous Εικων Βασιλικη, *A Portraiture of his ſacred Majeſty in his ſolitude and ſufferings*; which ran through 50 editions in the courſe of a year. Upon the return of Charles II. he was promoted to the ſee of Exeter; and in 1662 was removed to Worceſter, much to his regret, having flattered himſelf with the hopes of a tranſlation to Wincheſter: and his death happened the ſame year. He wrote many controverſial pieces ſuited to the circumſtances of the times, and to his own views from them.—The *Eikon Baſilike* above mentioned he publiſhed as the king's private meditations: though on this point there has been a long controverſy. After the biſhop's death, his widow, in a letter to one of her ſons, calls it "The Jewel;" and ſaid, her huſband had hoped to make a fortune by it; and that ſhe had a letter of a very great man's, which would clear up that he writ it. This aſſertion, as the earl of Clarendon had predicted, was eagerly eſpouſed by the anti-royaliſts, in the view of diſparaging Charles I. But it has been obſerved, that Gauden had too luxuriant an imagination, which betrayed him into a rankneſs of ſtyle in the Aſiatic way; and from thence, as biſhop Burnet argues with others, it may be certainly concluded, that not he, but the king himſelf, was the true author of the Εικων Βασιλικη: in which there is a nobleneſs and juſtneſs of thought, with a greatneſs of ſtyle, that made it be looked on as the beſt written book in the Engliſh language.

GAVEL, or Gable, among builders. See Gable.

Gavel, in law: tribute, toll, cuſtom, or yearly revenue; of which we had in old time ſeveral kinds. See Gabel.

Gavel-*Kind*, a tenure or cuſtom belonging to lands in the county of Kent. The word is ſaid by Lambard to be compounded of three Saxon words, *gyfe, eal, kyn*, "*omnibus cognatione proximis data.*" Verſtegan calls it *gavelkind*, quaſi "give all kind," that is, to each child his part: and Taylor, in his hiſtory of *gavelkind*, derives it from the Britiſh *gavel*, i. e. a hold or tenure, and *cenned*, "*generatio* aut *familia*;" and ſo *gavel cenned* might ſignify *tenura generationis.*—It is univerſally known what ſtruggles the Kentiſh men made to preſerve their ancient liberties, and with how much ſucceſs thoſe ſtruggles were attended. And as it is principally here that we meet with the cuſtom of gavelkind, (though it was and is to be found in ſome other parts of the kingdom), we may fairly conclude, that this was a part of theſe liberties; agreeably to Mr Selden's opinion, that gavelkind, before the Norman conqueſt, was the general cuſtom of the realm. The diſtinguiſhing properties of this tenure are various: ſome of the principal are theſe. 1. The tenant is of age ſufficient to alienate his eſtate by feoffment, at the age of 15. 2. The eſtate does not eſcheat in caſe of an attainder and execution for felony; their maxim being, "the father to the bough, the ſon to the plough." 3. In moſt places he had a power of deviſing lands by will, before the ſtatute for that purpoſe was made. 4. The lands deſcend, not to the eldeſt, youngeſt, or any one ſon only, but to all the ſons together; which was indeed anciently the moſt uſual courſe of deſcent all over England, tho' in particular places particular cuſtoms prevailed.

GAVELET, in law, an ancient and ſpecial ceſſavit uſed in Kent, where the cuſtom of gavelkind continues, by which the tenant, if he withdraws his rent and ſervices due to the lord, forfeits his lands and tenements.

The proceſs of the gavelet is thus. The lord is firſt to ſeek by the ſteward of his court, from three weeks to three weeks, to find ſome diſtreſs upon the tenement, till the fourth court; and if at that time he find none, at this fourth court it is awarded, that he take the tenement in his hand in name of a diſtreſs, and keep it a year and a day without manuring; within which time, if the tenant pay his arrears, and make reaſonable amends for the with-holding, he ſhall have and enjoy his tenement as before: if he come not before the year and day be paſt, the lord is to go to the next county-court, with witneſſes of what had paſſed at his own court, and pronounce there his proceſs, to have

Gavelet ‖ Gaul.

have further witneſſes; and then by the award of his own court, he ſhall enter and manure the tenement as his own: ſo that if the tenant deſired afterwards to have and hold it as before, he muſt agree with the lord; according to this old ſaying: "Has he not ſince any thing given, or any thing paid, then let him pay five pound for his were, e're he become healder again." Other copies have the firſt part with ſome variation; "Let him nine times pay, and nine times repay."

GAVELET, in London, is a writ uſed in the huſtings, given to lords of rents in the city of London. Here the parties, tenant and demandant, appear by *ſcire facias*, to ſhew cauſe why the one ſhould not have his tenement again on payment of his rent, or the other recover the lands on default thereof.

GAUGAMELA, (anc. geog.), a village of Aturia, lying between the rivers Lycus and Tigris; famous for Alexander's victory over Darius. It is ſaid to have been allowed to Darius Hyſtaſpes for the maintenance of a camel; and hence the name. It was not far from a more conſiderable place called *Arbela*; whence the latter gave the name to the victory. See ARBELA.

GAUGE-POINT of a ſolid meaſure, the diameter of a circle whoſe area is equal to the ſolid content of the ſame meaſure.

GAUGER, a king's officer, who is appointed to examine all tuns, pipes, hogſheads, and barrels of wine, beer, ale, oil, honey, &c. and give them a mark of allowance, before they are ſold in any place within the extent of his office.

GAUGING. See GEOMETRY.

GAUL, the name given by the Romans to the preſent kingdom of France.—The original inhabitants were deſcended from the Celtes or Gomerians, by whom the greateſt part of Europe was peopled; the name of *Galli*, or *Gauli*, being probably given them long after their ſettlement in that country.

The ancient hiſtory of the Gauls is entirely wrapped up in obſcurity and darkneſs; all we know concerning them for a long time is, that they multiplied ſo faſt, that, their country being unable to contain them, they poured forth in vaſt multitudes into other countries, which they generally ſubdued, and ſettled themſelves in. It often happened, however, that theſe colonies were ſo moleſted by their neighbours, that they were obliged to ſend for aſſiſtance to their native country. This was always very eaſily obtained. The Gauls were, upon every occaſion, ready to ſend forth great numbers of new adventurers; and as theſe ſpread deſolation where-ever they came, the very name of *Gauls* proved terrible to moſt of the neighbouring nations.

1 Account of the Gauliſh excurſions into Italy.

—The earlieſt excurſion of theſe people of which we have any diſtinct account, was into Italy, under a famed leader, named *Bellovefus*, about 622 years before Chriſt. He croſſed the Rhone and the Alps, till then unattempted; defeated the Hetrurians; and ſeized upon that part of their country, ſince known by the names of *Lombardy* and *Piedmont*.—The ſecond grand expedition was made by the Cœnomani, a people dwelling between the rivers Seine and Loire, under a general named *Elitonis*. They ſettled in thoſe parts of Italy, now known by the names of *Breſciano*, *Cremoneſe*, *Mantuan*, *Carniola*, and *Venetian*. —In a third excurſion, two other Gauliſh nations ſettled on both ſides of the river Po; and in a fourth, the Boii and Lingones ſettled in the country between Ravenna and Bologna. The time of theſe three laſt expeditions is uncertain. Gaul.

The fifth expedition of the Gauls was more remarkable than any of the former, and happened about 200 years after that of Bellovefus. The Senones, ſettled between Paris and Meaux, were invited into Italy by an Hetrurian lord, and ſettled themſelves in Umbria. Brennus their king laid ſiege to Cluſium, a city in alliance with Rome: and this produced a war with the Romans, in which the latter were at firſt defeated, and their city taken and burnt; but at length the whole army was cut off by Camillus, inſomuch that not a ſingle perſon eſcaped.

Some other expeditions the Gauls undertook againſt the Romans: in which, though they always proved unſucceſsful, by reaſon of their want of military diſcipline; yet their fierceneſs and courage made them ſo formidable to the republic, that, on the firſt news of their march, extraordinary levies of troops were made, ſacrifices and public ſupplications offered to the gods, and the law which granted an immunity from military ſervice to prieſts and old men, was, for the time, aboliſhed.

2 Expedition againſt the Greeks.

Againſt the Greeks, the expeditions of the Gauls were very little more ſucceſsful than againſt the Romans. The firſt of theſe we hear of, was about 279 years before Chriſt, in the year after Pyrrhus had invaded Italy. At this time, the Gauls finding themſelves greatly overſtocked at home, ſent out three great colonies to conquer new countries for themſelves. One of theſe armies was commanded by *Brennus*, another by *Cerethrius*, and the third by *Belgius*. The firſt entered Pannonia or Hungary; the ſecond Thrace; and the third marched into Illyricum and Macedonia. Here Belgius at firſt met with great ſucceſs; and enriched himſelf by plunder to ſuch a degree, that Brennus envying him, reſolved to enter the ſame countries, in order to ſhare the ſpoil. In a ſhort time, however, Belgius met with ſuch a total defeat, that his army was almoſt entirely deſtroyed; upon which Brennus haſtened to the ſame place. His army at firſt conſiſted of 150,000 foot and 15,000 horſe: but two of his principal officers revolted, and carried off 20,000 men, with whom they marched into Thrace; where, having joined Cerethrius, they ſeized on Byzantium and the weſtern coaſt of Propontis, making the adjacent parts tributary to them.—To retrieve this loſs, Brennus ſent for freſh ſupplies from Gaul; and having increaſed his army to 150,000 foot, and upwards of 60,000 horſe, he entered Macedonia, defeated the general who oppoſed him, and ravaged the whole country. He next marched towards the ſtraits of Thermopylæ, with a deſign to invade Greece; but was ſtopped by the forces ſent to defend that paſs againſt him. He paſſed the mountains, however, as Xerxes had formerly done; upon which the guards retired, to avoid being ſurrounded. Brennus then, having ordered Acicherius, the next to him in command, to follow at a diſtance with part of his army, marched with the bulk of the forces to Delphi, in order to plunder the rich temple there. This enterpriſe proved exceedingly unfortunate: a great number of his men were deſtroyed by a dreadful ſtorm of hail, thunder, and lightning; another

3 Miſerable fate of their army.

Gaul. another part of his army was deſtroyed by an earthquake; and the remainder, ſome how or other, imagining themſelves attacked by the enemy, fought againſt each other the whole night, ſo that in the morning ſcarce one half of them remained. The Greek forces then poured in upon them from all parts; and that in ſuch numbers, that though Acichorius came up in due time with his forces, Brennus found himſelf unable to make head againſt the Greeks, and was defeated, with great ſlaughter. He himſelf was deſperately wounded; and ſo diſheartened by his misfortune, that, having aſſembled all his chiefs, he adviſed them to kill all the wounded and diſabled, and to make the beſt retreat they could; after which, he put an end to his own life. On this occaſion, it is ſaid that 20,000 of theſe unhapy people were executed by their own countrymen. Acichorius then ſet out with the remainder for Gaul; but by being obliged to march through the country of their enemies, the calamities they met with by the way were ſo grievous, that not one of them reached their own country. A juſt judgement, ſay the Greek and Roman authors, for their ſacrilegious intentions againſt Delphi.

4 Gaul invaded by the Romans.

The Romans having often felt the effects of the Gauliſh ferocity and courage, thought proper at laſt, in order to humble them, to invade their country. Their firſt ſucceſsful attempt was about 118 years before Chriſt, under the command of Quintus Marcius, ſurnamed *Rex*. He opened a way betwixt the Alps and the Pyrenees, which laid the foundation for conquering the whole country. This was a work of immenſe labour of itſelf, and rendered ſtill more difficult by the oppoſition of the Gauls, eſpecially thoſe called the Stœni, who lived at the foot of the Alps. Theſe people finding themſelves overpowered by the conſular army, ſet fire to their houſes, killed their wives and children, and then threw themſelves into the flames. After this Marcius built the city of Narbonne, which became the capital of a province. His ſucceſſor Scaurus alſo conquered ſome Gauliſh nations; and in order to facilitate the ſending troops from Italy into that country, he made ſeveral excellent roads between them, which before were almoſt impaſſable. Theſe ſucceſſes gave riſe to the invaſion of the Cimbri and Teutones; an account of whoſe unfortunate expedition is given under the articles Cimbri, Rome, Teutones, &c.

From this time, the Gauls ceaſed to be formidable to the Romans, and even ſeem to have been for ſome time on good terms with them. At laſt, however, the Helvetii kindled a war with the republic, which brought Cæſar over the Alps, and ended in the total ſubjection of the country. Orgetorix was the firſt cauſe of it; who had engaged a vaſt number of his countrymen to burn their towns and villages, and to go in ſearch of new conqueſts. Julius Cæſar, to whoſe lot the whole country of Gaul had fallen, made ſuch haſte to come and ſuppreſs them, that he was got to the Rhone in eight days; broke down the bridge of Geneva, and, in a few days more, finiſhed the famed wall between that city and mount Jura, now St Claude, which extended ſeventeen miles in length, was ſixteen feet high, fortified with towers and caſtles at proper diſtances, and a ditch that ran the whole length of it. If his own account of it may be relied upon, he did not ſet out till the beginning of April; and yet this huge work was finiſhed by the ides or 13th of the month: ſo that, ſubtracting the eight days he was acoming, it muſt have been all done in about five days: a prodigious work, conſidering he had but one legion there, or even though the whole country had given him aſſiſtance. Whilſt this was doing, and the reinforcements he wanted were coming, he amuſed the Helvetii, who had ſent to demand a paſſage through the country of the Allobroges, till he had got his reinforcements; and then flatly refuſed it to them: whereupon a dreadful battle enſued; in which they loſt one hundred and thirty thouſand men, in ſpite of all their valour; beſides a number of priſoners, among whom was the wife and daughter of Orgetorix, the leader of this unfortunate expedition. The reſt ſubmitted, and begged they might be permitted to go and ſettle among the Ædui, from whom they originally ſprung; and, at the requeſt of theſe laſt, were permitted to go.

Gaul.

The Gauls were conſtantly in a ſtate of variance with one another; and Cæſar, who knew how to make the moſt of theſe inteſtine broils, ſoon became the protector of the oppreſſed, a terror to the oppreſſor, and the umpire of all their contentions. Among thoſe who applied to him for help, were his allies the Ædui; againſt whom Arioviſtus, king of the Germans, joined with the Arverni, who inhabited the banks of the Loire, had taken the country of the Sequani from them, and obliged them to ſend hoſtages to him. Cæſar forthwith ſent to demand the reſtitution of both, and, in an interview which he ſoon after obtained of that haughty and treacherous prince, was like to have fallen a ſacrifice to his perfidy; upon which he bent his whole power againſt him, forced him out of his ſtrong intrenchments, and gave him a total overthrow. Arioviſtus eſcaped, with difficulty, over the Rhine; but his two wives, and a daughter, with a great number of Germans of diſtinction, fell into the conqueror's hand. Cæſar, after this ſignal victory, put his army into winter-quarters, whilſt he went over the Alps to make the neceſſary preparations for the next campaign. By this time all the Belgæ in general were ſo terrified at his ſucceſs, that they entered into a confederacy againſt the Romans, as their common enemy. Of this, Labienus, who had been left in Gaul, ſent Cæſar notice; upon which, he immediately left Rome, and made ſuch diſpatch, that he arrived upon their confines in about fifteen days. On his arrival, the Rhemi ſubmitted to him; but the reſt, appointing Galba, king of the Sueſſones, general of all their forces, which amounted to one hundred and fifty thouſand men, marched directly againſt him. Cæſar, who had ſeized on the bridge of the Axona, now Aiſne, led his light horſe and infantry over it; and, whilſt the others were incumbered in croſſing that river, made ſuch a terrible ſlaughter of them, that the river was filled with their dead, inſomuch that their bodies ſerved for a bridge to thoſe who eſcaped. This new victory ſtruck ſuch terror into the reſt, that they diſperſed themſelves; immediately after which, the Sueſſones, Bellovaci, Ambiones, and ſome others, ſubmitted to him. The Nervii, indeed, joined with the Atrebates and Veromandui, againſt them; and, having firſt ſecured

6 A general confederacy againſt him.

7 The Gauls defeated with great ſlaughter.

5 Surpriſing ſucceſs of Julius Cæſar.

ſome

Gaul.

their wives and children, made a vigorous reſiſtance for ſome time; but were at length defeated, and the greateſt part of them ſlain. The reſt, with their wives and old men, ſurrendered themſelves, and were allowed to live in their own cities and towns as formerly. The Aduatici were next ſubdued; and, for their treachery to the conqueror, were ſold for ſlaves, to the number of fifty thouſand. Young Craſſus, the ſon of the triumvir, ſubdued likewiſe ſeven other nations, and took poſſeſſion of their cities; which not only completed the conqueſt of the Belgæ, but brought ſeveral nations from beyond the Rhine to ſubmit to the conqueror. The Veneti, or ancient inhabitants of Vannes in Britany, who had been likewiſe obliged to ſend hoſtages to the conqueror, were, in the mean time, making great preparations, by ſea and land, to recover their liberty. Cæſar, then in Illyricum, was forced to equip a fleet on the Loire; and, having given the command of it to Brutus, went and defeated them by land, as Brutus did by ſea; and, having put their chief men to death, ſold the reſt for ſlaves. The Unelli, with Veridorix their chief, together with the Lexovii and Auleroi, were, about the ſame time, ſubdued by Sabinus, and the Aquitani by Craſſus, with the loſs of thirty thouſand men. There remained nothing but the countries of the Morini and Menapii to be conquered, of all Gaul. Cæſar marched himſelf againſt them: but he found them ſo well intrenched in their inacceſſible fortreſſes, that he contented himſelf with burning and ravaging their country; and, having put his troops into winter-quarters, again paſſed over the Alps, to have a more watchful eye on ſome of his rivals there. He was, however, ſoon after obliged to come to defend his Gauliſh conqueſts againſt ſome nations of the Germans, who were coming to ſettle there, to the number of four hundred thouſand. Theſe he totally defeated, and then reſolved to carry his conquering arms into Germany: but for an account of his exploits there, ſee the article GERMANY.

8 The Gauls revolt, but are ſubdued.

Upon his return into Gaul, he found it labouring under a great famine, which had cauſed a kind of univerſal revolt. Cotta and Sabinus, who were left in the country of the Eburones, now Liege, were betrayed into an ambuſh by Ambiorix, one of the Gauliſh chiefs, and had moſt of their men cut off. The Aduatici had fallen upon Q. Cicero, who was left there with one legion, and had reduced him to great ſtraits: at the ſame time Labienus, with his legion, was attacked by Indutiomarus, at the head of the Rheni and Senones; but had better luck than the reſt, and, by one bold ſally upon them, put them to flight, and killed their general. Cæſar acquired no ſmall credit by quelling all theſe revolts; but each victory loſt the lives of ſo many of his troops, that he was forced to have recourſe to Pompey for a freſh ſupply, who readily granted him two of his own legions to ſecure his Gauliſh conqueſts.

9 A ſecond revolt.

But it was not long before the Gauls, ever reſtleſs under a foreign yoke, raiſed up a new revolt, and obliged him to return thither. His fear leſt Pompey ſhould gain the affections of the Roman people, had obliged him to ſtrip the Gauls of their gold and ſilver, to bribe them over to his intereſt; and this gave no ſmall handle to thoſe frequent revolts which happened during his abſence. He quickly, however, reduced the Nervii, Adnatici, Menapii, and Treviri; the laſt of whom had raiſed the revolt, under the command of Ambiorix: but he found the flame ſpread much farther, even to the greateſt part of the Gauls, who had choſen Vercingetorix their generaliſſimo. Cæſar was forced to leave Inſubria, whither he had retired to watch the motions of Pompey, and, in the midſt of winter and ſnow, to repaſs the Alps, into the province of Narbonne. Here he gathered his ſcattered troops with all poſſible ſpeed; and, in ſpite of the hard weather, beſieged and took Noviodunum, now Noyons; and defeated Vercingetorix, who was come to the relief of that place. He next took the city of Avaricum, now Bourges, one of the ſtrongeſt in Gaul, and which had a garriſon of forty thouſand men; of whom he made ſuch a dreadful ſlaughter, that hardly eight hundred eſcaped. Whilſt he was beſieging Gergovia, the capital of the Arverni, he was informed that the Nitiobriges, or Agenois, were in arms; and that the Ædui were ſending to Vercingetorix ten thouſand men, which they were to have ſent to reinforce Cæſar. Upon this news, he left Fabius to carry on the ſiege, and marched againſt the Ædui. Theſe, upon his approach, ſubmitted, in appearance, and were pardoned; but ſoon after that whole nation roſe up in arms, and murdered all the Italian troops in their capital. Cæſar, at this, was in great ſtraits what meaſures to take; but reſolved at length to raiſe the ſiege of Gergovia, and at once attack the enemy's camp, which he did with ſome ſucceſs: but when he thought to have gone to Noviodunum, or Noyons, where his baggage, military cheſt, &c. were left, he heard that the Ædui had carried it off, and burnt the place. Labienus, juſtly thinking that Cæſar would want his aſſiſtance in the condition he now was, went to join him, and in his way defeated a Gauliſh general, named *Camulogenes*, who came to oppoſe his march: but this did not hinder the revolt from ſpreading itſelf all over Celtic Gaul, whither Vercingetorix had ſent for freſh ſuppies, and, in the mean time, attacked Cæſar; but was defeated, and forced to retire to Aleſia, a ſtrong place, now Aliſe in Burgundy, as is ſuppoſed. Hither Cæſar haſtened, and beſieged him; and, having drawn a double circumvallation, with a deſign to ſtarve him in it, as he was likely to have done, upon that account refuſed all offers of a ſurrender from him. At length, the long-expected reinforcement came, conſiſting of one hundred and ſixty thouſand men, under four generals: theſe made ſeveral fruitleſs attacks on Cæſar's trenches; but were defeated in three ſeveral battles, which at length obliged Vercingetorix to ſurrender at diſcretion. Cæſar uſed all his priſoners with great ſeverity, except the Ædui and Arverni, by whoſe means he hoped to gain their nations, which were the moſt potent of Celtic Gaul: nor was he diſappointed; for both of them ſubmitted to him, and the former received him into their capital, where he ſpent the winter, after he had put his army into winter-quarters. This campaign, as it proved one of the hardeſt he ever had, ſo he gained more glory by it than any Roman general had done before: yet could not all by this procure from the ſervile ſenate, now wholly dedicated to his rival, a prolongation of his proconſulſhip; upon which he is reported to have laid his hand upon his ſword, and ſaid, that that ſhould do it.

10 They are again ſubdued.

Gaul.

He was good as his word; and the Gauls, upon their former ill ſucceſs, reſolving to have as many ſeparate armies as provinces, in order to embarraſs him the more, Cæſar, and his generals Labienus and Fabius, were forced to fight them one after another; which they did, however, with ſuch ſucceſs, that, notwithſtanding the hardneſs of the ſeaſon, they ſubdued the Bituriges, Carnuti, Rhemi, and Bellovaci, with their general Correus, by which he at once quieted all the Belgic provinces bordering on Celtic Gaul. The next who followed were the Treviri, the Eburones, and the Andes, under their general Dunmarus. The laſt place which held out againſt him was Uxellodunum; which was defended by the two laſt acting generals of the Gauls, Drapes the Senonian, and Luterius the Cadurcean. The place being ſtrong, and well garriſoned, Cæſar was obliged to march thither, from the ſartheſt part of Belgic Gaul; and ſoon after reduced it, for want of water. Here again he cauſed the right-hands of all that were fit to bear arms to be cut off, to deter the reſt from revolting afreſh. Thus was the conqueſt of Gaul finiſhed from the Alps and Pyrenees to the Rhine, all which vaſt tract was now reduced to a Roman province under the government of a prætor. During his ſeveral expeditions into Gaul, Cæſar is ſaid to have taken 800 cities; to have ſubdued 300 different nations; and to have defeated, in ſeveral battles, three millions of men, of whom one million were killed, and another taken priſoners.—The hiſtory of the country, from the time of its conqueſt by the Romans to the preſent, is given under the articles Rome and France.

11 Gaul reduced to a Roman province.

12 Character, &c. of the ancient Gauls.

The Gauls anciently were divided into a great number of different nations, which were continually at war with one another, and at variance among themſelves. Cæſar tells us, that not only all their cities, cantons, and diſtricts, but even almoſt all families, were divided and torn by factions; and thus undoubtedly facilitated the conqueſt of the whole. The general character of all theſe people was an exceſſive ferocity and love of liberty. This laſt they carried to ſuch an extreme, that either on the appearance of ſervitude, or incapacity of action through old age, wounds, or chronic diſeaſes, they put an end to their own lives, or prevailed upon their friends to kill them. In cities, when they found themſelves ſo ſtraitly beſieged that they could hold out no longer, inſtead of thinking how to obtain honourable terms of capitulation, their chief care very often was to put their wives and children to death, and then to kill one another, to avoid being led into ſlavery. This exceſſive love of liberty and contempt of death, according to Strabo, very much facilitated their conqueſt by Cæſar; for pouring their numerous forces upon ſuch an experienced enemy as Cæſar, their want of conduct very ſoon proved the ruin of the whole.

The chief diverſion of the Gauls was hunting; and indeed, conſidering the vaſt foreſts with which their country abounded, and the multitude of wild beaſts which lodged in them, they were under an abſolute neceſſity to hunt and deſtroy them, to prevent the country from being rendered totally uninhabitable. Beſides this, however, they had alſo their hippodromes, horſe and chariot races, tilts and tournaments; at all of which the bards aſſiſted with their poems, ſongs, and muſical inſtruments.—For an account of their religion, ſee the article Druid.

Gaul ‖ Gauntlope.

The Gauls were exceſſively fond of feaſting, in which they were very profuſe; as, like all other northern nations, they were great lovers of good eating and drinking. Their chief liquors were beer and wine. Their tables were very low. They eat but little bread, which was baked flat and hard, and eaſily broken in pieces: but devoured a great deal of fleſh, boiled, roaſted, or broiled; and this they did in a very ſlovenly manner, holding the piece in their hands, and tearing it with their teeth. What they could not part by this way, they cut with a little knife which hung at their girdle. When the company was numerous, the *Coryphee*, or chief of the feaſt, who was either one of the richeſt, or nobleſt, or braveſt, ſat in the middle, with the maſter of the houſe by his ſide; the reſt took their places next according to their rank, having their ſervants holding their ſhields behind them. Theſe feaſts ſeldom ended without bloodſhed; but if by chance the feaſt proved a peaceable one, it was generally accompanied not only with muſic and ſongs, but likewiſe with dances, in which the dancers were armed cap-a-pee, and beat time with their ſwords upon their ſhields. On certain feſtivals they were wont to dreſs themſelves in the ſkins of beaſts, and in that attire accompany the proceſſions in honour of their deities or heroes. Others dreſſed themſelves in maſquerade habits, ſome of them very indecent, and played ſeveral antic and immodeſt tricks. This laſt cuſtom continued long after their converſion to Chriſtianity.

GAUNT-*bellied*, in the manege, is ſaid of a horſe whoſe belly ſhrinks up towards his flanks.

GAUNTLOPE, pronounced *gauntlet*, a military puniſhment for felony, or ſome other heinous offence.

In veſſels of war, it is executed in the following manner. The whole ſhip's crew is diſpoſed in two rows, ſtanding face to face, on both ſides of the deck, ſo as to form a lane whereby to go *forward* on one ſide, and return *aft* on the other; each perſon being furniſhed with a ſmall twiſted cord, called a *knittle*, having two or three knots upon it. The delinquent is then ſtripped naked above the waiſt, and ordered to paſs forward between the two rows of men, and aft on the other ſide, a certain number of times, rarely exceeding three; during which every perſon gives him a ſtripe as he runs along. In his paſſage through this painful ordeal, he is ſometimes tripped up, and very ſeverely handled while incapable of proceeding. This puniſhment, which is called *running the gauntlet*, is ſeldom inflicted, except for ſuch crimes as will naturally excite a general antipathy among the ſeamen; as, on ſome occaſions, the culprit would paſs without receiving a ſingle blow, particularly in caſes of mutiny and ſedition, to the puniſhment of which our ſailors ſeem to have a conſtitutional averſion.

In the land-ſervice, when a ſoldier is ſentenced to run the gauntlope, the regiment is drawn out in two ranks facing each other; each ſoldier, having a ſwitch in his hand, laſhes the criminal as he runs along naked from the waiſt upwards. While he runs, the drums beat at each end of the ranks. Sometimes he runs three, five, or ſeven times, according to the nature of the offence. The major is on horſeback, and takes care that each ſoldier does his duty.

GAVOTTA,

Gavotta || Gay.

GAVOTTA, or GAVOTTE, is a kind of dance, the air of which has two briſk and lively ſtrains in common time, each of which ſtrains is twice played over. The firſt has uſually four or eight bars; and the ſecond contains eight, twelve, or more. The firſt begins with a minim, or two crotchets, or notes of equal value, and the hand riſing; and ends with the fall of the hand upon the dominant or mediant of the mode, but never upon the final, unleſs it be a rondeau: and the laſt begins with the riſe of the hand, and ends with the fall upon the final of the mode.

Tempi di GAVOTTA, is when only the time or movement of a gavotte is imitated, without any regard to the meaſure, or number of bars or ſtrains.—Little airs are often found in ſonatas, which have this phraſe to regulate their motions.

GAUZE, or GAWSE, in commerce, a very ſlight, thin, open kind of ſtuff, made of ſilk, ſometimes of thread. There are alſo figured gauzes, and ſome with gold or ſilver on ſilk ground.

GAY (John), a celebrated Engliſh poet, deſcended from an ancient family in Devonſhire, was born at Exeter, and received his education at the free ſchool of Barnſtaple in that county, under the care of Mr. William Rayner.—He was bred a mercer in the Strand; but having a ſmall fortune, independent of buſineſs, and conſidering the attendance on a ſhop as a degradation of thoſe talents which he found himſelf poſſeſſed of, he quitted that occupation, and applied himſelf to other views, and to the indulgence of his inclination for the muſes. In 1712 we find him ſecretary, or rather domeſtic ſteward, to the ducheſs of Monmouth, in which ſtation he continued till the beginning of the year 1714; at which time he accompanied the earl of Clarendon to Hanover, whither that nobleman was diſpatched by queen Anne. In the latter end of the ſame year, in conſequence of the queen's death, he returned to England, where he lived in the higheſt eſtimation and intimacy of friendſhip with many perſons of the firſt diſtinction both in rank and abilities.—He was even particularly taken notice of by queen Caroline, then princeſs of Wales, to whom he had the honour of reading in manuſcript his tragedy of the *Captives*; and in 1726 dedicated his *Fables*, by permiſſion, to the duke of Cumberland.—From this countenance ſhewn to him, and numberleſs promiſes made him of preferment, it was reaſonable to ſuppoſe, that he would have been genteelly provided for in ſome office ſuitable to his inclination and abilities. Inſtead of which, in 1727, he was offered the place of gentleman-uſher to one of the youngeſt princeſſes; an office which, as he looked on it as rather an indignity to a man whoſe talents might have been ſo much better employed, he thought proper to refuſe; and ſome pretty warm remonſtrances were made on the occaſion by his ſincere friends and zealous patrons the duke and ducheſs of Queenſberry, which terminated in thoſe two noble perſonages withdrawing from court in diſguſt. Mr Gay's dependencies on the promiſes of the great, and the diſappointments he met with, he has figuratively deſcribed in his fable of the *Hare with many friends*. However, the very extraordinary ſucceſs he met with from public encouragement made an ample amends, both with reſpect to ſatisfaction and emolument, for thoſe private diſappointments.—For, in the ſeaſon of 1727-8, appeared his *Beggar's Opera*; the vaſt ſucceſs of which was not only unprecedented, but almoſt incredible.—It had an uninterrupted run in London of ſixty-three nights in the firſt ſeaſon, and was renewed in the enſuing one with equal approbation. It ſpread into all the great towns of England; was played in many places to the thirtieth and fortieth time, and at Bath and Briſtol fifty; made its progreſs into Wales, Scotland, and Ireland, in which laſt place it was acted for twenty-four ſucceſſive nights; and laſt of all it was performed at Minorca. Nor was the fame of it confined to the reading and repreſentation alone, for the card-table and drawing-room ſhared with the theatre and cloſet in this reſpect; the ladies carried about the favourite ſongs of it engraven upon their fan-mounts, and ſcreens and other pieces of furniture were decorated with the ſame. In ſhort, the ſatire of this piece was ſo ſtriking, ſo apparent, and ſo perfectly adapted to the taſte of all degrees of people, that it overthrew the Italian opera, that Dagon of the nobility and gentry, which had ſo long ſeduced them to idolatry, and which Dennis, by the labours and outcries of a whole life, and many other writers by the force of reaſon and reflection, had in vain endeavoured to drive from the throne of public taſte. The profits of this piece was ſo very great, both to the author and Mr Rich the manager, that it gave riſe to a quibble, which became frequent in the mouths of many, viz. *That it had made* Rich gay, *and* Gay rich; and it has been aſſerted, that the author's own advantages from it were not leſs than two thouſand pounds. In conſequence of this ſucceſs, Mr Gay was induced to write a ſecond part to it, which he entitled *Polly*. But the diſguſt ſubſiſting between him and the Court, together with the miſrepreſentations made of him as having been the author of ſome diſaffected libels and ſeditious pamphlets, occaſioned a prohibition and ſuppreſſion of it to be ſent from the lord chamberlain, at the very time when every thing was in readineſs for the rehearſal of it. A very conſiderable ſum, however, accrued to him from the publication of it afterwards in quarto.—Mr Gay wrote ſeveral other pieces in the dramatic way, and many very valuable ones in verſe. Among the latter, his *Trivia*, or the *Art of walking the ſtreets of London*, though his firſt poetical attempt, is far from being the leaſt conſiderable, and is what recommended him to the eſteem and friendſhip of Mr Pope: but, as among his dramatic works his *Beggar's Opera* did at firſt, and perhaps ever will, ſtand as an unrivalled maſter-piece, ſo, among his poetical works, his *Fables* hold the ſame rank of eſtimation, the latter having been almoſt as univerſally read as the former was repreſented, and both equally admired. Mr Gay's diſpoſition was ſweet and affable, his temper generous, and his converſation agreeable and entertaining. But he had one foible, too frequently incident to men of great literary abilities, and which ſubjected him at times to inconveniencies which otherwiſe he needed not to have experienced, viz. an exceſs of indolence, without any knowledge of œconomy. So that, though his emoluments were, at ſome periods of his life, very conſiderable, he was at others greatly ſtraitened in his circumſtances; nor could he prevail on himſelf to follow the advice of his friend dean Swift, whom we find

Gay.

Gaza
||
Gazette.

in many of his letters endeavouring to perſuade him to the purchaſing of an annuity, as a reſerve for the exigencies that might attend on old age.—Mr Gay choſe rather to throw himſelf on patronage, than ſecure to himſelf an independent competency by the means pointed out to him; ſo that, after having undergone many viciſſitudes of fortune, and being for ſome time chiefly ſupported by the liberality of the duke and ducheſs of Queenſberry, he died at their houſe in Burlington-gardens, in December 1732. He was interred in Weſtminſter-abbey, and a monument erected to his memory, at the expence of his aforementioned noble benefactors, with an inſcription expreſſive of their regards and his own deſerts, and an epitaph in verſe by Mr Pope.

GAZA (Theodore), a famous Greek in the 15th century, was born in 1398. His country being invaded by the Turks, he retired into Italy; where he at firſt ſupported himſelf by tranſcribing ancient authors, an employment the learned had frequent recourſe to before the invention of printing. His uncommon parts and learning ſoon recommended him to public notice; and particularly to cardinal Beſſarion, who procured him a benefice in Calabria. He was one of thoſe to whom the revival of polite literature in Italy was principally owing. He tranſlated from the Greek into Latin, Ariſtotle's Hiſtory of Animals, Theophraſtus on Plants, and Hippocrates's Aphoriſms; and put into Greek, Scipio's Dream, and Cicero's Treatiſe on Old Age. He wrote ſeveral other works in Greek and Latin; and died at Rome, in 1475.

GAZA, (anc. geog.) a principal city, and one of the five ſatrapies of the Philiſtines. It was ſituated about 100 ſtadia from the Mediterranean, on an artificial mount, and ſtrongly walled round. It was deſtroyed by Alexander the Great, and afterwards by Antiochus. In the time of the Maccabees it was a ſtrong and flouriſhing city; but was deſtroyed a third time by Alexander Jannæus. At preſent it has a miſerable appearance. The buildings are mean, both as to the form and matter. Some remains of its ancient grandeur appear in the handſome pillars of Parian marble which ſupport ſome of the roofs; while others are diſpoſed of here and there, in different parts of almoſt every beggarly cottage. On the top of the hill, at the north-eaſt corner of the town, are the ruins of large arches ſunk low into the earth, and other foundations of a ſtately building, from whence ſome of the baſhaws have carried off marble pillars of an incredible ſize. The caſtle is a contemptible ſtructure, and the port is ruined. E. Long. 34. 55. N. Lat. 31. 28.

GAZE-HOUND, or *Gaſt-hound*, one that makes more uſe of his ſight than of his noſe. Such dogs are much uſed in the north of England: they are fitter in an open champaign country, than in buſhy and woody places. If at any time a well-taught gaze-hound takes a wrong way, he will return upon a ſignal and begin the chace afreſh. He is alſo excellent at ſpying out the fatteſt of a herd; and having ſeparated it from the reſt, will never give over the purſuit till he has worried it to death.

GAZELLA, in zoology, a ſpecies of CAPRA.

GAZETTE, a newſpaper, or printed account of the tranſactions of all the countries in the known world, in a looſe ſheet or half-ſheet. This name is with us confined to that paper of news publiſhed by authority. The word is derived from *gazetta*, a Venetian coin, which was the uſual price of the firſt news-paper printed there, and which was afterwards given to the paper itſelf. Gazna.

The firſt gazette in England was publiſhed at Oxford, the court being there, in a folio half-ſheet, Nov. 7, 1665. On the removal of the court to London, the title was changed to the *London Gazette*. The Oxford gazette was publiſhed on Tueſdays, the London on Saturdays; and theſe have continued to be the days of publication ever ſince.

GAZNA, a city of Aſia, once much celebrated, and the capital of a very extenſive empire; but which is now either entirely ruined, or become of ſo little conſideration, that it is not taken notice of in our books of geography.—This city was anciently an emporv and fortreſs of Sableſtan, not far from the confines of India. During the vaſt and rapid conqueſts of the Arabs, all this country had been reduced under their ſubjection. On the decline of the power of the khaliſs, however, the vaſt empire eſtabliſhed by Mahomet and his ſucceſſors was divided into a number of independent principalities, moſt of which were but of ſhort duration. In the year of the Hegira 384, anſwering to the 994th of the Chriſtian æra, the city of Gazna, with ſome part of the adjacent country, was governed by Mahmud Gazni; who became a great conqueror, and reduced under his ſubjection a conſiderable part of India, and moſt of Perſia.

This empire continued in the family of Mahmud Gazni for upwards of 200 years. None of his ſucceſſors, however, were poſſeſſed of his abilities; and therefore the extent of the empire, inſtead of increaſing, was very conſiderably diminiſhed ſoon after Mahmud's death. The Seljuks made themſelves maſters of Khoraſan, and could not be driven out; the greateſt part of the Perſian dominions alſo fell off; and in the 547th year of the Hegira, the race of Gazni ſultans were entirely ſet aſide by one Gauri, who conquered Khoſru Shah the reigning prince, and beſtowed his dominions on his own nephew Gayathoddin Mohammed. Theſe new ſoltans proved greater conquerors than the former, and extended their dominions farther than even Mahmud Gazni himſelf had done. They did not, however, long enjoy the ſovereignty of Gazna; for in 1218, Jenghiz Khan, having conquered the greateſt part of China and almoſt all Tartary, began to turn his arms weſtward; and ſet out againſt the ſultan of Gazna at the head of 700,000 men.

To oppoſe this formidable army, Mohammed, the reigning ſoltan, could muſter only 400,000 men; and, in the firſt battle, 160,000 of his troops are ſaid to have periſhed. After this victory, Jenghiz Khan advanced; Mohammed not daring to riſk a ſecond battle, the loſs of which would have been attended with the entire ruin of his kingdom. He therefore diſtributed his army among the ſtrongeſt fortified towns he had in his dominions; all of which Jenghiz Khan took one after another. The rapid progreſs of his conqueſts, indeed, almoſt exceeds belief. In 1219 and 1220, he had reduced Zarnuk, Nur, Bokhara, Otrar, Saganak, Uzkant, Alſhaſh, Jund, Tonkat, Khojend, and

Gazna. and Samarcand.—Mohammed, in the mean time, fled firſt to Bokhara; but on the approach of Jenghiz Khan's army, quitted that place, and fled to Samarcand. When this laſt city was alſo in danger of being invelled, the ſoltan did not think proper to truſt himſelf in it more than in the other, though it was garriſoned by 110,000 of his braveſt troops; and therefore fled through by-ways into the province of Ghilan in Perſia, where he took refuge in a ſtrong fortreſs called *Eſtabad*. But being alſo found out in this retreat, he fled to an iſland in the Caſpian ſea called *Abiſkun*; where he ended his days, leaving his empire, ſuch as it was, to his ſon Jalaloddin.

The new ſoltan was a man of great bravery and experience in war; but nothing was able to ſtop the progreſs of the Moguls. In 1220 and 1221, they made themſelves maſters of all the kingdoms of Karazm and Khoraſan, committing every where ſuch maſſacres as were never heard of before or ſince that time. In the mean time Jaloloddin aſſembled his forces with the utmoſt diligence, and defeated two detachments of the Mogul army. This happened while Jenghiz Khan was beſieging Bamiyan; but anſwered little other purpoſe, than ſerving to bring upon that city the terrible deſtruction, of which an account is given under the article BAMIYAN. Immediately after the reduction of that city, Jenghiz Khan marched towards Gazna; which was very ſtrongly fortified, and where he expected to have found Jaloloddin. But he had left the place 15 days before; and, as Jenghiz Khan's army was much reduced, he might perhaps have ſtood his ground, had it not been for an accident. He had been lately joined by three Turkiſh commanders, each of whom had a body of 10,000 men under his command. After his victories over the Moguls, theſe officers demanded the greateſt ſhare of the ſpoils; which being refuſed, they ſeparated themſelves from the ſoltan. He uſed his utmoſt endeavours to make them hearken to reaſon; and ſent ſeveral meſſages and letters to them, repreſenting the inevitable ruin which muſt attend their ſeparation, as Jenghiz Khan was advancing againſt them with his whole army. At laſt they were perſuaded to lay aſide their animoſities; but it was now too late; for Jenghiz Khan, being informed of what paſſed, detached 60,000 horſe to prevent their joining the ſoltan's army; who finding himſelf deprived of this powerful aid, retired towards the river Indus. When he was arrived there, he ſtopped in a place where the ſtream was moſt rapid and the place confined, with a view both to prevent his ſoldiers from placing any hopes of ſafety in flight, and to hinder the whole Mogul army from attacking him at once. Ever ſince his departure from Gazna he had been tormented with a colic: yet, at a time when he ſuffered moſt, hearing that the enemy's vanguard was arrived at a place in the neighbourhood called *Herder*, he quitted his litter, and, mounting a horſe, marched with ſome of his choſen ſoldiers in the night; ſurpriſed the Moguls in their camp; and having cut them almoſt all in pieces, without the loſs of a ſingle man on his ſide, returned with a conſiderable booty.

Jengziz Khan, finding by this that he had a vigilant enemy to deal with, proceeded with great circumſpection. When he came near the Indus, he drew out his army in battalia: to Jagatay, one of his ſons, he gave the command of the right wing; to Oktay, another ſon, he gave the command of the left; and put himſelf in the centre, with 6000 of his guards. On the other ſide, Jaloloddin prepared for battle like one who had no reſource but in victory. He firſt ſent the boats on the Indus farther off; reſerving only one to carry over his mother, wife, and children: but unluckily the boat ſplit when they were going to embark, ſo that they were forced to remain in the camp. The ſoltan took to himſelf the command of the main body of the army. His left wing, drawn up under ſhelter of a mountain which hindered the whole right wing of the Moguls from engaging at once, was commanded by his vizir; and his right by a lord named *Amin Malek*. This lord began the fight; and forced the enemy's left wing, notwithſtanding the great diſparity of numbers, to give ground. The right wing of the Moguls likewiſe wanting room to extend itſelf, the ſoltan made uſe of his left as a body of reſerve, detaching from thence ſome ſquadrons to the aſſiſtance of the troops who ſtood in need of them. He alſo took one part of them with him when he went at the head of his main body to charge that of Jenghiz Khan; which he did with ſo much reſolution and vigour, that he not only put it in diſorder, but penetrated into the place where Jenghiz Khan had originally taken his ſtation: but that prince, having had a horſe killed under him, was retired from thence, to give orders for all the troops to engage.

Gazna.

This diſadvantage had like to have loſt the Moguls the battle; for a report being immediately ſpread that the enemy had broken through the main body, the troops were ſo much diſcouraged, that they would certainly have fled, had not Jenghiz Khan encouraged them by riding from place to place in order to ſhew himſelf. At laſt, however, Jaloloddin's men, who were in all but 30,000, having fought a whole day with ten times their number, were ſeized with fear, and fled. One part of them retired to the rocks which were on the ſhore of Indus, where the enemy's horſe could not follow them; others threw themſelves into the river, where many were drowned, though ſome had the good fortune to croſs over in ſafety; while the reſt, ſurrounding their prince, continued the fight through deſpair. The ſoltan, however, conſidering that he had ſcarce 7000 men left, began to think of providing for his own ſafety: therefore, having bidden a final adieu to his mother, wife and children, he mounted a freſh horſe, and ſpurred him into the river, which he croſſed in ſafety, and even ſtopped in the middle of it to inſult Jenghiz Khan, who was now arrived at the bank. His family fell into the hands of the Moguls; who killed all the males, and carried the women into captivity.

Jaloloddin being now ſecurely landed in India, got up into a tree, in order to preſerve himſelf from wild beaſts. Next day, as he walked melancholy among the rocks, he perceived a troop of his ſoldiers, with ſome officers, three of whom proved to be his particular friends. Theſe, at the beginning of the defeat, had found a boat in which they had failed all night, with much danger from the rocks, ſhelves, and rapid current of the river. Soon after, he ſaw 300 horſe coming towards him; who informed him of 4000 more

Gazna || Gelatina.

that had escaped by swimming over the river; and these also soon after joined the rest. In the mean time an officer of his household, named Jamalarrazad, knowing that his master and many of his people were escaped, ventured to load a very large boat with arms, provisions, money, and stuff to clothe the soldiers; with which he crossed the river. For this important service Jaloloddin made him steward of his household, and surnamed him the *Chosen* or the *Glory of the faith*. For some time after, the sultan's affairs seemed to go on prosperously: he gained some battles in India; but the princes of that country, envying his prosperity, conspired against him, and obliged him to repass the Indus. Here he again attempted to make head against the Moguls; but was at last defeated and killed by them, and a final end put to the once mighty empire of Gazna.

The metropolis was reduced by Oktay; who no sooner entered the country in which it was situated, than he committed the most horrid cruelties. The city was well provided with all things necessary for sustaining a siege; had a strong garrison, and a brave and resolute governor. The inhabitants, expecting no mercy from Jenghiz Khan, who they knew had sworn their ruin, were resolved to make a desperate defence. They made frequent sallies on the besiegers, several times overthrew their works, and broke above 100 of their battering rams. But one night, after an obstinate fight, part of the city-walls fell down; and a great number of Moguls having filled up the ditch, entered the city sword-in-hand. The governor perceiving all was lost, at the head of his bravest soldiers rushed into the thickest of his enemies, where he and his followers were all slain. However, Gazna was not entirely destroyed, nor were the people all killed; for after the massacre had continued four or five hours, Oktay ordered it to cease, and taxed those who were left alive at a certain rate, in order to redeem themselves and the city. It doth not, however, appear that after this time the city of Gazna ever made any considerable figure.—It was taken by the Moguls in the year 1222.

GECCO, in natural history, a name given by the Indians to their terrible poison, which kills when mixed with the blood in ever such a small quantity. They say that this gecco is a venomous froth or humour vomited out of the mouths of their most poisonous serpents; which they procure in this fatal strength, by hanging up the creatures by the tails, and whipping them to enrage them: they collect this in proper vessels as it falls; and when they would use it, they either poison a weapon with it, or wounding any part of the flesh introduce the smallest quantity imaginable into it; and this is said to be immediate death.

GECKO. See LACERTA.

GEDDES (James), born of a respectable family in Scotland in 1710, was educated for and practised at the bar several years; but died of a consumption before he arrived at the age of 40. He published *An essay on the composition and manner of writing of the ancients*; and left behind him several other tracts.

GELATINA, JELLY, a form of food, or medicine, prepared from the juices of ripe fruits, boiled to proper consistence with sugar, or of the strong decoctions of the horns, bones, or extremities of animals boiled to such a degree as to be stiff and firm when cold, without the addition of sugar.

The jellies of fruits are cooling, saponaceous, and acescent; and therefore are good as medicines in all disorders of the primæ viæ arising from alkalescent juices, especially when not given alone, but diluted with water. On the contrary, the jellies made from animal-substances are all alkalescent, and are therefore good in all cases where an acidity of the humours prevails: the alkalescent quality of these, however, is in a great measure taken off by adding lemon-juice and sugar to them. There were formerly a kind of jellies much in use, called *compound jellies*; these had the restorative medicinal drugs added to them, but they are now scarce ever heard off.

GELATINA *Avenæ*, *Oat-jelly*; a jelly of common oats, recommended by many of the German physicians in all hectic disorders, to be taken with broth of snails and craw-fish.—It is made by boiling a large quantity of oats, freed from the husk, with some hartshorn shavings and currants, together with a leg of veal cut in pieces, and with the bones all broken: these are to be set over the fire with a large quantity of water, till the whole is reduced to a kind of jelly; which when strained and cold will be very firm and hard. A few spoonfuls of this are to be taken every morning, diluted with a basin of either of the abovementioned broths, or any other warm liquor.

GELD, in the English old customs, a Saxon word signifying *money*, or *tribute*. It also denoted a compensation for some crime committed: Hence *wergeld*, in their ancient laws, was used for the value of a man slain; and *orfgeld*, of a beast.

GELDENHAUR (Gerard), in Latin *Geldenhavius*, an historian and Protestant divine in the 16th century. He was a native of Nimeguen, and studied classical learning at Deventer. He went through his course of philosophy at Louvaine, where he contracted a very strict friendship with several learned men, and particularly with Erasmus. He became reader and historian to Charles of Austria, and afterwards to Maximilian of Burgundy. At length he embraced the Protestant religion; taught history at Marpurg; and afterwards divinity till his death, in 1542. He wrote, 1. History of Holland. 2. History of the Low Countries; 3. History of the bishops of Utrecht; and other works.

GELDERLAND. See GUELDERLAND.

GELDERS. See GUELDRES.

GELDING, the operation of castrating any animal, particularly horses.

The operation consists in cutting out the testicles; in performing which, three things are to be observed: first, regard is to be had to their age; next to the season of the year; and lastly to the state of the moon. For the first, if the operation is to be performed on a colt, he may be gelded at nine or fifteen days old, if the testicles be come down; in regard the sooner he is gelt the better it will be for his growth, shape, and courage; though a horse may be gelt at any age, if proper care is taken in the cure. As for the second, the best time is about April or May, or else about the latter end of September. And for the third, the wane of the moon is the most proper time for performing this operation.

The manner of gelding is as follows. The beast be-

Gelati || Gelding

Gelding ‖ Gellert.

being cast down on some soft place, the operator takes the stones between his foremost and his great finger, and slitting the cod presses the stones forth; then taking a pair of nippers made very smooth, either of steel, box, or brasil-wood, he claps the strings of the stones between them, very near to where the stones are set on, and presses them so hard that there may be no flux of blood; then with a thin, drawing, cauterising iron, fears away the stone. This done, he takes a hard plaster made of rosin, wax, and washed turpentine, well dissolved together, and melts it on the head of the strings: he then fears them, and melts more of the salve, till such time as he has laid a good thickness of it upon the strings.

When this is done to one stone, the nippers are loosened, and the like is done to the other; and the two slits of the cod are then filled with white salt, and the outside of the cod is anointed with hog's grease: and thus they let him rise, and keep him in a warm stable, without tying him up. If he swells much in his cods or sheath, they chafe him up and down, and make him trot for an hour in a day, which soon recovers him.

The manner of gelding a hog is as follows: The operator, after having made two cross slits or incisions on the midst of the stones, presses them out, and anoints the sore with tar. But another general method, yet somewhat more dangerous if not well done, is, first to cut the stone on the top, and after having drawn that one forth, the operator puts in his fingers at the same slit, and with a lancet cuts the skin between the two stones, and by that slit presses out the other stone. Then having cleansed out the blood, he anoints the part with fresh grease: and thus there is but one incision made in the cod. Boar-pigs ought to be gelt about six months old; yet they are commonly gelded about three weeks or a month old.

GELENHAUSEN, a small imperial town of Wetteravia in Germany, with a castle built by the emperor Frederic I. E. Long. 8. 13. N. Lat. 50. 20.

GELENIUS (Sigismund), a learned and excellent man, born of a good family at Prague, about the year 1498. Erasmus conceiving an esteem for him at Basil, recommended him to John Frobenius as a corrector for his printing-house; which laborious charge he accepted, and had a great number of Hebrew, Greek, and Latin books to correct: he also translated many works himself from the Greek into Latin; and published a dictionary in four languages, Greek, Latin, German, and Sclavonian. Profitable and honourable employments were offered him in other places, but nothing could tempt him to quit his peaceful situation at Basil. He died in 1555. All his translations are highly esteemed.

GELLERT (Christian), one of the finest geniuses Germany has produced, was born at Hænichen, near Freyburg in Saxony in 1715; and studied at Leipsic, at which university he was for many years professor of philosophy and the belles lettres. He early distinguished himself by his talent for poetry; and contracted a strict friendship with the most learned and polite writers in Germany. All his works are filled with sentiment, and bear the impression of the sweetness of his disposition. The most considerable of them are his comedies, his spiritual songs and moral poems, and particularly his sacred odes, his fables, and his tales. He died in 1769, much lamented.

Gelli ‖ Gem.

GELLI (John Baptist), an eminent Italian writer, was born of mean parents at Florence, in the year 1498. He was bred a taylor: but had such an extraordinary genius, that he acquired several languages, and made an uncommon progress in the belles lettres; and though he continued always to work at his trade, became acquainted with all the wits and learned men at Florence, and his merit was universally known. He was chosen a member of the academy there, and the city made him a burgess. He acquired the highest reputation by his works, which are, 1. *I. Capricci del Bottaio*, quarto; which contains ten dialogues. 2. *La Circe*, octavo: This, which also contains ten dialogues, and treats of human nature, has been translated into Latin, French, and English. 3. Dissertations in Italian on the poems of Dante and Petrarch. 4. The comedies of *La Sporta* and *La Errore;* and other works. He died in 1563.

GELLIBRAND (Henry), a laborious astronomer of the last century, was born in 1597. Though he was not without good views in the church, yet he became so enamoured with mathematical studies, that on the death of his father he became a student at Oxford, contented himself with his private patrimony, and devoted himself solely to them. On the death of Mr Gunter, he was recommended by Mr Briggs to the trustees of Gresham college, for the astronomical professorship there; to which he was elected in 1627. His friend Mr Briggs dying in 1630, before he had finished his *Trigonometrica Britannica*, it was finished by Gellibrand at his request. He wrote several other things, chiefly tending to the improvement of navigation; and died in 1636.

GELLIUS (Aulus), or (as he is sometimes called) *Agellius*; a celebrated grammarian, who lived in the 2d century under Marcus Aurelius and some succeeding emperors. He wrote a collection of observations on authors, for the use of his children; and called it *Noctes Atticæ*, because composed in the evenings of a winter he spent at Athens. The chief value of it, is for preserving many facts and monuments of antiquity not to be found elsewhere. Critics and grammarians have bestowed much pains on this writer.

GELLY. See GELATINA.

GEM, in natural history, a common name for all precious stones; of which there are two classes, the pellucid and semipellucid.

The bodies composing the class of pellucid gems are bright, elegant, and beautiful fossils, naturally and essentially compound, ever found in small detached masses, extremely hard, pellucid, and of great lustre; composed of a very firm and pure matter, without any admixture of earthy substance; giving fire with steel, not fermenting with acid menstruums, and very difficultly calcinable in the fire. Of this class there are two genera; the chrostasima, and the chroastaces. See CHROSTASIMA and CHROASTACES.

The bodies composing the class of semipellucid gems, are stones naturally and essentially compound, not inflammable nor soluble in water, found in detached masses, and composed of crystalline mater, debased by earth: however, they are but slightly debased, and are of great beauty and brightness, of a moderate de-

Gem. degree of tranſparency, and are uſually found in ſmall maſſes.

Of this claſs there are two orders: the firſt of which conſiſts of the ſemipellucid gems, of but two variegations, and frequently of one plain ſimple colour; tho' ſometimes veined: this order contains four genera, viz. the ſardæ, the chalcedonies, the hydrophanæ, and the pramnion. See the articles SARDÆ, CHALCEDONII, HYDROPHANÆ, and PRAMNION.

The ſecond order of ſemipellucid gems, conſiſting of thoſe remarkable for their veins, zones, and variegations, contains alſo four genera, viz. the achatæ, the onyches, the ſardonyches, and the camæa. See the articles ACHATÆ, ONYCHES, SARDONYCHES, and CAMÆA.

The knowledge of gems depends principally on obſerving their hardneſs and colour. Their hardneſs is commonly allowed to ſtand in the following order: the diamond the hardeſt of all; then the ruby, ſapphire, jacinth, emerald, amethyſt, garnet, carneol, chalcedony, onyx, jaſper, agate, porphyry, and marble. This difference, however, is not regular and conſtant, but frequently varies. Good cryſtals may be allowed to ſucceed the onyx; but the whole family of metallic glaſſy fluors ſeem to be ſtill ſofter.—In point of colour, the diamond is valued for its tranſparency, the ruby for its purple, the ſapphire for its blue, the emerald for its green, the jacynth for its orange, the amethyſt carneol for its carnation, the onyx for its tawny, the jaſper, agate, and porphyry for their vermilion, green, and variegated colours, and the garnet for its tranſparent blood-red.

All theſe gems are ſometimes found coloured and ſpotted, and ſometimes quite limpid and colourleſs. In this caſe the diamond-cutter or poliſher knows how to diſtinguiſh their different ſpecies by their different degrees of hardneſs upon the mill. For the cutting or poliſhing of gems, the fine powder of the fragments of thoſe that are next in degree of hardneſs is always required to grind away the ſofter; but as none of them are harder than the diamond, this can only be poliſhed by its own powder.

Imitation or Counterfeiting of GEMS *in Glaſs.*—The art of imitating gems in glaſs, is too conſiderable to be paſſed without notice: ſome of the leading compoſitions therein, we ſhall briefly mention upon the authority of Neri.

Theſe gems are made of paſtes; and are noway inferior to the native ſtones, when carefully made and well poliſhed, in brightneſs or tranſparence, but want their hardneſs.

The general rules to be obſerved in making the paſtes are theſe: 1. That all the veſſels in which they are made be firmly luted, and the lute left to dry before they are put into the fire. 2. That ſuch veſſels be choſen for the work, as will bear the fire well. 3. That the powders be prepared on a porphyry ſtone; not in a metal mortar, which would communicate a tinge to them. 4. That the juſt proportion in the quantity of the ſeveral ingredients be nicely obſerved. 5. That the materials be all well mixed; and, if not ſufficiently baked the firſt time, to be committed to the fire again, without breaking the pot: for if this be not obſerved, they will be full of bliſters and air-bladders. 6. That a ſmall vacuity be always left at the top of the pot, to give room to the ſwelling of the ingredients.

To make paſte of extreme hardneſs, and capable of all the colours of the gems, with great luſtre and beauty.—Take of prepared cryſtal, ten pounds; ſalt of polverine, ſix pounds; ſulphur of lead, two pounds; mix all theſe well together into a fine powder; make the whole with common water into a hard paſte; and make this paſte into ſmall cakes of about three ounces weight each, with a hole made in their middle; dry them in the ſun, and afterwards calcine them in the ſtraiteſt part of a potter's furnace. After this, powder them, and levigate them to a perfect fineneſs on a porphyry-ſtone, and ſet this powder in pots in a glaſs-furnace to purify for three days: then caſt the whole into water, and afterwards return it into the furnace, where let it ſtand 15 days, in which time all foulneſs and bliſters will diſappear, and the paſte will greatly reſemble the natural jewels. To give this the colour of the emerald, add to it braſs thrice calcined; for a ſea-green, braſs ſimply calcined to a redneſs; for a ſapphire, add zaffer, with manganeſe; and for a topaz, manganeſe and tartar. All the gems are thus imitated in this, by the ſame way of working as the making of coloured glaſſes; and this is ſo hard, that they very much approach the natural gems.

The colour of all the counterfeit gems made of the ſeveral paſtes, may be made deeper or lighter, according to the work for which the ſtones are deſigned; and it is a neceſſary general rule, that ſmall ſtones for rings, &c. require a deeper colour, and large ones a paler. Beſides the colours made from manganeſe, verdigreaſe, and zaffer, which are the ingredients commonly uſed, there are other very fine ones which care and ſkill may prepare. Very fine red may be made from gold; and one not much inferior to that from iron; a very fine green from braſs or copper; a ſky-colour from ſilver, and a much finer one from the granates of Bohemia.

GEMARA, in Jewiſh antiquities, a collection of deciſions and determinations on the law, written after the Miſna was completed.

It was called *gema*, or *perfection*; becauſe it was conſidered as ſo perfect an explication of the law, that after it no further additions could be made, or any thing more deſired. It is otherwiſe called the *talmud*. See TALMUD.

GEMINI, the TWINS, in aſtronomy, one of the 12 ſigns of the zodiac, the third in order, beginning with Aries. See ASTRONOMY, n° 206.

GEMINIANI, a celebrated muſician and compoſer, was born at Lucca in the year 1680. He received his firſt inſtructions in muſic from Aleſſandro Scarlatti; and after that became a pupil of Carlo Ambroſio Lunati, ſurnamed *Il Gobbo*, a moſt celebrated performer on the violin; after which he became a diſciple of Corelli, and under him finiſhed his ſtudies on that inſtrument. In the year 1714, he came to England; where in a ſhort time he ſo recommended himſelf by his exquiſite performance, that all who profeſſed to love and underſtand muſic, were captivated with hearing him. Many of the nobility laid claim to the honour of being his patrons; but he ſeemed chiefly to attach himſelf to Baron Kilmanſegge, chamberlain to king George I. as elector of Hanover, and a favourite of

Gem. Geminiani

Geminiani. of that prince. In 1716, he publiſhed and dedicated to his patron 12 ſonatas *a violino violone e cembalo*: the firſt ſix with fugues and double ſtops as they are vulgarly called; the laſt with airs of various meaſures, ſuch as allemandes, courants, and jiggs. This publication was ſo well reliſhed by his patron, that he mentioned Geminiani to the king as an excellent performer; in conſequence of which our muſician had the honour to perform before his majeſty, in concert with the celebrated Handel who played on the harpſichord.

But though Geminiani was exceedingly admired, yet he had not a talent at aſſociating muſic with poetry, nor do we find that he ever became a public performer: he was therefore obliged to depend for his ſubſiſtence on the friendſhip of his patrons, and the profits which accrued to him from teaching. He had alſo the misfortune to be an enthuſiaſt in painting; and the verſatility of his temper was ſuch, that, in order to gratify this paſſion, he not only ſuſpended his ſtudies, and neglected to exerciſe his talents, but involved himſelf in debts. In 1727, he was offered the place of maſter and compoſer of the ſtate-muſic in Ireland; but this could not be conferred on a Catholic, and Geminiani refuſed to change his religion: upon which it was given to Matthew Dubourg, a young man who had been one of his pupils, and was a celebrated performer on the violin. Geminiani then ſet himſelf to compoſe parts to the *opera quinta* of Corelli; or, in other words, to make concertos of the firſt ſix of his ſolos. This work he completed, and, with the help of a ſubſcription, at the head of which were the names of the royal family, publiſhed in 1726. In 1732, he publiſhed his *opera ſeconda*, which contains a celebrated minuet that goes by his name. He publiſhed many other pieces, the profits of which did not much mend his circumſtances; but this perhaps was owing to his rambling diſpoſition and enthuſiaſtic fondneſs of painting. He was alſo an utter ſtranger to the buſineſs of an orcheſtra, and had no idea of the labour and pains neceſſary in the inſtruction of fingers for the performance of muſic to which they were ſtrangers. The conſequence of this was, that a *concerto ſpirituale*, which he had advertiſed for his own benefit in 1748, failed in the performance. The audience, however, compaſſionated his diſtreſs, and ſat very ſilent till the books were changed; when the performance was continued with compoſitions of the author's own, and which he executed in ſuch a manner as was never forgot. The profits ariſing from this performance enabled him to take a journey to Paris; where he ſtaid long enough to get plates engraven for a ſcore of ſolos, and the parts of two operas of concertos. About the year 1755 he returned to England, and advertiſed them for ſale.

In 1761, Geminiani went over to Ireland; and was kindly entertained there by Mr Matthew Dubourg, who had been his pupil, and was then maſter of the king's band in Ireland. This perſon through the courſe of his life had ever been diſpoſed to render him friendly offices; and it was but a ſhort time after Geminiani's arrival at Dublin, that he was called upon to do him the laſt. It ſeems that Geminiani had ſpent many years in compiling an elaborate treatiſe on muſic, which he intended for publication; but ſoon after his arrival at Dublin, by the treachery of a female ſervant, who, it was ſaid, was recommended to him for no other end than that ſhe might ſteal it, it was conveyed away, and could not be recovered. The greatneſs of this loſs, and his inability to repair it, made a deep impreſſion on his mind; and, as is conjectured, haſtened his end; at leaſt he ſurvived it but a ſhort time, ending his days on the 17th of September 1762. The following liſt comprifes the whole of his publications, except two or three articles of ſmall account. Twelve ſolos for a violin, *opera prima*; ſix concertos in ſeven parts, *opera ſeconda*; ſix concertos in ſeven parts, *opera terza*; twelve ſolos for a violin, *opera quarta*; ſix ſolos for a violoncello, *opera quinta*; the ſame made into ſolos for a violin; ſix concertos from his *opera quarta*; ſix concertos in eight parts, *opera ſettima*; rules for playing in taſte; a treatiſe on good taſte; the art of playing the violin; 12 ſonatas from his firſt ſolos, *opera undecima*; Ripieno parts to ditto; leſſons for the harpſichord; *Guida Armonica*; ſupplement to ditto; the art of accompaniment, two books; his firſt two operas of concertos in ſcore; and the enchanted foreſt.—Of his ſolos the *opera prima* is eſteemed the beſt. Of his concertos ſome are excellent, others of them ſcarce paſs the bounds of mediocrity. The ſixth of the third opera not only ſurpaſſes all the reſt, but, in the opinion of the beſt judges of harmony, is the fineſt inſtrumental compoſition extant. Gemma.

GEMMA, or Bud, in botany; a compendium or epitome of a plant ſeated upon the ſtem and branches, and covered with ſcales, in order to defend the tender rudiments incloſed from cold and other external injuries, till, their parts being unfolded, they acquire ſtrength, and render any further protection unneceſſary.

Buds, together with bulbs, which are a ſpecies of buds generally ſeated upon or near the root, conſtitute that part of the herb called by Linnæus *hyberuacula*; that is, the winter-quarters of the future vegetable: a very proper appellation, as it is during that ſevere ſeaſon that the tender rudiments are protected in the manner juſt mentioned.

Plants, conſidered in analogy to animals, may properly enough be reckoned both viviparous and oviparous. Seeds are the vegetable eggs; buds, living fœtuſes, or infant-plants, which renew the ſpecies as certainly as the ſeed.

Buds are placed at the extremity of the young ſhoots, and along the branches, being fixed by a ſhort foot-ſtalk upon a kind of brackets, the remainder of the leaves, in the wings or angles of which the buds in queſtion were formed the preceding year. They are ſometimes placed ſingle; ſometimes two by two, and thoſe either oppoſite or alternate; ſometimes collected in greater numbers in whirls or rings.

With reſpect to their conſtruction, buds are compoſed of ſeveral parts artificially arranged. Externally, we find a number of ſcales that are pretty hard, frequently armed with hairs, hollowed like a ſpoon, and placed over each other like tiles. Theſe ſcales are fixed into the inner plates of the bark, of which they appear to be a prolongation. Their uſe is to defend the internal parts of the bud; which, being unfolded, will produce, ſome, flowers, leaves, and ſtipulæ; others, footſtalks and ſcales. All theſe parts, while they remain in the bud, are tender, delicate, folded

Gemma, or Bud.

over each other, and covered with a thick clammy juice, which is fometimes refinous and odoriferous, as in the tacahamac-tree. This juice ferves not only to defend the more tender parts of the embryo-plant from cold, the affaults of inſects, and other external injuries; but likewiſe from exceſſive perſpiration, which, in its young and infant ſtate, would be very deſtructive. It is conſpicuous in the buds of horſe-cheſnut, poplar and willow trees.

In general, we may diſtinguiſh three kinds of buds; that containing the flower, that containing the leaves, and that containing both flower and leaves.

The firſt, termed *gemma florifera*, and by the French *bouton a fleur* or *a fruit*, contains the rudiments of one or ſeveral flowers, folded over each other, and ſurrounded with ſcales. In ſeveral trees, this kind of bud is commonly found at the extremity of certain ſmall branches, which are ſhorter, rougher, and leſs garniſhed with leaves, than the reſt. The external ſcales of this ſpecies of bud are harder than the internal; both are furniſhed with hairs, and in general more ſwelled than thoſe of the ſecond ſort. The bud containing the flower too is commonly thicker, ſhorter, almoſt ſquare, leſs uniform, and leſs pointed; being generally terminated obtuſely. It is called by Pliny *oculus gemma*; and is employed in that ſpecies of grafting called *inoculation*, or *budding*.

The ſecond ſpecies of bud, that, viz. containing the leaves, termed *gemma foliifera*, and by the French *bouton a feuilles* or *a bois*, contains the rudiments of ſeveral leaves, which are variouſly folded over each other, and outwardly ſurrounded by ſcales, from which the ſmall ſtipulæ that are ſeated at the foot of the young branches are chiefly produced. Theſe buds are commonly more pointed than the former ſort. In the hazel-nut, however, they are perfectly round; and in horſe-cheſnut, very thick.

The third ſort of bud is ſmaller than either of the preceding; and produces both flowers and leaves, tho' not always in the ſame manner. Sometimes the flowers and leaves are unfolded at the ſame time. This mode of the flower and leaf bud, is termed by Linnæus *gemma foliifera & florifera*. Sometimes the leaves proceed or emerge out of this kind of bud upon a ſmall branch, which afterwards produces flowers. This mode of the flower and leaf bud is termed by Linnæus *gemma foliifero-florifera*, and is the moſt common bud of any.

Such buds as produce branches adorned only with leaves, are called *barren*; ſuch as contain both leaves and flowers, *fertile*. From the bulk of the bud we may often, with eaſe, foretel whether it contains leaves only, or leaves and flowers together, as in cherry and pear trees.

Neither the buds produced on or near the root, called by ſome authors *turiones*, nor thoſe produced on the trunk, and from the angles or wings of the leaves, contain, in ſtrict propriety, an entire delineation of the plant; ſince the roots are wanting; and in various buds, as we have ſeen, ſhoots are contained with leaves only, and not with flowers: but as a branch may be conſidered as a part ſimilar to the whole plant, and, if planted, would, in proceſs of revegetation, exhibit or produce roots and flowers, we may in general allow, that the bud contains the whole plant, or the principles of the whole plant, which may be unfolded *ad libitum*; and thus reſembles the ſeed, in containing a delineation of the future plant in embryo: for although the bud wants a radicle, or plumula, of which the ſeed is poſſeſſed, yet it would undoubtedly form one, if planted in the earth. But as the medullary part adhering to the bud is too tender, and by the abundance of juice flowing into it from the earth would be diſpoſed to putrefaction, the buds are not planted in the ſoil, but generally inſerted within the bark of another tree; yet placed ſo that the production of the marrow, or pith, adhering to them, may be inſerted into the pith of the branch in which the fiſſure or cleft is made; by which means there is a large communication of juice. This propagation by gems or buds, called *inoculation*, is commonly practiſed with the firſt ſort of buds above deſcribed.

From the obvious uſes of the buds, we may collect the reaſon why the ſupreme Author of nature has granted this ſort of protection to moſt of the trees that are natives of cold climates; and, on the other hand, denied it to ſuch as, enjoying a warm benign atmoſphere, have not the tender parts of their embryo-ſhoots expoſed to injuries and depredations from the ſeverities of the weather. Of this latter kind are the plants of the following liſt; ſome of them very large trees; others, ſmaller woody vegetables, of the ſhrub and under-ſhrub kind: Citron, orange, lemon, caſſava, mock orange, blad-apple, ſhrubby ſwallow-wort, alaternus, ſhrubby geraniums, berry-bearing alder, Chriſt's-thorn, Syrian mallow, baobab or Ethiopian four-gourd, Juſticia, wild ſena, the acacias and ſenſitive plant, coral-tree, ſtinking bean-trefoil, medicago, oleander, viburnum, ſumach, ivy, tamariſk, heath, Barbadoes cherry, lavatera, rue, ſhrubby night-ſhades, Guinea-henweed, cypreſs, lignum-vitæ, and ſavine a ſpecies of juniper.

On annual plants, whoſe root as well as ſtalk periſhes after a year, true buds are never produced; in their ſtead, however, are protruded ſmall branches, like a little feather, from the wings of the leaves, which wither without any farther expanſion, if the plants climb, and have no lateral branches; but if, either by their own nature, or from abundance of ſap, the plants become branched, the ramuli juſt mentioned obtain an increaſe ſimilar to that of the whole plant.

The ſame appearance obtains in the trees of warm countries, ſuch as thoſe enumerated in the above liſt, in which a plumula, or ſmall feather, ſends forth branches without a ſcaly covering; as, in ſuch countries, this tender part requires no defence or protection from cold. A ſcaly covering then is peculiar to buds, as it protects the tender embryo incloſed from all external injuries. When we therefore ſpeak of trees having buds that are naked or without ſcales, our meaning is the ſame as if we had ſaid that they have no buds at all.

The buds that are to be unfolded the following year, break forth from the evolved buds of the preſent year, in ſuch a manner as to put on the appearance of ſmall eminences in the wings or angles of the leaves. Theſe eminences or knots grow but little during the ſummer; as, in that ſeaſon, the ſap is expended on the increaſe of the parts of the plant: but in autumn, when the leaves begin to wither and fall off, the buds placed

Gemmatio ‖ Gendarmes

placed on the wings, increaſe; and the embryo-plant, contained in the bud is ſo expanded, that the leaves and flowers, the parts to be evolved the following year, are diſtinctly viſible. Thus in horſe-chefnut the leaves, and in cornel-tree the flowers, are each to be obſerved in their reſpective buds.

As each bud contains the rudiments of a plant, and would, if ſeparated from its parent vegetable, become every way ſimilar to it; Linnæus, to ſhew the wonderful fertility of nature, has made a calculation, by which it appears, that, in a trunk ſcarce exceeding a ſpan in breadth, ten thouſand buds (that is, herbs) may be produced. What an infinite number, then, of plants might be raiſed from a very large tree!

GEMMATIO, from *gemma* "a bud;" a term uſed by Linnæus, expreſſive of the form of the buds, their origin, and their contents. It includes both thoſe properly called *buds*, and thoſe which are ſeated at the roots, ſtyled *bulbs*.

As to the origin of buds, they are formed either of the footſtalks of the leaves, of *ſtipulæ*, or of ſcales of the bark. Their contents have been already diſcovered, in the preceding article, to be either flowers, leaves, or both.

GENDARMES, or Gens d'armes, in the French armies, a denomination given to a ſelect body of horſe, on account of their ſucceeding the ancient Gendarmes, who were thus called from their being completely clothed in armour; (ſee *Scots* Gendarmes, *infra*.) Theſe troops are commanded by captain-lieutenants, the king and the princes of the blood being their captains: the king's troop, beſides a captain-lieutenant, has two ſublieutenants, three enſigns, and three guidons.

Grand Gendarmes, at preſent are a troop compoſed of 250 gentlemen; the king himſelf is their captain, and one of the firſt peers their captain-lieutenant, who has under him two lieutenants, three enſigns, three guidons, and other officers.

Small Gendarmery, are, the Scots Gendarmes, the queen's, the dauphin's, the gendarmes of Anjou, Burgundy, the Engliſh and Flemiſh gendarmes, having each a captain-lieutenant, ſub-lieutenant, enſign, guidon, and quarter-maſter.

Scots Gendarmes were originally inſtituted by Charles VII. of France, about the middle of the 15th century, and formed a part of his guard; in which ſtation alſo they acted under other princes. It was their prerogative to take precedence of all the companies of the gendarmerie of France; and, on particular occaſions, they even preceded the two companies of the king's mouſquetaires. The ſons of the Scottiſh monarchs were the uſual captains of this company; and, after Mary's acceſſion to the throne, its command belonged to them as a right. It was thence that James VI. made a claim of it for his ſon prince Henry. This honour, and its emoluments, were alſo enjoyed by Charles I. and the next in command to this prince was Louis Stuart duke of Lennox. George Gordon, marquis of Huntley, ſucceeded the duke of Lennox in the year 1624, and took the title of captain or commander in chief when Charles I. mounted the Engliſh throne. It is not certain whether Charles II. was ever captain of this company; but it was conferred on his brother the duke of York, who was captain of the Scots gendarmes till the year 1667, when he reſigned his commiſſion into the hands of the French king. Since that time, no native of Great Britain has enjoyed this command. See *Scots* Guards.

Stuart's Conſtit. of Scotland.

Gender ‖ Genealogy.

GENDER, among grammarians, a diviſion of nouns, or names, to diſtinguiſh the two ſexes.

This was the original intention of gender: but, afterwards, other words, which had no proper relation either to the one ſex or the other, had genders aſſigned them, rather out of caprice than reaſon; which is at length eſtabliſhed by cuſtom. Hence genders vary according to the languages, or even according to the words introduced from one language into another. Thus, *arbor*, in Latin, is feminine; but *arbre*, in French, is maſculine: and *dens*, in Latin, is maſculine; but *dent*, in French, is feminine.

The oriental languages frequently neglect the uſe of genders: and the Perſian language has none at all; which is no diſadvantage, the diſtinction of genders being in great meaſure uſeleſs.

The Latins, Greeks, &c. generally content themſelves to expreſs the different genders by different terminations, as *bonus equus*, "a good horſe;" *bona equa*, "a good mare," &c. But in Engliſh, we frequently go further, and expreſs the difference of ſex by different words: as boar, ſow; boy, girl; buck, doe; bull, cow; cock, hen; dog, bitch, &c.—We have only about 24 feminines, diſtinguiſhed from the males, by the variation of the termination of the male into *eſs*; of which number are abbot, abbeſs; count, counteſs; actor, actreſs; heir, heireſs; prince, princeſs, &c. which is all that our language knows of any thing like genders.

The eaſtern languages, as well as the vulgar languages of the weſt, have only two genders; the maſculine and feminine. The Greek and Latin have likewiſe the neuter, common, and the doubtful gender; and beſide theſe, they have the epicene, or promiſcuous, which under one ſingle gender and termination includes both the kinds.

GENDRE (Lewis le), an eſteemed hiſtorian, born at Roan. He became canon of Notre Dame at Paris, ſubchantor of the ſame church, and abbot of Notre Dame at Claire Fontaine in the dioceſe of Chartres. He wrote a great number of works; the principal of which are, 1. The manners and cuſtoms of the French, in the different times of that monarchy. 2. An hiſtory of France, in three volumes folio, and in ſeven volumes duodecimo. 3. The life of Cardinal d'Amboiſe. He died in 1733, aged 78.

Gendre (Gilbert Charles le), marquis of St Aubin, counſellor in the parliament of Paris, and afterwards maſter of requeſts in the king's houſehold. He wrote ſeveral works; but is chiefly diſtinguiſhed by his *Traite de Popinion*, 9 vols 12mo. a curious performance, proving, by hiſtoric examples, the empire of opinion over the works of art and ſcience. He died at Paris in 1746, aged 59.

GENEALOGY, an enumeration of a ſeries of anceſtors; or a ſummary account of the relations and alliances of a perſon or family, both in the direct and collateral line.

The word is Greek, γενεαλογια; which is formed of γενος, "race, or lineage," and λογος, "diſcourſe."

In divers chapters and military orders, it is required

Genealogica General.

that the candidates produce their genealogy, to shew that they are noble by so many descents.

GENEALOGICA ARBOR, or TREE *of Consanguinity*, signifies a genealogy or lineage drawn out under the figure of a tree, with its root, stock, branches, &c. The genealogical degrees are usually represented in circles, ranged over, under, and aside each other. This the Greeks called *stemmata*, a word signifying crown, garland, or the like. See the articles CONSANGUINITY and DESCENT, and the plates there referred to.

GENEP, a strong town of Germany, in the circle of Westphalia, subject to the king of Prussia. E. Long. 4. 29. N. Lat. 51. 42.

GENERAL, an appellation given to whatever belongs to a whole genus.

GENERAL *Charge*, in law. See CHARGE *to enter Heir*.

GENERAL *Terms*, among logicians, those which are made the signs of general ideas. See ABSTRACTION and IDEA.

All things that exist, Mr Locke observes, being particulars, it might be expected that words should be so too in their signification: but we find it quite contrary; for most of the words that make all languages are general terms. This is the effect of reason and necessity. For,

First, it is impossible that every particular thing should have a distinct name; because it is impossible to have distinct ideas of every particular thing; to retain its name, with its peculiar appropriation to that idea.

Secondly, it would be useless, unless all could be supposed to have the same ideas in their minds. For names, applied to particular things, whereof I alone have the ideas in my mind, could not be significant or intelligible to another who is not acquainted with all those particular things which have fallen under my notice.

Thirdly, it would be of no great use for the improvement of knowledge; which, though founded in particular things, enlarges itself by general views; to which things, reduced into sorts under general names, are properly subservient.

In things where we have occasion to consider and discourse of individuals and particulars, we use proper names; as in persons, countries, cities, rivers, mountains, &c. Thus we see, that jockeys have particular names for their horses, because they often have occasion to maintain this or that particular horse when he is out of sight.

Afterwards observing that a great number of things resemble each other in shape, and other qualities, we frame a general idea that takes in only the qualities in which those many particulars agree; and to this idea we give the name *man*, for example: in which there is nothing new; that which is peculiar to each individual being left out, and only that which is common to all retained. And thus we come to have a general idea and a general name. By the same method the mind proceeds to more general notions and names; as those of animal, substance, being, thing, and such universal terms as stand for any ideas whatsoever.

As to the signification of general words, it is evident they do not barely signify one particular thing; neither do they signify a plurality; but they signify a genus, kind, or sort of things. See the articles ABSTRACTION and GENUS.

GENERAL *Warrant*. See WARRANT. General.

GENERAL *of an Army*, in the art of war, he who commands in chief.

A general ought to be a man of great courage and conduct, to have great experience, and to be of good quality. His conduct appears in establishing his magazines in convenient places; in examining the country, that he may not engage his troops too far while he is ignorant of the means of bringing them off; in subsisting them; and in knowing how to take the most advantageous posts, either for fighting or shunning a battle. His experience inspires his army with confidence, and an assurance of victory; and his quality, by creating respect, augments his authority. By his liberality he gets intelligence of the strength and designs of the enemy, and by this means is enabled to take the most successful measures. A general ought likewise to be fond of glory, to have an aversion to flattery, to render himself beloved, and to keep a strict discipline.

The office of a general is, to regulate the march and encampment of the army: in the day of battle, to choose out the most advantageous ground; to make the disposition of the army; to post the artillery; and, where there is occasion, to send his orders by his aids-de-camp. At a siege, he is to cause the place to be invested; to order the approaches and attacks; to visit the works; and to send out detachments to secure his convoys.

GENERAL *of the Artillery*. See ORDNANCE.

GENERAL *of Horse*, and GENERAL *of Foot*, are posts next under the general of the army, and these have upon all occasions an absolute authority over all the horse and foot in the army.

Adjutant-GENERAL, one who attends the general, assists in council, and carries the general's orders to the army. He distributes the daily orders to the majors of brigade. He is likewise charged with the general detail of the duty of the army. The majors of brigade send every morning to the adjutant-general an exact return, by battalion and company, of the men of his brigade. In a day of battle the adjutant-general sees the infantry drawn up; after which, he places himself by the general, to receive any orders which may regard the corps of which he has the detail. In a siege, he orders the number of workmen demanded, and signs the warrant for their payment. He receives the guards of the trenches at their rendezvous, and examines their condition; he gives and signs all orders for parties. He has an orderly serjeant from each brigade of infantry in the line, to carry such orders as he may have occasion to send from the general.

Lieutenant-GENERAL, is the next in command after the general; and provided he should die or be killed, the order is, that the oldest lieutenant-general shall take the command. This office is the first military dignity after that of a general. One part of their function is, to assist the general with their counsel: they ought therefore, if possible, to possess the same qualities with the general himself; and the more, as they often command armies in chief.

The number of lieutenant-generals have been multiplied of late in Europe, in proportion as the armies have become numerous. They serve either in the field, or

General. or in sieges, according to the dates of their commissions. In battle, the oldest commands the right wing of the army, the second the left wing, the third the centre; the fourth the right wing of the second line, the fifth the left wing, the sixth the centre; and so on. In sieges, the lieutenant-generals always command the right of the principal attack, and order what they judge proper for the advancement of the siege during the 24 hours they are in the trenches; except the attacks, which they are not to make without an order from the general in chief.

*Lieutenant-*General *of the Ordnance.* See Ordnance.

*Lieutenant-*General *of Artillery*, is, or ought to be, a very great mathematician, and an able engineer; to know all the powers of artillery; to understand the attack and defence of fortified places, in all its different branches; how to dispose of the artillery in the day of battle to the best advantage; to conduct its march and retreat; as also to be well acquainted with all the numerous apparatus belonging to the train, and to the laboratory, &c.

*Major-*General, the next officer to the lieutenant-general. His chief business is to receive orders from the general, or in his absence from the lieutenant-general of the day; which he is to distribute to the brigade-majors, with whom he is to regulate the guards, convoys, detachments, &c. On him the whole fatigue and detail of duty of the army roll. It is the major-general of the day who is charged with the encampment of the army, who places himself at the head of it when they march, who marks out the ground of the camp to the quarter-master-general, and who places the new guards for the safety of the camp.

The day the army is to march, he dictates to the field-officers the order of the march, which he has received from the general, and on other days gives them the parole.

In a fixed camp he is charged with the foraging, with reconnoitring the ground for it, and posting the escorts, &c.

In sieges, if there are two separate attacks, the second belongs to him; but if there is but one, he takes, either from the right or left of the attack, that which the lieutenant-general has not chosen.

When the army is under arms, he assists the lieutenant-general, whose orders he executes.

If the army marches to an engagement, his post is at the head of the guards of the army, until they are near enough to the enemy to rejoin their different corps; after which he retires to his own proper post: for the major-generals are disposed on the order of battle as the lieutenant-generals are; to whom, however, they are subordinate, for the command of their divisions. The major-general has one aid-de-camp, paid for executing his orders.

General is also used for a particular march, or beat of drum; being the first which gives notice, commonly in the morning early, for the infantry to be in readiness to march.

General is also used for the chief of an order of monks; or of all the houses and congregations established under the same rule. Thus we say, the general of the Franciscans, Cistertians, &c.

GENERATE, in music, is used to signify the operation of that mechanical power in nature, which every sound has in producing one or more different sounds. Thus any given sound, however simple, produces along with itself, its octave, and two other sounds extremely sharp, viz. its twelfth above, that is to say, the octave of its fifth; and the other the seventeenth above, or, in other words, the double octave of its third major. Generate || Generation.

Whether we suppose this procreation of sounds to result from an aptitude in the texture and magnitude of certain particles in the air, for conveying to our ears vibrations that bear those proportions one to another, as being determined at once by the partial and total oscillations of any musical string; or from whatever œconomy of nature we choose to trace it; the power of one sound thus to produce another, when in action, is said to *generate*. The same word is applied by Signior Tartini and his followers, to any two sounds which, simultaneously heard, produce a third.

GENERATOR, in music, signifies the principal sound or sounds by which others are produced. Thus the lowest C for the treble of the harpsichord, besides its octave, will strike an attentive ear with its twelfth above, or G in alt, and with its seventeenth above, or E in alt. The C, therefore, is called their *generator*, the G and E its products or harmonics. But in the approximation of chords, for G, its octave below is substituted, which constitutes a fifth from the generator, or lowest C; and for E, is likewise substituted its fifteenth below, which, with the abovementioned C, forms a third major. To the lowest notes, therefore, exchanged for these in alt by substitution, the denominations of products or harmonics are likewise given, whilst the C retains the name of their *generator*. But still according to the system of Tartini, two notes in concord, which when sounded produce a third, may be termed the *concurring generators* of that third. (See *Generation Harmonique, par M. Rameau*; see also that delineation of Tartini's system called *The power and principles of harmony.*)

GENERATING line or figure, in geometry, is that which by its motion produces any other plane or solid figure. See Geometry.

GENERATION, in physiology, the act of procreating and producing a being similar to the parent.

According to Aristotle, the male animals contain the principle, and the female the matter, of generation; for though both are furnished indeed with a seminal liquor, yet the semen of the males alone is prolific. The moderns, on the other hand, as well those who contend for the system of generation from eggs, as they who adopt that of the animalcules in the male-seed, pretend that females have no such seminal liquor at all, and that what has been commonly taken for it is some other animal-fluid.

Harvey is of opinion, that all females are furnished with eggs; and that the embryos, or young animals, are formed in the same manner as a chick in the egg of any bird. Generation, according to this celebrated physician, is effected wholly by means of the uterus, or womb, which conceives the fœtus by a kind of contagion communicated to it by the male-seed, much in the same way as the load-stone communicates magnetism

Generation. magnetism to iron. This contagion, he thinks, acts not only on the uterus, but is communicated to the whole body of the female, which is altogether prolific; though the uterus, he acknowledges, is the only part that is capable of conceiving the fœtus, just as the brain is alone capable of forming ideas and notions. Agreeable to this doctrine of Harvey, Steno and other anatomists have pretended to discover certain eggs in the ovaries or testicles of women; which Mr Buffon denies to be the case, affirming, that there are no such eggs to be found there.

We cannot enter into a detail of the reasonings for and against the system of generation from eggs; and shall therefore only observe, that its advocates pretend to have discovered eggs in all the females on which they made observations; that the largest of those found in women did not exceed the bigness of a pea; that they are extremely small in young girls under fourteen, but that age and commerce with men makes them grow larger; that there are more than twenty such eggs in each ovary or testicle; that they are fecundated in the ovary by the spirituous and volatile part of the male-seed; that they afterwards are detached and fall into the uterus through the Fallopian tubes; that here the fœtus is formed of the internal substance of the egg, and the placenta of the exterior part.

Leewenhoek is the author of another system of generation, from animalcules in the male-seed. He tells us, he discovered many thousands of these in a drop less than a grain of sand. They are found in the semen of all males whatever, but not in that of females; and are so small, that 3,000,000,000 of them are not equal to a grain of sand, whose diameter is but the hundredth part of an inch. When any of these animalcules gets into an egg fit to receive it, and this falls into the womb through the Fallopian tubes, the humours which distil through the vessels of the womb, penetrating the coats of the egg, swell and dilate it, as the sap of the earth does seed thrown into it. The placenta begins to appear like a little cloud, upon one side of the external coat of the egg; and, at the same time, the spine of the embryo-animalcule is grown so big, as to become visible; and a little afterwards, the cerebrum and cerebellum appear like two bladders; and the eyes stand next, goggling out of the head; then the beating of the heart, or punctum saliens, is plainly to be seen; and the extremities discover themselves last of all.

These animalcules are of different figures, some like tadpoles, and others like eels *. In the semen of a man, and in that of a dog, there have been discovered two different kinds of them, the one supposed to be males, and the other females. Some even pretend to have seen animalcules disengage themselves from the membranes that surround them; and that they then appeared perfectly like men, with legs, arms, &c. like those of the human body!

* See *Animalcule*, nº 48—58.

All the advocates for the system of generation from animalcules strongly oppose that from eggs. They contend, that these animalcules cannot be looked upon as the inhabitants of the semen, since they were of greater extent than the liquor itself; not to mention, that no such animals are found in any other liquors of the body; and since females have nothing similar to these animals, they think it manifest that the prolific principle resides in males. When they are asked, To what purpose serves such an immense profusion of human animalcules? they answer, that it is agreeable to the ordinary course of nature, both in the animal and vegetable part of the creation. They likewise strengthen their system, by alledging the many examples we have of similar transformations in the insect-class of animals, which, from caterpillars and small worms, become winged animals of the butterfly or fly kinds. Generati

By this system, says Mr Buffon, the first woman cannot be said to have contained the whole race of mankind, as being all, according to it, the true posterity of the first man, and in their animalcule state contained only in him. On this principle, he proceeds to invalidate the system of generation from animalcules: for supposing the size of a man to be 1, then will that of one of the spermatic animalcules be $\frac{1}{1000000000}$; and as a man is to an animalcule of the first generation in the same ratio that this animalcule is to an animalcule of the second generation, it follows, that this last will be expressed by the fraction $\frac{1}{1000000000000000000}$. In this manner he computes the size of the animalcules of several generations, all supposed to be living animals, notwithstanding that their minuteness exceeds the power of imagination to conceive; and then tells us, that the system of generation from eggs is liable to the same objections, whereof the detail may be seen in his *Hist. Natur.* tom. ii. p. 157 *et seq.*

As to Buffon's own system, he thinks that every part, both of animals and vegetables, contains an infinite number of organic molecules; that these molecules assume successively different forms, and are put into different motions, according to the circumstances they are in; but that they are much more numerous in the seminal liquors of both sexes, and the seeds of plants, than in other parts; that these organic molecules make the matter of nutrition; that this matter is always active, and tends to organization, forming itself into different shapes, according to the moulds it meets with. When the quantity of this organic matter is but small, as in man and most large animals, generation only takes place at the age of maturity, and even then the number of animals produced is but small. The case is just the reverse in animals which abound with this matter, as in fishes, and most birds.

With respect to the generation of mankind, the same author thinks it a certain fact, that the male-seed is received into the womb of the woman; and that, for this purpose, it is highly probable the internal orifice opens during the act of coition. The female-seed also makes its way into the womb, where, being mixed with that of the male, they both together contribute to the formation of the fœtus; which is either male or female, according as the seed of the man or woman abounds most with organic molecules; and the infant resembles either father or mother, according to the different combinations of these molecules. Both these seminal liquors he thinks equally active in the formation of the fœtus, and that they fix and counterbalance each other; the molecules of each parent being thereby determined to form similar parts to those of the individual that furnished them, as the head, trunk, arms, legs, &c. He thinks the molecules proceeding from the genital parts fix themselves first; and that the other molecules arrange themselves successively

Generation. successively round these, in the same order which they before occupied in the parent. When a great quantity of the seminal liquors of both sexes is received into the womb, there are formed different spheres of attraction, in different parts of these liquors; the consequence of which is, that several fœtuses are formed at the same time.

Nearly akin to Mr Buffon's system, is that of Mr Maupertuis, which he has explained in his *Venus Physique*. He observes, that all the variety observable among mankind, may have been accidental at first; but being once established in the constitution of the parents, they become natural to their posterity. To illustrate this, he gives an instance of a sexdigitary family at Berlin, who had six fingers, or six toes, and frequently both; and that this peculiarity was transmitted equally by the father and mother, but was lost by alliances with those who had only the usual number of fingers or toes.

He farther observes, that most animals, excepting mankind, have stated seasons for procreation; and that the females go with young some a longer, others a shorter time. Mares go from eleven to twelve months; cows and hinds go nine months, as do also women; foxes and wolves, five months; and bitches go only seven weeks; cats nine weeks; and rabbits but thirty-one days. Most birds are hatched in twenty-one days; the canary-birds, and some others, are hatched in thirteen or fourteen days. It appears, therefore, that there is an endless variety in the time and manner of the generation of animals.

Whoever reads this short sketch of the different theories of generation that have hitherto been invented, will probably require no other arguments to convince him, that physicians and philosophers are still as ignorant of the nature of this mysterious operation as they were in the days of Noah.

Concerning the formation and nutrition of the fœtus after the female has conceived, there have also been great disputes; but as this subject is more easily investigated, and in some measure falls under the notice of our senses, there is much less uncertainty concerning these matters than generation, or the manner in which the embryo is originally formed. The following particulars are confirmed by the greatest number of observations.

About the seventh day, the eye may discover the first lineaments of the fœtus; but these lineaments are as yet very imperfect. Two little vesicles appear in an almost transparent jelly, the largest of which is destined to become the head of the fœtus, and the other smaller one is reserved for the trunk. But at this period no extremities are to be seen; the umbilical chord appears only as a very minute thread, and the placenta does not as yet absorb the red particles of the blood. At the end of fifteen days, not only the head but the features of the face begin to be developed.—The nose appears like a small prominent line; and we are able to Generation. distinguish another line under it, which is destined for the separation of the lips. Two black points appear in the place of eyes, and two minute holes mark the ears. At the sides of the trunk both above and below, we see four minute protuberances, which are the rudiments of the arms and legs. At the end of three weeks the body of the fœtus is somewhat augmented, and both the hands and feet are to be distinguished. The upper extremities are found to increase faster than the lower ones, and the separation of the fingers is accomplished sooner than that of the toes.

Towards the end of the first month, the fœtus is about an inch long, and the human form may be decisively ascertained: all the parts of the face may be distinguished; the shape of the body is clearly marked out, the haunches and the abdomen are elevated, the fingers and toes are separated from each other, and the intestines appear like minute threads. After six weeks the fœtus is grown much longer, and the human figure appears to be more perfect, but the head is still larger in proportion than the other parts of the body.

At the end of the second month, the fœtus measures two inches and a quarter; at the end of the third month, three inches and a half; and about the fourth or fifth month, usually about five inches; and from that time to the end of the ninth month, it gradually increases to about the length of twelve inches, sometimes more, and sometimes not quite so much.

The fœtus during all this time assumes an oval figure, which corresponds with the shape of the uterus. Its chin is found reclining on its breast, with its knees drawn up towards its chin, and its arms folded over them. But it seems likely that the posture of some of these parts is varied in the latter months of pregnancy, so as to cause those painful twitches which its mother usually feels from time to time.—In natural cases, its head is probably placed towards the os tincæ from the time of conception to that of its birth; though formerly it was considered as being placed towards the fundus uteri, till about the eighth or ninth month, when the head, by becoming specifically heavier than the other parts of the body, was supposed to be turned downwards.

The capacity of the uterus increases in proportion to the growth of the fœtus, but without becoming thinner in its substance, as might naturally be expected.—The nourishment of the fœtus, during all this time, seems to be derived from the placenta, which appears to be originally formed by that part of the ovum which is next the fundus uteri. The remaining unconnected part of the ovum, and likewise the surface of the placenta, are covered by a membrane called *chorion* (A), within which is another pellucid membrane called *amnios* (B); and these two include a watery fluid, which is the *liquor amnii*, in which the fœtus

(A) Besides these two membranes, Dr Hunter has discovered a third, which is the exterior one, being supposed to be a lamella from the inner surface of the uterus. In the latter months of pregnancy it becomes gradually thinner and more connected with the chorion. He has named it *membrana caduca*.

(B) In some quadrupeds, the urine appears to be conveyed from the bladder through a canal called *urachus*, to the *allantois*; which is a reservoir, resembling a long and blind gut, situated between the chorion and amnios. The human fœtus seems to have no such reservoir, though some writers have supposed that it does exist. From the top of the bladder, a few longitudinal fibres are extended to the umbilical chord; and these fibres have been considered as the urachus, though without having ever been found pervious.

Generation
||
Genesis.

fœtus floats till the time of its birth (c).—In the firſt months of pregnancy, the involucra bear a large proportion to their contents, but this proportion is afterwards reverſed as the fœtus increaſes in bulk.

The placenta, which is the medium through which the blood is conveyed from the mother to the fœtus, and the manner in which this conveyance takes place, deſerve to be clearly deſcribed, as being a ſubject not generally underſtood.—Without ſuch an explanation it might perhaps be readily ſuppoſed, that the arteries of the uterus paſs into the ſubſtance of the placenta; and that the blood, after being conveyed through the umbilical arteries to the fœtus, is returned back by the umbilical vein to the placenta, and from thence to the uterus.—Such an idea, however, would be a very erroneous one, and we ſhall point out the true manner in which this proceſs is conducted.

The *placenta* is a broad, flat, and ſpongey ſubſtance, like a cake, cloſely adhering to the inner ſurface of the womb, uſually near the fundus, and appearing to be made up by the ramifications of the umbilical arteries and vein. The arteries of the uterus diſcharge their contents into the ſpongey cells of this cake; and the veins of the placenta, abſorbing the blood from theſe cells in the ſame manner as they abſorb it in the corpora cavernoſa penis, at length form the *umbilical vein*, which paſſes on to the liver, and from thence to the heart of the fœtus, by the vena cava. Its circulation, however, through the heart is not conducted in the fœtus as it is in the adult: in the latter, the blood is carried from the right auricle of the heart through the pulmonary artery, and is returned to the left auricle by the pulmonary vein; but a dilatation of the lungs is eſſential to the paſſage of the blood through the pulmonary artery, and this dilatation cannot take place till after the child is born and has reſpired. This deficiency, however, is ſupplied in the fœtus, by an immediate communication between the right and left auricle of the heart, through an ovalopening in the ſeptum, which divides the two auricles, called *foramen ovale*. The blood is returned again from the fœtus, through two arteries called the *umbilical arteries*, which ſometimes ariſe from the iliacs, and ſometimes from the aorta deſcendens. Theſe two veſſels taking a winding courſe with the vein, form with that, and the membranes by which they are ſurrounded, what is called the *umbilical cord*. Theſe arteries, after ramifying through the ſubſtance of the placenta, open and diſcharge their blood into its cells, from whence it is abſorbed by the veins of the uterus; ſo that a conſtant depoſition and abſorption are carried on, and the fœtus is found to have a circulation independent of its mother.

GENERATION *of Fiſhes*. See FISH.

GENERATION *of Plants*. See BOTANY, ſect. v.

GENERATION *of Inſects*. See INSECTS.

Parts of GENERATION. See ANATOMY, n° 371, 372.

GENESIS, among mathematicians, ſignifies the formation or production of ſome figure or quantity.

GENESIS, among divines, a canonical book of the Old Teſtament, and the firſt of the pentateuch or five books of Moſes. The Hebrews call it *Bereſchith*, or, "In the beginning," theſe being the firſt words in the book. The Greeks gave it the name of *Geneſis*, from its beginning with the hiſtory of the creation of the world. See BIBLE.

Genet
||
Geneva

GENET, GENNET, or *Jennet*, in the manege, denotes a ſmall-ſized well-proportioned Spaniſh horſe.

To ride *a la genette*, is to ride after the Spaniſh faſhion, ſo ſhort, that the ſpurs bear upon the horſe's flank.

GENETTE, in zoology. See VIVERRA.

GENEVA, a city near the confines of France and Switzerland, in E. Long. 6. 0. N. Lat. 46. 20. It has a ſmall territory ſubject to it, and is a republic *. The city, called in Latin alſo *Geneva*, in German *Genf*, and in French *Genevé*, is ſituated where the Rhone makes it exit from the lake, 65 miles from Bern, 75 from Lyons, and 106 from Turin. A part of it ſtands on an iſland in the Rhone, and part on the banks on both ſides, being a handſome well-fortified city, and pretty large. In ſome of the ſtreets are arched walks or piazzas. The Treille is a moſt charming place, planted with linden trees; and commanding a fine proſpect of the lake, and of ſeveral ranges of mountains and rocks riſing behind one another, ſome covered with vineyards and herbage, and others with ſnow, with openings betwixt them. Immediately below the city, the Rhone is joined by the Arve. Over the former of theſe rivers are four bridges. The inhabitants of Geneva are moſtly Calviniſts. Of the ſix churches, the cathedral of St Peter is the principal, in which is a monument to the memory of Henry duke of Rohan. The ſervice in ſome of theſe churches is in French, in others in Italian, and in others in German. The guildhall is a ſtately free-ſtone edifice, ſituated on an eminence, the aſcent to which is without any ſteps, ſo that a perſon may not only walk, but ride from the top to the bottom. Here is an arſenal, which is ſaid to contain arms for 12,000 men; and an univerſity, which has 12 profeſſors belonging to it, with a very valuable library. Several learned men have either been natives, or profeſſors and miniſters, of this city; particularly Calvin, Theodore Beza, the Diodati, the Turretines, the late Mr Le Clerc, and others. As the quantity of corn produced in the territory of the city is not ſufficient for the conſumption of the inhabitants, the republic has erected large granaries, which always contain a quantity to ſupply the inhabitants two years. The bakers, the inn-keepers, the garriſon, and the artificers, employed by the city, are obliged to take what corn they want from theſe granaries, at a ſmall advance of the prime coſt. Beſides the revenue ariſing from hence, the city has other incomes, amounting to about 130,000 dollars, with part of which it maintains a garriſon conſiſting of 800 men, well diſciplined, and cloathed in a blue uniform turned up with red. The environs of the city are extremely pleaſant; which, with the goodneſs of the air and proviſions, the mildneſs of the gover-

* See Switzerland.

(c) The *liquor amnii* coagulates like the lymph. It has been ſuppoſed to paſs into the œſophagus, and to afford nouriſhment to the fœtus; but this does not ſeem probable. Children have come into the world without an œſophagus, or any communication between the ſtomach and the mouth; but there has been no well-atteſted inſtance of a child's having been born without a placenta; and it does not ſeem likely that any of the fluid can be abſorbed through the pores of the ſkin, the ſkin in the fœtus being every where covered with a great quantity of mucus.

Geneva

vernment, the politeneſs of the inhabitants, the numbers of foreign gentlemen always reſiding here, or paſſing from France, Germany, and other countries, to the north of the Alps, to Italy, and others lying ſouth of them, render it a moſt agreeable place: hence Mr Addiſon ſtyled it, very juſtly, the *court of the Alps*. In all the ſtreets are fountains and canals to ſupply the inhabitants with water, which is raiſed by engines from the Rhone. The trade of the city is very conſiderable, it being a great thoroughfare, and having a variety of manufactures, with a number of induſtrious and ingenious artificers, particularly in the watchmaking branch. The library belonging to the city is well furniſhed with excellent books, beſides a curious collection of medals and petrifactions, and ſome ancient manuſcripts. They are not ſo rigid in keeping the ſabbath here as the Calviniſts in England and Scotland: for they tolerate, and even authoriſe, all manner of manly exerciſes on Sundays, after divine ſervice; and then it is that the militia alſo are exerciſed. The ſun riſes later here, and ſets ſooner, than in moſt other places of the ſame latitude; which is owing to the Alps. Mr Addiſon ſays, that there are merchants in Geneva who are reckoned worth two millions of crowns, tho', perhaps, not one of them ſpends 500 pounds a-year. At the general hoſpital, beſides the city poor, poor travellers are maintained for one day, and then diſmiſſed, with ſome money in their pockets, to proceed on their journey. As to the government, it is much like that of Zurich and Bern. The number of burghers is about 1500, and the principal magiſtrates are the four ſyndics. There are no leſs than four councils, viz. the general council of the citizens and burghers, the council of 200, that of 60, and that of 25. Of the laſt, two perſons of the ſame family cannot be members at the ſame time. A ſon here, who refuſes to pay his father's debts, is incapable of any office in the ſtate. No marriages are permitted unleſs both parties are of the Proteſtant religion. A woman of 40 years of age muſt not marry a man of leſs than 30; if ſhe exceed 40, her huſband muſt at leaſt be 35: nor muſt a man above 60 marry a woman, who is not, at leaſt, 30. A widow muſt not alter her condition in leſs than ſix months after her huſband's deceaſe. The kings of France and Britain are conſtantly mentioned in their public prayers here. It is ſaid that Calvin lies buried in that part of the church-yard called the *Plain-palais*; but the particular ſpot is either not known, or pretended not to be known. Before the reformation, this city was the ſee of a biſhop, who was poſſeſſed of the ſovereignty thereof at firſt, jointly with its counts, and afterwards with the dukes of Savoy; but it got rid of both, about the period abovementioned, and entered into alliance with ſeveral of the cantons: at preſent, however, thoſe only with Bern and Zurich continue in force. The king of France always keeps a reſident here. So much are the magiſtracy afraid of opening a door to luxury and licentiouſneſs, that no theatre is permitted in the city. The lake, to which it gives name, reſembles a half-moon, whoſe convex ſide lies towards Switzerland. On that ſide it extends 18 leagues, reckoning along the ſhore, but on the Savoy ſide not above 12; and its greateſt breadth is upwards of ſeven. As for its depth, in ſome places it is ſaid to be unfathomable. Contrary to moſt other lakes, it decreaſes in winter, and increaſes in ſummer, which is owing to the melting of the ſnow in the neighbouring mountains. It is hardly ever frozen over; and has the territories of no leſs than five different ſtates bordering on it, viz. the kingdom of France, the duchy of Savoy, the canton of Bern, the biſhopric of Sion, and the republic of Geneva.

Geneva & Geniſta.

GENEVA, or *Gin*, among diſtillers, an ordinary malt ſpirit, diſtilled a ſecond time, with the addition of ſome juniper-berries.

Originally, the berries were added to the malt in the grinding; ſo that the ſpirit thus obtained was flavoured with the berries from the firſt, and exceeded all that could be made by any other method. At preſent, they leave out the berries entirely, and give their ſpirits a flavour by diſtilling them with a proper quantity of oil of turpentine; which, though it nearly reſembles the flavour of juniper-berries, has none of their valuable virtues.

GENGISKHAN, the renowned ſovereign of the Moguls, a barbarous and bloody conqueror. See JENGHIZ KHAN, and (*Hiſtory* of the) MOGULS.

GENIAL, an epithet given by the Pagans to certain gods who were ſuppoſed to preſide over generation. The genial gods, ſays Feſtus, were earth, air, fire, and water. The twelve ſigns, together with the ſun and moon, were ſometimes alſo ranked in the number.

GENII, a ſort of intermediate beings, by the Mahometans believed to exiſt, between men and angels. They are of a groſſer fabric than the latter, but much more active and powerful than the former. Some of them are good, others bad, and they are capable of future ſalvation or damnation like men. The Orientals pretend that theſe genii inhabited the world many thouſand years before the creation of Adam, under the reigns of ſeveral princes, who all bore the common name of Solomon: but falling at length into an almoſt general corruption, Eblis was ſent to drive them into a remote part of the earth, there to be confined: that ſome of that generation ſtill remaining were by Tahmurath, one of the ancient kings of Perſia, forced to retreat into the famous mountains of *Kaf*; of which ſucceſſions and wars they have many fabulous and romantic ſtories. They alſo make ſeveral ranks and degrees among this kind of beings, (if they are not rather different ſpecies); ſome being abſolutely called *Jin*; ſome *Peri*, or fairies; ſome *Div*, or giants; and other *Tacwins*, or fates.

GENIOGLOSSI, in anatomy. See ANATOMY, *Table of the muſcles*.

GENIOHYOIDÆUS, in anatomy. *Ibid.*

GENISTA, BROOM or DYERS-WEED; a genus of the decandria order, belonging to the diadelphia claſs of plants. There are ſeveral ſpecies: of which the moſt remarkable are, the cytiſo-geniſta, or common broom; and the tinctoria, or dyers-weed.—The firſt is too well known to need deſcription. Its young flowers are ſometimes preſerved as pickles; and the plant, when burnt, affords a tolerably pure alkaline ſalt. Dr Mead relates the caſe of a dropſical patient that was cured by taking half a pint of a decoction of green broom tops, with a ſpoonful of whole white muſtard-ſeed, every morning and evening. The patient had been tapped three times, and tried the uſual remedies before. An infuſion of the ſeeds, drank

Genital || Genius.

freely, has been known to produce similar happy effects; but these are by no means to be expected in every instance. Cows, horses, and sheep, refuse the plant.—2. The tinctoria is also a native of Britain. It rises with shrubby stalks three feet high, garnished with spear-shaped leaves placed alternate, and terminated by several spikes of yellow flowers, succeeded by pods. The branches of the plant are used by dyers, for giving a yellow colour; from whence it is called dyers-broom, green-wood, wood-waxen, or dyers-weed. A dram and an half of the powdered seeds operates as a mild purgative. A decoction of the plant is diuretic; and, like the former, has proved serviceable in dropsical cases. Horses, cows, goats, and sheep, eat it.

GENITAL, an appellation given to whatever belongs to the parts of generation. See ANAT. n° 371.

GENITES, among the Hebrews, those descended from Abraham, without any mixture of foreign blood.

The Greeks distinguished by the name of *genites* such of the Jews as were issued from parents, who, during the Babylonish captivity, had not allied with any gentile family.

GENITIVE, in grammar, the second case of the declension of nouns. The relation of one thing considered as belonging in some manner to another, has occasioned a peculiar termination of nouns, called the *genitive case*: but, in the vulgar tongues, they make use of a sign to express the relation of this case. In English they prefix the particle *of*, in French *de* or *du*, &c.: Though in strictness there are no cases in either of these languages; inasmuch as they do not express the different relations of things by different terminations, but by additional prepositions, which is otherwise in the Latin.

GENIUS, a good or evil spirit, or dæmon, whom the ancients supposed set over each person, to direct his birth, accompany him in life, and to be his guard. See DÆMON.

Among the Romans, Festus observes, the name *genius* was given to the god who had the power of doing all things, *deum qui vim obtineret rerum omnium gerendarum*; which Vossius, *de Idol.* rather chooses to read *genendarum*, who has the power of producing all things; by reason Censorinus frequently uses *gerere* for *gignere*.

Accordingly, St Augustin *de Civitat. Dei*, relates, from Varro, that the genius was a god who had the power of generating all things; and presided over them when produced.

Festus adds, that Aufustius spake of the *genius* as the Son of God, and the Father of men, who gave them life; others, however, represented the *genius* as the peculiar or tutelary god of each place: and it is certain, the last is the most usual meaning of the word. The ancients had their *genii* of nations, of cities, of provinces, &c. Nothing is more common than the following inscription on medals, GENIUS POPULI ROM. "the *genius* of the Roman people;" or GENIO POP. ROM. "to the *genius* of the Roman people." In this sense, *genius* and *lar* were the same thing; as, in effect, Censorinus and Apulius affirm they were. See LARES and PENATES.

The Platonists, and other eastern philosophers, supposed the *genii* to inhabit the vast region, or extent of air, between earth and heaven. They were a sort of intermediate powers, who did the office of mediators between gods and men. They were the interpreters and agents of the gods; communicated the wills of the deities to men; and the prayers and vows of men to the gods. As it was unbecoming the majesty of the gods to enter into such trifling concerns; this became the lot of the *genii*, whose nature was a mean between the two; who derived immortality from the one, and passions from the other; and who had a body framed of an aërial matter. Most of the philosophers, however, held, that the genii of particular men were born with them, and died; and Plutarch attributes the ceasing of oracles partly to the death of the genii. See ORACLE. Genius.

The heathens, who considered the genii as the guardians of particular persons, believed that they rejoiced and were afflicted at all the good and ill fortune that befel their wards. They never, or very rarely, appeared to them; and then only in favour of some person of extraordinary virtue or dignity. They likewise held a great difference between the genii of different men; and that some were much more powerful than others: on which principle it was, that a wizard in *Appian* bids Anthony keep at a distance from Octavius, by reason Anthony's genius was inferior to and stood in awe of that of Octavius. There were also evil genii, who took a pleasure in persecuting men, and bringing them evil tidings: such was that in *Patereculus*, &c. which appeared to Brutus the night before the battle of Philippi. These were also called *larvæ*, and *lemures*. See LARVÆ and LEMURES.

GENIUS, in matters of literature, &c. a natural talent or disposition to do one thing more than another; or the aptitude a man has received from nature to perform well and easily that which others can do but indifferently and with a great deal of pains.

To know the bent of nature is the most important concern. Men come into the world with a genius determined not only to a certain art, but to certain parts of that art, in which alone they are capable of success. If they quit their sphere, they fall even below mediocrity in their profession. Art and industry add much to natural endowments, but cannot supply them where they are wanting. Every thing depends on genius. A painter often pleases without observing rules; whilst another displeases though he observes them, because he has not the happiness of being born with a genius for painting.

A man born with a genius for commanding an army, and capable of becoming a great general by the help of experience, is one whose organical conformation is such, that his valour is no obstruction to his presence of mind, and his presence of mind makes no abatement of his valour. Such a disposition of mind cannot be acquired by art: it can be possessed only by a person who has brought it with him into the world.—What has been said of these two arts may be equally applied to all other professions. The administration of great concerns, the art of putting people to those employments for which they are naturally formed, the study of physic, and even gaming itself, all require a genius. Nature has thought fit to make a distribution of her talents among men, in order to render them necessary to

Genius. to one another; the wants of men being the very firſt link of ſociety: ſhe has therefore pitched upon particular perſons, to give them aptitude to perform rightly ſome things which ſhe has rendered impoſſible to others; and the latter have a greater facility granted them for other things, which facility has been refuſed to the former. Nature, indeed, has made an unequal diſtribution of her bleſſings among her children; yet ſhe has diſinherited none; and a man diveſted of all kinds of abilities, is as great a phenomenon as an univerſal genius.

From the diverſity of genius, the difference of inclination ariſes in man, whom nature has had the precaution of leading to the employments for which ſhe deſigns them, with more or leſs impetuoſity in proportion to the greater or leſſer number of obſtacles they have to ſurmount, in order to render themſelves capable of anſwering this vocation. Thus the inclinations of men are ſo very different, becauſe they follow the ſame mover, that is, the impulſe of their genius. This, as with the painter, is what renders one poet pleaſing, even when he treſpaſſes againſt rules; while others are diſagreeable, notwithſtanding their ſtrict regularity.

The genius of theſe arts, according to the abbe du Bos, conſiſts in a happy arrangement of the organs of the brain; in a juſt conformation of each of theſe organs; as alſo in the quality of the blood, which diſpoſes it to ferment, during exerciſe, ſo as to furniſh plenty of ſpirits to the ſprings employed in the functions of the imagination. Here he ſuppoſes that the compoſer's blood is heated; for that painters and poets cannot invent in cool blood; nay, that it is evident they muſt be wrapt into a kind of enthuſiaſm when they produce their ideas. Ariſtotle mentions a poet who never wrote ſo well as when his poetic fury hurried him into a kind of frenzy. The admirable pictures we have in Taſſo of Armida and Clorinda, were drawn at the expence of a diſpoſition he had to real madneſs, into which he fell before he died. "Do you imagine, (ſays Cicero,) that Pacuvius wrote in cold blood? No, it was impoſſible. He muſt have been inſpired with a kind of fury, to be able to write ſuch admirable verſes."

GENOA, a city of Italy, and capital of a republic of the ſame name, ſituated in E. Long. 9. 30. N. Lat. 44. 30.—By the Latin authors it is very frequently, though corruptly, called *Janua*; and its preſent territories made part of the ancient Liguria. The æra of its foundation is not known. In the time of the ſecond Punic war it was a celebrated emporium; and having declared for the Romans, was plundered and burnt by Mago the Carthaginian. It was afterwards rebuilt by the Romans; and with the reſt of Italy continued under their dominion till the decline of the weſtern empire in 476. Soon after, it fell under the power of Theodoric the Oſtrogoth; who having defeated the uſurper Odoacer, became king of Italy. This happened in the year 498; and in a ſhort time, the Goths being almoſt entirely ſubdued by Beliſarius the emperor Juſtinian's general, Genoa was reannexed to the Roman empire. In 1638, it was plundered and burnt by the Lombards, whoſe king Protharis erected it into a provincial dukedom.

The Lombards continued maſters of Genoa till the year 774, when they were conquered by Charles the Great, ſon to Pepin, king of France. He reduced Liguria to the ancient bounds ſettled by Auguſtus, and erected it into a marquiſate; appointing his relation *Audemarus* the firſt count or margrave. Genoa at this time being diſtinguiſhed for its wealth and populouſneſs, began to give its name to the whole coaſt; and continued under the dominion of theſe counts for about 100 years, till the race of the Pepins became entirely extinct in Italy, and the empire was transferred to the German princes. In the year 935 or 936, while the Genoeſe forces were abſent on ſome expedition, the Saracens ſurpriſed the city, which they plundered and burnt, putting to death a great number of the inhabitants, and carrying others into captivity. Having embarked their captives, together with an immenſe booty, they ſet ſail for Africa: but the Genoeſe immediately returning, purſued the invaders; and having entirely defeated them, recovered all the captives and booty, and took a great many of the enemy's ſhips. Genius.

About the year 950, the Franks having loſt all authority in Italy, the Genoeſe began to form themſelves into a republic, and to be governed by their own magiſtrates, who were freely elected, and took the name of *Conſuls*. In order to ſupport their independence, they applied themſelves with great aſſiduity to commerce and navigation; and being apprehenſive that ſome of the German emperors, who frequently entered Italy as invaders, might renew their pretenſions to their ſtate, they conſented to acknowledge Berengarius III. duke of Friuli, who had been elected emperor by a party of Italian nobles. Berengarius, who had much ado to maintain himſelf in his new dignity, endeavoured by his conceſſions to enlarge the number of his friends and adherents; and accordingly made no difficulty to confirm the new republic in all its rights and privileges. After this the Genoeſe began to extend their commerce from Spain to Syria, and from Egypt to Conſtantinople; their veſſels, according to the cuſtom of theſe times, being fitted for fighting as well as merchandiſe. Having thus acquired great reputation, they were invited, in 1017, by the Piſans, who had likewiſe formed themſelves into a republic, to join with them in an expedition againſt Sardinia, which had been conquered by the Moors. In this expedition they were ſucceſsful; the iſland was reduced; but from this time an enmity commenced between the two republics, which did not end but with the ruin of the Piſans.

The firſt war with Piſa commenced about 30 years after the Sardinian expedition, and laſted 18 years; when the two contending parties having concluded a treaty of peace, jointly ſent their forces againſt the Moors in Africa, of whom they are ſaid to have killed 100,000. The Genoeſe were very active in the time of the cruſades, and had a principal ſhare in the taking of Jeruſalem. They alſo waged conſiderable wars with the Moors in Spain, of whom they generally got the better. They alſo prevailed againſt the neighbouring ſtates; and, in 1220, had enlarged their territories beyond the ſkirts of the Appennines, ſo that the reſt of Italy looked upon them with a jealous eye: but in 1311 the factions which had for a long time reigned in the city, notwithſtanding

Genoa. ſtanding all its wealth and power, induced the inhabitants to ſubmit themſelves for 20 years to the dominion of Henry VII. emperor of Germany. That emperor, however, died in Auguſt 1312; and the vicar he had left, ſoon after went to Piſa, upon which the diſſentions in Genoa revived with greater fury than ever. In 1317, a quarrel happened between the families of Spinola and Doria; which came to ſuch an height, that both parties fought in the ſtreets for 24 days without intermiſſion, raiſed battering engines againſt each others houſes, and filled the city with blood. At laſt the Spinolæ quitted the city, and retired to their territories in the Apennine mountains. The civil war continued till the year 1331; when, by the mediation of the king of Naples, it was concluded, that all exiles ſhould return to the city; that the republic ſhould be governed by the king's vicar; and all the offices of the ſtate be equally divided between the Guelfs and the Gibellines, the two contending parties.

By this ruinous war, the coaſt of Genoa, formerly adorned with palaces and vineyards, was now reduced to the appearance of a barren waſte. So great was the general deſolation, that, according to Petrarch, the ſpectators who failed along were ſtruck with aſtoniſhment and horror. Villani, a cotemporary author, relates, that it was ſuppoſed by the learned, that greater exploits had not been performed at the ſiege of Troy; and that the loſſes each party had ſuſtained would have been ſufficient to have purchaſed a kingdom, the Genoeſe republic being in his time the richeſt and moſt powerful ſtate in Chriſtendom. The annaliſt Stella informs us, that, before the war, the moſt extravagant profuſion and luxury prevailed among the Genoeſe: but that, towards the end, many noble families were reduced to indigence and poverty; ſo that, about 100 years after, it became faſhionable for the nobles to live in a plain manner, without any ſhew or magnificence.

In 1336, both parties, ſuſpending their mutual animoſities, ſent two fleets of 20 galleys each into the German ocean, to the aſſiſtance of the king of France, who was engaged in a war with Edward III. king of England. This naval expedition proved the cauſe of a moſt remarkable revolution in the Genoeſe government. The ſailors of the fleet, thinking themſelves injured by their officers, whom they accuſed of defrauding them of their pay, proceeded to an open mutiny; and, having expelled the admiral and other commanders, ſeized the galleys. The king of France being choſen arbitrator, decided in favour of the officers, and impriſoned 16 of the chiefs of the mutineers. Upon this ſeveral of the ſailors left the fleet, and returned to Genoa; where they went round the coaſts, repeating their mutinous complaints, which were greatly heark-ened to, upon a falſe report that the mutineers who had been impriſoned were broke upon the wheel. The factious ſpirit increaſed; and at laſt the Genoeſe inſiſted in a tumultuous manner for having an abbot of their own chooſing, and 20 of the people with the conſent of the captains of the republic aſſembled for that purpoſe. While the mob were impatiently expecting their deciſion, a mechanic, generally accounted a fool, mounted a wooden bench, and called out that one Simon Bucanigree ſhould be choſen abbot. This being inſtantly echoed by the populace, he was firſt declared *abbot*, then *lord*, and at laſt *duke* of Genoa. Genoa.

This new expedient did not at all anſwer the purpoſe. The diſſentions continued as violent as ever, notwithſtanding the power of the new magiſtrates; and by theſe perpetual diviſions the republic was at laſt ſo much weakened, that in 1390 the king of France was declared lord of Genoa. Under the French government, however, they ſoon became exceedingly impatient; and, in 1422, the duke of Milan obtained the ſovereignty. With this ſituation they were equally diſpleaſed, and therefore revolted in 1436. Twenty-two years after, finding themſelves preſſed by a powerful fleet and army ſent by Alphonſo king of Naples, they again conferred the ſovereignty of their ſtate upon the king of France. In 1460, they revolted from the French; and, four years after, put themſelves again under the protection of the duke of Milan; from whom they revolted in 1478. He was again declared ſovereign of the republic in 1488; and, 11 years after, the city and territories of Genoa were conquered by Lewis XII. of France.

The almoſt unparalleled fickleneſs of the Genoeſe diſpoſition was not to be corrected by this misfortune. They revolted in 1506; but next year were again ſubdued by Lewis. Six years after, they again revolted; and in 1516, the city was taken and plundered by the Spaniards. In 1528, Andrew Doria, a Genoeſe admiral in the ſervice of the French, undertook to reſcue his country from the dominion of foreign princes, and reſtore it to its liberty. Knowing well the fickle diſpoſition of his countrymen, he took all occaſions of exciting diſcontents among them againſt the government. He perſuaded them, that the French (who had again obtained the ſovereignty) had left them only a ſhadow of liberty, while they pretended to protect them from their enemies. To the nobility he repreſented the diſgrace of ſuffering the government to be veſted in the hands of foreigners leſs worthy of authority than themſelves. Thus he ſoon formed a ſtrong faction, and formed his plan; for the execution of which he took the moſt proper time, namely, when almoſt three-fourths of the French garriſon had been carried off by the plague.—He advanced with 500 men; and his friends having opened the gates of the city to him, he ſeized the principal poſts, and thus became maſter of it without drawing his ſword. The garriſon retired to the forts, where they ſoon after capitulated, and being driven out of the city, Doria re-eſtabliſhed the ancient form of government *. * See DORIA.

The republic hath ſince continued to preſerve her liberty, though greatly fallen from her ancient ſplendor, and now become a very inconſiderable ſtate. In 1684, the Genoeſe had the misfortune to fall under the reſentment of Lewis XIV. at which time the city was almoſt deſtroyed by a formidable bombardment. In the year 1688, it was bombarded by admiral Byng, and forced to capitulate; but there were at that time no views of making a permanent conqueſt of the city. In 1730, the iſland of Corſica revolted from the Genoeſe, and could never afterwards be reduced by them; for which reaſon it was ſold to the French, who in the year 1770 totally reduced it.

The Genoeſe territories extend along that part of the Mediterranean ſea, commonly called the *gulph of Genoa*,

Genoa. *Genoa*, about 152 miles; but their breadth is very unequal, being from eight to about 20 miles. Where they are not bounded by the sea, the following states and countries, taking them from west to east, are their boundaries, *viz.* Piedmont, Montferat, Milan, Placentia, Parma, the dukedom of Tuscany, and the republic of Lucca. This tract, though a great part of it is mountainous, and some of that barren enough, yet produces plenty of excellent fruit, good pasture, wood, garden-stuff, and mulberry-trees, with some wine and oil, but little corn. What they want of the last, they have either from Lombardy, Sicily, or Naples.

Genoa stands on the coast of the Mediterranean sea, at the bottom of a little gulph, partly on the flat, and partly on the declivity, of a pleasant hill; in consequence of which, it appears to great advantage from the sea. It is defended on the land-side a by double wall, which in circumference is about ten Italian miles. Two of the streets consist entirely of a double straight row of magnificent palaces. The others, though clean and well paved, are crooked and narrow. The palaces of the nobility are almost all of marble, and many of them are painted on the outside. That there should be such a profusion of marble here, is not to be wondered at, as the neighbouring hills abound with it. The city contains a vast number of palaces, churches, and convents, and several hospitals. The palace where the doge resides, and where the great and little council, and the two colleges of the procuratori and governatori assemble, is a large stone building in the centre of the city: but it contains some fine paintings in fresco; two statues of Andrew and John Doria in white marble; and an arsenal, in which are said to be arms for thirty-four thousand men, with a shield, containing one hundred and twenty pistol-barrels, and thirty-three coats of mail, which, it is pretended, were worn by as many Genoese heroines in a croisade. Of the churches, the finest are those of the annunciation, St Mary Carignan, St Dominic, and St Martha. In the cathedral is a dish made of a single emerald. All the inhabitants here, except the principal ladies, who are carried in chairs, walk on foot, on account of the narrowness or steepness of the streets. The fortifications of the city, towards the sea, are remarkably strong. There are two fine stone-bridges over the rivers Bonzevera and Bisagno, the first whereof washes the west, and the other the east side of the city, within which there is also a surprising stone-bridge joining two hills. The harbour, though large, is far from being safe; but no care or expence have been spared, to render it as safe and commodious as possible. The wind to which it is most exposed, is that called *Labeccio*, or the south-west. The place where the republic's galleys lie, is called the Darsena, where are a great number of Turkish slaves. On a rock, on the west side of the harbour, is the fanal or light-house, a high tower, on the top of which is a lanthorn, containing thirty-six lamps. The trade of Genoa is chiefly in velvets, damasks, plush, and other silks, brocades, lace, gloves, sweetmeats, fruits, oil, Parmesan cheese, anchovies, and medicinal drugs from the Levant; but the badness of the harbour, and the high price of commodities, greatly check its commerce. In 1751, Genoa was declared a free port for ten years, under certain restrictions: in that called *Porto Franco*, any merchant may have a ware-house, and import or export goods duty free; but such as are disposed of in the city, or on the continent, are taxed pretty high. The nobility are allowed to trade in the wholesale way; to carry on velvet, silk, and cloth manufactures; and to have shares in merchant-ships: and some of them, as the Palavacini, are actually the greatest merchants in Genoa. Another very profitable article of trade carried on by them is banking, and dealing in bills of exchange. A new academy of painting, sculpture, civil and military architecture, was instituted here in 1751. One may walk the streets of Genoa in the night with the greatest safety, which is more than can be said of many cities in Italy. Excessive splendor and luxury are, in several respects, restrained by salutary laws. No beggars are permitted to ask alms in Genoa, and the inns are better than those at Turin. When a single person is buried, a kind of garland of all sorts of artificial flowers is placed on the coffin. The Genoese in general are esteemed crafty, industrious, and inured to labour above the other Italians.

Genoa, Genfing, Gentiana.

GENSING. See PANAX.

GENTIANA, GENTIAN, in botany, a genus of the digynia order, belonging to the pentandria class of plants. The most remarkable species are the following:

1. The lutea, or common gentian of the shops. It is a native of the mountainous parts of Germany; from whence the roots, the only part used in medicine, are brought to this country. These have a yellowish-brown colour, and a very bitter taste. The lower leaves are of an oblong oval shape, a little pointed at the end, stiff, of a yellowish green, and have five large veins on the back of each. The stalk rises four or five feet high, garnished with leaves growing by pairs at each joint, almost embracing the stalk at their base. They are of the same form with the lower, but diminish gradually in their size to the top. The flowers come out in whorls at the joints on the upper part of the stalks, standing on short foot-stalks, whose origin is in the wings of the leaves. They are of a pale yellow colour.—The roots of this plant are very frequently used in medicine as stomachic bitters. In taste they are less exceptionable than most of the substances of this class. Infusions of gentian-root flavoured with orange-peel, are sufficiently grateful. Some years ago a poisonous root was discovered among the gentian brought to London; the use of which occasioned violent disorders, and in some cases death. This root is easily distinguished from the gentian, by its being internally of a white colour, and void of bitterness.

2. The centaureum, or lesser centaury of the shops, is a native of many parts of Britain. It grows on dry pastures; and its height is commonly proportioned to the goodness of the soil, as in rich soils it will grow to the height of a foot, but in poor ones not above three or four inches. It is an annual plant, with upright branching stalks, garnished with small leaves, placed by pairs. The flowers grow in form of an umbel at the top of the stalk, and are of a bright purple colour. They come out in July, and the seed ripens in autumn. The plant cannot be cultivated in gardens. The tops are an useful aperient bitter, in which

Gentile, Gentleman.

which view they are often used in the present practice of medicine.

GENTILE, in matters of religion, a Pagan, or worshipper of false gods.

The origin of this word is deduced from the Jews, who called all those who were not of their name גוים *gojim*, i. e. *gentes*, which in the Greek translations of the Old Testament is rendered εθνη; in which sense it frequently occurs in the New Testament; as in Matth. vi. 32. "All these things the nations or Gentiles seek." Whence the Latin church also used *gentes* in the same sense as our *Gentiles*, especially in the New Testament. But the word *gentes* soon got another signification, and no longer meant all such as were not Jews; but those only who were neither Jews nor Christians, but followed the superstitions of the Greeks and Romans, &c. In this sense it continued among the christian writers, till their manner of speech, together with their religion, was publicly and by authority received in the empire; when *gentiles*, from *gentes*, came into use: and then both words had two significations, viz. in treatises or laws concerning religion, they signified Pagans, neither Jews nor Christians; and in civil affairs, they were used for all such as were not Romans.

GENTILE, in the Roman law and history, a name which sometimes expresses what the Romans otherwise called *barbarians*, whether they were allies of Rome or not: but this word was used in a more particular sense for all strangers and foreigners not subject to the Roman empire.

GENTILIS (Albericus), professor of civil law at Oxford; an Italian by birth. He had quitted Italy with his father, on account of religion. He wrote several works; three books, in particular, *De jure belli*, which have not been unserviceable to Grotius. He died at London in 1608.

GENTILIS (Scipio), brother to the former, and as celebrated a civilian as he, forsook his native country that he might openly profess the Protestant religion. He was counsellor of the city of Nuremberg, and professor of law with uncommon reputation. He was a great humanist; and in his lectures, as well as books, mixed the flowers of polite learning with the thorns of the law. He died in 1616.

GENTLEMAN. Under this denomination are comprehended all above the rank of yeomen *, where- * See *Commonalty*
by noblemen are truly called *gentlemen*.

A gentleman is usually defined to be one who, without any title, bears a coat of arms, or whose ancestors have been freemen; and by the coat that a gentleman giveth, he is known to be, or not to be, descended from those of his name that lived many hundred years since.

The word is formed of the French *gentilhomme*; or rather of *gentil*, "fine, fashionable, or becoming;" and the Saxon *man*, q. d. *honestus*, or *honesto loco natus*.—The same signification has the Italian *gentilhuomo*, and the Spanish *hidalgo*, or *hijo dalgo*, that is, the son of somebody, or of a person of note.—If we go farther back, we shall find *gentleman* originally derived from the Latin *gentilis homo*; which was used among the Romans for a race of noble persons of the same name, born of free or ingenuous parents, and whose ancestors had never been slaves or put to death by law. Thus Cicero, in his *Topics*, "*Gentiles sunt, qui inter se eodem sunt nomine, ab ingenuis oriundi, quorum majorum nemo fervitutem servivit, qui capite non sunt diminuti*, &c.—Some hold that it was formed from *gentile*, i. e. pagan; and that the ancient Franks, who conquered Gaul, which was then converted to Christianity, were called *gentiles* by the natives, as being yet heathens.—Others relate, that towards the declension of the Roman empire, as recorded by Ammianus Marcellinus, there were two companies of brave soldiers, the one called *gentilium*, and the other *scutariorum*; and that it was hence we derive the names *gentleman* and *esquire*. See ESQUIRE. —This sentiment is confirmed by Pasquier, who supposes the appellation *gentiles* and *ecuyers* to have been transmitted to us from the Roman soldiery; it being to the *gentiles* and *scutarii*, who were the bravest of the soldiery, that the principal benefices and portions of lands were assigned. See BENEFICE.—The Gauls observing, that, during the empire of the Romans, the *scutarii* and *gentiles* had the best tenements or appointments of all the soldiers on the frontiers of the provinces, became insensibly accustomed to apply the same names, *gentilhommes* and *ecuyers*, to such as they found their kings gave the best provisions or appointments to. Gentleman.

GENTLEMAN-*Usher of the Black Rod*. See ROD.

GENTLEMEN *of the Chapel*, officers whose duty and attendance is in the royal chapel, being in number thirty-two. Twelve of them are priests; the other twenty, commonly called *clerks of the chapel*, assist in the performance of divine service. One of the first twelve is chosen for confessor of the household; whose office it is to read prayers every morning to the household servants, to visit the sick, examine and prepare communicants, and administer the sacrament. One of twenty clerks, well versed in music, is chosen first organist, who is master of the children, to instruct them in music, and whatever else is necessary for the service of the chapel; a second is likewise an organist; a third, a lutanist; and a fourth, a violist. There are likewise three vergers, so called from the silver rods they carry in their hands; being a serjeant, a yeoman, and groom of the vestry: the first attends the dean and sub-dean, and finds surplices and other necessaries for the chapel; the second has the whole care of the chapel, keeps the pews, and seats the nobility and gentry; the groom has his attendance within the chapel-door, and looks after it.

GENUS, among metaphysicians and logicians, denotes a number of beings which agree in certain general properties common to them all: so that a genus is nothing else but an abstract idea, expressed by some general name or term. See LOGIC, n° 18, &c. Genus.

It is plain, therefore, that by a genus we do not barely signify one particular thing, nor yet a plurality of things; but a sort or kind of things, all agreeing in certain general properties.

Thus animal is said to be a genus in respect of man and brute, in regard man and brute agree in the common nature and character of animal: so a right-lined figure of four sides, is a genus in respect of a parallelogram and a trapezium; and so likewise is substance, in respect of substance extended, which is body, and thinking substance, which is mind.

The method by which the mind advances to form genera

Genus. genera is, according to Mr Locke, as follows.—Obſerving ſeveral things, that differ from the mind's idea of man, for inſtance, and therefore cannot be comprehended under that name, to agree with man in ſome certain qualities; by retaining only thoſe qualities, and uniting them into one idea, it gets another more general idea, to which giving a name, it makes a new genus, or a term of a more comprehenſive extenſion. Thus, by leaving out the ſhape, and other properties ſignified by the word *man*, and retaining only a body with life, ſenſe, and ſpontaneous motion, we form the idea ſignified by the name *animal*. By the ſame way the mind proceeds to body, ſubſtance, and at laſt to being, thing, and ſuch univerſal terms as ſtand for any ideas whatever.

This ſhews the reaſon why, in defining things, we make uſe of the genus, namely, to ſave the labour of enumerating the ſeveral ſimple ideas which the next term ſtands for: from whence it appears, that genus is no more than an abſtract idea, comprehending a greater or leſs number of ſpecies, or more particular claſſes. See SPECIES.

GENUS is alſo uſed for a character or manner applicable to every thing of a certain nature or condition: in which ſenſe it ſerves to make capital diviſions in diverſ ſciences, as rhetoric, anatomy, and natural hiſtory.

GENUS, in rhetoric. Authors diſtinguiſh the art of rhetoric, as alſo orations or diſcourſes produced thereby, into three genera or kinds, demonſtrative, deliberative, and judiciary. To the demonſtrative kind belong panegyrics, genethliacons, epithalamiums, funeral harangues, &c. To the deliberative kind belong perſuaſions, diſſuaſions, commendations, &c. To the judiciary kind belong defences and accuſations.

GENUS, in natural hiſtory, a ſubdiviſion of any claſs or order of natural beings, whether of the animal, vegetable, or mineral kingdoms, all agreeing in certain common characters. See BOTANY and ZOOLOGY.

GENUS, in muſic, by the ancients called *genus melodiæ*, is a certain manner of dividing and ſubdividing the principles of melody; that is, the conſonant and diſſonant intervals, into their concinnous parts.

The moderns conſidering the octave as the moſt perfect of intervals, and that whereon all the concords depend, in the preſent theory of muſic, the diviſion of that interval is confidered as containing the true diviſion of the whole ſcale.

But the ancients went to work ſomewhat differently: the diateſſaron, or fourth, was the leaſt interval which they admitted as concord; and therefore they ſought firſt how that might be moſt conveniently divided; from whence they conſtituted the diapente and diapaſon.

The diateſſaron being thus, as it were, the root and foundation of the ſcale, what they called the genera, or kinds, aroſe from its various diviſions; and hence they defined the *genus modulandi* to be the manner of dividing the tetrachord and diſpoſing its four ſounds as to ſucceſſion. Geocentric || Geography.

The genera of muſic were three, the enharmonic, chromatic, and diatonic. The two firſt were variouſly ſubdivided: and even the laſt, tho' that is commonly reckoned to be without any ſpecies; yet different authors have propoſed different diviſions under that name, without giving any particular names to the ſpecies, as was done to the other two.

For the characters, &c. of theſe ſeveral genera, ſee ENHARMONIC, CHROMATIC, and DIATONIC.

GEOCENTRIC, in aſtronomy, is applied to a planet, or its orbit, to denote it concentric with the earth, or as having the earth for its centre, or the ſame centre with the earth.

GEOFFREY *of* MONMOUTH, biſhop of St Aſaph, called by our ancient biographers *Galfridus Monumetenſis*. Leland conjectures that he was educated in a Benedictine convent at Monmouth, where he was born; and that he became a monk of that order. Bale, and after him Pits, call him archdeacon of Monmouth; and it is generally aſſerted that he was made biſhop of St Aſaph in the year 1151 or 1152, in the reign of king Stephen. His hiſtory was probably finiſhed after the year 1138. It contains a fabulous account of Britiſh kings, from the Trojan Brutus, to the reign of Cadwallader in the year 690. But Geoffrey, whatſoever cenſure he may deſerve for his credulity, was not the inventor of the ſtories he relates. It is a tranſlation from a manuſcript written in the Britiſh language, and brought to England from Armorica by his friend Gualter, archdeacon of Oxford. But the atchievements of king Arthur, Merlin's prophecies, many ſpeeches and letters, were chiefly his own addition. In excuſe for this hiſtorian, Mr Wharton judiciouſly obſerves, that fabulous hiſtories were then the faſhion, and popular traditions a recommendation to his book.

GEOFFROY (STEPHEN FRANCIS), a celebrated phyſician, botaniſt, and chemiſt, born at Paris in 1672. After having finiſhed his ſtudies, he travelled into England, Holland, and Italy. In 1704, he received the degree of doctor of phyſic at Paris; and at length became profeſſor of chemiſtry, and phyſician of the Royal College. He was a member of the Royal Society of London, and of the Academy of Sciences. He wrote, 1. Several very curious Theſes in Latin, which were afterwards tranſlated into French. 2. An excellent treatiſe, intitled *Tractatus de Materia Medica, ſive de Medicamentorum ſimplicium, hiſtoria, virtute, delectu, & uſu.* He died at Paris, in 1731.

GEOGRAPHICAL MILE, the ſame with the ſea-mile; being one minute, or the 60th part of a degree of a great circle on the earth's ſurface.

GEOGRAPHY.

GEOGRAPHY (γεωγραφια, from γη *terra*, and γραφω *ſcribo*); the doctrine or knowledge of the earth, both as in itſelf, and as to its affections; or a deſcription of the terreſtrial globe, and particularly of the known and inhabitable parts thereof, with all its different diviſions.

SECT.

Sect. I. *History of the Science.*

At what time the science of geography began first to be studied among mankind is entirely uncertain. It is generally agreed, that the knowledge of it was derived to the Greeks, who first of the European nations cultivated this science, from the Egyptians or Babylonians; but it is impossible to determine which of these two nations had the honour of the invention. Herodotus tells us, that the Greeks first learned the pole, the gnomon, and the twelve divisions of the day, from the Babylonians. By Pliny, and Diogenes Laertius, however, we are told, that Thales of Miletus first found out the passage of the sun from tropic to tropic; which he could not have done without the assistance of a gnomon. He is said to have been the author of two books, the one on the tropic, and the other on the equinox; both of which he probably determined by the gnomon; and by this he was led to the discovery of the four seasons of the year, which are determined by the solstices and equinoxes.

1 Seasons of the year discovered by Thales.

Thales divided the year into 365 days; which was undoubtedly a method discovered by the Egyptians, and communicated by them to him. It is said to have been invented by the second Mercury, surnamed Trismegistus, who, according to Eusebius, lived about 50 years after the *Exodus*. Pliny tells us expressly, that this discovery was made by observing when the *shadow returned to its marks*; a clear proof that it was done by the gnomon. Thales also knew the method of determining the height of bodies by the length of their shadows, as appears by his proposing this method for measuring the height of the Egyptian pyramids. Hence many learned men have been of opinion, that as the use of the gnomon was known in Egypt long before the dawn of learning in Greece, the pyramids and obelisks, which to common travellers appeared only to be buildings of magnificence, were in reality as many sun-dials on a very large scale, and built with a design to ascertain the season of the year, by the variation of the length of their shadows: and, in confirmation of this opinion, it was found by M. Chazelles in 1694, that the two sides, both of the larger and smaller pyramids, stood exactly north and south; so that, even at this day, they form true meridian lines.

2 Conjecture concerning the use of the Egyptian pyramids and obelisks.

From the days of Thales, who flourished in the sixth century before Christ, very little seems to have been done towards the establishment of geography for 200 years. During this period, there is only one astronomical observation recorded; namely, that of Meton and Euctemon, who observed the summer solstice at Athens, during the archonship of Apseudes, on the 21st of the Egyptian month Phamenoth, in the morning, being the 27th of June, 432. B. C. This observation was made by watching narrowly the shadow of the gnomon, and was done with a design to fix the beginning of their cycle of 19 years.

3 Longitudes and latitudes determined.

Timocharis and Aristillus, who began to observe about 295 B. C. seem to have been the first who attempted to fix the longitudes and latitudes of the fixed stars, by considering their distances from the equator. One of their observations gave rise to the discovery of the precession of the equinoxes, which was first observed by Hipparchus about 150 years after; and he made use of Timocharis and Aristillus's method, in order to delineate the parallels of latitude, and the meridians on the surface of the earth; thus laying the foundation of the science of geography as we have it at present. History.

But though the latitudes and longitudes were thus introduced by Hipparchus, they were not attended to by any of the intermediate astronomers, till the days of Ptolemy. Strabo, Vitruvius, and Pliny, have all of them entered into a minute geographical description of the situation of places, according to the length of the shadows of the gnomon, without taking the least notice of the degrees and minutes of longitude and latitude.

The discovery of the longitudes and latitudes immediately laid a foundation for making maps, or delineations of the surface of the earth *in plano*, on a very different plan from what had been attempted before. Formerly the maps were little more than rude outlines and topographical sketches of different countries. The earliest were those of Sesostris, mentioned by Eusthathius; who says, that "this Egyptian king, having traversed great part of the earth, recorded his march in maps, and gave copies of his maps not only to the Egyptians, but to the Scythians, to their great astonishment.—Some have imagined, that the Jews made a map of the Holy Land, when they gave the different portions to the nine tribes at Shiloh: for Joshua tells us, that they were sent to walk through the land, and that they *described it in seven parts in a book*; and Josephus tells us, that when Joshua sent out people from the different tribes to measure the land, he gave them, as companions, persons well skilled in geometry, who could not be mistaken in the truth. 4 Accounts of the ancient maps.

The first Grecian map on record is that of Anaximander, mentioned by Strabo, lib. i. p. 7. It has been conjectured by some, that this was a general map of the then known world, and is imagined to be the one referred to by Hipparchus under the designation of the *ancient map*. Herodotus minutely describes a map made by Aristagoras tyrant of Miletus, which will serve to give us some idea of the maps of those ages. He tells us, that Aristagoras shewed it to Cleomenes king of Sparta, with a view of inducing him to attack the king of Persia, even in his palace at Susa, in order to restore the Ionians to their ancient liberty. It was traced upon brass or copper, and contained the intermediate countries which were to be traverfed in that march. Herodotus tells us, that it contained "the whole circumference of the earth, the whole sea, or ocean, and all the rivers;" but these words must not be understood literally. From the state of geography at that time, it may be fairly concluded that by the *sea* was meant no more than the Mediterranean; and therefore, the earth or land signified the coasts of that sea, and more particularly the Lesser Asia, extending towards the middle of Persia. The rivers were the Halys, the Euphrates, and Tigris, which Herodotus mentions as necessary to be crossed in that expedition. It contained one straight line, called the *Royal Highway*, which took in all the stations or places of encampment from Sardis to Susa. Of these there were 111 in the whole journey, containing

taining 13,500 ſtadia, or 1687 ½ Roman miles of 5000 feet each.

These itinerary maps of the places of encampment were indiſpenſably neceſſary in all armies. Athenæus quotes Bæton as author of a work intitled, *The encampments of Alexander's march*; and likewiſe Amyntas to the ſame purpoſe. Pliny tells us, that Diognetus and Bæton were the ſurveyors of Alexander's marches, and then quotes the exact number of miles according to their menſuration; which he afterwards confirms by the letters of Alexander himſelf. It likewiſe appears, that Alexander was very careful in examining the meaſures of his ſurveyors, and took care to employ the moſt ſkilful in every country for this purpoſe. The ſame author alſo acquaints us, that a copy of this great monarch's ſurveys, was given by Xenocles his treaſurer, to Patrocles the geographer, who, as Pliny informs us, was admiral of the fleets of Seleucus and Antiochus. His book on geography is often quoted both by Strabo and Pliny; and it appears, that this author furniſhed Eratoſthenes with the principal materials for conſtructing his map of the oriental part of the world.

5 Parallel of latitude how drawn at firſt.

Eratoſthenes was the firſt who attempted to reduce geography to a regular ſyſtem, and introduced a regular parallel of latitude. This was traced over certain places where the longeſt day was of the ſame length. He began it from the ſtraits of Gibraltar; and it thence paſſed through the Sicilian ſea, and near the ſouthern extremities of Peloponneſus. From thence it was continued through the Iſland of Rhodes and the Bay of Iſſus; and there entering Cilicia, and croſſing the rivers Euphrates and Tigris, it was extended to the mountains of India. By means of this line, he endeavoured to rectify the errors of the ancient map, ſuppoſed to be that of Anaximander. In drawing this parallel, he was regulated by obſerving where the longeſt day was fourteen hours and an half, which Hipparchus afterwards determined to be the latitude of 36 degrees.

The firſt parallel through Rhodes was ever afterwards conſidered with a degree of preference, like the foundation-ſtone of all ancient maps; and the longitude of the then known world was often attempted to be meaſured in ſtadia and miles, according to the extent of that line, by many ſucceeding geographers. Eratoſthenes ſoon after attempted, not only to draw other parallels of latitude, but alſo to trace a meridian, at right angles to theſe, paſſing through Rhodes and Alexandria, down to Syene and Meroë; and as the progreſs he thus made tended naturally to enlarge his ideas, he at laſt undertook a ſtill more arduous taſk,

6 Attempts to determine the extent of the earth's circumference.

namely, to determine the circumference of the globe, by an actual meaſurement of a ſegment of one of its great circles. Here he made his computation by uniting certain accurate obſervations made in the heavens, with a correſponding diſtance carefully ſurveyed and taken upon a meridian of the earth. The ſegment of the meridian which he pitched upon for this purpoſe, was that between Alexandria and Syene, the diſtance betwixt which places was found to be 5000 ſtadia. The angle of the ſhadow on the ſun-dial of Alexandria was equal to the 50th part of the circle; but at Syene there was no ſhadow on the day of the ſummer ſolſtice; and that this might be the more accurately obſerved, they dug a deep well, which being perpendicular, was completely illuminated at the bottom when the ſun was vertical. Even this, however, was not ſufficient to give the exact line of the tropic; becauſe the ſun was found to be vertical, or to caſt no ſhadow at all, for a circular ſpace of 300 ſtadia. The reaſon of this is, that the apparent diameter of the ſun is 32 minutes, and he muſt therefore appear perpendicular to an extent of ground equivalent to that ſpace.

The inveſtigation of this problem of the circumference of the earth was eſſentially neceſſary for determining the radical principles of all maps; and therefore the moſt eminent of the ancient geographers made repeated attempts to diſcover this exactly. Eratoſthenes made the circumference 250,000 or 252,000 ſtadia; thus allowing 700 ſtadia, or 87½ Roman miles, to each degree. Hipparchus added 25,000 ſtadia to this meaſurement of Eratoſthenes, which increaſed the degree to 96 Roman miles. Poſſidonius, however, having obtained a more accurate meaſurement than that of Eratoſthenes, reduced the circumference of the earth to 180,000 ſtadia, and the degree to 62½ Roman miles.

7 Inaccuracy of the ancient maps.

The map of Eratoſthenes, though the beſt of which antiquity can boaſt, was nevertheleſs exceedingly imperfect and inaccurate. It contained little more than the ſtates of Greece, and the dominions of the ſucceſſors of Alexander, digeſted according to the ſurveys above-mentioned. He had ſeen, indeed, and has quoted, the voyages of Pytheas into the great Atlantic ocean, which gave him ſome faint idea of the weſtern parts of Europe; but ſo imperfect, that they could not be realiſed into the outlines of a chart. Strabo tells us, that he was extremely ignorant of Gaul, Spain, Germany, and Britain. He was equally ignorant of Italy, the coaſts of the Adriatic, Pontus, and all the countries towards the north. We are alſo told by the ſame author, that Eratoſthenes made the diſtance between Epidamnus or Dyrrhachium on the Adratic, and the bay of Thermæ on the Ægean ſea, to be only 900 ſtadia, when in reality it was above 2000; and in another inſtance, he had enlarged the diſtance from Carthage to Alexandria to 15,000 ſtadia, when in reality it was no more than 9000.

Such was the ſtate of geography and the nature of the maps prior to the time of Hipparchus; who, as already obſerved, made a cloſer connection between geography and aſtronomy, by determining the longitudes and latitudes from celeſtial obſervations. It muſt be owned, however, that the previous ſteps to this new projection of the ſphere had been in a great meaſure made eaſy by Archimedes, upwards of 50 years before the time of Hipparchus, when he invented his noble theorems for meaſuring the ſurface of a ſphere and its different ſegments.

It appears that war has been generally the occaſion of making the moſt accurate maps of different countries; and therefore geography made great advances from the progreſs of the Roman arms. In all the provinces occupied by that people, we find that camps were every where conſtructed at proper intervals, and roads were raiſed with ſubſtantial materials, for making an eaſier communication between them; and thus civiliſation and ſurveying were carried on according to ſyſtem throughout the extent of that large empire.

History. Every new war produced a new ſurvey and itinerary of the countries where the ſcenes of action paſſed; ſo that the materials of geography were accumulated by every additional conqueſt. Polybius tells us, that at the beginning of the ſecond Punic war, when Hannibal was preparing his expedition againſt Rome, the countries through which he was to paſs, were carefully meaſured by the Romans. Julius Cæſar cauſed a general ſurvey of the Roman empire to be made, by a decree of the ſenate. Three ſurveyors, Zenodoxus, Theodotus, and Polyclitus, had this taſk aſſigned them, and are ſaid to have completed it in 25 years. The Roman itineraries that are ſtill extant, alſo ſhew what care and pains they had been at in making ſurveys in all the different provinces of their empire; and Pliny has filled the third, fourth, and fifth books of his Natural Hiſtory with the geographical diſtances that were thus meaſured. We have likewiſe another ſet of maps ſtill preſerved to us, known by the name of the *Peutingerian Tables*, publiſhed by Welſer and Bertius, which give a ſufficient ſpecimen of what Vegetius calls the *Itinera Picta*, for the clearer direction of their armies in their march.

The Roman empire had been enlarged to its greateſt extent, and all its provinces well known and ſurveyed, when Ptolemy, in the reign of Antoninus Pius, about 150 years after Chriſt, compoſed his ſyſtem of geography. The principal materials he made uſe of for compoſing this work, were *the proportions of the gnomon to its ſhadow*, taken by different aſtronomers at the times of the equinoxes and ſolſtices; calculations founded upon the length of the longeſt days; the meaſures or computed diſtances of the principal roads contained in their ſurveys and itineraries; and the various reports of travellers and navigators, who often determined the diſtances of places by hearſay and conjecture. All theſe were compared together, and digeſted into one uniform body or ſyſtem; and afterwards were tranſlated by him into a new mathematical language, expreſſing the different degrees of longitude and latitude, according to the invention of Hipparchus, but which Ptolemy had the merit of carrying into full practice and execution, after it had been neglected for upwards of 250 years. With ſuch imperfect and inaccurate materials, it is no wonder to find many errors in Ptolemy's ſyſtem. Neither were theſe errors ſuch as had been introduced in the more diſtant extremities of his maps, but even in the very centre of that part of the world which was the beſt known to the ancient Greeks and Romans, and where all the famed ancient aſtronomers had made their obſervations.—Yet this ſyſtem, with all its imperfections, continued in vogue till the beginning of the preſent century. The improvements in geography which at that time, and ſince have taken place, were owing to the great progreſs made in aſtronomy by ſeveral eminent men who lived during that period. More correct methods and inſtruments for obſerving the latitude were found out, and the diſcovery of Jupiter's ſatellites afforded a much eaſier method of finding the longitudes than was formerly known. The voyages made by different nations alſo, which were now become much more frequent than formerly, brought to the knowledge of the Europeans a vaſt number of countries utterly unknown to them before. The late voyages of Captain Cooke, made by order of his Britannic Majeſty, have contributed more to the improvement of geography than any thing that has been done during the preſent century; ſo that now the geography of the utmoſt extremities of the earth is in a fair way of being much better known to the moderns, than that of the moſt adjacent countries was to the ancients. This, however, muſt be underſtood only of the ſea-coaſts of theſe countries; for, as to their internal geography, it is leſs known now than before, except in a very few places. History.

8 Geography ſtill imperfect.

On the whole, it may be obſerved, that geography is a ſcience even yet far from perfection. The maps of America and the eaſtern parts of Aſia are, perhaps, more unfiniſhed than any of the reſt. Even the maps of Great Britain and Ireland are very imperfect and unſatisfactory; and the numbers we have of them, varied, and republiſhed, without any real improvement, juſtly confirm an obſervation made by Lord Bacon, namely, that an opinion of plenty is one of the cauſes of want. The late Dr Bradley was of opinion, that there were but two places in England whoſe longitude might be depended upon as accurately taken; and that theſe were the obſervatory at Greenwich, and Serburncaſtle the ſeat of the Earl of Macclesfield in Oxfordſhire; and that their diſtance was one degree in ſpace, or four minutes in time. Even this was found to be inaccurate, the diſtance in time being obſerved by the late tranſit of Venus to be only three minutes and forty-ſeven ſeconds. It were well, however, if there were no greater errors with regard to other places: but if we examine the longitude of the Lizard, we ſhall find ſcarce any two geographers that agree concerning it; ſome making it 4° 40′ from London; others 5°, and 5° 14′; while ſome enlarge it to 6°. Our beſt maps are therefore ſtill to be conſidered as unfiniſhed works, where there will always be many things to be added and corrected, as different people have an opportunity.

Sect. II. *Principles and Practice of Geography.*

The practical part of geography conſiſts in meaſuring the diſtances between different places on the ſurface of the earth, and laying them down upon paper according to their different longitudes and latitudes. For this purpoſe, an exact obſervation of the longitudes and latitudes of the different places is ſufficient; for when once theſe are known, the diſtance between the places themſelves is eaſily found, that is to ſay, provided the extent of the circumference of the earth is known; for without this, it is impoſſible to aſcertain the diſtance between any two places except by actual menſuration. For the ſolution of this problem, it is only neceſſary to meaſure one degree of the earth's ſurface; which may be done in the following manner. Having found exactly the latitude of the place from whence your menſuration is to commence, by the directions given under Astronomy, n° 209. proceed exactly northward or ſouthward, carefully meaſuring the diſtance as you go along, till you find by another celeſtial obſervation that you are got to one degree of latitude either farther north or farther ſouth than the place from whence you ſet out. The diſtance between the two places is the length of a degree on the earth's ſurface; and conſequently, if multiplied by 360, will give the meaſure of the whole circumference of the earth.

9 How to meaſure a degree of the earth's ſurface.

This

Principles and Practice

This method, however, though in theory it seems to be so easy and simple, is nevertheless attended with very great, nay, almost insurmountable, difficulties in practice. It is impossible to find a perfect plane on the surface of the earth, which extends for so great a length. In the mensuration of a degree, therefore, the inequalities with which the earth every where abounds are found to be exceeding great obstacles. For this reason, we are obliged to have recourse to trigonometrical calculations of the distances between different places, till we arrive at one distant from that whence we set out by a degree of latitude. But it is impossible to make any calculation in the trigonometrical way without some small error; nay, often not without a very great one; for the different states of the atmosphere are found greatly to affect trigonometrical mensurations. Hence there hath arisen a prodigious disagreement among those who have attempted to measure the circumference of the terraqueous globe; for as a degree of the earth's surface cannot be measured but by many calculations, the error in one being repeated in all the rest must necessarily become very considerable at last. Those who first attempted this mensuration, computed the circumference of the earth to be 50,000 Italian miles; by Ptolemy it was reckoned only 21,600 of the same miles; and the more modern geometricians have computed the circumference of the earth at about 25,000 miles.

A method more easily practicable would seem to be by attempting to measure the degrees of longitude. We know, that at the equator a degree of longitude is equal to a degree of latitude; but as we advance towards either of the poles, the degrees of longitude continually decrease by reason of the approximation of the meridians to each other, till at the pole itself they totally vanish. If we know the length of a degree of longitude at the equator, therefore, we can easily, by a geometrical calculation liable to no unavoidable error, find the length of a degree of longitude at any distance either north or south from the equator. Again, if we know the measure of a degree of longitude at any distance from the equator, we may easily, by a like calculation, find the length of a degree of longitude at the equator itself. If, therefore, attempts are made to measure the degrees of longitude at the equator itself, and in many different places north and south from it, making at the same time proper geometrical calculations, it is plain that all these different operations will tend to confirm or correct one another, and by their mutual agreement or disagreement among themselves we will know which of them comes nearest the truth.

As a difference in longitude makes also a difference in the hour of the day, we have from thence a much easier method of measuring a degree of longitude than of measuring one of latitude. We know, that if two places are distant from each other by 15 degrees of longitude, it will be one o'clock in the afternoon in the one, when it is only twelve o'clock in the other. If they are distant from each other by a single degree of longitude, it will be four minutes after twelve at the one, when it is exactly twelve at the other. If they are distant half a degree, the difference will be two minutes; or if a quarter of a degree, the difference in time will be one minute. Instruments for computing time, are now brought to such a degree of perfection, that if two of them are exactly set with each other, they may be safely trusted for a much longer time than what is necessary for the operation we now speak of. Having therefore chosen our first station, and drawn there a meridian line as directed at ASTRONOMY, n° 174, 175. we must observe exactly when the sun is in the meridian, and then set our time-piece to twelve o'clock. We must then proceed directly eastward or westward a considerable way, till we arrive at some other convenient station; and having there also drawn a meridian line, we are to observe exactly by it when the sun comes to the meridian, and looking upon our time-piece at the same time, we will know how much the one place differs from the other in longitude by the distance of time shewn by the time-piece either before or after twelve, when the sun is exactly in the meridian of the second station.

Principles and Practice

The advantages which this method hath over the other, arise from the exactness with which the instrument is supposed to measure time, and from there being a less space on the surface of the earth to be measured than in the other. A minute, or even half a minute of time, may be observed by a proper instrument very exactly; and one of Mr Harrison's time-pieces may undoubtedly be trusted as perfectly exact for two or three days. If we attempt the mensuration of a degree of longitude at the equator, we must choose our second station at a considerable distance before we can expect a variation in time great enough to be observed with any tolerable accuracy: thus before a difference of one minute at the equator could be perceived, we must travel more than 17 English miles eastward or westward; but in the latitude of 60 degrees we would only have half that space to travel, and therefore could measure it with more exactness; at the latitude of 70 degrees, little more than a third of that space would require to be measured; and at 80 degrees, scarce an eighth part. The extreme cold in these high latitudes, however, renders it almost impossible to penetrate so far; though the voyage of the Hon. Constantine Phipps afforded a very favourable opportunity for a mensuration of this kind, and several as favourable opportunities as could be wished occurred in the voyages of captain Cook, had such a thing been thought of. Yet it is not to be expected that the extent of the earth's circumference will ever be known with great accuracy, though we are certainly not yet arrived at the nearest approximation to truth which is attainable on this subject.

Hitherto we have supposed the circumference of the earth to be exactly circular, or the globe itself to be a perfect sphere; but, from some observations, this appears not to be the case. Some time ago, the French made an observation, shewing that a pendulum vibrates slower in proportion as it is brought nearer to the equator: that is, the gravity or celerity of descent of the pendulum, and of all other bodies, is less in countries approaching to the equator than in places near either pole. This excited the curiosity of the celebrated philosophers Huygens and Newton, who thence conjectured that the earth must have some other figure than what was commonly supposed. Sir Isaac Newton afterwards demonstrated that this diminution of weight naturally arises from the earth's rotation

10 Earth not an exact sphere.

PRINCIPLES and PRACTICE

round its axis; which, according to the laws of circular motion, repels all heavy bodies from the axis of motion: so that this motion, being swifter at the equator than in parts more remote, the weight of bodies must also be much less there than nearer the poles *. —To determine this matter, several mathematicians were by the French king employed to measure a degree on the earth's surface in different parts of the world; and, according to their mensurations, the diameter of the earth from north to south is shorter than that from east to west, by 36 miles.

* See *Earth*, n° 28.

11 Of finding the longitudes and latitudes.

With regard to the method of finding the longitudes and latitudes of particular places, rules have been already laid down under ASTRONOMY, n° 209. and 282, 283. The same thing, however, may be done by other methods. Thus, the latitude may be found by observing exactly the meridian altitude of the sun, and knowing his declination for that day, the declination subtracted from the meridian altitude gives the complement of the latitude, and this last subtracted from 90° leaves the latitude required. As to the longitude, Mr Harrison, by his invention of time-pieces which go much more exactly than either clocks or watches could be made to do formerly, hath in a great measure facilitated that. For, supposing any person, possessed of one of these time-pieces, to set out on a journey, *e. g.* from London. If he adjusts his time-piece properly before he goes away, he will know the hour at London exactly, let him go where he pleases; and when he hath proceeded so far either eastward or westward, that a difference is perceived betwixt the hours shown by his time-piece, and those on the clocks or watches at the place to which he goes, the distance of that place from London in degrees and minutes of longitude will be known; and if the length of a degree of longitude is known, the real distance between the two places may also be easily found. It is not to be expected, however, that any instrument, with whatever care it may be constructed, can always be depended upon as an exact measurer of time; and therefore frequent corrections of longitudes taken in this manner will be necessary. The method of finding the longitude from the eclipses of Jupiter's satellites appears to be the best of any. Eclipses of the sun, and occultations of the stars by the moon, are also very proper, though they happen but seldom. Eclipses of the moon have also been made use of for this purpose; but it is found impossible to observe either the beginning or end of a lunar eclipse with the accuracy necessary for determining the longitude of any place. —All these different methods agree in this, that they determine the longitude by the difference of time between the observation of the phenomenon in two different places; and of this time, four minutes are to be allowed for every degree of longitude either east or west.

12 Of the different kinds of maps.

After the geographer is thus become acquainted with the longitudes and latitudes of a great number of different places, he may delineate them upon paper, or make a *map*, either of the whole world, or of any particular country with which he is best acquainted. General maps of the world, or of very large tracts, answer the purpose of shewing in what manner the different countries of the world lie with respect to each other. They cannot be made of such a size as to admit the delineation of many particular towns or cities, neither indeed is it at all required. Where the whole world is delineated at once, the mind can hardly take in more than the idea of the situations of different kingdoms from one another; the situations of the different cities of each particular kingdom being almost wholly overlooked, and not attended to: and this happens likewise where a very large portion of the globe, as one of the four quarters, is represented on a single map. Besides these, therefore, it is necessary to have particular maps of all the different countries done upon a larger scale, that thus the mind may not be fatigued by endeavouring to comprehend too much at once. The qualifications which maps ought to have, in order to render them complete, are, 1. That they represent the countries exactly of the same shape, and in the same proportions to the eye, that they really have on the earth itself. 2. That the divisions of one country from another be distinctly marked, and readily perceptible, without a disagreeable and tedious search. 3. That the longitudes and latitudes of different places be found exactly on the map, and with little or no trouble.

PRINCIPLES and PRACTICE

The foundation of all maps is what is called *the projection of the sphere*, i. e. the delineation of those circles apparently traced out by the sun in the heavens, upon some substance, either plane or spherical, designed to represent the surface of the earth; upon which also are delineated the parallels of latitude, and the meridians, in as great numbers as the size of the map will admit of without confusion.

These delineations upon a spherical surface are very easy: and under the article GLOBE, full directions are given for the construction of the spherical substances upon which maps of the earth and the heavens are usually delineated; and which, when furnished with the rest of their apparatus, are called *terrestrial* and *celestial globes*. The method of drawing the maps for these globes, is never followed in any other case; for which reason it is also referred to the article GLOBE. The ordinary kinds of maps are constructed by delineating the circles of the sphere upon a plane surface, according to the rules of perspective. This is properly the projection of the sphere; and is designed to give a view of the terraqueous globe, as it would appear, at some distance, to an eye that could take in the whole extent of it at once.

§. 1. *Of Projections of the Sphere, and Maps.*

OF projections there are two kinds, the *orthographic* and *stereographic*; both of which represent the surface of the earth projected upon the plane of one of its great circles.

13 Orthographic projection.

I. The *orthographic* supposes the eye to be placed at an infinite distance in the axis of the circle of projection, while the second supposes it to be only in the pole of that circle. The circles on which the projections are usually made, are, the equator, some of the meridians, or the rational horizon of some particular place. For maps of the world, a meridian is generally chosen; and most commonly that one which passes through Ferro, one of the Canary Islands, because thus the continents of Europe, Asia, and Africa, are conveniently delineated in one circle, and America in the other.

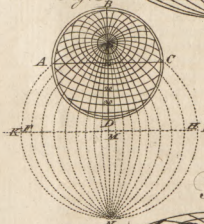

Fig. 4.

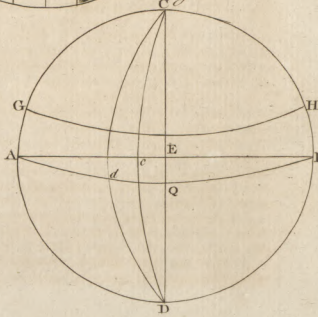
Fig. 3.

Fig. 6.



PRINCIPLES and PRACTICE

1. To project the sphere orthographically on the plane of any meridian, we have only to consider, that as the eye is supposed to be at an infinite distance, all the rays which come from the disk of the earth are parallel; and consequently all lines drawn from the eye to the disk must be perpendicular to the latter. Let, therefore, A B C D, (fig. 1.) represent the plane of one of the meridians. The equator, which cuts all the meridians in the middle, must be represented by an infinite number of points let fall upon the plane of projection, and dividing it exactly in the middle; that is, by the right line B D. The parallels of latitude, being also perpendicular to the plane of the meridian, will be marked out by an infinite number of right lines let fall from their peripheries upon that plane, thus forming the right lines *a b*, *c d*, &c. The meridians will likewise be represented on the disk by an infinite number of right lines let fall perpendicularly from their peripheries upon the plane of projection, and thus will form the elliptic curves A10C A20C, &c. From an inspection of the figure, therefore, it appears, that in this projection both longitudes and latitudes are measured by a line of sines, and both of them decrease prodigiously as we approach the edges of the disk; and hence the countries which lie at a distance from the equator are exceedingly distorted, and it is even impossible to draw them with any degree of accuracy. The orthographic projection on the plane of a meridian, therefore, is never used for a map of the world.

14 On the plane of a meridian.

3d Plate CXV.

15 On the equator, fig. 2.

2. On the plane of the equator, the orthographic projection represents the meridians as straight lines diverging from a centre, and the parallels of latitude as concentric circles. The latter, however, are by no means to be placed at equal distances from each other; for the meridians are to be divided by the line of sines, as in the last; and thus the equatorial parts of the globe are as much distorted and confused as the polar ones were in the foregoing. This projection, therefore, is seldom used for a map of the whole world, though it answers very well for a representation of the polar regions.

16 On any particular horizon, fig. 3.

3. On the horizon of any particular place, except either of the poles, or any point lying directly under the equator, the orthographic projection represents both parallels and meridians by segments of ellipses. The figure shews a map done on the horizon of Ur of the Chaldees: it is obvious, however, that a considerable degree of distortion takes place here also; though less than in the former cases. Projections of this kind, therefore, are used only for the construction of solar eclipses. See ASTRONOMY, n° 269.

17 Stereographic projection.

II. The *stereographic* projection of the sphere supposes the eye to be in the pole of the circle of projection. The laws of this projection are,

1. A right circle is projected into a line of half tangents.

2. The representation of a right circle, perpendicularly opposed to the eye, will be a circle in the plane of the projection.

3. The representation of a circle placed oblique to the eye, will be a circle in the plane of the projection.

4. If a great circle is to be projected upon the plane of another great circle, its centre will lie in the line of measures, distant from the centre of the primitive by the tangent of its elevation above the plane of the primitive.

PRINCIPLES and PRACTICE

5. If a lesser circle, whose poles lie in the plane of the projection, were to be projected; the centre of its representation would be in the line of measures, distant from the centre of the primitive, by the secant of the lesser circles distance from its pole, and its semidiameter or radius be equal to the tangent of that distance.

6. If a lesser circle were to be projected, whose poles lie not in the plane of the projection, its diameter in the projection, if it falls on each side of the pole of the primitive, will be equal to the sum of the half tangents of its greatest and nearest distance from the pole of the primitive, set each way from the centre of the primitive in the line of measures.

7. If the lesser circle to be projected fall entirely on one side of the pole of the projection, and do not encompass it: then will its diameter be equal to the difference of the half tangents of its greatest and nearest distance from the pole of the primitive, set off from the centre of the primitive one; and the same way in the line of measures.

8. In the stereographic projection, the angles made by the circles of the surface of the sphere, are equal to the angles made by their representatives in the plane of their projection.

For a demonstration of these laws, see the articles PERSPECTIVE and PROJECTION. The method of delineating general maps of the world will, however, be easily understood by the following directions.

18 On the plane of a meridian, fig. 6.

1. To delineate a map of the earth upon the plane of a meridian. Draw a circle of any convenient magnitude, as ABCD, to represent one half of the earth's disc; draw two diameters AB, CD, intersecting each other at right angles; AB will then represent the equator, and CD that meridian which is directly perpendicular to the plane of projection. C will be the north pole, and D the south pole. Divide the circle into 360 equal parts, representing the degrees of latitude; or into smaller parts, if it can admit of such a division, to represent minutes. Then, by means of a sector, divide the equator AB into two lines of semitangents EA and EB, which will represent the degrees of longitude. Then with the secant of 80°, as a radius describe the arch of the circle C *c* D, which represents a meridian cutting the plane of projection at an angle of 80°; with the secant of 70°, describe the arch C*d*D, which represents a meridian cutting the plane of projection at 70°; and thus proceed with the rest of the meridians, which are usually drawn at every ten degrees longitude, as the parallels are at every ten degrees latitude. These last are to be drawn with the tangents for radii as the meridians are with the secants; GH, representing the parallel of ten degrees, with the tangent of 80°, that of 20 with the tangent of 70, &c. The ecliptic AQB is drawn with the tangent of 66. 31 for a radius, its greatest distance from the equator being 23. 29. This is the most common projection for maps of the world, and is that on which the map Plate CXVI. is delineated. It hath this disadvantage, however, that neither the degrees of longitude nor latitude continue of the same length, even under the same parallel; and consequently the shape of the countries

PRINCIPLES and PRACTICE

tries is somewhat distorted: it is also exceedingly difficult to find the precise degree of longitude or latitude belonging to any place, upon maps of this kind, as must be evident from an inspection of the figures.

19 On a particular horizon. Plate CXV.

2. On the plane of the horizon. Suppose, for instance, it is desired to have London the centre of the map: its latitude we will suppose to be 51 degrees 32 minutes. Take then the point E (fig. 5.) for London; and from this, as a centre, describe the circle ABCD to represent the horizon; which you are then to divide into four quadrants, and each of these into 90 degrees. Let the diameter BD be the meridian, B the northern quarter, D the southern; the line of equinoctial east and west shews the first vertical, A the west, C the east, or a place of 90 degrees from the zenith in the first vertical. All the verticals are represented by right lines drawn from the centre E to the several degrees of the horizon. Divide BD into 180 degrees, as in the former method; the point in EB, representing 51 deg. 32 min. of the arch BC, will be the projection of the north pole, which note with the letter P. The point in ED representing 51 deg. 32 min. of the arch DC, (reckoning from C towards D), will be the projection of the intersection of the equator and meridian of London; and from this, towards P, write the numbers of the degrees, 1, 2, 3, &c. As also towards D, and from B towards P, viz. 51, 52, 53, &c.

Then taking the corresponding points of equal degrees, 88, 89, &c. about those, as diameters, describe circles, which will represent parallels, or circles of latitude, with the equator, tropics, and polar circles. For the meridians, first describe a circle through the three points A, P, C. This will represent the meridian 90 degrees from London. Let its centre be M in BD, (continued to the point N, which represents the south pole), PN being the diameter, through M draw a parallel to AC, viz. FH, continued each way to K and L. Divide the circle PHNF into 360 degrees; and from the point P draw right lines to the several degrees, cutting KFHL; through the several points of intersection, and the two poles P, N, as through three given points, describe circles representing all the meridians. The centres for describing the arches will be in the same KL, as being the same that are found by the former intersection; but are to be taken with this caution, that for the meridian next BDN towards A, the most remote centre towards L be taken for the second, the second from this, &c.—The circles of longitude and latitude thus drawn, insert the places from a table.

Maps of this kind may be useful for particular purposes: but the irregular length of the degrees, both of longitude and latitude, render them very unfit for representing the countries in their proper shape; and the difficulties in finding the particular degrees of longitude and latitude are even greater in this than any other projection, as is evident from the inspection of fig. 4.

III. Besides these, there may be a variety of other projections, though few of them are applicable to any particular purpose. The three following are those most generally useful, as having each some peculiar property which cannot be found in any other but themselves.

PRINCIPLES and PRACTICE

1. If, instead of its globular figure, we suppose the earth to have a conical one, it is plain, that the meridians would be represented by straight lines diverging from the apex of the cone, while the parallels are shewn by concentric circles, placed at equal distances. This kind of projection is shewn in the map of the world, Plate CXVII. It hath this great advantage, that the longitudes and latitudes may be found with the greatest ease, by means of a moveable index placed on the centre. The whole earth may also be thus represented on a single circle: but thus the countries towards the south pole are prodigiously augmented in breadth in proportion to their length; for the degrees of longitude constantly increase the farther we are removed from the pole, while those of latitude still remain the same. This apparent error, however, doth not in the least affect the real proportion of the map, or render it more difficult to find the longitudes or latitudes upon it.

20 Projection in which the earth is supposed to become.

21 Mercator's projection, supposing it a cylinder.

2. Mercator's projection supposes the earth, instead of a globular, to have a cylindrical figure; in consequence of which, the degrees of longitude become of an equal length throughout the whole surface, and are marked out on the map by parallel lines. The circles of latitude also are represented by lines crossing the former at right angles, but at unequal distances. The farther we remove from the equator, the longer the degrees of latitude become in proportion to those of longitude, and that in no less a degree than as the secant of an arch to the radius of the circle: that is, if we make one degree of longitude at the equator the radius of a circle; at one degree distant from the equator, a degree of latitude will be expressed by the secant of one degree; at ten degrees distance, by the secant of ten degrees; and so on *. A map of the world, therefore, cannot be delineated upon this projection, without distorting the shape of the countries in an extraordinary manner. The projection itself is, however, very useful in navigation, as it shews the different bearings with perfect accuracy, which cannot be done upon any other map. See the map of the New Discoveries, Plate CXVII.

* See 2d Plate CXVI.

22 Globular projection.

3. The globular projection, is an invention of M. de la Hire, and is more useful than any of the former for exhibiting the true shape of the countries. It may be made in the following manner: Having drawn a circle, representing one half of the earth's disc, draw two diameters as before, which represent the equator and vertical meridian. Divide each of these into 180 equal parts, for the measures of the degrees of longitude and latitude. Then, through the two poles, and every tenth division on the equator, draw arches of circles for the meridians; and in like manner, through every tenth degree on each semicircle, draw an arch, which shall likewise pass through every tenth division on the meridian, for the parallels of latitude.

23 Construction of particular maps.

IV. The construction of maps of particular parts of the earth requires a different operation. Large portions of its surface may indeed be drawn on the plane of the meridian, as before directed; but when a small part, as the island of Britain for instance, is to be represented on a large scale, it would be found diffi-

PRINCIPLES and PRACTICE

difficult to draw the arches of fuch large circles as are neceſſary, and therefore the following method may be adopted. In this caſe, the degrees of longitude and latitude may be both repreſented by ſtraight lines. It is to be remembered, however, that though the degrees of latitude always continue of an equal length, it is not ſo with thoſe of longitude. They muſt neceſſarily decreaſe as we approach the pole. The proportion in which they decreaſe, may be found by the line of longitudes on the plain ſcale; or by the following

TABLE, ſhewing the Number of Miles contained in a Degree of Longitude, in each Parallel of Latitude from the Equator.

30	51	96	60	30	00	90	00	00

Suppoſe, then, it is required to draw the meridians and parallels for a map of Britain. This iſland is known to lie between 50 and 60 degrees of latitude, and two and ſeven of longitude. Having therefore choſen the length of your degrees of latitude, you muſt next proportion your degrees of longitude to it. By the table you find, that in the latitude of 50° the length of a degree of longitude is to one of latitude as 38,57 is to 60; that is, a degree of longitude in lat. 50, is ſomewhat more than half the length of a degree of latitude. The exact proportion may eaſily be taken by a diagonal ſcale; after which you are to mark out ſeven or eight of thoſe degrees upon a right line, for the length of your intended map. On the extremities of this line raiſe two perpendiculars, upon which mark out ten degrees of latitude for the height of it. Then, having completed the parallellogram, conſult the table for the length of a degree of longitude in Lat. 60°, which is found to be very nearly one half a degree of latitude. It will always be proper, however, to draw a vertical meridian exactly in the middle of the parallellogram, to which the meridian on each ſide may converge; and from this you are to ſet off the degrees of longitude on each ſide. Then, having divided the lines bounding your map into as many parts as can conveniently be done, to ſerve for a ſcale, you may by their means ſet off the longitudes and latitudes with much leſs trouble than where curve lines are uſed. This method may always be followed where a particular kingdom is to be delineated, and will repreſent the true figure and ſituation of the places with tolerable exactneſs. The particular points of the compaſs, on which the towns lie with reſpect to one another, or their bearings, cannot be exactly known, except by a globe, or Mercator's projection. Their diſtances, however, may by this means be accurately expreſſed, and this is the only kind of maps to which a ſcale of miles can be truly adapted.

PRINCIPLES and PRACTICE

§. 2. *Deſcription and Uſe of the Globes and Armillary Sphere.*

WHEN we have thus diſcovered, by means of maps, or any other way, the true ſituation of the different places of the earth with regard to one another, we may eaſily know every other particular relative to them; as, how far diſtant they are from us, what hour of the day it is, what ſeaſon of the year, &c. at any particular place. As each of theſe problems, however, would require a particular and ſometimes troubleſome calculation, machines have been invented, by which all the calculations may be ſaved, and every problem in geography may be ſolved mechanically, and in the moſt eaſy and expeditious manner. Theſe machines are the celeſtial and terreſtrial globes, and the armillary ſphere; of which, and the method of uſing them, we proceed to give a deſcription.

24 The terreſtrial globe.

If a map of the world be accurately delineated on a ſpherical ball, the ſurface thereof will repreſent the ſurface of the earth: for the higheſt hills are ſo inconſiderable with reſpect to the bulk of the earth, that they take off no more from its roundneſs than grains of ſand do from the roundneſs of a common globe; for the diameter of the earth is 8000 miles in round numbers, and no known hill upon it is much above three miles in perpendicular height.

For the proof of the earth's being ſpherical, ſee ASTRONOMY, n° 123.

With regard to what we call *up* and *down*, ſee the article GRAVITY.

To an obſerver placed any where in the indefinite ſpace, where there is nothing to limit his view, all remote objects appear equally diſtant from him; and ſeem to be placed in a vaſt concave ſphere, of which his eye is the centre. The moon is much nearer to us than the ſun; ſome of the planets are ſometimes nearer, and ſometimes farther from us, than the ſun; others of them never come ſo near to us as the ſun always is; the

PRINCIPLES and PRACTICE

the remoteſt planet in our ſyſtem is beyond compariſon nearer to us than any of the fixed ſtars are: and yet all theſe celeſtial objects appear equally diſtant from us. Therefore, if we imagine a large hollow ſphere of glaſs to have as many bright ſtuds fixed to its inſide, as there are ſtars viſible in the heaven, and theſe ſtuds to be of different magnitudes, and placed at the ſame angular diſtances from each other as the ſtars are; the ſphere will be a true repreſentation of the ſtarry heaven, to an eye ſuppoſed to be in its centre, and viewing it all around. And if a ſmall globe, with a map of the earth upon it, be placed on an axis in the centre of this ſtarry ſphere, and the ſphere be made to turn round on this axis, it will repreſent the apparent motion of the heavens round the earth.

25 The face of the heavens and of the earth repreſented in a machine.

If a great circle be ſo drawn upon this ſphere, as to divide it into two equal parts or hemiſpheres, and the plane of the circle be perpendicular to the axis of the ſphere, this circle will repreſent the *equinoctial*, which divides the heaven into two equal parts, called the *northern* and the *ſouthern hemiſpheres*; and every point of that circle will be equally diſtant from the *poles*, or ends of the axis in the ſphere. That pole which is in the middle of the northern hemiſphere, will be called the *north pole of the ſphere*; and that which is in the middle of the ſouthern hemiſphere, the *ſouth pole*.

If another grand circle be drawn upon the ſphere, in ſuch a manner as to cut the equinoctial at an angle of $23\frac{1}{2}$ degrees in two oppoſite points, it will repreſent the *ecliptic*, or circle of the ſun's apparent annual motion; one half of which is on the north ſide of the equinoctial, and the other half on the ſouth.

If a large ſtud be made to move eaſtward in this ecliptic, in ſuch a manner as to go quite round it in the time that the ſphere is turned round weſtward 366 times upon its axis; this ſtud will repreſent the *ſun*, changing his place every day a 365th part of the ecliptic; and going round weſtward, the ſame way as the ſtars do; but with a motion ſo much ſlower than the motion of the ſtars, that they will make 366 revolutions about the axis of the ſphere, in the time that the ſun makes only 365. During one half of theſe revolutions, the ſun will be on the north ſide of the equinoctial; during the other half, on the ſouth; and at the end of each half, in the equinoctial.

If we ſuppoſe the terreſtrial globe in this machine to be about one inch in diameter, and the diameter of the ſtarry ſphere to be about five or ſix feet, a ſmall inſect on the globe would ſee only a very little portion of its ſurface; but it would ſee one half of the ſtarry ſphere, the convexity of the globe hiding the other half from its view. If the ſphere be turned weſtward round the globe, and the inſect could judge of the appearances which ariſe from that motion, it would ſee ſome ſtars riſing to its view in the eaſtern ſide of the ſphere, whilſt others were ſetting on the weſtern: but as all the ſtars are fixed to the ſphere, the ſame ſtars would always riſe in the ſame points of view on the eaſt ſide, and ſet in the ſame points of view on the weſt ſide. With the ſun it would be otherwiſe; becauſe the ſun is not fixed to any point of the ſphere, but moves ſlowly along an oblique circle in it. And if the inſect ſhould look towards the ſouth, and call that point of the globe, where the equinoctial in the ſphere ſeems to cut it on the left ſide, the *eaſt point*; and where it cuts the globe on the right ſide, the *weſt point*; the little animal would ſee the ſun riſe north of the eaſt, and ſet north of the weſt, for $182\frac{1}{2}$ revolutions; after which, for as many more, the ſun would riſe ſouth of the eaſt, and ſet ſouth of the weſt. And in the whole 365 revolutions, the ſun would riſe only twice in the eaſt point, and ſet twice in the weſt. All theſe appearances would be the ſame, if the ſtarry ſphere ſtood ſtill (the ſun only moving in the ecliptic) and the earthly globe were turned round the axis of the ſphere eaſtward. For, as the inſect would be carried round with the globe, he would be quite inſenſible of its motion, and the ſun and ſtars would appear to move weſtward.

PRINCIPLES and PRACTICE

We may imagine as many circles deſcribed upon the earth as we pleaſe; and we may imagine the plane of any circle deſcribed upon the earth to be continued, until it marks a circle in the concave ſphere of the heavens.

26 The horizon.

The *horizon* is either *ſenſible* or *rational*. The *ſenſible* horizon is that circle which a man ſtanding upon a large plane obſerves to terminate his view all around, where the heaven and earth ſeem to meet. The plane of our ſenſible horizon continued to the heaven, divides it into two hemiſpheres; one viſible to us, the other hid by the convexity of the earth.

The plane of the *rational horizon*, is ſuppoſed parallel to the plane of the ſenſible; to paſs through the centre of the earth, and to be continued to the heavens. And although the plane of the ſenſible horizon touches the earth in the place of the obſerver, yet *this* plane, and that of the rational horizon, will ſeem to coincide in the heaven, becauſe the whole earth is but a point compared to the ſphere of the heaven.

27 The poles.

The earth being a ſpherical body, the horizon, or limit of our view, muſt change as we change our place.

The *poles of the earth*, are thoſe two points on its ſurface in which its axis terminates. The one is called the *north pole*, and the other the *ſouth pole*.

The *poles of the heavens*, are thoſe two points in which the earth's axis produced terminates in the heaven; ſo that the *north pole* of the heaven is directly over the north pole of the earth, and the *ſouth pole* of the heaven is directly over the ſouth pole of the earth.

28 Equator.

The *equator* is a great circle upon the earth, every part of which is equally diſtant from either of the poles. It divides the earth into two equal parts, called the *northern* and *ſouthern hemiſpheres*. If we ſuppoſe the plane of this circle to be extended to the heaven, it will mark the *equinoctial* therein; and will divide the heaven into two equal parts, called the *northern* and *ſouthern* hemiſpheres of the heaven.

29 Meridian.

The *meridian* of any place is a great circle paſſing through that place and the poles of the earth. We may imagine as many ſuch meridians as we pleaſe; becauſe any place that is ever ſo little to the eaſt or weſt of any other place, has a different meridian from that place; for no one circle can paſs through any two ſuch places and the poles of the earth.

The *meridian* of any place is divided by the poles into two ſemicircles: that which paſſes thro' the place is called the *geographical*, or *upper*, *meridian*; and that which paſſes through the oppoſite place, is called the *lower meridian*.

When the rotation of the earth brings the plane of the

PRINCIPLES and PRACTICE

the geographical meridian to the fun, it is *noon* or *midday* to that place; and when the lower meridian comes to the fun, it is *mid-night*.

All places lying under the fame geographical meridian, have their noon at the fame time, and conſequently all the other hours. All thoſe places are ſaid to have the ſame *longitude*, becauſe no one of them lies either eaſtward or weſtward from any of the reſt.

30 Hour-circles.

If we imagine 24 ſemicircles, one of which is the geographical meridian of a given place, to meet at the poles, and to divide the equator into 24 equal parts; each of thoſe meridians will come round to the ſun in 24 hours, by the earth's equable motion round its axis in that time. And, as the equator contains 360 degrees, there will be 15 degrees contained between any two of theſe meridians which are neareſt to one another: for 24 times 15 is 360. And as the earth's motion is eaſtward, the ſun's apparent motion will be weſtward, at the rate of 15 degrees each hour. Therefore,

They whoſe geographical meridian is 15 degrees weſtward from us, have noon, and every other hour, an hour ſooner than we have. They whoſe meridian is fifteen degrees weſtward from us, have noon, and every other hour, an hour later than we have: and ſo on in proportion, reckoning one hour for every fifteen degrees.

For the ecliptic circle, ſigns, and degrees, ſee ASTRONOMY, nº 122,—137.

31 Tropics.

The *tropics* are leſſer circles in the heaven, parallel to the equinoctial; one on each ſide of it, touching the ecliptic in the points of its greateſt declination; ſo that each tropic is $23\frac{1}{2}$ degrees from the equinoctial, one on the north ſide of it, and the other on the ſouth. The northern tropic touches the ecliptic at the beginning of Cancer, the ſouthern at the beginning of Capricorn; for which reaſon the former is called the *tropic of Cancer*, and the latter the *tropic of Capricorn*.

32 Polar circles.

The *polar circles* in the heaven, are each $23\frac{1}{2}$ degrees from the poles, all around. That which goes round the north pole, is called the *arctic circle*. The ſouth polar circle, is called the *antarctic circle*, from its being oppoſite to the arctic.

The ecliptic, tropics, and polar circles, are drawn upon the terreſtrial globe, as well as upon the celeſtial. But the ecliptic, being a great fixed circle in the heavens, cannot properly be ſaid to belong to the terreſtrial globe; and is laid down upon it only for the conveniency of ſolving ſome problems. So that, if this circle on the terreſtrial globe was properly divided into the months and days of the year, it would not only ſuit the globe better, but would alſo make the problems thereon much eaſier.

1. *Deſcription and Uſe of the Terreſtrial Globe.*

33 The terreſtrial globe deſcribed. Plate CXVI fig. 2.

THE equator, ecliptic, and tropics, polar circles, and meridians, are laid down upon the globe in the manner already deſcribed. The ecliptic is divided into 12 ſigns, and each ſign into 30 degrees. Each tropic is $23\frac{1}{2}$ degrees from the equator, and each polar circle $23\frac{1}{2}$ degrees from its reſpective pole. Circles are drawn parallel to the equator, at every ten degrees diſtance from it on each ſide to the poles: theſe circles are called *parallels of latitude*. On large globes there are circles drawn perpendicularly through every tenth degree of the equator, interſecting each other at the poles: but on globes of or under a foot diameter, they are only drawn through every fifteenth degree of the equator; theſe circles are generally called *meridians*, ſometimes *circles of longitude*, and at other times *hour-circles*.

PRINCIPLES and PRACTICE

The globe is hung in a braſs-ring called the *brazen meridian*; and turns upon a wire in each pole ſunk half its thickneſs into one ſide of the meridian ring; by which means that ſide of the ring divides the globe into two equal parts, called the *eaſtern* and *weſtern hemiſpheres*; as the equator divides it into two equal parts, called the *northern* and *ſouthern hemiſpheres*. The ring is divided into 360 equal parts or degrees, on the ſide wherein the axis of the globe turns. One half of theſe degrees are numbered, and reckoned, from the equator to the poles, where they end at 90: their uſe is to ſhew the latitudes of places. The degrees on the other half of the meridian are numbered from the poles to the equator, where they end at 90: their uſe is to ſhew how to elevate either the north or ſouth pole above the horizon, according to the latitude of any given place, as it is north or ſouth of the equator.

The brazen meridian is let into two notches made in a broad flat ring called the *wooden horizon*; the upper ſurface of which divides the globe into two equal parts, called the *upper* and *lower hemiſpheres*. One notch is in the north point of the horizon, and the other in the ſouth. On this horizon are ſeveral concentric circles, which contain the months and days of the year, the ſigns and degrees anſwering to the ſun's place for each month and day, and the 32 points of the compaſs.—The graduated ſide of the braſs meridian lies towards the eaſt ſide of the horizon, and ſhould be generally kept towards the perſon who works problems by the globes.

There is a ſmall *horary circle*, ſo fixed to the north part of the brazen meridian, that the wire in the north pole of the globe is in the centre of that circle; and on the wire is an *index*, which goes over all the 24 hours of the circle, as the globe is turned round its axis. Sometimes there are two horary circles, one between each pole of the globe and the brazen meridian.

There is a thin ſlip of braſs, called the *quadrant of altitude*, which is divided into 90 equal parts or degrees, anſwering exactly to ſo many degrees of the equator. It is occaſionally fixed to the uppermoſt point of the brazen meridian by a nut and ſcrew. The diviſions end at the nut, and the quadrant is turned round upon it.

2. *Deſcription and Uſe of the Armillary Sphere.*

34 Armillary ſphere deſcribed. Plate CXVI fig. 1.

THE exterior parts of this machine are, a compaſs of braſs rings, which repreſent the principal circles of the heaven, *viz.* 1. The equinoctial *AA*, which is divided into 360 degrees (beginning at its interſection with the ecliptic in Aries) for ſhewing the ſun's right aſcenſion in degrees; and alſo into 24 hours, for ſhewing his right aſcenſion in time. 2. The ecliptic *BB*, which is divided into 12 ſigns, and each ſign into 30 degrees, and alſo into the months and days of the year; in ſuch a manner, that the degree or point of the ecliptic in which the ſun is, on any given day, ſtands over that day in the circle of months. 3. The

PRINCIPLES and PRACTICE

tropic of Cancer *CC*, touching the ecliptic at the beginning of Cancer in *e*, and the tropic of Capricorn *DD*, touching the ecliptic at the beginning of Capricorn in *f*; each $23\frac{1}{2}$ degrees from the equinoctial circle. 4. The arctic circle *E*, and the antarctic circle *F*, each $23\frac{1}{2}$ degrees from its reſpective pole at *N* and *S*. 5. The equinoctial colure *GG*, paſſing through the north and ſouth poles of the heaven at *N* and *S*, and through the equinoctial points Aries and Libra, in the ecliptic. 6. The ſolſtitial colure *HH*, paſſing through the poles of the heaven, and through the ſolſtitial points Cancer and Capricorn in the ecliptic. Each quarter of the former of theſe colures is divided into 90 degrees, from the equinoctial to the poles of the world, for ſhewing the declination of the ſun, moon, and ſtars; and each quarter of the latter, from the ecliptic at *e* and *f*, to its poles *b* and *d*, for ſhewing the latitude of the ſtars.

In the north pole of the ecliptic is a nut *b*, to which is fixed one end of a quadrantal wire, and to the other end a ſmall ſun *Y*, which is carried round the ecliptic *BB*, by turning the nut: and in the ſouth pole of the ecliptic is a pin *d*, on which is another quadrantal wire, with a ſmall moon *Z* upon it, which may be moved round by the hand: but there is a particular contrivance for cauſing the moon to move in an orbit which croſſes the ecliptic at an angle of $5\frac{1}{2}$ degrees, in two oppoſite points called the *moon's nodes*; and alſo for ſhifting theſe points backward in the ecliptic, as the *moon's nodes* ſhift in the heaven.

Within theſe circular rings is a ſmall terreſtrial globe *I*, fixt on an axis *KK*, which extends from the north and ſouth poles of the globe at *n* and *s*, to thoſe of the celeſtial ſphere at *N* and *S*. On this axis is fixed the flat celeſtial meridian *LL*, which may be ſet directly over the meridian of any place on the globe, and then turned round with the globe, ſo as to keep over the ſame meridian upon it. This flat meridian is graduated the ſame way as the braſs meridian of a common globe, and its uſe is much the ſame. To this globe is fitted the moveable horizon *MM*, ſo as to turn upon two ſtrong wires proceeding from its eaſt and weſt points to the globe, and entering the globe at the oppoſite points of its equator, which is a moveable braſs ring let into the globe in a groove all around its equator. The globe may be turned by hand within this ring, ſo as to place any given meridian upon it, directly under the celeſtial meridian *LL*. The horizon is divided into 360 degrees all around its outermoſt edge, within which are the points of the compaſs for ſhewing the amplitude of the ſun and moon both in degrees and points. The celeſtial meridian *LL*, paſſes thro' two notches in the north and ſouth points of the horizon, as in a common globe: but here, if the globe be turned round, the horizon and meridian turn with it. At the ſouth pole of the ſphere is a circle of 24 hours, fixed to the rings; and on the axis is an index which goes round that circle, if the globe be turned round its axis.

The whole fabric is ſupported on a pedeſtal *N*, and may be elevated or depreſſed upon the joint *O*, to any number of degrees from 0 to 90, by means of the arc *P*, which is fixed in the ſtrong braſs arm *Q*, and ſlides in the upright piece *R*, in which is a ſcrew at *r*, to fix it at any proper elevation.

PRINCIPLES and PRACTICE

In the box *T* are two wheels (as in Dr Long's ſphere), and two pinions, whoſe axes come out at *V* and *U*; either of which may be turned by the ſmall winch *W*. When the winch is put upon the axis *V*, and turned backward, the terreſtrial globe, with its horizon and celeſtial meridian, keep at reſt; and the whole ſphere of circles turns round from eaſt, by ſouth, to weſt, carrying the ſun *Y*, and moon *Z*, round the ſame way, and cauſing them to riſe above and ſet below the horizon. But when the winch is put upon the axis *U*, and turned foreward, the ſphere with the ſun and moon keep at reſt; and the earth, with its horizon and meridian, turn round from weſt, by ſouth, to eaſt; and bring the ſame points of the horizon to the ſun and moon, to which theſe bodies came when the earth kept at reſt and they were carried round it; ſhewing that they riſe and ſet in the ſame points of the horizon, and at the ſame times in the hour-circle, whether the motion be in the earth or in the heaven. If the earthly globe be turned, the hour-index goes round its hour-circle; but if the ſphere be turned, the hour-circle goes round below the index.

And ſo, by this conſtruction, the machine is equally fitted to ſhew either the real motion of the earth, or the apparent motion of the heaven.

To rectify the ſphere for uſe, firſt ſlacken the ſcrew *r* in the upright ſtem *R*, and taking hold of the arm *Q*, move it up or down until the given degree of latitude for any place be at the ſide of the ſtem *R*; and then the axis of the ſphere will be properly elevated ſo as to ſtand parallel to the axis of the world, if the machine be ſet north and ſouth by a ſmall compaſs: this done, count the latitude from the north pole, upon the celeſtial meridian *LL*, down towards the north notch of the horizon, and ſet the horizon to that latitude; then, turn the nut *b* until the ſun *Y* comes to the given day of the year in the ecliptic, and the ſun will be at its proper place for that day: find the place of the moon, by an Ephemeris, and ſet them right accordingly: laſtly, turn the winch *W*, until either the ſun comes to the meridian *LL*, or until the meridian comes to the ſun (according as you want the ſphere or earth to move) and ſet the hour-index to the XII, marked noon, and the whole machine will be rectified.

Then turn the winch, and obſerve when the ſun or moon riſe and ſet in the horizon, and the hour-index will ſhew the times thereof for the given day.

As thoſe who underſtand the uſe of the globes will be at no loſs to work many other problems by this ſphere, it is needleſs to enlarge any farther upon it.

3. *Directions for uſing Globes.*

In uſing globes, keep the eaſt ſide of the horizon towards you (unleſs the problem requires the turning of it), which ſide you may know by the word Eaſt upon the horizon; for then you have the graduated ſide of the meridian towards you, the quadrant of altitude before you, and the globe divided exactly into two equal parts, by the graduated ſide of the meridian.

35 Directions for uſing the terreſtrial globe.

In working ſome problems, it will be neceſſary to turn the whole globe and horizon about, that you may look on the weſt ſide thereof; which turning will be apt to jog the ball ſo, as to ſhift away that degree of the

PRINCIPLES and PRACTICE

the globe which was before fet to the horizon or meridian: to avoid which inconvenience, you may thruft in the feather-end of a quill between the ball of the globe and the brazen meridian; which, without hurting the ball, will keep it from turning in the meridian, whilft you turn the weft fide of the horizon towards you.

PROB. I. *To find the latitude and longitude of any given place upon the globe.*—Turn the globe on itsaxis, until the given place comes exactly under that graduated fide of the brafen meridian on which the degrees are numbered from the equator; and obferve what degree of the meridian the place then lies under; which is its latitude, north or fouth, as the place is north or fouth of the equator.

The globe remaining in this poſition, the degree of the equator, which is under the brafen meridian, is the longitude of the place, which is eaſt or weſt, as the place lies on the eaſt or weſt ſide of the firſt meridian of the globe.—All the Atlantic ocean, and America, is on the weſt ſide of the meridian of London; and the greateſt part of Europe, and of Africa, together with all Aſia, is on the eaſt ſide of the meridian of London, which is reckoned the *firſt meridian* of the globe by the Britiſh geographers and aſtronomers.

PROB. II. *The longitude and latitude of a place being given, to find that place on the globe.*—Look for the given longitude in the equator (counting it eaſtward or weſtward from the firſt meridian, as it is mentioned to be eaſt or weſt;) and bringing the point of longitude in the equator to the brafen meridian, on that ſide which is above the ſouth point of the horizon: then count from the equator, on the brafen meridian, to the degree of the given latitude, towards the north or ſouth pole, according as the latitude is north or ſouth; and under that degree of latitude on the meridian, you will have the place required.

PROB. III. *To find the difference of longitude, or difference of latitude, between any two given places.*—Bring each of theſe places to the brafen meridian, and ſee what its latitude is: the leſſer latitude ſubtracted from the greater, if both places are on the ſame ſide of the equator, or both latitudes added together if they are on different ſides of it, is the difference of latitude required. And the number of degrees contained between theſe places, reckoned on the equator, when they are brought ſeparately under the brafen meridian, is their difference of longitude, if it be leſs than 180; but if more, let it be ſubtracted from 360, and the remainder is the difference of longitude required. Or,

Having brought one of the places to the brafen meridian, and ſet the hour-index to XII, turn the globe until the other place comes to the brafen meridian; and the number of hours and parts of an hour, paſſed over by the index, will give the longitude in time; which may be eaſily reduced to degrees, by allowing 15 degrees for every hour, and one degree for every four minutes.

N. B. When we ſpeak of bringing any place to the braſen meridian, it is the graduated ſide of the meridian that is meant.

PROB. IV. *Any place being given, to find all thoſe places that have the ſame longitude or latitude with it.*—Bring the given place to the braſen meridian; then all thoſe places which lie under that ſide of the meridian, from pole to pole, have the ſame longitude with the given place. Turn the globe round its axis; and all thoſe places which paſs under the ſame degree of the meridian that the given place does, have the ſame latitude with that place.

Since all latitudes are reckoned from the equator, and all longitudes are reckoned from the firſt meridian, it is evident, that the point of the equator which is cut by the firſt meridian, has neither latitude nor longitude.—The greateſt latitude is 90 degrees, becauſe no place is more than 90 degrees from the equator: And the greateſt longitude is 180 degrees, becauſe no place is more than 180 degrees from the firſt meridian.

PROB. V. *To find the* antœci, periœci, *and* antipodes, *of any given place.*—Bring the given place to the braſen meridian; and having found its latitude, keep the globe in that ſituation, and count the ſame number of degrees of latitude from the equator towards the contrary pole; and where the reckoning ends, you have the *antœci* of the given place upon the globe. Thoſe who live at the equator have no *antœci*.

The globe remaining in the ſame poſition, ſet the hour-index to the upper XII on the horary circle, and turn the globe until the index comes to the lower XII; then, the place which lies under the meridian, in the ſame latitude with the given place, is the *periœci* required. Thoſe who live at the poles have no *periœci*.

As the globe now ſtands (with the index at the lower XII), the *antipodes* of the given place will be under the ſame point of the braſen meridian where its *antœci* ſtood before. Every place upon the globe has its *antipodes*.

PROB. VI. *To find the diſtance between any two places on the globe.*—Lay the graduated edge of the quadrant of altitude over both the places, and count the number of degrees intercepted between them on the quadrant; then multiply theſe degrees by 60, and the product will give the diſtance in geographical miles: but to find the diſtance in miles, multiply the degrees by $69\frac{1}{2}$, and the product will be the number of miles required. Or, take the diſtance betwixt any two places with a pair of compaſſes, and apply that extent to the equator; the number of degrees, intercepted between the points of the compaſſes, is the diſtance in degrees of a great circle; which may be reduced either to geographical miles, or to Engliſh miles, as above.

PROB. VII. *A place on the globe being given, and its diſtance from any other place; to find all the other places upon the globe which are at the ſame diſtance from the given place.*—Bring the given place to the braſen meridian, and ſcrew the quadrant of altitude to the meridian directly over that place; then keeping the globe in that poſition, turn the quadrant quite round upon it, and the degree of the quadrant that touches the ſecond place will paſs over all the other places which are equally diſtant with it from the given place.

This is the ſame as if one foot of a pair of compaſſes was ſet in the given place, and the other foot extended to the ſecond place, whoſe diſtance is known; for if the compaſſes be then turned round the firſt place as a centre, the moving foot will go over all thoſe places which are at the ſame diſtance with the

second from it.

PROB. VIII. *The hour of the day at any place being given, to find all those places where it is noon at that time.*—Bring the given place the brasen meridian, and set the index to the given hour; this done, turn the globe until the index points to the upper XII, and then all the places that lie under the brasen meridian have noon at that time.

N. B. The upper XII always stands for noon; and when the bringing of any place to the brasen meridian is mentioned, the side of that meridian on which the degrees are reckoned from the equator is meant, unless the contrary side be mentioned.

PROB. IX. *The hour of the day at any place being given, to find what o'clock it then is at any other place.*—Bring the given place to the brasen meridian, and set the index to the given hour; then turn the globe, until the place where the hour is required comes to the meridian, and the index will point out the hour at that place.

PROB. X. *To find the sun's place in the ecliptic, and his declination, for any given day of the year.*—Look on the horizon for the given day, and right against it you have the degree of the sign in which the sun is (or his place) on that day at noon. Find the same degree of that sign in the ecliptic line upon the globe, and having brought it to the brasen meridian, observe what degree of the meridian stands over it; for that is the sun's declination, reckoned from the equator.

PROB. XI. *The day of the month being given, to find all those places of the earth over which the sun will pass vertically on that day.*—Find the sun's place in the ecliptic for the given day, and having brought it to the brasen meridian, observe what point of the meridian is over it; then, turning the globe round its axis, all those places which pass under that point of the meridian are the places required; for as their latitude is equal, in degrees and parts of a degree, to the sun's declination, the sun must be directly over-head to each of them at its respective noon.

PROB. XII. *A place being given in the torrid zone, to find those two days of the year on which the sun shall be vertical to that place.*—Bring the given place to the brasen meridian, and mark the degree of latitude that is exactly over it on the meridian; then turn the globe round its axis, and observe the two degrees of the ecliptic which pass exactly under that degree of latitude: lastly, find on the wooden horizon, the two days of the year in which the sun is in those degrees of the ecliptic, and they are the days required: for on them, and none else, the sun's delination is equal to the latitude of the given place; and consequently, he will then be vertical to it at noon.

PROB. XIII. *To find all those places of the north frigid zone, where the sun begins to shine constantly without setting, on any given day, from the 21st of March to the 23d of September.*—On these two days, the sun is in the equinoctial, and enlightens the globe exactly from pole to pole: therefore, as the earth turns round its axis, which terminates in the poles, every place upon it will go equally through the light and the dark, and so make the day and night equal to all places of the earth. But as the sun declines from the equator, towards either pole, he will shine just as many degrees round that pole, as are equal to his declination from the equator: so that no place within that distance of the pole will then go through any part of the dark, and consequently the sun will not set to it. Now, as the sun's declination is northward, from the 21st of March to the 23d of September, he must constantly shine round the north pole all that time; and on the day that he is in the northern tropic, he shines upon the whole north frigid zone; so that no place within the north polar circle goes through any part of the dark on that day. Therefore,

Having brought the sun's place for the given day to the brasen meridian, and found his declination (by Prob. IX.) count as many degrees on the meridian, from the north pole, as are equal to the sun's declination from the equator, and mark that degree from the pole where the reckoning ends: then turning the globe round its axis, observe what places in the north frigid zone pass directly under that mark; for they are the places required.

The like may be done for the south frigid zone, from the 23d of September to the 21st of March, during which time the sun shines constantly on the south pole.

PROB. XIV. *To find the place over which the sun is vertical at any hour of a given day.*—Having found the sun's declination for the given day (by Prob. X.) mark it with a chalk on the brazen meridian: then bring the place where you are (suppose Edinburgh) to the brazen meridian, and set the index to the given hour; which done, turn the globe on its axis, until the index points to XII at noon; and the place on the globe, which is then directly under the point of the sun's declination marked upon the meridian, has the sun that moment in the zenith, or directly over head.

PROB. XV. *The day and hour of a lunar eclipse being given; to find all those places of the earth to which it will be visible.*—The moon is never eclipsed but when she is full, and so directly oppolite to the sun, that the earth's shadow falls upon her. Therefore, whatever place of the earth the sun is vertical to at that time, the moon must be vertical to the antipodes of that place: so that the sun will be then visible to one half of the earth, and the moon to the other.

Find the place to which the sun is vertical at the given hour (by Prob. XIV.) elevate the pole to the latitude of that place, and bring the place to the upper part of the brazen meridian, as in the former problem: then, as the sun will be visible to all those parts of the globe which are above the horizon, the moon will be visible to all those parts which are below it, at the time of her greatest obscuration.

PROB. XVI. *To rectify the globe for the latitude, the zenith, and the sun's place.*—Find the latitude of the place, (by Prob. I.) and if the place be in the northern hemisphere, raise the north pole above the north point of the horizon, as many degrees (counted from the pole upon the brazen meridian) as are equal to the latitude of the place. If the place be in the southern hemisphere, raise the south pole above the south point of the horizon as many degrees as are equal to the latitude. Then, turn the globe till the place comes under its latitude on the brasen meridian, and fasten the quadrant of altitude so, that the chamfered edge of its nut (which is even with the graduated

ated edge) may be joined to the zenith, or point of latitude. This done, bring the sun's place in the ecliptic for the given day (found by Prob. X.) to the graduated side of the brazen meridian, and set the hour-index to XII at noon, which is the uppermost XII on the hour-circle; and the globe will be rectified.

PROB. XVII. *The latitude of any place, not exceeding 66½ degrees, and the day of the month, being given; to find the time of sun rising and setting, and consequently the length of the day and night.*—Having rectified the globe for the latitude, and for the sun's place on the given day (as directed in the preceding problem), bring the sun's place in the ecliptic to the eastern side of the horizon, and the hour-index will shew the time of sun-rising; then turn the globe on its axis, until the sun's place comes to the western side of the horizon, and the index will shew the time of sun-setting.

The hour of sun-setting doubled, gives the length of the day; and the hour of sun-rising doubled, gives the length of the night.

PROB. XVIII. *The latitude of any place, and the day of the month, being given; to find when the morning twilight begins, and the evening twilight ends, at that place.*—This problem is often limited: for, when the sun does not go 18 degrees below the horizon, the twilight continues the whole night; and for several nights together in summer, between 49 and 66½ degrees of latitude; and the nearer to 66½, the greater is the number of these nights. But when it does begin and end, the following method will shew the time for any given day.

Rectify the globe, and bring the sun's place in the ecliptic to the eastern side of the horizon; then mark with a chalk that point of the ecliptic which is in the western side of the horizon, it being the point opposite to the sun's place: this done, lay the quadrant of altitude over the said point, and turn the globe eastward, keeping the quadrant at the chalk mark, until it is just 18 degrees high on the quadrant; and the index will point out the time when the morning twilight begins: for the sun's place will then be 18 degrees below the eastern side of the horizon. To find the time when the evening twilight ends, bring the sun's place to the western side of the horizon; and the point opposite to it, which was marked with the chalk, will be rising in the east: then, bring the quadrant over that point, and keeping it thereon, turn the globe westward, until the said point be 18 degrees above the horizon on the quadrant, and the index will shew the time when the evening twilight ends; the sun's place being then 18 degrees below the western side of the horizon.

PROB. XIX. *To find on what day of the year the sun begins to shine constantly without setting, on any given place in the north frigid zone; and how long he continues to do so.*—Rectify the globe to the latitude of the place, and turn it about until some point of the ecliptic, between Aries and Cancer, coincides with the north point of the horizon where the brazen meridian cuts it; then find, on the wooden horizon, what day of the year the sun is in that point of the ecliptic; for that is the day on which the sun begins to shine constantly on the given place, without setting. This done, turn the globe, until some point of the ecliptic, between Cancer and Libra, coincides with the north point of the horizon, where the brazen meridian cuts it; and find, on the wooden horizon, on what day the sun is in that point of the ecliptic; which is the day that the sun leaves off constantly shining on the said place, and rises and sets to it as to other places on the globe. The number of natural days, or complete revolutions of the sun about the earth, between the two days above found, is the time that the sun keeps constantly above the horizon without setting: for all that portion of the ecliptic, which lies between the two points which intersect the horizon in the very north, never sets below it; and there is just as much of the opposite part of the ecliptic that never rises: therefore, the sun will keep as long constantly below the horizon in winter, as above it in summer.

PROB. XX. *To find in what latitude the sun shines constantly without setting, for any length of time less than 182½ of our days and nights.*—Find a point in the ecliptic half as many degrees from the beginning of Cancer (either toward Aries or Libra) as there are natural days in the time given; and bring that point to the north side of the brazen meridian, on which the degrees are numbered from the pole towards the equator: then, keep the globe from turning on its axis, and slide the meridian up or down until the forefaid point of the ecliptic comes to the north point of the horizon, and then the elevation of the pole will be equal to the latitude required.

PROB. XXI. *The latitude of a place, not exceeding 66½ degrees, and the day of the month, being given; to find the sun's amplitude or point of the compass on which he rises or sets.*—Rectify the globe, and bring the sun's place to the eastern side of the horizon; then observe what point of the compass on the horizon stands right against the sun's place, for that is his amplitude at rising. This done, turn the globe westward, until the sun's place comes to the western side of the horizon, and it will cut the point of his amplitude at setting. Or, you may count the rising amplitude in degrees, from the east point of the horizon, to that point where the sun's place cuts it; and the setting amplitude, from the west point of the horizon, to the sun's place at setting.

PROB. XXII. *The latitude, the sun's place, and his altitude, being given; to find the hour of the day, and the sun's azimuth, or number of degrees that he is distant from the meridian.*—Rectify the globe, and bring the sun's place to the given height upon the quadrant of altitude; on the eastern side of the horizon, if the time be in the forenoon; or the western side, if it be in the afternoon: then the index will shew the hour; and the number of degrees in the horizon, intercepted between the quadrant of altitude and the south point, will be the sun's true azimuth at that time.

PROB. XXIII. *The latitude, hour of the day, and the sun's place, being given; to find the sun's altitude and azimuth.*—Rectify the globe, and turn it until the index points to the given hour; then lay the quadrant of altitude over the sun's place in the ecliptic, and the degree of the quadrant cut by the sun's place is his altitude at that time above the horizon; and the degree of the horizon cut by the quadrant is the sun's azimuth, reckoned from the south.

PROB. XXIV. *The latitude, the sun's altitude, and his*

PRINCIPLES and PRACTICE

his azimuth being given; to find his place in the ecliptic, the day of the month, and hour of the day, though they had all been left.—Rectify the globe for the latitude and zenith, and set the quadrant of altitude to the given azimuth in the horizon; keeping it there, turn the globe on its axis until the ecliptic cuts the quadrant in the given altitude: that point of the ecliptic which cuts the quadrant there, will be the sun's place; and the day of the month answering thereto, will be found over the like place of the sun on the wooden horizon. Keep the quadrant of altitude in that position; and, having brought the sun's place to the brazen meridian, and the hour-index to XII at noon, turn back the globe, until the sun's place cuts the quadrant of altitude again, and the index will shew the hour.

Any two points of the ecliptic, which are equidistant from the beginning of Cancer or of Capricorn, will have the same altitude and azimuth at the same hour, though the months be different; and therefore it requires some care in this problem, not to mistake both the month and the day of the month: to avoid which, observe, that from the 20th of March to the 21st of June, that part of the ecliptic which is between the beginning of Aries and beginning of Cancer is to be used; from the 21st of June to the 23d of September, between the beginning of Cancer and beginning of Libra; from the 23d of September to the 21st of December, between the beginning of Libra and the beginning of Capricorn; and from the 21st of December to the 20th of March, between the beginning of Capricorn and beginning of Aries. And as one can never be at a loss to know in what quarter of the year he takes the sun's altitude and azimuth, the above caution with regard to the quarters of the ecliptic will keep him right as to the month and day thereof.

PROB. XXV. *To find the length of the longest day at any given place.*—If the place be on the north side of the equator (find its latitude by Prob. I.) and elevate the north pole to that latitude; then, bring the beginning of Cancer to the brazen meridian, and set the hour-index to XII at noon. But if the given place be on the south side of the equator, elevate the south pole to its latitude, and bring the beginning of Capricorn to the brass meridian, and the hour-index to XII. This done, turn the globe westward, until the beginning of Cancer or Capricorn (as the latitude is north or south) comes to the horizon; and the index will then point out the time of sun-setting, for it will have gone over all the afternoon hours, between midday and sun-set; which length of time being doubled, will give the whole length of the day from sun-rising to sun-setting. For, in all latitudes, the sun rises as long before mid-day, as he sets after it.

PROB. XXVI. *To find in what latitude the longest day is, of any given length, less than 24 hours.*—If the latitude be north, bring the beginning of Cancer to the brazen meridian, and elevate the north pole to about 66½ degrees; but if the latitude be south, bring the beginning of Capricorn to the meridian, and elevate the south pole to about 66½ degrees; because the longest day in north latitude is, when the sun is in the first point of Cancer; and in south latitude, when he is in the first point of Capricorn. Then set the hour-index to XII at noon, and turn the globe westward, until the index points at half the number of hours given; which done, keep the globe from turning on its axis, and slide the meridian down in the notches, until the aforesaid point of the ecliptic (*viz.* Cancer or Capricorn) comes to the horizon; then, the elevation of the pole will be equal to the latitude required.

PROB. XXVII. *The latitude of any place, not exceeding 66½ degrees, being given; to find in what climate the place is.*—Find the length of the longest day at the given place, by Prob. XXV. and whatever be the number of hours whereby it exceedeth twelve, double that number, and the sum will give the climate in which the place is.

PROB. XXVIII. *The latitude, and the day of the month, being given; to find the hour of the day when the sun shines.*—Set the wooden horizon truly level, and the brass meridian due north and south by a mariner's compass; then, having rectified the globe, stick a small sewing-needle into the sun's place in the ecliptic, perpendicular to that part of the surface of the globe: this done, turn the globe on its axis, until the needle comes to the brass meridian, and set the hour-index to XII at noon; then, turn the globe on its axis, until the needle points exactly towards the sun (which it will do when it casts no shadow on the globe), and the index will shew the hour of the day.

4. *The Use of the Celestial Globe.*

36 How to use the celestial globe.

HAVING done for the present with the terrestrial globe, we shall proceed to the use of the celestial; first premising, that as the equator, ecliptic, tropics, polar-circles, horizon, and brass meridian, are exactly alike on both globes, all the former problems concerning the sun are solved the same way by both globes. The method also of rectifying the celestial globe is the same as rectifying the terrestrial. *N. B.* The sun's place for any day of the year stands directly over that day on the horizon of the celestial globe, as it does on that day of the terrestrial.

37 Latitude and longitude of stars.

The *latitude* and *longitude* of the stars, or of all other celestial phenomena, are reckoned in a very different manner from the latitude and longitude of places on the earth: for all terrestrial latitudes are reckoned from the equator; and longitudes from the meridian of some remarkable place, as of London by the British, and of Paris by the French. But the astronomers of all nations agree in reckoning the latitudes of the moon, stars, planets, and comets, from the ecliptic; and their longitudes from the equinoctial colure, in that semi-circle of it which cuts the ecliptic at the beginning of Aries; and thence eastward, quite round, to the same semi-circle again. Consequently those stars which lie between the equinoctial and the northern half of the ecliptic, have north declination and south latitude; those which lie between the equinoctial and the southern half of the ecliptic, have south declination and north latitude; and all those which lie between the tropics and poles, have their declinations and latitudes of the same denomination.

There are six great circles on the celestial globe, which cut the ecliptic perpendicularly, and meet in two opposite points in the polar circles; which points are each ninety degrees from the ecliptic, and are called

PRINCIPLES and PRACTICE

led its poles. These polar points divide those circles into 12 semicircles; which cut the ecliptic at the beginnings of the twelve signs. They resemble so many meridians on the terrestrial globe: and as all places which lie under any particular meridian-semicircle on that globe, have the same longitude; so all those points of the heaven, through which any of the above semicircles are drawn, have the same longitude.—And as the greatest latitudes on the earth are at the north and south poles of the earth, so the greatest latitudes in the heaven are at the north and south poles of the ecliptic.

For the division of the stars into constellations, &c. see ASTRONOMY, n° 203. 206.

PROB. I. *To find the right ascension and declination of the sun, or any fixed star.*—Bring the sun's place in the ecliptic to the brasen meridian: then that degree in the equinoctial which is cut by the meridian, is the sun's *right ascension*; and that degree of the meridian which is over the sun's place, is his *declination*. Bring any fixed star to the meridian, and its right ascension will be cut by the meridian in the equinoctial; and the degree of the meridian that stands over it, is its declination.

So that right ascension and declination, on the celestial globe, are found in the same manner as longitude and latitude on the terrestrial.

PROB. II. *To find the latitude and longitude of any star.*—If the given star be on the north side of the ecliptic, place the 90th degree of the quadrant of altitude on the north pole of the ecliptic, where the twelve semicircles meet, which divide the ecliptic into the 12 signs; but if the star be on the south side of the ecliptic, place the 90th degree of the quadrant on the south pole of the ecliptic: keeping the 90th degree of the quadrant on the proper pole, turn the quadrant about, until its graduated edge cuts the star: then, the number of degrees in the quadrant, between the ecliptic and the star, is its latitude; and the degree of the ecliptic, cut by the quadrant, is the star's longitude, reckoned according to the sign in which the quadrant then is.

PROB. III. *To represent the face of the starry firmament, as seen from any given place of the earth, at any hour of the night.*—Rectify the celestial globe for the given latitude, the zenith, and sun's place, in every respect, as taught by the XVIth problem for the terrestrial; and turn it about, until the index points to the given hour: then, the upper hemisphere of the globe will represent the visible half of the heaven for that time; all the stars upon the globe being then in such situations, as exactly correspond to those in the heaven. And if the globe be placed duly north and south, by means of a small sea-compass, every star in the globe will point toward the like star in the heaven: by which means, the constellations and remarkable stars may be easily known. All those stars which are in the eastern side of the horizon, are then rising in the eastern side of the heaven; all in the western, are setting in the western side; and all those under the upper part of the brasen meridian, between the south point of the horizon and the north pole, are at their greatest altitude, if the latitude of the place be north; but if the latitude be south, those stars which lie under the upper part of the meridian, between the north point of the horizon and the south pole, are at their greatest altitude.

PRINCIPLES and PRACTICE

PROB. IV. *The latitude of the place, and day of the month, being given; to find the time when any known star will rise, or be upon the meridian, or set.*—Having rectified the globe, turn it about until the given star comes to the eastern side of the horizon, and the index will shew the time of the star's rising; then turn the globe westward, and when the star comes to the brasen meridian, the index will shew the time of the star's coming to the meridian of your place; lastly, turn on, until the star comes to the western side of the horizon, and the index will shew the time of the star's setting. *N. B.* In northern latitudes, those stars which are less distant from the north pole than the quantity of its elevation above the north point of the horizon, never set; and those which are less distant from the south pole than the number of degrees by which it is depressed below the horizon, never rise: and *vice versa* in southern latitudes.

PROB. V. *To find at what time of the year a given star will be upon the meridian, at a given hour of the night.*—Bring the given star to the upper semicircle of the brass meridian, and set the index to the given hour; then turn the globe, until the index points to XII at noon, and the upper semicircle of the meridian will then cut the sun's place, answering to the day of the year sought; which day may be easily found against the like place of the sun among the signs on the wooden horizon.

PROB. VI. *The latitude, day of the month, and azimuth of any known star, being given; to find the hour of the night.*—Having rectified the globe for the latitude, zenith, and sun's place, lay the quadrant of altitude to the given degree of azimuth in the horizon: then turn the globe on its axis, until the star comes to the graduated edge of the quadrant; and when it does, the index will point out the hour of the night.

PROB. VII. *The latitude of the place, the day of the month, and altitude of any known star, being given; to find the hour of the night.*—Rectify the globe as in the former problem, guess at the hour of the night, and turn the globe until the index points at the supposed hour: then lay the graduated edge of the quadrant of altitude over the known star; and if the degree of the star's height in the quadrant upon the globe answers exactly to the degree of the star's observed altitude in the heaven, you have guessed exactly: but if the star on the globe is higher or lower than it was observed to be in the heaven, turn the globe backwards or forewards, keeping the edge of the quadrant upon the star, until its centre comes to the observed altitude in the quadrant; and then the index will shew the true time of the night.

PROB. VIII. *An easy method for finding the hour of the night by any two known stars, without knowing either their altitude or azimuth; and then, of finding both their altitude and azimuth, and thereby the true meridian.*—Tie one end of a thread to a common musket-bullet; and, having rectified the globe as above, hold the other end of the thread in your hand, and carry it slowly round betwixt your eye and the starry heaven, until you find it cuts any two known stars at once. Then guessing at the hour of the night, turn the globe until the index points to that time in the hour-circle; which

PRINCIPLES and PRACTICE

which done, lay the graduated edge of the quadrant over any one of these two stars on the globe, which the thread cut in the heaven. If the said edge of the quadrant cuts the other star also, you have guessed the time exactly; but if it does not, turn the globe slowly backwards or forwards, until the quadrant (kept upon either star) cuts them both through their centres: and then, the index will point out the exact time of the night; the degree of the horizon, cut by the quadrant, will be the true azimuth of both these stars from the south; and the stars themselves will cut their true altitudes in the quadrant. At which moment, if a common azimuth-compass be so set upon a floor or level pavement, that these stars in the heaven may have the same bearing upon it (allowing for the variation of the needle) as the quadrant of altitude has in the wooden horizon of the globe, a thread extended over the north and south points of that compass will be directly in the plane of the meridian: and if a line be drawn upon the floor or pavement, along the course of the thread, and an upright wire be placed in the southmost end of the line, the shadow of the wire will fall upon that line, when the sun is on the meridian, and shines upon the pavement.

PROB. IX. *To find the place of the moon, or of any planet; and thereby to shew the time of its rising, south-ing, and setting.* Look in Dr Long's or Weaver's ephemeris the geocentric place of the moon or planet in the ecliptic, for the given day of the month; and, according to its longitude and latitude, as shewn by the ephemeris, mark the same with a chalk upon the globe. Then, having rectified the globe, turn it round its axis westward; and as the said mark comes to the eastern side of the horizon, to the brasen meridian, and to the western side of the horizon, the index will shew at what time the planet rises, comes to the meridian, and sets, in the same manner as it would do for a fixed star.

For an explanation of the harvest-moons by a globe, see ASTRONOMY, n° 168.

For the description and use of a planetary globe, see ASTRONOMY, n° 320.

For the equation of time, see ASTRONOMY, n° 181.

PRINCIPLE and PRACTICE

or as is necessary to answer any common purpose. The circles drawn round the centre at the distance of $11\frac{1}{2}$ each, shew the point of the compass on which the sun rises and sets, and on what point the twilight begins and ends.

In order to make use of this analemma, it is only necessary to consider, that, when the latitude of the place and the sun's declination are both north or both south, the sun rises before six o'clock, between the east and the elevated pole; that is, towards the north, if the latitude and declination are north; or towards the south, if the latitude and declination are south. Let us now suppose it is required to find the time of the sun's rising and setting, the length of the days and nights, the time when the twilight begins and ends, and what point of the horizon the sun rises and sets on, for the Lizard point in England, Frankfort in Germany, or Abbeville in France, on the 30th of April. The latitude of these places by the maps will be found nearly 50° north. Place the moveable index so that its point may touch 50° on the quadrant of north latitude in the figure; then observe where its edge cuts the parallel line on which April 30th is wrote. From this reckon the hour-lines towards the centre, and you will find that the parallel-line is cut by the index nearly at the distance of one hour and 15 minutes. So the sun rises at one hour fifteen minutes before six, or 45 minutes after four in the morning, and sets 15 minutes after seven in the evening. The length of the day is 14 hours 30 minutes. Observe how far the intersection of the edge of the index with the parallel of April 30th is distant from any of the concentric circles; which you will find to be a little beyond that marked *two points of the compass*; and this shews, that on the 30th of April the sun rises two points and somewhat more from the east towards the north, or a little to the northward of E. N. E. and sets a little to the northward of W. N. W. To find the beginning and ending of twilight, take from the graduated arch of the circle $17\frac{1}{2}$ degrees with a pair of compasses; move one foot of the compasses extended to this distance along the parallel for the 30th of April, till the other just touches the edge of the index, which must still point at 50. The place where the other foot rests on the parallel of April 30th, then denotes the number of hours before six at which the twilight begins. This is somewhat more than three hours and an half; which shews, that the twilight then begins soon after two in the morning, and likewise that it begins to appear near five points from the east towards the north. The uses of this analemma may be varied in a great number of ways; but the example just now given will be sufficient for the ingenious reader.—The small circles on the same plate, marked *Island*, *Promontory*, &c. are added in order to render the maps more intelligible, by shewing how the different subjects are commonly delineated on them.

47 Solution of several problems by an analemma.

MOST of the above problems may also be performed by means of accurate maps; but this requires a great deal of calculation, which is often very troublesome. The Analemma, or Orthographic Projection, delineated on 2d Plate CXVI. will solve many of the most curious; and with the assistance of the maps will be almost equivalent to a terrestrial globe. The parallel lines drawn on this figure represent the degrees of the sun's declination from the equator, whether north or south, amounting to $23\frac{1}{2}$ nearly. On these lines are marked the months and days which correspond to such and such declinations. The size of the figure does not admit of having every day of the year inserted; but by making allowance for the intermediate days, in proportion to the rest, the declination may be guessed at with tolerable exactness. The elliptical lines are designed to shew the hours of sun-rising or sun-setting before or after six o'clock. As 60 minutes make an hour of time, a fourth part of the space between each of the hour-lines will represent 15 minutes; which the eye can readily guess at, and which is as great exactness as can be expected from any mechanical invention,

HAVING thus explained the use of the globes, and general principles of geography, we must refer to the *maps* for the situation of each particular country, with regard to longitude, latitude, &c. and to the *names* of the countries as they occur in the order of the alphabet, for the most remarkable particulars concerning them.

GEOMETRY

ORIGINALLY ſignified no more than the art of meaſuring the earth, or any diſtances or dimenſions within it: but at preſent it denotes the ſcience of magnitude in general; comprehending the doctrine and relations of whatever is ſuſceptible of augmentation or diminution, conſidered in that light.

Hence to geometry may be referred the conſideration not only of lines, ſurfaces, and ſolids; but alſo of time, velocity, number, weight, *&c.*

This ſcience had its riſe among the Egyptians, who were in a manner compelled to invent it, to remedy confuſion which generally happened in their lands, from the inundations of the river Nile, which carried away all boundaries, and effaced all the limits of their poſſeſſions. Thus this invention, which at firſt conſiſted only in meaſuring the lands, that every perſon might have what belonged to him, was called *geometry*, or the art of meaſuring land; and it is probable that the draughts and ſchemes, which they were annually compelled to make, helped them to diſcover many excellent properties of theſe figures; which ſpeculations continued to be gradually improved, and are ſo to this day.

From Egypt geometry paſſed into Greece; where it continued to receive new improvements in the hands of Thales, Pythagoras, Archimedes, Euclid, *&c.* The Elements of Geometry, written by this laſt in 15 books, are a moſt convincing proof to what perfection this ſcience was carried among the ancients. However, it muſt be acknowledged, that it fell ſhort of modern geometry; the bounds of which, what by the invention of fluxions, and the diſcovery of the almoſt infinite orders of curves, are greatly enlarged.

We may diſtinguiſh the progreſs of geometry into three ages; the firſt of which was in its meridian glory at the time when Euclid's Elements appeared; the ſecond, beginning with Archimedes, reaches to the time of Des Cartes, who, by applying algebra to the elements of geometry, gave a new turn to this ſcience, which has been carried to its utmoſt perfection by Sir Iſaac Newton and Mr Leibnitz.

In treating this uſeful ſubject, we ſhall divide it into two parts; the firſt containing the general principles; and the ſecond, the application of theſe principles to the menſuration of ſurfaces, ſolids, *&c.*

PART I.

GENERAL PRINCIPLES OF GEOMETRY.

Art. 1. A Point is that which is not made up of parts, or which is of itſelf indiviſible.

2. A line is a length without breadth, as B——

Geometry Plates, n° I.

3. The extremities of a line are points; as the extremities of the line AB, are the points A and B, fig. 1.

4. If the line AB be the neareſt diſtance between its extremes A and B, then it is called a *ſtrait line*, as AB; but if it be not the neareſt diſtance, then it is called a *curve line*, as *a b*, fig. 1.

5. A ſurface is that which is conſidered as having only length and breadth, but no thickneſs, as fig. 2.

6. The terms or boundaries of a ſurface are lines.

7. A plain ſurface is that which lies equally between its extremes.

8. The inclination between two lines meeting one another, (provided they do not make one continued line), or the opening between them, is called an *angle*; thus the inclination of the line AB to the line CB (fig. 3.) meeting one another at B, or the opening between the two lines AB and CB, is called an *angle*.

9. When the lines forming the angle are right lines, then it is called a *right-lined angle*, as fig. 4.; if one of them be right and the other curved, it is called a *mixed angle*, as fig. 5.; if both of them be curved it is called a *curve-lined angle*, as fig. 6.

10. If a right line AB fall upon another DC, (fig. 7.) ſo as to incline neither to one ſide nor to the other; but make the angles ABD, ABC, on each ſide equal to one another; then the line AB is ſaid to be *perpendicular* to the line DC, and the two angles are called *right-angles*.

11. An obtuſe angle is that which is greater than a right one, as fig. 8.; and an acute angle, that which is leſs than a right one, as fig. 9.

12. If a right line DC be faſtened at one of its ends C, and the other end D be carried quite round, then the ſpace comprehended is called a *circle*; the curve-line deſcribed by the point D, is called the *periphery* or *circumference* of the circle; the fixed point C is called the *centre* of it; fig. 10.

13. The deſcribing line CD is called the *radius*, *viz.* any line drawn from the centre to the circumference; whence all radii of the ſame or equal circles are equal.

14. Any line drawn through the centre, and terminated both ways by the circumference, is called a *diameter*, as BD is a diameter of the circle BADE. And the diameter divides the circle and circumference into two equal parts, and is double the radius.

15. The circumference of every circle is ſuppoſed to be divided into 360 equal parts, called *degrees*; and each degree is divided into 60 equal parts, called *minutes*; and each minute into 60 equal parts, called *ſeconds*; and theſe into *thirds*, *fourths*, &c. theſe parts being greater or leſs according as the radius is.

16. Any part of the circumference is called an *arch*, or *arc*; and is called an arc of as many degrees as it contains parts of the 360, into which the circumference was divided: thus if AD be the $\frac{1}{8}$ of the circumference, then the arc AD is an arc of 45 degrees.

17. A line drawn from one end of an arc to the other, is called a *chord*, and is the meaſure of the arc:

thus the right line AB is the chord of the arc ADB, fig. 11.

18. Any part of a circle cut off by a chord, is called a *ſegment*; thus the ſpace comprehended between the chord AB and circumference ADB (which is cut off by the chord AB) is called a *ſegment*. Whence it is plain,

1*ſt*, That all chords divide the circle into two ſegments.

2*dly*, The leſs the chord is, the more unequal are the ſegments, and *e contra*.

3*dly*, When the chord is greateſt, *viz*. when it is a diameter, then the ſegments are equal, *viz*. each a ſemicircle.

19. Any part of a circle (leſs than a ſemicircle) contained between two radii and an arc, is called a *ſector*; thus the ſpace contained between the two radii, AC, BC, and the arc AB, is called the ſector, fig. 12.

20. The right ſine of any arc, is a line drawn perpendicular from one end of the arc, to a diameter drawn through the other end of the ſame arc; thus (fig. 13.) AD is the right ſine of the arc AB, it being a line drawn from A, the one end of the arc AB, perpendicular to CB, a diameter paſſing through B, the other end of the arc AB.

Now the ſines ſtanding on the ſame diameter, ſtill increaſe till they come to the centre, and then becoming the radius, it is plain that the radius EC is the greateſt poſſible ſine, and for that reaſon it is called the *whole ſine*.

Since the whole ſine EC muſt be perpendicular to the diameter FB (by def. 20.), therefore producing the diameter EG, the two diameters FB, EG, muſt croſs one another at right angles, and ſo the circumference of the circle muſt be divided by them into four parts, EB, BG, GF, and FE, and theſe four parts are equal to one another (by def. 10.), and ſo EB a quadrant, or fourth part of the circumference; therefore the radius EC is always the ſine of the quadrant, or fourth part of the circle EB.

Sines are ſaid to be of ſo many degrees, as the arc contains parts of the 360, into which the circumference is ſuppoſed to be divided; ſo the radius being the ſine of a quadrant, or fourth part of the circumference, which contains 90 degrees (the fourth part of 360), therefore the radius muſt be the ſine of 90 degrees.

21. The part of the radius comprehended between the extremity of the right ſine and the lower end of the arc, *viz*. DB, is called the verſed ſine of the arc AB.

22. If to any point in the circumference, *viz*. B, there be drawn a diameter FCB, and from the point B, perpendicular to that diameter, there be drawn the line BH; that line is called a *tangent* to the circle in the point B; which tangent can touch the circle only in one point B, elſe if it touched it in more, it would go within it, and ſo not be a tangent but a chord, (by art. 17.)

23. The tangent of any arc AB, is a right line drawn perpendicular to a diameter through the one end of the arc B, and terminated by a line CAH, drawn from the centre through the other end A; thus BH is the tangent of the arc AB.

24. And the line which terminates the tangent, *viz*. CH, is called the ſecant of the arc AB.

25. What an arc wants of a quadrant is called the *complement* of that arc; thus AE, being what the arc AB wants of the quadrant EB, is called the complement of the arc AB.

26. And what an arc wants of a ſemicircle is called the *ſupplement* of that arc; thus ſince AF is what the arc AB wants of the ſemicircle BAF, it is the ſupplement of the arc AB.

27. The ſine, tangent, &c. of the complement of any arc, is called the *co-ſine*, *co-tangent*, &c. of that arc; thus the ſine, tangent, &c. of the arc AE is called the co-ſine, co-tangent, &c. of the arc AB.

28. The ſine of the ſupplement of an arc is the ſame with the ſine of the arc itſelf; for, drawing them according to the definitions, there reſults the ſelf-ſame line.

29. A right-lined angle is meaſured by an arc of a circle deſcribed upon the angular point as a centre, comprehended between the two legs that form the angle; thus (fig. 14.) the angle ABD is meaſured by the arc AD of the circle CADE that is deſcribed upon the point B as a centre; and the angle is ſaid to be of as many degrees as the arc is; ſo if the arc AD be 45 degrees, then the angle ABD is ſaid to be an angle of 45 degrees.

Hence the angles are greater or leſs, according as the arc deſcribed about the angular point and terminated by the two legs contain a greater or a leſs number of degrees.

30. When one line falls perpendicularly on another, as AB on CD, fig. 15. then the angles are right (by the 10th def.); and deſcribing a circle on the centre B, ſince the angles ABC ABD are equal, their meaſures muſt be ſo too, *i. e.* the arcs AC AD muſt be equal; but the whole CAD is a ſemicircle, ſince CD, a line paſſing through the centre B, is a diameter; therefore each of the parts AC AD is a quadrant, *i. e.* 90 degrees; ſo the meaſure of a right angle is always 90 degrees.

31. If one line AB fall any way upon another, CD, then the ſum of the two angles ABC ABD is always equal to the ſum of two right angles; fig. 16. For on the point B, deſcribing the circle CAD, it is plain, that CAD is a ſemicircle (by the 14th); but CAD is equal to CA and AD the meaſure of the two angles; therefore the ſum of the two angles is equal to a ſemicircle, that is, to two right angles, (by the laſt).

Cor. 1. From whence it is plain, that all the angles which can be made from a point in any line, towards one ſide of the line, are equal to two right angles.

2. And that all the angles which can be made about a point, are equal to four right ones.

32. If one line AC croſs another BD in the point E, then the oppoſite angles are equal, *viz*. BEA to CED, and BEC equal to AED; fig. 17. For upon the point E, as a centre, deſcribing the circle ABCD, it is plain ABC is a ſemicircle, as alſo BCD (by the 14th); therefore the arc ABC is equal to the arc BCE; and from both taking the common arc BC, there will remain AB equal to CD, *i. e.* the angle BEA equal to the angle CED (by art. 29.) After the ſame manner

manner we may prove, that the angle BEC is equal to the angle AED.

33. Lines which are equally diſtant from one another, are called *parallel lines;* as AB, CD, fig. 18.

34. If a line GH croſs two parallels AB, CD, (fig. 19.) then the external oppoſite angles are equal, *viz.* GEB equal to CFH, and AEG equal to HFD. For ſince AB and CD are parallel to one another, they may be conſidered as one broad line, and GH croſſing it; then the vertical or oppoſite angles GEB CFH are equal (by art. 32.), as alſo AEG and HFD by the ſame.

35. If a line GH croſs two parallels AB CD, then the alternate angles, *viz.* AEF and EFD, or CFE and FEB, are equal; that is, the angle AEF is equal to the angle EFD, and the angle CFE is equal to the angle FEB, for GEB is equal to AEF (by art. 32.), and CFH is equal to EFD (by the ſame); but GEB is equal to CFH (by the laſt); therefore AEF is equal to EFD. The ſame way we may prove FEB equal to EFC.

36. If a line GH croſs two parallel lines AB, CD, then the external angle GEB is equal to the internal oppoſite one EFD, or GEA equal to CFE. For the angle AEF is equal to the angle EFD (by the laſt); but AEF is equal to GEB (by art. 32.), therefore GEB is equal to EFD. The ſame way we may prove AEG equal to CFE.

37. If a line GH croſs two parallel lines AB, CD, then the ſum of the two internal angles, *viz.* BEF and DFE, or AEF and CFE, are equal to two right angles; for ſince the angle GEB is equal to the angle EFD (by art. 36.), to both add the angle FEB, then GEB and BEF are equal to BEF and DFE; but GEB and BEF are equal to two right angles (by art. 31.), therefore BEF and DFE are alſo equal to two right angles. The ſame way we may prove that AEF and CFE are equal to two right angles.

38. A figure is any part of ſpace bounded by lines or a line. If the bounding lines be ſtrait, it is called a *rectilineal figure*, as fig. 20. if they be curved, it is called a *curvineal figure*, as fig. 21. and fig. 22.; if they be partly curve lines and partly ſtrait, it is called a *mixt figure*, as fig. 23.

39. The moſt ſimple rectilinear figure is that which is bounded by three right lines, and is called a *triangle*, as fig. 24.

40. Triangles are divided into different kinds, both with reſpect to their ſides and angles: with reſpect to their ſides they are commonly divided into three kinds, *viz.*

41. A triangle having all its three ſides equal to one another, is called an *equilateral triangle*, as fig. 25.

42. A triangle having two of its ſides equal one another, and the third ſide not equal to either of them, is called an *Iſoſceles triangle*, as fig. 26.

43. A triangle having none of its ſides equal to one another, is called a *ſcalene triangle*, as fig. 27.

44. Triangles, with reſpect to their angles, are divided in three different kinds, *viz.*

45. A triangle having one of its angles right, is called a *right-angled triangle*, as fig. 28.

46. A triangle having one of its angles obtuſe, or greater than a right angle, is called an *obtuſe-angled triangle*, as fig. 29.

47. Laſtly, a triangle having all its angles acute, is called an *acute-angled triangle*, as fig. 30.

48. In all right-angled triangles, the ſides comprehending the right angle are called the *legs*, and the ſide oppoſite to the right angle is called the *hypothenuſe*. Thus in the right-angled triangle ABC, fig. 31. (the right angle being at B) the two ſides AB and BC, which comprehend the right angle ABC, are the legs of the triangle; and the ſide AC, which is oppoſite to the right angle ABC, is the hypothenuſe of the right-angled triangle ABC.

49. Both obtuſe and acute angled triangles are in general called *oblique-angled triangles;* in all which any ſide is called the *baſe*, and the other two the *ſides*.

50. The perpendicular height of any triangle is a line drawn from the vertex to the baſe perpendicularly; thus if the triangle ABC (fig. 32.) be propoſed, and BC be made its baſe, then A will be the vertex, *viz.* the angle oppoſite to the baſe; and if from A you draw the line AD perpendicular to BC, then the line AD is the height of the triangle ABC ſtanding on BC as its baſe.

Hence all triangles ſtanding between the ſame parallels have the ſame height, ſince all the perpendiculars are equal by the nature of parallels.

51. A figure bounded by four ſides is called a *quadrilateral* or *quadrangular figure*, as ABDC, fig. 33.

52. Quadrilateral figures whoſe oppoſite ſides are parallel, are called *parallelograms*. Thus in the quadrilateral figure ABDC, if the ſide AC be parallel to the ſide BD which is oppoſite to it, and AB be parallel to CD, then the figure ABDC is called a parallelogram.

53. A parallelogram having all its ſides equal and angles right, is called a *ſquare*, as fig. 34.

54. That which hath only the oppoſite ſides equal and its angles right, is called a *rectangle*, as fig. 35.

55. That which hath equal ſides but oblique angles, is called a *rhombus*, as fig. 36. and is juſt an inclined ſquare.

56. That which hath only the oppoſite ſides equal and the angles oblique, is called a *rhomboides*, as fig. 37. and may be conceived as an inclined rectangle.

57. When none of the ſides are parallel to another, then the quadrilateral figure is called a *trapezium*.

58. Every other right lined figure, that has more ſides than four, is in general called a *polygon*. And figures are called by particular names according to the number of their ſides, *viz.* one of five ſides is called a *pentagon*, of ſix a *hexagon*, of ſeven a *heptagon*, and ſo on. When the ſides forming the polygon are equal to one another, the figure is called a regular figure or polygon.

59. *In any triangle* ABC (fig. 38.) *one of its legs*, *as* BC, *being produced towards* D, *the external angle* ACD *is equal to both the internal oppoſite ones taken together*, viz. *to* ABC *and* BAC. In order to prove this, through C, draw CE parallel to AB; then ſince CE is parallel to AB, and the lines AC and BD croſſeth them, the angle ECD is equal to ABC (by art. 36.) and the angle ACE equal to CAB (by art. 35.); therefore the angles ECD and ECA are equal to the augles ABC and CAB; but the angles ECD and ECA are together

gether equal to the angle ACD; therefore the angle ACD is equal to both the angles ABC and CAB taken together.

Cor. Hence it may be proved, that if two lines AB and CD (fig. 39.) be croſſed by a third line EF, and the alternate angles AEF and EFD be equal, the lines AB and CD will be parallel; for if they are not parallel, they muſt meet one another on one ſide of the line EF (ſuppoſe at G) and ſo form the triangle EFG, one of whoſe ſides GE being produced to A, the exterior angle AEF muſt (by this article) be equal to the ſum of the two angles EFG and EGF; but, by ſuppoſition, it is equal to the angles EFG alone; therefore the angle AEF muſt be equal to the ſum of the two angles EFG and EGF, and at the ſame time equal to the angle EFG alone, which is abſurd; ſo the lines AB and CD cannot meet, and therefore muſt be parallel.

60. *In any triangle* ABC, *all the three angles taken together are equal to two right angles.* To prove this, you muſt produce BC, one of its legs, to any diſtance, ſuppoſe to D; then by the laſt propoſition, the external angle, ACD, is equal to the ſum of the two internal oppoſite ones CAB and ABC; to both add the angle ACB, then the ſum of the angles ACD and ACB will be equal to the ſum of the angles CAB and CBA and ACB. But the ſum of the angles ACD and ACB, is equal to two right ones (by art. 32.), therefore the ſum of the three angles CAB and CBA and ACB, is equal to two right angles; that is, the ſum of the three angles of any triangle ACB is equal to two right angles.

Cor. 1. Hence in any triangle given, if one of its angles be known, the ſum of the other two is alſo known: for ſince (by the laſt) the ſum of all the three is equal to two right angles, or a ſemicircle, it is plain, that taking any one of them from a ſemicircle or 180 degrees, the remainder will be the ſum of the other two. Thus (in the former triangle ABC) if the angle ABC be 40 degrees, by taking 40 from 180 we have 140 degrees; which is the ſum of the two angles BAC, ACB: the converſe of this is alſo plain, *viz.* the ſum of any two angles of a triangle being given, the other angle is alſo known by taking that ſum from 180 degrees.

2. In any right-angled triangle, the two acute angles muſt juſt make up a right one between them; conſequently, any one of the oblique angles being given, we may find the other by ſubtracting the given one from 90 degrees, which is the ſum of both.

61. If in any two triangles, ABC (fig. 40.) DEF (fig. 41.) two legs of the one, *viz.* AB and AC, be equal to two legs of the other, *viz.* to DE and DF, each to each reſpectively, *i. e.* AB to DE and AC to DF; and if the angles included between the equal legs be equal, *viz.* the angle BAC equal to the angle EDF; then the remaining leg of the one ſhall be equal to the remaining leg of the other, *viz.* BC to EF; and the angles oppoſite to equal legs ſhall be equal, *viz.* ABC equal to DEF (being oppoſite to the equal legs AC and DF), alſo ACB equal to DFE (which are oppoſite to the equal legs AB and DE). For if the triangle ABC be ſuppoſed to be lifted up and put upon the triangle DEF, and the point A on the point D; it is plain, ſince BA and DE are of equal length, the point E will fall upon the point B; and ſince the angles BAC EDF are equal, the line AC will fall upon the line DF; and they being of equal length, the point C will fall upon the point F; and ſo the line BC will exactly agree with the line EF, and the triangle ABC will in all reſpects be exactly equal to the triangle DEF; and the angle ABC will be equal to the angle DEF, alſo the angle ACB will be equal to the angle DFE.

Cor. 1. After the ſame manner it may be proved, that if in any two triangles ABC, DEF, (ſee the preceding figure) two angles ABC and ACB of the one, be equal to two angles DEF and DFE of the other, each to each reſpectively, *viz.* the angle ABC to the angle DEF, and the angle ACB equal to the angle DFE, and the ſides included between theſe angles be alſo equal, *viz.* BC equal to EF, then the remaining angles and the ſides oppoſite to the equal angles, will alſo be equal each to each reſpectively; *viz.* the angle BAC equal to the angle EDF, the ſide AB equal to DE, and AC equal to DF: for if the triangle ABC be ſuppoſed to be lifted up and laid upon the triangle DEF, the point B being put upon the point E, and the line BC upon the line EF, ſince BC and EF are of equal lengths, the point C will fall upon the point F, and ſince the angle ACB is equal to the angle DFE, the line CA will fall upon the line FD, and by the ſame way of reaſoning the line BA will fall upon the line ED; and therefore the point of interſection of the two lines BA and CA, *viz.* A, will fall upon the point of interſection of the two lines ED and FD, *viz.* D, and conſequently BA will be equal to ED, and AC equal to DF, and the angle BAC equal to the angle EDF.

Cor. 2. It follows likewiſe from this article, that if any triangle ABC (fig. 42.) has two of its ſides AB and AC equal to one another, the angles oppoſite to theſe ſides will alſo be equal, *viz.* the angles ABC equal to the angle ACB. For ſuppoſe the line AD, biſecting the angle BAC, or dividing it into two equal angles BAD and CAD, and meeting BC in D, then the line AD will divide the whole triangle BAC into two triangles ABD and DAC; in which BA and AD two ſides of the one, are equal to CA and AD two ſides of the other, each to each reſpectively, and the included angles BAD and DAC are by ſuppoſition equal; therefore (by this article) the angle ABC muſt be equal to the angle ACB.

62. *Any angle, as* BAD (fig. 42.) *at the circumference of a circle* BADE, *is but half the angle* BCD *at the centre ſtanding on the ſame arch* BED. To demonſtrate this, draw through A and the centre C, the right line ACE, then the angle ECD is equal to both the angles DAC and ADC (by art. 59.); but ſince AC and CD are equal (being two radii of the ſame circle) the angles ſubtended by them muſt be equal alſo, (by *art.* 62. *cor.* 2.) *i. e.* the angle CAD equal to the angle CDA; therefore the ſum of them is double any one of them, *i. e.* DAC and ADC is double of CAD, and therefore ECD is alſo double of DAC: the ſame way it may be proved, that ECB is double of CAB; and therefore the angle BCD is double of the angle BAD, or BAD the half of BCD, which was to be proved.

Cor.

Cor. 1. Hence an angle at the circumference is measured by half the arc it ſubtends; for the angle at the centre (ſtanding on the ſame arc) is meaſured by the whole arc (by art. 29.); but ſince the angle at the centre is double that at the circumference, it is plain the angle at the circumference muſt be meaſured by only half the arc it ſtands upon.

Cor. 2. Hence all angles, ACB, ADB, AEB, *&c.* (fig. 44.) at the circumference of a circle, ſtanding on the ſame chord AB, are equal to one another; for by the laſt corollary they are all meaſured by the ſame arc, *viz.* half the AB which each of them ſubtends.

Cor. 3. Hence an angle in a ſegment greater than a ſemicircle is leſs than a right angle: thus, if ADB be a ſegment greater than a ſemicircle, (ſee the laſt figure) than the arc AB, on which it ſtands, muſt be leſs than a ſemicircle, and the half of it leſs than a quadrant or a right angle; but the angle ADB in the ſegment is meaſured by the half of AB, therefore it is leſs than a right angle.

Cor. 4. An angle in a ſemicircle is a right angle. For ſince ABD (fig. 46.) is a ſemicircle, the arc AED muſt alſo be a ſemicircle: but the angle ABD is meaſured by half the arc AED, that is, by half a ſemicircle or quadrant; therefore the angle ABD is a right one.

Cor. 5. Hence an angle in a ſegment leſs than a ſemicircle, as ABD, (fig. 45.) is greater than a right angle: for ſince the arc ABD is leſs than a ſemicircle, the arc AED muſt be greater than a ſemicircle, and ſo it is half greater than a quadrant, *i. e.* than the meaſure of a right angle; therefore the angle ABD, which is meaſured by half the arc AED, is greater than a right angle.

63. *If from the centre* C *of the circle* ABE, (fig 47.) *there be let fall the perpendicular* CD *on the chord* AB, *then that perpendicular will biſect the chord* AB *in the point* D. To demonſtrate this, draw from the centre to the extremities of the chord the two lines CA, CB; then ſince the lines CA and CB are equal, the angles CAB, CBA, which they ſubtend muſt be equal alſo, (by *art.* 62. *cor.* 2.) but the perpendicular CD divides the triangle ACB into two right-angled triangles ACD and CDB, in which the ſum of the angles ACD and CAD in the one, is equal to the ſum of the angles DCB and CBD in the other, each being equal to a right angle, (by *cor.* 2. of *art.* 61.) but CAD is equal to CBD, therefore ACD is equal to BCD. So in the two triangles ACD and BCD, the two legs AC and CD in the one, are equal to the two legs BC and CD in the other, each to each reſpectively, and the included angles ACD and BCD are equal; therefore the remaining legs AD and BD are equal (by art. 61.) and conſequently AB biſected in D.

64. If from the centre C of a circle ABE, there be drawn a perpendicular CD on the chord AB, and produced till it meet the circle in F, then the line CF biſects the arch AB in the point F; for (ſee the foregoing figure) joining the points A and F, F and B by the ſtreight lines AF, FB, then in the triangles ADF, BDF, AD is equal to DB (by art. 62.) and DF common to both; therefore AD and DF, two legs of the triangle ADF, are equal to BD and DF, two legs of the triangle BDF, and the included angles ADF BDF are equal, being both right; therefore (by art. 61.) the remaining legs AF and FB are equal; but in the ſame circle equal lines are chords of equal arches, therefore the arches AF and FB are equal. So the whole arch AFB is biſected in the point F by the line CF.

Cor. 1. From art. 63. it follows, that any line biſecting a chord at right angles is a diameter; for ſince (by art. 63.) a line drawn from the centre perpendicular to a chord, biſects that chord at right angles; therefore, converſly, a line biſecting a chord at right angles, muſt paſs through the centre, and conſequently be a diameter.

Cor. 2. From the two laſt articles it follows, that the ſine of any arc is the half of the chord of twice the arc; for (ſee the foregoing ſcheme) AD is the ſine of the arc AF, by the definition of a ſine, and AF is half the arc AFB, and AD half the chord AB (by art. 63.); therefore the *corollary* is plain.

65. In any triangle, the half of each ſide is the ſine of the oppoſite angle; for if a circle be ſuppoſed to be drawn through the three angular points A, B, and D of the triangle ABD, fig. 48. then the angle DAB is meaſured by half the arch BKD (by *cor.* 1. of *art.* 62.) but the half of BD, *viz.* BE, is the ſine of half the arch BKD, *viz.* the ſine of BK (by *cor.* 2. of the laſt) which is the meaſure of the angle BAD; therefore the half of BD is the ſine of the angle BAD; the ſame way it may be proved, that the half of AD is the ſine of the angle ABD, and the half of AB is the ſine of the angle ADB.

66. The ſine, tangent, *&c.* of any arch is called alſo the *ſine*, *tangent*, &c. of the angle whoſe meaſure the arc is: thus becauſe the arc GD (fig. 49.) is the meaſures of the angle GCD; and ſince GH is the ſine, DE the tangent, HD the verſed ſine, CE the ſecant, alſo GK the co-ſine, BF the co-tangent, and CF the co-ſecant, *&c.* of the arch GD; then GH is called the *ſine*, DE the *tangent*, &c. of the angle GCD, whoſe meaſure is the arch GD.

67. *If two equal and parallel lines*, AB *and* CD (fig. 50.) *be joined by two others*, AC *and* BD; *then theſe ſhall alſo be equal and parallel.* To demonſtrate this, join the two oppoſite angles A and D with the line AD; then it is plain this line AD divides the quadrilateral, ACDB, into two triangles, *viz.* ABD, ACD, in which AB a leg of the one, is equal to DC a leg of the other, by ſuppoſition, and AD is common to both triangles; and ſince AB is parallel to CD, the angle BAD will be equal to the angle ADC, (by art. 36.) therefore in the two triangles BA and AD, and the angle BAD, is equal to CD and DA, and the angle ADC; that is, two legs and the included angle in the one, is equal to two legs and the included angle in the other; therefore (by art. 61.) BD is equal to AC, and ſince the angle DAC is equal to the angle ADB, therefore the lines BD, AC are parallel (by *cor. art.* 59.)

Cor. 1. Hence it is plain, that the quadrilateral ABDC is a parallelogram, ſince the oppoſite ſides are parallel.

Cor. 2. In any parallelogram the line joining the oppoſite angles (called the *diagonal*) as AD, divides the figure into two equal parts, ſince it has been proved

ved that the triangles ABD ACD are equal to one another.

Cor. 3. It follows alſo, that a triangle ACD on the ſame baſe CD, and between the ſame parallels with a parallelogram ABDC, is the half of that parallelogram.

Cor. 4. Hence it is plain, that the oppoſite ſides of a parallelogram are equal; for it has been proved, that ABDC being a parallelogram, AB will be equal to CD, and AC equal to BD.

68. All parallelograms on the ſame or equal baſes, and between the ſame parallels, are equal to one another; that is, if BD and GH (fig. 51.) be equal, and the lines BH and AF be parallel, then the parallelograms ABDC, BDFE, and EFHG, are equal to one another. For AC is equal to EF, each being equal to BD, (by *cor.* 4. of 67.) To both add CE, then AE will be equal to CF. So in the two triangles ABE CDF, AB a leg of the one, is equal to CD a leg in the other; and AE is equal to CF, and the angle BAE is equal to the angle DCF (by art. 36.); therefore the two triangles ABE CDF are equal (by art. 61.); and taking the triangle CKE from both, the figure ABKC will be equal to the figure KDFE; to both which add the little triangle KBD, then the parallelogram ABDC will be equal to the parallelogram BDFE. The ſame way it may be proved, that the parallelogram EFHG is equal to the parallelogram EFDB; ſo the three parallelograms ABDC, BDFE, and EFHG will be equal to one another.

Cor. Hence it is plain, that triangles on the ſame baſe, and between the ſame parallels, are equal; ſince they are the half of the parallelograms on the ſame baſe and between the ſame parallels, (by *cor.* 3. of laſt *art.*)

69. *In any right-angled triangle*, ABC, (fig. 52.) *the ſquare of the hypothenuſe* BC, *viz.* BCMH, *is equal to the ſum of the ſquares made on the two ſides* AB *and* AC, viz. *to* ABDE *and* ACGF. To demonſtrate this, through the point A draw AKL perpendicular to the hypothenuſe BC, join AH, AM, DC, and BG; then it is plain that DB is equal to BA (by art. 53.), alſo BH is equal to BC (by the ſame); ſo in the two triangles DBC ABH, the two legs DB and BC in the one are equal to the two legs AB and BH in the other; and the included angles DBC and ABH are alſo equal; (for DBA is equal to CBH, being both right; to each add ABC, then it is plain that DBC is equal to ABH) therefore the triangles DBC ABH are equal (by art. 61.) but the triangle DBC is half of the ſquare ADBE (by *cor.* 3. of 67.) and the triangle ABH is half the parallelogram BKLH (by the ſame), therefore half the ſquare ABDE is equal to half the parallelogram BKLH. Conſequently the ſquare ABDE is equal to the parallelogram BKLH. The ſame way it may be proved, that the ſquare ACGF is equal to the parallelogram KCML. So the ſum of the ſquares ABDE and ACGF is equal to the ſum of the parallelograms BKLH and KCML, but the ſum of theſe parallelograms is equal to the ſquare BCMH; therefore the ſum of the ſquares on AB and AC is equal to the ſquare on BC.

Cor. 1. Hence in a right-angled triangle, the hypothenuſe and one of the legs being given, we may eaſily find the other, by taking the ſquare of the given leg from the ſquare of the hypothenuſe, and the ſquare root of the remainder will be the leg required.

Cor. 2. Hence, the legs in a right-angled triangle being given, we may find the hypothenuſe, by taking the ſum of the ſquares of the given legs, and extracting the ſquare root of that ſum.

70. If upon the line AB (fig. 53.) there be drawn a ſemicircle ADB, whoſe centre is C, and on the point C there be raiſed a perpendicular to the line AB, *viz.* CD; then it is plain the arc DB is a quadrant, or contains 90 degrees; ſuppoſe the arc DB to be divided into 9 equal arcs, each of which will contain 10 degrees, then on the point B raiſing BE perpendicular to the line AB, it will be a tangent to the circle in the point B, and if to every one of the diviſions of the quadrant, *viz.* B 10, B 20, B 30, B 40, *&c.* you draw the ſine, tangent, *&c.* (as in the ſcheme) we ſhall have the ſine, tangent, *&c.* to every 10 degrees in the quadrant: and the ſame way we may have the ſine, tangent, *&c.* to every ſingle degree in the quadrant, by dividing it into 90 equal parts beginning from B, and drawing the ſine, tangent, *&c.* to all the arcs beginning at the ſame point B. By this method they draw the lines of ſines, tangents, *&c.* of a certain circle on the ſcale; for after drawing them on the circle, they take the length of them, and ſet them off in the lines drawn for that purpoſe. The ſame way, by ſuppoſing the radius of any number of equal parts, (ſuppoſe 1000, or 10,000, *&c.*) it is plain the ſine, tangent, *&c.* of every arc muſt conſiſt of ſome number of theſe equal parts, and by computing them in parts of the radius, we have tables of ſines, tangents, *&c.* to every arc in the quadrant, called *natural ſines, tangents*, &c. and the logarithms of theſe give us tables of logarithmic ſines, tangents, *&c.* See LOGARITHMS.

71. In any triangle, ABC, (fig. 1.) if one of its ſides, as AC, be biſected in E, (and conſequently AC double of AE) and through E be drawn ED, parallel to BC, and meeting AB in D, then BC will be double of ED, and AB double of AD. Through D draw DF, parallel to AC, meeting BC in F: for ſince, by conſtruction, DF is parallel to AC, and DE parallel to BC; therefore, (by art. 36.) the angle BFD will be equal to the angle BCA, (and by the ſame article) the angle BCA will be equal to the angle DEA, conſequently the angle BFD will be equal to the angle DEA; alſo, (by art. 36.) the angle BDF will be equal to the angle DAE; and ſince DF is parallel to EC, and DE parallel to FC, the quadrilateral DFCE will be a parallelogram; and therefore, (by art. 59. cor. 4.) DF will be equal to EC, which, by conſtruction, is equal to AE; ſo in the two triangles BDF DAE, the two angles BFD and BDF in the one, are equal to the two angles DEA and DAE in the other, each to each reſpectively; and the included ſide DF, is equal to the included ſide AE; therefore, (by art. 61. cor. 1.) AD will be equal to DB, and conſequently AB double of AD; alſo (by the ſame) DE will be equal to BF; but DE is alſo (by art. 67. cor. 4.) equal to FC; therefore BF and ED together, or BC, will be double of DE. *Geometry Plates, n° II.*

After the ſame manner it may be proved, that if in the triangle AKG, (fig. 2.) AE be taken equal to a third

third part of AK, and through E be drawn ED, parallel to KG, and meeting AG in D; then ED will be equal to a third part of GK, and AD equal to a third part of AG.

Likewiſe if in any triangle ABC, (fig. 3.) upon the ſide AB, be taken AE, equal to one-fourth, one-fifth, one-ſixth, *&c.* of AB, and through E be drawn ED parallel to BC and meeting AC in D; then DE will be one-fourth, one-fifth, one-ſixth, *&c.* of BC, and AD the like part of AC; and, in general, if in any triangle ABC, there be aſſumed a point E on one of its ſides AB, and through that point be drawn a line ED, parallel to one of its ſides BC, and meeting the other ſide AC in D; then whatever part AE is of AB, the ſame part will ED be of BC, and AD of AC.

Cor. Hence it follows, that if in any triangle ABC, there be drawn ED, parallel to one of its ſides BC, and meeting the other two in the points E and D, then AE : AB :: ED : BC :: AD : AC; that is, AE is to AB, as ED is to BC, and that as AD to AC.

72. If any two triangles ABC, fig. 4. a b c, fig. 5. are ſimilar, or have all the angles of the one equal to all the angles of the other, each to each reſpectively; that is, the angle CAB equal to the angle c a b, and the angle ABC equal to the angle a b c, and the angle ACB equal to the angle a c b; then the legs oppoſite to the equal angles are proportioned, *viz.* AB : a b :: AC : a c :: and AB : a b :: BC : b c :: and AC : a c :: BC : b c. On AB of the largeſt triangle ſet off AE equal to a b, and through E draw ED parallel to BC, meeting AC in D; then ſince DE and BC are parallel, and AB croſſing them, the angle AED will (by art. 36.) be equal to the angle ABC, which (by ſuppoſition) is equal to the angle a b c, alſo the angle DAE is (by ſuppoſition) equal to the angle c a b; ſo in the two triangles AED, a b c, the two angles DAE AED of the one, are equal to two angles c a b a b c of the other, each to each reſpectively, and the included ſide AE is (by conſtruction) equal to the included ſide a b; therefore, (by art. 61. cor. 1.) AD is equal to a c, and DE equal to c b; but ſince, in the triangle ABC, there is drawn DE parallel to BC one of its ſides, and meeting the two other ſides in the points D and E, therefore (by cor. art. 71.) AB : AE :: AC : AD, and AB : AE :: BC : DE, and AC : AD :: BC : DE; and in the three laſt proportions, inſtead of the lines AE, DE, and AD, putting in their equals a b, b c, and a c, we ſhall have AB : a b :: AC : a c, and AB : a b :: BC : b c, and laſtly, AC : a c :: BC : b c.

73. The chord, ſine, tangent, *&c.* of any arc in one circle, is to the chord, ſine, tangent, *&c.* of the ſame arc in another, as the radius of the one is to the radius of the other, fig. 6, 6. Let ABD a b d be two circles, BD b d two arcs of theſe circles, equal to one another, or conſiſting of the ſame number of degrees; FD f d the tangents, BD b d the chords, BE b e the ſines, *&c.* of theſe two arcs BD b d, and CD c d the radii of the circles; then ſay, CD : c d :: FD : f d, and CD : c d :: BD : b d, and CD : c d :: BE : b e, *&c.* For ſince the arcs BD b d are equal, the angles BCD b c d will be equal; and FD f d, being tangents to the points D and d, the angles CDF c d f will be equal, being each a right angle (art. 22.) ſo in the two triangles CDF c d f, the two angles FCD CDF of the one, being equal to the two angles f c d c d f of the other, each to each, the remaining angle CFD, will be equal to the remaining angle c f d (by art. 60.); therefore the triangles CFD c f d are ſimilar, and conſequently (by art. 72.) CD : c d :: FD : f d. In the ſame manner it may be demonſtrated, that CD : c d :: BD : b d, and CD : c d :: BE b e, *&c.*

74. Let ABD (fig. 7.) be a quadrant of a circle deſcribed by the radius CD; BD any arc of it, and BA its complement; BG or CF the ſine, CG or BF the coſine; DE the tangent, and CE the ſecant of that arc BD. Then ſince the triangles CDE CGB are ſimilar or equiangular, it will be (by art. 72.) DE : EC :: GB : BC, *i. e.* the tangent of any arc, is to the ſecant of the ſame, as the ſine of it is to the radius. Alſo ſince DE : EC :: GB : BC; therefore, by inverting that proportion, we have EC : DE :: BC : GB, *i. e.* the ſecant is to the tangent, as the radius is to the ſine of any arc.

Again, ſince the triangles CDE CGB are ſimilar, therefore (by art. 72.) it will be CD : CE :: CG : CB, *i. e.* as the radius is to the ſecant of any arc, ſo is the co-ſine of that arc to the radius. And by inverting the proportion we have this, *viz.* as the ſecant of any arc is to the radius, ſo is the radius to the coſine of that arc.

75. In all circles the chord of 60 is always equal in length to the radius. Thus in the circle AEBD, (fig. 8.) if the arc AEB be an arc of 60 degrees, then drawing the chord AB, I ſay AB ſhall be equal to the radius CB or AC; for in the triangle ACB, the angle ACB is 60 degrees, being meaſured by the arc AEB; therefore the ſum of the other two angles is 120 degrees, (by *cor.* 1. of 60.); but ſince AC and CB are equal, the two angles CAB, CBA will alſo be equal; conſequently each of them half their ſum 120, *viz.* 60 degrees; therefore all the three angles are equal to one another, conſequently all the legs, therefore AB is equal to CB.

Cor. Hence the radius from which the lines on any ſcale are formed, is the chord of 60 on the line of chords.

Geometrical Problems.

Prob. 1. From a point C (fig. 9.) in a given line AB to raiſe a perpendicular to that line.

Rule. From the point C take the equal diſtances CB, CA on each ſide of it. Then ſtretch the compaſſes to any diſtance greater than CB or CA, and with one foot of them in B, ſweep the arc EF with the other; again, with the ſame opening, and one foot in A, ſweep the arc GH with the other, and theſe two arcs will interſect one another in the point D; then join the given points C and D with the line CD, and that ſhall be the perpendicular required.

2. To divide a given right line AB (fig. 10.) into two equal parts; that is, to biſect it.

Rule. Take any diſtance with your compaſſes that you are ſure is greater than half the given line; then ſetting one foot of them in B, with the other ſweep the arc DFC; and with the ſame diſtance, and one foot in A, with the other ſweep the arc CED; theſe two arcs will interſect one another in the points CD, which joined by the right line DC will biſect AB in G.

3. From

3. From a given point D, (fig. 11.) to let fall a perpendicular on a given line AB.

Rule. Set one foot of the compaſſes in the point D, and extend the other to any diſtance greater than the leaſt diſtance between the given point and the line, and with that extent ſweep the arc AEB, cutting the line in the two points A and B, then (by the laſt prob.) biſect the line AB in the point C; laſtly join C and D, and that line CD is the perpendicular required.

4. (Fig. 12.) Upon the end B of a given right line BA, to raiſe a perpendicular.

Rule. Take any extent in your compaſſes, and with one foot in B fix the other in any point C without the given line; then with one point of the compaſſes in C, deſcribe with the other the circle EBD, and thro' E and C draw the diameter ECD meeting the circle in D; join D and B, and the right line DB is that required; for EBD is a right angle (by *cor.* 4. of 63.)

5. (Fig. 13.) To draw one line parallel to another given line AB, that ſhall be diſtant from one another by any given diſtance D.

Rule. Extend your compaſſes to the given diſtance D; then ſetting one foot of them in any point of the given line (ſuppoſe A,) with the other ſweep the arc FCG; again, at the ſame extent, and one foot in any other point of the given line B, ſweep the arc HDK, and draw the line CD touching them, and that will be parallel to the given line AB, and diſtant from it by the line D as was required.

6. (Fig. 14.) To divide a given line AB into any number of equal parts, ſuppoſe 7.

Rule. From the point A draw any line AD, making an angle with the line AB, then through the point B, draw a line BC parallel to AD; and from A, with any ſmall opening of the compaſſes, ſet off a number of equal parts (on the line AD,) leſs by one than the propoſed number (here 6.); then from B ſet off the ſame number of the ſame parts (on the line BC); laſtly, join 6 and 1, 2 and 5, 3 and 4, 4 and 3, 5 and 2, 6 and 1, and theſe lines will cut the given line as required.

7. (Fig. 15.) To quarter a given circle, or to divide it into four equal parts.

Rule. Through the centre C of the given circle, draw a diameter AB, then upon the point C raiſe a perpendicular DCE to the line AB; and theſe two diameters AB and DE ſhall quarter the circle.

8. (Fig. 16.) Through three given points A, B, and D, to draw a circle. *Note,* The three points muſt not lie in the ſame ſtreight line.)

Rule. Join A and B, alſo B and D, with the ſtreight lines AB BD; then (by prob. 2.) biſect AB with the line EC, alſo BD with the line FC, which two lines will cut one another in ſome point C; that is the centre of the circle required: then fixing one point of your compaſſes in D, and ſtretching the other to A, deſcribe the circle ABDG, which will paſs through the three points given. The reaſon of this is plain from cor. 1. of art. 64.

9. (Fig. 17.) From the point A of the given line AB, to draw another line (ſuppoſe AC) that ſhall make with AB an angle of any number of degrees, ſuppoſe 45.

Rule. Let the given line AB be produced, then take off your ſcale the length of the chord of 60 degrees, which is equal to the radius of the circle the ſcale was made for (by art. 75.); and ſetting one foot in A, with the other ſweep off the arc BC; then with your compaſſes take from your ſcale the chord of 45 degrees, and ſet off that diſtance from B to C. Laſtly, join A and C, and the line AC is that required. For the angle CAB, which is meaſured by the arc BC, is an angle of 45 degrees, as was required.

10. An angle BAC (fig. 18.) being given, to find how many degrees it contains.

Rule. With your compaſſes take the length of your chord of 60 from your ſcale. Then, ſetting one foot of them in A, with the other ſweep the arc BC, which is the arc comprehended between the two legs AB, AC produced if needful. Laſtly, take with your compaſſes the diſtance BC, and applying it to your line of chords on the ſcale, you will find how many degrees the arc BC contains, and conſequently the degrees of the angle BAC which was required.

11. Three lines *x*, *y*, and *z* being given, (fig. 19. 19.) to form a triangle of them; but any two of theſe lines taken together muſt always be greater than the third.

Rule. Make any one of them, as *x*, the baſe; then with your compaſſes take another of them, as *z*, and ſetting one foot in one end of the line *x*, as B, with the other ſweep the arc DE; and taking with your compaſſes the length of the other *y*, ſet one foot of them in A, the other end of the line *x*, and with the other ſweep the arc FG, which will cut the other in C; laſtly, join CA and CB, and the triangle CAB is that required.

12. To make a triangle, having one of its legs of any number of equal parts (ſuppoſe 160,) and one of the angles at that leg 50 degrees, and the other 44 degrees.

Rule. Draw an indefinite line ED, (fig. 20.) then take off the line of equal parts with your compaſſes, 160 of them, and ſet them on the indefinite line, as BC; then (by prob. 9.) draw BA, making the angle ABC of 50 degrees, and (by the ſame) draw from C the line AC, making the angle ACB of 44 degrees; which two lines will meet one another in A, and the triangle ABC is that required. See TRIGONOMETRY.

13. Upon a given line AB (fig. 21.) to make a ſquare.

Rule. Upon the extremity A of the given line AB, raiſe a perpendicular AC (by prob. 4.); then take AC equal to AB, and with that extent, ſetting one foot of the compaſſes in C, ſweep with the other foot the arc GH; then with the ſame extent, and one foot in B, with the other ſweep the arc EF, which will meet the former in ſome point D; laſtly, join C and D, D and B, and the figure ABDC will be the ſquare required.

14. On a given line AB (fig. 22.) to draw a rhomb that ſhall have one of its angles equal to any number of degrees, ſuppoſe 60 degrees.

Rule. From the point A of the given line AB, draw the line AC, making the angle CAB of 60 degrees, (by prob. 9.) then take AC equal to AB, and with that extent, fixing one foot of the compaſſes in

B,

B, with the other deſcribe the arc GH; and at the ſame extent, fixing one foot of the compaſſes in C, with the other deſcribe the arc EF cutting the former in D; laſtly, join CD and DB, and the figure ACDB is that required.

15. Given two lines *x* and *z*, of theſe two to make a rectangle.

Rule. Draw a line, as AB, (fig. 23. 23.) equal in length to one of the given lines *x*; and on the extremity A of that line, raiſe a perpendicular AC, on which take AC equal to the other line *z*; then take with your compaſſes the length of the line AB, and at that extent, fixing one foot of them in C, with the other ſweep the arc EF; and alſo taking with your compaſſes the extent of the line AC, fix one foot of them in B, and with the other ſweep the arc GH, which will meet the former in D; laſtly, join CD and BD, and the figure ABDC will be that required.

16. Two lines *x* and *z* being given, of theſe to form a rhomboides that ſhall have one of its angles any number of degrees, ſuppoſe 50.

Rule. Draw a line AB (fig. 24. 24.) equal in length to one of the lines, as *x*; then draw the line AC, making with the former the angle BAC equal to the propoſed, ſuppoſe 50 degrees, and on that line take AC equal to the given line *z*; then with your compaſſes take the length of AB, and fixing one foot in C, ſweep the arc EF; alſo, taking the length of AC, and ſetting one foot in B, with the other ſweep the arc GH, which will cut the former in D; then join CD and DB, ſo the figure ACDB will be that required.

PART II.

THE APPLICATION OF THE FOREGOING PRINCIPLES TO THE MENSURATION OF SURFACES, SOLIDS, &c.

CHAP. I. *Of the Menſuration of Lines and Angles.*

A Line, or length, to be meaſured, whether it be diſtance, height, or depth, is meaſured by a line leſs than it. With us the leaſt meaſure of length is an inch: not that we meaſure no line leſs than it, but becauſe we do not uſe the name of any meaſure below that of an inch; expreſſing leſſer meaſures by the fractions of an inch: and in this treatiſe we uſe decimal fractions as the eaſieſt. Twelve inches make a foot; three feet and an inch make the Scots ell; ſix ells make a fall; forty falls make a furlong; eight furlongs make a mile: ſo that the Scots miles is 1184 paces, accounting every pace to be five feet. Theſe things are according to the ſtatutes of Scotland; notwithſtanding which, the glaziers uſe a foot of only eight inches; and other artiſts for the moſt part uſe an Engliſh foot, on account of the ſeveral ſcales marked on the Engliſh foot-meaſure for their uſe. But the Engliſh foot is ſomewhat leſs than the Scots; ſo that 185 of theſe make 186 of thoſe.

Lines, to the extremities and any intermediate point of which you have eaſy acceſs, are meaſured by applying to them the common meaſure a number of times. But lines, to which you cannot have ſuch acceſs, are meaſured by methods taken from geometry; the chief whereof we ſhall here endeavour to explain. The firſt is by the help of the geometrical ſquare.

"As for the Engliſh meaſures, the yard is 3 feet, "or 36 inches. A pole is ſixteen feet and a half, or "five yards and a half. The chain, commonly called "*Gunter's chain*, is four poles, or 22 yards, that is, "66 feet. An Engliſh ſtatute-mile is fourſcore chains, "or 1760 yards, that is, 5280 feet.

"The chain (which is now much in uſe, becauſe it "is very convenient for ſurveying) is divided into "100 links, each of which is $7\frac{92}{100}$ of an inch: whence "it is eaſy to reduce any number of thoſe links to "feet, or any number of feet to links.

"A chain that may have the ſame advantages in "ſurveying in Scotland, as Gunter's chain has in Eng-"land, ought to be in length 74 feet, or 24 Scots ells, "if no regard is had to the difference of the Scots "and Engliſh foot above-mentioned. But, if regard "is had to that difference, the Scots chain ought to "conſiſt of $74\frac{2}{7}$ Engliſh feet, or 74 feet 4 inches and "$\frac{4}{7}$ of an inch. This chain being divided into 100 "links, each of thoſe links is 8 inches and $\frac{2}{7}\frac{9}{10}\frac{1}{0}$ of "an inch. In the following table, the moſt noted "meaſures are expreſſed in Engliſh inches and deci-"mals of an inch."

	Engliſh Inch.	*Dec.*
The Engliſh foot, is	12	000
The Paris foot,	12	788
The Rhindland foot, meaſured by Mr Picart,	12	362
The Scots foot,	12	065
The Amſterdam foot, by Snellies and Picart,	11	172
The Dantzick foot, by Hevelius,	11	297
The Daniſh foot, by Mr Picart,	12	465
The Swediſh foot, by the ſame,	11	692
The Bruſſels foot, by the ſame,	10	828
The Lyons foot, by Mr Auzout,	13	458
The Bononian foot, by Mr Caſſini,	14	938
The Milan foot, by Mr Auzout,	15	631
The Roman palm uſed by merchants, according to the ſame,	9	791
The Roman palm uſed by architects,	8	779
The palm of Naples, according to Mr Auzout,	10	314
The Engliſh yard,	36	000
The Engliſh ell,	45	000
The Scots ell,	37	200
The Paris aune uſed by mercers, according to Mr Picart,	46	786
The Paris aune uſed by drapers, according to the ſame,	46	680
The Lyons aune, by Mr Auzout,	46	570
The Geneva aune,	44	760
The Amſterdam ell,	26	800
The Daniſh ell, by Mr Picart,	24	930

The Swediſh ell,	23	380
The Norway ell,	24	510
The Brabant or Antwerp ell,	27	170
The Bruſſels ell,	27	260
The Burges ell,	27	550
The brace of Bononia, according to Auzout,	25	200
The brace uſed by architects in Rome,	30	730
The brace uſed in Rome by merchants,	34	270
The Florence brace uſed by merchants, according to Picart,	22	910
The Florence geographical brace,	21	570
The vara of Seville,	33	127
The vara of Madrid,	39	166
The vara of Portugal,	44	031
The cavedo of Portugal,	27	354
The ancient Roman foot,	11	632
The Perſian ariſh, according to Mr Græves,	38	364
The ſhorter pike of Conſtantinople, according to the ſame,	25	576
Another pike of Conſtantinople, according to Meſſ. Mallet and De la Porte,	27	920

PROPOSITION I.

PROB. *To deſcribe the ſtructure of the geometrical ſquare.*—The geometrical ſquare is made of any ſolid matter, as braſs or wood, or of any four plain rulers joined together at right angles, (as in fig. 1.) where A is the centre, from which hangs a thread with a ſmall weight at the end, ſo as to be directed always to the centre. Each of the ſides BE and DE is divided into an hundred equal parts, or (if the ſides be long enough to admit of it) into a thouſand parts; C and F at two ſights, fixed on the ſide AD. There is moreover an index GH, which, when there is occaſion, is joined to the centre A, in ſuch manner as that it can move round, and remain in any given ſituation. On this index are two ſights perpendicular to the right line going from the centre of the inſtrument: theſe are K and L. The ſide DE of the inſtrument is called the upright ſide; E the reclining ſide.

Geometry Plates, n° III.

PROPOSITION II.

FIG. 2. *To meaſure an acceſſible height,* AB, *by the help of a geometrical ſquare, its diſtance being known.*—Let BR be an horizontal plane, on which there ſtands perpendicularly any line AB: let BD, the given diſtance of the obſervator from the height, be 96 feet; let the height of the obſervator's eye be ſuppoſed 6 feet: and let the inſtrument, held by a ſteady hand, or rather leaning on a ſupport, be directed towards the ſummit A, ſo that one eye (the other being ſhut) may ſee it clearly through the ſights; the perpendicular or plumb-line meanwhile hanging free, and touching the ſurface of the inſtrument: let now the perpendicular be ſuppoſed to cut off on the right ſide KN 80 equal parts. It is clear that LKN, ACK, are ſimilar triangles; for the angles LKN, ACK are right angles, and therefore equal; moreover LN and AC are parallel, as being both perpendicular to the horizon; conſequently, (by art. 60. cor. 1. Part I.) the angles KLN, KAC, are equal; wherefore, (by art. 60. cor. 2. of Part I.) the angles LNK, and AKC, are likewiſe equal: ſo that in the triangles NKL, KAC, (by art. 72. of Part I.) as NK : KL :: KC (*i. e.* BD) : CA; that is, as 80 to 100, ſo is 96 feet to CA. Therefore, by the rule of three, CA will be found to be 120 feet; and CB, which is 6 feet, being added, the whole height is 126 feet.

But if the diſtance of the obſervator from the height, as BE, be ſuch, that when the inſtrument is directed as formerly toward the ſummit A, the perpendicular falls on the angle P, oppoſite to H, the centre of the inſtrument, and BE or CG be given of 120 feet; CA will alſo be 120 feet. For in the triangles HGP, ACG, equiangular, as in the preceding caſe, as PG : GH : : GC : CA. But PG is equal to GH; therefore GC is likewiſe equal to CA: that is, CA will be 120 feet, and the whole height 126 feet as before.

Let the diſtance BF be 300 feet, and the perpendicular or plumb-line cut off 40 equal parts from the reclining ſide: Now, in this caſe, the angle, QAC, QZI, are equal, and the angles QZI, ZIS, are equal; therefore the angle ZIS is equal to the angle QAC. But the angles ZSI QCA are equal, being right angles; therefore, in the equiangular triangles ACQ, SZI, it will be, as ZS : SI : : CQ : CA; that is, as 100 to 40, ſo is 300 to CA. Wherefore, by the rule of three, CA will be found to be of 102 feet. And, by adding the height of the obſervator, the whole BA will be 126 feet. Note, that the height is greater than the diſtance, when the perpendicular cuts the right ſide, and leſs if it cut the reclined ſide: and that the height and diſtance are equal, if the perpendicular fall on the oppoſite angle.

SCHOLIUM.

If the height of a tower, to be meaſured as above, end in a point, (as in fig. 3.) the diſtance of the obſervator oppoſite to it, is not CD, but is to be accounted from the perpendicular to the point A; that is, to CD muſt be added the half of the thickneſs of the tower, *viz.* BD: which muſt likewiſe be underſtood in the following propoſitions, when the caſe is ſimilar.

PROPOSITION III.

FIG. 4. *From the height of a tower* AB *given, to find a diſtance on the horizontal plane* BC, *by the geometrical ſquare*—Let the inſtrument be ſo placed, as that the mark C in the oppoſite plane may be ſeen through the ſights; and let it be obſerved how many parts are cut off by the perpendicular. Now, by what hath been already demonſtrated, the triangles AEF, ABC, are ſimilar; therefore, it will be as EF, to AE, ſo AB (compoſed of the height of the tower BG, and of the height of the centre of the inſtrument A, above the tower BG) to the diſtance BC. Wherefore, if, by the rule of three, you ſay, as EF to AE, ſo is AB to BC, it will be the diſtance ſought.

PROPOSITION IV.

FIG. 5. *To meaſure any diſtance at land or ſea, by the geometrical ſquare.*—In this operation, the index is to be applied to the inſtrument, as was ſhown in the deſcription; and, by the help of a ſupport, the inſtrument is to be placed horizontally at the point A; then let it be turned till the remote point F, whoſe diſtance is to be meaſured, be ſeen through the fixed ſights; and bring the index to be parallel with the other ſide of the inſtrument, obſerve by the ſights upon it any acceſſible mark B, at a ſenſible diſtance: then carrying the inſtrument to the point B, let the immoveable

moveable ſights be directed to the firſt ſtation A, and the ſights of the index to the point F. If the index cut the right ſide of the ſquare, as in K, in the two triangles BRK, and BAF, which are æquiangular, it will be as BR to RK, ſo BA (the diſtance of the ſtations to be meaſured with a chain) to AF; and the diſtance AF ſought will be found by the rule of three. But if the index cut the reclined ſide of the ſquare in any point L, where the diſtance of a more remote point is ſought; in the triangles BLS, BAG, the ſide LS ſhall be to SB, as BA to AG, the diſtance ſought; which accordingly will be found by the rule of three.

PROPOSITION V.

FIG. 6. *To meaſure an acceſſible height by means of a plain mirror.*—Let AB be the height to be meaſured; let the mirror be placed at C, in the horizontal plane BD, at a known diſtance BC; let the obſerver go back to D, till he ſee the image of the ſummit in the mirror, at a certain point of it, which he muſt diligently mark; and let DE be the height of the obſervator's eye. The triangles ABC and EDC are equiangular; for the angles at D and B are right angles; and ACB, ECD, are equal, being the angles of incidence and reflexion of the ray AC, as is demonſtrated in optics; wherefore the remaining angles at A and E are alſo equal: therefore it will be, as CD to DE, ſo CB to BA; that is, as the diſtance of the obſervator from the point of the mirror in the right line betwixt the obſervator and the height, is to the height of the obſervator's eye, ſo is the diſtance of the tower from that point of the mirror, to the height of the tower ſought; which therefore will be found by the rule of three.

Note 1. The obſervation will be more exact, if, at the point D, a ſtaff be placed in the ground perpendicularly, over the top of which the obſervator may ſee a point of the glaſs exactly in a line betwixt him and the tower.

Note 2. In place of a mirror may be uſed the ſurface of water contained in a veſſel, which naturally becomes parallel to the horizon.

PROPOSITION VI.

FIG. 7. *To meaſure an acceſſible height* AB *by means of two ſtaffs.*—Let there be placed perpendicularly in the ground a longer ſtaff DE, likewiſe a ſhorter one FG, ſo as the obſervator may ſee A, the top of the height to be meaſured, over the ends D F of the two ſtaffs; let FH and DC, parallel to the horizon, meet DE and AB in H and C; then the triangles FHD, DCA, ſhall be equiangular; for the angles at C and H are right ones; likewiſe the angle A is equal to the angle FDH; wherefore the remaining angles DFH, and ADC, are alſo equal: wherefore, as FH, the diſtance of the ſtaffs, to HD, the exceſs of the longer ſtaff above the ſhorter; ſo is DC, the diſtance of the longer ſtaff from the tower, to CA, the exceſs of the height of the tower above the longer ſtaff. And thence CA will be found by the rule of three.

To which if the length DE be added, you will have the whole height of the tower BA.

SCHOLIUM.

FIG. 8. Many other methods may be occaſionally contrived for meaſuring an acceſſible height. For example, from the given length of the ſhadow BD, to find out the height AB, thus: Let there be erected a ſtaff CE perpendicularly, producing the ſhadow EF: The triangles ABD, CEF, are equiangular; for the angles at B and E are right; and the angles ADB and CFE are equal, each being equal to the angle of the ſun's elevation above the horizon: Therefore, as EF, the ſhadow of the ſtaff, to EC, the ſtaff itſelf; ſo BD, the ſhadow of the tower, to BA, the height of the tower. Though the plane on which the ſhadow of the tower falls be not parallel to the horizon, if the ſtaff be erected in the ſame plane, the rule will be the ſame.

PROPOSITION VII.

To meaſure an inacceſſible height by means of two ſtaffs.—Hitherto we have ſuppoſed the height to be acceſſible, or that we can come at the lower end of it; now if, becauſe of ſome impediment, we cannot get to a tower, or if the point whoſe height is to be found out be the ſummit of a hill, ſo that the perpendicular be hid within the hill; if, for want of better inſtruments, ſuch an inacceſſible height is to be meaſured by means of two ſtaffs, let the firſt obſervation be made with the ſtaffs DE and FG, (as in prop. 6.); then the obſervator is to go off in a direct line from the height and firſt ſtation, till he come to the ſecond ſtation; where (fig. 11.) he is to place the longer ſtaff perpendicularly at RN, and the ſhorter ſtaff at KO, ſo that the ſummit A may be ſeen along their tops; that is, ſo that the points KNA may be in the ſame right line. Through the point N, let there be drawn the right line NP parallel to FA: Wherefore in the triangles KNP, KAF, the angles KNP, KAF are equal, alſo the angle AKF is common to both; conſequently the remaining angle KPN is equal to the remaining angle KFA. And therefore, PN : FA :: KP : KF. But the triangles PNL, FAS are ſimilar; therefore, PN : FA :: NL : SA. Therefore, (by the 11. 5. Euc.) KP : KF :: NL : SA. Thence, alternately, it will be, as KP (the exceſs of the greater diſtance of the ſhort ſtaff from the long one above its leſſer diſtance from it) to NL, the exceſs of the longer ſtaff above the ſhorter; ſo KF, the diſtance of the two ſtations of the ſhorter ſtaff to SA, the exceſs of the height ſought above the height of the ſhorter ſtaff. Wherefore SA will be found by the rule of three. To which let the height of the ſhorter ſtaff be added, and the ſum will give the whole inacceſſible height BA.

Note 1. In the ſame manner may an inacceſſible height be found by a geometrical ſquare, or by a plain ſpeculum. But we ſhall leave the rules to be found out by the ſtudent, for his own exercife.

Note 2. That by the height of the ſtaff we underſtand its height above the ground in which it is fixed.

Note 3. Hence depends the method of uſing other inſtruments invented by geometricians; for example, of the geometrical croſs: and if all things be juſtly weighed, a like rule will ſerve for it as here. But we incline to touch only upon what is moſt material.

PROPOSITION VIII.

FIG. 9. *To meaſure the diſtance* AB, *to one of whoſe extremities we have acceſs, by the help of four ſtaffs.*—Let there be a ſtaff fixed at the point A; then going back at ſome ſenſible diſtance in the ſame right line, let another be fixed in C, ſo as that both the points A

and B be covered and hid by the ſtaff C: likewiſe going off in a perpendicular from the right line CB, at the point A, (the method of doing which ſhall be ſhown in the following *ſcholium*), let there be placed another ſtaff at H; and in the right line CKG (perpendicular to the ſame CB, at the point B), and at the point of it K, ſuch that the points K, H, and B may be in the ſame right line, let there be fixed a fourth ſtaff. Let there be drawn, or let there be ſuppoſed to be drawn, a right line GH parallel to CA. The triangles KGH, HAB, will be equiangular; for the angles HAB KGH are right angles. Alſo the angles ABH, KHG are equal; wherefore, as KG (the exceſs of CK above AH) to GH, or to CA, the diſtance betwixt the firſt and ſecond ſtaff; ſo is AH, the diſtance betwixt the firſt and third ſtaff, to AB the diſtance ſought.

SCHOLIUM.

Fig. 10. To draw on a plane a right line AE perpendicular to CH, from a given point A; take the right lines AB, AD, on each ſide equal; and in the points B and D, let there be fixed ſtakes, to which let there be tied two equal ropes BE, DE, or one having a mark in the middle, and holding in your hand their extremities joined, (or the mark in the middle, if it be but one), draw out the ropes on the ground; and then, where the two ropes meet, or at the mark, when by it the rope is fully ſtretched, let there be placed a third ſtake at E; the right line AE will be perpendicular to CH in the point A (prob. 1. of Part I.). In a manner not unlike to this, may any problems that are reſolved by the ſquare and compaſſes, be done by ropes and a cord turned round as a radius.

PROPOSITION IX.

Fig. 12. *To meaſure the diſtance* AB, *one of whoſe extremities is acceſſible.*—From the point A, let the right line AC of a known length be made perpendicular to AB, (by the preceding *ſcholium*): likewiſe draw the right line CD perpendicular to CB, meeting the right line AB in D: then as DA : AC : : AC : AB. Wherefore, when DA and AC are given, AB will be found by the rule of three.

SCHOLIUM.

All the preceding operations depend on the equality of ſome angles of triangles, and on the ſimilarity of the triangles ariſing from that equality. And on the ſame principles depend innumerable other operations which a geometrician will find out of himſelf, as is very obvious. However, ſome of theſe operations require ſuch exactneſs in the work, and without it are ſo liable to errors, that, *cæteris paribus*, the following operations, which are performed by a trigonometrical calculation, are to be preferred; yet could we not omit thoſe above, being moſt eaſy in practice, and moſt clear and evident to thoſe who have only the firſt elements of geometry. But if you are provided with inſtruments, the following operations are more to be relied upon. We do not inſiſt on the eaſieſt caſes to thoſe who are ſkilled in plain trigonometry, which is indeed neceſſary to any one who would apply himſelf to practice. See TRIGONOMETRY.

PROPOSITION X.

Fig. 13. *To deſcribe the conſtruction and uſe of the geometrical quadrant.*—The geometrical quadrant is the fourth part of a circle divided into 90 degrees, to which two ſights are adapted, with a perpendicular or plumb-line hanging from the centre. The general uſe of it is for inveſtigating angles in a vertical plane, comprehended under right lines going from the centre of the inſtrument, one of which is horizontal, and the other is directed to ſome viſible point. This inſtrument is made of any ſolid matter, as wood, copper, *&c.*

PROPOSITION XI.

Fig. 14. *To deſcribe and make uſe of the graphometer.*—The graphometer is a ſemicircle made of any hard matter, of wood, for example, or braſs, divided into 180 degrees; ſo fixed on a *fulcrum*, by means of a braſs ball and ſocket, that it eaſily turns about, and retains any ſituation; two ſights are fixed on its diameter. At the centre there is commonly a magnetical needle in a box. There is likewiſe a moveable ruler, which turns round the centre, and retains any ſituation given it. The uſe of it is to obſerve any angle, whoſe vertex is at the centre of the inſtrument in any plane, (though it is moſt commonly horizontal, or nearly ſo), and to find how many degrees it contains.

PROPOSITION XII.

Fig. 15. and 16. *To deſcribe the manner in which angles are meaſured by a quadrant or graphometer.*—Let there be an angle in a vertical plane, comprehended between a line parallel to the horizon HK, and the right line RA, coming from any remarkable point of a tower or hill, or from the ſun, moon, or a ſtar. Suppoſe that this angle RAH is to be meaſured by the quadrant: let the inſtrument be placed in the vertical plane, ſo as that the centre A may be in the angular point: and let the ſights be directed towards the object at R, (by the help of the ray coming from it, if it be the ſun or moon, or by the help of the viſual ray, if it is any thing elſe), the degrees and minutes in the arc BC cut off by the perpendicular, will meaſure the angle RAH required. For, from the make of the quadrant, BAD is a right angle; therefore BAR is likewiſe right, being equal to it. But, becauſe HK is horizontal, and AC perpendicular, HAC will be a right angle; and therefore equal alſo to BAR. From thoſe angles ſubtract the part HAB that is common to both; and there will remain the angle BAC equal to the angle RAH. But the arc BC is the meaſure of the angle BAC; conſequently, it is likewiſe the meaſure of the angle RAH.

Note, That the remaining arc on the quadrant DC is the meaſure of the angle RAZ, comprehended between the foreſaid right line RA and AZ which points to the zenith.

Let it now be required to meaſure the angle ACB (fig. 16.) in any plane, comprehended between the right lines AC and BC, drawn from two points A and B, to the place of ſtation C. Let the graphometer be placed at C, ſupported by its *fulcrum* (as was ſhown above); and let the immoveable ſights on the ſide of the inſtrument DE be directed towards the point A; and likewiſe (while the inſtrument remains immoveable) let the ſights of the ruler FG (which is moveable about the centre C) be directed to the point B. It is evident that the moveable ruler cuts off an arc DH, which is the meaſure of the angle ACB ſought.

Moreover,

Moreover, by the same method, the inclination of CE, or of FG, may be observed with the meridian line, which is pointed out by the magnetic needle inclosed in the box, and is moveable about the centre of the instrument, and the measure of this inclination or angle found in degrees.

PROPOSITION XIII.

FIG. 17. *To measure an accessible height by the geometrical quadrant.*—By the 12th prop. of this Part, let the angle C be found by means of the quadrant. Then in the triangle ABC, right-angled at B, (BC being supposed the horizontal distance of the observator from the tower), having the angle at C, and the side BC, the required height BA will be found by the 3d case of plain trigonometry. See TRIGONOMETRY.

PROPOSITION XIV.

FIG. 18. *To measure an inaccessible height by the geometrical quadrant.*—Let the angle ACB be observed with the quadrant (by the 12th prop. of this Part); then let the observer go from C to the second station D, in the right line BCD (provided BCD be a horizontal plane); and after measuring this distance CD, take the angle ADC likewise with the quadrant. Then, in the triangle ACD, there is given the angle ADC, with the angle ACD; becauſ ACB was given before: therefore (by art. 59. of Part I.) the remaining angle CAD is given likewise. But the side CD is likewise given, being the distance of the station C and D; therefore (by the first case of oblique-angled triangles in trigonometry) the side AC will be found. Wherefore, in the right-angled triangle ABC, all the angles and the hypothenuſe AC are given; consequently, by the fourth case of trigonometry, the height sought AB will be found; as also (if you please) the distance of the station C, from AB the perpendicular within the hill or inaccessible height.

PROPOSITION XV.

FIG. 19. *From the top of a given height, to measure the distance* BC.—Let the angle BAC be observed by the 12th prop. of this; wherefore in the triangle ABC, right-angled at B, there is given by observation the angle at A; whence (by the 59th art. of Part I.) there will also be given the angle BCA: moreover the side AB (being the height of the tower) is supposed to be given. Wherefore, by the 3d case of trigonometry, BC, the distance sought, will be found.

PROPOSITION XVI.

FIG. 20. *To measure the distance of two places* A *and* B, *of which one is accessible, by the graphometer.*—Let there be erected at two points A and C, sufficiently distant, two visible signs; then (by the 12th prop. of this Part) let the two angles BAC, BCA, be taken by the graphometer. Let the distance of the stations A and C be measured with a chain. Then the third angle B being known, and the side AC being likewise known; therefore, by the first case of trigonometry, the distance required, AB will be found.

PROPOSITION XVII.

FIG. 21. *To measure by the graphometer, the distance of two places, neither of which is accessible.*—Let two stations C and D be chosen, from each of which the places may be seen whose distance is sought; let the angles ACD, ACB, BCD, and likewise the angles BDC, BDA, CDA, be measured by the graphometer; let the distance of the stations C and D be measured by a chain, or (if it be necessary) by the preceding practice. Now, in the triangle ACD, there are given two angles ACD and ADC; therefore, the third CAD is likewise given; moreover the side CD is given; therefore, by the first case of trigonometry, the side AD will be found. After the same manner, in the triangle BCD, from all the angles and one side CD given, the side BD is found. Wherefore, in the triangle ADB, from the given sides DA and DB, and the angle ADB contained by them, the side AB (the distance sought) is found by the 4th case of trigonometry of oblique-angled triangles.

PROPOSITION XVIII.

FIG. 22. *It is required by the graphometer and quadrant, to measure an accessible height* AB, *placed so on a steep, that one can neither go near it in an horizontal plane, nor recede from it, as we supposed in the solution of the 14th prop.*—Let there be chosen any situation as C, and another D; where let some mark be erected: let the angles ACD and ADC be found by the graphometer; then the third angle DAC will be known. Let the side CD, the distance of the stations, be measured with a chain, and thence (by trigon.) the side AC will be found. Again, in the triangle ACB, right-angled at B, having found by the quadrant the angle ACB, the other angle CAB is known likewise: but the side AC in the triangle ADC is already known; therefore the height required AB will be found by the 4th case of right-angled triangles. If the height of the tower is wanted, the angle BCF will be found by the quadrant; which being taken from the angle ACB already known, the angle ACF will remain: but the angle FAC was known before; therefore the remaining angle AFC will be known. But the side AC was also known before; therefore, in the triangle AFC, all the angles and one of the sides AC being known, AF, the height of the tower above the hill, will be found by trigonometry.

SCHOLIUM.

It were easy to add many other methods of measuring heights and distances; but, if what is above be understood, it will be easy (especially for one that is versed in the elements) to contrive methods for this purpose, according to the occasion: so that there is no need of adding any more of this sort. We shall subjoin here a method by which the diameter of the earth may be found out.

PROPOSITION XIX.

FIG. 1. *To find the diameter of the earth from one observation.*—Let there be chosen a high hill AB, near the sea-shore, and let the observator on the top of it, with an exact quadrant divided into minutes and seconds by transverse divisions, and fitted with a telescope in place of the common sights, measure the angle ABE contained under the right line AB, which goes to the centre, and the right line BE drawn to the sea, a tangent to the globe at E; let there be drawn from A perpendicular to BD, the line AF meeting BE in F. Now in the right-angled triangle BAF all the angles are given, also the side AB, the height of the hill; which is to be found by some of the foregoing methods, as exactly as possible; and (by trigonometry) the sides BF and AF are found. But, by cor. 36th 3. Eucl. *Geometry Plate, n° IV.*

3. Eucl. AF is equal to FE; therefore BE will be known. Moreover, by 36th 3. Eucl. the rectangle under BA and BD is equal to the square of BE. And thence by 17th 6. Eucl. as AB : BE : : BE : BD. Therefore, since AB and BE are already given, BD will be found by 11th 6. Eucl. or by the rule of three; and subtracting BA, there will remain AD the diameter of the earth sought.

SCHOLIUM.

Many other methods might be propoſed for meaſuring the diameter of the earth. The moſt exact is that propoſed by Mr Picart of the academy of ſciences at Paris.

"According to Mr Picart, a degree of the meridian "at the latitude of 49° 21', was 57,060 French toiſes, "each of which contains ſix feet of the ſame meaſure: from which it follows, that, if the earth be an "exact ſphere, the circumference of a great circle of "it will be 123,249,600 Paris feet, and the ſemidiameter of the earth 19,615,800 feet: but the French "mathematicians, who of late have examined Mr Picart's operations, aſſure us, that the degree in that "latitude is 57,183 toiſes. They meaſured a degree "in Lapland, in the latitude of 66° 20', and found it "of 57,438 toiſes. By comparing theſe degrees, as "well as by the obſervations on pendulums, and the "theory of gravity, it appears that the earth is an "oblate ſpheroid; and (ſuppoſing thoſe degrees to be "accurately meaſured) the axis or diameter that paſſes through the poles will be to the diameter of the "equator, as 177 to 178, or the earth will be 22 miles "higher at the equator than at the poles. A degree "has likewiſe been meaſured at the equator, and found "to be conſiderably leſs than at the latitude of Paris; "which confirms the oblate figure of the earth. But "an account of this laſt menſuration has not been puBliſhed as yet. If the earth was of an uniform den"ſity from the ſurface to the centre, then, according "to the theory of gravity, the meridian would be an "exact ellipſis, and the axis would be to the diameter "of the equator as 230 to 231; and the difference of "the ſemidiameter of the equator and ſemiaxis about "17 miles."

In what follows, a figure is often to be laid down on paper, like to another figure given; and becauſe this likeneſs conſiſts in the equality of their angles, and in the ſides having the ſame proportion to each other (by the definitions of the 6th of Eucl.) we are now to ſhew what methods practical geometricians uſe for making on paper an angle equal to a given angle, and how they conſtitute the ſides in the ſame proportion. For this purpoſe they make uſe of a protractor, (or, when it is wanting, a line of chords), and of a line of equal parts.

PROPOSITION XX.

FIG. 2. 3. 4. 5. and 6. *To deſcribe the conſtruction and uſe of the protractor, of the line of chords, and of the line of equal parts.* The protractor is a ſmall ſemicircle of braſs, or ſuch ſolid matter. The ſemicircumference is divided into 180 degrees. The uſe of it is, to draw angles on any plane, as on paper, or to examine the extent of angles already laid down. For this laſt purpoſe, let the ſmall point in the centre of the protractor be placed above the angular point, and let the ſide AB coincide with one of the ſides that contain the angle propoſed; the number of degrees cut off by the other ſide, computing on the protractor from B, will ſhow the quantity of the angle that is to be meaſured.

But if an angle is to be made of a given quantity on a given line, and at a given point of that line, let AB coincide with the given line, and let the centre A of the inſtrument be applied to that point. Then let there be a mark made at the given number of degrees; and a right line drawn from that mark to the given point, will conſtitute an angle with the given right line of the quantity required; as is manifeſt.

This is the moſt natural and eaſy method, either for examining the extent of an angle on paper, or for deſcribing on paper an angle of a given quantity.

But when there is ſcarcity of inſtruments, or becauſe a line of chords is more eaſily carried about, (being deſcribed on a ruler on which there are many other lines beſides), practical geometricians frequently make uſe of it. It is made thus: let the quadrant of a circle be divided into 90 degrees; (as in fig. 4.) The line AB is the chord of 90 degrees; the chord of every arc of the quadrant is transferred to this line AB, which is always marked with the number of degrees in the correſponding arc.

Note, that the chord of 60 degrees is equal to the radius, by corol. 15. 4th Eucl. If now a given angle EDF is to be meaſured by the line of chords from the centre D, with the diſtance DG, (the chord of 60 degrees), deſcribe the arch GF; and let the points G and F be marked where this arch interſects the ſides of the angle. Then if the diſtance GF, applied on the line of chords from A to B, gives (for example) 25 degrees, this ſhall be the meaſure of the angle propoſed.

When an obtuſe angle is to be meaſured with this line, let its complement to a ſemicircle be meaſured, and thence it will be known. It were eaſy to tranſfer to the diameter of a circle the chords of all arches to the extent of a ſemicircle; but ſuch are rarely found marked upon rules.

But now, if an angle of a given quantity, ſuppoſe of 50 degrees, is to be made at a given point M of the right line KL (fig. 6.) From the centre M, and the diſtance MN, equal to the chord of 60 degrees, deſcribe the arc QN. Take off an arc NR, whoſe chord is equal to that of 50 degrees on the line of chords; join the points M and R; and it is plain that MR ſhall contain an angle of 50 degrees with the line KL propoſed.

But ſometimes we cannot produce the ſides, till they be of the length of a chord of 60 degrees on our ſcale; in which caſe it is fit to work by a circle of proportions (that is a ſector), by which an arc may be made of a given number of degrees to any radius.

The quantities of angles are likewiſe determined by other lines uſually marked upon rules, as the lines of ſines, tangents, and ſecants; but, as theſe methods are not ſo eaſy or ſo proper in this place, we omit them.

To delineate figures ſimilar or like to others given, beſides the equality of the angles, the ſame proportion is to be preſerved among the ſides of the figure that is to be delineated, as is among the ſides of the figures given. For which purpoſe, on the rules uſed by artiſts, there

there is a line divided into equal parts, more or less in number, and greater or lesser in quantity, according to the pleasure of the maker.

A foot is divided into inches; and an inch, by means of transverse lines, into 100 equal parts; so that with this scale, any number of inches, below 12, with any part of an inch, can be taken by the compasses, providing such part be greater than the one 100th part of an inch. And this exactness is very necessary in delineating the plans of houses, and in other cases.

PROPOSITION XXI.

FIG. 7. *To lay down on paper, by the protractor or line of chords, and line of equal parts, a right-lined figure like to one given, providing the angles and sides of the figure given be known by observation or mensuration.* For example, suppose that it is known that in a quadrangular figure, one side is of 235 feet, that the angle contained by it and the second side is of 84°, the second side of 288 feet, the angle contained by it and the third side of 72°, and that the third side is 294 feet. These things being given, a figure is to be drawn on paper like to this quadrangular figure. On your paper at a proper point A, let a right line be drawn, upon which take 235 equal parts, as AB. The part representing a foot is taken greater or lesser, according as you would have your figure greater or less. In the adjoining figure, the 100th part of an inch is taken for a foot. And accordingly an inch divided into 100 parts, and annexed to the figure, is called a scale of 100 feet. Let there be made at the point B (by the preceding proposition) an angle ABC of 85°, and let BC be taken of 288 parts like to the former. Then let the angle BCD be made of 72°, and the side CD of 294 equal parts. Then let the side AD be drawn; and it will compleat the figure like to the given. The measures of the angle A and D can be known by the protractor or line of chords, and the side AD by the line of equal parts; which will exactly answer to the corresponding angles and to the side of the primary figure.

After the very same manner, from the sides and angles given, which bound any right-lined figure, a figure like to it may be drawn, and the rest of its sides and angles be known.

COROLLARY.

Hence any trigonometrical problem in right-lined triangles, may be resolved by delineating the triangle from what is given concerning it, as in this proposition. The unknown sides are examined by a line of equal parts, and the angles by a protractor or line of chords.

PROPOSITION XXII.

The diameter of a circle being given, to find its circumference nearly.—The periphery of any polygon inscribed in the circle is less than the circumference, and the periphery of any polygon described about a circle is greater than the circumference. Whence Archimedes first discoved that the diameter was in proportion to the circumference, as 7 to 22 nearly; which serves for common use. But the moderns have computed the proportion of the diameter to the circumference to greater exactness. Supposing the diameter 100, the periphery will be more than 314, but less than 315. The diameter is more nearly to the circumference, as 113 to 355. But Ludolphus van Cuelen exceeded the labours of all; for by immense study he found, that, supposing the diameter 100,000,000,000,000,000,000,000,000,000,000,000, the periphery will be less than 314,159,265,358,979,323,846,264,338,327,951, but greater than 314,159,265,358,979,323,846,264,338,327,950; whence it will be easy, any part of the circumference being given in degrees and minutes, to assign it in parts of the diameter.

Of Surveying and Measuring of LAND.

HITHERTO we have treated of the measuring of angles and sides, whence it is abundantly easy to lay down a field, a plane, or an entire country: for to this nothing is requisite but the protraction of triangles, and of other plain figures, after having measured their sides and angles. But as this is esteemed an important part of practical geometry, we shall subjoin here an account of it with all possible brevity; suggesting withal, that a surveyor will improve himself more by one day's practice, than by a great deal of reading.

PROPOSITION XXIII.

To explain what surveying is, and what instruments Surveyors use.—First, it is necessary that the surveyor view the field that is to be measured, and investigate its sides and angles, by means of an iron chain (having a particular mark at each foot of length, or at any number of feet, as may be most convenient for reducing lines or surfaces to the received measures), and the graphometer described above. Secondly, It is necessary to delineate the field *in plano*, or to form a map of it; that is, to lay down on paper a figure similar to the field; which is done by the protractor (or line of chords) and of the line of equal parts. Thirdly, It is necessary to find out the area of the field so surveyed and represented by a map. Of this last we are to treat below.

The sides and angles of small fields are surveyed by the help of a plain table: which is generally of an oblong rectangular figure, and supported by a *fulcrum*, so as to turn every way by means of a ball and socket. It has a moveable frame, which surrounds the board, and serves to keep a clean paper put on the board close and tight to it. The sides of the frame facing the paper are divided into equal parts every way. The board hath besides a box with a magnetic needle, and moreover a large index with two sights. On the edge of the frame of the board are marked degrees and minutes, so as to supply the room of a graphometer.

PROPOSITION XXIV.

FIG. 8. *To delineate a field by the help of a plain-table, from one station whence all its angles may be seen and their distances measured by a chain.*—Let the field that is to be laid down be ABCDE. At any convenient place F, let the plain-table be erected; cover it with clean paper, in which let some point near the middle represent the station. Then applying at this place the index with the sights, direct it so as that through the sights some mark may be seen at one of the angles, suppose A; and from the point F, representing the station, draw a faint right line along the side of the index: then, by the help of the chain, let FA the distance

tance of the ſtation from the foreſaid angle be meaſured. Then taking what part you think convenient for a foot or pace from the line of equal parts, ſet off on the faint line the parts correſponding to the line FA that was meaſured; and let there be a mark made repreſenting the angle of the field A. Keeping the table immoveable, the ſame is to be done with the reſt of the angles; then right lines joining thoſe marks ſhall include a figure like to the field, as is evident from 5, 6. Eucl.

COROLLARY.

The ſame thing is done in like manner by the graphometer: for having obſerved in each of the triangles, AFB, BFC, CFD, *&c.* the angle at the ſtation F, and having meaſured the lines from the ſtation to the angles of the field, let ſimiliar triangles be protracted on paper (by the 21. prop. of this) having their common vertex in the point of ſtation. All the lines, excepting thoſe which repreſent the ſides of the field, are to be drawn faint or obſcure.

Note 1. When a ſurveyor wants to lay down a field let him place diſtinctly in a regiſter all the obſervations of the angles, and the meaſures of the ſides, until, at time and place convenient, he draw out the figure on paper.

Note 2. The obſervations made by the help of the graphometer are to be examined: for all the angles about the point F ought to be equal to four right ones. (by cor. 2. art. 30. of Part I.)

PROPOSITION XXV.

FIG. 9. *To lay down a field by means of two ſtations, from each of which all the angles can be ſeen, by meaſuring only the diſtance of the ſtations.*—Let the inſtrument be placed at the ſtation F: and having choſen a point repreſenting it upon the paper which is laid upon the plain table, let the index be applied at this point, ſo as to be moveable about it. Then let it be directed ſucceſſively to the ſeveral angles of the field: and when any angle is ſeen through the ſights, draw an obſcure line along the ſide of the index. Let the index, with the ſights, be directed after the ſame manner to the ſtation G: on the obſcure line drawn along its ſide, pointing to A, ſet off from the ſcale of equal parts a line correſponding to the meaſured diſtance of the ſtations, and this will determine the point G. Then remove the inſtrument to the ſtation G, and applying the index to the line repreſenting the diſtance of the ſtations, place the inſtrument ſo that the firſt ſtation may be ſeen through the ſights. Then the inſtrument remaining immoveable, let the index be applied at the point repreſenting the ſecond ſtation G, and be ſucceſſively directed by means of its ſights, to all the angles of the field, drawing (as before) obſcure lines: and the interſection of the two obſcure lines that were drawn to the ſame angle from the two ſtations will always repreſent that angle on the plan. Care muſt be taken that thoſe lines be not miſtaken for one another. Lines joining thoſe interſections will form a figure on the paper like to the field.

SCHOLIUM.

It will not be difficult to do the ſame by the graphometer, if you keep a diſtinct account of your obſervations of the angles made by the line joining the ſtations, and the lines drawn from the ſtations to the reſpective angles of the field. And this is the moſt common manner of laying down whole countries. The tops of two mountains are taken for two ſtations, and their diſtance is either meaſured by ſome of the methods mentioned above, or is taken according to common repute. The ſights are ſucceſſively directed towards cities, churches, villages, forts, lakes, turnings of rivers, woods, &c.

Note, The diſtance of the ſtations ought to be great enough, with reſpect to the field that is to be meaſured; ſuch ought to be choſen as are not in a line with any angle of the field. And care ought to be taken likewiſe that the angles, for example, FAG, FDG, &c. be neither very acute, nor very obtuſe. Such angles are to be avoided as much as poſſible; and this admonition is found very uſeful in practice.

PROPOSITION XXVI.

FIG. 10. *To lay down any field, however irregular its figure may be, by the help of the graphometer.*—Let ABCEDHG be ſuch a field. Let its angles (in going round it) be obſerved with a graphometer (by the 12. of this) and noted down; let its ſides be meaſured with a chain; and (by what was ſaid on the 21. of this) let a figure like to the given field be protracted on paper. If any mountain is in the circumference, the horizontal line hid under it is to be taken for a ſide, which may be found by two or three obſervations according to ſome of the methods deſcribed above; and its place on the map is to be diſtinguiſhed by a ſhade, that it may be known a mountain is there.

If not only the circumference of the field is to be laid down on the plan, but alſo its contents, as villages, gardens, churches, public roads, we muſt proceed in this manner.

Let there be (for example) a church F, to be laid down in the plan. Let the angles ABF BAF be obſerved and protracted on paper in their proper places, the interſection of the two ſides BF and AF will give the place of the church on the paper: or, more exactly, the lines BF AF being meaſured, let circles be deſcribed from the centres B and A, with parts from the ſcale correſponding to the diſtances BF and AF, and the place of the church will be at their interſection.

Note 1. While the angles obſerved by the graphometer are taken down, you muſt be careful to diſtinguiſh the external angles, as E and G, that they may be rightly protracted afterwards on paper.

Note 2. Our obſervations of the angles may be examined by computing if all the internal angles make twice as many right angles, four excepted, as there are ſides of the figure: (for this is demonſtrated by 32. 1. Eucl.) But in place of any external angle DEC, its complement to a circle is to be taken.

PROPOSITION XXVII.

FIG. 11. *To lay down a plain field without inſtruments.*—If a ſmall field is to be meaſured, and a map of it to be made, and you are not provided with inſtruments; let it be ſuppoſed to be divided into triangles, by right-lines, as in the figure; and after meaſuring the three ſides of any of the triangles, for example of ABC, let its ſides be laid down from a convenient ſcale on paper, (by the 22. of this.) Again, let the other two ſides BD CD of the triangle CBD be meaſured and protracted on the paper by the ſame

ſcale

ſcale as before. In the ſame manner proceed with the reſt of the triangles of which the field is compoſed, and the map of the field will be perfected; for the three ſides of a triangle determine the triangle; whence each triangle on the paper is ſimilar to its correſpondent triangle in the field, and is ſimilarly ſituated; conſequently the whole figure is like to the whole field.

SCHOLIUM.

If the field be ſmall, and all its angles may be ſeen from one ſtation, it may be very well laid down by the plain-table, (by the 24. of this.) If the field be larger, and have the requiſite conditions, and great exactneſs is not expected, it likewiſe may be plotted by means of the plain-table, or by the graphometer, (according to the 25. of this;) but in fields that are irregular and mountainous, when an exact map is required, we are to make uſe of the graphometer, (as in the 26. of this,) but rarely of the plain-table.

Having protracted the bounding lines, the particular parts contained within them may be laid down by the proper operations for this purpoſe, (delivered in the 26th propoſition; and the method deſcribed in the 27th propoſition may be ſometimes of ſervice;) for we may truſt more to the meaſuring of ſides, than to the obſerving of angles. We are not to compute four-ſided and many ſided figures till they are reſolved into triangles: for the ſides do not determine thoſe figures.

In the laying down of cities, or the like, we may make uſe of any of the methods deſcribed above that may be moſt convenient.

The map being finiſhed, it is transferred on clean paper, by putting the firſt ſketch above it, and marking the angles by the point of a ſmall needle. Theſe points being joined by right lines, and the whole illuminated by colours proper to each part, and the figure of the mariner's compaſs being added to diſtinguiſh the north and ſouth, with a ſcale on the margin, the map or plan will be finiſhed and neat.

We have thus briefly and plainly treated of ſurveying, and ſhown by what inſtruments it is performed; having avoided thoſe methods which depend on the magnetic needle, not only becauſe its direction may vary in different places of a field (the contrary of this at leaſt doth not appear,) but becauſe the quantity of an angle obſerved by it cannot be exactly known; for an error of two or three degrees can ſcarcely be avoided in taking angles by it.

As for the remaining part of ſurveying, whereby the area of a field already laid down on paper is found in acres, roods, or any other ſuperficial meaſures; this we leave to the following ſection, which treats of the menſuration of ſurfaces.

" Beſides the inſtruments deſcribed above, a ſurveyor ought to be provided with an off-ſet ſtaff equal " in length to 10 links of the chain, and divided into " 10 equal parts. He ought likewiſe to have 10 arrows or ſmall ſtraight ſticks near two feet long, ſhod " with iron ferrils. When the chain is firſt opened, " it ought to be examined by the off-ſet ſtaff. In " meaſuring any line, the leader of the chain is to " have the 10 arrows at firſt ſetting out. When the " chain is ſtretched in the line, and the near end " touches the place from which you meaſure, the " leader ſticks one of the 10 arrows in the ground, at " the far end of the chain. Then the leader leaving " the arrow, proceeds with the chain another length; " and the chain being ſtretched in the line, ſo that the " near end touches the firſt arrow, the leader ſticks " down another arrow at his end of the chain. The " line is preſerved ſtraight, if the arrows be always " ſet ſo as to be in a right line with the place you " meaſure from, and that to which you are going. " In this manner they proceed till the leader have no " more arrows. At the eleventh chain, the arrows " are to be carried to him again, and he is to ſtick " one of them into the ground, at the end of the chain. " And the ſame is to be done at the 21. 31. 41. *&c.* " chains, if there are ſo many in a right line to be " meaſured. In this manner you can hardly commit " an error in numbering the chains, unleſs of 10 chains " at once.

" The off-ſet ſtaff ſerves for meaſuring readily the " diſtances of any things proper to be repreſented in " your plan, from the ſtation-line while you go along. " Theſe diſtances ought to be entered into your field-" book, with the correſponding diſtances from the laſt " ſtation, and proper remarks, that you may be enabled to plot them juſtly, and be in no danger of " miſtaking one for another when you extend your " plan. The field-book may be conveniently divided " into five columns. In the middle column the angles " at the ſeveral ſtations taken by the theodolite are to " be entered, with the diſtances from the ſtations. The " diſtances taken by the off-ſet ſtaff, on either ſide of " the ſtation-line, are to be entered into columns on " either ſide of the middle column, according to their " poſition with reſpect to that line. The names " and characters of the objects, with proper re-" marks, may be entered in columns on either ſide of " theſe laſt.

" Becauſe, in the place of the graphometer deſcribed by our author, ſurveyors now make uſe of the " theodolite, we ſhall ſubjoin a deſcription of Mr Siſſon's lateſt improved theodolite from Mr Gardner's " practical ſurveying improved. See a figure of it in " the IVth Plate.

" In this inſtrument, the three ſtaffs, by braſs ferrils at top, ſcrew into bell-metal joints, that are " moveable between braſs pillars, fixed in a ſtrong " braſs plate; in which, round the centre, is fixed a " ſocket with a ball moveable in it, and upon which " the four ſcrews preſs, that ſet the limb horizontal: " Next above is another ſuch plate, through which the " ſaid ſcrews paſs, and on which, round the centre, " is fixed a fruſtum of a cone of bell-metal, whoſe axis " (being connected with the centre of the bell) is " always perpendicular to the limb, by means of a " conical braſs ferril fitted to it, whereon is fixed " the compaſs-box; and on it the limb, which is a " ſtrong bell-metal ring, whereon are moveable three " braſs indexes; in whoſe plate are fixed four braſs " pillars, that, joining at top, hold the centre pin " of the bell-metal double ſextant, whoſe double in-" dex is fixed on the centre of the ſame plate: " Within the double ſextant is fixed the ſpirit-level,

" and over it the telescope.

" The compass-box is graved with two diamonds " for north and south, and with 20 degrees on both " sides of each, that the needle may be set to the " variation, and its error also known.

" The limb has two *fleurs de luce* against the dia- " monds in the box, instead of 180 each, and is cu- " riously divided into whole degrees, and numbered " to the left hand at every 10 to twice 180, having " three indexes distant 120, (with Nonius's divisions " on each for the decimals of a degree,) that are " moved by a pinion fixed below one of them, with- " out moving the limb; and in another is a screw " and spring under, to fix it to any part of the limb. " It has also divisions numbered, for taking the quar- " ter girt in inches of round timber at the middle " height, when standing 10 feet horizontally distant " from its centre; which at 20 must be doubled, and " at 30 tripled; to which a shorter index is used, ha- " ving Nonius's divisions for the decimals of an inch; " but an abatement must be made for the bark, if not " taken off.

" The double sextant is divided on one side from " under its centre (when the spirit-tube and telescope " are level) to above 60 degrees each way, and num- " bered at 10, 20, *&c.* and the double index (through " which it is moveable) shews on the same side the de- " gree and decimal of any altitude or depression to that " extent by Nonius's divisions: On the other side are " divisions numbered, for taking the upright height " of timber, *&c.* in feet, when distant 10 feet; which " at 20 must be doubled, and at 30 tripled; and also " the quantities for reducing hypothenusal lines to ho- " rizontal. It is moveable by a pinion fixed in the " double index.

" The telescope is a little shorter than the diameter " of the limb, that a fall may not hurt it; yet it will " magnify as much, and shew a distant object as per- " fect, as most of triple its length. In its focus are " very fine cross wires, whose intersection is in the " plane of the double sextant; and this was a whole " circle, and turned in a lathe to a true plane, and is " fixed at right angles to the limb; so that, when- " ever the limb is set horizontal, (which is readily " done by making the spirit-tube level over two screws, " and the like over the other two,) the double sex- " tant and telescope are moveable in a vertical plane; " and then every angle taken on the limb (though the " telescope be never so much elevated or depressed) " will be an angle in the plane of the horizon. And " this is absolutely necessary in plotting a horizontal " plane.

" If the lands to be plotted are hilly, and not in a- " ny one plane, the lines measured cannot be truly " laid down on paper, without being reduced to one " plane, which must be the horizontal, because angles " are taken in that plane.—

" In viewing your objects, if they have much alti- " tude or depression, either write down the degree " and decimal shewn on the double sextant, or the " links shewn on the back side; which last subtracted " from every chain in the station-line, leaves the " length in the horizontal plane. But if the degree " is taken, the following table will shew the quantity.

A Table of the links to be subtracted out of every chain in hypothenusal lines of several degrees altitude, or depression, for reducing them to horizontal.

Degrees.	*Links.*	*Degrees.*	*Links.*	*Degrees.*	*Links.*
4,05	$\frac{1}{4}$	14,07	3	23,074	8
5,73	$\frac{1}{2}$	16,26	4	24,495	9
7,02	$\frac{3}{4}$	18,195	5	25,84	10
8,11	1	19,95	6	27,13	11
11,48	2	21,565	7	28,36	12

" Let the first station line really measure 1107 links, " and the angle of altitude or depression be 19°, 95: " looking in the table you will find against 19°, 95, is " 6 links. Now 6 times 11 is 66, which subtracted " from 1107, leaves 1041, the true length to be laid " down in the plan.

" It is useful in surveying, to take the angles, which " the bounding lines form, with the magnetic needle, " in order to check the angles of the figure, and to " plot them conveniently afterwards."

Of the Surfaces of Bodies.

THE smallest superficial measure with us is a square inch; 144 of which make a square foot. Wrights make use of these in the measuring of deals and planks; but the square foot which the glaziers use in measuring of glass, consists only of 64 square inches. The other measures are, first, the ell square; secondly, the fall, containing 36 square ells; thirdly, the rood, containing 40 falls; fourthly, the acre, containing 4 roods. Slaters, masons, and pavers, use the ell square and the fall; surveyors of land use the square ell, the fall, the rood, and the acre.

The superficial measures of the English are, first, the square foot; secondly, the square yard, containing 9 square feet, for their yard contains only 3 feet; thirdly, the pole, containing $30\frac{1}{4}$ square yards; fourthly, the rood, containing 40 poles; fifthly, the acre, containing 4 roods. And hence it is easy to reduce our superficial measures to the English, or theirs to ours.

" In order to find the content of a field, it is most " convenient to measure the lines by the chains de- " scribed above, p. 9. that of 22 yards for comput- " ing the English acres, and that of 24 Scots ells for " the acres of Scotland. The chain is divided into " 100 links, and the square of the chain is 10,000 " square links; 10 squares of the chain, or 100,000 " square links, give an acre. Therefore, if the area " be expressed by square links, divide by 100,000, or " cut off five decimal places, and the quotient shall " give the area in acres and decimals of an acre. " Write the entire acres apart; but multiply the de- " cimals of an acre by 4, and the product shall give " the remainder of the area in roods and decimals of " a rood. Let the entire roods be noted apart after " the acres; then multiply the decimals of a rood by " 40, and the product shall give the remainder of the " area in falls or poles. Let the entire falls or poles " be then writ after the roods, and multiply the deci- " mals of a fall by 36, if the area is required in the " measures of Scotland; but multiply the decimals of " a pole by $30\frac{1}{4}$, if the area is required in the measures " of England, and the product shall give the remain- " der of the area in square ells in the former case, but

" in

" in square yards in the latter. If, in the former case, " you would reduce the decimals of the square ell to " square feet, multiply them by 9.50694; but, in the lat- " ter case, the decimals of the English square yard are " reduced to square feet, by multiplying them by 9.

" Suppose, for example, that the area appears to " contain 12.65842 square links of the chain of 24 " ells; and that this area is to be expressed in acres, " roods, falls, *&c.* of the measures of Scotland. Di- " vide the square links by 100,000, and the quotient " 12.65842 shows the area to contain 12 acres $\frac{6}{10}\frac{6}{00}\frac{4}{00}\frac{2}{00}$ " of an acre. Multiply the decimal part by 4, and " the product 2.63368 gives the remainder in roods " and decimals of a rood. Those decimals of the " rood being multiplied by 40, the product gives " 25.3472 falls. Multiply the decimals of the fall by " 36, and the product gives 12.4992 square ells. " The decimals of the square ell multiplied by 9.50994 " give 4.7458 square feet. Therefore the area pro- " posed amounts to 12 acres, 2 roods, 25 falls, 12 " square ells, and $4\frac{7}{10}\frac{4}{00}\frac{5}{00}\frac{8}{00}$ square feet.

" But if the area contains the same number of " square links of Gunter's chain, and is to be expressed " by English measures, the acres and roods are com- " puted in the same manner as in the former case. " The poles are computed as the falls. But the deci- " mals of the pole, *viz.* $\frac{2}{10}\frac{7}{00}\frac{2}{00}$, are to be multiplied " by $30\frac{1}{4}$ (or 30.25), and the product gives 10.5028 " square yards. The decimals of the square yard, " multiplied by 9, give 4.5252 square feet; there- " fore, in this case, the area is in English measure 12 " acres, 2 roods, 25 poles, 10 square yards, and " $4\frac{5}{10}\frac{2}{00}\frac{5}{00}\frac{2}{00}$ square feet.

" The Scots acre is to the English acre, by statute, " as 100,000 to 78,694, if we have regard to the dif- " ference betwixt the Scots and English foot above " mentioned. But it is customary in some parts of " England to have 18,21, *&c.* feet to a pole, and " 160 such poles to an acre; whereas, by the statute, " $16\frac{1}{2}$ feet make a pole. In such cases the acre is " greater in the duplicate ratio of the number of feet " to a pole.

" They who measure land in Scotland by an ell of " 37 English inches, make the acre less than the true " Scots acre by $593\frac{6}{10}$ square English feet, or by a- " bout $\frac{1}{10}$ of the acre.

" An husband-land contains 6 acres of sock and " sythe-land, that is, of land that may be tilled with " a plough, and mown with a sythe; 13 acres of " arable land make an oxgang or oxengate; four " oxengate make a pound-land of old extent (by a de- " cree of the Exchequer, March 11. 1585), and is " called *librata terræ*. A forty-shilling land of old ex- " tent contains eight oxgang, or 104 acres.

" The arpent, about Paris, contains 32400 square " Paris feet, and is equal to $2\frac{1}{2}$ Scots roods, or $3\frac{1}{10}\frac{7}{00}$ " English roods.

" The *actus quadratus*, according to Varro, Collu- " mella, *&c.* was a square of 120 Roman feet. The " *jugerum* was the double of this. It is to the Scots " acre as 10,000 to 20,456, and to the English acre " as 10,000 to 16,097. It was divided (like the *as*) " into 12 *unciæ*, and the *uncia* into 24 *scrupula*."— This, with the three preceding paragraphs, are taken from an ingenious manuscript, written by Sir Robert Stewart professor of natural philosophy. The greatest part of the table in p. 9, 10. was taken from it likewise.

PROPOSITION XXVIII.

FIG. 12. *To find out the area of a rectangular parallelogram* ABCD.—Let the side AB, for example, be 5 feet long, and BC (which constitutes with BA a right angle at B) be 17 feet. Let 17 be multiplied by 5, and the product 85 will be the number of square feet in the area of the figure ABCD. But if the parallelogram proposed is not rectangular as BEFC, its base BC multiplied into its perpendicular height AB (not into its side BE) will give its area. This is evident from art. 68. of Part I.

PROPOSITION XXIX.

FIG. 13. *To find the area of a given triangle.*—Let the triangle BAC be given, whose base BC is supposed 9 feet long: let the perpendicular AD be drawn from the angle A opposite to the base, and let us suppose AD to be 4 feet. Let the half of the perpendicular be multiplied into the base, or the half of the base into the perpendicular, or take the half of the product of the whole base into the perpendicular, the product gives 18 square feet for the area of the given triangle.

But if only the sides are given, the perpendicular is found either by protracting the triangle, or by 12th and 13th 2. Eucl. or by trigonometry. But how the area of a triangle may be found from the given sides only, shall be shewn in the 31st proposition.

PROPOSITION XXX.

FIG. 14. *To find the area of any rectilineal figure.*—If the figure be irregular, let it be resolved into triangles; and drawing perpendiculars to the bases in each of them, let the area of each triangle be found by the preceding proposition, and the sum of these areas will give the area of the figure.

SCHOLIUM 1.

In measuring boards, planks, and glass, their sides are to be measured by a foot-rule divided into 100 equal parts; and after multiplying the sides, the decimal fractions are easily reduced to lesser denominations. The mensuration of these is easy, when they are rectangular parallelograms.

SCHOLIUM 2.

If a field is to be measured, let it first be plotted on paper, by some of the methods above described, and let the figure so laid down be divided into triangles, as was shown in the preceding proposition.

The base of any triangle, or the perpendicular upon the base, or the distance of any two points of the field, is measured by applying it to the scale according to which the map is drawn.

SCHOLIUM 3.

But if the field given be not in a horizontal plane, but uneven and mountainous, the scale gives the horizontal line between any two points, but not their distance measured on the uneven surface of the field. And indeed it would appear, that the horizontal plane is to be accounted the area of an uneven and hilly country. For if such ground is laid out for building on, or for planting with trees, or bearing corn, since these stand perpendicular to the horizon, it is plain, that a mountainous country cannot be considered as of greater extent for those uses than the horizontal

plane; nay, perhaps, for nourishing of plants, the horizontal plane may be preferable.

If, however, the area of a figure, as it lies regularly on the surface of the earth, is to be measured, this may be easily done by resolving it into triangles as it lies. The sum of their areas will be the area sought; which exceeds the area of the horizontal figure more or less, according as the field is more or less uneven.

PROPOSITION XXXI.

FIG. 13. *The sides of a triangle being given, to find the area, without finding the perpendicular.*—Let all the sides of the triangle be collected into one sum; from the half of which let the sides be separately subtracted, that three differences may be found betwixt the foresaid half sum and each side; then let these three differences and the half sum be multiplied into one another, and the square root of the product will give the area of the triangle. For example, let the sides be 10, 17, 21; the half of their sum is 24; the three differences betwixt this half sum and the three sides, are 14, 7, and 3. The first being multiplied by the second, and their product by the third, we have 294 for the product of the differences; which multiplied by the foresaid half sum 24, gives 7056; the square root of which 84 is the area of the triangle. The demonstration of this, for the sake of brevity, we omit. It is to be found in several treatises, particularly in Clavius's Practical Geometry.

PROPOSITION XXXII.

FIG. 15. *The area of the ordinate figure* ABEFGH *in equal to the product of the half circumference of the polygon, multiplied into the perpendicular drawn from the centre of the circumscribed circle to the side of the polygon.*—For the ordinate figure can be resolved into as many equal triangles, as there are sides of the figure; and since each triangle is equal to the product of half the base into the perpendicular, it is evident that the sum of all the triangles together, that is the polygon, is equal to the product of half the sum of the bases (that is the half of the circumference of the polygon) into the common perpendicular height of the triangles drawn from the centre C to one of the sides; for example, to AB.

PROPOSITION XXXIII.

FIG. 16. *The area of a circle is found by multiplying the half of the periphery into the radius, or the half of the radius into the periphery.*—For a circle is not different from an ordinate or regular polygon of an infinite number of sides, and the common height of the triangles into which the polygon or circle may be supposed to be divided is the radius of the circle.

Were it worth while, it were easy to demonstrate accurately this proposition, by means of the inscribed and circumscribed figures, as is done in the 5th prop. of the treatise of Archimedes concerning the dimensions of the circle.

COROLLARY.

Hence also it appears, that the area of the sector ABCD is produced by multiplying the half of the arc into the radius, and likewise that the area of the segment of the circle ADC is found by subtracting from the area of the sector the area of the triangle ABC.

PROPOSITION XXXIV.

FIG. 17. *The circle is to the square of the diameter, as* 11 *to* 14 *nearly.*—For if the diameter AB be supposed to be 7, the circumference AHBK will be almost 22 (by the 22d prop. of this Part), and the area of the square DC will be 49; and, by the preceding prop. the area of the circle will be $38\frac{1}{2}$: therefore the square DC will be to the inscribed circle as 49 to $38\frac{1}{2}$, or as 98 to 77, that is, as 14 to 11. *Q. E. D.*

If greater exactness is required, you may proceed to any degree of accuracy: for the square DC is to the inscribed circle, as $1 \text{ to } 1-\frac{2}{4}+\frac{1}{5}-\frac{1}{7}+\frac{1}{9}-\frac{1}{11}+\frac{1}{13}$, *&c. in infinitum.*

"This series will be of no service for computing the "area of the circle accurately, without some further "artifice, because it converges at too slow a rate. "The area of the circle will be found exactly enough "for most purposes, by multiplying the square of the "diameter by 7854, and dividing by 10,000, or cutting off four decimal places from the product; for "the area of the circle is to the circumscribed square "nearly as 7854 to 10,000."

PROPOSITION XXXV.

FIG. 18. *To find the area of a given ellipse.*—Let ABCD be an ellipse, whose greater diameter is BD, and the lesser AC, bisecting the greater perpendicularly in E. Let a mean proportional HF be found (by 13th 6. Eucl.) between AC and BD, and (by the 33d of this) find the area of the circle described on the diameter HF. This area is equal to the area of the ellipse ABCD. For because, as BD to AC, so the square of BD to the square of HF, (by 2. cor. 20th 6. Eucl.): but (by the 2d 12. Eucl.) as the square of BD to the square of HF, so is the circle of the diameter BD to the circle of the diameter HF: therefore as BD to AC, so is the circle of the diameter BD to the circle of the diameter HF. And (by the 5th prop. of Archimedes of spheroids) as the greater diameter BD to the lesser AC, so is the circle of the diameter BD to the ellipse ABCD. Consequently (by the 11th 5. Eucl.) the circle of the diameter BD will have the same proportion to the circle of the diameter HF, and to the ellipse ABCD. Therefore, (by 9th 5. Eucl.) the area of the circle of the diameter HF will be equal to the area of the ellipse ABCD. *Q. E. D.*

SCHOLIUM.

From this and the two preceding propositions, a method is derived of finding the area of an ellipse. There are two ways: 1st, Say, as one is to the lesser diameter, so is the greater diameter to a fourth number, (which is found by the rule of three.) Then again say, as 14 to 11, so is the fourth number found to the area sought. But the second way is shorter. Multiply the lesser diameter into the greater, and the product by 11; then divide the whole product by 14, and the quotient will be the area sought of the ellipse. For example, Let the greater diameter be 10, and the lesser 7; by multiplying 10 by 7, the product is 70; and multiplying that by 11, it is 770; and dividing 770 by 14, the quotient will be 55, which is the area of the ellipse sought.

"The area of the ellipse will be found more accu- "rately, by multiplying the product of the two dia- "meters by 7854."

We

We shall add no more about other plain surfaces, whether rectilinear or curvilinear, which seldom occur in practice; but shall subjoin some propositions about measuring the surfaces of solids.

PROPOSITION XXXVI.

To measure the surface of any prism.—By the 14th definition of the 11th Eucl. a prism is contained by planes, of which two opposite sides (commonly called the bases) are plain rectilineal figures; which are either regular and ordinate, and measured by prop. 32. of this; or however irregular, and then they are measured by the 28th prop. The other sides are parallelograms, which are measured by prop. 28th; and the whole superficies of the prism consists of the sum of those taken altogether.

PROPOSITION XXXVII.

To measure the superficies of any pyramid.—Since its basis is a rectilineal figure, and the rest of the planes terminating in the top of the pyramid are triangles; these measured separately, and added together, give the surface of the pyramid required.

PROPOSITION. XXXVIII.

To measure the superficies of any regular body.—These bodies are called *regular*, which are bounded by equilateral and equiangular figures. The superficies of the tetraedon consists of four equal and equiangular triangles; the superficies of the hexaedron, or cube, of six equal squares; an octedron, of eight equal equilateral triangles; a dodecaedron, of twelve equal and ordinate pentagons; and the superficies of an icosiædron of twenty equal and equilateral triangles. Therefore it will be easy to measure these surfaces from what has been already shown.

In the same manner we may measure the superficies of a solid contained by any planes.

PROPOSITION XXXIX.

Fig. 19. *To measure the superficies of a cylinder.*—Because a cylinder differs very little from a prism, whose opposite planes (or bases) are ordinate figures of an infinite number of sides, it appears that the superficies of a cylinder, without the bases, is equal to an infinite number of parallelograms; the common altitude of all which is the same with the height of the cylinder, and the bases of them all differ very little from the periphery of the circle which is the base of the cylinder. Therefore this periphery multiplied into the common height, gives the superficies of the cylinder, excluding the bases; which are to be measured separately by the 33d proposition.

This proposition concerning the measure of the surface of the cylinder (excluding its basis) is evident from this, that when it is conceived to be spread out, it becomes a parallelogram, whose base is the periphery of the circle of the base of the cylinder stretched into a right line, and whose height is the same with the height of the cylinder.

PROPOSITION XL.

Fig. 20. *To measure the surface of a right cone.*—The surface of a right cone is very little different from the surface of a right pyramid, having an ordinate polygon for its base of an infinite number of sides; the surface of which (excluding the base) is equal to the sum of the triangles. The sum of the bases of these triangles is equal to the periphery of the circle of the base, and the common height of the triangles is the side of the cone AB; wherefore the sum of these triangles is equal to the product of the sum of the bases (*i. e.* the periphery of the base of the cone) multiplied into the half of the common height, or it is equal to the product of the periphery of the base.

If the area of the base is likewise wanted, it is to be found separately by the 33d prop. If the surface of a cone is supposed to be spread out on a plane, it will become a sector of a circle, whose radius is the side of the cone; and the arc terminating, the sector is made from the periphery of the base. Whence, by corol. 33d prop. of this, its dimension may be found.

COROLLARY.

Hence it will be easy to measure the surface of a *frustum* of a cone cut by a plane parallel to the base.

PROPOSITION XLI.

Fig. 21. *To measure the surface of a given sphere.*—Let there be a sphere, whose centre is A, and let the area of its convex surface be required. Archimedes demonstrates (37th prop. 1. book of the sphere and cylinder) that its surface is equal to the area of four great circles of the sphere; that is, let the area of the great circle be multiplied by 4, and the product will give the area of the sphere; or, (by the 20th 6. and 2d 12. of Eucl.) the area of the sphere given is equal to the area of a circle whose radius is the right line BC, the diameter of the sphere. Therefore having measured (by 33d prop.) the circle described with the radius BC, this will give the surface of the sphere.

PROPOSITION XLII.

Fig. 22. *To measure the surface of a segment of a sphere.*—Let there be a segment cut off by the plane ED. Archimedes demonstrates (49, and 50. 1. *De sphæra*) that the surface of this segment, excluding the circular base, is equal to the area of a circle whose radius is the right line BE drawn from the vertex B of the segment to the periphery of the circle DE. Therefore, (by the 33d prop.) it is easily measured.

COROLLARY 1.

Hence that part of the surface of a sphere that lieth between two parallel planes is easily measured, by subtracting the surface of the lesser segment from the surface of the greater segment.

COROLLARY 2.

Hence likewise it follows, that the surface of a cylinder, described about a sphere (excluding the basis) is equal to the surface of the sphere, and the parts of the one to the parts of the other, intercepted between planes parallel to the basis of the cylinder.

Of solid Figures and their Mensuration, comprehending likewise the Principles of Gauging Vessels of all Figures.

As in the former part of this treatise we took an inch for the smallest measure in length, and an inch square for the smallest superficial measure; so now, in treating of the mensuration of solids, we take a cubical inch for the smallest solid measure. Of these 109 make a Scots pint; other liquid measures depend on this, as is generally known.

In dry measures, the firlot, by statute, contains 19½ pints; and on this depend the other dry measures: therefore, if the content of any solid be given in cubical

bical inches, it will be eafy to reduce the fame to the common liquid or dry meafures, and converfely to reduce thefe to folid inches. The liquid and dry meafures, in ufe among other nations, are known from their writers.

" As to the Engliſh liquid meaſures, by act of parliament 1706, any round veſſel commonly called a *cylinder*, having an even bottom, being ſeven inches in diameter throughout, and ſix inches deep from the top of the inſide to the bottom, (which veſſel will be found by computation to contain 230 $\frac{9}{1000}$ cubical inches,) or any veſſel containing 231 cubical inches, and no more, is deemed to be a lawful wine-gallon. An Engliſh pint therefore contains 28$\frac{7}{8}$ cubical inches; 2 pints make a quart; 4 quarts a gallon; 18 gallons a roundlet; 3 roundlets and an half, or 63 gallons, make a hogſhead; the half of a hogſhead is a barrel; 1 hogſhead and a third, or 84 gallons, make a puncheon; 1 puncheon and a half, or 2 hogſheads, or 126 gallons, make a pipe or butt; the third part of a pipe, or 42 gallons, make a tierce; 2 pipes, or 3 puncheons, or 4 hogſheads, make a ton of wine. Though the Engliſh wine gallon is now fixed at 231 cubical inches, the ſtandard kept in Guildhall being meaſured, before many perſons of diſtinction, May 25. 1688, it was found to contain only 224 ſuch inches.

" In the Engliſh beer-meaſure, a gallon contains 282 cubical inches; conſequently 35$\frac{1}{4}$ cubical inches make a pint, 2 pints make a quart, 4 quarts make a gallon, 9 gallons a firkin, 4 firkins a barrel. In ale, 8 gallons make a firkin, and 32 gallons make a barrel. By an act of the firſt of William and Mary, 34 gallons is the barrel, both for beer and ale, in all places, except within the weekly bills of mortality.

" In Scotland it is known that 4 gills make a mutchkin, 2 matchkins make a chopin; a pint is two chopins; a quart is two pints; and a gallon is four quarts, or eight pints. The accounts of the cubical inches contained in the Scots pint vary conſiderably from each other. According to our author, it contains 109 cubical inches. But the ſtandard-jugs kept by the dean of guild of Edinburgh (one of which has the year 1555, with the arms of Scotland, and the town of Edinburgh, marked upon it) having been carefully meaſured ſeveral times, and by different perſons, the Scots pint, according to thoſe ſtandards, was found to contain about 103,$\frac{4}{10}$ cubic inches. The pewterers jugs (by which the veſſels in common uſe are made) are ſaid to contain ſometimes betwixt 105 and 106 cubic inches. A caſk that was meaſured by the brewers of Edinburgh, before the commiſſioners of exciſe in 1707, was found to contain 46$\frac{2}{8}$ Scots pints; the ſame veſſel contained 18$\frac{1}{8}$ Engliſh ale-gallons. Suppoſing this menſuration to be juſt, the Scots pint will be to the Engliſh ale-gallon as 289 to 750; and if the Engliſh ale-gallon be ſuppoſed to contain 282 cubical inches, the Scots pint will contain 108.664 cubical inches. But it is ſuſpected, on ſeveral grounds, that the experiment was not made with ſufficient care and exactneſs.

" The commiſſioners appointed by authority of parliament to ſettle the meaſures and weights, in their act of Feb. 19. 1618, relate, That having cauſed fill the Linlithgow firlot with water, they found that it contained 21$\frac{1}{2}$ pints of the juſt Stirling jug and meaſure. They likewiſe ordain that this ſhall be the juſt and only firlot; and add, *That the wideneſs and breadneſs of the which firlot, under and above even over within the buirds, ſhall contain nineteen inches and the ſixth part of an inch, and the deepneſs ſeven inches and a third part of an inch.* According to this act (ſuppoſing their experiment and computation to have been accurate) the pint contained only 99.56 cubical inches; for the content of ſuch a veſſel as is deſcribed in the act, is 2115.85, and this divided by 21$\frac{1}{2}$ gives 99.56. But, by the weight of water ſaid to fill this firlot in the ſame act, the meaſure of the pint agrees nearly with the Edinburgh ſtandard above mentioned.

" As for the Engliſh meaſures of corn, the Winchefter gallon contains 272$\frac{1}{2}$ cubical inches; 2 gallons make a peck; 4 pecks, or 8 gallons (that is, 2178 cubical inches) make a buſhel; and a quarter is 8 buſhels.

" Our author ſays, that 19$\frac{1}{2}$ Scots pints make a firlot. But this does not appear to be agreeable to the ſtatute above-mentioned, nor to the ſtandard-jugs. It may be conjectured that the proportion aſſigned by him has been deduced from ſome experiment of how many pints, according to common uſe, were contained in the firlot. For if we ſuppoſe thoſe pints to have been each of 108.664 cubical inches, according to the experiment made in the 1707 before the commiſſioners of exciſe, deſcribed above; then 19$\frac{1}{2}$ ſuch pints will amount to 2118.9$\frac{4}{8}$ cubical inches; which agrees nearly with 2115.85, the meaſure of the firlot by ſtatute above-mentioned. But it is probable, that in this he followed the act 1587, where it is ordained, That the wheat-firlot ſhall contain 19 pints and two joucattes. A wheat-firlot marked with the Linlithgow ſtamps being meaſured, was found to contain about 2211 cubical inches. By the ſtatute of 1618 the barley-firlot was to contain 31 pints of the juſt Stirling-jug.

" A Paris pint is 48 cubical Paris inches, and is nearly equal to an Engliſh wine-quart. The *Boiſſeau* contains 644.68099 Paris cubical inches, or 780.36 Engliſh cubical inches.

" The Roman *amphora* was a cubical Roman foot, the *congius* was the eighth part of the *amphora*, the *ſextarius* was one ſixth of the *congius*. They divided the *ſextarius* like the *as* or *libra*. Of dry meaſures, the *medimnus* was equal to two amphoras, that is, about 1$\frac{1}{2}$$\frac{1}{2}$ Engliſh legal buſhels; and the *modius* was the third part of the *amphora*."

PROPOSITION XLIII.

To find the ſolid content of a given priſm.—By the 29th prop. let the area of the baſe of the priſm be meaſured, and be multiplied by the height of the priſm, the product will give the ſolid content of the priſm.

PROPOSITION XLIV.

To find the ſolid content of a given pyramid.—The area of the baſe being found, (by the 30th prop.) let it be multiplied by the third part of the height of the pyramid, or the third part of the baſe by the height, the product will give the ſolid content, by 17th 12. Eucl.

COR-

COROLLARY.

If the solid content of a *fruſtum* of a pyramid is required, firſt let the ſolid content of the entire pyramid be found; from which ſubtract the ſolid content of the part that is wanting, and the ſolid content of the broken pyramid will remain.

PROPOSITION XLV.

To find the content of a given cylinder.—The area of the baſe being found by prop. 33. if it be a circle, and by prop. 35. if it be an ellipſe, (for in both caſes it is a cylinder), multiply it by the height of the cylinder, and the ſolid content of the cylinder will be produced.

COROLLARY.

FIG. 23. And in this manner may be meaſured the ſolid content of veſſels and caſks not much different from a cylinder, as ABCD. If towards the middle EF it be ſomewhat groſſer, the area of the circle of the baſe being found (by 33d prop.) and added to the area of the middle circle EF, and the half of their ſum (that is, an arithmetical mean between the area of the baſe and the area of the middle circle) taken for the baſe of the veſſel, and multiplied into its height, the ſolid content of the given veſſel will be produced.

Note, That the length of the veſſel, as well as the diameters of the baſe, and of the circle EF, ought to be taken within the ſtaves; for it is the ſolid content within the ſtaves that is ſought.

PROPOSITION XLVI.

To find the ſolid content of a given cone.—Let the area of the baſe (found by prop. 33.) be multiplied into $\frac{1}{3}$ of the height, the product will give the ſolid content of the cone; for by the 10th 12. Eucl. a cone is the third part of a cylinder that has the ſame baſe and height.

PROPOSITION XLVII.

FIG. 24. 25. *To find the ſolid content of a* fruſtum *of a cone cut by a plane parallel to the plane of the baſe.*—Firſt, let the height of the entire cone be found, and thence (by the preceding prop.) its ſolid content; from which ſubtract the ſolid content of the cone cut off at the top, there will remain the ſolid content of the *fruſtum* of the cone.

How the content of the entire cone may be found, appears thus: Let ABCD be the *fruſtum* of the cone (either right or ſcalenous, as in the figures 2. and 3.) let the cone ECD be ſuppoſed to be completed; let AG be drawn parallel to DE, and let AH and EF be perpendicular on CD; it will be (by 2d 6. Eucl.) as as CG : CA :: CD : CE; but (by art. 72. of Part. I.) as CA : AH :: CE : EF; conſequently (by 22d 5. Eucl.) as CG : AH :: CD : EF; that is, as the exceſs of the diameter of the leſſer baſe is to the height of the *fruſtum*, ſo is the diameter of the greater baſe to the height of the entire cone.

COROLLARY.

FIG. 26. Some caſks whoſe ſtaves are remarkably bended about the middle, and ſtrait towards the ends, may be taken for two portions of cones, without any conſiderable error. Thus ABEF is a *fruſtum* of a right cone, to whoſe baſe EF, on the other ſide, there is another ſimilar *fruſtum* of a cone joined, EDCF. The vertices of theſe cones, if they be ſuppoſed to be completed, will be found at G and H. Whence, (by the preceding propoſition) the ſolid content of ſuch veſſels may be found.

PROPOSITION XLVIII.

FIG. 27. A cylinder circumſcribed about a ſphere, that is, having its baſe equal to a great circle of the ſphere, and its height equal to the diameter of the ſphere, is to the ſphere as 3 to 2.

Let ABEC be the quadrant of a circle, and ABDC the circumſcribed ſquare; and likewiſe the triangle ADC; by the revolution of the figure about the right line AC, as axis, a hemiſphere will be generated by the quadrant, a cylinder of the ſame baſe and height by the ſquare, and a cone by the triangle. Let theſe three be cut any how by the plane HF, parallel to the baſe AB; the ſection in the cylinder will be a circle whoſe radius is FH, in the hemiſphere a circle of the radius EF, and in the cone a circle of the radius GF.

By (art. 69. of Part I.) EAq, or HFq=EFq and FAq taken together, (but AFq=FGq, becauſe AC=CD); therefore the circle of the radius FH is equal to a circle of the radius EF, together with a circle of the radius GF; and ſince this is true every where, all the circles together deſcribed by the reſpective *radii* HF (that is, the cylinder) are equal to all the circles deſcribed by the reſpective *radii* EF and FG (that is, to the hemiſphere and the cone taken together;) but, (by the 10th 12. Eucl.) the cone generated by the triangle DAC is one third part of the cylinder generated by the ſquare BC. Whence it follows, that the hemiſphere generated by the rotation of the quadrant ABEC is equal to the remaining two third parts of the cylinder, and that the whole ſphere is $\frac{2}{3}$ of the double cylinder circumſcribed about it.

This is that celebrated 39th prop. 1. book of Archimedes of the ſphere and cylinder; in which he determines the proportion of the cylinder to the ſphere inſcribed to be that of 3 to 2.

COROLLARY.

Hence it follows, that the ſphere is equal to a cone whoſe height is equal to the ſemidiameter of the ſphere, having for its baſe a circle equal to the ſuperficies of the ſphere, or to four great circles of the ſphere, or to a circle whoſe radius is equal to the diameter of the ſphere, (by prop. 41. of this.) And indeed a ſphere differs very little from the ſum of an infinite number of cones that have their baſes in the ſurface of the ſphere, and their common vertex in the centre of the ſphere; ſo that the ſuperficies of the ſphere, (of whoſe dimenſion ſee prop. 41. of this) multiplied into the third part of the ſemidiameter, gives the ſolid content of the ſphere.

PROPOSITION XLIX.

FIG. 28. *To find the ſolid content of a ſector of the ſphere.*—A ſpherical ſector ABC (as appears by the corollary of the preceding prop.) is very little different from an infinite number of cones, having their baſes in the ſuperficies of the ſphere BEC, and their common vertex in the centre. Wherefore the ſpherical ſuperficies BEC being found, (by prop. 42. of this,) and multiplied into the third part of AB the radius of the ſphere, the product will give the ſolid content of the ſector ABC.

COROLLARY.

It is evident how to find the ſolidity of a ſpherical ſegment

ſegment leſs than a hemiſphere, by ſubtracting the cone ABC from the ſector already found. But if the ſpherical ſegment be greater than a hemiſphere, the cone correſponding muſt be added to the ſector, to make the ſegment.

PROPOSITION L.

FIG. 29. *To find the ſolidity of the ſpheroid, and of its ſegments cut by planes perpendicular to the axis.*—In prop. 44. of this, it is ſhewn, that every where EH : EG :: CF : CD; but circles are as the ſquares deſcribed upon their rays, that is, the circle of the radius EH is to the circle of the radius EG, as CF*q* to CD*q*. And ſince it is ſo every where, all the circles deſcribed with the reſpective rays EH, (that is, the ſpheroid made by the rotation of the ſemi-ellipſis AFB around the axis AB,) will be to all the circles deſcribed by the reſpective *radii* EG, (that is, the ſphere deſcribed by the rotation of the ſemicircle ADB on the axis AB,) as FC*q* to CD*q*; that is, as the ſpheroid to the ſphere on the ſame axis, ſo is the ſquare of the other axis of the generating ellipſe to the ſquare of the axis of the ſphere.

And this holds, whether the ſpheroid be found by a revolution around the greater or leſſer axis.

COROLLARY 1.

Hence it appears, that the half of the ſpheroid, formed by the rotation of the ſpace AHFC around the axis AC, is double of the cone generated by the triangle AFC about the ſame axis; which is the 32d prop. of Archimedes of conoids and ſpheroids.

COROLLARY 2.

Hence, likewiſe, is evident the meaſure of ſegments of the ſpheroid cut by planes perpendicular to the axis. For the ſegment of the ſpheroid made by the rotation of the ſpace ANHE, round the axis AE, is to the ſegment of the ſphere having the ſame axis AC, and made by the rotation of the ſegment of the circle AMGE, as CF*q* to CD*q*.

But if the meaſure of this ſolid be wanted with leſs labour, by the 34th prop. of Archimedes of conoids and ſpheroids, it will be as BE to AC+EB; ſo is the cone generated by the rotation of the triangle AHE round the axis AE, to the ſegment of the ſphere made by the rotation of the ſpace ANHE round the ſame axis AE; which could eaſily be demonſtrated by the method of indiviſibles.

COROLLARY 3.

Hence it is eaſy to find the ſolid content of the ſegment of a ſphere or ſpheroid intercepted between two parallel planes, perpendicular to the axis. This agrees as well to the oblate as to the oblong ſpheroid; as is obvious.

COROLLARY 4.

FIG. 30. If a caſk is to be valued as the middle piece of an oblong ſpheroid, cut by the two planes DC and FG, at right angles to the axis: firſt, let the ſolid content of the half ſpheroid ABCED be meaſured by the preceding prop. from which let the ſolidity of the ſegment DEC be ſubtracted, and there will remain the ſegment ABCD; and this doubled will give the capacity of the caſk required.

The following method is generally made uſe of for finding the ſolid content of ſuch veſſels. The double area of the greateſt circle, that is, of that which is deſcribed by the diameter AB at the middle of the caſk, is added to the area of the circle at the end, that is, of the circle DC or FG (for they are uſually equal), and the third part of this ſum is taken for a mean baſe of the caſk; which therefore multiplied into the length of the caſk OP, gives the content of the veſſel required.

Sometimes veſſels have other figures, different from thoſe we have mentioned; the eaſy methods of meaſuring which may be learned from thoſe who practiſe this art. What hath already been delivered, is ſufficient for our purpoſe.

PROPOSITION LI.

FIG. 31. and 32. *To find how much is contained in a veſſel that is in part empty, whoſe axis is parallel to the horizon.*—Let AGBH be the great circle in the middle of the caſk, whoſe ſegment GBH is filled with liquor, the ſegment GAH being empty; the ſegment GBH is known, if the depth EB be known, and EH a mean proportional between the ſegments of the diameter AB and EB; which are found by a rod or ruler put into the veſſel at the orifice. Let the baſis of the caſk, at a medium, be found, which ſuppoſe to be the circle CKDL; and let the ſegment KCL be ſimilar to the ſegment GAH (which is either found by the rule of three, becauſe as the circle AGBH is to the circle CKDL, ſo is the ſegment GAH to the ſegment KCL; or is found from the tables of ſegments made by authors); and the product of this ſegment multiplied by the length of the caſk will give the liquid content remaining in the caſk.

PROPOSITION LII.

To find the ſolid content of a regular and ordinate body.—A tetraedon being a pyramid, the ſolid content is found by the 44th prop. The hexaedron, or cube, being a kind of priſm, it is meaſured by the 43d prop. An octaedron conſiſts of two pyramids of the ſame ſquare baſe and of equal heights; conſequently its meaſure is found by the 44th prop. A dodecaedron conſiſts of 12 pyramids having equal equilateral and equiangular pentagonal baſes; and ſo one of theſe being meaſured (by the 44th prop. of this) and multiplied by 12, the product will be equal to the ſolid content of the dodecaedron. The icoſiaedron conſiſts of 20 equal pyramids having triangular baſes; the ſolid content of one of which being found (by the 44th prop.) and multiplied by 20, gives the whole ſolid. The baſes and heights of theſe pyramids, if you want to proceed more exactly, may be found by trigonometry. See TRIGONOMETRY.

PROPOSITION LIII.

To find the ſolid content of a body however irregular.—Let the given body be immerſed into a veſſel of water, having the figure of a paralelopipedon or priſm, and let it be noted how much the water is raiſed upon the immerſion of the body. For it is plain, that the ſpace which the water fills, after the immerſion of the body, exceeds the ſpace filled before its immerſion, by a ſpace equal to the ſolid content of the body, however irregular. But when this exceſs is of the figure of a parallelopipedon or priſm, it is eaſily meaſured by the 43d prop. of this, *viz.* by multiplying the area of the baſe, or month of the veſſel, into the difference of the elevations of the water before and after

after immerſion: Whence is found the ſolid content of the body given.

In the ſame way the ſolid content of a part of a body may be found, by immerſing that part only in water.

There is no neceſſity to inſiſt here on diminiſhing or enlarging ſolid bodies in a given proportion. It will be eaſy to deduce theſe things from the 11th and 12th books of Euclid.

" The following rules are ſubjoined for the ready " computation of the contents of veſſels, and of any " ſolids in the meaſures in uſe in Great Britain.

" I. To find the content of a cylindric veſſel in Engliſh wine gallons, the diameter of the baſe and altitude of the veſſel being given in inches and decimals of an inch.

" Square the number of inches in the diameter of the veſſel; multiply this ſquare by the number of inches in the height: then multiply the product by the decimal fraction .0034; and this laſt product ſhall give the content in wine-gallons and decimals of ſuch a gallon. To expreſs the rule arithmetically; let D repreſent the number of inches and decimals of an inch in the diameter of the veſſel, and H the inches and decimals of an inch in the height of the veſſel; then the content in wine-gallons ſhall be $\text{DDH} \times \frac{14}{1\,0\,0\,0\,0}$, or DDHx.0034. *Ex.* Let the diameter D=51.2 inches, the height H=62.3 inches, then the content ſhall be $51.2 \times 51.2 \times 62.3 \times .0034 = 555.27.332$ wine-gallons. This rule follows from prop. 33. and 45. For, by the former, the area of the baſe of the veſſel is in ſquare inches DDx.7854; and by the latter, the content of the veſſel in ſolid inches is DDHx.7854; which divided by 231 (the number of cubical inches in a wine-gallon) gives DDHx.0034, the content in wine-gallons. But though the charges in the exciſe are made (by ſtatute) on the ſuppoſition that the wine-gallon contains 231 cubical inches; yet it is ſaid, that in ſale, 224 cubical inches, the content of the ſtandard meaſured at Guildhall (as was mentioned above), are allowed to be a wine-gallon.

" II. Suppoſing the Engliſh ale-gallon to contain 282 cubical inches, the content of a cylindric veſſel is computed in ſuch gallons, by multiplying the ſquare of the diameter of a veſſel by its height as formerly, and their product by the decimal fraction .0,027,851: that is, the ſolid content in ale-gallons is DDHx.0,027,851.

" III. Suppoſing the Scots pint to contain about 103.4 cubical inches, (which is the meaſure given by the ſtandards at Edinburgh, according to experiments mentioned above), the content of a cylindric veſſel is computed in Scots pints, by multiplying the ſquare of the diameter of the veſſel by its height, and the product of theſe by the decimal fraction .0076. Or the content of ſuch a veſſel in Scots pints is DDHx.0076.

" Suppoſing the Wincheſter buſhel to contain 2187 cubical inches, the content of a cylindric veſſel is computed in thoſe buſhels by multiplying the ſquare of the diameter of the veſſel by the height, and the product by the decimal fraction .0,003,606. But the ſtandard buſhel having been meaſured by Mr Everard and others in 1696, it was found to contain only 2145.6 ſolid inches; and therefore it was enacted in the act for laying a duty upon malt, *That every round buſhel, with a plain and even bottom, being 18½ inches diameter throughout, and 8 inches deep, ſhould be eſteemed a legal* Wincheſter *buſhel.* According to this act (ratified in the firſt year of queen Anne) the legal Wincheſter buſhel contains only 2150.42 ſolid inches. And the content of a cylindric veſſel is computed in ſuch buſhels, by multiplying the ſquare of the diameter by the height, and their product by the decimal fraction .0,003,625. Or the content of the veſſel in thoſe buſhels is DDHx.0,003,625.

" V. Suppoſing the Scots wheat-firlot to contain 21½ Scots pints, (as is appointed by the ſtatute 1618), and the pint to be conform to the Edinburgh ſtandards above mentioned, the content of a cylindric veſſel in ſuch firlots is computed by multiplying the ſquare of the diameter by the height, and their product by the decimal fraction .00,3358. This firlot, in 1426, is appointed to contain 17 pints; in 1457, it was appointed to contain 18 pints; in 1587, it is 19½ pints; in 1628, it is 21¼ pints: and though this laſt ſtatute appears to have been founded on wrong computations in ſeveral reſpects, yet this part of the act that relates to the number of pints in the firlot ſeems to be the leaſt exceptionable; and therefore we ſuppoſe the firlot to contain 21½ pints of the Edinburgh ſtandard, or about 2197 cubical inches; which a little exceeds the Wincheſter buſhel, from which it may have been originally copied.

" VI. Suppoſing the bear-firlot to contain 31 Scots pints, (according to the ſtatute 1618), and the pint conform to the Edinburgh ſtandards, the content of a cylindric veſſel in ſuch firlots is found by multiplying the ſquare of the diameter by the height, and this product by .000245.

" When the ſection of the veſſel is not a circle, but an ellipſis, the product of the greateſt diameter by the leaſt, is to be ſubſtituted in thoſe rules for the ſquare of the diameter.

" VII. To compute the content of a veſſel that may be conſidered as a *fruſtum* of a cone in any of thoſe meaſures.

" Let A repreſent the number of inches in the diameter of the greater baſe, B the number of inches in the diameter of the leſſer baſe. Compute the ſquare of A, the product of A multiplied by B, and the ſquare of B, and collect theſe into a ſum. Then find the third part of this ſum, and ſubſtitute it in the preceding rules in the place of the ſquare of the diameter; and proceed in all other reſpects as before. Thus, for example, the content in wine-gallons in $\text{AA} \times \text{AB} \times \text{BB} \times \frac{1}{3} \times \text{H} \times .0034$.

" Or, to the ſquare of half the ſum of the diameters A and B, add one third part of the ſquare of half their difference, and ſubſtitute this ſum in the preceding rules for the ſquare of the diameter of the veſſel; for the ſquare of $\frac{1}{2}\text{A} \times \frac{1}{2}\text{B}$ added to $\frac{1}{3}$ of the ſquare of $\frac{1}{2}\text{A} - \frac{1}{2}\text{B}$, gives $\frac{1}{3}\text{AA} \times \frac{1}{3}\text{AB} \times \frac{1}{3}\text{BB}$.

" VIII. When a veſſel is a *fruſtum* of a parabolic conoid, meaſure the diameter of the ſection at the

" middle of the height of the *fruſtum*; and the con-
" tent will be preciſely the ſame as of a cylinder of
" this diameter, of the ſame height with the veſſel.

" IX. When a veſſel is a *fruſtum* of a ſphere, if
" you meaſure the diameter of the ſection at the
" middle of the height of the *fruſtum*, then compute
" the content of a cylinder of this diameter of the
" ſame height with the veſſel, and from this ſubſtract
" $\frac{1}{3}$ of the content of a cylinder of the ſame height,
" on a baſe whoſe diameter is equal to its height;
" the remainder will give the content of the veſſel.
" That is, if D repreſent the diameter of the middle
" ſection, and H the height of the *fruſtum*, you are
" to ſubſtitute DD—$\frac{1}{3}$ HH for the ſquare of the di-
" ameter of the cylindric veſſel in the firſt ſix rules.

" X. When the veſſel is a *fruſtum* of a ſpheroid,
" if the baſes are equal, the content is readily found
" by the rule in p. (24.) In other caſes, let the axis
" of the ſolid be to the conjugate axis as n to 1;
" let D be the diameter of the middle ſection of the
" *fruſtum*, H the height or length of the *fruſtum*;
" and ſubſtitute in the firſt ſix rules DD——$\frac{\text{VIII}}{3nn}$ for
" the ſquare of the diameter of the veſſel.

" XI. When the veſſel is an hyperbolic conoid,
" let the axis of the ſolid be to the conjugate axis as
" n to 1, D the diameter of the ſection at the middle
" of the *fruſtum*, H the height or length: compute
" DD $\times \frac{1}{3nn} \times$ HH, and ſubſtitute this ſum for the
" ſquare of the diameter of the cylindric veſſel in the
" firſt ſix rules.

" XII. In general, it is uſual to meaſure any
" round veſſel, by diſtinguiſhing it into ſeveral *fruſ-*
" *tums*, and taking the diameter of the ſection at
" the middle of each *fruſtum*; thence to compute
" the content of each, as if it was a cylinder of
" that mean diameter; and to give their ſum as
" the content of the veſſel. From the total con-
" tent, computed in this manner, they ſubſtract ſuc-
" ceſſively the numbers which expreſs the circular
" areas that correſpond to thoſe mean diameters, each
" as often as there are inches in the altitude of the
" *fruſtum* to which it belongs, beginning with the
" uppermoſt; and in this manner calculate a table for
" the veſſel, by which it readily appears how much
" liquor is at any time contained in it, by taking
" either the dry or wet inches; having regard to the
" inclination or drip of the veſſel, when it has any.

" This method of computing the content of a
" *fruſtum* from the diameter of the ſection at the
" middle of its height, is exact in that caſe only
" when it is a portion of a parabolic conoid; but in
" ſuch veſſels as are in common uſe, the error is not
" conſiderable. When the veſſel is a portion of a
" cone or hyperbolic conoid, the content by this me-
" thod is found leſs than the truth; but when it is a
" portion of a ſphere or ſpheroid, the content com-
" puted in this manner exceeds the truth. The dif-
" ference or error is always the ſame, in the different
" parts of the ſame or of ſimilar veſſels, when the
" altitude of the *fruſtum* is given. And when the
" altitudes are different, the error is in the triplicate
" *ratio* of the altitude. If exactneſs be required,
" the error in meaſuring the *fruſtum* of a conical veſ-
" ſel, in this manner, is $\frac{1}{4}$ of the content of a cone
" ſimilar to the veſſel, of an altitude equal to the
" height of the *fruſtum*. In a ſphere, it is $\frac{1}{3}$ of a
" cylinder of a diameter and height equal to the
" *fruſtum*. In the ſpheroid and hyperbolic conoid,
" it is the ſame as in a cone generated by the right-
" angled triangle, contained by the two ſemiaxes of
" the figure, revolving about that ſide which is the
" ſemiaxis of the *fruſtum*.

" In the uſual method of computing a table for a
" veſſel, by ſubducting from the whole content the
" number that expreſſes the uppermoſt area, as often
" as there are inches in the uppermoſt *fruſtum*, and
" afterwards the numbers for the other areas ſucceſ-
" ſively; it is obvious, that the contents aſſigned by
" the table, when a few of the uppermoſt inches are
" dry, are ſtated a little too high, if the veſſel ſtands
" on its leſſer baſe, but too low when it ſtands on its
" greater baſe; becauſe, when one inch is dry, for
" example, it is not the area at the middle of the up-
" permoſt *fruſtum*, but rather the area at the middle
" of the uppermoſt inch, that ought to be ſubducted
" from the total content, in order to find the content
" in this caſe.

" XIII. To meaſure round timber: Let the mean
" circumference be found in feet and decimals of a
" foot; ſquare it; multiply this ſquare by the deci-
" mal .079,577, and the product by the length.
" Ex. Let the mean circumference of a tree be 10 3
" feet, and the length 24 feet. Then 10 3 × 10 3
" × 079,577 × 24=202.615, is the number of cubi-
" cal feet in the tree. The foundation of this rule
" is, that when the circumference of a circle is 1, the
" area is .0,795,774,715, and that the areas of circles
" are as the ſquares of their circumferences.

" But the common way uſed by artificers for mea-
" ſuring round timber, differs much from this rule.
" They call one fourth part of the circumference the
" *girt*, which is by them reckoned the ſide of a
" ſquare, whoſe area is equal to the area of the ſec-
" tion of the tree; therefore they ſquare the *girt*, and
" then multiply by the length of the tree. Ac-
" cording to their method, the tree of the laſt ex-
" ample would be computed at 159.13 cubical feet
" only.

" How ſquare timber is meaſured, will be eaſily
" underſtood from the preceding propoſitions. Fifty
" ſolid feet of hewn timber, and forty of rough tim-
" ber, make a load.

" XIV. To find the burden of a ſhip, or the num-
" ber of tons it will carry, the following rule is com-
" monly given. Multiply the length of the keel
" taken within board, by the breadth of the ſhip
" within board, taken from the midſhip beam from
" plank to plank, and the product by the depth of
" the hold, taken from the plank below the keelſon
" to the under part of the upper deck plank, and di-
" vide the product by 94, the quotient is the content
" of the tonnage required. This rule however can-
" not be accurate; nor can one rule be ſuppoſed to
" ſerve for the meaſuring exactly the burden of ſhips
" of all ſorts. Of this the reader will find more in
" the Memoirs of the Royal Academy of Sciences
" at Paris, for the year 1721.

" Our author having ſaid nothing of weights, it
" may be of uſe to add briefly, that the Engliſh

Troy-

" Troy-pound contains 12 ounces, the ounce 20 pen-
" ny-weight, and the penny-weight 24 grains; that
" the Averdupois pound contains 16 ounces, the ounce
" 16 drams, and that 112 pounds is ufually called the
" hundred weight. It is commonly fuppofed, that
" 14 pounds Averdupois are equal to 17 pounds
" Troy. According to Mr Everard's experiments,
" 1 pound Averdupois is equal to 14 ounces 12 pen-
" ny-weight and 16 grains Troy, that is, to 7000
" grains; and an Averdupois ounce is $437\frac{1}{2}$ grains.
" The Scots Troy-pound (which, by the ftatute
" 1718, was to be the fame with the French) is com-
" monly fuppofed equal to $15\frac{3}{4}$ ounces Engliſh Troy,
" or 7560 grains. By a mean of ftandards kept by
" the dean of guild at Edinburgh, it is $7599\frac{1}{2}$, or
" 7600 grains. They who have meafured the weights
" which were fent from London, after the union of
" of the kingdoms, to be the ftandards by which the
" weights in Scotland ſhould be made, have found
" the Engliſh Averdupois pound (from a medium of
" the feveral weights) to weigh 7000 grains, the fame
" as Mr Everard; according to which, the Scots, Pa-
" ris, or Amſterdam pound, will be to the pound
" Averdupois as 38 to 35. The Scots Troy-ſtone
" contains 16 pounds, the pound 2 marks or 16
" ounces, an ounce 16 drops, a drop 36 grains.
" Twenty Scots ounces make a Tron-pound; but be-
" cauſe it is uſual to allow one to the ſcore, the Tron-
" pound is commonly 21 ounces. Sir John Skene,
" however, makes the Tron-ſtone to contain only
" $19\frac{1}{2}$ pounds."

George. GEO GEO George.

GEORGE I. II. and III. kings of Great Britain.—George I. the ſon of Erneſt Auguſtus, duke of Brunſwick Lunenburgh, and elector of Hanover; ſucceeded to the throne of Great Britain in 1714, in virtue of an act of parliament, paſſed in the latter part of the reign of king William III. limiting the ſucceſſion of the crown, after the demiſe of that monarch, and queen Anne (without iſſue), to the princeſs Sophia of Hanover, and the heirs of her body, being Proteſtants.—George II. the only ſon of the former, ſucceeded him in 1727, and enjoyed a long rein of glory; dying amidſt the moſt rapid and extenſive conqueſts in the 77th year of his age. He was ſucceeded by his grandſon George III. our preſent ſovereign. For particulars, ſee BRITAIN, n° 369,—458.

GEORGE, or *Knights of St* GEORGE, has been the denomination of ſeveral military orders, whereof that of the garter is one of the moſt illuſtrious. See GARTER.

King GEORGE's *Iſlands*, are two iſlands in the South Sea, lying in W. Long. 144. 56. S. Lat. 14. 28. They were firſt diſcovered by commodore Byron in 1765, and have ſince been viſited by Captain Cook in 1774. Commodore Byron's people had an encounter with the inhabitants, which proved fatal to ſome of the natives; but Captain Cook was more fortunate. A lieutenant and two boats well armed were ſent on ſhore by Captain Cook; and landed without oppoſition. As ſoon as the gentlemen landed, the iſlanders embraced them by touching noſes, a mode of civility uſed in New Zealand, which is 900 leagues diſtant, and the only place beſides this where the cuſtom has been obſerved to prevail. Notwithſtanding this ceremony, however, very little real friendſhip ſeemed to take place on the part of the iſlanders. They crowded about the boats as the people were ſtepping into them, and ſeemed in doubt whether they ſhould detain them or let them go; at laſt, however, not thinking themſelves ſufficiently ſtrong, they ſeemed contented with their departure, and aſſiſted them in puſhing off their boats; but ſome of the moſt turbulent threw ſtones into the water which fell very near them, and all ſeemed to glory that they had as it were driven them off. The Britiſh, however, brought off five dogs of a white colour with fine long hair, with which the iſland ſeemed to be plentifully ſupplied. Theſe they purchaſed with ſmall nails, and ſome ripe bananas which had been brought from the Marqueſas. On this iſland Mr Foreſter found a kind of ſcurvy-graſs, which the natives informed him they were wont to bruiſe and mix with ſhell-fiſh; after which, they threw it into the ſea whenever they perceived a ſhoal of fiſh. This preparation intoxicates them for ſome time; and thus they are caught on the ſurface of the water without any other trouble than that of taking them out. The name of this plant among the natives is *e now*. The largeſt iſland, which they call *Tiookea*, is ſomething of an oval ſhape, and about ten leagues in circuit; the other iſland, which lies two leagues to the weſtward of Tiookea, is four leagues long from north-eaſt to ſouthweſt, and from five to three miles long. The ſoil of both is extremely ſcanty; the foundation conſiſts of coral, very little elevated above the ſurface of the water.

St GEORGE *del Mina*, the capital of the Dutch ſettlements, on the gold-coaſts of Guinea, ſituated ſeven or eight miles weſt of Cape-coaſt caſtle, the capital of the Britiſh ſettlements there. W. Long. 5° and N. Lat. 5°.

St GEORGE, a fort and town of Aſia, in the peninſula on this ſide the Ganges, and on the coaſt of Coromandel, belonging to the Engliſh; it is otherwiſe called *Madraſs*, and by the natives *Chili-patam*. It fronts the ſea, and has a ſalt-water river on its back ſide, which hinders the freſh-water ſprings from coming near the town, ſo that they have no good water within a mile of them. In the rainy ſeaſons it is incommoded by inundations; and from April to September it is ſo ſcorching hot, that if the ſea-breezes did not cool the air, there would be no living there. There are two towns, one of which is called the *White Town*, which is walled round, and has ſeveral bulwarks and baſtions to defend it: it is 400 paces long and 150 broad, and is divided into regular ſtreets. Here are two churches, one for the Proteſtants, and the other for the Papiſts; as alſo a good hoſpital, a town-hall, and a priſon for debtors. They are a corporation, and have a mayor and aldermen, with other proper officers. The *Black Town* is inhabited by Gentoos, Mahometans, and Portugueſe and Armenian Chriſtians, and each religion have their temples and churches. This, as well as the White Town, is ruled by the Engliſh governor and his council. The diamond-mines are but a week's journey from this place, which renders them pretty plentiful,

Georgia. but there are no large ones since that great diamond was procured by governor Pitt. This colony produces very little of its own growth or manufacture for foreign markets, and the trade is in the hands of the Armenians and Gentoos. The chief things the British deal in, besides diamonds, are calicoes, chintz, muslins, and the like. This colony may consist of 80,000 inhabitants in the towns and villages, and there are generally 400 or 500 Europeans. Their rice is brought by sea to Gangam and Orixa, their wheat from Surat and Bengal, and their fire-wood from the islands of Diu: so that an enemy, with a superior force at sea, may easily distress them. The houses of the White Town are built with brick, and have lofty rooms and flat roofs; but the Black Town consists chiefly of thatched cottages. The military power is lodged in the governor and council, who are also the last resort in civil causes. The company have two chaplains, who officiate by turns, and have each 100l. a-year, besides the advantages of trade. They never attempt to make profelytes, but leave that to the Popish missionaries. The salaries of the company's writers are very small: but, if they have any fortune of their own, they may make it up by trade; which must generally be the case, for they commonly grow rich. It was taken by the French in 1746, who restored it at the peace of Aix la Chapelle.

St George's, the largest of the Bermuda or Summer islands. W. Long. 65. 10. N. Lat. 32. 30.

Cross of St George, a red one in a field argent, which makes part of the British standard.

GEORGIA, a country of Asia, subject to the Turks. It is bounded on the north by Circassia, on the east by Daghestan and Shirvan, on the south by Armenia, and on the west by the Euxine or Black Sea; comprehending the greatest part of the ancient Colchis, Iberia, and Albania. About the etymon of the name of this country, authors are not agreed. The most probable opinion is, that it is a corruption softening of *Kurgia*, from the river Kur; whence also it is supposed that the inhabitants are called by the Persians indifferently *Georgi*, *Gurgi*, and *Kurgi*; and the country *Kurgistan* and *Gurgistan*: It is divided by a ridge of mountains into eastern and western; the former of which is again subdivided into the kingdoms of Caket, Carduel or Carthuel, and Goguetia; and the latter into the provinces of Abcassia, Mireta, or Imaretta, and Guriel. Another division is into Georgia Proper, Abcassia, and Mingrelia.

"Georgia (says Sir John Chardin) is as fertile a country as can be seen; the bread is as good here as in any part of the world; the fruit of an exquisite flavour, and of different sorts; no place in Europe yields better pears and apples, and no place in Asia better pomegranates. The country abounds with cattle, venison, and wild-fowl, of all sorts; the river Kuris is well stocked with fish; and the wine is so rich, that the king of Persia has always some of it for his own table. The inhabitants are robust, valiant, and of a jovial temper; great lovers of wine, and esteemed very trusty and faithful; endowed with good natural parts, but, for want of education, very vicious. The women are generally so fair and comely, that the wives and concubines of the king of Persia and his court are for the most part Georgian women. Nature has adorned them with graces no where else to be met with; it is impossible to see them without loving them; they are of a good size, clean-limbed, and well-shaped." Another traveller, however, of no mean character, thus expresses himself with respect to the women: "As to the Georgian women, they did not at all surprize us; for we expected to find them perfect beauties. They are, indeed, no way disagreeable; and may be counted beauties, if compared with the Curdes. They have an air of health that is pleasing enough; but, after all, they are neither so handsome nor so well shaped as is reported. Those who live in the towns have nothing extraordinary, more than the others; so that I may, I think, venture to contradict the accounts that have been given of them by most travellers." Georgia. Georgia abounds with woods and mountains, intermixed with a great number of beautiful plains.

The only rivers of note in this country are the Cyrus, Cyrnus, Corus, or Kur, and the Araxus. The first springs from the Moschian mountains, which separate Colchis from Armenia, waters the country now called *Mokan*, and, after receiving into its channel the Araxus and Araxes, falls by one mouth into the Caspian sea. This river is navigable the greatest part of its course. The Araxus springs from the mountains that separate Iberia from Colchis, and falls into the Cyrus.

Iberia, or Georgia, is tributary or subject either to the Porte or the king of Persia, and known to the Persians by the name of Gurgistan, that is, "the land of the Georgians;" for *tan* is an ancient Celtic word, signifying a country, and still in use among the eastern nations, as appears from the modern names of Curdestan, Indostan, &c. that is, the country of the Curdes, of the Indians, &c.

The whole country of Georgia is but thinly inhabited, and has but very few cities in proportion to its extent and fertility; which is doubtless in a great measure owing to the barbarous and unnatural traffic carried on here in boys and girls, parents selling their children, masters their servants, and lords their vassals and tenants. Every one, in short, trades in the males and females he is master of, and disposes of them to the Turks and Persians, who employ them in their armies and seraglios, as slaves, mutes, eunuchs, soldiers, statesmen, and concubines, according to their capacities, and the favour they have obtained with their masters.

This country formerly abounded with great cities, as appears not only from its history, but from the ruins of many of them still visible, which shew that they must have been very large, opulent, and magnificiently built. These were all destroyed by the inundations of northern barbarians from mount Caucasus, as the Alans, Huns, Suevi, and some others, so much noted in history for their strength, courage, and conquests.

The air of Georgia is serene, dry, and healthful; but very cold in winter, and hot in summer.

The fine weather commonly begins about May, and lasts till November. But the lands want a good deal of watering to make them produce a plentiful crop; when they yield all sorts of grain, fruit, and pulse, in abundance, which sell at so cheap a rate that the people want for nothing. The cattle, both small and great, are fat and good, and in great numbers; but the common

Georgia. mon people live moſtly on ſwine's fleſh, which is every where excellent, and, by their own account, wholeſome and of eaſy digeſtion. The river Kur, as well as the Caſpian ſea, which lies eaſt of Georgia, ſupplies it with plenty and variety of fiſh.

The mountains of Caucaſus, that lie partly in this country, are known at preſent to the inhabitants by the names of *Cochas* and *Cochias*, which are, without doubt, a corruption of the ancient. The Arabs call them the *Mountains of Raf*.

The inhabitants are civil enough to ſtrangers, allowing them to live and trade as they pleaſe, and to profeſs what religion they have a mind: hence people of various nations are ſeen here, as Turks, Armenians, Perſians, Jews, Greeks, Indians, Tartars, Ruſſians, and other Europeans. But the Armenians are the moſt numerous; and, by carrying on the greateſt part of the trade, are alſo the richeſt; for which reaſon the Georgians hate and deſpiſe them, regarding them in much the ſame light as the Europeans do the Jews. The Georgians wear four caps on their heads, and a kind of long veſt, open before, but which may be buttoned at pleaſure; their breeches and under-garments are like thoſe of the Perſians, as is the entire dreſs of the women.

Their houſes, eſpecially thoſe of the better ſort, are alſo after the model of thoſe of Perſia, as well as all their public buildings: and they may afford to have them built after the beſt manner, having not only ſtone, wood, plaſter, lime, and all other materials, in the greateſt plenty and cheapneſs; but alſo can have the moſt laborious work done by their own vaſſals, over whom they have ſuch an abſolute power, that they can keep them employed whole months together, without allowing them either wages or food.

Iberia, or Georgia, according to Joſephus, was firſt peopled by Tubal, the brother of Gomer and Magog. His opinion is confirmed by the Septuagint; for Meſhech and Tubal are by theſe interpreters rendered *Moſchi* and *Iberians*. We know little of the hiſtory of the country till the reign of Mithridates, when their king, named *Artocis*, ſiding with that prince againſt Lucullus, and afterwards againſt Pompey, was defeated by the latter, with great ſlaughter; but afterwards obtained a peace, upon delivering up his ſons as hoſtages. Little notice is taken of the ſucceeding kings by the ancient hiſtorians. They were probably tributary to the Romans till that empire was overturned, when this, with the other countries in Aſia bordering on it, fell ſucceſſively under the power of the Saracens and Turks. A certain prince of Georgia, named *Heraclius*, has lately made a great noiſe, and a conſiderable progreſs in his endeavours to ſhake off the Turkiſh yoke, having, according to advices from the eaſt, ſeveral times defeated the Ottoman troops: but it ſeems either his former good fortune forſook him, or an accommodation took place; for all the intelligence from that part of the world, for ſome time paſt, hath been entirely ſilent with regard to him.

The capital of the country is TEFLIS; for an account of which, ſee that article.

GEORGIA, one of the provinces of the Britiſh empire in America, lying between South Carolina and Florida. It extends 120 miles upon the ſea-coaſt, and 300 miles from thence to the Apalachian mountains, and its boundaries to the north and ſouth are the rivers Savannah and Alatamaha. The Britiſh miniſtry had been long deſirous of erecting a colony on this tract of country, that was conſidered as dependent upon Carolina. One of thoſe inſtances of benevolence, which liberty, the ſource of every patriotic virtue, renders more frequent in Britain than in any other country, ſerved to determine the views of government with regard to this place. A rich and humane citizen, at his death, left the whole of his eſtate to ſet at liberty ſuch inſolvent debtors as were detained in priſon by their creditors. Prudential reaſons of policy concurred in the performance of this will dictated by humanity; and the government gave orders, that ſuch unhappy priſoners as were releaſed, ſhould be tranſplanted into that deſert country, which was now intended to be peopled. It was named *Georgia*, in honour of the reigning ſovereign. Georgia

The parliament added 9,843 l. 15 s. to the eſtate left by the will of a citizen; and a voluntary ſubſcription produced a much more conſiderable ſum. General Oglethorpe was fixed upon to direct theſe public finances, and to carry into execution ſo excellent a project. He choſe to conduct, himſelf, the firſt coloniſts that were ſent to Georgia; where he arrived in January 1733, and fixed his people on a ſpot ten miles diſtant from the ſea, in an agreeable and fertile plain on the banks of the Savannah. This riſing ſettlement was called *Savannah*, from the name of the river; and inconſiderable as it was in its infant ſtate, was, however, to become the capital of a flouriſhing colony. It conſiſted at firſt of no more than 100 perſons; but before the end of the year the number was increaſed to 618, of whom 127 had emigrated at their own expence. Three hundred men, and 113 women, 102 lads, and 83 girls, formed the beginning of this new population, and the hopes of a numerous poſterity. Raynal's Hiſt.

This ſettlement was increaſed in 1735 by the arrival of ſome Scotch Highlanders. Their national courage induced them to accept an eſtabliſhment offered them upon the borders of the Alatamaha, to defend the colony, if neceſſary, againſt the attacks of the neighbouring Spaniards. Here they built the towns of Darien and Frederica, and ſeveral of their countrymen came over to ſettle among them.

In the ſame year, a great number of Proteſtants driven out of Saltzburg by a fanatical prieſt, embarked for Georgia to enjoy peace and liberty of conſcience. At firſt they ſettled on a ſpot juſt above that of the infant colony; but they afterwards choſe to be at a greater diſtance, and to go as far down as the mouth of the Savannah, where they built a town called *Ebenezer*.

Some Switzers followed the example of theſe wiſe Saltzburghers, though they had not, like them, been perſecuted. They alſo ſettled on the banks of the Savannah; but at the diſtance of 34 miles from the Germans. Their colony conſiſting of 100 habitations, was named *Purißburgh*, from Pury their founder; who having been at the expence of their ſettlement, was deſervedly choſen their chief, in teſtimony of their gratitude to him.

In theſe four or five colonies, ſome men were found more inclined to trade than agriculture. Theſe, therefore,

Georgia. fore, separated from the reſt in order to build the city Auguſta, 236 miles diſtant from the ocean. The goodneſs of the ſoil, though excellent in itſelf, was not the motive of their fixing upon this ſituation; but they were induced to it by the facility it afforded them of carrying on the peltry trade with the ſavages. Their project was ſo ſucceſsful, that, as early as the year 1739, 600 people were employed in this commerce. The ſale of theſe ſkins was carried on with the greater facility from the circumſtance of the Savannah admitting the largeſt ſhips to ſail upon it as far as the walls of Auguſta.

The mother-country ought, one would imagine, to have formed great expectations from a colony, where ſhe had ſent near 5000 men, and laid out 64,968 l. excluſive of the voluntary contributions that had been raiſed by zealous patriots. But to her great ſurpriſe ſhe received information in 1741, that there remained ſcarce a fixth part of that numerous colony ſent to Georgia; who being now totally diſcouraged, ſeemed only deſirous to fix in a more favourable ſituation. The reaſons of theſe calamities were inquired into and diſcovered.

This colony, even in its infancy, brought with it the ſeeds of its decay. The government, together with the property of Georgia had been ceded to individuals. The firſt uſe that the proprietors of Georgia made of the unlimited power they were inveſted with was to eſtabliſh a ſyſtem of legiſlation, that made them entirely maſters not only of the police, juſtice, and finances, of the country, but even of the lives and eſtates of its inhabitants. Every ſpecies of right was withdrawn from the people, who are the original poſſeſſors of them all. Obedience was required of the people, though contrary to their intereſt and knowledge; and it was conſidered here, as in other countries, as their duty and their fate.

As great inconveniences had been found to ariſe in other colonies from large poſſeſſions, it was thought proper in Georgia to allow each family only 50 acres of land; which they were not permitted to mortgage, or even to diſpoſe of by will to their female iſſue. This laſt regulation of making only the male iſſue capable of inheritance, was ſoon aboliſhed; but there ſtill remained too many obſtacles to excite a ſpirit of emulation. It ſeldom happens, that a man reſolves to leave his country but upon the proſpect of ſome great advantage that works ſtrongly upon his imagination. All limits, therefore, preſcribed to his induſtry, are ſo many checks which prevent him from engaging in any project. The boundaries aſſigned to every plantation muſt neceſſarily have produced this bad effect. Several other errors ſtill affected the original plan of this country, and prevented its increaſe.

The taxes impoſed upon the moſt fertile of the Britiſh colonies, are very inconſiderable; and even theſe are not levied till the ſettlements have acquired ſome degree of vigour and proſperity. From its infant ſtate, Georgia had been ſubjected to the fines of a feudal government, with which it had been as it were fettered. The revenues raiſed by this kind of ſervice increaſed prodigiouſly, in proportion as the colony extended itſelf. The founders of it, blinded by a ſpirit of avidity, did not perceive that the ſmalleſt duty impoſed upon the trade of a populous and flouriſhing province, would much ſooner enrich them than the largeſt fines laid upon a barren and uncultivated country. Georgia ‖ Geranium.

To this ſpecies of oppreſſion was added another, which, however incredible it may appear, might ariſe from a ſpirit of benevolence. The planters in Georgia were not allowed the uſe of ſlaves. Carolina and ſome other colonies having been eſtabliſhed without their aſſiſtance, it was thought that a country deſtined to be the bulwark of thoſe American poſſeſſions ought not to be peopled by a ſet of ſlaves, who could not be in the leaſt intereſted in the defence of their oppreſſors. But it was not at the ſame time foreſeen, that coloniſts, who were leſs favoured than their neighbours by the mother-country, who were ſituated in a country leſs ſuſceptible of tillage, and in a hotter climate, would want ſtrength and ſpirit to undertake a cultivation that required greater encouragement.

The indolence which ſo many obſtacles gave riſe to, found a further excuſe in another prohibition that had been impoſed. The diſturbances produced by the uſe of ſpirituous liquors over all the continent of North America, induced the founders of Georgia to forbid the importation of rum. This prohibition, though well intended, deprived the coloniſts of the only liquor that could correct the bad qualities of the waters of the country, which were generally unwholeſome; and of the only means they had to reſtore the waſte of ſtrength and ſpirits that muſt be the conſequence of inceſſant labour. Beſides this, it prevented their commerce with the Antilles; as they could not go thither to barter their wood, corn, and cattle, that ought to have been their moſt valuable commodities, in return for the rum of thoſe iſlands.

The mother-country at length perceived how much theſe defects in the political regulations and inſtitutions had prevented the increaſe of the colony, and freed them from the reſtraints they had before been clogged with. The government in Georgia was ſettled upon the ſame plan as that which had rendered Carolina ſo flouriſhing; and, inſtead of being dependent on a few individuals, became one of the national poſſeſſions.

GEORGIA *Southern*. See AMERICA, n° 20.

GEORGIC, a poetical compoſition upon the ſubject of huſbandry, containing rules therein, put into a pleaſing dreſs, and ſet off with all the beauties and embelliſhments of poetry. The word is borrowed from the Latin *georgicus*, and that of the Greek γεωργικος, of γη, *terra*, "earth," and εργαζομαι, *opero*, "I work, or labour," of εργον, *opus*, "work."

Heſiod and Virgil are the two greateſt maſters in this kind of poetry.

The moderns have produced nothing in this kind, except Rapin's book of Gardening; and the celebrated poem entitled Cyder, by Mr Philips, who, if he had enjoyed the advantage of Virgil's language, would have been ſecond to Virgil in a much nearer degree.

GERANITES, in natural hiſtory, an appellation given to ſuch of the ſemipellucid gems as are marked with a ſpot reſembling a crane's eye.

GERANIUM, crane's bill; a genus of the decandria order, belonging to the monodelphia claſs of plants. There are 57 ſpecies; the moſt remarkable of which are, 1. The Pratenſe, with a crowfoot leaf, and

Gerard || Gerbier.

and large blue flowers, a native of many parts of Britain, growing in moiſt meadows, but is often planted in gardens on account of the beauty of its flowers. Of this there are two varieties, with white, and variegated flowers. 2. The ſanguineum, a native of Germany and Switzerland, with deep-red or purple flowers from the ſide of the branches, one upon each foot-ſtalk. Of this there are ſeveral varieties, differing from one another chiefly in the figure of the ſtalks and leaves. 3. The phæum, a native of the Alps and Helvetian mountains, with blackiſh purple flowers, two upon each footſtalk. 4. The nodoſum, a native of France, with pale purple flowers, two upon each footſtalk. 5. The macnorrhizum, or ſweet-ſmelling geranium, a native of Germany and Switzerland, with beautiful purple flowers. 6. The ſtriatum, with white flowers, beautifully variegated with purple. 7. The zonale, a native of the Cape of Good Hope, with an hairy lady's-mantle leaf, red flowers, and a ſhrubby ſtalk branching ſix or eight feet high.

The firſt ſix ſpecies are hardy plants, with fibrous perennial roots, and annual ſtalks which riſe from the root in ſpring. The flowers come out in May, June, and July; and are extremely numerous, each conſiſting of five ſmall ſpreading petals. Theſe are ſucceeded by plenty of ſeed in Auguſt and September; which, if permitted to ſcatter, will raiſe an abundant crop of young plants. They may alſo be propagated by parting the roots. The laſt ſort is that moſt commonly cultivated in gardens; but being a native of a warm climate, will not bear the open air here in the winter-time. There is a variety of this ſpecies, which is particularly valued on account of its finely variegated leaves.

GERARD (John), a learned Lutheran divine, was profeſſor of divinity, and rector of the academy of Jena, the place of his birth. He wrote, 1. The harmony of the Eaſtern languages; 2. A treatiſe on the Coptic church; and other works which are eſteemed. He died in 1668.

GERARDE (John), a ſurgeon in London, and the greateſt botaniſt of his time, was many years chief gardener to Lord Burleigh; who was himſelf a great lover of plants, and had the beſt collection of any nobleman in the kingdom, among which were a great number of exotics introduced by Gerarde. In 1597 he publiſhed his *Herbal*, which was printed at the expence of J. Norton, who procured the figures from Francfort. In 1663, Thomas Johnſon, an apothecary, publiſhed an improved edition of Gerarde's book; which met with ſuch approbation by the Univerſity of Oxford, that they conferred on him the degree of doctor of phyſic; and it is ſtill much eſteemed. The deſcriptions in the herbal are plain and familiar; and both theſe authors have laboured more to make their readers underſtand the characters of the plants, than to inform them that they themſelves underſtood Greek and Latin.

GERBIER, (Sir Balthazar), a painter of Antwerp, born in the year 1592, diſtinguiſhed himſelf by painting ſmall figures in diſtemper. King Charles I. was ſo pleaſed with his performances, that he invited him to his court, where he obtained the eſteem of the Duke of Buckingham, and grew into great favour. He was not only knighted, but ſent to Bruſſels, where he long reſided as agent for the king of Great Britain.

GERM, among gardeners: See GEMMA.

Germ || Germany.

GERMAN, in genealogy, denotes *entire* or *whole*: thus, a brother-german is one both by the father's and mother's ſide; and couſins-german are the children of brothers or ſiſters.

GERMAN, or *Germanic*, alſo denotes any thing belonging to Germany; as the German empire, German flute, &c.

GERMANDER, in botany. See the article TEUCRIUM.

GERMANICUS CÆSAR, the ſon of Druſus, and paternal nephew to the emperor Tiberius, who adopted him; a renowned general, but ſtill more illuſtrious for his virtues. He took the title of *Germanicus* from his conqueſts in that country; and though he had the moderation to refuſe the empire offered to him by his army, Tiberius, jealous of his ſucceſs, and of the univerſal eſteem he acquired, cauſed him to be poiſoned, A. D. 29, aged 34. He was a protector of learning; and compoſed ſome Greek comedies and Latin poems, ſome of which are ſtill extant.

GERMANY, a very extenſive empire of Europe, but which, in different ages of the world, hath had very different limits. Its name, according to the moſt probable conjecture, is derived from the Celtic words *Ghar man*, ſignifying a warlike man, to which their other name, *Allman*, or *Aleman*, likewiſe alludes.

The ancient hiſtory of the Germans is altogether wrapped up in obſcurity; nor do we, for many ages, know any thing more of them, than what may be learned from the hiſtory of their wars with the Romans. The firſt time we find them mentioned by the Roman hiſtorians, is about the year 211 B. C. at which time Marcellus ſubdued Inſubria and Liguria, and defeated the Gæſatæ, a German nation, ſituated on the banks of the Rhine. From this time hiſtory is ſilent with regard to any of theſe northern nations, till the eruption of the Cimbri and Teutones, who inhabited the moſt northerly parts of Germany. The event of their enterpriſe is related under the articles AMBRONES, CIMBRI, and TEUTONES. We muſt not, however, imagine, becauſe theſe people happened to invade Italy at the ſame time, that therefore their countries were contiguous to one another. The Cimbri and Teutones only, dwelt beyond the Rhine; while the Ambrones inhabited the country between Switzerland and Provence. It is indeed very difficult to fix the limits of the country called *Germany* by the Romans. The ſouthern Germans were intermixed with the Gauls, and the northern ones with the Scythians; and thus the ancient hiſtory of the Germans includes that of the Dacians, Huns, Goths, &c. till the deſtruction of the weſtern Roman empire by them. Ancient Germany, therefore, we may reckon to have included the northern part of France, the Netherlands, Holland, *Germany* ſo called at preſent, Denmark, Pruſſia, Poland, Hungary, part of Turky in Europe, and Muſcovy.

1 Limits of ancient Germany.

The Romans divided Germany into two regions; Belgic or Lower Germany, which lay to the ſouthward of the Rhine; and Germany Proper, or High Germany. The firſt lay between the rivers Seine and the Rhine; and in this we find a number of different nations, the moſt remarkable of which were the following.

2 Nations inhabiting Lower Germany.

1. The

Germany. 1. The Ubii, whose territory lay between the Rhine and the Mosa or Maese, and whose capital was the city of Cologne. 2. Next to them were the Tungri, supposed to be the same whom Cæsar calls *Eburones* and *Condrusi*; and whose metropolis, then called *Attuatica*, has since been named *Tongres*. 3. Higher up from them, and on the other side of the Moselle, were the Treviri, whose capital was Augusta Trevirorum, now *Triers*. 4. Next to them were the Tribocci, Nemetes, and Vangiones. The former dwelt in Alsace, and had Argentoratum, now *Strasburg*, for their capital: the others inhabited the cities of Worms, Spire, and Mentz. 5. The Mediomatrici were situated along the Moselle, about the city of Metz in Lorrain; and above them were situated another German nation, named *Rauraci*, *Rauraci*, or *Rauriaci*, and who inhabited that part of Helvetia, or Switzerland, about Basil. To the westward and southward of these were the Nervii, Suessones, Silvanectes, Leuci, Rhemi, Lingones, &c. who inhabited Belgic Gaul.

Between the heads of the Rhine and Danube were seated the ancient kingdom of Vindelicia, whose capital was called *Augusta Vindelicorum*, now *Augsburg*. Below it on the banks of the Danube were the kingdoms of Noricum and Pannonia. The first of these was divided into Noricum *Ripense* and *Mediterraneum*. It contained a great part of the provinces of Austria, Styria, Carinthia, Tyrol, Bavaria, and some others of less note. The latter contained the kingdom of Hungary, divided into Upper and Lower; and extending from Illyricum to the Danube, and the mountains Cætii in the neighbourhood of *Vindebona*, now *Vienna*.

3 Nations inhabiting High Germany.

Upper or High Germany lay beyond the Rhine and the Danube. Between the Rhine and the Elbe were the following nations. 1. The Chauci, Upper and Lower; who were divided from each other by the river Visurgis, now the *Weser*. Their country contained what is now called *Bremen*, *Lunenburg*, *Friezland*, and *Groninghen*. The upper Chauci had the Cherusci, and the lower the Chamavi on the south-east, and the German Ocean on the north-west. 2. The Frisii, upper and lower, were divided from the lower Chauci by the river Amisia, now the Ems; and from one another by an arm of the Rhine. Their country still retains the name of Friesland, and is divided into east and west; but the latter is now dismembered from Germany, and become one of the Seven United Provinces. 3. Beyond the Isela, now the *Isel*, which bounded the country of the Frisii, were situated the Bructeri, who inhabited that tract now called *Broekmorland*; and the Marsi, about the river Luppe. On the other side of that river were the *Usipii* or *Usipites*; but these were famed for often changing their territories, and therefore found in other places. 4. Next to these were the Juones, or inhabitants of Juliers, between the Maese and the Rhine. 5. The Catti, another ancient and warlike nation, inhabited Hesse and Thuringia, from the Hartzian mountains to the Rhine and Weser; among whom were comprehended the Mattiaci, whose capital is by some thought to be *Marpurg*, by others *Baden*. 6. Next to these were the Seducii, bordering upon Suabia; Narisci, or the ancient inhabitants of Northgow, whose capital was Nuremberg; and the Marcomanni, whose country anciently reached from the Rhine to the head of the Danube, and to the Neckar. The Marcomanni afterwards went and settled in Bohemia and Moravia, under their general or king Maroboduus; and some of them in Gaul, whence they drove the Boii, who had seated themselves there. 7. On the other side of the Danube, and between the Rhine and it, were the Hermunduri, who possessed the country now called *Misnia* in Upper Saxony; though some make their territories to have extended much farther, and to have reached quite to, or even beyond, the kingdom of Bohemia, once the seat of the Boii, whence its name. 8. Beyond them, on the north of the Danube, was another seat of the Marcomanni along the river Albis, or Elbe. 9. Next to Bohemia were situated the Quadi, whose territories extended from the Danube to Moravia, and the northern part of Austria. These are comprehended under the ancient name of *Suevi*; part of whom at length forced their way into Spain, and settled a kingdom there. 10. Eastward of the Quadi were situated the Bastarnæ, and parted from them by the Granna, now *Gran*; a river that falls into the Danube, and by the Carpathian mountains, from them called *Alpes Bastarnicæ*. The country of the Bastarnæ indeed made part of the European Sarmatia, and so was without the limits of Germany properly so called; but we find these people so often in league with the German nations, and joining them for the destruction of the Romans, that we cannot but account them as one people.

Germany.

Between those nations already taken notice of, seated along the other side of the Danube and the Hercynian forest, were several others whose exact situation is uncertain, viz. the Martingi, Burii, Borades, Lygii, or Logiones, and some others, who are placed by our geographers along the forest above-mentioned, between the Danube and the Vistula.

On this side the Hercynian forest, were the famed Rhætii, now *Grisons*, seated among the Alps. Their country, which was also called *Western Illyricum*, was divided into Rhætia *Prima* or *Propria*, and *Secunda*; and was then of much larger extent, spreading itself towards Suabia, Bavaria, and Austria.

On the other side of the Hercynian forest, were, 1. The Suevi, who spread themselves from the Vistula to the river Elbe. 2. The Longobardi, so called, according to some, on account of their wearing long beards; but, according to others, on account of their consisting of two nations, viz. the Bardi and Lingones. These dwelt along the river Elbe, and bordered southward on the Chauci above-mentioned. 3. The Burgundi, of whose original seat we are uncertain. 4. The Semnones; who, about the time of Tiberius, were seated on the river Elbe. 5. The Angles, Saxons, and Goths; were probably the descendants of the Cimbri; and inhabited the countries of Denmark, along the Baltic sea, and the peninsula of Scandinavia, containing Norway, Sweden, Lapland, and Finmark. 6. The Vandals were a Gothic nation, who, proceeding from Scandinavia, settled in the countries now called *Mecklenburgh* and *Brandenburgh*. 7. Of the same race were the Dacians, who settled themselves in the neighbourhood of Palus Mæotis, and extended their territories along the banks of the Danube.

These

Germany.

These were the names of the German nations who performed the moſt remarkable exploits in their wars with the Romans. Beſides theſe, however, we find mention made of the Scordiſci, a Thracian nation, who afterwards ſettled on the banks of the Danube. About the year 113 B. C. they ravaged Macedon, and cut off a whole Roman army ſent againſt them; the general, M. Porcius Cato, grandſon to Cato the cenſor, being the only perſon who had the good fortune to make his eſcape. After this, they ravaged all Theſſaly; and advanced to the coaſts of the Adriatic, into which, becauſe it ſtopped their farther progreſs, they diſcharged a ſhower of darts. By another Roman general, however, they were driven back into their own country with great ſlaughter; and, ſoon after, Metellus ſo weakened them by repeated defeats, that they were incapable, for ſome time, of making any more attempts on the Roman provinces. At laſt, in the conſulſhip of M. Livius Druſus and L. Calpurnius Piſo, the former prevailed on them to paſs the Danube, which thenceforth became the boundary between the Romans and them. Notwithſtanding this, in the time of the Jugurthine war, the Scordiſci repaſſed the Danube on the ice, every winter, and being joined by the Triballi a people of Lower Mæſia, and the Daci of Upper Mæſia, penetrated as far as Macedon, committing every where dreadful ravages. So early did theſe northern nations begin to be formidable to the Romans, even when they were moſt renowned for warlike exploits.

4 Wars of the Scordiſci with the Romans.

5 Expedition of Julius Cæſar into Germany.

Till the time of Julius Cæſar, however, we hear nothing more concerning the Germans. About 58 years B. C. he undertook his expedition into Gaul; during which, his aſſiſtance was implored by the Ædui, againſt Arioviſtus, a German prince who oppreſſed them. Cæſar, pleaſed with this opportunity of increaſing his power, invited Arioviſtus to an interview; but this being declined, he next ſent deputies deſiring him to reſtore the hoſtages he had taken from the Ædui, and to bring no more troops over the Rhine into Gaul. To this a haughty anſwer was returned; and a battle ſoon after enſued, in which Arioviſtus was entirely defeated, and with great difficulty made his eſcape.

In 55 B. C. Cæſar having ſubdued the Sueſſones, Bellovaci, Ambiani, Nervii, and other nations of Belgic Gaul, haſtened to oppoſe the Uſipetes and Tencteri. Theſe nations having been driven out of their own country by the Suevi, had croſſed the Rhine with a deſign to ſettle in Gaul. As ſoon as he appeared, the Germans ſent him a deputation, offering to join him provided he would aſſign them lands. Cæſar replied, that there was no room in Gaul for them; but he would deſire the Ubii to give them leave to ſettle among them. Upon this, they deſired time to treat with the Ubii; but in the mean time fell upon ſome Roman ſquadrons: which ſo provoked Cæſar, that he immediately marched againſt them, and, coming unexpectedly upon them, defeated them with great ſlaughter. They fled in the utmoſt confuſion; but the Romans purſued them to the conflux of the Rhine and the Maeſe, where the ſlaughter was renewed with ſuch fury, that almoſt 400,000 of the Germans periſhed. After this, Cæſar being reſolved to ſpread the terror of the Roman name through Germany, built a bridge over the Rhine, and entered that country. In this expedition, however, which was his laſt in Germany, he performed no remarkable exploit. A little before his death, indeed, he had projected the conqueſt of that as well as of a great many other countries; but his aſſaſſination prevented the execution of his deſigns. Nor is there any thing recorded of the Germans till about 17 B. C. when the Tencteri made an irruption into Gaul, and defeated M. Lollius, proconſul of that province. At laſt, however, they were repulſed, and forced to retire with great loſs beyond the Rhine. Germany.

Soon after this the Rhæti invaded Italy, where they committed the greateſt deva ſtations, putting all the males they met to the ſword, without diſtinction of ſex or age: nay, we are told, that when they happened to take women with child, they conſulted their augurs to know whether the child was a male or female; and if they pronounced it a male, the mother was immediately maſſacred. Againſt theſe barbarians was ſent Druſus, the ſecond ſon of Livia, a youth of extraordinary valour and great accompliſhments. He found means to bring them to a battle; in which the Romans proved victorious, and cut in pieces great numbers of their enemies, with very little loſs on their own ſide. Thoſe who eſcaped the general ſlaughter, being joined by the Vindelici, took their route towards Gaul, with a deſign to invade that province. But Auguſtus, upon the firſt notice of their march, diſpatched againſt them Tiberius with ſeveral choſen legions. He was no leſs ſucceſsful than Druſus had been; for, having tranſported his troops over the lake Brigantium, now Conſtance, he fell unexpectedly on the enemy, gave them a total overthrow, took moſt of their ſtrong-holds, and obliged the whole nation to ſubmit to ſuch terms as he choſe to impoſe upon them. Thus were the Vindelici, the Rhæti, and Norici, three of the moſt barbarous nations in Germany, ſubdued. Tiberius, to keep the conquered countries in awe, planted two colonies in Vindelicia, and opened from thence a road into Rhætia and Noricum. One of the cities which he built for the defence of his colonies, he called, from his father Druſus, *Druſomagus*; the other by the name of Auguſtus, *Auguſta Vindelicorum*; which cities are now known by the names of *Mimminghen* and *Augſburg*. He next encountered the Pannonians, who had been ſubdued by Agrippa, but revolted on hearing the news of that great commander's death, which happened 11 years B. C. Tiberius, however, with the aſſiſtance of their neighbours the Scordiſci, ſoon forced them to ſubmit. They delivered up their arms, gave hoſtages, and put the Romans in poſſeſſion of all their towns and ſtrong-holds. Tiberius ſpared their lives; but laid waſte their fields, plundered their cities, and ſent the beſt part of their youth into other countries. 6 Rhæti invade Italy. 7 They are ſubdued, together with the Vindelici and Norici. 8 And the Pannonians.

In the mean time, Druſus having prevented the Gauls from revolting, which they were ready to do, prepared to oppoſe the Germans who dwelt beyond the Rhine. They had collected the moſt numerous and formidable army that had ever been ſeen in thoſe parts; with which they were advancing towards the Rhine, in order to invade Gaul. Druſus defeated them as they attempted to croſs that river; and, purſuing the advantage he had gained, entered the country of the

Germany. Uſipetes, now *Relinchuſen*, and from thence advanced againſt the Sicambri, in the neighbourhood of the Lyppe and Iſſel. Them he overthrew in a great battle, laid waſte their country, burnt moſt of their cities, and, following the courſe of the Rhine, approached the German ocean, reducing the Friſii and the Chauci between the Ems and the Elbe. In theſe marches the troops ſuffered extremely for want of proviſions; and Druſus himſelf was often in great danger of being drowned, as the Romans who attended him were at that time quite unacquainted with the flux and reflux of the ocean.

9 Exploits of Druſus in Germany.

The Roman forces went into eaſt Frieſland for their winter-quarters; and next year (10 B. C.) Druſus marched againſt the Tencteri, whom he eaſily ſubdued. Afterwards, paſſing the Lupias, now the Lyppe, he reduced the Catti and Cheruſci, extending his conqueſts to the banks of the Viſurgis or Weſer: which he would have paſſed, had he not been in want of proviſions, the enemy haing laid waſte the country to a conſiderable diſtance. As he was retiring, the Germans unexpectedly fell upon him in a narrow paſſage; and having ſurrounded the Roman army, cut a great many of them in pieces. But Druſus having animated his men by his example, after a bloody conflict, which laſted the whole day, the Germans were defeated with ſuch ſlaughter, that the ground was ſtrewed for ſeveral miles with dead bodies. Druſus found in their camp a great quantity of iron-chains which they had brought for the Romans; and ſo great was their confidence, that they had agreed before-hand about the diviſion of the booty. The Tencteri were to have the horſe, the Cheruſci and Sicambri the baggage, and the Uſipetes and Catti the captives. After this victory, Druſus built two forts to keep the conquered countries in awe; the one at the confluence of the Lyppe and the Alme, the other in the country of the Catti on the Rhine. On this occaſion alſo he made a famous canal, long after called in honour of him *Foſſa Druſiana*, to convey the waters of the Rhine into the Sala or Sale. It extended eight miles; and was very convenient for conveying the Roman troops by water to the countries of the Friſii and Chauci, which was the deſign of the undertaking.

The following year, (9 B. C.), Auguſtus, bent on ſubduing the whole of Germany, advanced to the banks of the Rhine, attended by his two ſons-in-law Tiberius and Druſus. The former he ſent againſt the Daci, who lived on the ſouth ſide of the Danube; and the latter to complete the conqueſts he had ſo ſucceſsfully begun in the weſtern parts of Germany. The former eaſily overcame the Daci, and tranſplanted 40,000 of them into Gaul. The latter, having paſſed the Rhine, ſubdued all the nations from that river to the Elbe; but having attempted in vain to croſs this laſt, he ſet out for Rome: an end, however, was put to his conqueſts and his life by a violent fever, with which he was ſeized on his return.

After the death of Druſus, Tiberius again over-ran all thoſe countries in which Druſus had ſpent the preceding ſummer; and ſtruck ſome of the northern nations with ſuch terror, that they ſent deputies to ſue for peace. This, however, they could not obtain upon any terms; the emperor declaring that he would not conclude a peace with one, unleſs they all deſired it. But the Catti, or according to ſome the Sicambri, could not by any means be prevailed upon to ſubmit; ſo that the war was ſtill carried on, though in a languid manner, for about 18 years. During this period, ſome of the German nations had quitted their foreſts, and begun to live in a civilized manner under the protection of the Romans; but one Quintilius Varus being ſent to command the Roman forces in that country, ſo provoked the inhabitants by his extortions, that not only thoſe who ſtill held out refuſed to ſubmit, but even the nations that had ſubmitted were ſeized with an eager deſire of throwing off the yoke. Among them was a young nobleman of extraordinary parts and valour, named *Arminius*. He was the ſon of Sigimer, one of the moſt powerful lords among the Catti, had ſerved with great reputation in the Roman armies, and been honoured by Auguſtus with the privileges of a Roman citizen and the title of knight. But the love of his country prevailing over his gratitude, he reſolved to improve the general diſcontent which reigned among his countrymen, to deliver them from the bondage of a foreign dominion. With this view he engaged, underhand, the leading men of all the nations between the Rhine and the Elbe, in a conſpiracy againſt the Romans. In order to put Varus off his guard, he at the ſame time adviſed him to ſhew himſelf to the inhabitants of the more diſtant provinces, adminiſter juſtice among them, and accuſtom them, by his example, to live after the Roman manner, which he ſaid would more effectually ſubdue them than the Roman ſword. As Varus was a man of a peaceable temper, and averſe from military toils, he readily conſented to this inſidious propoſal; and, leaving the neighbourhood of the Rhine, marched into the country of the Cheruſci. Having there ſpent ſome time in hearing cauſes and deciding civil controverſies, Arminius perſuaded him to weaken his army, by ſending out detachments to clear the country of robbers. When this was done, ſome diſtant nations of Germany roſe up in arms by Arminius's directions; while thoſe through which Varus was to paſs in marching againſt them, pretended to be in a ſtate of profound tranquillity, and ready to join the Romans againſt their enemies.

10 Arminius heads the Germans againſt the Romans.

On the firſt news of the revolt, Varus marched againſt the enemy with three legions and ſix cohorts; but being attacked by the Germans as he paſſed through a wood, his army was almoſt totally cut off, while he himſelf and moſt of his officers fell by their own hands. Such a terrible overthrow, though it raiſed a general conſternation in Rome, did not, however, diſhearten Auguſtus, or cauſe him to abandon his enterprife. About two years after, (A. D. 12), Tiberius and Germanicus were appointed to command in Germany. The death of Auguſtus, however, which happened ſoon after, prevented Tiberius from going on his expedition; and Germanicus was for ſome time hindered from proceeding in his, by a revolt of the legions, firſt in Pannonia, and then in Germany. About the year 15, Germanicus having brought over the ſoldiers to their duty, laid a bridge acroſs the Rhine, over which he marched 12,000 legionaries, 26 cohorts of the allies, and eight *alæ* (ſquadrons of 300 each) of horſe. With theſe he firſt traverſed the Cœſian foreſt, (part of the Hercynian, and thought to lie part-

11 Cuts off Varus with his army.

Germany.

Germany. ly in the duchy of Cleves, and partly in Weſtphalia), and ſome other woods. On his march he was informed that the Marſi were celebrating a feſtival with great mirth and jollity. Upon this he advanced with ſuch expedition, that he ſurpriſed them in the midſt of their debauch; and giving his army full liberty to make what havock they pleaſed, a terrible maſſacre enſued, and the country was deſtroyed with fire and ſword for 50 miles round, without the loſs of a ſingle man on the part of the Romans.—This general maſſacre roufed the Bructeri, the Tubantes, and the Uſipetes; who, befetting the paſſes through which the Roman army was to return, fell upon their rear, and put them into ſome diſorder; but the Romans ſoon recovered themſelves, and defeated the Germans with conſiderable loſs.

12 Exploits of Germanicus.

The following year, (A. D. 16), Germanicus taking advantage of ſome inteſtine broils which happened among the Catti, entered their country, where he put great numbers to the ſword. Moſt of their youth, however, eſcaped by ſwiming over the Adrana, now the *Eder*, and attempted to prevent the Romans from laying a bridge over that river: but being diſappointed in this, ſome of them ſubmitted to Germanicus, while the greater part, abandoning their villages, took refuge in the woods; ſo that the Romans, without oppoſition, ſet fire to all their villages, towns, &c. and having laid their capital in aſhes, began their march back to the Rhine.

Germanicus had ſcarce reached his camp, when he received a meſſage from Segeſtes, a German prince, in the intereſt of the Romans, acquainting him that he was beſieged in his camp by Arminius. On this advice, he inſtantly marched againſt the beſiegers; entirely defeated them; and took a great number of priſoners, among whom was Thuſneldis, the wife of Arminius, and daughter of Segeſtes, whom the former had carried off, and married againſt her father's will. Arminius then, more enraged than ever, for the loſs of his wife, whom he tenderly loved, ſtirred up all the neighbouring nations againſt the Romans. Germanicus, however, without being diſmayed by ſuch a formidable confederacy, prepared himſelf to oppoſe the enemy with vigour: but, that he might not be obliged to engage ſuch numerous forces at once, he detached his Lieutenant Cæcina, at the head of 40 cohorts, into the territories of the Bructeri; while his cavalry, under the command of Pedo, entered the country of the Friſii. As for Germanicus himſelf, he embarked the remainder of his army, conſiſting of four legions, on a neighbouring lake; and tranſported them by rivers and canals to the place appointed on the river Ems, where the three bodies met. In their march they found the ſaid remains of the legions conducted by Varus, which they buried with all the ceremony their circumſtances could admit. After this they advanced againſt Arminius, who retired and poſted himſelf advantageouſly cloſe to a wood. The Roman general followed him; and coming up with him, ordered his cavalry to advance and attack the enemy. Arminius, at their firſt approach, pretended to fly; but ſuddenly wheeled about, and giving the ſignal to a body of troops, whom he had concealed in the wood, to ruſh out, obliged the cavalry to give ground. The cohorts then advanced to their relief; but they too were put into diſorder, and would have been puſhed into a moraſs, had not Germanicus himſelf advanced with the reſt of the cavalry to their relief. Arminius did not think it prudent to engage theſe freſh troops, but retired in good order; upon which Germanicus alſo retired towards the Ems. Here he embarked with four legions, ordered Cæcina to reconduct the other four by land, and ſent the cavalry to the ſea-ſide, with orders to march along the ſhore to the Rhine. Though Cæcina was to return by roads well known, yet Germanicus adviſed him to paſs, with all poſſible ſpeed, a cauſeway, called the *long bridges*, which led acroſs vaſt marſhes, ſurrounded on all ſides with woods and hills that gently roſe from the plain. Germany.

Arminius, however, having got notice of Cæcina's march, arrived at the long bridges before Cæcina, and filled the woods with his men, who, on the approach of the Romans, ruſhed out, and attacked them with great fury. The legions, not able to manage their arms in the deep waters and ſlippery ground, were obliged to yield; and would in all probability have been entirely defeated, had not night put an end to the combat. The Germans, encouraged by their ſucceſs, inſtead of refreſhing themſelves with ſleep, ſpent the whole night in diverting the courſes of the ſprings which roſe in the neighbouring mountains; ſo that, before day, the camp which the Romans had begun was laid under water, and their works were overturned. Cæcina was for ſome time at a loſs what to do; but at laſt reſolved to attack the enemy by day break, and, having driven them to their woods, to keep them there in a manner beſieged, till the baggage and wounded men ſhould paſs the cauſeway, and get out of the enemy's reach. But when his army was drawn up, the legions poſted on the wings, ſeized with a ſudden panic, deſerted their ſtations, and occupied a field beyond the marſhes. Cæcina thought it adviſable to follow them; but the baggage ſtuck in the mire, as he attempted to croſs the marſhes, which greatly embaraſſed the ſoldiers. Arminius perceiving this, laid hold of the opportunity to begin the attack; and crying out, "This is a ſecond Varus, the ſame fate attends him and his legions," fell on the Romans with inexpreſſible fury. As he had ordered his men to aim chiefly at the horſes, great numbers of them were killed; and the ground becoming ſlippery with their blood and the ſlime of the marſh, the reſt either fell or threw their riders, and, galloping through the ranks, put them in diſorder. Cæcina diſtinguiſhed himſelf in a very eminent manner; but his horſe being killed, he would have been taken priſoner, had not the firſt legion reſcued him. The greedineſs of the enemy, however, ſaved the Romans from utter deſtruction; for juſt as the legions were quite ſpent, and on the point of yielding, the barbarians on a ſudden abandoned them in order to ſeize their baggage. During this reſpite, the Romans ſtruggled out of the marſh, and having gained the dry fields, formed a camp with all poſſible ſpeed, and fortified it in the beſt manner they could.

The Germans having loſt the opportunity of deſtroying the Romans, contrary to the advice of Arminius, attacked their camp next morning, but were repulſed with great ſlaughter; after which they gave Cæcina no more moleſtation till he reached the banks of the Rhine. Germanicus, in the mean time, having

Germany. conveyed the legions he had with him down the river Ems into the ocean, in order to return by ſea to the river Rhine, and finding that his veſſels were overloaded, delivered the ſecond and fourteenth legions to Publius Vitellius, deſiring him to conduct them by land. But this march proved fatal to great numbers of them; who were either buried in the quickſands, or ſwallowed up by the overflowing of the tide, to which they were as yet utter ſtrangers. Thoſe who eſcaped, loſt their arms, utenſils, and proviſions; and paſſed a melancholy night upon an eminence, which they had gained by wading up to the chin. The next morning the land returned with the tide of ebb; when Vitellius, by an haſty march, reached the river Uſingis, by ſome thought to be the Hoerenſter, on which the city of Groningen ſtands. There Germanicus, who had reached that river with his fleet, took the legions again on board, and conveyed them to the mouth of the Rhine, whence they all returned to Cologne, at a time when it was reported they were totally loſt.

This expedition, however, coſt the Romans very dear, and procured very few advantages. Great numbers of men had periſhed; and by far the greateſt part of thoſe who had eſcaped ſo many dangers returned without arms, utenſils, horſes, &c. half naked, lamed, and unfit for ſervice. The next year, however, Germanicus, bent on the entire reduction of Germany, made vaſt preparations for another expedition. Having conſidered the various accidents that had befallen him during the war, he found that the Germans were chiefly indebted for their ſafety to their woods and marſhes, their ſhort ſummers and long winters; and that his troops ſuffered more from their long and tedious marches than from the enemy. For this reaſon he reſolved to enter the country by ſea, hoping by that means to begin the campaign earlier, and ſurpriſe the enemy. Having, therefore built with great diſpatch, during the winter, 1000 veſſels of different ſorts, he ordered them early in the ſpring (A. D. 16) to ſail down the Rhine, and appointed the iſland of the Batavians for the general rendezvous of his forces. When the fleet was ſailing, he detached Silius one of his lieutenants, with orders to make a ſudden irruption into the country of the Catti; and, in the mean time, he himſelf, upon receiving intelligence that a Roman fort on the Luppias was beſieged, haſtened with ſix legions to its relief. Silius was prevented, by ſudden rains, from doing more than taking ſome ſmall booty, with the wife and daughter of Arpen king of the Catti; neither did thoſe who beſieged the fort wait the arrival of Germanicus. In the mean time, the fleet arriving at the iſland of the Batavians, the proviſions and warlike engines were put on board and ſent forward; ſhips were aſſigned to the legions and allies; and the whole army being embarked, the fleet entered the canal formerly cut by Druſus, and from his name called *Foſſa Druſiana*. Hence he ſailed proſperouſly to the mouth of the Ems; where, having landed his troops, he marched directly to the Weſer, where he found Arminius encamped on the oppoſite bank, and determined to diſpute his paſſage. The next day Arminius drew out his troops in order of battle: but Germanicus, not thinking it adviſable to attack them, ordered the horſe to ford over under the command of his lieutenants Stertinius and Emilius; who, to divide the enemy's forces, croſſed the river in two different places. At the ſame time Cariovalda, the leader of the Batavian auxiliaries, croſſed the river where it was moſt rapid: but, being drawn into an ambuſcade, he was killed, together with moſt of the Batavian nobility; and the reſt would have been totally cut off, had not Stertinius and Emilius haſtened to their aſſiſtance. Germanicus in the mean time paſſed the river without moleſtation. A battle ſoon after enſued; in which the Germans were defeated with ſo great a ſlaughter that the ground was covered with arms and dead bodies for more than ten miles round; and among the ſpoils taken on this occaſion, were found, as formerly, the chains with which the Germans had hoped to bind their captives. Germany.

In memory of this ſignal victory Germanicus raiſed a mount, upon which he placed as trophies the arms of the enemy, and inſcribed underneath the names of the conquered nations. This ſo provoked the Germans, though already vanquiſhed and determined to abandon their country, that they attacked the Roman army unexpectedly on its march, and put them into ſome diſorder. Being repulſed, they encamped between a river and a large foreſt ſurrounded by a marſh except on one ſide, where it was incloſed by a broad rampart formerly raiſed by the Angrivarii as a barrier between them and the Cheruſci. Here another battle enſued; in which the Germans behaved with great bravery, but in the end were defeated with great ſlaughter.

13 His ſecond expedition.

After this ſecond defeat, the Angrivarii ſubmitted, and were taken under the protection of the Romans, and Germanicus put an end to the campaign. Some of the legions he ſent to their winter-quarters by land, while he himſelf embarked with the reſt on the river Ems, in order to return by ſea. The ocean proved at firſt very calm, and the wind favourable: but all of a ſudden a ſtorm ariſing, the fleet, conſiſting of 1000 veſſels, was diſperſed: ſome of them were ſwallowed up by the waves; others were daſhed in pieces againſt the rocks, or driven upon remote and unhoſpitable iſlands, where the men either periſhed by famine, or lived upon the fleſh of the dead horſes with which the ſhores ſoon appeared ſtrewed; for, in order to lighten their veſſels, and diſengage them from the ſhoals, they had been obliged to throw overboard their horſes and beaſts of burden, nay, even their arms and baggage. Moſt of the men, however, were ſaved, and even great part of the fleet recovered. Some of them were driven upon the coaſt of Britain; but the petty kings who reigned there, generouſly ſent them back.

14 His fleet diſperſed by a ſtorm.

On the news of this misfortune, the Catti, taking new courage, ran to arms; but Caius Silius being detached againſt them with 30,000 foot and 3000 horſe, kept them in awe. Germanicus himſelf, at the head of a numerous body, made a ſudden irruption into the territories of the Marſi, where he recovered one of Varus's eagles, and having laid waſte the country, he returned to the frontiers of Germany, and put his troops into winter-quarters; whence he was ſoon recalled by Tiberius, and never ſuffered to return into Germany again.

After the departure of Germanicus, the more northern nations of Germany were no more moleſted by the Romans. Arminius carried on a long and ſucceſsful war with Maroboduus king of the Marcommanni,

Germany. manni, whom he at laſt expelled, and forced to apply to the Romans for aſſiſtance; but, excepting Germanicus, it ſeems they had at this time no other general capable of oppoſing Arminius, ſo that Maroboduus was never reſtored. After the final departure of the Romans, however, Arminius having attempted to enſlave his country, fell by the treachery of his own kindred. The Germans held his memory in great veneration; and Tacitus informs us, that in his time they ſtill celebrated him in their ſongs.

15 Death of Arminius.

Nothing remarkable occurs in the hiſtory of Germany from this time till the reign of the emperor Claudius. A war indeed is ſaid to have been carried on by Lucius Domitius, father to the emperor Nero. But of his exploits we know nothing more than that he penetrated beyond the river Elbe, and led his army farther into the country than any of the Romans had ever done. In the reign of Claudius, however, the German territories were invaded by Cn. Domitius Corbulo, one of the greateſt generals of his age. But when he was on the point of forcing them to ſubmit to the Roman yoke, he was recalled by Claudius, who was jealous of the reputation he had acquired.

In the reign of Veſpaſian, a terrible revolt happened among the Batavians and thoſe German nations who had ſubmitted to the Romans, a particular account of which is given under the article ROME. The revolters were with difficulty ſubdued; but, in the reign of Domitian, the Dacians invaded the empire, and proved a more terrible enemy than any of the other German nations had been. After ſeveral defeats, the emperor was at laſt obliged to conſent to pay an annual tribute to Decebalus king of the Dacians; which continued to the time of Trajan. But this warlike prince refuſed to pay tribute; alleging, when it was demanded of him, that "he had never been conquered by Decebalus." Upon this the Dacians paſſed the Danube, and began to commit hoſtilities in the Roman territories. Trajan, glad of this opportunity to humble an enemy whom he began to fear, drew together a mighty army, and marched with the utmoſt expedition to the banks of the Danube. As Decebalus was not appriſed of his arrival, the emperor paſſed the river without oppoſition, and entering Dacia, laid waſte the country with fire and ſword. At laſt he was met by Decebalus with a numerous army. A bloody engagement enſued, in which the Dacians were defeated; tho' the victory coſt the Romans dear: the wounded were ſo numerous, that they wanted linen to bind up their wounds; and to ſupply the defect, the emperor generouſly devoted his own wardrobe. After the victory, he purſued Decebalus from place to place, and at laſt obliged him to conſent to a peace on the following terms. 1. That he ſhould ſurrender the territories which he had unjuſtly taken from the neighbouring nations. 2. That he ſhould deliver up his arms, his warlike engines, with the artificers who made them, and all the Roman deſerters. 3. That, for the future, he ſhould entertain no deſerters, nor take into his ſervice the natives of any country ſubject to Rome. 4. That he ſhould dismantle all his fortreſſes, caſtles, and ſtrong-holds; and laſtly, that he ſhould have the ſame friends and foes with the people of Rome.

16 The Dacians invade the Roman empire.

With theſe hard terms Decebalus was obliged to comply, though ſore againſt his will; and being introduced to Trajan, threw himſelf on the ground before him, acknowledging himſelf his vaſſal: after which the latter, having commanded him to ſend deputies to the ſenate for the ratification of the peace, returned to Rome. Germany.

This peace was of no long duration. Four years after, (A. D. 105), Decebalus, unable to live in ſervitude as he called it, began, contrary to the late treaty, to raiſe men, provide arms, entertain deſerters, fortify his caſtles, and invite the neighbouring nations to join him againſt the Romans as a common enemy. The Scythians hearkened to his ſolicitations; but the Jazyges, a neighbouring nation, refuſing to bear arms againſt Rome, Decebalus invaded their country. Hereupon Trajan marched againſt him; but the Dacian, finding himſelf unable to withſtand him by open force, had recourſe to treachery, and attempted to get the emperor murdered. His deſign, however, proved abortive, and Trajan purſued his march into Dacia. That his troops might the more readily paſs and repaſs the Danube, he built a bridge over that river; which by the ancients is ſtiled the moſt magnificent and wonderful of all his works*. To guard the bridge, he ordered two caſtles to be built; one on this ſide the Danube, and the other on the oppoſite ſide; and all this was accompliſhed in the ſpace of one ſummer. Trajan, however, as the ſeaſon was now far advanced, did not think it adviſable to enter Dacia this year, but contented himſelf with making the neceſſary preparations.

* See *Architecture*, n° 138.

17 They are ſubdued by Trajan.

In the year 106, early in the ſpring, Trajan ſet out for Dacia; and having paſſed the Danube on the bridge he had built, reduced the whole country, and would have taken Decebalus himſelf had he not put an end to his own life, in order to avoid falling into the hands of his enemies. After his death the kingdom of Dacia was reduced to a Roman province; and ſeveral caſtles were built in it, and garriſons placed in them, to keep the country in awe.

After the death of Trajan, the Roman empire began to decline, and the northern nations to be daily more and more formidable. The province of Dacia indeed was held by the Romans till the reign of Gallienus; but Adrian, who ſucceeded Trajan, cauſed the arches of the bridge over the Danube to be broken down, leſt the barbarians ſhould make themſelves maſters of it, and invade the Roman territories. In the time of Marcus Aurelius, the Marcomanni and Quadi invaded the empire, and gave the emperor a terrible overthrow. He continued the war, however, with better ſucceſs afterwards, and invaded their country in his turn. It was during the courſe of this war that the Roman army is ſaid to have been ſaved from deſtruction by that miraculous event related under the article CHRISTIANS, in Vol. III. p. 1935. par. ult.

18 Marcommanni and Quadi formidable to the empire.

In the end, the Marcommanni and Quadi were, by repeated defeats, brought to the verge of deſtruction; inſomuch that their country would probably have been reduced to a Roman province, had not Marcus Aurelius been diverted from purſuing his conqueſts by the revolt of one of his generals. After the death of Marcus Aurelius, the Germanic nations became every day more and more formidable to the Romans. Far from being able to invade and attempt the conqueſt of theſe

Germany. these northern countries, the Romans had the greatest difficulty to repress the incursions of their inhabitants. But for a particular account of their various invasions of the Roman empire, and its total destruction by them at last, see the article ROME.

19 Roman empire destroyed by the Heruli. The immediate destroyers of the Roman empire were the Heruli; who, under their leader Odoacer, dethroned Augustulus the last Roman emperor, and proclaimed Odoacer king of Italy. The Heruli were soon expelled by the Ostrogoths; and these in their turn were subdued by Justinian, who re-annexed Italy to the eastern empire. But the Popes found means to obtain the temporal as well as spiritual jurisdiction over a considerable part of the country, while the Lombards subdued the rest. These last proved very troublesome to the Popes, and at length besieged Adrian I. in his capital. In this distress he applied to Charles the Great, king of France; who conquered both Italy and Germany, and was crowned emperor of the west in 800. See FRANCE, n° 24, *&c.*

20 History of Germany since the time of Charlemagne. The posterity of Charlemagne inherited the empire of Germany until the year 880; at which time the different princes assumed their original independence, rejected the Carlovinian line, and placed Arnulph king of Bohemia on the throne. Since this time, Germany has ever been considered as an elective monarchy. Princes of different families, according to the prevalence of their interest and arms, have mounted the throne. Of these the most considerable, until the Austrian line acquired the imperial power, were the houses of Saxony, Franconia, and Swabia. The reigns of these emperors contain nothing more remarkable than the contests between them and the popes; for an account of which, see the article ITALY. From hence, in the beginning of the 13th century, arose the factions of the Guelphs and Gibelines, of which the former was attached to the popes, and the latter to the emperor; and both, by their virulence and inveteracy, tended to disquiet the empire for several ages. The emperors too were often at war with the Infidels; and sometimes, as happens in all elective kingdoms, with one another, about the succession.

But what more deserves our attention is the progress of government in Germany, which was in some measure oppofite to that of the other kingdoms of Europe. When the empire, raised by Charlemagne, fell asunder, all the different independent princes assumed the right of election; and those now distinguished by the name of *electors* had no peculiar or legal influence in appointing a successor to the imperial throne; they were only the officers of the king's household, his secretary, his steward, chaplain, marshal, or master of his horse, &c. By degrees, however, as they lived near the king's person, and had, like all other princes, independent territories belonging to them, they increased their influence and authority; and in the reign of Otho III. 984, acquired the sole right of electing the emperor. Thus, while in the other kingdoms of Europe, the dignity of the great lords, who were all originally allodial or independent barons, was diminished by the power of the king, as in France, and by the influence of the people, as in Great Britain; in Germany, on the other hand, the power of the electors was raised upon the ruins of the emperor's supremacy, and of the people's jurisdiction. In 1440, Frederic III. duke of Austria, was elected emperor, and the imperial dignity continued in the male line of that family for 300 years. His successor Maximilian married the heiress of Charles duke of Burgundy; whereby Burgundy, and the 17 provinces of the Netherlands, were annexed to the house of Austria. Charles V. grandson of Maximilian, and heir to the kingdom of Spain, was elected emperor in the year 1519. Under him MEXICO and PERU were conquered by the Spaniards; and in his reign happened the REFORMATION in several parts of Germany, which, however, was not confirmed by public authority till the year 1648, by the treaty of Westphalia, and in the reign of Ferdinand III. The reign of Charles V. was continually disturbed by his wars with the German princes and the French king Francis I. Though successful in the beginning of his reign, his good fortune, towards the conclusion of it, began to forsake him; which, with other reasons, occasioned his abdication of the crown *. Germany.

His brother Ferdinand I. who in 1558 succeeded to the throne, proved a moderate prince with regard to religion. He had the address to get his son Maximilian declared king of the Romans in his own lifetime, and died in 1564. By his last will he ordered, that if either his own male issue, or that of his brother Charles, should fail, his Austrian estates should revert to his second daughter Anne, wife to the elector of Bavaria, and her issue. We mention this destination, as it gave rise to the late opposition made by the house of Bavaria to the pragmatic sanction, in favour of the empress queen of Hungary, on the death of her father Charles VI. The reign of Maximilian II. was disturbed with internal commotions, and an invasion from the Turks; but he died in peace, in 1576. He was succeeded by his son Rodolph; who was involved in wars with the Hungarians, and in differences with his brother Matthias, to whom he ceded Hungary and Austria in his lifetime. He was succeeded in the empire by Matthias; under whom the reformers, who went under the names of *Lutherans* and *Calvinists*, were so much divided among themselves, as to threaten the empire with a civil war. The ambition of Matthias at last tended to reconcile them; but the Bohemians revolted, and threw the imperial commissaries out of a window at Prague. This gave rise to a ruinous war, which lasted 30 years. Matthias thought to have exterminated both parties; but they formed a confederacy, called the *Evangelic League*, which was counterbalanced by a Catholic league.

Matthias dying in 1618, was succeeded by his cousin Ferdinand II.; but the Bohemians offered their crown to Frederic the elector Palatine, the most powerful Protestant prince in Germany, and son-in-law to his Britannic majesty James I. That prince was incautious enough to accept of the crown: but he lost it, by being entirely defeated by the duke of Bavaria and the imperial generals at the battle of Prague; and he was even deprived of his electorate, the best part of which was given to the duke of Bavaria. The Protestant princes of Germany, however, had among them at this time many able commanders, who were at the head of armies, and continued the war with wonderful obstinacy: among them were the margrave of Baden Durlach, Christian duke of Brunswic, and count Mansfield; the last was one of the best generals of the age.

* See *Charles V.*

Germany. age. Chriſtiern IV. king of Denmark declared for them; and Richlieu, the French miniſter, was not fond of ſeeing the houſe of Auſtria aggrandized. The emperor, on the other hand, had excellent generals; and Chriſtiern, having put himſelf at the head of the evangelic league, was defeated by Tilly, an imperialiſt of great reputation in war. Ferdinand made ſo moderate a uſe of his advantages obtained over the Proteſtants, that they formed a freſh confederacy at Leipſic, of which the celebrated Guſtavus Adolphus king of Sweden was the head. An account of this glorious victories is given under the article SWEDEN. At laſt he was killed at the battle of Lutzen, in 1632. But the Proteſtant cauſe did not die with him. He had brought up a ſet of heroes, ſuch as the duke of Saxe Weimar, Torſtenſon, Banier, and others, who ſhook the Auſtrian power; till, under the mediation of Sweden, a general peace was concluded among all the belligerant powers, at Munſter, in the year 1648; which forms the baſis of the preſent political ſyſtem of Europe.

Ferdinand II. was ſucceeded by his ſon Ferdinand III. This prince died in 1657; and was ſucceeded the emperor Leopold, a ſevere, unamiable, and not very fortunate prince. He had two great powers to contend with, France on the one ſide, and the Turks on the other; and was a loſer in his war with both. France took from him Alſace, and many other frontier places of the empire; and the Turks would have taken Vienna, had not the ſiege been raiſed by John Sobieſki king of Poland. Prince Eugene of Savoy was a young adventurer in arms about the year 1697; and being one of the imperial generals, gave the Turks the firſt checks they received in Hungary. The empire, however, could not have withſtood the power of France; who purſued her conqueſts with ſuch rapidity, that the other parts of Europe were alarmed, and a great confederacy, conſiſting of the Empire, Great Britain, the Dutch under William Prince of Orange, and the northern powers, was formed to check the progreſs of the French, and render abortive the ambitious plan contrived by Lewis XIV. for founding an univerſal monarchy. At laſt, however, a peace was concluded at Ryſwick, in 1697; and two years after, the Turks conſented to a peace, which was ſigned at Carlowitz in 1699. The Hungarians, ſecretly encouraged by the French, and exaſperated by the unfeeling tyranny of Leopold, were ſtill in arms, under the protection of the Porte, when that prince died in 1705.

He was ſucceeded by his ſon Joſeph, who put the electors of Cologne and Bavaria to the ban of the empire; but being ill ſerved by prince Lewis of Baden, general of the empire, the French partly recovered their affairs, notwithſtanding their repeated defeats. The duke of Marlborough had not all the ſucceſs he expected or deſerved. Joſeph himſelf was ſuſpected of a deſign to ſubvert the Germanic liberties; and it was plain by his conduct, that he expected England ſhould take the labouring oar in the war, which was to be entirely carried on for his benefit. The Engliſh were diſguſted at his ſlowneſs and ſelfiſhneſs: but he died in 1711, before he had reduced the Hungarians; and leaving no male iſſue, he was ſucceeded in the empire by his brother Charles VI. whom the allies were endeavouring to place on the throne of Spain, in oppoſition to Philip, duke of Anjou, grandſon to Lewis XIV. Germany.

When the peace of Utrecht took place in 1713, Charles at firſt made a ſhew as if he would continue the war; but found himſelf unable, now that he was forſaken by the Engliſh. He therefore was obliged to conclude a peace with France at Baden in 1714, that he might attend the progreſs of the Turks in Hungary; where they received a total defeat from prince Eugene, at the battle of Peterwaradin. They received another of equal importance from the ſame general in 1717, before Belgrade, which fell into the hands of the imperialiſts; and next year the peace of Paſſarowitz, between them and the Turks, was concluded. Charles employed every minute of his leiſure in making arrangements for increaſing and preſerving his hereditary dominions in Italy and the Mediterranean. Happily for him, the crown of Britain devolved to the houſe of Hanover; an event which gave him a very deciſive weight in Europe, by the connections between George I. and II. and the empire. Charles was ſenſible of this; and carried matters with ſo high a hand, that, about the years 1724 and 1725, a breach enſued between him and George I. and ſo unſteady was the ſyſtem of affairs all over Europe at that time, that the capital powers often changed their old alliances, and concluded new ones contradictory to their intereſt. Without entering into particulars, it is ſufficient to obſerve, that the ſafety of Hanover, and its aggrandizement, was the main object of the Britiſh court; as that of the emperor was the eſtabliſhment of the pragmatic ſanction, in favour of his daughter, the preſent empreſs-queen, he having no male iſſue. Mutual conceſſions upon thoſe great points reſtored a good underſtanding between George II. and the emperor Charles; and the elector of Saxony, flattered with the view of gaining the throne of Poland, relinquiſhed the great claims he had upon the Auſtrian ſucceſſion.

The emperor, after this, had very bad ſucceſs in a war he entered into with the Turks, which he had undertaken chiefly to indemnify himſelf for the great ſacrifices he had made in Italy to the princes of the houſe of Bourbon. Prince Eugene was then dead, and he had no general to ſupply his place. The ſyſtem of France, however, under cardinal Fleury, happened at that time to be pacific; and ſhe obtained for him, from the Turks, a better peace than he had reaſon to expect. Charles, to keep the German and other powers eaſy, had, before his death, given his eldeſt daughter, the preſent empreſs queen, in marriage to the duke of Lorrain, a prince who could bring no acceſſion of power to the Auſtrian family.

Charles died in 1740; and was no ſooner in the grave, than all he had ſo long laboured for muſt have been overthrown, had it not been for the firmneſs of George II. The young king of Pruſſia entered and conquered Sileſia, which he ſaid had been wrongfully diſmembered from his family. The king of Spain and the elector of Bavaria ſet up claims directly incompatible with the pragmatic ſanction, and in this they were joined by France; though all thoſe powers had ſolemnly guaranteed it. The imperial throne, after a conſiderable vacancy, was filled up by the elector of Bavaria, who took the title of *Charles VII.* in January 1742.

Germany. 1742. The French poured their armies into Bohemia, where they took Prague; and the queen of Hungary, to take off the weight of Pruſſia, was forced to cede to that prince the moſt valuable part of the duchy of Sileſia by a formal treaty.

Her youth, her beauty, and ſufferings, and the noble fortitude with which ſhe bore them, touched the hearts of the Hungarians, into whoſe arms ſhe threw herſelf and her little ſon; and though they had been always remarkable for their diſaffection to the houſe of Auſtria, they declared unanimouſly in her favour. Her generals drove the French out of Bohemia; and George II. at the head of an Engliſh and Hanoverian army, gained the battle of Dettingen, in 1743. Charles VII. was at this time miſerable on the imperial throne, and would have given the queen of Hungary almoſt her own terms; but ſhe haughtily and impolitically rejected all accommodation, though adviſed to it by his Britannic majeſty, her beſt and indeed only friend. This obſtinacy gave a colour for the king of Pruſſia to invade Bohemia, under pretence of ſupporting the imperial dignity: but though he took Prague, and ſubdued the greateſt part of the kingdom, he was not ſupported by the French; upon which he abandoned all his conqueſts, and retired into Sileſia. This event confirmed the obſtinacy of the queen of Hungary; who came to an accommodation with the emperor, that ſhe might recover Sileſia. Soon after, his imperial majeſty, in the beginning of the year 1745, died; and the duke of Lorrain, then grand duke of Tuſcany, conſort to the queen of Hungary, after ſurmounting ſome difficulties, was choſen emperor.

The bad ſucceſs of the allies againſt the French and Bavarians in the Low Countries, and the loſs of the battle of Fontenoy, retarded the operations of the empreſs-queen againſt his Pruſſian majeſty. The latter beat the emperor's brother, prince Charles of Lorrain, who had before driven the Pruſſians out of Bohemia: and the conduct of the empreſs queen was ſuch, that his Britannic majeſty thought proper to guarantee to him the poſſeſſion of Sileſia, as ceded by treaty. Soon after, his Pruſſian majeſty pretended that he had diſcovered a ſecret convention which had been entered into between the empreſs-queen, the empreſs of Ruſſia, and the king of Poland as elector of Saxony, to ſtrip him of his dominions, and to divide them among themſelves. Upon this his Pruſſian majeſty, very ſuddenly, drove the king of Poland out of Saxony, defeated his troops, and took poſſeſſion of Dreſden; which he held till a treaty was made under the mediation of his Britannic majeſty, by which the king of Pruſſia acknowledged the duke of Lorrain, great duke of Tuſcany, for emperor. The war, however, continued in the Low Countries, not only to the diadvantage, but to the diſcredit, of the Auſtrians and Dutch, till it was finiſhed by the treaty of Aix-la-Chapelle, in April 1748. By that treaty Sileſia was once more guaranteed to the king of Pruſſia. It was not long before that monarch's jealouſies were renewed and verified; and the empreſs of Ruſſia's views falling in with thoſe of the empreſs-queen and the king of Poland, who were unnaturally ſupported by France in their new ſchemes, a freſh war was kindled in the empire. The king of Pruſſia declared againſt the admiſſion of the Ruſſians into Germany, and his Britannic majeſty againſt that of the French. Upon thoſe two principles all former differences between theſe monarchs were forgotten, and the Britiſh parliament agreed to pay an annual ſubſidy of 670,000l. to his Pruſſian majeſty during the continuance of the war. Germany.

The flames of war now broke out in Germany with greater fury and more deſtructive violence than ever. The armies of his Pruſſian majeſty, like an irreſiſtable torrent, burſt in Saxony; totally defeated the imperial general Brown at the battle of Lowoſitz; forced the Saxons to lay down their arms, though almoſt impregnably fortified at Pirna; and the elector of Saxony fled to his regal dominions in Poland. After this, his Pruſſian majeſty was put to the ban of the empire; and the French poured, by one quarter, their armies, as the Ruſſians did by another, into the empire. The conduct of his Pruſſian majeſty on this occaſion is the moſt amazing that is to be met with in hiſtory; for a particular account of which, ſee the article PRUSSIA.

At laſt, however, the taking of Colberg by the Ruſſians, and of Schweidnitz by the Auſtrians, was on the point of completing his ruin, when his moſt formidable enemy, the empreſs of Ruſſia, died, January 5. 1762; George II. his only ally, had died on the 25th of October, 1760.

The deaths of thoſe illuſtrious perſonages were followed by great conſequences. The Britiſh miniſtry of George III. ſought to finiſh the war with honour, and the new emperor of Ruſſia recalled his armies. His Pruſſian majeſty was, notwithſtanding, ſo very much reduced by his loſſes, that the empreſs-queen, probably, would have completed his deſtruction, had it not been for the wife backwardneſs of other German princes, not to annihilate the houſe of Brandenburg. At firſt the empreſs-queen rejected all terms propoſed to her, and ordered 30,000 men to be added to her armies. The viſible backwardneſs of her generals to execute her orders, and new ſucceſſes obtained by his Pruſſian majeſty, at laſt prevailed on her to agree to an armiſtice, which was ſoon followed by the treaty of Hubertſburg, which ſecured to his Pruſſian majeſty the poſſeſſion of Sileſia. Upon the death of the emperor, her huſband, in 1765, her ſon Joſeph, who had been crowned king of the Romans in 1764, ſucceeded him in the empire.

At preſent, Germany is bounded on the north by the Baltic Sea, Denmark, and the German Ocean; on the eaſt by Pruſſia, Hungary, and Poland; and on the weſt by the Low Countries, Lorraine, and Franche Compte: ſo that it now comprehends the Palatinates of Cologn, Triers, and Liege, which formerly belonged to the Gauls; and is diſmembered of Frieſland, Groningen, and Overyſſel, which are now incorporated with the Low Countries.

21
Situation, extent, &c. of Germany.

Since the time of Charles the Great, this country has been divided into High and Low Germany. The firſt comprehends the Palatinate of the Rhine, Franconia, Suabia, Bavaria, Bohemia, Moravia, Auſtria, Carinthia, Carniola, Stiria, the Swiſs, and the Griſons. The provinces of Low Germany are, the Low Country of the Rhine, Triers, Cologne, Mentz, Weſtphalia, Heſſe, Brunſwic, Miſnia, Lufatia, High Saxony upon the Elbe, Low Saxony upon the Elbe, Mecklenburg, Lu-

Germany. Lunenburg, Brandenburg, and Pomerania. For a particular deſcription of all theſe, ſee the articles as they occur in the order of the alphabet.

22 Conſtitution of the empire. The empire, as we have already obſerved, is elective; and the laws require no other qualifications in a candidate, but that he be *juſtus, bonus, et utilis*, without any limitation in regard to religion, nation, ſtate, or age. But as the Popiſh electors are more in number than the Proteſtant, a Roman-catholic prince is always choſen. The election is at Franckfort on the Maine, within three months after the former emperor's death. The electors appear either in perſon or by their envoys; and if an elector abſent himſelf, the election, notwithſtanding, is valid. Before the day of election, all foreigners are ordered to depart the town. Whoever has more than half the voices of the college for him, is elected; and an elector may even give his vote for himſelf. When the election is over, the perſon elected, or his plenipotentiary, muſt immediately ſubſcribe and ſwear to the capitulation of election: but if the perſon elected is not preſent in perſon, he muſt ſwear to it himſelf before he is crowned, and before he can take upon him the government; which, till then, belongs to the vicars of the empire. His coronation, for which he appoints a day himſelf, is always performed in the place where he was elected; though both election and coronation ought to be in the city of Aix-la-Chapelle. He then takes a general oath of a ruler, and, among other things, promiſes all due veneration to the Pope and church. The emperors uſed formerly to be crowned by the Popes, till the reign of Charles V. but from that time the papal coronation has been diſpenſed with. However, immediately upon his entering upon the government, he teſtifies his veneration for the Pope by an embaſſy. The title of the emperor runs thus: "N. by the grace of God, elected Roman emperor *(imperator)*, at all times augmenter of the empire *(ſemper Auguſtus)*, in or of Germany king." Then follow the titles of the hereditary imperial dominions. The ſtates of the empire give the emperor the title of "Moſt illuſtrious, moſt powerful, and moſt invincible Roman emperor;" the laſt of which is omitted by the electors. The emperor is looked upon by all other crowned heads and ſtates in Europe as the firſt European potentate, and as ſuch precedence is given him and his ambaſſadors. He is the ſupreme head of the German empire; but his power in the adminiſtration thereof is very limited. With reſpect to eccleſiaſtical matters, his prerogative conſiſts principally in the right of the firſt petition *(jus primari arum precum)*; by virtue of which, in all foundations and cloiſters of the empire, he may, once during his adminiſtration, confer a benefice on any perſon qualified for it by the ſtatutes; and in that of a panis brief to each foundation or cloiſter in the empire, by virtue of which, ſuch foundation is obliged to admit into it the perſon who has obtained the emperor's brief, and there provide him, during life, with meat, drink, cloaths, and other neceſſaries. With reſpect to temporal matters, he can create princes, dukes, marquiſſes, counts, barons, knights, &c. raiſe countries and territories to a higher rank; beſtow arms, and grant letters of reſpite and protection, ſecuring a debtor againſt his creditor; eſtabliſh univerſities, fairs, and markets; empower any perſon to adopt another, and to aſſume a title from his eſtate; erect any place into a ſanctuary; confer majority on minors; legitimate children born out of wedlock; confirm the contracts and ſtipulations of the empire; remit oaths extorted from them; inveſt ſuch as poſſeſs fiefs of the empire, and decide in feudal matters relative thereto, &c. but he cannot grant to any perſon privileges detrimental to the rights of the immediate ſovereign of that perſon. He can alſo grant excluſive privileges for printing particular books, and for new-invented machines, &c. He appoints moſt of the officers, civil and military, of the empire, except ſuch as are hereditary; as the great chancellor, treaſurer, &c. but theſe are only honorary. In ancient times the emperor had conſiderable domains and incomes in the empire; but almoſt all theſe have been ſucceſſively mortgaged and alienated, ſo that at preſent the certain revenues of the emperor are very inconſiderable: but then, as he has the diſpoſal of moſt offices, the creation of princes and noblemen, is entitled to all confiſcations and forfeitures, and inveſts the ſeveral princes in their eſtates, beſides thoſe that hold fiefs of the empire in Italy, the profit of theſe articles may amount to a large ſum. He has alſo ſome offerings from the Jews, and the free giſts of the order of knights of the empire. A ſucceſſor in the empire is frequently choſen by the electors during the life of the emperor, who is ſtyled *king of the Romans*. He is elected and crowned in the ſame manner as the emperor; has the title of *majeſty*; takes precedence of all other kings in Chriſtendom; and ſucceeds of courſe at the emperor's death. Germany.

23 Powers of the emperor.

24 Arms of the empire. The arms of the empire are a black eagle with two heads, hovering with expanded wings in a field of gold; and over the heads of the eagle is ſeen the imperial crown.

25 The diet. The diet of the empire conſiſts of the emperor, the nine electors, the eccleſiaſtical and ſecular princes, and the deputies of imperial cities.. The electors are divided into ſpiritual and temporal. The ſpiritual electors are, the archbiſhops of Mentz, Triers, and Cologne; and the ſecular, thoſe of Bohemia, Palatine, Brandenburgh, Saxony, Bavaria, and Hanover. The ſpiritual electors are ſuch of courſe as ſoon as they are choſen to their ſees by their reſpective chapters. In the reign of Henry IV. the right of election is ſaid to have been introduced. Till the peace of Weſtphalia there were only ſeven electors, when an eighth was added; and, in 1692, a ninth, in favour of the illuſtrious houſe of Brunſwic Lunenburg, now in poſſeſſion of a much higher and infinitely more valuable dignity, viz. the crown of Great Britain. The ſpiritual are ſtyled by the emperor, *highly worthy nephews*; the temporal, *moſt illuſtrious uncles*. By the other members of the empire, the ſpiritual, who were not born princes, are ſtyled, *your electoral grace*; but ſuch as were, and alſo the temporal electors, have the appellation of, *your electoral ſerenity*. Foreign kings ſtyle the temporal electors, and thoſe of the ſpiritual who were princes born, *brothers*. The ſpiritual are alſo ſtiled, *highly and moſt worthy*; and the temporal, *moſt illuſtrious*.

26 Powers of the electors. The elector of Mentz is arch-chancellor of the holy Roman empire in Germany, and director of the electoral college. This prince notifies the death of an

Germany. emperor to his co-electors, appoints the diet of election, adminifters the oath to the electors or their envoys, collects their voices, proclaims the election, anoints the elected emperor, and either he or the elector of Cologne crowns him. He hears all grievances, and other matters, before the different colleges of the empire. He names a vice-chancellor of the empire, who takes an oath to him, as well as to the emperor. He appoints all officers for the chancery of the empire; has fupreme jurifdiction over them; as alfo the infpection of the archives of the empire, and the protection of the poft-office, in confequence of which his counfellors pay no poftage.

The elector of Treves is the arch-chancellor of the holy Roman empire in Gaul and the kingdom of Arles; but this at prefent is only a bare title. At an election of the king of the Romans, he has the firft voice; and, before the election, takes the oath of the elector of Mentz.

The elector of Cologne is arch-chancellor of the holy Roman empire in Italy. At an election of a king of the Romans, he has the fecond voice; and he crowns the emperor, when the coronation is at Aix-la-Chapelle, and in the archbifhopric of Cologne.

The king and elector of Bohemia is arch-cupbearer of the holy Roman empire, precedes all the temporal electors whatfoever, and has the third voice in the electoral college.

The elector of Bavaria is arch-fewer of the holy Roman empire. At the coronation he carries the monde before the emperor, ranks next to Bohemia, places four filver difhes, weighing twelve marks, on the imperial table, and ferves up the firft courfe.

The elector of Saxony is arch-marfhal of the holy Roman empire. He alfo, when there is no emperor, is one of the vicars of the empire. At the diets, and on other folemn occafions, he carries the fword of ftate before the emperor; and, at the coronation, he rides into a heap of oats, and fills a filver meafure with that grain. During the holding of the diets, he has jurifdiction over all electoral and other officers of the ftates of the empire, as alfo in criminal matters. When the fee of Mentz is vacant, he holds the directory of the diet, and the right of protection over the imperial city of Mullhaufen, and all trumpeters throughout the Roman empire.

The elector of Brandenburgh is arch-chamberlain of the holy Roman empire; carries the fceptre before the emperor, which he bears alfo in his coat of arms; prefents the emperor with water in a filver bafon in order to wafh himfelf; may proceed with refpect to his fiefs, principalities, and lands, as with allodial eftates; and, at his own pleafure, impofe new tolls, and erect mills on all rivers.

The elector Palatine was formerly arch-fewer, but fince the treaty of Weftphalia arch-treafurer. This houfe has the right of protection over all the braziers of a large diftrict, and throughout all Germany is protector of the order of St. John; can raife nobles and gentlemen to the degree of counts; and has the right of venery, by virtue of which, all illegitimate perfons, and others of foreign countries, who within a year and a day have no fucceeding lord, may be made bondfmen in fuch places as are fubject to his jurifdiction; fo that they muft bind themfelves to the duties of the electorate, and to the payment of a certain tribute and mortuaries. Germany.

When the elector of Bavaria was put under the ban of the empire in 1706, the Palatine recovered the office of arch-fewer, and the elector of Brunfwic Lunenburg obtained the office of arch-treafurer, by which he ftill ftiles himfelf, till another fuitable arch-office be conferred on him. He enjoys the alternate fucceffion in the bifhopric of Ofnaburgh, together with fome other rights and privileges.

Without the privity of thefe electors, the emperor can do nothing with regard to leagues and wars of the empire, alienations and mortgages of lands belonging to it, &c. At their inveftiture they pay no fees, and a new-elected emperor muft immediately confirm their privileges and dignities. The diets are held by the emperor, with the confent of the electors; and, at their defire, each elector enjoys a right of appointing two chamber-court affeffors, and their electorates have an unlimited privilege *de non appellando*. They may meet together, and hold what are called *electoral diets*. A fubject may be guilty of treafon againft them; and their whole electorates defcend to their firft-born. By the imperial capitulation, their envoys are to take place of princes in perfon.

Next to the electors are the princes of the empire, who are alfo partly fpiritual, and partly temporal. The fpiritual are archbifhops, bifhops, abbots, provofts, abbeffes, the mafters of the Teutonic order, and of St John; but of thefe, fome have each a voice, and others vote by colleges. The temporal princes are dukes, marquiffes, counts, vifcounts, and barons; of which, as among the fpiritual, the higher have fingle voices, but the lower vote by colleges.

Not only all thofe princes who have feat and voice in the diet, but many others, are veffed with fovereign power in their refpective territories, or at leaft are under very few reftraints. They are, indeed, more free and abfolute than fome crowned heads; but ftill they are fubject to the general laws of the empire, and fworn not to engage in any wars or alliances to the prejudice of the emperor and empire. But here it is to be obferved, that many have titles of nobility though they are no fovereigns, nor have any feat in the diets: fome, however, have a feat, that do not hold immediately of the emperor; or, which is the fame, are immediately fubject to fome other prince, and only mediately to the emperor. The Franks, in imitation of the Romans, reduced all Germany into provinces, over which they placed governors with different titles. They were generally of noble families; and, if there was no material objection againft it, their fons were appointed to fucceed them: from whence thefe governors came at length to infift on a right of fucceeding their anceftors, and refufed to pay homage to the German emperors, every one taking upon him to exercife regal power in his province; from whence have fprung up fo many petty fovereigns in the empire. Thefe officers were either *hertogen* or dukes, to whom were committed the government of the larger diftricts; *graffen*, or earls, who had the care of fmaller parts; *pfaltz-graven*, *pallfgraves*, or counts-palatine, who adminiftered juftice when in the verge of the court; *landgraves*, who were fet over provinces; *margraves*, or marquiffes, who were charged with

Germany. with the care of the marches or borders; and *burgraves*, who were governors of the royal caſtles and forts. The third college of the diet is that of the free or imperial cities, *i. e.* ſuch as are governed by magiſtrates of their own, and ſtand immediately under the emperor and empire. Some of theſe are wholly Catholic, others entirely Lutheran, and others again mixed. Within their territory they exerciſe ſupreme power; and are divided into two benches, the Rheniſh and Suabian. As the princes of the empire took advantage of the neceſſities or indulgence of the German emperors, to erect the governments they held in capacity of viceroys or governors, into independent principalities and ſtates, ſo did the cities now called *free* and *imperial*. The emperors, frequently wanting ſupplies of money to carry on wars, or for other occaſions, borrowed large ſums of the wealthy trading towns, and paid them again in munificent grants and privileges, making them free ſtates, and independent of the governors of the provinces where they ſtood: accordingly, theſe cities, like the princes, exerciſe all kinds of ſovereign power that are conſiſtent with the general laws of the empire; they make laws, conſtitute courts of juſtice, coin money, raiſe forces, and enter into alliances and confederacies; only acknowledging the emperor for their ſupreme lord, and contributing their ſhare towards the common defence of the empire.

27 Powers of the diet.

The diet meets at Ratiſbon on the emperor's ſummons, and any of the princes may ſend their deputies thither in their ſtead. The diet makes laws, raiſes taxes, determines differences between the ſeveral princes and ſtates, and can relieve ſubjects from the oppreſſions of their ſovereign: and there are two ſupreme councils, called the *aulic council*, and the *chamber of Witzlar*, to which any of the princes and ſtates, or their ſubjects, may appeal, when they apprehend themſelves aggrieved. The empire was anciently divided into ten circles; which diviſion was confirmed by the emperor Charles V. who ſettled the portion which every circle, and every prince and member of each circle, ſhould contribute towards the ordinary and extraordinary taxes of the empire. This was entered in a regiſter, called a *matriculation-book*, which is kept by the elector of Mentz. The taxes are either ordinary or extraordinary. The former is what is ſtyled the *chamber-terms*, or the money which each ſtate of the empire is to contribute annually for maintaining the chamber-judicatory of the emperor and empire. The latter are called *Roman months*, which are a certain rate of money or troops ſettled by the ſtates of the empire, and granted ſometimes to the emperor; as for inſtance, for the ſupport of the emperor, or of the army of the empire, or the forts thereof, or for the war againſt the Turks, the expences of an embaſſy of the empire, &c. By the matricula ſettled by Charles V. twelve florins were to be paid monthly in lieu of every horſeman, and four for every foot ſoldier. Afterwards it was enacted, that ſixty florins ſhould be advanced in lieu of every trooper wanting, and twelve for every footman; and theſe payments obtained the name of *Roman months*, becauſe the forces or money abovementioned were at firſt applied towards the forming a body of horſe and foot for ſix months, to conduct the emperor in his journey to Rome to receive the papal coronation. Germany.

28 Annual meetings of the ſtates.

Beſides the diet, there are yearly meetings of the ſtates of one, two, or three of the circles that lie neareſt to one another, called from thence *correſponding circles*; of which there are three claſſes: firſt, the Upper Rhine, Lower Rhine, and Weſtphalia; ſecondly, the Upper and Lower Saxony; and, thirdly, Franconia, Suabia, and Auſtria. That of Upper Saxony aſſembles uſually at Leipſic; that of Franconia at Nuremberg; and that of Suabia at Ulm. They treat of the regulation of their coin, the public peace, their treaſure, magazines, fortifications, and commerce, rectifying the matricula, putting the decrees of the empire in execution, and appointing judges of the imperial chamber of Witzlar or Spire, and of the aulic council at Vienna; and have power of enacting laws which are not inconſiſtent with the conſtitution of the empire. In every circle there are one or two directors, who ſummon the ſtates of the circle, and have the command of the militia when embodied, regulating their march, quarters, &c. and putting the decrees of the empire in execution, when any prince or member refuſes to comply with their reſolutions. It is to be obſerved here, that the Proteſtant eſtates of the empire, in the diets, are called the *evangelic body*, and have a director, viz. the elector of Saxony. Beſides the higher nobility, or high *adel* of the empire, conſiſting of princes, counts, &c. there is the lower *adel*, or rank of knighthood, which is very numerous in Germany.

29 Character of the ancient Germans.

With regard to the character of the ancient Germans, they are deſcribed to us by the Greek and Roman writers, as reſembling the Gauls, and differing from other nations by the largeneſs of their ſtature, ruddy complexion, blue eyes, and yellow buſhy hair, haughty and threatening looks, ſtrong conſtitutions, and being proof againſt hunger, cold, and all kinds of hardſhip.

Their native diſpoſition diſplayed itſelf chiefly in their martial genius, and in their ſingular fidelity. The former of theſe they did indeed carry to ſuch an exceſs, as came little ſhort of downright ferocity: but, as to the latter, they not only valued themſelves highly upon it, but were greatly eſteemed by other nations for it; inſomuch that Auguſtus, and ſeveral of his ſucceſſors, committed the guard of their perſons to them, and almoſt all other nations either courted their friendſhip and alliance, or hired them as auxiliaries: though it muſt be owned, at the ſame time, that their extreme love of liberty, and their hatred of tyranny and oppreſſion, have often hurried them to treachery and murder, eſpecially when they have thought themſelves ill uſed by thoſe who hired them; for, in all ſuch caſes, they were eaſily ſtirred up, and extremely vindictive. In other caſes, Tacitus tells us, they were noble, magnanimous, and beneficent, without ambition to aggrandize their dominions, or invading thoſe from whom they received no injury; rather chooſing to employ their ſtrength and valour defenſively, than offenſively; to preſerve their own, than to ravage their neighbours.

Their friendſhip and intercourſe was rather a compound of honeſt bluntneſs and hoſpitality, than of wit, humour, or gallantry. All ſtrangers were ſure

Germany. to meet with a kind reception from them, to the utmoſt of their ability: even thoſe who were not in a capacity to entertain them, made it a piece of duty to introduce them to thoſe who could; and nothing was looked upon as more ſcandalous and deteſtable, than to refuſe them either the one or the other. They do not ſeem, indeed, to have had a taſte for grand and elegant entertainments; they affected in every thing, in their houſes, furniture, diet, &c. rather plainneſs and ſimplicity, than ſumptuouſneſs and luxury. If they learned the Romans and Gauls the uſe of money, it was rather becauſe they found it more convenient than their ancient way of bartering one commodity for another; and then they preferred thoſe ancient coins which had been ſtamped during the times of the Roman liberty, eſpecially ſuch as were either milled or cut in the rims, becauſe they could not be ſo eaſily cheated in them, as in ſome others, which were frequently nothing but copper, or iron, plated over with ſilver. This laſt metal they likewiſe preferred before gold, not becauſe it made a greater ſhew, but becauſe it was more convenient for buying and ſelling: And as they became, in time, more feared by, or more uſeful to, the Romans; ſo they learned how to draw enough of it from them to ſupply their whole country, beſides what flowed to them from other nations.

As they deſpiſed ſuperfluities in other caſes, ſo they did alſo in the connubial way: every man was contented with one wife, except ſome few of their nobles, who allowed themſelves a plurality, more for ſhew than pleaſure; and both were ſo faithful to each other, and chaſte, true, and diſintereſted, in their conjugal affections, that Tacitus prefers their manners, in this reſpect, to thoſe of the Romans. The men fought not dowries from their wives, but beſtowed them upon them. Their youth, in thoſe cold climes, did not begin ſo ſoon to feel the warmth of love, as they do in hotter ones: it was a common rule with them, not to marry young; and thoſe were moſt eſteemed who continued longeſt in celibacy, becauſe they looked upon it as an effectual means to make them grow tall and ſtrong; and to marry, or be concerned with a woman, before they were full twenty-years old, was accounted ſhameful wantonneſs. The women ſhared with their huſbands not only the care of their family, and the education of their children, but even the hardſhips of war. They attended them in the field, cooked their victuals for them, dreſſed their wounds, ſtirred them up to fight manfully againſt their enemies, and ſometimes have by their courage and bravery recovered a victory when it was upon the point of being ſnatched from them. In a word, they looked upon ſuch conſtant attendance on them, not as a ſervitude, like the Roman dames, but as a duty and an honour. But what appears to have been ſtill an harder fate upon the ancient German dames was, that their great Odinus excluded all thoſe from his *valhalla*, or paradiſe, who did not, by ſome violent death, follow their deceaſed huſbands thither. Yet notwithſtanding their having been ancientely in ſuch high repute for their wiſdom, and ſuppoſed ſpirit of prophecy, and their continuing ſuch faithful and tender helpmates to their huſbands, they ſunk, in time, ſo low in their eſteem, that, according to the old Saxon law, he that hurt or killed a woman, was Germany. to pay but half the fine that he ſhould have done if he had hurt or killed a man.

39 Their funerals.

There is ſcarcely any one thing in which the Germans, though ſo nearly allied in moſt of their other cuſtoms to the Gauls, were yet more oppoſite to them than in their funerals. Thoſe of the latter were performed with great pomp and profuſion; thoſe of the former were done with the ſame plainneſs and ſimplicity which they obſerved in all other things: the only grandeur they affected in them was, to burn the bodies of their great men with ſome peculiar kinds of wood; but then the funeral pile was neither adorned with the cloaths and other fine furniture of the deceaſed, nor perfumed with fragant herbs and gums: each man's armour, that is, his ſword, ſhield, and ſpear, were flung into it, and ſometimes his riding-horſe. The Danes, indeed, flung into the funeral-pile of a prince, gold, ſilver, and other precious things, which the chief mourners, who walked, in a gloomy guiſe, round the fire, exhorted the byſtanders to fling liberally into it in honour of the deceaſed. They afterwards depoſited their aſhes in urns, like the Gauls, Romans, and other nations; as it plainly appears, from the vaſt numbers which have been dug up all over the country, as well as from the ſundry diſſertations which have been written upon them by ſeveral learned moderns of that nation. One thing we may obſerve, in general, that, whatever ſacrifices they offered for their dead, whatever preſents they made to them at their funerals, and whatever other ſuperſtitious rites they might perform at them, all was done in conſequence of thoſe excellent notions which their ancient religion had taught them, the immortality of the ſoul, and the bliſs or miſery of a future life.

31 Their belief of a future ſtate.

It is impoſſible, indeed, as they did not commit any thing to writing till very lately, and as none of the ancient writers have given us any account of it, to gueſs how ſoon the belief of their great Odin, and his paradiſe, was received among them. It may, for aught we know, have been older than the times of Tacitus, and he have known nothing of it, by reaſon of their ſcrupulous care in concealing their religion from ſtrangers: but as they conveyed their doctrines to poſterity by ſongs and poems, and moſt of the northern poets tell us that they have drawn their intelligence from thoſe very poems which were ſtill preſerved among them; we may rightly enough ſuppoſe, that whatever doctrines are contained in them, were formerly profeſſed by the generality of the nation, eſpecially ſince we find their ancient practice ſo exactly conformable to it. Thus, ſince the ſureſt road to this paradiſe was, to excel in martial deeds, and to die intrepidly in the field of battle; and ſince none were excluded from it but baſe cowards, and betrayers of their country; it is natural to think, that the ſignal and exceſſive bravery of the Germans flowed from this ancient belief of theirs: and, if their females were ſo brave and faithful, as not only to ſhare with their huſbands all the dangers and fatigues of war, but, at length, to follow them, by a voluntary death, into the other world; it can hardly be attributed to any thing elſe but a ſtrong perſuaſion of their being admitted to live with them in that place of bliſs. This belief, therefore, whether received originally from the old Celtes,

or

Germany. or afterwards taught them by the ſince deified Odin, ſeems, from their general practice, to have been univerſally received by all the Germans, though they might differ one from another in their notions of that future life.

The notion of a future happineſs obtained by martial exploits, eſpecially by dying ſword in hand, made them bewail the fate of thoſe who lived to an old age, as diſhonourable here, and hopeleſs hereafter: upon which account, they had a barbarous way of ſending them into the other world, willing or not willing. And this cuſtom laſted ſeveral ages after their receiving Chriſtianity, eſpecially among the Pruſſians and Venidi; the former of whom, it ſeems, diſpatched, by a quick death, not only their children, the ſick, ſervants, &c. but even their parents, and ſometimes themſelves: and among the latter we have inſtances of this horrid parricide being practiſed even in the beginning of the 14th century. All that need be added is, that, if thoſe perſons, thus ſuppoſed to have lived long enough, either deſired to be put to death, or, at leaſt, ſeemed chearfully to ſubmit to what they knew they could not avoid, their exit was commonly preceded with a faſt, and their funeral with a feaſt; but if they endeavoured to ſhun it, as it ſometimes happened, both ceremonies were performed with the deepeſt mourning. In the former, they rejoiced at their deliverance, and being admitted into bliſs; in the latter, they bewailed their cowardly excluding themſelves from it. Much the ſame thing was done towards thoſe wives, who betrayed a backwardneſs to follow their dead huſbands.

32 Remarkable for drinking to exceſs.

We muſt likewiſe obſerve, that, in theſe funerals, as well as in all their other feaſts, they were famed for drinking to exceſs; and one may ſay of them, above all the other deſcendents of the ancient Celtes, that their hoſpitality, banquets, &c. conſiſted much more in the quantity of ſtrong liquors, than in the elegance of eating. Beer and ſtrong mead, which were their natural drink, were looked upon as the chief promoters of health, ſtrength, fertility, and bravery; upon which account, they made no ſcruple to indulge themſelves to the utmoſt in them, not only in their feaſts, and eſpecially before an engagement, but even in their common meals.

33 Character of the modern Germans.

The modern Germans in their perſons are tall, fair, and ſtrong built. The ladies have generally fine complexions; and ſome of them, eſpecially in Saxony, have all the delicacy of features and ſhape that are ſo bewitching in a certain iſland of Europe.

Both men and women affect rich dreſſes, which in faſhion are the ſame as in France and England; but the better ſort of men are exceſſively fond of gold and ſilver lace, eſpecially if they are in the army. The ladies at the principal courts differ not much in their dreſs from the French and Engliſh, only they are not ſo exceſſively fond of paint as the former. At ſome courts they appear in rich furs; and all of them are loaded with jewels, if they can obtain them. The female part of the burghers families, in many German towns, dreſs in a very different manner, and ſome of them inconceivably fantaſtic, as may be ſeen in many prints publiſhed in books of travels: but in this reſpect they are gradually reforming, and many of them make quite a different appearance in their dreſs from what they did thirty or forty years ago. As to the peaſantry and labourers, they dreſs as in other parts of Europe, according to their employments, convenience, and opulence. In Weſtphalia, and moſt other parts of Germany, they ſleep between two featherbeds, or rather the upper one of down, with ſheets ſtitched to them, which by uſe becomes a very comfortable practice. The moſt unhappy part of the Germans are the tenants of little needy princes, who ſqueeze them to keep up their own grandeur; but, in general, the circumſtances of the common people are far preferable to thoſe of the French. Germany.

The Germans are naturally a frank, honeſt, hoſpitable people, free from artifice and diſguiſe. The higher orders are ridiculouſly proud of titles, anceſtry, and ſhew. The Germans, in general, are thought to want animation, as their perſons promiſe more vigour and activity than they commonly exert, even in the field of battle. But when commanded by able generals, eſpecially the Italians, ſuch as Montecuculi and prince Eugene, they have done great things, both againſt the Turks and the French. The imperial arms have ſeldom made any remarkable figure againſt either of thoſe two nations, or againſt the Swedes or Spaniards, when commanded by German generals. This poſſibly might be owing to the arbitrary obſtinacy of the court of Vienna; for in the two laſt wars the Auſtrians exhibited prodigies of military valour and genius.

Induſtry, application, and perſeverance, are the great characteriſtics of the German nation, eſpecially the mechanical part of it. Their works of art would be incredible were they not viſible, eſpecially in watch and clock making, jewellery, turnery, ſculpture, drawing, painting, and certain kinds of architecture. The Germans have been charged with intemperance in eating and drinking; and perhaps not unjuſtly, owing to the vaſt plenty of their country in wine and proviſions of every kind. But thoſe practices ſeem now to be wearing out. At the greateſt tables, though the gueſts drink pretty freely at dinner, yet the repaſt is commonly finiſhed by coffee, after three or four public toaſts have been drank. But no people have more feaſting at marriages, funerals, and birth-days.

The Geman nobility are generally men of ſo much honour, that a ſharper in other countries, eſpecially in England, meets with more credit if he pretends to be a German, than of any other nation.

The merchants and tradeſmen are very civil and obliging. All the ſons of noblemen inherit their fathers titles, which greatly perplexes the heralds and genealogiſts of that country. This perhaps is one of the reaſons why the German huſbands are not quite ſo complaiſant as they ought otherwiſe to be to their ladies, who are not entitled to any pre-eminence at the table; nor indeed do they ſeem to affect it, being far from either ambition or loquacity, though they are ſaid to be ſomewhat too fond of gaming. From what has been premiſed, it may eaſily be conceived, that many of the German nobility, having no other hereditary eſtate than a high-ſounding title, eaſily enter into their armies, and thoſe of other ſovereigns. Their fondneſs for title is attended with many other inconveniencies. Their princes think that the cultivation of their lands, tho' it may treble their revenue, is-

Germen, Germinatio

is below their attention; and that, as they are a ſpecies of beings ſuperior to labourers of every kind, they would demean themſelves in being concerned in the improvement of their grounds.

The domeſtic diverſions of the Germans are the ſame as in England; billiards, cards, dice, feucing, dancing, and the like. In ſummer, people of faſhion repair to places of public reſort, and drink the waters. As to their field-diverſions, beſides their favourite one of hunting, they have bull and bear-beating, and the like. The inhabitants of Vienna live luxuriouſly, a great part of their time being ſpent in feaſting and carouſing; and in winter, when the ſeveral branches of the Danube are frozen over, and the ground covered with ſnow, the ladies take their recreations in ſledges of different ſhapes, ſuch as griffins, tygers, ſwans, ſcollop-ſhells, &c. Here the lady ſits, dreſſed in velvet lined with rich furs, and adorned with laces and jewels, having on her head a velvet cap; and the ſledge is drawn by one horſe, ſtag, or other creatures ſet off with plumes of feathers, ribbons, and bells. As this diverſion is taken chiefly in the night-time, ſervants ride before the ſledge with torches, and a gentleman ſitting on the ſledge behind guides the horſe.

GERMEN, the ſeed-bud; defined by Linnæus to be the baſe of the piſtillum, which contains the rudiments of the ſeed; and, in progreſs of vegetation, ſwells and becomes the ſeed-veſſel.

In aſſimilating the vegetable and animal kingdoms, Linnæus denominates the ſeed-bud the *ovarium* or *uterus* of plants; and affirms its exiſtence to be chiefly at the time of the diſperſion of the male-duſt by the antheræ; as, after its impregnation, it becomes a ſeed-veſſel.

GERMEN, by Pliny and the ancient botaniſts, is uſed to ſignify a bud containing the rudiments of the leaves. See GEMMA.

GERMINATIO, among botaniſts, comprehends the preciſe time which the ſeeds take to riſe after they have been committed to the ſoil.—The different ſpecies of ſeeds are longer or ſhorter in riſing, according to the degree of heat which is proper to each. Millet, wheat, and ſeveral of the graſſes, riſe in one day; blite, ſpinach, beans, muſtard, kidney-beans, turneps, and rocket, in three days; lettuce and dill, in four; cucumber, gourd, melon, and creſs, in five; radiſh and beet, in ſix; barley, in ſeven; orach, in eight; purſlane, in nine; cabbage, in ten; hyſſop, in thirty; parſley, in forty or fifty days; peach, almond, walnut, cheſnut, pæony, horned-poppy, hypecoum, and ranunculus falcatus, in one year; roſe-buſh, cornel-tree, hawthorn, medlar, and hazel-nut, in two. The ſeeds of ſome ſpecies of orchis, and of ſome liliaceous plants, never riſe at all. Of ſeeds, ſome require to be ſowed almoſt as ſoon as they are ripe, otherwiſe they will not ſprout or germinate. Of this kind are the ſeeds of coffee and fraxinella. Others, particularly thoſe of the pea-bloom flowers, preſerve their germinating faculty for a ſeries of years.—Mr Adanſon aſſerts, that the ſenſitive plant retains that virtue for thirty or forty years.

Air and water are the agents of germination. The humidity of the air alone makes ſeveral ſeeds to riſe that are expoſed to it. Seeds too are obſerved to riſe in water, without the intervention of earth: but water, without air, is inſufficient.—Mr Homberg's experiments on this head are deciſive. He put ſeveral ſeeds under the exhauſted-receiver of an air-pump, with a view to eſtabliſh ſomething certain on the cauſes of germination. Some of them did not riſe at all; and the greateſt part of thoſe which did, made very weak and feeble productions. Gervaiſe of Gelner.

Thus it is for want of air that ſeeds which are buried at a very great depth in the earth, either thrive but indifferently, or do not riſe at all.

They frequently preſerve, however, their germinating virtue for many years, within the bowels of the earth; and it is not unuſual, upon a piece of ground being newly dug to a conſiderable depth, to obſerve it ſoon after covered with ſeveral plants, which had not been ſeen there in the memory of man.

Were this precaution frequently repeated, it would doubtleſs be the means of recovering certain ſpecies of plants which are regarded as loſt; or which perhaps, never coming to the knowledge of botaniſts, might hence appear the reſult of a new creation.

Some ſeeds require a greater quantity of air than others. Thus purſlane, which does not riſe till after lettuce in the free air, riſes before it *in vacuo*; and both proſper but little, or periſh altogether, whilſt creſſes vegetate as freely as in the open air.

GERVAISE, (or GERVASE), of Tilbury, a famous Engliſh writer of the 13th century; thus named from his being born at Tilbury on the Thames. He was nephew to Henry II. king of England; and was in great credit with Otho IV. emperor of Germany, to whom he dedicated a deſcription of the world, and a Chronicle. He alſo compoſed a hiſtory of England, that of the Holy Land, and other works.

GERUND, in grammar, a verbal noun of the neuter gender, partaking of the nature of a participle, declinable only in the ſingular number, through all the caſes except the vocative; as nom. *amandum*, gen. *amandi*, dat. *amando*, accuſ. *amandum*, abl. *amando*. The word is formed of the Latin *gerundivus*, and that from the verb *gerere*, "to bear."

The *gerund* expreſſes not only the *time*, but alſo the *manner*, of an action; as, "he fell in running poſt."—It differs from the participle, in that it expreſſes the *time*, which the participle does not; and from the tenſe properly ſo called, in that it expreſſes the *manner*, which the tenſe does not.

Grammarians are much embarraſſed to ſettle the nature and character of the *gerunds*. It is certain they are not verbs, nor diſtinct moods of verbs, in regard they do not mark any judgment, or affirmation of the mind, which is the eſſence of a verb. And, beſide, they have caſes; which verbs have not. Some, therefore, will have them to be adjectives paſſive, whoſe ſubſtantive is the infinitive of the verb: on this footing they denominate them *verbal nouns*, or names formed of verbs, and retaining the ordinary regimen thereof. Thus, ſay they, *tempus eſt legendi libros*, or *librorum*, is as much as to ſay, *tempus eſt ad legere libros*, vel *librorum*. But others ſtand up againſt this deciſion.

GESNER (Conrad), a celebrated phyſician and naturaliſt, was born at Zurich in 1516. Having finiſhed his ſtudies in France, he travelled into Italy, and taught medicine and philoſophy in his own country with extraordinary reputation. He was acquainted with the languages; and excelled ſo much in natural hiſtory, that he was ſurnamed the *Pliny of Germany*.

Geſtation || Ghent.

mary. He died in 1565, leaving many works behind him; the principal of which are, 1. A hiſtory of animals, plants, and foſſils; 2. *Bibliotheca Univerſalis*; 3. A Greek and Latin lexicon.

GESTATION, among phyſicians. See PREGNANCY.

GESTRICIA, a province of Sweden, bounded by Helſingia on the north, by the Bothnic gulph on the eaſt, by Upland on the ſouth, and by Dalecarlia on the weſt.

GESTURE, in rhetoric, conſiſts chiefly in the proper action of the hands and face. See DECLAMATION, n° xii. and ORATORY, n° 130, 131.

GETHIN (Lady Grace), an Engliſh lady of uncommon parts, was the daughter of Sir George Norton of Abbots-Leigh in Somerſetſhire, and born in the year 1676. She had all the advantages of a liberal education; and became the wife of Sir Richard Gethin, of Gethin-Grott in Ireland. She was miſtreſs of great accompliſhments, natural and acquired, but did not live long enough to diſplay them to the world; for ſhe died in the 21ſt year of her age. She was buried in Weſtminſter-abbay, where a beautiful monument with an inſcription is erected over; and, for perpetuating her memory, proviſion was made for a ſermon to be preached in Weſtminſter-abbey, yearly, on Aſh-Wedneſday for ever. She wrote, and left behind her, in looſe papers, a work, which, ſoon after her death, was methodized, and publiſhed under the title of "*Reliquiæ Gethinianæ*: or, Some remains of "the moſt ingenious and excellent lady, Grace lady "Gethin, lately deceaſed. Being a collection of choice "diſcourſes, pleaſant apophthegms, and witty ſen-"tences. Written by her, for the moſt part, by way "of eſſay, and at ſpare hours." Lond. 1700, 4to; with her picture before it.

GEUM, AVENS, or *Herb-Bennet*; a genus of the pentagynia order, belonging to the icoſandria claſs of plants. There are five ſpecies, of which the moſt remarkable are, 1. The urbanum, with thick fibrous roots of an aromatic taſte, rough, ſerrated leaves, and upright, round, hairy ſtalks terminated by large yellow flowers, ſucceeded by globular fruit. 2. The rivale, with a very thick, fleſhy, and fibrous root, hairy leaves, and upright ſtalks, 10 or 12 inches high, terminated by purple flowers nodding on one ſide. Of this there are varieties with red and with yellow flowers.—Both theſe are natives of Britain, and are eaſily propagated either by the root or ſeed. The roots of the firſt, gathered in the ſpring before the ſtem comes up, and infuſed in ale, give it a pleaſant flavour, and prevent its growing ſour. Infuſed in wine, they have a ſtomachic virtue. The taſte is mildly auſtere and aromatic, eſpecially when the plant grows in warm dry ſituations; but in moiſt ſhady places, it hath little virtue. Cows, goats, ſheep, and ſwine, eat the plant; horſes are not fond of it.—The powdered root of the ſecond ſpecies will cure tertian agues, and is daily uſed for that purpoſe by the Canadians. Sheep and goats eat the plant; cows, horſes, and ſwine, are not fond of it.

GHENT, a city of the Auſtrian Netherlands, capital of the province of Flanders. It is ſeated on four navigable rivers, the Scheld, the Lys, the Lieve, and the Moere, which run through it, and divide it into canals. Theſe form 26 little iſles, over which there are 300 bridges: among which there is one remarkable for a ſtatue of braſs of a young man who was obliged to cut off his father's head; but as he was going to ſtrike, the blade flew into the air, and the hilt remained in his hand, upon which they were both pardoned. There is a picture of the whole tranſaction in the town-houſe. Ghent is ſurrounded with walls and other fortifications, and is tolerably ſtrong for a place of its circumference. But all the ground within the walls is not built upon. The ſtreets are large and well paved, the market-places ſpacious, and the houſes built with brick. But the Friday's market-place is the largeſt, and is remarkable for the ſtatue of Charles V. which ſtands upon a pedeſtal in the imperial habit. That of Cortere is remarkable for a fine walk under ſeveral rows of trees. In 1737 a fine opera-houſe was built here, and a guard-houſe for the garriſon. Near the town is a very high tower, with a handſome clock and chimes. The great bell weighs 11,000 pounds. Ghent || Giant.

This town is famous for the pacifications ſigned here, in 1526, for ſettling the tranquillity of the Seventeen Provinces, which was afterwards confirmed by the king of Spain. It was taken by Lewis XIV. in 1678, who afterwards reſtored it. The French took poſſeſſion of it again after the death of Charles II. of Spain. In 1706, it was taken by the duke of Marlborough; and by the French, in 1708; but it was retaken the ſame year. Laſt of all, the French took it by ſurpriſe after the battle of Fontenoy; but at the peace of Aix la Chapelle, it was rendered back. This is the birth-place of John of Gaunt. It is very well ſeated for trade, on account of its rivers and canals. It carries on a great commerce in corn; and has linen, woollen, and ſilk manufactures. E. Long. 4. 0. N. Lat. 51. 24.

GIAGH, in chronology, a cycle of 12 years; in uſe among the Turks and Cathayans.

Each year of the giagh bears a name of ſome animal: the firſt, that of a mouſe; the ſecond, that of a bullock; the third, of a lynx or leopard; the fourth, of a hare; the fifth, of a crocodile; the ſixth, of a ſerpent; the ſeventh, of a horſe; the eighth, of a ſheep; the ninth, of a monkey; the tenth, of a hen; the eleventh, of a dog; and the twelfth, of a hog.

They alſo divide the day into 12 parts, which they call *giaghs*, and diſtinguiſh them by the name of ſome animals. Each giagh contains two of our hours, and is divided into eight kehs, as many as there are quarters in our hours.

GIALLOLINO, in natural hiſtory, a fine yellow pigment much uſed under the name of NAPLES YELLOW.

GIANT, a perſon of extraordinary bulk and ſtature.

The romances of all ages have furniſhed us with ſo many extravagant accounts of giants of incredible bulk and ſtrength, that the exiſtence of ſuch people is now generally diſbelieved. It is commonly thought, that the ſtature of man hath been the ſame in all ages; and ſome have even pretended to *demonſtrate* the impoſſibility of the exiſtence of giants mathematically. Of theſe our countryman M'Laurin hath been the moſt explicit. "In general, (ſays he), it will eaſily appear, that the efforts tending to deſtroy the coheſion of beams ariſing from

Giant. from their own gravity only, increaſe in the quadruplicate ratio of their lengths; but that the oppoſite efforts tending to preſerve their coheſion, increaſe only in the triplicate proportion of the ſame lengths. From which-it follows, that the greater beams muſt be in greater danger of breaking than the leſſer ſimilar ones; and that though a leſſer beam may be firm and ſecure, yet a greater ſimilar one may be made ſo long, that it will neceſſarily break by its own weight. Hence Galileo juſtly concludes, that what appears very firm, and ſucceeds very well in models, may be very weak and infirm, or even fall to pieces by its own weight, when it comes to be executed in large dimenſions according to the model.

"From the ſame principle he argues, that there are neceſſary limits in the operations of nature and art, which they cannot ſurpaſs in magnitude. Were trees of a very enormous ſize, their branches would fall by their own weight. Large animals have not ſtrength in proportion to their ſize; and if there were any land-animals much larger than thoſe we know, they could hardly move, and would be perpetually ſubject to the moſt dangerous accidents. As to the animals of the ſea, indeed, the caſe is different; for the gravity of the water in a great meaſure ſuſtains thoſe animals; and in fact, theſe are known ſometimes to be vaſtly larger than the greateſt land-animals. Nor does it avail againſt this doctrine to tell us, that bones have ſometimes been found which were ſuppoſed to have belonged to giants of immenſe ſize; ſuch as the ſkeletons mentioned by Strabo and Pliny, the former of which was 60 cubits high, and the latter 46: for naturaliſts have concluded on juſt grounds, that in ſome caſes theſe bones had belonged to elephants; and that the larger ones were bones of whales, which had been brought to the places where they were found by the revolutions of nature that have happened in paſt times. Though it muſt be owned, that there appears no reaſon why there may not have been men who have exceeded by ſome feet in height the talleſt we have ſeen."

It will eaſily be ſeen, that arguments of this kind can never be concluſive; becauſe, along with an increaſe of ſtature in any animal, we muſt always ſuppoſe a proportional increaſe in the coheſion of the parts of its body. Large works ſometimes fail when conſtructed on the plan of models, becauſe the coheſion of the materials whereof the model is made and of the large work are the ſame; but a difference in this reſpect will produce a very remarkable difference in the ultimate reſult. Thus, ſuppoſe a model is made of firwood, the model may be firm and ſtrong enough; but a large work made alſo of fir, when executed according to the plan of the model, may be ſo weak that it will fall to pieces with its own weight. If, however, we make uſe of iron for the large work inſtead of fir, the whole will be ſufficiently ſtrong, even though made exactly according to the plan of the model. The like may be ſaid with regard to large and ſmall animals. If we could find an animal whoſe bones exceeded in hardneſs and ſtrength the bones of other animals as much as iron exceeds fir, ſuch an animal might be of a monſtrous ſize, and yet be exceedingly ſtrong. In like manner, if we ſuppoſe the fleſh and bones of a giant to be greatly ſuperior in hardneſs and ſtrength to the bones of other men, the great ſize of his body will be Giant. no objection at all to his ſtrength. The whole of the matter, therefore, concerning the exiſtence of giants, muſt reſt on the credibility of the accounts we have from thoſe who pretend to have ſeen them, and not on any arguments drawn *a priori*.

In the ſcripture we are told of *giants*, who were produced from the marriages of the *ſons of God* with the *daughters of men*. But of this paſſage no ſufficient explanation hath yet been found: nor can we be ſure that the word tranſlated *giants* does there imply any extraordinary ſtature; ſeeing in other places it is explained by *falling away*, *revolting*, or *tranſgreſſing*. In other places of ſcripture, however, giants, with their dimenſions, are mentioned in ſuch a manner that we cannot poſſibly doubt; as in the caſe of Og king of Baſhan, and Goliath. In a memoir read before the Academy of Sciences at Rouen, M. Le Cat gives the following account of giants that are ſaid to have exiſted in different ages.

"Profane hiſtorians have given ſeven feet of height to Hercules their firſt hero; and in our days we have ſeen men eight feet high. The giant who was ſhewn in Rouen, in 1735, meaſured eight feet ſome inches. The emperor Maximin was of that ſize; Skenkius and Platerus, phyſicians of the laſt century, few ſeveral of that ſtature; and Goropius ſaw a girl who was ten feet high.—The body of Oreſtes, according to the Greeks, was eleven feet and a half; the giant Galbara, brought from Arabia to Rome under Claudius Cæſar, was near ten feet; and the bones of Secondilla and Puſio, keepers of the gardens of Salluſt, were but ſix inches ſhorter. Funnam, a Scotſman, who lived in the time of Eugene II. king of Scotland, meaſured eleven feet and a half: and Jacob le Maire, in his voyage to the ſtreights of Magellan, reports, that, on the 17th of December 1615, they found at Port Deſire ſeveral graves covered with ſtones; and having the curioſity to remove the ſtones, they diſcovered human ſkeletons of ten and eleven feet long. The chevalier Scory, in his voyage to the Pike of Teneriffe, ſays, that they found in one of the ſepulchre caverns of that mountain the head of a Guanche which had 80 teeth, and that the body was not leſs than 15 feet long. The giant Ferragus, ſlain by Orlando nephew of Charlemagne, was 18 feet high. Rioland, a celebrated anatomiſt, who wrote in 1614, ſays, that ſome years before there was to be ſeen in the ſuburbs of St Germain the tomb of the giant Iforet, who was 20 feet high. In Rouen, in 1509, in digging in the ditches near the Dominicans, they found a ſtone-tomb containing a ſkeleton whoſe ſkull held a buſhel of corn, and whoſe ſhin-bone reached up to the girdle of the talleſt man there, being about four feet long, and conſequently the body muſt have been 17 or 18 feet high. Upon the tomb was a plate of copper, whereon was engraved, "In this tomb lies the noble and puiſſant lord, the chevalier Ricon de Vallemont, and his bones." Platerus, a famous phyſician, declares, that he ſaw at Lucerne the true human bones of a ſubject which muſt have been at leaſt 19 feet high. Valence in Dauphiné boaſts of poſſeſſing the bones of the giant Bucart, tyrant of the Vivarais, who was ſlain by an arrow by the count De Cabillon his vaſſal. The Dominicans had a part of the ſhin-bone, with the articulation near

Giant. of the knee, and his figure painted in fresco, with an inscription, shewing that this giant was 22 feet and a half high, and that his bones were found in 1705, near the banks of the Morderi, a little river at the foot of the mountain of Cruffol, upon which (tradition says) the giant dwelt.

"January 11. 1613, some masons digging near the ruins of a castle in Dauphiné, in a field which (by tradition) had long been called *the giant's field*, at the depth of 18 feet discovered a brick-tomb 30 feet long, 12 feet wide, and 8 feet high; on which was a grey stone, with the words *Theutobochus Rex* cut thereon. When the tomb was opened, they found a human skeleton entire, 25 feet and a half long, 10 feet wide across the shoulders, and five feet deep from the breastbone to the back. His teeth were about the size each of an ox's foot, and his shin-bone measured four feet. —Near Mazarino, in Sicily, in 1516, was found a giant 30 feet high; his head was the size of an hogshead, and each of his teeth weighed five ounces. Near Palermo, in the valley of Mazara, in Sicily, a skeleton of a giant 30 feet long was found, in the year 1548; and another of 33 feet high, in 1550; and many curious persons have preserved several of these gigantic bones.

"The Athenians found near their city two famous skeletons, one of 34 and the other of 36 feet high.

"At Totu, in Bohemia, in 758, was found a skeleton, the head of which could scarce be encompassed by the arms of two men together, and whose legs, which they still keep in the castle of that city, were 26 feet long. The skull of the giant found in Macedonia, September 1691, held 210 pounds of corn.

"The celebrated Sir Hans Sloane, who treated this matter very learnedly, does not doubt these facts; but thinks the bones were those of elephants, whales, or other enormous animals.

"Elephants bones may be shewn for those of giants; but they can never impose on connoisseurs. Whales, which, by their immense bulk, are more proper to be substituted for the largest giants, have neither arms nor legs; and the head of that animal hath not the least resemblance to that of a man. If it be true, therefore, that a great number of the gigantic bones which we have mentioned have been seen by anatomists, and by them have been reputed real human bones, the existence of giants is proved."

With regard to the credibility of all, or any of these accounts, it is difficult to determine any thing. If, in any castle of Bohemia, the bones of a man's leg 26 feet in length are preserved, we have indeed a decisive proof of the existence of a giant, in comparison of whom most others would be but pigmies. Nor indeed could these bones be supposed to belong to an elephant; for an elephant itself would be but a dwarf in comparison of such an enormous monster. But if these bones were really kept in any part of Bohemia, it seems strange that they have not been frequently visited, and particular descriptions of them given by the learned who have travelled into that country.—It is certain, however, that there have been nations of men considerably exceeding the common stature. Thus, all the Roman historians inform us, that the Gauls and Germans exceeded the Italians in size, and it appears that the Italians in those days were of much the same stature with the people of the present age. Among these northern nations, it is also probable, that there would be as great differences in stature, as there are among the present race of men. If that can be allowed, we may easily believe that some of these barbarians might be called *giants*, without any great impropriety. Of this superiority of size, indeed, the historian Florus gives a notable instance in Teutobochus, abovementioned, king of the Teutones; who being defeated and taken prisoner by Marius, was carried in triumph before him at Rome, when his head reached above the trophies that were carried in the same procession. Giant.

But whether these accounts are credited or not, we are very certain, that the stature of the human body is by no means absolutely fixed. We are ourselves a kind of giants in comparison of the Laplander; nor are these the most diminutive people to be found upon the earth. The abbe la Chappe, in his journey into Siberia in order to observe the last transit of Venus, passed through a village inhabited by people called *Wottacks*, neither men nor women of whom were above four feet high. The accounts of the Patagonians also, which cannot be entirely discredited, render it very probable, that somewhere in South America there is a race of people very considerably exceeding the common size of mankind, and consequently that we cannot altogether discredit the relations of giants handed down to us by ancient authors; though what degree of credit we ought to give them, is not easy to be determined.

GIANTS-*Causeway*, a vast collection of Basaltic pillars in the county of Antrim in Ireland. See the article BASALTES.

The principal or grand causeway, for there are several less considerable and scattered fragments of similar workmanship, consists of a most irregular arrangement of many hundred thousands of columns of a black kind of rock, hard as marble: almost all of them are of a pentagonal figure, but so closely and compactly situated on their sides, though perfectly distinct from top to bottom, that scarce any thing can be introduced between them. The columns are of an unequal height and breadth; some of the highest, visible above the surface of the strand, and at the foot of the impending angular precipice, may be about 20 feet; they do not exceed this height, at least none of the principal arrangement. How deep they are fixed in the strand, was never yet discovered. This grand arrangement extends nearly 200 yards, visible at low water; how far beyond, is uncertain: from its declining appearance, however, at low water, it is probable it does not extend under water to a distance any thing equal to what is seen above. The breadth of the principal causeway, which runs out in one continued range of columns, is, in general, from 20 to 30 feet; at one place or two it may be nearly 40 for a few yards. In this account are excluded the broken and scattered pieces of the same kind of construction, that are detached from the sides of the grand causeway, as they do not appear to have ever been contiguous to the principal arrangement, though they have frequently been taken into the width; which has been the cause of such wild and dissimilar representations of this causeway, which different accounts have exhibited. The highest part of this causeway is the narrowest at the

Giant. very foot of the impending cliff, from whence the whole projects, where, for four or five yards, it is not above ten or fifteen feet wide. The columns of this narrow part incline from a perpendicular a little to the weſtward, and form a ſlope on their tops, by the very unequal height of the columns on the two ſides, by which an aſcent is made at the foot of the cliff, from the head of one column to the next above, *gradatim*, to the top of the great cauſeway, which, at the diſtance of half a dozen yards from the cliff, obtains a perpendicular poſition, and, lowering in its general height, widens to about 20 or between 20 and 30 feet, and for 100 yards nearly is always above water. The tops of the columns for this length being nearly of an equal height, they form a grand and ſingular parade, that may be eaſily walked on, rather inclining to the water's edge. But from high water-mark, as it is perpetually waſhed by the beating ſurges on every return of the tide, the platform lowers conſiderably, and becomes more and more uneven, ſo as not to be walked on but with the greateſt care. At the diſtance of 150 yards from the cliff, it turns a little to the eaſt for 20 or 30 yards, and then ſinks into the ſea. The figure of theſe columns is almoſt unexceptionably pentagonal, or compoſed of five ſides; there are but very few of any other figure introduced: ſome few there are of three, four, and ſix ſides, but the generality of them are five-ſided, and the ſpectator muſt look very nicely to find any of a different conſtruction: yet what is very extraordinary, and particularly curious, there are not two columns in ten thouſand to be found, that either have their ſides equal among themſelves, or whoſe figures are alike. Nor is the compoſition of theſe columns or pillars leſs deſerving the attention of the curious ſpectator. They are not of one ſolid ſtone in an upright poſition; but compoſed of ſeveral ſhort lengths, curiouſly joined, not with flat ſurfaces, but articulated into each other like ball and ſocket, or like the joints in the vertebræ of ſome of the larger kind of fiſh, the one end at the joint having a cavity, into which the convex end of the oppoſite is exactly fitted. This is not viſible, but by diſjoining the two ſtones. The depth of the concavity or convexity is generally about three or four inches. And what is ſtill farther remarkable of the joint, the convexity, and the correſpondent concavity, is not conformed to the external angular figure of the column, but exactly round, and as large as the ſize or diameter of the column will admit; and, conſequently, as the angles of theſe columns are, in general, extremely unequal, the circular edges of the joint are ſeldom coincident with more than two or three ſides of the pentagonal, and from the edge of the circular part of the joint to the exterior ſides and angles they are quite plain. It is ſtill farther very remarkable, likewiſe, that the articulations of theſe joints are frequently inverted; in ſome the concavity is upwards, in others the reverſe. This occaſions that variety and mixture of concavities and convexities on the tops of the columns, which is obſervable throughout the platform of this cauſeway, yet without any diſcoverable deſign or regularity with reſpect to the number of either. The length, alſo, of theſe particular ſtones, from joint to joint, is various: in general, they are from 18 to 24 inches long; and, for the moſt part, longer toward the bottom of the columns than nearer the top, and the articulation of the joints ſomething deeper. The ſize, or diameter, likewiſe, of the columns is as different as their length and figure; in general, they are from 15 to 20 inches in diameter. There are really no traces of uniformity or deſign diſcovered throughout the whole combination, except in the form of the joint, which is invariably by an articulation of the convex into the concave of the piece next above or below it; nor are there any traces of a finiſhing in any part, either in height, length, or breadth, of this curious cauſeway. If there is here and there a ſmooth top to any of the columns above water, there are others juſt by, of equal height, that are more or leſs convex or concave, which ſhew them to have been joined to pieces that have been waſhed or by other means taken off. And undoubtedly thoſe parts that are always above water have, from time to time, been made as even as might be; and the remaining ſurfaces of the joints muſt naturally have been worn ſmoother by the conſtant friction of weather and walking, than where the ſea, at every tide, is beating upon it and continually removing ſome of the upper ſtones and expoſing freſh joints. And farther, as theſe columns preſerve their diameters from top to bottom, in all the exterior ones, which have two or three ſides expoſed to view, the ſame may, with reaſon, be inferred of the interior columns, whoſe tops only are viſible. Yet what is very extraordinary, and equally curious, in this phenomenon, is, that notwithſtanding the univerſal diſſimilitude of the columns, both as to their figure and diameter, and though perfectly diſtinct from top to bottom, yet is the whole arrangement ſo cloſely combined at all points, that hardly a knife can be introduced between them either on the ſides or angles. And it is really a moſt curious piece of entertainment to examine the cloſe contexture and nice inſertion of ſuch an infinite variety of angular figures as are exhibited on the ſurface of this grand parade. From the infinite diſſimilarity of the figure of theſe columns, this will appear a moſt ſurpriſing circumſtance to the curious ſpectator; and would incline him to believe it a work of human art, were it not, on the other hand, inconceivable that the wit or invention of man ſhould conſtruct and combine ſuch an infinite number of columns, which ſhould have a general apparent likeneſs, and yet be ſo univerſally diſſimilar in their figure, as that, from the minuteſt examination, not two in ten or twenty thouſand ſhould be found, whoſe angles and ſides are equal among themſelves, or of the one column to thoſe of the other. That it is the work of nature, there can be no doubt to an attentive ſpectator, who carefully ſurveys the general form and ſituation, with the infinitely various figuration of the ſeveral parts of this cauſeway. There are no traces of regularity or deſign in the outlines of this curious phenomenon; which, including the broken and detached pieces of the ſame kind of workmanſhip, are extremely ſcattered and confuſed, and, whatever they might originally, do not, at preſent, appear to have any connection with the grand or principal cauſeway, as to any ſuppoſable deſign or uſe in its firſt conſtruction, and as little deſign can be inferred from the figure or ſituation of the ſeveral conſtituent parts. The whole exhibition is, indeed, extremely confuſed, diſuniform, and deſtitute of every appear- Giant.

ance

Giant, Gibbous.

ance of use or design in its original construction. But what, beyond dispute, determines its original to have been from nature, is, that the very cliffs, at a great distance from the causeway, especially in the bay to the eastward, exhibit, at many places, the same kind of columns, figured and jointed in all respects like those of the grand causeway: some of them are seen near to the top of the cliff, which in general, in these bays to the east and west of the causeway, is near 300 feet in height; others again are seen about midway, and at different elevations from the strand. A very considerable expoſure of them is seen in the very bottom of the bay to the eastward, near a hundred rods from the causeway, where the earth has evidently fallen away from them upon the strand, and exhibits a most curious arrangement of many of these pentagonal columns, in a perpendicular position, supporting, in appearance, a cliff of different strata of earth, clay, rock, &c. to the height of 150 feet or more, above. Some of these columns are between 30 and 40 feet high, from the top of the sloping bank below them; and, being longest in the middle of the arrangement, shortening on either hand in view, they have obtained the appellation of *organs*, from a rude likeneſs, in this particular to the exterior or frontal tubes of that instrument; and as there are few broken pieces on the strand near it, it is probable that the outside range of columns that now appears, is really the original exterior line, to the seaward, of this collection. But how far they extend internally into the bowels of the incumbent cliff, is unknown. The very substance, indeed, of that part of the cliff which projects to a point, between the two bays on the east and west of the causeway, seems compoſed of this kind of materials; for beſides the many pieces that are seen on the sides of the cliff that circulate to the bottom of the bays, particularly the eastern side, there is, at the very point of the cliff, and just above the narrow and highest part of the causeway, a long collection of them seen, whose heads or tops just appearing without the sloping bank, plainly shew them to be in an oblique position, and about half-way between the perpendicular and horizontal. The heads of these, likewise, are of mixed surfaces, convex and concave, and the columns evidently appear to have been removed from their original upright, to their present inclining or oblique position, by the sinking or falling of the cliff.

GIBBOUS, a term in medicine, denoting any protuberance or convexity of the body, as a person haunched or hump-backed.

Infants are much more subject to gibbosity than adults, and it oftener proceeds from external than internal causes. A fall, blow, or the like, frequently thus distorts the tender bones of infants. When it proceeds from an internal cause, it is generally from a relaxation of the ligaments that sustain the spine, or a caries of its vertebræ; though the spine may be inflected forward, and the vertebræ thrown out by a too strong and repeated action of the abdominal muscles. This, if not timely redreſſed, grows up and fixes as the bones harden, till in adults it is totally irretrievable: but when the diſorder is recent, and the person young, there are hopes of a cure. The common method is by a machine of paſteboard, wood, or steel, which is made to preſs principally on the gibbous part; and this by long wearing may set all right. The surgeons, however, have a different instrument, which they call a *croſs*, much more efficacious, though not quite so convenient in the wearing. By the use of this, the parts are always prevented from growing any worse, and are often cured. During the application of these assistances, the parts should be at times rubbed with hungary-water, spirit of lavender, or the like, and defended with a strengthening plaster. Gibbous Gibraltar.

GIBBOUS, in astronomy, a term used in reference to the enlightened parts of the moon, whilst she is moving from the first quarter to the full, and from the full to the last quarter: for all that time the dark part appears horned, or falcated; and the light one hunched out, convex, or gibbous.

GIBELINS, or GIBELLINS, a famous faction in Italy, opposite to another called the GUELPHS.

These two factions ravaged and laid waste Italy for a long series of years; so that the history of that country, for the space of two centuries, is no more than a detail of their mutual violences and slaughters. The Gibelins stood for the emperor against the pope: but concerning their origin and the reason of their names, we have but a very obscure account. According to the generality of authors, they rose about the year 1240, upon the emperor Fredrick II.'s being excommunicated by the pope Gregory IX. Other writers maintain, that the two factions arose ten years before, though still under the same pope and emperor. But the most probable opinion is that of Maimbourg, who says, that the two factions of Guelphs and Gibellins arose from a quarrel between two ancient and illustrious houses on the confines of Germany, that of the Henries of Gibeling, and that of the Guelphs of Adorf. See (*Hiſtory* of) ITALY.

GIBET, a machine in manner of a gallows, whereon notoriouscriminals, after execution, are hung in irons or chains, as spectacles *in terrorem*. See GALLOWS.—The word in French, *gibet*, properly denotes what we call gallows: it is supposed to come originally from the Arabic *gibel*, "mount, or elevation of ground;" by reason *gibets* are usually placed on hills or eminences.

GIBBET. See GIBET.

GIBRALTAR, a famous promontory, or rather peninsula, of Spain, lying in N. Lat. 35° 50′, W. Long. 5° 35′. To the ancients it was known by the name of *Calpe*, and was also called one of the *Pillars of Hercules*; by the Arabians it is called *Gebel Tarek*, that is, the Mount of Tarek, from *Tarek*, the name of the Saracen general who conquered Spain in the beginning of the eighth century. The whole is an immense rock, rising perpendicularly about 440 yards, measuring, from north to south, about two English miles, but not above one in breadth from east to west.—The town lies along the bay on the west side of the mountain on a decline; by which, generally speaking, the rains pass through it, and keep it clean. The old town was considerably larger than the new, which at present consists of between 4 and 500 houses. Many of the streets are narrow and irregular: the buildings are of different materials; some of natural stone out of the quarries, some of a factitious or artificial stone, and a few of brick. The people are supplied with fresh provisions chiefly from the coast of Barbary, with fruit,

Gibraltar. roots, and vegetables, of all sorts from thence, or from their own gardens. Besides what is properly called the town, there are several spacious and commodious public edifices erected; such as barracks for the soldiers, with apartments for their officers, magazines of different kinds, storehouses for provisions, &c. The inhabitants, exclusive of the British subjects dependent on the garrison, or who reside there from other motives, consist of some Spaniards, a few Portuguese, a considerable number of Genoese, and about as many Jews; making in the whole, according to Dr Campbell, between two and three thousand, without reckoning the garrison; though some make them much fewer. The town may be said to have two ports; the first lying to the north, and is proper only for small vessels; the other is very commodious for large vessels, and has a fine stone quay. The bay is very beautiful and capacious, being in breadth about five miles, and in depth eight or nine, with several small rivers running into it. It is very advantageous to the place. There is no ground to be found in the middle of it at an hundred fathoms depth, so that a squadron may lie there in great safety; the breezes from it are very refreshing; and it contributes likewise to the subsistence of the inhabitants, by supplying them with plenty of fish.

The strait of Gibraltar, through which the ocean passes into the Mediterranean, thereby dividing Europe from Africa, runs from west to east about 13 leagues. In this strait there are three remarkable promontories or capes on the Spanish side, and as many opposite to them on the Barbary side. The first of these, on the side of Spain, is cape Trefalgar, opposite to which is cape Spartel; and in the neighbourhood of this stood the fortress of Tangier, once in the possession of the British. The next on the Spanish side is Tarifa; and over against it lies Malabata, near the town of Alcafar, where the straits are about five leagues broad. Lastly, Gibraltar, facing the mountain of Abyla, near the fortress and town of Ceuta, which make the eastern entry of the straits.

The fortress of Gibraltar was formerly thought to be impregnable; but, in 1704, it was proposed by the two English Admirals Sir John Leake and Sir George Rooke, and by Prince George of Hesse Darmstadt, to attempt the reduction of it. The fleet entered the bay on the 21st of July; the prince landed a body of troops on the Isthmus, between the bay and the Mediterranean; the fleet cannonaded the town from the bay; and a detachment of English seamen having debarked at Europa point, with some loss, carried the outworks. This made such an impression on the inhabitants and the garrison, that the governor (the Marquis de Salinas) capitulated; and the Prince of Hesse took possession of the place on the 24th of the same month, with the loss of less than 100 men. The Spaniards, extremely sensible of the loss they had sustained, immediately sent an army of 10,000 men, under the command of the Marquis le Villadarias, to besiege it; and at the same time the Count de Thoulouse, who commanded the French fleet in the Mediterranean, put to sea in order to co-operate with the Spaniards. This produced the battle of Malaga, August 13th 1704, in which the French were defeated; though Sir George Rooke was in no condition to prosecute his victory, on account of his want of ammunition. The siege, however, went on, and the place was so much pressed, that if Sir John Leake, who was sent to its relief, had arrived one day later, the place had been inevitably lost. Five hundred Spaniards had bound themselves by an oath, either to become masters of Gibraltar, or to perish in the attempt. They had accordingly concealed themselves in some of the caves, of which there are many in the southern part of the promontory. The mountain had also at that time many trees upon it, by which the Spaniards ascended, and which were on that account afterwards cut down by the garrison. The enterprize of the Spaniards, however, did not succeed; for, having attempted to scale the walls, they were all to a man destroyed. Marshal de Tesse then joined the Spanish army, with a considerable body of French troops, and the siege was continued for six months longer; when the French fleet being defeated by Sir John Leake*, they were forced to turn the siege into a blockade. The excellent conduct, however, of Sir John Leake, and the Prince of Hesse Darmstadt, obliged them at last to abandon the enterprize. On the conclusion of the war, the fortress of Gibraltar was ceded to Britain, but without any territory; and ever since the Spaniards have fortified lines on the Isthmus, to prevent any communication between the garrison and the country. They have ever since continued to behold it with a jealous eye, and have meditated several attempts against it. In 1727 they again besieged it in form with a great army: but having made very little progress during four months, which they consumed before it, a cessation of arms took place; and no further attempt has been made till the present year (1779.)

Gibraltar, Gibson.

* See *Leake*.

The possession of Gibraltar is of very great consequence to Britain. It not only gives us the command of the Straits, and their navigation: but affords refreshment and accommodation to our fleets in time of war, and to our merchantmen at all times; which, to a maritime power, is of very great advantage. From its situation, it divides both the kingdoms of France and Spain; that is, it hinders a ready communication by sea between the different parts of these kingdoms. This, of course, hinders the conjunction of the fleets and squadrons with each other, or at least renders it so difficult as to be a perpetual check upon these ambitious powers. It awes also the piratical states of Barbary, and in like manner the emperor of Morocco; insomuch, that our commerce is more safe than that of any other European power, which gives us great advantages in point of freight. It is otherwise highly favourable to our trade in the Mediterranean and Levant. It procures us the respect of the Italian and other powers; who, though far distant from Britain, must consider this as an instance of her power to hurt or assist them. It also saves us the expence of squadrons and convoys, upon any disputes or disturbances that may happen among those powers, and which would otherwise be necessary for the protection of our navigation.

GIBSON (Richard), an English painter, commonly called the *Dwarf*, was originally page to a lady at Mortlake; who, observing that his genius led him to painting, had the generosity to get him instructed in the rudiments of that art. He devoted himself to Sir Lely's manner, and copied his pictures to

Gibſon. to admiration, eſpecially his portraits: his paintings in water-colours were alſo eſteemed. He was in great favour with Charles I. who made him his page of the back-ſtairs; and he had the honour to inſtruct in drawing queen Mary and queen Anne when they were princeſſes. He married one Mrs Anne Shepherd, who was alſo a dwarf; on which occaſion king Charles I. honoured their marriage with his preſence, and gave away the bride. Mr Waller wrote a poem on this occaſion, intitled "The Marriage of the Dwarfs;" in which are theſe lines:

"Deſign or chance makes others wive,
"But nature did this match contrive;
"Eve might as well have Adam fled,
"As ſhe deny'd her little bed
"To him, for whom heav'n ſeem'd to frame
"And meaſure out this only dame."

Mr Fenton, in his notes on this poem, obſerves that he had ſeen this couple painted by Sir Peter Lely; and that they were of an equal ſtature, each being three feet ten inches high. However, they had nine children, five of which arrived at maturity; theſe well proportioned, and of the uſual ſtandard of mankind. But what nature denied this couple in ſtature, ſhe gave them in length of days: for Mr Gibſon died in the 75th year of his age; and his wife, having ſurvived him almoſt 20 years, died in 1709, aged 89.

Gibson (Dr Edmund), biſhop of London, was born in Weſtmoreland, in 1669. He applied himſelf early and vigorouſly to learning, and diſplayed his knowledge in ſeveral writings and tranſlations, which recommended him to the patronage of archbiſhop Tenniſon. He was appointed domeſtic chaplain to his Grace; and we ſoon after find him rector of Lambeth, and archdeacon of Surry. Becoming thus a member of the convocation, he engaged in a controverſy, which was carried on with great warmth by the members of both houſes, and defended his patron's rights, as preſident, in eleven pamphlets; he then formed and completed his more comprehenſive ſcheme of the legal duties and rights of the Engliſh clergy, which was at length publiſhed under the title of *Codex Juris Eccleſiaſtici Anglicani*, in folio. Archbiſhop Tenſon dying in 1715, and Dr Wake biſhop of Lincoln being made archbiſhop of Canterbury, Dr Gibſon ſucceeded the latter in the ſee of Lincoln, and in 1720 was promoted to the biſhoprick of London. He now not only governed his dioceſe with the moſt exact regularity, but by his great care promoted the ſpiritual affairs of the Church of England colonies in the Weſt-Indies. He was extremely jealous of the leaſt of the privileges belonging to the church; and therefore, though he approved of the toleration of the Proteſtant Diſſenters, he continually guarded againſt all the attempts made to procure a repeal of the corporation and teſt acts; in particular, his oppoſition to thoſe licentious aſſemblies called *maſquerades*, gave great umbrage at court, and effectually excluded him from all further favours. He ſpent the latter part of his life in writing and printing paſtoral letters, viſitation-charges, occaſional ſermons, and tracts againſt the prevailing immoralities of the age. His paſtoral letters are juſtly eſteemed as the moſt maſterly productions againſt infidelity and enthuſiaſm. His moſt celebrated work, the *Codex*, has been already mentioned. His other publications are, 1. An edition of Drummond's *Polemo Middiana*, and James V. of Scotland's *Cantilena Ruſtica*, with notes. 2. The *Chronicon Saxonicum*, with a Latin tranſlation, and notes. 3. *Reliquiæ Spelmannianæ*, the poſthumous works of Sir Henry Spelman, relating to the laws and antiquities of England. 4. An edition of *Quintilian de Arte Oratoria*, with notes. 5. An Engliſh tranſlation of Camden's *Britannia*, with additions, two volumes folio: and, 5. A number of ſmall pieces, that have been collected together and printed in three volumes folio.—His intenſe application to ſtudy impaired his his health; notwithſtanding which, he attained the age of 79. He expired in September 1748, after an epiſcopate of near 33 years. Gibſon of Gilbert.

With regard to biſhop Gibſon's private life and character, he was in every reſpect a perfect œconomiſt. His abilities were ſo well adapted to diſcharge the duties of his ſacred function, that, during the incapacity of archbiſhop Wake, the tranſaction of eccleſiaſtical affairs was committed to the biſhop of London. He was a true friend to the eſtabliſhed church and government, and as great an enemy to perſecution. He was uſually conſulted by the moſt learned and exalted perſonages in church and ſtate, and the greateſt deference was paid to his judgment. He poſſeſſed the ſocial virtues in an eminent degree; his beneficence was very extenſive; and had ſuch generoſity, that he freely gave two thouſand five hundred pounds, left him by Dr Crow, who was once his chaplain, to Crow's own relations, who were very poor.

GIFT, *Donum*, in law, is a conveyance which paſſeth either lands or goods; and is of a larger extent than a grant, being applied to things moveable and immoveable; yet as to things immoveable, when taken ſtrictly, it is applicable only to lands and tenements given in tail; but *gift*, and *grant*, are too often confounded.

GIGG, Giga, or Jigg; a gay, briſk, and ſprightly compoſition; and yet in full meaſure, as well as the allemande, which is more ſerious.—Menage takes the word to ariſe from the Italian *giga*, a muſical inſtrument mentioned by Dante.

GILAN, or Ghilan, a conſiderable province of Aſia, in Perſia, lying on the ſide of the Caſpian ſea, and to the S. W. of it. It is ſuppoſed to be the Hyrcania of the ancients. It is very agreeably ſituated, having the ſea on one ſide, and high mountains on the other; and there is no entering in but through narrow paſſes, which may eaſily be defended. The ſides of the mountains are covered with many ſorts of fruit-trees, and in the higheſt parts of them there are deer, bears, wolves, leopards, and tygers; which laſt the Perſians have a method of taming, and hunt with them as we do with dogs.—Gilan is one of the moſt fruitful provinces of all Perſia; and produces abundance of ſilk, oil, wine, rice, and tobacco, beſides excellent fruits. The inhabitants are brave, and of a better complexion than the other Indians, and the women are accounted extremely handſome. Reſht is the capital town.

GILBERT, or Gilberd, (William), a phyſician, was born at Colcheſter, in the year 1540, the eldeſt ſon of the recorder of that borough. Having ſpent ſome time in both univerſities, he went abroad; and

Gilbert. and at his return settled in London, where he practised with considerable reputation. He became a member of the college of physicians, and physician in ordinary to Queen Elizabeth, who, we are told, gave him a pension to encourage him in his studies. From his epitaph it appears that he was also physician to King James I. He died in the year 1603, aged 63; and was buried in Trinity-church in Colchester, where a handsome monument was erected to his memory. His books, globes, instruments, and fossils, he bequeathed to the college of physicians, and his picture to the school-gallery at Oxford. He wrote, 1. *De magnete, magneticeque corporibus, et de magno magnete tellure, physiologia nova*; London 1900, folio. 2. *De mundo nostro sublunari, philosophia nova*; Amsterdam 1651, 4to. He was also the inventor of two mathematical instruments for finding the latitude at sea without the help of sun, moon, or stars. A description of these instruments was afterwards published by Thomas Blondeville in his *Theoriques of the planets*.

GILBERT (Sir Humphrey), a brave officer, and skilful navigator, was born about the year 1539, in Devonshire, of an ancient and honourable family. Though a second son, he inherited a considerable fortune from his father. He was educated at Eaton, and afterwards at Oxford; where probably he did not continue long, as he hath escaped the industrious Anthony Wood. It seems he was intended to finish his studies in the Temple; but, being introduced at court by his aunt Mrs Catharine Ashley, then in the queen's service, he was diverted from the study of the law, and commenced soldier. Having distinguished himself in several military expeditions, particularly that to Newhaven in 1563, he was sent over to Ireland to assist in suppressing a rebellion; where, for his signal services, he was made commander in chief and governor of Munster, and knighted by the lord deputy, Sir Henry Sidney, on the first day of the year 1570. He returned soon after to England, where he married a rich heiress. Nevertheless, in 1572, he sailed with a squadron of nine ships, to reinforce Colonel Morgan, who at that time meditated the recovery of Flushing.

Probably on his return to England he resumed his cosmographical studies, to which he was naturally inclined: for, in the year 1576, he published his book on the North-west passage to the East Indies; and as Martin Frobisher sailed the same year, probably it was in consequence of this treatise. In 1578, he obtained from the queen a very ample patent, empowering him to discover and possess in North America any lands then unsettled. He sailed to Newfoundland, but soon returned to England without success: nevertheless, in 1583, he embarked a second time with five ships, the largest of which put back on account of a contagious distemper on board. Our general landed on Newfoundland on the third of August, and on the fifth took possession of the harbour of St John's. By virtue of his patent, he granted leases to several people; but, though none of them remained there at that time, they settled afterwards in consequence of these leases: so that Sir Humphrey deserves to be remembered as the real founder of our vast American empire. On the 20th of August, he put to sea again, on board a small sloop; which on the 29th foundered in a hard gale of wind. Thus perished Sir Humphrey Gilbert; a man of quick parts, a brave soldier, a good mathematician, a skilful navigator, and of a very enterprising genius. We learn also, that he was remarkable for his eloquence, being much admired for his patriotic speeches both in the English and Irish parliaments. He wrote "A discourse to prove a passage by the north-west to Cathaia and the East Indies, printed Lond. 1576." This treatise, which is a masterly performance, is preserved in Hakluyt's collection of voyages, vol. iii. p. 11. The style is superior to most, if not to all, the writers of that age; and shews the author to have been a man of considerable reading. He mentions, at the close of this work, another treatise, on Navigation, which he intended to publish: it is probably lost. Gilbertines, Gilchrist

GILBERTINES, a religious order founded in England by St Gilbert, in the reign of Henry I. The nuns followed the rule St Benedict, and the monks that of Augustin. There were many monasteries of this order in different parts of England.

GILCHRIST (Dr Ebenezer), an eminent Scots physician, was born at Dumfries in 1707. He began the study of medicine at Edinburgh, which he afterwards prosecuted at London and Paris. He obtained the degree of doctor of medicine from the university of Rheims; and in the year 1732, he returned to the place of his nativity, where he afterwards constantly resided, and continued the practice of medicine till his death.

It may with justice be said, that few physicians of the present century have exercised their profession in a manner more respectable or successful than Dr Gilchrist; and few have contributed more to the improvement of the healing art. Having engaged in business in an early period of life, his attention was wholly devoted to observation. Endowed by nature with a judgment acute and solid, with a genius active and inventive, he soon distinguished himself by departing, in various important particulars, from established but unsuccessful modes of practice. Several of the improvements which he introduced have procured him great and deserved reputation, both at home and abroad.

His practice, in ordinary cases, was allowed to be judicious, and placed him high in the confidence and esteem of the inhabitants of that part of the country where he lived. But his usefulness was not confined to his own neighbourhood. On many occasions he was consulted by letter from the most distant parts of the country.

In different collections are to be found several of his performances, which prove that he had something new and useful to offer upon every subject to which he applied himself. But those writings which do him the greatest honour, are two long dissertations on Nervous Fevers, in the Medical Essays and Observations published by a Society in Edinburgh; and a treatise on the use of Sea-voyages in medicine, which first made its appearance in the year 1757, and was afterwards re-printed in 1771. By means of the former, the attention of physicians was first turned to a species of fever which is now found to prevail universally in this country; and the liberal use of wine, which he was the first among the moderns to recommend, has since been adopted in these fevers by the most judicious physicians of the present age, and has probably contributed

not

Gild || Gilding

not a little to the success of their practice. His treatise on Sea-voyages points out in a manner so clear, and so much on the sure footing of experience, their utility in various distempers, particularly in consumptions, that there is now a prospect of our being able to employ a remedy in this untractable disease much more efficacious than any hitherto in use. Dr Gilchrist died in 1774.

GILD, or GUILD. See GUILD.

GILDAS (surnamed *the Wise*), was born in Wales, in the year 511. Where he was educated is uncertain; but it appears from his own writings that he was a monk. Some writers say that he went over to Ireland; others, that he visited France and Italy. They agree however in asserting, that after his return to England, he became a celebrated and most assiduous preacher of the gospel. Du Pin says he founded a monastery at Venetia in Britain. Gildas is the only British author of the sixth century, whose works are printed; they are therefore valuable on account of their antiquity, and as containing the only information we have concerning the times of which he wrote. His *History of Britain* is, however, a very flimsy performance, and his style obscure and inelegant.

GILDING, the art of spreading or covering a thing over with gold, either in leaf or liquid. The art of gilding was not unknown among the ancients, though it never arrived among them at the perfection to which the moderns have carried it.

1 Gilding when first introduced at Rome.

Pliny assures us, that the first gilding seen at Rome, was after the destruction of Carthage, under the censorship of Lucius Mummius, when they began to gild the ceilings of their temples and palaces; the Capitol being the first place on which this enrichment was bestowed. But he adds, that luxury advanced on them so hastily, that in a little time you might see all, even private and poor persons, gild the very walls, vaults, &c. of their houses.

We need not doubt but they had the same method with us, of beating gold, and reducing it into leaves; though it should seem they did not carry it to the same height, if it be true which Pliny relates, that they only made 750 leaves of four fingers square out of a whole ounce. Indeed he adds, that they could make more; that the thickest were called *bracteæ Prænestinæ*, by reason of a statue of the goddess Fortune at Præneste gilt with such leaves; and that the thinner fort were called *bracteæ questoriæ*.

The modern gilders do also make use of gold-leaves of divers thicknesses; but there are some so fine, that a thousand do not weigh above four or five drachms. The thickest are used for gilding on iron, and other metals; and the thinnest, on wood. But we have another advantage over the ancients, in the manner of using or applying the gold: the secret of painting in oil, discovered of late ages, furnishes us with means of gilding works that shall endure all the injuries of time and weather, which to the ancients was impracticable. They had no way to lay the gold on bodies that would not endure the fire, but with whites of eggs, or size; neither of which will endure the water: so that they could only gild such places as were sheltered from the moisture of the weather.

2 Ancient gilding inferior to the modern.

The Greeks called the composition on which they applied their gilding on wood, *leucophæum* or *leucophorum*; which is described as a sort of glutinous, compound earth, serving, in all probability, to make the gold stick, and bear polishing. But the particulars of this earth, its colour, ingredients, &c. the antiquaries and naturalists are not agreed upon. Gilding.

The lustre and beauty of gold have occasioned several inquiries and discoveries concerning the different methods of applying it to different substances. Hence the art of gilding is very extensive, and contains many particular operations and various management.

3 False gilding with laquer or Dutch-leaf.

A colour of gold is given by painting and by varnishes, without employing gold; but this is a false kind of gilding. Thus a very fine golden colour is given to brass and to silver, by applying upon these metals a gold-coloured varnish, which, being transparent, shews all the brilliancy of the metals beneath. Many ornaments of brass are varnished in this manner, which is called *gold lacquering*, to distinguish them from those which are really gilt. Silver-leaves thus varnished are put upon leather, which is then called *gilt leather*. See LACQUER.

Amongst the false gilding may also be reckoned those which are made with thin leaves of copper or brass, called *Dutch-leaf*. In this manner are made all the kinds of what is called *gilt paper*.

In the true gilding, gold is applied to the surface of bodies. The gold intended for this purpose ought in general to be beat into thin leaves, or otherwise divided into very fine parts.

4 Gilding with size.

As metals cannot adhere well merely by contact to any but to other metallic substances, when gold is to be applied to the surface of some unmetallic body, that surface must be previously covered with some gluey and tenacious substance, by which the gold shall be made to adhere. These substances are in general called *sizes*. Some of these are made of vegetable and animal glues, and others of oily, gluey, and drying matters. Upon them the leaves of gold are applied, and pressed down with a little cotton or a hare's foot; and when the whole is dry, the work is to be finished and polished with a hard instrument, called a *dogs-tooth*, to give lustre.

5 With oil.

When the work is required to be capable of resisting rain or moisture, it ought to be previously covered with a composition of drying oil and yellow ochre ground together; otherwise a water-size may be used, which is prepared by boiling cuttings of parchment or white leather in water, and by mixing with this some chalk or whiting: several layers of this size must be laid upon the wood, and over these a layer of the same size mixed with yellow ochre. Lastly, another mixture, called *gold size*, is to be applied above these; upon which the gold-leaves are to be fixed. This gold size, the use of which is to make the gold-leaf capable of being burnished, is composed of tobacco-pipe clay, ground with some ruddle or black lead, and tempered with a little tallow or oil of olives. The edges of glasses may be gilt by applying, first, a very thin coat of varnish, upon which the gold-leaf is to be fixed; and when the varnish is hardened, may be burnished. This varnish is prepared by boiling powdered amber with linseed oil in a brass vessel to which a valve is fitted, and by diluting the above solution with four or five times its quantity of oil of turpentine; and that it may dry sooner, it may be ground with some white lead.

The

Gilding.

6 Of gilding metals.

The method of applying gold upon metals is entirely different. The furface of the metal to be gilt is firft to be cleaned; and then leaves are to be applied to it, which, by means of rubbing with a polifhed bloodftone, and a certain degree of heat, are made to adhere perfectly well. In this manner filver-leaf is fixed and burnifhed upon brafs in the making of what is called *French plate*, and fometimes alfo gold-leaf is burnifhed upon copper and upon iron.

Gold is applied to metals in feveral other manners. One of thefe is by previoufly forming the gold into a paffe or amalgam with mercury. In order to obtain a fmall amalgam of gold and mercury, the gold is firft to be reduced into thin plates or grains, which are heated red-hot, and thrown into mercury previoufly heated, till it begins to fmoke. Upon ftirring the mercury with an iron rod, the gold totally difappears. The proportion of mercury to gold is generally as fix or eight to one.

With this amalgam the furface of the metal to be gilded is to be covered; then a fufficient heat is to be applied to evaporate the mercury; and the gold is laftly to be burnifhed with a blood-ftone.

This method of gilding by amalgamation is chiefly ufed for gilding copper, or an allay of copper, with a fmall portion of zinc, which more readily receives the amalgam; and is alfo preferable for its colour, which more refembles that of gold than the colour of copper. When the metal to be gilt is wrought or chafed, it ought to be previoufly covered with quickfilver, before the amalgam is applied, that this may be eafier fpread: but when the furface of the metal is plain, the amalgam may be applied directly to it. The quickfilver or amalgam is made to adhere to the metal by means of a little aquafortis, which is rubbed on the metallic furface at the fame time, by which this furface is cleanfed from any ruft or tarnifh which might prevent the union or adhefion of the metals. But the ufe of the nitrous acid in this operation is not, as is generally fuppofed, confined merely to cleanfe the furface of the metal to be gilt from any ruft or tarnifh it may have acquired; but it alfo greatly facilitates the application of the amalgam

7 Ufe of the nitrous acid in gilding.

to the furface of that metal, probably in the following manner: It firft diffolves part of the mercury of the amalgam; and when this folution is applied to the copper, this latter metal having a ftronger difpofition to unite with the nitrous acid than the mercury has, precipitates the mercury upon its furface, in the fame manner as a polifhed piece of iron precipitates upon its furface copper, from a folution of blue vitriol. When the metal to be gilt is thus covered over with a thin precipitated coat of mercury, it readily receives the amalgam. In this folution and precipitation of mercury, the principal ufe of the nitrous acid in the procefs of gilding appears to conffift. The amalgam being equally fpread over the furface of the metal to be gilt, by means of a brufh, the mercury is then to be evaporated by a heat juft fufficient for that purpofe; for if it be too great, part of the gold may alfo be expelled, and part of it will run together, and leave fome of the furface of the metal bare: while the mercury is evoporating, the piece is to be, from time to time, taken from the fire, that it may be examined, that the amalgam may be fpread more equally by means of a brufh, that any defective parts of it may be again covered, and that the heat may not be too fuddenly applied to it: when the mercury is evaporated, which is known by the furface being entirely become of a dull yellow colour, the metal muft then undergo other operations, by which the fine gold-colour is given to it. Firft, the gilded piece of metal is rubbed with a fcratch-brufh (which is a brufh compofed of brafs wire) till its furface is made fmooth; then it is covered over with a compofition called *gilding wax*, and is again expofed to the fire till the wax be burnt off. This wax is compofed of bees-wax, fometimes mixed with fome of the following fubftances; red ochre, verdegrife, copper-fcales, alum, vitriols, borax: but, according to Dr Lewis, the faline fubftances alone are fufficient, without any wax. By this operation the colour of the gilding is heightened; and this effect feems to be produced by a perfect diffipation of fome mercury remaining after the former operation. This diffipation is well effected by this equable application of heat. The gilt furface is then covered over with a faline compofition conffifting of nitre, alum, or other vitriolic falt, ground together, and mixed up into a paffe with water or urine. The piece of metal thus covered is expofed to a certain degree of heat, and then quenched in water. By this method its colour is further improved, and brought nearer to that of gold. This effect feems to be produced by the acid of nitre (which is difengaged by the vitriolic acid of the alum or other vitriolic falt during the expofure to heat) acting upon any particles of copper which may happen to lie on the gilded furface. Laftly, fome artifts think that they give an additional luftre to their gilt-work by dipping it in a liquor prepared by boiling fome yellow materials, as fulphur, orpiment, or turmeric. The only advantage of this operation is, that a part of the yellow matter, as the fulphur, or turmeric, remains in fome of the hollows of the carved work, in which the gilding is apt to be more imperfect, and to which it gives a rich and folid appearance.

Iron cannot be gilt by amalgamation, unlefs, as it is faid, it be previoufly coated with copper by dipping in a folution of blue vitriol. Iron may alfo receive a golden coat from a faturated folution of gold in aquaregia, mixed with fpirit of wine, the iron having a greater affinity with the acid, from which it therefore precipitates the gold. Whether any of thefe two methods be applicable to ufe, is uncertain: but the method commonly employed of fixing gold upon iron is that abovementioned, of burnifhing gold-leaf upon this metal when heated fo as to become blue; and the operation will be more perfect, if the furface has been previoufly fcratched or graved.

Another method is mentioned by authors of gilding upon metals, and alfo upon earthen ware, and upon glafs; which is, to fufe gold with regulus of antimony, to pulverize the mafs which is fufficiently brittle to admit that operation, to fpread this powder upon the piece to be gilt, and expofe it to fuch a fire that the regulus may be evaporated, while the gold remains fixed. The inconveniencies of this method, according to Dr Lewis, are, that the powder does not adhere to the piece, and cannot be equally fpread; that part of the gold is diffipated along with the regulus; that glafs is fufible with the heat neceffary for the evaporation of regulus of antimony; and that copper

is

Gilding.

Gilding. is liable to be corroded by the regulus, and to have its furface rendered uneven.

8 Improvements by Dr Lewis.

On the fubject of gilding by amalgamation Dr Lewis has the following remarks. "There are two principal inconveniencies in this bufinefs: One, that the workmen are expofed to the fumes of the mercury, and generally, fooner or later, have their health greatly impaired by them: the other, the lofs of the mercury; for tho' part of it is faid to be detained in cavities made in the chimney for that purpofe, yet the greateft part of it is loft. From fome trials I have made, it appeared that both thefe inconveniencies, particularly the firft and moft confiderable one, might in good meafure be avoided, by means of a furnace of a due conftruction. If the communication of a furnace with its chimney, inftead of being over the fire, is made under the grate, the afh-pit door or other apertures beneath the grate clofed, and the mouth of the furnace left open; the current of air, which otherwife would have entered beneath, enters now at the top, and, paffing down thro' the grate to the chimney, carries with it completely both the vapour of the fuel, and the fumes of fuch matters as are placed upon it: the back part of the furnace fhould be raifed a little higher above the fire than the fore part, and an iron plate laid over it, that the air may enter only at the front, where the workman ftands, who will be thus effectually fecured from the fumes, and from being incommoded by the heat, and at the fame time have full liberty of introducing, infpecting, and removing the work. If fuch a furnace is made of ftrong forged (not milled) iron plate, it will be fufficiently durable: the upper end of the chimney may reach above a foot and a half higher than the level of the fire: over this is to be placed a larger tube, leaving an interval of an inch or more all round between it and the chimney, and reaching to the height of 10 or 12 feet, the higher the better. The external air, paffing up between the chimney and the outer pipe, prevents the latter from being much heated, fo that the mercurial fumes will condenfe againft its fides into running quickfilver, which, falling down to the bottom, is there catched in a hollow rim formed by turning inwards a portion of the lower part, and conveyed, by a pipe at one fide, into a proper receiver.

Phil. Com. of Arts.

9 Mr Du Fay's method of raifing gold figures.

"Mr Hellot communicates, in the Memoirs of the French Academy for the year 1745, a method of making raifed figures of gold on works of gold or filver, found among the papers of Mr du Fay, and of which Mr du Fay himfelf had feen feveral trials. Fine gold in powder (fuch as refults from the parting of gold and filver by aquafortis, is directed to be laid in a heap on a levigating ftone, a cavity made in the middle of the heap, and half its weight of pure mercury put into the cavity: fome of the fetid fpirit, obtained from garlick root by diftillation in a retort, is then to be added, and the whole immediately mingled and ground with a muller, till the mixture is reduced into an uniform grey powder. The powder is to be ground with lemon juice to the confiftence of paint, and applied on the piece previoufly well cleaned and rubbed over with the fame acid juice: the figures drawn with it may be raifed to any degree by repeating the application. The piece is expofed to a gentle fire till the mercury is evaporated fo as to leave the gold yellow, which is then to be preffed down, and rubbbed with the finger and a little fand, which makes it appear folid and brilliant: after this it may be cut and embellifhed. The author obferves, that being of a fpongy texture, it is more adviseable to cut it with a chifel than to raife it with a graver; that it has an imperfection of being always pale; and that it would be a defirable thing to find means of giving it colour, as by this method ornaments might be made of exquifite beauty and with great facility. As the palenefs appears to proceed from a part of the mercury retained by the gold, I apprehend it might be remedied by the prudent application of a little warm aquafortis, which, diffolving the mercury from the exterior part, would give at leaft a fuperficial high colour: if the piece is filver, it muft be defended from the aquafortis by covering it with wax. Inftruments or ornaments of gold, ftained by mercury, where the gold is connected with fubftances incapable of bearing fire, may be reftored to their colour by the fame means.

Gilding.

10 Another method.

"The foregoing procefs is given entirely on the authority of the French writer. I have had no experience of it myfelf, but have feen very elegant figures of gold raifed upon filver, on the fame principle, by a different procedure. Some cinnabar was ground, not with the diftilled fpirit, but with the expreffed juice of garlick, a fluid remarkably tenacious. This mixture was fpread all over the polifhed filver; and when the firft layer was dry, a fecond, and after this a third was applied. Over thefe were fpread as many layers of another mixture, compofed chiefly of afphaltum and linfeed oil boiled down to a due confiftence. The whole being dried, with a gentle heat, on a kind of wire-grate, the figures were traced and cut down to the filver fo as to make its furface rough: the incifions were filled with an amalgam of gold, raifed to different heights in different parts according to the nature of the defign; after which a gentle fire, at the fame time that it evaporated the mercury, deftroyed the tenacity of the gummy juice, fo that the coating, which ferved to confine the amalgam, and as a guide in the application of it, was now eafily got off. The gold was then preffed down and embellifhed as in the former method; and had this advantage, that the furface of the filver under it having been made rough, it adhered more firmly, fo as not to be in danger of coming off, as M. du Fay fays the gold applied in his way fometimes did. The artift, however, found the procefs fo troublefome, that though he purchafed the receipt for a confiderable fum, he has laid the practice afide."

11 Eafy method of gilding filver.

Finally, fome metals, particularly filver, may be gilt in the following manner:

Let gold be diffolved in aqua-regia. In this folution pieces of linen are to be dipt, and burnt to black afhes. Thefe afhes being rubbed on the furface of the filver by means of a wet linen rag, apply the particles of gold which they contain, and which by this method adhere very well. The remaining part of the afhes is to be waffhed off; and the furface of the filver, which in this ftate does not feem to be gilt, is to be burnifhed with a blood-ftone, till it acquire a fine colour of gold. This method of gilding is very eafy, and confumes a very fmall quantity of gold. Moft gilt ornaments upon fans, fnuff-boxes, and other toys of much fhow and little value, are nothing but filver gilt in this manner.

Gill || Gilpin.

Gold may alſo be applied to glaſs, porcelain, and other vitrified matters. As the ſurface of theſe matters is very ſmooth, and conſequently is capable of a very perfect contact with gold leaves, theſe leaves adhere to them with ſome force, although they are not of metallic nature. This gilding is ſo much more perfect, as the gold is more exactly applied to the ſurface of the glaſs. The pieces are then to be expoſed to a certain degree of heat, and burniſhed ſlightly to give them luſtre.

12 Methods of gilding glaſs.

A more ſubſtantial gilding is fixed upon glaſs, enamel, and porcelain, by applying to theſe ſubſtances powder of gold mixed with a ſolution of gum arabic, or with ſome eſſential oil, and a ſmall quantity of borax; after which a ſufficient heat is to be applied to ſoften the glaſs and the gold, which is then to be burniſhed. With this mixture any figures may be drawn. The powders for this purpoſe may be made, 1. By grinding gold-leaf with honey, which is afterwards to be waſhed away with water. 2. By diſtilling to dryneſs a ſolution of gold in aqua-regia. 3. By evaporating the mercury from an amalgam of gold, taking care to ſtir well the maſs near the end of the proceſs. 4. By precipitating gold from its ſolution in aqua-regia by applying to it a ſolution of green vitriol in water, or ſome copper, and perhaps ſome other metallic ſubſtances.

GILL, a meaſure of capacity, containing a quarter of an Engliſh pint.

GILLS, in ichthyology. See BRANCHIÆ.

GILOLO, a large iſland of the pacific ocean, lying between 1° S. Lat. and 2° N. Lat. and between 125° and 128° E. Long. It belongs to the Dutch; but does not produce any of the fine ſpices, tho' it lies in the neighbourhood of the ſpice-iſlands. The natives are fierce and cruel ſavages.

GILPIN (Bernard), rector of Houghton, diſtinguiſhed by his extraordinary piety and hoſpitality, was deſcended from an ancient and honourable family in Weſtmoreland, and born in 1517. As he was bred in the Catholic religion, ſo he for ſome time defended it againſt the reformers, and at Oxford held a diſputation with Hooper afterward biſhop of Worceſter and martyr for the Proteſtant faith; but was ſtaggered in another diſputation with Peter Martyr, and began ſeriouſly to examine the conteſted points by the beſt authorities. Thus, being preſented to the vicarage of Norton in the diocefe of Durham, he ſoon reſigned it, and went abroad to conſult eminent profeſſors on both ſides; and after three years abſence returned a little before the death of queen Mary, ſatisfied in the general doctrines of the reformation. He was kindly received by his uncle Dr Tonſtall, biſhop of Durham; who ſoon after gave him the archdeaconry of Durham, to which the rectory of Eſſington was annexed. When repairing to his pariſh, tho' the perſecution was then at its height, he boldly preached againſt the vices, errors, and corruptions of the times, eſpecially in the clergy, on which a charge conſiſting of 13 articles was drawn up againſt him, and preſented in form to the biſhop. But Dr Tonſtall found a method of diſmiſſing the cauſe in ſuch a manner as to protect his nephew, without endangering himſelf, and ſoon after preſented him to the rich living of Houghton le Spring. He was a ſecond time accuſed to the biſhop, and again protected; when his enemies, enraged at this ſecond defeat, laid their complaint before Dr Bonner, biſhop of London; who immediately gave orders to apprehend him. Upon which Mr Gilpin bravely prepared for martyrdom; and ordering his houſe-keeper to provide him a long garment, that he might make a decent appearance at the ſtake, ſet out for London. Luckily, however, he broke his leg on the journey; which protracted his arrival until the news of the queen's death freed him from all further apprehenſions. Being immediately ſet at liberty, he returned to Houghton, where he was received by his pariſhioners with the ſincereſt joy. Gilpin.

Upon the deprivation of the Popiſh biſhops, he was offered the ſee of Carliſle, which he declined; and confining his attention to his rectory, diſcharged all the duties of his function in the moſt exemplary manner. To the greateſt humanity and courteſy, he added an unwearied application to the inſtruction of thoſe under his care. He was not ſatisfied with the advice he gave in public, but uſed to inſtruct in private; and brought his pariſhioners to come to him with their doubts and difficulties. He had a moſt engaging manner towards thoſe whom he thought well-diſpoſed: nay, his very reproof was ſo conducted, that it ſeldom gave offence; the becoming gentleneſs with which it was urged, made it always appear the effect of friendſhip. Thus, with unceaſing aſſiduity, did he employ himſelf in admoniſhing the vicious, and encouraging the well-intentioned; by which means, in a few years, he made a greater change in his neighbourhood, than could well have been imagined. A remarkable inſtance, what reformation a ſingle man may effect, when he hath it earneſtly at heart!

But his hopes were not ſo much in the preſent generation, as in the ſucceeding. It was an eaſier taſk, he found, to prevent vice, than to correct it; to form the young to virtue, than to amend the bad habits of the old. He employed much of his time, therefore, in endeavouring to improve the minds of the younger part of his pariſh; ſuffering none to grow up in an ignorance of their duty; but preſſing it as the wiſeſt part to mix religion with their labour, and amidſt the cares of this life to have a conſtant eye upon the next. He attended to every thing which might be of ſervice to his pariſhioners. He was very aſſiduous in preventing all law-ſuits among them. His hall is ſaid to have been often thronged with people, who came to him about their differences. He was not indeed much acquainted with laws; but he could decide equitably, and that ſatisfied: nor could his ſovereign's commiſſion have given him more weight, than his own character gave him.

His hoſpitable manner of living was the admiration of the whole country. He ſpent in his family every fortnight 40 buſhels of corn, 20 buſhels of malt, and a whole ox; beſides a proportionable quantity of other kinds of proviſion. Strangers and travellers found a cheerful reception. All were welcome that came; and even their beaſts had ſo much care taken of them, that it was humorouſly ſaid, "If a horſe was turned "looſe in any part of the country, it would immediately make its way to the rector of Houghton's."

Every Sunday, from Michaelmas till Eaſter, was a ſort of public day with him. During this ſeaſon he expected to ſee all his pariſhioners and their families.

For

Gilpin. For their reception, he had three tables well covered: the firſt was for gentlemen, the ſecond for huſbandmen and farmers, and the third for day-labourers. This piece of hoſpitality he never omitted, even when loſſes, or a ſcarcity of proviſion, made its continuance rather difficult to him. He thought it his duty, and that was a deciding motive. Even when he was abſent from home, no alteration was made in his family-expences: the poor were fed as uſual, and his neighbours entertained.

But notwithſtanding all this painful induſtry, and the large ſcope it had in ſo extended a pariſh, Mr Gilpin thought the ſphere of his benevolence yet too confined. It grieved him extremely, to ſee every where in the pariſhes around him, ſo great a degree of ignorance and ſuperſtition, occaſioned by the ſhameful neglect of the paſtoral care in the clergy of thoſe parts. Theſe bad conſequences induced him to ſupply, as far as he could, what was wanting in others. For this purpoſe, every year he uſed regularly to viſit the moſt neglected pariſhes in Northumberland, Yorkſhire, Cheſhire, Weſtmoreland, and Cumberland; and that his own pariſh in the mean time might not ſuffer, he was at the expence of a conſtant aſſiſtant. In each place he ſtayed two or three days; and his method was, to call the people about him, and lay before them, in as plain a way as poſſible, the danger of leading wicked, or even careleſs lives; explaining to them the nature of true religion; inſtructing them in the duties they owed to God, their neighbour, and themſelves; and ſhewing them how greatly a moral and religious conduct would contribute to their preſent as well as future happineſs.

As Mr Gilpin had all the warmth of an enthuſiaſt, though under the direction of a very calm and ſober judgment, he never wanted an audience, even in the wildeſt parts; where he roufed many to a ſenſe of religion, who had contracted the moſt inveterate habits of inattention to every thing of a ſerious nature. And wherever he came, he uſed to viſit all the gaols and places of confinement; few in the kingdom having at that time any appointed miniſter. And by his labours, and affectionate manner of behaving, he is ſaid to have reformed many very abandoned perſons in thoſe places. He would employ his intereſt likewiſe for ſuch criminals whoſe caſes he thought attended with any hard circumſtances, and often procured pardons for them.

There is a tract of country upon the border of Northumberland, called *Readſ-dale* and *Tine-dale*, of all barbarous places in the north, at that time the moſt barbarous. Before the Union, this place was called the *debateable land*, as ſubject by turns to England and Scotland, and the common theatre where the two nations were continually acting their bloody ſcenes. It was inhabited by a kind of deſperate banditti, rendered fierce and active by conſtant alarms: they lived by theft, uſed to plunder on both ſides of the barrier; and what they plundered on one, they expoſed to ſale on the other; by that means eſcaping juſtice. And in this dreadful country, where no man would even travel that could help it, Mr Gilpin never failed to ſpend ſome part of every year.

He generally choſe the Chriſtmas holidays for his journey, becauſe he found the people at that ſeaſon moſt diſengaged, and moſt eaſily aſſembled. He had Gilpin.
ſet places for preaching, which were as regularly attended as the aſſize-towns of a circuit. If he came where there was a church, he made uſe of it: if not, of barns, or any other large building; where great crowds of people were ſure to attend him, ſome for his inſtructions, and others for his charity.—This was a very difficult and laborious employment. The country was ſo poor, that what proviſion he could get, extreme hunger only could make palatable. The inclemency of the weather, and the badneſs of the roads through a mountainous country, and at that ſeaſon covered with ſnow, expoſed him likewiſe often to great hardſhips. Sometimes he was overtaken by the night, the country being in many places deſolate for ſeveral miles together, and obliged to lodge out in the cold. At ſuch times, we are told, he would make his ſervant ride about with his horſes, whilſt himſelf on foot uſed as much exerciſe as his age and the fatigues of the preceding day would permit. All this he cheerfully underwent; eſteeming ſuch ſervices well compenſated by the advantages which he hoped might accrue from them to his uninſtructed fellow-creatures.

The diſintereſted pains he took among theſe barbarous people, and the good offices he was always ready to do them, drew from them the warmeſt and ſincereſt expreſſions of gratitude. Indeed, he was little leſs than adored among them, and might have brought the whole country almoſt to what he pleaſed. One inſtance that is related, ſhews how greatly he was revered. By the careleſſneſs of his ſervant, his horſes were one day ſtolen. The news was quickly propagated, and every one expreſſed the higheſt indignation at the fact. The thief was rejoicing over his prize, when, by the report of the country, he found whoſe horſes he had taken. Terrified at what he had done, he inſtantly came trembling back, confeſſed the fact, returned the horſes, and declared he believed the devil would have ſeized him directly, had he carried them off, knowing them to have been Mr Gilpin's.

We have already taken notice of Mr Gilpin's uncommonly generous and hoſpitable manner of living. The value of his rectory was about 400l. a year: an income, indeed, at that time very conſiderable, but yet in appearance very unproportionate to the generous things he did: indeed, he could not have done them, unleſs his frugality had been equal to his generoſity. His friends, therefore, could not but wonder to find him, amidſt his many great and continual expences, entertain the deſign of building and endowing a grammar-ſchool: a deſign, however, which his exact œconomy ſoon enabled him to accompliſh, though the expence of it amounted to upwards of 500l. His ſchool was no ſooner opened, than it began to flouriſh; and there was ſo great a reſort of young people to it, that in a little time the town was not able to accommodate them. He put himſelf, therefore, to the inconvenience of fitting up a part of his own houſe for that purpoſe, where he ſeldom had fewer than twenty or thirty children. Some of theſe were the ſons of perſons of diſtinction, whom he boarded at eaſy rates: but the greater part were poor children, whom he not only educated, but cloathed and maintained: he was at the expence likewiſe of boarding in the town many other poor children. He uſed to bring ſeveral every

Gilpin. year from the different parts where he preached, particularly Readſ-dale and Tine-dale; which places he was at great pains in civilizing, and contributed not a little towards rooting out that barbariſm which every year prevailed leſs among them.

As to his ſchool, he not only placed able maſters in it, whom he procured from Oxford, but himſelf likewiſe conſtantly inſpected it. And, that encouragement might quicken the application of his boys, he always took particular notice of the moſt forward: he would call them *his own ſcholars*, and would ſend for them often into his ſtudy, and there inſtruct them himſelf. One method uſed by him to fill his ſchool, was a little ſingular. Whenever he met a poor boy upon the road, he would make trial of his capacity by a few queſtions; and if he found it ſuch as pleaſed him, he would provide for his education. And beſides thoſe whom he ſent from his own ſchool to the univerſities, and there wholly maintained, he would likewiſe give to others, who were in circumſtances to do ſomething for themſelves, what farther aſſiſtance they needed. By which means he induced many parents to allow their children a liberal education, who otherwiſe would not have done it. And Mr Gilpin did not think it enough to afford the means only of an academical education to theſe young people, but endeavoured to make it as beneficial to them as he could. He ſtill conſidered himſelf as their proper guardian; and ſeemed to think himſelf bound to the public for their being made uſeful members of it, as far as it lay in his power to make them ſo. With this view he held a punctual correſpondence with their tutors; and made the youths themſelves frequently write to him, and give him an account of their ſtudies. So ſolicitous indeed was he about them, knowing the many temptations to which their age and ſituation expoſed them, that once every other year he generally made a journey to the univerſities, to inſpect their behaviour. And this uncommon care was not unrewarded; for many of his ſcholars became ornaments to the church, and exemplary inſtances of piety.

To the account that hath been already given of Mr Gilpin's hoſpitality and benevolence, the following particulars may be added. Every Thurſday throughout the year, a very large quantity of meat was dreſſed wholly for the poor; and every day they had what quantity of broth they wanted. Twenty-four of the pooreſt were his conſtant penſioners. Four times in the year a dinner was provided for them; when they received from his ſteward a certain quantity of corn, and a ſum of money: and at Chriſtmas they had always an ox divided among them.

Wherever he heard of any in diſtreſs, whether of his own pariſh, or any other, he was ſure to relieve them. In his walks abroad, he would frequently bring home with him poor people, and ſend them away cloathed as well as fed. He took great pains to inform himſelf of the circumſtances of his neighbours, that the modeſty of the ſufferer might not prevent his relief. But the money beſt laid out was, in his opinion, that which encouraged induſtry. It was one of his greateſt pleaſures to make up the loſſes of his laborious neighbours, and prevent their ſinking under them. If a poor man had loſt a beaſt, he would ſend him another in his room: or if any farmer had had a bad year, he would make him an abatement in his tythes.—Thus, as far as he was able, he took the miſfortunes of his pariſh upon himſelf; and, like a true ſhepherd, expoſed himſelf for his flock. But of all kinds of induſtrious poor, he was moſt forward to aſſiſt thoſe who had large families: ſuch never failed to meet with his bounty, when they wanted to ſettle their children in the world. Gilpin Ginkgo.

In the diſtant pariſhes where he preached, as well as in his own neighbourhood, his generoſity and benevolence were continually ſhewing themſelves; particularly in the deſolate parts of Northumberland. "When "he began his journey," ſays an old manuſcript life of him, "he would have ten pounds in his purſe; and, "at his coming home, he would be twenty nobles in "debt, which he would always pay within a fortnight "after."—In the gaols he viſited, he was not only careful to give the priſoners proper inſtructions, but uſed to purchaſe for them likewiſe what neceſſaries they wanted.

Even upon the public road, he never let ſlip an opportunity of doing good. He has often been known to take off his cloak, and give it to an half-naked traveller: and when he has had ſcarce money enough in his pocket to provide himſelf a dinner, yet would he give away part of that little, or the whole, if he found any who ſeemed to ſtand in need of it.—Of this benevolent temper, the following inſtance is preſerved. One day returning home, he ſaw in a field ſeveral people crowding together; and judging ſomething more than ordinary had happened, he rode up, and found that one of the horſes in a team had ſuddenly dropped down, which they were endeavouring to raiſe; but in vain, for the horſe was dead. The owner of it ſeemed much dejected with his misfortune; and declaring how grievous a loſs it would be to him, Mr Gilpin bade him not be diſheartened: "I'll let you have, (ſays he) "honeſt man, that horſe of mine," and pointed to his ſervant's.—"Ah! maſter, (replied the countryman) my pocket will not reach ſuch a beaſt as that." "Come, come, (ſaid Mr Gilpin) take him, take "him; and when I demand my money, then thou "ſhalt pay me."

This worthy and excellent divine, who merited and obtained the glorious titles of *the Father of the Poor*, and *the Apoſtle of the North*, died in 1583, in the 66th year of his age.

GILTHEAD, in ichthyology. See SPARUS.

GIN. See GENEVA.

GIN, in mechanics, a machine for driving piles, fitted with a windlaſs and winches at each end, where eight or nine men heave, and round which a rope is reeved that goes over the wheel at the top: one end of this rope is ſeized to an iron-monkey, that hooks to a beetle of different weights, according to the piles they are to drive, being from eight to thirteen hundred weight; and when hove up to a croſs-piece, near the wheel, it unhooks the monkey, and lets the beetle fall on the upper end of the pile, and forces the ſame into the ground: then the monkey's own weight overhauls the windlaſs, in order for its being hooked again to the beetle.

GINKGO, the MAIDEN-HAIR TREE, is a native of Japan, where it is alſo known by the names of *Ginan* and *Itſio*. It riſes with a long, erect, thick and branched

Ginkgo
Giorgione.

branched ſtem, to the ſize of a walnut-tree. The bark is aſh-coloured, the wood brittle and ſmooth, the pith ſoft and fungous. The leaves are large, expanded from a narrow bottom into the figure of a maiden-hair leaf, unequally parted, ſtreaked, without fibres or nerves; both ſurfaces having the ſame appearance, and ſupported upon footſtalks, which are compreſſed upon the upper ſurface, and extended into the ſubſtance of the leaf. From the uppermoſt ſhoots hang the flowers in long catkins that are filled with the fertilizing powder; and to which ſucceeds the fruit, adhering to a thick fleſhy pedicle, which proceeds from the boſom of the leaves. This fruit is either exactly or nearly round, and of the appearance and ſize of a damaſk plum. The ſubſtance ſurrounding the fruit is fleſhy, juicy, white, very harſh, and adheres ſo firmly to the incloſed nut, as not to be ſeparated from it, except by putrefaction. The nut, properly termed *Gineau*, reſembles the piſtachia nut, eſpecially a Perſian ſpecies named *bergjes piſtai*; but is almoſt double in ſize, and of the figure of an apricot ſtone. The ſhell is ſomewhat white, woody, and brittle; and incloſes a white looſe kernel, having the ſweetneſs of an almond, along with a degree of harſhneſs. Theſe kernels taken after dinner are ſaid to promote digeſtion, and to give relief in ſurfeits; whence they never fail to make part of the deſſert in great feaſts and anniverſary entertainments.—Many of theſe plants have been reared by Mr James Gordon at his nurſery near Mile-end. They ſeem to be very hardy, and thrive in this country in the open air.

GINSENG. See PANAX.

GIOIA (Flavio,) of Amalfi, in the kingdom of Naples, the celebrated mathematican; who, from his knowledge of the magnetic powers, invented the mariner's compaſs, by which the navigation of the Europeans was extended to the moſt diſtant regions of the globe: before this invention, navigation was confined to coaſting. The king of Naples being a younger branch of the royal family of France, he marked the north point with a fleur de lis, in compliment to that country. It is ſaid the Chineſe knew the compaſs long before; be this as it may, the Europeans are indebted to Gioia for this invaluable diſcovery. He floriſhed A.D. 300.

GIRAFFE, in zoology. See CERVUS.

GIRALD (Barry), or *Giraldus Cambrenſis*. See BARRY.

GIORGIONE, ſo called from his comely aſpect, was an illuſtrious Venetian painter, born in 1478. He received his firſt inſtructions from Giovanni Bellino; but ſtudying afterwards the works of Leonardo da Vinci, he ſoon ſurpaſſed them both, being the firſt among the Lombards who found out the admirable effects of ſtrong lights and ſhadows. Titian became his rival in this art; and was ſo careful in copying the life, that he excelled Giorgione in diſcovering the delicacies of nature, by tempering the boldneſs of his colouring. The moſt valuable piece of Giorgione in oil is that of Chriſt carrying his croſs, now in the church of San Rovo in Venice; where it is held in great veneration. He died of the plague young, in 1511.

Gioſeppino
Giraldon.

GIOSEPPINO, an eminent painter, ſo called by way of contraction from *Gioſeppe d'Arpino*, the town of Naples, where he was born in 1560. Being carried to Rome very young, and employed by painters then at work in the Vatican to grind their colours, he ſoon made himſelf maſter of the elements of deſign, and by degrees grew very famous. His wit and humour gained him the favour of popes and cardinals, who found him buſineſs in plenty. Gregory XIII. ſhewed him great reſpect; and Lewis XIII. of France made him a knight of the order of St Michael. By the force of a happy genius he acquired a light and agreeable manner of deſigning; though it is remarked by De Piles, that he degenerated into a ſtyle which neither partook of true nature, nor of the antique. His battles in the capitol are the moſt eſteemed of all his pieces. He died at Rome in 1640.

GIOTTO, an ingenious painter, ſculptor, and architect of Florence, born in 1276. He was the diſciple of Cimabue; but far ſuperior to his maſter in the air of his heads, the attitude of his figures, and in the tone of his colouring; but could not expreſs livelineſs in the eyes, tenderneſs in the fleſh, or ſtrength in the muſcles of his naked figures. He was principally admired for his works in moſaic; the beſt of which is over the grand entrance of St Peter's church at Rome. The obſervation of Alberti on that piece is, that in the ſhip of Giotto, the expreſſion of fright and amazement of the diſciples at ſeeing St Peter walk upon the water is ſo excellent, that each of them exhibits ſome characteriſtic ſign of his terror. His death happened in 1336, and the city of Florence honoured his memory with a ſtatue of marble over his tomb.

GIRALDI (Lilio Gregorio), an ingenious critic, and one of the moſt learned men that modern Italy has produced, was born at Ferrara in 1479. He was at Rome when it was plundered by the emperor Charles V.; and having thus loſt all he had, and being tormented by the gout, he ſtruggled through life with ill fortune and ill health. He wrote, neverthleſs, 17 performances, which were collected and publiſhed at Baſil in 2 vols folio in 1580, and at Leyden in 1696. Authors of the firſt rank have beſtowed the higheſt eulogies on Giraldus; particularly Caſaubon and Thuanus.

GIRALDI (John Baptiſt Cintio), an Italian poet of the ſame family with the foregoing Lilio, was born in 1504. He was ſecretary to the duke of Ferrara, and afterwards became profeſſor of rhetoric at Pavia. He died in 1573. His works, which conſiſt chiefly of tragedies, were collected and publiſhed at Venice by his ſon Celſo Giraldi, in 1583; and ſome ſcruple not to rank him among the beſt tragic writers Italy has produced.

GIRARDON (Francis), a celebrated French architect and ſculptor, born at Troyes, in 1627. Lewis XIV. being informed of his great talents, ſent him to Rome with a penſion of 1000 crowns. At his return into France, he laboured for the royal palaces, and the gardens of Verſailles and Trianon; where there are many of his works executed in bronze and in marble, from the deſigns of Charles le Brun. The mauſoleum

of

Gironne of cardinal de Richlieu, in the Sorbonne, and the equeſtrian ſtatue of Lewis XIV. at the Place de Ven-
Gladiators. dome, where the ſtatue and horſe are caſt in one piece, paſs for his moſt excellent performances. Girardon was profeſſor, rector, and chancellor, of the Academy of Painting and Sculpture; and had the poſt of inſpector-general of all the works done in ſculpture. He died in 1715.

GIRONNE, or GIRONNY, in heraldry, a coat of arms divided into girons, or triangular figures, meeting in the centre of the ſhield, and alternately colour and metal.

GITTITH, a Hebrew word occurring frequently in the Pſalms, and generally tranſlated *wine-preſſes*. The conjectures of interpreters are various concerning this word. Some think it ſignifies a ſort of muſical inſtrument; others, that the pſalms with this title were ſung after the vintage; laſtly, others, that the hymns of this kind were invented in the city of Gath. Calmet is rather of opinion, that it was given to the claſs of young women or ſongſtreſſes of Gath to be ſung by them; Pſal. viii. 1. lxxxi. 1. lxxxiv. 1. Dr Hammond thinks that the pſalms with this title were all ſet to the ſame tune, and made on Goliah the Gittite.

GIULA, a ſtrong town of Upper Hungary, on the frontiers of Tranſilvania. It was taken by the Turks in 1566, and retaken by the Imperialiſts in 1695. It is ſeated on the river Kereſblan, in E. Long. 21. 1. N. Lat. 46. 25.

GIUSTANDEL, a large and ſtrong town of Turkey in Europe, and in Macedonia, with a Greek archbiſhop's ſee. It is ſeated near the lake Ochrida, in E. Long. 20. 50. N. Lat. 41. 10.

GLACIES MARIÆ. See LAPIS *Specularis*.

GLACIS, in building, an eaſy inſenſible ſlope or declivity.

The deſcent of the glacis is leſs ſteep than that of the talus. In gardening, a deſcent ſometimes begins in talus, and ends in glacis.

The glacis of the corniche, is an eaſy imperceptible ſlope in the cymatium, to promote the deſcent and draining off the rain-water.

GLACIS, in fortification, that maſs of earth which ſerves as a parapet to the covered way, ſloping eaſily towards the champaign or field.

GLADE, in gardening and agriculture, an opening and light paſſage made through a wood, by lopping off the branches of trees along that way.

GLADIATORS, in antiquity, perſons who fought, generally in the arena at Rome, for the entertainment of the people.

The gladiators were uſually ſlaves, and fought out of neceſſity; though ſometimes freemen made profeſſion thereof, like our prize-fighters, for a livelihood. The Romans borrowed this cruel diverſion from the Aſiatics; and we find that even the high-prieſts had their ludi pontificales, and ludi ſacerdotales. As from the earlieſt ages of antiquity we read that it was cuſtomary to ſacrifice priſoners of war to the manes of the great men that fell in the engagement, in proceſs of time they came to ſacrifice ſlaves at the funerals of all perſons of condition; but as it would have appeared barbarous to cut their throats like beaſts, they were appointed to fight with each other, and to do their beſt to ſave their own lives by killing their adverſary. Hence aroſe the maſters of arms called *laniſtæ*, and Gladiators
men learned to fight. Theſe laniſtæ bought ſlaves to train up to this cruel trade, whom they afterwards ſold to ſuch as had occaſion to exhibit ſhews. Junius Brutus, who expelled the kings, was the firſt that honoured the funeral of his father with theſe inhuman diverſions at the ſepulchre of the deceaſed: but afterwards they were removed to the circus and amphitheatres; and other perſons, beſides ſlaves, would hire themſelves to this infamous office.

They were all firſt ſworn that they would fight till death; and if they failed, they were put to death, either by fire, ſwords, clubs, whips, &c. It was uſual with the people, or emperor, to grant them life when they ſhewed no ſigns of fear. Auguſtus decreed that it ſhould always be granted them.

From ſlaves and freed-men, the wanton ſport ſpread to perſons of rank, as we find in Nero's time. And Domitian exhibited combats of women in the night-time. We alſo read, that dwarfs encountered with one another. Conſtantine the Great firſt prohibited theſe combats in the Eaſt; but the practice was not entirely aboliſhed in the Weſt before Theodoric king of the Oſtrogoths in the year 500.

When any perſon deſigned to entertain the people with a ſhow of gladiators, he ſet up bills in the public places, giving an account of the time, the number and names of the combatants, and the circumſtances whereby they were to be diſtinguiſhed; each having his ſeveral badge, which generally was a peacock's feather: they alſo gave notice what time the ſhow would laſt; and ſometimes gave repreſentations of theſe things in painting, as is practiſed among us by thoſe who have any thing to ſhow at fairs, &c.

Upon the day appointed for the ſhow, in the firſt place the gladiators were brought out all together, and obliged to take a circuit round the arena in a very ſolemn and pompous manner. After this they proceeded *paria componere*, to match them by pairs, in which great care was taken to make the matches equal. The firſt ſort of weapons they made uſe of were ſtaves, or wooden foils called *rudes*; and the ſecond were effective weapons, as ſwords, poinards, &c.

The firſt were called *arma luſoria*, or *exercitoria*; the ſecond, *decretoria*, as being given by decree or ſentence of the prætor, or of him at whoſe expence the ſpectacle was exhibited.

They began to fence or ſkirmiſh with the firſt, which was to be the prelude to the battle; and from theſe, when well warmed, they advanced to the ſecond, with which they fought naked. The firſt part of the engagement was called *ventilare*, *preludare*; and the ſecond *dimicare ad certum*, or *verſis armis pugnare*.

When any received a remarkable wound, either his adverſary or the people uſed to cry out, *Habet*, or *Hoc habet*. If the vanquiſhed ſurrendered his arms, it was not in the victor's power to grant him life: it was the people during the time of the republic, and the prince or people during the time of the empire, that were alone empowered to grant this boon. The two ſigns of favour and diſlike given by the people were, *premere pollicem*, and *vertere pollicem*; the former of which M. Dacier takes to be a clenching of the fingers of both hands between one another, and ſo holding the two thumbs upright cloſe together, was a ſign
of

Gladiolus || Gland.

of the people's admiration of the courage ſhewn by both combatants; and at the ſame time for the conqueror to ſpare his antagoniſt's life: but the contrary motion, or bending back of the thumbs, ſignified the diſſatisfaction of the ſpectators, and authoriſed the victor to kill the other combatant downright for a coward. The emperor ſaved whom he liked, if he was preſent at the ſolemnity, in the ſame manner.

After the engagement, ſeveral marks of favour were conferred on the victor, particularly a branch of palm-tree; and oftentimes a ſum of money, perhaps gathered up among the ſpectators: but the moſt common rewards were the pileus and the rudis. The former was given only to ſuch gladiators as were ſlaves, for a token of obtaining their freedom. But the rudis ſeems to have been beſtowed both on ſlaves and freemen; with this difference, that it procured the former no more than a diſcharge from any further performance in public, upon which they commonly turned laniſta: but the rudis, when given to ſuch perſons as, being free, had hired themſelves out for theſe ſhows, reſtored them to a full enjoyment of their liberty. See PILEUS, RUDIS, and LANISTA.

GLADIOLUS, CORN-FLAG; a genus of the monogynia order, belonging to the pentandria claſs of plants. There are ten ſpecies, of which the moſt remarkable is the communis, or common gladiolus. This hath a round, compreſſed, tuberous root; long ſword-ſhaped leaves; an erect flower-ſtalk, two or three feet high; the top garniſhed with ſeveral pretty large flowers of a red or white colour, having each ſix petals. They appear in May and June, and are ſucceeded by plenty of ſeed in Auguſt. The plants are very hardy, and will thrive in any ſoil or ſituation. They are propagated by offſets from the roots.

GLAMORGANSHIRE, by the Welſh called *Gwlad Morganwg* or *Vorganwg*, i. e. the county of *Morganwg*; a county of South Wales, bounded on the ſouth by the Severn ſea, on the north by Brecknockſhire, on the eaſt by Monmouthſhire, and on the weſt by Caermarthenſhire. It extends in length 48 miles, in breadth 27; and in circumference about 116. On the north ſide, where there are mountains covered with ſnow a great part of the year, the air is ſharp, and the ſoil very indifferent; but, on the ſouth ſide, as the country approaches nearer to a level, the ſoil grows better, producing plenty both of corn and groſs. Its commodities are black cattle, ſheep, coals, lead, fiſh, and butter. The chief rivers of this country are the Rhymney or Remny, the Taff, the Ogmore, the Avon, the Cledaugh, and the Tavye. This country was formerly full of caſtles, moſt of which are now fallen to decay. It hath many ſmall harbours on the coaſt for exporting coals and proviſions. Of the former it ſends large quantities both to England and Ireland; but of the latter, to England almoſt ſolely, eſpecially butter. It ſends two members to parliament, one for the ſhire, and one for the borough of Cardiff the capital.

GLAND, in anatomy, may be defined a circumſcribed apparatus of the ſoft parts, whoſe office is to ſecern a certain juice, and throw it out of the immediate circulation.

The glands are roundiſh bodies, ſeated in the cellular membrane, generally near the large veſſels; their ſubſtance is firm, and of various colours. Sylvius was the firſt who divided the glands into conglobate and conglomerate. Malpighi added what he calls the folliculus or ſimple gland; inſtances of which are the ſmall glands behind the ears, but the moſt remarkable are thoſe in the fauces. Glanders || Glanvil.

Dr Nicholls divides the glands into ſinuous, tubular, and equal. What he means by *ſinuous* gland is, when each little gland hath its own excretory duct, through which it tranſmits its liquor to a common baſin, as the kidneys; his *tubular* is the ſame as the conglobate gland of Sylvius, of which the teſtes are an inſtance. By an *equal* gland he means where the veſſels are branched, as in the liver.

Ruyſch proves by ſubtle injections, that the ſubſtance of the glands is vaſcular, conſiſting of a ramifying artery, partly terminating in a vein, and partly in an excretory duct.

Mr Hewſon ſays, that the little corpora globoſa, which moſt modern anatomiſts call cryptæ and folliculæ, are nothing but convoluted arteries.

The glands are often diſordered by becoming large and indurated. When they are ſwelled and hard, they are ſaid to be *indurated*; if they grow harder, they are ſaid to be *ſcirrhous*: if, when hard, they become painful, they are *incipient* or *occult* cancers; if their hardneſs and pain continue long, they are called *carcinomata*, or *inveterate occult* cancers; and if the ſkin breaks, they are called *ulcerated* cancers *.

* See Surgery.

GLANDERS. See FARRIERY, § xii.

GLANDORP (Matthias), a learned phyſician, born in 1595, at Cologn, in which town his father was a ſurgeon. After receiving a doctor's degree at Padua, and viſiting the principal towns of Italy, he ſettled at Bremen in 1618, where he practiſed phyſic and ſurgery with ſo much ſucceſs, that he was made phyſician to the republic, and to the archbp. He publiſhed at Bremen, *Speculum chirurgorum, Methodus medendæ paronychiæ, Tractatus de polypo narium affectu graviſſimo*, and *Gazophylacium polypuſum fontiviſſimo*; which four pieces were collected and publiſhed, with his life prefixed, at London, in 4to. 1729. Glandorp died young; and it muſt ſuggeſt a high opinion of his abilities, that, notwithſtanding the great improvements in all branches of ſcience, his works ſhould be deemed worthy a republication 100 years after his death.

GLANVIL (Joſeph), a learned, ingenious, but fanciful and credulous, writer in the 17th century, was born at Plymouth in 1636, and bred at Oxford. He became a great admirer of Mr Baxter, and a zealous perſon for a commonwealth. After the reſtoration, he publiſhed *The vanity of dogmatizing*; was choſen a fellow of the Royal Society; and, taking orders in 1662, was preſented to the vicarage of Frome-Selwood in Somerſetſhire. This ſame year he publiſhed his *Lux Orientalis*; in 1665, his *Scepſis Scientifica*; and in the year following, *Some philoſophical conſiderations touching the being of witches and witchcraft*, and other pieces on the ſame ſubject. In 1660, he publiſhed *Plus ultra; or, The progreſs and advancement of knowledge ſince the days of Ariſtotle*. He likewiſe publiſhed *A ſeaſonable recommendation and defence of reaſon*; and *Philoſophia Pia*; or, *A diſcourſe of the religious temper and tendencies of the experimental phi-*

philosophy. In 1678 he was made a prebendary of Worcester, and died in 1680.

GLARIS, one of the cantons of Switzerland, is bounded on the east, partly by the Grisons, and partly by the territory of Sargans; on the north, by the bailiwick of Gaster, and by the lake Wahlestatt; on the east, by the canton of Schwits; and on the south, by part of the canton of Uri, and part of the league of the Grisons. It is a mountainous country, being entirely within the Alps. Near the village Ober-Urnen there is a famous mineral spring, which is sometimes hot and sometimes cold. The lake Wahlestatt is bounded by high rocks and mountains, through one of which a road is cut. Towards the top of one of these there is a large hole, through which the sky may be seen.

GLARIS, a town of Switzerland, capital of the canton of the same name. It is seated in a plain, at the foot of high craggy mountains. The streets are large, and the houses kept in good repair. It has some public buildings; among which are two churches, one in the middle of the town, and the other without, upon an eminence. On this eminence there is a cavern, with grotesque figures formed by the water that drops therein. The general assemblies of the country are held here on the first Sundays in May, where all the males above the age of sixteen are obliged to appear. Both the Calvinists and the Roman-Catholics are tolerated in this town, and they have divine service by turns in the same church. It is seated on the river Lint, E. Long. 9° 13′. N. Lat. 47° 6′.

GLASGOW, a large city of Lanerkshire or Clydesdale in Scotland, situated in W. Long. 4° 30′. N. Lat. 55° 50′.

Concerning the foundation of this city we have no authentic records. The word in the Gaelic language signifies a *gray-smith*; from whence it may perhaps be inferred, that some spot in the most ancient part of the city was originally the residence of some blacksmith, who had become eminent in his profession, so that the place went by his name.

1 Bishopric of Glasgow, when founded.

In the year 560, a bishopric is said to have been founded here by Saint Mungo, or Kentigern, supposed to be the son of Thamates, daughter of Loth king of the Picts; but in what state the town at that time was, is altogether uncertain. Most probably the priests and disciples who attended St Kentigern, would contribute considerably towards its advancement: the aged and infirm, who were unfit for the purposes of war, or such as were religiously inclined, would come and settle round the habitation of the holy man, in order to have the benefit of his prayers; and as a number of miracles were said to have been wrought at his tomb, the same causes would still contribute to the increase of the town.

History has not informed us of the name of the prince who founded and endowed the bishopric of Glasgow in favour of St Kentigern. But from an abstract of the life of Kentigern (contained in Mr Innes's Critical Essay on the Ancient Inhabitants of Scotland) which was written in the 12th century, we learn, that the saint being ill used by Marken or Marcus, one of the kings of the Britons, retired into Wales. On the invitation of Roderic, however, one of Marken's successors, he returned to Glasgow, and enjoyed the see till 601, when he died. He was buried in the church of Glasgow, where his monument is still to be seen; and we find him marked among the saints of the Roman calendar, January 13th 578. Glasgow

The immediate successors of Kentingern were Baldrede and Conwal. The first established a religious house at Inchinnan, the second went into Lothian to preach to the Saxons; and both of them are ranked as saints in the Roman calendar, Baldrede on the 6th of March 608, and Conwal on the 18th of May 612. From this time, however, till the 1115 we have no distinct accounts concerning the city or bishopric of Glasgow. We find then, that David I. king of Scotland made an attempt to retrieve the people from a state of gross barbarity into which they were fallen, and restored to the church those lands of which she had been robbed. The only account we have of the transactions with regard to Glasgow, during that period, is in the inquisition made by David concerning the church-lands of Glasgow, and is as follows.—"This church, by the divine appointment, admitted St Kentigern into the bishopric, who furnished large draughts of knowledge to those thirsting after heavenly things, &c. But a fraudulent destroyer, employing his common wiles, brought in, after a long series of time, unaccountable scandals into the Cumbrian church. For after St Kentigern and many of his successors were removed to heaven, various disturbances every where arising, not only destroyed the church and her possessions, but, wasting the whole country, drove the inhabitants into exile. These good men being destroyed, various tribes of different nations flocking in from several quarters, possessed the foresaid deserted country; but being of different origins, and varying from each other in their language and customs, and not easily agreeing among themselves, they followed the manners of the Gentiles, rather than those of the true faith. The inhabitants of which unhappy and abandoned country, though living like brutes, the Lord, who chooses that none should perish, vouchsafed to visit in mercy, &c."

2 Barbarity of the people in the time of David.

From the year 1116 to the reformation, the records of the bishopric are tolerably complete. The most remarkable particulars furnished by them are the following.

In 1136, John Achaius, chosen bishop of Glasgow by David I. built and adorned a part of the cathedral, which he solemnly consecrated on the 9th of July. The king was present at the ceremony; and bestowed on the church the lands of Perdeyc, now Patrick. This prelate also divided the diocese into the two archdeanries of Glasgow and Teviotdale; and established the offices of dean, subdean, chancellor, treasurer, sacrist, chantor, and successor; and settled a prebendary upon each of them, out of the donatives he received from the king.

In 1174, Joceline, abbot of Melrose, was elected bishop, and consecrated by Eskilus, bishop of Lunden in Denmark, the Pope's legate for that kingdom, on the 1st of June 1175. He rebuilt the cathedral, or rather made an addition to the church already built by John Achaius. He also procured a charter from William, king of Scotland, erecting Glasgow into a royal borough, and likewise a charter for a royal burgh.

3 Glasgow erected into a royal burgh.

Glaſgow.

a fair to be held there annually for eight days.

In 1335, John Lindſay, biſhop of Glaſgow, was killed in an engagement at ſea with the Engliſh, as he was returning home from Flanders. His ſucceſſor, William Rae, built the ſtone bridge over the Clyde. In the time of Matthew Glendoning, who was elected biſhop in 1387, the great ſpire of the church, which had been built only of wood, was conſumed by lightning. The biſhop intended to have built another of ſtone; but was prevented by death, in 1408, from accompliſhing his purpoſe. His ſucceſſor, William Lauder, laid the foundation of the veſtry of the cathedral, and built the great tower of ſtone, as far as the firſt battlement. The great tower of the epiſcopal palace was founded about the year 1437, on which biſhop Cameron expended a great deal of money.

4 Glaſgow erected into a regality, and the univerſity founded.

In 1447, William Turnbull, a ſon of the family of Bedrule in Roxburgh-ſhire, was choſen biſhop. He obtained from king James II. in 1450, a charter erecting the town and the patrimony of the biſhops into a regality. He alſo procured a bull from pope Nicholas V. for erecting an univerſity within the city, which he endowed, and on which he alſo beſtowed many privileges. He died in 1454, leaving behind him a moſt excellent character. The eſtabliſhment of the college contributed more than any thing that had been formerly done towards the enlargement of the town. Before this time the town ſeems to have been inconſiderable. Mr Gibſon * is of opinion, that the number of its inhabitants did not exceed 1500. But though the eſtabliſhment of the univerſity greatly increaſed the number of inhabitants, it in fact deſtroyed the freedom of the town. Biſhop Turnbull ſeems to have made a point of it with king James II. that the city of Glaſgow, with the biſhops foreſt, ſhould be erected into a regality in his favour; which was accordingly done at the time above-mentioned; and this at once took away all power from the citizens, and transferred it to the biſhop. As the powers of the biſhop, however, were reckoned by Turnbull inſufficient to convey to the members of the univerſity all that freedom which he wiſhed to beſtow upon them, he therefore obtained from the king a great many privileges for them; and afterwards he himſelf, with the conſent of his chapter, granted them many more.

* *Hiſt. of Glaſgow*, p. 74.

5 Which deſtroys the freedom of the city.

6 Population of Glaſgow increaſed by the univerſity.

The good effects of the eſtabliſhment of the college were very ſoon obvious in Glaſgow. The number of inhabitants increaſed exceedingly; the high ſtreet, from the convent of the black friars, to where the croſs is now placed, was very ſoon filled up; the ancient road which led to the common, being too far diſtant for the conveniency of the new inhabitants, the Gallows-gate was begun to be built. Soon after, the collegiate church of the bleſſed Mary (now the Tron-church) being founded by the citizens, occaſioned the Trongate ſtreet to be carried to the weſtward as far as the church. The reſt of the city increaſed gradually towards the bridge, by the building of the Salt-market ſtreet. The burrough-roods, and the cattle that grazed on the commons, were now found inſufficient to maintain the increaſed number of inhabitants; for which reaſon a greater degree of attention than formerly was paid to the fiſhing in the river. Many poor people ſubſiſted themſelves by this occupation: they were incorporated into a ſociety; and in order that they might be at hand to proſecute their buſineſs, they built a conſiderable part of the ſtreet now called the *Bridge-gate*, but at that time *Fiſhers-gate*. Glaſgow.

Notwithſtanding all this, however, the city of Glaſgow did not for a long time attain the rank among the other towns of Scotland, which it holds at preſent. In 1556, it held only the 11th place among them, as appears by queen Mary's taxation. The introduction of the reformed religion proved for ſome time prejudicial to the opulence of the city. The money which had formerly been expended among the citizens by the biſhop and his clergy, was now diverted into other channels: the advantages reſulting from the univerſity were alſo for a time loſt; for as the reformers generally deſpiſed human learning, the college was in a manner deſerted.

In the time of the civil wars, Glaſgow ſuffered ſeverely. To the miſchiefs attending inteſtine diſcord, were added a peſtilence and famine; and to complete their miſfortunes, a violent fire broke out in June, which deſtroyed the greateſt part of the Saltmarket, Trongate, and High-ſtreet. The fronts of the houſes at that time were moſtly of wood, ſo that they became an eaſy prey to the flames. The fire continued with great violence for the ſpace of 18 hours; by which, a great many of the inhabitants were ruined, the habitations of almoſt 1000 families being totally deſtroyed. On this account collections were made through different parts of the country; and to prevent ſuch accidents for the future, the fronts were built with free ſtone, which abounds in the neighbourhood. 7 Great part of the town deſtroyed by a fire.

By the charter given to biſhop Turnbull in 1450, the citizens had been deprived of the power of electing their own magiſtrates, which was thenceforth exerciſed by the biſhop; which, however, was not done without ſome reſiſtance on the part of the inhabitants. After the reformation was introduced into Scotland, we find this power exerciſed by the citizens, the biſhop, the earl of Lennox, and others. The idea that the town was a biſhop's burgh, and not a royal free burgh, gave occaſion to this unſettled manner of appointing the magiſtracy; and though, in 1633, they were declared to be a royal free burgh by the parliament, yet their freedom of election was afterwards diſturbed by the privy-council, by Cromwell, and the duke of York. But on the 4th of June 1690, the town was declared free by a charter of William and Mary; and in confirmation of this charter it was inſerted in the act of parliament, dated June 14th the ſame year, that they ſhould have power to elect their own magiſtrates as fully and freely, in all reſpects, as the city of Edinburgh, or any other royal burgh within the kingdom; which freedom of election ſtill continues. 8 Glaſgow declared free by William and Mary.

By the aſſeſſment of the burghs in 1695, we find the city of Glaſgow reckoned the ſecond in Scotland in point of wealth, which place it ſtill continues to hold. To account for this great increaſe of wealth, we muſt obſerve, that for a long time, even before the reſtoration of Charles II. the inhabitants of Glaſgow had been in poſſeſſion of the ſale both of raw and refined ſugars for the greateſt part of Scotland; they had a privilege of diſtilling ſpirits from their molaſſes, 9 Great increaſe of its wealth.

Glasgow. free of all duty and excise; the herring-fishery was also carried on to what was at that time thought a very considerable extent; they were the only people in Scotland who made soap; and they sent annually some hides, linen, &c. to Bristol, from whence they brought back in exchange, a little tobacco, sugar, and goods of the manufacture of England, with which they supplied a considerable part of the kingdom. From the year 1707, however, in which the union between Scotland and England took place, we may date the prosperity of Glasgow. By the union, the American trade was laid open to the inhabitants: and so sensible were they of their advantageous situation, that they began almost instantly to prosecute that commerce; an assiduous application to which, ever since, hath greatly contributed to raise the city to that pitch of affluence and splendor which it now enjoys. The city was now greatly enlarged; and as the community were sensible of the inconvenience that attended the want of a sufficiency of water in the river, for carrying on their commerce, they resolved to have a port of their own, nigher the mouth of the river. At first, they thought of making their harbour at Dumbarton: but as this is a royal borough, the magistrates opposed it; because they thought that the influx of sailors and others, occasioned by the harbour, would be so great, that a scarcity of provisions would be occasioned. The magistrates and town-council of Glasgow, therefore, purchased some lands on the south side of the river Clyde for this purpose; and so expeditious were they in making their harbour, and rearing their town, that in 1710 a baillie was appointed for the government of Port-Glasgow. It is now a very considerable parish, and lies 14 miles nigher the mouth of Clyde than Glasgow.

I Erection of Port-Glasgow.

In 1725, Mr Campbell, the member of parliament for Glasgow, having given his vote for having the malt-tax extended over Scotland, a riot ensued among the lower class of people. In this disturbance, Mr Campbell's furniture was destroyed, and some excisemen were maltreated for attempting to take an account of the malt. General Wade, who commanded the forces in Scotland, had sent two companies of soldiers, under the command of Captain Bushell, to prevent any disturbance of this kind. Captain Bushell drew up his men in the street, where the multitude pelted them with stones. Them he endeavoured to disperse, by firing with powder only: but this expedient failing, he ordered his men to load their pieces with ball; and, without the sanction of the civil authority, commanded them to fire four different ways at once. By this discharge about 20 persons were killed and wounded; which enraged the multitude to such a degree, that having procured some arms, they pursued Bushel and his men to the castle of Dumbarton, about five miles distant.

II Disturbance about the excise-bill.

General Wade being informed of this transaction, assembled a body of forces, and being accompanied by Duncan Forbes, lord advocate, took possession of the town: the magistrates were apprehended, and carried prisoners to Edinburgh; but on an examination before the lords, their innocence clearly appeared, upon which they were immediately dismissed. Bushell was tried for murder, convicted, and condemned; but, instead of suffering the penalties of law, he was indulged with a pardon, and promoted in the service. Glasgow.
Mr Campbell petitioned the House of Commons for an indemnification of his losses: a bill was passed in his favour; and this, together with some other expences incurred in the affair, cost the town 9000 l. ster.

During the time of the rebellion in 1745, the citizens of Glasgow gave proof of their attachment to revolution principles, by raising two battalions, of 600 men each, for the service of government. This piece of loyalty, however, had like to have cost them dear. The rebels, in their journey south, took a resolution to plunder and burn the city; which would probably have been done, had not Mr Cameron of Lochiel threatened, in that case, to withdraw his clan. A heavy contribution, however, was laid on. The city was compelled to pay 5000 l. in money, and 500 l. in goods; and on the return of the rebels from England, they were obliged to furnish them with 12,000 linen shirts, 6000 cloth coats, 6000 pairs of shoes, 6000 pairs of hose, and 6000 bonnets. These goods, with the money formerly paid them, the expence of raising and subsisting the two city-battalions, and the charge of maintaining the rebel army in free quarters for ten days, cost the community about 14,000 l. sterling; 10,000 l. of which they recovered in 1749, by an application to parliament.

12 Change of manners and method of living.

About the year 1750, a very considerable change took place in the manner of living among the inhabitants of Glasgow. Till this time, an attentive industry, and a frugality bordering upon parsimony, had been their general characteristic; the severity of the ancient manners prevailed in its full vigour; But now, when an extensive commerce and increased manufactures had produced wealth, the ideas of the people were enlarged, and schemes of trade and improvement were adopted, which people would formerly have been denominated madmen if they had undertaken; a new stile was introduced in living, dress, building, and furniture; wheel-carriages were set up, public places of entertainment were frequented, and an assembly-room, ball-room, and playhouse, were built by subscription; and from this time we may date all the improvements that have taken place, not only in Glasgow, but all over the west of Scotland. The best method, however, of estimating the growing improvement of any town, is by the frequency of their applications for assistance to parliament; we shall therefore enumerate the acts of parliament which have been passed in favour of the city of Glasgow since the year 1750. In 1753, an act passed for repairing several roads leading into the city of Glasgow.—In 1756, an act for erecting and supporting a light-house in the island of Little Cumray, at the mouth of the Clyde, and for rendering the navigation of the frith and river more safe and commodious.—In 1759, an act for improving the navigation of the river Clyde to the city of Glasgow, and for building a bridge across the river from the city to the village of Gorbells.—In 1767, the people of Glasgow having proposed to make a small cut or canal from the frith of Forth to that of Clyde, for the conveniency of their trade to the eastern side of the island, several gentlemen at Edinburgh, and throughout different parts of the kingdom, proposed that this canal should be executed upon a much larger scale than what had been originally projected. An act was accordingly obtained, and

13 Acts of parliament in favour of the city.

Glaſgow. and the canal executed in the manner deſcribed under the article CANAL.—In 1770, another act was obtained for improving the navigation of the river, and for building the bridge from the city to the village of Gorbells, being an amendemnt of the former act for that purpoſe.—In 1771, an act for making and widening a paſſage from the Salt-market to St Andrew's church; for enlarging and completing the church-yard of that church, and likewiſe for building a convenient exchange or ſquare in the city; alſo for amending and explaining the former act relative to the navigation of the Clyde.—An act for making and maintaining a navigable canal and waggon-way from the collieries in the pariſhes of Old and New Monkland, to the city of Glaſgow.

This laſt canal, which was undertaken with a view to reduce the price of coals, has not been attended with the deſired effect. The other improvements have been productive of very great advantages: and it may be confidently aſſerted, that ſince the year 1750 a total change has been effected in the city of Glaſgow and all round it; the manners of the people have undergone an alteration greatly for the better; a ſpirit of induſtry and activity has been raiſed, and now pervades every order of men; commerce has been increaſed; manufactures carried on to a conſiderable extent, and ſtill increaſing; every perſon is employed; not a beggar is to be ſeen in the ſtreets; the very children are buſy.

14 Deſcription of the city.

Such is the preſent flouriſhing ſtate of the city of Glaſgow, which for its beauty and elegance exceeds every other city in Scotland. The moſt ancient part of it ſtands on a riſing ground. The foundation of the cathedral is 104 feet higher than the bed of the river; and the deſcent from the high ground reaches to about 100 yards below the college. The reſt of the city is built upon a plain. The city reaches from north to ſouth, *i. e.* from the Stable-green port, to the ſouth end of the Gorbells, 2000 yards; from eaſt to weſt, *i. e.* from the Gallowgate toll-bar to Grahameſtown toll-bar, 3160 yards. The ſtreets are clean and well paved; the medium breadth of the principal ones is 52 feet; and ſeveral of them interſecting one another at right angles, produce a very fine effect. The houſes, excepting a very few, are built of free-ſtone well hewed; few of them exceed four floors in height; and many of them are in an exceeding good taſte, inſomuch that Mr Pennant pronounces Glaſgow to be the beſt ſecond-rate city he had ever ſeen. The moſt remarkable public buildings are,

15 Of the cathedral.

1. *The Cathedral, or High Church*, is a magnificent building, and its ſituation greatly to its advantage, as it ſtands higher than any part of the city. It has been intended to form a croſs, though the traverſe part has never been finiſhed. The great tower is founded upon four large maſſy pillars, each of them about 30 feet in circumference. The tower itſelf is 25½ feet ſquare within; and is ſurrounded by a balluſtrade, within which riſes an octangular ſpire terminated by a fane. The tower upon the weſt end is upon the ſame level, but appears not to have been finiſhed, though it is covered over with lead. In this tower is a very large bell 11 feet 4 inches in diameter. The principal entry was from the weſt; the gate 11 feet broad at the baſe, and 17 feet in height. The weſt end of the choir is now appropriated for a place of divine worſhip; and is divided from the remaining part by a ſtone-partition, which is incloſed by another ſtone-wall parting it from the nave. It is impoſſible to form an adequate idea of the awful ſolemnity of the place occaſioned by the loftineſs of the roof and the range of pillars by which the whole is ſupported. Glaſgow.

The nave of the church riſes four ſteps higher than the choir; and on the weſt ſide ſtood the organ-loft, formerly ornamented with a variety of figures, but now defaced. The pillars here are done in a better taſte than thoſe in the choir, and their capitals are ornamented with fruits. The arched roof of the altar is ſupported by five pillars, over which was a fine terrace walk, and above it a large window of curious workmanſhip, but now ſhut up. On the north ſide of the altar is the veſtry, being a cube of 28 feet, the roof arched and vaulted at top, and ſupported by one pillar in the centre of the houſe. Arched pillars from every angle terminate in the grand pillar, which is 19 feet high. The lower part of the ſouth croſs is made uſe of as a burying place for the clergy of the city; and is by much the fineſt piece of workmanſhip in the whole building. It is 55 feet long, 28 broad, and 15 high; arched and vaulted at top, and ſupported by a middle range of pillars, with their capitals highly ornamented; correſponding to which are columns adjoining to the walls, which as they riſe, ſpring into ſemi-arches, and are every where met at acute angles by their oppoſites, and are ornamented with carvings at the cloſing and croſſing of the lines. At the eaſt end of the choir you deſcend by flights of ſteps upon each ſide into paſſages which, in former times, were the principal entries to the burying vault which is immediately under the nave. It is now made uſe of as a pariſh-church for the barony of Glaſgow; and is full of pillars, ſome of them very maſſy, which ſupport the arched roof: but it is a very uncomfortable place for devotion. The ſpace under the altar and veſtry, though now made uſe of as a burying place by the heritors of the barony, was formerly, according to tradition, employed for keeping of the relics; and indeed, from the beautiful manner in which this place is finiſhed, one would imagine that it had not been deſtined for common uſe. Here is ſhewn the monument of St Mungo, or Kentigern, with his figure lying in a cumbent poſture.

The whole length of the cathedral within the walls is 284 feet, its breadth 65; the height of the choir, from the floor to the canopy, 90 feet; the height of the nave, 85 feet; the height of the middle tower, 220 feet. This fabric was begun by John Achaius in 1123, and conſecrated in 1136; and continued by ſucceeding biſhops till ſuch time as it was finiſhed in the manner in which it ſtands at preſent. The wealth of the ſee of Glaſgow, however, was not ſufficient for ſo great an undertaking, ſo that they were obliged to have recourſe to all the churches of Scotland for aſſiſtance in it. Near the cathedral is the ruin of the caſtle or biſhop's palace.

16 St Andrew's church.

2. *St Andrew's Church* was begun by the community in 1739, and finiſhed in 1756. It is the fineſt piece of modern architecture in the city; and is built after the model of St Martins in the fields, London,

Glasgow. whose architect was the famous Gibbs. The length of the church is 104 feet, and its breadth 66. It has a fine arched roof, well ornamented with figures in stucco, and sustained by stone-columns of the Corinthian order. Correspondent to the model, it has a place for the altar on the east, in which is a very ancient Venetian window; but the altar-place being seated makes this end appear to no great advantage. The fronts of the galleries and the pulpit are done in mahogany in a very elegant manner. The spire by no means corresponds with the rest of the building; and, instead of being an ornament, disgraces this beautiful fabric. Its height is 170 feet.

17 The college. 3. *The College.* The front of this building extends along the east side of the high street, and is upwards of 330 feet long. The gate at the entrance is decorated with rustics, and over it are the king's arms. The first court is 88 feet long and 44 broad. The west side is elevated upon stone pillars, on which are placed pilasters supporting the Doric entablature, and ornamented with arches forming a piazza. Above these is the public hall; the ascent to which is by a double flight of steps inclosed by a handsome stone balustrade, upon the right of which is placed a lion, and on the left an unicorn, cut in free stone. The spire stands on the east side, is 135 feet high, and has a very good clock. Under this is the gateway into the inner and largest court, which is 103 feet long and 79 broad. Over the entry, in a niche, is a statue of Mr Zacharias Boyd, who was a benefactor to the university. On the east side of the court is a narrow passage leading into a handsome terrace walk, gravelled, 122 feet long by 64 feet broad. This walk is inclosed to the east by an iron pallisade, in the centre of which is a gate leading into the garden. This last consists of seven acres of ground, laid out in walks for the recreation of the students. On the south side of the walk stands the library; a very neat edifice, well constructed for the purpose intended, and containing a very valuable collection of books.

18 Townhouse, &c. 5. *The Town-House and Assembly-Hall.* This is a magnificent and extremely elegant building. The front is adorned with a range of Ionic pilasters; the top of the building is ornamented with a balustrade and handsome vases; the front is elevated on strong rusticated pillars adorned with arches, forming a piazza for merchants and others to shelter themselves from the weather when met upon business. The assembly-hall is a neat room, and is finished in a good taste, though too small for the city; its length is 47 feet, its breadth and height 24. The town-hall is a very spacious and lofty apartment, 52 feet long by 27 broad, and 24 in height. It is finished in a very grand manner; the ceiling is divided into different compartments well ornamented. In it are full-length portraits of king James VI. and VII. Charles I. and II. William and Mary, queen Anne, king George I. II. and III. and Archibald duke of Argyle in his justiciary robes. The two last are by Ramsay. Opposite to the front of this building is the exchange, which is well paved with free stone, and inclosed from the street by stone pillars. Upon it is an equestrian statue of king William III. placed upon a lofty pedestal, and surrounded with an iron rail.

19 Guild-hall. 5. *The Guild-Hall, or Merchants House.* This building is situated upon the south side of Bridge-gate-street; and is in length 82 feet, in breadth 31. The great hall, which is the whole length and breadth of the building, is so capacious, that it is better adapted for the reception of great and numerous assemblies than any other in the city. This house is adorned with a very elegant spire 200 feet high. Glasgow.

20 Town's hospital. 6. *The Town's Hospital* is a very neat building, consisting of two wings and a large front: the length 156 feet, the breadth of the centre 30 feet, and the depth of the wings 68 feet. Behind the building is an infirmary 127 feet long by 25 feet broad, the ascent to which is by a flight of steps. The lower part of this building is appointed for the reception of lunatics. The area between the buildings is large, which, with the agreeable open situation of the hospital on the river, must conduce to the health of the inhabitants.

21 New bridge 7. *The New Bridge* is built in an elegant manner. It is 32 feet wide; with a commodious foot-way for passengers, five feet broad on each side, raised above the road made for carriages, and paved with free stone. This bridge is about 500 feet in length; and consists of seven arches, the faces of which are wrought in rustic, with a strong block cornice above. The arches spring but a little way above low-water mark; which, tho' it renders the bridge stronger than if they sprung from taller piers, diminishes its beauty. Between every arch there is a small circular one: these break the force of the water when the river rises to a flood, and add to the strength of the whole. The parapet-wall or breast-work is cut out in the Chinese taste; and the two ends are finished off with a sweep.

22 Markets, &c. 8. *The Markets in King's Street* are justly admired, as being the completest of their kind in Britain. They are placed on both sides of the street. That on the east side, appropriated entirely for butcher-meat, is 112 feet in length, and 67 in breadth. In the centre is a spacious gateway, decorated on each side with coupled Ionic columns set upon their pedestals, and supporting an angular pediment. At the north end is a very neat hall belonging to the incorporation of butchers, the front ornamented with rustics and a pediment. The markets upon the west side of the street consist of three courts, set apart for fish, mutton, and cheese. The whole of the front is 173 feet, the breadth 46 feet; in the centre of which, as on the opposite side, is a very spacious gateway of the Doric order, supporting a pediment. This is the entry to the mutton-market. Each of the other two has a well-proportioned arch faced with rustics for their entrance. All these markets are well paved with free stone; have walks all round them; and are covered over for shelter by roofs standing upon stone piers, under which the different commodities are exposed to sale. They have likewise pump-wells within, for cleaning away all the filth; which render the markets always sweet and agreeable.

9. *The Guard-House* is a very handsome building, with a piazza formed by arches, and columns of the Ionic order set upon their pedestals. The entablature supports at Attic course, in which are oval port-holes ornamented with palm-branches.

10. *The Herb-Market*, is neat and commodious; in length 130, and in breadth 41 feet. The principal entry is decorated with coupled Ionic columns, supporting an angular pediment. It is laid out in the same manner with the markets in King's-street.

The most remarkable public charities in Glasgow are,

1. *Muir-*

Glaſgow.

1. *Muirhead's or St Nicholas's Hoſpital.* This was originally appointed to ſubſiſt 12 old men and a chaplain: but its revenues have, from ſome unknown cauſes, been loſt; ſo that no more of them now remains than the paltry ſum of 130l. 2s. 5d. Scots money, 12s l. of which is annually divided among four old men annually, at the rate of 2l. 13s. 4d. each.

2. *Hutcheſon's Hoſpital*, was founded and endowed in 1639 by George Hutcheſon of Lamb-hill, notary-public, and Mr Thomas Hutcheſon his brother, who was bred a preacher, for the maintenance of old men and orphans. The funds of this hoſpital were afterwards increaſed by James Blair merchant in Glaſgow, in 1710; and by ſubſequent donations, the managers now have it in their power to give away above 900l. Sterling in penſions, from 5l. 10s. to 10l. per penſioner.

3. *The Town's Hoſpital* was opened for the reception of the poor on the 15th of November 1733. The funds from whence this hoſpital is ſubſiſted are, the general ſeſſion, the town-council, the trades houſe and merchants houſe, the intereſt of money belonging to their funds, which are ſums that have been mortified for the uſe of the houſe. Theſe ſupplies, however, are found inſufficient to defray the expences of the houſe; for which reaſon an aſſeſſment is annually made upon the inhabitants in the following manner. The magiſtrates nominate 12, 14, or ſometimes more gentlemen of known integrity and character, who have a liſt laid before them of all the inhabitants in town. This liſt they divide into 16 or 18 columns. Each of theſe columns contains the names of ſuch inhabitants as carry on trade to a certain extent, or are ſuppoſed to be well able to pay the ſum affixed to the particular column in which their names are inſerted. If it is neceſſary to raiſe 500l. for inſtance, then each name, in every ſeparate column, is valued at as much as the fortunes of the perſons in each particular column are ſuppoſed to be. If 1000l. or more is to be raiſed, it is only continuing a proportional increaſe through the whole of the columns. The higheſt ſum that ever was thus raiſed, was 12s. 6d. upon every thouſand pounds that each perſon was ſuppoſed to be worth. The number of people maintained in this hoſpital are about 620.

24 Members of the univerſity.

The univerſity of Glaſgow owes its origin, as we have already obſerved, to biſhop Turnbull. The inſtitution conſiſted at firſt of a rector, a dean of faculty, a principal who taught theology, and three profeſſors of philoſophy; and, ſoon after this, the civil and canon laws were taught by ſome clergymen. From the time of its eſtabliſhment in 1450 to the reformation in 1560, the college was chiefly frequented by thoſe who were intended for the church; its members were all eccleſiaſtics, and its principal ſupport was derived from the church. The reformation brought the univerſity to the verge of deſtruction: maſters, ſtudents, and ſervants, all forſook it. The magiſtrates were ſo ſenſible of the loſs which the community had ſuſtained by this deſertion, that they endeavoured to reſtore it in 1572, by beſtowing upon it conſiderable funds, and preſcribing a ſet of regulations for its management. Theſe, however, proved inſufficient; for which reaſon king James VI. erected it anew, by a charter called the *Nova Erectio*, in 1577, and beſtowed upon it the teinds of the

23 Public charities.

pariſh of Govan. The perſons who were to compoſe the new univerſity were, a principal, three profeſſors of philoſophy, four ſtudents burſars, one œconomus, a principal's ſervant, a janitor, and cook. Glaſgow.

Since the year 1577, the funds of the univerſity have been conſiderably increaſed by the bounty of kings and the donations of private perſons. The profeſſors have therefore alſo been increaſed; ſo that at preſent the univerſity of Glaſgow conſiſts of a chancellor, rector, dean of faculty, principal, and 13 profeſſors, together with burſars, &c. The archbiſhop of Glaſgow was formerly chancellor of the univerſity *ex officio*; at preſent, the chancellor is choſen by the rector, dean of faculty, principal, and maſters.

The chancellor, as being the head of the univerſity, is the fountain of honour, and in his name are all academical degrees beſtowed. The office of rector is to exerciſe that academical juriſdiction in diſputes among the ſtudents themſelves, or between the ſtudents and citizens, which is beſtowed upon the greater part of the univerſities in Europe. He is choſen annually in the *comitia*; that is, in a meeting in which all the ſtudents, as well as the other members of the univerſity, have a voice. Immediately after his admiſſion, he has been in uſe to chooſe certain perſons as his aſſeſſors and counſellors in his capacity of judge: and, in former periods, it was cuſtomary to name the miniſters of Glaſgow, or any other gentlemen who had no connection with the univerſity; but, for a great while paſt, the rector has conſtantly named the dean of faculty, the principal, and maſters for his aſſeſſors; and he has always been, and ſtill is, in the daily practice of judging in the cauſes belonging to him, with the advice of his aſſeſſors. Beſides theſe powers as judge, the rector ſummons and preſides in the meetings of the univerſity for the election of his ſucceſſor; and he is likewiſe in uſe to call meetings of the profeſſors for drawing up addreſſes to the king, electing a member to the general aſſembly, and other buſineſs of the like kind.

The dean of faculty has, for his province, the giving directions with regard to the courſe of ſtudies; the judging, together with the rector, principal, and profeſſors, of the qualifications of thoſe who deſire to be created maſters of arts, doctors of divinity, &c.; and he preſides in meetings which are called by him for theſe purpoſes. He is choſen annually by the rector, principal, and maſters.

The principal and maſters, independent of the rector and dean, compoſe a meeting in which the principal preſides; and, as they are the perſons for whoſe behoof chiefly the revenue of the college was eſtabliſhed, the adminiſtration of that revenue is therefore committed to them.

The revenue ariſes from the teinds of the pariſh of Govan, granted by king James VI. in 1557; from the teinds of the pariſhes of Renfrew and Kilbride, granted by the ſame monarch in 1617, and confirmed by king Charles I. on the 28th of June 1630; from the teinds of the pariſhes of Calder, Old and New Monkland, conveyed to them by a charter from Charles II. in 1670; from a tack of the archbiſhopric; and from ſeveral donations received from private perſons.

The college of Glaſgow, for a very conſiderable time after its erection, followed the mode of public teaching which is common even to this day in Oxford

and

Glaſgow. and Cambridge, and in many other univerſities through-out Europe; that is, each profeſſor gave a few lectures every year, *gratis*, upon the particular ſcience which he profeſſed: but, in place of this, the profeſſors have, for a great while paſt, adopted the mode of private teaching; that is, they lecture and examine two hours every day during the ſeſſion, viz. from the 20th of October to the 10th of June; a method which comes much cheaper to the ſtudent, as he has it in his power, if he is attentive, to acquire his education without being under the neceſſity of employing a tutor. They have alſo private claſſes, in which they teach one hour *per* day. The fixed fee for a public claſs is 1 l. 11 s. 6d. *per* ſeſſion; the fixed fee for a private one is 1 l. 1 s. *per* D°. The number of ſtudents who have attended this college for ſeveral years paſt, has been upwards of 500 each ſeaſon.

25
Hiſtory of the trade of Glaſgow.

The trade of Glaſgow is ſaid to have been firſt promoted by one Mr William Elphinſtone in 1420. This trade was moſt probably the curing and exporting of ſalmon; but the firſt authentic document concerning Glaſgow as a trading city is in 1546. Complaints having been made by Henry VIII. king of England, that ſeveral Engliſh ſhips had been taken and robbed by veſſels belonging to Scotland, an order of council was iſſued, diſcharging ſuch captures for the future; and among other places made mention of in this order is the city of Glaſgow. The trade which at that time they carried on could not be great. It probably conſiſted of a few ſmall veſſels to France loaded with pickled ſalmon; as this fiſhery was, even then, carried on to a conſiderable extent, by Glaſgow, Renfrew, and Dumbarton. Between the year 1630 and 1660, a very great degree of attention ſeems to have been paid to inland commerce by the inhabitants of Glaſgow. Principal Baillie informs us, that the increaſe of Glaſgow ariſing from this commerce was exceedingly great. The exportation of ſalmon and of herrings was alſo continued and increaſed. In the war between Britain and Holland during the reign of Charles II. a privateer was fitted out in Clyde to cruiſe againſt the Dutch. She was called the *Lion of Glaſgow*, Robert M'Allan commander; and carried five pieces of cannon, and 60 hands.

A ſpirit of commerce appears to have ariſen among the inhabitants of Glaſgow between the year 1660 and 1707. The citizens who diſtinguiſhed themſelves moſt during this period were Walter Gibſon and John Anderſon. Gibſon cured and packed in one year 300 laſts of herrings, which he ſent to St Martins in France on board of a Dutch veſſel, called the *St Agate*, of 450 tons burthen; his returns were brandy and ſalt. He was the firſt who imported iron from Stockholm into Clyde. Anderſon is ſaid to have been the firſt who imported white-wines.

Whatever their trade was at this time, it could not be conſiderable: the ports to which they were obliged to trade lay all to the eaſtward: the circumnavigation of the iſland would therefore prove an almoſt unſurmountable bar to the commerce of Glaſgow; and of conſequence the people on the eaſt coaſt would be poſſeſſed of almoſt all the commerce of Scotland. The union with England opened a field for commerce for which the ſituation of Glaſgow was highly advantageous. Since that time the commerce of the eaſt coaſt has declined, and that of the weſt increaſed to an amazing degree. No ſooner was the treaty of union ſigned, than the inhabitants of Glaſgow began to proſecute the trade to Virginia and Maryland; they chartered veſſels from Whitehaven, ſent out cargoes of goods, and brought back tobacco in return. The method in which they at firſt proceeded in this trade, was certainly a very prudent one. A ſupercargo went out with every veſſel. He bartered his goods for tobacco, until ſuch time as he had either ſold all his goods, or procured as much tobacco as was ſufficient to load his veſſel. He then immediately ſet out on his return; and if any of his goods remained unſold, he brought them home with him. While they continued to trade in this way, they were of great advantage to the country, by the quantity of manufactures which they exported; their own wealth began to increaſe; they purchaſed ſhips of their own; and, in 1718, the firſt veſſel of the property of Glaſgow croſſed the Atlantic. Their imports of tobacco were now conſiderable, and Glaſgow began to be looked upon as a conſiderable port; the tobacco-trade at the ports of Briſtol, Liverpool, and Whitehaven, was obſerved to dwindle away; the people of Glaſgow began to ſend tobacco to theſe places, and to underſell the Engliſh even in their own ports. Thus the jealouſy of the latter was ſoon excited, and they took every method in their power to deſtroy the trade of Glaſgow. The people of Briſtol preſented remonſtrances to the commiſſioners of the cuſtoms at London againſt the trade of Glaſgow, in 1717. To theſe remonſtrances the merchants of Glaſgow ſent ſuch anſwers to the commiſſioners as convinced them that the complaints of the Briſtol merchants were without foundation. But in 1721, a moſt formidable confederacy was entered into by almoſt all the tobacco-merchants in South Britain againſt the trade of Glaſgow. Thoſe of London, Liverpool, and Whitehaven, preſented ſeverally to the Lords of the Treaſury, petitions, arraigning the Glaſgow merchants of frauds in the tobacco trade. To theſe petitions the Glaſgow people gave in replies; and the lords of the treaſury, after a full and impartial hearing, were pleaſed to diſmiſs the cauſe with the following ſentence: "That the complaints of the merchants of London, Liverpool, and Whitehaven, were groundleſs; and that they proceeded from a ſpirit of envy, and not from a regard to the intereſt of trade, or of the king's revenue."

But the malice of theſe gentlemen did not ſtop here. They brought their complaints into the houſe of commons. Commiſſioners were ſent to Glaſgow in 1722, who gave in their reports to the houſe in 1723. The merchants ſent up diſtinct and explicit anſwers to theſe reports; but ſuch was the intereſt of their adverſaries, that theſe anſwers were diſregarded. New officers were appointed at the ports of Greenock and Port-Glaſgow, whoſe private inſtructions ſeem to have been, to ruin the trade if poſſible, by putting all imaginable hardſhips upon it. In ſhort, every ſpecies of perſecution, which malice aſſiſted by wealth and intereſt could invent, were put in practice to deſtroy the trade of Glaſgow; and they in part ſucceeded. It languiſhed till the year 1735; but after that began to revive, though even after its revival it was carried on but ſlowly for a conſiderable ſpace of time. Glaſgow

With

Glasgow. With regard to the manufactures of Glasgow, Mr Gibson is of opinion that the commerce to America first suggested the idea of introducing them, in any considerable degree at least. The first attempts in this way were about the year 1725, and their increase for some time was very slow, nor did they begin to be considerable till great encouragement was given by the legislature to the linen manufacture in Scotland. The first causes of the success of this manufacture were the act of parliament in 1748, whereby the wearing of French cambrics was prohibited under severe penalties; that of 1751, allowing weavers in flax or hemp to settle and exercise their trades any where in Scotland free from all corporation-dues; and the bounty of three-halfpence per yard on all linens exported at and under 18d. per yard. Since that time a spirit of manufacture has been excited among the inhabitants of Glasgow; and great variety of goods, and in very great quantity, have been manufactured. Checks, linen, and linen and cotton, are manufactured to a great extent. Printed linens and cottons were begun to be manufactured in 1738; but they only made garments till 1754, when handkerchiefs were first printed. There is no manufacture more upon the increase in Glasgow than this; nor can any branch be more beneficial to the country, as the cloths on which they print are all made in Scotland; whereas at London, and through the greatest part of England, the cloths they print upon are all imported from Germany.

26 Manufactures of Glasgow.

A manufactory of ribbons has been very lately introduced into Glasgow; and though this branch of business is yet in its infancy, they are made equal in quality to those in England, and rather cheaper.

Incles were first made here about the year 1732. The engine-looms used at that time were so inconvenient, and took up so much time in making the goods, that the Dutch, who were the only people possessed of the large incle looms, were almost solely in possession of this manufacture. Mr Hervey, who began this branch in Glasgow, was so sensible of the disadvantages under which it laboured, that he went over to Holland; and, in spite of the care and attention which the Dutch took to conceal their methods of manufacturing, he brought over with him from Harlem two of their looms, and one of their workmen. This Dutchman remained some years in Glasgow; but on some disgust he went to Manchester, and instructed the people there in the method of carrying on the manufacture.

In 1757, carpets were begun to be made, and are now carried on to a considerable extent. Hunters cloths, English blankets, and other goods of the same kind, are also made; and, with proper attention, these manufactures certainly will succeed.

Besides these, a great variety of articles are manufactured at Glasgow, of which our limits will not permit us to enter into a detail, such as soap, refining of sugar, iron-mongery, brass, jewellery, &c.—Types for printing are made in this city by Dr Wilson and Sons, perhaps superior to any others in Europe. Printing of books was first begun here by George Anderson about the year 1638. But there was no good printing in Glasgow till the year 1735; when Robert Urie printed several books in a very elegant manner. The highest perfection, however, to which printing hath yet been carried in this place, or perhaps in any other, was by the late Robert and Andrew Foulis, (who began in the year 1740;) as the many elegant and splendid editions of books printed by them in different languages sufficiently testify. The same gentlemen also established an academy of painting; but the wealth of Scotland being unequal to the undertaking, it hath been since given up. Glasgow, Glass.

27 Government, revenue, &c. of the city.

The government of the city of Glasgow is vested in a provost and three baillies, a dean of guild, deacon-convener, and a treasurer, with a common council of 13 merchants and 12 mechanics. The provost and two of the bailies must, by the set of the burgh, be elected from the merchant rank, and the other bailie from the trades rank, *i. e.* the mechanics. The provost is, from courtesy and custom, styled *lord provost*. He is properly lord of the police of the city, president of the community, and is *ex officio* a justice of the peace for both the burgh and county.

The revenue of Glasgow amounts to about L. 6000 Sterling *per annum*. It arises from a duty upon all grain and meal brought into the city, (this tax is denominated *the ladles*); from the rents of lands and houses the property of the community; from an impost of two pennies Scots upon every Scots pint of ale or beer brewed, inbrought, or sold, within the city; from certain dues payable out of the markets; from the rents of the seats in churches; from the dues of cranage at the quay, at the weigh-house, tonnage on the river, pontage on the bridge, statute-work within the burgh, &c. The number of inhabitants is computed to be about 43,000.

GLASS, a transparent, brittle, factitious body, produced from fand melted in a strong fire with fixed alkaline salts, lead, slags, &c. till the whole becomes perfectly clear and fine. The word is formed of the Latin *glastum*, a plant called by the Greeks *isatis*, by the Romans *vitrum*, by the ancient Britons *guadum*, and by the English *woad*. We find frequent mention of this plant in ancient writers, particularly Cæsar, Vitruvius, Pliny, &c. who relate, that the ancient Britons painted or dyed their bodies with glastum, guadum, vitrum, &c. i. e. with the blue colour procured from this plant. And hence, the factitious matter we are speaking of came to be called *glass*; as having always somewhat of this bluishness in it.

28 History of glass-making.

At what time the art of glass-making was first invented, is altogether uncertain. Some imagine it to have been invented before the flood: but of this we have no direct proof, though there is no improbability in the supposition; for we know, that it is almost impossible to excite a very violent fire, such as is necessary in metallurgic operations, without vitrifying part of the bricks or stones wherewith the furnace is built. This indeed might furnish the first hints of glass-making; tho' it is also very probable, that such imperfect vitrifications would be observed a long time before people thought of making any use of them.

Neri traces the antiquity of glass as far back as the time of Job. That writer, speaking of the value of wisdom, chap. xxviii. verse 17. says, that gold and *crystal* cannot equal it. But this word, which Neri will have to signify factitious glass, is capable of a great many different interpretations, and properly signifies only whatever is beautiful or transparent. Dr Merret will have the art to be as ancient as that of pottery or the

Glafs. the making of bricks, for the reafons already given, viz. that by all vehement heats fome imperfect vitrifications are produced. Of this kind undoubtedly was the foffile glafs mentioned by Ferant. Imperator. to have been found under-ground where great fires had been. But it is evident, that fuch imperfect vitrifications might have paffed unnoticed for ages; and confequently we have no reafon to conclude from thence, that the art of glafs-making is of fuch high antiquity.

The Egyptians boaft, that this art was taught them by their great Hermes. Ariftophanes, Ariftotle, Alexander, Aphrodifeus, Lucretius, and St John the divine, put it out of all doubt that glafs was ufed in their days. Pliny relates, that it was firft difcovered accidentally in Syria, at the mouth of the river Belus, by certain merchants driven thither by a ftorm at fea; who being obliged to continue there, and drefs their victuals by making a fire on the ground, where there was great plenty of the herb kali; that plant, burning to aftes, its falts mixed and incorporated with the fand, or ftones fit for vitrification, and thus produced glafs; and that this accident, being known, the people of Sidon, in that neighbourhood, eflayed the work, and brought glafs into ufe; fince which time the art has been continually improving. Be this as it will, however, the firft glafs-houfes mentioned in hiftory were erected in the city of Tyre, and here was the only ftaple of the manufactory for many ages. The fand which lay on the fhore for about half a mile round the mouth of the river Belus was peculiarly adapted to the making of glafs, as being neat and glittering; and the wide range of the Tyrian commerce gave an ample vent for the productions of the furnace. It appears, however, that before the conqueft of Britain by the Romans, glafs-houfes had been erected in this ifland, as well as in Gaul, Spain, and Italy. Hence, in many parts of the country are to be found annulets of glafs, having a narrow perforation and thick rim, denominated by the remaining Britons *gleineu naidreedh*, or *glafs adders*, and which were probably in former times ufed as amulets by the druids *. It can fcarcely be queftioned that the Britons were fufficiently well verfed in the manufacture of glafs, to form out of it many more ufeful inftruments than the glafs-beads. Hiftory indeed aflures us, that they did manufacture a conliderable quantity of glafs veffels. Thefe, like their annulets, were moft probably green, blue, yellow, or black, and many of them curioufly ftreaked with other colours. The procefs in the manufacture would be nearly the fame with that of the Gauls or Spaniards. The fand of their fhores being reduced to a fufficient degree of finenefs by art, was mixed with three fourths of its weight of their nitre (much the fame with our kelp), and both were melted together. The metal was then poured into other veffels, where it was left to harden into a mafs, and afterwards replaced in the furnace, where it became tranfparent in the boiling, and was afterwards figured by blowing, or modelling in the lath, into fuch veffels as they wanted.

It is not probable that the arrival of the Romans would improve the glafs manufacture among the Britons. The taite of the Romans at that time was juft the reverfe of that of the inhabitants of this ifland. The former preferred filver and gold to glafs for the compofition of their drinking veffels. They made indeed great improvements in their own at Rome, during the government of Nero. The veffels then formed of this metal rivalled the bowls of porcelain in their dearnefs, and equalled the cups of cryftal in their tranfparency. But thefe were by far too coftly for common ufe; and therefore, in all probability, were never attempted in Britain. The glafs commonly made ufe of by the Romans was of a quality greatly inferior; and, from the fragments which have been difcovered at the ftations or towns of either, appear to have conlifted of a thick, fometimes white, but moftly blue-green, metal.

Glafs.

* See *Anguinum Ovum.*

2 Theory of vitrification uncertain.

With regard to the theory of vitrification, we are almoft totally in the dark. In general, it feems to be that ftate, in which folid bodies are, by the vehement action of fire, fitted for being diffipated, or carried off in vapour. In all vitrifications, there is a plentiful evaporation; and if any folid fubftance is carried off in vapour by the intenfe heat of a burning fpeculum, a vitrification is always obferved previoufly to take place. The difference, then, between the ftate of fufion and vitrification of a folid body we may conceive to be, that in the former the element of fire acts upon the parts of the folid in fuch a manner as only to disjoin them, and render the fubftance fluid; but, in vitrification, the fire not only disjoins the particles, but combines with them in a latent ftate, into a third fubftance; which, having now as much fire as it can contain, can receive no further change from that element, except being carried off in vapour.

But, though we are unable to effect this change upon folid bodies without a very violent heat, it is otherwife in the natural procefles. By what we call *cryftalization*, nature produces more perfect glaffes than we can make with our furnaces. Thefe are called *precious ftones*; but in all trials they difcover the eflential properties of glafs, and not of ftones. The moft diftinguifhing property of glafs is its refifting the force of fire, fo that this element cannot calcine or change it as it does other bodies, but can only melt it, and then carry it off in vapours. To this laft all the precious ftones are fubject. The diamond (the hardeft and moft ponderous of them all) is diffipable in a lefs degree of heat than what would diffipate common glafs. Nor can it be any objection to this idea, that fome kinds of glafs are capable of being converted into a kind of porcelain by a long-continued cementation with certain materials. This change happens only to thofe kinds of glafs which are made of alkaline falt and fand; and Dr Lewis hath fhewn that this change is produced by the diffipation of the faline principle, which is the leaft fixed of the two. Glafs, therefore, we may ftill conlider as a fubftance upon which the fire has no other effect than either to melt, or diffipate it in vapour.

3 Remarkable properties of glafs.

The other properties of glafs are very remarkable, fome of which follow.

1. It is one of the moft elaftic bodies in nature. If the force with which glafs-balls ftrike each other be reckoned 16, that wherewith they recede by virtue of their elafticity will be nearly 15.

2. When glafs is fuddenly cooled, it becomes exceedingly brittle; and this brittlenefs is fometimes attended with very furprifing phenomena. Hollow bells made of unnealed glafs, with a fmall hole in them, filver

Glaſs.

will fly to pieces by the heat of the hand only, if the hole by which the internal and external air communicate be ſtopped with a finger. Lately, however, ſome veſſels made of ſuch unnealed glaſs have been diſcovered, which have the remarkable property of reſiſting very hard ſtrokes given from without, though they ſhiver to pieces by the ſhocks received from the fall of very light and minute bodies dropped into their cavities. Thoſe glaſſes may be made of any ſhape; all that needs be obſerved in making them is, that their bottoms be thicker than their ſides. The thicker the bottom is, the eaſier do the glaſſes break. One whoſe bottom is three fingers breadth in thickneſs, flies with as much eaſe at leaſt as the thinneſt glaſs. Some of theſe veſſels have been tried with ſtrokes of a mallet ſufficient to drive a nail into wood tolerably hard, and have held good without breaking. They have alſo reſiſted the ſhock of ſeveral heavy bodies let fall into their cavities, from the height of two or three feet; as muſket-balls, pieces of iron, or other metal, pyrites, jaſper, wood, bone, &c. But this is not ſurpriſing, as other glaſſes of the ſame ſhape and ſize will do the ſame: but the wonder is, that taking a ſhiver of flint of the ſize of a ſmall pea, and letting it fall into the glaſs only from the height of three inches, in about two ſeconds the glaſs flies, and ſometimes at the very moment of the ſhock; nay, a bit of flint no larger than a grain, dropped into ſeveral glaſſes ſucceſſively, though it did not immediately break them, yet when ſet by, they all flew in leſs than three quarters of an hour. Some other bodies produce the ſame effect with flint; as ſapphire, diamond, porcelain, hard tempered ſteel; alſo marbles ſuch as boys play with, and likewiſe pearls.

4 Surpriſing fragility of unnealed glaſs.

Theſe experiments were made before the Royal Society; and ſucceeded equally when the glaſſes were held in the hand, when they were reſted on a pillow, put in water, or filled with water. It is alſo remarkable, that the glaſſes broke upon having their bottoms ſlightly rubbed with the finger, though ſome of them did not fly till half an hour after the rubbing. If the glaſſes are every where extremely thin, they do not break in theſe circumſtances.

5 Attempts to account for it.

Some have pretended to account for theſe phenomena, by ſaying, that the bodies dropped into the veſſels cauſe a concuſſion which is ſtronger than the coheſive force of the glaſs, and conſequently that a rupture muſt enſue. But why does not a ball of iron, gold, ſilver, or copper, which are perhaps a thouſand times heavier than the flint, produce the ſame effect? Is it becauſe they are not elaſtic? But ſurely iron is more elaſtic than the end of one's finger.—Mr Euler has endeavoured to account for theſe appearances from his principles of percuſſion. He thinks that this experiment entirely overthrows the opinion of thoſe who meaſure the force of percuſſion by the *vis viva*, or abſolute apparent ſtrength of the ſtroke. According to his principles, the great hardneſs and angular figure of the flint, which makes the ſpace of contact with the glaſs extremely ſmall, ought to cauſe an impreſſion on the glaſs vaſtly greater than lead, or any other metal; and this may account for the flint's breaking the veſſel, though the bullet, even falling from a conſiderable height, does no damage.—Hollow cups made of green bottle-glaſs, ſome of them three inches thick at the bottom, were inſtantly broken by a ſhiver of flint, weighing about two grains, though they had reſiſted the ſhock of a muſket-ball from the height of three feet. Glaſs.

That Mr Euler's theory cannot be concluſive more than the other, muſt appear evident from a very ſlight conſideration. It is not by angular bodies alone that the glaſſes are broken. The marbles with which children play are round, and yet they have the ſame effect with the angular flint. Beſides, if it was the mere force of percuſſion which broke the glaſſes, undoubtedly the fracture would always take place at the very inſtant of the ſtroke; but we have ſeen, that this did not happen ſometimes till a very conſiderable ſpace of time had elapſed. It is evident, therefore, that this effect is occaſioned by the putting in motion ſome ſubtile fluid with which the ſubſtance of the glaſs is filled; and that the motions of this fluid, when once excited in a particular part of the glaſs, ſoon propagate themſelves through the whole or greateſt part of it, by which means the coheſive power becomes at laſt too weak to reſiſt them. There can be little doubt that the fluid juſt now mentioned is that of electricity. It is known to exiſt in glaſs, in very great quantity; and it alſo is known to be capable of breaking glaſſes, even when annealed with the greateſt care, if put into too violent a motion. Probably the cooling of glaſs haſtily may make it more electric than is conſiſtent with its coheſive power, ſo that it is broken by the leaſt increaſe of motion in the electric fluid by friction or otherwiſe. This is evidently the caſe when it is broken by rubbing with the finger; but why it ſhould alſo break by the mere contact of flint and the other bodies abovementioned, has not yet been ſatisfactorily accounted for.

6 Rotation of glaſs-tubes before a fire.

A moſt remarkable phenomenon alſo is produced in glaſs tubes placed in certain circumſtances. When theſe are laid before a fire in an horizontal poſition, having their extremities properly ſupported, they acquire a rotatory motion round their axis, and alſo a progreſſive motion towards the fire, even when their ſupports are declining from the fire, ſo that the tubes will move a little way uphill towards the fire. When the progreſſive motion of the tubes towards the fire is ſtopped by any obſtacle, their rotation ſtill continues. When the tubes are placed in a nearly upright poſture, leaning to the right hand, the motion will be from eaſt to weſt; but if they lean to the left hand, their motion will be from weſt to eaſt; and the nearer they are placed to the perfectly upright poſture, the leſs will the motion be either way.

If the tube is placed horizontally on a glaſs plane, the fragment, for inſtance, of coach window-glaſs, inſtead of moving towards the fire, it will move from it, and about its axis in a contrary direction to what it had done before; nay, it will recede from the fire, and move a little up-hill when the plane inclines towards the fire.—Theſe experiments are recorded in the philoſophical tranſactions †. They ſucceeded beſt with tubes about 20 or 22 inches long, which had in each end a pretty ſtrong pin fixed in cork for an axis. † No 476. § 1.

7 Attempts to account for it.

The reaſon given for theſe phenomena, is the ſwelling of the tubes towards the fire by the heat, which is known to expand all bodies. For, ſay the adopters of this hypotheſis, granting the exiſtence of ſuch a

Glaſs. fwelling, gravity muſt pull the tube down when ſupported near its extremities, and a freſh part being expoſed to the fire, it muſt alſo ſwell out and fall down, and ſo on.—But, without going farther in the explanation of this hypotheſis, it may be here remarked, that the fundamental principle on which it proceeds is falſe: for though fire indeed makes bodies expand, it does not increaſe them in weight; and therefore the ſides of the tube, though one of them is expanded by the fire, muſt ſtill remain *in equilibrio*; and hence we muſt conclude, that the cauſes of theſe phenomena remain yet to be diſcovered.

4. Glaſs is leſs dilatable by heat than metalline ſubſtances, and ſolid glaſs-ſticks are leſs dilatable than tubes. This was firſt diſcovered by Col. Roy, in making experiments in order to reduce barometers to a greater degree of exactneſs than hath hitherto been found practicable; and ſince his experiments were made, one of the tubes 18 inches long, being compared with a ſolid glaſs-rod of the ſame length, the former was found by a pyrometer, to expand four times as much as the other, in a heat approaching to that of boiling oil. — On account of the general quality which glaſs has of expanding leſs than metal, M. de Luc recommends it to be uſed in pendulums: and he ſays it has alſo this good quality, that its expanſions are always equable, and proportioned to the degrees of heat; a quality which is not to be found in any other ſubſtance yet known.

Phil. Tranſ. vol. lxvii. p. 663.

Ibid. vol. lxviii. p. 474.

5. Glaſs appears to be more fit for the condenſation of vapours than metallic ſubſtances. An open glaſs filled with water, in the ſummer-time, will gather drops of water on the outſide, juſt as far as the water in the inſide reaches; and a perſon's breath blown on it, manifeſtly moiſtens it. Glaſs alſo becomes moiſt with dew, when metals do not. See DEW.

6. A drinking-glaſs partly filled with water, and rubbed on the brim with a wet finger, yields muſical notes, higher or lower as the glaſs is more or leſs full; and will make the liquor friſk and leap. See HARMONICA.

7. Glaſs is poſſeſſed of very great electrical virtues. See ELECTRICITY, *paſſim*.

8 Materials for glaſs.

Materials for Making of GLASS. The materials whereof glaſs is made, we have already mentioned to be ſalt and ſand or ſtones. The ſalt here uſed, is procured from a ſort of aſhes, brought from the Levant, called *polverine*, or *rochetta*; which aſhes are thoſe of a ſort of water-plant called *kali* *, cut down in ſummer, dried in the ſun, and burnt in heaps, either on the ground, or on iron gates; the aſhes falling into a pit, grow into a hard maſs, or ſtone, fit for uſe. It may alſo be procured from common kelp, or the aſhes of the *fucus veſiculoſus*. See KELP, and FUCUS in *The* APPENDIX.

* See *Salſola*.

To extract the ſalt, theſe aſhes, or polverine, are powdered and ſifted, then put into boiling water, and there kept till one third of the water be conſumed; the whole being ſtirred up from time to time, that the aſhes may incorporate with the fluid, and all its ſalts be extracted: then the veſſel is filled up with new water, and boiled over again, till one half be conſumed; what remains is a ſort of lee, ſtrongly impregnated with ſalt. This lee, boiled over again in freſh coppers, thickens in about twenty-four hours, and ſhoots its ſalt; which is to be ladled out, as it ſhoots, into earthen pans, and thence into wooden vats to drain and dry. This done, it is groſly pounded, and thus put in a ſort of oven, called *calcar*, to dry. It may be added, that there are other plants, beſides kali, and fucus, which yield a ſalt fit for glaſs: ſuch are the common way-thiſtle, bramble, hops, wormwood, woad, tobacco, fern, and the whole leguminous tribe, as peaſe, beans, &c. In ſome kinds of glaſs, however, litharge, common pearl-aſhes, and nitre, are uſed in great quantity. Glaſs.

The ſand or ſtone, called by the artiſts *tarſo*, is the ſecond ingredient in glaſs, and that which gives it the body and firmneſs. Theſe ſtones, Agricola obſerves, muſt be ſuch as will fuſe; and of theſe ſuch as are white and tranſparent are beſt; ſo that cryſtal challenges the precedency of all others.

At Venice they chiefly uſe a ſort of pebble, found in the river Teſino, reſembling white marble, and called *cuogolo*. Indeed Ant. Neri aſſures us, that all ſtones which will ſtrike fire with ſteel, are fit to vitrify: but Dr Merret ſhews, that there are ſome exceptions from this rule. Flints are admirable; and when calcined, powdered, and ſearched, make a pure white cryſtalline metal: but the expence of preparing them makes the maſters of our glaſs-houſes ſparing of their uſe. Where proper ſtones cannot be ſo conveniently had, ſand is uſed; which ſhould be white, and ſmall, and well waſhed, before it be applied: ſuch is uſually found in the mouths and ſides of rivers. Our glaſs-houſes are furniſhed with a fine ſand for cryſtal, from Maidſtone; the ſame with that uſed for ſand-boxes, and in ſcouring; and with a coarſer for green glaſs, from Woolwich. For cryſtal glaſs, to 200 lb of tarſo, pounded fine, they put 130 lb of ſalt of polverine; then mix them together, and put them into the calcar, a ſort of reverberatory furnace, being firſt well heated. Here they remain baking, frying, and calcining, for five hours, during which the workman keeps mixing them with a rake, to make them incorporate: when taken out, the mixture is called *frit*, or *bollito*.

It may be further obſerved, that glaſs might be made by immediately melting the materials without thus calcining and making them frit; but the operation would be much more tedious.

9 Dr Shaw's receipt for very hard glaſs.

A glaſs much harder than any prepared in the common way may be made by means of borax, in the following manner. Take four ounces of borax, and an ounce of fine white ſand, reduced to powder, and melt them together in a large cloſe crucible ſet in a wind-furnace, keeping a ſtrong fire for half an hour; then take out the crucible, and, when cold, break it; and there will be found at the bottom, a hard, pure glaſs, capable of cutting common glaſs almoſt like a diamond. This experiment duly varied, ſays Dr Shaw, may lead to ſome conſiderable improvements in the art of making glaſs, enamels, and artificial gems. It ſhews us an expeditious method of making glaſs without the uſe of fixed ſalts, which has generally been thought an eſſential ingredient in glaſs, and which is the ingredient that gives common glaſs its ſoftneſs; and it is not yet known, whether calcined cryſtal, or other ſubſtances being added to this ſalt, inſtead of ſand, it might not make a glaſs approaching to the nature

Glafs. nature of a diamond.

10 Different kinds of glafs.

Kinds of GLASS. Of thefe materials we have many forts of glafs made, which may principally be diftinguifhed according to their beauty: as the cryftal flint-glafs, the cryftal white-glafs, the green-glafs, and the bottle-glafs. Again, thefe feveral forts are diftinguifhed by their feveral ufes: as plate or coach glaffes, looking-glaffes, optic-glaffes, &c. which are made of the firft fort. The fecond fort includes crown-glafs, toys, phials, drinking glaffes, &c. The third fort is well known by its colour, and the fecond by its form.

Balas-coloured GLASS is made thus: Put into a pot cryftal frit, thrice waflied in water; tinge this with manganefe prepared into a clear purple: to this add alumen cativum fifted fine in fmall quantities, and at feveral times; this will make the glafs grow yellowifh, and a little reddifh, but not blackifh, and always diffipates the manganefe. The laft time you add manganefe, give no more of the alumen cativum, unlefs the colour be too full. Thus will the glafs be exactly of the colour of the balas-ruby.

Red GLASS. A blood-red glafs may be made in the following manner: Put fix pounds of glafs of lead, and ten pounds of common glafs, into a pot glazed with white glafs: when the whole is boiled and refined, add, by fmall quantities, and at fmall diftances of time, copper calcined to a rednefs, as much as, on repeated proofs, is found fufficient: then add tartar in powder by fmall quantities at a time, till the glafs is become as red as blood; and continue adding one or other of the ingredients till the colour is quite perfect.

11 Dr Lewis's experiments for tinging glafs red. *Phil. Com. of Arts.*

A much finer red, however, may be communicated to glafs by means of gold, of which Dr Lewis gives the following account. "The tinging of glafs and enamels by preparations of gold appears to have been firft attempted about the beginning of the laft century. Libavius, whofe works compofe a valuable body of the chemical knowledge of his own time, conjectures, in one of his tracts entitled *Alchymia*, printed in 1606, that the colour of the ruby proceeds from gold, and that gold diffolved and brought to rednefs might be made to communicate a like colour to factitious gems or glafs. Neri, in his *Art of Glafs* dated 1611, gives a procefs on this principle, which he fays was found to fucceed: he directs the gold to be diffolved in aqua regia, the menftruum to be evaporated or drawn off by diftillation, more aqua regia added, and the abftraction repeated five or fix times: the remaining matter is to be calcined till it becomes purple, and then mixed with a proper quantity of the fineft white or cryftal glafs. But though this procefs may be fuppofed to have fometimes proved fuccefsful, it doubtlefs very often miscarried; infomuch that the introduction of this defirable colour into the glafs was very little known for many years after.

"Glauber, in the fecond part of his *Philofophical Furnaces* publifhed in 1648, gives another method of producing a red colour by gold in a matter which is of the vitreous kind, though not perfect glafs. When powdered flint or fand is well ground with four times its weight of fixt alkaline falt, the mixture melts in a moderately ftrong fire, and when cold looks like glafs, but on account of its over-proportion of alkaline falt it runs into a liquid ftate on being expofed to the air: on adding this liquor to folution of gold in aqua regia, the acid, which held the gold diffolved, unites with the alkali which held the flint diffolved, and the gold and flint precipitate together in form of a yellow powder, which by calcination becomes purple: this powder being mixed with three or four times its weight of the alkaline folution of flint, the mixture dried, and kept melted in a ftrong fire for an hour, a mafs is obtained, of a tranfparent ruby colour, and of a vitreous appearance; though ftill foluble in water, or by the moifture of the air, on account of the redundance of falt. Glafs.

"Boyle, in his treatife on the Porofity of Bodies, and in the appendix to his *Sceptical Chemift* publifhed in 1680, mentions an experiment, in which a like colour was introduced into glafs without fufion. A mixture of gold and mercury having been kept in digeftion for fome months, the fire was at laft immoderately increafed, infomuch that the glafs burft with a violent explofion: the lower part of the glafs was found tinged throughout of a tranfparent red colour, which feemed, he fays, to emulate that of a not common ruby.

"About the fame time Caffius difcovered the precipitation of gold by tin, and that glafs might be tinged of a ruby colour by melting it with this precipitate. I can give no further account of his experiments, having never had the good fortune to meet with his treatife.

"The procefs was foon after brought to perfection by Kunckel, who fays he prepared the ruby glafs in large quantity, and fold it for about forty fhillings an ounce; and that he made a chalice of it for the elector of Cologn, weighing no lefs than 24 pounds, a full inch thick, and of an uniform fine colour throughout. He has nowhere communicated the procefs he followed, but fome ufeful obfervations relating to it are difperfed through his writings: he fays, that one part of the precipitate by tin is fufficient to give a ruby colour to twelve hundred and eighty parts of glafs, and a fenfible rednefs to upwards of nineteen hundred parts: that the fucceſs is by no means conftant, and that, after long practice, he ftill frequently failed: that oftentimes the glafs comes out of the fire colourlefs as cryftal, and receives its ruby colour on being afterwards expofed to a fmoky flame, infomuch that he imagines the difcovery of the ruby glafs did not arife from fimply melting the gold precipitate with glafs, but from the fubfequent foftening and working of the glafs in the flame of a lamp, in the ufe of which Caffius was very converfant: that the addition of nitre and fal ammoniac calls forth the colour, and that the colour produced by fal ammoniac is more beautiful than that by nitre, but quickly difappears on a continuance of the fire.

"Orfchal, in a treatife entitled *fol fine veſte*, gives a procefs, by which he fays he obtained a very fine ruby. He directs the purple precipitate, made by tin, to be ground with fix times its quantity of Venice glafs in a very fine powder, and this compound to be exquifitely mingled with the fritt or vitreous compofition to be tinged: his fritt confifts of equal parts of borax, nitre, and fixt alkaline falt, and four times as much calcined flint as of each of the falts; but in

Glaſs. what proportion the gold precipitate is to be mixed with the fritt, and in what manner the fuſion is to be performed, he does not mention. He reports that he had found the muddy matter, obtained in poliſhing gold by a pumice ſtone, to impart likewiſe a ruby colour to glaſs.

" Grummet, who had been operator to Kunckel in making the red glaſs, publiſhed a tract in oppoſition both to him and Orſchal, under the title of *Sol non ſine veſte;* in which he obſerves, that the furnace ought to be ſo conſtructed, that the operator may have full liberty of examining the glaſs in the fire, and of removing it as ſoon as it appears to have acquired the proper colour: he ſays the enamellers obtain a ruby colour, by melting, with a large proportion of Venice glaſs, the browniſh powder precipitated from ſolution of gold in aqua regia by fixt alkaline ſalts. But he imagines that the gold is nowiſe concerned in the production of the colour. Venice glaſs, and moſt of the finer colourleſs kinds of glaſs, have an addition of manganeſe, without which it would be very difficult to render them perfectly void of colour: the manganeſe communicates at firſt a purpliſh hue, which on continuing the fire diſappears, and at the ſame time ſuppreſſes or diſcharges any other tinge that the glaſs may be impregnated with: the addition of a little nitre revives the purpliſh colour of the manganeſe; and Grummet is of opinion that the colour with which glaſs becomes tinged, by the admixture of preparations of gold, is no other than that of the manganeſe extricated by the nitrous ſalt which the gold has retained in its precipitation. He affirms, that the ſame purpliſh red colour will be obtained on melting Venice glaſs with an eighth part of nitre, without any gold; that in a hundred repetitions of this experiment, it ſcarcely fails once; and that neither nitre nor the gold-precipitate were found to give any thing of the admired colour to thoſe kinds of glaſs which have no manganeſe in their compoſition.

" The colours which manganeſe imparts to glaſs, it belongs not to this place to examine: but that precipitates of gold will communicate, in certain circumſtances, a purpliſh red colour, I have ſeveral times experienced; having myſelf tinged of this colour fritts compoſed of calcined flint, nitre and borax, without the addition of manganeſe or of glaſſes containing it. Though gold, diſſolved in common aqua regia, exhibits its own yellow colour; yet, when the menſtruum is ſeparated by fire to a certain point, or when the gold is precipitated by tin, or when it is precipitated by alkaline ſalts and afterwards moderately heated, or when gold is barely divided by mechanical means into ſubtile powder, and expoſed for ſome time, in mixture with earthy bodies, to a ſlight heat, it aſſumes, in different circumſtances, a violet colour, a purple, or a red verging to purple: in a ſtrong fire, theſe colours vaniſh, and the gold melts into a maſs of its original appearance. All theſe colours I have introduced into glaſs by preparations of gold; and I have found them to be nearly as periſhable in the fire when the coloured gold-powder was thus diffuſed through the glaſs, as when expoſed to the fire by itſelf: when the fire was raiſed to any great degree, and the glaſs made to flow thin, there was generally a button of revived gold collected at the bottom.

" A ſolution of gold in aqua regia being inſpiſſated Glaſs.
to dryneſs in the bottom of a Florence flaſk, and the heat further increaſed till the gold reſumed its proper colour, the lower part of the glaſs was by this ſimple proceſs tinged purpliſh: pieces of it being expoſed to the flame of a lamp, they became in ſome parts violet coloured, in ſome of a bright purple, and in others purpliſh red; and the parts which in one poſition looked violet or purpliſh, in another appeared red.

" A colour nearly of the ſame kind is impreſſed on glaſs by gold-leaf in ſome electrical experiments; a fact which we are obliged to Mr Franklin for the firſt knowledge of. A narrow ſtrip of gold-leaf being placed between two ſlips of glaſs, with both the ends hanging out a little, and the glaſs well tied round with ſilk thread, a ſtrong electrical exploſion is made to paſs through the gold-leaf. On examining the glaſs, the gold-leaf, he obſerves, will be found miſſing in ſeveral places, and inſtead of it a reddiſh ſtain on both the glaſſes, exactly ſimilar on both in the minuteſt ſtroke, though ſometimes ſpread a little wider than the breadth of the leaf: the ſtain appears to have penetrated into the ſubſtance of the glaſs, ſo as to be protected by it from the action of aqua regia. I have had this experiment ſeveral times repeated with plate-glaſs; and found it tinged, as above deſcribed, in ſome parts violet, in ſome purpliſh, and in ſome reddiſh: the colours could not be ſcraped off, and reſiſted aqua regia and ſpirit of ſalt. If the electric exploſion is made very ſtrong, the glaſs commonly flies in pieces, with ſuch force, that it is neceſſary for the operator to have his face ſcreened from them.

" The preparation of gold which has been principally recommended for tinging glaſs is Caſſius's precipitate by ſolution of tin. To obtain this precipitate of the due colour, a good deal of care is neceſſary both in diſſolving the tin and in diluting the ſolutions. A mixture of two parts of aqua fortis and one of ſpirit of ſalt, is ſuppoſed to be the beſt menſtruum for the tin: into this mixture ſome fine block-tin, granulated, is to be let fall, grain by grain, waiting till one grain is diſſolved before another is dropt in, that the diſſolution may go on ſlowly, without any heat or diſcharge of fumes. The gold is diſſolved in common aqua regia; and a few drops of this ſolution being mixed with ſome ounces of pure water, as many drops of the ſolution of tin are added. If the mixture changes immediately to a clear bright purpliſh red colour, the due degree of dilution has been hit; if the colour appears dull, a greater quantity of water muſt be added for the reſt of the ſolutions. After the mixture has depoſited its red matter, and become clear, a little more of the tin-ſolution is to be dropt in, for diſcovering, and precipitating, any gold that may ſtill remain in it: the liquor being then poured off, the precipitate is waſhed and dried.

" Kunckel mentions another purple gold-powder, made nearly like that of Neri already mentioned, by inſpiſſating ſolution of gold to dryneſs, abſtracting from it freſh aqua regia three or four times till the matter looks almoſt like oil, then precipitating with ſtrong alkaline ley, and waſhing the precipitate with water. By diſſolving this powder in ſpirit of ſalt, and precipitating again, it becomes, he ſays, extreme-

ly

Glafs. ly fair, and in this ſtate he directs it to be mixed with a due proportion of Venice glaſs.

" Hellot deſcribes a preparation which in mixture with Venice glaſs was found to give a beautiful purple enamel. Equal parts of ſolution of gold, and of ſolution of zinc in aqua regia, are mixed together; and a volatile ſpirit, prepared from ſal ammoniac by quick-lime, added to the mixture in ſufficient quantity to precipitate the two metals. The precipitate is to be gradually heated, till it acquires a violet colour: it does not fulminate, making only a ſlight dull decrepitation without any of its particles flying about.

" Though a purple, or a red colour approaching to that of the ruby, may by the foregoing means be baked upon glaſs or enamels, and introduced into the maſs by fuſion, the way of equally diffuſing ſuch a colour through a quantity of fluid glaſs is ſtill a ſecret.

" I was once, many years ago, fortunate enough to ſucceed, at a glaſs-houſe, in a ſmall pot of glaſs, of which a ſalver was blown of a fine ruby red: the tinging matter was the precipitate of gold by tin; the particulars of the proceſs cannot now be recollected. I have ſince tried the remainder of the ſame preparation, with common flint glaſs, with green glaſs, with various fritts compoſed of flint, borax, pure fixt alkaline ſalt, nitre, ſal ammoniac. When flint was uſed, it was ſeveral times made red-hot, and quenched in water, to render it more eaſily pulverable: both the flint and glaſſes were powdered in an iron mortar, and the powders well waſhed with diluted oil of vitriol, to extract ſuch particles of iron as they might have worn off in the trituration; the gold precipitate was ground with the other ingredients, in agate or glaſs mortars; its proportion was varied from an eighth part to an eight hundredth of the vitreous materials; and the fire was continued, in a wind furnace, from ſix to thirty hours. All the glaſſes came out conſiderably coloured; ſome of a deep duſky yellow; ſome of a fine pale tranſparent yellow; ſome of a brown colour, greatly reſembling that which the glaſs mentioned below acquired under a muffle; ſome appeared yelloviſh or browniſh when looked down upon, and of a purple-violet or reddiſh purple when held between the eye and the light: ſome had ſpecks and veins of a fine red; no one was either red or purple throughout. Several of theſe glaſſes were melted again and again, by themſelves, and with the addition of more vitreous matter: ſome were worked in the flame of a lamp: ſome were laid in a mixture of powdered charcoal and foot, and made red-hot in a cloſe crucible; and others being laid in the ſame manner, the fire was increaſed till they melted. The colours were by theſe means altered; but did not become uniform, or more approaching to the ruby colour than before: ſome pieces, which had at firſt very conſiderable ſpecks of a ruby luſtre, loſt them on a repetition of the fuſion.

" At the ſame time that theſe experiments were tried, the ſame kinds of vitreous compoſitions, mixed with different metallic preparations, were expoſed to the fire in different parts of the ſame furnace, and were all found to receive beautiful and uniform colours. To what cauſe the miſcarriage of thoſe with gold was owing; whether the ſucceſs, in regard to this metal, is influenced by the quantity of the matter, by the unſteadineſs of the heat in a ſmall furnace, by the fuſibility of the vitreous compoſition, by the metallic matter being ground with the ingredients before their expoſure to the fire, or added to them in fuſion, by the continuance of the fire, by the fluid matter being kept unmoved or ſtirred with an iron rod, by the crucible being covered or open, or other like circumſtances; or whether the admixture of a little manganeſe, though gold will certainly give a ruby colour without it, does not contribute to ſecure the ſucceſs; I have not yet diſcovered. The proportion of the gold precipitate to the vitreous matter is perhaps of principal importance. Solution of gold, as we have ſeen already, produces no redneſs with tin unleſs diluted with a very large quantity of water, in which circumſtance the whole mixture acquires that beautiful colour which we here want to transfer from the watery fluid into fluid glaſs. It ſhould ſeem, therefore, that the quantity of gold precipitate, for communicating the admired colour to a certain volume of glaſs, ought to be the ſame with that which communicated a like colour to an equal volume of water in the precipitation: a quantity extremely minute, and much leſs than that employed in any of my experiments.

" I have lately been favoured with ſome pieces of glaſs, in greateſt part colourleſs, with one or two large red ſpots, ſeveral ſmall ſtreaks of violet, and ſome of a light browniſh yellow. The perſon from whom I received them informs me, " that he had " found, that in a heat not very ſtrong, under a " muffle, the glaſs becomes of an opake brown, and, " if then poliſhed, appears variegated like a fine " pebble." I expoſed a colourleſs piece to the flame of a lamp, impelled by a blow-pipe; and on working it about, ſometimes in the ſmoke, and ſometimes in the flame, found it change to a true ruby-red, perfectly tranſparent, and free from veins of any other colour. Another piece, kept for two hours under a cloſe muffle, in ſuch a heat as made it juſt ſoft enough to bend and receive an impreſſion, became on the ſurface green, brown, and pale yellow in different parts, greatly reſembling the coat of ſome pebbles: in this ſtate, looked through againſt the ſun, it appeared of a beautiful ruby-colour, and on breaking it, the internal part was found throughout of an uniform dark-red when looked down upon, and of the ruby-red when placed between the eye and the light. A large piece being continued under the muffle for four hours, its figure was found ſcarcely altered, the coat was much thicker, and beautifully veined with various colours, which were all loſt in a glorious red when the piece was viewed between the light.

" All I have been able to learn in regard to the preparation of this glaſs is, that the quantity made at once is about ſix cwt.; that the tinging matter is mixed with the vitreous materials before they are put into the melting-pot, the mixture being brought to the glaſs-houſe in tubs; that the matter is not ſtirred in fuſion; and that it is kept no longer in the fire than is neceſſary for perfecting the glaſs, which, as ſoon as fine, is caſt into a kind of bricks. Some imagine that this glaſs has no mixture of calx of lead, of which a large proportion is uſed in the compoſition of the Glaſs.

Glafs. en frame, with truſtles for the convenience of moving to the annealing furnace; into which, ſtrewed with ſand, the new plate is ſhoved, where it will harden in about ten days. After this, the glaſs needs only to be ground, poliſhed, and foliated for uſe.

Grinding and Poliſhing of Plate-Glass. Glaſs is made tranſparent by fire; but it receives its luſtre by the ſkill and labour of the grinder and poliſher, the former of whom takes it rough out of the hands of the maker.

In order to grind plate-glaſs, they lay it horizontally upon a flat ſtone table (fig. 3.) made of a very fine-grained free-ſtone: and for its greater ſecurity they plaſter it down with lime or ſtucco; for otherwiſe the force of the workmen, or the motion of the wheel with which they grind it, would move it about.

This ſtone table is ſupported by a ſtrong frame A, made of wood, with a ledge quite round its edges, riſing about two inches higher than the glaſs. Upon this glaſs to be ground, is laid another rough glaſs not above half ſo big, and ſo looſe as to ſlide upon it; but cemented to a wooden plank, to guard it from the injury it muſt otherwiſe receive from the ſcraping of the wheel to which this plank is faſtened, and from the weights laid upon it to promote the grinding or triture of the glaſſes. The whole is covered with a wheel, B, made of hard light wood, about ſix inches in diameter; by pulling of which backwards and forwards alternately, and ſometimes turning it round, the workmen, who always ſtand oppoſite to each other, produce a conſtant attrition between the two glaſſes, and bring them to what degree of ſmoothneſs they pleaſe, by firſt pouring in water and coarſe ſand; after that, a finer ſort of ſand, as the work advanceth, till at laſt they muſt pour in the powder of ſmalt. As the upper or incumbent glaſs poliſhes and grows ſmoother, it muſt be taken away, and another from time to time put in its place.

This engine is called a *mill* by the artiſts, and is uſed only in the largeſt-ſized glaſſes; for in the grinding of the leſſer glaſſes, they are content to work without a wheel, and to have only four wooden handles faſtened to the four corners of the ſtone which loads the upper plank, by which they work it about.

When the grinder has done his part, who finds it very difficult to bring the glaſs to an exact plainneſs, it is turned over to the poliſher; who, with the fine powder of tripoli-ſtone, or emery, brings it to a perfect evenneſs and luſtre. The inſtrument made uſe of in this branch is a board, *c c*, furniſhed with a felt, and a ſmall roller, which the workman moves by means of a double handle at both ends. The artiſt in working this roller, is aſſiſted with a wooden hoop or ſpring, to the end of which it is fixed: for the ſpring, by conſtantly bringing the roller back to the ſame points, facilitates the action of the workman's arm.

Painting in Glass. The ancient manner of painting in glaſs was very ſimple: it conſiſted in the mere arrangement of pieces of glaſs of different colours in ſome ſort of ſymmetry, and conſtituted what is now called *Moſaic work*. See Mosaic.

In proceſs of time they came to attempt more regular deſigns, and alſo to repreſent figures heightened with all their ſhades: yet they proceeded no farther than the contours of the figures in black with water-colours, and hatching the draperies after the ſame manner on glaſſes of the colour of the object they deſigned to paint. For the carnation, they uſed glaſs of a bright red colour; and upon this they drew the principal lineaments of the face, &c. with black. Glaſs.

But in time, the taſte for this ſort of painting improving conſiderably, and the art being found applicable to the adorning of churches, baſilics, &c. they found out means of incorporating the colours in the glaſs itſelf, by heating them in the fire to a proper degree; having firſt laid on the colours.

This art, however, has frequently met with much interruption, and ſometimes been almoſt totally loſt; of which Mr Walpole gives us the following account, in his Anecdotes of Painting in England.

"The firſt interruption given to it was by the reformation, which baniſhed the art out of churches; yet it was in ſome meaſure kept up in the eſcutcheons of the nobility and gentry, in the windows of their ſeats. Towards the end of queen Elizabeth's reign it was omitted even there; yet the practice did not entirely ceaſe. The chapel of our Lady at Warwick was ornamented anew by Robert Dudley earl of Leiceſter, and his counteſs, and the cipher of the glaſs-painter's name yet remains, with the date 1574: and in ſome of the chapels at Oxford the art again appears, dating itſelf in 1622, by the hand of no contemptible maſter.

"I could ſupply even this gap of 48 years by many dates on Flemiſh glaſs; but nobody ever ſuppoſed that the ſecret was loſt ſo early as the reign of James I. and that it has not periſhed ſince, will be evident from the following ſeries reaching to the preſent hour.

"The portraits in the windows of the library at All Souls, Oxford. In the chapel at Queen's college there are twelve windows dated 1518. P. C. a cipher on the painted glaſs in the chapel at Warwick, 1574. The windows at Wadham-college; the drawing pretty good, and the colours fine, by Bernard Van Linge, 1622. In the chapel at Lincoln's-Inn, a window, with the name of *Bernard*, 1623. This was probably the preceding Van Linge. In the church of St Leonard, Shoreditch, two windows by Baptiſta Sutton, 1634. The windows in the chapel at Univerſity-college, Hen. Giles *pinxit*, 1687. At Chriſt-church, Iſaac Oliver, aged 84, 1700. Window in Merton-chapel, William Price, 1700. Windows at Queen's New-college, and Maudlin, by William Price, the ſon, now living, whoſe colours are fine, whoſe drawing is good, and whoſe taſte in ornaments and moſaic is far ſuperior to any of his predeceſſors; is equal to the antique, to the good Italian maſters, and only ſurpaſſed by his own ſingular modeſty.

"It may not be unwelcome to the curious reader to ſee ſome anecdotes of the revival of taſte for painted glaſs in England. Price, as we have ſaid, was the only painter in that ſtyle for many years in England. Afterwards one Rowell, a plumber at Reading, did ſome things, particularly for the late Henry earl of Pembroke; but Rowel's colours ſoon vaniſhed. At laſt he found out a very durable and beautiful red; but he died in a year or two, and the ſecret with him. A man at Birmingham began the ſame art in 1756 or 1757, and fitted up a window for lord Lyttelton, in the church of Hagley; but ſoon broke. A little after him,

Glafs. him, one Peckitt at York began the fame bufinefs, and has made good proficiency. A few lovers of that art collected fome difperfed panes from ancient buildings, particularly the late lord Cobham, who erected a Gothic temple at Stowe, and filled it with arms of the old nobility, &c. About the year 1753, one Afciotti, an Italian, who had married a Flemifh woman, brought a parcel of painted glafs from Flanders, and fold it for a few guineas to the honourable Mr Bateman, of Old Windfor. Upon that I fent Afciotti again to Flanders, who brought me 450 pieces, for which, including the expence of his journey, I paid him 36 guineas. His wife made more journeys for the fame purpofe; and fold her cargoes to one Palmer, a glazier in St Martin's-lane, who immediately raifed the price to one, two, or five guineas for a fingle piece, and fitted up entire windows with them, and with mofaics of plain glafs of different colours. In 1761, Paterfon, an auctioneer at Eflex-houfe in the Strand, exhibited the two firft auctions of painted glafs, imported in like manner from Flanders. All this manufacture confifted in rounds of fcripture-ftories, ftained in black and yellow, or in fmall figures of black and white; birds and flowers in colours, and Flemifh coats of arms."

The colours ufed in painting or ftaining of glafs are very different from thofe ufed in painting either in water or oil colours.

For black, take fcales of iron, one ounce; fcales of copper, one ounce; jet, half an ounce: reduce them to powder, and mix them.* For blue, take powder of blue, one pound; fal nitre, half a pound; mix them and grind them well together. For carnation, take red chalk, eight ounces; iron fcales, and litharge of filver, of each two ounces; gum arabic, half an ounce; diffolve in water; grind all together for half an hour as ftiff as you can; then put it in a glafs and ftir it well, and let it ftand to fettle fourteen days. For green, take red-lead, one pound; fcales of copper, one pound; and flint, five pounds: divide them into three parts; and add to them as much fal nitre; put them into a crucible, and melt them with a ftrong fire; and when it is cold, powder it, and grind it on a porphyry. For gold colour, take filver, an ounce; antimony, half an ounce; melt them in a crucible; then pound the mafs to powder; and grind it on a copper plate; add to it yellow oker, or brick-duft calcined again, fifteen ounces; and grind them well together with water. For purple, take minium, one pound; brown ftone, one pound; white flint, five pounds: divide them into three parts, and add to them as much fal nitre as one of the parts; calcine, melt, and grind it as you did the green. For red, take jet, four ounces; litharge of filver, two ounces; red chalk, one ounce; powder them fine, and mix them. For white, take jet, two parts; white flint, ground on a glafs very fine, one part; mix them. For yellow, take Spanifh brown, ten parts; leaf-filver, one part; antimony, half a part; put all into a crucible, and calcine them well.

In the windows of ancient churches, &c. there are to be feen the moft beautiful and vivid colours imaginable, which far exceed any of thofe ufed by the moderns, not fo much becaufe the fecret of making thofe colours is entirely loft, as that the moderns will not go to the charge of them, nor be at the neceffary pains, by reafon that this fort of painting is not now fo much in eftecm as formerly. Thofe beautiful works which were made in the glafs-houfes were of two kinds. Glafs.

In fome, the colour was diffufed through the whole fubftance of the glafs. In others, which were the more common, the colour was only on one fide, fcarce penetrating within the fubftance above one third of a line; though this was more or lefs according to the nature of the colour, the yellow being always found to enter the deepeft. Thefe laft, though not fo ftrong and beautiful as the former, were of more advantage to the workmen, by reafon that on the fame glafs, though already coloured, they could fhew other kind of colours where there was occafion to embroider draperies, enrich them with foliages, or reprefent other ornaments of gold, filver, &c.

In order to this, they made ufe of emery, grinding or wearing down the furface of the glafs, till fuch time as they were got through the colour to the clear glafs. This done, they applied the proper colours on the other fide of the glafs. By thefe means, the new colours were hindered from running and mixing with the former, when they expofed the glaffes to the fire, as will appear hereafter.

When indeed the ornaments were to appear white, the glafs was only bared of its colour with emery, without tinging the place with any colour at all; and this was the manner by which they wrought their lights, and heightnings, on all kinds of colour.

The firft thing to be done, in order to paint or ftain glafs, in the modern way, is to defign, and even colour the whole fubject on paper. Then they choofe fuch pieces of glafs as are clear, even, and fmooth, and proper to receive the feveral parts; and proceed to diftribute the defign itfelf, or papers it is drawn on, into pieces fuitable to thofe of the glafs; always taking care that the glaffes may join in the contours of the figures and the folds of the draperies; that the carnations, and other finer parts, may not be impaired by the lead with which the pieces are to be joined together. The diftribution being made, they mark all the glaffes as well as papers, that they may be known again: which done, applying every part of the defign upon the glafs intended for it, they copy, or transfer, the defign upon this glafs with the black colour diluted in gum-water, by tracing and following all the lines and ftrokes as they appear through the glafs with the point of a pencil.

When thefe ftrokes are well dried, which will happen in about two days, the work being only in black and white, they give a flight wafh over with urine, gum arabic, and a little black; and repeat it feveral times, according as the fhades are defired to be heightened; with this precaution, never to apply a new wafh till the former is fufficiently dried.

This done, the lights and rifings are given by rubbing off the colour in the refpective places with a wooden point, or the handle of the pencil.

As to the other colours above-mentioned, they are ufed with gum-water, much as in painting in miniature; taking care to apply them lightly, for fear of effacing the outlines of the defign; or even, for the greater fecurity, to apply them on the other fide; efpecially yel-

Glafs, Glaſtonbury.

low, which is very pernicious to the other colours, by blending therewith. And here too, as in pieces of black and white, particular regard muſt always be had not to lay colour on colour, or lay on a new lay, till ſuch time as the former are well dried.

It may be added, that the yellow is the only colour that penetrates through the glaſs, and incorporates therewith by the fire; the reſt, and particularly the blue, which is very difficult to uſe, remaining on the ſurface, or at leaſt entering very little. When the painting of all the pieces is finiſhed, they are carried to the furnace, or oven, to anneal, or bake the colours.

The furnace here uſed is ſmall, built of brick, from 18 to 30 inches ſquare. At ſix inches from the bottom is an aperture to put in the fuel, and maintain the fire. Over this aperture is a grate, made of three ſquare bars of iron, which traverſe the furnace, and divide it into two parts. Two inches above this partition, is another little aperture, through which they take out pieces to examine how the coction goes forward. On the grate is placed a ſquare earthen pan, ſix or ſeven inches deep, and five or ſix inches leſs every way than the perimeter of the furnace. On the one ſide hereof is a little aperture, through which to make trials, placed directly oppoſite to that of the furnaces deſtined for the ſame end. In this pan are the pieces of glaſs to be placed, in the following manner: Firſt, the bottom of the pan is covered with three ſtrata, or layers, of quicklime pulveriſed; thoſe ſtrata being ſeparated by two others of old broken glaſs, the deſign whereof is to ſecure the painted glaſs from the too intenſe heat of the fire. This done, the glaſſes are laid horizontally on the laſt or uppermoſt layer of lime.

The firſt row of glaſs they cover over with a layer of the ſame powder, an inch deep; and over this they lay another range of glaſſes, and thus alternately till the pan is quite full; taking care that the whole heap always end with a layer of the lime-powder.

The pan being thus prepared, they cover up the furnace with tiles, on a ſquare table of earthen ware, cloſely luted all round; only leaving five little apertures, one at each corner, and another in the middle, to ſerve as chimneys. Things thus diſpoſed, there remains nothing but to give the fire to the work. The fire for the firſt two hours muſt be very moderate, and muſt be increaſed in proportion as the coction advances, for the ſpace of ten or twelve hours; in which time it is uſually compleated. At laſt the fire, which at firſt was charcoal, is to be of dry wood, ſo that the flame covers the whole pan, and even iſſues out at the chimneys.

During the laſt hours, they make eſſays, from time to time, by taking out pieces laid for the purpoſe through the little aperture of the furnace and pan, to ſee whether the yellow be perfect, and the other colours in good order. When the annealing is thought ſufficient, they proceed with great haſte to extinguiſh the fire, which otherwiſe would ſoon burn the colours, and break the glaſſes.

Glass *of Antimony*. See Chemistry, n° 454.

Glass *of Lead*. See Glazing.

GLASTONBURY, a town of Somerſetſhire in England; ſeated in W. Lon. 2. 46. N. Lat. 51. 15. —It is noted for a famous abbey, ſome magnificent ruins of which are ſtill remaining; but they are every day diminiſhing for the ſake of the ſtones. However, the curious ſtructure called *the Abbot's kitchen* is ſtill pretty entire, and is of a very unuſual contrivance. The monks pretend that it was the reſidence of Joſeph of Arimathea, and of St Patrick; but for this aſſertion they produce no good authority. The king of the Weſt Saxons erected a church here, which he and the ſucceeding kings enriched to ſuch a degree, that the abbot lived like a prince, had the title of *lord*, and ſat among the barons in parliament; and no perſon, not even a biſhop or prince, durſt ſet foot on the iſle of Avalon, in which the abbey ſtands, without his leave. The revenue of the abbey was above 40,000 l. per ann. beſides ſeven parks well ſtocked with deer. The laſt abbot, (Richard Whiting,) who had 100 monks, and 300 domeſtics, was hanged in his pontificals, with two of his monks, on the Tor, a high hill in the neighbourhood, for refuſing to take the oath of ſupremacy to Henry VIII. and ſurrender his abbey when required. Edgar and many other Saxon kings were buried here; and, as ſome will have it, Arthur the Britiſh king.——The ſtory of the Glaſtonbury thorn, and of its budding always upon Chriſtmas-day, is well known: however, that circumſtance is falſe; though, if the winter is mild, it always buds about the latter end of December, but later if the weather is ſevere.

Glaſtonbury || Glaucoma.

GLATZ, a handſome and ſtrong town of Bohemia, and capital of a county of the ſame name. It is ſeated on the river Neiſſe; and has ſtrong fortifications, with a caſtle built upon a mountain. The county was ceded to the king of Pruſſia by the queen of Hungary in 1742; and is about 45 miles in length, and 25 in breadth. It has mines of pit-coal, ſilver, and iron; good quarries, plenty of cattle, and fine ſprings of mineral water. The town is ſituated in E. Lon. 15. 16. N. Lat. 50. 25.

GLAUBER (John Rhodolphus), a celebrated German chemiſt, who flouriſhed about the year 1646. He wrote a great number of different treatiſes on chemiſtry, ſome of which have been tranſlated into Latin and French. All his works have been collected into one volume, entitled, *Glauberus concentratus*, which has been tranſlated into Engliſh, and was printed at London, in folio, in 1689.

Glauber's *Salt*. See Chemistry, n° 124.

GLAUCUS, a marine god, or deity of the ſea. There are a great many fabulous accounts of this divinity: but the poetical hiſtory of him is, that, before his deification, he was a fiſherman of the town of Anthedon, who, having one day taken a conſiderable number of fiſhes, which he laid upon the bank, on a ſudden perceived, that theſe fiſhes, having touched a kind of herb that grew on the ſhore, received new ſtrength, and leaped again into the ſea: upon the ſight of which extraordinary accident, he was tempted to taſte of the herb himſelf, and preſently leaped into the ſea after them, where he was metamorphoſed into a Triton, and became one of the ſea-gods.

GLAUCOMA, or Glaucosis, from γλαυκος, a *ſky-blue colour*. Mr Sharp, in his *Operations of Surgery*, p. 158—163, ſays, that the *glaucoma* of the ancient Greeks is the *ſuffuſio* of the Latins, and the

cataract

Glaucus || Glazing.

cataract of the present times. See (Index subjoined to) MEDICINE and SURGERY. Mr St Yves says, it is a *cataract* accompanied with a *gutta serena*; according to which nothing need be added, except that, in such a case, the operation and all other means are useless, except to ease pain, and to mend the figure of the eye.

GLAUCUS, in ichthyology. See SQUALUS.

GLAZIER, an artificer who works in glass.—The principal part of a glazier's business consists in fitting panes of glass to the sashes and window-frames of houses, pictures, &c. and in cleaning the same.

GLAZING, the crusting over earthen ware by a vitreous substance, the basis of which is lead.

For making a pure glass of lead, the following receipt will be found to answer: Put a large quantity of lead into a potter's kiln, and keep it in a state of fusion with a moderate fire, till it is calcined to a grey loose powder; then spread it in the kiln, and give it a greater heat, continually stirring it to keep it from running into lumps. Continue this for several hours, till the powder becomes of a fair yellow; then take it out and sift it fine. This is called *calcined lead*.—Take of this calcined lead, 15 pounds; and crystalline or other fritt, 12 pounds: mix these as well as possible together; put them into a pot, and set them in a furnace for 10 hours; then cast the whole, which will now be perfectly melted, into water; separate the loose lead from it, and return the metal into it; and after standing in fusion 12 hours more, it will be fit for use.

The workers of common earthen ware, however, are not at the trouble of thus previously making a pure glass of lead. Their usual composition for glazing their ware is formed of sand, wood-ashes, lead-ashes, and salt. The ware, after being turned on the wheel, and dried in the open air, is covered over with this composition by means of a brush; and when set in the furnace the violent heat soon reduces it to a perfect glass, covering the whole internal and external surface of the vessel.

The various colours for glazing are the same with those for tinging glass, which we have already described. A black colour is given with manganese or iron. The proportions, however, are not exactly ascertained, nor are there any receipts published concerning these things on which we can much depend. In the Philosophical Transactions we have the following receipt for a fine gold-coloured glazing, communicated to the Royal Society by Mr Heinsius of Petersburg. Take of litharge three parts, of sand or calcined flint one part; mix these very well together, then run them into a yellow glass with a strong fire. Pound this glass, and moisten it when in subtile powder with a well-saturated solution of silver, which make into a paste. Put this paste into a crucible, and cover it. Give at first a gentle degree of fire, then increase and continue it till you have a perfect glass which will be green. Pound this glass again, and reduce it to a fine powder: moisten this powder with some beer, so that by means of an hair-pencil you may apply it upon the vessels. Those that are painted or covered over with this glazing must be first well heated, then put under a muffle; and as soon as the glass runs you must smoke them, and take out the vessels. This preparation owes its colour to the silver in it; the precipitates of which, spread upon a glass plate, have the property of staining it yellow by ignition, without fusion. When used in glazing vessels, however, they must be held over the smoke of burning vegetables, in order to call forth the beautiful colour. Glazing, Gleaning.

A red or green tinge may be given to glazings by means of copper. The red colour appears first; but by a continuation of the fire, it is changed into a green. The finest red colour, however, that can be given to glazings, is that prepared from the solution of gold in aqua regia, as mentioned under the article GLASS.—The finest blue is always given by means of zaffre or smalt. A purplish colour, as well as a brown or black, may also be given by manganese; but a mixture of the materials for red and blue will undoubtedly produce the finest colour. The colouring materials for glazings, therefore, in short are the following.

Red—Gold or copper.
Yellow—Silver, iron.
Green—Copper.
Blue—Zaffre or smalt.
Black—Manganese.
White—Calx of tin.

Each of these materials mixed up in a proper quantity with any composition that readily vitrifies, will form a glazing of the desired colour upon any kind of earthen ware. The proportions in which they are to be used may easily be determined by a few trials.—Stone ware is glazed by another method, viz. the vitrification of a small part of the substance of the ware itself, by the fumes of salt thrown into the furnace when the vessels are intensely heated. See STONE WARE.—The application of different colours to it, however, is equally easy with the former.

The Romans had a method of glazing their earthen vessels, which in many respects appears to have been superior to ours. The common brown glazing easily scales off, cracks, and in a short time becomes disagreeable to the eye. Besides, it is very easily destroyed by acids; nor can vessels glazed in this manner be even employed to hold water, without part of it oozing through their pores. Lead is also very destructive to the human body; and if acids are unwarily put into vessels glazed with lead, the liquors will receive a very dangerous impregnation from the metal. The Roman glazing, which is yet to be seen upon urns dug up in several places, appears to have been made of some kind of varnish; and Pliny gives us a hint that it was made of bitumen. He tells us that it never lost its beauty, and that at length it became customary to glaze over statues in this manner. As this varnish sunk deep into the substance of the ware, it was not subject to those cracks and flaws which disfigure our vessels; and as it was not liable to be corroded by acids, it could not be liable to any of the accidents which may ensue from the use of vessels glazed with lead.

GLEANING, the act of gathering or picking up the ears of corn left behind after the field has been reaped and the crop carried home. By the customs of some countries, particularly those of Melun and Estampes, all farmers and others are forbid, either by themselves or servants, to put any cattle into the fields, or prevent the gleaning in any manner whatever for

Glebe
||
Gliſſon.

the ſpace of 24 hours after the carrying off the corn, under penalty of confiſcation.

GLEBE, among miners, ſignifies a piece of earth in which is contained ſome mineral ore.

GLEBE, in law, the land belonging to a pariſh-church beſides the tithes.

GLECHOMA, Ground-ivy; a genus of the angioſpermia order, belonging to the didynamia claſs of plants. There are three ſpecies; the moſt remarkable of which is the hederacea, or common ground-ivy, which is ſo well known that it requires no deſcription. Many virtues were formerly attributed to this plant, which it is now found not to be poſſeſſed of. Some, however, it has. The leaves are thrown into the vat with ale to clarify it and give it a flavour. Ale thus prepared is often drank as an antiſcorbutic. The expreſſed juice mixed with a little wine, and applied morning and evening, deſtroys the white ſpecks upon horſes eyes. The plants that grow near it do not flouriſh. It is ſaid to be hurtful to horſes if they eat much of it. Sheep eat it, horſes are not fond of it; cows, goats, and ſwine, refuſe it.

GLEDITSIA, triple-thorned Acacia; a genus of the dioecia order, belonging to the polygamia claſs of plants. There is but one ſpecies, which riſes with an upright trunk 30 or 40 feet high, branching out regularly with many long triple thorns, and cloſely garniſhed with doubly pinnated leaves, each leaf conſiſting often of near 200 ſmaller leaves or foliola. The flowers are amentaceous, and of a greeniſh colour proceeding from the ſides of the branches, and ſucceeded by broad ſeed-pods near a foot and an half long.—This plant is a native of South America, but will thrive in this country in any ſituation. They are propagated by ſeeds, which are annually procured from America by the ſeedſmen.

GLEET, in medicine, the flux of a thin limpid humour from the urethra. See (the *Index* ſubjoined to) Medicine.

GLICAS, or Glycas, (Michael), a Greek hiſtorian about the middle of the 15th century, lived in Sicily, and wrote Annals of what paſſed from the creation of the world to the death of Alexis Comnenus, in 1118. Leunclavius added to it a fifth part, which carries it down to the taking of Conſtantinople. Glicas was alſo the author of ſeveral uſeful and curious letters.

GLENOIDES, the name of two cavities, or ſmall depreſſions, in the inferior part of the firſt vertebra of the neck.

GLIRES, the name of Linnæus's fourth order of mammalia. See Zoology.

GLIS, in zoology. See Sciurus.

GLISSON (Francis), a learned Engliſh phyſician in the 17th century, was educated at Cambridge, and was made regius profeſſor of that univerſity. In 1634, he was admitted a fellow of the college of phyſicians in London. During the civil wars, he practiſed phyſic at Colcheſter, and afterwards ſettled in London. He greatly improved phyſic by his anatomical diſſections and obſervations, and made ſeveral new diſcoveries of ſingular uſe towards eſtabliſhing a rational practice. He wrote, 1. *De rachitide*, &c. 2. *De lymphæductis nuper repertis*; with the *Anatomica prolegomena*, & *Anatomia hepatis*. 3. *De natura ſubſtantiæ energetica; ſeu de via vitæ naturæ, ejuſque tribus primis facultatibus*, &c. quarto. 4. *Tractatus de ventriculo & inteſtinis*, &c. The world is obliged to him for the *capſula communis*, or *vaginæ portæ*.

Gliſter, Globe.

GLISTER, in ſurgery. See Clyster.

GLOBE, in geometry, a round or ſpherical body, more uſually called a *ſphere*. See Sphere.

Globe, is more particularly uſed for an artificial ſphere of metal, plaſter, paper, or other matter; on whoſe convex ſurface is drawn a map, or repreſentation, either of the earth, or heavens, with the ſeveral circles conceived thereon. See Geography.

Globes are of two kinds, *terreſtrial* and *celeſtial*; each of very conſiderable uſe, the one in aſtronomy, and the other in geography; to perform many of the operations thereof, in an eaſy, ſenſible manner, ſo as to be conceived without any knowledge of the mathematical grounds of thoſe arts.

The fundamental parts, common to both globes, are an axis, repreſenting that of the world; and a ſpherical ſhell, or cover, which makes the body of the globe, on whoſe external ſurface the repreſentation is drawn. See Axis, Pole, &c.

Globes, we have obſerved, are made of divers materials, viz. ſilver, braſs, paper, plaſter, &c. Thoſe commonly uſed, are of plaſter, and paper: The conſtruction whereof is as follows:

Conſtruction of Globes.—A wooden axis is provided, ſomewhat leſs than the intended diameter of the globe; and into the extremes hereof two iron wires are driven, for poles: this axis is to be the beam, or baſis of the whole ſtructure.

On the axis are applied two ſpherical, or rather hemiſpherical caps, formed on a kind of wooden mould or block.—Theſe caps conſiſt of paſteboard, or paper, laid one lay after another, on the mould, to the thickneſs of a crown-piece; after which, having ſtood to dry and embody, making an inciſion along the middle, the two caps thus parted are ſlipped off the mould.

They remain now to be applied on the poles of the axis, as before they were on thoſe of the mould: and to fix them in their new place, the two edges are ſewed together with pack-thread, &c.

The rudiments of the globe thus laid, they proceed to ſtrengthen and make it ſmooth and regular. In order to this, the two poles are haſped in a metalline ſemicircle, of the ſize intended; and a kind of plaſter, made of whiting, water, and glue, heated, melted, and incorporated together, is daubed all over the paper-ſurface. In proportion as the plaſter is applied, the ball is turned round in the ſemicircle, the edge whereof pares off whatever is ſuperfluous and beyond the due dimenſion, leaving the reſt adhering in places that are ſhort of it. After ſuch application of plaſter, the ball ſtands to dry; which done, it is put again in the ſemicircle, and freſh matter applied: thus they continue alternately to apply the compoſition, and dry it, till ſuch time as the ball every where accurately touches the ſemicircle; in which ſtate it is perfectly ſmooth, regular, firm, &c.

The ball thus finiſhed, it remains to paſte the map or deſcription thereon: in order to this, the map is projected in ſeveral gores, or guſſets; all which join accurately on the ſpherical ſurface, and cover the whole

Globularia Gloceſter.

whole ball. To direct the application of theſe gores, lines are drawn by a ſemicircle on the ſurface of the ball, dividing it into a number of equal parts correſponding to thoſe of the gores, and ſubdividing thoſe again anſwerably to the lines and diviſions of the gores.

The papers thus paſted on, there remains nothing but to colour and illuminate the globe; and to varniſh it, the better to reſiſt duſt, moiſture, &c.—The globe itſelf thus finiſhed, they hang it in a braſs meridian, with an hour-circle, and a quadrant of altitude; and thus fit it into a wooden horizon.

For the uſes, *&c.* of the globes, ſee GEOGRAPHY, n° 33. 35, &c. ASTRONOMY, n° 168, 320. and Plate XLVIII. fig. 2.

GLOBULARIA, GLOBULAR BLUE DAISY; a genus of the monogynia order, belonging to the tetrandria claſs of plants. There are ſeveral ſpecies; but only one is commonly to be met with in our gardens, viz. the vulgaris, or common blue daiſy. It hath broad thick radical leaves, three parted at the ends, upright ſtalks from about ſix to ten or twelve inches high, garniſhed with ſpeared-ſhaped leaves, and the top crowned by a globular head of fine blue flowers compoſed of many florets in one cup. It flowers in June, and makes a good appearance; but thrives beſt in a moiſt ſhady ſituation. It is propagated by parting the roots in September.

GLOBULE, a diminutive of globe, frequently uſed by phyſicians in ſpeaking of the red particles of the blood. See BLOOD.

GLOCESTER, the capital of Gloceſterſhire in England. It is an ancient city, and by Antoninus is called *Clevum*, or *Glevum*, which Cambden thinks was formed from the Britiſh *Caer-Glowe*, ſignifying a fair city. It was built by the Romans to curb the Silures; and a colony was placed there, called *Colonia Glevum*. It ſtands upon the bank of the Severn; and, except on the ſide next the river, is ſurrounded by a wall. Towards the ſouth there was anciently a caſtle built in the time of William the Conqueror, the remains of which is now the common gaol for debtors and felons. Ceaulin, king of the Weſt Saxons, firſt took it from the Britons in 570; but it afterwards became ſubject to the Mercians. The preſent cathedral was erected by Aldred, archbiſhop of York, and biſhop of Worceſter, after the conqueſt, but hath been greatly improved and adorned ſince. In the ſouth iſle Edward II. lies interred in an alabaſter tomb; and not far from him, in the middle of the choir, Robert Curt-hoſe, eldeſt ſon of William the Conqueror. This city ſuffered much in the barons wars, was plundered by Edward the ſon of Henry III. and not long after almoſt entirely deſtroyed by an accidental fire. King John made it a borough; and Henry III. who was crowned here, a corporation. Richard III. made it a county of itſelf, adding two hundreds to it, and gave it his ſword and cap of maintenance. It had once eleven pariſh-churches; but five of them were demoliſhed when it was beſieged by Charles I. againſt whom it had ſhut its gates. In the reign of Charles II. its walls were pulled down, and two hundreds taken from its county by act of parliament. It was erected into an epiſcopal ſee by Henry VIII. on the ſuppreſſion of the abbey of St Peter, with a dean and ſix prebends. About the time of the conqueſt, its chief buſineſs ſeems to have been forging of iron; for in Doomſday book it is ſaid, that the only tribute required of it was ſo many acres, or bars of iron. At preſent it has ten incorporated companies, a ſtone-bridge over the river, with a key and wharf; but though it is well ſituated for trade, yet its traffic is not conſiderable, having been much impaired by the neighbourhood of Briſtol. One of its chief manufactures now is pin-making. Several parliaments were anciently held here, particularly by Richard II. and III.; and in the town are many croſſes and ſtatues of the kings of England. By a charter from Charles II. it is governed by a ſteward, mayor, recorder, twelve aldermen, a town-clerk, two ſheriffs choſen yearly out of twenty-ſix common-council men, a ſword-bearer, and four ſerjeants at mace. Cambden ſays, the Roman way, that extends from St David's in Wales to Southampton, paſſes through this city. It gives title of duke to the ſecond brother of his preſent majeſty George III.

Gloceſterſhire.

GLOCESTERSHIRE, a county of England, is bounded on the weſt by Monmouthſhire and Herefordſhire, on the north by Worceſterſhire, on the eaſt by Oxfordſhire and Warwickſhire, and on the ſouth by Wiltſhire and part of Somerſetſhire. It is ſixty miles in length, twenty-ſix in breadth, and one hundred and ſixty in circumference; containing eight hundred thouſand acres, twenty-nine hundreds, one city, twenty-five market-towns; and ſends eight members to parliament, viz. two for the county, two for the city of Gloceſter, two for Cirenceſter, and two for Tewkſbury. It lies in the dioceſe that takes its name from the capital, and in the Oxford circuit. The air of the county is very wholeſome, but the face of it is very different in different parts: for the eaſtern part is hilly, and is called *Cotteſwold*; the weſtern woody, and called the *Foreſt of Dean*; and the reſt is a fruitful valley, through which runs the river Severn. This river is in ſome places between two and three miles broad; and its courſe through the country, including its windings, is not leſs than ſeventy miles. The tide of flood, called the *Boar*, riſes very high, and is very impetuous. It is remarkable, that the greateſt tides are one year at the full-moon, and the other at the new; one year the night-tides, and the next the day. This river affords a noble conveyance for goods and merchandiſe of all ſorts, to and from the county; but it is watered by ſeveral others, as the Wye, the Avon, the Iſis, the Leden, the Frome, the Strond, and Windruſh, beſides leſſer ſtreams, all abounding with fiſh, the Severn in particular with ſalmon, conger-eels, and lampreys. The ſoil is in general very fertile, though pretty much diverſified, yielding plenty of corn, paſture, fruit, and wood. In the hilly part of the county, or Cotteſwold, the air is ſharper than in the lowlands; and the ſoil, though not ſo fit for grain, produces excellent paſture for ſheep; ſo that of the four hundred thouſand that are computed to be kept in the county, the greater part are fed here. Of theſe ſheep the wool is exceeding fine; and hence it is that this ſhire is ſo eminent for its manufacture of cloth, of which fifty thouſand pieces are ſaid to have been made yearly, before the practice of clandeſtinely exporting Engliſh wool became ſo common. In the vale,

Glocester-shire || Gloriosa.

vale, or lower part of the county, through which the Severn paſſes, the air and ſoil are very different from thoſe of the Cottefwold: for the former is much warmer, and the latter richer, yielding the moſt luxuriant paſtures; in conſequence of which, numerous herds of black cattle are kept, and great quantities of that excellent cheeſe, for which it is ſo much celebrated, made in it. The remaining part of the county, called the *Foreſt of Dean*, was formerly almoſt entirely over-run with wood, and extended twenty miles in length, and ten in breadth. It was then a neſt of robbers, eſpecially towards the Severn; but now it contains many towns and villages, conſiſting chiefly of miners, employed in the coal-pits, or in digging for or forging iron ore, with both which the foreſt abounds. Theſe miners have their particular laws, cuſtoms, courts, and judges; and the king, as in all royal foreſts, has a ſwain-mote, for the preſervation of the vert and veniſon. This foreſt was anciently, and is ſtill noted for its oaks, which thrive here ſurpriſingly; but as there is a prodigious conſumption of wood in the forges, it is continually diwindling way. There were ſo many religious houſes in the county before the reformation, that it gave occaſion to the proverb, "As ſure as God is in Glocesterſhire."

GLOGAW, a ſtrong and conſiderable town of Germany, in Sileſia, and capital of a duchy of the ſame name. It is not very large, but is well fortified on the ſide of Poland. It has a handſome caſtle, with a tower, in which ſeveral counſellors were condemned by Duke John, in 1498, to periſh with hunger. Beſides the Papiſts, there are a large number of Proteſtants and Jews. It was taken by aſſault, by the king of Pruſſia, in 1741, and the garriſon made priſoners. After the peace in 1742, the king of Pruſſia ſettled the ſupreme court of juſtice here, it being, next to Breſlaw, the moſt populous place in Sileſia. It is ſeated on the river Oder, in E. Lon. 15. 13. N. Lat. 51. 40.

GLOGAW *the* LESS, a town of Sileſia, in the duchy of Opelen, now in poſſeſſion of the king of Pruſſia. It is two miles S. E. of Great Glogaw, and forty-five N. W. of Breſlaw. E. Lon. 16. 15. N. Lat. 51. 38.

GLORIA PATRI, among eccleſiaſtical writers. See DOXOLOGY.

GLORIOSA, SUPERB LILY; a genus of the monogynia order, belonging to the hexandria claſs of plants. There is but one ſpecies, a native of Malabar. It hath a thick, fleſhy, tuberous root, ſending forth from its centre declinated round ſtalks growing eight or ten feet long, and garniſhed with very long narrow leaves running out into a point, terminated by a long tendril. From the upper part of the ſtalks proceed large flame-coloured drooping flowers, conſiſting of ſix widely-ſpreading reflexed petals. It flowers in June and July, and is of admirable beauty whence; its name of *Gloriosa*, or Superb Lily.—This plant being a native of a very warm climate, requires the protection of a hot-houſe in this country. The flower-ſtalks ſhoot forth in March or April; which being long and trailing, muſt have tall ſticks placed for their ſupport. The plants are propagated by offſets, which are produced in tolerable plenty, and may be ſeparated any time after the ſtalks decay, or in ſpring before new ones ariſe.

Gloſs || Glove

GLOSS, a comment on the text of any author, to explain his ſenſe more fully and at large, whether in the ſame language or any other. See the article COMMENTARY. The word, according to ſome, comes from the Greek γλωσσα, "tongue;" the office of a *gloſs* being to explain the text, as that of the tongue is to diſcover the mind.

GLOSS is likewiſe uſed for a literal tranſlation, or an interpretation of an author in another language word for word.

GLOSS is alſo uſed in matters of commerce, &c. for the luſtre of a ſilk, ſtuff, or the like.

GLOSSARY, a ſort of dictionary, explaining the obſcure and antiquated terms in ſome old author; ſuch are Du Cange's Latin and Greek Gloſſaries, Spelman's Gloſſary, and Kennet's Gloſſary at the end of his Parochial Antiquities.

GLOSSOPETRA, in natural hiſtory, a genus of extraneous foſſils, ſo called from their having been ſuppoſed the tongues of ſerpents turned into ſtone; though they are really the teeth of ſharks, and daily found in the mouths of thoſe fiſhes, where-ever taken.

The ſeveral ſizes of teeth of the ſame ſpecies, and the ſeveral different ſpecies of ſharks, furniſh us with a vaſt variety of theſe foſſil-teeth. Their uſual colours are black, bluiſh, yellowiſh, or brown. In ſhape they are uſually ſomewhat approaching to triangular; ſome are ſimple, and others have a ſmaller point on each ſide the large one. Many of them are quite ſtraight; but they are frequently met with crooked and bent in all the different directions, ſome inwards, ſome outwards, and ſome ſideways. They are alſo of various ſizes; the larger ones being four or five inches long, and the ſmaller leſs than a quarter of an inch. They are found with us in the ſtrata of blue clay, and are very plentiful in the clay-pits of Richmond, and ſome other places; but they are nowhere ſo common as in the iſland of Malta.

GLOTTIS, in anatomy, the narrow ſlit at the upper part of the aſpera arteria, which is covered by the epiglottis when we hold our breath and when we ſwallow. The glottis, by its dilatation and contraction, modulates the voice. See ANATOMY, n° 380.

GLOVE, a covering for the hand and wriſt.

Gloves, with reſpect to commerce, are diſtinguiſhed into leathern-gloves, ſilk-gloves, thread-gloves, cotton-gloves, worſted-gloves, &c. Leathern-gloves are made of chamois, kid, lamb, doe, elk, buff, &c.

To throw the glove, was a practice or ceremony very uſual among our forefathers; being the challenge, whereby another was defied to ſingle combat.—It is ſtill retained at the coronation of our kings; when the king's champion caſts his glove in Weſtminſter-hall. See CHAMPION.

Favyn ſuppoſes the cuſtom to have aroſe from the eaſtern nations, who in all their ſales and deliveries of lands, goods, &c. uſed to give the purchaſer their glove by way of livery or inveſtiture. To this effect he quotes Ruth iv. 7. where the Chaldee paraphraſe calls *glove*, what the common verſion renders by *ſhoe*. He adds, that the Rabbins interpret by *glove*, that paſſage in the cviiith Pſalm, *In Idumæam extendam calceamentum*.

Glove
Glow-worm

calceamentum meum, "Over *Edom* will I caſt out my ſhoe."—Accordingly, among us, he who took up the *glove*, declared thereby his acceptance of the challenge; and as a part of the ceremony, continues Favyn, took the *glove* off his own right-hand, and caſt it upon the ground, to be taken up by the challenger. This had the force of a mutual engagement on each ſide, to meet at the time and place which ſhould be appointed by the king, parliament, or judges.—The ſame author aſſerts, that the cuſtom which ſtill obtains of bleſſing *gloves* in the coronation of the kings of France, is a remain of the eaſtern practice of giving poſſeſſion with the *glove*, l. xvi. p. 1017, &c.

Anciently it was prohibited the judges to wear gloves on the bench. And at preſent in the ſtables of moſt princes, it is not ſafe going in without pulling off the gloves.

GLOW-WORM, a ſmall inſect, remarkable for its ſhining in the dark. See CICINDELA.

The male and female of this ſpecies differ greatly from each other. The male has wings, and is a ſmall fly: the female has no wings, but is a large crawling worm.—The body of the male is oblong, and ſomewhat flatted; the wings are ſhorter than the body; the head is broad, dun, and flat; the eyes are large and black. This has no light iſſuing from it, and is not commonly ſuppoſed to be at all akin to the glow-worm. The female is what we expreſsly call by this name. This is a very ſlow-paced animal, ſomewhat reſembling a caterpillar: the head is ſmall, flat, hard, black, and ſharp towards the mouth. It has ſhort antennæ, and ſix moderately long legs. The body is flat, and is compoſed of twelve rings, whereas the body of the male conſiſts only of five. It is of a duſky colour, with a ſtreak of white down the back. It is often ſeen in the day-time, but is not known till dark; at which time it is eaſily diſtinguiſhed by the glowing light, or lambent flame, that is ſeen near the tail, iſſuing from the under part of the body. It is commonly met with under hedges; and if carefully taken up may be kept alive many days upon freſh turfs of graſs, all which time it will continue to ſhine in the dark.

The light of this little inſect is ſo ſtrong, that it will ſhew itſelf through ſeveral ſubſtances in which the creature may be put up; a thin pill-box eaſily ſhews it through, and even though lined with paper the light is not impeded by both. The creature is ſluggiſh, and appears dead in the day-time; and its light is not diſtinguiſhable even if carried into a darkened room, unleſs the creature be turned upon its back and diſturbed, ſo as to be put in motion, and then it is but very faint: after ſun-ſet the light returns, and with it the life and motion of the creature. The motion and light of this inſect indeed ſeem in ſome meaſure to depend upon one another: it never ſhines but when its body is in ſome ſort of motion; and when it ſhines moſt, the body is extended to one third more than its length in the day-time. In the time of brighteſt ſhining it will ſometimes of a ſudden turn its body about, and the light will not be longer than the head of a pin; and, on being touched, ſhe will then immediately extend herſelf, and the light will become as large and as bright as ever.

Flying GLOW-*Worm*, *(cicindela volans.)* In the warmer months of the year, this creature is ſometimes caught in our houſes flying to the flame of a candle; and examined in the dark is found to be luminous at theſe times, tho' perhaps leſs or not at all ſo at others; which may be a reaſon of its not being known though caught in the fields; and to this it may be owing, that many who have deſcribed this creature, have thought it not a native of Britain. Without wings, it is frequently enough found in form of the common glow-worm, and then always ſhines. Aldrovandus informs us, that it lays eggs which in a ſhort time hatch ſmall worms; and that theſe afterwards become flies, by the ſame ſort of change which happens to butterflies and other ſpecies of winged inſects. Mouffet, and Thomas Bartholine, give much the ſame deſcription with Aldrovandus, but allow the male only to have wings. Julius Scaliger, however, contradicts this, and affirms that he has caught them both winged in the act of generation; but this is not acknowledged even by all thoſe who have quoted the abovementioned paſſage from Scaliger. Mr Waller, in the philoſophical tranſactions, confirms Scaliger's account, having obſerved them in the ſame manner in the act of copulation both winged; only with this difference, that the female was the larger of the two, which is the caſe with many other inſects. The male and female in this winged ſtate both ſhine in hot weather, and their light is ſo vivid that it may eaſily be ſeen even when there is a candle in the room. The vibrations of this light are irregular, and its colour greeniſh. The luminous parts are two ſmall ſpecks under the tail at the end, and the light continues in theſe ſome time after the tail is cut off; but then gradually goes out. The parts of inſects continue alive in ſome degree for a conſiderable time after they are ſeparated from the reſt of the body; and probably the light of the tail of this animal continues juſt as long as this ſort of life remains in it.

The uſe of this light ſeems to be to direct the animal in its courſe, and in the taking of its prey; and to this purpoſe it is admirably placed. The tail is eaſily bent under the belly, and then throws the light full upon any object about or under the head of the animal; and the eyes are placed, not on the upper part, but on the under ſide of the head; ſo that they have all the advantages of it, while the light in this part is not offenſive to the eyes, as it naturally would have been if carried before the head. Upon occaſion the inſect can cover this light, ſo that its enemies cannot take the advantage in order to purſue it.

The inſect is of the beetle kind, of a brown or duſky colour. It has hard caſe or ſhell wings, as the other beetles have; and, when theſe are expanded, there appears a pair of very large membranaceous ones. Its head is covered with a ſort of ſhield or broad-brimmed hat; under this hat are placed the eyes, which are black and large, and are moveable, ſo that the creature can upon occaſion thruſt them forward to the ſides of the hat or covering of the head. It has two hairy antennæ; and its legs are like thoſe of the common fly, hard, ſhelly, and hairy. Its eyes afford an elegant object for the microſcope, being compoſed of an infinite number of lenſes, like thoſe of the libellæ and other inſects.

GLUKSTADT, a ſtrong and conſiderable town of Germany,

Glue. Germany, in the circle of Upper Saxony, and duchy of Holftein, with a ſtrong caſtle, and ſubject to Denmark. It is ſeated on the river Elbe, near is mouth; E. Long. 9. 15. N. Lat. 52. 53.

GLUE, among artificers, a tenacious viſcid matter, which ſerves as a cement to bind or connect things together.

Glues are of different kinds, according to the various uſes they are deſigned for, as the common glue, glove-glue, and parchment-glue; whereof the two laſt are more properly called *ſize*.

The common or ſtrong glue is chiefly uſed by carpenters, joiners, cabinet-makers, *&c.*

It is made of the ſkins of animals, as oxen, cows, calves, ſheep, *&c.*; and the older the creature is, the better is the glue made of its hide. Indeed whole ſkins are but rarely uſed for this purpoſe, but only the ſhavings, parings, or ſcraps of them; or the feet-ſinews, &c. That made of whole ſkins, however, is undoubtedly the beſt; as that made of ſinews is the very worſt.

The Method of Making GLUE. In making glue of parings, they firſt ſteep them two or three days in water: then, waſhing them well out, they boil them to the conſiſtence of a thick jelly; which they paſs, while hot, through ozier-baſkets, to ſeparate the impurities from it; and then let it ſtand ſome time, to purify it further: when all the filth and ordures are ſettled to the bottom of the veſſel, they melt and boil it a ſecond time. They next pour it into flat frames or moulds; whence it is taken out pretty hard and ſolid, and cut into ſquares pieces or cakes. They afterwards dry it in the wind, in a ſort of coarſe net; and at laſt ſtring it, to finiſh its drying.

The glue made of ſinews, feet, &c. is managed after the ſame manner; only with this difference, that they bone and ſcour the feet, and do not lay them to ſteep.

Of this commodity there is a very great exportation from England; the Engliſh glue being univerſally allowed to be the beſt in Europe, partly from the excellency of the materials, and partly from the ſkill of the manufacturers. Next to this is the Flanders glue. In both countries it is made by the tanners from fragments of good ſkins dried with much care. In France it is a ſeparate trade: and the glue-makers pick up their materials as they can, from the ſeveral dealers in ſkins, and boiling theſe with cow-heels make their glue; which as they purchaſe every thing, muſt render it dear, as well as of an inferior quality. The duty on exportation is ten-pence, and on importation three ſhillings and ten-pence, on every hundred weight.

The beſt glue is that which is made from the ſkin of the oldeſt beaſt, eſpecially if a bull's hide is uſed. Experience likewiſe ſhews that glue is conſiderably improved in quality by keeping after it is made; and the ſureſt way to try its goodneſs is to lay a piece to ſteep three or four days, and if it ſwell conſiderably without melting, and when taken out reſumes its former drineſs, it is excellent.

A glue that will hold againſt fire or water, it is ſaid, may be made thus: Mix a handful of quicklime with four ounces of linſeed oil; boil them to a good thickneſs: then ſpread it on tin-plates in the ſhade, and it will become exceeding hard, but may be eaſily diſſolved over a fire, as glue, and will effect the buſineſs to admiration.

Neumann obſerves, that glue diſſolved in a ſolution of lapis calaminaris in ſpirit of nitre, and afterwards inſpiſſated, forms an extremely ſlippery tenacious maſs, which might be of uſe for entangling flies, caterpillars, and other inſects, if it was not too expenſive.

Method of Preparing and Uſing GLUE. Set a quart of water on the fire, then put in about half a pound of good glue, and boil them gently together till the glue be entirely diſſolved and of a due conſiſtence. When glue is to be uſed, it muſt be made thoroughly hot; after which, with a bruſh dipped in it, beſmear the faces of the joints as quick as poſſible: then clapping them together, ſlide or rub them lengthwiſe one upon another, two or three times, to ſettle them cloſe; and ſo let them ſtand till they are dry and firm.—Mr Boyle gives a receipt for preparing a fine ſtrong glue from iſinglaſs in the following manner: Steep the iſinglaſs for 24 hours in common brandy. When the meuſtruum has opened and mollified the iſinglaſs, they muſt be gently boiled together, and kept ſtirring till they appear well mixed, and till a drop thereof, ſuffered to cool, turns into a ſtrong jelly. Then ſtrain it, whilſt hot, through a clean linen cloth, into a veſſel to be kept cloſe ſtopped. A gentle heat ſuffices to diſſolve this glue into a tranſparent and almoſt colourleſs fluid, but very ſtrong; ſo that pieces of wood glued together with it will ſeparate elſewhere rather than in the place where they are joined. See ISINGLASS.

GLUME, *Gluma*, among botaniſts. See BOTANY, p. 1293.

GLUTÆUS, in anatomy. See there, *Table of the muſcles*.

GLYCINE, KNOBBED-ROOTED LIQUORICE-VETCH; a genus of the decandria order, belonging to the diadelphia claſs of plants. There is but one ſpecies commonly cultivated in our gardens, viz. the frutescens, or Carolina kidney-bean tree. This hath ſhrubby climbing ſtalks, twining round any ſupport, 15 or 20 feet high, adorned with pinnated leaves of three pair of follicles terminated by an odd one, and from the axillas cluſters of large bluiſh-purple flowers, ſucceeded by long pods like thoſe of the climbing kidney-bean. It flowers in June and July, but the ſeeds do not ripen in this country. It is eaſily propagated, either by ſeeds imported from America, where it is native, or by layers.—The ſtalks and roots of the abrus, another ſpecies of glycine which grows in Egypt and the Indies, are very ſweet to the taſte. Herman affirms that the juice obtained from them by decoction is little inferior to liquorice; whence its name of *wild-liquorice* in thoſe parts of America where it is native.

GLYCYRRHIZZA, LIQUORICE; a genus of the decandria order, belonging to the diadelphia claſs of plants. There are two ſpecies. 1. The glabra, or common liquorice, hath a long, thick, creeping root, ſtriking ſeveral feet deep into the ground; upright, firm, herbaceous ſtalks annually, three or four feet high, garniſhed with winged leaves of four or five pair of oval lobes, terminated by an odd one; and from the axillas erect ſpikes of pale blue flowers in July, ſucceeded by ſhort ſmooth pods.

The root of this is the uſeful part, which is replete with

Glue ‖ Glycyrrhiza.

Glycyrhiza.

with a ſweet, balſamic, pectoral juice, much uſed in all compoſitions for coughs and diſorders of the ſtomach. 2. The echinata, or prickly-poded liquorice, is nearly like the common ſort, only the ſeed-pods are prickly.

Both theſe ſpecies are very hardy perennials; but the firſt is the ſort commonly cultivated for uſe, its roots being fuller of juice and ſweeter than the other.

The roots are perennial; but the ſtalks riſe in ſpring, and decay in autumn.

They delight in a deep light ſoil, in which the roots will run down three or four feet deep, and attain a large ſize, if permitted to ſtand three or four years. From the main root ſmaller ones run off horizontally; and from theſe horizontal roots, that run near the ſurface, cuttings for ſets or young plants are taken for propagation, which are generally procured at the time when the liquorice is taken up for uſe, being fit in three years after planting.

Where large quantities are required for ſale, they may be cultivated in fields, as practiſed in many parts of England; vaſt quantities are alſo raiſed in the kitchen-gardens about London, where, by the richneſs and depth of the ground, the roots attain their utmoſt perfection in length and bulk.

The length and thickneſs of the roots is a principal conſideration to the planter, as they are always ſold by weight.

Propagation and culture. Their propagation is, as above obſerved, effected by cuttings of the ſmall roots iſſuing from the ſides of the main ones, near the ſurface of the earth, dividing them into lengths of ſix or eight inches, each having one or more good buds or eyes; and the proper ſeaſon for procuring the ſets for planting is, any time, in open weather, from October till March, though from the middle of February till the middle of March is rather the moſt ſucceſsful ſeaſon for planting.

An open ſituation is the moſt ſuitable for a plantation of theſe plants.

Particular regard ſhould alſo be had to the ſoil: it ought to be of a light, looſe temperature, and three or four feet deep if poſſible; for the roots of the liquorice will arrive at that depth and more, and the longer the roots the more valuable they are for ſale by weight.

Having fixed on the ground, let it be trenched three ſpades deep, if the depth of proper ſoil will admit; then having your ſets ready, proceed to plant them by line and dibble, planting the ſets a foot diſtance in each row; putting them perpendicular into the ground, with the tops about an inch under the ſurface; and let the rows be a foot and a half aſunder; though the London gardeners ſeldom allow more than twelve inches between row and row. Theſe gardeners alſo ſow a crop of onions on the ſame ground the firſt year; which, as the onions root but ſlender, and ſpread but little at top, may be done without any detriment to the liquorice, nor that to the onions, as it does not riſe above ten or twelve inches high the firſt ſummer; obſerving to keep the ground clean from weeds during that ſeaſon by hoeing. If there is a crop of onions, uſe the ſmall hoe, cutting out the onions to four or five inches diſtance, clearing away ſuch as grow immediately cloſe to the liquorice plants; and when the onions are gathered, give the ground a thorough hoeing with a large hoe, to looſen the ſurface and deſtroy all weeds effectually; and in autmn cut down the decayed ſtalks of the liquorice, and nothing more is neceſſary to be done till ſpring; when, in February or March, give a ſlight digging between the rows; during ſpring and ſummer, keep down all weeds by broad-hoeing; and in autumn, when the ſtalks are in a decaying ſtate, cut them down to the ſurface of the earth.

Glycyrhiza || Gnaphalium.

In three years after planting, the roots of the liquorice will be fit to take up: and the proper ſeaſon for this is, any time from the beginning of November till February; for it ſhould neither be taken up before the ſtalks are fully decayed, nor deferred till late in ſpring, otherwiſe the roots will be apt to ſhrivel and diminiſh in weight.

In taking them up, the ſmall ſide-roots are trimmed off, and the beſt divided into lengths for freſh ſets, and the main roots are tied in bundles ready for ſale. It is of advantage to ſell them as ſoon as poſſible after they are taken up, before they looſe much of their weight. They are ſold to the druggiſts, from about twenty to thirty or forty ſhillings per hundred weight, and an acre of ground has produced three thouſand and upwards, which has been ſold for more than ſixty pounds; but the price is commonly in proportion to the goodneſs of the roots.

The common liquorice is cultivated in moſt countries of Europe for the ſake of its root. That which is cultivated in Britain is preferable to ſuch as comes from abroad; this laſt being generally mouldy, which this root is very apt to become, unleſs kept in a dry place. The powder of liquorice uſually ſold is often mingled with flour, and probably too often with ſubſtances not quite ſo wholeſome: the beſt fort is of a browniſh yellow colour (the fine pale yellow being generally ſophiſticated), and of a very rich ſweet taſte, much more agreeable than that of the freſh root. Liquorice is almoſt the only ſweet that quenches thirſt; whence it was called by the Greeks *adipſon*. Galen takes notice, that it was employed in this intention in hydropic caſes, to prevent the neceſſity of drinking. Mr Fuller, in his *Medicina Gymnaſtica*, recommends this root as a very uſeful pectoral; and ſays it excellently ſoftens acrimonious humours, at the ſame time that it proves gently detergent: and this account is warranted by experience. An extract is directed to be made from it in the ſhops; but this preparation is chiefly brought from abroad, though the foreign extract is not equal to ſuch as is made with proper care among ourſelves.

GLYPH, in ſculpture and architecture, denotes any canal or cavity uſed as an ornament.

GNAPHALIUM, CUDWEED, GOLDY-LOCKS, ETERNAL FLOWER, &c. a genus of the polygamia ſuperflua order, belonging to the ſyngeneſia claſs of plants. There are 41 ſpecies; the moſt remarkable of which are, 1. The margaritaceum, or pearly white eternal flower, hath creeping, very ſpreading roots, crowned with broad, ſpear-ſhaped, white, hoary leaves; herbaceous, thick, woolly ſtalks, a foot and an half high, branching outward, garniſhed with long acute pointed white woolly leaves, and termina-

Gnapha-lium, Gnat.

ted by a corymbofe cluſter of yellowiſh flowers, which appear in June and July, and are very ornamental. 2. The plantaginifolium, hath large woolly radical leaves, decumbent running roots, and herbaceous ſimple ſtalks, riſing ſix or eight inches high, terminated by a corymbus of white flowers in June, July, &c. 3. The ſtæchas hath a ſhrubby ſtalk, dividing into ſlender branches three feet long, terminated by corymbofe cluſters of yellow flowers, appearing in May and June. 4. The orientale, or oriental goldilocks, hath three varieties, with yellow, gold-coloured, and white ſilvery flowers. They have ſhrubby ſtalks, riſing two or three feet high. 5. The odoratiſſimum, or ſweet-ſcented eternal flower, hath ſhrubby winged ſtalks, branching irregularly a yard high, with corymbofe cluſters of bright yellow flowers, changing to a dark yellow. 6. The arboreum, or tree gnaphalium, hath a woody ſtem, branching four or five feet high, narrow feſſile leaves, with revolute borders, ſmooth on their upper ſide, and roundiſh bunches of pale yellow flowers.

The firſt three ſorts are hardy, and will thrive in any ſoil or ſituation. The two firſt increaſe exceedingly by their roots; and the third is eaſily propagated by ſlips. The fourth, fifth, and ſixth ſorts are ſomewhat tender; and therefore ſhould be kept in pots, to be ſheltered in a green-houſe or garden-frame in winter. Others may be planted in the full ground, in a dry and warm ſituation, eſpecially the oriental kind and varieties, and likewiſe the ſweet-ſcented kind; for theſe two ſpecies will ſtruggle tolerably through an ordinary winter, and make a pretty appearance during the ſummer-months. All theſe are propagated by ſlips, or cuttings of their ſhoots.—The flowers of all theſe ſpecies are remarkable for retaining their beauty for years, if carefully gathered in a dry day, ſoon after they are blown.

GNAT, in zoology. See MUSCA.

There is no ſpecies of inſects ſo particularly troubleſome to mankind as the gnats. Others give more pain with their ſtings, but it is only by accident that we are ſtruck by them; but the gnats thirſt for our blood, and follow us about in whole companies for it. There are many marſhy places in our country where the legs and arms are all the ſummer ſwelled to an enormous ſize by the bitings of theſe inſects, and in many other countries they are yet more troubleſome than with us.

All the naturaliſts have of late years employed the microſcope to examine the parts of this little animal; and Swammerdam, Hooke, Bonanni, Lewenhoek, &c. have given very good accounts and very valuable drawings of the creature.

The trunk of the gnat, or the inſtrument with which it ſtrikes the fleſh and ſucks the blood from animal bodies, is of a very curious conſtruction. The piercer, or, more properly, the piercers of this inſtrument are all entirely hid in the ſheath of the inſtrument which makes what we call the *trunk*, and is the only part naturally offered to our view. This trunk appears to be cylindric in the greateſt part of its length; and is covered with ſcales not unlike thoſe on the nerves of the creature's wings, and reſembling ſmall leaves. Near its end it has a little ſwelling, where there is an oblong button broader at its inſertion than at its point: the end of this button is furniſhed with an aperture out of which the creature occaſionally thruſts a fine point. Many naturaliſts have obſerved this point. Swammerdam conſidered it as a ſingle pointed body formed to pierce the ſkin; but Lewenhoek diſcovered that it was made up of a vaſt number of pointed bodies. There is no occaſion, however, for all the accuracy of Swammerdam, nor all the power of the magnifying-glaſſes of Lewenhoek, to diſcover that this is a complex body; a common ſmall magnifying glaſs and a little attention will at any time diſcover it. Gnat.

If a gnat is held by the corcelet between the fingers, and a little ſqueezed, the trunk will frequently be ſeen to open lengthwiſe on each ſide; ſometimes only a little way, at others almoſt its whole length; and a fine gloſſy reddiſh filament ſhews itſelf at the opening of this caſe. This filament is bent and turned inwards, and one very ſoon diſtinguiſhes that it is indeed a congeries of a great number of filaments: theſe one may eaſily ſeparate in ſome meaſure, from one another by any pointed inſtrument; and very often the filament of itſelf ſeparates into ſeveral in the bending. It is plain, therefore, that the inſtrument deſtined to pierce the ſkin and ſuck the blood is of a complex ſtructure; that what we might naturally take for this inſtrument, is only its caſe or ſheath; and that this caſe or ſheath, inſtead of a plain cylindric body is really a compoſition of two ſemi-cylindric ones, which the animal has the power of ſeparating from one another on proper occaſions.

The beſt way to get a regular ſight of the trunk of this creature and of the manner of uſing it, is to ſuffer a gnat to ſettle upon the hand, and not to diſturb him in the operation; but, with a magnifying glaſs in the other hand, to obſerve all his motions. In this caſe, we may firſt obſerve a ſmall and ſlender point thruſt out of the caſe, and the animal try ſeveral different parts of the ſkin with this ſharp inſtrument. When this is done, it chooſes that part which is moſt eaſily pierced, and where there lies a veſſel underneath capable of furniſhing as much blood as it will have occaſion to ſuck. As ſoon as it has made its choice, the wound is immediately given: and ſince the point of the compound piercer cannot be protruded ſo far out of the caſe as it is neceſſary it ſhould be to ſtrike to a proper depth, the uſe of the ſlit in this caſe is ſeen; for while the button at the end of this remains firmly applied to the orifice of the wound, where the piercer is introduced, and ſupports that feeble and delicate inſtrument from bending, the caſe opens at the ſlit, and its two ſides bend to give room to the piercer to penetrate; and, at length, when the piercer is ſunk to its utmoſt depth, the two extremities of each piece touch, and the two ſides are brought cloſe together.

The ſeveral ſpecies of gnats have great variety in their trunks. One of them deſerves to be remarked, as having no need of the button at the end of the caſe, common to all the reſt, to ſupport it while it enters the fleſh. This has a caſe on which it reſts itſelf as on a ſeventh leg; from which it darts a piercer, which without any ſupport is of ſufficient ſtrength to penetrate the fleſh, and do its office for the animal. This ſpecies of gnat has two very long beards placed above its trunk, and terminated by an end covered

Gnat. vered with white ſcales. What remains of theſe beards is covered with brown ſcales, the body of the gnat alſo is brown, and the corcelet reddiſh. Gnat.

Though it is eaſy to find that the trunk of a gnat is compoſed of ſeveral pieces, yet it is by no means ſo eaſy to ſay what the preciſe number of them is. The beſt microſcopes often ſhew the whole a ſingle body, its ſeveral parts being ſo extremely well joined; and when they have been found to be more than one, it is yet extremely difficult to ſay how many they are. Lewenhoeck believed them to be four in number; and Swammerdam, who at firſt believed the whole to be a ſingle filament, afterwards thought he diſcovered ſix pieces going to its compoſition.

After ſeparating the piercer of the gnat wholly from its ſheath, if it be cut tranſverſely near its baſe, or inſertion in the head, and the ſection laid upon the plate of a microſcope, and there touched with an extremely fine pointed inſtrument, it may be divided into four, and ſometimes into five ſeparate pieces. Two of theſe may be often ſeen to come out of a third as out of a canal or tube. The ſeeming neceſſity of a tube in this inſtrument for ſucking the blood, has made many ready to perſuade themſelves that they have actually ſeen one: but if we follow the analogy of nature in her other works, we ſhall find there is no abſolute neceſſity for ſuch an organization in this part; ſince, in the gad-fly, the ſeveral pieces of which the piercer is compoſed are of themſelves able to form a tube for the conveying of the blood.

Out of the immenſe number of gnats that one ſees in ſummer, few can have any chance, even once in their lives, of ſucking the blood of the larger animals; the reſt, however, are by no means doomed to perpetual famine: the herbs of the field afford them a ſufficient nouriſhment; for the gnats, like many other inſects, are partly carnivorous, and partly otherwiſe, feeding equally on fleſh and vegetables.

The wings of gnats are of a very curious ſtructure, and worthy of an attentive obſervation. It is well known, that, on touching the wings of butterflies, a coloured powder is left upon the fingers; which, tho' to the naked eye it appears a mere ſhapeleſs duſt, yet when examined by the microſcope is found to conſiſt of beautiful and very regularly figured bodies reſembling feathers and ſcales. The generality of flies have nothing of this kind; but a cloſe examination of the wings of the gnat will ſhew that they are not wholly deſtitute of them: they are beſtowed much more ſparingly indeed upon the gnat than on the butterfly; but they are arranged with great regularity.

The wings of the gnat, like thoſe of moſt other inſects, are of a cartilaginous ſubſtance, friable, and tranſparent like a flake of talc; and the circumference and many parts of the inner ſurface of the wing are ſtrengthened by ſlender but firm ribs, which are divaricated into ſeveral ramifications. Theſe appear to us to be mere ſtrait fibres; but they are probably hollow, and perform the office of veſſels for the carrying of fluids or air neceſſary to the ſupport of the wing, as well as to ſtrengthen it. In the wings of butterflies there are ſimilar ribs, but they are there all hid by the ſcales: but it is not ſo in the gnat; for in its wings, as in thoſe of the other flies, theſe ribs ſeem naked. The aſſiſtance of the microſcope, however, ſhews that they are not abſolutely ſo in the wings of gnats, but theſe nerves or ribs, with their ſeveral ramifications, look like as many ſtalks of a plant covered with ſmall oblong leaves. The ſeveral ſcales that are attached to theſe ribs make acute angles with them, and are directed towards the end of the wing. The number of theſe ſcales is very ſmall in compariſon with thoſe of the butterfly-claſs; but they make a ſlighter and more elegant ornament. There are ſome ſpecies which have the intermediate ſpaces of the wing alſo adorned with theſe ſcales; but they are in theſe only thinly ſcattered. The intermediate ſpaces of the wings, when they have no ſcales are finely wrought and pointed: the inner edges of the wings are always bordered with a row of ſcales in form of a fringe; which, in ſome ſpecies, is compoſed of ſcales all of the ſame ſize, and in others is made up of many various lengths: and the exterior edge of the wing, which is ſurrounded by a rib much thicker and ſtronger than the interior, is not fringed with a ſeries of ſcales, but is beſet at proper diſtances with a kind of prickles.

The ordinary ſhape of the wings of the gnats is that of an oblong battledoor, one end of which is broader and the other more pointed. The narrower end is that from which goes the ſtalk by which it adheres to the rib. The other end is ſometimes more, ſometimes leſs round, and is ſometimes a little hollowed in the middle. Some of theſe are much longer in proportion to their breadth than others; and ſome of them have their extremity formed into an open creſcent. All have a number of fine lines running longitudinally through the whole ſcale.

Gnat-*Worm*, in natural hiſtory, a ſmall aquatic inſect produced from the egg of a gnat, and which is after its ſeveral changes again tranſformed into a gnat.

Theſe worms do not frequent rivers, but ditches, ponds, and other ſtagnant waters; where they are found in vaſt abundance from the middle of May till towards the beginning of winter. This is the reaſon why watery and marſhy places are found moſt to abound with gnats, and why the wet ſummers are found to produce the greateſt numbers of them; becauſe in dry ſeaſons the ponds and ditches where they are to paſs their worm-ſtate are dried up, and the worms killed. Theſe are creatures, however, that one need not go far to ſeek; ſince one need only expoſe a veſſel of water in a garden, or any open place, in the ſummer time, and ſooner or later it will not fail to produce plenty of them.

Before they arrive at their full growth, though they are then but ſmall, they are eaſily found; becauſe they are under a neceſſity of coming often to the top of the water by having occaſion for frequent reſpiration; and to do this, they are obliged to keep the end of a ſmall pipe they are furniſhed with from the laſt ring of their body above water. The end of this pipe is hollow and indented, and forms a ſort of funnel upon the ſurface of the water. It is of the length of about three rings of the body, and is ſomewhat thicker at its inſertion than at its extremity.

The worm is of the third claſs of thoſe which are tranſformed into two-winged flies: that is, it has no legs, and has a head of a conſtant and invariable figure; and has no teeth or moveable jaws formed to play againſt one another. Their body is long, and their

Gnat
Gnomon.

head is somewhat detached from the firſt ring, to which it is faſtened by a ſort of neck. This firſt ring is the longeſt and largeſt of all, and ſeems a ſort of corcelet to the worm. The creature has eight rings beſides this. Theſe grow ſmaller as they approach the hinder extremity.

While the worm is young, the body is whitiſh or greeniſh; but when it is at its full growth, and draws near the time of its change, it becomes greyiſh. The great tranſparency of the body of this worm gives a fine view of what paſſes within it; and it is at any time eaſy to ſee the motion of the inteſtines by which the food is puſhed on towards the anus. The two principal tracheæ are alſo ſeen very diſtinctly in this creature. They are two white tubes placed in a direction parallel to one another, and run from the firſt ring to the tube of reſpiration.

This worm ſeveral times changes its ſkin in the courſe of its life. After three changes of this kind, which uſually happen in the ſpace of three weeks, it undergoes a fourth, in which the old ſkin is as eaſily thrown off as before; but the animal now appears in a new form, viz. that of a nymph. It is now ſhorter and rounder than before; and the body is ſo bent, that the tail is now applied to the under part of the head: this, however, is only its form in a voluntary ſtate of reſt, for it can yet move; and, when it pleaſes, extends its tail, and ſwims as ſwiftly as before.

All the parts of the future gnat may be ſeen in this nymph; the ſkin of it is extremely thin and tranſparent, yet ſufficiently tough and firm for the uſe for which it is intended. It is uncertain how long the animal lives in this nymph ſtate; but after the time is accompliſhed, its change into the gnat is very quick, and attended with great danger to the animal, ſince multitudes of them are drowned in the act of getting out.

GNESNA, a large and ſtrong town of Great Poland, of which it is capital, and in the palatinate of Caliſh, with an archbiſhop's ſee, whoſe prelate is primate of Poland, and viceroy during the vacancy of the throne. It was the firſt town built in the kingdom, and formerly more conſiderable than at preſent. E. Lon. 18.20. N. Lat. 52. 28.

GNOMES, *gnomi*, certain imaginary beings, who, according to the cabbaliſts, inhabit the inner parts of the earth. They are ſuppoſed ſmall in ſtature, and the guardians of quarries, mines, &c. See FAIRY.

GNOMON, in dialling, the ſtyle, pin, or cock of a dial; which, by its ſhadow, ſhews the hour of the day. The gnomon of every dial repreſents the axis of the world. See DIAL and DIALLING. The word is Greek, γνωμων, which literally implies ſomething that makes a thing known; by reaſon that the ſtyle or pin indicates or makes the hour known.

GNOMON, in geometry. If, in a parallelogram ABCD (Pl. CXL. fig. 8. n° 1.) the diameter AC be drawn; alſo two lines EF, HI, parallel to the ſides of the parallelogram, and cutting the diameter in one and the ſame point G, ſo that the parallelogram is, by theſe parallels, divided into four parallelograms; then are the two parallelograms DG, BG, through which the diameter does not paſs, called *complements*; thoſe through which the diameters paſs, EH, FI, are called *the parallelograms about the diameter*; and a gnomon conſiſts of the two complements, and either of the parallelograms about the diameter, viz. GD+HE +EI, or GD+FI+GB. Gnomon
Coa.

GNOMON, in aſtronomy, a ſtyle erected perpendicular to the horizon, in order to find the altitude of the ſun. Thus, in the right-angled triangle ABC are given, AB the length of the ſtyle, BC the length of its ſhadow, and the right angle ABC. Hence, making CB the radius, we have this analogy for finding the angle ACB, the ſun's altitude, viz. BC: AB:: radius: tangent of the angle C.

By means of a gnomon, the ſun's meridian altitude, and conſequently the latitude of the place, may be found more exactly than with the ſmaller quadrants. See QUADRANT.

By the ſame inſtrument the height of any object GH may be found: for as DF, the diſtance of the obſerver's eye from the gnomon, is to DE, the height of the ſtyle; ſo is FH, the diſtance of the obſerver's eye from the object, to GH, its height.

GNOMON *of a Globe*; the index of the hour-circle.

GNOMONICS, the art of dialling. See DIALLING.

GNOSTICS, (from the Greek γινωσκω, *I know*,) in church-hiſtory, Chriſtian heretics ſo called; it being a name which almoſt all the ancient heretics affected to take, that they might expreſs the new knowledge and extraordinary light to which they made pretenſions.

St Epiphanius aſcribes the origin of the Gnoſtics to Simon Magus; and ſays, that they acknowledged two principles, a good and a bad. They ſuppoſed there were eight different heavens, each of which was governed by its particular prince. The prince of the ſeventh heaven, whom they named *Sabaoth*, created the heavens and the earth, the ſix heavens below him, and a great number of angels. In the eighth heaven they placed their *Barbelo* or *Barbero*, whom they ſometimes called *the father*, and ſometimes *the mother, of the univerſe*. All the Gnoſtics diſtinguiſhed the creator of the univerſe from God who made himſelf known to men by his ſon, whom they acknowledged to be the Chriſt. They denied that the Word was made fleſh; and aſſerted that Jeſus Chriſt was not born of the Virgin Mary; that he had a body only in appearance, and that he did not ſuffer in reality. They neither believed a reſurrection nor a judgment to come; but imagined that thoſe who had been inſtructed in their maxims would return into the world, and paſs into the bodies of hogs, and other like animals. They had ſeveral apocryphal books, as the *Goſpel of St Philip*; the *Revelation of Adam*; the *Goſpel of Perfection*, &c.

GOA, a large and ſtrong town of Aſia, in the peninſula on this ſide the Ganges, and on the Malabar coaſt. It was taken by the Portugueſe in 1508, and is the chief town of all the ſettlements the Europeans have in India. It ſtands in an iſland about 12 miles in length, and ſix in breadth; and the city is built on the north ſide of it, having the conveniency of a fine ſalt-water river, capable of receiving ſhips of the greateſt burthen, where they lie within a mile of the town. The banks of the river are beautified with a great number of handſome ſtructures; ſuch as churches, caſtles,

Goa — God.

caſtles, and gentlemen's houſes. The air within the town is unwholeſome, for which reaſon it is not ſo well inhabited now as it was formerly. The viceroy's palace is a noble building; and ſtands at a ſmall diſtance from the river, over one of the gates of the city, which leads to a ſpacious ſtreet, terminated by a beautiful church. This city contains a great number of handſome churches, convents, and cloiſters, with a ſtately large hoſpital; all well endowed, and kept in good repair. The market-place takes up an acre of ground; and in the ſhops about it may be had the produce of Europe, China, Bengal, and other countries of leſs note. Every church has a ſet of bells, ſome of which are continually ringing. Their religion is the Roman Catholic, and they have a ſevere inquiſition. There are a great many Indian converts; but they generally retain ſome of their old cuſtoms, particularly they cannot be brought to eat beef. However, there are many Gentoos in the city, who are tolerated, becauſe they are more induſtrious than the Chriſtians, and better artiſts. The clergy are very numerous, and illiterate; but the churches are finely embelliſhed, and have great numbers of images. The houſes are large, and make a fine ſhew; but within they are but poorly furniſhed. The inhabitants are contented with greens, fruits, and roots; which, with a little bread, rice, and fiſh, is their principal diet, though they have hogs and fowls in plenty. However, they are very much addicted to women; and are generally weak, lean, and feeble. Captain Hamilton ſtood on a hill near the city, and counted above 80 churches, convents, and monaſteries; and he was told, that there were about 30,000 prieſts and monks. The body of St Francis Xavier is buried in St Paul's church; and, as they pretend, performs a great many miracles. It is remarkable, that none of the churches, except one, have glaſs windows; for they make uſe of clear oyſter-ſhells inſtead of glaſs, and all their fine houſes have the ſame. Goa itſelf has few manufactures or productions; their beſt trade being in arrack. The river's mouth is defended by ſeveral forts and batteries, well planted with large cannon on both ſides; and there are ſeveral other forts in different places. It is 250 miles N. by W. of Cochin. E. Lon. 74. 0. N. Lat. 15. 31.

GOAL. See Gaol.

GOAT, in zoology. See Capra.

Goat's-*Beard*, in botany. See Tragopogon.

Goat-*Sucker*, in ornithology. See Caprimulgus.

GOBELIN (Giles), a famous French dyer, in the reign of Francis I. diſcovered a method of dying a beautiful ſcarlet, and his name has been given ever ſince to the fineſt French ſcarlets. His houſe, in the ſuburb of St Marcel at Paris, and the river he made uſe of, are ſtill called *the Gobelins*. An academy for drawing, and a manufactory of fine tapeſtries, were erected in this quarter in 1666; for which reaſon the tapeſtries are called *the Gobelins*.

GOBIUS, in ichthyology, a genus of fiſhes belonging to the order of thoracici. They have two holes between the eyes, four rays in the membrane of the gills, and the belly-fins are united in an oval form. There are eight ſpecies, principally diſtinguiſhed by the number of rays in their fins.

GOD, one of the many names of the Supreme Being. See Christianity; Metaphysics, n° 6. 222 - 230.; and Moral Philosophy, n° 161, &c.

Goddard — Godfrey.

GODDARD (Jonathan), an eminent phyſician and chemiſt, and one of the firſt promoters of the Royal Society, was born about the year 1617. He was elected a fellow of the college of phyſicians in 1646, and appointed reader of the anatomical lecture in that college in 1647. As he took part againſt Charles I. accepted the wardenſhip of Merton-college, Oxford, from Oliver Cromwell when chancellor, and ſat ſole repreſentative of that univerſity in Cromwell's parliament, he was removed from his wardenſhip in a manner diſgraceful to him by Charles II. He was however then profeſſor of phyſic at Greſham college, to which he retired, and continued to attend thoſe meetings that gave birth to the Royal Society; upon the firſt eſtabliſhment of which, he was nominated one of the council. Being fully perſuaded that the preparation of medicines was no leſs the phyſician's duty than the preſcribing them, he conſtantly prepared his own; and in 1668 publiſhed a treatiſe recommending his example to general practice. He died of an apoplectic fit in 1674; and his memory was preſerved by the drops that bore his name, otherwiſe called *Guttæ Anglicanæ*, the ſecret of which he ſold to Charles II. for 5000 l. and which Dr Liſter aſſures us was only the volatile ſpirit of raw ſilk rectified with oil of cinnamon or ſome other eſſential oil. But he claims more particular regard, if what biſhop Seth Ward ſays be true, that he was the firſt Engliſhman who made that noble aſtronomical inſtrument, the teleſcope.

GODDESS, a heathen deity of the female ſex. The ancients had almoſt as many goddeſſes as gods: ſuch were, Juno the goddeſs of air, Diana the goddeſs of woods, &c. and under this character were repreſented the virtues, graces, and principal advantages of life; truth, juſtice, piety, liberty, fortune, victory, &c.

It was the peculiar privilege of the goddeſſes to be repreſented naked on medals; for it was ſuppoſed that the imagination muſt be awed and reſtrained by the conſideration of the divine character.

GODEAU (Anthony), biſhop of Graſſe and Vence in France, was born at Dreux in 1605. He was a very voluminous writer, both in proſe and verſe; but his principal works are, 1. *An eccleſiaſtical hiſtory*, 3 vols. folio, containing the firſt eight centuries only, as he never finiſhed more. 2. *Tranſlation of the Pſalms into French verſe*; which was ſo well approved, that even thoſe of the reformed religion preferred it to that of Marat. He died in 1671.

GODFATHERS *and* Godmothers, perſons who, at the baptiſm of infants, anſwer for their future conduct, and ſolemnly promiſe that they will renounce the devil and all his works, and follow a life of piety and virtue; and by this means lay themſelves under an indiſpenſable obligation to inſtruct them, and watch over their conduct.

This cuſtom is of great antiquity in the Chriſtian church; and was probably inſtituted to prevent children being brought up in idolatry, in caſe their parents died before they arrived at years of diſcretion.

The number of godfathers and godmothers is reduced to two, in the church of Rome; and three, in the church of England; but formerly they had as many as they pleaſed.

GODFREY

Godfrey
||
Goito.

GODFREY (of Bouillon), prince of Lorrain, a moſt celebrated cruſader, and victorious general. He was choſen general of the expedition which the Chriſtians undertook for the recovery of the Holy Land and ſold his dukedom to prepare for the war. He took Jeruſalem from the Turks in 1099; but his piety, as hiſtorians relate, would not permit him to wear a diadem of gold in the city where his Saviour had been crowned with thorns. The ſultan of Egypt afterwards ſent a terrible army againſt him; which he defeated, with the ſlaughter of above 100,000 of the enemy. He died in 1160.

GODOLPHIN (John), an eminent Engliſh civilian, was born in the iſland of Scilly in 1617, and educated at Oxford. In 1642-3, he was created doctor of civil law; in 1653, he was appointed one of the judges of the admiralty; and at the Reſtoration, he was made one of his majeſty's advocates. He was eſteemed as great a maſter of divinity, as of his own faculty; and publiſhed, 1. *The holy limbeck.* 2. *The holy arbour.* 3. *A view of the admiral's juriſdiction.* 4. *The orphan's legacy.* 5. *Repertorium canonicum, &c.* He died in 1678.

GODWIN (Francis), ſucceſſively biſhop of Landaff and Hereford, was born in 1567. He was eminent for his learning and abilities; being a good mathematician, an excellent philoſopher, a pure Latiniſt, and an accurate hiſtorian. He underſtood the true theory of the moon's motion, a century before it was generally known. He firſt ſtarted thoſe hints afterwards purſued by biſhop Wilkins, in his *Secret and ſwift meſſenger*; and publiſhed *A catalogue of the lives of Engliſh biſhops.* He has nevertheleſs been accuſed as a great ſimoniac, for omitting no opportunity of diſpoſing of preferments in order to provide for his children. He died in 1648.

GODWIN (Thomas), a learned Engliſh writer born in 1517, was maſter of the free-ſchool at Abingdon in Berkſhire; where he educated a great many youths, who became eminent both in church and ſtate. His works ſhew him to have been a man of great learning; ſuch as, *Hiſtoriæ Romanæ anthologia, Synopſis antiquitatum Hebraicarum, Moſes & Aaron, Florilegium Phraſicon, &c.* He died in 1642.

GODWIT, in ornithology. See SCOLOPAX.

GOES, or TER GOES, a ſtrong and conſiderable town of the United Provinces, in Zealand, and capital of the iſland of South-Beveland. It communicates with the ſea by a canal; and is 10 miles eaſt of Middleburg, and 30 north of Ghent. E. Lon. 3. 50. N. Lat. 51. 33.

GOGMAGOG-HILLS, are hills ſo called, three miles from Cambridge, remarkable for the intrenchments and other works caſt up here: whence ſome ſuppoſe it was a Roman camp; and others, that it was the work of the Danes.

GOITO, a town of Italy, in the duchy of Mantua, taken by the Germans in 1701, and by the prince of Heſſe in 1706. It is ſeated on the river Mincio, between the lake of Mantua and that of Garda, 10 miles north-weſt of Mantua. E. Lon. 11. 0. N. Lat. 45. 16.

GOLCONDA, a kingdom of Aſia, in the peninſula on this ſide the Ganges. It is bounded on the north by that of Orixa, on the weſt by that of Balagate, on the ſouth by Biſnagar, and on the eaſt by the gulph of Bengal. It abounds in corn, rice, and cattle; but that which renders it moſt remarkable are the diamond-mines, they being the moſt conſiderable in the world: they are uſually purchaſed of the black merchants, who buy parcels of ground to ſearch for theſe precious ſtones in. They ſometimes fail in meeting with any, and in others they find immenſe riches. They have alſo mines of ſalt, fine iron for ſword-blades, and curious callicoes and chintzes. It is ſubject to the Great Mogul; and has a town of the ſame name, ſeated at the foot of a mountain, being one of the largeſt in the Eaſt-Indies. It is about ſix miles in circumference; and was formerly the reſidence of the kings, till it was conquered by the Great Mogul. It is now much frequented by the European merchants. E. Lon. 79. 10. N. Lat. 16. 30. Golconda, Gold.

GOLD, the moſt precious of all the metals.

For an account of the places where gold is found in greateſt quantities; the methods of extracting it from the ore, and afterwards purifying it; with an account of its different phenomena in combination with other metals; ſee the article METALLURGY. An account of its chemical properties, ſolution in different menſtrua, &c. is given under CHEMISTRY, n° 194, 236, 348.—For its effects on glaſs, ſee the article GLASS and VITRIFICATION.

GOLD is the moſt fixed of all the metals; and it hath been generally believed, till very lately, that it was abſolutely fixed in every degree of fire which could be excited by human art. Some chemiſts indeed pretended to have evaporated, calcined, and even vitrified gold, by expoſing it to the focus of a good burning-glaſs; but as their experiments did not appear to have all the authenticity that was neceſſary, the opinion fell into diſcredit; and this the more readily that gold is found to reſiſt the moſt violent furnace fires without any loſs. Mr Macquer, however, in the laſt additions to his Chemical Dictionary, hath found, that this metal, when expoſed to the heat of a good burning-glaſs, loſes in weight conſiderably, and that even in a very ſhort time. He held ſome very fine gold in the focus of a large burning-glaſs, at ſeveral times, at half an hour each time, ſometimes in a hollow piece of charcoal, or in veſſels made of earthen ware and procelain; and whenever the air was very clear, and the ſun bright, a very ſenſible ſmoke aroſe to the height of three or four inches. To know the nature of this ſmoke, a cold ſilver-plate was expoſed to it; by which means, ſome of the vapour appeared on the ſilver like a tarniſh a little leſs white, but not ſenſibly yellow. But when this part of the ſilver was rubbed with a burniſher, it appeared ſo evidently to be gilded, that none could doubt the evaporation of the metal. At this experiment ſeveral members of the Academy of Sciences were preſent.

The experiments with regard to the calcination and vitrification of gold were alſo tried by Mr Macquer, in preſence of Meſſrs Montigny, Cadet, Lavoiſier, and Briſſon. The glaſs employed was that of Tſchirnhauſen, the ſame which had formerly been employed by Mr Homberg. Gold of 24 carats fine was expoſed to the focus of this glaſs ſeveral times, by half an hour at a time, on veſſels made of a very refractory porcelain earth.—When the gold was melted, which

Gold. which happened in the ſpace of a few ſeconds, it took a ſpherical form as nearly as its gravity would permit, and had nearly the conſiſtence of quickſilver. The melted maſs ſoon acquired a rotatory motion round its axis, ſometimes in one direction, and ſometimes in another, according to the direction of the focus upon the metal; (which, by-the-bye, is a very curious appearance, and ſeems difficult to be accounted for). A ſmoke aroſe as in the former experiments. On the ſurface of the melted gold, ſpots evidently vitrified were formed, which ſeparated from the metal. Theſe afterwards united into a dark violet-coloured maſs, of a greater curvature than the melted gold, in which they were found to be ſet, as jewels in a ring; and produced nearly the ſame appearance that the tranſparent cornea has on the globe of the eye; that is, as the ſegment of a ſmall ſphere joined to the ſurface of a large one. On a maſs of liquid gold, of about half an inch diameter, he obtained, after four hours calcination, a button of this violet glaſs, whoſe diameter exceeded two lines; and this glaſs was obſerved gradually to increaſe as the gold diminiſhed. Yet, though this very much reſembles the vitrification of the gold, Mr Macquer doth not take upon him to aſſert that it certainly is ſo; ſeeing it may ariſe from the veſſels on which the gold is ſupported, and which were coloured purple to a conſiderable diſtance, and beſides were ſprinkled with many ſmall particles of gold undecompoſed, eaſily diſtinguiſhable by a microſcope; and in the violet glaſs alſo, many ſimilar particles were obſervable. To determine the matter accurately, the experiment ought to be continued till all the particles of the metal be certainly either vitrified or evaporated.—Though this experiment, however, is hitherto equivocal when the heat of burning-glaſſes is made uſe of, it certainly ſucceeds with a ſtrong flaſh of electric fire. See ELECTRICITY, n° 113.

Method of Recovering GOLD *from Gilt Works.* The ſolubility of gold and the indiſſolubility of ſilver in aqua regia affords a principle on which gold may be ſeparated from the ſurface of ſilver; and, on this foundation, different proceſſes have been contrived, of which the two following appear to be the beſt.—Some powdered ſal ammoniac, moiſtened with aqua fortis into the conſiſtence of a paſte, is ſpread upon the gilt ſilver, and the piece heated, till the matter ſmokes, and becomes nearly dry: being then thrown into water, it is rubbed with a ſcratch bruſh, compoſed of fine braſs-wire bound together, by which the gold eaſily comes off. The other way is, by putting the gilt ſilver into common aqua regia, kept ſo hot as nearly to boil, and turning the metal frequently till it becomes all over black: it is then to be waſhed with a little water, and rubbed with the ſcratch bruſh, to get off what gold the aqua regia may have left. This laſt method appears preferable to the other; as the ſame aqua regia may be made to ſerve repeatedly till it becomes ſaturated with the gold, after which the gold may be recovered pure by precipitation with ſolution of vitriol, as directed under the article METALLURGY.

For ſeparating gold from gilt copper, ſome direct a ſolution of borax to be applied on the gilt parts, but nowhere elſe, with a pencil, and a little powdered ſulphur to be ſprinkled on the places thus moiſtened; the principal uſe of the ſolution of borax ſeems to be to make the ſulphur adhere; the piece being then made red hot, and quenched in water, the gold is ſaid to be ſo far looſened, as to be wiped off with a bruſh. Others mix the ſulphur with nitre and tartar, and form the mixture with vinegar into a paſte, which is ſpread upon the gilt parts. Gold.

Schlutter recommends mechanical means, as being generally the leaſt expenſive, for ſeparating gold from the ſurface both of ſilver and copper. If the gilt veſſel is round, the gold is conveniently got off by turning it in a lathe, and applying a proper tool, a ſkin being placed underneath for receiving the ſhavings: he ſays it is eaſy to collect into two ounces of ſhavings, all the gold of a gilt veſſel weighing thrice as many pounds. Where the figure of the piece does not admit of this method, it is to be properly fixed, and ſcrapers applied, of different kinds, according to its ſize and figure; ſome large, and furniſhed with two handles, one at each end; others ſmall and narrow, for penetrating into depreſſed parts. If the gold cannot be got off by either of theſe ways, the file muſt be had recourſe to, which takes off more of the metal underneath than the turning tool or the ſcraper, particularly than the former. The gold ſcrapings, or filings, may be purified from the ſilver or copper they contain, by the methods deſcribed under the article METALLURGY.

THE editors of the *Encyclopédie* give a method of recovering the gold from wood that has been gilt on a water-ſize: this account is extracted from a memoir on the ſame ſubject, paſſented to the Academy of Sciences by M. de Montamy. The gilt wood is ſteeped for a quarter of an hour, in a quantity of water, ſufficient to cover it, made very hot: the ſize being thus ſoftened, the wood is taken out, and ſcrubbed, piece by piece, in a little warm water, with ſhort ſtiff briſtle bruſhes of different ſizes, ſome ſmall for penetrating into the carvings, and others large for the greater diſpatch in flat pieces. The whole mixture of water, ſize, gold, &c. is to be boiled to dryneſs, the dry matter made red hot in a crucible to burn off the ſize, and the remainder ground with mercury, either in a mortar, or, where the quantity is large, in a mill.

GOLD-*Coaſt.* See GUINEA.

GOLD-*Wire*, a cylindrical ingot of ſilver, ſuperficially gilt or covered with gold at the fire, and afterwards drawn ſucceſſively through a great number of little round holes, of a wire-drawing iron, each leſs than the other, till it be ſometimes no bigger than a hair of the head. See WIRE-*Drawing*.

It may be obſerved, that, before the wire be reduced to this exceſſive fineneſs, it is drawn through above an hundred and forty different holes; and that each time they draw it, it is rubbed afreſh over with new wax, both to facilitate its paſſage, and to prevent the ſilver's appearing through it.

GOLD-*Wire flatted*, is the former wire flatted between two rollers of poliſhed ſteel, to fit it to be ſpun on a ſtick, or to be uſed flat, as it is, without ſpinning, in certain ſtuffs, laces, embroideries, &c. See STUFF, &c.

GOLD-*Thread*, or *Spun-gold*, is flatted gold, wrapped or laid over a thread of ſilk, by twiſting it with wheel and iron-bobbins.

To

Gold. To dispose the wire to be spun on silk, they pass it between two rollers of a little mill: these rollers are of nicely polished steel, and about three inches in diameter. They are set very close to each other, and turned by means of a handle fastened to one of them, which gives motion to the other. The gold wire in passing between the two, is rendered quite flat, but without losing any thing of its gilding; and is rendered so exceedingly thin and flexible, that it is easily spun on silk-thread, by means of a hand-wheel, and so wound on a spool or bobbin. See WIRE-*Drawing*.

GOLD-*Leaf*, or *Beaten Gold*, is gold beaten with a hammer into exceeding thin leaves, so that it is computed, that an ounce may be beaten into sixteen hundred leaves, each three inches square, in which state it takes up more than 159,052 times its former surface. See *Gold*-LEAF.

It must be observed, however, that gold is beaten more or less, according to the kind or quality of the work it is intended for; that for the gold-wire drawers to gild their ingots withal, is left much thicker than that for gilding the frames of pictures, &c. See GILDING.

GOLD-*Brocade*. See BROCADE.

Fulminating-GOLD. See CHEMISTRY, n° 356.—Since that article was printed, however, we are informed by Mr Macquer, that fulminating gold may be made without any nitrous acid. Of consequence, the conjecture there given concerning the cause of its explosion cannot be true in as far as the nitrous ammoniacal salt is concerned; though possibly the fixed air contained in the calx of gold may considerably contribute towards it.—Mr Bergman, whom Mr Macquer quotes, found that he could prepare fulminating gold at any time, by applying volatile alkali to it when in a greatly divided state. He doth not indeed tell us whether the alcali used, was in a caustic or mild state, (*i. e.* whether it was deprived of its fixed air or not): but though the experiment should even be found to succeed with caustic alkali, still the explosion might depend on fixed air; because caustic volatile alkalies are found either to imbibe, or generate this kind of air, even though excluded from the atmosphere in the most careful manner; and hence the complaint among druggists, that alkaline spirits, made with quicklime, do not keep equally well with others. See *Alkaline* SPIRITS.

Shell-GOLD, that used by the illuminers, and wherewith we write gold-letters. It is made of the parings of leaf-gold, and even of the leaves themselves, reduced into an impalpable powder, by grinding on a marble with honey. After leaving it to infuse some time in aqua fortis, they put it in shells, where it sticks. To use it, they dilute it with gum-water, or soap water.

GOLD-*Finch*, in ornithology. See FRINGILLA.

These are feed-birds of very curious colours, and which, were they not so common in this country, would probably be very much esteemed.

They are usually taken about Michaelmas, and soon become tame; but they differ very much in their song. —They frequently breed in the upper part of plum-trees, making their nests of the moss that grows upon apple-trees, and of wool; quilting the inside with all sorts of hairs they find upon the ground. They breed three times a-year; and the young are to be taken with the nest at about ten days old, and fed as follows:—Pound some hemp-seed very fine in a mortar; then sift it through a sieve, and add to it as much wheat-bread as hemp-seed; and likewise a little flower of canary-seeds: then with a small stick or quill, take up as much as the bigness of a white-pea, and give them several times a-day. This ought to be made fresh every day: for if it is suffered to sour, it will spoil their stomachs, causing them to cast up their meat; which if they do, it is very probable that they will die.—These young birds must be carefully kept warm till they can feed themselves, for they are very tender. In feeding, be sure to make your bird clean his bill and mouth. If any of the meat falls upon his feathers, take it off, or else he will not thrive. Such as eat hemp-seed, to purge them, should have the seeds of melons, succory, and mercury; or else let them have lettuce and plantane for that purpose. When there is no need of purging, give them two or three times a week a little sugar or loam in their meat, or at the bottom of the cage; for all seeds have an oiliness, so that if they have not something to absorb it, in length of time it fouls their stomachs, and brings on them a flux, which is very dangerous. Golden.

GOLD-*Fish*. See CYPRINUS.

GOLDEN, something that has a relation to gold, or consists of gold.

GOLDEN *Calf*, was a figure of a calf, which the Israelites cast in that metal, and set up in the wilderness, to worship, during Moses's absence into the mount; and which that legislator, at his return, burnt, grinded to powder, and mixed with the water the people were to drink of; as related in Exod. xxxii. The commentators have been divided on this article: the pulverizing of *gold*, and rendering it potable, is a very difficult operation in chemistry. Many, therefore, suppose it done by a miracle: and the rest, who allow of nothing supernatural in it, advance nothing but conjectures as to the manner of the process. Moses could not have done it by simple calcination, nor amalgamation, nor antimony, nor calcination; nor is there one of those operations that quadrates with the text.

M. Stahl has endeavoured to remove this difficulty. The method Moses made use of, according to this author, was by dissolving the metal with hepar sulphuris; only, instead of the vegetable alkali, he made use of the Egyptian natron, which is common enough throughout the east. See CHEMISTRY, n° 359.

GOLDEN *Fleece*, in the ancient mythology, was the skin, or fleece of the ram, upon which Phryxus and Hella are supposed to have swam over the sea to Colchis; and which being sacrificed to Jupiter, was hung upon a tree in the grove of Mars, guarded by two brazen-hoof'd bulls, and a monstrous dragon that never slept; but was taken and carried off by Jason and the Argonauts.

Many authors have endeavoured to shew that this fable is an allegorical representation of some real history, particularly of the philosopher's stone. Others have explained it, by the profit of the wool-trade to Colchis, or the gold which they commonly gathered there with fleeces in the rivers.

Order of the GOLDEN FLEECE, is a military order instituted

Golden, Goldingen.

inſtituted by Philip the Good, duke of Burgundy, in 1429. It took its denomination from a repreſentation of the *golden* fleece, borne by the knights on their collars, which conſiſted of ſtints, and ſteels. The king of Spain is now grand maſter of the order, in quality of duke of Burgundy: the number of knights is fixed to thirty-one.

It is uſually ſaid to have been inſtituted on occaſion of an immenſe profit which that prince made by wool; though others will have a chemical myſtery couched under it, as under that famous one of the ancients, which the adepts contend to be no other than the ſecret of the elixir, wrote on the fleece of a ſheep.

Oliver de la Marche writes that he had ſuggeſted to Philip I. archduke of Auſtria, that the order was inſtituted by his grandfather Philip the Good, duke of Burgundy, with a view to that of Jaſon; and that John Germain, biſhop of Chalons, chancellor of the order, upon this occaſion made him change his opinion, and aſſured the young prince that the order had been inſtituted with a view to the fleece of Gideon. William biſhop of Tournay, chancellor likewiſe of the order, pretends that the duke of Burgundy had in view both the golden fleece of Jaſon, and Jacob's fleece, *i. e.* the ſpeckled ſheep belonging to this patriarch, according to agreement made with his father-in-law Laban. Which ſentiment gave birth to a great work of this prelate, in two parts: in the firſt, under the ſymbol of the fleece of Jaſon, is repreſented the virtue of magnanimity, which a knight ought to poſſeſs; and under the ſymbol of the fleece of Jacob, he repreſents the virtue of juſtice.

Paradin is of the ſame mind, and tells us that the duke deſigned to inſinuate that the fabulous conqueſt which Jaſon is ſaid to have made of the *golden fleece* in Colchis, was nothing elſe but the conqueſt of virtue, which gains a victory over thoſe horrible monſters vice and our evil inclinations.

Golden *Number*, in chronology, a number ſhewing what year of the moon's cycle any given year is. See Astronomy, n° 304——307.

Golden-*Roſe*. The pope annually conſecrates a golden-roſe on the fourth Sunday in Lent, which is ſent to princeſſes, or to ſome church, as a mark of his peculiar affection.

Golden *Rule*, in arithmetic, a rule or praxis, of great uſe and extent in the art of numbers; whereby we find a fourth proportional to three quantities given.

The *golden rule* is alſo called the *Rule of Three*, and *Rule of Proportion*. See its nature and uſe under the article Arithmetic, n° 13.

GOLDINGEN, a town of Poland in the duchy of Courland, with a handſome caſtle, ſeated on the river Weia, in E. Long. 22. 31. N. Lat. 56. 48.

Goldsmith, or, as ſome chooſe to expreſs it, *ſilverſmith*, an artiſt who makes veſſels, utenſils, and ornaments, in gold and ſilver.

The goldſmith's work is either performed in the mould, or beat out with the hammer or other engine. All works that have raiſed figures, are caſt in a mould, and afterwards poliſhed and finiſhed: plates, or diſhes, of ſilver or gold, are beat out from thin flat plates; and tankards, and other veſſels of that kind, are formed of plates ſoldered together, and their mouldings are beat, not caſt. The buſineſs of the goldſmiths formerly required much more labour than it does at preſent; for they were obliged to hammer the metal from the ingot to the thinneſs they wanted: but there are now invented flatting-mills, which reduce metals to the thinneſs that is required, at a very ſmall expence. The goldſmith is to make his own moulds; and for that reaſon ought to be a good deſigner, and have a taſte in ſculpture: he alſo ought to know enough of metallurgy, to be able to aſſay mixed metals, and to mix the alloy. Goldſmith.

The goldſmiths in London employ ſeveral hands under them for the various articles of their trade: ſuch are the jeweller, the ſnuff-box and toy maker, the ſilver-turner, the gilder, the burniſher, the chaſer, the refiner, and the gold-beater. See the articles Jeweller, &c.

Goldſmiths are ſuperior tradeſmen: their wares muſt be aſſayed by the wardens of the company of this name in London, and marked; and gold is to be of a certain touch. No goldſmith may take above one ſhilling the ounce of gold, beſides what he has for the faſhioning, more than the buyer may be allowed for it at the king's exchange; and here any falſe metal ſhall be ſeized and forfeited to the king. The cities of York, Exeter, Briſtol, &c. are places appointed for the aſſaying wrought-plate of goldſmiths; alſo a duty is granted on ſilver-plate of ſix-pence an ounce, &c. Plate made by goldſmiths ſhall be of a particular fineneſs, on pain of forfeiting 10 l.; and if any parcel of plate ſent to the aſſayers is diſcovered to be of a coarſer alloy than the reſpective ſtandards, it may be broken and defaced; and the fees for aſſaying are particularly limited.

Goldsmith (Oliver), a celebrated Engliſh writer, was born at Roſcommon in Ireland, in the year 1731. His father, who poſſeſſed a ſmall eſtate in that county, had nine ſons, of which Oliver was the third. He was originally intended for the church; and with that view, after being well inſtructed in the claſſics, was, with his brother the Rev. Henry Goldſmith, placed in Trinity college, Dublin, about the latter end of the year 1749. In this ſeminary of learning he continued a few years, when he took a bachelor's degree: but, his brother not being able to obtain any preferment after he left the college, Oliver, by the advice of Dean Goldſmith of Cork, turned his thoughts to the ſtudy of phyſic; and, after attending ſome courſes of anatomy in Dublin, proceeded to Edinburgh in the year 1751, where he ſtudied the ſeveral branches of medicine under the different profeſſors in that univerſity. His beneficent diſpoſition ſoon involved him in unexpected difficulties; and he was obliged precipitately to leave Scotland, in conſequence of engaging himſelf to pay a conſiderable ſum of money for a fellow-ſtudent.

A few days after, about the beginning of the year 1754, he arrived at Sunderland, near Newcaſtle, where he was arreſted at the ſuit of a taylor in Edinburgh, to whom he had given ſecurity for his friend. By the good offices of Laughlin Maclane, Eſq; and Dr. Sleigh, who were then in the college, he was ſoon delivered out of the hands of the bailiff; and took his paſſage on board a Dutch ſhip to Rotterdam, where, after a ſhort ſtay, he proceeded to Bruſſels:

Goldſmith. he then viſited great part of Flanders; and after paſſing ſome time at Straſbourg and Louvain, where he obtained a degree of bachelor in phyſic, he accompanied an Engliſh gentleman to Berne and Geneva.

It is undoubtedly fact, that this ingenious, unfortunate man, travelled on foot moſt part of his tour. He had left England with very little money; and, being of a philoſophical turn, and at that time poſſeſſing a body capable of ſuſtaining every fatigue, and a heart not eaſily terrified at danger, he became an enthuſiaſt to the deſign he had formed of ſeeing the manners of different countries. He had ſome knowledge of the French language, and of muſic, and he played tolerably well on the German flute; which, from an amuſement, became at ſome times the means of ſubſiſtence. His learning produced him a hoſpitable reception at moſt of the religious houſes; and his muſic made him welcome to the peaſants of Flanders and other parts of Germany. "Whenever I approached," he uſed to ſay, "a peaſant's houſe towards night-fall, I played one of my moſt merry tunes; and that procured me not only a lodging, but ſubſiſtence for the next day: but in truth, (his conſtant expreſſion), I muſt own, whenever I attempted to entertain perſons of a higher rank, they always thought my performance odious, and never made me any return for my endeavours to pleaſe them."

On Mr Goldſmith's arrival at Geneva, he was recommended as a proper perſon for a travelling tutor to a young man, who had been unexpectedly left a conſiderable ſum of money by his uncle Mr S——, formerly an eminent pawnbroker near Holborn. This youth, who had been articled to an attorney, on receipt of his fortune, determined to ſee the world; and, on his engaging with his preceptor, made a proviſo, that he ſhould be permitted to govern himſelf; and Goldſmith ſoon found his pupil underſtood the art of directing in money-concerns extremely well, as avarice was his prevailing paſſion. His queſtions were uſually how money might be ſaved, and which was the leaſt expenſive courſe of travel; whether any thing could be bought that would turn to account when diſpoſed of again in London? Such curioſities on the way as could be ſeen for nothing he was ready enough to look at; but, if the ſight of them was to be paid for, he uſually aſſerted, that he had been told they were not worth ſeeing. He never paid a bill that he would not obſerve how amazingly expenſive travelling was; and all this, though he was not yet twenty-one. During Goldſmith's continuance in Switzerland, he aſſiduouſly cultivated his poetical talent, of which he had given ſome ſtrikings proofs while at the college of Edinburgh. It was here he ſent the firſt ſketch of his delightful poem, called the Traveller, to his brother the clergyman in Ireland, who, giving up fame and fortune, had retired, with an amiable wife, to happineſs and obſcurity, on an income of only 40 l. a year.

From Geneva Mr Goldſmith and his pupil viſited the ſouth of France; where the young man, upon ſome diſagreement with his preceptor, paid him the ſmall part of his ſalary which was due, and embarked at Marſeilles for England. Our wanderer was left once more upon the world at large, and paſſed through a variety of difficulties in traverſing the greateſt part of France. At length his curioſity being ſatiated, he Goldſmith. bent his courſe towards England, and arrived at Dover, the beginning of the winter, in the year 1758. When he came to London, his ſtock of caſh did not amount to two livres. An entire ſtranger in this metropolis, his mind was filled with the moſt gloomy reflections on his embarraſſed ſituation. With ſome difficulty he diſcovered that part of the town in which his old acquaintance Dr Sleigh reſided. This gentleman received him with the warmeſt affection, and liberally invited him to ſhare his purſe till ſome eſtabliſhment could be procured for him. Goldſmith, unwilling to be a burden to his friend, a ſhort time after eagerly embraced an offer which was made him to aſſiſt the late Rev. Dr Milner, in inſtructing the young gentlemen at the academy at Peckham; and acquitted himſelf greatly to the doctor's ſatisfaction for a ſhort time: but, having obtained ſome reputation by the criticiſms he had written in the Monthly Review, Mr Griffith, the proprietor, engaged him in the compilation of it; and, reſolving to purſue the profeſſion of writing, he returned to London, as the mart where abilities of every kind were ſure of meeting diſtinction and reward. As his finances were by no means in a good ſtate, he determined to adopt a plan of the ſtricteſt œconomy, and took lodgings in an obſcure court in the Old Bailey, where he wrote ſeveral ingenious little pieces. The late Mr Newberry, who at that time gave great encouragement to men of literary abilities, became a kind of patron to our young author; and introduced him as one of the writers in the Public Ledger, in which his Citizen of the World originally appeared, under the title of "Chineſe Letters."

Fortune now ſeemed to take ſome notice of a man ſhe had long neglected. The ſimplicity of his character, the integrity of his heart, and the merit of his productions, made his company very acceptable to a number of reſpectable families; and he emerged from his ſhabby apartments in the Old Bailey, to the politer air of the Temple, where he took handſome chambers, and lived in a genteel ſtyle. The publication of his Traveller, and his Vicar of Wakefield, was followed by the performance of his comedy of the Good-natured Man at Covent-Garden theatre, and placed him in the firſt rank of the poets of the preſent age.

Among many other perſons of diſtinction who were deſirous to know him, was the duke of Northumberland; and the circumſtance that attended his introduction to that nobleman is worthy of being related, in order to ſhew a ſtriking trait of his character. "I was invited," ſaid the Doctor (as he was then univerſally called) "by my friend Mr Pierey, to wait upon the duke, in conſequence of the ſatisfaction he had received from the peruſal of one of my productions. I dreſſed myſelf in the beſt manner I could; and, after ſtudying ſome compliments I thought neceſſary on ſuch an occaſion, proceeded to Northumberland-houſe, and acquainted the ſervants that I had particular buſineſs with his Grace. They ſhewed me into an antichamber; where, after waiting ſome time, a gentleman, very elegantly dreſſed, made his appearance. Taking him for the duke, I delivered all the fine things I had compoſed, in order to compliment him on the honour he had done me: when, to my great

Goldsmith. great aſtoniſhment, he told me, I had miſtaken him for his maſter, who would ſee me immediately. At that inſtant, the duke came into the apartment; and I was ſo confuſed on the occaſion, that I wanted words, barely ſufficient to expreſs the ſenſe I entertained of the duke's politeneſs, and went away exceedingly chagrined at the blunder I had committed."

Another feature in his character we cannot help laying before the reader. Previous to the publication of his Deſerted Village, the bookſeller had given him a note for one hundred guineas for the copy, which the doctor mentioned, a few hours after, to one of his friends; who obſerved, it was a very great ſum for ſo ſhort a performance, "In truth," replied Goldſmith, "I think ſo too; I have not been eaſy ſince I received it; therefore I will go back and return him his note:" which he abſolutely did, and left it entirely to the bookſeller to pay him according to the profits produced by the ſale of the piece, which turned out very conſiderable.

During the laſt rehearſal of his comedy, intitled, She ſtoops to Conquer, which Mr Coleman had no opinion would ſucceed, on the Doctor's objecting to the repetition of one of Tony Lumpkin's ſpeeches, being apprehenſive it might injure the play, the manager with great keenneſs replied, "Pſha, my dear Doctor, do not be fearful of ſquibs, when we have been ſitting almoſt theſe two hours upon a barrel of gunpowder." The piece, however, contrary to Mr Coleman's expectation, was received with uncommon applauſe by the audience; and Goldſmith's pride was ſo hurt by the ſeverity of the above obſervation, that it entirely put an end to his friendſhip for the gentleman that made it.

Notwithſtanding the great ſucceſs of his pieces, by ſome of which it is aſſerted, upon good authority, he cleared 1800l. in one year, his circumſtances were by no means in a proſperous ſituation; which was partly owing to the liberality of his diſpoſition, and partly to an unfortunate habit he had contracted of gaming, the arts of which he knew very little of, and conſequently became the prey of thoſe who were unprincipled enough to take advantage of his ſimplicity.

Juſt before his death he had formed a deſign for executing an Univerſal Dictionary of Arts and Sciences, the proſpectus of which he actually publiſhed. In this work ſeveral of his literary friends (particularly, Sir Joſhua Reynolds, Dr Johnſon, Mr Beauclerc, and Mr Garrick) had undertaken to furniſh him with articles upon different ſubjects. He had entertained the moſt ſanguine expectations from the ſucceſs of it. The undertaking, however, did not meet with that encouragement from the bookſellers which he had imagined it would undoubtedly receive; and he uſed to lament this circumſtance almoſt to the laſt hour of his exiſtence.

He had been for ſome years afflicted, at different times, with a violent ſtrangury, which contributed not a little to embitter the latter part of his life; and which, united with the vexations which he ſuffered upon other occaſions, brought on a kind of habitual deſpondency. In this unhappy condition he was attacked by a nervous fever, which, being improperly treated, terminated in his diſſolution on the 4th of April 1774. His remains were privately depoſited in the Temple burial-ground. Goldſmith.

As to his character, it is ſtrongly illuſtrated by Mr Pope's line,

In wit a man, ſimplicity a child.

The learned leiſure he loved to enjoy was too often interrupted by diſtreſſes which aroſe from the liberality of his temper, and which ſometimes threw him into loud fits of paſſion: but this impetuoſity was corrected upon a moment's reflection; and his ſervants have been known, upon theſe occaſions, purpoſely to throw themſelves in his way, that they might profit by it immediately after; for he who had the good fortune to be reproved, was certain of being rewarded for it. The univerſal eſteem in which his poems were held, and the repeated pleaſure they give in the peruſal, is a ſtriking teſt of their merit. He was a ſtudious and correct obſerver of nature; happy in the ſelection of his images, in the choice of his ſubjects, and in the harmony of his verſification; and, though his embarraſſed ſituation prevented him from putting the laſt hand to many of his productions. His Hermit, his Traveller, and his Deſerted Village, bid fair to claim a place among the moſt finiſhed pieces in the Engliſh language.

Beſides the works already mentioned, he wrote, 1. Hiſtory of the earth and animated nature, 6 vols 8vo. 2. Hiſtory of England, 4 vols 8vo. 3. Hiſtory of Rome, 2 vols. 4. Abridgements of the two laſt, for the uſe of ſchools. 5. A view of experimental philoſophy, 3 vols 8vo.; a poſthumous work, not eſteemed. 6. Miſcellanies, &c.

GOLIUS (James), a celebrated profeſſor of Arabic and the mathematics at Leyden, was deſcended from a very honourable family, and born at the Hague in the year 1596. He was put to the univerſity of Leyden, where he ſtudied under Erpinius; and having made himſelf maſter of all the learned languages, applied himſelf to the mathematics, phyſic, and divinity. He afterwards travelled into Africa and Aſia; and became greatly eſteemed by the king of Morocco, and the ſultan of the Turks. He at length returned to Leyden, loaden with manuſcripts; and in 1624, ſucceeded Erpenius in the Arabic chair. As he had been an eye-witneſs of the wretched ſtate of Chriſtianity in the Mahometan countries, he was filled with the compaſſion of a fellow-chriſtian; and none ever ſolicited for a place of honour and profit with greater eagerneſs, than he for procuring a new edition of the New Teſtament, in the original language, with a tranſlation into the vulgar Greek, by an Archimandrite; and as there are ſome of theſe Chriſtians, who uſe the Arabic tongue in divine ſervice, he alſo took care to have diſperſed among them an Arabic tranſlation of the Confeſſion of the Proteſtants, together with the Catechiſm and Liturgy. In 1626, he was alſo choſen profeſſor of mathematics; and diſcharged the functions of both profeſſorſhips, with the greateſt applauſe, during 40 years. He was likewiſe appointed interpreter in ordinary to the ſtates for the Arabic, Turkiſh, Perſian, and other eaſtern languages, for which he had an annual penſion, and a preſent of a gold chain, with a very beautiful medal, which he wore as a badge of his office. He publiſhed, 1. The life of Tamerlane, written in Arabic. 2. The hiſtory of the Saracens, written by Elmacin. 3. Alferganus's

Goltzius elements of aſtronomy, with a new verſion and learned commentaries. 4. An excellent Arabic lexicon.
Gombroon. 5. A Perſian Dictionary. He died in 1667.

GOLTZIUS (Henry), a famous engraver and painter, born in 1558, at Mulbreck, in the duchy of Juliers. His ill health induced him to travel; and to prevent his being known, he took the name of his man-ſervant, maintained by him for his ſkill in painting: by which ſtratagem he enjoyed the pleaſure of hearing what was ſaid of his works, without being known. Travelling reſtored his health for a while; but he relapſed, and died at Harlem in 1617. Mr Evelyn has given a ſtrong teſtimony of his merit as an Engraver. As his works are very numerous, his execution muſt have been remarkably ready.

GOLTZIUS (Hubert), a learned German, born at Venlo in the duchy of Guelders in 1526. His father was a painter, and himſelf was bred to the art under Lambert Lombard: but he did little at painting, or at leaſt his pictures are very ſcarce; for having a peculiar turn to antiquities, he devoted himſelf to the ſtudy of medals. He travelled through Germany, France, and Italy, to make collections, as well as to draw from thence all the lights he could towards clearing up ancient hiſtory: he was the author of ſeveral excellent works, in which he was ſo accurate and nice, that he had them printed at his own houſe, under his own correction, and even engraved the plates and medals with his own hand. His veneration for Roman antiquities was ſo great, that he gave all his children Roman names: and married, for his ſecond wife, the widow of the antiquarian Martinus Smetius; probably more for the ſake of Smetius's medals and inſcriptions, than for his own ſake; and was puniſhed accordingly by her plaguing him all his life, if ſhe did not ſhorten it. He died in 1583.

GOMBAULD (John Ogier de), one of the beſt French poets in the 17th century, and one of the firſt members of the French academy, was born at St. Juſt de Luſſac. He acquired the eſteem of Mary de Medicis, and of the wits of his time. He was a Proteſtant, and died in a very advanced age. He wrote many works in verſe and proſe. His epigrams, and ſome of his ſonnets, are particularly eſteemed.

GOMBROON, by the natives called *Bander Abaſſi*, a city of Perſia, ſituated in N. Lat. 27. 40. E. Long. 55. 30. The name of *Gombroon*, or *Comerong*, Captain Hamilton tells us, it had from the Portugueſe; becauſe it was remarkable for the number of prawns and ſhrimps caught on its coaſts, by them called *comerong*. This city owes its wealth and grandeur to the demolition of Ormus, and the downfal of the Portugueſe empire in the Eaſt-Indies. It is now juſtly accounted one of the greateſt marts in the Eaſt, was built by the great ſhah Abas, and from him, as ſome think, obtained the name of *Bander-Abaſſi*, which ſignifies the court of Abas. It ſtands on a bay about nine leagues to the northward of the eaſt end of the iſland of Kiſhmiſh, and three leagues from the famous Ormus. The Engliſh began to ſettle here about the year 1631, when, in conſideration of their ſervices againſt the Portugueſe, ſhah Abas granted them half the cuſtoms of that port. This was confirmed by a phirmaund, and duly regarded, till the Engliſh began to neglect the ſervices they had ſtipulated. Whether the company has any emolument from the cuſtoms, at preſent, is what we cannot pretend to aſcertain. The town is large, but its ſituation bad; wanting almoſt every thing that contributes to the happineſs, and even ſupport of life. Towards the land it is encompaſſed by a ſort of wall; and towards the ſea are ſeveral ſmall forts, with a platform, and a caſtle or citadel, mounted with cannon to ſecure it and the road from the attempts of an enemy by ſea. The houſes in moſt of the ſtreets are ſo out of repair, ſome half down, others in a heap of rubbiſh, that a ſtranger would imagine the town had been ſacked and ravaged by a barbarous people; not a veſtige of the wealth really contained in the place appearing in view. The bazars and ſhops round them, are kept, for the moſt part, by Banians, whoſe houſes are generally in good order. Moſt of the houſes are built with earth and lime, but ſome of the beſt with ſtone. Many of them have a ſort of ventilators at top, which contribute greatly to the health of the inhabitants in the hot ſeaſons of the year. The moſt ſickly months here are April, May, September, and October. With fiſh and mutton the inhabitants are well ſupplied. Rice is imported from India; and wheat is ſo plenty, that the poor ſubſiſt chiefly on bread and dates. The country hereabouts abounds in the moſt delicious fruits, as apricots, peaches, pomegranates, pears, mangoes, grapes, quavas, plumbs, ſweet quinces, and water-melons. The apricots, however, are ſmall, and extremely dangerous if eaten to exceſs.

Gombroon

Thoſe conveniences are more than overbalanced by the ſcarcity of freſh water, with which the inhabitants are ſupplied from Aſſeen, a place ſeven miles diſtant, there not being a ſpring or well in the town. Perſons of condition keep a camel conſtantly employed in bringing freſh and wholeſome water. Captain Hamilton gives it as his opinion, that one cauſe of the unwholeſomeneſs of this city is the reflection of the rays of light from a high mountain to the north of it. He ſays, that when the beams are reflected from this mountain, they almoſt fire the air, and, for two or three months in the year, render the ſituation intolerable. For this reaſon the people of condition retire into the country, to paſs the heats of June, July, and Auguſt. The very ſea, during this ſeaſon, is affected, inſomuch that the ſtench is no leſs diſagreeable than that of putrid carcaſes; and this is encreaſed by the quantities of ſhell-fiſh left on the ſhore, from which an exhalation ariſes that tarniſhes gold and ſilver, and is leſs tolerable than the bilge-water of a tight ſhip. At Aſſeen the Engliſh factory have a country-houſe and gardens, to which they retire occaſionally. Here they have whole groves of Seville orange-trees, which, though not natural to the country, thrive very well, and are always verdant, bearing ripe and green fruit, with bloſſoms, all at the ſame time. They have likewiſe tanks and ponds of fine freſh water, with every thing elſe that can moderate the heat of the climate, and render life agreeable and elegant. About ten miles from Aſſeen is a place called *Minoa*, where are cold and hot natural baths, reckoned infallible in the cure of all ſcrophulous diſorders, rheumatiſms, and other diſeaſes, by bathing.

Gombroon is extremely populous, on account of the commerce carried on by the Dutch and Engliſh factories,

Gomera || Gomphræna.

factories, as well as the natives. The Engliſh factory is cloſe by the ſea, at ſome diſtance from the Dutch, which is a commodious and fine new building. A great part of the company's profit ariſes from freights. As the natives have not one good ſhip of their own, and are extremely ignorant of navigation, they freight their goods for Surat, and other Indian marts, in Engliſh and Dutch bottoms, at an exorbitant rate. The commodities of the Gombroon market are, fine wines of different kinds, raiſins, almonds, kiſh-miſhes, prunellas, dates, piſtachio-nuts, ginger, ſilks, carpets, leather, tutty, galbanum, ammoniac, aſa-fœtida, tracaganth, with other gums, and a variety of ſhop medicines. Theſe are in a great meaſure the produce of Carmania, which they bring to Gombroon in caravans. The Engliſh company had once a ſmall factory in the province of Carmania, chiefly for the ſake of a fine wool produced there, and uſed by the hatters. The ſaid company had once a project of carrying a breed of the Perſian goats to St Helena; but whether it was executed, or what ſucceſs it met with, we cannot ſay. Although the company pay no cuſtoms, yet they uſually make a preſent to the ſhabander, to avoid the trouble he has it in his power to give them. All private traders with the company's paſſes, enjoy the ſame privileges, on paying two *per cent.* to the company, one to the agent, and one to the broker. All private trade, either by European or country ſhips, has long been engroſſed by the company's ſervants.

GOMERA, one of Canary iſlands lying between Ferro and Teneriffe. It has one good town of the ſame name, with an excellent harbour, where the Spaniſh fleet often take in refreſhments. They have corn ſufficient to ſupply the inhabitants, with one ſugar-work, and great plenty of wine and fruits. It is ſubject to the Spaniards, who conquered it in 1445. W. Long. 17. 10. N. Lat. 28. 0.

GOMORRAH, (anc. geog.) one of the cities of the plain or of the vale of Siddim in Judæa, deſtroyed together with Sodom by fire from heaven, on account of the wickedneſs of the people. To determine its particular ſituation at preſent, is impoſſible.

GOMORRO iſlands. See COMORA.

GOMPHOSIS, in anatomy, that kind of articulation by which the teeth are fixed in the jaw-bone. See ANATOMY, n° 2. c.

GOMPHRÆNA, GLOBE AMARANTH; a genus of the digynia order, belonging to the pentandria claſs of plants. There are ſeven ſpecies; but only one of them is commonly cultivated in our gardens, *viz.* the globoſa. It hath an upright ſtalk branching all round, two or three feet high, garniſhed with oval, lanceolate, and oppoſite leaves; and every branch and ſide-ſhoot terminated by a cloſe globular head of flowers, compoſed of numerous, very ſmall ſtarry florets cloſely covered with dry ſcaly calices placed *imbricatim*, perſiſtent, and beautifully coloured purple, white, red, or ſtripped and variegated. The flowers themſelves are ſo ſmall, and cloſely covered with the ſcaly calices, that they ſcarcely appear. The numerous cloſely placed ſcaly coverings being of a dry, firm, conſiſtence, coloured and glittering, collected into a compact round head, about the ſize of an ordinary cherry, make a fine appearance. They are annual plants, natives of India; and require artificial heat to raiſe and forward them to a proper growth, ſo that they may flower in perfection, and produce ripe ſeed. They flower from June to November; and if the flowers are gathered when at full growth, and placed out of the ſun, they will retain their beauty ſeveral months.

Gondi || Gondola.

GONDI (John Francis Paul), cardinal de Retz, was the ſon of Philip Emannel de Gondi, count de Joigny, lieutenant-general, &c. and was born in 1613. From a doctor of the Sorbonne, he firſt became coadjutor to his uncle John Francis de Gondi, whom he ſucceeded in 1654 as archbiſhop of Paris; and was finally made a cardinal. This extraordinary perſon has drawn his own character in his memoirs with impartiality. He was a man who, from the greateſt degree of debauchery, and ſtill languiſhing under its conſequences, made himſelf adored by the people as a preacher. At the age of 23, he was at the head of a conſpiracy againſt the life of cardinal Richelieu; he precipitated the parliament into cabals, and the people into ſedition: he was, ſays M. Voltaire, the firſt biſhop who carried on a civil war without the maſk of religion. However, his intrigues and ſchemes turned out ſo ill, that he was obliged to quit France; and he lived the life of a vagrant exile for five or ſix years, till the death of his great enemy cardinal Mazarin, when he returned on certain ſtipulated conditions. After aſſiſting in the conclave at Rome, which choſe Clement IX. he retired from the world, and ended his life like a philoſopher in 1679; which made Voltaire ſay, that in his youth he lived like Catiline, and like Atticus in his old age. He wrote his Memoirs in his retirement; the beſt edition of which is that of Amſterdam, 4 vols. 12mo. 1719.

GONORRHÆA, an effluvia of white, greeniſh, or differently-coloured matter from the urethra; moſt commonly owing to venereal infection. See (Index ſubjoined to) MEDICINE, and SURGERY.

GONZAGA (Lucretia), was one of the moſt illuſtrious ladies of the 16th century; and much celebrated for her wit, her learning, and her delicate ſtyle. Hortenſio Lando wrote a beautiful panegyric upon her, and dedicated to her his dialogue of moderating the paſſions. Her beautiful letters have been collected with the greateſt care. We learn from theſe, that her marriage with John Paul Manfrone was unhappy.—She was married to him when ſhe was not 14 years of age, and his conduct afterwards gave her infinite uneaſineſs. He engaged in a conſpiracy againſt the duke of Ferrara; was detected and impriſoned by him; but, though condemned by the judges, not put to death. She did all in her power to obtain his enlargement, but in vain; for he died in priſon, having ſhewn ſuch impatience under his misfortunes, as made it imagined he had loſt his ſenſes. She never would liſten afterwards to any propoſals of marriage, tho' ſeveral were made to her. All that came from her pen was ſo much eſteemed, that a collection was made even of the notes ſhe writ to her ſervants; ſeveral of which are to be met with in the edition of her letters.

GONDOLA, a ſort of barge curiouſly ornamented, and navigated on the canals of Venice; alſo a paſſage-boat, of ſix or eight oars, in other parts of the coaſts of Italy.

GOOD,

Good. GOOD, in general, whatever is apt to increaſe pleaſure, ro diminiſh pain in us; or, which amounts to the ſame, whatever is able to procure or preſerve to us the poſſeſſion of agreeable ſenſations, and remove thoſe of an oppoſite nature.

Moral Good denotes the right conduct of the ſeveral ſenſes and paſſions, or their juſt proportion and accommodation to their reſpective objects and relations. See Morals.

Good *Abearing*, *(bonus geſtus,)* ſignifies an exact carriage or behaviour of a ſubject towards the king and the people, whereunto ſome perſons upon their miſbehaviour are bound: and he that is bound to this, is ſaid to be more ſtrictly bound than to the peace; becauſe where the peace is not broken, the ſurety *de bono geſtu* may be forfeited by the number of a man's company, or by their weapons.

Good *Behaviour*, in law, an exact carriage and behaviour to the king and his people.

A juſtice of the peace may, at the requeſt of another, or where he himſelf ſees cauſe, demand ſurety for the good behaviour; and to that end the juſtice may iſſue out his warrant againſt any perſons whatſoever, under the degree of nobility; but when it is a nobleman, complaint is to be made in the court of chancery, or king's-bench, where ſuch nobleman may be bound to keep the peace. Infants and feme-coverts, who ought to find ſurety by their friends, may be bound over to their good behaviour; as alſo lunatics, that have ſometimes lucid intervals, and all others *Jacob's Law Dict.* who break the peace, or being ſuſpected to do it, by affrays, aſſaults, battery, wounding, fighting, quarrelling, threatening, &c. A perſon may be likewiſe bound to his good behaviour for a ſcandalous way of living, keeping bawdy-houſes, gaming-houſes, &c. and ſo may common drunkards, whoremongers, common whores, cheats, libellers, &c. He who demands ſurety for the peace, on any violence offered, muſt take an oath before the juſtice, that he goes in fear of his life, or ſome bodily harm, &c. and that it is not out of malice, but from a regard to his own ſafety.

Good-*Friday*, a faſt of the Chriſtian church, in memory of the ſufferings and death of Jeſus Chriſt. It is obſerved on the Friday in *holy* or *paſſion week*; and it is called, by way of eminence, *good*, becauſe of the bleſſed effects of our Saviour's ſufferings, which were a propitiatory or expiating ſacrifice for the ſins of the world. The commemoration of our Saviour's ſufferings has been kept from the very firſt ages of Chriſtianity, and was always obſerved as a day of the ſtricteſt faſting and humiliation. Among the Saxons it was called *Long-Friday;* but for what reaſon, except on account of the long faſtings and offices then uſed, is uncertain. On Good-Friday the Pope ſits on a plain form; and, after ſervice is ended, when the cardinals wait on him back to his chamber, they are obliged to keep a deep ſilence, as a teſtimony of their ſorrow. In the night of Good-Friday, the Greeks perform the obſequies of our Saviour round a great crucifix, laid on a bed of ſtate, adorned with flowers: theſe the biſhops diſtribute among the aſſiſtants, when the office is ended. The Armenians, on this day, ſet open a holy ſepulchre, in imitation of that of mount Calvary.

Good-*Hope*, or *Cape of Good-Hope*, the moſt ſoutherly promontory of Africa, where the Dutch have built a good town and fort. It is ſituated in the country of the Hottentots. See Hottentots. Goose Gordius.

Good *Manners*. See Manners.

GOOSE, in ornithology. See Anas.

Goose-*Ander*, in ornithology. See Mergus.

Goose-*Berry*, in botany. See Ribes.

Goose-*Neck*, in a ſhip, a piece of iron fixed on the one end of the tiller, to which the laniard of the whip-ſtaff or the wheel-rope comes, for ſteering the ſhip.

Goose-*Wing*, in the ſea-language. When a ſhip ſails before, or with a quarter-wind on a freſh gale, to make the more haſte, they lanch out a boom, and ſail on the lee-ſide; and a ſail ſo fitted, is called a *gooſe-wing*.

GORCUM, a town of the United Provinces, in South Holland, which carries on a conſiderable trade in cheeſe and butter. It is ſituated on the rivers Lingne and Maeſe, in E. Lon. 4. 55. N. Lat. 51. 49.

GORDIANUS I. (Roman general,) was for his valour and virtues, choſen emperor by the army in the reign of Maximinus, A. D. 237; but his ſon, whom he had aſſociated with himſelf in the throne, being ſlain by Capellian, the governor of Mauritania for Maximinus, Gordianus killed himſelf the ſame year. See Rome.

Gordianus III. (grandſon of the former), a renowned warrior, and ſtyled *The guardian of the Roman commonwealth*. He was treacherouſly aſſaſſinated by Philippus, an Arabian, one of his generals; who, to the eternal diſgrace of the Romans of that æra, ſucceeded him in the empire, A. D. 244. See Rome.

GORDIAN-*Knot*, in antiquity, a knot made in the leathers or harneſs of the chariot of Gordius king of Phrygia, ſo very intricate, that there was no finding where it began or ended. The inhabitants had a tradition, that the oracle had declared, that he who untied this knot ſhould be maſter of Aſia. Alexander having undertaken it, was unable to accompliſh it; when fearing leſt his not untying it ſhould be deemed an ill augury, and prove a check in the way of his conqueſts, he cut it aſunder with his ſword, and thus either accompliſhed or eluded the oracle.

GORDIUS, the hair-worm, a genus of inſects belonging to the claſs of *vermes inteſtina*. There are two ſpecies, 1. The aquaticus, with a filiform body, of equal thickneſs, and ſmooth. It hath a pale colour, with both the ends black; and inhabits boggy places, and clay at the bottom of water. 2. The argillaceus is of an uniform yellow colour, twiſted ſpirally, and lying flat. It is common in the inteſtines of herring, and other ſea-fiſh. Ariſtotle remarks, that the ballerus and tillo are infeſted in the dog-days with a worm that torments them ſo much, that they riſe to the top of the water, where the heat deſtroys them. To theſe worms alſo may probably be owing the agonies to which the bleaks are at certain times ſubject. See Cyprinus.

GORDIUS, king of Phrygia, and father of Midas, was a poor huſbandman, with two yokes of oxen, wherewith he ploughed his land and drew his wain. An eagle ſitting a long while upon one of his oxen, he conſulted the ſoothſayers; a virgin bid him ſacrifice

to

Gordon ‖ Gorget.

to Jupiter in the capacity of king. He married the virgin, who brought forth Midas. The Perſians inſtructed by the oracle to ſet the firſt perſon they met in a wain upon the throne, met Gordius, and made him king. Midas for this good fortune dedicated to Jupiter his father's cart. The knot of the yoke, they ſay, was ſo well twiſted, that he who could unlooſe it was promiſed the empire of Aſia; hence the proverb of *the Gordian knot* had its original. See GORDIAN *Knot*.

GORDON (Thomas) noted for his tranſlations and political writings, was born at Kirkudbright in North-Britain. He came young to London; where he ſupported himſelf by teaching languages, until he procured employment under the earl of Oxford in queen Anne's time, but in what capacity is not now known. He firſt diſtinguiſhed himſelf in the defence of Dr Hoadley in the Bangorian controverſy; which recommended him to Mr Trenchard, in conjunction with whom he wrote the well-known *Cato's Letters*, upon a variety of important public ſubjects. Theſe were followed by another periodical paper, under the title of *The Independent Whig*; which was continued ſome years after Mr Trenchard's death, by Gordon alone, againſt the hierarchy of the church; but with more acrimony than was ſhewn in *Cato's Letters*. At length Sir Robert Walpole retained him to defend his adminiſtration, to which end he wrote ſeveral pamphlets; and died firſt commiſſioner of the wine-licences in 1750. There are two other collections of tracts of his writing, *The cordial for low ſpirits*, and *The pillars of prieſtcraft and orthodoxy ſhaken*. In his tranſlations of *Salluſt* and other works, he places the verbs at the ends of ſentences, according to the Latin idiom, in a very ſtiff and affected manner.

GORE, in heraldry, one of the abatements, which, according to Gullim, denotes a coward. It is a figure conſiſting of two arch lines drawn one from the ſiniſter chief, and the other from the ſiniſter baſe, both meeting in an acute angle in the middle of the feſs point. See HERALDRY.

GOREE, a ſmall iſland of Africa, near Cape de Verd, ſubject to the French. It is barren, but of great importance on account of its good trade. It was taken by the Engliſh in May 1759, and given up by the treaty of peace in 1763. E. Long. 12. 25. N. Lat. 14. 30.

GOREE, the capital town of an iſland of the ſame name in Holland, eight miles South of Briel. E. Long. 3. 50. N. Lat. 51. 55.

GORGE, in architecture, the narroweſt part of the Tuſcan and Doric capitals, lying between the aſtragal, above the ſhaft of the pillar, and the annulets.

GORGE, in fortification, the entrance of the platform of any work. See FORTIFICATION.

GORGED, in heraldry, the bearing of a crown, coronet, or the like, about the neck of a lion, a ſwan, &c. and in that caſe it is ſaid, the lion or cygnet is *gorged* with a ducal coronet, &c.

Gorged is alſo uſed when the gorge or neck of a peacock, ſwan, or the like bird, is of a different colour or metal from the reſt.

GORGET, a kind of breaſt-plate like a half moon, with the arms of the prince thereon; worn by the officers of foot. They are to be either gilt or ſilver, according to the colour of the buttons on the uniforms.

Gorgons ‖ Goritia.

GORGONS, in antiquity. Authors are not agreed in the accounts they give of the Gorgons. Diodorus Siculus will have the Gorgons and Amazons to have been two warlike nations of women who inhabited that part of Libya which lay on the lake Tritonidis. We may well imagine, ſays that author, that they had frequent quarrels together; as being women and neighbours. He goes on to give an account of a moſt bloody engagement between them, wherein the Amazons had the better; three thouſand of the Gorgons being made priſoners, and the reſt obliged to take ſhelter in a wood, to which the Amazons ſet fire, with an intention to deſtroy the whole nation of Gorgons; but as the wind did not prove favourable, they were obliged to deſiſt, and retire to their own territories. Here the Amazons, intoxicated with their victory, gave themſelves up to feaſting and mirth; and as the guard was very negligently kept in the night-time, the 3000 priſoners laid hold of the opportunity, and, ſeizing the ſwords of theſe imprudent females, maſſacred a great number of them; but were themſelves at laſt overpowered and cut to pieces. Myrine, the queen of the Amazons, cauſed monuments to be erected to her female warriors who had been ſlain on this occaſion; which monuments were ſtill to be ſeen, ſays our author, in his days. Theſe female nations are ſaid to have been exterminated by Hercules.

Pauſanias's account of the Gorgons is much to the ſame purpoſe. They were, ſays he, the daughters of Phorbus; after whoſe death one of them, named *Medufa*, reigned over the people dwelling near the lake Tritonidis. The queen was paſſionately fond of hunting and war, ſo that ſhe laid the neighbouring countries quite waſte. At laſt, Perſeus having made war on the Gorgons, and killed the queen herſelf, when he came to take a view of the field of battle, he found the queen's corpſe ſo extremely beautiful, that he ordered her head to be cut off, which he carried home with him to ſhew to his countrymen the Greeks, who could not behold it without aſtoniſhment.

Theſe accounts appear ſomewhat credible; but others repreſent the Gorgons in a very incredible manner, making them to be a kind of monſtrous women, all covered over with hair, who lived in woods and foreſts. Others again, make them a kind of animal reſembling a ſheep, with ſuch long hair on their faces, that it required their utmoſt efforts to clear it away before they could ſee any thing; but when once they had effected this, they killed all they ſaw with the poiſonous influence of their eyes.

GORGONA, a ſmall iſland of Italy, in the ſea of Tuſcany, and near that of Corſica, about eight miles in circumference; remarkable for the large quantity of anchovies taken near it. E. Long. 10. 9. N. Lat. 43. 22.

GORGONA, a ſmall iſland of the South Sea, 12 miles Weſt of the coaſt of Peru, in America. It is indifferent high land, very woody, and ſome of the trees are very tall and large, and proper for maſts. It is about 10 miles in circumference, and has ſeveral ſprings and rivulets of excellent water, but is ſubject to conſtant rains. W. Long. 79. 3. S. Lat. 3. 30.

GORITIA, or GORITZ, a ſtrong town of Germany, in the circle of Auſtria, and duchy of Carniola, with a

Gorlitz || Gossypium.

with a caſtle; ſeated on the river Lizonzo, 20 miles north-eaſt of Aquileia, and 70 north-eaſt of Venice. E. Long. 13. 43. N. Lat. 46. 12.

GORLITZ, a town of Germany, in Upper Luſatia, ſubject to the elector of Saxony. It is a handſome ſtrong place, and ſeated on the river Nieſſe, in E. Long. 15. 15. N. Lat. 51. 10.

GOSHAWK. See FALCO.

GOSLAR, a large and ancient town of Lower Saxony, and in the territory of Brunſwick; it is a free imperial city, and it was here that gun-powder was firſt invented, by a monk as is generally ſuppoſed. It is a large place, but the buildings are in the ancient taſte. In 1728, 280 houſes, and St Stephen's fine church, were reduced to aſhes. It is ſeated on a mountain, near the river Goſe, and near it are rich mines of iron. The inhabitants are famous for brewing excellent beer. E. Long. 3. 37. N. Lat. 51. 55.

GOSPEL, the hiſtory of the life, actions, death, reſurrection, aſcenſion, and doctrine of Jeſus Chriſt.

The word is Saxon, and of the ſame import with the Latin term *evangelium*, which ſignifies glad tidings, or good news.

This hiſtory is contained in the writings of St Matthew, St Mark, St Luke, and St John; who from thence are called *evangeliſts*. The Chriſtian church never acknowledged any more than theſe four goſpels as canonical; notwithſtanding which, ſeveral apocryphal goſpels are handed down to us, and others are entirely loſt.

GOSSYPIUM, or COTTON, a genus of the polyandria order, belonging to the monodelphia claſs of plants. There are four ſpecies, all of them natives of warm climates. 1. The herbaceum, or common herbaceous cotton, hath an herbaceous ſmooth ſtalk two feet high, branching upwards; five-lobed ſmooth leaves; and yellow flowers from the ends of the branches, ſucceeded by roundiſh capſules full of ſeed and cotton. 2. The hirſutum, or hairy American cotton, hath hairy ſtalks branching laterally two or three feet high: palmated, three and five lobed hairy leaves; and yellow flowers, ſucceeded by large oval pods furniſhed with ſeeds and cotton. 3. The barbadenſe, or Barbadoes ſhrubby cotton, hath a ſhrubby ſtalk branching four or five feet high, three-lobed ſmooth leaves, glandulous underneath; and yellow flowers ſucceeded by oval pods, containing ſeeds and cotton. 4. The arboreum, or tree-cotton, hath an upright woody perennial ſtalk, branching ſix or eight feet high; palmated, four or five lobed ſmooth leaves; and yellow flowers, ſucceeded by large pods filled with ſeeds and cotton.

The firſt three ſpecies are annual, but the fourth is perennial both in root and ſtalk. In warm countries theſe plants are cultivated in great quantities in the fields for the ſake of the cotton they produce; but the firſt ſpecies is moſt generally cultivated. The pods are ſometimes as large as middling-ſized apples, cloſely filled with the cotton ſurrounding the ſeed. When theſe plants are raiſed in this country, they muſt be continually kept in a warm ſtove, where they will produce ſeeds and cotton. They are propagated by ſeeds. See COTTON.

The American Iſlands produce cotton ſhrubs of various ſizes, which riſe and grow up without any culture; eſpecially in low and marſhy grounds. Their produce is of a pale red; ſome paler than others; but ſo ſhort that it cannot be ſpun. None of this is brought to Europe, though it might be uſefully employed in making of hats. The little that is picked up, ſerves to make mattraſſes and pillows. Goſſypium || Gothland.

The cotton-ſhrub that ſupplies our manufactures, requires a dry and ſtony ſoil, and thrives beſt in grounds that have already been tilled. Not but that the plant appears more flouriſhing in freſh lands than in thoſe which are exhauſted; but, while it produces more wood, it bears leſs fruit.

A weſtern expoſure is fitteſt for it. The culture of it begins in March and April, and continues during the firſt ſpring-rains. Holes are made at ſeven or eight feet diſtance from each other, and a few ſeeds thrown in. When they are grown to the height of five or ſix inches, all the ſtems are pulled up, except two or three of the ſtrongeſt. Theſe are cropped twice before the end of Auguſt. This precaution is the more neceſſary, as the wood bears no fruit till after the ſecond pruning; and, if the ſhrub was ſuffered to grow more than four feet high, the crop would not be the greater, nor the fruit ſo eaſily gathered. The ſame method is purſued for three years; for ſo long the ſhrub may continue, if it cannot conveniently be renewed oftener with the proſpect of an advantage that will compenſate the trouble.

This uſeful plant will not thrive if great attention is not paid to pluck up the weeds that grow about it. Frequent rains will promote its growth; but they muſt not be inceſſant. Dry weather is particularly neceſſary in the months of March and April, which is the time of gathering the cotton, to prevent it from being diſcoloured and ſpotted.

When it is all gathered in, the ſeeds muſt be picked out from the wool with which they are naturally mixed. This is done by means of a cotton-mill; which is an engine, compoſed of two rods of hard wood, about 18 feet long, 18 lines in circumference, and fluted two lines deep. They are confined at both ends, ſo as to leave no more diſtance between them than is neceſſary for the ſeed to ſlip through. At one end is a kind of little millſtone, which, being put in motion with the foot, turns the rods in contrary directions. They ſeparate the cotton, and throw out the ſeed contained in it.

GOTHA, a town of Germany, in the circle of Upper Saxony, and capital of a duchy of the ſame name. It is 15 miles weſt of Erford, and 15 ſouth-eaſt of Mulhauſen. E. Long. 11. 0. N. Lat. 52. 25.

GOTHARD, one of the higheſt mountains of Swiſſerland; and from the top, where there is an hoſpital for monks, is one of the fineſt proſpects in the world. It is eight miles from Aldorf.

GOTHIC, in general, whatever has any relation to the Goths: thus, we ſay, Gothic cuſtoms, Gothic architecture, &c.

GOTHLAND, the moſt ſouthern province of Sweden, being a peninſula, encompaſſed on three ſides by the Baltic Sea, or the channel at the entrance of it. It is divided into ſeveral parts, which are Eaſt Gothland, Weſt Gothland, Smaland, Halland, Bleaking, and Schonen. It was a long time in the poſſeſſion of the kings of Denmark, but was ceded to Sweden in 1654. The principal towns of Gothland are Calmar, Landſcroon,

Goths. ſeroön, Chriſtianople, Daleburg, Gothenburg, Helmſtat, Lunden, Malmone, and Vexio.

GOTHS, a warlike nation, and above all others famous in the Roman hiſtory, came originally out of Scandinavia, (the name by which the ancients diſtinguiſhed the preſent countries of Sweden, Norway, Lapland, and Finmark.) According to the moſt probable accounts, they were the firſt inhabitants of thoſe countries; and from thence ſent colonies into the iſlands of the Baltic, the Cimbrian Cherſoneſus, and the adjacent places yet deſtitute of inhabitants. The time of their firſt ſettling in Scandinavia, and the time when they firſt peopled with their colonies the abovementioned iſlands and Cherſoneſus, are equally uncertain; though the Gothic annals ſuppoſe the latter to have happened in the time of Serug the great-grandfather of Abraham. This firſt migration of the Goths is ſaid to have been conducted by their king Eric; in which all the ancient Gothic chronicles, as well as the Daniſh and Swediſh ones, agree. Their ſecond migration is ſuppoſed to have happened many ages after; when, the abovementioned countries being overſtocked with people, Berig, at that time king of the Goths, went out with a fleet in queſt of new ſettlements. He landed in the country of the Ulmerugians, now Pomerania, drove out the ancient inhabitants, and divided their lands among his followers. He fell next upon the Vandals, whoſe country bordered on that of the Ulmerugians, and overcame them; but inſtead of forcing them to abandon their country, he only made them ſhare their poſſeſſions with the Goths.

The Goths who had ſettled in Pomerania and the adjacent parts of Germany being greatly increaſed, inſomuch that the country could no longer contain them, they undertoook a third migration in great numbers, under Filimer ſurnamed the *Great*, their fifth prince after leaving Scandinavia; and taking their route eaſtward, entered Scythia, advanced to the Cimmerian Boſphorus, and, driving out the Cimmerians, ſettled in the neighbourhood of the Palus Mæotis. Thence in proceſs of time, being greatly increaſed in Scythia, they reſolved to ſeek new ſettlements; and accordingly, taking their route eaſtward, they traverſed ſeveral countries, and at length returned into Germany.

Their leader in this expedition was the celebrated Woden, called alſo *Voden*, *Othen*, *Oden*, *Godan*, and *Guadan*. Of this Woden many wonderful things are related in the Sueo-gothic chronicles. He was king of the Aſgardians, whom the northern writers will have to be the ſame with a people called *Aſpurgians* mentioned by Strabo and Ptolemy. By Strabo they are placed near the Cimmerian Boſphorus. Aſpurgia was the metropolis of a province which Strabo calls *Aſia*; and Woden and his followers are ſtyled by the ancient Gothic writers *Aſæ*, *Aſianæ*, and *Aſiotæ*. The kings of Aſpurgia were maſters of all that part of Scythia which lay to the weſtward of Imaus, and was by the Latins called *Scythia intra Imaum*, or "Scythia within Imaus."

At what time Woden reigned in this country, is quite uncertain; but all hiſtorians agree, that he went out in queſt of new ſettlements with incredible numbers of people following him. He firſt entered Roxolania, comprehending the countries of Pruſſia, Livonia, and great part of Muſcovy. From thence he went by ſea into the north parts of Germany; and having reduced Saxony and Jutland, he at laſt ſettled in Sweden, where he reigned till his death, and became ſo famous that his name reached all countries, and he was by the northern nations worſhipped as a god. He is ſuppoſed to have brought with him the Runic characters out of Aſia, and to have taught the northern nations the art of poetry; whence he is ſtyled the father of the Scaldi or Scaldri, their poets, who deſcribed in verſe the exploits of the great men of their nation, as the bards did among the Gauls and Britons. Goths.

The Romans diſtinguiſhed the Goths into two claſſes; the Oſtrogoths and Viſigoths. Theſe names they received before they left Scandinavia, the *Viſigothi* being ſoftened by the Latins from *Weſtergothi*, or thoſe who inhabited the Weſtern part of Scandinavia, as the Oſtrogoths were thoſe who inhabited the eaſtern part of that country. Their hiſtory affords nothing of moment till the time of their quarrelling with the Romans; which happened under the reign of the emperor Caracalla, ſon to Severus. After that time their hiſtory becomes ſo cloſely interwoven with that of the Romans, that for the moſt remarkable particulars of it we muſt refer to the article Rome. After the deſtruction of the Roman empire by the Heruli, the Oſtrogoths, under their king Theodoric, became maſters of the greateſt part of Italy, having overcome and put to death Odoacer king of the Heruli in 494. They retained their dominion in this country till the year 553; when they were finally conquered by Narſes, the emperor Juſtinian's general. See (Hiſtory of) Italy. The Viſigoths ſettled in Spain in the time of the emperor Honorius, where they founded a kingdom which continued till the country was ſubdued by the Saracens; for a particular account of all which, ſee the article Spain.

The Goths were famous for their hoſpitality and kindneſs to ſtrangers, even before they embraced the Chriſtian religion. Nay, it is ſaid, that from their being eminently good, they were called *Goths* by the neighbouring nations; that name, according to Grotius and moſt other writers, being derived from the German word *goten*, which ſignifies "good." They encouraged, ſays Dio, the ſtudy of philoſophy above all other barbarous or foreign nations, and often choſe kings from among their philoſophers. Polygamy was not only allowed but countenanced among them; every one being valued or reſpected according to the number of his wives. By ſo many wives they had an incredible number of children, of whom they kept but one at home, ſending out the reſt in queſt of new ſettlements; and hence thoſe ſwarms of people which overran ſo many countries. With them adultery was a capital crime, and irremiſſibly puniſhed with death. This ſeverity, and likewiſe polygamy, prevailed among them when they were known to the Romans only by the name of *Getes*, (their moſt ancient name); as appears from the poet Menander, who was himſelf one of that nation; and from Horace, who greatly commends the chaſtity of their women. Their laws fell little ſhort of thoſe of the ancient Romans. Their government was monarchical; their religion was much the ſame with that of the ancient Germans or Celtes; and their dreſs is deſcribed by Apollinaris Sidonius in the following words: "They are ſhod (ſays he) with high

Gothofred Gottenburg

shoes made of hair, and reaching up to their ankles; their knees, thighs, and legs, are without any covering; their garments of various colours scarce reaching to the knee; their sleeves only cover the top of their arms; they wear green cassocks with a red border; their belts hang on their shoulder; their ears are covered with twisted locks, they use hooked lances and missile weapons."

GOTHOFRED, or Godfrey, (Denis or Dionysius) an eminent civil lawyer, born of an illustrious house at Paris, in 1549. Finding his country involved in the confusion of the leaguers, he accepted of a professor's chair at Geneva, until he was patronized and employed by Henry IV.; but being afterward stripped of his employments as a huguenot, he at length retired to Heidelburg, from whence no offers were able to detach him. He was, however, disappointed of his intention to end his days there; for the disturbances that broke out in the Palatinate obliged him, in 1621, to take refuge in Strasburg, where he died the following year. He wrote a great number of books; but his principal work is the *Corpus Juris Civilis cum notis.*

Gothofred (Thodore), son of the former, was born at Geneva, in 1580. As soon as he had finished his studies, he went to Paris; where he conformed to the Romish religion, and applied with indefatigable industry to the study of history, that of France particularly, wherein he became very eminent, as appears by his works. In 1632, the king made him one of his historiographers, with a stipend of 3000 livres; and, in 1636, he was sent to Cologn, to assist at the treaty of peace negociating there, on the part of France, by the cardinal of Lyons. This treaty being removed to Munster, Gothofred was sent thither, where he drew up Memoirs on the subject; and continued in that city, in the king's service, to his death in 1649. His principal work is his *Account of the Ceremonial* of the kings of France.

Gothofred (James), brother of the preceding, was born at Geneva, in 1587. Applying himself to the study of the law, he obtained the professor's chair there, was made counsellor of the city, and was several times employed in France, Germany, Piedmont, and Switzerland, to negociate their affairs in the name of the republic. He died in 1562; and his chief work is his *Codex Theodosianus, cum perpetuis commentariis, &c.*

Gothofred (Denis), son of Theodore above mentioned, was born at Paris, in 1615. He studied history, after his father's example; became as eminent in that department of knowledge; and obtained the reversion of his father's place of historiographer royal, from Lewis XIII. when he was but 25 years of age. He published his father's *Ceremonial of France;* finished his *Memoirs of Philip de Commines;* and was preparing a *History of Charles VIII.* when he died in 1681. It was published by his eldest son, Denis, in 1684.

GOTTENBURG, a rich and strong town of West Gothland, in Sweden, with a good harbour, at the mouth of the river Gothelba; which is the best situated for foreign trade of any in Sweden, as it lies without the sound. E. Lon. 11. 50. N. Lat. 57. 44.

GOTTINGEN, a confederable town of Lower Saxony, in Germany, and in the duchy of Brunswick; formerly free and imperial, but now subject to the elector of Hanover. Here his late Majesty, George II. founded an university. It is seated on the river Leine, in E. Lon. 10. 5. N. Lat. 51. 32.

Gottorp Gourgues.

GOTTORP, a town of the duchy of Hefwic, in Denmark, and capital of the duchy of Holitein Gottorp, where the duke has a very fine palace.

GOUDA, or Turgow, a confiderable town of South Holland, in the United Provinces, remarkable for its ftately church. It is feated on the river Iffel, in E. Lon. 4. 37. N. Lat. 52. 2.

GOVERNMENT, in general, is the polity of a ftate, or an orderly power conftituted for the public good.

Civil government was inftituted for the prefervation and advancement of mens civil intereſts, and for the better fecurity of their lives, liberties, and properties. The uſe and neceſſity of goverument is ſuch, that there never was an age or country without ſome ſort of civil authority: but as men are ſeldom unanimous in the means of attaining their ends, ſo their differences in opinion in relation to government has produced a variety of forms of it. To enumerate them, would be to recapitulate the hiſtory of the whole earth. But, according to Monteſquieu, and moſt other writers, they may in general be reduced to one of theſe three kinds. 1. The republican. 2. The monarchical. 3. The deſpotic.—The firſt is that, where the people in a body, or only a part of the people, have the ſovereign power: the ſecond, where one alone governs, but by fixed and eſtabliſhed laws: but, in the deſpotic government, one perſon alone, without law and without rule, directs every thing by his own will and caprice. See the article Law, n° 1. 3—10.— On the ſubject of government at large, ſee Monteſquieu's *L' Eſprit des Loix*, l. 2. c. 1.; Locke, ii. 129, &c. quarto edition, 1768; Sidney on Government; Sir Thomas Smith *de Repub. Angl.*; and Acherly's Britannic Conſtitution.—As to the Gothic government, its original and faults, &c. ſee Monteſquieu's *L'Eſprit des Loix*, l. 11. c. 8.—With reſpect to the feudal policy, how it limited government; ſee Feodal *Syſtem.*

Government is alſo a poſt or office, which gives a perſon the power or right to rule over a place a city, or a province, either ſupremely, or by deputation.

Government is likewiſe uſed for the city, country, or place to which the power of governing is extended.

GOULART (Simon), a famous miniſter of Geneva, was born at Senlis, in 1543; and was one of the moſt indefatigable writers of his time. He made conſiderable additions to the Catalogue of witneſſes of the truth, compoſed by Illyricus; and acquired a great reputation by his works, the principal of which are, 1. A tranſlation of Seneca. 2. A collection of memorable hiſtories. 3. A tranſlation of St Cyprian *De lapſis.* 4. Several devotional and moral treatiſes. He died at Geneva in 1628.

GOURD, in botany. See Cucurbita.

GOURGUES (Dominique de), an illuſtrious French patriot, a private gentleman of Gaſcony. The Spaniards having inhumanly maſſacred a colony of Frenchmen who had ſettled in Forida, Gourgues took a ſevere revenge on them, an account of which is gi-

ven

Gournay Gown.

ven under the article FLORIDA. On his return, he was received with acclamations by his countrymen, but was forbid to appear at court. Queen Elizabeth invited him to command an Engliſh fleet againſt the Spaniards, in 1593; but he died at Tours, in his way to England.

GOURNAY, a town of France, in the duchy of Normandy and territory of Bray, celebrated for its butter-market. It is ſeated on the river Ept, in E. Lon. 0. 33. N. Lat. 49. 25.

GOURNAY (Mary de Jars de), a lady celebrated for her learning, was the daughter of William de Jars, lord of Neufvi and Gournay. After the death of her father, ſhe was protected by Montaigne and Cardinal Richlieu. To the daughter of the former ſhe dedicated her Noſegay of Pindus; and compoſed ſeveral other works, the moſt conſiderable of which is *Les Avis*. She died at Paris in 1685, aged 80. The critics are divided concerning the reputation of this lady: by ſome ſhe is ſtyled the *Syren of France*; others ſay her works ſhould have been buried with her.

GOUT. See (Index ſubjoined to) MEDICINE.

GOWER (John), one of our moſt ancient Engliſh poets, was cotemporary with Chaucer, and his intimate friend. Of what family, or in what county he was born, is uncertain. He ſtudied the law, and was ſome time a member of the ſocicty of Lincoln's inn, where his acquaintance with Chaucer began. Some have aſſerted that he was a judge; but this is by no means certain. In the firſt year of Henry IV. he became blind; a misfortune which he laments in one of his Latin poems. He died in the year 1402; and was buried in St Mary Overie, which church he had rebuilt, chiefly at his own expence, ſo that he muſt have lived in affluent circumſtances. His tomb was magnificent, and curiouſly ornamented. It ſtill remains, but hath been repaired in later times. From the collar of SS, round the neck of his effigies, which lies upon the tomb, it is conjectured that he had been knighted. As to his character as a man, it is impoſſible, at this diſtance of time, to ſay any thing with certainty. With regard to his poetical talents, he was undoubtedly admired at the time when he wrote, though a modern reader may find it difficult to diſcover much harmony or genius in any of his compoſitions. He wrote, 1. *Speculum meditantis*, in French; in ten books. There are two copies of this in the Bodleian library. 2. *Vox clamantis*, in Latin verſe; in ſeven books. Preſerved alſo in the Bodleian library, and in that of All-Souls. It is a chronicle of the inſurrection of the commons in the reign of Richard II. 3. *Confeſſio amantis*; printed at Weſtminſter by Caxton, in 1493. Lond. 1532, 1554. It is a ſort of poetical ſyſtem of morality, interſperſed with a variety of moral tales. 4. *De rege Henrico* IV. Printed in Chaucer's works. There are likewiſe ſeveral hiſtorical tracts, in manuſcript, written by our author, which are to be found in different libraries; alſo ſome ſhort poems printed in Chaucer's works.

GOWN, ROBE, a long upper garment, wore by lawyers, divines, and other graduates; who are hence called *men of the gown*, or *gownmen*.

The gown is an ample ſort of garment, wore over the ordinary cloaths, hanging down to the feet.—It is faſhioned differently for eccleſiaſtics, and for laymen. Gown, Graaf.

At Rome, they gave the name "virile gown," *toga virilis*, to a plain kind of gown which their youth aſſumed when arrived at puberty. This they particularly denominated *prætexta*. See TOGA, PRETEXTA, &c.

"The remarkable dreſs of our Britiſh anceſtors, (Mr Whitaker obſerves), which continued very nearly the ſame to the commencement of the laſt century among the natives of Ireland, and has actually deſcended to the preſent among the mountaineers of Scotland, and is therefore rendered very familiar to our ideas, carried in it an aſtoniſhing appearance to the Romans. And it ſeems to have been equally the dreſs of the men and women, among the nobles of Britain. But, in a few years after the erection of the Roman-Britiſh towns in the north, and in the progreſs of refinement among them, this ancient habit began to be diſcſteemed by the chiefs of the cities, and looked upon as the badge of ancient barbariſm. And the growing prejudices were ſoon ſo greatly improved, that, within twenty years only after the conſtruction of the towns, the Britiſh ſagum was actually reſigned, and the Roman *toga* or "gown" aſſumed by many of them." *Hiſtory of Manchester*, i. 302.

"The gown, however, never became univerſal in Britain. And it ſeems to have been adopted only by the barons of the cities and the officers of the crown; and has therefore been tranſmitted to us as the robe of reverence, the enſign of literature, and the mantle of magiſtracy. The woollen and plaided garments of the chiefs having naturally ſuperſeded the feathern veſtures of their clients, the former were ſtill wore by the generality of the Britons. And they were retained by the gentlemen of the country, and by the commonalty both in country and city. That this was the caſe, appears evident from the correſpondent conduct of the Gauls and Britons; who kept their Virgata Sagula to the laſt, and communicated them to the Franks and Saxons. The plaided drapery of the Britons ſtill appeared general in the ſtreets of Mancheſter; and muſt have formed a ſtriking contraſt to the gown of the chief, the dark mantle of Italy. And it, and the ornamented buttons on the ſhoulder, are preſerved among us even to the preſent moment, in the parti-coloured cloathing and the taſſelled ſhoulder-knots of our footmen."

In ſome univerſities, phyſicians wear a ſcarlet-gown.—In the Sorbonne, the doctors are always in gowns and caps. Beadles, &c. wear gowns of two or more colours.

Among the French officers, &c. they diſtinguiſh thoſe of the *ſhort gown* or *robe*; which are ſuch as have not been regularly examined.—They have alſo barbers of the *ſhort gown*, who are ſuch as are obliged to practiſe in an inferior way to thoſe of the long robe.

GOWN is alſo taken in the general for civil magiſtrature, or the profeſſion oppoſite to that of arms. In this ſenſe it was that Cicero ſaid, *cedant arma togæ*.

GRAAF (Regnier de), a celebrated phyſician, born at Schoonhaven, in Holland, in 1641. He ſtu-

Grabe, Grace. died phyſic at Pruſſia. He was educated in Leyden, where he acquired great honour by publiſhing a treatiſe *De Succo Pancreatico*. He alſo publiſhed three pieces upon the organs of generation, both male and female; upon which ſubject he had a controverſy with Swammerdam. He died young, in 1673; and his works, with his life prefixed, were publiſhed at Leyden in 1677, in 8vo.

GRABE (John Erneſt), a very learned writer in the beginning of the 18th century, a native of Koninſberg in Pruſſia. He was educated in the Lutheran religion; but the reading of the fathers led him into doubts. He preſented to the electoral conſiſtory at Sambia in Pruſſia a memorial, containing his doubts. The elector gave orders to three eminent divines to anſwer them. Their anſwers ſhook him a little in his reſolution of embracing the Roman Catholic religion; and one of them, Spener, adviſed him to go to England. He went; and king William gave him a penſion, which was continued by Queen Anne. He was ordained a prieſt of the church of England, and honoured with the degree of Doctor of Divinity by the univerſity of Oxford; upon which occaſion Dr George Smalridge pronounced two Latin orations, which were afterwards printed. He wrote, 1. *Spicilegium S. S. Patrum, ut et Hereticorum ſæculi poſt Chriſtum natum*, 8vo. 2. An edition of the Septuagint, from the Alexandrian manuſcript in St James's library. 3. Notes on Juſtin, &c.; and other works, which are eſteemed by the learned.

GRACE, among divines, is taken, 1. For the free love and favour of God, which is the ſpring and ſource of all the benefits we receive from him. 2. For the work of the Spirit renewing the ſoul after the image of God; and continually guiding and ſtrengthening the believer to obey his will, to reſiſt and mortify ſin, and overcome it.

GRACE is alſo uſed, in a peculiar ſenſe, for a ſhort prayer ſaid before and after meat.

The proofs of the moral obligation of this ceremony, drawn from different paſſages of the New Teſtament, are ſo well known, that it is needleſs to inſiſt on them here. Some others, drawn from the practice of different nations, and of very remote antiquity, may not be diſagreeable to our readers.

1. Athenæus tells us, in his *Deipnoſoph.* lib. ii. that in the famous regulation made by Amphictyon, king of Athens, with reſpect to the uſe of wine, both in ſacrifices, and at home, he required that the name of *Jupiter the Suſtainer* ſhould be decently and reverently pronounced. The ſame writer, in lib. iv. p. 149. quotes Hermeias, an author extant in his time, who informs us of a people in Egypt, inhabitants of the city of Naucratis, whoſe cuſtom it was on certain occaſions, after they had placed themſelves in the uſual poſture of eating at the table, to riſe again, and kneel; when the prieſt or precentor of the ſolemnity began to chant a grace, according to a ſtated form amongſt them; and when that was over, they joined in the meal, in a ſolemn ſacrificial manner. Heliodorus, has a paſſage in his *Æthiopics* to the ſame purpoſe, that it was the cuſtom of the Egyptian philoſophers to pour out libations and put up ejaculations before they ſat down to meals. Porphyry, in his treatiſe *De abſtin.* lib. iv. p. 408. gives a great character of the Samnean gymnoſophiſts in Egypt, for the ſtrictneſs of their life: as one article in their favour, he obſerves, that at the ſounding of a bell before their meals, which conſiſted only of rice, bread, fruits, and herbs, they went to prayers; which being ended, and not before, the bell ſounded again, and they ſat down to eating. In general, this was a religious uſage or rite amongſt the ancient Greeks; and derived from yet older ages, if Clement of Alexandria rightly informs us. He mentions, that theſe people, when they met together to refreſh themſelves with the juice of the grape, ſung a piece of muſic, in imitation of the Hebrews pſalms, which they called a *ſcholion*. Livy, lib. xxxix. ſpeaks of it as a ſettled cuſtom among the old Romans, that they offered ſacrifice and prayer to the gods, at their meals and compotations. But one of the fulleſt teſtimonies to our purpoſe is given by Quintilian, *Declam* 301. *Adiſti menſam*, ſays he, *ad quam cum venire cœpimus, Deos invocamus*; "We approached the table (at ſupper together), and then invoked the gods."

The Jeſuit Trigantius, in his very elegant and inſtructive narrative of the Chriſtian expedition of their miſſionaries into China, book i. p. 69. gives this account of the people there, in the particular now under conſideration. "Before they place themſelves for partaking of an entertainment, the perſon who makes it, ſets a veſſel, either of gold or ſilver, or marble, or ſome ſuch valuable material, in a charger full of wine, which he holds with both his hands, and then makes a low bow to the perſon of chief quality or character at the table. Then, from the hall or dining room, he goes into the porch or entry, where he again makes a very low bow, and turning his face to the ſouth, pours out this wine upon the ground, as a thankful oblation to the Lord of heaven. After this, repeating his reverential obeiſaace, he returns into the hall, &c."

The Turks pray for a bleſſing on their meat; and many more inſtances might be produced of infidels, who have conſtantly obſerved the like cuſtom, in ſome way or other.

2. The fact, therefore, with reſpect to the heathen world, being thus evident; we proceed to the ſentiments and behaviour of the *Jews* in this particular. Their celebrated hiſtorian *Joſephus*, giving a detail of the rites and cuſtoms of the *Eſſenes*, who were confeſſedly the ſtricteſt and moſt pious profeſſors of the Jewiſh religion, has this remarkable paſſage to the preſent purpoſe: "The prieſt," ſays he, "begs a bleſſing before they preſume to take any nouriſhment; and it is looked upon as a great ſin to take or taſte before." Then follows the thankſgiving before meat: and "when the meal," proceeds he, "is over, the prieſt prays again; and the company with him bleſs and praiſe God as their preſerver, and the donor of their life and nouriſhment."

Philo, in his book *De vita contemplativa*, gives an account of a body of men and women ſtricter than even the Eſſenes themſelves. He diſtinguiſhes them by no particular name, though his relation is very accurate and circumſtantial; namely, that, on certain ſpecial occaſions, before "they took their meals, they placed themſelves in a proper decent order; when, lifting up their hands and eyes to heaven, they prayed to God,

Grace.

Grace. God, that he would be pleased to be propitious to them in the use of those his good creatures."

From the Hebrew ritual it appears, that the Jews had their hymns and psalms of thanksgiving, not only after eating their passover, but on a variety of other occasions, at and after meals, and even between their several courses and dishes; as when the best of their wine was brought upon the table, or their aromatic confections, or the fruit of the garden, &c. On the day of the passover was sung Psalm cxiv. *When Israel came out of Egypt*, &c.

Aristæus has a passage full on the present subject. "*Moses*," says he, "*commands, that when the Jews are going to eat or drink, the company should immediately join in sacrifice or prayer.*" Where Rabbi Eleazar (upon that author) met with this sentence, has been controverted. But supposing it not to be found *in scriptis*, it is sufficient for us to know that the Jews did constantly practise this custom, upon the foundation of an ancient and general tradition and usage. That the prophet Daniel gave thanks after meat, is evident from the Apocryphal book concerning *Bel and the Dragon*, where, ver. 38, 39. we find, that *Daniel said, Thou hast remembered me, O God! neither hast thou forsaken them who seek thee and love thee. So Daniel arose, and did eat.* Of this text Prudentius takes notice in Cathemirin. hymn iv.

> *His sumptis Danielis excitavit*
> *In cœlum faciem, cibique fortis,*
> *Amen reddidit, alleluiah dixit.*
>
> The much-belov'd took the repast,
> And up to heav'n his eyes he cast;
> By which refresh'd, he sung aloud,
> Amen, and alleluiah to his God

Where, by the way, it may be observed, that the poet is a little mistaken, in making the prophet give thanks after meat; whereas, according to the text, he did it before.

Grace, or *Gracefulness*, in the human character; an agreeable attribute, inseparable from motion as opposed to rest, and as comprehending speech, looks, gesture, and loco-motion.

As some motions are homely, the opposite to *graceful*; it is to be inquired, With what motions is this attribute connected? No man appears graceful in a mask; and therefore, laying aside the expressions of the countenance, the other motions may be genteel, may be elegant, but of themselves never are graceful. A motion adjusted in the most perfect manner to answer its end, is elegant; but still somewhat more is required to complete our idea of grace or gracefulness.

What this unknown *more* may be, is the nice point. One thing is clear from what is said, that this *more* must arise from the expressions of the countenance: and from what expressions so naturally as from those which indicate mental qualities, such as sweetness, benevolence, elevation, dignity? This promises to be a fair analysis; because of all objects mental qualities affect us the most; and the impression made by graceful appearance upon every spectator of taste, is too deep for any cause purely corporeal.

The next step is, to examine what are the mental qualities, that, in conjunction with elegance of motion, produce a graceful appearance. Sweetness, cheerfulness, affability, are not separately sufficient, nor even in conjunction. Dignity alone, with elegant motion, produce a graceful appearance; but still more graceful with the aid of other qualities, those especially that are the most exalted. See Dignity. Grace.

But this is not all. The most exalted virtues may be the lot of a person whose countenance has little expression: such a person cannot be graceful. Therefore to produce this appearance, we must add another circumstance, viz. an expressive countenance, displaying to every spectator of taste, with life and energy, every thing that passes in the mind.

Collecting these circumstances together, grace may be defined, "that agreeable appearance which arises from elegance of motion and from a countenance expressive of dignity". Expressions of other mental qualities are not essential to that appearance, but they heighten it greatly.

Of all external objects, a graceful person is the most agreeable.

Dancing affords great opportunity for displaying grace, and haranguing still more. See Dancing, Declamation, and Oratory.

But in vain will a person attempt to be graceful, who is deficient in amiable qualities. A man, it is true, may form an idea of qualities he is destitute of; and, by means of that idea, may endeavour to express these qualities by looks and gestures: but such studied expression will be too faint and obscure to be graceful.

Act of Grace, the appellation given to the act of parliament 1696, c. 32. which allows prisoners for civil debts to be set at liberty, upon making oath that they have not wherewithal to support themselves in prison, unless they are alimented by the creditors on whose diligences they were imprisoned, within ten days after intimation made for that purpose. See Law, Part III. N° clxxxv. 13.

Days of Grace, three days immediately following the term of payment of a bill, within which the creditor must protest it if payment is not obtained, in order to entitle him to recourse against the drawer. See Law, Part III. N° clxxiii. 16.

Grace is also a title of dignity given to dukes, archbishops, and in Germany to barons and other inferior princes.

Graces, in heathen mythology, three goddesses, whose names were *Aglia*, *Thalia*, and *Euphrosyne*; that is, *shining*, *flourishing*, and *gay*; or, according to some authors, *Pasithea*, *Euphrosyne*, and *Ægiale*. Some make them the daughters of Jupiter, and Eurynome, or Eunomia, the daughter of Oceanus; but the most common opinion is, that they were the daughters of Bacchus and Venus.

They are sometimes represented dressed; but more frequently naked, to shew, perhaps, that whatever is truly graceful, is so in itself, without the aid of exterior ornaments. They presided over mutual kindness and acknowledgment; bestowed liberality, eloquence, and wisdom, together with a good grace, gaiety of disposition, and easiness of manners.

GRACCHUS (Tiberius), elected tribune of the Roman people, demanded in the senate, in their name, the execution of the Agrarian law; by which all persons possessing above 200 acres of land were to be deprived of the surplus, for the benefit of the poor citizens, amongst whom an equal distribution of them

was

Gracula Grafting.

was to be made; having carried his plan into execution by violent meaſures, he fell a victim to his zeal, being aſſaſſinated by his own party, 133 B. C. Caius, his brother, purſuing the ſame ſteps, was killed by the conſul Opimius, 121 B. C. See (hiſtory of) ROME.

GRACULA, in ornithology, a genus belonging to the order of picæ. The bill is convex, cultrated, and bare at the point; the tongue is not cloven, but is fleſhy and ſharpiſh; it has three toes before, and one behind. There are eight ſpecies, principally diſtinguiſhed by their colour.

GRACULUS, in ornithology. See CORVUS.

GRADATION, in general, the aſcending ſtep by ſtep, or in a regular and uniform manner.

GRADATION, in logic, a form of reaſoning, otherwiſe called SORITES.

GRADATION, in painting, a gradual and inſenſible change of colour, by the diminution of the teints and ſhades.

GRADATION, in rhetoric, the ſame with CLIMAX.

GRADISKA, a ſtrong town of Hungary in Sclavonia, on the frontiers of Croatia, taken by the Turks in 1691. It is ſeated on the river Save, in E. Lon. 17. 55. N. Lat. 45. 38.

GRADISKA, a ſtrong town of Italy, in a ſmall iſland of the ſame name on the frontiers of Friuli, in E. Lon. 13. 37. N. Lat. 46. 6. It is ſubject to the houſe of Auſtria.

GRADO, a ſtrong town of Italy, in a ſmall iſland of the ſame name, on the coaſt of Friuli, and in the territory of Venice. E. Lon. 13. 35. N. Lat. 45. 52.

GRADUATE, a perſon who has taken a degree in the univerſity. See DEGREE.

GRÆVIUS (John George), one of the moſt learned writers in the 17th century. In the 24th year of his age, the elector of Brandenburg made him profeſſor at Duiſbourg. In 1658, he was invited to Deventer to ſucceed his former maſter Gronovius. In 1661, he was appointed profeſſor of eloquence at Utrecht; and 12 years after, he had the profeſſorſhip of politics and hiſtory conferred on him. He fixed his thoughts here, and refuſed ſeveral advantageous offers. He had, however, the ſatisfaction to be ſought after by divers princes, and to ſee ſeveral of them come from Germany to ſtudy under him. He died in 1703, aged 71. His *Theſaurus antiquitatum et hiſtoriarum Italiæ*, &c. and other works, are well known.

GRAFTING, or ENGRAFTING, in gardening, is the taking a ſhoot from one tree, and inſerting it into another in ſuch a manner, that both may unite cloſely and become one tree. By the ancient writers on huſbandry and gardening, this operation is called *inciſion*, to diſtinguiſh it from inoculation or budding, which they call *inſerere oculos*.

Grafting hath been practiſed from the moſt remote antiquity; but its origin and invention is differently related by naturaliſts. Theophraſtus tells us, that a bird having ſwallowed a fruit whole, caſt it forth into a cleft or cavity of a rotten tree; where mixing with ſome of the putrified parts of the wood, and being waſhed with the rains, it budded, and produced within this tree another tree of a different kind. This led the huſbandman to certain reflections, from which ſoon afterwards aroſe the art of engrafting.

Grafting.

Pliny ſets the ſame thing in a different light: a countryman having a mind to make a paliſade in his grounds, that it might endure the longer, he bethought himſelf to fill up and ſtrengthen the bottom of the paliſade, by running or wattling it with the trunks of ivy. The effect of this was, that the ſtakes of the paliſades taking root, became engrafted into the trunks, and produced large trees; which ſuggeſted to the huſbandman the art of engrafting.

The uſe of grafting is to propagate any curious ſorts of fruits ſo as to be certain of the kinds; which cannot be done by any other method: for as all the good fruits have been accidentally obtained from ſeeds, ſo the ſeeds of theſe, when ſown, will many of them degenerate, and produce ſuch fruit as is not worth the cultivating: but when ſhoots are taken from ſuch trees as produce good fruit, theſe will never alter from their kind, whatever be their ſtock or tree on which they are grafted.

The reaſon or philoſophy of engrafting is ſomewhat obſcure; and had not accident given the firſt hint, all our knowledge of nature would never have led us to it. The effect is ordinarily attributed to the diverſity of the pores or ducts of the graft from thoſe of the ſtock, which change the figure of the particles of the juices in paſſing through them to the reſt of the tree.

Mr Bradley, on occaſion of ſome obſervations of Agricola, ſuggeſts ſomething new on this head. The ſtock grafted on, he thinks, is only to be conſidered as a fund of vegetable matter, which is to be filtered through the cyon, and digeſted, and brought to maturity, as the time of growth in the veſſels of the cyon directs. A cyon, therefore, of one kind, grafted on a tree of another, may be rather ſaid to take root in the tree it is grafted in, than to unite itſelf with it: for it is viſible that the cyon preſerves its natural purity and intent, though it be fed and nouriſhed with a mere crab; which is, without doubt, occaſioned by the difference of the veſſels in the cyon from thoſe of the ſtock: ſo that grafting may be juſtly compared to planting.

In proſecution of this view of that ingenious author, we add, that the natural juices of the earth, by their ſecretion and comminution in paſſing through the roots, &c. before they arrive at the cyon, muſt doubtleſs arrive there half elaborated and concocted; and ſo diſpoſed for a more eaſy, plentiful, and perfect aſſimilation and nutrition; whence the cyon muſt neceſſarily grow and thrive better and faſter than if it were put immediately in the ground, there to live on coarſe diet and harder of digeſtion: and the fruit produced by this further preparation in the cyon, muſt be finer and further exalted than if fed immediately from the more imperfectly prepared and altered juices of the ſtock.

Many have talked of changing of ſpecies, or producing mixed fruits, by engrafting one tree on another of the ſame claſs; but as the graft carries the juices from the ſtock to the pulp of the fruit, there is little hope of ſucceeding in ſuch an expectation by ever ſo many repeated grafts: but if, after changing the graft and ſtock ſeveral ſucceſſive times, you ſet the ſeed of the fruit produced on the graft in a good mould, it is poſſible that a change may happen, and

Grafting. a new mixed plant may be produced. Thus the almond and peach may, by many changes in the graftings, and by interrations of the ſtones of the peaches, and of the ſhells of the almonds, and by teribrations of the ſtem of the root here and there, alter their nature ſo much, that the coat or pulp of the almond may approach to the nature of the peach, and the peach may have its kernel enlarged into a kind of almond; and on the ſame principle, the curious gardener may produce many ſuch mixed kinds of things.

Mr Du Hamel has obſerved, that, in grafting of trees, there is always found at the inſertion of the graft, a change in the directions of fibres, and a ſort of twiſting or turning about of the veſſels, which greatly imitates that in the formation of certain glands in animal bodies: and from thence he infers, that a new ſort of viſcus being formed by this means, the fruit may very naturally be ſo far influenced by it, as to be meliorated on the new branch; but that no ſuch ſudden and eſſential changes can be effected by thoſe means, as too many of the writers on agriculture pretend. He obſerves, however, that this anatomical obſervation would not have been ſufficient to convince him of the falſity of too many of theſe relations, had not experiment joined to confirm him in this opinion. He tried many grafts on different trees; and, for fear of error, repeated every experiment of conſequence ſeveral times: but all ſerved only to convince him of the truth of what he at firſt ſuſpected. He grafted in the common way the peach upon the almond, the plum upon the apricot, the pear upon the apple, the quince, and the white thorn; one ſpecies of plum on other very different ſpecies, and upon the peach the apricot and the almond. All theſe ſucceeded alike: the ſpecies of the fruit was never altered; and in thoſe which would not come to fruit, the leaves, the wood, and the flowers, were all the ſame with thoſe of the tree from whence the graft was taken.

Authors on agriculture have alſo mentioned a very different ſort of grafting; namely, the ſetting grafts of one tree upon ſtocks of a different genus; ſuch as the grafting the pear upon the oak, the elm, the maple, or the plum, &c. Mr Du Hamel tried a great number of thoſe experiments carefully, and found every one of them unſucceſsful; and the natural concluſion from this was, that there muſt be ſome natural alliance between the ſtocks and their grafts, otherwiſe the latter will either never grow at all, or very ſoon periſh.

Notwithſtanding the facility with which grafts generally take on good ſtocks, there are many accidents and uncertainties attending them in their different periods. Some periſh immediately; ſome, after appearing healthy for many months, and ſome even for years. Of theſe laſt ſome die without the ſtocks ſuffering any thing; others periſh together with the ſtocks. It is very certain, that the greater part of grafted trees do not live ſo long as they would have done in their natural ſtate; yet this is no unexceptionable rule: for there are ſome which evidently live the longer for this practice; nay, there are inſtances of grafts which, being placed on ſtocks naturally of ſhort duration, live longer than when placed on thoſe which are more robuſt and laſting. Theſe irregularities have been but little conſidered hitherto, though they might be made productive of conſiderable advantages.—One Grafting. great requiſite for the ſucceeding of any graft is, that it be in its own nature capable of ſo cloſe and intimate an union with the ſubſtance of the ſtock, that it becomes as it were a natural branch of it. If all trees reſembled one another in their ſtructure and juices, the ſize and elaſticity of their veſſels, &c. probably the grafts of all trees would ſucceed upon on another; but this is by no means the caſe.

Trees are well known to be compoſed of numerous arrangements of hollow fibres, and theſe are different and unequal in every ſpecies of tree. In order to the ſucceeding of a graft, it is plain that there muſt be a conformity in its veſſels and juices with thoſe of the ſtock; and the more nearly they agree in this, probably the better they ſucceed, and the farther they differ, the worſe.—If there be, however, ſome difference in the ſolid parts of trees, there are evidently many more in the juices. The ſap in ſome trees is white as milk, in others it is reddiſh, and in ſome as clear and limpid as water. In ſome, it is thin and very fluid; in others, thick and viſcous. In the taſte and ſmell of theſe juices there are alſo not leſs differences: ſome are ſweet, ſome inſipid, ſome bitter, ſome acrid, and ſome fetid: the quality of the ſap thus makes a very great difference in the nature of trees; but its quantity, and derivation to the parts, is ſcarce leſs obſervable. Of this we have familiar inſtances in the willow and the box; one of which will produce longer ſhoots in a year, than the other in 20.

Another difference yet more ſtriking, and indeed more eſſential in regard to the growth of grafts than all theſe, is the different ſeaſon of the year at which trees ſhoot out their leaves, or ripen their flowers. The almond-tree is in flower before other trees in general have opened their earlieſt buds; and when other trees are in flower, this is full of leaves, and has its fruit ſet before the mulberry begins to puſh out its earlieſt buttons. When we conſider all theſe differences in trees, we cannot but wonder how it is poſſible for a branch of one to live upon another; and it becomes a much more perplexing queſtion how any graft can ſucceed, than how ſuch numbers come to miſcarry. A graft of one pear upon another ſhall be ſeen to ſucceed preſently as if upon its own tree; and in a fortnight will gain ſix inches in length, and ſo of ſome others.—This muſt be owing to the great ſimilarity between the ſtock and the graft in all reſpects; and a great contrariety or difference in ſtructure of parts will make as remarkable a difference on the other hand. An inſtance of this may be obſerved in the plum and the elm; which no art can ever make to ſucceed upon one another, whether the plum be grafted on the elm, or the elm upon the plum ſtock. Theſe are examples of the extremes of eaſy growth, and of abſolute decay; but there are many conjunctions of trees which ſeem of a middle nature between the two, and neither immediately periſh, nor totally ſucceed. Of theſe, ſuch as were grafted in autumn uſually remain green the whole winter without puſhing; and thoſe which are grafted in ſpring remain green a month or longer, but ſtill without ſhooting. Some particular ones have alſo been known to make a few ſhoots the firſt, or even the ſecond ſap ſeaſon after the operation; but all periſh at the end of theſe times.

Grafting

times. Of this kind are the grafts of the pear-tree upon the elm, the maple, and the hornbeam, and the mulberry upon the elm and fig, with many others.

When we come to inquire into the cauſe of this, we find that theſe grafts, though unnatural, have yet had a communication with the ſtock by means of a few ſmall veſſels, which has been ſufficient to keep them green, or even to make them ſhoot a little, during the great aſcent of the ſap: But the far greater number of the fibres have had all the while no communication, and are found putrified, dried up, or covered with a putrid juice. This has evidently happened by means of the diſproportion in ſize between the veſſels of the ſtock and of the graft, and the great difference between their natural juices, which are obſtacles abundantly ſufficient to prevent either an union of the fibres, or the introduction of new ſap.

The grafts of the almond on the plum, and of the plum on the almond, always grow very vigorouſly for the firſt year, and give all the appearances imaginable of ſucceeding entirely; yet they always periſh in the ſecond or third year. The almond-graft upon the plum-ſtock always puſhes out very vigorouſly at firſt; but the part of the ſtock immediately under the graft grows ſmaller and periſhes, the graft abſorbing too much of the juices, and the graft neceſſarily periſhes with it. The decay of the whole generally happens early in the ſpring; and that plainly from the different ſeaſon of the natural ſhooting of the two trees, the almond puſhing very vigorouſly, and conſequently draining the ſtock of its juices, at a time when, according to its nature, the juices are but in ſmall quantity in it, and the ſap does not begin to aſcend. The grafts of the plum on the almond are, from the ſame cauſe, furniſhed with an abundance of ſap which they have at that time no occaſion for; and conſequently they as certainly periſh of repletion, as the other of inanition.

The peach grafted on the plum ſucceeds excellently, and lives longer than it would have done in a natural ſtate; the reaſon ſeems to be, that the peach is a tender tree, ſhoots with great vivacity, and produces more branches than the root is able to maintain. Thus the peach trees are uſually full of dead wood; and often their large branches periſh, and ſometimes their whole trunk. On this occaſion the plum being a ſlow ſhooting tree, communicates its virtue to the graft; and the peach conſequently ſends out ſhoots which are more robuſt and ſtrong, and are no more in number than the root is able to ſupply with nouriſhment, and conſequently the tree is the more laſting.

The grafts, or cions, with which the grafting is effected, are young ſhoots of laſt ſummer's growth, for they muſt not be more than one year, and ſuch as grow on the outſide branches, and robuſt but moderate ſhooters; ſuch alſo as are firm and well ripened, ſhould always be choſen from healthful trees: obſerving, that the middle part of each ſhoot is always the beſt graft, cut at the time of grafting to five or ſix inches in length, or ſo as to have four or five good eyes or buds; but ſhould be preſerved at full length till grafting time, and then prepared as hereafter directed.

They ſhould be collected or cut from the trees in February, in mild weather, before their buds begin to ſwell, or advance much for ſhooting: in collecting them, chooſe ſuch as have not made lateral or ſide ſhoots; cut them off at full length; and if they are not to be uſed as ſoon as they are collected, lay their lower ends in ſome dry earth in a warm border till grafting time, and, if ſevere weather ſhould happen, cover them with dry litter. Grafting.

The proper tools and other materials uſed in grafting, are,

A ſtrong knife for cutting off the heads of the ſtocks, previous to the inſertion of the graft; alſo a ſmall hand-ſaw for occaſional uſe in cutting off the heads of large ſtocks.

A common grafting-knife, or ſtrong, ſharp pen-knife, for cutting and ſhaping the grafts ready for inſertion; alſo to ſlope and form the ſtocks for the reception of the grafts.

A flat grafting-chiſel and ſmall mallet for cleſting large ſtocks, in cleft-grafting, for the reception of the graft.

A quantity of new baſs-ſtrings for bandages, for tying the grafted parts cloſe, to ſecure the grafts, and promote their ſpeedy union with the ſtock. And,

A quantity of grafting clay, for claying cloſely round the grafts after their inſertion and binding, to defend the parts from being dried by the ſun and winds, or too much liquified by wet, or pinched by cold; for theſe parts ought to be cloſely ſurrounded with a coat of clay in ſuch a manner as effectually to guard them from all weathers, which would prove injurious to young grafts, and deſtroy their cementing property, ſo as to prevent the junction: therefore, a kind of ſtiff loamy mortar muſt be prepared of ſtrong fat loam, or, in default thereof, any ſort of tough binding clay, either of which ſhould be laid in an heap, adding thereto about a fourth of freſh horſe-dung free from litter, and a portion of cut hay, mixing the whole well together, and adding a little water: then let the whole be well beaten with a ſtick upon a floor, or other hard ſubſtance; and as it becomes too dry, apply more water, at every beating turning it over, always continuing to beat it well at top till it becomes flat; which muſt be repeated more or leſs according to the nature of the the clay, but ſhould be ſeveral times done the firſt day: next morning repeat the beating, ſtill moiſtening it with water; and by thus repeating the beating ſix or eight times every day for two or three days, or every other day at leaſt, for a week, it will be in proper order for uſe; obſerving, it ſhould be prepared a week at leaſt before it is uſed, but if a month the better.

The ſeaſon for performing the operation of grafting is February and March: though, when the work is performed in February, it for the general part proves the moſt ſucceſsful, more eſpecially for cherries, plums, and pears; and March grafting is well adapted for apples.

There are different methods of grafting in practice, termed Whip-grafting---Cleft-grafting---Crown-grafting--Cheek-grafting---Side-grafting---Root-grafting—and Grafting by approach or Inarching: but Whip-grafting and Cleft-grafting are moſt commonly uſed; and Whip-grafting moſt of all, as being the moſt expeditious and ſucceſsful of any.

Whip-graſting.—This being the moſt ſucceſsful method of grafting is the moſt commonly practiſed in all the nurſeries; it is always performed upon ſmall ſtocks, from

Grafting. from about the ſize of a gooſe-quill, to half an inch or a little more or leſs in diameter, but the nearer the ſtock and graft approach in ſize the better; and is called *whip-grafting*, becauſe the grafts and ſtocks being nearly of a ſize, are ſloped on one ſide, ſo as to fit each other, and tyed together in the manner of whips, or joints of angling-rods, &c. and the method is as follows.

Mawe's Dict. of Gardening. Having the cions or grafts, knife, bandages, and clay ready, then begin the work by cutting off the head of the ſtock at ſome clear ſmooth part thereof; this done, cut one ſide ſloping upward, about an inch and half or near two inches in length, and make a notch or ſmall ſlit near the upper part of the ſlope downward about half an inch long, to receive the tongue of the cion; then prepare the cion, cutting it to five or ſix inches in length, forming the lower end alſo in a ſloping manner, ſo as exactly to fit the ſloped part of the ſtock, as if cut from the ſame place, that the rinds of both may join evenly in every part; and make a ſlit ſo as to form a ſort of tongue to fit the ſlit made in the ſlope of the ſtock; then place the graft, inſerting the tongue of it into the ſlit of the ſtock, applying the parts as evenly and cloſe as poſſible; and immediately tye the parts cloſe together with a ſtring of baſs, bringing it in a neat manner ſeveral times round the ſtock and graft; then clay the whole over near an inch thick on every ſide, from about half an inch or more below the bottom of the graft, to an inch over the top of the ſtock, finiſhing the whole coat of clay in a kind of oval globular form, rather longwiſe, up and down, cloſing it effectually about the cion, and every part, ſo as no ſun, wind, nor wet may penetrate, to prevent which is the whole intention of claying; obſerving to examine it now and then, to ſee if it any where cracks or falls off, and if it does it muſt be inſtantly repaired with freſh clay.

This ſort of grafting may alſo be peformed, if neceſſary, upon the young ſhoots of any bearing tree, if intended to alter the ſorts of fruits, or have more than one ſort on the ſame tree.

By the middle or latter end of May, the grafts will be well united with the ſtock, as will be evident by the ſhooting of the graft; then the clay ſhould be wholly taken away; but ſuffer the baſs bandage to remain ſome time longer until the united parts ſeem to ſwell and be too much confined by the ligature, then take the tying wholly off.

Their farther culture is directed under the reſpective articles, whether deſigned for dwarfs or ſtandards, &c.

Cleft-grafting.—This is ſo called, becauſe the ſtock being too large for whip-grafting is cleft or ſlit down the middle for the reception of the graft; and is performed upon ſtocks from about one to two inches diameter.

Firſt, with a ſtrong knife cut off the head of the ſtock; or if the ſtock is very large, it may be headed with a ſaw; and cut one ſide ſloping upwards about an inch and half to the top; then proceed with a ſtrong knife or chiſel, to cleave the ſtock at top, croſs-way the ſlope, fixing the knife or chiſel towards the back of the ſlope, and with your mallet ſtrike it, ſo as to cleave the ſtock about two inches, or long enough to admit the graft, keeping it open with the chiſel; this done, prepare the cion, cutting it to ſuch length as to leave four or five eyes, the lower part of which being ſloped on each ſide, wedge-faſhion, an inch and half or two inches long, making one ſide to a thin edge, the other much thicker, leaving the rind thereon, which ſide muſt be placed outward in the ſtock; the cion being thus formed, and the cleft in the ſtock being made and kept open with the chiſel, place the graft therein at the back of the ſtock the thickeſt ſide outward, placing the whole cut part down into the cleft of the ſtock, making the rind of the ſtock and graft join exactly; then removing the grafting chiſel, each ſide of the cleft will cloſely ſqueeze the graft, ſo as to hold it faſt; it is then to be bound with a ligature of baſs, and clayed over, as obſerved in whip-grafting, leaving three or four eyes of the cions uncovered. Grafting

If intended to graft any pretty large ſtocks or branches by this method, two or more grafts may be inſerted in each; in this caſe the head muſt be cut off horizontally, making no ſlope on the ſide, but ſmooth the top, then cleave it quite a-croſs, and place a graft on each ſide, as the ſtock may be cleft in two places, and inſert two grafts in each cleft; they are thus to be tied and clayed as in the other methods.

This method of grafting may be performed upon the branches of bearing trees, when intended either to renew the wood, or change the ſort of fruit.

Towards the latter end of May, or the beginning of June, the junction of the graft and ſtock in either method will be effectually formed, and the graft begin to ſhoot, when the clay may be taken off, and in a fortnight or three weeks after take off alſo the bandages.

Crown-grafting.—This kind of grafting is commonly practiſed upon ſuch ſtocks as are too large to cleave, and is often performed upon the large branches of apple and pear trees, &c. that already bear fruit, when it is intended to change the ſorts, or renew the tree with freſh-bearing wood. It is termed *crown-grafting*, becauſe the ſtock or branch being headed down, ſeveral grafts are inſerted at top all around betwixt the wood and bark, ſo as to give it a crown-like appearance: obſerving, that this kind of grafting ſhould not be performed until March, or early in April; for then the ſap being in motion, renders the bark and wood of the ſtock much eaſier to be ſeparated for the admiſſion of the graft.

The manner of performing this ſort of grafting is as follows:

Firſt, cut off the head of the ſtock or branch with a ſaw horizontally, and pare the top ſmooth; then having the grafts, cut one ſide of each flat, and ſomewhat ſloping, an inch and half long, forming a ſort of ſhoulder at top of the ſlope to reſt upon the crown of the ſtock; and then raiſing the rind of the ſtock with a wedge, ſo as to admit the cion between that and the wood two inches down, place the grafts with the flat ſide next the wood, thruſting it down far enough for the ſhoulder to reſt upon the top of the ſtock, and in this manner may be put three, four, five, or more grafts in one large ſtock or branch.

When the grafts are all thus inſerted, let the whole be tied tight and well clayed; obſerving to leave two or three eyes of each graft uncovered, but raiſing the clay an inch above the top of the ſtock, ſo as to throw the wet quickly off, without lodging about the grafted

Grafting. parts, which would ruin the whole work.

Crown-grafting may alſo be performed, by making ſeveral clefts in the crown of the ſtock, and inſerting the grafts round the top into the clefts.

The grafts will be pretty well united with the ſtock, and exhibit a ſtate of growth, by the end of May or beginning of June, and the clay may then be taken away.

Mawe's Dict. The trees grafted by this method will ſucceed extremely well; but, for the firſt two or three years, have this inconvenience attending them, of being liable to be blown out of the ſtock by violent winds; which muſt be remedied by tying long ſticks to the body of the ſtock or branch, and each graft tied up to one of the ſticks.

Cheek-grafting.—Cut the head of the ſtock off horizontally, and pare the top ſmooth; then cut one ſide ſloping an inch and half or two inches deep, and cut the lower part of the graft ſloping the ſame length, making a fort of ſhoulder at top of the ſloped part: it is then to be placed upon the ſloped part of the ſtock, reſting the ſhoulder upon the crown of it: bind it with baſs, and finiſh with a covering of clay as in the other methods.

Side-grafting.—This is done by inſerting grafts into the ſides of the branches without heading them down; and may be practiſed upon trees to fill up any vacancy, or for the purpoſe of variety, to have ſeveral ſorts of apples, pears, plums, &c. upon the ſame tree.

It is performed thus. Fix upon ſuch parts of the branches where wood is wanted to furniſh the head or any part of the tree; there ſlope off the bark and a little of the wood, and cut the lower end of the grafts to fit the part as near as poſſible; then join them to the branch, and tie them with baſs, and clay them over.

Root-grafting.—This is done by Whip-grafting cions upon pieces of the root of any tree of the ſame genus, and planting the root where it is to remain; it will take root, draw nouriſhment, and feed the graft.

Grafting by Approach, or Inarching.—This ſort of grafting is, when the ſtocks deſigned to be grafted, and the tree from which you intend to take the graft, either grow ſo near, or can be placed ſo near together, that the branch or graft may be made to approach the ſtock, without ſeparating it from the tree, till after its union or junction with the ſtock; ſo that the branch or graft being bent to the ſtock, they together form a fort of arch; whence it is called Grafting by Approach, or Inarching. Being a ſure method, it is commonly practiſed upon ſuch trees as are with difficulty made to ſucceed by any of the former ways of grafting.

When intended to propagate any kind of tree or ſhrub by this method of grafting, if the tree, &c. is of the hardy kind, and growing in the full ground, a proper quantity of young plants for ſtocks muſt be ſet round it; and when grown of a proper height, the work of inarching muſt be performed; or, if the branches of the tree you deſign to graft from is too high for the ſtocks, in that caſe ſtocks muſt be planted in pots, and a ſlight ſtage muſt be erected around the tree, of due height to reach the branches, and the pots containing the ſtocks muſt be placed upon the ſtage. Grafting.

As to the method of performing the work: Obſerve, that in this method of grafting, it is ſometimes performed with the head of the ſtock cut off, and ſometimes with the head left on till the graft is united with the ſtock; though, by previouſly heading the ſtock, the work is much eaſier performed; and having no top, its whole effort will be directed to the nouriſhment of the graft; having, however, the ſtocks properly placed, either planted in the ground, or in pots around the tree to be propagated; then make the moſt convenient branches approach the ſtock, and mark on the body of the branches the parts where they will moſt eaſily join to the ſtock, and in thoſe parts of each branch pare away the bark and part of the wood two or three inches in length, and in the ſame manner pare the ſtock in the proper place for the junction of the graft; then make a ſlit upwards in the branch, ſo as to form a fort of tongue, and make a ſlit downwards in the ſtock to admit it; let the parts be then joined, ſlipping the tongue of the graft into the ſlip of the ſtock, making the whole join in an exact manner, and tie them cloſely together with baſs, and afterwards cover the whole with a due quantity of clay, as before directed in the other methods.

After this, let a ſtout ſtake be fixed, if poſſible, for the ſupport of each graft, to which let that part of the ſtock and graft be faſtened, which is neceſſary to prevent their being diſjoined by the wind.

The operation being performed in ſpring, let them remain in that poſition about four months, when they will be united, and the graft may then be ſeparated from the mother-tree. In doing this, be careful to perform it with a ſteady hand, ſo as not to looſen or break out the graft, ſloping it off downwards cloſe to the ſtock; and if the head of the ſtock was not cut down at the time of grafting, it muſt now be done cloſe to the graft, and all the old clay and bandage muſt alſo be cleared away, and replaced with new, to remain a few weeks longer.

Obſerve, however, that if you ſhall think the grafts are not firmly united with the ſtock in the period of time above-mentioned, let them remain another year till autumn, before you ſeparate the grafts from the parent-tree.

By this kind of grafting, you may raiſe almoſt any kind of tree or ſhrub, which is often done by way of curioſity, to ingraft a fruit-bearing branch of a fruit-tree upon any common ſtock of the ſame fraternity or genus, whereby a new tree bearing fruit is raiſed in a few months. This is ſometimes practiſed upon orange and lemon trees, &c. by grafting bearing-branches upon ſtocks raiſed from the kernels of any of the ſame kind of fruit, or into branches of each other, ſo as to have orange, lemons, and citrons, all on the ſame tree.

An anonymous author has given us in a treatiſe, publiſhed at Hamburgh, under the title *Amenitates Hortenſes Novæ*, a new method of grafting trees, ſo as to have very beautiful pyramids of fruit upon them, which will exceed in beauty, flavour, and quantity, all that can be otherwiſe produced. This, he ſays, he had long experienced, and gives the following method

Graham. thod of doing it. The trees are to be tranſplanted in autumn, and all their branches cut off. Early in the following ſummer the young ſhoots are to be pulled off, and the buds are then to be ingrafted into them in an inverted direction. This, he ſays, adds not only to the beauty of the pyramids, but alſo makes the branches more fruitful. Theſe are to be cloſely connected to the trunk, and to be faſtened in with the common ligature: they are to be placed circularly round the tree, three buds in each circle, and theſe circles at ſix inches diſtance from one another. The old trees may be grafted in this manner, the ſucceſs having been found very good in thoſe of twenty years ſtanding; but the moſt eligible trees are thoſe which are young, vigorous, and full of juice, and are not above a finger or two thick. When theſe young trees are tranſplanted, they muſt be fenced round with pales to defend them from the violence of the wind; and there muſt be no dung put to them till they are thoroughly rooted, for fear of rotting them before the fibres ſtrike. The buds ingrafted muſt be ſmall, that the wounds made in the bark to receive them, not being very large, may heal the ſooner; and if the buds do not ſucceed, which will be perceived in a fortnight, there muſt be others put in their place. The wound made to receive theſe buds muſt be a ſtraight cut, parallel to the horizon; and the piece of bark taken out muſt be downward, that the rain may not get in at the wound. In the autumn of the ſame year, this will be a green and flouriſhing pyramid; and the next ſummer it will flower, and ripen its fruit in autumn.

GRAHAM (James), Marquis of Montroſe, was comparable to the greateſt heroes of antiquity. He undertook, againſt almoſt every obſtacle that could terrify a leſs enterpriſing genius, to reduce the kingdom of Scotland to the obedience of the king; and his ſucceſs was anſwerable to the greatneſs of the undertaking. By valour, he in a few months almoſt effectuated his deſign; but, for want of ſupplies, was forced to abandon his conqueſts. After the death of Charles I. he, with a few men, made a ſecond attempt, but was immediately defeated by a numerous army. As he was leaving the kingdom in diſguiſe, he was betrayed into the hands of his enemy, by the Lord Aſton, his intimate friend. He was carried to his execution with every circumſtance of indignity that wanton cruelty could invent; and hanged upon a gibbet 30 feet high, with the book of his exploits appended to his neck. He bore this reverſe of fortune with his uſual greatneſs of mind, and expreſſed a juſt ſcorn at the rage and inſult of his enemies. We meet with many inſtances of valour in this active reign; but Montroſe is the only inſtance of heroiſm. He was executed May 21ſt, 1650. See BRITAIN, n° 137, 143, 165.

GRAHAM (Sir Richard), lord viſcount Preſton, eldeſt ſon of Sir George Graham of Netherby, in Cumberland, Bart. was born in 1648. He was ſent ambaſſador by Charles II. to Lewis XIV. and was maſter of the wardrobe and ſecretary of ſtate under James II. But when the Revolution took place, he was tried and condemned, on an accuſation of attempting the reſtoration of that prince; though he obtained a pardon by the queen's interceſſion. He ſpent the remainder of his days in retirement, and publiſhed an elegant tranſlation of *Boethius on the conſolation of philoſophy*. He died in 1695.

GRAHAM (George), clock and watch maker, the moſt ingenious and accurate artiſt in his time, was born in 1675. After his apprenticeſhip, Mr Tompion received him into his family, purely on account of his merit; and treated him with a kind of parental affection as long as he lived. Beſide his univerſally acknowledged ſkill in his profeſſion, he was a complete mechanic and aſtronomer; the great mural arch in the obſervatory at Greenwich, was made for Dr Halley, under his immediate inſpection, and divided by his own hand: and from this incomparable original, the beſt foreign inſtruments of the kind are copies made by Engliſh artiſts. The ſector by which Dr Bradley firſt diſcovered two new motions in the fixed ſtars, was of his invention and fabric: and when the French academicians were ſent to the north to aſcertain the figure of the earth, Mr Graham was thought the fitteſt perſon in Europe to ſupply them with inſtruments; thoſe who went to the ſouth were not ſo well furniſhed. He was for many years a member of the Royal Society, to which he communicated ſeveral ingenious and important diſcoveries; and regarded the advancement of ſcience more than the accumulation of wealth. He died in 1751.

GRAHAM's *Dyke*. See ANTONINUS's *Wall*.

GRAIN, corn of all ſorts, as barley, oats, rye, &c. See CORN, WHEAT, &c.

GRAIN is alſo the name of a ſmall weight, the twentieth part of a ſcruple in apothecaries weight, and the twenty-fourth of a penny-weight troy.

A grain-weight of gold-bullion is worth two-pence, and that of ſilver but half a farthing.

GRAIN alſo denotes the component particles of ſtones and metals, the veins of wood, &c. Hence croſs-grained, or againſt the grain, means contrary to the fibres of wood, &c.

GRAIN (Baptiſte le), maſter of the requeſts in ordinary to Mary de Medicis queen of France's houſehold, wrote *The hiſtory of Henry the Great*, and of *Lewis* XIII. from the beginning of his reign to the death of the maſhal d'Ancre in 1617. This hiſtory is reckoned to be wrote with impartiality, and the ſpirit of a true patriot; and contains many things not to be found any where elſe. He vigorouſly aſſerts the edict that had been granted to the reformed.

GRAMINA, GRASSES; one of the ſeven tribes or natural families, into which all vegetables are diſtributed by Linnæus in his *Philoſophia Botanica*. They are defined to be plants which have very ſimple leaves, a jointed ſtem, a huſky calix termed *gluma*, and a ſingle ſeed. This deſcription includes the ſeveral ſorts of corn as well as graſſes. In Tournefort they conſtitute a part of the fifteenth claſs, termed *apetali*; and in Linnæus's ſexual method, they are moſtly contained in the ſecond order of the third claſs, called *triandria digynia*. Grain || Gramina.

This numerous and natural family of the graſſes, has engaged the attention and reſearches of ſeveral eminent botaniſts. The principal of theſe are, Ray, Monti, Micheli, and Linnæus.

M. Monti, in his *Catalogus ſtirpium agri Bononienſis, gramina ac hujuſmodi affinia complectiens*, printed at Bononia in 1719, divides the graſſes, from the diſ-

Gramina. position of their flowers, as Theophraſtus and Ray had divided them before him, into three ſections or orders—Theſe are, 1. Graſſes having flowers collected in a ſpike. 2. Graſſes having their flowers collected in a panicle or looſe ſpike. 3. Plants that in their habit and external appearance are allied to the graſſes.

This claſs would have been natural if the author had not improperly introduced ſweet-ruſh, juncus, and arrow-headed graſs, into the third ſection. Monti enumerates about 306 ſpecies of the graſſes, which he reduces under Tournefort's genera; to theſe he has added three new genera.

Scheuchzer, in his *Ariſtographia*, publiſhed likewiſe in 1719, divides the graſſes, as Monti, from the diſpoſition of their flowers into the five following ſections. 1. Graſſes with flowers in a ſpike, as phalaris, anthoxanthum, and frumentum. 2. Irregular graſſes, as ſchœnanthus and cornucopiæ. 3. Graſſes with flowers growing in a ſimple panicle or looſe ſpike, as reed and millet. 4. Graſſes with flowers growing in a compound panicle, or diffuſed ſpike, as oats and poa. 5. Plants by their habit nearly allied to the graſſes, as cypreſs-graſs, ſcirpus, linagroſtis, ruſh, and ſceuchzeria.

Scheuchzer has enumerated about four hundred ſpecies, which he deſcribes with amazing exactneſs. Gramina.

Micheli has divided the graſſes into ſix ſections, which contain in all, forty-four genera, and are arranged from the ſituation and number of the flowers.

GRAMINA, the name of the fourth order in Linnæus's fragments of a natural method, conſiſting of the numerous and natural family of the graſſes, viz. agroſtis; aira; alopecurus, or fox-tail graſs; anthoxanthum, or vernal graſs; ariſtida; arundo, or reed; avena, or oats; bobartia; briza; bromus; cinna; cornucopiæ, or horn-of-plenty graſs; cynoſurus; dactylis; elymus; feſtuca, or feſcue-graſs; hordeum, or barley; lagurus, or hare's-tail graſs; lolium, or darnel; lygeum, or hooded matweed; melica; mileum, or millet; nardus; oryza, or rice; panicum, or panic-graſs; paſpalum; phalaris, or canary-graſs; phleum; poa; ſaccharum, or ſugar-cane; ſecale, or rye; ſtipa, or winged ſpike-graſs; triticum, or wheat; uniola, or ſea-ſide oats of Carolina; coix, or Job's tears; olyra; pharus; tripſacum; zea, Indian Turkey wheat, or Indian corn; zizania; ægilops, or wild feſcue-graſs; andropogon; apluda; cenchrus; holcus, or Indian millet; iſchæmum. See BOTANY, p. 1305, col. 2.

GRAMMAR.

1. GRAMMAR is *the art of ſpeaking or of writing any language with propriety.*

2. Grammar conſidered as an *Art*, neceſſarily ſuppoſes the previous exiſtence of language; and as its deſign is to teach any language to thoſe who are ignorant of it, it muſt be adapted to the genius of that particular language of which it treats.—A juſt method of grammar, therefore, ſuppoſing a language introduced by cuſtom, without attempting any alterations in it, furniſhes certain obſervations called *rules*, to which the methods of ſpeaking uſed in this language may be reduced; this collection of rules is what is called a *grammar* of any particular language. For the greater diſtinctneſs with regard to theſe rules, grammarians have uſually divided this ſubject into four diſtinct heads, viz. ORTHOGRAPHY, or *the art of combining letters into ſyllables, and ſyllables into words*; ETYMOLOGY, or *the art of deducing one word from another, and the various modifications by which the ſenſe of any one word can be diverſified*; SYNTAX, or what relates *to the conſtruction or due diſpoſition of the words of a language into ſentences or phraſes*; and PROSODY, or that which treats of *the quantities and accents of ſyllables, and the art of making verſes.*

3. But grammar conſidered as a *Science*, views language in itſelf: neglecting particular modifications, or the analogy which *words* may bear to *each other*, it examines the analogy and relation between *words* and *things*; diſtinguiſhes between thoſe particulars which are *eſſential* to language, and thoſe which are only *accidental*; and thus furniſhes a certain ſtandard by which different languages may be compared, and their ſeveral excellencies or defects pointed out. This is what is called PHILOSOPHIC or UNIVERSAL GRAMMAR.

OF UNIVERSAL GRAMMAR.

4. IT is not neceſſary here to inquire how language was originally invented, to trace the various changes it may have undergone, or to examine whether any one language may be conſidered as the original from which all others have been derived: it is ſufficient for our purpoſe to obſerve, that all mankind, however diverſified in other reſpects, agree in the common uſe of language; from which it appears, that language is not merely accidental and arbitrary, but founded in the nature of things, and within the reach of all mankind. It is therefore an object worthy of a philoſophic inquiry, to diſcover the foundations upon which this univerſal fabric has been raiſed.

5. The deſign of ſpeech is to publiſh to others the thoughts and perceptions of our mind. The moſt acute feelings of man, as well as of every other animal, are expreſſed by ſimple inarticulate ſounds, which, as they tend to the preſervation of the individual, are univerſally underſtood. Theſe inarticulate but ſignificant ſounds, therefore, conſtitute a natural and univerſal language, which man, as a mere ſenſitive being, partakes in common with the other animals. But as man is not only endowed with ſenſation, but with the faculty of reaſoning, ſimple inarticulate ſounds are inſufficient for expreſſing all the various modifications of thought, or for communicating to others a chain of argumentation: it was therefore neceſſary to call in the aid of *articulation*; which by modifying theſe ſimple ſounds, and by fixing a particular meaning to theſe modifications, forms the language peculiar to man, and which diſtinguiſhes him from all other animals, and enables him to communicate with facility all

Division of Words.

all that diverſity of ideas with which his mind is ſtored. Theſe ſounds, thus modified and having a determinate meaning, are called WORDS; and as all language is compoſed of ſignificant words variouſly combined, a knowledge of them is neceſſary previous to our acquiring an adequate idea of language.

6. But, as it is by words that we expreſs the various ideas which occur to the mind, it is neceſſary to examine how ideas themſelves are ſuggeſted, before we can aſcertain the various claſſes into which words may be diſtributed. With this view, therefore, let us ſuppoſe a reaſonable being, devoid of every prepoſſeſſion whatever, placed upon this globe. His attention would, in the firſt place, be directed to the various objects which he ſaw exiſting around him: theſe he would naturally endeavour to diſtinguiſh from one another, and give them names, by means of which the idea of them might be recalled when the objects themſelves were abſent. This is one copious ſource of words; and forms a natural claſs which muſt be common to every language, and which is diſtinguiſhed by the name of NOUNS. And as theſe nouns are the names of the ſeveral ſubſtances which exiſt, they have likewiſe been called SUBSTANTIVES.

7. It would likewiſe be early diſcovered, that every one of theſe ſubſtances was endowed with certain qualities or attributes, to expreſs which another claſs of words would be requiſite. Thus, *to be weighty*, is a quality of matter; *to think*, is an attribute of man. Therefore, in every language, words have been invented to expreſs the various qualities of the ſeveral objects which exiſt. Theſe may all be comprehended under the general denomination of ATTRIBUTIVES.

8. Theſe two claſſes of words muſt comprehend all things that exiſt: for whatever exiſts, muſt of neceſſity be either a ſubſtance, or the attribute of ſome ſubſtance; and hence theſe two claſſes muſt comprehend all thoſe words which are ſignificant of themſelves, and may be called WORDS SIGNIFICANT OF THEMSELVES. If any other words occur, they can only be ſignificant in ſo far as they tend to explain or connect the words of the two former claſſes.

9. But, although theſe words form the baſis or matter of a language, in the ſame manner as ſtones form the matter of a building; yet, as ſtones cannot be arranged into a regular ſtructure without a cement to bind and connect them, ſo theſe original words ſtand in need of others to connect them, before they can be made to expreſs all the variety of our ideas. Another order of words, therefore, was neceſſary, which, although not of themſelves ſignificant, yet, when joined with others, might acquire a meaning. Theſe form a ſecond general claſs of words, that may be called WORDS NOT OF THEMSELVES SIGNIFICANT, and which cannot acquire any meaning but ſo far as they ſerve either to EXPLAIN OR CONNECT the others.

10. Hence, therefore, all words which can poſſibly be invented, may be divided into two general claſſes; thoſe that are SIGNIFICANT OF THEMSELVES, and thoſe that are NOT. Words which are ſignificant of themſelves, are either expreſſive of the names of ſubſtances, and therefore called SUBSTANTIVES; or, of qualities, which we call ATTRIBUTIVES. Words which are not ſignificant of themſelves, muſt acquire a meaning either as defining or connecting others, which we ſhall arrange under the two claſſes of DEFINITIVES and CONNECTIVES, each of which ſhall be examined in their order.

Of nouns.

CHAPTER I.

Of SUBSTANTIVES.

11. SUBSTANTIVES may be divided into two claſſes, viz. thoſe which are primary, commonly called NOUNS; and thoſe of a ſecondary order, which are often ſubſtituted for nouns, and are hence called PRONOUNS; each of which we ſhall conſider ſeparately.

SECT. I. *Of* Subſtantives *of the Firſt Order, called* NOUNS.

12. NOUNS are *all thoſe words by which objects or ſubſtances are denominated, and which diſtinguiſh them from one another, by names applicable to each, without marking either quantity, quality, action, or relation.* And as all the objects which exiſt muſt be either in the ſame ſtate that they were produced by *nature*, or changed from their original ſtate by *art*, or *abſtracted* from ſubſtances by the powers of imagination, this naturally ſuggeſts a diviſion of nouns into NATURAL, as *man, vegetable, tree*, &c.; ARTIFICIAL, as *houſe, ſhip, watch*, &c.; or ABSTRACT, as *whiteneſs, temperance*, &c.

13. But the diverſity of objects being ſo great as to render it impoſſible for any perſon to know the diſtinct names of every individual, therefore it has been found expedient to arrange them under certain general claſſes, the names of which may be more eaſily acquired, ſo that by referring any unknown object to the claſs to which it belongs, we in ſome meaſure ſupply the want of proper names. Hence, therefore, each of the above ſpecies of nouns are divided into thoſe which denote genera, ſpecies, and individuals. Thus, in natural ſubſtances, *animal, vegetable*, and *foſſile*, denote genera; *man, dog, tree, metal*, are ſpecies; and *Alexander, Cæſar, oak, gold*, are individuals. In artificial ſubſtances, *edifice* is a genus; *houſe, tower, church*, are ſpecies; and the *Vatican, Tron-church*, and *Herriot's-hoſpital*, individuals. In *abſtract* ſubſtances, *motion* is a genus; *flight* and *courſe*, are ſpecies; the *flight of Mahomet*, the *courſe of a gre-hound*, are innividuals. Each of theſe general claſſes might be ſubdivided into many ſmaller; but as theſe leſſer diviſions can only relate to the particular genius of different languages, it does not fall within our plan to conſider them. We therefore proceed to take notice of the accidents which accompany nouns. Of which kind may be reckoned *number* and *gender*.

14. As *nouns* are the names of *ſubſtances*, and as there may be many ſubſtances of the ſame kind, therefore nouns muſt be adapted to expreſs whether there is one or more of thoſe objects of which we ſpeak. Nouns, therefore, in every language, admit of a certain variation to denote this circumſtance, which is called *number*. Thus, in the Engliſh language, when we ſpeak of a ſingle place of habitation, we call it *a houſe*; but if of more, we call them *houſes*. In the firſt of theſe caſes the noun is ſaid to be in the *ſingular*, and in the laſt caſe the *plural* number: nor does the Engliſh, or any other language except the Greek, admit of any other variation but theſe two: and altho' the Greek language admits of a particular variation of the

Of nouns. the noun called the *dual* number, which is a plural limited to two objects; yet this cannot be considered as essential to language; and it is perhaps doubtful whether this variation ought to be considered as an elegance or a defect in that language.

15. But although number be a natural accident of nouns, it can only be considered as essential to those which denote genera or species, as it does not descend to individuals. Thus we say, *animal*, or *animals*, *vegetables*, and *fossils*; as also *man*, or *men*, *dogs*, *trees*, &c. But we only say, *Xenophon*, *Cæsar*, *Bucephalus*, &c. in the singular. Nor do these admit of a plural, excepting when we consider any proper name as a general appellative under which many others are arranged, when it is no longer the name of an individual, but that of a species, and as such admits of a plural; as the *Alexanders*, the *Ptolemies*, the *Howards*, the *Pelhams*, the *Montagues*, &c. The reason of all which will be obvious, if we consider, that every genus may be found whole and entire in each of its *species*; for *man*, *horse*, and *dog*, are each of them an entire and complete *animal*: and every species may be found whole and entire in each of its individuals; for *Socrates*, *Plato*, and *Xenophon*, are each of them completely and entirely a *man*. Hence it is, that every *genus*, though ONE, is multiplied into MANY; and every *species*, though ONE, is also multiplied into MANY, *by reference to those beings which are their subordinates*. But as *no individual has any such subordinates*, it can never in strictness be considered as MANY, and so is truly an INDIVIDUAL as well in *nature* as in *name*, and therefore cannot admit of number.

16. Besides number, another accident of nouns is *gender*, the nature of which may be thus explained: As nouns are the names of the various objects in nature; and as the distinction of sex is perceptible among all those objects which are animated, and as those which are inanimate cannot admit of any sex at all; therefore all the beings which can become the objects of our speculation, may be considered as either *males* or *females*, or such as admit of *no* sex, and therefore may be said to be neuter, or of *neither* sex. Hence, therefore, grammarians have made a threefold distinction of nouns, into *masculine genders*, or those which denote *males*; *feminine*, or those which denote *females*; and *neuters*, which denote those substances that admit of no sex. But, although the origin of genders is thus so clear and obvious; yet every language that we know of, except the English, deviates from the order of nature, and often attributes sex to those substances which are totally incapable of any: nay, some languages are so particularly defective in this respect, as to class every object inanimate as well as animate under either the *masculine* or *feminine gender*, as they admit of no gender for those that are of neither sex. This is the case with the French, Italian, and Spanish. But the English, strictly following the order of nature, puts every noun which denotes a male animal, and no others, in the *masculine* gender; every name of a female animal, in the *feminine*; and every animal whose sex is not obvious, or known, as well as every inanimate object whatever, in the *neuter* gender. Nor does this rule admit of any exceptions; although poets take the liberty of personifying any objects they think proper, and endow them with whatever sex suits their purpose best; which serves admirably to distinguish between the cool language of philosophy, and the enthusiasm of poetry. Of nouns.

17. Although *Cases* are not necessary accidents of nouns; yet as they have been often considered as such, it will perhaps be deemed proper to take some notice of them.—As natural objects remain the same, although observed from many different points of view, they are not in their own nature altered, although they may be connected with others in many different ways: their names therefore ought to remain unchanged, although their relations to other words may be varied. However, there are certain circumstances in which nouns may be considered with respect to their relation *to*, and connection *with*, other words, which occur more frequently than others. Some languages (particularly the Greek and Latin) express *some* of these circumstances by a variation of the original noun, which variations are called CASES. But the English, and almost all the modern languages of Europe, have followed the order of nature, and allow the noun to remain the same, expressing its relation and connection with other words by the help of distinct words called *prepositions*.—Which of these methods is best, it is not our present purpose to inquire. See LANGUAGE.

18. It has been supposed the English nouns admit of one variation which answers to the genitive case of the Latins.—Thus the word *Alexander* is an English noun in its proper form, and in that case which in Latin would be called the *Nominative*. The variation which they called the *Genitive* Case, is expressed in English by adding the preposition OF before the noun; thus, OF *Alexander*. But the same meaning may be conveyed by the word *Alexander's*; for the meaning is the same, if I say the house *of Alexander*, or *Alexander's* house. This, therefore, has been called a true inflection of the original noun. However, although this opinion has been adopted by all grammarians, it appears to have been adopted without sufficient examination, as will be evident from the following considerations.

There are certain circumstances in which this supposed genitive cannot be substituted instead of the other: for I may say, I speak OF *Alexander*, I write OF *Cæsar*, I think OF *Pompey*; but I cannot say, I speak *Alexander's*, I write *Cæsar's*, or I think *Pompey's*. Hence these two are not in all cases synonymous terms; and therefore one of them must be considered as only accidentally coinciding with the other in particular circumstances.

Again, every one of these supposed genitives can with propriety assume all the various signs of the different *cases* in the English language: for we may say simply, as in the nominative case, *Alexander's* house; but we can also say, OF *Alexander's house*, TO, WITH, FROM, IN, BY, or FOR *Alexander's house*, &c. If this then be a real genitive, it requires the sign of the genitive, as well as of the other cases, to explain it; which would be an absurdity too great to be admitted. —But it may be asked, If these are not genitives, to what class of words can they be referred?

In answer to this, it has been already observed, that the variety of substances is so great, that it is im-

Pronouns. impoſſible for any perſon to know the names of every one of them; and therefore, they have been arranged under the ſeveral orders of genera and ſpecies. We now further obſerve, that as the individuals are ſo exceedingly numerous, it would be impoſſible even to invent proper names for each, and far leſs would it be poſſible to make theſe names be known to every perſon who might accidentally ſee them: therefore, when we want to aſcertain any individual object, and diſtinguiſh it from all the other individuals of the ſame ſpecies, we are obliged to have recourſe to particular epithets, or definitives, to aſcertain that individual.—Thus, I ſee a particular houſe which I want to diſtinguiſh from other houſes: this has no particular name of its own: I muſt therefore aſcertain it in the beſt manner I can: and as the ſhorteſt is always the beſt, we muſt naturally denominate it from its owner or poſſeſſor if we know him; and therefore call it *Alexander*'s, *James*'s, or *John*'s, houſe.—Here then we ſee, that the words *Alexander*'s, *James*'s, and *John*'s, do not ſtand as nouns, but as *articles* or *definitives* ſerving to aſcertain and point out the individuality of the noun with which they are joined, and are much nearer allied to adjectives than to ſubſtantives. Theſe, therefore, like other articles, do not alter the caſe of the noun; ſo that the term *Alexander's houſe*, is as much the proper name of a particular houſe, as *Alexander* or *James* are the proper names of particular men, and of conſequence may be varied through the different caſes as well as the other.—It is ſurpriſing, that this idea never occurred to grammarians; for *St Peter's* at Rome, and *St Paul's* at London, are as truly the proper names of theſe two noble edifices, as the *Rotundo* or the *Circus* are the proper names of two other ſtructures.—We may therefore ſafely conclude, that the Engliſh language admits of no caſes at all, and that the only eſſential accidents of nouns are gender and number.

Sect. II. *Of* Subſtantives *of the Second Order, called* Pronouns.

19. All converſation paſſes between individuals. When theſe individuals are unknown to each other, how ſhall the one ſpeaker addreſs the other when he knows not his name; or how explain himſelf by his own name, of which the other is wholly ignorant? This might perhaps have been at firſt effected by pointing: but as it behoved this method to be extremely inconvenient and defective, it was neceſſary that a particular claſs of words ſhould be invented for this purpoſe; and as theſe words always ſupply the place of a noun, they have been called PRONOUNS;—the nature of which may be explained as follows.

20. Suppoſe the parties converſing to be wholly unacquainted, and the ſubject of the converſation to be the ſpeaker himſelf: here, to ſupply the place of pointing, the inventors of language have furniſhed the ſpeaker with the pronoun *I*; *I write*, *I deſire*: and as the ſpeaker is always principal with reſpect to his own diſcourſe, they have therefore called this the *pronoun* of the FIRST perſon.

Again, ſuppoſe the ſubject of the converſation to be the party addreſſed: here, for ſimilar reaſons, they invented the pronoun THOU, THOU *writeſt*, THOU *walkeſt*; and as the party addreſſed is next in dignity to the ſpeaker, or at leaſt comes next with reference to the diſcourſe, they therefore called this the *pronoun* of the SECOND perſon. Pronouns.

But as the ſubject of the converſation may be ſome third object different from either the ſpeaker or the party addreſſed, another pronoun was neceſſary; and as this object might be either a *male* or a *female*, or a *neuter*, it was neceſſary to have one pronoun for each of the genders, HE for the *maſculine*, SHE for the *feminine*, and IT for the *neuter*: and this, in diſtinction to the former, was called the *pronoun* of the THIRD perſon.—Hence the diſtribution of pronouns into *perſons*.

21. We have already ſeen that nouns admit of number; pronouns, which are their ſubſtitutes, likewiſe admit of number. There may be many ſpeakers of the ſame ſentiment, as well as one who including himſelf ſpeaks the ſame ſentiment with MANY; ſpeech may likewiſe be addreſſed to MANY at a time as well to as ONE; and the ſubject of the diſcourſe may likewiſe be MANY; therefore the pronoun of every one of the *perſons* muſt admit of number, to expreſs this ſingularity or plurality. Hence, therefore, the pronoun of the firſt perſon *I*, has the plural WE; that of the ſecond perſon *thou*, has the plural YOU; and that of the third perſon *he*, *ſhe*, or *it*, has the plural THEY, which is equally applied to all the three genders.

22. With regard to gender, we do not find in any language that the pronouns of the *Firſt* or *Second* perſons admit of any diſtinction in this reſpect: nor was it neceſſary that they ſhould; as the ſpeaker and party addreſſed are uſually preſent with one another, this diſtinction is generally obvious from dreſs and external appearance. But this is not the caſe with regard to the pronoun of the *Third* perſon; of whoſe character and diſtinctions we often know no more than what we learn from the diſcourſe itſelf; and hence it is, that in almoſt all languages the pronoun of the third perſon admits of genders, as we have already ſeen the Engliſh admits of the triple diſtinction of maſculine, feminine, and neuter.—The utility of which threefold diſtinction will be beſt ſhewn by an example. Suppoſing there was no ſuch diſtinction, and that we ſhould read in any hiſtory HE cauſed HIM to deſtroy HIM, and were told that the pronoun which is here thrice repeated ſtood each time for ſomething different; that is to ſay, for a man, for a woman, and for a city, whoſe names were *Alexander*, *Thais*, and *Perſepolis*. Taking the pronoun thus diveſted of its genders, it does not appear which of the three was deſtroyed, which the deſtroyer, or which the cauſe that moved to the deſtruction. But there is no ambiguity when we hear the genders diſtinguiſhed; and when, inſtead of the ambiguous ſentence, *he* cauſed *him* to deſtroy *him*, we are told with the proper diſtinctions that SHE cauſed HIM to deſtroy IT. Then we know with certainty, that the promoter was the *woman*, that her inſtrument was the *hero*, and that the ſubject of her cruelty was the unfortunate *city*.—From this example we would be ſurpriſed how the *Italian*, *French*, and *Spaniſh*, could expreſs themſelves with preciſion or elegance, with no more than two variations of this perſon.

23. From the ſame cauſes, as a diſtinction of gender is unneceſſary in the pronouns of the firſt and ſecond perſons, we ſee the reaſon why a ſingle pronoun to each perſon, an *I* for the firſt, and a THOU for the ſecond, are

Pronouns. are sufficient for all the purposes of language, as these are always supposed present and obvious. But it is not so with respect to the third person, as the various relations of different objects made it necessary to have not *one*, but *many*; such as, HE, SHE, IT, THIS, THAT, OTHER, SOME, ALL, ANY, &c.

24. Although we have said that there is only one pronoun for each of the first and second persons, yet the English reader may perhaps be puzzled with finding two distinct words applied to each; I and ME, for the first person; THOU and THEE, for the second. The learned reader will at once see that these two words ME and THEE are equivalent to the *accusative* case of the Latin pronoun: but, in order to make the meaning of this as plain as possible without embarrassing ourselves about unnecessary terms, we shall only observe, no effect can be produced without a cause, and no action can be performed without producing some effect. The same person may in different circumstances be either the active and efficient cause *of*, or the passive subject who suffers *by*, an action: some languages have therefore formed different words to express the same object in these different circumstances. Thus in the Latin sentences, *Brutus amavit Cassium*, Brutus loved Cassius; and *Cassius amavit Brutum*, Cassius loved Brutus; the word *Brutus* in the first, and *Cassius* in the second, is the form which the noun assumes when it is used as the efficient cause; and *Brutum* and *Cassium* the forms which the same nouns assume when they are represented as the passive subjects. This last, then, is what was called the *accusative* case of the noun, and the first was called the *nominative*. We have already seen, that the English noun admits of no cases, the active subject always preceding the verb, and the passive following it; as is plain from the above sentences, where *Brutus* and *Cassius* remain unchanged in both situations; and the same might be observed of all other modern languages: yet the English and all modern languages admit of a different word to express the different state of the pronouns. Thus, we say, I *esteem* THEE, I *admire* HIM, I *love* HER: in all of which sentences, *I* the pronoun of the first person, is the *active*; and THEE of the second person, and HIM and HER of the third, are the *passive* subjects, and are therefore expressed by the words THEE, HIM, and HER. But if the case be reversed, and the pronoun of the first person becomes the passive subject, and the others the active, they assume a different form; thus, THOU *esteemest*, HE *admires*, SHE *loves*—ME. Hence, therefore, it appears that we have two distinct words for each of these pronouns to express the different states in which they may be represented, exactly analogous to the nominative and accusative cases of the Romans. Whether these are to be admitted as cases of our pronouns, or whether they may not rather be considered as distinct words formed for that particular purpose, is of little consequence for us to inquire; as, in whatever light they be considered, this variation cannot be looked upon as an essential part of language, but only as a particular refinement, invented to prevent the disagreeable repetition of the pronoun, which behoved frequently to have happened without this contrivance. This seems to be the only reason why pronouns have been endowed with this variety, and not nouns. For as nouns are in themselves greatly diversified, the sameness of sounds does not here so often occur as it would have done in the pronouns, where the same *I*, THOU, HE, SHE, or IT, answers for the name of every object which occurs in nature; but, by this diversity in the form of the words, this circumstance is in some measure obviated. And it is probably for the same reason, that the plural of each of these pronouns is so very different from the singular. Thus, from *I* of the first person is formed WE in the plural, and from ME the plural US; from THOU and THEE the plurals YE and YOU; from HE, SHE,—HIM, HER, and IT, the plurals THEY and THEM. In all of which there is not the least resemblance between the singular and plural of any one word; and, except in HE and HIM, THEY and THEM, there is not any similarity between what may by some be thought to be the different *cases* of the same word. Pronouns.

25. We have seen that the same object may sometimes be the cause of an action, and sometimes the object which suffers by it. We now observe, that the same object may sometimes be, with regard to the same action, both the active cause and passive subject: as when we say, *Brutus killed himself*. In which case it is evident, that Brutus was both the cause that produced, and the object that suffered by the action; the pronoun *himself* being put for his name: for, were it not for the sameness of the sound, and the ambiguity which would be occasioned by it, we might surely say, *Brutus killed Brutus*. It was therefore necessary to have a particular pronoun for the passive subject, in all those cases where the same object was the agent; and on this account the word SELF has been invented, having the plural SELVES. This pronoun therefore, which serves on all occasions to represent the action as returning upon the agent that produced it, may be called the *reciprocal pronoun*; which has this peculiarity, that it can never stand by itself, but must alway have the assistance of the pronoun in whose place it is substituted; as, MYSELF, THYSELF, HIMSELF, HERSELF, ITSELF, with their plurals. But although this seems to have been the original use of this pronoun; yet, in the English language, its use has been extended further; and from its always having a reference to the agent of any action, it has been employed to denote that agent by way of emphasis, as performing the action without the aid or assistance of any other; as, *he himself went*. And from this circumstance it has been further extended to denote any object as performing or suffering any thing which we would not naturally have expected from its known character or nature; as in this sentence: "The most daring of mankind are sometimes startled before they venture upon the commission of any extraordinary crime; even Cæsar HIMSELF felt the utmost perturbation of mind before he dared to pass the Rubicon."

26. These are all that can be properly called *personal pronouns*; but there are others which are derived from them, called *possessive pronouns*, as, MY, THY, MINE, HIS, HER'S, ITS, &c. the nature of which it will be necessary here to explain. We have already shewn how nouns, when they came to denote possession, were no longer to be considered as nouns, but rather as definitives or articles; so the pronouns which we here consider, being the real substitutes of *nominal* articles, ought also to be considered as a distinct class of pronomial articles; for as these never, in any case, can be sub-

Pronouns. substituted for a noun, they cannot be considered as pronouns. Grammarians have been led into the miſtake of placing them under this head, becauſe they are the ſubſtitutes of theſe words, which, although they aſſume the appearance of nouns, only perform the part of definitives. Thus we have ſeen, that when we ſay, *Alexander's houſe;* the word *Alexander's* can only be conſidered as a definitive: and, in the ſame manner, if Alexander was the ſpeaker, he might ſay, MY *houſe;* if the party addreſſed, it would be, THY *houſe;* or if any third perſon, HIS, and in the ſame manner HER'S or ITS, *houſe*. In all which caſes this poſſeſſive pronoun is ſubſtituted for that word which only ſerves to define and aſcertain the identity of the noun; and not for the noun itſelf, which muſt always be either expreſſed or underſtood. Hence the reaſon why one pronoun becomes the ſubſtitute of this noun and its proper definitive, whether that definitive appears in the form of a noun or pronoun: for I can ſay, "*Alexander's houſe* is more elegant than *Mary's*, or *his houſe* is more elegant than *hers*, although IT neither is ſo commodious nor agreeable to live in." In which example it is plain, that the words *his* and *hers* are ſtrictly the ſubſtitutes only of *Alexander's* and *Mary's*, and nothing more; whereas the pronoun IT is the ſubſtitute of the whole noun with its definitive *Alexander's houſe*. The other claſs of pronouns poſſeſſive, MINE, THINE, &c. as they do not ſo much ſerve to diſtinguiſh individuals, as to aſcertain the property of the thing ſpoken of, which may, in a certain ſenſe, be conſidered as an attribute thereof, are more nearly allied to attributives, and have therefore by ſome been called *adjectives*. And it muſt be acknowledged, that theſe two claſſes of words are ſo nearly allied to one another, that it is difficult to aſcertain, in all caſes, the preciſe boundary between them.

27. Beſides theſe, there are other words which ſometimes aſſume the province of pronouns, and are generally conſidered as belonging to this claſs, although in many caſes improperly; ſuch as, THIS, THAT, ANY, SOME, THESE, THOSE, ALL, and ſome others, which may be called *improper* pronouns. To diſtinguiſh when they may be conſidered as pronouns, we may obſerve, that when they ſtand by themſelves, and ſupply the place of a noun, as when we ſay, THIS *is virtue, give me* THAT, then are they pronouns. But when they are aſſociated to ſome noun, as when we ſay, THIS HABIT *is virtue*, or THAT MAN *defrauded me;* then, as they do not ſupply *the place* of a noun, but only ſerve to *aſcertain* one, they fall rather under the ſpecies of *definitives*, or *articles*. And indeed it muſt be confeſſed, that theſe, as well as the poſſeſſive pronouns, are more properly adapted to define and aſcertain individuals among nouns, than to ſupply their place; and therefore are oftener to be conſidered as articles than as pronouns. The beſt rule to diſtinguiſh when they are to be conſidered as the one or the other, is this. The genuine PRONOUN *always ſtands by itſelf*, aſſuming the power of a NOUN, and ſupplying its *place*. The genuine ARTICLE *never ſtands* by *itſelf;* but appears at all times *aſſociated to ſomething elſe*, requiring a noun for its ſupport, as much as *attributives* or *adjectives*.

28. The three orders of pronouns already mentioned, may be called *prepoſitive;* becauſe they are capable of introducing or leading a ſentence, without having reference to any thing previous. But there is another order of pronouns which can never be employed but to *connect* ſentences, and muſt therefore always have a reference to ſome ſentence that precedes them; as, WHO, WHICH, WHAT. The nature of which may be explained as follows. Pronouns.

29. Suppoſe I ſay, LIGHT *is a body;* LIGHT *moves with great celerity;* theſe would apparently be two diſtinct ſentences. But if, inſtead of the ſecond LIGHT, I were to place the prepoſitive pronoun IT, and ſay, LIGHT *is a body,* IT *moves with great celerity;* the ſentences would ſtill be diſtinct, and two. But if I add a *connective*, (as for example, AND) ſaying, LIGHT *is a body,* AND IT *moves with great celerity;* I then, by connection, make the two into *one*. Now it is *in the united powers of a connective and another pronoun*, that we may ſee the force and character of the pronoun here treated of. For if, inſtead of the words AND IT, we ſubſtitute THAT or WHICH; ſaying, LIGHT *is a body* WHICH *moves with great celerity;* the ſentence ſtill retains its *unity*, and becomes, if poſſible, more compact than before. We may therefore call this pronoun the SUBJUNCTIVE; becauſe it cannot introduce an original ſentence, but only ſerves to *ſubjoin one to ſome other which is previous*.

30. The application of this *ſubjunctive*, like the other pronouns, is univerſal. It may be the ſubſtitute of all kinds of ſubſtantives, natural, artificial, or abſtract; general, ſpecial, or particular: for we may ſay, The *man who*, the *ſhip which*, *Alexander who*, *virtue which*, &c. Nay, it may even be the ſubſtitute of all the other pronouns, and is therefore of courſe expreſſive of all the three perſons. Thus we ſay, I WHO *now write*, THOU WHO *now readeſt*, HE WHO *now heareth*, &c. And thus the SUBJUNCTIVE is truly a *pronoun* from its *ſubſtitution;* there being no ſubſtantive exiſting in whoſe place it may not ſtand. At the ſame time it is eſſentially diſtinguiſhed from the other pronouns by this particular, that it is not only a *ſubſtitute*, but likewiſe a *connective*.

31. As to the accidents of this pronoun: From its performing the part of a connective, it of courſe follows, that neither *gender* nor *number* can be conſidered as eſſential to it; becauſe theſe are always expreſſed in the preceding parts of the ſentence to which it refers; nor do we in fact find, that this pronoun, at leaſt in modern languages, admits of any diſtinction to denote *number*, although the Engliſh language admits of one variation for the *gender;* as we employ WHO for the *maſculine* and *feminine*, and WHICH for the *neuter* gender, thus: *The man*, or *the woman*, WHO *went to Rome;* the TREE *which ſtands on yonder plain*, &c. It likewiſe admits of a variation ſimilar to that of the accuſative caſe; at leaſt when applied to males or females. For when the object which it repreſents is the efficient cauſe of action, it is WHO; as, *the man* WHO *fell*, &c.; but when it is the paſſive ſubject, it then, in certain circumſtances, takes the form of WHOM; as, *the man of* WHOM *I ſpeak;* although this is not univerſal; as we likewiſe ſay, *the man* WHO *was beaten*. But the neuter admits of no ſuch diſtinctions, as we equally ſay, *the tree* WHICH *fell*, or *the tree of* WHICH *I ſpoke*. But both of theſe admit of a variation to denote poſſeſſion or qualities, which is the

Verbs. word WHOSE for all genders. Thus we fay, *Socrates* WHOSE *only ſtudy was virtue*; *Elizabeth*, WHOSE *reign was glorious*.

32. To conclude: We have ſeen that ſubſtantives are either *primary* or *ſecondary*; or, in other words, NOUNS OF PRONOUNS. The NOUNS denote ſubſtances, either *natural*, *artificial*, or *abſtract*; and theſe either *general*, *ſpecial*, or *particular*. The PRONOUNS, their ſubſtitutes, are either *prepoſitive* or *ſubjunctive*: the PREPOSITIVE is diſtinguiſhed into three orders, called the *firſt*, the *ſecond*, and the *third* perſons; the SUBJUNCTIVE includes the powers of all the three, having *ſuperadded*, as of its own, the peculiar force of a connective.

CHAPTER II.

Of ATTRIBUTIVES.

33. As all attributives muſt either be expreſſive of the attributes of SUBSTANCES, or of other ATTRIBUTES, we divide this claſs into two kinds; calling thoſe of the firſt kind, ATTRIBUTIVES OF THE FIRST ORDER; and thoſe of the ſecond kind, ATTRIBUTIVES OF THE SECOND ORDER.

SECT. I. Attributives *of the Firſt Order*.

34. ATTRIBUTIVES are all thoſe *principal* words that denote *attributes* conſidered as attributes. Such, for example, are the words, *black*, *white*, *great*, *little*, *wiſe*, *eloquent*, *to write*, *to walk*, *to ſpeak*, &c. all of which are the *attributes of ſubſtances*. Thus *black* is an attribute of *jet*, *white* of *ſnow*;—*wiſe* and *eloquent*, as alſo, *to write* and *ſpeak*, are attributes of *men*.

In examining the different attributes of ſubſtances, we readily perceive that ſome of them have their eſſence in *motion*: ſuch are, *to walk*, *to fly*, *to ſtrike*, *to live*, &c. Others have it in the *privation* of *motion*; as, *to ſtop*, *to reſt*, *to ceaſe*, *to die*, &c. And others have it in ſubjects that have *nothing to do* with either *motion* or its *privation*; ſuch are the attributes of *great* and *little*, *wiſe* and *fooliſh*, *white* and *black*, and, in a word, the ſeveral *quantities* and *qualities* of all things. This therefore furniſhes a natural diviſion of attributives of this order; and grammarians have called all thoſe, whoſe eſſence conſiſts in *motion* or its *privation*, VERBS; and all the others have been called ADJECTIVES; each of which we ſhall conſider ſeparately.

I. *Of* VERBS.

35. VERBS are all thoſe principal words which denote *attributes*, whoſe eſſence conſiſts in *motion*, or *energies*; (for we chooſe to make uſe of this laſt term, as it implies the exertions of the mind as well as thoſe of the body), or their *privation*. This order of attributives differs from the order called *adjectives*; not only in the particular above-mentioned, but alſo becauſe adjectives denote only qualities or quantities, which do not admit of any change of ſtate; whereas the verbal attributives may be conſidered as in ſeveral different ſtates, and therefore admit of ſeveral variations in the term employed to expreſs theſe. It may, in the firſt place, be conſidered as a ſimple attribute or energy, without particularizing any circumſtance relating to the ſtate it may be in; as in the word to WRITE. Or, in the ſecond place, as theſe are all attributes which denote motions or energies, they may be repreſented as in the ſtate of actual motion or exertion; as in the word WRITING. Or, laſtly, the motion or energy may be finiſhed, and its effect completed; as in the word WRITTEN. Hence, therefore, every verb admits of a threefold variation in every language, in each of which languages they are diſtinguiſhed by ſome particular names. Our grammarians have given the name of the INFINITIVE MODE to the original verb itſelf, and the other two variations of it are both diſtinguiſhed by the name of PARTICIPLES; that variation which exhibits the verb in its ſtate of energy being called the PARTICIPLE PRESENT OR ACTIVE, and the other variation is called the PARTICIPLE PERFECT OR PAST. Verbs.

36. Theſe variations of the verb are founded in the nature of things, and therefore muſt be found in every language under ſome form or other. As to the other ſuppoſed variations of verbs relating to perſon, number, time, &c. the ſlighteſt reflection on this ſubject will ſhew, that a verb, conſidered as a ſimple attributive, can admit of none of theſe affections, but muſt for ever remain the ſame at all times and in all ſituations whatever; for who does not ſee, that the attribute *to write* is the ſame whether it is poſſeſſed by *you*, by *me*, or by any number of different perſons? Nor does this attribute ſuffer any change, whether it is repreſented as having been exerted a *thouſand years ago*, or at *this preſent moment*, or at *any other* aſſignable period of duration; but, like every other attribute, it muſt remain for ever the ſame. For however *ſubſtances* may vary with time, and be inceſſantly changing; yet *attributes* of every ſort are altogether beyond its power. And we muſt eaſily perceive, that the attribute which is expreſſed by the word GOOD, is the ſame now as it was at the creation, or will be while the world exiſts. And in the ſame manner, *to walk*, *to write*, *to fly*, denote attributes, which muſt each of them preſerve their own particular nature during all the ſucceſſive ages of time. Hence therefore we ſee, that the verbal attribute muſt for ever remain in that ſtate, or modification, in which it is at firſt repreſented. Nor can it ſuffer any change, however different the circumſtances may be in which it can be applied in language. All, therefore, that can be ſaid of theſe ſeveral variations with which grammarians have uſually endowed verbs, is this, That, as an attributive, it hath ſuch an intimate connection with a ſubſtantive, as neceſſarily to be united with one, before it can make a principal figure in language: and as that union may be repreſented as taking place at different times, and under different circumſtances, the inventors of ſome languages have contrived to expreſs theſe different connections by a ſingle word, inſtead of doing it by different words, as the thing in itſelf would naturally require; in the ſame manner as thoſe who uſe the ſhort-hand method of writing, make a ſingle character expreſs a whole word or ſentence: And as it was moſt natural for the contrivers of theſe words to derive them from the verb itſelf of which they are compounded, they have each of them become a *real* variation of the original *word* which expreſſes the verbal attribute; and, from thus being a variation of the verbal *word*, they have at laſt come to be conſidered as an *eſſential* variation of the *verb itſelf*, which has occaſioned thoſe contradictory definitions, and that confuſion of ideas, which we meet with

with among all writers on this subject. But as we here consider language as in itself, without regarding the particular forms under which it may appear, we must reject all these variations of *persons*, *numbers*, *modes*, and *tenses*, which the verb itself has usually been supposed to undergo; and consider them, not as essential variations of the verb itself, but as variations produced in language by the combination of the verb with other parts of speech; and, therefore, relating to *syntax*, and of course belonging to those grammatical disquisitions alone which treat of the peculiarities of any particular language. But as these variations have been so universally considered as essential parts of the verb itself, and as the terms which this division of the verb have introduced into grammar are so frequently to be met with, it will be necessary to explain, in some measure, the meaning of these several terms.

37. In the natural world, no attribute can possibly exist without a substance to which it belongs, nor any substance without possessing certain attributes. So necessary and intimate is the connection between these, that it is as impossible to separate them, as to create or annihilate the several substances that possess these attributes. But although we are thus circumscribed as to our bodily powers, the mind admits not of such limitation; but can, with the utmost facility, separate every quality from every object whatever, and consider them apart; as, *colour* without *superficies*, *superficies* without *solidity*, or *weight* without *matter*, &c. and, when thus separated, apply them to what objects, and in what manner, it pleases. In this manner the mind abstracts those attributes which denote *motions* or *energies* from their *agents* or *energizers*, in the same way as it abstracts *qualities* from their *substances*. And it is these energies thus abstracted, which form that species of words called *verbs*; in the same manner as those attributes which denote *quantities* and *qualities* abstracted from their necessary substances, form *adjectives*. Thus, the term *to walk*, denotes a particular *energy* as considered perfectly apart from every *energizer*, in the same manner as the word *good* denotes a certain *quality* without regard to any particular *substance*.

38. Here then we discover a most essential difference between the order of nature, and that representation of it which man makes by means of words. For in *nature*, every quality must at all times be united with some substance, nor can ever be exhibited separate from it; but in *language*, every attributive, if it be considered at all, must be separated from the object to which it naturally belongs. Hence we see the reason why, in language, every *energy* and energizer, not only *may* be considered separately, but *must* for ever remain separate, unless they be united by some other power than what is necessarily their own. For the attribute *to write*, can no more be united to *man* its proper energizer, than a motion could commence without a cause; and till this attribute is united to its proper energizer, it must remain in a great measure dead and inefficacious in language.—To communicate life and energy, therefore, to this inert attribute, it must be united to its proper energizer; which can only be effected by the help of an assertion of the speaker himself; which may be considered as the same with regard to language, as life is in the natural world.

39. It is evident, that, by the assistance of an assertion, the speaker is enabled to unite any energy to any particular energizer, and thus, without making any change upon the attribute itself, represent a variety of changes produced upon other bodies by its means.—Thus, if I say, *I write*, what do I more than assert that I myself am possessed of that particular attribute denoted by the verb *to write*? If I say, *You write*, or *He writes*, what do I more than assert that another person is possessed of that particular attribute or energy?—If I say, *He* DID *write*, I only assert that the same attribute was possessed at another time, by the same person, as before. Hence, therefore, by the help of this assertion of the speaker, we are enabled to join this particular attribute to many different energizers, as well as to represent these different combinations as occurring at many different times; so that the same attribute may thus be made to appear under a great many different circumstances, and exhibit a great variety of changes upon other objects, although itself remains unchanged; the several variations which we perceive, only relating to the objects with which it is combined, or the means by which that union is effected.—In the same manner it often happens, that any object in nature, a house, for example, may appear extremely different when viewed from different situations.

40. From the intimate connection that takes place between the energy, the energizer, the assertion, and time, these several accessories have been considered as essential parts of the verb; and therefore some grammarians have defined a verb to be *A word denoting an energy, with time, and an assertion.* But if we were thus to confound things with those which may necessarily accompany them, we could never arrive at a clear perception of any subject whatever. But not to enter into the arguments that might be produced to shew the impropriety of this definition, we shall only observe, that by the universal acknowledgment of all grammarians this cannot be just. For they unanimously agree, that the *infinitive mode* is not only *a part* of every verb, but the *most essential part*; as it forms the root from which all the other parts are derived. But as this mode neither denotes either time or an assertion, it is evident that these, even by their own acknowledgment, can be at best but accessories, and not essential parts of the verb.

41. From these arguments, therefore, we must conclude, that the verb itself admits of no other variations but those already taken notice of;—that before it can produce any active effect in language, like every other attribute, it must be united to some proper energizer;—that this union in language can never be effected but by means of an exertion of the vital powers of the speaker, whereby he either publishes his perception thereof, or his will that it should be;—and that this union may be represented as taking place at all the different times that can be assigned. These, therefore, are each of them necessary accompaniments of a verb, but each of them separate and distinct in their own nature, not only from this verb, but from one another; and it becomes an essential part of the syntax of every language, to consider the various ways in which these can be combined and affect one another.—Nay, so intimate has this connection been thought to be by some, that the contrivers of certain languages have arranged

Verbs. them under particular classes, for the sake of distinctness and precision.—The form which a verb assumed, when thus varied in all the ways that their particular language would admit of, was called the CONJUGATION of the verb; the several parts of which may be understood from the following sketch.

42. When the verb is considered under the compound form of which we now speak, it can admit of variations chiefly in three respects. For, first, supposing the *attribute*, the *energizer*, and the *time* when that attribute was exerted by the energizer, to be the same; a variation may be occasioned by a change being produced in the *perception* or *volition* of the speaker, (which, for brevity, we will call the *assertion*), as in these examples: *I write*, SCRIBO; *I may write*, SCRIBAM; *do you write*, SCRIBE. The variations produced by this means have been called MODES. Secondly, Supposing the *attribute*, the *energizer*, and the *assertion*, to be the same; a change may be produced in the *time*, as in these examples: *I do write*, SCRIBO; *I have written*, SCRIPSI; *I shall write*, SCRIBAM, &c. The variations produced from this cause have been called TENSES. And thirdly, Supposing the *attribute*, the *time*, and the *assertion*, to remain unchanged, there may be a difference in the *energizer*; and this likewise admits of a division: for as the energizer may be only *one* or more persons, it must have a variation into *singular* and *plural* on these accounts; as in these examples: *I write*, SCRIBO; *thou writeſt*, SCRIBIS; *he writes*, SCRIBIT; and in the plural, *we write*, SCRIBIMUS; *ye write*, SCRIBITIS; *they write*, SCRIBUNT. The variations produced from this cause have been called PERSON and NUMBER.——These are all the variations which have been made in the Latin or Greek languages; and therefore our grammarians, who have adopted every idea they have of grammar from these languages, mention no more: but it was not necessary that they should have stopt here; for an attribute is surely as susceptible of the distinction of sex as of person, so that they might have had a variation for *Gender* also; and instead of having one word SCRIBIT to answer for all the three genders, *he*, *ſhe*, or *it writes*, they might have had three different words.—The composers of the Hebrew language have adopted this plan, and admit of two variations on this account. And the Russian language admits of a like variation in their verb for these genders; as in this example: ON ZOHELAL, *he has done*; ONA ZOHELALA, *ſhe has done*, &c. But as the two languages above-mentioned do not admit of this distinction, therefore all the variations that our verbs are said to admit of are MODES, which include within them TENSES, which include under them PERSONS, under which head is included NUMBER; and these are all the parts into which a CONJUGATION has been divided.—As to what concerns the nature and lesser distinctions of each of these, the following general remarks may be sufficient.

43. With regard to MODES; as this relates solely to the *perception* or *volition* of the speaker, it necessarily follows, that there ought to be a distinct and particular MODE for each diversity that there can be in his manner of perceiving or willing any thing whatever, the principal of which are the following.

If we simply declare that we perceive any object, or that such a thing is or will be, without any limitation or contingency, it forms what has been called the DECLARATIVE or INDICATIVE MODE; as, *I write*.—Again, if we simply represent it to be within our *power*, or to depend upon our choice, it forms two other modes, which may be called the POTENTIAL, as, *I can write*; or the ELECTIVE, as, *I may write*.—In the same manner, if the speaker represents himself, or any other object, as *determined* to perform any action, or as *compelled* to it, or as it is his *duty* to perform it; these form so many distinct modes, which may be called the DETERMINATIVE, as, *I will write*; the COMPULSIVE, as, *I muſt write*; and OBLIGATIVE, as, *I ſhould write*. But although each of these represents the speaker as perceiving the agent under a different light with respect to the action; yet as all of them, except the indicative, agree in this, that however much they may represent it as the *duty* or *inclination*, &c. of the agent to perform any action with which they are associated, yet as they are still of the nature of contingents which may never take effect, they are frequently subjoined to any other verb; therefore the Latins have comprehended all of these under one mode, which they have called the SUBJUNCTIVE. We only take notice of this circumstance here, to shew, that however naturally *sentences* may be distinguished into modes, according to the different situation of the speaker; yet as the whole order of the variation of words in the conjugation of a verb is merely arbitrary, those who invent them may arrange them into what order they please, and call them by what names they may think most proper. But, however they may vary the names or external arrangement, this does not affect the things themselves. For, by whatever name the *mode* may be known which comprehends the words expressive of these several meanings, the sentences formed by these will be either *potential*, *obligative*, *compulsive*, &c. as above explained. Verbs.

All these modes above-mentioned only relate to the different *perceptions* of the speaker. But as man is not only endowed with the powers of *perception*, but those of *volition* also, he must have words to express these; which forms another order of modes. As he is not only dependent himself, but has others depending upon him, he may *command*, *intreat*, *beg*, *pray*, *wiſh*, *inquire*.—Hence, therefore, so many different orders of modes, the IMPERATIVE, REQUISITIVE, PRECATIVE, OPTATITE, INTERROGATIVE, &c. to which may be added the VOCATIVE. But although each of these displays a distinct affection of the speaker, yet grammarians have allotted only one variation of the verb for all of these purposes, called the IMPERATIVE MODE; all the other volitions being expressed by this, or some other modes, by the help of particular contrivances, which are different in different languages.

44. With regard to that variation of the verb which relates to *time*, called TENSES: As an action or event may be represented as happening at any assignable period of time, it is necessary to divide that duration into certain parts, that we may be able to represent the different relations which events bear to one another with respect to this particular. The first and most obvious division of time is into *present*, *paſt*, and *future*. But we may go farther still in our divisions of time. For as time past and future may be infinitely extended, we may in *universal time paſt* assume *many particular*

lar times paſt, and in *univerſal time future many particular times future*, ſome more, ſome leſs remote, and correſponding to each other under different relations. Even *preſent time*, however, in ſtrict phyſical truth, it may be incapable of it, is by the power of the imagination brought to admit of theſe differences, and as neceſſarily implies *ſome degree of extenſion*, as every given line however minute: And hence it is not ſufficient for language to denote INDEFINITELY mere *paſt*, *preſent*, or *future* times; but on many occaſions to DEFINE with more preciſion what *kind* of *paſt*, *preſent*, or *future*, is meant.

45. Tenſes, therefore, or thoſe variations of a verb which denote a difference of *time* only, may be all divided into PRESENT, PAST, and FUTURE; each of which may be ſubdivided into DEFINITE and INDEFINITE. The *definite tenſes* are thoſe where the particular inſtant of time, whether preſent, paſt, or future, is pointed out. The *indefinite* are thoſe where paſt, preſent, or future time is indicated in general, without confining it to a particular inſtant in either of theſe caſes. Theſe have been diſtinguiſhed among grammarians by the name of AORISTS.—Thus when Milton makes Adam ſay,

Millions of ſpiritual creatures WALK *the earth,*
Unſeen, both when we wake and when we ſleep,

the verb WALK means not that they were walking at that inſtant only when Adam ſpoke, but *indefinitely* in any inſtant whatever. So likewiſe, when the ſame author calls hypocriſy

—— *the only evil which* WALKS
Inviſible except to God alone,

the verb WALKS has the like aoriſtical ſignification. *He* WENT, *he* FELL, are *aoriſts* of the paſt, as they do not ſpecify any particular inſtant, but refer to paſt time in general. So likewiſe in the legiſlative ſentences, *thou ſhalt not kill*, *thou ſhalt not ſteal*, &c. the ſame aoriſtical meaning is perceived, as the prohibition does not relate to any *particular time future*, but is extended indefinitely to *every* time *future*.

46. But it is not ſufficient for a language to denote time in this indefinite manner: it is neceſſary likewiſe that it ſhould be capable of ſpecifying any particular inſtant of time in an exact and definite manner. Thus, if, inſtead of the word WALK in the firſt ſentence above quoted, we were to put ARE WALKING, it brings down the verb to denote a particular time, and ſpecifies that theſe *ſpiritual creatures* are, at that very *inſtant* in which Adam ſpeaks, walking upon the earth unſeen. In like manner, in the ſecond ſentence, if the word WALKS were changed to IS WALKING, it denotes, that hypocriſy, at that *particular inſtant* in which the ſentence was pronounced, was walking inviſible upon the earth. And in the ſame manner, was WALKING, or WILL BE WALKING, each of them denote, that theſe energies *were* or *will be* exerted at a particular ſpecified time. Theſe, therefore, form ſo many diſtinct definite tenſes, under whatever technical name theſe may be known.

47. Here then we may ſee the uſe of that diſtinction of the different ſtates of the verb, into the *verb properly ſo called*, and *participles*. For as the verb itſelf exhibits the word as altogether *indefinite*; when this is joined to its proper energizer, it forms all theſe INDEFINITE TENSES which our language requires. Thus, *I write*, *I did write*, *I will write*, *I may write*, *I can write*, &c. each of them, although they repreſent the attribute as united to the energizer in ſome *paſt*, *preſent*, or *future* time, do not ſpecify any particular inſtant, and are therefore ſo many aoriſts or indefinite tenſes. Whereas in the *participle* the attribute is repreſented as in a ſtate of exertion, it neceſſarily follows, that if it be ever united to its energizer, it muſt point out the particular inſtant when that union took effect, and of conſequence form as great a variety of DEFINITE TENSES as the verb forms of indefinite. Thus, *I am writing*, neceſſarily implies that I am actually exerting this particular energy at the *very inſtant* that I declare it. So likewiſe, if I ſay, *I was writing*, it indicates, that at one *particular inſtant* of paſt duration, to which this has a reference, I was actually employed in that particular occupation. This inſtant is generally fixed by ſome collateral circumſtance; as, "upon the twentieth day of Auguſt laſt, at twelve o'clock, *I was writing*;" or, "when the thunder broke upon the tower in my neighbourhood, *I was writing*," &c. And the ſame may be ſaid of future time; as, "to-morrow at ten o'clock *I ſhall be writing*," &c. In all of which caſes it is obvious, that a particular *now* or *inſtant* is pointed out, in which the attribute is repreſented as united to its proper energizer. We might here proceed to ſhew the various times that each of theſe different ſtates of the verb might be made to indicate; the number of *tenſes* that each mode admitted of; the ſeveral changes that might be produced by joining the *participle perfect* with any object; which cannot be here called the *energizer*, but the *ſubject*; for as the energy is by this participle repreſented as compleated, if it has any connection with any perſon, as the attribute cannot be affected by any energizer after it is compleated, it muſt of neceſſity affect the perſon, inſtead of being affected by it; and hence it is that the ſeveral variations produced by this participle perfect have been called the PASSIVE VOICE of the verb. But as all theſe particulars only relate to the conſtruction of one particular language, it would lead us a great deal too far from the particular ſubject of which this article treats. We ſhall therefore only obſerve, that beſides the above variations of the verb, which the Greeks and Romans have thought proper to make, the terms of which we have adopted; there are many others that they might with equal propriety have made, but which they rather choſe to expreſs by the help of other words called *adverbs*. But ſome other languages have gone further in this reſpect, and endowed their verbal word with ſeveral variations to expreſs ſeveral other circumſtances than they do. This is particularly the caſe with the Hebrew language, which, beſides the variation for gender above-mentioned, has allotted certain other variations of its verb to expreſs ſeveral other circumſtances. Thus, PAKAD in that language ſignifies *he viſited*; PAKEDA, *ſhe viſited*, &c.; PIKKED, *he viſited diligently*; HEPHKED, *he made him viſit*; and HETHPEKED, *he viſited himſelf*. In this manner is every verb in that language varied; and each of theſe different conjugations of their verb admits of a particular variation for the paſſive of each.—Hence, therefore,

Verbs. fore, the conjugation of a verb in that language admits of a great many variations which neither the Greeks nor Romans were aquainted with: for beſides the diſtinctions of *modes*, *tenſes*, *perſons*, and *number*, they have divided their verb into ſo many diſtinct diviſions to anſwer for theſe diſtinctions above mentioned, which they have denominated KAL, PIHEL, HIPHIL, and HITHPAHEL. with their paſſives NIPHAL, PUHAL, and HOPHAL; each of which admit of variations through all the *modes*, *tenſes*, *perſons*, *numbers*, and *genders* which any of their verbs admit of.

48. The only uſe which we meant to make of theſe obſervations on the Hebrew verbs, is this: That as the authors, who have formed their idea of grammar from the forms which the ſeveral parts of ſpeech admit of in the Greek and Latin languages, have ſuppoſed that every variation which theſe languages admitted of was a natural and neceſſary part of language; and that therefore every languuge which did not admit of the ſame number of variations, with theirs, in every part of ſpeech, was in ſo far defective and incomplete; ſo, for the ſame reaſon, an author who had formed his idea of grammar upon the model of the Hebrew tongue, would as naturally ſuppoſe, that the ſeveral variations which the verb admitted of in his own favourite language were eſſential and neceſſary; and that, of conſequence, every language which did not admit of as many variations was imperfect and incomplete. But to any one who conſiders this matter with attention, it will appear, that there could be no end to theſe unneceſſary diſcuſſions and groundleſs claims of fancied ſuperiority: for if compound words have ſuch an advantage over ſimple, the Chineſe language, in which we are told almoſt every ſentence has a particular compound character to expreſs it, muſt be by far the moſt perfect in the world; but ſo far is this from being the caſe, that every one allows it to be the moſt imperfect and incomplete. The only method, therefore, which remains for us to conſider this ſubject is, to diſregard every particular form of language, and conſider the words in themſelves, as diveſted of every extraneous circumſtance, and obſerve what variations they neceſſarily require, allowing every particular language to compound theſe with one another in what manner it ſhall think proper. It is in this manner we have conſidered the verbal attributives, and endeavoured to diſentangle them from thoſe unneceſſary fetters with which they have been loaded, and reſtore them to their own original freedom.

49. Beſides the variations above-mentioned, verbs have been diſtinguiſhed from one another in a different manner; the names and nature of which may be thus explained.

We have already ſeen, that all verbs, as they denote *energies*, neceſſarily have reference to certain *energizing ſubſtances*. For, how could there be ſuch energies as *to love*, *to fly*, *to wound?* &c. were there not ſuch beings as *men*, *birds*, *ſwords*, &c. Farther, every energy not only requires an energizer, but is neceſſarily converſant about ſome ſubject. For example, if we ſay, *Brutus loves*, we muſt needs ſupply —loves *Cato*, *Caſſius*, or ſome one. And thus it is, that every energy is neceſſarily ſituated between two ſubſtantives, an energizer which is *active* and a ſubject which is *paſſive*. If the energizer leads the ſentence, the energy has been ſaid to follow its character, and becomes what we call a VERB ACTIVE: thus we ſay, BRUTUS AMAT, *Brutus loves*. On the contrary, if the paſſive ſubject be principal, it is ſaid to follow the character of this too, and becomes what we call a VERB PASSIVE: thus we ſay, PORTIA AMATUR, *Portia is loved*. But in ſome verbs it happens, that the energy *always keeps within the energizer*, and never paſſes out to any extraneous ſubject. Thus, when we ſay, *Cæſar walketh*, *Cæſar ſitteth*, it is impoſſible that the energy *ſhould paſs out*, becauſe both the *energizer* and the *paſſive ſubject* are united in the *ſame perſon*. For what is the cauſe of this walking or ſitting? it is the *will* and *vital powers* belonging to *Cæſar*: And what is the ſubject made ſo to move or ſit? it is the *body* and *limbs* belonging alſo to the ſame *Cæſar*. This ſpecies of verbs have been by grammarians diſtinguiſhed by the name of VERBS NEUTER, as if they were void both of *action* and *paſſion*, when perhaps they may be rather ſaid to imply both. It is in this manner, that verbs have been diſtinguiſhed into the three claſſes of *active*, *paſſive*, and *neuter*. Theſe, however, might with more propriety be divided into two claſſes, which might be called verbs TRANSITIVE, and NOT TRANSITIVE; the firſt claſs including all thoſe verbs which are uſually called *active*, with the *paſſives* belonging to them; for it is evident, that theſe paſſives are not verbs themſelves, but a variation only of a verb; and the ſecond claſs including thoſe verbs commonly called *neuter*.

Some languages, as the Greek and French, have another claſs of verbs, which are called by the firſt VERBS MIDDLE, and by the laſt RECIPROCAL VERBS; which are employed to denote that ſtate of any tranſitive verb, when the energizer himſelf becomes the ſubject; as thus, *Brutus killed himſelf*, &c. But as theſe only expreſs a ſlight variation of an accompaniment of a verb, they have no claim to be conſidered as a diſtinct ſpecies.

Adjective

II. Of ADJECTIVES.

50. ADJECTIVES are all thoſe words which denote attributes whoſe eſſence does not conſiſt in motion or its privation: or, in other words, they are thoſe words which denote the attributes of quantity, quality, and relation; ſuch as, *many*, *few*, *great* and *little*, *black* and *white*, *good* and *bad*, *double*, *treble*, *quadruple*, &c.

As theſe attributes admit of no change of ſtate, nor can be effected by the variations of time, or any other accident, but are in their own nature perfectly fixed and invariable, the words which expreſs them ought to be in all ſituations and on all occaſions the ſame. For as the qualities *good* or *bad*, *black* or *white*, admit of no change in their own nature, whether they be applied to a *man*, to a *woman*, to *many* or to *few*; neither ought the word which expreſſes any one of theſe attributes in ſtrictneſs to admit of any alteration, whether it be joined to one or other of theſe ſubſtantives. So that although, in ſome languages, from the particular conſtruction of the other parts of ſpeech, it has been found neceſſary to endow their adjectives with the threefold diſtinction of *gender*, *number*, and *caſe*; yet this muſt only be conſidered as an accidental variation occaſioned by particular circumſtances, and

not

Adverbs. not in the leaſt eſſential to language, but rather a deviation from the order of nature, which would require them to be kept invariably the ſame in all caſes. This order, the Engliſh language (which in this and almoſt every other caſe is moſt ſtrictly conformable to the nature of things than any other language we are acquainted with) moſt ſtrictly obſerves; as we ſay equally, *a good man*, or *a good woman*, *a good houſe*; or *good men*, *good houſes*, &c.

It has probably been from obſerving that the adjectives in ſome particular languages are endowed with variations conformable to the *gender*, *number*, and *caſe* of their ſubſtantives, that grammarians have been led into the ſtrange abſurdity of ranging them with nouns, and ſeparating them from verbs; though with reſpect to verbs they are perfectly homogeneous, and with reſpect to nouns they are quite the contrary. Adjectives are homogeneous with reſpect to verbs, as both ſorts denote *attributes*; they are hetergeneous with reſpect to nouns, as *never properly denoting ſubſtances*.

51. Beſides original adjectives, there is another claſs which are formed from ſubſtantives. Thus when we ſay, *the party of Pompey*, *the ſtyle of Cicero*, *the philoſophy of Socrates*; in theſe caſes, the party, the ſtyle, and philoſophy ſpoken of, receive a ſtamp and character from the perſons they reſpect, and actually paſs into attributives, and as ſuch aſſume the form of *adjectives*. And hence we ſay, *the Pompeian party*, *the Ciceronian ſtyle*, and *the Socratic philoſophy*. In like manner, for a trumpet of braſs, we ſay, *a braſen trumpet*; for a crown of gold, *a golden crown*, &c. Even pronomial ſubſtances admit the like mutation; as, inſtead of ſaying the book *of me*, *of thee*, or *of him*, we ſay, *my* book, *thy* book, *his* book, &c. Yet it muſt be acknowledged, that theſe, as they often ſerve rather to define a noun than to denote any quality appertaining to it; they partake more of the nature of *articles* than *adjectives*; ſo that it is in many caſes difficult to aſcertain exactly to which claſs they are to be refered. But of this we have already taken particular notice.

The nature of theſe variations of adjectives, which have been called *degrees of compariſon*, will be more properly explained under the following ſection.

SECT. II. *Of* Attributives of *the Second Order*, *called* ADVERBS.

52. As the Attributives hitherto mentioned denote the *attributes of ſubſtances*, ſo there is an inferior claſs of them which denote the *attributes* only of *attributes*. To explain theſe by examples of either kind: When we ſay, "*Cicero* and *Pliny* were both of them *eloquent*; *Statius* and *Virgil* both of them *wrote*;" in theſe inſtances, the attributes *eloquent* and *wrote*, are immediately referable to the ſubſtantives *Cicero*, *Virgil*, &c.: As, therefore, denoting the *attributes of ſubſtances*, we call them ATTRIBUTIVES OF THE FIRST ORDER. But when we ſay, "*Pliny* was *moderately* eloquent, but *Cicero exceedingly* eloquent; *Statius* wrote *indifferently*, but *Virgil* wrote *admirably*:" in theſe inſtances, the attributives *moderately*, *exceedingly*, *indifferently*, and *admirably*, are not referrable to *ſubſtantives*, but to *other attributes*; that is, to the words *eloquent* and *wrote*: As, therefore, denoting *attributes of attributes*, we call them ATTRIBUTIVES OF THE SECOND ORDER. Theſe have been by grammarians, called ADVERBS. And indeed, if we take the word VERB in its moſt comprehenſive ſignification, as including all the words which denote the *attributes* of *ſubſtances*, (which was the ſenſe in which Ariſtotle and many of the moſt ancient grammarians employed it), we ſhall find the name ADVERB to be a very juſt appellation, as denoting a *part of ſpeech the natural appendage of verbs*. So great is this dependence in grammatical ſyntax, that an *adverb* can no more ſubſiſt without its *verb*, than a *verb* can ſubſiſt without its *ſubſtantive*.

53. Among the attributes of ſubſtances are reckoned quantities and qualities. Thus we ſay, *a white garment*, *a high mountain*, &c. Now ſome of theſe quantities and qualities are capable of *intenſion* and *remiſſion*. Thus we ſay, *a garment* EXCEEDINGLY *white*, *a mountain* TOLERABLY or MODERATELY *high*. Hence, then, one copious ſource of ſecondary attributives, or adverbs, to denote theſe two, that is, *intenſion* and *remiſſion*; ſuch as, *greatly*, *vaſtly*, *extremely*, *ſufficiently*, *moderately*, *tolerably*, *indifferently*, &c.

But where there are different intenſions of the ſame attribute, they may be *compared* together: thus, if the garment A be EXCEEDINGLY *white*, and the garment B be MODERATELY *white*, we may ſay, the garment A is MORE *white* than the garment B. In theſe inſtances, the adverb MORE not only denotes intenſion, but *relative intenſion*. Nay, we ſtop not here, as we not only denote intenſion *merely relative*, but *relative intenſion than which there is none greater*. Thus we not only ſay, the *mountain* A *is* MORE *high than the mountain* B, but that *it is the* MOST *high of all mountains*. Even *verbs* properly ſo called, as they admit of *ſimple intenſions*, ſo they admit alſo of theſe *comparative ones*. Thus, in the following example, *Fame he* LOVETH MORE *than riches*, *but virtue of all things he* LOVETH MOST; the words MORE and MOST denote the different *comparative intenſions* of the verbal attribute *loveth*.

54. Hence the riſe of COMPARISON of adjectives, and of its different *degrees*, which cannot well be more than the two ſpecies above-mentioned; one to denote *ſimple exceſs*, and one to denote *ſuperlative*. Were we indeed to introduce more degrees than theſe, we ought perhaps to introduce *infinite*, which is abſurd. For why ſtop at a limited number, when in all ſubjects ſuſceptible of intenſion the intermediate exceſſes are in a manner infinite? There are infinite degrees of *more white*, between the firſt *ſimple white*, and the ſuperlative *whiteſt*; and the ſame may be ſaid of *more* great, *more* ſtrong, *more* minute, &c. The doctrine of grammarians about three ſuch degrees of compariſon, which they call the *poſitive*, the *comparative*, and the *ſuperlative*, muſt be abſurd; both becauſe in their poſitive there is no compariſon at all, and becauſe their ſuperlative is a comparative as much as their comparative itſelf. Examples to evince this may be met with every where; *Socrates was the* MOST WISE *of all the Athenians*; *Homer was the* MOST SUBLIME *of all poets*, &c.

55. The authors of language have in ſome inſtances contrived a way to retrench theſe comparative adverbs, by expreſſing their force by an inflection of the primary

Adverbs.

primary attributive. Thus, inſtead of *more fair*, they ſay FAIRER; inſtead of *moſt fair*, FAIREST: and the ſame method of compoſition takes place both in the Greek and Latin languages; with this difference, however, between the genius of theſe languages and ours, that we are at liberty to form the compariſon either in the one method or the other: but, in theſe languages, the compariſon is almoſt never formed by the aſſiſtance of the adverb, but always by the inflection of the adjective; and hence this inflection is always conſidered by them as a neceſſary accident of the adjective. But this method of expreſſing the power of the adverb has reached no farther than to adjectives, or to their participles, which are ſo nearly allied to adjectives. Verbs were perhaps thought to be too much diverſified, to admit of more variations without perplexity.

56. Some qualities admit of compariſon, others admit of none: ſuch, for example, are thoſe which denote *that quality of bodies ariſing from their figure*; as when we ſay, a *circular* table, a *quadrangular* court, a *conical* piece of metal, *&c.* The reaſon is, that a million of things participating the ſame figure, participate it *equally* if they do it all. To ſay, therefore, that while A and B are both quadrangular, that A is more or leſs quadrangular than B, is abſurd. The ſame holds in all attributives denoting *definite quantities*, of whatever nature. For as there can be no *compariſon* without *intenſion* or *remiſſion*, and as there can be no intenſion or remiſſion in things *always definite*, therefore theſe attributives can admit of no compariſon. By the ſame method of reaſoning, we diſcover the cauſe why *why no ſubſtantive is ſuſceptible of theſe degrees of compariſon*. A *mountain* cannot be ſaid MORE TO BE OR TO EXIST than a *mole-hill*; nor the *lion* A cannot be *more a lion* than the lion B: but the *more or leſs* muſt be ſought for in their quantities and qualities; a mountain is more *bulky* than a mole-hill, and the lion A is *more fierce* than the lion B; the exceſs being always derived from their attributes.

57. Of the adverbs or ſecondary qualities already mentioned, thoſe denoting intenſion and remiſſion may be called adverbs of QUANTITY CONTINUOUS; *once, twice, thrice*, &c. are adverbs of QUANTITY DISCRETE; *more* and *moſt*, *leſs* and *leaſt*, to which may be added *equally*, *proportionally*, &c. are adverbs of RELATION. There are others of QUALITY; as when we ſay, HONESTLY *induſtrious*, PRUDENTLY *brave*; *they fought* BRAVELY, *he painted* FINELY, *&c.*

58. The adverbs hitherto mentioned, are common *to verbs of every ſpecies*; but there are ſome which are confined to *verbs* properly ſo called, that is to ſay, to ſuch as denote *motions* or *energies* with their *privations*. All *motion* and *reſt* imply *time* and *place* as a kind of neceſſary coincidence. Hence, if we would expreſs the *place* or *time* of either, we muſt needs have recourſe to adverbs formed for this purpoſe; of PLACE, as when we ſay, *he ſtood* THERE, *he went* HENCE, *he travelled* FAR, *&c.*; or of TIME, as when we ſay, *he ſtood* THEN, *he went* AFTERWARD, *he travelled* FORMERLY, *&c.* Should it be aſked, Why *adverbs of time*, when verbs have *tenſes?* The anſwer is, though tenſes may be ſufficient to denote the greater diſtinctions of time, yet to denote them all by tenſes would be a perplexity without end. What a variety of forms would be neceſſary to denote *yeſterday*, *to-day*, *to-morrow*, *formerly*, *juſt now*, *now*, *immediately*, *preſently*, *ſoon*, *hereafter?* &c.

59. To theſe adverbs juſt mentioned may be added thoſe which denote the *intenſions* and *remiſſions peculiar to* MOTION, ſuch as *ſpeedily*, *haſtily*, *ſwiftly*, *ſlowly*, &c.; as alſo adverbs of *place* made out of *prepoſitions*, ſuch as *upward* and *downward*, from *up* and *down*. In ſome inſtances the prepoſition ſuffers no change, but becomes an adverb by nothing more than its application; as when we ſay, *he rides* ABOUT, *he was* NEAR *falling*, &c.

60. There are likewiſe adverbs of INTERROGATION: ſuch as, *where*, *whence*, *whither*, *how*, &c. of which there is this remarkable, that when they loſe their *interrogative power*, they aſſume that of a *relative*, ſo as to repreſent the *relative* or *ſubjunctive pronoun*; as in this doggerel tranſlation of a line from Virgil,

And corn doth grow WHERE *Troy town ſtood*;

that is to ſay, *corn groweth in that place* IN WHICH *Troy ſtood*, the power of the relative being implied in the adverb. It is in like manner that the *relative pronoun* becomes an *interrogative*; as in this line from Milton,

Who firſt ſeduc'd them to that foul revolt?

The reaſon of this is as follows: the *pronoun* and *adverbs* here mentioned are all, in their original character, RELATIVES. Even when they become interrogatives, they loſe not this character, but are ſtill relatives as much as ever: the difference is, that, *without* an interrogation, they have reference to a ſubject which is *antecedent*, *definite*, and *known*; *with* an interrogation, to a ſubject which is *ſubſequent*, *indefinite*, and *unknown*, and which it is expected the anſwer ſhould expreſs and aſcertain. WHO *firſt ſeduc'd them?* The queſtion itſelf ſuppoſes a ſeducer, to which, though *unknown*, the pronoun *who* has a reference—*Th' infernal ſerpent*. Here, in the anſwer, we have the ſubject, which was *indefinite*, aſcertained; ſo that we ſee WHO, in the *interrogation*, is as much a *relative* as if it had been ſaid originally, without any interrogation at all, *It was the infernal ſerpent who firſt ſeduced them:* and thus interrogatives and relatives mutually paſs into one another.

Having thus conſidered all thoſe parts of ſpeech which ARE SIGNIFICANT OF THEMSELVES, we proceed to thoſe AUXILIARY PARTS which are ONLY SIGNIFICANT WHEN ASSOCIATED WITH OTHERS, which we have already ſaid are either DEFINITIVES or CONNECTIVES. Of which in their order.

CHAPTER III.

Concerning DEFINITIVES commonly called ARTICLES.

61. The knowledge of man is at beſt but limited and confined. Although we have invented words to denominate almoſt all the ſubſtances which exiſt, yet as it is impoſſible for any perſon to be acquainted with all of theſe, it was neceſſary to fall upon ſome contrivance in language to obviate the difficulties which would ariſe from this cauſe. With this view, we have already ſeen, that ſubſtances have been divided into general claſſes, each of which includes under it ſeveral leſſer in

A Bell Sculp.

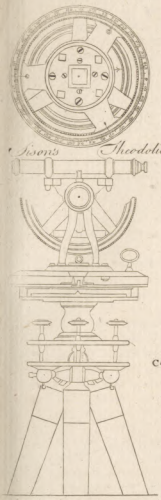

Fig. 1.

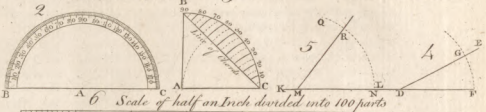

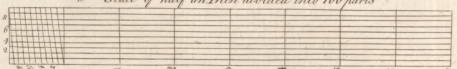

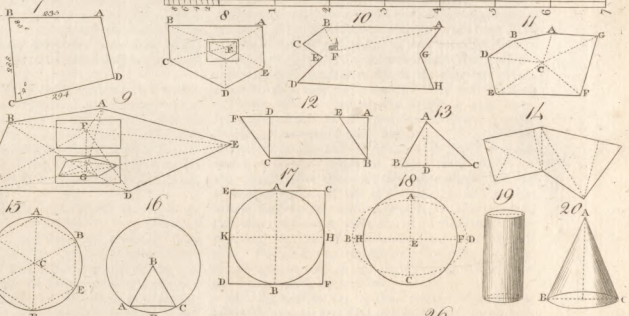

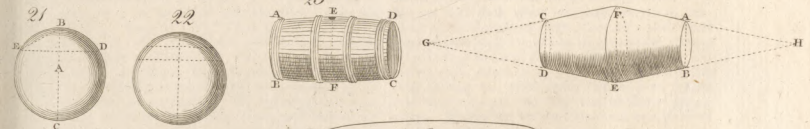

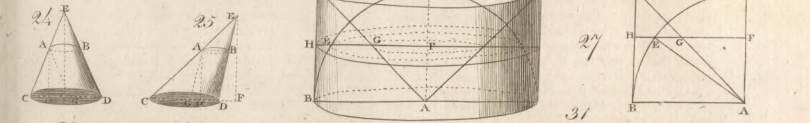

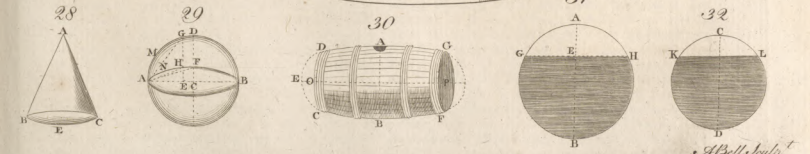

A Bell Sculp.t

Articles. subdivisions; the names of which general classes, being but few, may be more easily retained, as *animal*, *edifice*, *motion*, &c. for by referring the several objects that we may accidentally see, and with which we are unacquainted, to the several classes to which they may belong, we are in some measure enabled to communicate our ideas without the knowledge of the particular names. But as this particular object must in some manner be distinguished from others of the same class to which it belongs, a particular class of words was found necessary to define and ascertain these individuals; which has given rise to this order of words of which we now treat, and which we have called *definitives*, because they serve to *define and ascertain any particular object, so as to separate it from the general class to which it does belong, and of course denote its individuality.* The principal of these definitives have been usually called ARTICLES, the nature of which may be explained as follows. Articles.

62. Supposing I see an object with which I am totally unacquainted, having a head and limbs, and appearing to possess the powers of self-motion and sensation. If I know it not as an individual, I refer it to its proper species, and call it *a dog*, *a horse*, *a lion*, or the like; and if none of the names of any species with which I am acquainted fit it, I refer it to the genus, and call it *an animal*.

But this is not enough. The object at which we are looking, and want to distinguish, is perhaps an individual.—Of what kind? *Known* or *unknown?* Seen now *for the first time*, or *seen before* and now remembered? It is here we shall discover the use of the two articles A and THE; for the article A respects our *primary* perception, and denotes individuals as *unknown*; whereas THE respects our *secondary* perception, and denotes individuals as *known*. To explain this by an example, I see an object pass by which I never saw till then: What do I say? *There goes* A *beggar with* A *long beard*. The man departs, and returns a week after: What do I then say? *There goes* THE *beggar with* THE *long beard*. Here the article only is changed, the rest remains unaltered. Yet mark the force of this apparently minute change. The individual *once vague* is now recognised as *something known*, and that merely by the efficacy of this latter article, which tacitly insinuates a kind of *previous* acquaintance, by referring a present perception to a like perception already past. Hence therefore we see, that although the articles A and THE are both of them *definitives*, as they circumscribe the latitude of genera and species, by reducing them, for the most part, to denote individuals; yet they differ in this respect, that the article A leaves the individual itself *unascertained*, but the article THE *ascertains the individual also*, and is for that reason the more accurate definitive of the two. They differ likewise in this respect, that as the article A serves only to separate one particular object from the general class to which it belongs, it cannot be applied to plurals. But as the article THE serves to define objects, or refer to them as already known, without relation to number, or any other circumstances, it is applicable to both numbers indiscriminately, as well as nouns of every *gender*, without suffering any sort of change; for it is evident, that no variation of the nature of the noun can make any difference in those words which serve to define or denote a certain reference to them. So that although we find some modern languages which admit of a variation of their article, which relates to the gender of the noun with which it is associated, yet this cannot be considered as essential to this species of words: and so far is this from being an improvement to the language, that it only serves to perplex and confuse, as it always presents a particular idea of sex, where in many cases it is not in the least necessary.

63. Of all the parts of speech which may be considered as essential to language, there is none in which we find so many languages defective as in this. For we know of no language, except our own, which has the particular article A; and the Latin language has no word of the same import with the word THE. The reason of which deficiency is, that as other parts of speech may be so easily converted from their original meaning, and be made to assume the character of definitives, they have made some of these perform both of these offices: and as the article A only separates a particular object, and is therefore so nearly allied to a *numeral*, many languages, as the *French*, *Italian*, *Spanish*, and *German*, have made the numeral word ONE supply its office; while others, as the Greek, have denoted this particular object by a mere negation of the other article; and as the article THE agrees with pronouns in this respect, that they both *denote reference*, the Latins made their pronoun, by a forced periphrasis, supply the place of this. But all of these methods of supplying the want of the genuine article are defective, as will appear more particularly by and by.

64. As articles are by their nature definitives, it follows of course, that they cannot be united with such words as are in their own nature *as definite as they may be;* nor with such words as, *being indefinite, cannot properly be made otherwise;* but only with those words *which, though indefinite, are yet capable, through the article, of becoming definite.* Hence we see the reason why it is absurd to say THE I, or THE THOU, because nothing can make these pronouns more *definite* than they are; and the same may be said of proper names. Neither can we say THE BOTH, because these words are *in their own nature* each of them perfectly defined. Thus, if it be said, "I have read BOTH poets," this plainly indicates *a definite pair*, of whom some mention has been made already. On the contrary, if it be said, "I have read TWO poets," this may mean *any pair*, out of all that ever existed. And hence this numeral, being in this sense *indefinite*, (as indeed are all others as well as itself,) is forced *to assume the article* whenever it would become *definite*. Hence also it is, that as TWO, when taken alone, has reference to some *primary* and *indefinite* perception, while the article THE has reference to some perception *secondary* and *definite*, it is bad language to say TWO THE MEN, as this would be *blending of incompatibles*, that is to say, of *a defined substantive* with an *undefined attributive*. On the contrary, to say BOTH THE MEN, is good and allowable; because the substantive cannot possibly be less apt, by being defined, to coalesce with an attributive which is defined as well as itself. So likewise it is correct to say, THE TWO MEN; because here the article, being placed at the beginning, *extends*

Articles. *its power* as well through ſubſtantive as attributive, and equally tends to *define* them both.

65. As ſome of the above words admit of no article, *becauſe they are by nature as definite as may be;* ſo there are others which admit it not, *becauſe they are not to be defined at all.* Of this ſort are all INTERROGATIVES. If we queſtion about ſubſtantives, we cannot ſay THE WHO IS THIS; but WHO IS THIS? And the ſame as to *qualities*, and both kinds of *quantities:* for we ſay without an article, WHAT SORT OF, HOW MANY, HOW GREAT? The reaſon is, the article THE reſpects beings *already known*, and interrogatives reſpect beings *about which we are ignorant;* for as to what we know, interrogation is ſuperfluous. In a word, the *natural aſſociators with articles* are ALL THOSE COMMON APPELLATIVES WHICH DENOTE THE SEVERAL GENERA AND SPECIES OF BEINGS. It is theſe, which, by aſſuming a different article, ſerve either to explain an individual upon its firſt being perceived, or elſe to indicate, upon its return, a recognition or repeated knowledge.

66. But although proper names do not admit of the article, being in their own nature *definite;* yet as theſe often fall into *homonymie*, that is, different perſons often go by the ſame name, it is neceſſary to diſtinguiſh theſe from one another, to prevent the ambiguity that this would occaſion. For this purpoſe we are obliged to have recourſe to *adjectives* or *epithets*. For example, there were two *Grecian chiefs* who bore the name of *Ajax*; and it was not without reaſon that *Mneſtheus* uſes *epithets*, when his intention was to diſtinguiſh the one from the other: "If both *Ajaxes* "cannot be ſpared, (ſays he), at leaſt let mighty *Te-* "*lamonian Ajax* come." But as epithets are in their own nature perfectly *indefinite*, ſeeing the ſame adjective may be applied to infinite ſubjects, it is neceſſary to define theſe when we want to apply them to any particular object; ſo that it is neceſſary to endow theſe with an article, that they may have a *reference to ſome ſingle perſon only.* And thus it is we ſay, *Trypho* THE *grammarian*, *Apollodorus* THE *Cyrenian*, &c. It is with reaſon, therefore, that the article is here alſo added, *as it brings the adjective to an individuality as preciſe as the proper name.* Even common appellatives, by the help of an article, come to have the force of proper names, without the aſſiſtance of any epithet whatever. Thus, in Engliſh, *city* is a name common to many places, and *ſpeaker* a name common to many men. Yet if we prefix the article, THE CITY means our metropolis; and the THE SPEAKER, a high officer in the Britiſh parliament. And hence, by an eaſy tranſition, the article, from denoting *reference*, comes to denote *eminence* alſo; that is to ſay, from implying an *ordinary* pre-acquaintance, to preſume a kind of *general and univerſal notoriety.* Thus, among the Greeks, THE POET meant *Homer*, and THE STAGYRITE meant *Ariſtotle;* not but that there were many *poets* beſides *Homer*, and many *ſtagyrites* beſides *Ariſtotle*, but none equally illuſtrious.

67. The articles already mentioned are thoſe ſtrictly ſo called; but, beſide theſe, there are the PRONOMINAL ARTICLES, ſuch as *this*, *that*, *any*, *ſome*, *all*, *other*, *none*, &c. Of theſe we have already ſpoken in the chapter upon *Pronouns*, where we have ſhewn when they may be taken as pronouns, and when as articles. Yet, in truth, if the eſſence of an article be to *define* and *aſcertain*, they are much more ſtrictly articles than Articles. any thing elſe, and ought to be conſidered as ſuch in univerſal grammar. Thus, when we ſay, "THIS picture I approve, but THAT I diſlike;" what do we perform by the help of theſe definitives, but bring down the common appellatives to denote individuals? So when we ſay, "SOME men are virtuous, but ALL men are mortal;" what is the natural effect of this ALL and SOME, but to define that *univerſality* and *particularity* which would remain indefinite were we to take them away? The ſame is evident in ſuch ſentences as theſe: "SOME ſubſtances have ſenſation, OTHERS want it; chooſe ANY way of acting, and SOME men will find fault, &c." For here, SOME, OTHER, and ANY, ſerve all of them to *define* different parts of a given whole; SOME, to denote a *definite part;* ANY, to denote an *indefinite;* and OTHER, to denote the *remaining part*, when a part has been already aſſumed. Even the attributive pronouns, *my*, *thy*, *his*, *her's*, &c. are, in ſtrictneſs, more properly articles than any thing elſe, ſeeing each of them ſerves only to define and aſcertain the individual object to which it is applied. As when we ſay, "MY houſe is leſs commodious than YOUR'S; HER form is more elegant than HIS, &c." For, in theſe examples, what do the words MY and YOUR'S do, but aſcertain two individual *houſes?* or the words HIS and HER'S, but aſcertain two individual *forms*, which are compared with one another? In the ſame manner, we have already ſeen nouns ſometimes lay aſide their own proper character, and become definitives, as in the words ALEXANDER'S, CÆSAR'S, POMPEY'S, &c. which may be ſaid to form ſo many NOMIAL ARTICLES. But of theſe we have ſpoken ſo fully in the chapter of *Nouns*, that it is unneceſſary to ſay more of them in this place.

68. Before we leave this ſubject, we ſhall produce one example to ſhew the utility of this ſpecies of words; which, although of themſelves inſignificant and ſeemingly of ſmall importance, yet, when properly applied, ſerve to make a few general terms be ſufficient for the accurate expreſſion of a great variety of particulars, and thus makes language capable of expreſſing things *infinite*, without wandering into infinitude itſelf.——To explain this: Let the general term be MAN, which I have occaſion to employ for the denoting of ſome particular. Let it be required to expreſs this particular, as *unknown*; I ſay, A *man: —Known*; I ſay, THE *man:—Definite*; A CERTAIN *man:—Indefinite*; ANY *man:—Preſent, and near*; THIS *man:—Preſent, and diſtant*; THAT *man:—Like to ſome other*; SUCH A *man:—Different from ſome other*; ANOTHER *man:—An indefinite multitude*; MANY *men:—A definite multitude*; A THOUSAND *men:—The ones of a multitude, taken throughout*; EVERY *man:—The ſame ones, taken with diſtinction*; EACH *man:—Taken in order*; FIRST *man*, SECOND *man*, &c.—*The whole multitude of particulars taken collectively*; ALL *men:—The negation of that multitude*; NO *man:—A number of particulars preſent, and at ſome diſtance*; THESE *men:—At a greater diſtance, or oppoſed to others*; THOSE *men:—A number preſent and near*; THESE *men;—A number of individuals from another number*; OTHER *men:—A great number of individuals taken collectively*; MANY *men:—A ſmall number*; FEW *men:—A proportionally greater number*;

MORE

Conjunctions.

more *men*:---*Smaller number*; fewer *men*:---And so on we might go almoſt to infinitude. But not to dwell longer upon this article, we ſhall only remark, "that minute changes in principles, lead to mighty changes in effects; ſo that principles are well intitled to regard, however trivial they may appear."

Chapter IV.
Of Connectives.

69. Connectives, according as they connect either *ſentences* or *words*, are called by the different names of conjunctions or prepoſitions. Of theſe names, that of the *prepoſition* is taken from a mere accident, as it commonly ſtands in connection before the part which it connects. The *conjunction*, as is evident, has reference to its *eſſential character*. We ſhall treat of theſe two ſeparately.

Sect. I. *Of* Conjunctions.

70. A Conjunction *is a part of ſpeech void of ſignification itſelf, but ſo formed as to help ſignification, by making* two *or more ſignificant ſentences to be one ſignificant ſentence*. As, therefore, it is the *eſſence* of conjunctions to *connect ſentences*; at the ſame time that they do this, they muſt either *connect* their *meaning* or *not*. For example, let us take theſe two ſentences, *Rome was enſlaved—Cæſar was ambitious*, and connect them together by the conjunction because; *Rome was enſlaved*, because *Cæſar was ambitious*. Here the *meanings*, as well as the *ſentences*, appear to be connected. But if I ſay, *manners muſt be reformed*, or *liberty will be loſt*; here the conjunction or, though it join the ſentences, yet, as to their reſpective *meanings*, is a perfect *disjunctive*. And thus it appears, that though all conjunctions *conjoin ſentences*, yet, with reſpect to the *ſenſe*, ſome are conjunctive, and others are disjunctive.

Thoſe *conjunctions which conjoin both ſentences and their meanings* are either copulatives or continuatives. The principal copulative in *Engliſh* is and. The continuatives are much more numerous; if, because, therefore, wherefore, hence, that, *&c.* The difference between theſe is this: The *copulative* does no more than barely *couple* ſentences, and is therefore applicable to all ſubjects whoſe natures are *not incompatible: Continuatives*, on the contrary, by a more intimate connection, conſolidate ſentences *into one continuous whole*; and are therefore applicable only to ſubjects which have an *eſſential coincidence*: For example, it is noway improper to ſay, *Lyſippus was a ſtatuary*, and *Priſcian a grammarian*; *the ſun ſhineth*, and *the ſky is clear*; becauſe theſe are things that may co-exiſt, and yet imply no abſurdity. But it would be abſurd to ſay, *Lyſippus was a ſtatuary*, because *Priſcian was a grammarian*; though not to ſay, *the ſun ſhineth* because *the ſky is clear*. The reaſon is, with reſpect to the firſt, the *coincidence* is merely *accidental*: with reſpect to the laſt, it is *eſſential*, and founded in nature.

As to the *continuatives*, they are suppoſitive, ſuch as *if*; or poſitive, ſuch as *becauſe, therefore, as, &c.* Take examples of each:—*You will live happily* if *you live honeſtly*: *You live happily* because *you live honeſtly*:—*You live honeſtly*, therefore *you live happily*. The difference between theſe *continuatives* is this: The *ſuppoſitives* denote *connection*, but do not aſſert actual exiſtence; the *poſitives* imply both the *one* and the *other*.

Theſe *poſitives* above mentioned are either casual, ſuch as *becauſe, ſince, as, &c.* or collective, ſuch as *therefore, wherefore, &c.* The difference between which is this: The *caſuals* ſubjoin *cauſes* to *effects*; "*the ſun is in eclipſe*, because *the moon intervenes*;" The *collectives* ſubjoin *effects* to *cauſes*; "*the moon intervenes*, therefore *the ſun is in eclipſe*." We therefore uſe *caſuals* in thoſe inſtances where the *effect* being conſpicuous we ſeek for its *cauſe*; and *collectives*, in demonſtrations and ſcience, properly ſo called, where the *cauſe* being firſt known, by its help we diſcern *effects*.

All theſe *continuatives* are reſolvable into *copulatives*: For, inſtead of ſaying, because *it is day, it is light*; we may ſay, *It is day*, and *it is light*. Inſtead of If *it is day, it is light*; we may ſay, *It is at the ſame time neceſſary to be day*, and *to be light*. The reaſon is, That the power of the *copulative* extends to all connections, as well to the *eſſential* as to the *caſual*. Hence the continuative may be reſolved into a *copulative and ſomething more*; that is to ſay, into a *copulative* implying an *eſſential* coincidence in the ſubjects conjoined.

As to *caſual conjunctions*, we may further obſerve, that there is no one of the four ſpecies of cauſes which they are not capable of denoting. For example, the material *cauſe*; *The trumpet ſounds*, because *it is made of metal*. The formal; *The trumpet ſounds*, because *it is long and hollow*. The efficient; *The trumpet ſounds*, because *an artiſt blows it*. The final; *The trumpet ſounds*, that *it may rouſe our courage*. It is worth obſerving, that the three firſt cauſes are expreſſed by the ſtrongeſt affirmation; becauſe, if the *effect* actually be, that muſt be alſo. But this is not the caſe with reſpect to the laſt, which is only affirmed as a thing that *may* happen. The reaſon is, That however this may be the end which ſet the artiſt firſt to work, it may ſtill be beyond his power to obtain, and which, like all other contingents, may either happen or not. Hence alſo it is connected by a particular conjunction, that, abſolutely confined to this *cauſe*.

We now come to the disjunctive conjunctions; a ſpecies of words which bear this contradictory name, becauſe, while they disjoin *the ſenſe*, they conjoin *the ſentences*.

With reſpect to theſe, we may obſerve, that as there is a principle of union diffuſed through all things by which this whole is kept together and preſerved from diſſipation; ſo there is, in like manner, a principle of diversity diffuſed through all, the ſource of *diſtinction*, of *number*, and of *order*. Now, it is to expreſs in ſome degree the *modifications of this diverſity*, that disjunctive conjunctions ſeem at firſt to have been invented.

Of theſe *disjunctives*, ſome are simple, ſome adversative. *Simple*; as when we ſay, either *it is day*, or *it is night*:—*Adverſative*; as when we ſay, *It is not day*, but *it is night*. The difference between theſe is, that the *ſimple* do no more than *merely* diſjoin; the *adverſative* diſjoin with a concomitant *oppoſition*. Add to this, that the *adverſative* are *definite*; the *ſimple indefinite*. Thus, when we ſay, *the number*

Conjunctions.

three is not an even number, BUT *an odd*; we not only *disjoin* two oppofite attributes, but we *definitely* affirm one, and deny the other. But, when we fay, *the number of the ſtars is* EITHER *even* OR *odd*; though we aſſert one attribute *to be*, and the other *not to be*, yet the alternative is, notwithſtanding, left *indefinite*.

As to *adverſative disjunctives*, it has been already ſaid, that they imply OPPOSITION. Now, there can be no oppoſition of the *ſame* attribute in the *ſame* ſubject; as when we ſay, *Nereus was beautiful.* But the oppoſition muſt be either of the *ſame* attribute in different ſubjects; as when we ſay, "*Brutus* was a *patriot*, BUT *Cæſar* was not:" Or of *different* attributes in the *ſame* ſubject; as when we ſay, "*Gorgius* was a *ſophiſt*, BUT not a *philoſopher*:" Or of *different* attributes in *different* ſubjects; as when we ſay, "*Plato* was a *philoſopher*, BUT *Hippias* was a *ſophiſt*." The conjunctions uſed for all theſe purpoſes may be called *abſolute* adverſatives.

But there are *other* adverſatives beſides theſe: as when we ſay, "*Nereus* was more beautiful THAN *Achilles*,—*Virgil* was as great a *poet* as *Cicero* was an *orator*." The character of theſe latter is, that they go farther than the former, by marking not only *oppoſition*, but that *equality* or *exceſs* which ariſes from the compariſon of ſubjects; and therefore they may be called *adverſatives of compariſon*.

Beſides the adverſatives here mentioned, there are two other ſpecies, of which the moſt eminent are UNLESS and ALTHOUGH: For example, "*Troy* will be taken, UNLESS the *Palladium* be preſerved; *Troy* will be taken, ALTHOUGH *Hector* defend it." The nature of theſe adverſatives may be thus explained. As every *event* is naturally allied to its *cauſe*, ſo, by parity of reaſon, it is oppoſed to its *preventive*; and as every cauſe is either *adequate* or *inadequate*, (inadequate, when it endeavours, without being effectual), ſo in like manner is every *preventive*. Now, *adequate* preventives are expreſſed by ſuch adverſatives —as UNLESS: "*Troy* will be taken, UNLESS the *Palladium* be preſerved;" that is, that this alone is *ſufficient* to prevent it. The *inadequate* are expreſſed by ſuch adverſatives as ALTHOUGH: "*Troy* will be taken, ALTHOUGH *Hector* defend it;" that is, *Hector's* defence will prove *ineffectual*. Theſe may be called adverſatives ADEQUATE and INADEQUATE.

Before we leave this ſubject, we may obſerve, that the words *when* and *where*, and all others of the ſame nature, ſuch as *whence*, *whether*, *whenever*, *where-ever*, &c. may be called ADVERBIAL conjunctions; becauſe they participate the nature both of adverbs and conjunctions; of *conjunctions*, as they *conjoin* ſentences; of *adverbs*, as they denote the attributes either of *time* or *place*. And theſe *adverbial* conjunctions (contrary to the character of *acceſſary* words, which have ſtrictly no ſignification but when aſſociated with other words), have a kind of *obſcure* ſignification when taken alone, by denoting theſe attributes of time and place. And hence it is, that they appear in grammar like *zoophytes* in nature, a kind of middle beings, of amphibious character, which, by ſharing the attributes of the higher and the lower, conduce to link the whole together.

SECT. II. *Of thoſe* Connectives, *called* PREPOSITIONS. Prepoſitions.

A PREPOSITION *is a part of ſpeech devoid itſelf of ſignification, but ſo formed as to unite two words that are ſignificant, and that refuſe to coaleſce of themſelves.* This connective power (which relates to words only, and not to ſentences) will be better underſtood by the following obſervations.

Some things naturally coaleſce and unite of *themſelves*, while others refuſe to do ſo *without help*, and as it were by compulſion. For example, all quantities and qualities coaleſce immediately with their ſubſtances: thus it is we ſay, *a fiere lion*, *a vaſt mountain*, &c. In like manner actions coaleſce with their agents, and paſſions with their patients: thus it is we ſay, *Alexander conquers*, *Darius is conquered*. Nay, as every energy is a kind of medium between its agent and patient, the whole three, agent, energy, and patient, coaleſce with the ſame facility; as when we ſay, *Alexander conquers Darius*. Farther than this, as the greateſt part of attributives themſelves may be characteriſed, as when we ſay of ſuch attributives as *ran*, *beautiful*, *learned*, &c. "he ran *ſwiftly*, ſhe was *very* beautiful, he was *moderately* learned," &c. theſe muſt readily coaleſce with the attributes which they thus characteriſe. From all which it appears, that *thoſe parts of ſpeech unite of themſelves in grammar, whoſe original archetypes unite of themſelves in nature.* Hence, therefore, it is, that although ſubſtances naturally coincide with their attributes, yet they abſolutely refuſe doing ſo one with another: and hence thoſe known maxims in phyſics, that *body is impenetrable*, that *two bodies cannot poſſeſs the ſame place*, &c.

From theſe principles it follows, that when we form a ſentence, the ſubſtance without difficulty coincides with the verb, from the natural coincidence of ſubſtance with energy; *the* SUN WARMETH: ſo likewiſe the energy with the ſubject on which it operates; WARMETH *the* EARTH: ſo likewiſe both ſubſtance and energy with their proper attributes; *the* SPLENDID SUN GENIALLY WARMETH *the* FERTILE EARTH. But ſuppoſe we are to add other ſubſtantives, as, for inſtance, *air*, or *beams*; how could theſe coincide, or under what character be introduced? Not either as the *energizer* of the verb, nor as *the ſubject on which it operates*; for both of theſe places are already filled up, the firſt by the word SUN, and the laſt by the ſubſtance EARTH: not as *attributes* to theſe laſt, or to any other thing; for attributes by nature they neither *are* nor *can be made*. Here, then, we perceive the riſe and uſe of *prepoſitions*: by theſe we connect thoſe ſubſtantives to ſentences, which at the time are unable to *coaleſce of themſelves*. Let us aſſume, for inſtance, a pair of theſe connectives, THROUGH and WITH, and mark their effect upon the ſubſtances here mentioned; *the ſplendid ſun* WITH *his beams genially warmeth* THROUGH *the air the fertile earth*: the ſentence, as before, remains entire and one; the ſubſtantives required are both introduced, and not a word which was there before is diſplaced from its proper ſtation.

It muſt be here obſerved, that *moſt* if not *all* prepoſitions ſeem originally formed to denote the relations of *place*; becauſe this is that grand *relation* which *bodies*

Prepositions.

dies or *natural ſubſtances* maintain at all times to one another, whether they are contiguous or remote, whether in motion or at reſt. Thus we have prepoſitions to denote the *contiguous relation of body*; as when we ſay, *Caius walked* WITH *a ſtaff*; *the ſtatue ſtood* UPON *a pedeſtal*; *the river ran* OVER *a precipice*. Others, for the *detached relation*; as when we ſay, *he is going* TO *Italy*; *the ſun is riſen* ABOVE *the hills*; *theſe figs came* FROM *Turkey*. So, as to *motion* and *reſt*: only with this difference, that here the prepoſition varies its character with the verb: thus if we ſay, *that lamp hangs* FROM *the ceiling*, the prepoſition FROM aſſumes the character of *quieſcence*; but if we ſay, *that lamp is falling* FROM *the ceiling*, the prepoſition aſſumes a character of *motion*. So in Milton;

——*To ſupport uneaſy ſteps*
OVER *the burning marle*——

Again,

——*He with looks of cordial love*
Hung OVER *her enamour'd*.——

In the firſt of theſe examples, OVER denotes *motion*, and in the laſt it denotes *reſt*.

But though the original uſe of prepoſitions was to denote the relations of *place*, they could not be confined to this office only; but by degrees extended themſelves to ſubjects *incorporeal*, and came to denote relations as well *intellectual* as *local*. Thus becauſe, in *place*, he who is *above* has commonly the advantage of him who is *below*, we transfer OVER and UNDER to *dominion* and *obedience*: of a king we ſay, *he ruled* OVER *his people*; of a common ſoldier, *he ſerved* UNDER *ſuch a general*: ſo too we ſay, WITH *thought*; WITHOUT *attention*; *thinking* OVER *a ſubject*; UNDER *anxiety*; FROM *fear*; OUT OF *love*; THROUGH *jealouſy*, &c. All which inſtances, with many of the like kind, ſhew, that the *firſt words* of men, like their *firſt ideas*, had an immediate reference to *ſenſible objects*; and that, in after days, when they began to diſcern with their *intellect*, they took theſe words which they found already made, and transferred them, by *metaphor*, to *intellectual conceptions*. There is indeed no method to expreſs new ideas, but either by *metaphor*, or by *coining new words*; both which have been practiſed by philoſophers, according to the nature and exigence of the occaſion.

In the foregoing uſe of prepoſitions, we have ſeen how they are employed by way of *juxta-poſition*; that is to ſay, where they are prefixed to a word without becoming a part of it: But they may be alſo uſed by way of *compoſition*; that is, they may be prefixed to a word ſo as to become a part of it: thus, to UNDER*ſtand*, to FORE*tell*, to OVER*act*, to UNDER*value*, to OUT*go*, &c. are ſo many diſtinct words formed by prepoſitions joined intimately with ſome other word: in all which caſes, the prepoſitions commonly tranſuſe ſomething of their own meaning into the word with which they are compounded; and this imparted meaning, in moſt inſtances, will be found reſolvable into ſome of the relations of *place*, as uſed either in its *proper* or *metaphorical* acceptation.

Interjections.

Beſides the above parts of ſpeech, there is another, which cannot be comprehended under any of the foregoing claſſes, called INTERJECTIONS: of this kind are the words, AH! ALAS! FIE! &c. *This ſpecies of words coincide with no part of ſpeech, but are either uttered alone, or elſe thrown into a ſentence, without altering its form either in ſyntax or ſignification.* It may be therefore objected, that as we ſay, that all language is divided into the ſeveral parts above enumerated, and this claſs cannot be comprehended in any of theſe diviſions; of courſe, the analyſis that we have made cannot be juſt, becauſe it does not comprehend the whole. To this objection it may be anſwered, that the language of which we have been treating, is that which has been formed by mutual compact, for the purpoſes of reaſoning and ſpeculation; that, beſides this artificial language, man, like every other ſenſitive animal, is endowed with a natural language, by which he can expreſs any ſtrong ſenſation. This language does not owe its characteriſtical expreſſion to the arbitrary form of articulation; but derives its whole force from the tone of voice, and modification of countenance and geſture: and of conſequence theſe tones and geſtures expreſs the ſame meaning without any relation to the articulation which they may aſſume, and are therefore univerſally underſtood by all mankind. Now, *interjection* is the name by which we diſtinguiſh theſe natural expreſſions: theſe cannot be properly called words, or parts of ſpeech; but certain adventitious ſounds, or voices of nature, expreſſing thoſe paſſions and natural emotions which ſpontaneouſly ariſe in the mind upon the view or narrative of intereſting events. We muſt, therefore, ſtill conclude, that all language properly ſo called is compoſed of *words*, all of which may be arranged into the ſeveral claſſes above-mentioned; and as a recapitulation of the whole that we have ſaid, we have annexed a TABLE, which preſents at one view the ſeveral claſſes and ſubdiviſions of words.

G R A

GRAMMARIAN, one that is ſkilled in, or teaches grammar.

Anciently the name *grammarian* was a title of honour, literature, and erudition, being given to perſons accounted learned in any art or faculty whatever. But it is otherwiſe now, being frequently uſed as a term of reproach, to ſignify a dry plodding perſon, employed about words and phraſes, but inattentive to the true beauties of expreſſion and delicacy of ſentiment. The ancient grammarians, called alſo *philologers*, muſt not be confounded with the grammatiſts, whoſe ſole buſineſs was to teach children the firſt elements of language. Varro, Cicero, Meſſala, and even Julius Cæſar, thought it no diſhonour to be ranked grammarians, who had many privileges granted to them by the Roman emperors.

GRAMMONT, a town of France, in the Limoſine, remarkable for its abbey, which is the chief of the order. E. Lon. 1°. 33'. N. Lat. 45°. 56'.

GRAMPOUND, a town of Cornwall in England, ſeated on the river Valle in W. Lon. 5°. 25'. N. Lat. 50°. 20'. The inhabitants have a conſiderable manufacture of gloves. It ſends two members to parliament.

GRAM-

Grampus ‖ Granada.

GRAMPUS, in ichythology; a ſpecies of delphinus. See DELPHINUS.

GRANADA, a province of Spain, which for a long time was a kingdom diſtinct from the reſt of that country, the hiſtory of which is given under the article of SPAIN. At preſent it is ſometimes called Upper Andaluſia. It is bounded to the ſouth and eaſt by the Mediterranean, to the weſt and north by Lower Andaluſia, and to the north-eaſt by Murcia. Its extent from weſt to eaſt is two hundred and ten miles; but its greateſt breadth exceeds not eighty. The air here is temperate and healthy; and though there are many mountains in the province, and ſome of them very high, yet they are almoſt every where covered with vines and fruit-trees, together with laurel, myrtle, ſweet-baſil, thyme, lavender, marjoram, and other aromatic herbs, which give an exquiſite taſte to the fleſh of their ſheep and cattle. A great deal of ſilk and ſugar, flax and hemp, honey and wax, is alſo produced here; beſides dates and acorns, ſuperior to the fineſt nuts; good ſtone for building; ſeveral ſorts of gems; ſumach, uſed in dreſſing goat-ſkins; and galls, of which a dye is made for leather. The valleys, with which the mountains are interſperſed, are extremely beautiful and fertile. The inhabitants of ſome of the higheſt mountains are ſaid to be deſcendants of the Moors; and, though they are become Roman-catholics, retain, in a great meaſure, their ancient cuſtoms, manners, and language. The principal rivers in the province are the Xenil and Guadalantin, beſides which there are many leſſer ſtreams. Abundance of ſalt is made in this province; which, though neither ſo populous nor ſo well cultivated as when ſubject to the Moors, yet is as much ſo as any in Spain. It was the laſt of the kingdoms poſſeſſed by the Moors, and was not reduced and annexed to the crown of Caſtile until 1492.

GRANADA, the capital of the above province, ſtands at the conflux of the Xenil and Dario, in a wholeſome air and fruitful country, an hundred and eighty miles ſouth of Madrid, in W. Long. 2. 30. N. Lat. 36. 56. It is large and magnificent, containing a great number of very handſome public and private buildings. Its walls, which are adorned with many towers at equal diſtances, are ſaid to be ten miles in compaſs. Here are two caſtles; the one built by the Moors, and the other by Charles V. and Philip II. They both command a very fine proſpect; and the firſt is ſo large, that it looks like a city by itſelf, and, it is ſaid, has room enough to accommodate forty thouſand people, excluſive of the royal palace, and the convent of St. Francis. Here is alſo a court of inquiſition; a royal tribunal; and an univerſity, founded in 1531; with the ſee of an archbiſhop, who has a revenue of forty thouſand ducats per annum. A great many noblemen, clergymen, and wealthy citizens, reſide in this city, of which the ſilk trade and manufacture is very great, and the arſenal is ſaid to be the beſt furniſhed of any in Spain. The inhabitants, who are partly deſcended of the Moors, are well ſupplied with water. There are ſeveral fine ſquares, particularly that called the Bivaramba or Plaça Mayor, where the bull-fights are held; and without the city is a large plain, full of towns and villages, called La Vega de Granada.

Granada ‖ Granado.

GRANADA, or GRENADA, one of the Caribbee iſlands. See GRENADA.

GRANADA, a town of America, in the province of Nicaragua, and in the audience of Guatimala, ſeated on the lake Nicaragua, 70 miles from the S. Sea. It was taken twice by the French buccaneers, and pillaged. The inhabitants carry on a great trade by means of the lake, which communicates with the N. Sea. W. Lon. 85. 10. N. Lat. 11. 8.

GRANADA, NEW, a province of South America, in Terra Firma, about 75 miles in length, and as much in breadth. It is bounded on the N. by Carthagena and St. Martha, on the E. by Venezuela, on the S. by Popayan, and on the W. by Darien. It contains mines of gold, copper, and iron; horſes, mules, good paſtures, corn, and fruits. It belongs to the Spaniards, and Santa-Fe-de-Bagota is the capital town.

GRANADILLOES, the name of ſome iſlands of the Caribbees, in America, having St Vincent to the N. and Granada to the S. They are ſo inconſiderable that they are quite neglected; but were ceded to England by the treaty of peace in 1763.

GRANADIER, a ſoldier armed with a ſword, a firelock, a bayonet, and a pouch full of hand-granadoes. They wear high caps, are generally the talleſt and briſkeſt fellows, and are always the firſt upon all attacks.

Every battalion of foot has generally a company of grenadiers belonging to it; or elſe four or five granadiers belong to each company of the battalion, which, on occaſion, are drawn out, and form a company of themſelves. Theſe always take the right of the battalion.

GRANADO or GRENADE, (in the art of war, a hollow ball or ſhell of iron or other metal, of about $2\frac{1}{2}$ inches diameter, which being filled with fine powder, is ſet on fire by means of a ſmall fuſe, driven into the fuſe-hole, made of well-ſeaſoned beech-wood, and thrown by the grenadiers into thoſe places where the men ſtand thick, particularly into the trenches and other lodgements made by the enemy. As ſoon as the compoſition within the fuſe gets to the powder in the grenado, it burſts into many pieces, greatly to the damage of all who happen to be in its way. Granados were invented about the year 1594. The author of the Military Dictionary has the following remark on the uſe of granados. "Grenades have unaccountably ſunk into diſuſe; but I am perſuaded there is nothing more proper than to have grenades to throw among the enemy who have jumped into the ditch. During the ſiege of Caſſel under the Count de La Lippe, in the campaign of 1762, a young engineer undertook to carry one of the outworks with a much ſmaller detachment than one which had been repulſed, and ſucceeded with eaſe from the uſe of grenades; which is a proof that they ſhould not be neglected, either in the attack or defence of poſts."—The word *Granado* takes its riſe from hence, that the ſhell is filled with grains, of powder as a pomegranate is with kernels.

GRANARY, a building to lay or ſtore corn in, eſpecially that deſigned to be kept a conſiderable time.

Sir Henry Wotton adviſes to make it look towards the north, becauſe that quarter is the cooleſt and moſt temperate,

Grandee ‖ grandeur.

temperate. Mr Worlidge obſerves, that the beſt granaries are built of brick, with quarters of timber wrought in the inſide, to which the boards may be nailed, with which the inſide of the granary muſt be lined ſo cloſe to the bricks, that there may not be any room left for vermin to ſhelter themſelves. There may be many ſtories one above another, which ſhould be near the one to the other; becauſe the ſhallower the corn lies, it is the better, and more eaſily turned.

GRANDEE, a deſignation given to a nobleman of Spain or Portugal.

The grandees are allowed to be covered before the king, who treats them like princes, ſtyling them Illuſtrious, in his letters; and in ſpeaking to them, or of them, they are ſtyled Eminences.

GRANDEUR *and* Sublimity. Theſe terms have a double ſignification: they commonly ſignify the quality or circumſtance in objects by which the emotions of grandeur and ſublimity are produced; ſometimes the emotions themſelves.

1 Double ſignification.

In handling the preſent ſubject, it is neceſſary that the impreſſion made on the mind by the magnitude of an object, abſtracting from its other qualities, ſhould be aſcertained. And becauſe abſtraction is a mental operation of ſome difficulty, the ſafeſt method for judging is, to chooſe a plain object that is neither beautiful nor deformed, if ſuch a one can be found. The plaineſt that occurs, is a huge maſs of rubbiſh, the ruins perhaps of ſome extenſive building; or a large heap of ſtones, ſuch as are collected together for keeping in memory a battle or other remarkable event. Such an object, which in miniature would be perfectly indifferent, makes an impreſſion by its magnitude, and appears agreeable. And ſuppoſing it ſo large, as to fill the eye, and to prevent the attention from wandering upon other objects, the impreſſion it makes will be ſo much the deeper. See Attention.

But though a plain object of that kind be agreeable, it is not termed *grand:* it is not entitled to that character, unleſs, together with its ſize, it be poſſeſſed of other qualities that contribute to beauty, ſuch as regularity, proportion, order, or colour: and according to the number of ſuch qualities combined with magnitude, it is more or leſs grand. Thus St Peter's church at Rome, the great pyramid of Egypt, the Alps towering bove the clouds, a great arm of the ſea, and above all a clear and ſerene ſky, are grand; becauſe, beſide their ſize, they are beautiful in an eminent degree. On the other hand, an overgrown whale, having a diſagreeable appearance, is not grand. A large building agreeable by its regularity and proportions, is grand; and yet a much larger building deſtitute of regularity, has not the leaſt tincture of grandeur. A ſingle regiment in battle-array, makes a grand appearance; which the ſurrounding crowd does not, though perhaps ten for one in number. And a regiment where the men are all in one livery and the horſes of one colour, makes a grander appearance, and conſequently ſtrikes more terror, than where there is confuſion of colour and dreſs. Thus greateſs or magnitude is the circumſtance that diſtinguiſhes grandeur from beauty: agreeableneſs is the genus, of which beauty and grandeur are ſpecies.

2 Grandeur diſtinguiſhed from beauty.

The emotion of grandeur, duly examined, will be found an additional proof of the foregoing doctrine. That this emotion is pleaſant in a high degree, requires no other evidence but once to have ſeen a grand object: and if an emotion of grandeur be pleaſant, its cauſe or object, as obſerved above, muſt infallibly be agreeable in proportion. Grandeur and Sublimity.

The qualities of grandeur and beauty are not more diſtinct, than the emotions are which theſe qualities produce in a ſpectator. It is obſerved in the article Beauty, that all the various emotions of beauty have one common character, that of ſweetneſs and gaiety. The emotion of grandeur has a different character: a large object that is agreeable, occupies the whole attention, and ſwells the heart into a vivid emotion, which, though extremely pleaſant, is rather ſerious than gay. And this affords a good reaſon for diſtinguiſhing in language theſe different emotions. The emotions raiſed by colour, by regularity, by proportion, and by order, have ſuch a reſemblance to each other, as readily to come under one general term, viz. *the emotion of beauty;* but the emotion of grandeur is ſo different from theſe mentioned, as to merit a peculiar name.

Though regularity, proportion, order, and colour, contribute to grandeur as well as to beauty, yet theſe qualities are not by far ſo eſſential to the former as to the latter. To make out that propoſition, ſome preliminaries are requiſite. In the firſt place, the mind, not being totally occupied with a ſmall object, can give its attention at the ſame time to every minute part; but in a great or extenſive object, the mind, being totally occupied with the capital and ſtriking parts, has no attention left for thoſe that are little or indifferent. In the next place, two ſimilar objects appear not ſimilar when viewed at different diſtances: the ſimilar parts of a very large object, cannot be ſeen but at different diſtances; and for that reaſon, its regularity, and the proportion of its parts, are in ſome meaſure loſt to the eye; neither are the irregularities of a very large object ſo conſpicuous as of one that is ſmall. Hence it is, that a large object is not ſo agreeable by its regularity, as a ſmall object; nor ſo diſagreeable by its irregularities. 3 Demands not ſtrict regularity.

Theſe conſiderations make it evident, that grandeur is ſatisfied with a leſs degree of regularity, and of the other qualities mentioned, than is requiſite for beauty; which may be illuſtrated by the following experiment. Approaching to a ſmall conical hill, we take an accurate ſurvey of every part, and are ſenſible of the ſlighteſt deviation from regularity and proportion. Suppoſing the hill to be conſiderably enlarged, ſo as to make us leſs ſenſible of its regularity, it will upon that account appear leſs beautiful. It will not, however, appear leſs agreeable, becauſe ſome ſlight emotion of grandeur comes in place of what is loſt in beauty. And at laſt, when the hill is enlarged to a great mountain, the ſmall degree of beauty that is left, is ſunk in its grandeur. Hence it is, that a towering hill is delightful, if it have but the ſlighteſt reſemblance of a cone; and a chain of mountains not leſs ſo, though deficient in the accuracy of order and proportion. We require a ſmall ſurface to be ſmooth; but in an extenſive plain, conſiderable inequalities are overlooked. In a word, regularity, proportion, order, and colour, contribute to grandeur as well as to beauty; but with a remarkable difference, that in paſſing from ſmall to great, they are not required in the ſame degree, 4 Qualities contributing to grandeur.

Grandeur and Sublimity.

degree of perfection. This remark ſerves to explain the extreme delight we have in viewing the face of nature, when ſufficiently enriched and diverſified with objects. The bulk of the objects in a natural landſcape are beautiful, and ſome of them grand: a flowing river, a ſpreading oak, a round hill, an extended plain, are delightful; and even a rugged rock, or barren heath, though in themſelves diſagreeable, contribute by contraſt to the beauty of the whole; joining to theſe the verdure of the fields, the mixture of light and ſhade, and the ſublime canopy ſpread over all; it will not appear wonderful, that ſo extenſive a groupe of ſplendid objects ſhould ſwell the heart to its utmoſt bounds, and raiſe the ſtrongeſt emotion of grandeur. The ſpectator is conſcious of an enthuſiaſm which cannot bear confinement, nor the ſtrictneſs of regularity and order: he loves to range at large; and is ſo enchanted with magnificent objects, as to overlook ſlight beauties or deformities.

The ſame obſervation is applicable in ſome meaſure to works of art. In a ſmall building, the ſlighteſt irregularity is diſagreeable: but in a magnificent palace, or a large Gothic church, irregularities are leſs regarded. In an epic poem, we pardon many negligences that would not be permitted in a ſonnet or epigram. Notwithſtanding ſuch exceptions, it may be juſtly laid down for a rule, That in works of art, order and regularity ought to be governing principles; and hence the obſervation of Longinus, "In works of art "we have regard to exact proportion; in thoſe of na- "ture, to grandeur and magnificence."

5 Sublimity.

The ſame reflections are in a good meaſure applicable to ſublimity: particularly, that, like grandeur, it is a ſpecies of agreeableneſs; that a beautiful object placed high, appearing more agreeable than formerly, produces in the ſpectator a new emotion, termed *the emotion of ſublimity*; and that the perfection of order, regularity, and proportion, is leſs required in objects placed high, or at a diſtance, than at hand.

The pleaſant emotion raiſed by large objects, has not eſcaped the poets;

——He doth beſtride the narrow world
Like a Coloſſus; and we petty men
Walk under his huge legs. *Julius Cæſar, act* 1. *ſc.* 3.

Cleopatra. I dreamt there was an emp'ror Antony:
Oh ſuch another ſleep, that I might ſee
But ſuch another man!
His face was as the heav'ns: and therein ſtuck
A ſun and moon, which kept their courſe, and lighted
The little O o'th' earth.
His legs beſtrid the ocean, his rear'd arm
Creſted the world. *Antony and Cleopatra, act* 5. *ſc.* 3.

——Majeſty
Dies not alone; but, like a gulph, doth draw
What's near it with it. It's a maſſy wheel
Fix'd on the ſummit of the higheſt mount;
To whoſe huge ſpokes ten thouſand leſſer things
Are mortis'd and adjoin'd; which when it falls
Each ſmall annexment, petty conſequence,
Attends the boiſt'rous ruin. *Hamlet, act* 3. *ſc.* 8.

The poets have alſo made good uſe of the emotion produced by the elevated ſituation of an object:

Quod ſi me lyricis vatibus inſeres,
Sublimi feriam ſidera vertice. *Horat. Carm. l.* 2. *ode* 1.

Oh thou! the earthly author of my blood,
Whoſe youthful ſpirit, in me regenerate,
Doth with a twofold vigour lift me up,
To reach at victory above my head.
Richard II. *act* 1. *ſc.* 4.

Northumberland, thou ladder wherewithal
The mounting Bolingbroke aſcends my throne.
Richard II. *act* 5. *ſc.* 2.

Anthony. Why was I raiſ'd the meteor of the world,
Hung in the ſkies, and blazing as I travell'd,
Till all my fires were ſpent; and then caſt downward
To be trod out by Cæſar? *Dryden, All for Love, act* 1.

The deſcription of Paradiſe in the fourth book of *Paradiſe Loſt*, is a fine illuſtration of the impreſſion made by elevated objects:

So on he fares, and to the border comes
Of Eden, where delicious Paradiſe,
Now nearer, crowns with her incloſure green,
As with a rural mound, the champain head
With a ſteep wilderneſs; whoſe hairy ſides
Of thickeſt covert was, groteſque and wild,
Acceſs deny'd; and over head up grew
Inſuperable height of loftieſt ſhade,
Cedar, and pine, and fir, and branching palm,
A ſylvan ſcene; and as the ranks aſcend,
Shade above ſhade, a woody theatre
Of ſtateſieſt view. Yet higher than their tops
The verd'rous wall of Paradiſe up ſprung;
Which to our general ſire gave proſpect large
Into his nether empire, neighb'ring round.
And higher than that wall a circling row
Of goodlieſt trees, loaden with faireſt fruit,
Bloſſoms and fruits at once of golden hue,
Appear'd, with gay enamell'd colours mix'd. *l.* 131.

Though a grand object is agreeable, we muſt not infer that a little object is diſagreeable; which would be unhappy for man, conſidering that he is ſurrounded with ſo many objects of that kind. The ſame holds with reſpect to place: a body placed high is agreeable; but the ſame body placed low, is not by that circumſtance rendered diſagreeable. Littleneſs and lowneſs of place are preciſely ſimilar in the following particular, that they neither give pleaſure nor pain. And in this may viſibly be diſcovered peculiar attention in fitting the internal conſtitution of man to his external circumſtances. Were littleneſs and lowneſs of place agreeable, greatneſs and elevation could not be ſo: were littleneſs and lowneſs of place diſagreeable, they would occaſion uninterrupted uneaſineſs.

The difference between great and little with reſpect to agreeableneſs, is remarkably felt in a ſeries when we paſs gradually from the one extreme to the other. A mental progreſs from the capital to the kingdom, from that to Europe—to the whole earth—to the planetary ſyſtem—to the univerſe, is extremely pleaſant: the heart ſwells, and the mind is dilated at every ſtep. The returning in an oppoſite direction is not poſitively painful, though our pleaſure leſſens at every ſtep, till it vaniſh into indifference: ſuch a progreſs may ſometimes produce pleaſure of a different ſort, which ariſes from taking a narrower and narrower inſpection. The ſame obſervation holds in a progreſs upward and downward. Aſcent is pleaſant becauſe it elevates us; but deſcent is never painful: it is for the moſt part pleaſant from a different cauſe, that it is according to the order of nature. The fall of a ſtone from

Grandeur and Sublimity.

from any height, is extremely agreeable by its accelerated motion. We feel it pleasant to descend from a mountain, because the descent is natural and easy. Neither is looking downward painful; on the contrary, to look down upon objects, makes part of the pleasure of elevation: looking down becomes then only painful when the object is so far below as to create dizziness; and even when that is the case, we feel a sort of pleasure mixed with the pain: witness Shakespear's description of Dover cliffs:

——How fearful
And dizzy 'tis, to cast one's eye so low!
The crows and choughs, that wing the midway air,
Show scarce so gross as beetles. Half-way down
Hangs one that gathers samphire; dreadful trade!
Methinks he seems no bigger than his head.
The fishermen that walk upon the beach,
Appear like mice; and yon tall anchoring bark
Diminish'd to her cock; her cock, a buoy
Almost too small for sight. The murmuring surge,
That on th' unnumber'd idle pebbles chafes,
Cannot be heard so high. I'll look no more,
Lest my brain turn, and the deficient sight
Topple down headlong. *King Lear, act 4. sc. 6.*

A remark is made above, that the emotions of grandeur and sublimity are nearly allied. And hence it is, that the one term is frequently put for the other: an increasing series of numbers, for example, producing an emotion similar to that of mounting upward, is commonly termed *an ascending series*: a series of numbers gradually decreasing, producing an emotion similar to that of going downward, is commonly termed *a descending series*: we talk familiarly of going *up* to the capital, and of going *down* to the country: from a lesser kingdom we talk of going *up* to a greater; whence the *anabasis* in the Greek language, when one travels from Greece to Persia. We discover the same way of speaking in the language even of Japan; and its universality proves it the offspring of a natural feeling.

6 Grandeur and sublimity in a figurative sense.

The foregoing observation leads us to consider grandeur and sublimity in a figurative sense, and as applicable to the fine arts. Hitherto these terms have been taken in their proper sense, as applicable to objects of sight only: and it was of importance to bestow some pains upon that article; because, generally speaking, the figurative sense of a word is derived from its proper sense, which holds remarkably at present. Beauty, in its original signification, is confined to objects of sight; but as many other objects, intellectual as well as moral, raise emotions resembling that of beauty, the resemblance of the effects prompts us to extend the term *beauty* to these objects. This equally accounts for the terms *grandeur* and *sublimity* taken in a figurative sense. Every emotion, from whatever cause proceeding, that resembles an emotion of grandeur or elevation, is called by the same name: thus generosity is said to be an *elevated* emotion, as well as great courage; and that firmness of soul which is superior to misfortunes, obtains the peculiar name of *magnanimity*. On the other hand, every emotion that contracts the mind, and sixeth it upon things trivial or of no importance, is termed *low*, by its resemblance to an emotion produced by a little or low object of sight: thus an appetite for trifling amusements, is called *a low taste*. The same terms are applied to characters and actions: we talk familiarly of an *elevated* genius, of a *great* man, and equally so of *littleness* of mind: some actions are *great* and *elevated*, and others are *little* and *grovelling*. Sentiments, and even expressions, are characterised in the same manner: an expression or sentiment that raises the mind, is denominated *great* or *elevated*; and hence the SUBLIME in poetry. In such figurative terms, we lose the distinction between *great* and *elevated* in their proper sense; for the resemblance is not so entire, as to preserve these terms distinct in their figurative application. We carry this figure still farther. Elevation, in its proper sense, imports superiority of place; and lowness, inferiority of place: and hence a man of *superior* talents, of *superior* rank; of *inferior* parts, of *inferior* taste, and such like. The veneration we have for our ancestors, and for the ancients in general, being similar to the emotion produced by an elevated object of sight, justifies the figurative expression, of the ancients being *raised* above us, or possessing a *superior* place. The notes of the gamut, proceeding regularly from the blunter or grosser sounds, to the more acute and piercing, produce in the hearer a feeling somewhat similar to what is produced by mounting upward; and this gives occasion to the figurative expressions, *a high note*, *a low note*.

Grandeur and Sublimity.

7 The sublime in poetry.

Such is the resemblance in feeling between real and figurative grandeur, that among the nations on the east coast of Africa, who are directed purely by nature, the officers of state are, with respect to rank, distinguished by the length of the batoon each carries in his hand; and in Japan, princes and great lords shew their rank by the length and size of their sedanpoles. Again, it is a rule in painting, that figures of a small size are proper for grotesque pieces; but that an historical subject, grand and important, requires figures as great as the life. The resemblance of these feelings is in reality so strong, that elevation in a figurative sense is observed to have the same effect, even externally, with real elevation:

8 Real and figurative grandeur intimately connected.

K. Henry. This day is call'd the feast of Crispian.
He that outlives this day, and comes safe home,
Will stand a-tiptoe when this day is nam'd,
And rouse him at the name of Crispian.
Henry V. act 4. sc. 8.

The resemblance in feeling between real and figurative grandeur, is humorously illustrated by Addison in criticising upon English tragedy *: "The ordinary method of making an hero, is to clap a "huge plume of feathers upon his head, which rises "so high, that there is often a greater length from "his chin to the top of his head, than to the sole of "his foot. One would believe, that we thought a "great man and a tall man the same thing. As these "superfluous ornaments upon the head, make a "great man; a princess generally receives her grandeur, from those additional incumbrances that fall "into her tail: I mean the broad sweeping train, "that follows her in all her motions; and finds con"stant employment for a boy, who stands behind her "to open and spread it to advantage." The Scythians, impressed with the fame of Alexander, were astonished when they found him a little man.

* *Spectator*, N° 42.

A gradual progress from small to great, is not less

Grandeur and Sublimity.

remarkable in figurative than in real grandeur or elevation. Every one muſt have obſerved the delightful effect of a number of thoughts or ſentiments, artfully diſpoſed like an aſcending ſeries, and making impreſſions deeper and deeper: ſuch diſpoſition of members in a period, is termed a *climax*.

Within certain limits grandeur and ſublimity produce their ſtrongeſt effects, which leſſen by exceſs as well as by defect. This is remarkable in grandeur and ſublimity taken in their proper ſenſe: the greateſt emotion that can be raiſed by a viſible object is where the object can be taken in at one view; if ſo immenſe as not to be comprehended but in parts, it tends rather to diſtract than ſatisfy the mind *: in like manner, the ſtrongeſt emotion produced by elevation, is where the object is ſeen diſtinctly; a greater elevation leſſens in appearance the object, till it vaniſh out of ſight with its pleaſant emotions. The ſame is equally remarkable in figurative grandeur and elevation; which ſhall be handled together, becauſe, as obſerved above, they are ſcarce diſtinguiſhable. Sentiments may be ſo ſtrained, as to become obſcure, or to exceed the capacity of the human mind: againſt ſuch licence of imagination, every good writer will be upon his guard. And therefore it is of greater importance to obſerve, that even the true ſublime may be carried beyond that pitch which produces the higheſt entertainment. We are undoubtedly ſuſceptible of a greater elevation than can be inſpired by human actions, the moſt heroic and magnanimous; witneſs what we feel from Milton's deſcription of ſuperior beings: yet every man muſt be ſenſible of a more conſtant and ſweet elevation, when the hiſtory of his own ſpecies is the ſubject; he enjoys an elevation equal to that of the greateſt hero, of an Alexander, or a Cæſar, of a Brutus, or an Epaminondas: he accompanies theſe heroes in their ſublimeſt ſentiments and moſt hazardous exploits, with a magnanimity equal to theirs; and finds it no ſtretch, to preſerve the ſame tone of mind for hours together, without ſinking. The caſe is not the ſame in deſcribing the actions or qualities of ſuperior beings: the reader's imagination cannot keep pace with that of the poet; the mind, unable to ſupport itſelf in a ſtrained elevation, falls as from a height; and the fall is immoderate like the elevation: where that effect is not felt, it muſt be prevented by ſome obſcurity in the conception, which frequently attends the deſcriptions of unknown objects. Hence the St Franciſes, St Dominics, and other tutelary ſaints among the Roman Catholics. A mind unable to raiſe itſelf to the Supreme Being ſelf-exiſtent and eternal, or to ſupport itſelf in a ſtrained elevation, finds itſelf more at eaſe in uſing the intereceſſion of ſome faint whoſe piety and penances while on earth are ſuppoſed to have made him a favourite in heaven.

9 Figurative grandeur.

A ſtrained elevation is attended with another inconvenience, that the author is apt to fall ſuddenly as well as the reader; becauſe it is not a little difficult, to deſcend, ſweetly and eaſily, from ſuch elevation, to the ordinary tone of the ſubject. The following paſſage is a good illuſtration of that obſervation: Grandeur and Sublimity.

> Sæpe etiam immenſum cœlo venit agmen aquarum,
> Et fœdam glomerant tempeſtatem imbribus atris
> Collectæ ex alto nubes. Ruit arduus æther,
> Et pluvia ingentia ſata lætæ bonmque labores
> Diluit. Implentur foſſæ, et cava flumina creſcunt
> Cum ſonitu, fervetque fretis ſpirantibus æquor.
> Ipſe Pater, media nimborum in nocte, coruſca
> Fulmina molitur dextra. Quo maxima motu
> Terra tremit: fugere feræ! et mortalia corda
> Per gentes humilis ſtravit pavor. Ille flagranti
> Aut Atho, aut Rhodopen, aut alta Ceraunia telo
> Dejicit: *ingeminant auſtri, et denſiſſimus imber.*
>
> *Virg. Georg. l. 1.*

In the deſcription of a ſtorm, to figure Jupiter throwing down huge mountains with his thunderbolts, is hyperbolically ſublime, if we may uſe the expreſſion: the tone of mind produced by that image, is ſo diſtant from the tone produced by a thick ſhower of rain, that the ſudden tranſition muſt be unpleaſant.

Objects of ſight that are not remarkably great nor high, ſcarce raiſe any emotion of grandeur or of ſublimity: and the ſame holds in other objects; for we often find the mind rouſed and animated, without being carried to that height. This difference may be diſcerned in many ſorts of muſic, as well as in ſome muſical inſtruments: a kettle-drum rouſes, and a hautboy is animating; but neither of them inſpires an emotion of ſublimity: revenge animates the mind in a conſiderable degree; but it never produceth an emotion that can be termed *grand* or *ſublime*; and perhaps no diſagreeable paſſion ever has that effect.

No deſire is more univerſal than to be exalted and honoured; and upon that account, chiefly, are we ambitious of power, riches, titles, fame, which would ſuddenly loſe their reliſh did they not raiſe us above others, and command ſubmiſſion and deference: and it may be thought, that our attachment to things grand and lofty, proceeds from their connection with our favourite paſſion. This connection has undoubtedly an effect; but that the preference given to things grand and lofty muſt have a deeper root in human nature, will appear from conſidering, that many beſtow their time upon low and trifling amuſements, without having the leaſt tincture of this favourite paſſion: yet theſe very perſons talk the ſame language with the reſt of mankind; and prefer the more elevated pleaſures: they acknowledge a more refined taſte, and are aſhamed of their own as low and groveling. This ſentiment, conſtant and univerſal, muſt be the work of nature; and it plainly indicates an original attachment in human nature to every object that elevates the mind: ſome men may have a greater reliſh for an object not of the higheſt rank; but they are conſcious of the preference given by mankind in general to things grand and ſublime; and they are ſenſible, that their peculiar taſte ought to yield to the general taſte.

What is ſaid above ſuggeſts a capital rule for reaching

* It is juſtly obſerved by Addiſon, that perhaps a man would have been more aſtoniſhed with the majeſtic air that appeared in one of Lyſippus's ſtatues of Alexander, though no bigger than the life, than he might have been with Mount Athos, had it been cut into the figure of the hero, according to the propoſal of Phidias, with a river in one hand and a city in the other. *Spectator*, N° 415.

Grandeur and Sublimity.

reaching the ſublime in ſuch works of art as are ſuſceptible of it; and that is, to preſent thoſe parts or circumſtances only which make the greateſt figure, keeping out of view every thing low or trivial; for the mind, elevated by an important object, cannot, without reluctance, be forced down to beſtow any ſhare of its attention upon trifles. Such judicious ſelection of capital circumſtances, is by an eminent critic ſtyled *grandeur* of *manner* *. In none of the fine arts is there ſo great ſcope for that rule as in poetry; which, by that means, enjoys a remarkable power of beſtowing upon objects and events an air of grandeur: when we are ſpectators, every minute object preſents itſelf in its order; but in deſcribing at ſecond hand, theſe are laid aſide, and the capital objects are brought cloſe together. A judicious taſte in thus ſelecting the moſt intereſting incidents, to give them an united force, accounts for a fact that may appear ſurpriſing; which is, that we are more moved by ſpirited narrative at ſecond hand, than by being ſpectators of the event itſelf, in all its circumſtances.

10 Grandeur of manner.

* *Spectator*, N° 415.

Longinus * exemplifies the foregoing rule by a compariſon of two paſſages.

* *Chap.* 8.

Ye pow'rs, what madneſs! how on ſhips ſo frail
(Tremendous thought!) can thoughtleſs mortals ſail?
For ſtormy ſeas they quit the pleaſing plain,
Plant woods in waves, and dwell amidſt the main.
Far o'er the deep (a trackleſs path) they go,
And wander oceans in purſuit of wo.
No eaſe their hearts, no reſt their eyes can find,
On heaven their looks, and on the waves their mind,
Sunk are their ſpirits, while their arms they rear,
And gods are wearied with their fruitleſs prayer.
ARISTÆUS.

Burſt as a wave that from the cloud impends,
And ſwell'd with tempeſts on the ſhip deſcends.
White are the decks with foam: the winds aloud
Howl o'er the maſts, and ſing through every ſhroud.
Pale, trembling, tir'd, the ſailors freeze with fears,
And inſtant death on every wave appears. HOMER.

In the latter paſſage, the moſt ſtriking circumſtances are ſelected to fill the mind with terror and aſtoniſhment. The former is a collection of minute and low circumſtances, which ſcatter the thought and make no impreſſion: it is at the ſame time full of verbal antitheſes and low conceit, extremely improper in a ſcene of diſtreſs.

The following deſcription of a battle is remarkably ſublime, by collecting together, in the feweſt words, thoſe circumſtances which make the greateſt figure.

"Like autumn's dark ſtorms pouring from two echoing hills, toward each other approached the heroes; as two dark ſtreams from high rocks meet and roar on the plain, loud, rough, and dark in battle, meet Lochlin and Iniſfail. Chief mixes his ſtrokes with chief, and man with man: ſteel ſounds on ſteel, and helmets are cleft on high: blood burſts and ſmokes around: ſtrings murmur on the poliſh'd yew: darts ruſh along the ſky: ſpears fall like ſparks of flame that gild the ſtormy face of night.

"As the noiſe of the troubled ocean when roll the waves on high, as the laſt peal of thundering heaven, ſuch is the noiſe of battle. Though Cormac's hundred bards were there, feeble were the voice of a hundred bards to ſend the deaths to future times; for many were the deaths of the heroes, and wide poured the blood of the valiant." FINGAL.

Grandeur and Sublimity.

The following paſſage in the 4th book of the Iliad is a deſcription of a battle, wonderfully ardent. "When now gathered on either ſide, the hoſts plunged together in fight; ſhield is harſhly laid to ſhield; ſpears craſh on the brazen corſlets; boſſy buckler with buckler meets; loud tumult rages over all; groans are mixed with boaſts of men; the ſlain and ſlayer join in noiſe; the earth is floating round with blood. As when two ruſhing ſtreams from two mountains come roaring down, and throw together their rapid waters below, they roar along the gulphy vale. The ſtartled ſhepherd hears the ſound, as he ſtalks o'er the diſtant hills; ſo, as they mixed in fight, from both armies clamour with loud terror aroſe." But ſuch general deſcriptions are not frequent in Homer. Even his ſingle-combats are rare. The fifth book is the longeſt account of a battle that is in the Iliad; and yet contains nothing but a long catalogue of chiefs killing chiefs, not in ſingle combat neither, but at a diſtance with an arrow or a javelin; and theſe chiefs named for the firſt time and the laſt. The ſame ſcene is continued through a great part of the ſixth book. There is at the ſame time a minute deſcription of every wound, which for accuracy may do honour to an anatomiſt, but in an epic poem is tireſome and fatiguing. There is no relief from horrid languor but the beautiful Greek language and melody of Homer's verſification.

In the twenty-firſt book of the Odyſſey, there is a paſſage which deviates widely from the rule above laid down: it concerns that part of the hiſtory of Penelope and her ſuitors, in which ſhe is made to declare in favour of him who ſhould prove the moſt dextrous in ſhooting with the bow of Ulyſſes:

Now gently winding up the fair aſcent,
By many an eaſy ſtep, the matron went:
Then o'er the pavement glides with grace divine,
(With poliſh'd oak the level pavements ſhine);
The folding gates a dazzling light diſplay'd,
With pomp of various architrave o'erlay'd.
The bolt, obedient to the ſilken ſtring,
Forſakes the ſtaple as ſhe pulls the ring;
The wards reſpondent to the key turn'd round;
The bars fall back; the flying valves reſound.
Loud as a bull makes hill and valley ring;
So roar'd the lock when it releas'd the ſpring.
She moves majeſtic through the wealthy room,
Where treaſur'd garments caſt a rich perfume;
There from the column where aloft it hung,
Reach'd, in its ſplendid caſe, the bow unſtrung.

Virgil ſometimes errs againſt this rule: in the following paſſages minute circumſtances are brought into full view; and what is ſtill worſe, they are deſcribed with all the pomp of poetical diction, *Æneid*, *L.* 1. *l.* 214, *to* 219. *L.* 6. *l.* 176, *to* 182. *L.* 6. *l.* 212, *to* 231.: and the laſt, which deſcribes a funeral, is the leſs excuſable, as the man whoſe funeral it is makes no figure in the poem.

The ſpeech of Clytemneſtra, deſcending from her chariot in the Iphigenia of Euripides *, is ſtuffed with a number of common and trivial circumſtances. * *Act* 3.

But of all writers, Lucan in this article is the moſt injudicious: the ſea-fight between the Romans and Maſſilians †, is deſcribed ſo much in detail, without exhibiting † Lib. iii. 567.

Grandeur and Sublimity.

exhibiting any grand or total view, that the reader is fatigued with endleſs circumſtances, without ever feeling any degree of elevation; and yet there are ſome fine incidents, thoſe, for example, of the two brothers, and of the old man and his ſon, which, taken ſeparately, would affect us greatly. But Lucan, once engaged in a deſcription, knows no end. See other paſſages of the ſame kind, *L.* 4. *l.* 292, *to* 337. *L.* 4. *l.* 750, *to* 765. The epiſode of the ſorcereſs Erictho, end of book 6th, is intolerably minute and prolix.

This rule is alſo applicable to other fine arts. In painting it is eſtabliſhed, that the principal figure muſt be put in the ſtrongeſt light; that the beauty of attitude conſiſts in placing the nobler parts moſt in view, and in ſuppreſſing the ſmaller parts as much as poſſible; that the folds of the drapery muſt be few and large; that foreſhortenings are bad, becauſe they make the parts appear little; and that the muſcles ought to be kept as entire as poſſible, without being divided into ſmall ſections. Every one at preſent ſubſcribes to that rule as applied to gardening, in oppoſition to parterres ſplit into a thouſand ſmall parts in the ſtiffeſt regularity of figure. The moſt eminent architects have governed themſelves by the ſame rule in all their works.

11 General terms ought to be avoided where ſublimity is intended.

Another rule chiefly regards the ſublime, though it is applicable to every ſort of literary performance intended for amuſement; and that is, to avoid as much as poſſible abſtract and general terms. Such terms, ſimilar to mathematical ſigns, are contrived to expreſs our thoughts in a conciſe manner; but images, which are the life of poetry, cannot be raiſed in any perfection but by introducing particular objects. General terms that comprehend a number of individuals, muſt be excepted from that rule: our kindred, our clan, our country, and words of the like import, though they ſcarce raiſe any image, have, however, a wonderful power over our paſſions: the greatneſs of the complex object overbalances the obſcurity of the image.

Grandeur, being an extreme vivid emotion, is not readily produced in perfection but by reiterated impreſſions. The effect of a ſingle impreſſion can be but momentary; and if one feel ſuddenly ſomewhat like a ſwelling or exaltation of mind, the emotion vaniſheth as ſoon as felt. Single thoughts or ſentiments are often cited as examples of the ſublime; but their effect is far inferior to that of a grand ſubject diſplay'd in its capital parts. We ſhall give a few examples, that the reader may judge for himſelf. In the famous action of Thermopylæ, where Leonidas the Spartan king, with his choſen band, fighting for their country, were cut off to the laſt man, a ſaying is reported of Dieneces, one of the band, which, expreſſing cheerful and undiſturbed bravery, is well entitled to the firſt place in examples of that kind: talking of the number of their enemies, it was obſerved, that the arrows ſhot by ſuch a multitude would intercept the light of the ſun; "So much the better, ſays he, for we ſhall then fight in the ſhade."

Herodot. lib. 7.

Somerſet. Ah! Warwick, Warwick, wert thou as we are,
We might recover all our loſs again.
The Queen from France hath brought a puiſſant power.
Ev'n now we heard the news. Ah! couldſt thou fly!
Warwick. Why, then I would not fly.
Third part, Henry VI. act 5. *ſc.* 3.

Such a ſentiment from a man expiring of his wounds, is truly heroic; and muſt elevate the mind to the greateſt height that can be done by a ſingle expreſſion: it will not ſuffer in a compariſon with the famous ſentiment *Qu'il mourut* of Corneille: the latter is a ſentiment of indignation merely, the former of firm and cheerful courage. Grandeur and Sublimity.

To cite in oppoſition many a ſublime paſſage, enriched with the fineſt images, and dreſſed in the moſt nervous expreſſions, would ſcarce be fair. We ſhall produce but one inſtance, from Shakeſpear, which ſets a few objects before the eye, without much pomp of language: it operates its effect by repreſenting theſe objects in a climax, raiſing the mind higher and higher till it feel the emotion of grandeur in perfection:

The cloud-capt tow'rs, the gorgeous palaces,
The ſolemn temples, the great globe itſelf,
Yea all which it inherit, ſhall diſſolve, &c.

The cloud-capt tow'rs produce an elevating emotion, heightened by the *gorgeous palaces*; and the mind is carried ſtill higher and higher by the images that follow. Succeſſive images, making thus ſtronger and ſtronger impreſſions, muſt elevate more than any ſingle image can do.

12 grandeur and ſublimity employed indirectly to ſink the mind.

As, on the one hand, no means directly applied have more influence to raiſe the mind than grandeur and ſublimity; ſo, on the other, no means indirectly applied have more influence to ſink and depreſs it: for in a ſtate of elevation, the artful introduction of an humbling object, makes the fall great in proportion to the elevation. Of this obſervation Shakeſpear gives a beautiful example, in the paſſage laſt quoted:

The cloud-capt tow'rs, the gorgeous palaces,
The ſolemn temples, the great globe itſelf,
Yea all which it inherit, ſhall diſſolve,
And like the baſeleſs fabric of a viſion
Leave not a rack behind.—— *Tempeſt, act* 4. *ſc.* 4.

The elevation of the mind in the former part of this beautiful paſſage, makes the fall great in proportion, when the moſt humbling of all images is introduced, that of an utter diſſolution of the earth and its inhabitants. The mind, when warmed, is more ſuſceptible of impreſſions than in a cool ſtate; and a depreſſing or melancholy object liſtened to, makes the ſtrongeſt impreſſion when it reaches the mind in its higheſt ſtate of elevation or cheerfulneſs.

But a humbling image is not always neceſſary to produce that effect: a remark is made above, that in deſcribing ſuperior beings, the reader's imagination, unable to ſupport itſelf in a ſtrained elevation, falls often as from a height, and ſinks even below its ordinary tone. The following inſtance comes luckily in view; for a better cannot be given: "God ſaid, Let there be light, and there was light." Longinus quotes this paſſage from Moſes as a ſhining example of the ſublime; and it is ſcarce poſſible, in fewer words, to convey ſo clear an image of the infinite power of the Deity: but then it belongs to the preſent ſubject to remark, that the emotion of ſublimity raiſed by this image is but momentary; and that the mind, unable to ſupport itſelf in an elevation ſo much above nature, immediately ſinks down into humility and veneration for a Being ſo far exalted above groveling mortals.

Grandeur and Sublimity.

mortals. Every one is acquainted with a diſpute about that paſſage between two French critics, the one poſitively affirming it to be ſublime, the other as poſitively denying. What has been remarked, ſhows, that both of them have reached the truth, but neither of them the whole truth: the primary effect of the paſſage is undoubtedly an emotion of grandeur; which ſo far juſtifies Boileau: but then every one muſt be ſenſible, that the emotion is merely a flaſh, which, vaniſhing inſtantaneouſly, gives way to humility and veneration. That indirect effect of ſublimity juſtifies Huet, on the other hand, who being a man of true piety, and probably not much carried by imagination, felt the humbling paſſions more ſenſibly than his antagoniſt did. And laying aſide difference of character, Huet's opinion may perhaps be defended as the more ſolid; becauſe in ſuch images, the depreſſing emotions are the more ſenſibly felt, and have the longer endurance.

* *Boileau and Huet.*

The ſtraining an elevated ſubject beyond due bounds, and beyond the reach of an ordinary conception, is not a vice ſo frequent as to require the correction of criticiſm. But falſe ſublime is a rock that writers of more fire than judgement commonly ſplit on; and therefore a collection of examples may be of uſe as a beacon to future adventurers. One ſpecies of falſe ſublime, known by the name of *bombaſt*, is common among writers of a mean genius: it is a ſerious endeavour, by ſtrained deſcription, to raiſe a low or familiar ſubject above its rank; which, inſtead of being ſublime, fails not to be ridiculous. The mind, indeed, is extremely prone, in ſome animating paſſions, to magnify its objects beyond natural bounds: but ſuch hyperbolical deſcription has its limits; and when carried beyond the impulſe of the propenſity, it degenerates into burleſque. Take the following examples:

¶ 3 Falſe ſublime.

Sejanus.——————Great and high
The world knows only two, that's Rome and I.
My roof receives me not: 'tis air I tread,
And at each ſtep I feel my advanc'd head
Knock out a ſtar in heav'n. *Sejanus, Ben Johnſon, act 5.*

A writer who has no natural elevation of mind, deviates readily into bombaſt: he ſtrains above his natural powers; and the violent effort carries him beyond the bounds of propriety.

Guiſford. Give way, and let the guſhing torrent come;
Behold the tears we bring to ſwell the deluge,
Till the flood riſe upon the guilty world
And make the ruin common.
Lady Jane Gray, act 4. near the end.

Another ſpecies of falſe ſublime, is ſtill more faulty than bombaſt: and that is, to force elevation by introducing imaginary beings without preſerving any propriety in their actions; as if it were lawful to aſcribe every extravagance and inconſiſtence to beings of the poet's creation. No writers are more licentious in that article than Johnſon and Dryden:

Methinks I ſee Death and the Furies waiting
What we will do, and all the heaven at leiſure
For the great ſpectacle. Draw then your ſwords:
And if our deſtiny envy our virtue
The honour of the day, yet let us care
To ſell ourſelves at ſuch a price, as may
Undo the world to buy us, and make Fate,
While ſhe tempts ours, ſo fear her own eſtate.
Catiline, act 5.

Grandeur ‖ Granicus.

——————The furies ſtood on hills
Circling the place, and trembled to ſee men
Do more than they: whilſt Piety left the field,
Griev'd for that ſide, that in ſo bad a cauſe
They knew not what a crime their valour was.
The Sun ſtood ſtill, and was, behind the cloud
The battle made, ſeen ſweating to drive up
His frighted horſe, whom ſtill the noiſe drove backward.
Ilid, act 5.

Ofmyn. While we indulge our common happineſs,
He's forgot by whom we all poſſeſs,
The brave Almanzor, to whoſe arms we owe
All that we did, and all that we ſhall do;
Who like a tempeſt that outrides the wind,
Made a juſt battle ere the bodies join'd.
Abdolla. His victories we ſcarce could keep in view,
Or purſue 'em ſo faſt as he rough drew.
Abdemelech. Fate after him below with pain did move,
And Victory could ſcarce keep pace above.
Death did at length ſo many ſlain forget,
And loſt the tale, and took 'em by the great.
Conqueſt of Granada, act 2. at beginning.

An actor on the ſtage may be guilty of bombaſt as well as an author in his cloſet: a certain manner of acting, which is grand when ſupported by dignity in the ſentiment and force in the expreſſion, is ridiculous where the ſentiment is mean and the expreſſion flat.

GRANGE, a houſe or farm, not only furniſhed with neceſſary places for all manner of huſbandry, as ſtables for horſes, ſtalls for cattle, &c. but where there are granaries and barns for corn, hay-lofts, &c. And by the grant of a grange, ſuch places will paſs, without being particularly mentioned.——The word is formed of the Latin *granea* or *granum*, grain, corn, &c. Hence alſo *granger*, or *grangier*, a grange-keeper or farmer.

GRANICUS, a ſmaller river near the Helleſpont in Leſſer Aſia, remarkable for the firſt victory gained by Alexander the Great over the armies of Darius.—Authors diſagree very much about the number of the Perſians, though all agree that they were vaſtly more numerous than the Greeks. Juſtin and Oroſius tell us, that the Perſian army conſiſted of 600,000 foot and 20,000 horſe; Arrian makes the foot amount to 200,000; but Diodorus tells us, that they were not more than 100,000 foot, and 10,000 horſe. The Macedonian army did not exceed 30,000 foot and 5000 horſe. The Perſian cavalry lined the banks of the Granicus, in order to oppoſe Alexander wherever he ſhould attempt a paſſage; and the foot were poſted behind the cavalry on an eaſy aſcent. Parmenio would have had Alexander to allow his troops ſome time to refreſh themſelves; but he replied, that, after having croſſed the Helleſpont, it would be a diſgrace to him and his troops to be ſtopped by a rivulet. Accordingly a proper place for croſſing the river was no ſooner found, than he commanded a ſtrong detachment of horſe to enter, he himſelf following with the right wing which he commanded in perſon; the trumpets in the mean time ſounding, and loud ſhouts of joy being heard through the whole army. The Perſians let fly ſuch ſhowers of arrows againſt the detachment of Macedonian horſe, as cauſed ſome confuſion; ſeveral of their horſes being killed or wounded. As they drew near the bank a moſt bloody engagement enſued; the Macedonians attempting to land, and the Perſians puſhing them back into the river. Alexander, who obſerved the confuſion they were in, took the command

Granicus, Granite.

mand of them himſelf; and landing in ſpite of all oppoſition, obliged the Perſian cavalry, after an obſtinate reſiſtance, to give ground. However, Spithrobates, governor of Ionia, and ſon-in-law to Darius, ſtill maintained his ground, and did all that lay in his power to bring them back to the charge. Alexander advanced full gallop to engage him; neither did he decline the combat, and both were ſlightly wounded at the firſt encounter. Spithrobates having thrown his javelin without effect, advanced ſword in hand to meet his antagoniſt, who ran him through with his pike as he raiſed his arm to diſcharge a blow with his ſcymitar. But Roſaces, brother to Spithrobates, at the ſame time gave Alexander ſuch a furious blow on the head with his battle-ax, that he beat off his plume, and ſlightly wounded him through the helmet. As he was ready to repeat the blow, Clitus with one ſtroke of his ſcymitar cut off Roſaces's head, and thus in all probability ſaved the life of his ſovereign. The Macedonians then, animated by the example of their king, attacked the Perſians with new vigour, who ſoon after betook themſelves to flight. Alexander did not purſue them; but immediately charged the enemy's foot with all his forces, who had now paſſed the river. The Perſians, diſheartened at the defeat of their cavalry, made no great reſiſtance. The Greek mercinaries retired in good order to a neighbouring hill, whence they ſent deputies to Alexander deſiring leave to march off unmoleſted. But he, inſtead of coming to a parley with them, ruſhed furiouſly into the middle of this ſmall body; where his horſe was killed under him, and he himſelf in great danger of being cut in pieces. The Greeks defended themſelves with incredible valour for a long time, but were at laſt almoſt entirely cut off.—In this battle the Perſians are ſaid to have loſt 20,000 foot and 2,500 horſe, and the Macedonians only 55 foot and 60 horſe.

GRANITE, in natural hiſtory, a diſtinct genus of ſtones, compoſed of ſeparate and very large concretions rudely compacted together; of great hardneſs, giving fire with ſteel, not fermenting with acids, and ſlowly and imperfectly calcinable in a great fire.

Of this genus there are three ſpecies: 1. The hard white granite with black ſpots, commonly called moorſtone. This is a very valuable kind, conſiſting of a beautiful congeries of very variouſly conſtructed and differently coloured particles, not diffuſed among or running into one another, but each pure and diſtinct, though firmly adhering to whichever of the others it comes in contact with, and forming a very firm maſs. It is much uſed in London for the ſteps of public buildings, and on other occaſions where great ſtrength and hardneſs are required. 2. The hard red granite variegated with black and white, and common in Egypt and Arabia. 3. The pale whitiſh granite, variegated with black and yellow. This is ſometimes found in ſtrata, but more frequently in looſe nodules, and is uſed for paving the ſtreets.

Some of theſe kinds of ſtones are found in almoſt every country, and in many places they are found of immenſe bigneſs. The largeſt maſs of this kind in the known world, lying as an unconnected ſtone, is found near the Cape of Good Hope in Africa, and of which we have the following deſcription in the Phi-

Granite, Grant.

lop. Tranſact. vol. 68. p. 102, given by Mr Anderſon in a letter to Sir John Pringle. "The ſtone is ſo remarkable, that it is called by the people here the *Tower of Babel*, and by ſome the *Pearl Diamond*. It either takes the laſt name from a place near which it is ſituated, or it gives name to the tract of cultivated land called the Pearl. It lies upon the top of a ridge of low hills, beyond a large plain, at the diſtance of about thirty miles from the Cape Town; beyond which, at a little diſtance, is a range of hills of a much greater height. It is of an oblong ſhape, and lies north and ſouth. The ſouth end is higheſt; the eaſt and weſt ſides are ſteep and high; but the top is rounded, and ſlopes away gradually to the north end, ſo that you can aſcend it by that way, and enjoy a moſt extenſive proſpect of the whole country. I could not preciſely determine its circumference, but it took us above half an hour to walk round it; and by making every allowance for the rugged way, and ſtopping a little, I think the moſt moderate computation muſt make it exceed half a mile. The ſame difficulty occurred with reſpect to knowing its height: but I think, that, at the ſouth-end, it is nearly equal to half its length; or, were I to compare it to an object you are acquainted with, I ſhould ſay it equalled the dome of St Paul's Church.

"I am uncertain whether it ought to be conſidered as the top of the hill, or a detached ſtone, becauſe there is no poſitive proof of either, unleſs we were to dig about its baſe; but it would certainly empreſs every beholder, at firſt ſight, with the idea of its being one ſtone, not only from its figure, but becauſe it is really one ſolid uniform maſs from top to bottom, without any interruption; which is contrary to the general character of the high hills of this country, they being commonly divided, or compoſed of different ſtrata, at leaſt if we may judge from the rows of plants or ſhrubs which grow on the ſides of the ſteepeſt, and, as I ſuppoſe, are produced from the ſmall quantity of earth interpoſed between them. It has indeed a few fiſſures, or rather impreſſions, which do not reach deeper than four or five feet; and near its north end a ſtratum of a more compact ſtone runs acroſs, which is not above twelve or fourteen inches thick, with its ſurface divided into little ſquares, or oblongs, diſpoſed obliquely. This ſtratum is perpendicular; but whether it cuts the other to its baſe, or is ſuperficial, I cannot determine. Its ſurface is alſo ſo ſmooth, that it does not appear to have formerly been joined to, or ſeparated from, any other part by violence, as is the caſe with many other large fragments; but enjoys the exact ſituation where it was originally placed, and has undergone little change from being expoſed for ſo many ſucceſſive ages to the calcining power of a very hot climate."—A part of this ſtone being examined by Sir William Hamilton, he determined it to be a granite, and of the ſame nature with the tops of ſome of the Alps; and ſuppoſes both of them to have been elevated by volcanic exploſions.

GRANIVOROUS, an appellation given to animals which feed on corn or ſeeds. Theſe are principally of the bird kind.

GRANT, in law, a conveyance in writing of ſuch things as cannot paſs or be conveyed by word only; ſuch are rents, reverſions, ſervices, &c.

GRANT

Grant. GRANT (Francis), Lord Cullen, an eminent lawyer and judge in Scotland, was deſcended from a younger branch of the family of the Grants of Grant in that kingdom, and was born about the year 1660. When he commenced advocate he made a diſtinguiſhed figure at the revolution, by oppoſing the opinion of the old lawyers, who warmly argued on the inability of the convention of eſtates to make any diſpoſition of the crown. The abilities he ſhewed in favour of the revolution recommended him to an extenſive practice; in which he acquired ſo much honour, that when the union between the two kingdoms was in agitation, queen Anne unexpectedly, and without application, created him a baronet, with a view of ſecuring his intereſt in that meaſure; and upon the ſame principle, ſhe ſoon after created him a judge, or one of the lords of ſeſſion. From this time, according to the cuſtom of Scotland, he was ſtyled, from the name of his eſtate, Lord Cullen; and the ſame good qualities that recommended him to this honourable office, were very conſpicuous in the diſcharge of it; which he continued for 20 years with the higheſt reputation, when a period was put to his life by an illneſs which laſted but three days. He expired without any agony on March 16th 1726.

His character is drawn to great advantage in the Biographia Britannica; where it is obſerved, among other remarks to his honour, "That as an advocate he was indefatigable in the management of buſineſs; but at the ſame time that he ſpared no pains, he would uſe no craft. He had ſo high an idea of the dignity of his profeſſion, that he held it equally criminal to neglect any honeſt means of coming at juſtice, or to make uſe of any arts to elude it.

"In reſpect to fortune, though he was modeſt and frugal, and had a large practice, yet he was far from being avaritious. His private charities were very conſiderable, and grew in the ſame proportion with his profits. He was, beſides, very ſcrupulous in many points; he would not ſuffer a juſt cauſe to be loſt through a client's want of money. He was ſuch an enemy to oppreſſion, that he never denied his aſſiſtance to ſuch as laboured under it; and with reſpect to the clergy of all profeſſions (in Scotland) his conſcience obliged him to ſerve them without a fee. He ſaw their wrongs required aſſiſtance, and he knew their circumſtances would not admit of expence. His additions, therefore, to his paternal eſtate were much inferior to what might have been expected, and a large acceſſion of character was the principal produce of that activity and diligence by which he was diſtinguiſhed at the bar.

"When his merit had raiſed him to the bench, he thought himſelf accountable to God and man for his conduct in that high office; and that deep ſenſe of his duty, at the ſame time that it kept him ſtrictly to it, encouraged and ſupported him in the performance. The pleadings in Scotland are carried on chiefly in writing, which renders them ſometimes very prolix, ſo as to take up much of a judge's time, and to exerciſe alike his parts and his patience in going through and making himſelf maſter of them. In this the diligence and dexterity of lord Cullen were equally conſpicuous: he went through every thing that came into his hands very carefully, and ſifted it thoroughly; ſo that the lawyers at the bar never found themſelves too ſtrong for the bench, but on the contrary were often told many things by his lordſhip, which had either eſcaped their notice, or which the intereſt of their client had engaged them to conceal. As his attention to the pleadings guided him to the real merits of the cauſe; ſo when he was once maſter of theſe, his ſecond care was to diſpatch it. He knew, that, in judicature, the next fault to denying, was delaying juſtice; by which families are always injured, and too often ruined. Whenever, therefore, he had provided againſt being miſtaken, he was deſirous of bringing the matter to a ſhort deciſion; and as he was very ſolicitous about the former, ſo the parties themſelves helped him not a little as to the latter. Whenever he ſat as lord ordinary; the paper of cauſes was remarkably full, for his reputation being equally eſtabliſhed for knowledge and integrity, there were none, who had a good opinion of their own pretenſions, but were deſirous of bringing them before him, and not many who did not ſit down ſatisfied with his deciſion. This prevailed more eſpecially after it was found that few of his ſentences were reverſed; and when they were, it was commonly owing to himſelf: for if, upon mature reflection, or upon new reaſons offered at the re-hearing, he ſaw any juſt ground for altering his judgment, he made no ſcruple of declaring it; being perſuaded, that it was more manly, as well as more juſt, to follow truth, than to ſupport opinion: and his conduct in this reſpect had a right effect; for inſtead of leſſening, it raiſed his reputation. Grant.

"He would not, however, with all this great ſtock of knowledge, experience, and probity, truſt himſelf in matters of blood, or venture to decide in criminal caſes on the lives of his fellow-creatures; which was the reaſon, that, though often ſolicited, he could never be prevailed upon to accept of a ſeat in the juſticiary court.

"He was ſo true a lover of learning, and was ſo much addicted to his ſtudies, that, notwithſtanding the multiplicity of his buſineſs while at the bar, and his great attention to his charge when a judge, he nevertheleſs found time to write various treatiſes, on very different and important ſubjects: Some political, which were remarkably well-timed, and highly ſerviceable to the government: others of a moſt extenſive nature, ſuch as his eſſays on law, religion, and education, which were dedicated to his preſent majeſty when prince of Wales; by whoſe command, his then ſecretary, Mr. Samuel Molyneaux, wrote him a letter of thanks, in which were many gracious expreſſions, as well in relation to the piece, as to its author. He compoſed, beſides theſe, many diſcourſes on literary ſubjects, for the exerciſe of his own thoughts, and for the better diſcovery of truth; which went no farther than his own cloſet, and from a principle of modeſty were not communicated even to his moſt intimate friends.

"In his lordſhip's private character he was as amiable as he was reſpectable in his public. There were certain circumſtances that determined him to part with an eſtate that was left him by his father; and it being foreſeen that he would employ the produce of it, and the money he had acquired by his profeſſion, in a new purchaſe, there were many decayed families who ſolicited him to take their lands upon his own terms, relying entirely

Grant, Granville.

entirely on that equity, which they conceived to be the rule of his actions. It appeared that their opinion of him was perfectly well grounded. For being at length prevailed upon to lay out his money on the eſtate of an unfortunate family, who had a debt upon it of more than it was worth; he firſt put their affairs into order, and by claſſing the different demands, and compromiſing a variety of claims, ſecured ſome thouſand pounds to the heirs, without prejudice to any, and of which they had never been poſſeſſed but from his interpoſition and vigilance in their behalf: So far was he either from making any advantage to himſelf of their neceſſities, or of his own ſkill in his profeſſion; a circumſtance juſtly mentioned to his honour, and which is an equal proof of his candor, generoſity, and compaſſion. He was charitable without oſtentation, diſintereſted in his friendſhips, and beneficent to all who had any thing to do with him. He was not only ſtrictly juſt; but ſo free from any ſpecies of avarice, that his lady, who was a woman of great prudence and diſcretion, finding him more intent on the buſineſs committed o him by others, than on his own, took upon herſelf the care of placing out his money; and to prevent his poſtponing, as he was apt to do, ſuch kind of affairs, when ſecurities offered, ſhe cauſed the circumſtances of them to be ſtated in the form of caſes, and ſo procured his opinion upon his own concerns, as if they had been thoſe of a client. Theſe little circumſtances are mentioned as more expreſſive of his temper, than actions of another kind could be; becauſe, in matters of importance, men either act from habit, or from motives that the world cannot penetrate; but, in things of a trivial nature, are leſs upon their guard, ſhew their true diſpoſition, and ſtand confeſſed for what they are."

GRANVILLE (George), lord Lanſdowne, was deſcended from a very ancient family, derived from Rollo the firſt duke of Normandy. At eleven years of age he was ſent to Trinity College in Cambridge, where he remained five years: but at the age of 13 was admitted to the degree of maſter of arts; having, before he was 12, ſpoken a copy of verſes of his own compoſition to the ducheſs of York at his college, when ſhe paid a viſit to the Univerſity of Cambridge. In 1696, his comedy called the *She-gallants* was acted at the theatre-royal in Lincolns-inn-fields, as his tragedy called *Heroic Love* was in the year 1698. In 1702 he tranſlated into Engliſh the *ſecond Olynthian of Demoſthenes*. He was member for the county of Cornwall in the parliament which met in 1710; was afterwards ſecretary of war, comptroller of the houſehold, then treaſurer, and ſworn one of the privy-council. The year following, he was created baron Lanſdowne. On the acceſſion of king George I. in 1714, he was removed from his treaſurer's place; and the next year entered his proteſt againſt the bills for attainting lord Bolingbroke and the duke of Ormond. He entered deeply into the ſcheme for raiſing an inſurrection in the weſt of England; and being ſeized as a ſuſpected perſon, was committed to the tower, where he continued two years. In 1719, he made a ſpeech in the houſe of Lords, againſt the bill to prevent occaſional conformity. In 1722, he withdrew to France, and continued abroad almoſt ten years. At his return in 1732, he publiſhed a fine edition of his works in 2 vols quarto. He died in 1735, leaving no male iſſue. Granville

GRANVILLE. a ſea-port town of France, in Lower Normandy, partly ſeated on a rock and partly on a plain. It gives a title to an Engliſh earl. W. Long. 1. 32. N. Lat. 48. 58. Graphometer.

GRANULATED, ſomething that has undergone granulation. See the next article.

GRANULATION, in chemiſtry, an operation by which metallic ſubſtances are reduced into ſmall grains, or roundiſh particles; the uſe of which is, to facilitate their combination with other ſubſtances.—This operation is very ſimple; it conſiſts only in pouring a melted metal ſlowly into a veſſel filled with water, which is in the mean time to be agitated with a broom. With melted copper, however, which is apt to explode with great violence on the contact of water, ſome precautions are to be obſerved, of which an account is given under the article CHEMISTRY, n° 406. Lead or tin may be granulated bypouring them when melted into a box, the internal ſurface of which is to be rubbed with powdered chalk, and the box ſtrongly ſhaken till the lead has become ſolid. Metals are granulated, becauſe their ductility renders them incapable of being pounded, and becauſe filing is long and tedious, and might render the metal impure by an admixture of iron from the file.

GRAPE, the fruit of the vine. See VINE.

GRAPE-*Shot*, in artillery, is a combination of ſmall ſhot put into a thick canvaſs bag, and corded ſtrongly together, ſo as to form a kind of cylinder, whoſe diameter is equal to that of the ball which is adapted to the cannon.

To form grape-ſhot, a bag of coarſe cloth is made juſt to hold the bottom which is put into it, then as many ſhot as the grape is to contain; and with a ſtrong pack-threed they are quilted, to keep the ſhot from moving; and when finiſhed they are put into boxes for carriage, to be tranſported wherever it is neceſſary. —The number of ſhot in a grape varies according to the ſervice or ſize of the guns. In ſea-ſervice the number is always nine; but by land it is increaſed to any number or ſize, from an ounce and a quarter in weight. It has not yet been determined with any accuracy, what number or ſize beſt anſwers in practice; for they often ſcatter ſo much, that only a ſmall number take place.

Proper charges for grape-ſhot have never yet been effectually determined. From ſome experiments, however, it appears, that for heavy ſix-pounders one third of the weight of the ſhot appears to be the beſt charge of powder; for the light ſix-pounders, one fourth of the weight of the ſhot; and, for howitzers, one eighth or one tenth anſwers very well.

This kind of fire ſeems yet not to have been enough reſpected or depended on. However, if cannon and howitzers can be made to throw one third or one fourth of their charge into a ſpace of 39×12 feet, at 200 and 300 yards diſtance, and thoſe fired ten or twelve times in a minute, it ſurely forms the thickeſt fire that can be produced from the ſame ſpace.

GRAPHOMETER, a mathematical inſtrument, otherwiſe called a *Semicircle*; the uſe of which is to obſerve any angle whoſe vertex is at the centre of the inſtrument in any plane, though it is moſt commonly hori-

Grappling, Grafs. horizontal, or nearly fo), and to find how many degrees it contains. See GEOMETRY, p. [12.]

GRAPPLING, a fort of fmall anchor, fitted with four or five flukes or claws, and commonly ufed to ride a boat or other fmall veffel.

Fire-GRAPPLING, an inftrument nearly refembling the former, but differing in the conftruction of its flukes, which are furnifhed with ftrong barbs on their points. Thefe machines are ufually fixed on the yard-arms of a fhip, in order to grapple any adverfary whom fhe intends to board. They are, however, more particularly ufeful in *fire-fhips* for the purpofes defcribed in that article.

GRASS, in botany, &c. a name given to feveral diftinct plants; as the agroftis or couch-grafs, the briza or quaking-grafs, &c. Under the term *grafs* alfo are comprehended all manner of herbaceous plants ferving for the food of cattle, as clover, rye-grafs, &c. See AGRICULTURE, and GRAMINA.

GRASS-*Sowing*. See AGRICULTURE, n° 51—57. and 133——137.

GRASS-*Walks* are made, for the moft part, not by fowing grafs-feed, but by laying turfs: and indeed the turfs from a fine common or down are much preferable to fown grafs: but if walks or plats are to be made by fowing, the beft way is to procure the feed from thofe paftures where the grafs is naturally fine and clear; or elfe the trouble of keeping it from fpiry or benty grafs will be very great, and it will fcarce ever look handfome.

In order to fow grafs-walks, the ground muft be firft dug; and when it has been dreffed and laid even, it muft be very carefully raked over, and all the clods and ftones taken off, and then covered over an inch thick with good mould.

This being done, the feed is to be fown pretty thick, that it may come up clofe and fhort; it muft then be raked over again, to cover the feed, that if the weather fhould happen to be windy, it may not be blown away. It ought alfo to be obferved, that where grafs is fown in gardens, either for lawns or walks, there fhould always be a good quantity of the white trefoil or dutch clover fown with it; for this will make a fine turf much fooner than any other fown grafs, and will continue a better verdure than any other of the grafs-tribe.

In order to keep grafs-plats or walks handfome, and in good order, you may fow in autumn freth feed over any places that are not well filled, or where the grafs is dead: but nothing improves grafs fo much as mowing and conftant rolling.

When turf is laid in gardens, it is a generally practice to cover the furface of the ground under the turf, either with fand or very poor earth: the defign of this is to keep the grafs fine, by preventing its growing too rank. This is proper enough for very rich ground: but it is not fo for fuch land as is middling, or but poor; for when this is practifed in fuch places, the grafs will foon wear out and decay in patches.

When turf is taken from a common or down, fuch ought to be chofen as is free from weeds: and when it is deftigned to remain for years without renewing, a dreffing fhould be laid upon it every other year, either of very rotten dung, afhes, or, where it can be eafily procured, very rotten tan; but thefe dreffings fhould be laid on early in the winter, that the rain may waft them into the ground, otherwife they will occafion the grafs to burn, when the warmth of the the fummer begins. Grafs-hopper.

When grafs is fo dreffed, and well rolled and mowed, it may be kept very beautiful for many years; but where it is not dreffed, or fed with fheep, it will rarely continue handfome more than eight or ten years.

GRASSHOPPER, in zoology, a fpecies of GRYLLUS. This infect breeds in fuch plenty in our meadows, that it is known to every body. It is of the colour of green leaves, except a line of brown which ftreaks the back, and two pale lines under the belly and behind the legs. It may be divided into the head, the corflet, and the belly. The head is oblong, regarding the earth, and bearing fome refemblance to that of a horfe. Its mouth is covered by a kind of round buckler, jutting over it, and armed with teeth of a brown colour, hooked at the points. Within the mouth is perceivable a large reddifh tongue, and fixed to the upper jaw. The antennæ are very long, tapering off to a point; and the eyes are like two black fpecks, a little prominent. The corflet is elevated, narrow, armed above and below by two ferrated fpines. The back is armed with a ftrong buckler, to which the mufcles of the legs are firmly bound; and round thefe mufcles are feen the veffels by which the animal breathes, as white as fnow. The laft pair of legs are much longer and ftronger than the firft two pair; fortified by thick mufcles, and well formed for leaping. It has four wings; the anterior ones fpringing from the fecond pair of legs, the pofterior from the third pair. The hinder wings are much finer and more expanfive than the foremoft, and are the principal inftruments of its flight. The belly is confiderably large, compofed of eight rings, and terminated by a forky tail, covered with down, like the tail of a rat. When examined internally, befides the gullet, we difcover a fmall ftomach; and behind that, a very large one, wrinkled and furrowed within-fide. Lower down, there is ftill a third: fo that it is thought, and with fome probability, that all the animals of this order chew the cud; as they fo much refemble ruminant animals in their internal conformation.

A fhort time after the grafshopper aflumes its wings, it fills the meadows with its note; which, like that among birds, is a call to courtfhip. The male only of this tribe is vocal; and, upon examining at the bafe of the wings, there will be found a little hole in its body, covered with a fine tranfparent membrane. This is thought, by Linnæus, to be the inftrument it employs in finging; but others are of opinion the found is produced by rubbing its hinder legs againft each other. But, however this may be, the note of one male is feldom heard, without being returned by another; and the two little animals, after many mutual infults of this kind, are feen to meet and fight defperately. The female is generally the reward of the victory; for, after the combat, the victor feizes her with his teeth behind the neck, and thus keeps her for feveral hours, till the bufinefs of fecundation is accomplifhed. At this time they are fo ftrongly united, that it is almoft impoffible to feparate them, without tearing their bodies afunder. Towards the latter end of autumn,

Grafs hopper.

the female prepares to depoſit her burthen; and her body is then ſeen greatly diſtended with eggs, which ſhe carries to the number of 150. In order to make a proper lodgment in the earth for them, nature has furniſhed her with an inſtrument in her tail, ſomewhat reſembling a two-edged ſword, which ſhe can ſheath and unſheath at pleaſure: with this ſhe pierces the earth as deep as ſhe is able; and into the hole which the inſtrument has made, ſhe depoſits her eggs one after the other.

Having thus provided for the continuation of her poſterity, the animal herſelf does not long ſurvive; but, as winter approaches, ſhe dries up, ſeems to feel the effect of age, and dies from a total decay. Some, however, aſſert that ſhe is killed by the cold; others, that ſhe is eaten by worms: but certain it is, that neither male nor female are ever ſeen to ſurvive the winter. In the mean time, the eggs which have been depoſited, continue unaltered either by the ſeverity of the ſeaſon, or the retardation of the ſpring. They are of an oval figure, white, and of the conſiſtence of horn: their ſize nearly equals that of a grain of aniſe: they are enveloped in the body within a covering branched all over with veins and arteries; and when excluded, they crack on being preſſed between the fingers. Their ſubſtance within, is a whitiſh, viſcous, and tranſparent fluid. In this manner they remain depoſited within the ſurface of the earth during the whole winter, till the return of ſpring begins to hatch them. About the beginning of May, each egg produces an inſect about the bigneſs of a flea. Theſe are at firſt of a whitiſh colour; at the end of two or three days they turn black, and ſoon after they become of a reddiſh brown. They appear from the beginning like graſshoppers wanting wings, and hop among the graſs, as ſoon as excluded, with great agility. Yet ſtill they are by no means arrived at their full ſtate of perfection; although they bear a ſtrong reſemblance to the animal in its perfect form. They want, or ſeem to want, the wings which they at laſt aſſume; and can only hop among the graſs, without being able to fly. The wings, however, are not wanting, but are concealed within four little bunches that ſeem to deform the ſides of the animal. There they lie rolled up in a moſt curious manner, and occupying a ſmaller ſpace than one could conceive who ſaw them extended. Theſe wings, however, it has never been deſtitute of; though they remain folded up for 20 days, ſo that they cannot be ſeen. When it is to undergo this change, the animal ceaſes from its graſſy food, and ſeeks about for a convenient place beneath ſome thorn or thiſtle that may protect it from an accidental ſhower. It ſwells up its head and neck, and then draws them in again; and thus alternately for ſome time it endeavours to get free. At length, the ſkin covering the head and breaſt divides above the neck, and the head iſſues forth. The other parts follow ſucceſſively; ſo that the little animal, with its long feelers, legs, &c. works its way from the old ſkin, which remains fixed to the thiſtle or thorn. It is indeed inconceiveable how the inſect can extricate itſelf from ſuch an exact ſheath as that which covered every part of its body.

The graſshopper, thus diſengaged from its outer ſkin, appears in its perfect form; but is then ſo feeble, and its body ſo ſoft and tender, that it may be moulded like wax. It is no longer of the obſcure colour it had before; but is of a greeniſh white, which becomes more vivid, as the moiſture on the ſurface is dried away. Still, however, the animal continues to ſhew no ſigns of life; but appears quite ſpent and fatigued with its labour for more than an hour together. During this time the body is drying, and the wings unfolding to their greateſt expanſion; and the curious obſerver will perceive them, fold after fold, opening to the ſun, till at laſt they become longer than the two hinder legs. The inſect's body alſo is lengthened during this operation, and it becomes much more beautiful than before. Graſs-hopper.

Theſe inſects are generally vocal in the midſt of ſummer; and they are heard at ſunſetting much louder than during the heats of the day. They are fed upon graſs; and if their belly be preſſed, they will be ſeen to return to the juices of the plants they have laſt fed upon. Though unwilling to fly, and ſlow of flight, particularly when the weather is moiſt or cool, they are ſometimes ſeen to fly to conſiderable diſtances. If they are caught by one of the hinder legs, they quickly diſengage themſelves from it, and leave the leg behind them. This, however, doth not grow again, as with crabs and ſpiders; for as they are animals of but a ſingle year's continuance, they have not ſufficient time for repairing theſe miſfortunes. The loſs of their leg alſo prevents them from flying; for being unable to lift themſelves in the air, they have not room upon the ground for the proper expanſion of their wings. If they be handled roughly, they will bite very fiercely; and, when they fly, they make a noiſe with their wings. They generally keep in the plain, where the graſs is luxuriant, and the ground rich and fertile: there they depoſit their eggs, particularly in thoſe cracks which are formed by the heat of the ſun.

Theſe animals are ſometimes very miſchievous, by reaſon of their great numbers. Some time ago they appeared in Languedoc, and other places of France, in very formidable ſwarms, and eat up all the harveſt of ſeveral years. They took their flight like birds, were about an inch long, of a grey colour, and exactly ſhaped like the common ſort. They were found in many places covering the whole ſurface of the earth, four or five inches deep, and uſed to lie quiet towards noon; but when the ſun then ſhone warmly upon them, they uſed to ariſe and take wing, and, ſetting on the corn-fields, they would in a few hours eat up the whole produce, ears, leaves, and even the more tender parts of the ſtalks.—When they had deſtroyed one field in this manner, they uſed to take wing and fly to another. They uſually flew very high in the air, and directly againſt the wind; but as ſoon as they ſaw a new crop of corn, they dropped together in a ſwarm, and cleared it as they had done the firſt. This practice they continued the whole day; and towards evening they ſettled upon the ground, where they remained quiet till the heat of the following day raiſed them again. When they had deſtroyed all the corn in the country, they ſeized upon the vines, garden-herbs, and willows, and at laſt upon the hemp. Whole fields of this laſt they eat up, notwithſtanding its great bitterneſs. Towards autumn, they

Gratarolus ‖ Gratian.

they left off feeding, and were then found in copulation; and ſoon after this, the females were every where ſeen laying their eggs, which they depoſited in the ground, making a hole with their tail, large enough to receive a gooſe-quill.

In theſe holes every female would lay 40 or 50 eggs, each of the ſize of a millet-ſeed; and when they had finiſhed the laying, they covered up the hole to keep out the water. After this they died apace; and the multitude of their carcaſes ſtunk intolerably, poiſoning the air. The next year they hatched in April: and from this one ſwarm ſuch prodigious numbers were hatched, that 15 tuns of them were deſtroyed while no bigger than flies, and nine tuns of their eggs before the hatching; and yet there remained enough of them to deſtroy, in a great meaſure, the ſucceeding harveſt. After this, they gradually decreaſed for ſeveral years, till they were not more numerous than elſewhere. This was attributed to the induſtry of the farmers in killing them; but it is more probable that unfavourable ſeaſons deſtroyed them.

GRATAROLUS (William), a learned phyſician in the 16th century, was born at Bergamo in Italy; and taught phyſic with reputation at Padua: but having embraced the Proteſtant religion, he retired to Switzerland, where he was made profeſſor of phyſic. He died at Baſil in 1568, aged 52. He wrote ſeveral curious works in Latin; amongſt which are, 1. The manner of preſerving and improving the memory. 2. Of preſerving in health travellers, men of letters, magiſtrates, and ſtudious perſons, &c.

GRATES *for* Fires, are compoſed of ribs of iron, placed at ſmall diſtances from one another, ſo that the air may have ſufficient acceſs to the fuel, and the accumulation of the aſhes, which would choke the fire, may be prevented.—Grates ſeem peculiarly adapted to the uſe of pit-coal, which requires a greater quantity of air to make it burn freely than other kinds of fuel. The hearths of the Britons ſeem to have been fixed in the centre of their halls, as is yet practiſed in ſome parts of Scotland, where the fire is nearly in the middle of the houſe, and the family ſit all around it. Their fire place was perhaps nothing more than a large ſtone, depreſſed a little below the level of the ground, and thereby adapted to receive the aſhes. About a century ago, it was only the floor of the room, with the addition of a back or hob of clay. But it was now changed among the gentlemen for a portable fire-pan, raiſed upon low ſupporters, and fitted with a circular grating of bars. Such were in uſe among the Gauls in the firſt century, and among the Welſh in the tenth.

GRATIAN, the ſon of Valentinian I. by his firſt wife, was declared Auguſtus by his father at the city of Amiens in 365, and ſucceeded him in 367; a prince equally extolled for his wit, eloquence, modeſty, chaſtity, and zeal againſt heretics. He aſſociated Theodoſius with him in the empire, and advanced the poet Auſonius to the conſulate. He made a great ſlaughter of the Germans at Straſburg *, and hence was ſurnamed *Alemannicus*. He was the firſt emperor who refuſed the title of *Pontifex Maximus*, upon the ſcore of its being a Pagan dignity. He was aſſaſſinated by Andragathius in 375, in the 24th year of his age.

* See *Argentoratum*.

Gratian, a famous Benedictine monk, in the 12th century, was born at Chiuſi, and employed near twenty-four years in compoſing a work, entitled, *Decretum*, or *Concordantia Diſcordantium Canonum*, becauſe he there endeavoured to reconcile the canons, which ſeemed contradictory to each other. This work he publiſhed in 1151. As he is frequently miſtaken, in taking one canon of one council, or one paſſage of one father, for another, and has often cited falſe decretals, ſeveral authors have endeavoured to correct his faults; and chiefly Anthony Auguſtine, in his excellent work, entitled, *De emendatione Gratiani*. To the decretals of Gratian, the popes principally owed the great authority they exerciſed in the thirteenth and following centuries.

Gratius ‖ Gratz.

GRATIUS, a Latin poet, cotemporary with Ovid, the author of a poem intitled *Cynegeticon*, or the *Manner of hunting with dogs*; the beſt edition of which is that of Leyden, 12mo, with the learned notes of Janus Ulitius.

GRATIOLA, HEDGE-HYSSOP; a genus of the monogynia order, belonging to the diandria claſs of plants. There are four ſpecies; the moſt remarkable of which is the officinalis, or common hedge-hyſſop. This grows naturally on the Alps and other mountainous parts of Europe. It hath a thick, fleſhy, fibrous, creeping root, which propagates very much, when planted in a proper ſoil and ſituation. From this ariſe ſeveral upright ſquare ſtalks, garniſhed with narrow ſpear-ſhaped leaves, placed oppoſite. The flowers are produced on the ſide of the ſtalks at each joint; they are ſhaped like thoſe of the fox-glove, but are ſmall, and of a pale yelloviſh colour.—This herb has an emetic and purgative virtue; to anſwer which intentions, it was formerly uſed by the common people in England, but was never much preſcribed by the phyſicians, and at laſt fell totally into diſuſe. Of late, however, it has been the ſubject of a diſſertation by Dr James Koſtrzewſki of Warſaw, in Poland; who gives ſome remarkable accounts of its effects in mania and obſtinate venereal caſes. It was given in powder, or in extract, to the quantity of half a drachm of the firſt, and a whole drachm of the ſecond, at each doſe. From the caſes related in his diſſertation, the author draws the following concluſions: 1. The gratiola may be given with ſafety both to male and female patients. 2. In all diſorders proceeding from a ſuperabundance of ſerum in the fluids, it appears to be a moſt effectual remedy. 3. In conſequence of this, it is had recourſe to with very great advantage in melancholy and mania ariſing from that ſtate of the ſyſtem. 4. It powerfully promotes purging, vomiting, ſweat, and urine; and is therefore much ſuperior to any of the uſual evacuating medicines, moſt of which prove only active in promoting one of theſe diſcharges at once. 5. The moſt obſtinate caſes of gonorrhœa, fluor albus, and venereal ulcers, are cured by the powder.—In ſome inſtances it has induced ſalivation; but whether or not it can always be made to produce that effect, is not as yet altogether certain. 6. The powder of gratiola prepared from the extract, and exhibited with ſugar, does not induce vomiting; and, on the contrary, the powder of the root always promotes that evacuation.

GRATZ, a handſome ſtrong town of Germany, and capital of Styria, with a caſtle ſeated on a rock,

Grave || Gravelines

and an univerſity. The Jeſuits have a college here; and there are a great number of handſome palaces, and a fine arſenal. The caſtle ſtands on a very lofty hill, and communicates with the river by means of a deep well. The empreſs-dowager was obliged to retire hither during the war of 1741 and 1742. It is ſeated on the river Muer, in E. Lon. 16. 25. N. Lat. 47. 4.

GRAVE, in muſic, is applied to a ſound which is of a low or deep tone.

Grave. The names of places ending with this ſyllable come from the Saxon *graf*, a wood, thicket, den, or cave.

Grave, a very ſtrong town of the Netherlands, in Dutch Brabant, ſeated on the river Maeſe, beyond which there is a fort. E. Lon. 5. 41. N. Lat. 51. 46.

GRAVEL, in natural hiſtory and gardening, a congeries of pebbles, which, mixed with a ſtiff loam, makes laſting and elegant gravel-walks; an ornament peculiar to our gardens, and which gives them an advantage over thoſe of other nations.

Gravel, in medicine. See the Index ſubjoined to that article.

Gravel-*Walks*. To make theſe properly, the bottom ſhould be laid with lime-rubbiſh, large flint-ſtones, or any other hard matter, for eight or ten inches thick, to keep weeds from growing through, and over this the gravel is to be laid ſix or eight inches thick. This ſhould be laid rounding up in the middle, by which means the larger ſtones will run off to the ſides, and may be raked away; for the gravel ſhould never be ſereened before it is laid on. It is a common miſtake to lay theſe walks too round, which not only makes them uneaſy to walk upon, but takes off from their apparent breadth. One inch in five feet is a ſufficient proportion for the riſe in the middle; ſo that a walk of 20 feet wide ſhould be four inches higher at the middle than at the edges, and ſo in proportion. As ſoon as the gravel is laid, it ſhould be raked, and the large ſtones thrown back again: then the whole ſhould be rolled both lengthwiſe and croſſwiſe; and the perſon who draws the roller ſhould wear ſhoes with flat heels, that he may make no holes; becauſe holes made in a new walk are not eaſily remedied. The walks ſhould always be rolled three or four times in very hard ſhowers, after which they will bind more firmly than otherwiſe they could ever be made to do.

Gravel, with ſome loam among it, binds more firmly than the rawer kinds; and when gravel is naturally very harſh and ſharp, it is proper to add a mixture of loam to it. The beſt gravel for walks is ſuch as abounds with ſmooth round pebbles, which, being mixed with a little loam, are bound ſo firmly together, that they are never afterwards injured either by wet or dry weather. Theſe are not ſo liable to be turned up by the feet in walking, as the more irregularly ſhaped pebbles, and remain much more firmly in their places after rolling.

GRAVELINES, a very ſtrong ſea-port town of the Netherlands in French Flanders, with a caſtle and harbour. It was ceded to France by the treaty of the Pyrenees, and is ſeated in a marſhy country on the river Aa, near the ſea, in E. Lon. 2. 13. N. Lat. 50. 59.

GRAVELLY land, or soil, that abounding with gravel or ſand, which eaſily admits of heat and moiſture; and the more ſtony ſuch lands are, the more barren they prove. Gravelly || Gravesend.

GRAVENAC, a town of Germany, in the circle of Suabia, and capital of a county of the ſame name. E. Lon. 8. 15. N. Lat. 48. 22.

GRAVER, in the art of engraving, a tool by which all the lines, ſcratches, and ſhades, are cut in copper, &c. See Engraving.

GRAVESANDE (William James), was born of an ancient and honourable family at Delft in Holland, in 1688. He ſtudied the civil law at Leyden, but mathematical learning was his favourite amuſement. When he had taken his doctor's degree in 1707, he ſettled at the Hague, and practiſed at the bar, in which ſituation he cultivated an acquaintance with learned men; with a ſociety of whom, he publiſhed a periodical review entitled *Le Journal Litteraire*, which was continued without interruption from the year 1713 to the year 1722, when he died. The moſt conſiderable of his works are, *A treatiſe on perſpective*; *An introduction to the Newtonian philoſophy, or a treatiſe on the elements of phyſics confirmed by experiments*; *A treatiſe on the elements of algebra, for the uſe of young ſtudents*; and *A courſe of logic and metaphyſics*. He had intended to have preſented the public with a ſyſtem of morality, but his death prevented the execution. The miniſters of the republic conſulted him on all occaſions wherein his talents were requiſite; and his ſkill in calculation was often of ſervice to them; as was his addreſs in decyphering, for detecting the ſecret correſpondence of their enemies. As profeſſor of mathematics and aſtronomy at Leyden, none ever applied the powers of nature with more ſucceſs, or to more uſeful purpoſes.

GRAVESEND, a town of Kent in England, ſituated on the banks of the Thames. It is a place of great reſort, being the common landing-place for ſeamen and paſſengers in their journey to London. All outward-bound ſhips are obliged to come to an anchor here, till they have been viſited and examined by the cuſtom-houſe officers, and here they generally take in proviſions. Here is a blockhouſe well mounted with cannon, to command the ſhips and river, directly oppoſite to Tilbury fort in Eſſex. Both at Billingſgate and Graveſend a bell is rung for 15 minutes at high water by night and day, to give notice to the tilt-boats and wherries to put off. The town is commonly called *the corporation of Graveſend and Milton*, theſe two places being united under the government of a mayor, 12 aldermen, 24 common-council, a town-clerk, &c. Here is a very handſome charitable foundation; Mr Henry Pinnock having in 1624 given two dwelling-houſes, and a houſe for a maſter-weaver, to employ the poor; and a good eſtate is alſo ſettled for the repairs. The town was plundered and burnt by the French and Spaniards in the reign of Richard II. after which the king, at the requeſt of the abbot of St Mary-le-Grace of Tower-hill, to whom he had granted a manor there, called *Parrocks*, veſted it with the ſole privilege of carrying paſſengers thence by water. Great part of it was deſtroyed by fire in 1727, together with the church. The latter has ſince been rebuilt as one of the 50 new churches, and the houſes

are

Gravina
||
Graunt.

are much handſomer than before. The ſtreets are narrow, but paved with ſtints. The chief employment of the labouring people is ſpinning of hemp to make ropes and nets for fiſhing. The town is alſo famous for gardening; the beſt aſparagus in the kingdom being produced here.

GRAVINA, a town of Italy, in the kingdom of Naples, and Terra di Bori, with a biſhop's ſee, and the title of a duchy. E. Lon. 17°. N. Lat. 41°.

GRAVINA (John Vincent), an eminent ſcholar, and illuſtrious lawyer of Italy, born at Roggiana in 1664. He was profeſſor of the canon law in the college of Sapienzi at Rome; and though many foreign univerſities made propoſals to draw him to them, he never quitted that city, but died there in 1718. His works are both curious and uſeful; the greateſt of them is *De ortu et progreſſu Juris Civilis*. A collection of his works was printed in 4to. at Leipſic in 1737, with the notes of Maſcovius.

GRAVINA (Peter), an Italian poet, much eſteemed by the great general Gonſalvo, and Proſper Colonna. He wrote, in a pure Roman ſtyle, diſcourſes on matters relating to the law and to the belles letters, as well as poems. He died in 1527.

GRAVITATION, in natural philoſophy, is ſometimes diſtinguiſhed from *gravity*. Thus M. Maupertuis takes gravity for that force whereby a body would fall to the earth; but gravitation for the ſame diminiſhed by the centrifugal force. See NEWTONIAN *Philoſophy*.

GRAVITY, or GRAVITATION, (for the words are moſt commonly uſed ſynonimouſly,) ſignifies either the force by which bodies are preſſed towards the ſurface of the earth, or the manifeſt effect of that force; in which laſt ſenſe the word has the ſame ſignification with *weight*, or *heavineſs*.

Concerning gravity in the firſt ſenſe of the word, or that active power by which all bodies are impelled towards the earth, there have been great diſputes. Many eminent philoſophers, and among the reſt Sir Iſaac Newton himſelf, have conſidered it as the firſt of all ſecond cauſes; an incorporeal or ſpiritual ſubſtance, which never can be perceived any other way than by its effects; an univerſal property of matter, &c. Others have attempted to explain the phenomena of gravitation by the action of a very ſubtile etherial fluid; and to this explanation Sir Iſaac, in the latter part of his life, ſeems not to have been averſe. He hath even given a conjecture concerning the manner in which this fluid might occaſion theſe phenomena. But for a full account of the diſcoveries of this great philoſopher concerning the laws of gravitation, the conjectures made by him and others concerning its cauſe, the various objections that have been made to his doctrine, and the ſtate of the diſpute at preſent, ſee the articles NEWTONIAN *Philoſophy*, ASTRONOMY, ATMOSPHERE, EARTH, ELECTRICITY, FIRE, LIGHT, ATTRACTION, REPULSION, PLENUM, VACUUM, &c.

Specific GRAVITY, denotes the weight belonging to an equal bulk of every different ſubſtance. Thus the exact weight of a cubic inch of gold, compared with a cubic inch of water, tin, lead, &c. is called its *ſpecific gravity*. See HYDROSTATICS.

GRAUNT (John), author of a curious and celebrated book, entitled, *Natural and political obſervations made upon the bills of mortality*. He was a haberdaſher of ſmall wares; but laid down his trade, and all public employments, on account of his religion. He was educated a Puritan; afterwards profeſſed himſelf a Socinian; yet, in the latter part of his life, declared himſelf of the Roman Catholic religion. He was a member of the royal ſociety, and died in 1674. Gray.

GRAY, a town of France, in the Franch Compte, and capital of the bailiwick of Amont. It is a trading place, and ſeated on the river Saone, in E. Lon. 5. 41. N. Lat. 47. 30.

GRAY (Thomas), an admired Engliſh poet, was the youngeſt and only ſurviving ſon of a reputable citizen of London, and was born in Cornhill in 1716. He was educated at Eton, where he contracted a friendſhip with Mr Horace Walpole, and with Mr Richard Weſt ſon of the lord chancellor of Ireland. Mr Weſt and Mr Gray were both intended for the bar; but the former died early in life, and the latter was diverted from that purſuit by an invitation to accompany Mr Walpole in his travels; which he accepted without any determined plan for his future life. During Mr Gray's travels, he wrote a variety of letters to Mr Weſt and to his parents, which are printed with his poems; and when he returned, finding himſelf in narrow circumſtances, yet with a mind indiſpoſed for active employment, he retired to Cambridge, and devoted himſelf to ſtudy. Soon after his return, his friend Weſt died: and the melancholy impreſſed on him by this event may be traced in his admired "Elegy wrote a country churchyard;" which is thought to have been begun, if not finiſhed, at this time: tho' the concluſion, as it ſtands at preſent, is certainly different from what it was in the firſt manuſcript copy.

The firſt impulſe of his ſorrow for the death of his friend gave birth to a very tender ſonnet in Engliſh, on the Petrarchian model; and alſo to a ſublime apoſtrophe in hexameters, written in the genuine ſtrain of claſſical majeſty, with which he intended to begin one of his books *De Principiis cogitandi*.

From the winter of the year 1742, to the day of his death, his principal reſidence was at Cambridge: from which he was ſeldom abſent any conſiderable time, except between the years 1759 and 1762; when, on the opening of the Britiſh Muſeum, he took lodgings in Southampton-row, in order to have recourſe to the Harleian and other manuſcripts there depoſited, from which he made ſeveral curious extracts, amounting in all to a tolerably-ſized folio, at preſent in the hands of Mr Walpole.

About the year 1747, Mr Maſon, the editor of Mr Gray's poems, was introduced to him. The former had written, a year or two before, ſome imitations of Milton's juvenile poems, *viz.* A Monody on the death of Mr Pope, and two pieces, entitled, *Il Bellicoſo*, and *Il Pacifico*, on the peace of Aix-la-Chapelle; and the latter reviſed them, at the requeſt of a friend. This laid the foundation of an intimacy, which continued without interruption to the death of Mr Gray.

About the year 1750, Mr Gray had put his laſt hand to his celebrated Elegy written in a country church-yard, and had communicated it to his friend Mr Walpole, whoſe good taſte was too much charmed with it to ſuffer him to with-hold the ſight of it from his acquaintance. Accordingly it was ſhown about for ſome

Gray. some time in manuſcript, and received with all the applauſe it ſo juſtly merited.

At laſt the publiſher of one of the magazines having obtained a ſurreptitious copy of it, Mr Gray wrote to Mr Walpole, deſiring that he would put his own manuſcript into the hands of Mr Dodſley, and order him to print it immediately. This was the moſt popular of all our author's publications. It ran through eleven editions in a very ſhort ſpace of time; was finely tranſlated into Latin by Meſſrs Anſty and Roberts; and, in the ſame year, by Mr Lloyd.

From July 1759, to the year 1762, he generally reſided in London, with a view, as we have already obſerved, of having recourſe to the Britiſh Muſeum. In July 1768, his grace the duke of Grafton wrote him a polite letter, informing him, that his majeſty had been pleaſed to offer to him the profeſſorſhip of Modern Hiſtory in the univerſity of Cambridge, then vacant by the death of Mr Laurence Brocket. This place was valuable in itſelf, the ſalary being 400l. a-year; but what rendered it particularly acceptable to Mr Gray was its being given him without any ſolicitation. He was indeed remarkably diſintereſted in all his purſuits. Though his income, before this addition, was very ſmall, he never read or wrote with a view of making his labours uſeful to himſelf. He may be ſaid to have been one of thoſe few perſonages in the annals of literature, eſpecially in the poetical claſs, who are devoid of ſelf-intereſt, and at the ſame time attentive to œconomy; and alſo was, among mankind in general, one of thoſe very few œconomiſts, who poſſeſs that talent, untinctured with the ſlighteſt ſtain of avarice. When his circumſtances were at the loweſt, he gave away ſuch ſums in private charity, as would have done credit to an ampler purſe. But what chiefly deterred him from ſeeking any advantage by his literary purſuits, was a certain degree of pride, which led him to deſpiſe the idea of being thought an author by profeſſion.

However, it is probable, that early in life he had an intention of publiſhing an edition of Strabo; for his papers contain a great number of notes and geographical diſquiſitions on that author, particularly with reſpect to that part of Aſia which comprehends Perſia and India. The indefatigable pains which he took with the writings of Plato, and the quantity of critical as well as explanatory obſervations which he has left upon almoſt every part of his works, plainly indicate, that no man in Europe was better prepared to republiſh and illuſtrate that philoſopher, than Mr Gray. Another work, on which he beſtowed uncommon labour, was the Anthologia. In an interleaved copy of that collection of Greek epigrams, he has tranſcribed ſeveral additional ones, which he ſelected in his extenſive reading; has inſerted a great number of critical notes and emendations, and ſubjoined a copious index. But, whether he intended this performance for the preſs or not, is uncertain. The only work, which he meditated upon, with this direct view from the beginning, was a hiſtory of Engliſh poetry, upon a plan ſketched out by Mr Pope. He has mentioned this himſelf in an advertiſement to thoſe three fine imitations of Norſe and Welch poetry, which he gave the world in the laſt edition of his Poems. But, after he had made ſome conſiderable preparations for the execution of this deſign, and Mr Maſon had offered him his aſſiſtance, he was informed, that Mr Warton, of Trinity College, Oxford, was engaged in a work of the ſame kind. The undertaking was therefore relinquiſhed, by mutual conſent; and, ſoon after, on that gentleman's deſiring a ſight of the plan, our author readily ſent him a copy of it. Gray.

Among other ſciences, Mr Gray had acquired a great knowledge of Gothic architecture. He had ſeen and accurately ſtudied in his youth, while abroad, the Roman proportions on the ſpot, both in ancient times, and in the works of Palladio. In his later years he applied himſelf to conſider thoſe ſtupendous ſtructures of more modern date that adorn our own country; which, if they have not the ſame grace, have undoubtedly equal dignity. He endeavoured to trace this mode of building, from the time it commenced, thro' its various changes, till it arrived at its perfection in the reign of Henry VIII. and ended in that of Elizabeth. For this purpoſe, he did not ſo much depend upon written accounts, as that internal evidence which the buildings themſelves give of their reſpective antiquity; ſince they conſtantly furniſh to the well informed eye, arms, ornaments, and other marks, by which their ſeveral ages may be aſcertained. On this account he applied himſelf to the ſtudy of heraldry, as a preparatory ſcience; and has left behind him a number of genealogical papers, more than ſufficient to prove him a complete maſter of it. By theſe means he arrived at ſo very extraordinary a pitch of ſagacity, as to be enabled to pronounce, at firſt ſight, on the preciſe time when every particular part of any of our cathedrals was erected.

But the favourite ſtudy of Mr Gray, for the laſt ten years of his life, was natural hiſtory, which he then rather reſumed than began; as, by the inſtructions of his uncle Antrobus, he was a conſiderable botaniſt at fifteen. The marginal notes, which he has left on Linnæus, and other writers on the vegetable, animal, and foſſile kingdoms, are very numerous: but the moſt conſiderable are on Hudſon's Flora Anglica, and the tenth edition of the *Syſtema Naturæ*; which latter he interleaved and filled almoſt entirely. While employed on zoology, he read Ariſtotle's treatiſe on that ſubject with great care, and explained many difficult paſſages of that obſcure ancient by the lights he had received from modern naturaliſts. In a word, excepting pure mathematics, and the ſtudies dependent on that ſcience, there was hardly any part of human learning, in which he had not acquired a competent ſkill, and in moſt of them a conſummate maſtery.

To this account of his literary character we may add, that he had a fine taſte in painting, prints, gardening, and muſic; and was moreover a man of good-breeding, virtue, and humanity.

He died in 1771; and an edition of his poems, with memoirs of his life and writings, were publiſhed in 4to, in 1775, by Mr Maſon. This gentleman, however, inſtead of employing his own pen in drawing Mr Gray's character, has adopted one drawn by the Rev. Mr Temple, rector of Mamhead in Devonſhire, in a letter to Mr Boſwell; to whom the public are indebted for communicating it.

"Perhaps (ſays Mr Temple) he was the moſt learned man in Europe. He was equally acquainted with the elegant and profound parts of ſcience, and that

Gray. Greaves.

that not superficially but thoroughly. He knew every branch of history, both natural and civil; had read all the original historians of England, France, and Italy; and was a great antiquarian. Criticism, metaphysics, morals, politics, made a principal part of his plan of study; voyages and travels of all sorts were his favourite amusement; and he had a fine taste in painting, prints, architecture, and gardening. With such a fund of knowledge, his conversation must have been equally instructing and entertaining; but he was also a good man, a well-bred man, a man of virtue and humanity. There is no character without some speck, some imperfection; and I think the greatest defect in his was an affectation in delicacy, or rather effeminacy, and a visible faltidiousnefs, or contempt and disdain of his inferiors in science. He also had, in some degree, that weakness which disgusted Voltaire so much in Mr Congreve: though he seemed to value others chiefly according to the progress they had made in knowledge, yet he could not bear to be considered himself merely as a man of letters; and though without birth, or fortune, or station, his desire was to be looked upon as a private independent gentleman, who read for his amusement. Perhaps it may be said, What signifies so much knowledge, when it produces so little? Is it worth taking so much pains to leave no memorial but a few poems? But let it be considered, that Mr Gray was, to others, at least innocently employed; to himself, certainly beneficially. His time passed agreeably; he was every day making some new acquisition in science; his mind was enlarged, his heart softened, and his virtue strengthened; the world and mankind were shewn to him without a mask; and he was taught to consider every thing as trifling, and unworthy the attention of a wise man, except the pursuit of knowledge, and the practice of virtue in that state wherein God hath placed us."

GRAYLING, in ornithology, a species of SALMO.

In angling for this fish your hook must be armed upon the shanks with a very narrow plate of lead, which should be slenderest at the bent of the hook, that the bait (which is to be a large grasshopper, the uppermost wing of which must be pulled off) may come over to it the more easily. At the point let there be a cadbait in a continual motion. The jag-tail, which is a worm of a pale flesh-colour, with a yellow tag on its tail, is an excellent bait for the grayling in March and April.

GREASE, a swelling and gourdinefs of the legs of a horse. See FARRIERY, § XXXV.

GREATER TONE, in music. See TONE.

GREAVES (John), an eminent physician and antiquary, was the eldest son of John Greaves rector of Colemore near Alresford in Hampshire, and born in 1602. He was educated at Baliol college in Oxford, from which he removed to Merton. He was afterwards, on the foot of his great merit, chosen geometry professor of Gresham college. His ardent thirst of knowledge soon carried him into several parts of Europe, where he eagerly seized every opportunity of improving it. His next voyage was into the eastern countries; where nothing remarkable in the heavens, earth, or even subterraneous places, seems to have escaped his nicest observation. He, with indefatigable industry, and even at the peril of his life, collected a considerable number of Arabic, Persic, and Greek manuscripts for archbishop Laud. Of these he well knew the value, as he was a master of the languages in which they were written. He also collected for that prelate many oriental gems and coins. He took a more accurate survey of the pyramids than any traveller who went before him. On his return from the East, he visited several parts of Italy a second time. During his stay at Rome, he made a particular inquiry into the true state of the ancient weights and measures. Soon after he had finished his second voyage, he was chosen Savilian professor of astronomy at Oxford. He was eminently qualified for this professorship, as the works of ancient and modern astronomers were familiar to him. His books relating to oriental learning, his *Pyramidographia*, or a description of the pyramids in Egypt, his *Epocha Celebriores*, and other curious and useful pieces, of which Mr Ward has given us a catalogue, shew him to have been a great man. Those which he intended to publish would have shewn him to be a greater; but he was stopped in his great career by death, in 1652.

Grebe, Greece.

GREBE, in ornithology. See COLYMBUS.

GREECE, the present Rumelia, and in many respects one of the most deservedly celebrated countries in the world, was anciently bounded on the north by Macedonia, and the river Strymon; on the west by the Ionian sea; on the south by the Mediterranean; and on the east by the Egean sea and Archipelago. It extended from the Strymon, by which it was parted from Thrace, to the promontory of Tenarus, the southmost point of the Peloponnesus, now the Morea, about 6° 20′ of latitude, or nearly 440 English miles, and in breadth from east to west about 359 miles.

The general names by which the inhabitants of this country were known to the ancients, were those of *Graioi*, or *Graicoi*, from whence the name of *Greece* is plainly derived. These names are thought come from Græcus, the father, or (according to some) the son, of Thessalus, who gave name to Thessaly; but some modern critics chuse to derive it from *Ragau*, the same with *Reu*, the son of Peleg, by the transposition of a letter to soften the sound.—These names were afterwards changed for *Achæi* and *Hellenes*; the first, as is supposed, from *Achæus*, the son of Xuthus, the son of Hellen, and father of Ion; or, according to the fable, the son of Jupiter: the other from Hellen, above-mentioned, the son of Deucalion, and father of Dorus, from whom came the *Dorei*, afterwards a famous nation among the Greeks.—Another name by which the Greeks were known in some parts of the country, was that of *Pelasgi*, which the Arcadians, the most ancient people in Greece, deduced from their pretended founder *Pelasgus*; who is said to have got such footing in Peloponnesus, that the whole peninsula from him was called *Pelasgia*. But the most ancient name of all is universally allowed to have been that of Ones, which the Greeks themselves derived from Ion the son of Xuthus; or, as the fable hath it, of Apollo, by Creusa the daughter of Erichtheus the grandson of Deucalion. Josephus, however, affirms, that their original is of much older date; and that Javan, the son of Japhet, and grandson of Noah, was the first who peopled these countries; which Bochart hath also rendered

Greece. dered very probable. It is true, indeed, that among the Greeks themſelves, only the Athenians, and ſuch colonies as ſprung from them, were called *Ioneſ*; but it is alſo plain beyond exception, that other nations gave this name to all the inhabitants of Greece.

The inhabitants of Greece in the firſt ages, even by the confeſſion of their own hiſtorians, appear to have been ſavages ſcarce a degree removed from brutes. They lived indifferently on every fruit, herb, or root that came in their way; and lay either in the open fields, or at beſt ſheltered themſelves in dens, caves, and hollow trees; the country itſelf in the mean time remaining one continued uncultivated deſart.—The firſt improvement they made in their way of living, was the exchanging of their old food for the more wholeſome acorns, building huts for themſelves to ſleep in, and covering their bodies with the ſkins of beaſts. For all this, it ſeems, they were beholden to Pelaſgius above-mentioned, (ſuppoſed by ſome to be Peleg ſpoke of in Scripture), and who was highly reverenced by them on that account.—This reformation in their way of life, however, it ſeems wrought none in their manners. On the contrary, they who had nothing to fight for but a hole to ſleep in, began now to envy and rob one another of theſe ſlender acquiſitions. This, in proceſs of time, put them under a neceſſity of joining themſelves into companies under ſome head, that they might either more falſely plunder their neighbours, or preſerve what they had got. Laws they had none, except that of the ſword: ſo that thoſe only lived in ſafety who inhabited the moſt barren and craggy places; and hence Greece for a long time had no ſettled inhabitants, the weakeſt being always turned out by the ſtrongeſt. Their gigantic ſize and ſtrength, if we may believe Plutarch, added ſo much to their inſolence and cruelty, that they ſeemed to glory in committing the greateſt acts of violence and barbarity on thoſe that unhappily fell into their hands.

The next advance towards civilization, was their forming themſelves into regular ſocieties, to cultivate the lands, and build themſelves towns and cities for their ſafety. Their original barbarity and mutual violences againſt each other naturally prevented them from uniting as one nation, or even into any conſiderable community; and hence the great number of ſtates into which Greece was originally divided. The moſt remarkable of theſe ſmall principalities mentioned in hiſtory are the following:—In Peloponneſus were thoſe of Sicyon, Argos, and Meſſenia, Achaia Propria, Arcadia, and Laconia. In Grecia Propria, (that part of Greece which lay without Peloponneſus), were thoſe of Attica, Megara, Bœotia, Locris, Epichnemidia, Doris, Phocis, Locris, Ozolæa, and Ætolia. In Epirus were the Moloſſi, Amphilochi, Caſſiopæi, Dræopes, Chaoces, Threſpotii, Almeni, and Acarnani. In Theſſaly were thoſe of Theſſaliotis, Eſtiotis, Pelaſgiotis, Magneſia, and Phthia.—All theſe have at one time or other been ſeverally governed by kings of their own, though we only find the names of many of them mentioned in the hiſtories of the more conſiderable kingdoms of Sparta, Attica, Thebes, &c.—The erection of theſe kingdoms, however, for ſame time, did not much alter the caſe; the inhabitants of the new kingdoms plundered and deſtroyed one another without mercy. Attica was the only place in any degree free from theſe incurſions, becauſe it was naturally deſtitute of every thing that could invite a plundering enemy; but thoſe cities fared much worſe which were ſituated in the ſea-coaſts; becauſe they were in continual danger of being plundered either by ſea or land: for pirates at that time did not leſs infeſt all thoſe ſeas, than robbers did the land. And this was one main cauſe why moſt of the ancient cities of Greece were ſituated at ſome conſiderable diſtance from the ſhore; but even in theſe, as all their ſafety conſiſted in the reſiſtance they could make againſt an invader, their inhabitants were under a neceſſity of going conſtantly armed, and being ever on their guard. Greece.

Another miſchief ariſing from theſe continual piracies and robberies was, that they occaſioned the far greater part of the lands to lie uncultivated, ſo that the people only planted and ſowed as much as was barely neceſſary for their preſent ſupport; and where there was ſuch an univerſal neglect of agriculture, there could be as little room for any diſcoveries in other uſeful arts and trades. Hence, when other nations, as the Jews, Egyptians, Midianites, Phœnicians, &c. had improved themſelves to a very high degree, the Greeks ſeem to have been utter ſtrangers to every uſeful art.

During this period of ſavage barbarity, the moſt renowned Grecian heroes, as Hercules, Theſeus, &c. performed their exploits; which, however exaggerated by poetic fiction, no doubt had a foundation in truth. Some indeed are of opinion that the Grecian heroes are entirely fictitious, and their exploits derived from thoſe of the Hebrew worthies, ſuch as Samſon, Gideon, &c. Yet, conſidering the extreme degree of barbarity which at that time prevailed throughout Greece, it ſeems not at all improbable that ſome perſons of extraordinary ſtrength and courage might undertake the cauſe of the oppreſſed, and travel about like the more modern knights-errant in queſt of adventures.

The firſt expedition in which we find the Greeks united, was that againſt Troy, the particulars of which are recited under the article Troy. Their ſucceſs here (which happened about 1184 B. C.) coſt them very dear; vaſt numbers of their braveſt warriors being ſlain; great numbers of the ſurvivors being caſt away in their return; and many of thoſe who had the good luck to get back again, being ſoon after murdered, or driven out of their country. It is probable, however, that their having ſtaid for ſuch a long time in Aſia, might contribute to civilize the Greeks ſomewhat ſooner than what they otherwiſe would have been; and accordingly from this time, we find their hiſtory ſomewhat leſs obſcure, and as it were beginto emerge out of darkneſs. The continual wars, indeed, in which they were engaged among themſelves, no doubt, for a long time, prevented them from making any conſiderable progreſs in thoſe arts in which they afterwards made ſo great progreſs. Theſe wars, which indeed never ceaſed as long as the Greeks preſerved their liberty, rendered them brave, and ſkilled in the military art, above all other nations; but at the ſame time they effectually prevented them from making permanent conqueſts, and confined them within the bounds of their own country; while the different ſtates were one way or other ſo equally balanced, that ſcarce Greece.

one

Greece. one of them was able perfectly to subdue another. The Spartans, however, having, with great difficulty, reduced the kingdom of Meſſene, and added its territories to their own, became the leading people in Greece. Their ſuperiority was long diſputed by Athens; but the Peloponneſian war at laſt determined that point in favour of the Spartans, when the city of Athens was taken, and its walls demoliſhed by Lyſander the Spartan general. See ATTICA, n° 164.—By the battle of Leuctra, the Spartans loſt that ſuperiority which they had maintained for 500 years, and which now devolved on the Thebans. After the death of Epaminondas, the celebrated Theban general, however, as no perſon was found poſſeſſed of his abilities, the Thebans were again obliged to yield the ſuperiority to the Spartans. But by this time the Greeks had become acquainted with the luxuries and elegancies of life; and all the rigour of their original laws could not prevent them from valuing theſe as highly as other people. This did not indeed abate their valour, but it heightened their mutual animoſities; at the ſame time that, for the ſake of a more eaſy and comfortable life, they became more diſpoſed to ſubmit to a maſter. The Perſians, whoſe power they had long dreaded, and who were unable to reſiſt them by force of arms, at laſt found out (by the advice of Alcibiades) the proper method of reducing the Grecian power; namely, by aſſiſting them by turns, and ſupplying one ſtate with money to fight againſt another, till they ſhould all be ſo much reduced, that they might become an eaſy prey. Thus the Greeks were weakened, though the Perſians did not reap any benefit from their weakneſs. Philip of Macedon entered into the ſame political views; and partly by intrigue, partly by force, got himſelf declared Generaliſſimo of Greece. His ſucceſſor Alexander the Great completed their ſubjection; and by deſtroying the city of Thebes, and exterminating its inhabitants, ſtruck ſuch a terror throughout Greece, that he was as fully obeyed by all the ſtates, as by any of the reſt of his ſubjects. During his abſence in Perſia, however, they attempted to ſhake off the Macedonian yoke, but were quelled by his general Antipater. The news of Alexander's death was to them a matter of the utmoſt joy; but their mutual animoſities prevented them from joining in any ſolid plan for the recovery of their liberties, and hence they continued to be oppreſſed by Alexander's ſucceſſors, or other tyrants, till Aratus, an Achæan, about 268 B. C. formed a deſign of ſetting his country free from theſe oppreſſors. He perſuaded a number of the ſmall republics to enter into a league for their own defence, which was called the *Achæan league;* and notwithſtanding that the republics, taken ſingly, had very little ſtrength, they not only maintained their independency, but ſoon became formidable when united. This aſſociation continued to become daily more and more powerful; but received a ſevere check from Cleomenes, king of Sparta, which obliged them to call in Antigonus to their aſſiſtance. This prince overcame Cleomenes at the battle of Sellaſia, and afterwards made himſelf maſter of Sparta. Thus he became a more formidable enemy than the one he had conquered, and the recovery of the Grecian liberties was incomplete.

Soon after this, the Greeks began to feel the weight of a power more formidable than any which they had yet experienced; namely, that of the Romans. That inſidious and haughty republic firſt intermeddled with the Grecian affairs, under pretence of ſetting them at liberty from the oppreſſion of Philip of Macedon. This, by a proper union among themſelves, they might have accompliſhed: but in this they acted as though they had been infatuated; receiving with the utmoſt joy the decree of the Roman conſul, who declared them free; without conſidering, that he who had thus given them liberty, might take it away at his pleaſure. This leſſon, however, they were ſoon taught, by the total reduction of their country to a Roman province; yet this can ſcarce be called a misfortune, when we look back to their hiſtory, and conſider their outrages upon one another: nor can we ſympathiſe with them for the loſs of that liberty which they only made uſe of to fill their country with ſlaughter and bloodſhed. After their conqueſt by the Romans, they made no united effort to recover their liberty. They continued in quiet ſubjection till the beginning of the 15th century. About that time, they began to ſuffer under the tyranny of the Turks, and their ſufferings were completed by the taking of Conſtantinople in 1453. Since that time, they have groaned under the yoke of a moſt deſpotic government; ſo that all traces of their former valour, ingenuity, and learning, are now in a manner totally extinct. Greece.

Modern Greece comprehends Macedonia; Albania, now called Arnaut; Epirus; Theſſaly, now Jana; Achaia, now Livadia; the Peloponneſus, now Morea; together with the iſlands on its coaſt, and in the Archipelago. The continent of Greece is ſeated betwixt the 36th and 43d degrees of north latitude; and between the 19th and 27th degrees of longitude, eaſt of London. To the north it is bounded, by Bulgaria and Servia, from which it is divided by a ridge of mountains; to the ſouth, by the Mediterranean ſea; to the eaſt, by Romania and the Archipelago; and to the weſt, by the Adriatic, or gulph of Venice. Its length is ſaid to be about four hundred miles, and its utmoſt breadth about three hundred and fifty. The air is extremely temperate and healthy: and the ſoil fruitful, though badly cultivated, yielding corn; wine, delicious fruits, and abounding with cattle, fowls, and veniſon. As to religion, Chriſtianity was planted in Greece ſoon after the death of our Saviour, and flouriſhed there for many ages in great purity; but ſince the Greeks became ſubject to the Turkiſh yoke, they have ſunk into the moſt deplorable ignorance, in conſequence of the ſlavery and thraldom under which they groan, and their religion is now greatly corrupted. It is indeed little better than a heap of ridiculous ceremonies and abſurdities. The head of the Greek church is the patriarch of Conſtantinople; who is choſen by the neighbouring archbiſhops and metropolitans, and confirmed by the emperor or grand vizir. He is a perſon of great dignity, being the head and director of the eaſtern church. The other patriarchs are thoſe of Jeruſalem, Antioch, and Alexandria, Mr. Tournefort tells us, that the patriarchates are now generally ſet to ſale, and beſtowed upon thoſe who are the higheſt bidders. The patriarchs, metropolitans, archbiſhops, and biſhops, are always choſen from among the Caloyers or Greek monks. Be-

Greece. fore the patriarchs receive their patents and the caftan, which is a veft of linfey-woolfey, or fome other ftuff, prefented by the grand fignior to ambaffadors and other perfons newly invefted with fome conliderable dignity, they are obliged to make large prefents to the vizir, &c. The income of the patriarch of Conftantinople is faid to amount to no lefs than one hundred and twenty thoufand guilders, of which he pays the one half by way of annual tribute to the Ottoman Porte, adding fix thoufand guilders befides as a prefent at the feaft of Bairam. The next perfon to a bifhop among the clergy is an archimandrite, who is the director of one or more convents, which are called mandren; then come the abbot, the arch-prieft, the prieft, the deacon, the under-deacon, the chanter, and the lecturer. The fecular clergy are fubjected to no rules, and never rife higher than high-prieft. They are allowed to marry once; but it muft be with a virgin, and before they are ordained. They have neither glebe nor tythes, but depend on the perquifites that arife from their office; and they feldom preach but in Lent. The Greeks have few nunneries; but a great many convents of monks, who are all priefts, and, ftudents excepted, obliged to follow fome handicraft employment, and lead a very auftere life. The Greeks deny the fupremacy of the pope, and abhor the worfhip of images; but have a multitude of pictures of faints in their churches, whom they pray to as mediators. Their faits are very fevere. They believe alfo in the doctrine of tranfubftantiation, and that the Holy Ghoft does not proceed from the Son. They admit not of purgatory, fays Mr. Thevenot: but yet they allow a third place, where they fay the bleffed remain, in expectation of the day of judgment. At mafs they confecrate with leavened bread; and communicate under both kinds, as well laics as priefts, and as well women and children as men. When they carry the facrament to the fick, they do not proftrate themfelves before it, nor expofe it to be adored: neither do they carry it in proceffion, or have any particular feaft in honour of it. Baptifm is performed among them by plunging the whole body of the child thrice into water. Immediately after baptifm, they give it confirmation and the communion; and feven days after that, it undergoes the ceremony of ablution. When a prieft is married, among other ceremonies, the bridegroom and bride drink each two glaffes of wine; then the glafs is given to the prieft, who merrily drinks off the reft of the wine, and breaking the glafs, fays, So may the bridegroom break the virginity of the bride. As to the character of the modern Greeks, they are faid to be very covetous, hypocritical, treacherous, great pederafts, and at the fame time revengeful to the higheft degree; but very fuperftitious. They are fo much defpifed by the Turks, that thefe do not value even a Greek who turns Mahometan. The Turks are remarkable for their taciturnity; they never ufe any unneceffary words: but the Greeks, on the contrary, are very talkative and lively. The Turks generally practife what their religion enjoins, but the Greeks do not; and their mifery puts them upon a thoufand mean fhifts and fcandalous practices, authorized by bad example, and perpetuated from father to fon. The Greek women have fine features and beautiful complexions: their countenances ftill very much refemble thofe of the ancient Greek ftatues.

Greek, Green.

GREEK, or GRECIAN, any thing belonging to ancient Greece.

The Greek language, as preferved in the writings of the celebrated authors of antiquity, as Homer, Hefiod, Demofthenes, Ariftotle, Plato, Xenophon, &c. has a great variety of terms and expreffions, fuitable to the genius and occafions of a polite and learned people, who had a tafte for arts and fciences. In it, proper names are fignificative; which is the reafon that the modern languages borrow fo many terms from it. When any new invention, inftrument, machine, or the like, is difcovered, recourfe is generally had to the Greek for a name to it; the facility wherewith words are there compounded, affording fuch as will be expreffive of its ufe: fuch are, barometer, hygrometer, microfcope, telefcope, thermometer, &c. But of all fciences, medicine moft abounds with fuch terms; as diaphoretic, diagnofis, diarrhœa, hæmorrhage, hydrophobia, phthifis, atrophy, &c. Befides the copioufnefs and fignificancy of the Greek, wherein it excels moft, if not all, other languages, it has alfo three numbers, *viz.* a fingular, dual, and plural: alfo abundance of tenfes in its verbs, which makes a variety in difcourfe, prevents a certain dryneſs that always accompanies too great an uniformity, and renders that language peculiarly proper for all kinds of verfe. The ufe of the participles, of the aorift and preterite, together with the compound words already mentioned, give it a peculiar force and brevity without taking any thing from its perfpicuity.

It is no eafy matter to aſſign the preciſe difference between the modern and ancient Greek; which conſiſts in the terminations of the nouns, pronouns, verbs, &c. not unlike what obtains between ſome of the dialects of the Italian or Spaniſh. There are alſo in the modern Greek many new words, not to be met with in the ancient. We may therefore diſtinguiſh three ages of the Greek tongue: the firſt of which ends at the time when Conſtantinople became the capital of the Roman empire; the ſecond laſted from that period to the taking of Conſtantinople by the Turks; and the third, from that time to this.

GREEK *Bible*. See BIBLE.

GREEK *Church*. See GREECE.

GREEK *Monks* and *Nuns*, of whatever order, conſider St Baſil as their founder and common father, and eſteem it the higheſt crime to deviate in the leaſt from his conſtitutions. There are ſeveral beautiful convents with churches, in which the monks perform divine ſervice day and night. Some of the monks are cœnobites, or live together, wear the ſame habit, eat at the ſame table, and perform the ſame exerciſes and employments.

GREEN, one of the original priſmatic colours, exhibited by the refraction of the rays of light. See OPTICS.

GREEN, among painters. See COLOUR-*Making*, n° 26.

GREEN *Cloth*, a board or court of juſtice held in the compting-houſe of the kings houſehold, compoſed of the Lord Steward and officers under him, who ſit daily. To this court is committed the charge and overſight of the king's houſehold in matters of juſtice

Green, Greenland.

justice and government, with a power to correct all offenders, and to maintain the peace of the verge, or jurisdiction of the court-royal; which is every way about 200 yards from the last gate of the palace where his majesty resides.

It takes its name, *board of green cloth*, from a green cloth spread over the board where they sit.

Without a warrant first obtained from this court, none of the king's servants can be arrested for debt.

Clerks of the GREEN *Cloth* are two officers of the board of green cloth, who appoint the diet of the king and his household; and keep all records, legers, and papers relating thereto; made up bills, parcels, and debentures for salaries, and provisions and necessaries for the officers of the buttery, pantry, cellar, &c.

They also wait upon foreign princes when entertained by his majesty.

GREEN-*Finch* in ornithology, the English name of the greenish fringilla, with the wings and tail variegated with yellow. See FRINGILLA.

GREEN-*House*, or *Conservatory*, a house in a garden, contrived for sheltering and preserving the most curious and tender exotic plants, which in our climate will not bear to be exposed to the open air, especially during the winter season. These are generally large and beautiful structures, equally ornamental and useful.

GREEN-*Silver*, the name of an ancient custom within the manor of Writtel in the county of Essex in England; which is, that every tenant whose fore-door opens to Greenbury, shall pay an half-penny yearly to the lord, by the name of *green-silver*.

GREEN *Wax*, is used where estates are delivered to the sheriffs out of the exchequer, under the seal of that court, made in green wax, to be levied in the several counties. This word is mentioned the 43d stat. Ed. III. c. 9. and 7 Hen. IV. c. 4.

GREENLAND, a general name by which are denoted the most easterly parts of America, stretching towards the north pole, and likewise some islands to the northward of the continent of Europe, lying in very high latitudes.

1 West Greenland described.

This country is divided into West and East Greenland.—West Greenland is now determined by our latest maps to be a part of the continent of America, though upon what authority is not very clear. That part of it which the Europeans have any knowledge of is bounded on the west by Baffin's bay, on the south by Davis's straits, and on the east by the northern part of the Atlantic Ocean. It is a very mountainous country, and some parts of it so high that they may be discerned thirty leagues off at sea. The inland mountains, hills, and rocks, are covered with perpetual snow: but the low lands on the sea-side are clothed with verdure in the summer season. The coast abounds with inlets, bays, and large rivers; and is surrounded with a vast number of islands of different dimensions. In a great many places however, on the eastern coast especially, the shore is inaccessible by reason of the floating mountains of ice. The principal river, called *Baal*, falls into the sea in the 64th degree of latitude, where the first Danish lodge was built in 1721; and has been navigated above 40 miles up the country.

West Greenland was first peopled by Europeans in the eighth century. At that time a company of Icelanders, headed by one Ericke Rande, were by accident driven on the coast. On his return he represented the country in such a favourable light, that some families again followed him thither, where they soon became a thriving colony, and bestowed on their new habitation the name of *Groenland*, or *Greenland*, on account of its verdant appearance. This colony was converted to Christianity by a missionary from Norway, sent thither by the celebrated Olaf, the first Norwegian monarch who embraced the true religion. The Greenland settlement continued to increase and thrive under his protection; and, in a little time, the country was provided with many towns, churches, convents, bishops, &c. under the jurisdiction of the archbishop of Drontheim. A considerable commerce was carried on between Greenland and Norway; and a regular intercourse maintained between the two countries till the year 1406, when the last bishop was sent over. From that time all correspondence was cut off, and all knowledge of Greenland has been buried in oblivion. Greenland. 2 Peopled by a colony from Iceland. 3 All correspondence with it suddenly cut off.

This strange and abrupt cessation of all trade and intercourse has been attributed to various causes; but the most probable is the following. The colony, from its first settlement, had been harassed by the natives, a barbarous and savage people, agreeing in customs, garb, and appearance, with the Esquimaux found about Hudson's Bay. This nation, called *Schrellings*, at length prevailed against the Iceland settlers who inhabited the western district, and exterminated them in the 14th century: insomuch, that when their brethren of the eastern district came to their assistance, they found nothing alive but some cattle and flocks of sheep running wild about the country. Perhaps they themselves afterwards experienced the same fate, and were totally destroyed by these Schrellings, whose descendants still inhabit the western parts of Greenland, and from tradition confirm this conjecture. They affirm that the houses and villages whose ruins still appear, were inhabited by a nation of strangers, whom their ancestors destroyed. There are reasons, however, for believing that there may be still some descendants of the ancient Iceland colony remaining in the eastern district, though they cannot be visited by land, on account of the stupendous mountains, perpetually covered with snow, which divide the two parts of Greenland; while they have been rendered inaccessible by sea, by the vast quantity of ice driven from Spitzbergen, or East Greenland. One would imagine that there must have been some considerable alteration in the northern parts of the world since the 15th century, so that the coast of Greenland is now become almost totally inaccessible, though formerly visited with very little difficulty. It is also natural to ask, By what means the people of the eastern colony surmounted the above-mentioned obstacles when they went to the assistance of their western friends, how they returned to their own country, and in what manner historians learned the success of their expedition? Concerning all this we have very little satisfactory information. All that can be learned from the most authentic records is, that Greenland was divided into two districts, called *West Bygd*, and *East Bygd*: that the western division contained four parishes, and 100 villages: that 4 Colony supposed to be exterminated. 5 Account of the colony.

Greenland. the eaſtern diſtrict was ſtill more flouriſhing, as being nearer to Iceland, ſooner ſettled, and more frequented by ſhipping from Norway. There are alſo many accounts, though moſt of them romantic and ſlightly atteſted, which render it probable that part of the eaſtern colony ſtill ſubſiſts, who, at ſome time or other, may have given the imperfect relation above-mentioned. This colony, in ancient times, certainly comprehended twelve extenſive pariſhes, one hundred and ninety villages, a biſhop's ſee, and two monaſteries. The preſent inhabitants of the weſtern diſtrict are entirely ignorant of this part, from which they are divided by rocks, mountains, and deſerts, and ſtill more effectually by their apprehenſion: for they believe the eaſtern Greenlanders to be a cruel, barbarous nation, that deſtroy and eat all ſtrangers who fall into their hands. About a century after all intercourſe between Norway and Greenland had ceaſed, ſeveral ſhips were

6 Attempts to rediſcover the country.

ſent ſucceſſively by the kings of Denmark, in order to diſcover the eaſtern diſtrict; but all of them miſcarried. Among theſe adventurers, Mogens Heinſon, after having ſurmounted many difficulties and dangers, got ſight of the land, which, however, he could not approach. At his return, he pretended that the ſhip was arreſted in the middle of her courſe, by certain rocks of loadſtone at the bottom of the ſea. The ſame year, 1576, in which this attempt was made, has been rendered remarkable by the voyage of Captain Martin Frobiſher, ſent upon the ſame errand by Queen Elizabeth. He likewiſe deſcried the land; but could not reach it, and therefore returned to England; yet not before he had ſailed ſixty leagues in the ſtrait which ſtill retains his name, and landed on ſeveral iſlands, where he had ſome communication with the natives. He had likewiſe taken poſſeſſion of the country in the name of Queen Elizabeth; and brought away ſome pieces of heavy black ſtone, from which the refiners of London extracted a certain proportion of gold. In the enſuing ſpring, he undertook a ſecond voyage, at the head of a ſmall ſquadron, equipped at the expence of the public; entered the ſtraits a ſecond time; diſcovered upon an iſland a gold and ſilver mine; beſtowed names upon different bays, iſlands, and headlands; and brought away a lading of ore, together with two natives, a male and a female, whom the Engliſh kidnapped.

Such was the ſucceſs of this voyage, that another armament was fitted out under the auſpices of Admiral Frobiſher, conſiſting of fifteen ſail, including a conſiderable number of ſoldiers, miners, ſmelters, carpenters, and bakers, to remain all the winter near the mines in a wooden fort, the different pieces of which they carried out in the tranſports. They met with boiſterous weather, Greenland. impenetrable fogs, and violent currents upon the coaſt of Greenland, which retarded their operations until the ſeaſon was far advanced. Part of their wooden fort was loſt at ſea; and they had neither proviſion nor fuel ſufficient for the winter. The admiral therefore determined to return with as much ore as he could procure: of this they obtained large quantities out of a new mine, to which they gave the name of the Counteſs of Suſſex. They likewiſe built an houſe of ſtone and lime, provided with ovens; and here, with a view to conciliate the affection of the natives, they left a quantity of ſmall morrice-bells, knives, beads, looking-glaſſes, leaden pictures, and other toys, together with ſeveral loaves of bread. They buried the timber of the fort where it could be eaſily found next year; and ſowed corn, peaſe, and other grain, by way of experiment, to know what the country would produce. Having taken theſe precautions, they ſailed from thence in the beginning of September; and after a month's ſtormy paſſage, arrived in England: but this noble deſign was never proſecuted.

Chriſtian IV. king of Denmark, being deſirous of diſcovering the old Greenland ſettlement, ſent three ſhips thither, under the command of Captain Godſke Lindenow; who is ſaid to have reached the eaſt coaſt of Greenland, where he traded with the ſavage inhabitants, ſuch as they are ſtill found in the weſtern diſtrict, but ſaw no ſigns of a civilized people. Had he actually landed in the eaſtern diviſion, he muſt have perceived ſome remains of the ancient colony, even in the ruins of their convents and villages. Lindenow kidnapped two of the natives, who were conveyed to Copenhagen; and the ſame cruel fraud * was practiſed by other two ſhips which ſailed into Davis's Straits, where they diſcovered divers fine harbours, and delightful meadows covered with verdure. In ſome places they are ſaid to have found a conſiderable quantity of ore, every hundred pounds of which yielded twenty-ſix ounces of ſilver. The ſame Admiral Lindenow made another voyage to the coaſt of Greenland in the year 1606, directing his courſe to the weſtward of Cape Farewell. He coaſted along the Straits of Davis; and having made ſome obſervations on the face of the country, the harbours and iſlands, returned to Denmark. Carſten Richards, being detached with two ſhips on the ſame diſcovery, deſcried the high land on the eaſtern ſide of Greenland; but was hindered by the ice from approaching the ſhore.

Other expeditions of the ſame nature have been planned and executed with the ſame bad ſucceſs, under the auſpices of a Daniſh company of merchants. Two ſhips

* Nothing can be more inhuman and repugnant to the dictates of common juſtice, than this practice of tearing away poor creatures from their country, their families, and connections: unleſs we ſuppoſe them altogether deſtitute of natural affection; and that this was not the caſe with thoſe poor Greenlanders, ſome of whom were brought alive to Copenhagen, appears from the whole tenor of their conduct, upon their firſt capture, and during their confinement in Denmark. When firſt captivated, they rent the air with their cries and lamentations: they even leaped into the ſea, and, when taken on board, for ſome time refuſed all ſuſtenance. Their eyes were continually turned towards their dear country, and their faces always bathed in tears. Even the countenance of his Daniſh majeſty, and the careſſes of the court and people, could not alleviate their grief. One of them was perceived to ſhed tears always when he ſaw an infant in the mother's arms; a circumſtance from whence it was naturally concluded, that he had left his wife with a young child in Greenland. Two of them went to ſea in their little canoes, in hope of reaching Greenland: but one of them was retaken. Other two made the ſame attempt: but were driven by a ſtorm on the coaſt of Schonen, where they were apprehended by the peaſants, and reconveyed to Copenhagen. One of them afterwards died of a fever, caught in fiſhing pearl, during the winter, for the governor of Kolding. The reſt lived ſome years in Denmark: but at length, ſeeing no proſpect of being able to reviſit their native country, they ſunk into a kind of melancholy diſorder, and expired.

Greenland. ships returned from the weſtern part of Greenland loaded with a kind of yellow ſand, ſuppoſed to contain a large proportion of gold. This being aſſayed by the goldſmiths of Copenhagen, was condemned as uſeleſs, and thrown overboard: but from a ſmall quantity of this ſand, which was reſerved as a curioſity, an expert chemiſt afterwards extracted a quantity of pure gold. The captain, who brought home this adventure, was ſo chagrined at his diſappointment, that he died of grief, without having left any directions concerning the place where the ſand had been diſcovered. In the year 1654, Henry Muller, a rich Dane, equipped a veſſel under the command of David de Nelles, who ſailed to the weſt coaſt of Greenland, from which he carried off three women of the country. Other efforts have been made, under the encouragement of the Daniſh king, for the diſcovery and recovery of the old Iceland colony in Greenland: but all of them miſcarried, and people began to look upon ſuch expeditions as wild and chimerical. At length the Greenland company at Bergen in Norway, tranſported a colony to the weſtern coaſt, about the 64th degree of latitude; and theſe Norwegians ſailed in the year 1712, accompanied by the Reverend Hans Egede, to whoſe care, ability, and preciſion, we owe the beſt and moſt authentic account of modern Greenland. This gentleman endeavoured to reach the eaſtern diſtrict, by coaſting ſouthwards, and advanced as far as the States Promontory: but the ſeaſon of the year, and continual ſtorms, obliged him to return; and as he could not even find the Strait of Frobiſher, he concluded that no ſuch place ever exiſted. In the year 1724, a ſhip, being equipped by the company, ſailed on this diſcovery, with a view to land on the eaſt ſide oppoſite to Iceland; but the vaſt ſhoals of ice, which barricadoed that part of the coaſt, rendered this ſcheme impracticable. His Daniſh majeſty, in the year 1728, cauſed horſes to be tranſported to Greenland, in hope that the ſettlers might by their means travel over land to the eaſtern diſtrict; but the icy mountains were found impaſſable. Finally, lieutenant Richards, in a ſhip which had wintered near the new Daniſh colony, attempted, in his return to Denmark, to land on the eaſtern ſhore; but all his endeavours proved abortive.

Mr Egede is of opinion, that the only practicable method of reaching that part of the country, will be to coaſt north-about in ſmall veſſels, between the great flakes of ice and the ſhore; as the Greenlanders have declared, that the currents continually ruſhing from the bays and inlets, and running ſouth-weſtwards along the ſhore, hinder the ice from adhering to the land; ſo that there is always a channel open, through which veſſels of ſmall burden might paſs, eſpecially if lodges were built at convenient diſtances on the ſhore, for the convenience and direction of the adventurers.

8
Egede's account of the country.

That part of the country which is now viſited and ſettled by the Danes and Norwegians, lies between the 64th and 68th degrees of north latitude; and thus far it is ſaid the climate is temperate. In the ſummer, which continues from the end of May to the middle of September, the weather is warm and comfortable, while the wind blows eaſterly; though even at this time ſtorms frequently happen, which rage with incredible violence; and the ſea-coaſts are infeſted with fogs that are equally diſagreeable and unhealthy. Greenland. Near the ſhore, and in the bays and inlets, the low land is clothed with the moſt charming verdure; but the inland mountains are perpetually covered with ice and ſnow. To the northward of the 68th degree of latitude the cold is prodigiouſly intenſe; and towards the end of Auguſt all the coaſt is covered with ice, which never thaws till April or May, and ſometimes not till the latter end of June. Nothing can exhibit a more dreadful, and at the ſame time a more dazzling appearance, than thoſe prodigious maſſes of ice that ſurround the whole coaſt in various forms, reflecting a multitude of colours from the ſun-beams, and calling to mind the enchanted ſcenes of romance. Such proſpects they yield in calm weather; but when the wind begins to blow, and the waves to riſe in vaſt billows, the violent ſhocks of thoſe pieces of ice daſhing againſt one another, fill the mind with horror.—Greenland is ſeldom viſited with thunder and lightning, but the *Aurora Borealis* is very frequent and bright. At the time of new and full moon, the tide riſes and falls upon this coaſt about three fathoms; and it is remarkable, that the ſprings and fountains on ſhore riſe and fall with the flux and reflux of the ocean.

The ſoil of Greenland varies like that of all other mountainous countries. The hills are very barren, being indeed frozen throughout the whole year; but the valleys and low grounds, eſpecially near the ſea, are rich and fruitful. The ancient Norwegian chronicles inform us, that Greenland formerly produced a great number of cattle; and that conſiderable quantities of butter and cheeſe were exported to Norway; and, on account of their peculiar excellency, ſet apart for the king's uſe. The ſame hiſtories inform us, that ſome parts of the country yielded excellent wheat; and that large oaks were found here, which carried acorns as big as apples. Some of theſe oaks ſtill remain in the ſouthern parts, and in many places the marks of ploughed land are eaſily perceived. At preſent, however, the country is deſtitute of corn and cattle, though in many places it produces excellent paſture; and, if properly cultivated, would probably yield grain alſo. Mr Egede ſowed ſome barley in a bay adjoining to the Daniſh colony. It ſprang up ſo faſt, that, by the latter end of July it was in the full ear; but being nipped by a night-froſt, it never arrived at maturity. This ſeed was brought from Bergen, where the ſummer is of greater heat and duration than in Greenland; but in all probability the corn which grows in the northern parts of Norway would alſo thrive here. Turnips and coleworts of an excellent taſte and flavour are alſo produced here. The ſides of the mountains near the bays are clothed with wild thyme, which diffuſes its fragrance to a great diſtance. The herb tormentil is very common in this country, and likewiſe many others not deſcribed by the botaniſts. Among the fruits of Greenland we number juniper-berries, blue-berries, bil-berries, and bramble-berries.

Greenland is thought to contain many mines of metal, though none of them are wrought. To the ſouthward of the Daniſh colony are ſome appearances of a mine of copper. Mr Egede once received a lump of ore from one of the natives; and here he found calamine of a yellow colour. He once ſent a conſiderable quantity

Greenland. quantity of ſand of a yellow colour, intermixed with ſtreaks of vermilion, to the Bergen company. They probably found their account in this preſent; for they deſired him by a letter to procure as much of that ſand as poſſible: but he was never able to find the place where he ſaw the firſt ſpecimen. It was one of the ſmalleſt among a great number of iſlands; and the mark he had ſet up was blown down by a violent ſtorm. Poſſibly this might be the ſame mineral of which Capt. Frobiſher brought ſo much to England. This country produces rock-cryſtals both red and white, and whole mountains of the aſbeſtos or incombuſtible flax. Around the colony, which is known by the name of *Good Hope*, they find a kind of baſtard marble of various colours, which the natives form into bowls, lamps, pots, &c. All that has been ſaid of the fertility of Greenland, however, muſt be underſtood only of that part which lies between the 60th and 65th degrees of latitude. The moſt northern parts are totally deſtitute of herbs and plants. The wretched inhabitants cannot find graſs in ſufficient quantities to ſtuff into their ſhoes to keep their feet warm, but are obliged to buy it from thoſe who inhabit the more ſouthern parts.

The animals which abound moſt in Greenland are rein-deer, foxes, hares, dogs, and white bears. The hares are of a white colour, and very fat; the foxes are of different colours, white, greyiſh, and bluiſh; and ſmaller than thoſe of Denmark and Norway. The natives keep a great number of dogs, which are large, white, or ſpeckled, and rough, with ears ſtanding upright, as is the caſe with all the dogs peculiar to cold climates. They are timorous and ſtupid; and neither bay nor bark, but ſometimes howl diſmally. In the northern parts the natives yoke them in ſledges; which, though heavy laden, they will draw on the ice at the rate of 70 miles in a ſhort winter's day. Theſe poor animals are very ill rewarded for their ſervice; being left to provide for themſelves, except when their maſters happen to catch a great number of ſeals. On theſe occaſions the dogs are regaled with the blood and entrails; at other times, they ſubſiſt, like wild beaſts, upon muſcles and berries. Here alſo are found great numbers of ravens, eagles of a prodigious ſize, falcons, and other birds of prey; and likewiſe a kind of linnet, which warbles very melodiouſly. Whales, ſword-fiſh, porpoiſes, &c. abound on the coaſts; alſo holybut, turbot, cod, haddock, &c. The more dubious animals alſo, called *mermaids*, *ſea ſerpents*, and *krakens*, ſaid to be found on the coaſt of Norway, are ſaid likewiſe to dwell in theſe ſeas. Mr Egede aſſures us, that, in the year 1734, the ſea-ſerpent was ſeen off the new Daniſh colony, and raiſed its head maſt-high above the ſurface of the water. See KRAKEN, MERMAID, and *Sea*-SERPENT.

9 Account of the inhabitants. The people who now inhabit the weſtern coaſt of Greenland, and who, without doubt, are the deſcendants of the ancient *Schrellings*, who exterminated the firſt Iceland colony, bear a near reſemblance to the Samoiedes and Laplanders in their perſons, complexions, and way of life. They are ſhort, brawny, and inclined to corpulency; with broad faces, flat noſes, thick lips, black hair and eyes, and a yellowiſh tawney complexion. They are for the moſt part vigorous and healthy, but remarkably ſhort-lived; few of them reaching the grand climacteric; and many dying in their infancy, and in the prime of youth. They are ſubject to a weakneſs in the eyes, occaſioned by the piercing winds and the glare of the ſnow in the winter-time. The leproſy is known among them, but is not contagious. Thoſe that dwell in the northern parts are miſerably tormented with dyſenteries, rheums, and pulmonary diſorders, boils, and epilepſy. The ſmall-pox being imported among them from Copenhagen in the year 1734, made terrible havoc among theſe poor people, who are utterly deſtitute of any knowledge of the medicinal art, and depend entirely for aſſiſtance upon their *angekuts* or conjurers. In their diſpoſitions the Greenlanders are cold, phlegmatic, indolent, and ſlow of apprehenſion; but very quiet, orderly, and good-natured. They live peaceably together; and have every thing in common, without ſtrife, envying, or animoſity. They are civil and hoſpitable, but ſlovenly to a degree almoſt beyond the Hottentots themſelves. They never waſh themſelves with water; but lick their paws like the cat, and then rub their faces with them. They eat after their dogs without waſhing their diſhes; devour the lice which devour them; and even lick the ſweat, which they ſcrape off from their faces with their knives. The women waſh themſelves with their own urine, which they imagine makes the hair grow; and in the winter-time go out immediately after, to let the liquor freeze upon their ſkin. They will often eat their victuals off the dirty ground, with out any veſſel to hold them in; and devour rotten fleſh with the greateſt avidity. In times of ſcarcity they will ſubſiſt on pieces of old ſkin, reeds, ſea-weed, and a root called *tugloronet*, dreſſed with train-oil and fat. The dung of rein-deer taken from the inteſtines, the entrails of partridges, and all ſorts of offals, are counted dainties among theſe ſavages; and of the ſcrapings of ſeals ſkins they make delicate pan-cakes. At firſt they could not taſte the Daniſh proviſions without abhorrence; but now they are become extremely fond of bread and butter, though they ſtill retain an averſion to tobacco and ſpirituous liquors, in which particular they differ from almoſt all ſavages on the face of the earth.

The Greenlanders commonly content themſelves with one wife; who is condemned, as among other ſavage nations, to do all the drudgery, and may be corrected, or even divorced, by the huſband at pleaſure. Heroes, however, and extraordinary perſonages, are indulged with a plurality of wives. Their young women are generally chaſte and baſhful; but at ſome of their feaſts, in the midſt of their jollity, a man retires with his neighbour's wife behind a curtain made of ſkins; and all the gueſts, thus coupled, retire in their turns. The women think themſelves happy if an angekut or prophet will thus honour them with his careſſes. Theſe people never marry within the prohibited degrees of conſanguinity, nor is it counted decent in a couple to marry who have been educated in the ſame family.—They have a number of ridiculous and ſuperſtitious cuſtoms, among which the two following are the moſt remarkable. While a woman is in labour, the goſſips hold a chamber-pot over her head, as a charm to haſten the delivery. When the child is a year old, the mother licks and ſlabbers it all over, to render it, as ſhe imagines, more ſtrong and hardy.

All

reenland. 10 anguage, ligion, c.

All the Greenlanders hitherto known ſpeak the ſame language, though different dialects prevail in different parts of the country. It abounds with double conſonants; and is ſo guttural, that the pronunciation of many words is not to be learned except by thoſe who have been accuſtomed to it from their infancy. The letters C, D, F, Q, and X, are not known in their alphabet. Like the North Americans, and inhabitants of Kamſchatka, they have a great number of long polyſyllables. Their words, nouns as well as verbs, are inflected at the end by varying the terminations without the help of articles; but their language being found defective, they have adopted a good many words from the Norwegian dialect. Notwithſtanding the endeavours of the Daniſh miſſionaries, they have no great reaſon to boaſt of the proſelytes they have made of the natives of Greenland. Theſe ſavages pay great deference and reſpect to the Danes, whom indeed they obey as their maſters, and hear the truths of the Chriſtian religion expounded without doubting the veracity of their teachers; but at the ſame time they liſten with the moſt mortifying indifference, without being in the leaſt influenced by what they have heard. They believe in the immortality of the ſoul, and the exiſtence of a ſpirit whom they call *Torngarſuk*; but of whom they have formed the moſt ridiculous notions. The Angekuts, who are ſuppoſed to be his immediate miniſters, differ concerning the principles of his exiſtence; ſome affirming that he is without form or ſhape; others, that he has the ſhape of a bear; others, that he has a large human body with only one arm; while others affirm that that he is no larger than a man's finger, with many other abſurdities of a ſimilar kind. They have alſo a peculiar kind of mythology, by which they believe all the elements to be full of ſpirits, from among which every one of their prophets is ſupplied with a familiar which they name *Torngack*, and who is always ready when ſummoned to his aſſiſtance.

The Greenlanders are employed all the year round either in fiſhing or hunting. At ſea they purſue whales, morſes, ſeals, fiſh for eating, and ſea-fowl. On ſhore they hunt the rein-deer in different parts of the country. They drive theſe animals, which feed in large herds, into a narrower circle or defile, where they are eaſily ſlain with arrows. Their bow is made of fir-tree, wound about with the twiſted ſinews of animals: the ſtring is compoſed of the ſame ſtuff, or of ſeal-ſkin: the arrow is a good fathom in length, pointed with a bearded iron, or a ſharp bone; but thoſe with which they kill birds are blunt, that they may not tear the fleſh. Sea-fowls they kill with lances, which they throw to a great diſtance with ſurpriſing dexterity. Their manner of catching whales is quite different from that practiſed by the Europeans. About 50 perſons, men and women, ſet out in one long boat, which is called a *kone-boat*, from *kone* a "woman," becauſe it is rowed by females only. When they find a whale, they ſtrike him with harpoons, to which are faſtened with long lines ſome ſeals ſkins blown up like bladders. Theſe, by floating on the ſurface, not only diſcover the back of the whale, but hinder him from diving under water for any length of time. They continue to purſue him until he loſes ſtrength, when they pierce him with ſpears and lances till he expires. On this occaſion they are clad in their ſpring-coats conſiſting of one piece, with gloves, boots, caps made of ſeal-ſkin ſo cloſely laced and ſewed that they keep out water. Thus accoutred, they leap into the ſea; and begin to ſlice off the fat, even under water, before the whale is dead.—They have many different ways of killing ſeals; namely, by ſtriking them with a ſmall harpoon equipped alſo with an air-bag; by watching them when they come to breathe at the air-holes in the ice, and ſtriking them with ſpears; by approaching them in the diſguiſe of their own ſpecies, that is, covered with a ſeal-ſkin, creeping upon the ice, and moving the head from ſide to ſide as the ſeals are accuſtomed to do. By this ſtratagem the Greenlander moves towards the unſuſpecting ſeal, and kills him with a ſpear. The Greenlanders angle with lines made of whale-bone cut very ſmall, by means of which they ſucceed wonderfully. The Greenland canoe, like that uſed in Nova Zembla and Hudſon's bay, is about three fathoms in length, pointed at both ends, and three quarters of a yard in breadth. It is compoſed of thin rafts faſtened together with the ſinews of animals. It is covered with dreſſed ſeal-ſkins both below and above, in ſuch a manner, that only a circular hole is left in the middle, large enough to admit the body of one man. Into this the Greenlander thruſts himſelf up to the waiſt, and faſtens the ſkin ſo tight about him that no water can enter. Thus ſecured, and armed with a paddle broad at both ends, he will venture out to ſea in the moſt ſtormy weather to catch ſeals and ſea-fowl; and if he is overſet, he can eaſily raiſe himſelf by means of his paddle. A Greenlander in one of theſe canoes, which was brought with him to Copenhagen, outſtripped a pinnace of 16 oars, manned with choice mariners.—The kone-boat is made of the ſame materials, but more durable; and ſo large, that it will contain 50 perſons with all their tackle, baggage, and proviſions. She is fitted with a maſt, which carries a triangular ſail made of the membranes and entrails of ſeals, and is managed without the help of braces and bowlings. Theſe kones are flat-bottomed, and ſometimes 60 feet in length. The men think it beneath them to take charge of them; and therefore they are left to the conduct of the women, who indeed are obliged to do all the drudgery, including even the building and repairing their houſes, while the men employ themſelves wholly in preparing their hunting implements and fiſhing tackle.

Greenland.

This country is but thinly inhabited. In the winter time the people dwell in huts built of ſtone or turf: on the one ſide are the windows, covered with the ſkins of ſeals or rein-deer. Several families live in one of theſe houſes, poſſeſſing each a ſeparate apartment, before which is a hearth with a great lamp placed on a trevit, over which hangs their kettle: above is a rack or ſhelf on which their wet clothes are dried. They burn train-oil in their lamps; and inſtead of wick, they uſe a kind of moſs, which fully anſwers the purpoſe. Theſe fires are not only ſufficient to boil their victuals; but likewiſe produce ſuch a heat, that the whole houſe is like a bagnio. The door is very low, that as little cold air as poſſible may be admitted. The houſe within is lined with old ſkins, and

Greenland. and furrounded with benches for the conveniency of ſtrangers. In the ſummer-time they dwell in tents made of long poles fixed in a conical form, covered in the inſide with deers ſkins, and on the outſide with ſeals ſkins, dreſſed ſo that the rain cannot pierce them.

East Greenland. 11 East Greenland was for a long time conſidered as a part of the continent of Weſt Greenland, but is now diſcovered to be an aſſemblage of iſlands lying between 76° 46′ and 80° 30′ of north latitude, and between 9° and 20° of eaſt longitude. It was diſcovered by Sir Hugh Willoughby in the 1553, who called it *Greenland*; ſuppoſing it to be a part of the weſtern continent. In 1595, it was again viſited by William Barentz and John Cornelius, two Dutchmen, who pretended to be the original diſcoverers, and called the country *Spitzbergen*, or Sharp Mountains, from the many ſharp-pointed and rocky mountains with which it abounds. They alleged that the coaſt diſcovered by Sir Hugh Willoughby was ſome other country; which accordingly the Hollanders delineated on their maps and charts by the name of *Willoughby Land*; whereas in fact no ſuch land ever exiſted; and long before the voyage of theſe Dutchmen, Stephen Barrows, an Engliſh ſhipmaſter, had coaſted along a deſolate country from N. Lat. 78° to 80° 11′, which was undoubtedly Spitzbergen. The ſea in the neighbourhood of the iſlands of Spitzbergen abounds very much with whales, and is the common reſort of the whale-fiſhing ſhips from different countries, and the country itſelf is frequently viſited by theſe ſhips; but till the late voyage of the Hon. Capt. Phipps, by order of his Majeſty, the ſituation of it was erroneouſly laid down. It was imagined that the land ſtretched to the northward as far as 82° of north latitude; but Capt. Phipps found the moſt northerly point of land, called *Seven Iſlands*, not to exceed 80° 30′ of latitude. Towards the eaſt he ſaw other lands lying at a diſtance, ſo that Spitzbergen plainly appeared to be ſurrounded by water on that ſide, and not joined to the continent of Aſia, as former navigators had ſuppoſed. The north and weſt coaſts alſo he explored, but was prevented by the ice from failing ſo far to the northward as he wiſhed. The coaſt appeared neither habitable nor acceſſible. It is formed of high, barren, black rocks, without the leaſt marks of vegetation; in many places bare and pointed; in others covered with ſnow, appearing even above the clouds. The valleys between the high cliffs were filled with ſnow and ice. "This proſpect," ſays Capt. Phipps, "would have ſuggeſted the idea of perpetual winter, had not the mildneſs of the weather, the ſmooth water, bright ſun-ſhine, and conſtant day-light, given a cheerfulneſs and novelty to the whole of this romantic ſcene." The current ran along this coaſt half a knot an hour, north. The height of one mountain ſeen here was found by geometrical menſuration to be at one time $1503\frac{1}{2}$ feet, at another $1503\frac{8}{10}$ feet. By a barometer conſtructed after De Luc's method, the height was found to be $1588\frac{1}{2}$ feet. On this occaſion Capt. Phipps has the following remarks. "I cannot account for the great difference between the geometrical meaſure and the barometrical according to M. de Luc's calculation, which amounts to 84.7 feet. I have no reaſon to doubt the accuracy of Dr Irving's obſervations, which were made with great care. As to the geometrical meaſure, the agreement of ſo many triangles, each of which muſt have diſcovered even the ſmalleſt error, is the moſt ſatisfactory proof of its correctneſs. Since my return I have tried both the theodolite and barometer, to diſcover whether there was any fault in either; and find them, upon trial, as I had always done before, very accurate." As Greenland Greenock

There is good anchorage in Schmeerenburg harbour, lying in N. Lat. 74° 44′ E. Long. 9° 50′ 45″, in 13 fathom, ſandy bottom, not far from the ſhore, and well ſheltered from all winds. Cloſe to this harbour is an iſland called *Amſterdam Iſland*, where the Dutch uſed formerly to boil their whale-oil; and the remains of ſome conveniency erected by them for that purpoſe are ſtill viſible. The Dutch ſhips ſtill reſort to this place for the latter ſeaſon of the whale-fiſhery. —The ſtone about this place is chiefly a kind of marble, which diſſolves eaſily in the marine acid. There were no appearances of minerals of any kind, nor any ſigns of ancient or modern volcanoes. No inſects, or any ſpecies of reptiles, were ſeen, not even the common earth-worm. There were no ſprings or rivers; but great plenty of water was produced from the ſnow which melted on the mountains.

The moſt remarkable views which theſe dreary regions preſent are thoſe called *Icebergs*. They are large bodies of ice filling the valleys between the high mountains. Their face towards the ſea is nearly perpendicular, and of a very lively light-green colour. One was about 300 foot high, with a caſcade of water iſſuing from it. The black mountains on each ſide, the white ſnow, and greeniſh coloured ice, compoſed a very beautiful and romantic picture. Large pieces frequently broke off from the icebergs, and fell with great noiſe into the water. One piece was obſerved to have floated out into the bay, and grounded in 24 fathom; it was 50 feet high above the ſurface of the water, and of the ſame beautiful colour with the iceberg from which it had ſeparated.

Theſe iſlands are totally uninhabited, though it doth not appear but that human creatures could ſubſiſt on them, notwithſtanding their vicinity to the pole. Eight Engliſh ſailors, who were accidentally left here by a whale-fiſhing ſhip, ſurvived the winter, and were brought home next ſeaſon. The Dutch then attempted to ſettle a colony on Amſterdam iſland above-mentioned; but all the people periſhed, not through the ſeverity of the climate, but of the ſcurvy, owing to the want of thoſe remedies which are now happily diſcovered, and which are found to be ſo effectual in preventing and curing that dreadful diſeaſe.—The late account alſo of ſix Ruſſian ſailors who ſtaid four years in this unhoſpitable country, affords a deciſive proof, that a colony might be ſettled on Eaſt Greenland, provided the doing ſo could anſwer any good purpoſe.

GREENOCK, a ſea-port town of Scotland, and one of the ports of the city of Glaſgow. It is ſituated 22 miles from that city; and was formerly called the *Bay of St Laurence*. The Frith of Clyde here expands into a fine baſon four miles wide, and is landlocked on all ſides.

GREENWICH, a town of the county of Kent, in England, pleaſantly ſituated on the bank of the Thames,

Greenwich. Thames, about five miles east from London. Here was formerly a royal palace, built by Humphry Duke of Gloceſter, enlarged by Henry VII. and completed by Henry VIII. The latter often choſe this town for his place of reſidence; as did alſo the Queens Mary and Elizabeth, who were born in it. This palace, however, is now pulled down; and what goes by the name of *palace* at preſent, ſerves for apartments for the governor of the hoſpital, and the ranger of the park. This park was walled and planted by Charles II. and hath a hill in the middle, whence there is a noble proſpect of London, the Thames, and ſhipping; alſo a Royal Obſervatory, furniſhed with a complete ſet of aſtronomical obſervations. This obſervatory in the lateſt Engliſh maps is accounted the place of the firſt meridian; and the degrees of longitude, either eaſt or weſt, are accounted from it. But the moſt remarkable building about Greenwich, is the hoſpital for ſuperannuated and diſabled ſeamen, and likewiſe for their widows and children. It is a very noble ſtructure; the wing next London being part of the palace which King Charles II. intended to have erected for himſelf, and which coſt him 36,000 pounds; being finely adorned with all the decorations of painting, ſculpture, and architecture. About 2000 old diſabled ſeamen are maintained in it. The nurſes, who muſt be ſeamens widows, have ten pounds a-year, and ſuch as attend the infirmary, two ſhillings a-week more. Beſides private benefactions, to the amount of about L. 60,000, the parliament, in the year 1732, ſettled upon this hoſpital the earl of Derwentwater's eſtate, to the value of L. 6000 *per annum*. The hall of the hoſpital is finely painted by Sir James Thornhill. All ſtrangers who ſee it, pay twopence each; and this income is applied to the ſupport of the mathematical ſchool for the ſons of ſailors. For the better ſupport of this hoſpital, every ſeaman in the royal navy, and in the merchant ſervice, pays ſixpence a-month, ſtopped out of their pay, and delivered in at the ſix-penny receiver's office in Tower-hill.—On this account, a ſeaman, who can produce an authentic certificate of his being diſabled, and rendered unfit for ſervice, by defending any ſhip belonging to his Majeſty's Britiſh ſubjects, or in taking any ſhip from the enemy, may be admitted into this hoſpital, and receive the ſame benefit from it as if he had been in his Majeſty's immediate ſervice. Beſides the ſeamen and widows above-mentioned, about 100 boys, the ſons of ſeamen, are bred up for the ſervice of the royal navy; but there are no out-penſioners as at Chelſea. Each of the mariners has a weekly allowance of bread, beef, mutton, peaſe, cheeſe, butter, and beer, and one ſhilling a-week tobacco-money. The tobacco-money of the boatſwains is two ſhillings and ſixpence a-week each, that of their mates one ſhilling and ſixpence, and that of the other officers in proportion to their rank. Each common penſioner alſo, once in two years, has a ſuit of blue clothes, a hat, three pair of ſtockings, two pair of ſhoes, five neck-cloths, three ſhirts, and two night-caps. The principal officers of the houſe, are a governor, lieutenant-governor, treaſurer, three captains, ſix lieutenants, two chaplains, a phyſician, and ſurgeon, a clerk of the checque, and an auditor, who have handſome ſalaries. The profits of the market belong to this hoſpital, whoſe governors have the direction of it. The firſt hoſpital founded by an Engliſh Proteſtant, was at Greenwich, in 1560, by one Mr Lambard, (author of a book called the *Perambulation of Kent*), for twenty poor.

Gregarious || Gregory.

GREGARIOUS, among zoologiſts, a term applied to ſuch animals as do not live ſolitary, but aſſociate in herds or flocks.

GREGORIAN CALENDAR, that which ſhews the new and full moon, with the time of Eaſter, and the moveable feaſts depending thereon, by means of epacts diſpoſed through the ſeveral months of the Gregorian year. See ASTRONOMY, n° 295.

GREGORIAN *Year*. See ASTRONOMY, n° 295.

GREGORY the Great, was born at Rome, of a patrician family. He diſcovered ſuch abilities in the exerciſe of the ſenatorial employments, that the emperor Juſtin the younger appointed him prefect of Rome. Pope Pelaſgius II. ſent him nuncio to Conſtantinople, to demand ſuccours againſt the Lombards. When he thought of enjoying a ſolitary life, he was elected Pope by the clergy, the ſenate, and the people of Rome. Beſides his learning and diligence in inſtructing the church, both by writing and preaching, he had a very happy talent in winning over princes in favour of the temporal as well as ſpiritual intereſt of religion. He undertook the converſion of the Engliſh, and ſent over ſome monks of his order, under the direction of Auguſtin their abbot. His morality with reſpect to the chaſtity of churchmen was very rigid, aſſerting that a man who had ever known a woman ought not to be admitted to the prieſthood; and he always cauſed the candidates for it to be examined upon that point. He likewiſe vigorouſly exerted himſelf againſt ſuch as were found guilty of calumny. However, he flattered the emperor Phocas, while his hands were yet reeking with the blood of Mauritius, and of his three children, who had been butchered in his ſight. He likewiſe flattered Brunehaut, a very wicked queen of France. He is accuſed of deſtroying the noble monuments of ancient Roman magnificence, that thoſe who viſited the city might not attend more to the triumphal arches, than to holy things; and burnt a multitude of heathen books, Livy in particular. He died in 604.

GREGORY of Nazianzen, ſirnamed the *Divine*, was one of the moſt illuſtrious ornaments of the Greek church in the fourth age. He was made biſhop of Conſtantinople in 397; but finding his election conteſted by Timotheus, archbiſhop of Alexandria, he voluntarily reſigned his dignity about 382, in the general council of Conſtantinople. His works are extant, in two volumes, printed at Paris in 1609. His ſtyle is ſaid to be equal to that of the moſt celebrated orators of ancient Greece.

GREGORY (Theodorus), ſurnamed *Thaumaturgus* on account of his miracles, was the ſcholar of Origen; and was elected biſhop of Neocæſarea, the place of his birth, about the year 240, during his abſence. He aſſiſted at the council of Antioch, in 255, againſt Paulus Samoſetanus; and died in 270. He had the ſatisfaction of leaving only ſeventeen idolaters in his dioceſe, where there were but ſeventeen Chriſtians when he was ordained. There is ſtill extant of his, A gratulatory oration to Origen, A canonical epiſtle, and ſome other works.

Gregory. GREGORY, biſhop of Nyſſa, one of the fathers of the church, and author of the Nicene creed, was born in Cappadocia, about the year 331. He was choſen biſhop of Nyſſa in 372, and baniſhed by the emperor Valens for adhering to the council of Nice. He was nevertheleſs afterwards employed by the biſhops in ſeveral important affairs, and died in 396. He wrote, Commentaries on the Scriptures; Sermons on the myſteries; Moral diſcourſes; Dogmatical treatiſes; Panegyrics on the ſaints; ſome letters on church-diſcipline; and other works. His ſtyle is very allegorical and affected.

GREGORY of Tours, or *Georgius Florentius Gregorius*, one of the moſt illuſtrious biſhops and celebrated writers of the ſixth century, was deſcended from a noble family in Auvergne. He was educated by his uncle Gallus, biſhop of Clermont; and diſtinguiſhed himſelf ſo much by his learning and virtue, that in 573 he was choſen biſhop of Tours. He afterwards went to Rome to viſit the tomb of the apoſtles, where he contracted a friendſhip with Gregory the Great, and died in 595. This author was extremely credulous with regard to miracles. He wrote, 1. The hiſtory of France. 2. The lives of the ſaints; and other works. The beſt edition is that publiſhed by Father Rumart, 1699.

GREGORY (James), an eminent mathematical genius of Scotland, was born at Aberdeen in 1639, and educated at that univerſity. He made a good progreſs in claſſical learning: but being more delighted with philoſophical reſearches, the works of Des Cartes and Kepler were his principal ſtudy; and he began early to make improvements on their diſcoveries in optics. The firſt of theſe improvements was the invention of the reflecting teleſcope, which ſtill bears his name; and which was ſo happy a thought, that that has given occaſion to the moſt conſiderable improvements made in optics ſince the invention of the teleſcope.

He publiſhed the conſtruction of this inſtrument in 1663, at the age of 24; and coming next year or the year after that to London, he became acquainted with Mr John Collins, who recommended him to the beſt optic glaſs grinders there, in order to have it executed. But as this could not be done for want of ſkill in the artiſts to grind a plate of metal for the object ſpeculum into a true parabolic concave, which the deſign required, he was much diſcouraged thereby; and after a few imperfect trials made with an ill poliſhed ſpherical one, which did not ſucceed to his wiſh, he dropped the purſuit, and reſolved to make the tour of Italy, then the mart of mathematical learning, in the view of proſecuting his favourite ſtudy with greater advantage.

He had not been long abroad, when the ſame inventive genius which had before ſhewed itſelf in practical mathematics, carried him to ſome new improvements in the ſpeculative part. The ſublime geometry on the doctrine of curves was then hardly paſt its infant ſtate; and the famed problem of ſquaring the circle ſtill continued a reproach to it, when our author diſcovered a new analytical method of ſumming up an infinite converging ſeries, whereby the area of the hyperbola, as well as of the circle, may be computed to any degree of exactneſs. He was then at Padua; and getting a few copies of his invention printed there in 1667, he ſent one to his friend Mr Collins, who communicated it to the Royal Society, where it met with the commendations of lord Brounker and Dr Wallis. Our author printed it at Venice, and publiſhed it the following year 1668; together with another piece, wherein he firſt of any one entertained the public with an account of the transformation of curves. An account of this piece was alſo read by Mr Collins before the Royal Society, of which Mr Gregory, being returned from his travels, was choſen a member, and communicated to them an account of the controverſy in Italy about the motion of the earth, which was denied by the famous aſtronomer Riccioli and his followers. Gregory.

The ſame year his quadrature of the circle being attacked by the celebrated Mr Huygens, a controverſy aroſe between theſe two eminent mathematicians, in which our author produced ſome improvements of his ſeries.

In 1672, Sir Iſaac Newton, in his wonderful diſcoveries on the nature of light, having contrived a new reflecting teleſcope, made ſeveral objections to Mr Gregory's. This gave occaſion to a controverſy betwixt theſe two philoſophers, which was carried on this and the following year in the moſt amicable manner on each ſide. Mr Gregory defended his own conſtruction, but gave his antagoniſt the whole honour of having made the catoptric teleſcopes preferable to the dioptric ones; ſhewing that the imperfections in theſe inſtruments were not ſo much owing to a defect in the object ſpeculum, as to the different refrangibility of the rays of light. In the courſe of this diſpute our author deſcribed a burning concave mirror, which was approved by Sir Iſaac, and is ſtill in good eſteem.

All this while he attended the proper buſineſs of his profeſſorſhip with great diligence; which, taking up the greateſt part of his time, eſpecially in the winter ſeaſon, hindered him in the purſuit of his proper ſtudies. Theſe, however, led him to farther improvements in the invention of infinite ſeries, which he occaſionally communicated to his friend and correſpondent Mr Collins, who might have had the pleaſure of receiving many more, had not our profeſſor's life been cut ſhort by a fever in December 1675, at the age of 36 years.

Beſides the inventions already mentioned, he was the firſt who gave a geometrical demonſtration of lord Brounker's ſeries for ſquaring the hyperbola, as it had been explained by Mercator in his Logarithmotechnia. He was likewiſe the firſt who demonſtrated the meridian line to be analogous to a ſcale of logarithmic tangents of the half complement of latitude. He alſo invented, and demonſtrated geometrically, by the help of the hyperbola, a very ſwift converging ſeries for making the logarithms, and therefore recommended by Dr Halley as very proper for practice. He alſo ſent to Mr Collins the ſolution of the famous Keplerian problem by an infinite ſeries. He found out a method of drawing tangents to curves geometrically, without any previous calculations. He gave a rule for the direct and inverſe method of tangents, which ſtands upon the ſame principle (of exhauſtions) with the fluxions, and differs not much from it in the method of

Gregory. of application. He likewiſe gave a ſeries for the length of the area of a circle from the tangent, and *vice verſa*; as alſo for the ſecant and logarithmic tangent and ſecant, and *vice verſa*. Theſe, with others for certifying or meaſuring the length of the elliptic and hyperbolic curves, were ſent to Mr Collins in return for ſome received from him of Sir Iſaac Newton's; and their elegancy being admirable, above whatever he had produced before, and after the manner of Sir Iſaac Newton, gave room to think that he had improved himſelf greatly by that maſter, whoſe example he followed in giving his ſeries in ſimple terms, independent of each other. Theſe ſeveral inventions are contained, 1. In his *Optica promota*, &c. 4to. edit. 1663. 2. *Vera circuli & hyperbolæ quadratura*, Padua 1667. 3. *Geometriæ pars univerſalis*, &c. 1667, 4to. 4. Several letters and papers printed in the *Philoſophical Tranſactions*; the *Journal des Scavans*; the *Commerc. epiſtol. Jo. Collins & alior*, 1715, 8vo. and in the Appendix to the Engliſh edition of Dr David Gregory's *Elements of Optics*, 1735, 8vo. by Dr Deſaguliers.

Gregory (David), nephew of the preceding, was born June 24th, 1661, at the ſame place, where he alſo received the firſt grounds of his learning; but was afterwards removed to Edinburgh, and took the degree of maſter of arts in that univerſity. The great advantage of his uncle's papers induced his friends to recommend the mathematics to him; and he had a natural ſubtilty of genius, which particularly fitted him for that ſtudy, to which he applied with indefatigable induſtry; and ſucceeded ſo well, that he was advanced to the mathematical chair at Edinburgh, at the age of 25: and the ſame year he publiſhed a treatiſe entitled, *Exercitatio geometrica de dimenſione figurarum*, Edinb. 1684, 4to.

He had already ſeen ſome hints in his uncle's papers concerning Sir Iſaac Newton's method, of which he made the beſt uſe he could, and the advantage he found thereby raiſed an ardent deſire in him to ſee that method publiſhed. Under this impatient expectation, the *Principia* was no ſooner out in 1687, but our author took it in hand, and preſently made himſelf ſo much maſter of it as to be able to read his profeſſorial lectures upon the philoſophy contained in it; and cauſing his ſcholars to perform their exerciſes for their degrees upon ſeveral branches of it, became its firſt introducer into the ſchools.

He continued at Edinburgh till the year 1691; when hearing the news of Dr Bernard's intention to reſign the Savilian profeſſorſhip at Oxford, he left Scotland, and, coming to London, was admitted a member of the Royal Society. Proceeding to Oxford, he was elected aſtronomical profeſſor there, having been firſt admitted of Baliol-college, incorporated maſter of arts, and created doctor of phyſic. He had no reliſh for the technical part of his profeſſion, and was ſeldom ſeen in the obſervatory. His genius lay more to geometry, in which he diſtinguiſhed himſelf both by his *Elements of Optics*, and of *Phyſical and geometrical aſtronomy*. This laſt is reckoned his maſterpiece; and having finiſhed it in 1702, he immediately engaged in carrying on the noble deſign of his predeceſſor, Dr Bernard, to print all the works of the ancient mathematicians; the firſt fruits of which appeared in an edition of Euclid's works in Greek and Latin, in folio, the following year; and, in the ſame deſign, he afterwards joined with his colleague Dr Halley, in preparing an edition of *Apollonius's Conics*. Dr Bernard had the materials for the firſt four books, which our author undertook to complete, but was prevented by his death, which happened Oct. 16. 1710. Gregory.

Gregory (Dr John), profeſſor of medicine in the univerſity of Edinburgh, was born in May 1725. His father was profeſſor of medicine in the King's-college, Aberdeen; and his grandfather was profeſſor of mathematics, firſt at St Andrews, and afterwards at Edinburgh. Thus Dr Gregory was the third profeſſor of his family in a lineal deſcent. But it deſerves to be remarked, that from his great-grandfather David Gregory, eſq; of Kinairdy in Aberdeenſhire, he was the 15th deſcendant who had held a profeſſorſhip in a Britiſh univerſity.

Dr Gregory began the ſtudy of medicine at Aberdeen; which he afterwards proſecuted, firſt at Edinburgh, next at Leyden, and then at Paris. In the 20th year of his age he was elected profeſſor of philoſophy in king's-college, Aberdeen; and had, at the ſame time, the degree of doctor of medicine conferred upon him. In the year 1756, upon the death of his brother Dr James Gregory, who had ſucceeded his father as profeſſor of medicine, he was elected to that chair. But about the beginning of the year 1765, he left Aberdeen, and came to Edinburgh. Soon after this he was appointed profeſſor of the practice of medicine in the univerſity there, in the room of Dr Rutherford, who reſigned in his favour. The year following, upon the death of Dr White, he was nominated firſt phyſician to his majeſty for Scotland. Thus, at the time of his death, beſides very extenſive practice, he enjoyed the higheſt and moſt important offices in the way of his profeſſion, which could be obtained in his native country.

Theſe diſtinguiſhing honours were univerſally allowed to be the juſt reward of ſingular merit. Of this the writings which he publiſhed will bear ample teſtimony to future ages. His firſt publication, which is entitled, *A comparative view of the faculties of man with thoſe of the animal world*, made its appearance in 1765. This production, while it demonſtrates the author to have been a philoſopher whoſe reflections were juſt and original, at the ſame time diſplays a liberality of ſentiment ſeldom to be equalled. Such was the avidity with which it was read, that in the ſpace of two years it went through four editions; and, while it was peruſed by all with peculiar pleaſure, it was honoured by thoſe diſtinguiſhed for taſte and literature with high approbation.

In the year 1770, a ſecond work of Dr Gregory's made its appearance; but without his conſent, and even contrary to his inclination. His preliminary lectures on the practice of phyſic were heard by his pupils with univerſal ſatisfaction. From a copy of theſe lectures taken down in ſhort-hand, there was publiſhed a book entitled, "Obſervations on the duties and office of a phyſician, and on the method of proſecuting inquiries in philoſophy." Although theſe lectures were not intended for the preſs, and did not paſs through the finiſhing hand of the author before they were preſented to the public; yet ſuch was

Gregory. the matter they contained, that, had they appeared in a much worſe dreſs, they could have done him no diſcredit. In theſe lectures, by the moſt forcible arguments, he laboured to convince his pupils, that a phyſician who ſtudies the principles of his profeſſion, who has an extenſive acquaintance with every branch of natural knowledge, and who properly applies his knowledge, muſt have an infinite advantage, as a practitioner, over one who is ignorant of the theory of medicine, and of every ſcience connected with it. He endeavoured to perſuade them, that genius and ſenſe, which indeed are the peculiar gifts of heaven, are yet capable of high improvement; and that, without improvement, they can be but of little account either to the public, or to an individual. In ſhort, no argument was ommitted which could prompt them to ſtudy medicine with attention and ardour, and afterwards to practiſe it with prudence and humanity.—Dr Gregory, however, was diſſatisfied with the dreſs in which this work appeared. Soon after, therefore, he publiſhed an edition of it himſelf, in which his former ſentiments are ſet off with all the advantages which can be derived from a correct and elegant ſtyle. His laſt publication, *Elements of the practice of phyſic*, was intended as a ſyllabus to his lectures; and in it he meant to have comprehended all the diſeaſes of which he uſually treated. But not having leiſure to finiſh the whole, he was obliged to ſtop at thoſe diſeaſes which are uſually reckoned febrile. Although this work appears with all thoſe diſadvantages, under which every text muſt labour; yet it ſufficiently ſhews how the author thought and acted in the exerciſe of his profeſſion. The world was deprived of this excellent perſon in February 1774. He left behind him a ſmall, but ineſtimable production, under the title of *A father's legacy to his daughters*, deſigned for their private inſtructions; but rendered a common bequeſt by the benevolence of his eldeſt ſon, who gave it to the public after his death. The maxims and advices it contains, which are claſſed under the general topics—of religion, of conduct and behaviour, of amuſements, of friendſhip, love, and marriage,—are as juſt as they are important; and appear to be the dictates of a mind which had long been inviolably attached to the intereſts of virtue; the reſults of an obſervation equally intereſting, extenſive, and mature. They are delivered in a ſtyle which is ſimple and unadorned; yet chaſtiſed with that elegance and correctneſs which reſult from the operations of a mind habitually governed by a refined taſte, and the cleareſt judgement.

Had Dr Gregory lived to a more advanced age, the world would probably have been favoured with other works no leſs honourable to the author than beneficial to mankind. But his extenſive practice, and his zeal in his duty as a profeſſor, occupied the greateſt part of his time.

To pretend to enumerate the many advantages which his pupils derived from him in the capacity of a teacher, would exceed our limits. Let it ſuffice to ſay, that, from the extent of his views, from the juſtice and importance of his obſervations, and from the force and accuracy of his reaſoning, every hearer obtained the moſt thorough conviction of his abilities, and retired from academical labours both pleaſed and inſtructed.

To conclude: Dr Gregory was not more eminent as a phyſician, than he was amiable and reſpectable as a man. With the mathematical genius of his family he united a correct taſte for the fine arts, and a high reliſh for every ſocial virtue. He poſſeſſed a clear and vigorous underſtanding; a chaſte and lively imagination; and an affectionate and feeling heart: and while he was diſtinguiſhed for paternal and conjugal attachment, he was a conſtant friend to poverty and diſtreſs, and an unwearied patron of ſcience and virtue.

Gre-hound ‖ Grenada.

GRE-HOUND. See CANIS.—Among a litter of gre-hound puppies, the beſt are always thoſe which are lighteſt. Theſe will make the nimbleſt dogs as they grow up. The gre-hound is beſt for open countries where there is little covert. In theſe places there will ſometimes be a courſe after a hare of two or three miles or more, and both the dogs and the game in ſight all the while. It is generally ſuppoſed that the gre-hound bitch will beat the dog in running: but this ſeems to be an error; for the dog is both longer-made, and conſiderably ſtronger, than the bitch of the ſame kind. In the breeding theſe dogs the bitch is principally to be regarded; for it is found by experience, that the beſt dog and a bad bitch will not get ſo good puppies as an indifferent dog with a good bitch. The dog and bitch ſhould be as nearly as may be of the ſame age; and for the breeding of fine and perfect dogs, they ſhould not be more than four years old. An old bitch may be uſed with a young dog, but the puppies of a young bitch and an old dog will never be good for any thing.

The general food for a gre-hound, ought to be chippings or raſpings of bread, with ſoft bones and griſtles; and thoſe chippings ought always to be ſoaked in beef or mutton broth.

The proper exerciſe for a gre-hound is courſing him three times a-week, and rewarding him with blood; which will animate him in the higheſt degree, and encourage him to proſecute his game. But the hare alſo ſhould ever have fair play. She ſhould have the law, as it is called; that is, have leave to run about twelve ſcore yards before the dog is ſlipped at her, that he may have ſome difficulty in the courſe, and not pick up the game too eaſily. If he kills the hare, he muſt never be ſuffered to tear her; but ſhe muſt be taken from him, his mouth cleaned of the wool, and the liver and lights given him by way of encouragement. Then he is to be led home, and his feet waſhed with butter and beer, and about an hour after he is to be fed.

When the dog is to be taken out to courſe, he ſhould have nothing in the morning but a toaſt and butter, and then he is to be kennelled till taken out to the field. The kennelling theſe dogs is of great uſe, always giving them ſpirit and nimbleneſs when they are let looſe: and the beſt way of managing a fine gre-hound is, never to let him ſtir out of the kennel, except at the times of feeding, walking, or courſing.

GRENADA, one of the Caribbee iſlands, lying in W. Long. 61. 40. N. Lat. 12. 0. It is the laſt of the Windward Caribbees; and lies 30 leagues north of New Andaluſia, on the continent. According to ſome, it is 24 leagues in compaſs; according to others, only

only 22; and it is said to be 30 miles in length, and in some places 15 in breadth. The chief port is called *Lewis*; and stands on the west side of the island, in the middle of a large bay, with a sandy bottom. It is pretended that 1000 barks, from 300 to 400 tons, may ride secure from storms; and that 100 ships, of 1000 tons each, may be moored in the harbour. A large round bason, which is parted from it by a bank of sand, would contain a considerable number of ships, if the bank was cut through: but by reason of it, the large ships are obliged to pass within 80 paces of one of the mountains lying at the mouth of the harbour; the other mountain lying about half a mile distant. The island abounds with wild game and fish; it produces also very fine timber, but the cocoa-tree is observed not to thrive here so well as in the other islands. A lake on a high mountain, about the middle of the island, supplies it with fresh-water streams. Several bays and harbours lie round the island, some of which might be fortified to great advantage; so that it is very convenient for shipping, not being subject to hurricanes. The soil is capable of producing tobacco, sugar, indigo, pease, and millet.

In 1638, M. Poincy, a Frenchman, attempted to make a settlement in Grenada; but was driven off by the Caribbeans, who resorted to this island in greater numbers than to the neighbouring ones, probably on account of the game with which it abounded. In 1650, Mons. Parquet, governor of Martinico, carried over from that island 200 men, furnished with presents to reconcile the savages to them; but with arms to subdue them, in case they should prove intractable. The savages are said to have been frightened into submission by the number of the Frenchmen: but, according to some French writers, the chief not only welcomed the new-comers; but in confideration of some knives, hatchets, scissars, and other toys, yielded to Parquet the sovereignty of the island, reserving to themselves their own habitations. The Abbe Raynal informs us, that these first French colonists, *imagining* they had purchased the island by these trifles, assumed the sovereignty, and soon acted as tyrants. The Caribs, unable to contend with them by force, took their usual method of murdering all those whom they found in a defenceless state. This produced a war; and the French settlers having received a reinforcement of 300 men from Martinico, forced the savages to retire to a mountain; from whence, after exhausting all their arrows, they rolled down great logs of wood on their enemies. Here they were joined by other savages from the neighbouring islands, and again attacked the French, but were defeated anew; and were at last driven to such desperation, that 40 of them, who had escaped from the slaughter, jumped from a precipice into the sea, where they all perished, rather than fall into the hands of their implacable enemies. From thence the rock was called *le morne des sauteurs*, or "the hill of the leapers;" which name it still retains. The French then destroyed the habitations and all the provisions of the savages; but fresh supplies of Caribbeans arriving, the war was renewed with great vigour, and great numbers of the French were killed. Upon this they resolved totally to exterminate the natives: and having accordingly attacked the savages unawares, they inhumanly put to death the women and children, as well as the men; burning also their boats and canoes, to cut off all communication between the few survivors and the neighbouring islands. Notwithstanding all these barbarous precautions, however, the Caribbees proved the irreconcileable enemies of the French, and their frequent insurrections at last obliged Parquet to sell all his property in the island to the Count de Cerillac in 1657. The new proprietor, who purchased Parquet's property for 30,000 crowns, sent thither a person of brutal manners to govern the island. He behaved with such insupportable tyranny, that most of the colonists retired to Martinico; and the few who remained condemned him to death, after a formal trial. In the whole court of justice that tried this miscreant, there was only one man (called *Archangeli*) who could write. A farrier was the person who impeached: and he, instead of the signatures, sealed with a horse-shoe; and Archangeli, who performed the office of clerk, wrote round it these words in French, "Mark of Mr de la Brie, council for the court."

It was apprehended that the court of France would not ratify a sentence passed with such unusual formalities; and therefore most of the judges of the governor's crimes, and witnesses of his execution, disappeared. Only those remained whose obscurity screened them from the pursuit of the laws. By an estimate, taken in 1700, there were at Grenada no more than 251 white people, 53 free savages or mulattoes, and 525 slaves. The useful animals were reduced to 64 horses, and 569 head of horned cattle. The whole culture consisted of three plantations of sugar, and 52 of indigo.—— The island had been sold in 1664 to the French West India company for 100,000 livres.

This unfavourable state of the affairs of Grenada was changed in 1714. The change was owing to the flourishing condition of Martinico. The richest of the ships from that island were sent to the Spanish coasts, and in their way touched at Grenada to take in refreshments. The trading privateers, who undertook this navigation, taught the people of that island the value of their soil, which only required cultivation. Some traders furnished the inhabitants with slaves and utensils to erect sugar-plantations. An open account was established between the two colonies. Grenada was clearing its debts gradually by its rich produce; and the balance was on the point of being closed, when the war, in 1744, interrupted the communication between the two islands, and at the same time stopped the progress of the sugar-plantations. This loss was supplied by the culture of coffee, which was pursued during the hostilities with all the activity and eagerness that industry could inspire.—The peace of 1748 revived all the labours, and opened all the former sources of wealth. In 1753 the population of Grenada consisted of 1262 white people, 175 free negroes, and 11,991 slaves. The cattle amounted to 2298 horses or mules, 2456 head of horned cattle, 3278 sheep, 902 goats, and 331 hogs. The cultivation rose to 83 sugar-plantations; 2,725,600, coffee-trees; 150,300 cocoa-trees, and 800 cotton-plants. The provisions consisted of 5,740,450 trenches of cassada; 933,596 banana trees; and 143 squares of potatoes and

Grénada. and yams. The colony made a rapid progrefs, in proportion to the excellence of its foil; but in the courfe of laft war, the iſland was taken by the Britiſh. At this time one of the mountains at the ſide of *Lewis* harbour was ſtrongly fortified, and might have made a good defence, but ſurrendered without firing a gun; and, by the treaty concluded in 1763, the iſland was ceded to Britain. On this ceſſion, and the management of the colony after that event, the Abbe Raynal has the following remarks.—"This long train of evils [the ambition and miſmanagement of his countrymen] has thrown Grenada into the hands of the Engliſh, who are in poſſeſſion of this conqueſt by the treaty of 1763. But how long will they keep this colony? Or, will it never again be reſtored to France?—England has not made a fortunate beginning. In the firſt enthuſiaſm raiſed by an acquiſition, of which the higheſt opinion had been previouſly formed, every one was eager to purchaſe eſtates there. They ſold for much more than their real value. This caprice, by expelling old coloniſts, who were inured to the climate, has ſent about L. 1,553,000 out of the mother-country. This imprudence has been followed by another. The new proprietors, miſled, no doubt, by national pride, have ſubſtituted new methods to thoſe of their predeceſſors. They have attempted to alter the mode of living among their ſlaves. The negroes, who from their very ignorance are more attached to their cuſtoms than other men, have revolted. It hath been found neceſſary to ſend out troops, and to ſhed blood. The whole colony was filled with ſuſpicions. The maſters who had laid themſelves under a neceſſity of uſing violent methods, were afraid of being burnt or maſſacred in their own plantations. The labours have declined, or been totally interrupted. Tranquillity has at length been reſtored. The number of ſlaves has been increaſed as far as 40,000, and the produce has been raiſed to the treble of what it was under the French government.

"The plantations will ſtill be improved by the neighbourhood of a dozen of iſlands, called the *Grenadines* or *Grenadilloes*, that are dependent on the colony. They are from three to eight leagues in circumference, but do not afford a ſingle ſpring of water. The air is wholeſome. The ground, covered only with thin buſhes, has not been ſcreened from the ſun. It exhales none of thoſe noxious vapours which are fatal to the huſbandman.

"Cariacou, the only one of the Grenadines which the French have occupied, was at firſt frequented by turtle fiſhermen; who, in the leiſure afforded them by ſo eaſy an occupation, employed themſelves in clearing the ground. In proceſs of time, their ſmall number was increaſed by the acceſſion of ſome of the inhabitants of Guadalupe; who, finding that their plantations were deſtroyed by a particular ſort of ants, removed to Cariacou. The iſland flouriſhed from the liberty that was enjoyed there. The inhabitants collected about 1200 ſlaves, by whoſe labours they made themſelves a revenue of near L. 20,000 a year in cotton.—The other Grenadines do not afford a proſpect of the ſame advantages, though the plantation of ſugar is begun there. It has ſucceeded remarkably well at Becouya, the largeſt and moſt fertile of theſe iſlands, which is no more than two leagues diſtant from St Vincent."

All theſe iſlands have lately been reduced again under the power of France, and the inhabitants treated with inhumanity and injuſtice. Grifon.

GRENADINES, or GRENADILLOS. See the preceding article.

GRENOBLE, a large, populous, and ancient town of Dauphiny in France, with a biſhop's ſee. It contains a great number of handſome ſtructures, particularly the churches and convents. The leather and gloves that are made here are highly eſteemed. It is ſeated on the river Iſere, over which there are two bridges to paſs into that part called *Perriere*, a large ſtreet on the other ſide of the river. E. Lon. 5. 49. N. Lat. 45. 12.

GRESHAM (Sir Thomas), an opulent merchant of London, deſcended from an ancient and honourable family of Norfolk, was born in 1519. He was, as his father had been before him, appointed king's agent at Antwerp, for taking up money of the merchants; and, in 1551, he removed to that city with his family. This employment was ſuſpended on the acceſſion of queen Mary; but, on proper repreſentations, was reſtored to him again. Queen Elizabeth conferred the honour of knighthood upon him, and made him her agent in foreign parts. It was at this time he thought proper to provide himſelf with a manſion-houſe in the city, ſuitable to his ſtation and dignity; with which intention he built that large houſe on the weſt ſide of Biſhopſgate-ſtreet, afterwards known by the name of *Greſham-college*. His father had propoſed building a houſe or exchange for the merchants to meet in, inſtead of walking in the open ſtreet; but this deſign remained for the ſon to accompliſh. Sir Thomas went beyond his father: he offered, if the citizens would provide a proper piece of ground, to build a houſe at his own expence; which being accepted, he fulfilled his promiſe after the plan of the exchange at Antwerp. When the new edifice was opened, the queen (Jan. 29, 1570,) came and dined with the founder; and cauſed a herald with a trumpet to proclaim it by the name of the *Royal Exchange*. In purſuance alſo of a promiſe to endow a college for the profeſſion of the ſeven liberal ſciences, he made a teſtamentary diſpoſition of his houſe in London for that purpoſe; leaving one moiety of the royal exchange to the corporation of London, and the other to the mercer's company, for the ſalaries of ſeven lecturers in divinity, law, phyſic, aſtronomy, geometry, muſic, and rhetoric, at 50l. each *per ann.* He left ſeveral other conſiderable benefactions, and died in 1579.—Thoſe who have drawn Sir Thomas's character obſerve, that he had the happineſs of a mind every way ſuited to his fortune, generous and benign; ready to perform any good actions, and encourage them in others. He was a great friend and patron of our celebrated martyrologiſt John Fox. He was well acquainted with the ancient and ſeveral modern languages; he had a very comprehenſive knowledge of all affairs relating to commerce, whether foreign or domeſtic; and his ſucceſs was not leſs, being in his time eſteemed the higheſt commoner in England. He tranſacted queen Elizabeth's mercantile affairs ſo conſtantly, that he was called *the royal merchant*; and his

reville. his houſe was ſometimes appointed for the reception of foreign princes upon their firſt arrival at London.

GREVILLE (Fulke) lord Brook, of Beauchamp's Court in Warwickſhire, a poet and miſcellaneous writer, was born in the year 1554, and deſcended from the noble families of Beauchamps of Powick and Willoughby de Brook. In company with his couſin Sir Philip Sidney, he began his education at a ſchool in Shrewſbury: thence he went to Oxford, where he remained for ſome time a gentleman commoner, and then removed to Trinity-college in Cambridge. Having left the univerſity; he viſited foreign courts, and thus added to his knowledge of the ancient languages a perfect knowledge of the modern. On his return to England he was introduced to queen Elizabeth by his uncle Robert Greville, at that time in her majeſty's ſervice; and by means of Sir Henry Sidney, lord preſident of Wales, was nominated to ſome lucrative employments in that principality.

In the year 1581, when the French commiſſioners who came to treat about the queen's marriage with the duke of Anjou were ſumptuouſly entertained with tilts and tournaments, Mr Greville, who was one of the challengers, ſo ſignalized himſelf, as to "win the reputation of a moſt valiant knight." He continued a conſtant attendant at court, and a favourite with the queen to the end of her reign, during which he obtained the office of treaſurer of marine cauſes, alſo a grant of the manor of Wedgnock, and likewiſe the honour of knighthood. In this reign he was ſeveral times elected member for the county of Warwick; and from the journals of the houſe ſeems to have been a man of buſineſs, as his name frequently appears in committees.

On the acceſſion of king James I. he was inſtalled knight of the Bath; and ſoon after obtained a grant of the ruinous caſtles of Warwick, which he repaired at a conſiderable expence, and where he probably reſided during the former part of this reign: but in the year 1614, the twelfth of James I. he was made under-treaſurer and chancellor of the exchequer, one of the privy-council, and gentleman of the bedchamber; and, in the 1620, was raiſed to the dignity of a baron, by the title of lord Brook of Beauchamp's Court. He was alſo privy-counſellor to king Charles I. in the beginning of whoſe reign he founded a hiſtory-lecture in Cambridge.

Having thus attained the age of 74, through a life of continued proſperity, univerſally admired as a gentleman and a ſcholar, he fell by the hand of an aſſaſſin, one of his own domeſtics, who immediately ſtabbed himſelf with the ſame weapon with which he had murdered his maſter. This fellow's name was Haywood; and the cauſe is ſaid to have been a ſevere reprimand for his preſumption in upbraiding his maſter for not providing for him after his death. It ſeems he had been witneſs to lord Brook's will, and knew the contents. Some ſay he ſtabbed him with a knife in the back; others, with a ſword. This affair happened at Brook-houſe in Holborn.—Lord Brook was buried with great pomp, in St Mary's church at Warwick, in his own vault, over which he had erected a monument of black and white marble, ordering at his death the following inſcription to be engraved upon the tomb. "Fulke Greville, ſervant to queen Elizabeth, counſellor to king James, and friend to Sir Philip Sidney. *Trophæum peccati.*" He wrote ſeveral works, both in verſe and proſe; among which are, 1. Two tragedies, Alaham and Muſtapha. 2. A treatiſe of human learning, &c. in verſe, folio. 3. The life of Sir Philip Sidney. 4. An inquiſition upon fame and honour, in 86 ſtanzas. 6. *Cælica*, a collection of 109 ſongs. 7. His remains, conſiſting of political and philoſophical poems.

Grew || Grey.

GREW (Nehemiah), a learned Engliſh writer in the 17th century, had a conſiderable practice as a phyſician in London, and ſucceeded Mr Oldenburgh in the office of ſecretary to the royal ſociety. In this capacity, purſuant to an order of council, he drew up a catalogue of the natural and artificial rarities belonging to the ſociety, under the title of *Muſæum Regalis Societatis*, &c. 1681. He alſo wrote, beſides ſeveral pieces in the Philoſophical Tranſactions. 1. The comparative anatomy of the ſtomach and guts, folio. 2. The anatomy of plants, folio. 3. *Tractatus de ſalis cathartici natura et uſu.* 4. *Coſmologia ſacra*, or a diſcourſe of the univerſe as it is the creature and kingdom of God; folio. He die dſuddenly in 1721.

GREWIA, in botany; a genus of the polyandria order, belonging to the gynandria claſs of plants.

Species. 1. The occidentalis, with oval crenated leaves, has long been preſerved in many curious gardens both in England and Holland. It is a native of the Cape of Good Hope, and grows to the height of ten or twelve feet. The ſtem and branches greatly reſemble thoſe of the ſmall-leaved elm, the bark being ſmooth, and of the ſame colour with that when young. The leaves are alſo very like thoſe of the elm, and fall off in autumn. The flowers are produced ſingly along the young branches from the wings of the leaves, and are of a bright purple colour. 2. The Africana, with oval ſpear-ſhaped ſerrated leaves, is a native of Senegal in Africa, from whence its ſeeds were brought by Mr Adanſon. In this country it riſes with a ſhrubby ſtalk five or ſix feet high, ſending out many lateral branches, with a brown hairy bark, and garniſhed with ſpear-ſhaped, ſerrated leaves; but the plants have not flowered in Britain.

Culture and uſes. The firſt ſort, though a native of a warm climate, will bear the open air in this country; only requiring to be ſheltered in a green-houſe during the winter-time. It may be propagated by cuttings or layers planted in pots filled with ſoft loamy earth. The ſecond ſort is tender, and muſt be kept conſtantly in a warm bark-ſtove. In ſummer, they require a large ſhare of the free air to be admitted to them, and ſhould have water three or four times a-week in warm weather; but in the winter they muſt be ſparingly watered. The negroes of Senegal highly value a decoction of the bark of this laſt ſpecies, and uſe it as a never-failing remedy againſt venereal complaints.

GREY or GRAY, a mixed colour, partaking of the two extremes black and white. See BLACK, n° 8, 9, 10.

GREY (Lady Jane), a moſt illuſtrious and unfortunate lady, deſcended of the blood-royal of England by both parents, was the eldeſt daughter of Henry Grey marquis of Dorſet and Francis the daughter of Charles Brandon lord Suffolk, by Mary the dowger

Grey. dowager of Lewis XII. king of France, who was the youngeſt daughter of Henry VII. king of England. She was born in the year 1537, at Broadgate, her father's ſeat in Leiceſterſhire. She diſcovered an early propenſity to all kinds of good literature; and having a fine genius, improved under the tuition of Mr Elmer, ſhe made a moſt ſurpriſing progreſs in the languages, arts, and ſciences. She underſtood perfectly both kinds of philoſophy, and could expreſs herſelf very properly at leaſt in the Latin and Greek tongues; and we are informed by Sir Thomas Chaloner (in Strype's memorials, vol. iii. p. 93.) that ſhe was well verſed in Hebrew, Chaldee, Arabic, French, and Italian; "and (he adds), ſhe played well on inſtrumental muſic, writ a curious hand, and was excellent at the needle." Chaloner alſo tells us, that ſhe accompanied her muſical inſtruments with a voice exquiſitely ſweet in itſelf, aſſiſted by all the graces that art could beſtow.

In the year 1553, the dukes of Suffolk and Northumberland, who were now, after the fall of Somerſet, arrived at the height of power, began, on the decline of the king's health, to think how to prevent that reverſe of fortune which, as things then ſtood, they foreſaw muſt happen upon Edward's death. To obtain this end, no other remedy was judged ſufficient but a change in the ſucceſſion of the crown, and transferring it into their own families, by rendering Lady Jane queen. Thoſe moſt excellent and amiable qualities which had rendered her dear to all who had the happineſs to know her, joined to her near affinity to the king, ſubjected her to become the chief tool of an ambition ſo notoriouſly not her own. Upon this very account ſhe was married to lord Guilford Dudley, fourth ſon of the duke of Northumberland, without diſcovering to her the real deſign of the match; which was celebrated with great pomp in the latter end of May, ſo much to the king's ſatisfaction, that he contributed bounteouſly to the expence of it from the royal wardrobe. The young king Edward VI. died in July following; and our fair ſcholar, with infinite reluctance, overpowered by the ſolicitations of her ambitious friends, allowed herſelf to be proclaimed queen of England, on the ſtrength of a deed of ſettlement extorted from that prince by her father-in-law the duke of Northumberland, which ſet aſide the ſucceſſion of queen Mary, queen Elizabeth, and Mary queen of Scots. Her regal pageantry continued but a few days. Queen Mary's undoubted right prevailed; and the unfortunate lady Jane Grey and her huſband were committed to the tower, and on the 13th of November arraigned and found guilty of high treaſon. On the 12th of February following they were both beheaded on Tower-hill. Her magnanimity in this dreadful cataſtrophe was aſtoniſhing. Immediately before her execution, ſhe addreſſed herſelf to the weeping multitude with amazing compoſure and coherency: ſhe acknowledged the juſtice of the law, and died in charity with that wretched world which ſhe had ſo much reaſon to execrate. Thus did the pious Mary begin her reign with the murder of an innocent young creature of 18; who for ſimplicity of manners, purity of heart, and extenſive learning, was hardly ever equalled in any age or country. But alas! Jane was an obſtinate heretic.—A few days before her execution, Fleckenham, the queen's chaplain, with a pious intention to reſcue her poor ſoul from eternal miſery, paid her frequent viſits in the tower, and uſed every argument in his power to convert her to the popiſh religion: but he found her ſo much his ſuperior in argument, that he gave up the conteſt; reſigning her body to the block, and her ſoul to the devil. Grey, Gribner.

Her writings are, 1. Four Latin epiſtles; three to Bullenger, and one to her ſiſter lady Catharine. The laſt was written, the night before her execution, in a blank leaf of a Greek Teſtament. Printed in a book entitled *Epiſtolæ Helveticæ Reformatoribus, vel ad eos ſcriptæ*, &c. Tiguri, 1742, 8vo. 2. Her conference with Fleckenham. (Ballard). 3. A letter to Dr Harding, her father's chaplain. Printed in the Phœnix, vol. ii. p. 28. 4. A prayer for her own uſe during her confinement. In Fox's acts and monuments. 5. Four Latin verſes; written in priſon with a pin. They are as follows.

Non aliena putes, homini, quæ obtingere poſſunt:
Sors hodierna mihi, tunc erit illa tibi.
Jane Dudley.

Deo juvante, nil nocet livor malus:
Et non juvante, nil juvat labor gravis.
Poſt tenebras ſpero lucem.

6. Her ſpeech on the ſcaffold. (Ballard). It began thus: "My Lords, and you good Chriſtian People who come to ſee me die; I am under a law, and by that law, as a never-erring judge, I am condemned to die: not for any thing I have offended the queen's majeſty; for I will waſh my hands guiltleſs thereof, and deliver to my God a ſoul as pure from ſuch treſpaſs as innocence from injuſtice; but only for that I conſented to the thing I was enforced unto, conſtraint making the law believe I did that which I never underſtood," &c.—Holliniſhed, Sir Richard Baker, Bale, and Fox, tell us that ſhe wrote ſeveral other things, but do not mention where they are to be found.

GREY-*Hound*. See GRE-*Hound*.

GRIBALDUS (Matthew), a learned civilian of Padua, left Italy in the 16th century, in order to make a public profeſſion of the Proteſtant religion. After having been for ſome time profeſſor of the civil law at Tubingen, he was obliged to make his eſcape to avoid the puniſhment he would have incurred had he been convicted of differing from Calvin with reſpect to the doctrine of the Trinity: but he was ſeized at Berne, where he would have met with very ſevere treatment had he not pretended to renounce his opinions; but as he relapſed again, he would certainly have been put to death, had he not died of the plague in 1664. He wrote *De methodo ac ratione ſtudendi in jure civili*; and ſeveral other works which are eſteemed.

GRIBNER (Michael Henry,) a learned civilian of Germany, was born at Leipſic in 1682. After writing ſome time in the journal of Leipſic, he was made profeſſor of law at Wittemberg; whence he paſſed to Dreſden, and was at laſt recalled to Leipſic to ſucceed M. Mencke. He died in 1734. Beſides ſeveral academical diſſertations, he wrote, 1. *Principia proceſſus judiciarii*; 2. *Principia juriſprudentiæ naturalis*, a ſmall work much eſteemed; 3. *Opuſcula juriſ*

Grief
||
Grifgris.

ris publici et privati.

GRIEF, or SORROW. The influence of this paſſion on the human mind is very great. It relaxes the ſolids, ſlackens the motion of the fluids, and deſtroys the health; it particularly weakens the ſtomach and inteſtines, deſtroying all appetite and deſire for food. Opiates, if not given in large doſes, are good cordials in this caſe.

GRIERSON (Conſtantia), born of poor parents in the county of Kilkenny in Ireland, was one of the moſt learned women on record, though ſhe died at the age of 27, in 1733. She was an excellent Greek and Latin ſcholar; and underſtood hiſtory, divinity, philoſophy, and mathematics. She proved her ſkill in Latin by her dedication of the Dublin edition of Tacitus to lord Carteret, and by that of Terence to his ſon; to whom ſhe alſo addreſſed a Greek epigram. She wrote many elegant Engliſh poems, ſeveral of which were inſerted by Mrs Barber among her own. When lord Carteret was lord lieutenant of Ireland, he obtained a patent for Mr Grierſon to be the king's printer; and to reward the uncommon merit of his wife, cauſed her life to be included in it.

GRIFFON, in heraldry, an imaginary animal, feigned by the ancients to be half eagle and half lion. By this form they intended to give an idea of ſtrength and ſwiftneſs joined, together with an extraordinary vigilance in guarding the things intruſted to its care. Thus the heathen naturaliſts perſuaded the ignorant, that gold mines were guarded by theſe creatures with incredible watchfulneſs and reſolution.

GRIMSBY, a large ſea-port town of Lincolnſhire in England, which had formerly a caſtle, and two pariſh-churches, with a commodious harbour, now almoſt choaked up. At preſent it has only one church, which is a large handſome ſtructure like a cathedral. The town conſiſts of ſeveral ſtreets, whoſe houſes are well built; and is a corporation, and ſends two members to parliament. E. Long. 0. 4. N. Lat. 53. 34.

GRINDING, the reducing hard ſubſtances to powder.

GRINDING *Optic Glaſſes*. See OPTICS, the *Mechanical Part*.

GRIPSWALD, a ſtrong and conſiderable town of Pomerania in Germany; formerly imperial, but now ſubject to the Swedes, with a good harbour and univerſity. E. long. 13. 53. N. lat. 54. 12.

GRISGRIS, a ſuperſtition greatly in vogue among the negroes in the interior parts of Africa. The griſgris, according to Le Maire, are certain Arabic characters mixed with magical figures drawn by the Marabuts or prieſts upon paper. Labat affirms, that they are nothing elſe than ſcraps of the alcoran in Arabic; but this is denied by Barbot, who brought over one of theſe griſgris to Europe, and ſhewed it to a number of perſons deeply ſkilled in oriental learning. None of theſe could find the leaſt trace of any character they underſtood. Yet, after all, this might be owing to the badneſs of the hand-writing; and the words are probably of the Mandingo language, though the characters are an attempt to imitate the Arabic. The pooreſt negro never goes to war without his Griſgris, as a charm againſt wounds; and if it proves ineffectual, the prieſt transfers the blame on the immorality

of his conduct. Theſe prieſts invent griſgris againſt all kinds of dangers, and in favour of all deſires and appetites; by virtue of which the poſſeſſors may obtain or avoid whatever they like or diſlike. They defend them from ſtorms, enemies, diſeaſes, pains, and misfortunes; and preſerve health, long life, wealth, honour, and merit, according to the Marabuts. No clergy in the world are more honoured and revered by the people, than theſe impoſtors are by the negroes; nor are any people in the world more impoveriſhed by their prieſts than theſe negroes are, a griſgris being frequently ſold at three ſlaves and four or five oxen. The griſgris intended for the head is made in the form of a croſs, reaching from the forehead to the neck behind, and from ear to ear; nor are the arms and ſhoulders neglected. Sometimes they are planted in their bonnets in the form of horns; at other times, they are made like ſerpents, lizards, or ſome other animals, cut out of a kind of paſteboard, &c. There are not wanting Europeans, and otherwiſe intelligent ſeamen and merchants, who are in ſome degree infected with this weakneſs of the country, and believe that the negro ſorcerers have an actual communication with the devil, and that they are filled with the malignant influence of that evil ſpirit, when they ſee them diſtort their features and muſcles, make horrid grimaces, and at laſt imitate all the appearance of epileptics.

Griſgris, Griſons.

GRISONS, a people ſituated among the Alps, and allies of the Swiſs. Their country is bounded on the north by the counties of Surgans and Bludenz, the canton of Glaris, and the principality of Lichtenſtein; on the ſouth by the canton's Italian bailiwics, the county of Chavenne, and the Valteline; on the eaſt by the territories of Venice and Milan; and on the weſt by ſome of the Italian bailiwics, and the canton of Uri. It is divided into three leagues, viz. the *Griſon* or *grey league*, the *league of the houſe of God*, and that of the *ten juriſdictions*. The two firſt lie towards the ſouth, and the third towards the north. The length of the whole is above 70 miles, and the breadth about 60. The inhabitants are ſaid to have had the name of *Griſons* from the grey coats they wore in former times. This country, lying among the Alps, is very mountainous; but the mountains yield good paſture for cattle, ſheep, and goats, with ſome rye and barley: in the valleys there is plenty of grain, pulſe, fruits, and wine. This country alſo abounds with hogs and wild-fowl; but there is a ſcarcity of fiſh and ſalt, and their horſes are moſtly purchaſed of foreigners. The principal rivers are the Rhine, the Inn, and the Adda. Here are alſo ſeveral lakes, moſt of which lie on the tops of the hills. The language of the Griſons is either a corrupt Italian, or the German. About two-thirds of the inhabitants are Calviniſts, and the reſt Papiſts; the latter of whom, in ſpirituals, are under the biſhop of Coire, except a few that are in the dioceſe of Como. Each of the leagues is ſubdivided into ſeveral leſſer communities, which are ſo many democracies; every male above 16 having a ſhare in the government of the community, and a vote in the election of magiſtrates. Deputies from the ſeveral communities conſtitute the general diet of the Griſon leagues, which meets annually, and alternately at the capital of each league; but they can conclude nothing without the conſent of their

Grifons || Groat.

conſtituents. This country was anciently a part of Rhetia. After the extinction of the Roman empire in the weſt, it was ſome time ſubject to its own dukes, or thoſe of Swabia. Then the biſhop of Coire, and other petty princes, dependent on the emperors of Germany, became maſters of great part of it: at laſt, by the extinction of ſome, purchaſe, voluntary grants, and force, it got rid of all its lords, and erected itſelf into three diſtinct republics, each of which, as we obſerved already, is ſubdivided into a certain number of communities, which are a ſort of republics, exerciſing every branch of ſovereignty, except that of making peace or war, ſending embaſſies, concluding alliances, and enacting laws relating to the whole country, which belong to the provincial diets of the ſeveral leagues. The communities may be compared to the cities of Holland, and the diets of the ſeveral leagues to the provincial ſtates. The particular diets are compoſed of a deputy from each community; and both in them and the communities every thing is determined by a majority of votes. In the communities, every male above 16 has a vote. Beſides the annual proviucial diets for chooſing the chiefs and other officers, and deliberating on the affairs of the reſpective leagues, there are general diets for what concerns all the three leagues, or whole body. In both theſe, the repreſentatives can do nothing of themſelves, but are tied down to the inſtructions of their principals: however, as all reſolutions are decided by the plurality of votes, and as the Proteſtants are at leaſt two-thirds of the people, this republic may be deemed a Proteſtant ſtate. There is a general ſeal for all the three leagues; and each particular league has a ſeparate ſeal. Beſides the ſtated times of meeting, extraordinary diets are ſometimes ſummoned, when either the domeſtic affairs of the ſtate or any foreign miniſter require it. In the general diets, the Grey League has 28 votes; that of the Houſe of God, 23; and that of the Ten Juriſdictions, 15. Theſe leagues, at different times, have entered into cloſe alliances with the neighbouring cantons, and their aſſociates. The bailiwics belonging in common to the three leagues are thoſe of the Valteline, Chiavenne, Bormio, Meyenfeld, Malans, and Jennins; the officers of which are nominated ſucceſſively by the ſeveral communities, every two years. The yearly revenue ariſing to the Griſons from their bailiwics is ſaid to amount to about 13,500 florins. The public revenues all together are but ſmall, though there are many private perſons in the country that are rich. However, in caſe of any extraordinary emergency, they tax themſelves in proportion to the neceſſity of the ſervice, and the people's abilities. They have no regular troops, but a well-diſciplined militia; and upon occaſion, it is ſaid, can bring a body of 30,000 fighting men into the field: but their chief ſecurity ariſes from the narrow paſſes and high mountains by which they are ſurrounded.

GRIST, in country affairs, denotes corn ground, or ready for grinding.

GROAT, an Engliſh money of account, equal to four pence. Other nations, as the Dutch, Polanders, Saxons, Bohemians, French, &c. have likewiſe their groats, groots, gröches, gros, &c. In the Saxon times, no ſilver coin bigger than a penny was ſtruck in England, nor after the conqueſt, till Edward III. who, about the year 1351, coined groſſes, i. e. *groats*, or great pieces, which went for 4d. a-piece; and ſo the matter ſtood till the reign of Henry VIII. who, in 1504, firſt coined ſhillings. Groats || Groninger

GROATS, in country affairs, oats after the hulls are off, or great oat-meal.

GROCERS, anciently were ſuch perſons as engroſſed all merchandize that was vendible; but now they are incorporated, and make one of the companies of the city of London, which deals in ſugar, foreign fruits, ſpices, &c.

GROENLAND, or SPITZBERGEN. See GREENLAND.

GROGRAM, a kind of ſtuff made of ſilk and mohair.

GROIN, that part of the belly next the thigh.—In the Philoſophical Tranſactions we have an account of a remarkable caſe, where a peg of wood was extracted from the groin of a young woman of 21, after it had remained 16 years in the ſtomach and inteſtines, having been accidentally ſwallowed when ſhe was about five years of age. *Vide* Vol. LXVII. p. 459.

GRONINGEN, the moſt northerly of the Seven United Provinces, is bounded on the north by the German ocean; on the ſouth, by the county of Drenthe; on the eaſt by the biſhopric of Munſter, and the principality of Eaſt-Frieſeland; and on the weſt by the province of Frieſeland, from which it is parted by the river Lawers. Its greateſt length from ſouth-eaſt to north-weſt is about 47 miles; but its breadth is very unequal, the greateſt being about 33 miles. Here alſo are rich paſtures, large herds of great and ſmall cattle, plenty of ſea and river fiſh, and of turf, with ſome foreſts and corn-land. There are ſeveral rivers in the province, of which the principal is the Hunſe; and a great number of canals and dykes. The ſtates conſiſt of the deputies of the town of Groningen, and the Ommeland, or circumjacent country; and hold their aſſemblies always in the town of Groningen. The province had anciently governors, under the title of *burgraves*; but their power being limited, the people enjoyed great privileges. Afterwards, it became ſubject to the biſhop of Utrecht; but ſhook off his yoke at laſt, and recovered its liberty. In 1536 it ſubmitted to Charles V. and in 1579 acceded to the union of Utrecht. The colleges are much the ſame here as in the other provinces, viz. the provincial ſtates, council of ſtate, provincial tribunal, and chamber of accounts. Six deputies are ſent from hence to the ſtates-general. Of the eſtabliſhed clergy there are 160 miniſters, which form ſeven claſſes, whoſe annual ſynod is held, by turns, at Groningen and Appingedam.

GRONINGEN, the capital of the province of that name, is ſituated about 12 miles from the neareſt ſhore of the German ocean, at the conflux of ſeveral rivulets, which form the Hunſe and Fivel. Ships of conſiderable burthen can come up to the city, in conſequence of which it enjoys a pretty good trade. It was formerly very ſtrong, but its fortifications are now much neglected. The univerſity here was founded in 1615, and is well endowed out of the revenues of the ancient monaſteries. The town, which was formerly one of the Hanſe, and has ſtill great privileges, is large and populous, being the ſeat of the high colleges, and containing

Gronovius || Grotius.

taining three ſpacious market-places, and 27 ſtreets, in which are many fine houſes, beſides churches and other public ſtructures. By the river Fivel, and the Eems, it has a communication with Weſtphalia. In 1672 it made ſuch a gallant reſiſtance againſt the biſhop of Munſter, that he is ſaid to have loſt ten thouſand men before it. Rodolphus Agricola and Veſelius, two of the moſt learned men of the age in which they lived, were born here. Under the juriſdiction of this city is a conſiderable diſtrict, called the *Gorecht*. E. Lon. 6. 25. N. Lat. 53. 10.

GRONOVIUS (John Frederic), a very learned critic, was born at Hamburgh in 1613; and having travelled through Germany, Italy, and France, was made profeſſor of polite learning at Deventer, and afterwards at Leyden, where he died in 1671. He publiſhed, 1. *Diatribe in Statii*, &c. 2. *De ſeſtertiis*. 3. Correct editions of Seneca, Statius, T. Livy, Pliny's Natural Hiſtory, Tacitus, Aulus Gellius, Phædrus's Fables, &c. with notes; and other works.

GRONOVIUS (James), ſon of the preceding, and a very learned man, was educated firſt at Leyden, then went over to England, where he viſited the univerſities, conſulted the curious MSS. and formed an acquaintance with ſeveral learned men. He was choſen by the grand duke to be profeſſor at Piſa, with a conſiderable ſtipend. He returned into Holland, after he had reſided two years in Tuſcany, and conſulted the MSS. in the Mediccan library. In 1679, he was invited by the curators of the univerſity to a profeſſorſhip; and his inaugural diſſertation was ſo highly approved of, that the curators added 400 florins to his ſtipend, and this augmentation continued to his death in 1716. He refuſed ſeveral honourable and advantageous offers. His principal works are, *The treaſure of Greek antiquities*, in 13 vols. folio; and a great number of diſſertations, and editions of ancient authors. He was compared to Schioppus for the virulence of his ſtyle; and the ſeverity with which he treated other great men who differed from him, expoſed him to juſt cenſure.

GROOM, a name particularly applied to ſeveral ſuperior officers belonging to the king's houſehold, as groom of the chamber, groom of the ſtole. See STOLE, and WARDROBE.

GROOM is more particularly uſed for a ſervant appointed to attend on horſes in the ſtable.—The word is formed from the Flemiſh *grom*, a *boy*.

GROOVE, among miners, is the ſhaft or pit ſunk into the earth, ſometimes in the vein, and ſometimes not.

GROOVE, among joiners, the channel made by their plough in the edge of a moulding, ſtyle, or rail, to put their pannels in, in wainſcotting.

GROSS-BEAK, in ornithology; a ſpecies of LOXIA.

GROSSULARIA. See RIBES.

GROTESQUE, or GROTESK, in ſculpture and painting, ſomething whimſical, extravagant, and monſtrous; conſiſting either of things that are merely imaginary, and have no exiſtence in nature; or of things ſo diſtorted, as to raiſe ſurpriſe and ridicule.

GROTIUS (Hugo), or more properly HUGO DE GROOT, one of the greateſt men in Europe, was born at Delft in 1583. He made ſo rapid a progreſs in his ſtudies, that at the age of 15 he had attained a great knowledge in philoſophy, divinity, and civil law; and a yet greater proficiency in polite literature, as appeared by the commentary he had made at that age on Martianus Capella. In 1598, he accompanied the Dutch ambaſſador into France, and was honoured with ſeveral marks of eſteem by Henry IV. He took his degree of doctor of laws in that kingdom; and at his return to his native country, devoted himſelf to the bar, and pleaded before he was 17 years of age. He was not 24 when he was appointed attorney-general. In 1613 he ſettled in Rotterdam, and was nominated ſyndic of that city; but did not accept of the office, till a promiſe was made him, that he ſhould not be removed from it. This prudent precaution he took from his foreſeeing, that the quarrels of the divines on the doctrine of grace, which had already given riſe to many factions in the ſtate, would occaſion revolutions in the chief cities. The fame year he was ſent into England, on account of the diviſions that reigned between the traders of the two nations, on the right of fiſhing in the northern ſeas; but he could obtain no ſatisfaction. He was afterwards ſent to England, as is it thought, to perſuade the king and the principal divines to favour the Arminians; and he had ſeveral conferences with king James on that ſubject. On his return to Holland, his attachment to Barnevelt involved him in great trouble; for he was ſeized, and ſentenced to perpetual impriſonment in 1619, and to forfeit all his goods and chattels. But after having been treated with great rigour for above a year and a half in his confinement, he was delivered by the advice and artifice of his wife, who having obſerved that his keepers had often fatigued themſelves with ſearching and examining a great trunk-full of ſoul linen which uſed to be waſhed at Gorkum, but now let it paſs without opening it, ſhe adviſed him to bore holes in it to prevent his being ſtifled, and then to get into it. He complied with this advice, and was carried to a friend's houſe in Gorkum; where dreſſing himſelf like a maſon, and taking a rule and trowel, he paſſed through the market-place, and ſtepping into a boat went to Valvec in Brabant. Here he made himſelf known to ſome Arminians, and hired a carriage to Antwerp. At firſt there was a deſign of proſecuting his wife, who ſtaid in the priſon; and ſome judges were of opinion that ſhe ought to be kept there in her huſband's ſtead: however, ſhe was releaſed by a plurality of voices, and univerſally applauded for her behaviour. He now retired into France, where he met with a gracious reception from that court, and Lewis XIII. ſettled a penſion upon him. Having reſided there eleven years, he returned to Holland, on his receiving a very kind letter from Frederic Henry, prince of Orange: but his enemies renewing their perſecution, he went to Hamburgh; where, in 1634, queen Chriſtina of Sweden made him her counſellor, and ſent him ambaſſor into France. After having diſcharged the duties of this office above eleven years, he returned, in order to give an account to queen Chriſtina of his embaſſy; when he took Holland in his way, and received many honours at Amſterdam. He was introduced to her Swediſh majeſty at Stockholm; and there begged that ſhe would grant his diſmiſſion, in order that he might return to Holland. This he obtained with difficulty; and the queen gave him many

Grotius.

Grotfcaw || Grotto.

marks of her eſteem, though he had many enemies at this court. As he was returning, the ſhip in which he embarked was caſt away on the coaſt of Pomerania; and being now ſick, he continued his journey by land; but was forced to ſtop at Roſtock, where he died, on the 28th of Auguſt 1645. His body was carried to Delft, to be interred in the ſepulchre of his anceſtors, Notwithſtanding the embaſſies in which he was employed, he compoſed a great number of excellent works; the principal of which are, 1. A treatiſe *De jure belli et pacis*, which is eſteemed a maſter-piece. 2. A treatiſe on the truth of the Chriſtian religion. 3. Commentaries on the holy ſcriptures. 4. The hiſtory and annals of Holland. 5. A great number of letters. All which are written in Latin.

GROTSCAW, a town of Turky in Europe, in the province of Servia, where a battle was fought between the Germans and Turks, in the year 1739, in which the Germans were forced to retreat with loſs. E. Lon. 21. 0. N. Lat. 45. 0.

GROTSKAW, a ſtrong town of Germany, capital of a province of the ſame name in Sileſia. It is very agreeably ſeated, in a fruitful plain. E. Lon. 17. 35. N. Lat. 50. 42.

GROTTO, a large deep cavern or den in a mountain or rock.

Of theſe there are ſeveral remarkable ones in different parts of the world†. The moſt celebrated one of our own country, is that called *Ookley-hole*, on the ſouth ſide of Mendip hills. Its length is about two hundred yards, and its height various; being in ſome places very low, and in others eight fathoms.

† See *Antiparos*.

GROTTO is alſo uſed for a ſmall artificial edifice made in a garden, in imitation of a natural grotto.

The outſides of theſe grottos are uſually adorned with ruſtic architecture, and their inſide with ſhell-work, coral, &c. and alſo furniſhed with various fountains and other ornaments.

GROTTA *del Cani*, a little cavern near Pozzuoli, four leagues from Naples, the ſteams whereof are of a mephitical or noxious quality; whence alſo it is called *bocca venenoſa*, the poiſonous mouth.

"Two miles from Naples, ſays Dr Mead, juſt by the Lago de Agnano, is a celebrated mofeta, commonly called *la Grotta del Cani*, equally deſtructive to all within the reach of its vapours.

"It is a ſmall *grotto* about eight feet high, twelve long, and ſix broad; from the ground ariſes a thin, ſubtile, warm fume, viſible enough to a diſcerning eye, which does not ſpring up in little parcels here and there, but in one continued ſtream, covering the whole ſurface of the bottom of the cave: having this remarkable difference from common vapours, that it does not, like ſmoke, diſperſe itſelf into the air, but quickly after its riſe falls back again, and returns to the earth, the colour of the ſides of the *grotto* being the meaſure of its aſcent; for ſo far it is of a darkiſh green, but higher only common earth. And as I myſelf found no inconveniency by ſtanding in it, ſo no animal, if its head be above this mark, is the leaſt injured. But when, as the manner is, a dog, or any other creature, is forcibly kept below it, or by reaſon of its ſmallneſs cannot hold its head above it, it preſently loſes all motion, falls down as dead or in a ſwoan, the limbs convulſed and trembling, till at laſt no more ſigns of life appear, than a very weak and almoſt inſenſible beating of the head and arteries; which, if the animal be left a little longer, quickly ceaſes too, and then the caſe is irrecoverable; but if ſnatched out, and laid in the open air, ſoon comes to life again, and ſooner if thrown into the adjacent lake." Grotto.

"The fumes of the *grotto*, the ſame author argues, are no real poiſon, but act chiefly by their gravity; elſe the creatures could not recover ſo ſoon; or if they did, ſome ſymptoms, as faintneſs, &c. would be the conſequence of it. He adds, that in creatures killed therewith, when diſſected, no marks of infection appear; and that the attack proceeds from a want of air, by which the circulation tends to an entire ſtoppage, and this ſo much the more, as the animal inſpires a fluid of a quite different nature from the air, and ſo nowiſe fit to ſupply its place.

"Taking the animal out while alive, and throwing it into the neighbouring lake, it recovers. This is owing to the coldneſs of the water, which promotes the contraction of the fibres, and ſo aſſiſts the retarded circulation. The ſmall portion of the air which remains in the veſiculæ, after every exſpiration, may be ſufficient to drive out the noxious fluid. After the ſame manner, cold water acts in a deliquium animi: the lake of Agnano has no other virtue in it more than others."

The ſteam ariſing in this grotto was for a long time reckoned to be of a poiſonous nature, and thought to *ſuffocate* the animals which breathed it. Dr Hales imagined that it deſtroyed the elaſticity of the air, cauſed the veſicles of the lungs to collapſe, and thus occaſioned ſudden death.—It is now, however, found that this ſteam is nothing elſe than fixed air, which from time immemorial hath iſſued out of the earth in that place in very great quantity, the cauſes of which cannot yet be inveſtigated from any of the modern diſcoveries concerning that ſpecies of air. It proves pernicious when breathed in too great quantity, by rarefying the blood too much; and hence the beſt method of recovering perſons apparently killed by fixed air, is to apply a great degree of cold all over their bodies, in order to condenſe the blood as much as poſſible. This is the reaſon why the dogs recover when thrown into the lake Agnano, as above-mentioned. See the articles BLOOD, DAMPS, and (the *Index* ſubjoined to) MEDICINE.

GROTTA *del Serpi*, is a ſubterraneous cavern near the village of Saſſa, eight miles from the city of Braccano in Italy, deſcribed by Kircher thus:

"The *grotta del ſerpi* is big enough to hold two perſons. It is perforated with ſeveral fiſtular apertures, ſomewhat in manner of a ſieve; out of which, at the beginning of the ſpring ſeaſon, iſſues a numerous brood of young ſnakes of divers colours, but all free from any particular poiſonous quality.

"In this cave they expoſe their lepers, paralytics, arthritics, and elephantiac patients, quite naked; where, the warmth of the ſubterraneous ſteams reſolving them into a ſweat, and the ſerpents clinging variouſly all around, licking and ſucking them, they become ſo thoroughly freed of all their vitious humours, that, upon repeating the operation for ſome time,

Grove. time, they become perfectly reſtored."

This cave Kircher viſited himſelf; and found it warm, and every way agreeable to the deſcription given of it. He ſaw the holes, and heard a murmuring hiſſing noiſe in them. Though he miſſed ſeeing the ſerpents, it not being the ſeaſon of their creeping out; yet he ſaw a great number of their exuviæ, or ſloughs, and an elm growing hard by laden with them.

Muſeum Worm. The diſcovery of this cave, was by the cure of a leper going from Rome to ſome baths near this place. Loſing his way, and being benighted, he happened upon this cave. Finding it very warm, he pulled off his clothes; and being weary and ſleepy, had the good fortune not to feel the ſerpents about him till they had wrought his cure.

GROVE, in gardening, a ſmall wood impervious to the rays of the ſun.

Groves are not only great ornaments to gardens; but are alſo the greateſt relief againſt the violent heats of the ſun, affording ſhade to walk under in the hotteſt parts of the day, when the other parts of the garden are uſeleſs; ſo that every garden is defective which has not ſhade.

Groves are of two ſorts, viz. either open or cloſe. Open groves are ſuch as have large ſhady trees, which ſtand at ſuch diſtances, as that their branches approach ſo near to each other as to prevent the rays of the ſun from penetrating through them.

Cloſe groves have frequently large trees ſtanding in them; but the ground under theſe are filled with ſhrubs or underwood: ſo that the walks which are in them are private, and ſcreened from winds; by which means they are rendered agreeable for walking, at thoſe times when the air is either too hot or too cold in the more expoſed parts of the garden. Theſe are often contrived ſo as to bound the open groves, and frequently to hide the walls or other incloſures of the garden: and when they are properly laid out, with dry walks winding through them, and on the ſides of theſe ſweet-ſmelling ſhrubs and flowers irregularly planted, they have a charming effect.

GROVE (Henry), a learned and ingenious Preſbyterian divine, was born at Taunton in Somerſetſhire, in 1683. Having obtained a ſufficient ſtock of claſſical literature, he went through a courſe of academical learning, under the reverend Mr Warren of Taunton, who had a flouriſhing academy. He then removed to London, and ſtudied ſome time under the Reverend Mr Rowe, to whom he was nearly related. Here he contracted a friendſhip with ſeveral perſons of merit, and particularly with Dr Watts, which continued till his death, though they were of different opinions in ſeveral points warmly controverted among divines. After two years ſpent under Mr Rowe, he returned into the country, and began to preach with great reputation; when an exact judgment, a lively imagination, and a rational and amiable repreſentation of Chriſtianity, delivered in a ſweet and well-governed voice, rendered him generally admired; and the ſpirit of devotion, which prevailed in his ſermons, procured him the eſteem and friendſhip of Mrs Singer, afterwards Mrs Rowe, which ſhe expreſſed in a fine ode on death, addreſſed to Mr Grove. Soon after his beginning to preach, he married; and on the death of Mr Warren, was choſen to ſucceed him in the academy at Taunton. Ground. This obliging him to reſide there, he preached for eighteen years to two ſmall congregations in the neighbourhood; and though his ſalary from both was leſs than twenty pounds a-year, and he had a growing family, he went through it cheerfully. In 1708, he publiſhed a piece, intitled *The regulation of diverſions*, drawn up for the uſe of his pupils. About the ſame time, he entered into a private diſpute by letter with Dr Samuel Clarke: but they not being able to convince each other, the debate was dropped with expreſſions of great mutual eſteem. He next wrote ſeveral papers printed in the Spectator, viz. Numb. 588. 601. 626. 635. The laſt was republiſhed, by the direction of Dr Gibſon biſhop of London, in the Evidences of the Chriſtian Religion, by Joſeph Addiſon, Eſq. In 1725, Mr James, his partner in the academy, dying, he ſucceeded him in his paſtoral charge at Fulwood, near Taunton, and engaged his nephew to undertake the other parts of Mr James's work as tutor; and in this ſituation Mr Grove conntinued till his death, which happened in 1738. His great concern with his pupils, was to inſpire and cheriſh in them a prevailing love of truth, virtue, liberty, and genuine religion, without violent attachments or prejudices in favour of any party of Chriſtians. He repreſented truth and virtue in a moſt engaging light; and though his income, both as a tutor and a miniſter, was inſufficient to ſupport his family, without breaking into his paternal eſtate, he knew not how to refuſe the call of charity. Beſides the above pieces, he wrote, 1. An eſſay towards a demonſtration of the ſoul's immortality. 2. An eſſay on the terms of Chriſtian communion. 3. The evidence of our Saviour's reſurrection conſidered. 4. Some thoughts concerning the proof of a future ſtate from reaſon. 5. A diſcourſe concerning the nature and deſign of the Lord's ſupper. 6. Wiſdom the firſt ſpring of action in the Deity. 7. A diſcourſe on faving faith. 8. Miſcellanies in proſe and verſe. 9. Many ſermons, &c. After his deceaſe, his poſthumous works were publiſhed by ſubſcription, in four volumes octavo, with the names of near 700 ſubſcribers, among whom were ſome of the beſt judges of merit in the eſtabliſhed church.

GROUND, in painting, the ſurface upon which the figures and other objects are repreſented.

The ground is properly underſtood of ſuch parts of the piece, as have nothing painted on them, but retain the original colour upon which the other colours are applied to make the repreſentations.

A building is ſaid to ſerve as a ground to a figure, when the figure is painted on the building.

The ground behind a picture in miniature, is commonly blue or crimſon, imitating a curtain of ſattin or velvet.

GROUND, in etching, denotes a gummous compoſition ſmeared over the ſurface of the metal to be etched, to prevent the aquafortis from eating, except in ſuch places where this ground is cut through with the point of a needle. See the article ETCHING.

GROUND-*Angling*, fiſhing under water without a float, only with a plumb of lead, or a bullet, placed about nine inches from the hook; which is better, becauſe it will roll on the ground. This method of fiſhing

Ground || Growth.

ing is moſt proper in cold weather, when the fiſh ſwim very low.

The morning and evening are the chief ſeaſons for the ground-line in fiſhing for trout; but if the day prove cloudy, or the water muddy, you may fiſh at ground all day.

GROUND-*Tackle*, a ſhip's anchors, cables, &c. and in general whatever is neceſſary to make her ride ſafe at anchor.

GROUND-*Ivy*, in botany. See GLECHOMA.

GROUND-*Pine*, in botany. See TEUCRIUM.

GROUNDSEL. See SENECIO.

GROUP, in painting and ſculpture, is an aſſemblage of two or more figures of men, beaſts, fruits, or the like, which have ſome apparent relation to each other. See PAINTING.—The word is formed of the Italian *groppo*, a *knot*.

The GROUPS, a cluſter of iſlands lately diſcovered in the ſouth ſea. They lie in about S. Lat. 18. 12. and W. Lon. 142. 42. They are long narrow ſlips of land, ranging in all directions, ſome of them ten miles or upwards in length, but not more than a quarter of a mile broad. They abound in trees, particularly thoſe of the cocoa-nut. They are inhabited by well-made people, of a brown complexion. Moſt of them carried in their hands a ſlender pole about 14 feet in length, pointed like a ſpear; they had likewiſe ſomething ſhaped like a paddle, about four feet long. Their canoes were of different ſizes, carrying from three to ſix or ſeven people, and ſome of them hoiſted a ſail.

GROUSE, or GROWSE. See TETRAO.

GROWTH, the gradual increaſe of bulk and ſtature that takes place, in animals or vegetables, to a certain period.—The increaſe of bulk in ſuch bodies as have no life, owing to fermentations excited in their ſubſtance, or to other cauſes, is called EXPANSION, SWELLING, &c.

The growth of animals, nay even of the human ſpecies, is ſubject to great variations. A remarkable inſtance in the laſt was obſerved in France in the year 1729. At this time the Academy of Sciences examined a boy who was then only ſeven years old, and who meaſured four feet eight inches and four lines high, without his ſhoes. His mother obſerved the ſigns of puberty on him at two years old, which continued to increaſe very quick, and ſoon arrived at the uſual ſtandard. At four years old he was able to lift and toſs the common bundles of hay in ſtables into the horſes racks; and at ſix years old could lift as much as a ſturdy fellow of twenty. But though he thus increaſed in bodily ſtrength, his underſtanding was no greater than is uſual with children of his age, and their playthings were alſo his favourite amuſements.

Another boy, a native of the hamlet of Bouzanquet, in the diocefe of Alais, though of a ſtrong conſtitution, appeared to be knit and ſtiff in his joints till he was about four years and a half old. During this time nothing farther was remarkable of him than an extraordinary appetite, which was ſatisfied no otherwiſe than by giving him plenty of the common aliments of the inhabitants of the country, conſiſting of rye-bread, cheſnuts, bacon, and water; but his limbs ſoon becoming ſupple and pliable, and his body beginning to expand itſelf, he grew up in ſo extraordinary a manner, that at the age of five years he meaſured four feet three inches; ſome months after, he was four feet eleven inches; and at ſix, five feet, and bulky in proportion. His growth was ſo rapid, that one might fancy he ſaw him grow: every month his cloaths required to be made longer and wider; and what was ſtill very extraordinary in his growth, it was not preceded by any ſickneſs, nor accompanied with any pain in the groin or elſewhere. At the age of five years his voice changed, his beard began to appear, and at ſix he had as much as a man of thirty; in ſhort, all the unqueſtionable marks of puberty were viſible in him. It was not doubted in the country but this child was, at five years old, or five and a half, in a condition of begetting other children; which induced the rector of the pariſh to recommend to his mother that ſhe would keep him from too familiar a converſation with children of the other ſex. Tho' his wit was riper than is commonly obſervable at the age of five or ſix years, yet its progreſs was not in proportion to that of his body. His air and manner ſtill retained ſomething childiſh, though by his bulk and ſtature he reſembled a complete man, which at firſt ſight produced a very ſingular contraſt. His voice was ſtrong and manly, and his great ſtrength rendered him already fit for the labours of the country. At the age of five years, he could carry to a good diſtance, three meaſures of rye, weighing eighty-four pounds; when turned of ſix, he could lift up eaſily on his ſhoulders and carry loads of a hundred and fifty pounds weight a good way off; and theſe exerciſes were exhibited by him as often as the curious engaged him thereto by ſome liberality. Such beginnings made people think that he would ſoon ſhoot up into a giant. A mountebank was already ſoliciting his parents for him, and flattering them with hopes of putting him in a way of making a great fortune. But all theſe hopes ſuddenly vaniſhed. His legs became crooked, his body ſhrunk, his ſtrength diminiſhed, his voice grew ſenſibly weaker, and he at laſt ſunk into a total imbecillity. Growth.

In the Paris Memoirs alſo there is an account of a girl who had her menſes at three months of age. When four years old, ſhe was four feet ſix inches in height, and had her limbs well proportioned to that height, her breaſts large and plump, and the parts of generation like thoſe of a girl of eighteen; ſo that there is no doubt but that ſhe was marriageable at that time, and capable of being a mother of children. Theſe things are more ſingular and marvellous in the northern than in the ſouthern climates, where the females come ſooner to maturity. In ſome places of the Eaſt Indies, the girls have children at nine years of age.

Many other inſtances of extraordinary growth might be brought, but the particulars are not remarkably different from thoſe already related.—It is at firſt ſight aſtoniſhing that children of ſuch early and prodigious growth do not become giants: but when we conſider that the ſigns of puberty appear ſo much ſooner than they ought, it ſeems evident that the whole is only a more than uſually rapid expanſion of the parts, as in hot climates; and accordingly it is obſerved that ſuch children, inſtead of becoming giants, always decay and die apparently of old age, long before the natural

Grub ‖ Gruter.

ral term of human life.

GRUB, in zoology, the Engliſh name of the hexapode worms, produced from the eggs of beetles, and which at length are transformed into winged inſects of the ſame ſpecies with their parents.

GRUBBING, in agriculture, the digging or pulling up of the ſtubs and roots of trees.

When the roots are large, this is a very troubleſome and laborious taſk; but Mr Mortimer hath ſhewn how it may be accompliſhed in ſuch a manner as to ſave great expence by a very ſimple and eaſy method. He propoſes a ſtrong iron hook to be made about two feet four inches long, with a large iron-ring faſtened to the upper part of it. This hook muſt be put into a hole in the ſide of the root, to which it muſt be faſtened; and a lever being put into the ring, three men, by means of this lever, may wring out the root, and twiſt the ſap-roots aſunder. Stubs of trees may alſo be taken up with the ſame hook, in which work it will ſave a great deal of labour, though not ſo much as in the other; becauſe the ſtubs muſt be firſt cleft with wedges, before the hook can enter the ſides of them, to wrench them out by pieces.

GRUBENHAGEN, a town and caſtle of the duchy of Brunſwic, in Lower Saxony, remarkable for its mines of ſilver, copper, iron, and lead. E. Lon. 9. 36. N. Lat. 51. 45.

GRUBS, in medicine, certain unctuous pimples ariſing in different parts of the face, but chiefly in the alæ of the noſe. The cure of theſe ought only to be attempted by evacuations and cleanſers of the blood.

GRUINALES, (from *grus*, a crane); the name of the fourteenth order in Linnæus's fragments of a natural method, conſiſting of geranium, and a few other genera which the author conſiders as allied to it in their habit and external ſtructure.

GRUME, in medicine, denotes a concreted clot of blood, milk, or other ſubſtance. Hence grumous blood is that which approaches to the nature of grume, and by its viſcidity and ſtagnating in the capillary veſſels produces ſeveral diſorders.

GRUPPO, or *Turned* SHAKE, a muſical grace, defined by Playford to conſiſt in the alternate prolation of two tones in juxtapoſition to each other, with a cloſe on the note immediately beneath the lower of them. See SHAKE.

GRUS, in ornithology. See ARDEA.

GRUTER (James), a learned philologer, and one of the moſt laborious writers of his time, was born at Antwerp in 1560. He was but a child, when his father and mother, being perſecuted for the Proteſtant religion by the ducheſs Parma governeſs of the Netherlands, carried him into England. He imbibed the elements of learning from his mother, who was one of the moſt learned women of the age, and beſides French, Italian, and Engliſh, was a complete miſtreſs of Latin, and well ſkilled in Greek. He ſpent ſome years in the univerſity of Cambridge; after which he went to that of Leyden, to ſtudy the civil law; but at laſt applied himſelf wholly to polite literature. After travelling much, he became profeſſor in the univerſity of Heidelburgh; near which city he died, in 1627. He wrote many works; the moſt conſiderable of which are, 1. A large collection of ancient inſcriptions. 2. *Theſaurus criticus*. 3. *Delicæ poetarum Gallorum, Italorum, et Belgarum*, &c.

Gruyers ‖ Gryllotalpa

GRUYERS, a town of Swiſſerland, in the canton of Friburgh, with a pretty good caſtle. It is famous for its cheeſe, which are all its riches. E. Lon. 7. 23. N. Lat. 46. 35.

GRYLLUS, in zoology, the name of the cricket and locuſt kind; which, together with the graſshoppers, make only one genus of inſects, belonging to the order of hemiptera. The characters are theſe: The antennæ are fetaceous and filiform; the exterior wings are membranaceous, narrow, and have much of the appearance of the wings of ſome of the fly-kind; the thorax is compreſſed and angulated; and the legs are formed for leaping. See Plate CXV. CXL. and the articles GRASSHOPPER, GRYLLOTALPA, LOCUST, (and CRICKET in *Appendix*.)

GRYLLOTALPA, the MOLE-CRICKET; an inſect very deſtructive to gardens. Like the cricket, it makes a noiſe in the evening; and like the mole, is perpetually employed in digging below ground. It is an inſect of a very unpleaſant form. It is of the length and thickneſs of a man's little finger; and is of a brown colour, which is darker in the male than in the female. There are on each ſide of the anus two hairy proceſſes, reſembling the tails of mice; its belly is compoſed of eight joints, and is covered with as many ſcales, which are of a pale fleſh-colour, and are covered with ſhort hair. The back is covered by a pair of pointed wings, along each of which there runs a black ſtreak or line. Theſe wings fold any way at the creature's pleaſure, and when fully expanded are very large. Over theſe lie the antennæ; which are variegated alſo with black, and reach about half the length of the wings. It has only four legs: the hinder pair are long and fit for hopping; the anterior pair are ſhort, and furniſhed with a ſort of hands for digging in the manner of the mole. The breaſt is covered with a cruſtaceous ſubſtance, which is blackiſh and hairy on the outſide, and ſmooth and pale within. The eyes are very bright and black, and are very hard; and the mouth is wide, and has two tonſils, and teeth in both jaws. This creature lives under ground, and is principally found in damp and boggy places. They come out in the duſk of the evening, and make a very loud noiſe of the nature of that of the cricket.

The mole-cricket moves very ſlowly: and Goedartius is of opinion, that its wings were given it rather as an ornament, than as a thing of uſe; or if they have any real uſe, that it is the covering and defending the tender body of the creature, which is very ſoft, and eaſily liable to accidents; and Mouffett ſays, that its flights are no more than long leaps. But we have a very different account of the uſe this creature makes of its wings, in the German Ephemerides. Mentzelius, in a paper there, declares this to be one of the moſt miſchievous inſects of the creation. He ſays it is a kind of amphibious creature; and that it lives equally well under ground, in the air, or under water: that while it is under ground, it does infinite miſchief, by burrowing under the beds of a garden, and eating the roots of flowers; and that in the night

it

Gryllotalpa

Guadalquiver.

it comes out, and taking wing, ſettles upon the fruit-trees, where it does no little miſchief: and all this the author affirms from his own experience, in the gardens which he obſerved.

This creature is very nice in the conſtruction of its neſt. This is always under ground, and it chooſes a ſolid clay for the purpoſe. All its precautions ſeem to be neceſſary to ſecure its eggs from becoming a prey to a kind of black fly, which conceals itſelf under ground. The noiſe of this animal is variouſly accounted for by naturaliſts; but it is moſt probably effected by the play of organs in their belly, of a ſingular conſtruction. This is certain, that if the head of the animal be taken off, or if it be ſevered in the middle, it continues to live, and even to chirp, for ſome conſiderable time.

It is remarkable of this creature, that it can move backward as faſt as forward, and often does ſo when frightened.

GRYNÆUS (Simon), ſon to a peaſant of Suabia, born in 1493, was Greek profeſſor at Heidelberg, in 1523. He took a tour into England, and received great civility from the lord chancellor Sir Thomas More, to whom Eraſmus had recommended him. He was a learned and laborious man, and did great ſervice to the commonwealth of letters. He was the firſt who publiſhed the Almageſt of Ptolemy in Greek. He alſo publiſhed a Greek Euclid, and Plato's works, with ſome commentaries of Proclus.

GRYPHIUS (Sebaſtian), an eminent Swiſs printer, and accurate corrector; on which account his Hebrew and Latin Bibles are eſteemed. He died in 1556.

GRYPHITES, in natural hiſtory, in Engliſh CROW'S STONE, an oblong foſſile ſhell, very narrow at the head, and becoming gradually wider to the extremity, where it ends in a circular limb; the head or beak of this is very hooked or bent inward.

They are frequently found in our gravel or claypits, in many counties. There are three or four diſtinct ſpecies of them; ſome are extremely rounded and convex on the back, others leſs ſo; and the plates of which they are compoſed, are in ſome ſmaller and thinner, in others thicker and larger, in ſpecimens of the ſame bigneſs.

GUADALAJARA, or GUADALAXARA, a town of Spain, in New Caſtile, and diſtrict of Alcala, ſeated on the river Herares, W. Lon. 2. 45. N. Lat. 40. 36.

GUADALAJARA, a conſiderable town of North America, and capital of a rich and fertile province of the ſame name, with a biſhop's ſee. W. Lon. 114.59. N. Lat. 20. 20.

GUADALAVIAR, a river of Spain, which riſes on the confines of Arragon and New Caſtile, and, running by Turvel in Arragon, croſſes the kingdom of Valencia, paſſes by the town of the ſame name, and ſoon after falls into the Mediterranean ſea, a little below Valencia.

GUADALUPE, a handſome town in Spain, in Eſtramadura, with a celebrated convent, whoſe ſtructure is magnificent, and is immenſely rich. It is ſeated on a rivulet of the ſame name. E. Lon. 3. 50. N. Lat. 39. 15.

GUADALQUIVER, one of the moſt famous rivers of Spain, riſes in Andaluſia, near the confines of Granada, and running quite through Andaluſia, by the towns of Baiza, Andaxar, Cordova, Seville, and St Lucar, falls at laſt into the Bay of Cadiz.

Guadalupe.

GUADALUPE, one of the Caribbee iſlands, belonging to the French, the middle of which is ſeated in about 16. 30. N. Lat. and 61. 20. W. Lon.

This iſland, which is of an irregular figure, may be about 80 leagues in circumference. It is divided into two parts by a ſmall arm of the ſea, which is not above two leagues long, and from 15 to 40 fathom broad. This canal, known by the name of the Salt River, is navigable, but will only carry veſſels of 50 tons burthen.

That part of the iſland which gives its name to the whole colony, is, towards the centre, full of craggy rocks, where the cold is ſo intenſe, that nothing will grow upon them but fern, and ſome uſeleſs ſhrubs covered with moſs. On the top of theſe rocks, a mountain called *la Souphriere*, or the *Brimſtone Mountain*, riſes to an immenſe height. It exhales, through various openings, a thick black ſmoke, intermixed with ſparks that are viſible by night. From all theſe hills flow numberleſs ſprings, which fertilize the plains below, and moderate the burning heat of the climate by a refreſhing ſtream, ſo celebrated, that the galleons which formerly uſed to touch at the Windward Iſlands, had orders to renew their proviſion with this pure and ſalubrious water. Such is that part of the iſland properly called *Guadalupe*. That which is commonly called *Grand Terre*, has not been ſo much favoured by nature. It is indeed leſs rugged; but it wants ſprings and rivers. The ſoil is not ſo fertile, or the climate ſo wholeſome or ſo pleaſant.

No European nation had yet taken poſſeſſion of this iſland, when 550 Frenchmen, led on by two gentlemen named *Loline* and *Dupleſſis*, arrived there from Dieppe on the 28th of June 1635. They had been very imprudent in their preparations. Their proviſions were ſo ill choſen, that they were ſpoilt in the paſſage; and they had ſhipped ſo few, that they were exhauſted in two months. They were ſupplied with none from the mother-country. St Chriſtopher's, whether from ſcarcity or deſign, refuſed to ſpare them any; and the firſt attempts in huſbandry they made in the country, could not as yet afford any thing. No reſource was left for the colony but from the ſavages; but the ſuperfluities of a people, who cultivate but little, and therefore had never laid up any ſtores, could not be very conſiderable. The new comers, not content with what the ſavages might freely and voluntarily bring, came to a reſolution to plunder them; and hoſtilities commenced on the 16th of January 1636.

The Caribs, not thinking themſelves in a condition openly to reſiſt an enemy who had ſo much the advantage from the ſuperiority of their arms, deſtroyed their own proviſions and plantations, and retired to Grand Terre, or to the neighbouring iſlands. From thence the moſt deſperate came over to the iſland from which they had been driven, and concealed themſelves in the thickeſt parts of the foreſts. In the day-time, they ſhot with their poiſoned arrows, or knocked down with their clubs, all the Frenchmen who were ſcattered about for hunting or fiſhing. In the night, they burned the houſes and deſtroyed the plantations of their unjuſt ſpoilers.

A dreadful famine was the conſequence of this kind of war. The coloniſts were reduced to graze in the fields,

Guadalupe. fields, to eat their own excrements, and to dig up dead bodies for their ſubſiſtence. Many who had been ſlaves at Algiers, held in abhorrence the hands that had broken their fetters; and all of them curſed their exiſtence. It was in this manner that they atoned for the crime of their invaſion, till the government of Aubert brought a peace with the ſavages at the end of the year 1640. The remembrance, however, of hardſhips endured in an invaded iſland, proved a powerful incitement to the cultivation of all articles of immediate neceſſity; which afterwards induced an attention to thoſe of luxury conſumed in the mother-country. The few inhabitants who had eſcaped the calamities they had drawn upon themſelves, were ſoon joined by ſome diſcontented coloniſts from St Chriſtopher's, by Europeans fond of novelty, by ſailors tired of navigation, and by ſome ſea-captains, who prudently choſe to commit to the care of a grateful ſoil the treaſures they had ſaved from the dangers of the ſea. But ſtill the proſperity of Guadalupe was ſtopped or impeded by obſtacles ariſing from its ſituation.

The facility with which the pirates from the neighbouring iſlands could carry off their cattle, their ſlaves, their very crops, frequently brought them into a deſperate ſituation. Inteſtine broils, ariſing from jealouſies of authority, often diſturbed the quiet of the planters. The adventurers who went over to the windward iſlands, diſdaining a land that was fitter for agriculture than for naval expeditions, were eaſily drawn to Martinico, by the convenient roads it abounds with. The protection of thoſe intrepid pirates, brought to that iſland all the traders who flattered themſelves that they might buy up the ſpoils of the enemy at a low price, and all the planters who thought they might ſafely give themſelves up to peaceful labours. This quick population could not fail of introducing the civil and military government of the Caribbee iſlands into Martinico. From that time, the French miniſtry attended more ſeriouſly to this than to the other colonies, which were not ſo immediately under their direction; and, hearing chiefly of this iſland, they turned all their encouragements that way.

It was in conſequence of this preference, that in 1700 the number of inhabitants in Guadalupe amounted only to 3825 white people, 325 ſavages, free negroes, mulattoes, and 6725 ſlaves, many of whom were Caribs. Her cultures were reduced to 60 ſmall plantations of ſugar, 66 of indigo, a little cocoa, and a conſiderable quantity of cotton. The cattle amounted to 1620 horſes and mules, and 3699 head of horned cattle. This was the fruit of ſixty years labour. But her future progreſs was as rapid as her firſt attempts had been ſlow.

At the end of the year 1755, the colony was peopled with 9,643 whites, 41,140 ſlaves of all ages and of both ſexes. Her ſaleable commodities were the produce of 334 ſugar-plantations, 15 plots of indigo, 46840 ſtems of cocoa, 11700 of tobacco, 2,257,725 of coffee, 12,748,447 of cotton. For her proviſions ſhe had 29 ſquares of rice or maize, and 1219 of potatoes or yams, 2,028,520 banana trees, and 32,577,950 trenches of caſſava. The cattle of Guadalupe conſiſted of 4946 horſes, 2924 mules, 125 aſſes, 13,716 head of horned cattle, 11,162 ſheep or goats, 2444 hogs. Such was the ſtate of Guadalupe when it was conquered by the Britiſh in the month of April 1759. Guadalupe.

France lamented this loſs; but the colony had reaſon to comfort themſelves for this diſgrace. During a ſiege of three months, they had ſeen their plantations deſtroyed, the buildings that ſerved to carry on their works burnt down, and ſome of their ſlaves carried off. Had the enemy been forced to retreat after all theſe devaſtations, the iſland was ruined. Deprived of all aſſiſtance from the mother-country, which was not able to ſend her any ſuccours; and expecting nothing from the Dutch, (who, on account of their neutrality, came into her roads), becauſe ſhe had nothing to offer them in exchange; ſhe could never have ſubſiſted till the enſuing harveſt.

The conquerors delivered them from theſe apprehenſions. The Britiſh, indeed, are no merchants in their colonies. The proprietors of lands, who moſtly reſide in Europe, ſend to their repreſentatives whatever they want, and draw the whole produce of the eſtate by the return of their ſhip. An agent ſettled in ſome ſea-port of Great Britain, is intruſted with the furniſhing the plantation, and receiving the produce. This was impracticable at Guadalupe; and the conquerors in this reſpect were obliged to adopt the cuſtom of the conquered. The Britiſh, informed of the advantage the French made of their trade with the colonies, haſtened, in imitation of them, to ſend their ſhips to the conquered iſland; and ſo multiplied their expeditions, that they overſtocked the market, and ſunk the price of all European commodities. The coloniſts bought them at a very low price, and, in conſequence of this plenty, obtained long delays for the payment.

To this credit, which was neceſſary, was ſoon added another ariſing from ſpeculation, which enabled the colony to fulfil its engagements. A great number of negroes were carried thither, to haſten the growth and enhance the value of the plantations. It has been ſaid in various memorials, all copied from each other, that the Engliſh had ſtocked Guadalupe with 30,000, during the four years and three months that they remained maſters of the iſland. The regiſters of the cuſtom-houſes, which may be depended on, as there could be no inducement for an impoſition, atteſt that the number was no more than 18,721. This was ſufficient to give the nation well-grounded hopes of reaping great advantages from their new conqueſt. But their hopes were fruſtrated; and the colony, with its dependencies, was reſtored to its former poſſeſſors, by the treaty of peace in July 1763.

By the ſurvey taken in 1767, this iſland, including the ſmaller iſlands, Deſeada, St Bartholomew, Marigalante, and the Saints, dependent upon it, contains 11,863 white people of all ages, and of both ſexes; 752 free blacks and mulattos; 72,761 ſlaves; which makes in all a population of 85,376 ſouls. The cattle conſiſts of 5060 horſes, 4854 mules, 111 aſſes, 17,378 head of horned cattle, 14,895 ſheep or goats, and 2669 hogs. The proviſion is 30,476,218 trenches of caſſava, 2,819,262 banana trees, 2118 ſquares of land planted with yams and potatoes. The plantations contain 72 arnotto trees, 327 of caſſia, 13,292 of cocoa, 5,881,176 of coffee, 12,156,769 of cotton, 21,474 ſquares of land planted with ſugar-canes.

||
Guajacum.

The woods occupy 22,097 ſquares of land. There are 20,247 in meadows, and 6405 are uncultivated or forſaken, Only 1582 plantations grow cotton, coffee, and proviſions. Sugar is made but in 401. Theſe ſugar-works employ 140 water-mills, 263 turned by oxen, and 11 wind-wills.

The produce of Guadalupe, including what is poured in from the ſmall iſlands under her dominion, ought to be very conſiderable. But in 1768, it yielded to the mother-country no more than 140,418 quintals of fine ſugar, 23,603 quintals of raw ſugar, 34,205 quintals of coffee, 11,955 quintals of cotton, 456 quintals of cocoa, 1884 quintals of ginger, 2529 quintals of logwood, 24 cheſts of ſweetmeats, 165 cheſts of liquors, 34 caſks of rum, and 1202 undreſſed ſkins. All theſe commodities were ſold in the colony only for 310,792 l. 18 s. 3d. and the merchandiſe it has received from France has coſt but 197,919l. 18 s. 6d.

GUADIANA, a large river of Spain, having its ſource in New Caſtile, and, paſſing croſs the high mountains, falls down to the lakes called *Ojas of Guadiana;* from whence it runs to Calatrava, Medelin, Merida, and Badajox in Eſtremadura of Spain; and after having run for ſome time in Alentejo in Portugal, it paſſes on to ſeparate the kingdom of Algarve from Andaluſia, and falls into the bay or gulph of Cadiz between Caſtro Marino and Agramonte.

GUADIX, a town of Spain, in the kingdom of Garnada, with a biſhop's ſee. It was taken from the Moors in 1253, who afterwards retook it, but the Spaniards again got poſſeſſion of it in 1489. It is ſeated in a fertile country, in W. Long. 2. 12. N. Lat. 37. 5.

GUAJACUM, Lignum Vitæ, or *Pockwood;* a genus of the monogynia order, belonging to the decandria claſs of plants.

Species. 1. The officinale, or common lignum vitæ uſed in medicine, is a native of the Weſt India iſlands. There it becomes a large tree, having a hard, brittle, browniſh bark, not very thick. The wood is firm, ſolid, ponderous, very reſinous, of a blackiſh yellow colour in the middle, and of a hot aromatic taſte. The ſmaller branches have an aſh-coloured bark, and are garniſhed with leaves divided by pairs of a bright green colour. The flowers are produced in cluſters at the end of the branches, and are compoſed of oval concave petals of a fine blue colour. 2. The ſanctum, with many pairs of obtuſe lobes, hath many ſmall lobes placed along the mid-rib by pairs of a darker green colour than thoſe of the foregoing ſort. The flowers are produced in looſe bunches towards the end of the branches, and are of a fine blue colour, with petals fringed on the edges. This ſpecies is alſo a native of the Weſt India iſlands, where it is called baſtard lignum vitæ. 3. The Alpum with many blunt-pointed leaves, is a native of the Cape of Good Hope. The plants retain their leaves all the year, but have never yet flowered in this country.

Culture. The firſt ſpecies can only be propagated by ſeeds, which muſt be procured from the countries where it naturally grows. They muſt be ſown freſh in pots, and plunged into a good hot-bed, where they will come up in ſix or eight weeks. While young, they may be kept in a hot-bed of tan-bark under a frame during the ſummer; but in autumn, they muſt be removed into the bark-ſtove, where they ſhould conſtantly remain. The ſecond ſort may be propogated the ſame way; but the third is to be propogated by layers, and will live all the winter in a good greenhouſe. Guajacum

Uſes. The wood of the firſt ſpecies is of very conſiderable uſe both in medicine and in the mechanical arts. Ulric Hutten ſays this wood was introduced into Europe in 1517; but Braſſavolus ſays, not until 1525. It is brought from the Weſt Indies, in large pieces, each weighing from four to five hundred weight: it is hard, compact, and ſo heavy as to ſink in water: the outer part is often of a pale yellowiſh colour; but the heart is blacker, or of a deep brown. Sometimes it is marbled with different colours. It has little or no ſmell, except when heated, and then a ſlight aromatic one is perceived. When chewed, it impreſſes a mild acrimony, biting the palate and fauces. Its pungency reſides in its reſinous matter, which it gives it out in ſome degree to water by boiling, but ſpirit extracts it wholly.

Of the bark of guaiac, there are two kinds, one ſmooth, the other unequal on the ſurface; they are both of them weaker than the wood.

The gum, or rather reſin, exſudes from the tree; and is of a brown colour, partly reddiſh, and often greeniſh, brittle, having a gloſſy ſurface when broke, of a pungent taſte, affecting the tongue and palate in the ſame manner as is ſaid of the wood. The chief of what is brought to us is in irregular maſſes, of a duſky green colour. There is a ſort in drops, which is the beſt, but is very rarely met with.

In the choice of the wood, that which is the freſheſt, moſt ponderous, and of the darkeſt colour, is the beſt; the largeſt pieces are to be preferred too; and the beſt method is to raſp them as wanted, for the finer parts are apt to exhale when the raſpings or chips are kept a while. In chooſing the gum, prefer thoſe pieces which have ſlips of the bark adhering to them, and that eaſily ſeparate there from by a quick blow.

Neumann aſſures us, that a compoſition of colophony and balſam of ſulphur is impoſed on the unwary for true gum guaiacum; but the cheat is eaſily detected by expoſing it to a due degree of heat, by which the odour of the falſe is perceived to be quite different from that of the true.

The guaiac wood was firſt introduced into Europe as a remedy for the venereal diſeaſe. It is a good aſſiſtant to mercury, as it warms and ſtimulates, and ſo promotes perſpiration and urine; it alſo proves gently purgative in a ſomewhat increaſed doſe: and theſe ſeem to be its primary virtues. When the excretory glands are obſtructed, the veſſels lax and flaccid, the habite replete with ſerous humours, in many cutaneous and catarrhous diſorders, ſome female weakneſſes, in gouty complaints, and rheumatic diſorders, it produces good effects. The hectic fever which ſometimes follows a ſalivation, gives way to a decoction of the woods.

A long uſe of this medicine hath been obſerved to produce a yellowneſs in the ſkin. In thin emaciated habits and an acrimonious ſtate of the fluids, it often does harm. It is alſo improper in hot bilous habits, and where the fibres are very tenſe.

Three

Gualeor || Guard.

Three ounces of the wood, or four ounces of the bark, may be boiled in 4lb. of water to 2lb. and if a little liquorice is added at the latter end of the boiling, or when the decoction is taken from the fire, it will abate the disagreeable pungency of this medicine, which affects the throat very much in swallowing it. Of this decoction, at least half a pint should be taken in a day. Of the gum, or extract, the dose may be from gr. v. to ℈ ii. which last purges pretty much. These should be dissolved by the mediation of egg, or the mucilage of gum arabic; for otherwise they do not easily mix the juices in the stomach.

A pound of guaiacum wood, distilled over an open fire, gave ℥ iiiß of acid, which is called spirit, and ℥ iß. of empyreumatic oil.—An hard extract of guaiacum is accounted an excellent errhine.

The wood of this tree is so hard, that it breaks the tools which are employed in felling it; and is therefore seldom used as firewood, but is of great use to the sugar-planters for making wheels and cogs to the sugar-mill. It is also frequently wrought into bowls, mortars, and other utensils.

GUALEOR, a large town of Indostan in Asia, and capital of a province of the same name, with a strong fort. E. Long. 69. 5. N. Lat. 25. 45.

GUAM, the largest of the Ladrone islands in the South Sea, being about 100 miles in circumference. The inhabitants are almost all natives, but the Spaniards have a garrison which keeps them in awe. The island abounds with excellent fruits, and the air is wholesome; notwithstanding which, the people are subject to the leprosy. E. Long. 139. 25. N. Lat. 13. 25.

GUAMANGA. a considerable town of South America, and capital of a province of the same name in Peru, and in the audience of Lima, with a bishop's see. It is remarkable for its sweetmeats, manufactures, and mines of gold, silver, loadstone, and quicksilver. W. Long. 7. 50. S. Lat. 13 0.

GUANUCO, a rich and handsome town of S. America, and capital of a district of the same name in the audience of Lima. W. Long. 72. 55. S. Lat. 9. 55.

GUANZAVELCA, a town of South America, in Peru, and in the audience of Lima. It abounds in mines of quicksilver. W. Lon. 71. 59. S. Lat. 12. 40.

GUARANTY, in matters of polity, the engagement of mediatorial or neutral states, whereby they plight their faith that certain treaties shall be inviolably observed, or that they will make war against the aggressor.

GUARD, in a general sense, signifies the defence or preservation of any thing; the act of observing what passes, in order to prevent surprize; or, the care, precaution, and attention, we make use of to prevent any thing from happening contrary to our intention or inclinations.

GUARD, in the military art, is a duty performed by a body of men, to secure an army or place from being surprised by an enemy. In garrison the guards are relieved every day; hence it comes that every soldier mounts guard once every three or four days in time of peace, and much oftener in time of war. See HONOURS.

Guard.

Advanced GUARD, is a party of either horse or foot, that marches before a more considerable body, to give notice of any approaching danger. These guards are either made stronger or weaker, according to situation, the danger to be apprehended from the enemy, or the nature of the country.

Van GUARD. See *Advanced* GUARD.

Artillery GUARD, is a detachment from the army to secure the artillery when in the field. Their *corps de garde* is in the front of the artillery park, and their centries dispersed round the same. This is generally a 48-hours guard; and upon a march, this guard marches in the front and rear of the artillery, and must be sure to leave nothing behind: if a gun or or waggon breaks down, the officer that commands the guard is to leave a sufficient number of men to assist the gunners and matrosses in getting it up again.

Artillery Quarter-GUARD, is frequently a non-commissioned officer's guard from the royal regiment of artillery, whose *corps de garde* is always in the front of their incampment.

Artillery Rear-GUARD, consists in a corporal and six men, posted in the rear of the park.

Corps de GARDE, are soldiers entrusted with the guard of a post, under the command of one or more officers. This word also signifies the place where the guard mounts.

Grand GUARD; three or four squadrons of horse, commanded by a field-officer, posted at about a mile or a mile and a half from the camp, on the right and left wings, towards the enemy, for the better security of the camp.

Forage GUARD, a detachment sent out to secure the foragers, and who are posted at all places, where either the enemy's party may come to disturb the foragers, or where they may be spread too near the enemy, so as to be in danger of being taken. This guard consists both of horse and foot, and must remain on their posts till the foragers are all come off the ground.

Main GUARD, is that from which all other guards are detached. Those who are for mounting guard assemble at their respective captain's quarters, and march from thence to the parade in good order; where, after the whole guard is drawn up, the small guards are detached to their respective posts: then the subalterns throw lots for their guards, who are all under the command of the captain of the main guard. This guard mounts in garrison at different hours, according as the governor pleases.

Piquet GUARD, a good number of horse and foot, always in readiness in case of an alarm: the horses are generally saddled all the time, and the riders booted.

The foot draw up at the head of the battalion, frequently at the beating of the tat-too; but afterwards return to their tents, where they hold themselves in readiness to march upon any sudden alarm. This guard is to make resistance in case of an attack, until the army can get ready.

Baggage GUARD, is always an officer's guard, who has the care of the baggage on a march. The waggons should be numbered by companies, and follow

Guard. one another regularly: vigilance and attention in the paſſage of hollow ways, woods, and thickets, muſt be ſtrictly obſerved by this guard.

Quarter GUARD, is a ſmall guard commanded by a ſubaltern officer, poſted in the front of each battalion, at 222 feet before the front of the regiment.

Rear GUARD, that part of the army which brings up the rear on a march, generally compoſed of all the old grand guards of the camp. The rear-guard of a party is frequently eight or ten horſe, about 500 paces behind the party. Hence the advance-guard going out upon a party, form the rear-guard in their retreat.

Rear GUARD, is alſo a corporal's guard placed in the rear of a regiment, to keep good order in that part of the camp.

Standard GUARD, a ſmall guard under a corporal, out of each regiment of horſe, who mount on foot in the front of each regiment, at the diſtance of 20 feet from the ſtreets, oppoſite the main ſtreet.

Trench GUARD, only mounts in the time of a ſiege, and ſometimes conſiſts of three, four, or ſix battalions, according to the importance of the ſiege. This guard muſt oppoſe the beſieged when they ſally out, protect the workmen, &c.

Provoſt GUARD, is always an officer's guard that attends the provoſt in his rounds, either to prevent deſertion, maroding, rioting, &c. See PROVOST.

GUARD, in fencing, implies a poſture proper to defend the body from the ſword of the antagoniſt.

Ordinary GUARDS, ſuch as are fixed during the campaign, and relieved daily.

Extraordinary GUARDS, or detachments, which are only commanded on particular occaſions; either for the further ſecurity of the camp, to cover the foragers, or for convoys, eſcorts, or expeditions.

GUARDS, alſo imply the troops kept to guard the king's perſon, and conſiſt both of horſe and foot.

Horſe GUARDS, in England, are gentlemen choſen for their bravery, to be entruſted with the guard of the king's perſon; and are divided into four troops, called *the 1ſt, 2d, 3d, and 4th troop of horſe-guards*. The firſt troop was raiſed in the year 1660, and the command given to lord Gerard; the ſecond in 1659, and the command given to Sir Philip Howard; the third in 1665, and the command given to earl Feverſham; the fourth in 1660, and the command given to earl Newburgh. Each troop has one colonel, two lieutenant-colonels, one cornet and major, one guidon and major, four exempts and captains, four brigadiers and lieutenants, one adjutant, four ſub-brigadiers and cornets, and 60 private men.

Horſe-Grenadier GUARDS, are divided into two troops, called *the 1ſt and 2d troops of horſe-grenadier guards*. The firſt troop was raiſed in 1693, and the command given to lieutenant-general Cholmondeley; the ſecond in 1702, and the command given to lord Forbes. Each troop has one colonel, lieutenant-colonel, one guidon or major, three exempts and captains, three lieutenants, one adjutant, three cornets, and 60 private men.

Yeomen of the GUARD, firſt raiſed by Henry VII. in the year 1485. They are a kind of pompous footguards to the king's perſon; and are generally called by a nickname, the *beef-eaters*. They were anciently 250 men of the firſt rank under gentry; and of larger ſtature than ordinary, each being required to be ſix feet high. At preſent there are but 100 in conſtant duty, and 70 more not on duty; and when any one of the 100 dies, his place is ſupplied out of the 70. They go dreſſed after the manner of king Henry VIII's time. Their firſt commander or captain was the earl of Oxford, and their pay is 2s. 6d. per day. Guard.

*Foot-*GUARDS, are regiments of foot appointed for the guard of his majeſty, and his palace. There are three regiments of them, called *the 1ſt, 2d, and 3d regiments of foot-guards*. They were raiſed in the year 1660; and the command of the firſt given to colonel Ruſſel, that of the ſecond to general Monk, and the third to the earl of Linlithgow. The firſt regiment is at preſent commanded by one colonel, one lieutenant-colonel, three majors, 23 captains, one captain-lieutenant, 31 lieutenants, and 24 enſigns; and contains three battalions. The ſecond regiment has one colonel, one lieutenant-colonel, two majors, 14 captains, one captain-lieutenant, 18 lieutenants, 16 enſigns; and contains only two battalions. The third regiment is the ſame as the ſecond.

The French GUARDS are divided into thoſe within, and thoſe without, the palace.—The firſt are the *gardes du corps*, or body-guards; which conſiſt of four companies, the firſt of which companies was anciently Scots. See *Scots* GUARDS, *infra*.

The guards without are the *Gens d'Armes*, light horſe, muſqueteers, and two other regiments, the one of which is French, and the other Swiſs.

Scots GUARDS; a celebrated band, which formed the firſt company of the ancient *gardes du corps* of France.

It happened from the ancient intercourſe between France and Scotland, that the natives of the latter kingdom had often diſtinguiſhed themſelves in the ſervice of the former. On this foundation the company of *Scots guards*, and the company of *Scots gendarmes*, were inſtituted.—Both of them owed their inſtitution to Charles VII. of France, by whom the firſt ſtanding army in Europe was formed, *anno* 1454; and their fates cannot but be intereſting to Scotſmen. See GENDARMES.

Valour, honour, and fidelity, muſt have been very conſpicuous features of the national character of the Scots, when ſo great and civilized a people as the French could be induced to chooſe a body of them, foreigners as they were, for guarding the perſons of their ſovereigns.—Of the particular occaſion and reaſons of this predilection, we have a recital by Lewis XII. a ſucceeding monarch. After ſetting forth the ſervices which the Scots had performed for Charles VII. in expelling the Engliſh out of France, and reducing the kingdom to his obedience, he adds—"Since which "reduction, and for the ſervice of the Scots upon that "occaſion, and for the great loyalty and virtue which "he found in them, he ſelected 200 of them for the "guard of his perſon, of whom he made an hundred "*men at arms*, and an hundred *life-guards*: And "hundred men at arms are the hundred lances of our "the ancient ordinances; and the life-guard men are "thoſe of our guard, who ſtill are near and about "our perſon."—As to their fidelity in this honourable ſtation; the hiſtorian, ſpeaking of Scotland, ſays, "The French have ſo ancient a friendſhip and *Hiſtory of Lewis XII.* by Claud Seyſil, maſter of requeſts to that prince.

Guard. and alliance with the Scots, that of 400 men appointed for the king's life-guard, there are an hundred of the ſaid nation who are the neareſt to his perſon, and in the night keep the keys of the apartment where he ſleeps. There are, moreover, an hundred complete lances and two hundred yeomen of the ſaid nation, beſides ſeveral that are diſperſed through the companies: And for ſo long a time as they have ſerved in France, never hath there been one of them found, that hath committed or done any fault againſt the kings or their ſtate; and they make uſe of them as of their own ſubjects."

The ancient rights and privileges of the Scottiſh life-guards were very honourable; eſpecially of the twenty-four firſt. The author of the *Ancient Alliance* ſays, "On high holidays, at the ceremony of the *royal touch*, the erection of knights of the king's order, the reception of extraordinary ambaſſadors, and the public entries of cities, there muſt be ſix of their number next to the king's perſon, three on each ſide; and the body of the king muſt be carried by theſe only, whereſoever ceremony requires. They have the keeping of the keys of the king's lodging at night, the keeping of the choir of the chapel, the keeping the boats where the king paſſes the rivers; and they have the honour of bearing the *white ſilk fringe* in their arms, which in France is the *coron colour*. The keys of all the cities where the king makes his entry are given to their captain in waiting or out of waiting. He has the privilege, in waiting or out of waiting, at ceremonies, ſuch as coronations, marriages, and funerals of the kings, and at the baptiſm and marriage of their children, to take duty upon him. The coronation-robe belongs to him: and this company, by the death or change of a captain, never changes its rank, as do the three others."

This company's firſt commander, who is recorded as a perſon of great valour and military accompliſhments, was Robert Patillock, a native of Dundee; and the band, ever ardent to diſtinguiſh itſelf, continued in great reputation till the year 1578. From that period, the Scots guards were leſs attended to, and their privileges came to be invaded. In the year 1612, they remonſtrated to Lewis XIII. on the ſubject of the injuſtice they had ſuffered, and ſet before him the ſervices they had rendered to the crown of France. Attempts were made to re-eſtabliſh them on their ancient foundation; but no negociation for this purpoſe was effectual. The troops of France grew jealous of the honours paid them: the death of Francis II. and the return of Mary to Scotland, at a time when they had much to hope, were unfortunate circumſtances to them: the change of religion in Scotland, was an additional blow: and the acceſſion of James VI. to the throne of England, diſunited altogether the intereſts of France and Scotland. The Scots guards of France have now, therefore, no connection with Scotland but the name.

GUARD-*Boat*, a boat appointed to row the rounds amongſt the ſhips of war which are laid up in any harbour, &c. to obſerve that their officers keep a good look-out, calling to the guard-boat as ſhe paſſes, and not ſuffering her crew to come on board, without having previouſly communicated the watch-word of the night.

GUARD-*Ship*, a veſſel of war appointed to ſuperintend the marine affairs in a harbour or river, and to ſee that the ſhips which are not commiſſioned have their proper watchward kept duly, by ſending her guard-boats around them every night. She is alſo to receive ſeamen who are impreſſed in the time of war. Guardian ‖ Guargala.

GUARDIAN, in law, a perſon who has the charge of any thing; but more commonly it ſignifies one who has the cuſtody and education of ſuch perſons as have not ſufficient diſcretion to take care of themſelves and their own affairs, as children and ideots.

Their buſineſs is to take the profits of the minor's lands to his uſe, and to account for the ſame: they ought to ſell all moveables within a reaſonable time, and to convert them into land or money, except the minor is near of age, and may want ſuch things himſelf; and they are to pay intereſt for the money in their hands, that might have been ſo placed out; in which caſe it will be preſumed that the guardians made uſe of it themſelves. They are to ſuſtain the lands of the heir, without making deſtruction of any thing thereon, and to keep it ſafely for him: if they commit waſte on the lands, it is a forfeiture of the guardianſhip, 3 Edw. I. And where perſons, as guardians, hold over any land, without the conſent of the perſon who is next intitled, they ſhall be adjudged treſpaſſers, and ſhall be accountable; 6 Ann. cap xviii.

GUARDIAN, or *Warden, of the Cinque-ports*, is an officer who has the juriſdiction of the Cinque-ports, with all the power which the admiral of England has in other places.

GUARDIAN *of the Spiritualities*, the perſon to whom the ſpiritual juriſdiction of any dioceſe is committed, during the time the ſee is vacant. A guardian of the ſpiritualities may likewiſe be either ſuch in law, as the archbiſhop is of any dioceſe within his province; or by delegation, as he whom the archbiſhop or vicar-general for the time appoints. Any ſuch guardian has power to hold courts, grant licences, diſpenſations, probates of wills, &c.

GUARINI (Battiſta), a celebrated Italian poet, born at Ferrara, in 1538. He was great-grandſon to Guarino of Verona and was ſecretary to Alphonſo; Duke of Ferrara, who entruſted him with ſeveral important commiſſions. After the death of that prince, he was ſucceſſively ſecretary to Vincenzio de Gonzaga, to Ferdinand de Medicis grand duke of Tuſcany, and to Francis Maria de Feltri duke of Urbino. But the only advantages he reaped under theſe various maſters, were great encomiums on his wit and compoſitions. He was well acquainted with polite literature; and acquired immortal reputation by his Italian poems, eſpecially by his *Paſtor Fido*, the moſt known and admired of all his works, and of which there have been innumerable editions and tranſlations. He died in 1612.

GUARDIA, or GUARDA, a town of Portugal, in the province of Beira, with a biſhop's ſee. It contains about 2300 inhabitants, is fortified both by art and nature, and has a ſtately cathedral. W. Lon. 5. 17. N. Lat. 40. 20.

GUARDIA-*Alferez*, a town of Italy, in the kingdom of Naples, and in the Contado-di-Moliſe, with a biſhop's ſee. E. Lon. 15. 53. N. Lat. 51. 50.

GUARGALA, or GUERGUELA, a town of Africa,

Guaſtalla ‖ Guber.

rica, and capital of a ſmall kingdom of the ſame name, in Biledulgerid, to the S. of Mount Atlas. E. Lon. 9. 55. N. Lat. 28. 0.

GUASTALLA, a ſtrong town of Italy, in the duchy of Mantua, with the title of a duchy, remarkable for a battle between the French and Imperialiſts in 1734. It was ceded to the duke of Parma in 1748, by the treaty of Aix-la-Chapelle. It is ſeated near the river Po, in E. Lon. 10. 33. N. Lat 44. 55.

GUATIMALA, *the* AUDIENCE *of*, in North America, and in New Spain, is above 750 miles in length, and 450 in breadth. It abounds in chocolate, which they make uſe of inſtead of money. It has 12 provinces under it: and the native Americans, under the dominions of Spain, profeſs Chriſtianity; but it is mixed with great many of their own ſuperſtitions. There is a great chain of high mountains, which run acroſs it from E. to W. and it is ſubject to earthquakes and ſtorms. It is however very fertile; and produces, beſides chocolate, great quantities of cochineal and cotton.

GUATIMALA, a province of North America, in New Spain, and in the Audience of the ſame name; bounded on the W. by Soconuſco, on the N. by Verapaz and Honduras, on the E. by Nicaragua, and on the S. by the ſouth ſea. St Jago de Guatimala is the capital of the whole audience.

GUATIMALA, a large and rich town of North America, in New Spain; and capital of a government of the ſame name, with a biſhop's ſee, and an univerſity. It carries on a great trade, eſpecially in chocolate. W. Lon. 91. 30. N. Lat. 14. 0.

GUATIMALA (the Volcano of), is a mountain, which throws out fire and ſmoke. St Jago de Guatimala was almoſt ruined by it in 1541. It was afterwards rebuilt at a good diſtance from this dreadful mountain. A few years ago, however, it was again deſtroyed, with circumſtances more terrible perhaps than any mentioned in hiſtory.

GUAXACA, a province of North America, in New Spain, which is very fertile in wheat, Indian corn, cochineal, and caſſia. It is bounded by the gulph of Mexico on the N. and by the ſouth ſea on S. It contains mines of gold, ſilver, and cryſtal. Guaxaca is the capital town.

GUAXACA, a town of North America, in the Audience of Mexico, and capital of a province of the ſame name, with a biſhop's ſee. It is without walls, and does not contain above 2000 inhabitants; but it is rich, and they make very fine ſweet-meats and chocolate. It has ſeveral rich convents, both for men and women. W. Lon. 100. 0. N. Lat. 17. 45.

GUAYRA, a diſtrict of the province of La Plata, in South America, having Braſil on the E. and Paraguay on the W.

GUBEN, a handſome town of Germany, in Lower Luſatia, ſeated on the river Nieſſe, and belonging to the houſe of Sax-Merſenburg. E. 14. 59. N. Lat. 51. 55.

GUBER, a kingdom of Africa, in Negroland. It is ſurrounded with high mountains; and the villages, which are many, are inhabited by people who are employed in taking care of their cattle ſheep. There are alſo abundance of artificers, and linen-weavers, who ſend their commodities to Tombuto. The whole country is overflowed every year by the inundations of the Niger, and at that time the inhabitants ſow their rice. There is one town, which contains almoſt 6000 families, among whom are many merchants.

Gubio ‖ Guelderland.

GUBIO, a town of Italy, in the territory of the church, and in the duchy of Urbino, with a biſhop's ſee. E. Lon. 12. 41. N. Lat. 43. 18.

GUDGEON, in ichthyology; a ſpecies of cyprinus. See CYPRINUS.

This fiſh, though ſmall, is of ſo pleaſant a taſte, that it is very little inferior to ſmelt. They ſpawn twice in the ſummer-ſeaſon; and their feeding is much like the barbels in ſtreams and on gravel, ſlighting all manner of flies: but they are eaſily taken with a ſmall red worm, fiſhing near the ground; and being a leather-mouthed fiſh, will not eaſily get off the hook when ſtruck.—The gudgeon may be fiſhed for with float, the hook being on the ground; or by hand, with a running line on the ground, without cork or float. But although the ſmall red worm above-mentioned is the beſt bait for this fiſh, yet waſps, gentles, and cadbaits will do very well. You may alſo fiſh for gudgeons with two or three hooks at once, and find very pleaſant ſport, where they riſe any thing large. When you angle for them, ſtir up the ſand or gravel with a long pole; this will make them gather to that place, bite faſter, and with more eagerneſs.

Sea-GUDGEON, *Rock-fiſh*, or *Black Goby*. See GOBIUS.

GUELPHS, or GUELFS, a celebrated faction in Italy, antagoniſts of the Gibelins. See GIBELIN.

The Guelphs and Gibelins filled Italy with blood and carnage for many years. The Guelphs ſtood for the Pope, againſt the emperor. Their riſe is referred by ſome to the time of Conrad III. in the twelfth century; by others, to that of Frederic I.; and by others, to that of his ſucceſſor Frederic II. in the thirteenth century.

The name of *Guelf* is commonly ſaid to have been formed from *Welfe*, or *Welfo*, on the following occaſion: the emperor Conrad III. having taken the duchy of Bavaria from Welfe VI. brother of Henry duke of Bavaria, Welfe, aſſiſted by the forces of Roger king of Sicily, made war on Conrad, and thus gave birth to the faction of the Guelfs.

Others derive the name *Guelfs* from the German *Wolf*, on account of the grievous evils committed by that cruel faction: others deduce the denomination from that of a German called *Guelfo*, who lived at Piſtoye; adding, that his brother, named *Gibel*, gave his name to the Gibelins. See (Hiſtory of) ITALY.

GUELDERLAND, one of the united provinces, bounded on the W. by Utrecht and Holland, on the E. by the biſhoprick of Munſter and the duchy of Cleves, on the N. by the Zuyder ſea and Overyſſel, and on the S. it is ſeparated from Brabant by the Maes. Its greateſt extent from N. to S. is about 47 miles, and from W. to E. near as much; but its figure is very irregular. The air here is much healthier and clearer than in the maritime provinces, the land lying higher. Excepting ſome part of what is called the *Veluwe*, the ſoil is fruitful. It it watered by the Rhine, and its three branches, the Wahal, the Yſſel, and the Leck, beſides leſſer ſtreams. In 1079, it was raiſed to a county by the emperor Henry IV. and in 1339 to a duchy by the emperor Lewis of Bavaria. It had dukes of its own till 1528, when it was yielded up to the

Gueldres
Guernsey

the emperor Charles V. In 1579, it acceded to the union of Utrecht. It is divided into three districts, each of which has its ſtates and diets. Thoſe for the whole province are held twice a-year at the capital towns. The province ſends 19 deputies to the ſtates-general. Here are computed 285 Calviniſt miniſters, 14 Roman-Catholic congregations, 4 of the Lutheran perſuaſion, beſides 3 others of Remonſtrants and Anabaptiſts. The places of moſt note are Nimeguen, Zutphen, Arnheim, Harderwyk, Loo, &c.

GUELDRES, a ſtrong town of the Netherlands, in the duchy of the ſame name. It was ceded to the king of Pruſſia by the peace of Utrecht, and is ſeated among marſhes. E. Lon. 6. 21. N. Lat. 51. 30.

GUERICKE, or Guericke, (Otho), the moſt celebrated mathematician of his time, was born in 1602. He was the inventor of the air-pump; and author of ſeveral works in natural philoſophy, the chief of which is *Experimenta Magdeburgica*. He died in 1686.

GUERNSEY, an iſland in the Engliſh channel, on the coaſt of Normandy, ſubject to Britain; but, (as well as the adjacent iſlands,) governed by its own laws. See Jersey.—Of this iſland, Dr Campbell gives the following account. "It lies 20 leagues ſouth-weſt from Weymouth in Dorſetſhire, between eight and nine leagues weſt from the coaſt of Normandy, 13 ſouth of Bretagne, ſeven north-weſt from Jerſey, five ſouth-weſt from Alderney, and two weſt from Sarke. In length from north-eaſt to ſouth-weſt, about twelve miles; in breadth, from ſouth to north, about nine; in circumference, upwards of 30; containing 50 ſquare miles, or 32,000 acres. The climate is mild and temperate; not ſubject to exceſſive heats, much leſs to ſevere cold; ſomewhat windy; but, taking all things together, equally healthy and pleaſant. The ſoil is, generally ſpeaking, rich and fertile; the country, though ſufficiently incloſed with ſtone fences, yet more open than in Jerſey, and as capable of cultivation of every kind. On the north ſide, the coaſt is commonly low and flat, riſing gradually, ſo that on the ſouth ſide the cliffs are of a prodigious height. The face of the country is variegated with hills and little eminences, and tolerably well watered with ſprings and ſharp gravelly ſtreams. There was formerly a fine lake, about half a league in extent, now filled up, and turned into a meadow; but many gentlemen have ſtill very beautiful and convenient fiſh-ponds.

"There are very few countries in the world more capable of improvement. Moſt of the riſing grounds afford a ſhort thick graſs, equally beautiful to the eye, and ſucculent as paſture. Roots and herbs it produces of all kinds, eſculent, medicinal, and aromatic; with a profuſion of flowers that grow wild, and are exquiſitely fragrant. All ſorts of ſhrubs and fruit-trees flouriſh here: and there is ſome, though but little timber; not through any defect of ſoil or climate, but becauſe they cannot conveniently afford it room. Grain they have of every ſpecies we cultivate in Britain, but more eſpecially wheat; and though they have not either lime, chalk, or marle, yet the ſea-wreck anſwers all the intention of manure, ſo well as to keep their ground in conſtant heart. They have large quantities of ſheep, but ſmall in ſize; and had formerly a very ſingular breed, of which the ewes had four horns, and the rams ſix; but theſe are now become very ſcarce. Their black cattle are in ſuch abundance, as not only to ſupport their own uſes, but to furniſh alſo a conſiderable exportation; and their horſes, though but little, are equally ſtrong and hardy. The ſea alſo furniſhes a prodigious variety as well as plenty of fiſh, more eſpecially red and grey mullet, excellent mackrel, and, above all, conger-eels. To theſe advantages we may add, the ſingular privilege of being free from all venomous creatures. Guernsey.

"There are in this iſland ten pariſhes, each of which is divided into ſeveral vintons, for the more eaſy management of affairs, civil, eccleſiaſtical, and military, and the choice of their reſpective officers and magiſtrates. Though the country is very fully peopled, yet the houſes are ſcattered up and down, according to the humour or the conveniency of the inhabitants: ſo that there is, properly ſpeaking, but one town in the iſland, which is likewiſe the only haven of any reſort; though there are ſome creeks on the north and weſt ſides of the iſland, ſuch as Bazon, L'Aucreſſe, Ferminer, St Sampſon, and the Weſt Paſſage. All theſe ports are in a ſtate of nature; but might be certainly improved and fortified, which would be productive of many advantages to the iſland; as was long ago obſerved and propoſed to government by captain Yarranton. In the reign of king Charles II. when the French formed an inſidious deſign of making themſelves maſters of this iſle by treachery, it left ſuch an impreſſion on his majeſty's mind, that ſome years after he ſent over the lord Dartmouth, accompanied by certain engineers, who diſcovered on the north-weſt ſide of the iſle, a deep bay, which, by the help of a mole, might cover a numerous ſquadron, even of ſhips of the line, under the protection of what was alſo intended to be built, a ſtrong caſtle: but his exchequer being exhauſted, this neceſſary work was never carried into execution. As this port would look full into the channel, it deſerves conſideration, how far it might be uſeful to us in the time of a French war, and of what infinite detriment it might prove if this iſland ſhould ever fall into the hands of our enemies.

"The inhabitants are very induſtrious in their reſpective employments; naturally ſober, frugal in their manner of living, honeſt in their dealings, ſincere in their religion, which is that of the church of England, and loyal to their princes, as well as ſteady to the Britiſh intereſt. They are, however, referred to a degree that makes them ſometimes thought moroſe; they are ſomewhat ſuſpicious; and, which is their greateſt error, they are, or at leaſt were, very litigious. They are good huſbandmen in their own way, and manage the ſea-wreck (which firſt ſerves the poor people for fuel, and then its aſhes are employed by thoſe in better circumſtances for manure) with great ſkill, and under very prudent regulations. The wreck is cut in ſummer, and about the vernal equinox, by the proclamation of the magiſtrates, and when dried, diſtributed by their order. As for the winter-wreck, which after ſtorms is thrown in large quantities on the coaſt; this is alſo equitably divided, and being ſtrewed wet, and ſo ploughed into the ground, renders it continually fertile. They have a ſtronger turn, however, to grazing, than to agriculture; and though they bring in annually ſome corn, yet in the ſame ſpace they ſend out a few hundred cattle,

Guernsey. cattle. They are ſtill more inclined to orchards, which enables them to make many thouſand hogſheads of cyder every year; of which, it being the common drink of the people, they export but little. The woollen is their principal manufacture, for the carrying on of which they are allowed to import 2000 tons from England, which they work up chiefly in ſtockings, waiſtcoats, and breeches. They might certainly make their fiſhery turn to profit, more eſpecially as of late years they have ſet up ſalt-works; and yet, except lobſters, I never heard that any of their fiſh went to a foreign market. Our French and Portugal merchants have large ſtocks of wine here, which they import as they have occaſion. As they are enabled, by this method, to keep it to a proper age before they are obliged to pay the duty, it ſeems to be a benefit to the mother-country, by putting it in their power both to buy and ſell cheaper: as on the other hand, from the rent of warehouſes, the ſubſiſting factors and their ſervants, the reſort of ſhips employed in this trade, it muſt be very advantageous to the inhabitants of this iſland. It is a point of juſtice to obſerve, that this manner of depoſiting wines, has nothing at all to do with ſmuggling; a practice equally injurious to the intereſts of this country and to the people of Guernſey, as it breeds few ſeamen, is carried on in very ſmall veſſels, and upon the whole is not only an infamous, but a very unprofitable kind of traffic. Heretofore, merchants of this iſle traded to moſt parts of Europe, and had ſeveral ſtout ſhips of their own; and if this vile practice was aboliſhed, as it might eaſily be, without any violation of the liberties of the people, they would ſoon find their account in it, by the revival of many lucrative branches of commerce. As they take from England ſome of the neceſſaries, and almoſt all the conveniencies, of life, ſuch as corn, malt-liquor, ſugars, ſpices, coals, houſehold-furniture, many ſpecies of the iron and leather manufactures, grocery, haberdaſhery, and hard-wares, the balance is greatly in our favour; and muſt continually increaſe, in proportion as they augment in number, and grow eaſier in circumſtances. At preſent, upon a very moderate computation, there are in Guernſey upwards of 15,000 ſouls.

"The ſeveral iſlets and vaſt chains of rocks that ſurround this country on every ſide, and cauſe ſuch a variety of tides and currents, add much to the ſecurity of the place, by rendering it equally difficult and dangerous for ſhips to approach it, unleſs they have pilots aboard extremely well acquainted with the coaſt. On the ſouth ſide, the cliffs are prodigiouſly high; ſo that the old writers ſay, it looks like a park in the ſea, impaled with rocks. On the weſt ſide lie the Hanoys, or, as the French write them, *Hanovaux*, which cover that coaſt ſo effectually, that a deſcent there is little to be feared. At the north-weſt extremity lies a little iſland called *the Howe;* which would be a very convenient place for a ſalt-work, glaſs-houſe, or manufactory of ſoap. At the north-eaſt extremity we meet with St Michael in the vale, a peninſula ſome miles in extent, connected with Guernſey by a very narrow iſthmus, with bays that might be rendered uſeful on both ſides. This peninſula is likewiſe guarded by rocks and iſlets, the moſt conſiderable of which are the Bryants, the Hummet, and the Hays. South-eaſt from the vale, lies the iſland of Harnet, or Arne, about a league in compaſs, formerly deſart, but now cultivated. At a league ſouth from thence lies Briehoe, of leſs extent; and between both, the little iſland of Gythau, or Jethau, which ſerves the governor for a kind of park, or rather paddock. Guiana.

GUIANA, a large country of South America, is bounded on the eaſt and north by the Atlantic ocean, and the river Oroonoko; on the ſouth, by the river of the Amazons; and on the weſt, by the provinces of Grenada and New-Andaluſia, in Terra-Firma, from which it is ſeparated both on the weſt and north by the river Oroonoko. It extends above 1200 miles from the north-eaſt to the ſouth-weſt, that is, from the mouth of the river Oroonoko to the mouth of the river of Amazons, and near 600 in the contrary direction.

Moſt geographers divide it into two parts, calling the country along the coaſt *Caribbeana Proper*, and the interior country *Guiana Proper:* the laſt is alſo ſtyled *El Dorado* by the Spainards, on account of the immenſe quantity of gold it is ſuppoſed to contain.

The Portugueſe, French, and Dutch, have all ſettlements along the coaſt. What lies ſouth of Cape North belongs to the firſt of theſe nations; the coaſt between Cape North and Cape Orange is poſſeſſed by the natives; French Guiana, Old Cayenne, or Equinoctial France, extends from Cape Orange, about 240 miles along the coaſt, to the river Marani; where the Dutch territory begins, and extends to the mouth of the Oroonoko.

Along the coaſt, the land is low, marſhy, and ſubject to inundations in the rainy ſeaſon, from a multitude of rivers which deſcend from the inland mountains. Hence it is, that the atmoſphere is ſuffocating hot, moiſt, and unhealthful, eſpecially where the woods have not been cleared away. Indeed, the Europeans are forced to live in the moſt diſagreeable ſituations, and fix their colonies at the mouths of the rivers, amidſt ſtinking marſhes, and the putrid ooze of ſalt moraſſes, for the conveniency of exportation and importation.

"Dutch Guiana (according to an account lately publiſhed by a gentleman who reſided ſeveral years at Surinam as a phyſician) was firſt diſcovered by Columbus in 1498. It lies between the 7° of north, and the 5° of ſouth latitude, and between the 53° and 60° of longitude weſt from London. It is bounded on the north and eaſt, by the Atlantic; on the weſt, by the rivers Oroonoko and Negroe; and on the ſouth, by the river of Amazons.

"It is now divided between the Spaniards, Dutch, French, and Portugueſe; but except its ſea-coaſt, and lands adjacent to its rivers, it has hitherto remained unknown to all but its original natives; and even of theſe, it is only the Dutch territories that foreigners have any knowledge of; for thoſe of the Spaniards, French, and Portugueſe, are inacceſſible to them.

"This country, on account of the diverſity and fertility of its ſoil, and of its vicinity to the equator, which paſſes through it, affords almoſt all the productions of the different American countries between the tropics, beſides a variety peculiar to itſelf.

"Dutch Guiana was formerly the property of the Engliſh, who made ſettlements at Surinam, where a kind

Guiana. kind of corrupt Engliſh is ſtill ſpoken by the negroes. The Dutch took it in the reign of Charles the Second; and it was ceded to them by a treaty in 1674, in exchange for what they had poſſeſſed in the province now called *New York*.

The land for 50 miles up the country from the ſea-coaſt is flat; and, during the rainy ſeaſons, covered two feet high with water. This renders it inconceivably fertile, the earth, for 12 inches deep, being a ſtratum of perfect manure: an attempt was once made to carry ſome of it to Barbadoes; but the wood-ants ſo much injured the veſſel, that it was never repeated The exceſſive richneſs of the ſoil is a diſadvantage, for the canes are too luxuriant to make good ſugar; and, therefore, during the firſt and ſecond crop, are converted into rum.

There are ſome trees on this part; but they are ſmall and low, conſiſting chiefly of a ſmall ſpecies of palm, intermixed with a leaf near 30 feet long and three feet wide, which grows in cluſters, called a *Troælie*; and, at the edges of running-water, with mangroves.

Farther inward the country riſes; and the ſoil, though ſtill fertile, is leſs durable. It is covered with foreſts of valuable timber, that are always green; and there are ſome ſandy hills, though no mountains; in the French territories, however, there are mountains, according to the report of the Indians, for they have never been viſited by any other people.

In this country the heat is ſeldom diſagreeable: the trade-winds by day, the land breezes in the evening, and the invariable length of the nights, with gentle dews, refreſh the air, and render it temperate and ſalubrious. There are two wet ſeaſons, and two dry, of three months each, in every year; and, during more than a month in each wet ſeaſon, the rain is inceſſant. The dry ſeaſons commence ſix weeks before the equinoxes, and continue ſix weeks after. The wet ſeaſons are more wholeſome than the dry, becauſe the rains keep the waters that cover the low lands, next the ſea, freſh and in motion; but during the dry ſeaſon it ſtagnates, and, as it waſtes, becomes putrid, ſending up very unwholeſome exhalations. Bloſſoms, green and ripe fruit, are to be found upon the ſame tree in every part of the year. There are ſome fine white and red agates in Guiana, which remain untouched; and mines of gold and ſilver, which the Dutch will not ſuffer to be wrought.

The inhabitants of Guiana are either natives, who are of a reddiſh brown; or negroes and Europeans; or a mixed progeny of theſe in various combinations. The natives are divided into different tribes, more or leſs enlightened, and poliſhed, as they are more or leſs remote from the ſettlements of the Europeans. They allow polygamy, and have no diviſion of lands. The men go to war, hunt, and fiſh; and the women look after domeſtic concerns, ſpin, weave, in their faſhion, and manage the planting of caſſava and manive, the only things which in this country are cultivated by the natives. Their arms are bows and arrows; ſhort poiſoned arrows, blown through a reed, which they uſe in hunting; and clubs made of a heavy wood called *iron-wood*. They eat the dead bodies of thoſe that are ſlain in war, and ſell for ſlaves thoſe they take priſoners; their wars being chiefly undertaken to furniſh the European plantations. All the different tribes go naked. On particular occaſions they wear caps of feathers; but, as cold is wholly unknown, they cover no part but that which diſtinguiſhes the ſex. They are chearful, humane, and friendly; but timid, except when heated by liquor, and drunkenneſs is a very common vice among them. Guiana Guidi.

Their houſes conſiſt of four ſtakes ſet up in a quadrangular form, with croſs poles, bound together by ſlit nibbees, and covered with the large leaves called *troælies*. Their life is ambulatory; and their houſe, which is put up and taken down in a few hours, is all they have to carry with them. When they remove from place to place, which, as they inhabit the banks of rivers, they do by water in ſmall canoes, a few veſſels of clay made by the women, a flat ſtone on which they bake their bread, and a rough ſtone on which they grate the roots of the caſſava, a hammock and a hatchet, are all their furniture and utenſils; moſt of them, however, have a bit of looking-glaſs framed in paper, and a comb.

Their poiſoned arrows are made of ſplinters of a hard heavy wood, called *cacario*: they are about 12 inches long, and ſomewhat thicker than a coarſe knitting needle: one end is formed into a ſharp point; round the other is wound ſome cotton, to make it fit the bore of the reed through which it is to be blown. They will blow theſe arrows 40 yards with abſolute certainty of hitting the mark, and with force enough to draw blood, which is certain and immediate death. Againſt this poiſon no antidote is known. The Indians never uſe theſe poiſoned arrows in war, but in hunting only, and chiefly againſt the monkies; the fleſh of an animal thus killed may be ſafely eaten, and even the poiſon itſelf ſwallowed with impunity.

GUIAQUIL, a town, bay, and harbour of South America, in Peru, and capital of an audience of the ſame name. W. Long. 76. 55. S. Lat. 2. 0.

GUIARA, a ſea-port town of South America, and on the Caracca coaſt. The Engliſh attempted to take it in 1749 and 1743; but they were repulſed both times. W. Long. 66. 5. N. Lat. 10. 35.

GUICCIARDINI (Franciſco), a celebrated hiſtorian, born at Florence in 1482. He profeſſed the civil law with reputation, and was employed in ſeveral embaſſies. Leo X. gave him the government of Modena and Reggio, and Clement VII. that of Romagna and Bologna. Guicciardini was alſo lieutenant-general of the pope's army, and diſtinguiſhed himſelf by his bravery on ſeveral occaſions; but Paul III. having taken from him the government of Bologna, he retired to Florence, where he was made counſellor of ſtate, and was of great ſervice to the houſe of Medicis. He at length retired into the country to write his Hiſtory of Italy, which he compoſed in Italian, and which comprehends what paſſed from the year 1494 to 1532. This hiſtory is greatly eſteemed; and was continued by John Baptiſt Adriani, his friend. He died in 1540.

GUICCIARDINI (Lewis), his nephew, compoſed a hiſtory of the Low Countries, and memoirs of the affairs of Europe, from 1530 to 1560. He wrote with great ſpirit, againſt the perſecution of the duke d'Alva, for which he impriſoned him. Died in 1583.

GUIDI (Alexander), an eminent Italian poet,

Guido Guilandina.

born at Pavia in 1650. Having a defire to fee Rome, he there attracted the notice of queen Chriſtina of Sweden, who retained him at her court; he beſide obtained a conſiderable benefice from pope Innocent XI. and a penſion from the duke of Parma. For a good office he did the ſtate of Milan with prince Eugene, he was enrolled among the nobles and decurions of that town; and died in 1712. Nature had been kinder to his intellects than to his exterior form; his body was ſmall and crooked, his head was large, and he was blind of his right eye. A collection of his works was publiſhed at Verona in 1726.

GUIDO (Reni), an illuſtrious Italian painter, born at Bologna in 1575. In his early age he was the diſciple of Denis Calvert, a Flemiſh maſter of good reputation; but afterwards entered himſelf in the ſchool of the Caracci. He firſt imitated Ludovico Caracci; but fixed at laſt in a peculiar ſtile of his own, that ſecured him the applauſe of his own time and the admiration of poſterity. He was much honoured, and lived in ſplendor: but an unhappy attachment to gaming ruined his circumſtances; the reflection on which brought on a languiſhing diſorder, that put an end to his life in 1642. There are ſeveral deſigns of this great maſter in print, etched by himſelf.

GUIENNE, the largeſt province of France, bounded on the north by Saintogne, Angoumois, and Limoſin; on the eaſt by Limoſin, Auvergne, and Languedoc; on the ſouth by the Pyrenees, Lower Navarre, and Bearn; and on the weſt by the ocean. It is about 225 miles in length, and 200 in breadth. It is divided into the Upper and Lower. The Upper comprehends Querci, Rouergue, Armagnac, the territory of Comminges, and the county of Bigorre. The Lower contains Bourdelois, Perigord, Agenois, Condomois, Bazadois, the Lander, Proper Gaſcony, and the diſtrict of Labour. The principal rivers are, the Garonne, the Adour, the Tarn, the Aveirou, and the Lot. Bourdeaux is the capital town.

GUILANDINA, the NICKAR TREE; a genus of the monogynia order, belonging to the decandria claſs of plants.

Species. 1. The bonduc, or yellow nickar. 2. The bonducella, or gray nickar. Theſe are climbing plants, natives of the Weſt Indies, where they riſe to the height of twelve or fourteen feet: the flowers come out at the wings of the ſtalks; and are compoſed of five concave yellow petals. They are ſucceeded by pods about three inches long and two broad, cloſely armed with ſlender ſpines, opening with two valves, each incloſing two hard ſeeds about the ſize of children's marbles, of a yellowiſh colour. 3. The moringa, or morunga nickar, is a native of the iſland of Ceylon, and ſome places on the Malabar coaſt. It riſes to the height of 25 or 30 feet, having flowers produced in looſe bunches from the ſide of the branches, and compoſed of an unequal number of petals.

Culture and Uſes. Theſe plants being natives of warm climates, require to be kept through the winter in a ſtove in this country. They are propagated by ſeeds; but thoſe of the firſt ſort are ſo hard, that unleſs they are ſoaked two or three days in water before they are put into the ground, or placed under the pots in the tan-bed to ſoften their covers, they will remain for years without vegetating.—The roots of the third ſort are ſcraped when young, and uſed by the inhabitants of Ceylon and Malabar as thoſe of horſe-radiſh are in Europe. The wood dyes a beautiful blue colour.

Guild Guinea.

GUILD, (from the Saxon *guildan*, to "pay"), ſignifies a fraternity or company, becauſe every one was *gildare, i. e.* to pay ſomething towards the charge and ſupport of the company. As to the original of theſe guilds or companies, it was a law among the Saxons, that every freeman of fourteen years of age ſhould find ſureties to keep the peace, or be committed; upon which the neighbours entered into an aſſociation, and became bound for each other, either to produce him who committed any offence, or to make ſatisfaction to the injured party: in order to this, they raiſed a ſum among themſelves, which they put into a common ſtock; out of which they, upon occaſion, made a pecuniary compenſation according to the quality of the offence committed. Theſe guilds are now companies joined together, with laws and orders made by themſelves, by the licence of the prince.

GUILD, in the royal boroughs of Scotland, is ſtill uſed for a company of merchants, who are freemen of the borough. See BOROUGH.

Every royal borough has a dean of *guild*, who is the next magiſtrate below the bailiff. He judges of controverſies among men concerning trade; diſputes between inhabitants touching buildings, lights, watercourſes, and other nuiſances; calls courts, at which his brethren of the *guild* are bound to attend; manages the common ſtock of the *guild*; and amerces and collects fines.

GUILD, *Gild*, or *Geld*, is alſo uſed among our ancient writers, for a compenſation, or mulct, for a fault committed.

GUILD-*Hall*, the chief hall of the city of London, for holding of courts, and for the meeting of the lord-mayor and commonalty, in order to make laws and ordinances for the welfare and regulation of the city.

Dean of Guild, in Scots law, a magiſtrate of a royal borough, who is head of the merchant-company. See Law, N° clviii. 11.

GUILDFORD, or GULDEFORD, a borough-town of Surry, ſituated on the river Wye, thirty-miles ſouth-weſt of London. It ſends two members to parliament. Long. 0. 40. N. Lat. 51. 16.

GUILLEMOT, in ornithology. See COLYMBUS.

GUILLIM, (John), of Welſh extraction, was born in Herefordſhire, about the year 1565. Having completed his education at Brazen-noſe college, Oxford, he became a member of the college of arms in London; and was made rouge croix purſuivant, in which poſt he died in 1621. He publiſhed, in 1610, a celebrated work, intitled *the Diſplay of Heraldry*, folio, which has gone through many editions. To the fifth, which came out in 1679, was added *A treatiſe of honour civil and military*, by captain John Loggan.

GUINEA, a large tract of country lying along the weſt ſide of the continent of Africa. It is divided into the upper and lower, the latter of which is alſo called *Congo*. See CONGO.—Theſe two together, reckoning from Cape Togrin, near the mouth of the river Sierra Leoni in N. Lat. 9° 18′, to Cape Negro

Guinea. gro in S. Lat. 16° 45′, extend about 2500 miles along the ſea-coaſt, and many more, if we reckon all the turnings, windings, and bays. As for its inland extent, it is not eaſy to aſcertain it.

As all this country lies between the tropics, the air is exceſſively hot, eſpecially from the beginning of September to the end of March, which, with the coolneſs of the nights, the frequent thick, ſtinking, ſulphureous miſts, and the periodical rains, when the flat country is overflowed, makes it very unhealthy, eſpecially to Europeans, to whom it is generally fatal. The winds on the coaſt of Guinea Proper ſet from weſt to eaſt, directly contrary to the trade-winds, except in the rainy ſeaſon, between the vernal and autumnal equinox, when they have violent ſtorms of wind, with terrible thunder and lightning: and theſe winds blowing from the ſouth, the ſhipping on the coaſt at this time are in great danger of being wrecked; and, even in the calmeſt weather, there is always ſuch a ſurf beating upon the ſhore, that it is very difficult and dangerous landing. As to the face of the country, a variety of hills, valleys, woods, and plains, are ſeen all along the coaſt, intermixed with bogs and moraſſes.

The animals of Guinea are the ſame as thoſe of Caffraria; but their grain is different. Here is no wheat; but plenty of Guinea grain, rice, maiz, or Indian corn. There are no grapes here; but the palm-tree affords them wine, and their cocoa-nuts a pleaſant drink. Here are alſo oranges and lemons, plantains, pomegranates, tamarinds, pine-apples, and other tropical fruits.

Of foreſt-trees they have a great variety, which grow to a prodigious height and bulk; ſome of them being excellent timber, and having a very beautiful grain.

Their metals are gold, copper, and iron. The gold is found by the natives in the ſands of their rivulets in duſt; ſometimes they meet with large pieces, but there are no gold mines open, and poſſibly there may be no mines of that metal. As it is found waſhed down into the brooks and rivulets in every place our people bring it from, it ſeems probable that it lies pretty near the ſurface. There is plenty of ſalt on the Guinea coaſt; which they make by letting the ſalt-water into ſhallow pans in the dry ſeaſons, and the ſun exhaling the water, the ſalt is left at bottom.

Beſides gold, ivory, and ſlaves, this country affords indigo, wax, gum-ſenega, gum-tragacanth, and a variety of other gums and drugs. Theſe articles may be had in moſt parts of this extenſive coaſt, but chiefly in Proper Guinea.

Of mountains in Guinea, the moſt remarkable are thoſe of Sierra Leoni. The principal capes are thoſe of Cape Blanco, Cape Verd, Cape Leon, Cape St. Ann's, Cape Palmas, and Cape Three-Points, Cape Formoſa, Cape Monte, Cape St. John, Cape Lopas, Cape Lede, and Cape Negro. The chief bays are the Cyprian or Cintra Bay, and the Bite of Guinea. Of the rivers, the moſt conſiderable are thoſe of Coanzo and Ambriſi, the Zaara, the Lunde, the Cameron, the Formoſa, the Volta, the Sierra Leon, and the Sherbro. All theſe run from eaſt to weſt, (except the Volta, which runs from north to ſouth), and fall into the Atlantic. Guinea.

The natives of Guinea, deſcended from the original inhabitants, are all negroes, well known by their flat noſes, thick lips, and ſhort woolly hair; though there are among them many camps or villages of Arabs, who are of a tawny complexion; and there is a mixed breed of Mulattoes, proceeding from the commerce of the Portugueſe and natives, who are almoſt as dark as the negroes.

As to their habits, the common people have generally only a cloth about their middle; but people of condition have another over their ſhoulders, and are adorned with abundance of rings, and bracelets of gold, ivory, or copper: the arms, legs, and a great part of the bodies of the men are naked; but the women are veiled, when they go abroad.

The Europeans tell us, that the natives have generally more wit than honeſty, frequently mixing their gold with baſe metal: but there is reaſon to ſuſpect, that the little tricks and cheats they uſe in trade have been taught them by the Chriſtians with whom they traffic; and if the women are lewd, they are not worſe than thoſe that accuſe them, who firſt tempt them to incontinence, and then reproach them for it.

Every family almoſt in Guinea make their own tools and utenſils: they are all ſmiths, carpenters, and maſons; building their own houſes or huts, which are, indeed, of very ſlight materials; and, till the Europeans brought them hammers, &c. one ſtone ſerved them for an anvil, and another for a hammer. The women manage all the huſbandry, as well as their domeſtic affairs: they dig, ſow, plant, and bring in the harveſt, while the huſband looks on: ſo that the more wives a man has, the richer he is ſaid to be in this country; and ſome negroes on the coaſt make money by letting out their wives; and, indeed, they make little difference between their wives and their ſlaves.

The ſmall-pox is as fatal to the negroes as the plague, and worms are an epidemical diſtemper; not thoſe in the ſtomach and bowels; but a ſpecies that are found between the ſkin and the fleſh, and give the patient extreme pain, till they are drawn out: which is an operation that ſometimes takes a month to perform; for, if they attempt to draw it out too haſtily, the worm breaks, and rots in the fleſh, or breaks out in another place. Some negroes have nine or ten of theſe worms in their ſkin at once, and the Europeans are not entirely free from them. A greedy ravenous appetite is alſo reckoned among the diſeaſes of the Guinea negroes; and the venereal diſeaſe is often fatal to them, having no effectual methods of cure of their own: nor are the wounds they receive in the field of Mars leſs dangerous than the other, eſpecially if the bones are ſhattered; for they can cure only ordinary fleſh-wounds, which they do by applying poultices of herbs. The negroes are ſeldom long-lived, though they are generally healthful while they live.

The diſtempers the Europeans are ſubject to on this coaſt are fevers, fluxes, and colics, which are occaſioned by indifferent water and bad air; their ſettlements lying near the coaſt, where the fogs and ſteams ariſing from the ooze and ſalt-marſhes, and

Guinea. the ſtinking fiſh the natives dry on the beach, corrupt the air, and render it fatal to the foreigners. The moſt temperate men find it difficult to preſerve their health; but a great many haſten their death by their intemperance, or negligence, expoſing themſelves to the cold air in the evening, after a very hot day. This ſudden change, from one extreme to the other, has often very bad effects in hot climates.

As to religion, the natives generally acknowledge one Supreme Being, that created the univerſe; and yet pay him no manner of worſhip or adoration, never praying to him, or giving him thanks for any thing they enjoy. They believe he is too far exalted above poor mortals to take notice of them; and therefore pray to a multitude of inferior deities, of which there are ſome common to whole nations, and yet every man has a god of his own chooſing beſides.

In Guinea there are ſome ſovereign princes, whoſe dominions are very extenſive, rich, powerful, and themſelves arbitrary, limited by no laws, or any other reſtraint; and there are many others, to whom the Dutch and other Europeans have given the name of kings, whoſe dominions do not exceed the bounds of an ordinary pariſh, and whoſe power and revenues are proportionably mean.

The country of Guinea-Proper extends from Cape Palmas to the river Volta, about an hundred and fifty leagues along the ſea-coaſt, which bounds it to the ſouth. The Europeans divide it into two parts, the Tooth and the Gold Coaſt; the former extending from Cape Palmas to the river Sueira da Caſta, 18 miles weſt of the river Mancha, by ſome called *Rio Cobre*, and Aukeber; and the latter from thence to the river Volta.

The Tooth, Ivory, or Quaqua Coaſt, is ſo called from the great plenty of elephants teeth found there. According to Dapper, the inhabitants of this coaſt, though they ſeem the moſt barbarous and ſavage people of all Guinea, are really the moſt civilized and the moſt reaſonable, and paſs for ſuch among their neighbours. When they come to trade with any ſhip, they take ſome water into their hands, and let a few drops of it fall into their eyes; which is a kind of oath, by which they intimate, that they would rather loſe their eye-ſight than cheat thoſe they trade with. They are no leſs averſe to drunkenneſs than to fraud; and though their country produces numbers of palm-trees, yet they drink no palm-wine, but only a certain liquor, called *bordon*, or *tonibo-wine*, which they mix with water. Their chief manufactures and trade conſiſt in cotton habits, which are called *Quaqua gowns*, and are made of five or ſix breadths ſewed together. One of the fundamental laws of this country is, that every one is obliged to continue all his life-time in the condition in which he was born; ſo that one whoſe father was a fiſherman, for inſtance, can never become any thing elſe but a fiſherman, and ſo of all other trades and profeſſions.

The Gold-coaſt had its name given it by the Portugueſe, from the immenſe quantity of that precious metal it produces: the ſame reaſon has made all the other nations of Europe retain the ſame appellation. According to the beſt charts, the ſituation of the Gold-coaſt is between 4° 30′ and 8° north latitude, and 16° and 8° 4′ of longitude, beginning at the river Ankobar, and extending to the Rio Volta, that is, about 130 leagues from weſt to eaſt. The beginning of the Gold-coaſt, however, is placed by many at Rio de Suiero da Coſta, near Iſnui, that being the firſt place where gold is found; and the end at Lay, in the country of Lampi, three or four leagues from Akra, becauſe there the gold is procured but accidentally, from a people called *Amaho*, inhabiting the more diſtant interior country. Guinea.

This coaſt contains a variety of different kingdoms and ſtates, viz. Adomir, called likewiſe *Saku*, and *Avina*: Axim, Ankobar, Adom, likewiſe called *Little Inkaſſan*, or *Warhes*; Jabi, or Jabs; Commendo, or Guaſſo: Fetu, Sabo, Fantin, Ackron, Agonna, or Anguirra; Amra, or Aquambus, Lubbade, and Ningo, or Lampi. Each of the above diviſions, provinces, or kingdoms, have one, two, or more towns or villages on the ſea-coaſt, between or under the European forts and ſettlements. Eight of them are real monarchies, having their own proper kings, who, before the arrival of the Europeans, were called *captains*; the reſt are republics, governed by magiſtrates, who are ſubject to the laws, and periodical changes. Upon the river Cobre or Ankbobar, and in the country of that name, which is properly the firſt country of the Gold-coaſt, there are a number of towns, in the three provinces of Ankobar, Aborrel or Abocro, and Eguira. The firſt is a monarchy; the two latter republics. For a number of years the Dutch had a fort at Eguira; and their gold trade, beſides what they drew from the neighbouring countries, was very conſiderable, this canton having its own proper mines; but loſt all their footing in the country by a quarrel with the negroes.

New GUINEA, a long and narrow iſland of the Eaſt Indies, very imperfectly known. It was ſuppoſed to be connected with New-Holland, until Captain Cook diſcovered the ſtrait which ſeparates them. New Guinea, including Papua, its north-weſtern part, (which according to Bougainville's conjecture is ſeparated from it by a ſtrait) reaches from the equator to the twelfth degree of ſouth latitude, and from 131 to 150 deg. eaſt longitude; in one part it does not appear to be above fifty miles broad. It was firſt viſited by an European ſhip in 1529. Saavedra, a Portugueſe, who made the diſcovery of the north-weſt part of this country, called it *Terra de Papuas* or *Papoi*. Van Schouten, a Dutch diſcoverer, afterwards gave the name of *New-Guinea* to its ſouth-weſtern part. Admiral Roggewain alſo touched here; and before him Dampier, 1ſt January 1700. Captain Cook made the coaſt of New-Guinea, in latitude 6 deg. 15. min. longitude 138. eaſt, on the 3d of September, and landed in the pinnace, accompanied by Mr Banks, Doctor Solander, nine of the ſhip's crew, and ſervants well armed, and leaving two ſeamen to take care of the boat advanced ſome little way up the country; but coming to the ſkirts of a thick wood, they judged it prudent to proceed no further, leſt they ſhould fall into an ambuſcade of the natives, and their retreat to the boat be cut off. Having advanced about a quarter of a mile from the boat, three Indians ruſhed out of the wood with a hideous ſhout; they threw their darts, and ſhowed ſuch a hoſtile diſpoſition, that the party, to prevent the deſtruction of theſe

Guinea ‖ Guiſe.

theſe people, returned to the boat, as they had no intention forcibly to invade their country, either to gratify their appetites or curioſity, and it was evident nothing could be done upon friendly terms. When they got on board the boat, they rowed along the ſhore, and the number of Indians aſſembled ſeemed to be between ſixty and a hundred. They made much the ſame appearance as the New-Hollanders, being ſtark naked, and their hair cropped ſhort. All the while they were ſhouting defiance, and throwing ſomething out of their hand which burnt exactly like gun-powder, but made no report; what theſe fires were, or for what purpoſe intended, could not be gueſſed at; thoſe who diſcharged them had in their hands a ſhort piece of ſtick, poſſibly a hollow cane, which they ſwung ſidewiſe from them, and immediately fire and ſmoke iſſued, exactly reſembling the diſcharge of a muſket, and of no longer duration. This wonderful phænomenon was obſerved from the ſhip; and the deception was ſo great, that the people on board thought they had fire-arms, and event in the boat, if they had not been ſo near as that, they muſt have heard the report, if there had been any, they ſhould have thought they had been firing volleys. After looking at them attentively ſome time, without making any notice of their ſtaſhing and vociferation, the ſailors fired ſome muſkets over their heads. Upon hearing the balls rattle among the trees, they walked leiſurely away, and the boat returned to the ſhip. Upon examining ſome weapons which the natives had thrown, they were found to be light darts, about four feet long, very ill made, of a reed or bamboo cane, and pointed with hard wood, in which there were many barbs. They were diſcharged with great force, for at ſixty yards diſtance they went beyond the party; but in what manner they were thrown could not be exactly ſeen. * But the general opinion was, that they were thrown with a ſtick in the manner practiſed by the New-Hollanders.

The land here is very low, as is every other part of the coaſt; but it is covered with a luxuriance of wood and herbage that can ſcarcely be conceived. Here the cocoa-nut, plantain, and bread-fruit, flouriſh in the higheſt perfection.

GUINEA is alſo the name of a Britiſh gold coin, value 1 l. 1 ſh. Sterling.

GUINEA *Hen*, in ornithology. See NUMIDIA.

GUINEA-*Pig*, in zoology. See MUS.

GUIPUSCOA, the north-eaſt diviſion of the province of Biſcay in Spain, ſituated on the confines of Navarre.

GUISE, ſmall town of France, in Picardy, and in Tierache, with a very ſtrong caſtle, and the title of a duchy. It is ſeated on the river Ouſe, in E. Lon. 3. 42. N. Lat. 49. 54.

GUISE (Henry) of Lorrain, duke of Guiſe, (eldeſt ſon of Francois of Lorrain duke of Guiſe) memorable in the hiſtory of France as a gallant officer; but an imperious, turbulent, ſeditious ſubject, who placed himſelf at the head of an armed force, and called his rebel band, The League. The plan was formed by the cardinal, his younger brother; and under the pretext of defending the Roman Catholic religion, the king Henry III. and the freedom of the ſtate, againſt the deſign of the Hugunots, or French Proteſtants, they carried on a civil war, maſſacred the Hugenots, and governed the king, who forbid his appearance at Paris: but Guiſe now became an open rebel, entered the city againſt the king's expreſs order, and put to the ſword all who oppoſed him; the ſtreets being barricadoed to prevent his progreſs, this fatal day is called in the French hiſtory, The day of the barricades. Maſters of Paris, the policy of the Guiſes failed them: for they ſuffered the king to eſcape to Blois, though he was deſerted in his palace at Paris by his very guards. At Blois, Henry convened an aſſembly of the ſtates of France; the duke of Guiſe had the boldneſs to appear to a ſummons ſent him for that purpoſe; a forced reconciliation took place between him and the king, by the advice of this aſſembly; but it being accidentally diſcovered, that Guiſe had formed a plan to dethrone the king, that weak monarch, inſtead of reſolutely bringing him to juſtice, had him privately aſſaſſinated, December 23, 1558, in the 38th year of his age. His brother the cardinal ſhared the ſame fate the next day.

Guitttar ‖ Gulf.

GUITTAR, GUITARRA, a muſical inſtrument of the ſtringed kind, with five double rows of ſtrings; of which thoſe that are baſs are in the middle, except it be for the burthen, an octave lower than the fourth.—This inſtrument was firſt uſed in Spain, and by the Italians. In the former country it is ſtill greatly in vogue. There are few of that nation who cannot play on the guittar; and with this inſtrument they ſerenade their miſtreſſes at night. At Madrid, and other cities in that country, it is common to meet in the ſtreets young men equipped with a guittar and a dark lanthorn, who, taking their ſtation under the windows, ſing, and accompany their voices with this inſtrument; and there is ſcarce an artificer or day-labourer in any of the cities or principal towns, who does not entertain himſelf with his guittar.

GULES, in heraldry, a corruption of the French word *geules*, which in this ſcience ſignifies *red*, and is repreſented in engraving by perpendicular lines. It may ſerve of itſelf to denote martial proweſs, boldneſs, and hardineſs: for the ancients uſed this colour to make themſelves terrible to their enemies, to ſtir up magnanimity, and to prevent the ſeeing of blood, by the likeneſs of the colours; for which reaſon perhaps it is uſed by the Engliſh. But, according to G. Leigh, if this tincture is compounded with

Or.	it ſignifies	Deſire.
Arg.		Envy.
Azu.		Ardour.
Ver.		Strength.
Pur.		Juſtice.
Sab.		Wearineſs.

This colour is by the generality of the Engliſh heralds ranked before azure; but French heralds, N. Upton and his followers, prefer azure to it.

GULL, in ichthyology. See LARUS.

GULF, a broad and capacious bay comprehended between two promontories, and ſometimes taking the name of a *ſea* when it is very extenſive; but particularly when it only communicates with the ſea by means of a ſtreight. Such are the Euxine or Black Sea, otherwiſe called *the Gulf of Conſtantinople;* the Adriatic Sea, called alſo *the Gulf of Venice;* the gulf of Sidra near Barbary; and the gulf of Lions near France. All theſe gulfs

Gum. gulfs are in the Mediterranean. There are, beſides the gulf of Mexico, the gulf of St Lawrence, and the gulf of California, which are in North America. There are alſo the gulf of Perſia, otherwiſe called *the Red Sea*, between Perſia and Arabia; the gulf of Bengal in India; and the gulfs of Cochinchina and Kamtſchatka, near the countries of the ſame name. See 2d Plate CXVI.

The word comes from the French *golfe*, and that from the Italian *golfo*, which ſignify the ſame. Some deduce theſe further from the Greek κολπος; which Guiſhart again derives from the Hebrew גב. *gob*. Du Cange derives them from the barbarous Latin *gulfum*, or *gulfus*, which ſignify the ſame thing.

GUM *(Gumma)*, in medicine, is a tumour ariſing out of the ſubſtance of a bone; it is ſo ſoft as to yield to the finger. When theſe tumours are harder they are called *tophs*; when harder ſtill, they receive the name of *nodes*: but the hardeſt tumours in bones are *exoſtoſes*. In venereal patients ſuch tumours often happen on the head, and even in the middle of the moſt ſolid bones. They ſeem to be produced when the veſſels running between the bony laminæ, being either obſtructed or inflamed, are dilated, and ſo raiſe the incumbent laminæ. Perhaps the bone degenerates too into a morbid ſoftneſs. A ſoftneſs of the bones ſometimes ſucceeds abſceſſes of the adjacent parts; and ſometimes the origin of the diſorder is lodged in the ſubſtance of the bone, eſpecially in the lues venerea; gummata have, however, been diſcovered, when no ſuch adequate cauſe could be obſerved.

GUM *(Gummi)*, is a concrete vegetable juice, of no particular ſmell or taſte, becoming viſcous and tenacious when moiſtened with water; totally diſſolving in water into a liquid, more or leſs glutinous in proportion to the quantity of the gum; not diſſolving in vinous ſpirits or in oils; burning in the fire to a black coal, without melting or catching flame; ſuffering no diſſipation in the heat of boiling water.

The true gums are gum arabic, gum tragacanth, gum ſenega, the gum of cherry and plum trees, and ſuch like. All elſe have more or leſs of reſin in them.

The virtues of gums are ſimilar to all mucilaginous ſubſtances in general, vegetable and animal; the more tenacious, glutinous, vegetable productions are called *gums*, thoſe that are leſs ſo are *mucilages*. The firſt diſtil naturally from trees, the ſecond are the produce of art.

GUM *Arabic*, called alſo *Gum Acanthinum*, *Gum Thebaicum*, *Gum Serapionis*, and the true *Gum Acacia*. It exſudes from the Egyptian acacia, or thorn-tree, whoſe fruit affords the inſpiſſated juice of that name. It is brought from Turkey in ſmall irregular maſſes, of a clear whitiſh, or very pale yellow colour.

The gum ſenega is generally ſold for it; but they are thus diſtinguiſhed: the gum arabic is in whitiſh tranſparent pieces, and is dry and brittle; but the gum ſenega is clammy, tenacious, rougher, of a deeper colour, and in larger pieces.

The gum does not diſſolve in ſpirit, nor in oil: yet when it is ſoftened with water into a mucilage, it is eaſily miſcible with both; alſo with reſins, and renders them miſcible with water. Dr Grew was uſed to mix eſſential oil with water by means of gum arabic; and in the Lond. Med. Obſ. and Inq. vol. i. a variety of experiments are inſerted, by which it appears that oils both expreſſed and diſtilled, reſins, balſams, &c. may by the ſame means be mixed uniformly with water or with ſpirit. Alkaline ſalts both fixed and volatile, though they render pure oil miſcible with water, prevent the mixture of gum with oil. Acids do not in the leaſt prevent the effect of the gum in this particular. Gum

Animal glues have the general qualities of the vegetable gums; with this difference, that the former are more nutrimental, and apt to run into a putrid ſtate. Conſidered as the ſubjects of chemiſtry, their difference is very great: thoſe of the animal kind are changed by fire into a volatile alkaline ſalt, and a fetid oil; the vegetable into an acid liquor, and a very minute portion of oily matter conſiderably leſs fetid than the former.

The medical character of gum arabic is its glutinous quality, in conſequence of which it ſerves to incraſſate and obtund thin acrid humours, ſo proves uſeful in tickling coughs, alvine fluxes, hoarſneſſes, in fluxes of the belly with gripes, and where the mucus is abraded from the bowels or from the urethra. In a dyſuria the true gum arabic is more cooling than the other ſimple gums, ſo ſhould be preferred.

One ounce of gum arabic renders a pint of water conſiderably glutinous; four ounces gives it a thick ſyrupy conſiſtence: but for mucilage, one part gum to two parts water is required; and for ſome purpoſes an equal proportion will be neceſſary.

In Dr Percival's Eſſays we have the following curious account, by Mr Henry, of the faculty which this gum hath of diſſolving and keeping ſuſpended in water not only reſinous but alſo other ſubſtances, which ſhould ſeem not likely to be at all affected by it. Vol. I. 319, &c.

"One ſcruple of balſam of tolu, rubbed with half an ounce of diſtilled rain-water, added gradually to it, for 15 minutes, formed a mixture, which on ſtanding about a minute ſubſided, but re-united by ſhaking: being ſet by a few days, the balſam became a concrete maſs, not again miſcible by ſhaking up the bottle. The ſame quantity required more trituration to mix it with common pump-water. One ſcruple of the ſame, rubbed with 15 grains of gum arabic, was nearly as long in perfectly uniting with half an ounce of diſtilled water, as that without the gum. This was perhaps owing to the latter piece being more reſinous; however, though on long ſtanding there was a ſmall ſediment, it immediately reunited a week after by agitation. Fifteen grains of balſam capivi united very ſmoothly with half an ounce of diſtilled water, by the medium of three grains of gum arabic. Five grains of the gum were not ſo effectual with pump-water. Balſam Peru ten drops, with gum arabic three grains, diſtilled water half an ounce, formed a neat white emulſion, but with common water a very unequal mixture. Gum myrrh powdered, that there might be no difference in the ſeveral quantities uſed, half a ſcruple, diſſolved readily with gum arabic three grains, in both kinds of water, and even mixed with them by longer trituration without any medium, but more eaſily with diſtilled than common ſpring water. Olibanum, maſtich, gum guaiacum, and galbanum, may likewiſe be mixed with water by rubbing, without any gum arabic

bic or egg. The ſpring-water made uſe of in theſe experiments was very aluminous.

" In the making of all the ſaline preparations, when any conſiderable quantities of water are uſed, diſtilled or pure rain or river water is greatly to be preferred: for the calcareous, aluminous, and ſelenitical matter, which ſo much abounds in moſt ſpring water, will render any ſalt diſſolved in it very impure.

" The ſolution of crude mercury with mucilage of gum arabic being ſo eaſily accompliſhed; and it being very diſagreeable to many patients, and to ſome almoſt impoſſible, to ſwallow pills, boluſes, or electuaries; I was induced to try whether calomel, cinnabar, and the other heavy and metalline bodies commonly adminiſtered only under theſe forms, might not by the ſame means be rendered miſcible with water, ſo as to be given more agreeably in a liquid form. I accordingly rubbed ten grains of cinnabar of antimony and a ſcruple of gum arabic, with a ſufficient quantity of diſtilled water to form a mucilage, and added a drachm of ſimple ſyrup, and three drachms more of water. This makes an agreeable little draught; and having ſtood about half an hour without depoſiting any ſediment, I added three drachms more of water to it; and notwithſtanding the mucilage was rendered ſo much more dilute, very little of the cinnabar ſubſided, even after it had ſtood ſome days.

" Steel ſimply prepared, and prepared tin, were both mixed with water by their own weight of gum arabic, and remained ſuſpended, except a very ſmall portion of each, which was not reduced to a ſufficiently fine powder.

" Five grains of calomel were mixed with two drachms of diſtilled water, and half a drachm of ſimple ſyrup, by means of five grains of gum arabic, which kept it ſufficiently ſuſpended: a double quantity of the gum preſerved the mixture uniform ſtill longer. In this form it will be much more eaſily given to children, than in ſyrups, conſerves, &c. as a great part of it is generally waſted, in forcing thoſe viſcid vehicles into them; and it may be joined with ſcammony and other reſinous purgatives by the ſame method, and of theſe perhaps the gum arabic would be the beſt corrector.

" Gum arabic likewiſe greatly abates the diſagreeable taſte of the corroſive ſublimate, mixed with water inſtead of brandy; and (from the few trials I have made) ſits eaſier on the ſtomach, and will not be ſo apt to betray the patient by the ſmell of the brandy.

Mr Plenck, who firſt inſtructed us in the method of mixing quickſilver with mucilage, obſerves, (and experience confirms the truth of it), that this preparation is not ſo apt to bring on a ſpitting as the *argent. viv.* mixed by any other medium, or as the ſaline and other mercurial preparations.—How far the theory by which he accounts for it may be juſt, is not of much importance; but it may perhaps be worth while to inquire whether it would not be equally effectual in preventing calomel, and the other preparations of mercury, from affecting the mouth.—If ſo, is it not improper, where a ſalivation is intended, to give emulſions with gum arabic and other mucilaginous liquors for the patient's common drink, as by that means the ſpitting may be retarded? And on the contrary, may it not be a uſeful medicine to diminiſh the diſcharge when too copious?

" The following caſe may in ſome meaſure ſerve to confirm the above obſervation.—A gentleman, always eaſily affected by mercurials, having taken about 26 grains of calomel in doſes from one to three grains, notwithſtanding he was purged every third day, was ſuddenly ſeized with a ſalivation. He ſpat plentifully, his breath was very fetid, teeth looſe, and his gums, fauces, and the margin of his tongue, greatly ulcerated and inflamed. He was directed to uſe the following gargle. ℞. *Gum. arab. ſemiunc. ſolve in aquæ font. bullient.-ſelib. & adde mel. roſac. unc. unam. M. ſt. gargar.* And to drink freely of a ptiſan prepared with *aq. hord. lib. ij. gum. arabic. unc. ij. nitr. pur. drachm. ij. ſacchar. alb. unc. ſ.*

Gum.

" His purgative was repeated the ſucceeding morning. The next day his gums were leſs inflamed; but the ſloughs on his tongue, &c. were ſtill as foul: his ſpitting was much the ſame: he had drank about a pint of the ptiſan.—Some *ſpt. vitrioli* was added to the gargle.—From this day to the fourth, he was purged every day without effect—his ſalivation ſtill continued,—his mouth was no better—he had neglected the mucilaginous drink—This evening he was perſuaded to drink about a pint of it which remained, and he had it repeated, and drank very freely of it that night.—On the fifth morning, the purgative was again repeated. Though it operated very little, yet the change was very ſurpriſing; his mouth was nearly well, and his ptyaliſm greatly decreaſed—The ptiſan was repeated; and on the ſixth day, being quite well, he was permitted to go abroad."

In Mr Haſſelquiſt's travels we have an inſtance of the extraordinary nutritive virtues of this gum. "The Abyſſinians, (ſays he), make a journey every year to Cairo, to ſell the products of their country. They muſt travel over terrible deſarts, and their journey depends as much on the weather as a voyage at ſea: conſequently they know as little as a ſeaman how long they muſt be on their journey; and the neceſſaries of life may chance to fail them when the journey laſts too long. This happened to the Abyſſinian caravan in the year 1740, their proviſions being conſumed when they had ſtill two months to travel. They were then obliged to ſearch for ſomething among their merchandiſe, wherewith they might ſupport nature; and found nothing more proper than gum Arabic, of which they had carried a conſiderable quantity along with them. This ſerved to ſupport above 1000 perſons for two months; and the caravan at laſt arrived at Cairo without any great loſs of people, either by hunger or diſeaſes."

Gum *Seneca*, is a gum extremely reſembling gum Arabic. It is brought to us from the country through which the river Senega runs, in looſe or ſingle drops; but theſe are much larger than thoſe of the gum arabic uſually are; ſometimes it is of the bigneſs of an egg, and ſometimes much larger: the ſurface is very rough, or wrinkled; and appears much leſs bright than the inner ſubſtance, where the maſſes are broken. It has no ſmell, and ſcarce any taſte. We are not acquainted with the tree which produces it. The virtues of it are the ſame with the gum arabic; but it is rarely uſed in medicine, unleſs as mixed with the gum arabic: the dyers and other artificers conſume the great quantities of it that are annually imported hither. The negroes

Gum || Gun.

negroes diſſolve it in milk, and in that ſtate make it a principal ingredient in many of their diſhes, and often feed on it thus alone.

Gum *Tragacanth*, the gum of the tragacanth, a thorny buſh growing in Crete, Aſia, and Greece. This gum is of a much ſtronger body than either of the foregoing, and does not ſo perfectly diſſolve in water. A dram of it will give the conſiſtence of a ſyrup to a whole pint of water, which an ounce of gum arabic will ſcarce do. Hence it is uſed for forming troches and the like purpoſes, in preference to the other gums. In its general medicinal virtues, it agrees with gum arabic.

Other ſubſtances known by the name of *gums*, are as follow:

Gum *Aloes*, a preparation of aloes. See PHARMACY, n° 613.

Gum *Ammoniac*. See AMMONIAC.

Gum *Elemi*. See ELEMI.

Gum *Guaiacum*. See GUAIACUM.

Gum *Lacca*. See LACCA.

Gum, among gardeners, a kind of gangrene incident to fruit-trees of the ſtone-kind, ariſing from a corruption of the ſap, which, by its viſcidity, not being able to make its way through the fibres of the tree, is, by the protruſion of other juice, made to extravaſate and ooze out upon the bark.

When the diſtemper ſurrounds the branch, it admits of no remedy; but when only on one part of a bough, it ſhould be taken off to the quick, and ſome cowdung clapped on the wound, covered over with a linnen cloth, and tied down. M. Quintinie directs to cut off the morbid branch two or three inches below the part affected.

Gums in anatomy, the hard fleſhly ſubſtance in either jaw, through which the teeth ſpring from the jawbone. See ANATOMY, n° 26. g.

The gums are apt to become ſpongy, and to ſeparate from the teeth; but the cauſe is frequently a ſtony kind of cruſt, which forms itſelf therein, which when ſeparated, the gums ſoon return to their former ſtate, eſpecially if rubbed with a mixture of the infuſion of roſes four parts, and the tincture of myrrh one part.—The ſcurvy is another diſorder which affects the gums. This diſorder, when not manifeſt in any other part, ſometimes appears in this: indeed when a ſcorbutic diſorder invades the whole habit, its firſt ſymptom is a putrid ſtate of the gums.

GUN, in the military art, a fire-arm, or weapon of offence, which forcibly diſcharges a ball or other hard and ſolid matter through a cylindric tube, by means of inflamed gun-powder. See *Gun*-POWDER.

The word gun now includes moſt of the ſpecies of fire-arms; piſtols and mortars being almoſt the only ones excepted from this denomination. They are divided into great and ſmall guns; the former including all that we alſo call cannon, ordnance, or artillery; the latter includes muſquets, carabines, muſquetoons, blunderbuſſes, fowling-pieces, &c.
